(1) Expected generation is the volume of energy that best represents our commodity position in energy markets from owned or contracted for capacity based upon a simulated dispatch model that makes assumptions regarding future market conditions, which are calibrated to market quotes for power, fuel, load following products, and options. Expected generation assumes 14 refueling outages in 2018, 11 in 2019, and 14 in 2020 at Exelon-operated nuclear plants and Salem. Expected generation assumes capacity factors of 93.4%, 94.9% and 93.9% in 2018, 2019, and 2020, respectively at Exelon-operated nuclear plants, at ownership. These estimates of expected generation in 2019 and 2020 do not represent guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years.

(2) Excludes EDF's equity ownership share of CENG Joint Venture

(3) Percent of expected generation hedged is the amount of equivalent sales divided by expected generation. Includes all hedging products, such as wholesale and retail sales of power, options and swaps.

(4) Effective realized energy price is representative of an all-in hedged price, on a per MWh basis, at which expected generation has been hedged. It is developed by considering the energy revenues and costs associated with our hedges and by considering the fossil fuel that has been purchased to lock in margin. It excludes uranium costs, RPM capacity and ZEC revenues, but includes the mark-to-market value of capacity contracted at prices other than RPM clearing prices including our load obligations. It can be compared with the reference prices used to calculate open gross margin in order to determine the mark-to-market value of Exelon Generation's energy hedges.

(5) Spark spreads shown for ERCOT and New England

(6) Reflects Oyster Creek and TMI retirements in October 2018 and September 2019, respectively. EGTP removal impacts full year 2018, 2019, and 2020 and is adjusted for retaining Handley Generating Station.

SI-SSA-0015-01273

ExGen Hedged Gross Margin* Sensitivities

Gross Margin* Sensitivities (with existing hedges)[1]	2018	2019	2020
Henry Hub Natural Gas ($/MMBtu)			
+ $1/MMBtu	$190	$410	$645
- $1/MMBtu	$(190)	$(400)	$(615)
NiHub ATC Energy Price			
+ $5/MWh	$75	$210	$345
- $5/MWh	$(70)	$(210)	$(340)
PJM-W ATC Energy Price			
+ $5/MWh	$30	$100	$165
- $5/MWh	$(15)	$(90)	$(160)
NYPP Zone A ATC Energy Price			
+ $5/MWh	-	$30	$55
- $5/MWh	-	$(35)	$(55)
Nuclear Capacity Factor			
+/- 1%	+/- $40	+/- $35	+/- $35

(1) Based on December 31, 2017, market conditions and hedged position; gas price sensitivities are based on an assumed gas-power relationship derived from an internal model that is updated periodically; power price sensitivities are derived by adjusting the power price assumption while keeping all other price inputs constant; due to correlation of the various assumptions, the hedged gross margin impact calculated by aggregating individual sensitivities may not be equal to the hedged gross margin impact calculated when correlations between the various assumptions are also considered; sensitivities based on commodity exposure which includes open generation and all committed transactions; excludes EDF's equity share of CENG Joint Venture

Exelon.

SI-SSA-0015-01274

ExGen Hedged Gross Margin* Upside/Risk

(1) Represents an approximate range of expected gross margin, taking into account hedges in place, between the 5th and 95th percent confidence levels assuming all unhedged supply is sold into the spot market; approximate gross margin ranges are based upon an internal simulation model and are subject to change based upon market inputs, future transactions and potential modeling changes; these ranges of approximate gross margin in 2019 and 2020 do not represent earnings guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years; the price distributions that generate this range are calibrated to market quotes for power, fuel, load following products, and options as of December 31, 2017

(2) Gross Margin Upside/Risk based on commodity exposure which includes open generation and all committed transactions

(3) Reflects Oyster Creek and TMI retirements in October 2018 and September 2019, respectively. EGTP removal impacts full year 2018, 2019, and 2020 and is adjusted for retaining Handley Generating Station.

SI-SSA-0015-01275

Illustrative Example of Modeling Exelon Generation 2019 Gross Margin*

Row	Item	Midwest	Mid-Atlantic	ERCOT	New York	New England	South, West & Canada
(A)	Start with fleet-wide open gross margin	← $3.9 billion →					
(B)	Capacity and ZEC	← $2 billion →					
(C)	Expected Generation (TWh)	97.2	54.2	24.5	16.6	8.7	
(D)	Hedge % (assuming mid-point of range)	52.5%	66.5%	55.5%	58.5%	36.5%	
(E=C*D)	Hedged Volume (TWh)	51.0	36.0	13.6	9.7	3.2	
(F)	Effective Realized Energy Price ($/MWh)	$29.50	$37.50	$3.50	$32.00	$5.00	
(G)	Reference Price ($/MWh)	$26.94	$30.72	$5.85	$26.15	$5.10	
(H=F-G)	Difference ($/MWh)	$2.56	$6.78	($2.35)	$5.85	($0.10)	
(I=E*H)	Mark-to-Market value of hedges ($ million)[1]	$130	$245	($30)	$55	$0	
(J=A+B+I)	Hedged Gross Margin ($ million)	$6,300					
(K)	Power New Business / To Go ($ million)	$750					
(L)	Non-Power Margins Executed ($ million)	$100					
(M)	Non-Power New Business / To Go ($ million)	$400					
(N=J+K+L+M)	Total Gross Margin*	$7,550 million					

(1) Mark-to-market rounded to the nearest $5 million

Exelon.

Additional ExGen Modeling Data

Total Gross Margin Reconciliation (in $M)[1]	2018	2019	2020
Revenue Net of Purchased Power and Fuel Expense*[2,3]	**$8,500**	**$8,025**	**$7,700**
Non-cash amortization of intangible assets, net, related to commodity contracts recorded at fair value at merger date	-	-	-
Other Revenues[4]	$(200)	$(175)	$(200)
Direct cost of sales incurred to generate revenues for certain Constellation and Power businesses	$(250)	$(300)	$(250)
Total Gross Margin* (Non-GAAP)	**$8,050**	**$7,550**	**$7,250**

Key ExGen Modeling Inputs (in $M)[1,5]	2018
Other[6]	$150
Adjusted O&M*	$(4,550)
Taxes Other Than Income (TOTI)[7]	$(375)
Depreciation & Amortization[8]	$(1,125)
Interest Expense	$(400)
Effective Tax Rate	**22.0%**

(1) All amounts rounded to the nearest $25M
(2) ExGen does not forecast the GAAP components of RNF separately, as to do so would be unduly burdensome. RNF also includes the RNF of our proportionate ownership share of CENG.
(3) Excludes the Mark-to-Market impact of economic hedging activities due to the volatility and unpredictability of the future changes to power prices
(4) Other Revenues reflects primarily revenues from Exelon Nuclear Partners, JExel Nuclear JV, variable interest entities, funds collected through revenues for decommissioning the former PECO nuclear plants through regulated rates, and gross receipts tax revenues
(5) ExGen amounts for O&M, TOTI, Depreciation & Amortization; excludes EDF's equity ownership share of the CENG Joint Venture
(6) Other reflects Other Revenues excluding gross receipts tax revenues, and includes nuclear decommissioning trust fund earnings from unregulated sites, and the minority interest in ExGen Renewables JV and Bloom
(7) TOTI excludes gross receipts tax of $150M
(8) 2019 Depreciation & Amortization is flat to 2018 and 2020 is favorable $50M due to nuclear plant retirements

SI-SSA-0015-01277

Driving Costs and Capital Out of the Generation Business

Adjusted O&M* ($M)[1,2]

Capital Expenditures ($M)[1,3,4]

Cost optimization programs and planned nuclear plant closures drive lower total O&M

(1) All amounts rounded to the nearest $25M
(2) O&M and Capital Expenditures reflect removal of Oyster Creek and TMI in 2018 and 2019, respectively, and removal of EGTP in 2018 forward, adjusted for retaining Handley Generating Station
(3) Capital spend represents cash CapEx with CENG at 100% and excludes merger commitments
(4) 2018E growth capital expenditures reflects a ~$175M shift of cash outlay from 2017A to 2018E related to timing of payments for the CCGT projects in Texas

Appendix

Reconciliation of Non-GAAP Measures

SI-SSA-0015-01279

Projected GAAP to Operating Adjustments

- **Exelon's projected 2018 adjusted (non-GAAP) operating earnings excludes the earnings effects of the following:**
  - Mark-to-market adjustments from economic hedging activities
  - Unrealized gains and losses from NDT fund investments to the extent not offset by contractual accounting as described in the notes to the consolidated financial statements
  - Non-cash amortization of intangible assets, net, related to commodity contracts recorded at fair value at the ConEdison Solutions and FitzPatrick acquisition dates
  - Certain merger and integration costs associated with the PHI and FitzPatrick acquisitions
  - Certain costs related to plant retirements
  - Costs incurred related to a cost management program
  - Generation's noncontrolling interest, primarily related to CENG exclusion items
  - Other unusual items

Cautionary Statements Regarding Forward-Looking Information

This presentation contains certain forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995, that are subject to risks and uncertainties. The factors that could cause actual results to differ materially from the forward-looking statements made by Exelon Corporation, Exelon Generation Company, LLC, Commonwealth Edison Company, PECO Energy Company, Baltimore Gas and Electric Company, Pepco Holdings LLC, Potomac Electric Power Company, Delmarva Power & Light Company, and Atlantic City Electric Company (Registrants) include those factors discussed herein, as well as the items discussed in (1) Exelon's 2017 Annual Report on Form 10-K in (a) ITEM 1A. Risk Factors, (b) ITEM 7. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) ITEM 8. Financial Statements and Supplementary Data: Note 23, Commitments and Contingencies; (2) Exelon's Second Quarter 2018 Quarterly Report on Form 10-Q in (a) Part II, Other Information, ITEM 1A. Risk Factors; (b) Part 1, Financial Information, ITEM 2. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) Part I, Financial Information, ITEM 1. Financial Statements: Note 17; and (2) other factors discussed in filings with the SEC by the Registrants. Readers are cautioned not to place undue reliance on these forward-looking statements, which apply only as of the date of this press release. None of the Registrants undertakes any obligation to publicly release any revision to its forward-looking statements to reflect events or circumstances after the date of this presentation.

SI-SSA-0015-01288

Non-GAAP Financial Measures

Exelon reports its financial results in accordance with accounting principles generally accepted in the United States (GAAP). Exelon supplements the reporting of financial information determined in accordance with GAAP with certain non-GAAP financial measures, including:

- ***Adjusted operating earnings*** exclude certain costs, expenses, gains and losses and other specified items, including mark-to-market adjustments from economic hedging activities, unrealized gains and losses from nuclear decommissioning trust fund investments, merger and integration related costs, impairments of certain long-lived assets, certain amounts associated with plant retirements and divestitures, costs related to a cost management program and other items as set forth in the reconciliation in the Appendix
- ***Adjusted operating and maintenance expense*** excludes regulatory operating and maintenance costs for the utility businesses and direct cost of sales for certain Constellation and Power businesses, decommissioning costs that do not affect profit and loss, the impact from operating and maintenance expense related to variable interest entities at Generation, EDF's ownership of O&M expenses, and other items as set forth in the reconciliation in the Appendix
- ***Total gross margin*** is defined as operating revenues less purchased power and fuel expense, excluding revenue related to decommissioning, gross receipts tax, JExel Nuclear JV, variable interest entities, and net of direct cost of sales for certain Constellation and Power businesses
- ***Adjusted cash flow from operations*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding capital expenditures, net merger and acquisitions, and equity investments
- ***Free cash flow*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding certain capital expenditures, net merger and acquisitions, and equity investments
- ***Operating ROE*** is calculated using operating net income divided by average equity for the period. The operating income reflects all lines of business for the utility business (Electric Distribution, Gas Distribution, Transmission).
- ***EBITDA*** is defined as earnings before interest, taxes, depreciation and amortization. Includes nuclear fuel amortization expense.
- ***Revenue net of purchased power and fuel expense*** is calculated as the GAAP measure of operating revenue less the GAAP measure of purchased power and fuel expense

Due to the forward-looking nature of some forecasted non-GAAP measures, information to reconcile the forecasted adjusted (non-GAAP) measures to the most directly comparable GAAP measure may not be currently available, as management is unable to project all of these items for future periods

SI-SSA-0015-01289

Non-GAAP Financial Measures Continued

This information is intended to enhance an investor's overall understanding of period over period financial results and provide an indication of Exelon's baseline operating performance by excluding items that are considered by management to be not directly related to the ongoing operations of the business. In addition, this information is among the primary indicators management uses as a basis for evaluating performance, allocating resources, setting incentive compensation targets and planning and forecasting of future periods.

These non-GAAP financial measures are not a presentation defined under GAAP and may not be comparable to other companies' presentation. Exelon has provided these non-GAAP financial measures as supplemental information and in addition to the financial measures that are calculated and presented in accordance with GAAP. These non-GAAP measures should not be deemed more useful than, a substitute for, or an alternative to the most comparable GAAP measures provided in the materials presented.

Non-GAAP financial measures are identified by the phrase "non-GAAP" or an asterisk. Reconciliations of these non-GAAP measures to the most comparable GAAP measures are provided in the appendices and attachments to this presentation, except for the reconciliation for total gross margin, which appears on slide 42 of this presentation.

SI-SSA-0015-01290

2nd Quarter Results

Q2 2018 EPS Results[1,2]

- GAAP earnings were $0.56/share in Q2 2018 vs. $0.10/share in Q2 2017
- Adjusted operating earnings* were $0.71/share in Q2 2018 vs. $0.56/share in Q2 2017, exceeding our guidance range of $0.55-$0.65/share

(1) Amounts may not add due to rounding
(2) Certain immaterial prior year amounts in the Registrants' Consolidated Statements of Operations and Comprehensive Income have been recast to reflect new accounting standards issued by the FASB and adopted as of January 1, 2018

Exelon

Operating Highlights

Exelon Utilities Operational Metrics

Operations	Metric	Q2 2018			
		BGE	ComEd	PECO	PHI
Electric Operations	OSHA Recordable Rate				
	2.5 Beta SAIFI (Outage Frequency)[1]				
	2.5 Beta CAIDI (Outage Duration)				
Customer Operations	Customer Satisfaction				
	Service Level % of Calls Answered in <30 sec				
	Abandon Rate				
Gas Operations	Percent of Calls Responded to in <1 Hour		No Gas Operations		

- Continued top tier reliability performance, with top decile performance in CAIDI and gas odor
- Customer performance metrics continue to be strong across all utilities

Q1	Q2
Q3	Q4

Exelon Generation Operational Performance

Exelon Nuclear Fleet[2]

- Continued best in class performance across our Nuclear fleet:
  - Q2 2018 Nuclear Capacity Factor: 93.2%
  - 96 outage days in Q2 2018 compared to 137 in Q2 2017

Fossil and Renewable Fleet

- Strong performance across our Fossil and Renewable fleet:
  - Q2 2018 Renewables energy capture: 95.1%
  - Q2 2018 Power dispatch match: 97.8%

(1) 2.5 Beta SAIFI is YE projection
(2) Excludes Salem and EDF's equity ownership share of the CENG Joint Venture

Tax Reform Producing Significant Customer Bill Savings

DPL

- DPL has filed to provide over **$40M** in annual distribution tax savings to customers
- DPL has also filed to provide **$12M** in annual transmission tax savings, in addition to another **$4M** pending approval from FERC

ACE

- ACE has filed to provide **$23M** in annual distribution tax savings to customers
- ACE has also filed to provide **$11M** in annual transmission tax savings, in addition to another **$4M** pending approval from FERC

ComEd

- ComEd has filed to provide **$201M** in annual distribution tax savings to customers
- ComEd has also filed to provide **$69M** in annual transmission tax savings, in addition to another **$17M** pending approval from FERC

Pepco

- Pepco has filed to provide over **$70M** in annual distribution tax savings to customers
- Pepco has also filed to provide **$13M** in annual transmission tax savings, in addition to another **$5M** pending approval from FERC

BGE

- BGE has filed to provide **$103M** in annual distribution tax savings to customers
- BGE has also filed to provide **$18M** in annual transmission tax savings, in addition to another **$5M** pending approval from FERC

PECO

- PECO has filed to provide **$72M** in annual distribution tax savings to customers
- PECO has also filed to provide **$20M** in annual transmission tax savings

Utility customers across our jurisdictions will benefit from tax reform, saving over $675M annually through planned and approved transmission and distribution bill adjustments

Constructive Legislation for Our Utilities

Delaware

- On June 14, Governor Carney signed Senate Bill 80, which enacted the Distribution System Investment Charge (DSIC) legislation
- The DSIC tracker establishes a system improvement charge that provides a mechanism to recover infrastructure investments, allowing for:
  - Gradual rate increases; and
  - Limiting frequency of rate cases
- DPL DE expects to make its first filing under the DSIC rules in Q4 2018, with the new charge appearing on customer bills by Q1 2019

Pennsylvania

- On June 28, Governor Wolf signed House Bill (HB) 1782
- HB 1782 authorizes the PA PUC to review and approve utility-proposed alternative rate mechanisms
  - Alternative methods include options such as decoupling mechanisms, formula rates, multi-year rate plans, and performance based rates
- HB 1782 will ensure that our utilities and state regulators have a full range of options to consider to meet PA's future infrastructure needs

Recent passage of legislation in DE and PA will support needed infrastructure investment that includes utility of the future initiatives to the benefit of our customers, while also allowing for timely recovery on those investments

SI-SSA-0015-01294

ZEC & Energy Policy Updates

ZEC Updates

New Jersey:

- Governor Murphy signed the NJ ZEC bill into law on May 23rd
- Implementation of the program is scheduled to be completed around the end of Q1 2019

Illinois:

- Oral arguments for the 7th Circuit occurred on January 3, 2018, with requests for supplemental briefings
- Supplemental briefings were filed on January 26, 2018
- Court issued order on February 21, 2018, inviting the U.S. Government to provide its views
- U.S. Solicitor General responded in support of the case on May 29th
- Currently awaiting court decision

New York:

- Oral arguments for the 2nd Circuit occurred on March 12, 2018
- No outstanding items following oral arguments
- Currently awaiting court decision

FERC Capacity Order

- On June 29, 2018, FERC issued an order rejecting both capacity repricing and MOPREx, but finding that the existing tariff is not just and reasonable
- FERC established a paper hearing proceeding to develop a new, two-part approach:
  - **Alternative FRR**: enables states to establish asset specific FRR arrangements that would allow them to compensate those assets directly and remove the associated load from the RPM auction
  - **MOPR**: if FRR is not elected, an expanded MOPR would apply to all existing and new resources with out-of-market support, with no or few exceptions
- FERC has required comments within 60 days, with replies 30 days later
- FERC aims to reach a final decision by January 4, 2019

PJM Price Formation

- PJM fast start proceeding was initiated by FERC (Docket No. EL18-34) and has now been fully briefed
- FERC has committed to providing a decision in September 2018
  - If FERC approves in September, without changes, then PJM could implement the changes in winter 2018/2019
- After assessing FERC's fast start decision, PJM will determine path forward for full integer relaxation
  - PJM has not set a definitive timeline for stakeholder deliberations
- Deliberations regarding scarcity pricing and reserves reforms are ongoing in Q3 and Q4 for early 2019 action

SI-SSA-0015-01295

2nd Quarter Adjusted Operating Earnings* Drivers

Q2 2018 Adjusted Operating EPS* Results

Q2 2018 vs. Guidance of $0.55 - $0.65

Exelon Utilities

- ⬆ Higher distribution and transmission revenue
- ⬆ Favorable weather

Exelon Generation

- ⬆ NDT realized gains(1)
- ⬆ Generation performance
- ⬆ Favorable market conditions
- ⬇ Higher transmission costs
- ⬇ Other

Note: Amounts may not sum due to rounding
(1) Gains related to unregulated sites

SI-SSA-0015-01296

Exelon

QTD Adjusted Operating Earnings* Waterfall

Note: Amounts may not sum due to rounding

(1) Increase in volume due to a decrease in outage days in 2018; additionally operating and maintenance expense decreased due to a decrease in outage days in 2018, excluding Salem

(2) Primarily lower realized energy prices, partially offset by the favorable impact of Generation's natural gas portfolio

(3) Certain immaterial prior year amounts in the Registrants' Consolidated Statements of Operations and Comprehensive Income have been recast to reflect new accounting standards issued by the FASB and adopted as of January 1, 2018

(4) Reflects CENG ownership at 100%

BGE[2] Gas			CF			IT	RT	EH IB	RB	FO			$85M[6]	10.50% / 53.40%	Jan 2019

CF	Rate case filed	RT	Rebuttal testimony	IB	Initial briefs	FO	Final commission order
IT	Intervenor direct testimony	EH	Evidentiary hearings	RB	Reply briefs	SA	Settlement agreement

Note: Based on current schedules of Illinois Commerce Commission, Maryland Public Service Commission, Delaware Public Service Commission, Public Service Commission of the District of Columbia, New Jersey Board of Public Utilities, and Pennsylvania Public Utility Commission and are subject to change

(1) Revenue requirement includes changes in depreciation and amortization expense and other costs where applicable, which have no impact on pre-tax earnings

(2) BGE briefing schedule will be determined during or at the end of the evidentiary hearing

(3) As permitted by Delaware law, Delmarva Power implemented interim rate increases of $2.5M on October 16, 2017, and implemented $5.8M full allowable rates on March 17, 2018, subject to refund. Per non-unanimous Settlement Agreement filed on June 27, 2018. Includes tax benefits from Tax Cuts and Jobs Act.

(4) As permitted by Delaware law, Delmarva Power implemented interim rate increases of $2.5M on November 1, 2017, and implemented $3.9M full allowable rates on March 17, 2018, subject to refund. Includes tax benefits from Tax Cuts and Jobs Act.

(5) Per non-unanimous Settlement Agreement filed on April 17, 2018, for Pepco DC and April 20, 2018, for Pepco MD. Includes tax benefits from Tax Cuts and Jobs Act.

(6) Reflects $63M increase and $22M STRIDE reset

SI-SSA-0015-01299

Utility CapEx Update

PECO's Gas Main and Service Replacement Program

- **Forecasted project cost:**
  - $2.3 billion of spend remaining
- **In service date:**
  - Multiple in service dates based on work plans with local townships
- **Project scope:**
  - Replace remaining 289 miles of gas services lines by end of 2022 and remaining 967 miles of main by end of 2035
  - Approximately 520 miles of mains and gas services lines have been replaced since 2010 at a cost of $381 million
  - Reduces risk on distribution system by replacing leak and break susceptible materials

BGE's Investment in Trade Point Atlantic

- **Forecasted project cost:**
  - $150 million investment in transmission & distribution over 5 years including the new 93 MW Fitzell substation
- **In service date:**
  - Fitzell substation: December 2020; electric and gas distribution investment: ongoing
- **Project scope:**
  - New substation as well as distribution infrastructure to support the new 3,100 acre Commercial & Industrial Trade Point Atlantic ("TPA") development
  - TPA is projected to generate 17,000 jobs, plus an additional 21,000 during construction; economic development is projected to be greater than $3 billion when completed[1]

Exelon Generation: Gross Margin Update

	June 30, 2018			Change from March 31, 2018		
Gross Margin Category ($M)[1]	**2018**	**2019**	**2020**	**2018**	**2019**	**2020**
Open Gross Margin[2,5] (including South, West, Canada hedged gross margin)	$4,700	$4,050	$3,800	$100	$100	-
Capacity and ZEC Revenues[2,5,6]	$2,300	$2,050	$1,900	-	$50	$50
Mark-to-Market of Hedges[2,3]	$400	$400	$300	$100	$(50)	$50
Power New Business / To Go	$150	$600	$800	$(200)	$(50)	$(50)
Non-Power Margins Executed	$350	$150	$100	$50	-	-
Non-Power New Business / To Go	$150	$350	$400	$(50)	-	-
Total Gross Margin*[4,5]	**$8,050**	**$7,600**	**$7,300**	**-**	**$50**	**$50**

Recent Developments

- Strong second quarter executing $200M of Power New Business in 2018 and $50M in both 2019 and 2020
- Capacity and ZEC Revenues include the favorable impact of NJ ZEC revenues in 2019 and 2020
- Behind ratable hedging position reflects the upside we see in power prices
  - ~10-13% behind ratable in 2019 when considering cross commodity hedges

(1) Gross margin categories rounded to nearest $50M
(2) Excludes EDF's equity ownership share of the CENG Joint Venture
(3) Mark-to-Market of Hedges assumes mid-point of hedge percentages
(4) Based on June 30, 2018, market conditions
(5) Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.
(6) 2018 includes $150M of IL ZEC revenues associated with 2017 production. 2019 and 2020 include the favorable impact of NJ ZEC revenues.

SI-SSA-0015-01302

The Exelon Value Proposition

- **Regulated Utility Growth** with utility EPS rising 6-8% annually from 2017-2021 and rate base growth of 7.4%, representing an expanding majority of earnings
- **ExGen's strong free cash generation** will support utility growth while also reducing debt by ~$3B over the next 4 years
- **Optimizing ExGen value by:**
  - Seeking fair compensation for the zero-carbon attributes of our fleet;
  - Closing uneconomic plants;
  - Monetizing assets; and,
  - Maximizing the value of the fleet through our generation to load matching strategy
- **Strong balance sheet is a priority** with all businesses comfortably meeting investment grade credit metrics through the 2021 planning horizon
- **Capital allocation priorities targeting**:
  - Organic utility growth;
  - Return of capital to shareholders with 5% annual dividend growth through 2020[(1)],
  - Debt reduction; and,
  - Modest contracted generation investments

(1) Quarterly dividends are subject to declaration by the board of directors

2018 Adjusted Operating Earnings* Guidance

Expect Q3 2018 Adjusted Operating Earnings* of $0.80 - $0.90 per share

Note: Amounts may not add due to rounding
(1) 2017 results based on 2017 average outstanding shares of 949M
(2) The Registrants' 2017 Adjusted Operating Earnings* have not been recast to reflect new accounting standards issued by the FASB and adopted as of January 1, 2018
(3) 2018 earnings guidance based on expected average outstanding shares of 969M

Exelon.

SI-SSA-0015-01305

YTD Adjusted Operating Earnings* Waterfall

Note: Amounts may not sum due to rounding

(1) Reflects the impacts of the New York Clean Energy and Illinois Zero Emission Standards, including the impact of zero emission credits generated in Illinois from June 1, 2017 through December 31, 2017

(2) Increase in volume due to a decrease in outage days in 2018; additionally operating and maintenance expense decreased due to a decrease in outage days in 2018, excluding Salem

(3) Primarily lower realized energy prices, the impact of the deconsolidation of EGTP and the conclusion of the Ginna Reliability Support Services Agreement, partially offset by the favorable impacts of Generation's natural gas portfolio

(4) Primarily reflects noncontrolling interest, partially offset by lower operating and maintenance expense primarily due to the impact of a supplemental NEIL insurance distribution, fewer outage days at Salem, decreased costs related to the sale of Generation's electrical contracting business

(5) Primarily due to increase in labor and contracting expense

(6) Certain immaterial prior year amounts in the Registrants' Consolidated Statements of Operations and Comprehensive Income have been recast to reflect new accounting standards issued by the FASB and adopted as of January 1, 2018

(7) Reflects CENG ownership at 100%

Tax Reform: Distribution-Related Customer Bill Savings

DPL

- MD PSC accepted DPL's proposal to provide **$14M** in annual tax savings to customers
- DPL has filed plans with DE PSC to provide over **$26M** in annual tax savings to customers

ACE

- ACE has filed a request with NJ BPU to provide **$23M** in annual tax savings to customers; expected to be approved by July
  - $2.37 savings on residential monthly bills

ComEd

- ICC approved ComEd's petition seeking approval to pass along approximately **$201M** in annual tax savings to customers
  - ~$3.00 decrease on the average residential monthly bill

Pepco

- Pepco has filed a request with the DC & MD PSC to provide over **$70M** in annual tax savings to customers
- Pepco has filed settlements which include these savings as adjusted in its proposals to the commission

PECO

- Approximately **$72M** in annual tax savings to customers

BGE

- MD PSC accepted BGE's proposal to provide approximately **$103M** in annual tax savings to customers
  - $2.91 decrease on the average residential monthly electric bill
  - $5.41 decrease on the average residential combined natural gas and electric bill

Utility customers across our jurisdictions will benefit from tax reform, saving over $500M annually through planned and approved distribution bill adjustments

Note: Includes only distribution-related customer savings amounts

Delmarva DE (Gas) Distribution Rate Case Filing

	Rate Case Filing Details	Notes
Docket No.	17-0978	• August 17, 2017, Delmarva DE filed an application with Delaware Public Service Commission (DPSC) seeking an increase in gas distribution base rates • Size of ask is driven by continued investments in gas distribution system to maintain and increase reliability and customer service • Forward looking reliability plant additions through September 2018 ($1.2M of Revenue Requirement based on 10.10% ROE) included in revenue requirement request
Test Year	January 1, 2017 – December 31, 2017	
Test Period	8 months actual and 4 months estimated	
Requested Common Equity Ratio	50.52%	
Requested Rate of Return	ROE: 10.10%; ROR: 6.98%(2)	
Proposed Rate Base (Adjusted)	$355M(2)	
Requested Revenue Requirement Increase	$3.8M(1,2)	
Residential Total Bill % Increase	4.3%	

Detailed Rate Case Schedule

PECO Distribution Rate Case Filing

Rate Case Filing Details	
Docket No.	R-2018-3000164
Test Year	January 1, 2019 – December 31, 2019
Test Period	12 Months Budget
Requested Common Equity Ratio	53.39%
Requested Rate of Return	ROE: 10.95%; ROR: 7.79%
Proposed Rate Base	$4,846M
Requested Revenue Requirement Increase	$82M[1]
Residential Total Bill % Increase	3.1%

Notes

- PECO filed an electric distribution base rate case on March 29, 2018
- Since January 1, 2016, through the Fully Projected Future Test Year (2019):
  - Relatively flat load growth
  - Operating expenses essentially flat
  - Capital investment of $1.9B
- Proposed investments would maintain strong reliability performance, strengthen system resiliency, and support physical security and cybersecurity

Detailed Rate Case Schedule

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Pre-filing notice			2/27/2018

Portfolio Management Strategy

Strategic Policy Alignment

- Aligns hedging program with financial policies and financial outlook
  - Establish minimum hedge targets to meet financial objectives of the company (dividend, credit rating)
  - Hedge enough commodity risk to meet future cash requirements under a stress scenario

Three-Year Ratable Hedging

- Ensure stability in near-term cash flows and earnings
  - Disciplined approach to hedging
  - Tenor aligns with customer preferences and market liquidity
  - Multiple channels to market that allow us to maximize margins
  - Large open position in outer years to benefit from price upside

Bull / Bear Program

- Ability to exercise fundamental market views to create value within the ratable framework
  - Modified timing of hedges versus purely ratable
  - Cross-commodity hedging (heat rate positions, options, etc.)
  - Delivery locations, regional and zonal spread relationships

Protect Balance Sheet | **Ensure Earnings Stability** | **Create Value**

SI-SSA-0015-01321

Exelon.

Components of Gross Margin Categories

Gross margin linked to power production and sales

Open Gross Margin

- Generation Gross Margin at current market prices, including ancillary revenues, nuclear fuel amortization and fossils fuels expense
- Power Purchase Agreement (PPA) Costs and Revenues
- Provided at a consolidated level for all regions (includes hedged gross margin for South, West and Canada[1])

Capacity and ZEC Revenues

- Expected capacity revenues for generation of electricity
- Expected revenues from Zero Emissions Credits (ZEC)

MtM of Hedges[2]

- Mark-to-Market (MtM) of power, capacity and ancillary hedges, including cross commodity, retail and wholesale load transactions
- Provided directly at a consolidated level for five major regions. Provided indirectly for each of the five major regions via Effective Realized Energy Price (EREP), reference price, hedge %, expected generation.

"Power" New Business

- Retail, Wholesale planned electric sales
- Portfolio Management new business
- Mid marketing new business

Margins move from new business to MtM of hedges over the course of the year as sales are executed[5]

Gross margin from other business activities

"Non Power" Executed

- Retail, Wholesale executed gas sales
- Energy Efficiency[4]
- BGE Home[4]
- Distributed Solar

"Non Power" New Business

- Retail, Wholesale planned gas sales
- Energy Efficiency[4]
- BGE Home[4]
- Distributed Solar
- Portfolio Management / origination fuels new business
- Proprietary trading[3]

Margins move from "Non power new business" to "Non power executed" over the course of the year

(1) Hedged gross margins for South, West & Canada region will be included with Open Gross Margin; no expected generation, hedge %, EREP or reference prices provided for this region
(2) MtM of hedges provided directly for the five larger regions; MtM of hedges is not provided directly at the regional level but can be easily estimated using EREP, reference price and hedged MWh
(3) Proprietary trading gross margins will generally remain within "Non Power" New Business category and only move to "Non Power" Executed category upon management discretion
(4) Gross margin for these businesses are net of direct "cost of sales"
(5) Margins for South, West & Canada regions and optimization of fuel and PPA activities captured in Open Gross Margin

Exelon.

Effective Realized Energy Price ($/MWh)[4]			
Midwest	$30.00	$29.00	$29.00
Mid-Atlantic[2,6]	$39.50	$38.00	$38.00
ERCOT[5]	$1.00	$3.50	$2.50
New York[2,6]	$37.00	$33.00	$30.00
New England[5]	$6.00	$1.50	$12.00

(1) Expected generation is the volume of energy that best represents our commodity position in energy markets from owned or contracted for capacity based upon a simulated dispatch model that makes assumptions regarding future market conditions, which are calibrated to market quotes for power, fuel, load following products, and options. Expected generation assumes 14 refueling outages in 2018, 11 in 2019, and 14 in 2020 at Exelon-operated nuclear plants and Salem. Expected generation assumes capacity factors of 94.2%, 94.9% and 93.9% in 2018, 2019, and 2020, respectively at Exelon-operated nuclear plants, at ownership. These estimates of expected generation in 2019 and 2020 do not represent guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years.
(2) Excludes EDF's equity ownership share of CENG Joint Venture
(3) Percent of expected generation hedged is the amount of equivalent sales divided by expected generation. Includes all hedging products, such as wholesale and retail sales of power, options and swaps.
(4) Effective realized energy price is representative of an all-in hedged price, on a per MWh basis, at which expected generation has been hedged. It is developed by considering the energy revenues and costs associated with our hedges and by considering the fossil fuel that has been purchased to lock in margin. It excludes uranium costs, RPM capacity and ZEC revenues, but includes the mark-to-market value of capacity contracted at prices other than RPM clearing prices including our load obligations. It can be compared with the reference prices used to calculate open gross margin in order to determine the mark-to-market value of Exelon Generation's energy hedges.
(5) Spark spreads shown for ERCOT and New England
(6) Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.

SI-SSA-0015-01324

ExGen Hedged Gross Margin* Sensitivities

Gross Margin* Sensitivities (with existing hedges)[1]	2018	2019	2020
Henry Hub Natural Gas ($/MMBtu)			
+ $1/MMBtu	$25	$335	$580
- $1/MMBtu	-	$(295)	$(535)
NiHub ATC Energy Price			
+ $5/MWh	$5	$155	$305
- $5/MWh	$(5)	$(155)	$(305)
PJM-W ATC Energy Price			
+ $5/MWh	$(10)	$60	$125
- $5/MWh	$15	$(40)	$(115)
NYPP Zone A ATC Energy Price			
+ $5/MWh	-	$10	$35
- $5/MWh	-	$(15)	$(35)
Nuclear Capacity Factor			
+/- 1%	+/- $20	+/- $35	+/- $30

(1) Based on June 30, 2018, market conditions and hedged position; gas price sensitivities are based on an assumed gas-power relationship derived from an internal model that is updated periodically; power price sensitivities are derived by adjusting the power price assumption while keeping all other price inputs constant; due to correlation of the various assumptions, the hedged gross margin impact calculated by aggregating individual sensitivities may not be equal to the hedged gross margin impact calculated when correlations between the various assumptions are also considered; sensitivities based on commodity exposure which includes open generation and all committed transactions; excludes EDF's equity share of CENG Joint Venture

Exelon.

SI-SSA-0015-01325

ExGen Hedged Gross Margin* Upside/Risk

(1) Represents an approximate range of expected gross margin, taking into account hedges in place, between the 5th and 95th percent confidence levels assuming all unhedged supply is sold into the spot market; approximate gross margin ranges are based upon an internal simulation model and are subject to change based upon market inputs, future transactions and potential modeling changes; these ranges of approximate gross margin in 2019 and 2020 do not represent earnings guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years; the price distributions that generate this range are calibrated to market quotes for power, fuel, load following products, and options as of June 30, 2018. Gross Margin Upside/Risk based on commodity exposure which includes open generation and all committed transactions. Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.

SI-SSA-0015-01326

Illustrative Example of Modeling Exelon Generation 2019 Total Gross Margin*

Row	Item	Midwest	Mid-Atlantic	ERCOT	New York	New England	South, West & Canada
(A)	Start with fleet-wide open gross margin	← $4.05 billion →					
(B)	Capacity and ZEC	← $2.05 billion →

Additional ExGen Modeling Data

Total Gross Margin Reconciliation (in $M)[1]	2018	2019	2020
Revenue Net of Purchased Power and Fuel Expense*[2,3]	**$8,500**	**$8,075**	**$7,750**
Other Revenues[4]	$(200)	$(175)	$(200)
Direct cost of sales incurred to generate revenues for certain Constellation and Power businesses	$(250)	$(300)	$(250)
Total Gross Margin* (Non-GAAP)	**$8,050**	**$7,600**	**$7,300**

Key ExGen Modeling Inputs (in $M)[1,5]	2018
Other[6]	$250
Adjusted O&M*	$(4,625)
Taxes Other Than Income (TOTI)[7]	$(375)
Depreciation & Amortization*[8]	$(1,125)
Interest Expense	$(400)
Effective Tax Rate	**22.0%**

(1) All amounts rounded to the nearest $25M
(2) ExGen does not forecast the GAAP components of RNF separately, as to do so would be unduly burdensome. RNF also includes the RNF of our proportionate ownership share of CENG.
(3) Excludes the Mark-to-Market impact of economic hedging activities due to the volatility and unpredictability of the future changes to power prices
(4) Other Revenues reflects primarily revenues from JExel Nuclear JV, variable interest entities, funds collected through revenues for decommissioning the former PECO nuclear plants through regulated rates, and gross receipts tax revenues
(5) ExGen amounts for O&M, TOTI, Depreciation & Amortization; excludes EDF's equity ownership share of the CENG Joint Venture
(6) Other reflects Other Revenues excluding gross receipts tax revenues, includes nuclear decommissioning trust fund earnings from unregulated sites, and includes the minority interest in ExGen Renewables JV and Bloom. Other for 2018 is favorable due to NDTF realized gains that may not occur in 2019 and 2020.
(7) TOTI excludes gross receipts tax of $150M
(8) 2019 Depreciation & Amortization is flat to 2018 and 2020 is favorable $50M due to nuclear plant retirements

Projected GAAP to Operating Adjustments

- **Exelon's projected 2018 adjusted (non-GAAP) operating earnings excludes the earnings effects of the following:**
  - Mark-to-market adjustments from economic hedging activities
  - Unrealized gains and losses from NDT fund investments
  - Certain merger and integration costs
  - Impairments of certain wind projects at Generation
  - Certain costs related to plant retirements
  - Costs incurred related to a cost management program
  - Generation's noncontrolling interest, primarily related to CENG exclusion items
  - One-time impacts of adopting new accounting standards
  - Other unusual items

SI-SSA-0015-01334

GAAP to Non-GAAP Reconciliations[1]

$$\text{Exelon FFO/Debt}^{(2)} = \frac{\text{FFO (a)}}{\text{Adjusted Debt (b)}}$$

Exelon FFO Calculation[2]

GAAP Operating Income
+ Depreciation & Amortization
= EBITDA
- GAAP Interest Expense
+/- GAAP Current Income Tax (Expense)/Benefit
+ Nuclear Fuel Amortization
+/- GAAP to Operating Adjustments
+/- Other S&P Adjustments
= FFO (a)

Exelon Adjusted Debt Calculation[1]

Long-Term Debt (including current maturities)
+ Short-Term Debt
+ Purchase Power Agreement and Operating Lease Imputed Debt
+ Pension/OPEB Imputed Debt (after-tax)
- Off-Credit Treatment of Non-Recourse Debt
- Cash on Balance Sheet * 75%
+/- Other S&P Adjustments
= Adjusted Debt (b)

(1) Due to the forward-looking nature of some forecasted non-GAAP measures, information to reconcile the forecasted adjusted (non-GAAP) measures to the most directly comparable GAAP measure may not be currently available; therefore, management is unable to reconcile these measures
(2) Calculated using S&P Methodology. Due to ring-fencing, S&P deconsolidates BGE from Exelon and analyzes solely as an equity investment

SI-SSA-0015-01335

GAAP to Non-GAAP Reconciliations[1]

$$\text{ExGen Debt/EBITDA} = \frac{\text{Net Debt (a)}}{\text{Operating EBITDA (b)}}$$

$$\text{ExGen Debt/EBITDA Excluding Non-Recourse} = \frac{\text{Net Debt (c)}}{\text{Operating EBITDA (d)}}$$

ExGen Net Debt Calculation

Long-Term Debt (including current maturities)
+ Short-Term Debt
- Cash on Balance Sheet
= Net Debt (a)

ExGen Net Debt Calculation Excluding Non-Recourse

Long-Term Debt (including current maturities)
+ Short-Term Debt
- Cash on Balance Sheet
- Non-Recourse Debt
= Net Debt Excluding Non-Recourse (c)

ExGen Operating EBITDA Calculation

GAAP Operating Income
+ Depreciation & Amortization
= EBITDA
+/- GAAP to Operating Adjustments
= Operating EBITDA (b)

ExGen Operating EBITDA Calculation Excluding Non-Recourse

GAAP Operating Income
+ Depreciation & Amortization
= EBITDA
+/- GAAP to Operating Adjustments
- EBITDA from Projects Financed by Non-Recourse Debt
= Operating EBITDA Excluding Non-Recourse (d)

(1) Due to the forward-looking nature of some forecasted non-GAAP measures, information to reconcile the forecasted adjusted (non-GAAP) measures to the most directly comparable GAAP measure may not be currently available; therefore, management is unable to reconcile these measures

Cautionary Statements Regarding Forward-Looking Information

This presentation contains certain forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995, that are subject to risks and uncertainties. The factors that could cause actual results to differ materially from the forward-looking statements made by Exelon Corporation, Exelon Generation Company, LLC, Commonwealth Edison Company, PECO Energy Company, Baltimore Gas and Electric Company, Pepco Holdings LLC, Potomac Electric Power Company, Delmarva Power & Light Company, and Atlantic City Electric Company (Registrants) include those factors discussed herein, as well as the items discussed in (1) Exelon's 2017 Annual Report on Form 10-K in (a) ITEM 1A. Risk Factors, (b) ITEM 7. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) ITEM 8. Financial Statements and Supplementary Data: Note 23, Commitments and Contingencies; (2) Exelon's First Quarter 2018 Quarterly Report on Form 10-Q in (a) Part II, Other Information, ITEM 1A. Risk Factors; (b) Part 1, Financial Information, ITEM 2. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) Part I, Financial Information, ITEM 1. Financial Statements: Note 17; and (2) other factors discussed in filings with the SEC by the Registrants. Readers are cautioned not to place undue reliance on these forward-looking statements, which apply only as of the date of this press release. None of the Registrants undertakes any obligation to publicly release any revision to its forward-looking statements to reflect events or circumstances after the date of this presentation.

SI-SSA-0015-01340

Non-GAAP Financial Measures

Exelon reports its financial results in accordance with accounting principles generally accepted in the United States (GAAP). Exelon supplements the reporting of financial information determined in accordance with GAAP with certain non-GAAP financial measures, including:

- ***Adjusted operating earnings*** exclude certain costs, expenses, gains and losses and other specified items, including mark-to-market adjustments from economic hedging activities, unrealized gains and losses from nuclear decommissioning trust fund investments, merger and integration related costs, impairments of certain long-lived assets, certain amounts associated with plant retirements and divestitures, costs related to a cost management program and other items as set forth in the reconciliation in the Appendix
- ***Adjusted operating and maintenance expense*** excludes regulatory operating and maintenance costs for the utility businesses and direct cost of sales for certain Constellation and Power businesses, decommissioning costs that do not affect profit and loss, the impact from operating and maintenance expense related to variable interest entities at Generation, EDF's ownership of O&M expenses, and other items as set forth in the reconciliation in the Appendix
- ***Total gross margin*** is defined as operating revenues less purchased power and fuel expense, excluding revenue related to decommissioning, gross receipts tax, JExel Nuclear JV, variable interest entities, and net of direct cost of sales for certain Constellation and Power businesses
- ***Adjusted cash flow from operations*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding capital expenditures, net merger and acquisitions, and equity investments
- ***Free cash flow*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding certain capital expenditures, net merger and acquisitions, and equity investments
- ***Operating ROE*** is calculated using operating net income divided by average equity for the period. The operating income reflects all lines of business for the utility business (Electric Distribution, Gas Distribution, Transmission).
- ***EBITDA*** is defined as earnings before interest, taxes, depreciation and amortization. Includes nuclear fuel amortization expense.
- ***Revenue net of purchased power and fuel expense*** is calculated as the GAAP measure of operating revenue less the GAAP measure of purchased power and fuel expense

Due to the forward-looking nature of some forecasted non-GAAP measures, information to reconcile the forecasted adjusted (non-GAAP) measures to the most directly comparable GAAP measure may not be currently available, as management is unable to project all of these items for future periods

SI-SSA-0015-01341

Non-GAAP Financial Measures Continued

This information is intended to enhance an investor's overall understanding of period over period financial results and provide an indication of Exelon's baseline operating performance by excluding items that are considered by management to be not directly related to the ongoing operations of the business. In addition, this information is among the primary indicators management uses as a basis for evaluating performance, allocating resources, setting incentive compensation targets and planning and forecasting of future periods.

These non-GAAP financial measures are not a presentation defined under GAAP and may not be comparable to other companies' presentation. Exelon has provided these non-GAAP financial measures as supplemental information and in addition to the financial measures that are calculated and presented in accordance with GAAP. These non-GAAP measures should not be deemed more useful than, a substitute for, or an alternative to the most comparable GAAP measures provided in the materials presented.

Non-GAAP financial measures are identified by the phrase "non-GAAP" or an asterisk. Reconciliations of these non-GAAP measures to the most comparable GAAP measures are provided in the appendices and attachments to this presentation, except for the reconciliation for total gross margin, which appears on slide 36 of this presentation.

SI-SSA-0015-01342

1st Quarter Results

Q1 2018 EPS Results(1,2)

- GAAP earnings were $0.60/share in Q1 2018 vs. $1.06/share in Q1 2017
- Adjusted operating earnings* were $0.96/share in Q1 2018 vs. $0.64/share in Q1 2017, which is within our guidance range of $0.90-$1.00/share

(1) Amounts may not add due to rounding
(2) Certain immaterial prior year amounts in the Registrants' Consolidated Statements of Operations and Comprehensive Income, Consolidated Statements of Cash Flows, Consolidated Balance Sheets and Consolidated Statements of Changes in Shareholders' Equity have been recasted to reflect new accounting standards issued by the FASB and adopted as of January 1, 2018

Operating Highlights

Exelon Utilities Operational Metrics

Operations	Metric	Q1 2018			
		BGE	ComEd	PECO	PHI
Electric Operations	OSHA Recordable Rate				
	2.5 Beta SAIFI (Outage Frequency)(1)				
	2.5 Beta CAIDI (Outage Duration)				
Customer Operations	Customer Satisfaction				
	Service Level % of Calls Answered in <30 sec				
	Abandon Rate				
Gas Operations	Percent of Calls Responded to in <1 Hour		No Gas Operations		

- Reliability performance year to date was strong across the utilities, adjusted for normal storm events
- Customer operation metrics reflect solid performance across the utilities
- Safety performance year to date has been disappointing; safety improvement plans have been implemented to improve performance going forward

Q1	Q2
Q3	Q4

(1) 2.5 Beta SAIFI is YE projection
(2) Excludes Salem
(3) Excludes EDF's equity ownership share of the CENG Joint Venture

Exelon Generation Operational Performance

Exelon Nuclear Fleet

- Continued best in class performance across our Nuclear fleet:
  - Q1 Nuclear Capacity Factor: 96.5%(2)
  - Owned and operated Q1 production of 40 TWh(2)

Fossil and Renewable Fleet

- Strong performance across our Fossil and Renewable fleet:
  - Q1 Renewables energy capture: 95.2%
  - Q1 Power dispatch match: 98.1%

Exelon

Our Scale Benefitted Customers Through Winter Storms

- **Three Nor'easters – Riley, Quinn and Toby – in March 2018 were the most damaging storms to hit the mid-Atlantic in the last six years**
  - Our East Cost utilities – ACE, BGE, DPL, Pepco and PECO – faced widespread outages due to the storms with a total of 1.7 million customers losing service at some point
  - Total operating and capital storm restoration expenditures of about $200 million
- **Exelon Utilities' scale and thoughtful pre-positioning expedited return to service for our customers**
  - ComEd dispatched 1,200 crews and contractors to our East Coast utilities to support storm response efforts
  - Common work protocols allowed for more efficient recovery efforts, speeding up service restoration for our customers

Exelon Utilities' scale allowed for quicker customer outage recovery during the recent winter storms

Exelon.

Tax Reform Yields Significant Customer Bill Savings

DPL

- MD PSC accepted DPL's proposal to provide **$14M** in annual tax savings to customers
  - $3.86 decrease on the average residential monthly bill
- DPL has filed plans with DE PSC to provide **$26M** in annual tax savings to customers
  - $2.99 and $4.77 decrease on the average residential monthly bill for Electric and Gas, respectively

ACE

- ACE has filed a request with NJ BPU to provide **$23M** in annual tax savings to customers; expected to be approved by July
  - $2.37 savings on residential monthly bills

ComEd

- ICC approved ComEd's petition seeking approval to pass along approximately **$201M** in annual tax savings to customers
  - ~$3.00 decrease on the average residential monthly bill

Pepco

- Pepco has filed a request with the DC & MD PSC to provide **$70M** in annual tax savings to customers
- Pepco has filed settlements which include these savings as adjusted in its proposals to the commission

BGE

- MD PSC accepted BGE's proposal to provide approximately **$103M** in annual tax savings to customers
  - $2.91 decrease on the average residential monthly electric bill
  - $5.41 decrease on the average residential combined natural gas and electric bill

PECO

- Approximately **$72M** in annual tax savings to customers

Utility customers across our jurisdictions will benefit from tax reform, saving over $500M annually through planned and approved bill adjustments

Note: Currently includes only distribution-related customer savings amounts

Exelon.

SI-SSA-0015-01346

ZEC & Policy Updates

New Jersey ZEC

- On April 12, 2018, the NJ ZEC bill passed both the Senate and Assembly with bipartisan support
- Bill is now before Governor Murphy, who has 45 days to sign
- Upon the Governor's signature, the BPU will begin the process of implementing the bill, including approving utility tariffs, developing a selection methodology, and reviewing applications for participation in the program
- Implementation of the program is scheduled to be completed around the end of Q1 2019

Illinois & New York ZEC Legal Challenges

Illinois:

- Oral arguments for the 7th Circuit occurred on January 3, 2018 – Judge requested supplemental briefings from parties
- Supplemental briefings were filed on January 26, 2018
- Court issued order on February 21, 2018, inviting the U.S. Government to provide its views
- Parties are awaiting response from the U.S. Solicitor General and further action by the court

New York:

- Oral arguments for the 2nd Circuit occurred on March 12, 2018
- No outstanding items following oral arguments
- Currently awaiting court decision

PJM Price Formation

Fast Start:

- Fast start NOPR was initiated by FERC (docket # EL18-34) and has now been fully briefed
- FERC has committed to providing a decision in September
  - If FERC approves by September, PJM believes it could implement the changes for the 2018/2019 winter

Baseload:

- PJM is in the midst of a stakeholder process scheduled to conclude in the 3rd quarter
- After completing the stakeholder process and receiving FERC's decision on the fast start docket, PJM will announce its process for moving forward

1st Quarter Adjusted Operating Earnings* Drivers

Q1 2018 Adjusted Operating EPS* Results

Q1 2018 vs. Guidance of $0.90 - $1.00

Exelon Utilities

- ⬇ Storm costs
- ⬆ ComEd ROE

Exelon Generation

- ⬆ Favorable O&M
- ⬆ Generation performance

Note: Amounts may not sum due to rounding

Exelon.

SI-SSA-0015-01348

QTD Adjusted Operating Earnings* Waterfall

Note: Amounts may not sum due to rounding

(1) Reflects the impacts of the New York Clean Energy and Illinois Zero Emission Standards, including the impact of zero emission credits generated in Illinois from June 1, 2017, through December 31, 2017

(2) Driven by lower nuclear outage days in 2018; excludes Salem

(3) Includes the unfavorable impact of the conclusion of the Ginna Reliability Support Services Agreement and lower realized energy prices, partially offset by the addition of two combined-cycle gas turbines in Texas

(4) Certain immaterial prior year amounts in the Registrants' Consolidated Statements of Operations and Comprehensive Income, Consolidated Statements of Cash Flows, Consolidated Balance Sheets and Consolidated Statements of Changes in Shareholders' Equity have been recasted to reflect new accounting standards issued by the FASB and adopted as of January 1, 2018

(5) Reflects CENG ownership at 100%

Exelon.

SI-SSA-0015-01349

Trailing 12 Month ROEs* vs Allowed ROE

Note: Represents the 12-month periods ending 3/31/2017 and 3/31/2018, respectively. ROEs* represent weighted average across all lines of business (Electric Distribution, Gas Distribution and Transmission). Includes 20 bps and 10 bps impact to TTM earned ROEs from FAS 109 and winter storms, respectively.

SI-SSA-0015-01351

Utility CapEx Update

DPL's Cedar Creek to Milford Transmission Rebuild

- Forecasted project cost:
  - $75 million
- In service date:
  - May 31, 2018
- Project scope:
  - Replace ~43 miles of 230 kV transmission poles as well as new conductor and optical ground wire
  - 230 kV line is a back-bone for the transmission network in the Delmarva region and one of the vital lines for north-south power flow within the Delmarva region
  - Improves reliability by eliminating the potential for outages due to structural failure of the line

ComEd's New Substation to Meet Data Center Growth

- Forecasted project cost:
  - $90 million
- In service date:
  - Q3 2021
- Project scope:
  - New green-field substation serving transmission and distribution loads; project to add over 300 MW of additional new capacity to the area
  - Supports transmission line reliability and projected data center growth in the Elk Grove Village area

Exelon Utilities remain committed to effectively deploying capital to the benefit of their customers

SI-SSA-0015-01352

Exelon Generation: Gross Margin Update

Gross Margin Category ($M)[1]	March 31, 2018			Change from December 31, 2017		
	2018	2019	2020	2018	2019	2020

Power New Business / To Go	$350	$650	$850	$(200)	$(100)	$(50)
Non-Power Margins Executed	$300	$150	$100	$100	$50	-
Non-Power New Business / To Go	$200	$350	$400	$(100)	$(50)	-
Total Gross Margin*[4,5]	**$8,050**	**$7,550**	**$7,250**	**-**	**-**	**-**

Recent Developments

- Open Gross Margin is up in all years due to strengthening ERCOT spark spreads, partly offset by lower NiHub prices
- Mark-to-Market of Hedges is down in all years due to higher prices, mostly offset by the execution of Power New Business
- Executed $200M and $100M of Power New Business in 2018 and 2019, respectively
- Behind ratable hedging position reflects the upside we see in power prices
  - ~8-11% behind ratable in 2019 when considering cross commodity hedges

(1) Gross margin categories rounded to nearest $50M
(2) Excludes EDF's equity ownership share of the CENG Joint Venture
(3) Mark-to-Market of Hedges assumes mid-point of hedge percentages
(4) Based on March 31, 2018, market conditions
(5) Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.
(6) 2018 includes $150M of IL ZEC revenues associated with 2017 production

The Exelon Value Proposition

- **Regulated Utility Growth** with utility EPS rising 6-8% annually from 2017-2021 and rate base growth of 7.4%, representing an expanding majority of earnings
- **ExGen's strong free cash generation** will support utility growth while also reducing debt by ~$3B over the next 4 years
- **Optimizing ExGen value by:**
  - Seeking fair compensation for the zero-carbon attributes of our fleet;
  - Closing uneconomic plants;
  - Monetizing assets; and,
  - Maximizing the value of the fleet through our generation to load matching strategy
- **Strong balance sheet is a priority** with all businesses comfortably meeting investment grade credit metrics through the 2021 planning horizon
- **Capital allocation priorities targeting**:
  - Organic utility growth;
  - Return of capital to shareholders with 5% annual dividend growth through 2020[1],
  - Debt reduction; and,
  - Modest contracted generation investments

(1) Quarterly dividends are subject to declaration by the board of directors

ComEd Distribution Rate Case Filing

	Rate Case Filing Details	Notes
Docket No.	18-0808	• April 16, 2018, ComEd filed its annual Distribution formula rate update with the Illinois Commerce Commission seeking a decrease to distribution base rates • The decrease is primarily driven by an adjustment for forecasted tax benefits resulting from federal tax reform, partially offset by continued investment in the electric grid, state tax rate increase, elimination of bonus depreciation and weather/economic impacts
Test Year	January 1, 2017 – December 31, 2017	
Test Period	2017 Actual Costs + 2018 Projected Plant Additions	
Requested Common Equity Ratio	47.11%	
Requested Rate of Return	ROE: 8.69%; ROR: 6.52%	
Proposed Rate Base (Adjusted)	$10,675M	
Requested Revenue Requirement Decrease	($22.9M)	
Residential Total Bill % Decrease	(1%)	

Detailed Rate Case Schedule(1)

(1) Anticipated schedule, actual dates will be determined by ALJ at pre-hearing conference

Delmarva DE (Electric) Distribution Rate Case Filing

	Rate Case Filing Details	Notes
Docket No.	17-0977	• August 17, 2017, Delmarva DE filed an application with Delaware Public Service Commission (DPSC) seeking an increase in electric distribution base rates • Size of ask is driven by continued investments in electric distribution system to maintain and increase reliability and customer service • Forward looking reliability plant additions through August 2018 ($3.1M of Revenue Requirement based on 10.10% ROE) included in revenue requirement request
Test Year	January 1, 2017 – December 31, 2017	
Test Period	6 months actual and 6 months estimated	
Requested Common Equity Ratio	50.52%	
Requested Rate of Return	ROE: 10.10%; ROR: 6.98%	
Proposed Rate Base (Adjusted)	$811M	
Requested Revenue Requirement Increase	$12.6M(1,2)	
Residential Total Bill % Increase	2.1%	

Detailed Rate Case Schedule

(1) As permitted by Delaware law, Delmarva Power implemented interim rate increases of $2.5 million on October 16, 2017, and implemented $5.8M full allowable rates on March 17, 2018, subject to refund

(2) Updated on February 9, 2018. Includes tax benefits from Tax Cuts and Jobs Act.

PECO Distribution Rate Case Filing

Rate Case Filing Details	
Docket No.	R-2018-3000164
Test Year	January 1, 2019 – December 31, 2019
Test Period	12 Months Budget
Requested Common Equity Ratio	53%
Requested Rate of Return	ROE: 10.95%; ROR: 7.79%
Proposed Rate Base	$4,846M
Requested Revenue Requirement Increase	$82M[1]
Residential Total Bill % Increase	3.1%

Notes

- PECO filed an electric distribution base rate case on March 29, 2018
- Since January 1, 2016, through the Fully Projected Future Test Year (2019):
  - Relatively flat load growth
  - Operating expenses essentially flat
  - Capital investment of $1.9B
- Proposed investments would maintain strong reliability performance, strengthen system resiliency, and support physical security and cybersecurity

Detailed Rate Case Schedule[2]

(1) Reflects $153M revenue requirement less an estimated $71M in 2019 tax benefit
(2) Anticipated schedule, actual dates will be determined by ALJ at pre-hearing conference

Portfolio Management Strategy

Strategic Policy Alignment

- Aligns hedging program with financial policies and financial outlook
  - Establish minimum hedge targets to meet financial objectives of the company (dividend, credit rating)
  - Hedge enough commodity risk to meet future cash requirements under a stress scenario

Three-Year Ratable Hedging

- Ensure stability in near-term cash flows and earnings
  - Disciplined approach to hedging
  - Tenor aligns with customer preferences and market liquidity
  - Multiple channels to market that allow us to maximize margins
  - Large open position in outer years to benefit from price upside

Bull / Bear Program

- Ability to exercise fundamental market views to create value within the ratable framework
  - Modified timing of hedges versus purely ratable
  - Cross-commodity hedging (heat rate positions, options, etc.)
  - Delivery locations, regional and zonal spread relationships

Protect Balance Sheet | **Ensure Earnings Stability** | **Create Value**

SI-SSA-0015-01367

Exelon.

Components of Gross Margin Categories

Gross margin linked to power production and sales

Open Gross Margin

- Generation Gross Margin at current market prices, including ancillary revenues, nuclear fuel amortization and fossils fuels expense
- Power Purchase Agreement (PPA) Costs and Revenues
- Provided at a consolidated level for all regions (includes hedged gross margin for South, West and Canada[1])

Capacity and ZEC Revenues

- Expected capacity revenues for generation of electricity
- Expected revenues from Zero Emissions Credits (ZEC)

MtM of Hedges[2]

- Mark-to-Market (MtM) of power, capacity and ancillary hedges, including cross commodity, retail and wholesale load transactions
- Provided directly at a consolidated level for five major regions. Provided indirectly for each of the five major regions via Effective Realized Energy Price (EREP), reference price, hedge %, expected generation.

"Power" New Business

- Retail, Wholesale planned electric sales
- Portfolio Management new business
- Mid marketing new business

Margins move from new business to MtM of hedges over the course of the year as sales are executed[5]

Gross margin from other business activities

"Non Power" Executed

- Retail, Wholesale executed gas sales
- Energy Efficiency[4]
- BGE Home[4]
- Distributed Solar

"Non Power" New Business

- Retail, Wholesale planned gas sales
- Energy Efficiency[4]
- BGE Home[4]
- Distributed Solar
- Portfolio Management / origination fuels new business
- Proprietary trading[3]

Margins move from "Non power new business" to "Non power executed" over the course of the year

(1) Hedged gross margins for South, West & Canada region will be included with Open Gross Margin; no expected generation, hedge %, EREP or reference prices provided for this region
(2) MtM of hedges provided directly for the five larger regions; MtM of hedges is not provided directly at the regional level but can be easily estimated using EREP, reference price and hedged MWh
(3) Proprietary trading gross margins will generally remain within "Non Power" New Business category and only move to "Non Power" Executed category upon management discretion
(4) Gross margin for these businesses are net of direct "cost of sales"
(5) Margins for South, West & Canada regions and optimization of fuel and PPA activities captured in Open Gross Margin

Exelon.

Effective Realized Energy Price ($/MWh)[4]			
Midwest	$29.00	$29.00	$30.00
Mid-Atlantic[2,6]	$38.00	$38.50	$39.50
ERCOT[5]	$0.00	$2.00	$1.00
New York[2,6]	$35.50	$31.50	$29.00
New England[5]	$5.50	$4.00	$10.00

(1) Expected generation is the volume of energy that best represents our commodity position in energy markets from owned or contracted for capacity based upon a simulated dispatch model that makes assumptions regarding future market conditions, which are calibrated to market quotes for power, fuel, load following products, and options. Expected generation assumes 14 refueling outages in 2018, 11 in 2019, and 14 in 2020 at Exelon-operated nuclear plants and Salem. Expected generation assumes capacity factors of 93.9%, 94.9% and 93.9% in 2018, 2019, and 2020, respectively at Exelon-operated nuclear plants, at ownership. These estimates of expected generation in 2019 and 2020 do not represent guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years.

(2) Excludes EDF's equity ownership share of CENG Joint Venture

(3) Percent of expected generation hedged is the amount of equivalent sales divided by expected generation. Includes all hedging products, such as wholesale and retail sales of power, options and swaps.

(4) Effective realized energy price is representative of an all-in hedged price, on a per MWh basis, at which expected generation has been hedged. It is developed by considering the energy revenues and costs associated with our hedges and by considering the fossil fuel that has been purchased to lock in margin. It excludes uranium costs, RPM capacity and ZEC revenues, but includes the mark-to-market value of capacity contracted at prices other than RPM clearing prices including our load obligations. It can be compared with the reference prices used to calculate open gross margin in order to determine the mark-to-market value of Exelon Generation's energy hedges.

(5) Spark spreads shown for ERCOT and New England

(6) Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.

SI-SSA-0015-01370

ExGen Hedged Gross Margin* Sensitivities

Exelon.

ExGen Hedged Gross Margin* Upside/Risk

(1) Represents an approximate range of expected gross margin, taking into account hedges in place, between the 5th and 95th percent confidence levels assuming all unhedged supply is sold into the spot market; approximate gross margin ranges are based upon an internal simulation model and are subject to change based upon market inputs, future transactions and potential modeling changes; these ranges of approximate gross margin in 2019 and 2020 do not represent earnings guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years; the price distributions that generate this range are calibrated to market quotes for power, fuel, load following products, and options as of March 31, 2018. Gross Margin Upside/Risk based on commodity exposure which includes open generation and all committed transactions. Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.

Additional ExGen Modeling Data

Total Gross Margin Reconciliation (in $M)[1]	2018	2019	2020
Revenue Net of Purchased Power and Fuel Expense*[2,3]	**$8,525**	**$8,025**	**$7,700**
Other Revenues[4]	$(200)	$(175)	$(200)
Direct cost of sales incurred to generate revenues for certain Constellation and Power businesses	$(275)	$(300)	$(250)
Total Gross Margin* (Non-GAAP)	**$8,050**	**$7,550**	**$7,250**

Key ExGen Modeling Inputs (in $M)[1,5]	2018
Other[6]	$150
Adjusted O&M*	$(4,550)
Taxes Other Than Income (TOTI)[7]	$(375)
Depreciation & Amortization*[8]	$(1,125)
Interest Expense	$(400)
Effective Tax Rate	**22.0%**

(1) All amounts rounded to the nearest $25M
(2) ExGen does not forecast the GAAP components of RNF separately, as to do so would be unduly burdensome. RNF also includes the RNF of our proportionate ownership share of CENG.
(3) Excludes the Mark-to-Market impact of economic hedging activities due to the volatility and unpredictability of the future changes to power prices
(4) Other Revenues reflects primarily revenues from JExel Nuclear JV, variable interest entities, funds collected through revenues for decommissioning the former PECO nuclear plants through regulated rates, and gross receipts tax revenues
(5) ExGen amounts for O&M, TOTI, Depreciation & Amortization; excludes EDF's equity ownership share of the CENG Joint Venture
(6) Other reflects Other Revenues excluding gross receipts tax revenues, includes nuclear decommissioning trust fund earnings from unregulated sites, and includes the minority interest in ExGen Renewables JV and Bloom
(7) TOTI excludes gross receipts tax of $125M
(8) 2019 Depreciation & Amortization is flat to 2018 and 2020 is favorable $50M due to nuclear plant retirements

Projected GAAP to Operating Adjustments

- **Exelon's projected 2018 adjusted (non-GAAP) operating earnings excludes the earnings effects of the following:**
  - Mark-to-market adjustments from economic hedging activities
  - Unrealized gains and losses from NDT fund investments to the extent not offset by contractual accounting as described in the notes to the consolidated financial statements
  - Certain merger and integration costs
  - Certain costs related to plant retirements
  - Costs incurred related to a cost management program
  - Generation's noncontrolling interest, primarily related to CENG exclusion items
  - One-time impacts of adopting new accounting standards
  - Other unusual items

Presentation

Operator

Good morning, ladies and gentlemen. Welcome to the Exelon 2018 Third Quarter Earnings Conference Call. My name is Jerome and I will be facilitating the audio portion of today's interactive broadcast. All lines have been placed on mute to prevent any background noise. After the speakers' remarks, there will be a question-and-answer session. (Operator Instructions)

At this time, I would like to turn the show over to Mr. Dan Eggers, Senior Vice President, Corporate Finance. The floor is yours.

Daniel Eggers, Senior Vice President, Corporate Finance

Thank you, Jerome. Good morning everyone and thank you for joining our third quarter 2018 earnings conference call. With me in the call today are Chris Crane, Exelon's President and Chief Executive Officer; and Joe Nigro, Exelon's Chief Financial Officer. They are joined by other members of Exelon's senior management team who will be available to answer your questions following our prepared remarks. We issued our earnings release this morning along with the presentation both of which can be found in the Investor Relations section of Exelon's website.

The earnings release and other matters which we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material and comments made during this call. Please refer to today's 8-K and Exelon's other SEC filings for discussions of risk factors and factors that may cause results to differ from management's projections, forecasts and expectations.

Today's presentation also references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures. We've scheduled 45 minutes for today's call.

I'll now turn the call over to Chris Crane, Exelon's CEO.

Christopher Crane, President and Chief Executive Officer

Thanks, Dan, and good morning everyone and thank you for joining us. Flipping to Slide 5, we delivered another strong quarter with earnings again at the upper end of our range which allows us to raise the lower end of our full year guidance. The utilities performed well with strong earned ROEs and largely first quartile operations. As we've stated previously, the Federal Courts of Appeal in Illinois and New York strongly affirmed the legality of the ZEC. And our focus on cost continues identifying an additional $200 million of gross savings which a $150 million of that will flow to the bottom line bringing our 6-year total savings to more than $900 million. Combined, this performance demonstrates our growing value. For the quarter, on a GAAP basis, we earned $0.76 per share versus $0.85 per share last year. On a non-GAAP operating basis, we earned $0.88 per share and again above the midpoint of our $0.80 to $0.90 range guidance that was provided.

Turning to Slide 6, our utilities continue to perform at high levels across key customer satisfaction and operating metrics. The investments we are making in technology and infrastructure continue to improve reliability which leads to greater customer satisfaction and ultimately supporting strong relations with our regulators and our legislators. PECO and BGE improved their J.D. Power residential gas and electric scores over the last year with PECO receiving its highest ranking ever, placing second in the residential electric survey. Our customer service metrics are strong. BGE and ComEd are in the top decile for customer satisfaction and PHI is in top decile for its service levels.

Each of our utilities achieved top quartile reliability performance in SAIFI or outage duration in CAIDI which is -- the outage frequency is SAIFI and CAIDI which is outage duration. ComEd and PHI performed in top decile for CAIDI. SAIFI, as we've discussed in the past is our highest priority, it remains that. Our metrics have continued to -- and improved since the beginning of the year. At ExGen our third quarter was 90 -- excuse me 39.7 terawatt hours of capacity factor at 93.6%. During the fourth hottest summer in nearly 125 years, we performed a 96.7% capacity factor and avoided 33 metric tons of carbon. Our gas and hydro fleet performed well but below plan with economic dispatch match at 95.8%. This lower performance was primarily the results of our CCGTs at Colorado Bend and Wolf Hollow being offline because of some turbine blade defects. The blades have been replaced, Wolf Hollow came back into service in late September, one of the Colorado Bend units returned to service in October and the other will be back into service shortly. It's in the process of restart as we speak. We took advantage of the outage time for normal maintenance that will be required to have then shut down for next spring.

From a financial (Technical Difficulty) repairs we're covering under our warranty and the markets impact from the plants being down were well within our full range outage contingency plan. The plans ran very well over the summer prior to the outages and we're very pleased with the performance of the design and their durability. They remain an integral part of our Texas strategy.

Turning to Slide 7. As you know, we've had strong track record of finding efficiencies in the business and driving cost savings which is why we created the business transformation team earlier this year to focus on a Business Services company. As part of that effort with additional savings from our nuclear fleet, we're announcing a $200 million reduction to our run rate -- 2021 cost of which $150 million will reach the bottom line at ExGen. Joe is going to cover this in more detail during his remarks.

I'll turn it now to the policy updates for the quarter and start with the ZEC programs. As I said, both the seventh and the second Court of Appeals dismissed challenges to the ZEC programs in Illinois and New York respectively. In doing so, each court found that the states have the right to choose generation sources based on attributes they prefer such as environmental performance and that these programs are not tethered to the market. The plan to start rehearing in Illinois in this case which the court denied last month, the rulings were consistent with our expectations and we're happy with the resounding information on these important state clean energy policies. In New Jersey, the process for implementation of the ZEC program there remains on track to take effect early in the second quarter of 2019.

final
Bloomberg Transcript
Bloomberg

The Board of Public Utilities has finished its hearings on implementation to ZEC program and the utilities have filed tariffs to recover the ZEC-related charges. We expect BPU to approve the changes later this month. On the federal policy front, we think that FERC's June order took an important step forward by empowering the states to continue prioritizing zero carbon energy throughout the state-led procurements outside of the PJM capacity module. The number of proposals were filed in response to the order including from a diverse coalition of which Exelon is a member and PJM. We see all of the major proposals is putting our generation fleet in a better position financially than the current market construct. We are pleased to have filed this part of a coalition and supports the rights of states to advance their clean energy goals.

Slide 22 gives a lot more detail on the coalition, but it includes consumer rate payer advocates, attorney generals, national environmental groups, renewable energy trade associations, public power and the other nuclear generators in PJM. Our proposal would provide states the flexibility to conduct the capacity procurement of resources they wish to support for the public policy reasons and would protect consumers for paying twice the capacity resources. It strikes the balance that FERC is looking for to ensure states can meet their environmental goals while protecting the competitive market. Reply of the comments are due November 6 and it will be important for FERC to issue an order early next year to give the markets guidance going forward. As you know, we are still waiting for orders from FERC on the fast start and resiliency examination.

And with that, now I'll turn it over to Joe to walk through the numbers.

Joseph Nigro, Chief Financial Officer

Thank you, Chris, and good morning everyone. Turning to Slide 8, we had another strong quarter financially, delivering adjusted non-GAAP operating earnings of $0.88 per share which is at the upper end of our guidance range of $0.80 to $0.90 per share. Exelon's utilities less holding company expenses earned a combined $0.55 per share. Compared to our plans, we benefited from reduced storm activity and favorable weather in our non-decoupled jurisdictions including PECO, Atlantic City Electric and Delmarva Delaware. Generation earned $0.33 per share in the third quarter which was slightly behind our plan.

This third quarter was impacted by lower realized ERCOT prices versus the end of the second quarter, lower-than-expected generation performance with the unplanned outages at our ERCOT CCGTs as just discussed as well as one at (inaudible). In addition, higher allocated transmission costs. These were partially offset by realized gains from our Nuclear Decommissioning Trust.

On Slide 9, we show our quarter-over-quarter walk. The $0.88 per share in the third quarter of this year was $0.03 per share higher than the third quarter of 2017. Overall, the utility earnings were collectively up $0.07 (ph) per share compared with last year driven primarily by higher rate base, new rates associated with completed rate cases and favorable weather. Generation earnings were down $0.03 per share compared with last year driven largely by the absence of EGTP gross margin from the deconsolidation in the fourth quarter of 2017 and higher planned nuclear outage days partially offset by contribution from a full quarter of Illinois ZEC revenues and savings from tax reform.

Turning to Slide 10. We are raising the lower end of our 2018 EPS guidance range from $2.90 to $3.20 per share to $3.05 to $3.20 per share. We are pleased with the strong operational results at both the utility and generation businesses that are pushing us up into the upper half of our range particularly as we have overcome unexpected headwinds including the challenging winter storms.

Moving to Slide 11. Improved operations at PHI and positive rate case outcomes are driving better earned ROEs. Pepco's higher ROE reflects last fall's distribution rate cases as well as the recent Pepco Maryland and DC settlement that took effect in June and August respectively. Delmarva's earned ROEs includes the benefits of internal rate which came effective during the first quarter with final rates for Delmarva Electric effective September 1 and favorable weather at Delmarva Delaware during the quarter. At Atlantic City Electric we saw higher earnings from last fall's rate case settlement as well as favorable weather during the quarter which improves 12-month trailing ROEs significantly from last quarter.

final

As we have previously discussed, trailing 12-month ROEs for all of our PHI utilities should continue to improve next quarter as the FAS 109 charges from the fourth quarter of 2017 drop out of the calculation. For the legacy Exelon utility, our earned ROEs remained over 10% were modestly dipped from last quarter. Our overall earned ROEs for Exelon utility were modestly higher than last quarter at 9.6%, well within our earned ROE target of 9% to 10% that underlines our earnings outlook for 2019 and beyond. We are pleased with our overall utility performance but have plans for continued improvement to bring PHI closer to the rest of our utility.

Turning to Slide 12. We remain busy on the regulatory front. On October 18, the Administrative Law Judge is presiding over PECO's electric distribution base rate case recommended the settlement with all parties be approved. The deal provides for an increase of $96 million in annual electric distribution revenues offset by $71 million in tax savings benefits for customers for a net $25 million revenue increase. We expect to receive an order in the fourth quarter. On August 9, the DC Commission approved the settlement that was reached in April based on a $24.1 million revenue reduction after incorporating tax reform. Rate 22 effect on August 13. A final order which received on August 21 for the settlement, we reached in June on the Delaware Delmarva electric distribution case. The case will provide a $7 million revenue decrease including the benefit to tax reform for customers.

On September 7, Delmarva Delaware entered into a settlement agreement in pending gas distribution base rate case that provides for revenue decrease of $3.5 million including tax benefits for customers. A final order is expected in the fourth quarter. We also have a number of rate cases still in progress. We expect an order for BGE's pending gas rate case in January of 2019. As a reminder, the case includes the requested $60.7 million increase to its gas revenues for infrastructure investments since 2015 and moving $21.7 million in revenue currently being recovered via the STRIDE surcharge in the base rate. We expect to receive an order from the Illinois Commerce Commission on ComEd's standard formula rate case in the fourth quarter.

And finally, on August 21, the Atlantic City Electric filed a distribution base rate case with the New Jersey Board of Public Utilities seeking a revenue increase of $109 million and we expect an order in the second half of 2019. The utilities and the regulatory teams are doing a lot of hard work to improve system reliability and performance for our customers and fostering its support of regulatory backdrop. That in turn is helping to lift earned ROEs towards their allocated levels across the acquired new settlement payments. More detail on the rate cases and their schedules can be found on Slides 24 through 30 in the Appendix.

Turning to Slide 13. We invested $1.4 billion of capital at the utilities during the third quarter and are at $3.9 billion year-to-date. We remain confident in our ability to meet our $5.5 billion capital budget for 2018. This quarter, I would like to feature two projects within our portfolio of utility investments. The first is the early completion of ComEd's $920 million smart meter installation program. ComEd installed more than $4 million smart meters in just over 7 years which is 3 years ahead of the original schedule and more than $20 million under budget. To help put this program into context, our ComEd team installed on average 2,400 smart meters per day over that 7-year span. In fact, one of our workers personally installed over 25,000 meters as part of this program.

The installation of smart meters on the ComEd system will allow customers to be better informed about their energy consumption that can help them save money and will allow ComEd to further improve its service offerings. In addition, it drives over $100 million of annual operational savings primarily from increased efficiencies in field operations such as meter reading and avoided truck rolls. The smart meter installation program is part of the $2.6 billion Energy Infrastructure Modernization Act program. The second project I want to highlight is Atlantic City Electric's Churchtown substation expansion project in Pennsville, New Jersey. This $50 million project entailed equipment upgrades for reliability and 230, 138 and 69 kV expansion for additional transmission capacity. Construction also included installation of 2.1 miles of transmission line consisting of 59 new structures. The expansion improves reliability for our customers by replacing and upgrading outdated equipment and by expanding regional transmission capacity which has the benefits of reducing congestion to our customers.

Turning to Slide 14. Relative to our last update, total gross margin was flat in 2018 and up $50 million in both 2019 and 2020, primarily as a result of higher power prices. For 2018, open gross margin was up $100 million primarily due to higher NiHub PJM West Hub and New York Zone A prices, and offset by weakening in our ERCOT spark spreads.

Bloomberg Transcript

Total gross margin is offset by lower mark-to-market of our hedging due to the higher power prices. For 2019 and 2020 open gross margin was up $250 million and $100 million respectively due to higher PJM West Hub prices and stronger ERCOT spark spreads.

In 2019, open gross margin was also up on higher NiHub and New York Zone A prices. Similar to 2018, the mark-to-market of our hedges is down both in '19 and '20 due to higher prices. We also executed $50 million of Power New Business in both 2018 and 2019 and executed $50 million of Non Power New Business each year. From a hedging perspective, we ended the quarter in line with our ratable hedging programs in 2018 a 9% to 12% behind ratable in 2019 and 8% to 11% behind ratable in 2020 when considering cross commodity hedges where we have increased our concentration.

Turning to Slide 15. As Chris mentioned, we are announcing another round of O&M cost reductions as part of our continual efforts to evaluate our work passages looking for ways to be more efficient, eliminate redundancies and better incorporate innovation and technology. With this new program, our gross run rate savings in '21 will be $200 million which we will ramp up over the next two years. These incremental savings will come from our Exelon Generation business primarily through even greater efficiencies in our nuclear operations and at the Business Services Company or BSC which is part of the transformation efforts that Jack is leading. The $200 million of savings is a gross number with about half from ExGen and half from the BSC organization.

And since BSC costs are shared roughly 50-50 between Exelon Generation and Exelon Utility we would expect our utility customers to benefit from $50 million in annual savings over time with the other $50 million flowing through Exelon Generation bottom line. When we include the $50 million of incremental direct savings at ExGen, we expect $150 million of savings to flow to our bottom line in 2021 relative to our previous guidance which we show on the lower left chart. Exelon continues to embrace a culture of cost discipline and operational excellence. These cost updates are consistent with these cultural values. If we look at all the cost savings announced since 2015, we have now reduced O&M by over $900 million. It's due to hard work of all of our employees who strive every day to run the company more efficiently while adhering to our commitments to safety, reliability and community stewardship.

Turning to Slide 16. We remain committed to our strong balance sheet and investment-grade credit rating. And to that end, since our last earnings call, S&P has placed our ratings at ExGen and Exelon Corporate on CreditWatch positive recognizing the improvements and overall strength of our balance sheet. Turning to the metrics. Our consolidated corporate credit metrics remain above our target ranges and meaningfully above S&P thresholds. We are forecasting ExGen's leverage to be 2.5 times debt to EBITDA at year-end 2018 which is below our long-term target of 3.0 times. On a recourse debt basis we are at 2.0 times which is well below our target range. We will continue to manage our balance sheet at ExGen over time to the 3.0 times debt-to-EBITDA level, so look for us to focus on debt reduction at both the Holdco and GenCo.

I will now turn the call back to Chris. Thank you.

Christopher Crane, President and Chief Executive Officer

Thanks, Joe. Turning to Slide 17. As we have shown you, we had a strong quarter financially and operationally. We continue to get stronger on both fronts. This is due to the hard work and dedication of all of our employees every day. We also had important wins in the course to preserve the ZEC program and are finding ways to operate more efficiently providing incremental cost savings as discussed. Our value proposition remains unchanged. We're focused on growing our utilities targeting a 6% to 8% EPS growth through 2021. We continue to use free cash flow from the GenCo to fund incremental equity needs at the utilities, pay down debt over the next four years at the GenCo and HoldCo and fund part of the faster dividend growth rate.

We will stay focused on optimizing value at the ExGen by seeking fair compensation for our carbon-free generation fleet, supporting proper price formation in PJM and resiliency efforts at FERC and supporting capacity market reforms that will allow states to continue to protect citizens from carbon and air pollution while benefiting from regional markets. We will close uneconomic and sell assets where it does not make sense to accelerate our debt reduction plans

final
Bloomberg Transcript
Bloomberg

and maximize value through generation to the load matching strategy. We continue to sustain strong investment-grade credit metrics and grow our dividend consistently at 5% through 2020.

Operator, now we can take -- open to the call up for questions. Thank you.

Questions And Answers

Operator

(Operator Instructions) Your first question comes from the line of Greg Gordon from Evercore. Greg, your line is now open.

Greg Gordon, Analyst

Thanks. Good morning, guys. A couple of questions. First on the quarter. Everything seems really good on the utility side, the underlying operations at the GenCo look decent too. But it was a little squishy around some of those operational issues. Can you just talk us through that and get us comfortable that they're sort of temporal and not structural?

Christopher Crane, President and Chief Executive Officer

Are you talking about the operational issues around the GenCo or in the sub power segment?

Greg Gordon, Analyst

Yes. In Texas the interruption and in Massachusetts the higher FTR costs, so I just want to make sure we can be comfortable that they're not going to sort of run out into the future and impact your ability to future numbers.

Christopher Crane, President and Chief Executive Officer

Let me start out with the Texas assets so I'll let Joe fill in on the rest of it. Those GE7HA.20, these were the first serial numbers 1 and 2. We were aware as GE was that there was some difficulty with the first-stage blades. We had approximated a run period that we could operate the assets before putting in the fix. The fix was already underway and then designed. GE did give us very strong warranties on those assets and responded very well on the first failure on the one CT at Colorado Bend.

We proactively shut the other three CTs down, replaced them with the new design, had them back up and running. And as I said, we expect, we're in the rollout phase now and the start-up phase of the fourth unit and we feel confident in the design. GE has put us inspection program together that will be borescoping after so many hours of operation. They've responded well, the solid engineering confirmed by independent assessment. So we feel that that is behind us. And we'll be able to continue those assets to operate at incredibly high capacity factors and efficiencies going forward. On the FTRs and the other issues, I'll let Joe cover it.

Joseph Nigro, Chief Financial Officer

Yeah. So, Greg I think the first thing is as Chris mentioned the generation issues drove some of the underperformance at ExGen. In addition to that, when you looked at power pressures in Texas at the end of June and where they realized for the quarter, there was an impact with the difference there. As you know, the spot market prices were lower than

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01388

when we walked into the quarter. On the transmission side, the costs were associated with Order 494 at FERC and that had a negative impact. So from our lens, when you talk about the Generation performance both at Mystic and at ERCOT, those are one-time occurrences similarly on the transmission side. The favorability was driven on the realized nuclear decommissioning trust gains. So I think when you look at it from our lens, you see these one-time items that are driving the early results.

Greg Gordon, Analyst

Great. Thanks. One follow up on ExGen and then one more if you'll hear me. Looking at the cost cuts, it's really quite an impressive incremental change. You've got the cost declining from $4.625 billion to $4.175 billion in 2020 and a little bit more in 2021, $450 million savings but that gross margins declined by $700 million. And so skeptical investors look at this and say well you guys are doing yeoman's job here, rightsizing the cost structure but earnings aren't getting better. I would argue that cost cuts are permanent and these backwardated power prices are hopefully temporary. But can you give us some confidence that there's positive operating leverage here as we move through time and that these lower commodity prices and capacity prices are not structural?

Christopher Crane, President and Chief Executive Officer

We talked about this before that we lack liquidity in the outyears. It's a softer market. Our fundamentals still tell us that this backwardated curve is not what we'll see as the prompt years come in. And so we're managing the book in that manner maintaining as much margin open and using cross-commodity hedges to be able to manage that. It's -- we will constantly look at driving efficiencies. You can't have a company that operate with any aspect or entity within the company being inefficient. So driving efficiencies has multiple benefits but one of them is reduction in expense and we'll continue to focus on that as we serve the customer. As far as the market issues, Jim or Joe do you want to cover anymore on that?

James McHugh, Executive Vice President and Chief Executive Officer of Costellation

Yeah, I think, the one thing I would add about the backwardation of the curve is with the next couple of years or in '25 and '24 due to lack of liquidity we're seeing net retirements of newbuilds over the next few years between '20 and '23 that that would lead us to believe that backwardation won't realize in spot. We're seeing spot prices in NiHub even in some of the lowest delivered fuel price here is clear north of $26, $27. So the backwardation to your point, it seems temporal, Greg.

Greg Gordon, Analyst

Okay. And then final question is given that the balance sheet is so strong and that the rating agencies are finally coming around considering higher credit ratings. How much balance sheet capacity does that create and/or does it give you more latitude to have a more aggressive risk management policy and take hedge less and take more of your power into the spot and therefore try to get those better prices?

Joseph Nigro, Chief Financial Officer

Hey, Greg, it's Joe. The short answer is with that balance sheet capacity, we can be more aggressive. And as I mentioned in my remarks when you look at how far behind we are of our ratable plan and when you overlay that fact that we're using gases approximately for power we are carrying a very long open-power positioning in 2019 and 2020, and then we're able to do that given the strength of the balance sheet that we have. We continue to challenge ourselves

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01389

in this regard as well. And as Jim mentioned on our use of power, we're going to continue to be constructive in the way we manage the portfolio relative to what we think fair value is in the outyears and not leverage on the balance sheet allows us to do that.

Greg Gordon, Analyst

Thank you guys.

Christopher Crane, President and Chief Executive Officer

Thanks, Greg.

Operator

Thank you, Greg. Your next question comes from the line of Julien Dumoulin-Smith from Bank of America. Julien, your line is now open.

Julien Dumoulin-Smith, Analyst

Hey, good morning everyone.

Christopher Crane, President and Chief Executive Officer

Good morning. How you doing?

Julien Dumoulin-Smith, Analyst

Good. Excellent. So I wanted to follow a little bit up on the utility activities. Obviously good progress at PHI yet again. But I wanted to elaborate a little bit further on this. Obviously the cost reductions of say $50 million-ish accrued of the utilities, how does that play out in terms again increasing your ROE right? I gather the bulk of that would be moving back to customers over time although clearly you're underearning relative to authorized level still. And then in tandem with that question if you could elaborate a little bit more on sort of the initial utility CapEx planning. Certainly this is a growing discussion of the legislation in Illinois as well as a litany of other smaller programs I think you've already alluded to a little bit elsewhere across your utility system.

Christopher Crane, President and Chief Executive Officer

I'll let Anne to take that.

Anne Pramaggiore, Senior Executive Vice President and Chief Executive Officer, Exelon Utilities

Sure. Good morning, Julien. So a couple of responses to your questions. As we think about moving forward, obviously we're going to blend the $50 million into the LRP over time. It's not the sitting there right now but we'll look at that as we do the next LRP iteration. And certainly our focus on O&M is to be flat to declining at the utilities and that's the goal as we move forward to manage back side of the equation. As we think about what we're doing on ROEs and sort

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01390

of developing that at the PHI utilities and the other utilities, the first thing we're doing is looking at how -- we're filing annually, how do we reduce lag?

One of the ways is as we're filing annually, we've got to stay up provision at DPL until 2020. But with the rest of the utilities, we'll be filing annually, we're looking at other mechanisms to reduce lag riders. We've got the Stride (ph) rider in Maryland Disc (ph) rider in Delaware and the IIT (ph) rider in New Jersey that we're looking to placed about $358 million of capital investment in right now. Interim rates at New Jersey is helping us close that lag gap. And we're looking at multiyear rate plan in DC. We've been invited to make that filing and we'll be doing that shortly.

So just got an outright provision at PECO authority for the commission to look at that, so that's something we'll be looking at going forward. So those are all the ways we're looking to close in on that ROE number. Obviously looking at, lag is our biggest sort of earn to allow gap but also looking at other disallowances too. But really trying to tighten up on the lag. So that's how we're thinking about on the ROE going forward. On the capital side, the question that you asked we've got -- we look at $5 billion a year a little bit plus north of that going forward for the foreseeable future. We have continuing modernization work at the utilities.

PECO for the 12 kV conversions were closer work. At ComEd we've got the FEJA, voltage optimization work that's about $500 million right there. BG&E has got big gas investment and PHI has got of a lot of material condition work, manhole refurbishment substation rebuilds, that sort of thing. We've got $1.5 billion in our gas program over the next LRP period. We've got close to $1 billion in security programs across the utilities over the LRP. So there's a lot of work to do. We always, always book ended with questions of affordability and that's why we stay tied on O&M. And we look at energy efficiency programs to give customers the ability to reduce usage and manage bills more tightly. And so we're always looking at the affordability side of it and our utilities fits pretty nicely when you look at the national average on percentage of income or percentage of proportion of bill to income. We're pretty good we'll below the national average on four and we're right at the national average on the other two bills.

Julien Dumoulin-Smith, Analyst

Got a quick clarification as a follow-up here on PJM. I know -- I appreciate your comments at the outset. Just timing-related how you -- how do you see this going down with respect to A getting an approval out of FERC? But then B, actually implementing a MOPR, just real quickly if you can.

Kathleen Barron, Senior Vice President of Governmental & Regulatory Affairs & Public Policy

Hi, Julien, this is Kathleen. I can take that question. As you know, reflect how much are going into FERC on November 6 with the expectation that the commission would address the paper hearing sometime in the January time frame. I think the commission is well aware that the market is looking for guidance as Chris said on what the rules are going to be going forward. And importantly the states need to know what changes that they need to make to their clean energy policies to accommodate the new rules coming out of FERC. So we will look to them to provide that guidance in the January time frame.

As you know we've delayed the auction until August to give states some time to react. Not just your question was specific to MOPR, but important for us is the ability of states to carve out the asset base they wish to support and to procure them directly to a state-led procurement. That is going to be an important change that we're looking for FERC to make in this next order based on the record in front of them, as an overwhelming amount of support from all partners (ph) of the stakeholder community and the states to put that change into the tariff and to give states that option going forward to continue to support the clean generation that will help them achieve their carbon reduction goals.

Julien Dumoulin-Smith, Analyst

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01391

So you don't see an issue with respect to getting clarity out of the states in time?

Kathleen Barron, Senior Vice President of Governmental & Regulatory Affairs & Public Policy

Obviously the states have different structures that they'll need to examine. And some may be able to use existing structures, some may need to adopt new structures including through legislation. So there will be a -- in the states where there's a need for legislation a premium on moving quickly. Now that being said, I think it's also incumbent on FERC to take that into account and to make sure that they have adequate time before the rules change in the tariff.

Julien Dumoulin-Smith, Analyst

Great. Thank you.

Operator

Thank you, Julien. Your next question comes from the line of Steve Fleishman from Wolfe Research. Steve, your line is now open.

Steve Fleishman, Analyst

Thank you. I'll actually just ask one question. The PJM from the standpoint of not -- obviously you have different stakeholders in lot of areas, states, customers, investors, et cetera. Just from an investor standpoint and not everyone else do you see the changes as proposed? Or as you would like to see them being kind of good for shareholders neutral? How should we think of it just from an investor standpoint?

Christopher Crane, President and Chief Executive Officer

No we definitely see this as a positive to create clarity and a more rewarding market going forward. We've lacked the clarity because we've isolated at times on programs. I think this is where we'll be able to create clarity, capital allotment, allocation will be much clear on where we'll be putting capital and what units we'll be operating and what units will be operating. And so -- but we see this as definitely a benefit to the markets, which will be a benefit to the consumer, which will be a benefit to the shareholder.

Steve Fleishman, Analyst

Okay. Thank you.

Operator

Thank you, Steve. Your next question comes from the line of Michael Weinstein from Credit Suisse. Michael, your line is now open.

Michael Weinstein, Analyst

Bloomberg
SI-SSA-0015-01392

Hi, guys, thanks for taking my questions. Two quick questions. The first one is do you think that the uncertainties surrounding FERC and surrounding new rules for capacity and energy. Do you think also (ph) uncertainty is delaying newbuild or new start construction plans if this is going to have an effect on tightening the market going over the next year or two? And then the second question I'll just ask it right now. Is -- Public Service Enterprise Group just announced that they're pulling out of the retail business. Is this a potential opportunity for Constellation?

Christopher Crane, President and Chief Executive Officer

First question, newbuilds are driven based off of market needs and economics. And unless we get the economics to support new asset entry, you're going to see what we see in the last couple of years the decline. Then we have to see what comes out of the resiliency review on how the market values different sources of firm fixed fuel. So there'll be an evolution before we'll see a real opening or a market response to the demand need for assets or investments to be made to come in. It's basic economics right now. The market is barely supporting the assets that are operating today so why would you invest in two new assets when you're not going to get a recovery or return on your capital.

James McHugh, Executive Vice President and Chief Executive Officer of Costellation

Hi, Michael, it's Jim McHugh. I can speak to the retail question. I think with the announcement of folks leaving or coming into the retail market, we're always on top of that and looking for opportunities to look for value and acquire books of business. In this case, I think if you take as noted that they're going to supply their contracts as they roll off. We'll obviously be there to serve customers as the No. 1 C&I customer and the No. 2 resi customer in the country to look for the business as they roll off. I think for us we have that scale. We've developed that scale over the years through acquisitions and organic growth and our platform is very capable of acquiring new customers and retaining existing customers pretty easily. We've been having lots of success also just finding new products and solutions for customers in both residential space and C&I space. So we'll keep taking advantage of those opportunities that are in front of us.

Michael Weinstein, Analyst

Great. Thank you very much.

Operator

Thank you, Michael. Your next question comes from the line of Jonathan Arnold from Deutsche Bank. Jonathan, your line is now open.

Jonathan Arnold, Analyst

Good morning, guys.

Christopher Crane, President and Chief Executive Officer

Just to stickup on the discussion around the states legislation and potentially not leaving legislation. Kathleen, I heard your comments that there could be different answers depending on which state you're talking about. But is it fair to say where you sit today that you think Illinois would have to legislate? And then I'm curious what you think about the state of play in New Jersey?

Kathleen Barron, Senior Vice President of Governmental & Regulatory Affairs & Public Policy

No, you're correct Jonathan. I agree with your assessment in Illinois. There will be a need for legislation to adjust to the change in rules. And I think a positive for us is that we are seeing not just here but across the country a growing sentiment among environmental groups and policymakers that the fastest and cheapest tap to decarbonizing is a policy that uses all zero carbon resources. And so, to the extent, states want to act to increase their clear energy ambition. We would be expected -- we would expect that all assets including ours would be able to participate in that type of a policy.

And FERC allowing the states to go ahead and procure clean capacity directly allows them to do so in a way that's going to be able to keep cost down for customers and achieve the clean energy goals at the same time. So we would look to that kind of structure to the extent that FERC puts this carve-out in the tariffs in Illinois. In New Jersey, given the way that the state law is written there and the authority at the BPU level to do a capacity procurement to the existing BGS structure there would not need -- there would not be a need for incremental legislation to allow that state's procurement effects (ph) to flow through the BGS. So that's why I said I think the answer is different depending on which jurisdiction you're in.

Jonathan Arnold, Analyst

Okay, great. I'm just willing to see if you provide that on the individual state, so thank you. Could I just have one quick follow up on the cost savings? You've obviously laid out how you expect them to be timed the Q3 '18 cost reductions. Can you remind us how much of the $250 million you've announced last year was flowing into ExGen? And maybe was sort of the sequencing in there in terms of how those ramp up as we try to unravel the numbers on, I guess in Slide 15?

Christopher Crane, President and Chief Executive Officer

Yeah. That is in the numbers. I think we're looking for the page. Now Joe has got it.

Joseph Nigro, Chief Financial Officer

The $250 million last year all of it is flowing into ExGen. The reductions were taken at ExGen across the platform nuclear constellation and our fossil fuels.

Jonathan Arnold, Analyst

And the timing Joe, is it kind of across the period out into 2020? Or is most of it kind of already there in '19?

Joseph Nigro, Chief Financial Officer

'19 -- 2019 you'll get to run rate year.

Jonathan Arnold, Analyst

Okay. All right. Thanks for that.

Operator

Thank you, Jonathan. That concludes the question-and-answer session of today's webcast. I'll hand the call over back to Mr. Chris Crane, CEO of Exelon Corporation.

Christopher Crane, President and Chief Executive Officer

Thanks again everybody for joining. Thanks for the questions, hopefully we covered everything. Any other concerns, please get a hold of IR, myself and I would be glad to continue to discuss them. But thanks to the team, all the 34,000 plus employees at Exelon for delivering another strong quarter and talk to you soon. Thanks. Bye.

Operator

Thank you. And that concludes today's webcast. Thank you all for participating. You may now disconnect.

Please refer to the information contained in the Appendix of our presentation and our earnings release

For reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures

Christopher M. Crane

Business Highlights

Performance

- Flipping to slide 5, we delivered another strong quarter with earnings again at the upper end of our range, which allows us to raise the lower end of our full-year guidance
- The utilities performed well with strong earned ROEs and largely first quartile operations
- As we've stated previously, the Federal Courts of Appeal in Illinois and New York strongly affirm the legality of the ZECs and our focus on cost continues, identifying an additional $200mm in gross savings, which $150mm of that will flow to the bottom line bringing our six-year total savings to more than $900mm

GAAP Basis

Bloomberg Transcript

- Combined, this performance demonstrates our growing value
- For the quarter, on a GAAP basis, we earned $0.76 per share vs. $0.85 per share last year
- On a non-GAAP operating basis, we are at $0.88 per share and again above the midpoint of our $0.80 to $0.90 range guidance that was provided

Investments

- Turning to slide 6, our utilities continue to perform at high levels across key customer satisfaction and operating metrics
- The investments we are making in technology and infrastructure continue to improve reliability, which leads to greater customer satisfaction and ultimately supporting strong relations with our regulators and our legislators

PECO and BGE

- PECO and BGE improved their JV power residential gas and electric scores over the last year with PECO receiving its highest ranking ever, placing second in the residential electric survey
- Our customer service metrics are strong
- BGE and ComEd are in the top decile for customer satisfaction; and PHI is in the top decile for its service levels

SAIFI and CAIDI

- Each of our utilities achieved top quartile reliability performance in SAIFI, or outage duration in CAIDI which is – outage frequency is SAIFI and CAIDI which is outage duration, ComEd and PHI performed in top decile for CAIDI.
- SAIFI, as we've discussed in the past, is our highest priority and remains that, our metrics have continued to improve since the beginning of the year

ExGen

- At ExGen, our third quarter was – 39.7 terawatt hours of capacity factor at 93.6% during the fourth hottest summer in nearly 125 years
- We performed at a 96.7% capacity factor and avoided 33 metric tons of carbon
- Our gas & hydro fleet performed well but below plan with economic dispatch match at 95.8%
  - This lower performance was primarily the results of our CCGTs at Colorado Bend and Wolf Hollow being offline because of some turbine blade defects
- The blades have been replaced
- Wolf Hollow came back into service in late September, one of the Colorado Bend units returned to service in October and the other will be back in service shortly
  - It's in the process of restart as we speak
- We took advantage of the outage time to perform normal maintenance that would have been required to have been shut down for next spring

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01397

Financial Perspective

- From a financial perspective, all the repairs were covered under a warranty and the markets impact from the plants being down were well within our full range outage contingency plan
- The plants ran very well over the summer prior to the outages and we're very pleased with the performance of the design and their durability
  - They remain an integral part of our Texas strategy

Business Transformation Team

- Turning to slide 7, as you know we've had a strong track record of finding efficiencies in the business and driving cost savings, which is why we created the Business Transformation team earlier this year to focus on our Business Services Company
- As part of that effort with additional savings from our nuclear fleet, we are announcing $200mm reduction to our run rate 2021 costs, of which $150mm will reach the bottom line at ExGen
- Joe is going to cover this in more detail during his remarks

ZEC Programs

- I'll turn it now to the policy updates for the quarter and start with the ZEC programs
- As I said, both the Seventh and the Second Court of Appeals dismissed challenges to the ZEC programs in Illinois and New York respectively
- In doing so, each court found that the states have the right to choose generation sources based on attributes they prefer such as environmental performance and that these programs are not tethered to the market
- The plaintiff sought rehearing in Illinois' case which the court denied last month
- The rulings were consistent with our expectations so we're happy with the resounding affirmation on these importantly state clean energy policies

Board of Public Utilities

- In New Jersey, the process for implementation of the ZEC program there remains on track to take effect early in Q2 2019
- The Board of Public Utilities has finished its hearings on implementation of the ZEC program and the utilities have filed tariffs to recover the ZEC-related charges
  - We expect the BPU to approve the changes later this month
- On the federal policy front, we think that FERC's June order took an important step forward by empowering the states to continue prioritizing zero-carbon energy throughout the state-led procurements outside of the PJM capacity module
- A number of proposals were filed in response to the order, including from a diverse coalition of which Exelon is a member in PJM.

Generation Fleet

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01398

- We see all of the major proposals as putting our Generation fleet in a better position financially than the current market construct
- We are pleased to have filed as part of our coalition and supports the rights of states to advance their clean energy goals
- Slide 22 gives a lot more detail on the coalition, but it includes consumer, rate payer, advocates, attorney generals, national environmental groups, renewable energy trade associations, public power and the other nuclear generators in PJM.

FERC

- Our proposal would provide states the flexibility to conduct a capacity procurement of resources they wish to support for the public policy reasons and would protect consumers for paying twice for capacity resources
- It strikes the balance that FERC is looking for to ensure states can meet their environmental goals while protecting the competitive market
- Reply to the comments are due November 6, and it will be important for FERC to issue an order early next year to give the markets guidance going forward
- As you know, we are still waiting for orders from FERC on the fast-start and resiliency examination

Joseph Nigro

Financial Highlights

Adjusted Non-GAAP Operating Earnings

- Turning to slide 8, we had another strong quarter financially, delivering adjusted non-GAAP operating earnings of $0.88 per share, which is at the upper end of our guidance range of $0.80 to $0.90 per share
- Exelon's utilities, less Holding Company expenses earned a combined $0.55 per share
- Compared to our plan, we benefited from reduced storm activity and favorable weather in our non-decoupled jurisdictions, including PECO, Atlantic City Electric and Delmarva/Delaware

ERCOT CCGT

- Generation earned $0.33 per share in Q3, which was slightly behind our plan
- Q3 was impacted by lot of realized lower realized ERCOT prices vs. the end of Q2; lower-than-expected Generation performance with the unplanned outages that our ERCOT CCGT was just discussed as well as one at Mystic 8 and 9, in addition to higher allocated transition costs
  - These were partially offset by realized gains from our nuclear decommissioning trust fund

Utility Earnings

- On slide 9, we show our q-over-q wall
- The $0.88 per share in Q3 this year was $0.03 per share higher than Q3 2017

final
Bloomberg Transcript
Bloomberg

- Overall, the Utility earnings were collectively up $0.75 per share compared with last year, driven primarily by higher rate base, new rates associated with completely rate cases, and favorable weather
- Generation earnings were down $0.03 per share compared with last year, driven largely by the absence of EGTP gross margin from the deconsolidation in Q4 2017, and higher planned nuclear outage days, partially offset by contribution from a full-quarter of Illinois ZEC revenues and savings from tax reform

Operational Results

- Turning to slide 10, we are raising the lower end of our 2018 EPS guidance range from $2.90 to $3.20 per share to $3.05 to $3.20 per share
- We are pleased with the strong operational results at both the Utilities and Generation businesses that are pushing us up into the upper half of our range, particularly as we have overcome unexpected headwinds including the challenging winter storms

ROE

- Moving to slide 11, improved operation at PHI and positive rate case outcomes are driving better earned ROE
- Pepco's higher ROE reflects last fall's distribution rate cases as well as the recent Pepco Maryland with DC settlement that took effect in June and August respectively
- Delmarva's earned ROE include the benefits of interim rates that became effective during Q1 with final rates for Delmarva Electric effective September 1 and the favorable weather at Delmarva/Delaware during the quarter

Atlantic City Electric

- At Atlantic City Electric, we saw higher earnings from last fall's rate case settlement as well as favorable weather during the quarter, which improves 12-month trailing ROEs significantly from last quarter
- As we have previously discussed, trailing 12-month ROEs for all of our PHI Utilities should continue to improve next quarter as the FASB's 109 charges from Q4 2017 drop out of the calculation

Legacy Exelon Utility

- For the legacy Exelon Utility, our earned ROEs remained over 10%, were modestly dipped from last quarter
- Our overall earned ROEs for Exelon Utility were modestly higher than last quarter at 9.6%, well within our earned ROE target of 9% to 10% that underlies our earnings outlook for 2019 and beyond
    - We are pleased with our overall Utility performance but have plans for continued improvement to bring PHI closer to the rest of our utilities

Tax-Saving Benefits

- Turning to slide 12, we remain busy on the regulatory fronts
- On October 18, the Administrative Law Judges presiding over PECO's electric distribution base rate case recommended the settlement with all parties be approved
- The deal provides for an increase of $96mm in annual electric distribution revenues, offset by $71mm in tax-saving benefits for customers for a net $25mm revenue increase

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01400

- We expect to receive an order in Q4

Tax Reform

- On August 9, the DC Commission approved the settlement that was reached in April based on $24.1mm revenue reduction after incorporating tax reform
- Rates went into effect on August 13
- A final order which received on August 21 for the settlement we reached in June on the Delaware/Delmarva Electric distribution case
- The case will provide $7mm revenue decrease including the benefits of capture firm for customers

Delmarva/Delaware

- On September 7, Delmarva/Delaware entered into a settlement agreement in pending gas distribution base rate case that provides for a revenue decrease of $3.5mm, including tax benefits for customers
- A final order is expected in Q4

Illinois Commerce Commission

- We also have number of rate cases still in progress
- We expect an order for BGE's spending gas rate case in January of 2019
- As a reminder, the case includes the requested $60.7mm increase to its gas revenues for infrastructure investments since 2015 and moving $21.7mm in revenue currently being recovered via the STRIDE surcharge into base rate
  - We expect to receive an order from the Illinois Commerce Commission on ComEd's standard formula rate case in Q4
- And, finally, on August 21, the Atlantic City Electric filed a distribution base rate case with the New Jersey Board of Public Utilities seeking of a revenue increase of $109mm and we expect an order in H2 2019

Regulatory Team

- The utilities and the regulatory teams are doing a lot of hard work to improve system reliability and performance of our customers and fostering in support of regulatory backdrop that, in turn, is helping to lift earned ROE towards their allocated levels across the Exelon Utility team
- More detail on the rate cases and their schedule can be found on slides 24 through 30 in the Appendix

Capital Budget

- Turning to slide 13, we invested $1.4B of capital at the utilities during Q3 and around $3.9B YTD
- We remain confident in our ability to meet our $5.5B capital budget for 2018
  - This quarter, I would like to feature two projects within our portfolio of Utility investors
- The first is the early completion of ComEd's $920mm smart meter installation program

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01401

- ComEd installed more than 4mm smart meters in just over seven years, which is three years ahead of the original schedule and more than $20mm under budget
- To help put this program into context, our ComEd team installed, on average 2,400 smart meters per day over that seven-year span

ComEd System

- In fact, one of our workers personally installed over 25,000 meters as part of this program
- The installation of smart meters on the ComEd system will allow customers to be better informed about their energy consumption that can help them save money and will allow ComEd to further improve its service offerings
- In addition, it drives over $100mm in annual operational savings, primarily from increased efficiencies in field operations, such as meter reading and avoided truck rolls
  - This smart meter installation program is part of the $2.6B Energy Infrastructure Modernization Act Program

Atlantic City Electric's Churchtown Substation Expansion Project

- The second project I want to highlight is Atlantic City Electric's Churchtown Substation Expansion Project in Pennsville, New Jersey
- This $50mm project entailed equipment upgrades for reliability and 230, 138 and 69 kV expansion for additional transmission capacity
- Construction also included installation of 2.1 miles of transmission line consisting of 59 new structures
- The expansion improved reliability for our customers by replacing and upgrading outdated equipment and by expanding regional transmission capacity which has the benefits of reducing congestion to our customers

Gross Margin

- Turning to slide 14, relative to our last update, total gross margin was flat in 2018 and up $50mm in both 2019 and 2020, primarily as a result of higher power prices
- For 2018, open gross margin was up $100mm primarily due to higher NiHub, PJM West Hub and New York Zone A prices and offset by weakening ERCOT spark spreads
  - Total gross margin is offset by lower mark-to-market of our hedges due to the higher power prices
- For 2019 and 2020, open gross margin was up $250mm and $100mm respectively due to higher PJM West Hub prices and stronger ERCOT spark spreads
- In 2019, open gross margin was also up on higher NiHub and New York Zone A prices
- Similar to 2018, the mark-to-market of our hedges is down both in 2019 and 2020 due to higher prices
  - We also executed $50mm of Power New Business in both 2018 and 2019 and executed $50mm of Non-Power New Business each year

Hedging Perspective

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01402

- From a hedging perspective, we ended the quarter in line with our ratable hedging program in 2018 and 9% to 12% behind ratable in 2019 and 8% to 11% behind ratable in 2020 when considering cross commodity hedges where we have increased our concentration

OEM Cost Reduction

- Turning to slide 15
- As Chris mentioned, we are announcing another round of OEM cost reductions as part of our continual efforts to evaluate our work practices, looking for ways to be more efficient, eliminate redundancies, and better incorporate innovation and technology

Gross Run Rate Savings

- With this new program, our gross run rate savings in 2021 will be $200mm, which we will ramp up over the next two years
- These incremental savings will come from our Exelon Generation business, primarily through even great efficiencies in our nuclear operations and at the Business Services Company or BSC, which is part of the transformation efforts that Jack has been leading
- The $200mm of savings is the gross number with about half from ExGen and half from the BSC organization
- And since BSC costs are shared roughly 50/50 between Exelon Generation and Exelon Utility, we would expect our Utility customers to benefit from $50mm of annual savings over time with the other $50mm flowing through Exelon Generation bottom line
- When we include the $50mm of incremental direct savings at ExGen, we expect $150mm of savings to flow to our bottom line in 2021, relative to our previous guidance, which we show on the lower left chart

Cost Savings

- Exelon continues to embrace a culture of cost discipline and operational excellence
- These cost updates are consistent with these cultural values
- If we look at all the cost savings amounts since 2015, we have now reduced O&M by over $900mm
  - It's due to hard work of all of our employees
- We strive every day to run the company more efficiently while adhering to our commitments to safety, reliability and community stewardship

Balance Sheet and Investment Grade Credit Ratings

- Turning to slide 16
- We remain committed to our strong balance sheet and investment grade credit ratings
- And to that end since our last earnings call, S&P has placed our ratings at ExGen and Exelon Corporate on credit watch positive, recognizing the improvements in overall strength of our balance sheet

Corporate Credit Metrics

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01403

- Turning to the metrics, our consolidated corporate credit metrics remain above our target ranges and meaningfully above S&P thresholds
- We are forecasting ExGen's leverage to be 2.5 times debt-to-EBITDA at year-end 2018, which is below our long-term target of 3.0 times
- On a recourse debt basis, we are at 2.0 times, which is well below our target range
- We will continue to manage our balance sheet at ExGen over time for the 3.0 times debt-to-EBITDA level, so look for us to focus on debt reduction at both the HoldCo and GenCo

Christopher M. Crane

Q3 Highlights

ZEC Program

- Turning to slide 17, as we have shown you, we have a strong quarter financially and operationally
- We continue to get stronger on both fronts
  - This is due to the hard work and dedication of all of our employees every day
- We also had important wins in the course to preserve the ZEC programs, and are finding ways to operate more efficiently, providing incremental cost savings as discussed

EPS Growth

- Our value proposition remains unchanged
- We're focused on growing our Utilities starting at 6% to 8% EPS growth through 2021
- We continue to use FCF from the GenCo upon the incremental equity needs at the Utilities, pay down debt over the next four years at the GenCo and HoldCo and fund a part of the faster dividend growth rate

PJM and Resiliency Efforts

- We will stay focused on optimizing value at the ExGen by seeking fair compensation for our carbon-free generation fleet, supporting proper price formation in PJM and resiliency efforts at FERC, and supporting capacity market reforms that will allow states to continue to protect citizens from carbon and air pollution, while benefiting from regional markets
- We will close uneconomic and sell assets where it does not make sense to accelerate our debt reduction plans and maximize value to generation to the load matching strategy
- We continue to sustain strong investment-grade credit metrics and grow our dividend consistently at 5% through 2020

QUESTION AND ANSWER SECTION

<Q - Greg Gordon>: First, on the quarter, everything seems really, really good on the Utility side and the underlying operations at the GenCo look decent too. But it was a little squishy around some of those operational issues. Can you just talk us through that and get us comfortable that they're sort of temporal and not structural?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01404

<A - Christopher M. Crane>: Are you talking about the operational issues around the GenCo in the Power...

<Q - Greg Gordon>: ...in Texas, the interruption in Massachusetts, the higher FDR costs. I just want to make sure we can be comfortable that they're not going to sort of run out into the future and impact your ability to get your future numbers?

<A - Christopher M. Crane>: Let me start out with the Texas assets. So, I'll let Joe fill in on the rest of it. Those GE 7HA.20 (sic) [7HA.02], these were the first serial numbers, .01 and .02. We were aware as GE was that there was some difficulty with the first-stage blades. We had approximated a run period that we could operate the assets before putting in the fix. The fix was already underway and then designed. GE did give us very strong warranties on those assets and responded very well on the first failure on the one CT at Colorado Bend. We proactively shut the other three CTs down, replaced them with the new design, have them back up and running and, as I said, we expect – we're in the rollout phase now and the start-up phase of the fourth unit. And we feel confident in the design. GE has put us in inspection program together, that will be borescoping after so many hours of operation. They've responded well, the solid engineering confirmed by independent assessments so we feel that that is behind us and we'll be able to continue those assets to operate at incredibly high capacity factors and efficiencies going forward.

On the FDRs and the other issues, I'll let Joe cover it.

<A - Joseph Nigro>: Yes. So, Greg, I think first thing is, as Chris mentioned, the generation issues drove some of the underperformance at ExGen. In addition to that, when you looked at power prices in Texas at the end of June and where they realized for the quarter, there was an impact with the difference there. As you know, the spot market prices were lower than when we walked into the quarter.

On the transmission side, the costs were associated with Order 494 at FERC and that had a negative impact. So, from our lens, when you talk about the Generation performance, both at Mystic and at ERCOT those are one-time occurrences similarly on the transmission side. The favorability was driven on the realized nuclear decommissioning trust gains. So I think when you look at it from our lens, you see these one-time items that are driving the lower results.

<Q - Greg Gordon>: Great. Thanks. And follow-up on ExGen and then one more if you'll hear me. Looking at the cost cuts, it's really quite an impressive, incremental change. You've got the costs declining from $4.265B to $4.175B in 2020 and a little bit more in 2021; $450mm savings, but that gross margins declined by $700mm. And so skeptical investors look at this and say, well, you guys are doing yeoman's job here right-sizing the cost structure but earnings aren't getting better. I would argue that cost cuts are permanent and these backward dated power prices are hopefully temporary. But can you give us some confidence that there's positive operating leverage here as we move through time and that these lower commodity prices and capacity prices are not structural?

<A - Christopher M. Crane>: We've talked about this before that we've lacked liquidity in the out-years. It's a softer market. Our fundamentals still tell us that this backward dated curve is not what we'll see as the prompt years come in, and so we're managing the book in that manner maintaining as much margin open and using cross commodity hedges to be able to manage that. It's – we will constantly look at driving efficiencies. You can't have a company and operate with any aspect or entity within the company being inefficient. So, driving efficiencies has multiple benefits, but one of them is a reduction in expense. And we'll continue to focus on that as we serve the customer. As far as the market issues, Jim or Joe, do you want to cover any more on that?

<A - James McHugh>: Yeah. I think the only thing I would add about the backwardation of the curve is with the next couple of years starting 2025 and 2024 due to lack of liquidity, we're seeing net retirements of newbuilds over the next year between 2020 and 2023 that would lead us to believe that backwardation won't really subside. We've seen stock prices and I have even in some of the lowest delivered fuel price years cleared north of $26, $27. So, the backwardation to your point is, it seems temporal, Greg.

<Q - Greg Gordon>: Okay. And the final question is given that the balance sheet is so strong and that the rating agencies are finally coming around to considering higher credit ratings, how much balance sheet capacity does that create and/or does it give you more latitude to have a more aggressive risk management policy and take hedge less and take more of your power into the spot and therefore try to get those better prices?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01405

<A - Joseph Nigro>: Greg, it's Joe. The short answer is with that balance sheet capacity, we can be more aggressive. And as I mentioned in my remarks when you look at how far behind we are with our ratable plan and when you overlay the fact that we're using gas as a proxy for power, we are carrying a very long opening power position in 2019 and 2020, and then we're able to do that given the strength of the balance sheet that we have. We continue to challenge ourselves in this regard as well.

And as Jim mentioned on our use of power, we're going to continue to be constructive in the way we manage the portfolio relative to what we think fair value is in the out-years and that leverage on the balance sheet allows us to do that.

<Q - Julien Dumoulin-Smith>: Good, excellent. So I wanted to follow a little bit up on the Utility activities, obviously good progress with PHI yet again but I wanted to elaborate a little bit further on this. Obviously, the cost reductions of say $50-ish million accrued in the Utilities, how does that play out in terms of again increasing your ROE, right? I gathered the bulk of that would be moving back to customers over time, although clearly you're under earning relative to authorized level still.

And then in tandem with that question, if you could elaborate a little bit more on the sort of initial Utility CapEx planning, certainly there's a growing discussion of legislation in Illinois as well as a litany of other smaller programs. I think you've already alluded to a little bit elsewhere across your Utilities system?

<A - Christopher M. Crane>: Yeah, I'll let Anne take that.

<A - Anne R. Pramaggiore>: Sure. Good morning, Julien. Yeah, so a couple responses to your questions. As we think about moving forward, obviously we're going to blend $50mm into the LRP over time. It's not sitting there right now, but we'll look at that as we do the next LRP iteration. And certainly our focus on O&M is to be flat to declining at the Utilities and that, that's the goal as we move forward to manage that side of the equation.

As we think about what we're doing on ROEs and sort of developing that at the PHI utilities and the other utilities, you know the first thing we're doing is looking at how – we were filing annually, how do we reduce lag? One of the ways is we file annually. We've got a stay out provision at DPL until 2020. But with the rest of the utilities, we'll be filing annually. We're looking at other mechanisms to reduce lag riders. We've got the STRIDE rider in Maryland, the DISC rider in Delaware and the IIT rider in New Jersey that we're looking to place about $358mm of capital investment in right now. Interim rates at New Jersey is helping us close that lag gap and we're looking at multiyear rate plan in DC. We've been invited to make that filing and we'll be doing that shortly. So just got an [ph] alt-reg (35:25) provision at PECO authority for the Commission to look at that, so that's something we'll be looking at going forward.

So those are all the ways we're looking to close in on that ROE number. Obviously, looking at – lags are biggest sort of earned to allowed GAAP but also looking at other disallowances too, but really trying to take enough on the lag. So that's how we're thinking about on the ROE going forward.

On the capital side, the question that you asked, we've got – we look at $5B a year, a little bit plus north of that going forward for the foreseeable future.

We have continuing modernization work at the Utilities. PECO 4 to 12 kV conversions were closer work. At ComEd, we've got the FEJA voltage optimization work that's about $500mm right there. BGE's got big [ph] bath (36:19) investment, and PHI's got a lot of material condition work – manhole refurbishments, substation rebuilds, that sort of thing.

We've got $1.5B in our gas program over the next LRP period. We've got close to $1B in security programs across the utilities over the LRP, so there's a lot of work to do. We always, always bookend it with questions of affordability and that's why we stay tight on O&M. And we look at energy efficiency programs to give customers the ability to reduce usage and manage those more tightly. So we're always looking at the affordability side of it and our Utilities fit pretty nicely when you look at the national average on percentage of income or percentage of proportion of build to income. We're pretty good. We're below the national average on four and we're right at the national average on the other two builds.

final

Bloomberg Transcript

<Q - Julien Dumoulin-Smith>: Got it. Quick clarification as a follow-up here on PJM. I appreciate your comments at the outset. Just timing-related, how do you see this going down with respect to (a) getting an approval out of FERC, but then (b) actually implementing a MOPR just real quickly if you can?

<A - Kathleen L. Barrón>: Hi Julien, it's Kathleen. I can take that question. As you know, reply comments are going into FERC on November 6 with the expectation that the Commission would address the paper hearing sometime in the January timeframe. I think the Commission is well aware that the market is looking for guidance, as Chris said, on what the rules are going to be going forward and importantly the states need to know what changes that they need to make to their clean energy policies to accommodate the new rules coming out of FERC.

So we will look to them to provide that guidance in the January timeframe. As you know, they have delayed the auction until August to give states some time to react, not just – your question was specific to MOPR, but important for us is the ability of states to carve out the assets they wish to support and to procure them directly through a state-led procurement, that is going to be an important change that we're looking for FERC to make in the next order based on the record in front of them, they have an overwhelming amount of support from all supporters of the stakeholder community and the states; to put that change into the tariff and to give states that option going forward to continue to support the clean generation that will help them achieve their carbon reduction goals.

<Q - Julien Dumoulin-Smith>: So you don't see an issue with respect to getting clarity out of the state in time?

<A - Kathleen L. Barrón>: Obviously, the states have different structures that they'll need to examine and some may be able to use existing structure, some may need to adopt new structures, including through legislation. So there will be a – in the states where there is a need for legislation, a premium on moving quickly. Now that being said, I think it's also incumbent on FERC to take that into account and to make that states have adequate time before the rules change into the tariff.

<Q - Steve Fleishman>: I will actually just ask one question. The PJM from a standpoint of – not obviously you have different stakeholders involved here – your states' customers, investors, et cetera. Just from an investor standpoint and not everyone else, do you see the changes as proposed or as you would like to see them being kind of good for shareholders, neutral, how should we think of it just from an investor standpoint?

<A - Christopher M. Crane>: No, we definitely see this as a positive to create clarity and a more rewarding market going forward. We've lacked the clarity, we've isolated at times on programs. I think this is where we'll be able to create clarity, capital allotment; allocation will be much clearer on where we'll be putting capital, what units will be operating, and what units won't be operating. So, but we see this as definitely a benefit to the markets which will be a benefit to the consumer, which will be a benefit to the shareholder.

<Q - Michael Weinstein>: Hey, two quick questions. The first one is do you think that the uncertainty surrounding FERC and surrounding new rules for capacity and energy. Given all this uncertainty is delaying newbuild or a new start construction plans, if this is going to have an effect on tightening the markets going over the next year or two?

And my second question, I'll just ask it right now is the Public Service Enterprise Group just announced that they're pulling out of the retail business. Is this a potential opportunity for Constellation?

<A - Christopher M. Crane>: First question, newbuilds are driven based off of market needs and economics, and unless we get the economics to support new asset entry, you are going to see what we've seen in the last couple of years, the decline. Then we have to see what comes out of the resiliency review on how the market values different sources of firm-fixed fuel. So, there'll be an evolution before we'll see a real opening or a market response to the demand need for assets or investments to be made to come in. It's basic economics right now. The market is barely supporting the assets that are operating today, so why would you invest into new assets when you are not going to get a recovery or return on your capital.

<A - James McHugh>: Yeah, I can – Hi, Michael, it's Jim McHugh, and I can speak to the retail question. I think with announcement of folks leaving or coming into the retail market, we're always on top of that and looking for opportunities to look for value and acquire books of business.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01407

In this case, I think PSEG has noted that they're going to supply their contracts as they roll off. We'll obviously be there to serve customers as the number one C&I customer and the number two resi customer in the country to look for the business as they roll on. I think, for us, we have that scale. We have developed that scale over the years through acquisitions in organic growth and our platform is very capable of acquiring new customers and retaining existing customers pretty easily. We've been having a lot of success also just finding new products and solutions for customers, in both the residential space and C&I space so we'll keep taking advantage of those opportunities that are in front of us.

<Q - Jonathan Philip Arnold>: Just to pick up on the discussion around the state's legislation and potentially not leading legislation. Kathleen, I heard your comments that there could be different answers depending on which state you're talking about. But is it fair to say, the way you said today that you think Illinois would have to legislate, and then I'm curious what you think about the state of play in New Jersey?

<A - Kathleen L. Barrón>: No, you're correct, Jonathan. I agree with your assessment in Illinois, there will be a need for legislation to adjust those change in rules. And I think a positive, for us, is that we are seeing not just here but across the country a growing sentiment among environmental groups and policymakers that the fastest and cheapest path to decarbonizing is a policy that uses all zero-carbon resources. And so to the extent states want to act to increase their clean energy ambition, we would expect that all assets, including ours would be able to participate in that type of policy as FERC allowing the states to go ahead and procure clean capacity, directly allows them to do so in a way that's going to be able to keep costs down per customers and achieve the clean energy goals at the same time.

So we would look to that kind of structure to the extent the FERC puts this carve out in the tariff in Illinois and in New Jersey given the way that the state law is written there and the authority at the BPU level to do the capacity procurement through the existing BGS structure, there would not be a need for incremental legislation to allow that state's procurement effects to flow through the BGS. So that's why I said I think the answer is different depending on which jurisdiction you're in.

<Q - Jonathan Philip Arnold>: Okay. Great. I was just wanting to see if you could provide that on the individual states, so thank you.

Could I just ask one quick follow-up on the cost savings, you've obviously laid out how you expect them to be timed Q3 2018 cost reductions. Can you remind us how much of the $250mm you've announced last year was flowing into ExGen and maybe what the sort of sequencing is there in terms of how those ramp up as we're trying to unravel the numbers on, I guess, it's slide 15.

<A - Christopher M. Crane>: Yeah that is in the numbers. I think we're looking for the page now. Joe's got it.

<A - Joseph Nigro>: The $250mm last year, all of it is flowing into ExGen. The reductions were taken at ExGen across the platform nuclear, Constellation in our...

<Q - Jonathan Philip Arnold>: And the timing Joe, is it kind of across the period into 2020 or is most of it is kind of already there in...

<A - Christopher M. Crane>: 2019, you'll get to run rate year.

MANAGEMENT DISCUSSION SECTION

Operator

Good morning, ladies and gentlemen, welcome to Exelon 2018's Third Quarter Earnings Conference Call. My name is Jerome and I will be facilitating the audio portion of today's interactive broadcast. All lines have been place on mute to prevent any background noise. After the speakers' remarks, there will be a question-and-answer session. [Operator Instructions]

At this time, I'd like turn the show over to Mr. Dan Eggers, Senior Vice President-Corporate Finance. The floor is yours.

Daniel L. Eggers

Thank you, Jerome. Good morning, everyone, and thank you for joining our third quarter 2018 earnings conference call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer; and Joe Nigro, Exelon's Chief Financial Officer. They're joined by other members of Exelon's senior management team who will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, both of which can be found in the Investor Relations section of Exelon's website. The earnings release and other matters which we'll discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material and comments made during this call. Please refer to today's 8-K and Exelon's other SEC filings for discussions of risk factors and factors that may cause results to differ from management's projections, forecast and expectations.

Today's presentation also references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the Appendix of our presentation and our earnings release

Bloomberg Transcript

for reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures. We scheduled 45 minutes for today's call.

I'll now turn the call over to Chris Crane, Exelon's CEO.

Christopher M. Crane

Thanks, Dan, and good morning everyone. Thank you for joining us. Flipping to slide 5, we delivered another strong quarter with earnings again at the upper end of our range, which allows us to raise the lower end of our full-year guidance.

The utilities performed well with strong earned ROEs and largely first quartile operations. As we've stated previously, the Federal Courts of Appeal in Illinois and New York strongly affirm the legality of the ZECs and our focus on cost continues, identifying an additional $200 million in gross savings, which a $150 million of that will flow to the bottom line bringing our six-year total savings to more than $900 million.

Combined, this performance demonstrates our growing value. For the quarter, on a GAAP basis, we earned $0.76 per share versus $0.85 per share last year. On a non-GAAP operating basis, we are at $0.88 per share and again above the midpoint of our $0.80 to $0.90 range guidance that was provided.

Turning to slide 6, our utilities continue to perform at high levels across key customer satisfaction and operating metrics. The investments we are making in technology and infrastructure continue to improve reliability, which leads to greater customer satisfaction and ultimately supporting strong relations with our regulators and our legislators.

PECO and BGE improved their JV power residential gas and electric scores over the last year with PECO receiving its highest ranking ever, placing second in the residential electric survey. Our customer service metrics are strong. BGE and ComEd are in the top decile for customer satisfaction; and PHI is in the top decile for its service levels.

Each of our utilities achieved top quartile reliability performance in SAIFI, or outage duration in CAIDI which is – outage frequency is SAIFI and CAIDI which is outage duration, ComEd and PHI performed in top decile for CAIDI. SAIFI, as we've discussed in the past, is our highest priority and remains that, our metrics have continued to improve since the beginning of the year.

At ExGen, our third quarter was – 39.7 terawatt hours of capacity factor at 93.6% during the fourth hottest summer in nearly 125 years. We performed at a 96.7% capacity factor and avoided 33 metric tons of carbon. Our gas & hydro fleet performed well but below plan with economic dispatch match at 95.8%. This lower performance was primarily the results of our CCGTs at Colorado Bend and Wolf Hollow being offline because of some turbine blade defects. The blades have been replaced. Wolf Hollow came back into service in late September, one of the Colorado Bend units returned to service in October and the other will be back in service shortly. It's in the process of restart as we speak. We took advantage of the outage time to perform normal maintenance that would have been required to have been shut down for next spring.

From a financial perspective, all the repairs were covered under a warranty and the markets impact from the plants being down were well within our full range outage contingency plan. The plants ran very well over the summer prior to the outages and we're very pleased with the performance of the design and their durability. They remain an integral part of our Texas strategy.

Turning to slide 7, as you know we've had a strong track record of finding efficiencies in the business and driving cost savings, which is why we created the Business Transformation team earlier this year to focus on our Business Services Company. As part of that effort with additional savings from our nuclear fleet, we are announcing a $200 million reduction to our run rate 2021 costs, of which $150 million will reach the bottom line at ExGen. Joe is going to cover this in more detail during his remarks.

I'll turn it now to the policy updates for the quarter and start with the ZEC programs. As I said, both the Seventh and the Second Court of Appeals dismissed challenges to the ZEC programs in Illinois and New York respectively. In

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01410

doing so, each court found that the states have the right to choose generation sources based on attributes they prefer such as environmental performance and that these programs are not tethered to the market. The plaintiff sought rehearing in Illinois' case which the court denied last month. The rulings were consistent with our expectations so we're happy with the resounding affirmation on these importantly state clean energy policies.

In New Jersey, the process for implementation of the ZEC program there remains on track to take effect early in the second quarter of 2019. The Board of Public Utilities has finished its hearings on implementation of the ZEC program and the utilities have filed tariffs to recover the ZEC-related charges. We expect the BPU to approve the changes later this month.

On the federal policy front, we think that FERC's June order took an important step forward by empowering the states to continue prioritizing zero-carbon energy throughout the state-led procurements outside of the PJM capacity module. A number of proposals were filed in response to the order, including from a diverse coalition of which Exelon is a member in PJM.

We see all of the major proposals as putting our Generation fleet in a better position financially than the current market construct. We are pleased to have filed as part of our coalition and supports the rights of states to advance their clean energy goals. Slide 22 gives a lot more detail on the coalition, but it includes consumer, rate payer, advocates, attorney generals, national environmental groups, renewable energy trade associations, public power and the other nuclear generators in PJM.

Our proposal would provide states the flexibility to conduct a capacity procurement of resources they wish to support for the public policy reasons and would protect consumers for paying twice for capacity resources. It strikes the balance that FERC is looking for to ensure states can meet their environmental goals while protecting the competitive market.

Reply to the comments are due November 6, and it will be important for FERC to issue an order early next year to give the markets guidance going forward. As you know, we are still waiting for orders from FERC on the fast-start and resiliency examination.

But with that, now I'll turn it over to Joe to walk through the numbers.

Joseph Nigro

Thank you, Chris, and good morning, everyone. Turning to slide 8, we had another strong quarter financially, delivering adjusted non-GAAP operating earnings of $0.88 per share, which is at the upper end of our guidance range of $0.80 to $0.90 per share.

Exelon's utilities, less Holding Company expenses earned a combined $0.55 per share. Compared to our plan, we benefited from reduced storm activity and favorable weather in our non-decoupled jurisdictions, including PECO, Atlantic City Electric and Delmarva/Delaware.

Generation earned $0.33 per share in the third quarter, which was slightly behind our plan. The third quarter was impacted by lot of realized lower realized ERCOT prices versus the end of the second quarter; lower-than-expected Generation performance with the unplanned outages that our ERCOT CCGT was just discussed as well as one at Mystic 8 and 9, in addition to higher allocated transition costs. These were partially offset by realized gains from our nuclear decommissioning trust fund.

On slide 9, we show our quarter-over-quarter wall. The $0.88 per share in the third quarter of this year was $0.03 per share higher than the third quarter of 2017. Overall, the Utility earnings were collectively up $.75 per share compared with last year, driven primarily by higher rate base, new rates associated with completely rate cases, and favorable weather.

Generation earnings were down $0.03 per share compared with last year, driven largely by the absence of EGTP gross margin from the deconsolidation in the fourth quarter of 2017, and higher planned nuclear outage days, partially offset by contribution from a full-quarter of Illinois ZEC revenues and savings from tax reform.

final
Bloomberg Transcript

Turning to slide 10, we are raising the lower end of our 2018 EPS guidance range from $2.90 to $3.20 per share to $3.05 to $3.20 per share. We are pleased with the strong operational results at both the Utilities and Generation businesses that are pushing us up into the upper half of our range, particularly as we have overcome unexpected headwinds including the challenging winter storms.

Moving to slide 11, improved operation at PHI and positive rate case outcomes are driving better earned ROE. Pepco's higher ROE reflects last fall's distribution rate cases as well as the recent Pepco Maryland with DC settlement that took effect in June and August respectively. Delmarva's earned ROE include the benefits of interim rates that became effective during the first quarter with final rates for Delmarva Electric effective September 1 and the favorable weather at Delmarva/Delaware during the quarter.

At Atlantic City Electric, we saw higher earnings from last fall's rate case settlement as well as favorable weather during the quarter, which improves 12-month trailing ROEs significantly from last quarter. As we have previously discussed, trailing 12-month ROEs for all of our PHI Utilities should continue to improve next quarter as the FASB's 109 charges from the fourth quarter of 2017 drop out of the calculation.

For the legacy Exelon Utility, our earned ROEs remained over 10%, were modestly dipped from last quarter. Our overall earned ROEs for Exelon Utility were modestly higher than last quarter at 9.6%, well within our earned ROE target of 9% to 10% that underlies our earnings outlook for 2019 and beyond. We are pleased with our overall Utility performance but have plans for continued improvement to bring PHI closer to the rest of our utilities.

Turning to slide 12, we remain busy on the regulatory fronts. On October 18, the Administrative Law Judges presiding over PECO's electric distribution base rate case recommended the settlement with all parties be approved. The deal provides for an increase of $96 million in annual electric distribution revenues, offset by $71 million in tax-saving benefits for customers for a net $25 million revenue increase. We expect to receive an order in the fourth quarter.

On August 9, the DC Commission approved the settlement that was reached in April based on a $24.1 million revenue reduction after incorporating tax reform. Rates went into effect on August 13. A final order which received on August 21 for the settlement we reached in June on the Delaware/Delmarva Electric distribution case. The case will provide a $7 million revenue decrease including the benefits of capture firm for customers.

On September 7, Delmarva/Delaware entered into a settlement agreement in pending gas distribution base rate case that provides for a revenue decrease of $3.5 million, including tax benefits for customers. A final order is expected in the fourth quarter.

We also have number of rate cases still in progress. We expect an order for BGE's spending gas rate case in January of 2019. As a reminder, the case includes the requested $60.7 million increase to its gas revenues for infrastructure investments since 2015 and moving $21.7 million in revenue currently being recovered via the STRIDE surcharge into base rate.

We expect to receive an order from the Illinois Commerce Commission on ComEd's standard formula rate case in the fourth quarter. And, finally, on August 21, the Atlantic City Electric filed a distribution base rate case with the New Jersey Board of Public Utilities seeking of a revenue increase of a $109 million and we expect an order in the second half of 2019.

The utilities and the regulatory teams are doing a lot of hard work to improve system reliability and performance of our customers and fostering in support of regulatory backdrop that, in turn, is helping to lift earned ROE towards their allocated levels across the Exelon Utility team. More detail on the rate cases and their schedule can be found on slides 24 through 30 in the Appendix.

Turning to slide 13, we invested $1.4 billion of capital at the utilities during the third quarter and around $3.9 billion year-to-date. We remain confident in our ability to meet our $5.5 billion capital budget for 2018. This quarter, I would like to feature two projects within our portfolio of Utility investors. The first is the early completion of ComEd's $920 million smart meter installation program. ComEd installed more than 4 million smart meters in just over seven years, which is three years ahead of the original schedule and more than $20 million under budget. To help put this program

final
Bloomberg Transcript

final

into context, our ComEd team installed, on average 2,400 smart meters per day over that seven-year span.

In fact, one of our workers personally installed over 25,000 meters as part of this program. The installation of smart meters on the ComEd system will allow customers to be better informed about their energy consumption that can help them save money and will allow ComEd to further improve its service offerings.

In addition, it drives over $100 million in annual operational savings, primarily from increased efficiencies in field operations, such as meter reading and avoided truck rolls. This smart meter installation program is part of the $2.6 billion Energy Infrastructure Modernization Act Program.

The second project I want to highlight is Atlantic City Electric's Churchtown Substation Expansion Project in Pennsville, New Jersey. This $50 million project entailed equipment upgrades for reliability and 230, 138 and 69 kV expansion for additional transmission capacity. Construction also included installation of 2.1 miles of transmission line consisting of 59 new structures. The expansion improved reliability for our customers by replacing and upgrading outdated equipment and by expanding regional transmission capacity which has the benefits of reducing congestion to our customers.

Turning to slide 14, relative to our last update, total gross margin was flat in 2018 and up $50 million in both 2019 and 2020, primarily as a result of higher power prices. For 2018, open gross margin was up $100 million primarily due to higher NiHub, PJM West Hub and New York Zone A prices and offset by weakening ERCOT spark spreads. Total gross margin is offset by lower mark-to-market of our hedges due to the higher power prices.

For 2019 and 2020, open gross margin was up $250 million and $100 million respectively due to higher PJM West Hub prices and stronger ERCOT spark spreads. In 2019, open gross margin was also up on higher NiHub and New York Zone A prices.

Similar to 2018, the mark-to-market of our hedges is down both in 2019 and 2020 due to higher prices. We also executed $50 million of Power New Business in both 2018 and 2019 and executed $50 million of Non-Power New Business each year.

From a hedging perspective, we ended the quarter in-line with our ratable hedging program in 2018 and 9% to 12% behind ratable in 2019 and 8% to 11% behind ratable in 2020 when considering cross commodity hedges where we have increased our concentration.

Turning to slide 15. As Chris mentioned, we are announcing another round of OEM cost reductions as part of our continual efforts to evaluate our work practices, looking for ways to be more efficient, eliminate redundancies, and better incorporate innovation and technology.

With this new program, our gross run rate savings in 2021 will be $200 million, which we will ramp up over the next two years. These incremental savings will come from our Exelon Generation business, primarily through even great efficiencies in our nuclear operations and at the Business Services Company or BSC, which is part of the transformation efforts that Jack has been leading. The $200 million of savings is the gross number with about half from ExGen and half from the BSC organization. And since BSC costs are shared roughly 50/50 between Exelon Generation and Exelon Utility, we would expect our Utility customers to benefit from $50 million of annual savings over time with the other $50 million flowing through Exelon Generation bottom line.

When we include the $50 million of incremental direct savings at ExGen, we expect $150 million of savings to flow to our bottom line in 2021, relative to our previous guidance, which we show on the lower left chart.

Exelon continues to embrace a culture of cost discipline and operational excellence. These cost updates are consistent with these cultural values. If we look at all the cost savings amounts since 2015, we have now reduced O&M by over $900 million. It's due to hard work of all of our employees. We strive every day to run the company more efficiently while adhering to our commitments to safety, reliability and community stewardship.

Turning to slide 16. We remain committed to our strong balance sheet and investment grade credit ratings. And to that end since our last earnings call, S&P has placed our ratings at ExGen and Exelon Corporate on credit watch positive,

Bloomberg Transcript

Bloomberg

SI-SSA-0015-01413

recognizing the improvements in overall strength of our balance sheet.

Turning to the metrics, our consolidated corporate credit metrics remain above our target ranges and meaningfully above S&P thresholds. We are forecasting ExGen's leverage to be 2.5 times debt-to-EBITDA at year-end 2018, which is below our long-term target of 3.0 times. On a recourse debt basis, we are at 2.0 times, which is well below our target range. We will continue to manage our balance sheet at ExGen over time for the 3.0 times debt-to-EBITDA level, so look for us to focus on debt reduction at both the HoldCo and GenCo.

I will now turn the call back to Chris. Thank you.

Christopher M. Crane

Thanks, Joe. Turning to slide 17, as we have shown you, we have a strong quarter financially and operationally. We continue to get stronger on both fronts. This is due to the hard work and dedication of all of our employees every day. We also had important wins in the course to preserve the ZEC programs, and are finding ways to operate more efficiently, providing incremental cost savings as discussed.

Our value proposition remains unchanged. We're focused on growing our Utilities starting at 6% to 8% EPS growth through 2021. We continue to use free cash flow from the GenCo upon the incremental equity needs at the Utilities, pay down debt over the next four years at the GenCo and HoldCo and fund a part of the faster dividend growth rate.

We will stay focused on optimizing value at the ExGen by seeking fair compensation for our carbon-free generation fleet, supporting proper price formation in PJM and resiliency efforts at FERC, and supporting capacity market reforms that will allow states to continue to protect citizens from carbon and air pollution, while benefiting from regional markets. We will close uneconomic and sell assets where it does not make sense to accelerate our debt reduction plans and maximize value to generation to the load matching strategy. We continue to sustain strong investment-grade credit metrics and grow our dividend consistently at 5% through 2020.

Operator, now we can take it – open the call up for questions. Thank you.

Q&A

Operator

[Operator Instructions] Your first question comes from the line of Greg Gordon from Evercore. Greg, your line is now open.

<Q - Greg Gordon>: Thanks. Good morning guys. A couple of questions.

<A - Christopher M. Crane>: Hey, Greg.

<Q - Greg Gordon>: First, on the quarter, everything seems really, really good on the Utility side and the underlying operations at the GenCo look decent too. But it was a little squishy around some of those operational issues. Can you just talk us through that and get us comfortable that they're sort of temporal and not structural?

<A - Christopher M. Crane>: Are you talking about the operational issues around the GenCo in the Power...

<Q - Greg Gordon>: ...in Texas, the interruption in Massachusetts, the higher FDR costs. I just want to make sure we can be comfortable that they're not going to sort of run out into the future and impact your ability to get your future numbers?

<A - Christopher M. Crane>: Let me start out with the Texas assets. So, I'll let Joe fill in on the rest of it. Those GE 7HA.20 (sic) [7HA.02], these were the first serial numbers, .01 and .02. We were aware as GE was that there was some difficulty with the first-stage blades. We had approximated a run period that we could operate the assets before putting in the fix. The fix was already underway and then designed. GE did give us very strong warranties on those assets and

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01414

responded very well on the first failure on the one CT at Colorado Bend. We proactively shut the other three CTs down, replaced them with the new design, have them back up and running and, as I said, we expect – we're in the rollout phase now and the start-up phase of the fourth unit. And we feel confident in the design. GE has put us in inspection program together, that will be borescoping after so many hours of operation. They've responded well, the solid engineering confirmed by independent assessments so we feel that that is behind us and we'll be able to continue those assets to operate at incredibly high capacity factors and efficiencies going forward.

On the FDRs and the other issues, I'll let Joe cover it.

<A - Joseph Nigro>: Yes. So, Greg, I think first thing is, as Chris mentioned, the generation issues drove some of the underperformance at ExGen. In addition to that, when you looked at power prices in Texas at the end of June and where they realized for the quarter, there was an impact with the difference there. As you know, the spot market prices were lower than when we walked into the quarter.

On the transmission side, the costs were associated with Order 494 at FERC and that had a negative impact. So, from our lens, when you talk about the Generation performance, both at Mystic and at ERCOT those are one-time occurrences similarly on the transmission side. The favorability was driven on the realized nuclear decommissioning trust gains. So I think when you look at it from our lens, you see these one-time items that are driving the lower results.

<Q - Greg Gordon>: Great. Thanks. And follow-up on ExGen and then one more if you'll hear me. Looking at the cost cuts, it's really quite an impressive, incremental change. You've got the costs declining from $4.265 billion to $4.175 billion in 2020 and a little bit more in 2021; $450 million savings, but that gross margins declined by $700 million. And so skeptical investors look at this and say, well, you guys are doing yeoman's job here right-sizing the cost structure but earnings aren't getting better. I would argue that cost cuts are permanent and these backward dated power prices are hopefully temporary. But can you give us some confidence that there's positive operating leverage here as we move through time and that these lower commodity prices and capacity prices are not structural?

<A - Christopher M. Crane>: We've talked about this before that we've lacked liquidity in the out-years. It's a softer market. Our fundamentals still tell us that this backward dated curve is not what we'll see as the prompt years come in, and so we're managing the book in that manner maintaining as much margin open and using cross commodity hedges to be able to manage that. It's – we will constantly look at driving efficiencies. You can't have a company and operate with any aspect or entity within the company being inefficient. So, driving efficiencies has multiple benefits, but one of them is a reduction in expense. And we'll continue to focus on that as we serve the customer. As far as the market issues, Jim or Joe, do you want to cover any more on that?

<A - James McHugh>: Yeah. I think the only thing I would add about the backwardation of the curve is with the next couple of years starting 2025 and 2024 due to lack of liquidity, we're seeing net retirements of newbuilds over the next year between 2020 and 2023 that would lead us to believe that backwardation won't really subside. We've seen stock prices and I have even in some of the lowest delivered fuel price years cleared north of $26, $27. So, the backwardation to your point is, it seems temporal, Greg.

<Q - Greg Gordon>: Okay. And the final question is given that the balance sheet is so strong and that the rating agencies are finally coming around to considering higher credit ratings, how much balance sheet capacity does that create and/or does it give you more latitude to have a more aggressive risk management policy and take hedge less and take more of your power into the spot and therefore try to get those better prices?

<A - Joseph Nigro>: Greg, it's Joe. The short answer is with that balance sheet capacity, we can be more aggressive. And as I mentioned in my remarks when you look at how far behind we are with our ratable plan and when you overlay the fact that we're using gas as a proxy for power, we are carrying a very long opening power position in 2019 and 2020, and then we're able to do that given the strength of the balance sheet that we have. We continue to challenge ourselves in this regard as well.

And as Jim mentioned on our use of power, we're going to continue to be constructive in the way we manage the portfolio relative to what we think fair value is in the out-years and that leverage on the balance sheet allows us to do that.

final
Bloomberg Transcript

<Q - Greg Gordon>: Thank you, guys.

<A - Christopher M. Crane>: Thanks, Greg.

Operator

Thank you, Greg. Your next question comes from the line of Julien Dumoulin-Smith from Bank of America. Julien, your line is now open.

<Q - Julien Dumoulin-Smith>: Hey, good morning, everyone.

<A - Christopher M. Crane>: Good morning. How are you doing?

<Q - Julien Dumoulin-Smith>: Good, excellent. So I wanted to follow a little bit up on the Utility activities, obviously good progress with PHI yet again but I wanted to elaborate a little bit further on this. Obviously, the cost reductions of say $50-ish million accrued in the Utilities, how does that play out in terms of again increasing your ROE, right? I gathered the bulk of that would be moving back to customers over time, although clearly you're under earning relative to authorized level still.

And then in tandem with that question, if you could elaborate a little bit more on the sort of initial Utility CapEx planning, certainly there's a growing discussion of legislation in Illinois as well as a litany of other smaller programs. I think you've already alluded to a little bit elsewhere across your Utilities system?

<A - Christopher M. Crane>: Yeah, I'll let Anne take that.

<A - Anne R. Pramaggiore>: Sure. Good morning, Julien. Yeah, so a couple responses to your questions. As we think about moving forward, obviously we're going to blend $50 million into the LRP over time. It's not sitting there right now, but we'll look at that as we do the next LRP iteration. And certainly our focus on O&M is to be flat to declining at the Utilities and that, that's the goal as we move forward to manage that side of the equation.

As we think about what we're doing on ROEs and sort of developing that at the PHI utilities and the other utilities, you know the first thing we're doing is looking at how – we were filing annually, how do we reduce lag? One of the ways is we file annually. We've got a stay out provision at DPL until 2020. But with the rest of the utilities, we'll be filing annually. We're looking at other mechanisms to reduce lag riders. We've got the STRIDE rider in Maryland, the DISC rider in Delaware and the IIT rider in New Jersey that we're looking to place about $358 million of capital investment in right now. Interim rates at New Jersey is helping us close that lag gap and we're looking at multiyear rate plan in DC. We've been invited to make that filing and we'll be doing that shortly. So just got an [ph] alt-reg (35:25) provision at PECO authority for the Commission to look at that, so that's something we'll be looking at going forward.

So those are all the ways we're looking to close in on that ROE number. Obviously, looking at – lags are biggest sort of earned to allowed GAAP but also looking at other disallowances too, but really trying to take enough on the lag. So that's how we're thinking about on the ROE going forward.

On the capital side, the question that you asked, we've got – we look at $5 billion a year, a little bit plus north of that going forward for the foreseeable future.

We have continuing modernization work at the Utilities. PECO 4 to 12 kV conversions were closer work. At ComEd, we've got the FEJA voltage optimization work that's about $500 million right there. BGE's got big [ph] bath (36:19) investment, and PHI's got a lot of material condition work – manhole refurbishments, substation rebuilds, that sort of thing.

We've got $1.5 billion in our gas program over the next LRP period. We've got close to $1 billion in security programs across the utilities over the LRP, so there's a lot of work to do. We always, always bookend it with questions of affordability and that's why we stay tight on O&M. And we look at energy efficiency programs to give customers the ability to reduce usage and manage those more tightly. So we're always looking at the affordability side of it and our

final

Utilities fit pretty nicely when you look at the national average on percentage of income or percentage of proportion of build to income. We're pretty good. We're below the national average on four and we're right at the national average on the other two builds.

<Q - Julien Dumoulin-Smith>: Got it. Quick clarification as a follow-up here on PJM. I appreciate your comments at the outset. Just timing-related, how do you see this going down with respect to (a) getting an approval out of FERC, but then (b) actually implementing a MOPR just real quickly if you can?

<A - Kathleen L. Barrón>: Hi Julien, it's Kathleen. I can take that question. As you know, reply comments are going into FERC on November 6 with the expectation that the Commission would address the paper hearing sometime in the January timeframe. I think the Commission is well aware that the market is looking for guidance, as Chris said, on what the rules are going to be going forward and importantly the states need to know what changes that they need to make to their clean energy policies to accommodate the new rules coming out of FERC.

So we will look to them to provide that guidance in the January timeframe. As you know, they have delayed the auction until August to give states some time to react, not just – your question was specific to MOPR, but important for us is the ability of states to carve out the assets they wish to support and to procure them directly through a state-led procurement, that is going to be an important change that we're looking for FERC to make in the next order based on the record in front of them, they have an overwhelming amount of support from all supporters of the stakeholder community and the states; to put that change into the tariff and to give states that option going forward to continue to support the clean generation that will help them achieve their carbon reduction goals.

<Q - Julien Dumoulin-Smith>: So you don't see an issue with respect to getting clarity out of the state in time?

<A - Kathleen L. Barrón>: Obviously, the states have different structures that they'll need to examine and some may be able to use existing structure, some may need to adopt new structures, including through legislation. So there will be a – in the states where there is a need for legislation, a premium on moving quickly. Now that being said, I think it's also incumbent on FERC to take that into account and to make that states have adequate time before the rules change into the tariff.

<Q - Julien Dumoulin-Smith>: Great. Thank you.

Operator

Thank you, Julien. Your next question comes from the line of Steve Fleishman from Wolfe Research. Steve, your line is now open.

<Q - Steve Fleishman>: Thank you. I will actually just ask one question. The PJM from a standpoint of – not obviously you have different stakeholders involved here – your states' customers, investors, et cetera. Just from an investor standpoint and not everyone else, do you see the changes as proposed or as you would like to see them being kind of good for shareholders, neutral, how should we think of it just from an investor standpoint?

<A - Christopher M. Crane>: No, we definitely see this as a positive to create clarity and a more rewarding market going forward. We've lacked the clarity, we've isolated at times on programs. I think this is where we'll be able to create clarity, capital allotment; allocation will be much clearer on where we'll be putting capital, what units will be operating, and what units won't be operating. So, but we see this as definitely a benefit to the markets which will be a benefit to the consumer, which will be a benefit to the shareholder.

<Q - Steve Fleishman>: Okay. Thank you.

Operator

Thank you, Steve. Your next question comes from the line of Michael Weinstein from Credit Suisse. Michael, your line is now open.

<Q - Michael Weinstein>: Hi guys. Thanks for taking my questions.

<A - Christopher M. Crane>: Hi, Michael.

<Q - Michael Weinstein>: Hey, two quick questions. The first one is do you think that the uncertainty surrounding FERC and surrounding new rules for capacity and energy. Given all this uncertainty is delaying newbuild or a new start construction plans, if this is going to have an effect on tightening the markets going over the next year or two?

And my second question, I'll just ask it right now is the Public Service Enterprise Group just announced that they're pulling out of the retail business. Is this a potential opportunity for Constellation?

<A - Christopher M. Crane>: First question, newbuilds are driven based off of market needs and economics, and unless we get the economics to support new asset entry, you are going to see what we've seen in the last couple of years, the decline. Then we have to see what comes out of the resiliency review on how the market values different sources of firm-fixed fuel. So, there'll be an evolution before we'll see a real opening or a market response to the demand need for assets or investments to be made to come in. It's basic economics right now. The market is barely supporting the assets that are operating today, so why would you invest into new assets when you are not going to get a recovery or return on your capital.

<A - James McHugh>: Yeah, I can – Hi, Michael, it's Jim McHugh, and I can speak to the retail question. I think with announcement of folks leaving or coming into the retail market, we're always on top of that and looking for opportunities to look for value and acquire books of business.

In this case, I think PSEG has noted that they're going to supply their contracts as they roll off. We'll obviously be there to serve customers as the number one C&I customer and the number two resi customer in the country to look for the business as they roll on. I think, for us, we have that scale. We have developed that scale over the years through acquisitions in organic growth and our platform is very capable of acquiring new customers and retaining existing customers pretty easily. We've been having a lot of success also just finding new products and solutions for customers, in both the residential space and C&I space so we'll keep taking advantage of those opportunities that are in front of us.

<Q - Michael Weinstein>: Great. Thank you very much.

Operator

Thank you Michael. Your next question comes from the line as Jonathan Arnold from Deutsche Bank. Jonathan, your line is now open.

<Q - Jonathan Philip Arnold>: Good morning, guys.

<A - Christopher M. Crane>: Hi, Jon.

<Q - Jonathan Philip Arnold>: Just to pick up on the discussion around the state's legislation and potentially not leading legislation. Kathleen, I heard your comments that there could be different answers depending on which state you're talking about. But is it fair to say, the way you said today that you think Illinois would have to legislate, and then I'm curious what you think about the state of play in New Jersey?

<A - Kathleen L. Barrón>: No, you're correct, Jonathan. I agree with your assessment in Illinois, there will be a need for legislation to adjust those change in rules. And I think a positive, for us, is that we are seeing not just here but across the country a growing sentiment among environmental groups and policymakers that the fastest and cheapest path to decarbonizing is a policy that uses all zero-carbon resources. And so to the extent states want to act to increase their clean energy ambition, we would expect that all assets, including ours would be able to participate in that type of policy as FERC allowing the states to go ahead and procure clean capacity, directly allows them to do so in a way that's going to be able to keep costs down per customers and achieve the clean energy goals at the same time.

So we would look to that kind of structure to the extent the FERC puts this carve out in the tariff in Illinois and in New Jersey given the way that the state law is written there and the authority at the BPU level to do the capacity procurement through the existing BGS structure, there would not be a need for incremental legislation to allow that state's procurement effects to flow through the BGS. So that's why I said I think the answer is different depending on which jurisdiction you're in.

<Q - Jonathan Philip Arnold>: Okay. Great. I was just wanting to see if you could provide that on the individual states, so thank you.

Could I just ask one quick follow-up on the cost savings, you've obviously laid out how you expect them to be timed the Q3 2018 cost reductions. Can you remind us how much of the $250 million you've announced last year was flowing into ExGen and maybe what the sort of sequencing is there in terms of how those ramp up as we're trying to unravel the numbers on, I guess, it's slide 15.

<A - Christopher M. Crane>: Yeah that is in the numbers. I think we're looking for the page now. Joe's got it.

<A - Joseph Nigro>: The $250 million last year, all of it is flowing into ExGen. The reductions were taken at ExGen across the platform nuclear, Constellation in our...

<Q - Jonathan Philip Arnold>: And the timing Joe, is it kind of across the period into 2020 or is most of it is kind of already there in...

<A - Christopher M. Crane>: 2019, you'll get to run rate year.

<Q - Jonathan Philip Arnold>: Okay. All right. Thanks for that.

Operator

Thank you, Jonathan. That concludes the question-and-answer session of today's webcast. I'll hand the call over back to Mr. Chris Crane, CEO of Exelon Corporation.

Christopher M. Crane

Thanks, again, everybody for joining and thanks for the questions. Hopefully, we've covered everything. Any other concerns, please get a hold of IR or myself and we'd be glad to continue to discuss them but thanks to the team – all the 34,000-plus employees at Exelon for delivering another strong quarter and talk to you soon. Thanks. Bye

Operator

Thank you. And that concludes today's webcast. Thank you all for participating. You may now disconnect.

MANAGEMENT DISCUSSION SECTION

Daniel L. Eggers

GAAP and Non-GAAP Financial Measures

Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures

Please refer to the information contained in the Appendix of our presentation and our earnings release for reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures

Christopher M. Crane

Business Highlights

Opening Remarks

- We understand it's a busy earnings release period
- So thanks for being with us
- Starting on slide 5, we're pleased to deliver another great quarter
- We achieved strong financial results while continuing to enhance our operational performance and make meaningful gains at our utilities on both the regulatory side and the legislative fronts
- Taken together these advances will support our continued strategy to invest in infrastructure, in technology at our utilities delivering better service for our customers

Bloomberg Transcript

GAAP and Non-GAAP Basis

- For the quarter, on a GAAP basis, we earned $0.56 per share vs. $0.10 last year
- On a non-GAAP basis, we earned $0.71 per share vs. $0.56 last year, which is above the midpoint of our $0.55 to $0.65 per share in the guidance range and puts us in a strong footing for the year

Investments

- Turning to slide 6, at the utilities, we continue to execute at top quartile levels across key customer satisfaction and operating metrics
- The investments we are making are paying off in improving reliability, strong customer satisfaction, which in turn strengthens our relationships with our regulators
- All of our utilities are achieving top decile performance in KD, which measures the average speed, which we are able to restore power when outages occur
- We are also delivering leading performance across the utilities on customer service metrics as we share best practices and give customers more tools to connect with the utilities when they need service
- Safety still remains our highest priority and the targeted programs implemented last quarter are driving improved results

ExGen

- At ExGen, nuclear generation output was 39 terawatt hours with a capacity factor of 93.2%
- We had 41 fewer outage days compared to last year
- Our gas and hydro fleet continue to perform very well with economic dispatch match rate of 97.8%

Tax Savings

- Turning to slide 7, I'm happy to report that the tax savings from our FERC regulated transmission assets will benefit our customers by an additional $175mm, adding these benefits to the $500mm of savings from our distribution operations that we discussed on last call
- Our 10mm utility customers will realize over $675,000 of an annual benefit from tax reform
- We're pleased that our constructive relationships with our state regulators in FERC allow us to pass these benefits back to our customers in a very timely fashion

Delaware and Pennsylvania

- Flipping over to slide 8, in June, Delaware and Pennsylvania both passed important legislation that reflect our utility priorities in the present and for the future supporting infrastructure investment and positioning for the utility of the future, respectively
- In Delaware, state regulators passed the Distribution System Investment Charge
  - This will support needed infrastructure investment to enhance the system improve service to our customers
- It will provide a mechanism for a more consistent and gradual rate increase for our customers, while also allowing for a more timely recovery on our infrastructure investments

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01421

- Delmarva Power, Delaware plans to make its first filing in Q4 with new rates effective by Q1 2019

Capital

- In Pennsylvania, Governor Wolf signed legislation authorizing the Pennsylvania Public Utility Commission to review and approve alternate rate mechanisms that will better position PECO to make investments in the utility of the future
- The forward-looking regulatory design options in the legislation include a decoupling mechanism, formula rates, multi-year rate plans and performance-based rates
- Both of these laws will help to ensure that our utilities can deploy much needed capital to support reliability and performance of the grid for our customers, while also decreasing the frequency of traditional rate cases

Stakeholders

- I want to especially thank the broad group of stakeholders in both Delaware and Pennsylvania for the support of these laws
- We look forward to finding common ground across all our jurisdictions, as we focus on improving customer service and investing in the utility of the future

ZEC Program

- Slide 9, turning to the ZEC programs, in both Illinois and New York, we are awaiting final decision from the Federal Appeals Court
- We are pleased with the Solicitor General's brief filed in the Illinois case in the Seventh Circuit, which agreed that the states have the authority to enact the ZEC programs
  - We remain confident in our legal position in both the cases, and continue to collect the ZEC revenues as they are being adjudicated

FERC

- In New Jersey, following Governor Murphy's signature, the Board of Public Utilities is beginning to implement the ZEC program there, which we expect to take effect around the end of Q1 2019
- On the Federal Energy policy front, FERC issued an order on PJM two capacity market mitigation proposals
- The order rejected the two-stage capacity re-pricing of multiple RECs proposal submitted by PJM and it also determined that the existing tariff is unjust and unreasonable
  - Instead FERC established a new proceeding to introduce a two part proposal
- The first proposal is to expand the current MOPR to ensure that most if not all plants that receive out-of-market payments will be subject to a minimum offer requirement

FRR

- The second proposal, however, would allow the plants receiving out-of-market payments to avoid the MOPR and instead be withdrawn from the market along with the commensurate amount of load
- This asset specific FRR can be implemented by the states to align with the state's environmental policies

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01422

- FERC has set a schedule to allowing 60 days for comments, 30 days for replies, and a goal of reaching the final decision by January 4

MOPR

- We disagree that the MOPR is necessary
- We are encouraged that FERC has now said that all assets receiving out-of-market payments should be treated the same
- The implementation details will matter but we believe that the partial FRR design could allow states to advance their energy policy goals, which we think is critical to ensure the needed reduction in carbon emissions

PJMs

- With respect to PJMs work on price formation, we continue to look forward for a decision from FERC on the fast start by September and PJM has committed to implement the rule changes in a timely fashion after the FERC order, including reengaging stakeholders on a full integral relaxation
- PJM continues to work through reforms to which storage pricing rules included those related to reserves in the operating reserves demand curve pursuant to the deadlines it had set for those rule changes

Resiliency

- Finally on resiliency, PJM has taken the input and the assumptions and the scenarios that it needs to model in order to assess fuel security of its generation fleet
- This will allow PJM to move forward on evaluating potential changes to market design to ensure that it is properly valuing the fuel security, while it awaits further direction from FERC in the open resilience docket
- We see all these changes as essential to preserve the effective competitive market in PJM and we applaud the ongoing efforts to design and implement these changes

Joseph Nigro

Financial Highlights

Non-GAAP Operating Earnings and Dividend

- Turning to slide 10, we had a strong quarter financially, delivering adjusted non-GAAP operating earnings of $0.71 per share which is above the $0.56 per share we earned in Q2 2017 as well as our guidance range of $0.55 to $0.65 per share
- Exelon's utilities less Holding Company expenses delivered a combined $0.37 per share
- Compared to our plan, the utility results were better on higher distribution revenue from the approval of the Pepco Maryland settlement, a transmission revenue true-up at BG&E and favorable weather impacts at PECO.

Market Conditions

- Generation earned $0.34 per share in Q2, which was also better than planned

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01423

- Upside came from realized gains from our nuclear decommissioning trust
- Our nuclear plants had another strong quarter with fewer outage days compared to both last year and what was budgeted for this year
- And we benefited from favorable market conditions including FTR settlements in PJM
  - These were partially offset by higher allocated transmission costs

Operating Earnings

- We are reaffirming our full year guidance range of $2.90 to $3.20 per share, which you can see on slide 19
- We expect to deliver operating earnings of $0.80 to $0.90 per share in Q3 compared with $0.85 last year

Utility Earnings

- Turning to slide 11, the $0.71 per share in Q2 this year was $0.15 per share higher than Q2 2017
- Our utility earnings were collectively up $0.04 per share compared to last year, driven primarily by higher rate base and mill rates associated with completed rate cases
- Generation earnings were up $0.12 per share compared with last year benefiting from fewer planned and unplanned nuclear outage days, contributions from the Illinois ZEC program and higher realized nuclear decommissioning trust gains partially offset by lower power price realizations

PHI

- Moving to slide 12, our utilities continued to execute financially as we look at our trailing 12-month earned ROEs
- Starting with PHI, we made modest gains at each utility as we continue to deliver improved operational and financial performance since the merger
- Pepco's higher earnings reflect the distribution rate cases from last fall and the recent Pepco Maryland settlement that took effect on June 1, 2018
- Looking to next quarter, Pepco's earned returns should benefit from a full quarter of the Maryland settlement reached in April and a partial quarter benefit from the pending DC settlement

Delaware

- Delmarva's earned ROEs now include the benefits of interim rates in Delaware that took effect in March 2018, and at Atlantic City Electric we saw higher earnings from the ACE settlement effective October 2017, which was largely offset with higher O&M and depreciation expense
- We expect to see ROE improvement with full flow through of the October 2017 settlement

PHI Utilities

- For all of the PHI utilities, trailing 12 month ROEs in Q4 should show additional uplift as the FAS 109 changes from Q4 2017 drop out of the calculation

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01424

- For the legacy Exelon utilities, our earned ROEs remained over 10%, lifting the consolidated utilities platform to nearly 9.5% including PHI.
- We are happy with our overall utility performance but still see room for improvement at PHI as the better operating performance translates into higher earned returns
- And as we have said before, we are confident in our ability to deliver on our plan and still expect earned ROEs in 2019 to be in the 9% to 10% range across the utilities

Regulatory Front

- Turing to slide 13, we remain busy on the regulatory front
- On the last call, we discussed settlement arrangements in April at both Pepco DC and Pepco Maryland, providing revenue decreases of $24.1mm and $15mm respectively after reflecting tax savings benefits for customers
- On May 31, the Maryland PSC approved the settlement for Pepco Maryland with rates effective on June 1

Pepco DC

- For Pepco DC, the Commission is expected to approve the settlement in Q3 with rates effective shortly thereafter
- We are also able to reach a settlement in our Delmarva, Delaware electric distribution case on June 27, 2018 making it the second consecutive electric case we have settled in recent history
- The case will provide $7mm revenue reduction inclusive of tax benefits
  - We expect a final order in Q3
- As Chris noted earlier, Delmarva Power, Delaware expects to make its first filing under the Distribution System Investment Charge tracker in Q4 2018, with the new charge appearing on customer bills by Q1 2019

STRIDE

- We also have a number of rate cases still in play
- On June 8th, BG&E filed for $63mm increase to its gas revenues and $22mm STRIDE surcharge reset with an order expected in January 2019
- BGE's continued investments in STRIDE and gas systems safety and reliability programs are driving the need for this requested increase
- In Delaware, we have an outstanding gas distribution rate case at Delmarva that is scheduled for completion in Q4
- In Pennsylvania, PECO filed for an electric distribution base rate case in March for the first time in three years
- We expect to receive an order in H2 this year
- Finally, on April 16th, we filed for rate updates at ComEd as part of the standard annual formula process
  - We expect to receive an order in Q4

Strategy

- We appreciate the hard work of our utilities and regulatory teams

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01425

- Our investment is focused on improving system reliability and the customer experience are having positive benefits in the communities we serve
- By delivering on a regulatory strategy, we're able to make these investments, while also earning a fair and timely return on the capital being deployed
- More details on the rate cases and their schedules can be found on slides 27 through 33 in the Appendix

Capital Investment

- Turning to slide 14 and continuing on the topic of capital investment at our utilities, we invested $1.3B of capital at the utilities during Q2 and are at $2.6B YTD
- We remain on track to meet our $5.5B capital budget for 2018

PECO's Gas Main and Service Replacement Program

- Today, I would like to highlight two additional projects that are part of our overall budget and offer real benefits to our customers and communities
- The first is PECO's gas main and service replacement program
- The project will replace nearly 1,800 miles of gas mains and service lines of which 520 miles has already been completed
- We continue to work with the state to accelerate the implementations having shortened the replacement cycle at the start of the program from 30 years to 20 years, today
  - These efforts will reduce risk on the distribution system by replacing aged materials, which we believe is good for our customers

TPA

- The second project relates to BGE's investments in Trade Point Atlantic or TPA
- Over the next five years BGE will invest $150mm in transmission and distribution infrastructure including construction of a 93 megawatt substation
- These investments will support the new 3,100 acre commercial industrial TPA development in Baltimore County, which is projected to generate 17,000 permanent jobs, plus an additional 21,000 during construction
  - This project is another example of our efforts to continuously work with our states to identify and support development efforts that drive economic growth in our service territories

ExGen

- Turning to slide 15, it provides our gross margin update for ExGen
- This quarter we have included the New Jersey ZEC revenue in our 2019 and 2020 disclosures for the first time
- Relative to our last update, we saw some movement within the buckets
- Our total gross margin in each year is unchanged from our last update with the exception of an additional $50mm in both 2019 and 2020 associated with the New Jersey ZEC revenue

final
Bloomberg Transcript
Bloomberg

- For 2018, open gross margin was up $100mm primarily due to higher NI Hub and PJM West Hub prices, offset by weakening ERCOT spark spreads and our hedges
- We had a strong quarter in new business execution creating $200mm of Power New Business in our retail and wholesale channels as we capitalized on ERCOT volatility

Gross Margin

- In 2019 and 2020, total gross margins are up $50mm in each year with the New Jersey ZEC revenue, which shows up in the capacity and ZEC line
- Open gross margin is up $100mm in 2019 due to higher prices in New York Zone A and PJM West Hub
- Open gross margin is flat in 2020
  - We also executed $50mm of Power New Business in 2019 and 2020

Hedging Program

- We ended the quarter basically in line with our ratable hedging program in 2018 and 10% to 13% behind ratable in 2019 and 6% to 9% behind ratable in 2020 when considering cross commodity hedges where we have increased our concentration
- We remain comfortable being more open when we look at the market fundamentals compared to forward prices particularly at NI Hub

Balance Sheet

- Turning to slide 16, we remain committed to maintaining a strong balance sheet and our efforts on this front have been noticed with Fitch placing Exelon, PECO, and BG&E all on positive outlook in June
- Our consolidated corporate credit metrics remain above our target ranges and meaningfully above S&P thresholds
- We are forecasting ExGen's leverage to be 2.6 times debt-to-EBITDA at year-end 2018, which is below our long-term target of 3.0 times

Debt Basis

- On a recourse debt basis, we are at 2.1 times, which is well below our target
- We will continue to manage our balance sheet at ExGen over time to the 3.0 debt-to-EBITDA level
  - So look for us to focus on debt reduction at both HoldCo and GenCo

Christopher M. Crane

Q2 Highlights

Rate Base Growth and EPS

- Turning to slide 17, again, we had a strong financial quarter and operationally that is a testament to the hard work and dedication of our employees

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01427

- Our financial footing and sounding continues to gain momentum
- Here again, I'll restate our proposition value
- We continue to focus on growing our utilities targeting 7.4% rate base growth and 6% to 8% EPS growth through 2021
- We continue to use free cash from the GenCo to fund incremental equity needs at the utilities, pay down debt over the next four years at ExGen and the HoldCo and fund part of the faster dividend growth
- We continue to focus on optimizing value for the ExGen business by seeking fair compensation for our carbon free generation fleet, supporting proper price formation in PJM and resiliency initiatives at FERC and working to develop capacity market reforms at PJM pursuant to the recent FRR order

Debt Reduction Plan

- We continue to close uneconomic plants and sell assets where it makes sense to accelerate our debt reduction plans and maximize value through the gentle load matching
- We continue to sustain strong investment-grade credit metrics, as Joe pointed out, in our growth driven consistently at 5% through 2020

QUESTION AND ANSWER SECTION

<Q - Ali Agha>: The first question on the PHI utilities, what's the aspiration there? I mean, are those utilities and the way the system is set up, are they set up that they can ultimately earn their authorized ROE or will there be a permanent lag in the system and when do you think you will be at the maximum in terms of your earned vs. allowed ROE [indiscernible] (24:22)?

<A - Christopher M. Crane>: So there is a lag component at a couple of the PHI utilities now that we're working on. We've talked about ACE. We think we have the right legislative package to help that reduce that in Delaware and we're also working on different proceedings at Pepco Maryland and Pepco DC. We project it to be within the 9.5% range by the end of 2019. We're on track to do that. We have the developed activities that are helping. We also have the efficiency programs we're putting in place. So, I think we're well on plan. We recognize the legacy issues that were happening around that and are having constructive dialogue with our legislators as we've done in Delaware, our regulators, as we're doing with the filing in New Jersey and we'll continue to focus on that.

<Q - Ali Agha>: Okay. And then Chris to the extent that Forex proposal for PJM and the FRR aspect of it does become law and moves forward. How do you look at that relative to your portfolio and what that means for Exelon?

<A - Christopher M. Crane>: Well, you can imagine. I'm going to let Kathleen Barrón cover that. But, as you can imagine, there's a lot of evaluation that we have to do right now to really choose the path that benefits our customers and our fleets. So, Kathleen?

<A - Kathleen L. Barrón>: Yeah. Thanks for the question, Ali. I think what we're facing here is markets that because they're not pricing pollution are making emitting resources look less expensive and they're pushing out clean resources, including ours, as you know, 10.6 gigawatts of uncleared nuclear in the last auction.

I think what FERC is saying in this order is that rather than letting RPM continue to push those units out, they're giving safety opportunity to pull them in and instead of paying PJM to support units that perhaps they don't want to support they can directly pay those assets. And so, as Chris said in the opening of the call, implementation details certainly matter. But we think this is an extremely constructive approach to allowing states to choose the resources, the clean resources that they need to continue to keep running to achieve the our goals of reducing carbon and air pollution for their citizens.

<Q - Ali Agha>: Okay. And last question with regards to the pending litigation in New York and Illinois, any marker we should be keeping an eye on to give us some framework of when the decision might come from either of those states?

<A - Kathleen L. Barrón>: Unfortunately, we have no way to know exactly when those orders will issue but the cases have been fully briefed and we expect them to issue any time. There is nothing that we know that's holding them up.

<Q - Greg Gordon>: Joe, just a question for you with regard to the quarter. I mean, obviously the numbers were quite robust, but there was $0.05 of positive earnings from NDT. I mean that's not necessarily – I know that that moves around every quarter, but I wouldn't consider that necessarily the highest quality earnings. But even if you exclude that, you were still ahead of your prior guidance range. So can you just walk us through what you think sort of a clean basis and was that still in excess of your expectations?

<A - Joseph Nigro>: Yeah. If you subtract the $0.05 for NDT, Greg, what I would say is, when you look at it overall, the midpoint of our range was $0.60. We obviously earned $0.71 on an operating basis. A little more than 50% of that was coming from the utilities. And as I mentioned in my prepared remarks, it is driven by three things: the transmission settlement at BG&E, the yearly implementation of the rate settlement at Pepco Maryland, and as well as stable weather at PECO were the big drivers there. And then the balance was GenCo and NDT was a big piece of that but we also had favorable market conditions related to the FDR option during the quarter. Our Generation performance was stellar, and then it was offset by some transmission costs. So you could see even subtracting out the NDTs, the performance was very strong across the operating businesses.

<Q - Greg Gordon>: Right. And I heard you indicate that you're – and show that you're running well below your debt to EBITDA target and thus you can address that by using your cash to – in addition to funding rate-based growth, dividend, not just think just think about paying down ExGen debt, but also working down parent debt. But there's a bigger issue here, which is that you know the FFO to debt targets that the rating agencies are holding you to seem excessively high relative to the declining risk profile of the company. What has to happen to evolve the conversation with the rating agencies to get a lower threshold? And is it really dependent on getting more certainty on capacity and energy market reforms at this point since you've shown demonstrably that you're one of the best operators on the utility side of the house in the country?

<A - Christopher M. Crane>: Yes. So Greg, we have been and will continue to have dialogue with all the rating agencies. You heard Joe's conversation on Fitch. We've had a good dialogue with S&P. They understand our strategy, they're wanting to see it consistently implemented. They recognize that it is being consistently implemented. I think you know a couple of milestones coming through with the final approval from the Appellate Court on the ZECs, making that revenue look much more like regulated revenue, continuing to follow our path on debt reduction, which part of that is building balance sheet space, de-risking, but also part of it is liability matching with the nuclear assets and their life into the 30s and 40s. So we just have to continue to execute on our plan. We're having very positive dialogue. We appreciate the Fitch positive. We look forward to hearing from the others and hopefully shortly that they're seeing it and we'll be able to talk about not only moving thresholds, but potentially a more positive rating.

<Q - Greg Gordon>: Okay. My last question you may have already demonstrably answered previously, but if in fact, you're given – you and the states are given the option of pursuing an FRR type structure for plants that are deemed to be important in those regions. Does the legislation that you currently have in Illinois and New Jersey for instance create the flexibility to do that or would you need to go back to your legislators and engage them in a restructuring of that legislation to give them the flexibility they would need to bring those assets out of the capacity market and properly compensate them?

<A - Kathleen L. Barrón>: Hey, Greg. It's Kathleen. We're currently looking at existing legislative authority in all of our states. And so I think it's going to depend on the jurisdiction. And it's also going to depend on what FERC's order ultimately says about what authority states will be to exercise in order to take advantage of this option. So I think, it's going to differ depending on the state. But we're currently evaluating the best path forward in each of the states that have clean energy targets that we think this order will help them meet.

<Q - Steve Fleishman>: Just I guess, you know it's hard to kind of interpret a lot of these FERC proposals in different directions. You also had the Mystic decision. And so, maybe you can just give a broader perspective of what they're trying to achieve here and just what could change vs. this initial proposal before we hear kind of I guess a final structure by early next year?

<A - Christopher M. Crane>: Yeah. So the fight – the disagreement within the stakeholders is around the supplemental income that is being received for the social benefit of carbon reduction within our states. We lack a federal policy as you know on carbon, although the conversation continues and that would be the ultimate fix. That would really level the playing field and allow the states to [ph] skip (34:15) support of federal policy. Short of that, the states have deemed – the majority of states that we operate in that they want to preserve the low carbon output that they have.

They understand that 60% of the power in the State of Illinois is carbon-free, 90% of that is nuclear. We start shutting down nuclear plants like you look at the FE announcement, every penny that's been spent in PJM and outside of PJM on REX to achieve a lower carbon output would be wiped out. It's like we threw the money away. So you've got a very passionate belief within some of our states that they want to keep these assets. PJM has been unable under the current tariffs to be able to separate and support at this point the environmental needs of their stakeholders. So what this allows from FERC is a positive move to say if the administration and the legislation in New Jersey wants to preserve a low carbon future for its state and for its citizens. It allows Illinois to do the same thing. If New York wanted to look at something, it could do something for New York. So I think, this is finally setting the final decision on how we manage these assets that may be out of the capacity revenue stream, not clearing, but the state wants to keep them. We had Secretary Perry at the FitzPatrick Plant yesterday with Congressman Katko and it was very positive. I mean we are gaining momentum, but not only in his opening comments, in the press conference and with our tour in discussion with local officials, is he concerned about the economic benefits of the plant. He's concerned about the reliability and the resiliency on the fuel diversity and he's also commented on their capabilities for low carbon.

So you've seen us go back and forth between ZECs and between other programs to try to save. We've seen the arguments from other stakeholders against it and I think this gives us a path to finally put it to bed.

<Q - Steve Fleishman>: Okay. That's helpful. And just one other question on it, if you were to get into kind of an FRR structure like, do you have any sense on like how long that would be i.e., you know if that's kind of a form of reregulation of the plant, is that for good, is that for you know a set amount of time like the ZECs are?

<A - Kathleen L. Barrón>: Yeah. Steve, I'll jump in on that, that's certainly one of the implementation details that will be worked out through the FERC docket, but it's important to know we're not talking about [ph] reload (37:27) regulation, we're talking about an alternative way to pay the units for capacity, and let the states choose which units they'd like to pay for capacity as opposed to letting RPM select the assets. So it's a step towards the future that Chris identified, that we anticipate will be short-term. The current FRR structure as you know allows units or zones to step out of RPM for a five year period with the option to come back in. And ultimately if we get this to the longer term carbon solution that Chris identified, then these decisions will be made by the market through a carbon price and that will be a longer term structure that will benefit our customers.

<Q - Julien Dumoulin-Smith>: Just to clarify the last question actually if we can start there. I just want to make sure I'm hearing this correctly. Is your expectation that states would actually move through the motions to file for this FRR or is it rather that your expectation that status quo would maintain itself with respect to just continue to clear assets or attempt to clear assets given wherever your avoided costs might be?

<A - Kathleen L. Barrón>: Julien, it's Kathleen. I think it's the former that we would expect states to be looking very closely at this opportunity, not just because of course of the nuclear [Technical Difficulty] (39:02) the renewable fleet effects, any asset efficiency demand response that's receiving support from customers directly. And so there are a lot of stakeholders who have an interest in making sure that the states are going to be able to do clean capacity procurements and have that capacity recognized by RPM – by PJM rather.

<Q - Julien Dumoulin-Smith>: And you've confidence that you can indeed find a way from a regulatory path to support an FRR implementation including compensation for the units, if that's where it goes in both Illinois and New Jersey, to be clear?

<A - Kathleen L. Barrón>: Yes, sir.

<Q - Julien Dumoulin-Smith>: All right, excellent. Now, let me turn back to the utility side of the equation here where things are booming obviously. Can you comment on the New Jersey side with CapEx? I mean we've talked a lot about New Jersey in the context of the nuclear plants, but obviously the Governor is implementing a lot more than that, maybe energy efficiency filings, offshore wind seems to generate some opportunities at ACE. Just curious how you're thinking about that and what's reflected in the budget as it stands today?

<A - Anne R. Pramaggiore>: Hi, Julien, it's Anne Pramaggiore. How are you?

<Q - Julien Dumoulin-Smith>: Good, thank you.

<A - Anne R. Pramaggiore>: Good morning. On the New Jersey side, obviously with the new legislation, there's a couple of areas that we're looking into, it's subject to – a lot of it's subject to regulatory proceedings that are yet to come. So you would not see what we would be looking at reflected in the budgets or the earnings to-date. But there's an area around energy efficiency, we traditionally have not been involved in energy efficiency programs except for some program funding in the past, and that's one of the things we'll look toward going forward.

So to the extent that there's capital investment in energy efficiency, voltage conservation programs, you could start to see those reflected going forward. We also have opportunity to invest in storage and solar going forward in New Jersey. But again, these are all subject to proceedings, at the commission before we have a sense of exactly what that looks like. But we think there's tremendous opportunity here especially as we think about utility of the future, the kind of businesses that we can be in looking forward, serving customers with the types of programs and products and services that they like. So we think there's a great platform there, but some work to do with the regulatory agency.

<A - Christopher M. Crane>: The only thing I'd add to that is, we have a very high sensitivity to rates on our customers. As you know that that part of the state has gone through a downturn. And so as we make the investments which we can do efficiently, we're going to keep a constant focus on those rates. So we're not impairing the future development of commercial, industrial or residential customers.

<Q - Michael Weinstein>: Hey. Can you talk a little bit about what your expectations are for the summer power market in Texas, given I guess it's gotten off to kind of a mild start? And then also talk about the recent acquisition on the retail side that you guys executed with FES and what the implications are for Constellation from that?

<A - James McHugh>: Okay. Hi, Michael. It's Jim McHugh from Constellation. As far as ERCOT summer, what we've seen is some volatility in the forward markets and the weekly markets going into delivery and even in the day ahead markets, we've seen some pricing that exhibited on the ORDC curve, some higher price spikes. In the real-time market, it hasn't come to fruition. So it's led to a large spread between day ahead and real-time. In real-time, we really saw great operating conditions. The wind performed at or better than forecast. There were minimal generation force outages, so the generators all performed very well, and there were some good demand response availability.

But prior to going into the period, we saw weeks trading as high as $800 or $900 and the month of July and August trading in the $200 range. As far as our portfolio, performed well, we're able to take advantage of some of that market volatility we saw in the forward markets. You saw that we executed $200mm of new business this quarter for 2018 on the power side, a good chunk of that is represented by our activity in Texas and what we're able to do and our gen-to-load strategy proved valuable once again. We were able to serve the high load and the high demand with our peaking fleet and the options that we owned.

Going forward, I think we expect that volatility to continue. You'll have continued demand growth of 1 gigawatt to 1.5 gigawatts a year with really some wind and solar build out and very little thermal gas combined cycle generation build out. So that volatility will continue, next summer is trading right around the $100 right now and we would expect you would see the same exhibited volatility on the forward curve between now and delivery period of next summer.

final

Bloomberg Transcript

For the acquisition of FirstEnergy, it's a great fit for our portfolio. We would be paying $140mm subject to price adjustments based on market moves before the process is over. But there's 900,000 customers on the C&I side and residential side across six states. It'd be a great fit for our gen-to-load and gen-to-customer strategy that we've been deploying. We'd also be buying some certain power in basis hedges as part of the process. So it's a strong complement to our existing portfolio and it would provide repeatable and sustainable customer business through renewals and brand recognition for us.

<Q - Michael Weinstein>: Hey, just a quick follow-up. I think you said that earlier in the call that you're a little closer to ratable in hedging for 2020 I think it was vs. 2019. And I'm just wondering, should I be reading anything into that that you're becoming closer to ratable as you go further out, is that sort of a negative take on the power markets or?

<A - James McHugh>: No, Michael, it's not. It's actually we're just building that position, as we hedged the third year of our three year program, we'll continue to grow that behind ratable position. We're currently about 7% or 8% behind ratable in 2020. We've added some gas hedges and cross-commodity hedges to further expose ourselves to upside in power markets. The concentration of our behind ratable position is largely in NI Hub and ERCOT. So I wouldn't read into that. I think our position is similar and growing to be similar across both those years.

<Q - Praful Mehta>: So just wanted to get a sense for getting back to the capacity auction on the capacity market reform piece. If the states are required to kind of support the asset both from the ZEC payment as well as [indiscernible] (46:33), are there any winners, losers in terms of states, I think would make it more difficult to get done especially in this timeframe. Are there some states who will be more inclined to get this vs. others?

<A - Kathleen L. Barrón>: I can take that one as well. It's certainly going to depend on the state's readiness, how quickly this gets implemented. So I take the question to be one of what kind of transition period might we be looking at, and I think that's going to be a subject of active debate in the paper hearing at FERC, as to whether there needs to be some sort of transition period to allow states to understand what the rules are and take advantage of them. So I think you should look for that to play out as part of the FERC process.

<Q - Praful Mehta>: Got you. Thank you. And then in terms of ERCOT, if the volatility clearly has been high, should we expect that if there are retail players struggling at the back end of extreme volatility that you're looking to expand your retail position or is there any goals that you see to kind of expand your portfolio position in ERCOT at all?

<A - James McHugh>: Hi Praful, it's Jim again. I think we did see going into the summer, one small retailer go out of business with the new collateral posting requirements by ERCOT, which include a look at the forward markets. It might be harder for some of the smaller retail providers to manage their balance sheet if they're undercapitalized through those collateral requirements. For us, I think strategy is the same. We'll look for good value propositions. Our track record with Integrys and Con Ed and what we're looking at now with the FES book will continue to be the same to look for value. As far as the lag effect, you may see the impact of the volatility for the larger players impact maybe in the longer term as the contract tenures and the extended start dates are further out in the curve. So they're currently contracting for load out two or three years forward.

<Q - Praful Mehta>: Got you. Thanks. And just quickly just, I mean, ExGen O&M cost reductions, I noticed their target, I think 75% in 2018, 50% by 2019. Is that all on track right now?

<A - Christopher M. Crane>: It's not only on track, it's Crane, Praful, it's not only on track. We are continuing to work to become more efficient, continue to compete in the markets we're in. We are on track to achieve those if not to exceed those, so we're in good shape.

MANAGEMENT DISCUSSION SECTION

Operator

Good morning and welcome to Exelon 2018 Second Quarter Earnings Call. My name is Nora and I will be facilitating the audio portion of today's interactive broadcast. [Operator Instructions]

This event also features streaming audio which allows you to listen to the show through your PC speakers. And for those of you on the stream, please take note of the option available in your event console.

At this time, I'd like turn the show over to Dan Eggers, Exelon's Senior Vice President of Investor Relations. Please go ahead, sir.

Daniel L. Eggers

Thank you, Nora. Good morning, everyone, and thank you for joining our second quarter 2018 earnings conference call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer; and Joe Nigro, Exelon's Chief Financial Officer. They're joined by other members of Exelon's senior management team who will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, both of which can be found in the Investor Relations section on Exelon's website. The earnings release and other matters which we'll discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material and comments made during this call. Please refer to today's 8-K and Exelon's other SEC filings for discussions of risk factors and factors that may cause results to differ from management's projections, forecast and expectations.

Bloomberg Transcript

Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the Appendix of our presentation and our earnings release for reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures. We scheduled 45 minutes for today's call.

I'll now turn the call over to Chris Crane, Exelon's CEO.

Christopher M. Crane

Thanks, Dan, and good morning, everybody. Thank you for joining us today. We understand it's a busy earnings release period. So thanks for being with us.

Starting on slide 5, we're pleased to deliver another great quarter. We achieved strong financial results while continuing to enhance our operational performance and make meaningful gains at our utilities on both the regulatory side and the legislative fronts. Taken together these advances will support our continued strategy to invest in infrastructure, in technology at our utilities delivering better service for our customers.

For the quarter, on a GAAP basis, we earned $0.56 per share versus $0.10 last year. On a non-GAAP basis, we earned $0.71 per share versus $0.56 last year, which is above the midpoint of our $0.55 to $0.65 per share in the guidance range and puts us in a strong footing for the year.

Turning to slide 6, at the utilities, we continue to execute at top quartile levels across key customer satisfaction and operating metrics. The investments we are making are paying off in improving reliability, strong customer satisfaction, which in turn strengthens our relationships with our regulators. All of our utilities are achieving top decile performance in KD, which measures the average speed, which we are able to restore power when outages occur. We are also delivering leading performance across the utilities on customer service metrics as we share best practices and give customers more tools to connect with the utilities when they need service. Safety still remains our highest priority and the targeted programs implemented last quarter are driving improved results.

At ExGen, nuclear generation output was 39 terawatt hours with a capacity factor of 93.2%. We had 41 fewer outage days compared to last year. Our gas and hydro fleet continue to perform very well with economic dispatch match rate of 97.8%.

Turning to slide 7, I'm happy to report that the tax savings from our FERC regulated transmission assets will benefit our customers by an additional $175 million, adding these benefits to the $500 million of savings from our distribution operations that we discussed on last call. Our 10 million utility customers will realize over $675,000 of an annual benefit from tax reform. We're pleased that our constructive relationships with our state regulators in FERC allow us to pass these benefits back to our customers in a very timely fashion.

Flipping over to slide 8, in June, Delaware and Pennsylvania both passed important legislation that reflect our utility priorities in the present and for the future supporting infrastructure investment and positioning for the utility of the future, respectively. In Delaware, state regulators passed the Distribution System Investment Charge. This will support needed infrastructure investment to enhance the system improve service to our customers. It will provide a mechanism for a more consistent and gradual rate increase for our customers, while also allowing for a more timely recovery on our infrastructure investments. Delmarva Power, Delaware plans to make its first filing in the fourth quarter with new rates effective by the first quarter of 2019.

In Pennsylvania, Governor Wolf signed legislation authorizing the Pennsylvania Public Utility Commission to review and approve alternate rate mechanisms that will better position PECO to make investments in the utility of the future. The forward-looking regulatory design options in the legislation include a decoupling mechanism, formula rates, multi-year rate plans and performance-based rates. Both of these laws will help to ensure that our utilities can deploy much needed capital to support reliability and performance of the grid for our customers, while also decreasing the frequency of traditional rate cases.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01435

I want to especially thank the broad group of stakeholders in both Delaware and Pennsylvania for the support of these laws. We look forward to finding common ground across all our jurisdictions, as we focus on improving customer service and investing in the utility of the future.

Slide 9, turning to the ZEC programs, in both Illinois and New York, we are awaiting final decision from the Federal Appeals Court. We are pleased with the Solicitor General's brief filed in the Illinois case in the Seventh Circuit, which agreed that the states have the authority to enact the ZEC programs. We remain confident in our legal position in both the cases, and continue to collect the ZEC revenues as they are being adjudicated.

In New Jersey, following Governor Murphy's signature, the Board of Public Utilities is beginning to implement the ZEC program there, which we expect to take effect around the end of the first quarter 2019.

On the Federal Energy policy front, FERC issued an order on PJM two capacity market mitigation proposals. The order rejected the two-stage capacity re-pricing of multiple RECs proposal submitted by PJM and it also determined that the existing tariff is unjust and unreasonable. Instead FERC established a new proceeding to introduce a two part proposal. The first proposal is to expand the current MOPR to ensure that most if not all plants that receive out-of-market payments will be subject to a minimum offer requirement.

The second proposal, however, would allow the plants receiving out-of-market payments to avoid the MOPR and instead be withdrawn from the market along with the commensurate amount of load. This asset specific FRR can be implemented by the states to align with the state's environmental policies. FERC has set a schedule to allowing 60 days for comments, 30 days for replies, and a goal of reaching the final decision by January 4.

We disagree that the MOPR is necessary. We are encouraged that FERC has now said that all assets receiving out-of-market payments should be treated the same. The implementation details will matter but we believe that the partial FRR design could allow states to advance their energy policy goals, which we think is critical to ensure the needed reduction in carbon emissions.

With respect to PJMs work on price formation, we continue to look forward for a decision from FERC on the fast start by September and PJM has committed to implement the rule changes in a timely fashion after the FERC order, including reengaging stakeholders on a full integral relaxation. PJM continues to work through reforms to which storage pricing rules included those related to reserves in the operating reserves demand curve pursuant to the deadlines it had set for those rule changes.

Finally on resiliency, PJM has taken the input and the assumptions and the scenarios that it needs to model in order to assess fuel security of its generation fleet. This will allow PJM to move forward on evaluating potential changes to market design to ensure that it is properly valuing the fuel security, while it awaits further direction from FERC in the open resilience docket. We see all these changes as essential to preserve the effective competitive market in PJM and we applaud the ongoing efforts to design and implement these changes.

Now, I'll turn it over to Joe and he can walk through some of the numbers.

Joseph Nigro

Thank you, Chris, and good morning, everyone. Turning to slide 10, we had a strong quarter financially, delivering adjusted non-GAAP operating earnings of $0.71 per share which is above the $0.56 per share we earned in the second quarter of 2017 as well as our guidance range of $0.55 to $0.65 per share. Exelon's utilities less Holding Company expenses delivered a combined $0.37 per share. Compared to our plan, the utility results were better on higher distribution revenue from the approval of the Pepco Maryland settlement, a transmission revenue true-up at BG&E and favorable weather impacts at PECO.

Generation earned $0.34 per share in the second quarter, which was also better than planned. Upside came from realized gains from our nuclear decommissioning trust. Our nuclear plants had another strong quarter with fewer outage days compared to both last year and what was budgeted for this year. And we benefited from favorable market

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01436

conditions including FTR settlements in PJM. These were partially offset by higher allocated transmission costs.

We are reaffirming our full year guidance range of $2.90 to $3.20 per share, which you can see on slide 19. We expect to deliver operating earnings of $0.80 to $0.90 per share in the third quarter compared with $0.85 last year.

Turning to slide 11, the $0.71 per share in the second quarter of this year was $0.15 per share higher than the second quarter of 2017. Our utility earnings were collectively up $0.04 per share compared to last year, driven primarily by higher rate base and mill rates associated with completed rate cases. Generation earnings were up $0.12 per share compared with last year benefiting from fewer planned and unplanned nuclear outage days, contributions from the Illinois ZEC program and higher realized nuclear decommissioning trust gains partially offset by lower power price realizations.

Moving to slide 12, our utilities continued to execute financially as we look at our trailing 12-month earned ROEs. Starting with PHI, we made modest gains at each utility as we continue to deliver improved operational and financial performance since the merger. Pepco's higher earnings reflect the distribution rate cases from last fall and the recent Pepco Maryland settlement that took effect on June 1, 2018.

Looking to next quarter, Pepco's earned returns should benefit from a full quarter of the Maryland settlement reached in April and a partial quarter benefit from the pending DC settlement.

Delmarva's earned ROEs now include the benefits of interim rates in Delaware that took effect in March 2018, and at Atlantic City Electric we saw higher earnings from the ACE settlement effective October 2017, which was largely offset with higher O&M and depreciation expense. We expect to see ROE improvement with full flow through of the October 2017 settlement. For all of the PHI utilities, trailing 12 month ROEs in the fourth quarter should show additional uplift as the FAS 109 changes from the fourth quarter of 2017 drop out of the calculation.

For the legacy Exelon utilities, our earned ROEs remained over 10%, lifting the consolidated utilities platform to nearly 9.5% including PHI. We are happy with our overall utility performance but still see room for improvement at PHI as the better operating performance translates into higher earned returns. And as we have said before, we are confident in our ability to deliver on our plan and still expect earned ROEs in 2019 to be in the 9% to 10% range across the utilities.

Turing to slide 13, we remain busy on the regulatory front. On the last call, we discussed settlement arrangements in April at both Pepco DC and Pepco Maryland, providing revenue decreases of $24.1 million and $15 million respectively after reflecting tax savings benefits for customers. On May 31, the Maryland PSC approved the settlement for Pepco Maryland with rates effective on June 1. For Pepco DC, the Commission is expected to approve the settlement in the third quarter with rates effective shortly thereafter. We are also able to reach a settlement in our Delmarva, Delaware electric distribution case on June 27, 2018 making it the second consecutive electric case we have settled in recent history. The case will provide a $7 million revenue reduction inclusive of tax benefits. We expect a final order in the third quarter.

As Chris noted earlier, Delmarva Power, Delaware expects to make its first filing under the Distribution System Investment Charge tracker in the fourth quarter of 2018, with the new charge appearing on customer bills by the first quarter of 2019.

We also have a number of rate cases still in play. On June 8th, BG&E filed for a $63 million increase to its gas revenues and a $22 million STRIDE surcharge reset with an order expected in January 2019. BGE's continued investments in STRIDE and gas systems safety and reliability programs are driving the need for this requested increase. In Delaware, we have an outstanding gas distribution rate case at Delmarva that is scheduled for completion in the fourth quarter. In Pennsylvania, PECO filed for an electric distribution base rate case in March for the first time in three years. We expect to receive an order in the second half of this year. Finally, on April 16th, we filed for rate updates at ComEd as part of the standard annual formula process. We expect to receive an order in the fourth quarter.

We appreciate the hard work of our utilities and regulatory teams. Our investment is focused on improving system reliability and the customer experience are having positive benefits in the communities we serve. By delivering on a regulatory strategy, we're able to make these investments, while also earning a fair and timely return on the capital

final

Bloomberg

being deployed. More details on the rate cases and their schedules can be found on slides 27 through 33 in the Appendix.

Turning to slide 14 and continuing on the topic of capital investment at our utilities, we invested $1.3 billion of capital at the utilities during the second quarter and are at $2.6 billion year-to-date. We remain on track to meet our $5.5 billion capital budget for 2018.

Today, I would like to highlight two additional projects that are part of our overall budget and offer real benefits to our customers and communities. The first is PECO's gas main and service replacement program. The project will replace nearly 1,800 miles of gas mains and service lines of which 520 miles has already been completed.

We continue to work with the state to accelerate the implementations having shortened the replacement cycle at the start of the program from 30 years to 20 years, today. These efforts will reduce risk on the distribution system by replacing aged materials, which we believe is good for our customers.

The second project relates to BGE's investments in Trade Point Atlantic or TPA. Over the next five years BGE will invest $150 million in transmission and distribution infrastructure including construction of a 93 megawatt substation. These investments will support the new 3,100 acre commercial industrial TPA development in Baltimore County, which is projected to generate 17,000 permanent jobs, plus an additional 21,000 during construction. This project is another example of our efforts to continuously work with our states to identify and support development efforts that drive economic growth in our service territories.

Turning to slide 15, it provides our gross margin update for ExGen. This quarter we have included the New Jersey ZEC revenue in our 2019 and 2020 disclosures for the first time. Relative to our last update, we saw some movement within the buckets. Our total gross margin in each year is unchanged from our last update with the exception of an additional $50 million in both 2019 and 2020 associated with the New Jersey ZEC revenue. For 2018, open gross margin was up $100 million primarily due to higher NI Hub and PJM West Hub prices, offset by weakening ERCOT spark spreads and our hedges. We had a strong quarter in new business execution creating $200 million of Power New Business in our retail and wholesale channels as we capitalized on ERCOT volatility.

In 2019 and 2020, total gross margins are up $50 million in each year with the New Jersey ZEC revenue, which shows up in the capacity and ZEC line. Open gross margin is up $100 million in 2019 due to higher prices in New York Zone A and PJM West Hub. Open gross margin is flat in 2020. We also executed $50 million of Power New Business in 2019 and 2020.

We ended the quarter basically in line with our ratable hedging program in 2018 and 10% to 13% behind ratable in 2019 and 6% to 9% behind ratable in 2020 when considering cross commodity hedges where we have increased our concentration. We remain comfortable being more open when we look at the market fundamentals compared to forward prices particularly at NI Hub.

Turning to slide 16, we remain committed to maintaining a strong balance sheet and our efforts on this front have been noticed with Fitch placing Exelon, PECO, and BG&E all on positive outlook in June. Our consolidated corporate credit metrics remain above our target ranges and meaningfully above S&P thresholds. We are forecasting ExGen's leverage to be 2.6 times debt-to-EBITDA at year-end 2018, which is below our long-term target of 3.0 times.

On a recourse debt basis, we are at 2.1 times, which is well below our target. We will continue to manage our balance sheet at ExGen over time to the 3.0 debt-to-EBITDA level. So look for us to focus on debt reduction at both HoldCo and GenCo.

I will now turn the call back to Chris. Thank you.

Christopher M. Crane

Thanks, Joe. Turning to slide 17, again, we had a strong financial quarter and operationally that is a testament to the hard work and dedication of our employees. Our financial footing and sounding continues to gain momentum. Here

final

Bloomberg
SI-SSA-0015-01438

again, I'll restate our proposition value.

We continue to focus on growing our utilities targeting 7.4% rate base growth and 6% to 8% EPS growth through 2021. We continue to use free cash from the GenCo to fund incremental equity needs at the utilities, pay down debt over the next four years at ExGen and the HoldCo and fund part of the faster dividend growth. We continue to focus on optimizing value for the ExGen business by seeking fair compensation for our carbon free generation fleet, supporting proper price formation in PJM and resiliency initiatives at FERC and working to develop capacity market reforms at PJM pursuant to the recent FRR order. We continue to close uneconomic plants and sell assets where it makes sense to accelerate our debt reduction plans and maximize value through the gentle load matching. We continue to sustain strong investment-grade credit metrics, as Joe pointed out, in our growth driven consistently at 5% through 2020.

With that operator, we can now open it up for questions.

Q&A

Operator

[Operator Instructions] Thank you. Your first question comes from the line of Ali of SunTrust. Your line is open.

<Q - Ali Agha>: Thank you. Good morning.

<A - Christopher M. Crane>: Good morning, Ali.

<Q - Ali Agha>: Good morning. The first question on the PHI utilities, what's the aspiration there? I mean, are those utilities and the way the system is set up, are they set up that they can ultimately earn their authorized ROE or will there be a permanent lag in the system and when do you think you will be at the maximum in terms of your earned versus allowed ROE [indiscernible] (24:22)?

<A - Christopher M. Crane>: So there is a lag component at a couple of the PHI utilities now that we're working on. We've talked about ACE. We think we have the right legislative package to help that reduce that in Delaware and we're also working on different proceedings at Pepco Maryland and Pepco DC. We project it to be within the 9.5% range by the end of 2019. We're on track to do that. We have the developed activities that are helping. We also have the efficiency programs we're putting in place. So, I think we're well on plan. We recognize the legacy issues that were happening around that and are having constructive dialogue with our legislators as we've done in Delaware, our regulators, as we're doing with the filing in New Jersey and we'll continue to focus on that.

<Q - Ali Agha>: Okay. And then Chris to the extent that Forex proposal for PJM and the FRR aspect of it does become law and moves forward. How do you look at that relative to your portfolio and what that means for Exelon?

<A - Christopher M. Crane>: Well, you can imagine. I'm going to let Kathleen Barrón cover that. But, as you can imagine, there's a lot of evaluation that we have to do right now to really choose the path that benefits our customers and our fleets. So, Kathleen?

<A - Kathleen L. Barrón>: Yeah. Thanks for the question, Ali. I think what we're facing here is markets that because they're not pricing pollution are making emitting resources look less expensive and they're pushing out clean resources, including ours, as you know, 10.6 gigawatts of uncleared nuclear in the last auction.

I think what FERC is saying in this order is that rather than letting RPM continue to push those units out, they're giving safety opportunity to pull them in and instead of paying PJM to support units that perhaps they don't want to support they can directly pay those assets. And so, as Chris said in the opening of the call, implementation details certainly matter. But we think this is an extremely constructive approach to allowing states to choose the resources, the clean resources that they need to continue to keep running to achieve the our goals of reducing carbon and air pollution for their citizens.

final

Bloomberg

<Q - Ali Agha>: Okay. And last question with regards to the pending litigation in New York and Illinois, any marker we should be keeping an eye on to give us some framework of when the decision might come from either of those states?

<A - Kathleen L. Barrón>: Unfortunately, we have no way to know exactly when those orders will issue but the cases have been fully briefed and we expect them to issue any time. There is nothing that we know that's holding them up.

<Q - Ali Agha>: Thank you.

Operator

Your next question comes from the line of Greg from Evercore ISI. Your line is open.

<Q - Greg Gordon>: Hey, good morning. I'm happy we're on a first name basis now.

<A - Daniel L. Eggers>: Thank you, Greg.

<Q - Greg Gordon>: Joe, just a question for you with regard to the quarter. I mean, obviously the numbers were quite robust, but there was $0.05 of positive earnings from NDT. I mean that's not necessarily – I know that that moves around every quarter, but I wouldn't consider that necessarily the highest quality earnings. But even if you exclude that, you were still ahead of your prior guidance range. So can you just walk us through what you think sort of a clean basis and was that still in excess of your expectations?

<A - Joseph Nigro>: Yeah. If you subtract the $0.05 for NDT, Greg, what I would say is, when you look at it overall, the midpoint of our range was $0.60. We obviously earned $0.71 on an operating basis. A little more than 50% of that was coming from the utilities. And as I mentioned in my prepared remarks, it is driven by three things: the transmission settlement at BG&E, the yearly implementation of the rate settlement at Pepco Maryland, and as well as stable weather at PECO were the big drivers there. And then the balance was GenCo and NDT was a big piece of that but we also had favorable market conditions related to the FDR option during the quarter. Our Generation performance was stellar, and then it was offset by some transmission costs. So you could see even subtracting out the NDTs, the performance was very strong across the operating businesses.

<Q - Greg Gordon>: Right. And I heard you indicate that you're – and show that you're running well below your debt to EBITDA target and thus you can address that by using your cash to – in addition to funding rate-based growth, dividend, not just think just think about paying down ExGen debt, but also working down parent debt. But there's a bigger issue here, which is that you know the FFO to debt targets that the rating agencies are holding you to seem excessively high relative to the declining risk profile of the company. What has to happen to evolve the conversation with the rating agencies to get a lower threshold? And is it really dependent on getting more certainty on capacity and energy market reforms at this point since you've shown demonstrably that you're one of the best operators on the utility side of the house in the country?

<A - Christopher M. Crane>: Yes. So Greg, we have been and will continue to have dialogue with all the rating agencies. You heard Joe's conversation on Fitch. We've had a good dialogue with S&P. They understand our strategy, they're wanting to see it consistently implemented. They recognize that it is being consistently implemented. I think you know a couple of milestones coming through with the final approval from the Appellate Court on the ZECs, making that revenue look much more like regulated revenue, continuing to follow our path on debt reduction, which part of that is building balance sheet space, de-risking, but also part of it is liability matching with the nuclear assets and their life into the 30s and 40s. So we just have to continue to execute on our plan. We're having very positive dialogue. We appreciate the Fitch positive. We look forward to hearing from the others and hopefully shortly that they're seeing it and we'll be able to talk about not only moving thresholds, but potentially a more positive rating.

<Q - Greg Gordon>: Okay. My last question you may have already demonstrably answered previously, but if in fact, you're given – you and the states are given the option of pursuing an FRR type structure for plants that are deemed to be important in those regions. Does the legislation that you currently have in Illinois and New Jersey for instance create

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01440

the flexibility to do that or would you need to go back to your legislators and engage them in a restructuring of that legislation to give them the flexibility they would need to bring those assets out of the capacity market and properly compensate them?

<A - Kathleen L. Barrón>: Hey, Greg. It's Kathleen. We're currently looking at existing legislative authority in all of our states. And so I think it's going to depend on the jurisdiction. And it's also going to depend on what FERC's order ultimately says about what authority states will be to exercise in order to take advantage of this option. So I think, it's going to differ depending on the state. But we're currently evaluating the best path forward in each of the states that have clean energy targets that we think this order will help them meet.

<Q - Greg Gordon>: Okay. Thank you all. Have a great day.

<A - Christopher M. Crane>: Thanks, Greg.

Operator

Your next question comes from the line of Steve of Wolfe Research. Your line is open.

<Q - Steve Fleishman>: Hi. Good morning. Hey, Chris.

<A - Christopher M. Crane>: Hi.

<Q - Steve Fleishman>: Just I guess, you know it's hard to kind of interpret a lot of these FERC proposals in different directions. You also had the Mystic decision. And so, maybe you can just give a broader perspective of what they're trying to achieve here and just what could change versus this initial proposal before we hear kind of I guess a final structure by early next year?

<A - Christopher M. Crane>: Yeah. So the fight – the disagreement within the stakeholders is around the supplemental income that is being received for the social benefit of carbon reduction within our states. We lack a federal policy as you know on carbon, although the conversation continues and that would be the ultimate fix. That would really level the playing field and allow the states to [ph] skip (34:15) support of federal policy. Short of that, the states have deemed – the majority of states that we operate in that they want to preserve the low carbon output that they have.

They understand that 60% of the power in the State of Illinois is carbon-free, 90% of that is nuclear. We start shutting down nuclear plants like you look at the FE announcement, every penny that's been spent in PJM and outside of PJM on REX to achieve a lower carbon output would be wiped out. It's like we threw the money away. So you've got a very passionate belief within some of our states that they want to keep these assets. PJM has been unable under the current tariffs to be able to separate and support at this point the environmental needs of their stakeholders. So what this allows from FERC is a positive move to say if the administration and the legislation in New Jersey wants to preserve a low carbon future for its state and for its citizens. It allows Illinois to do the same thing. If New York wanted to look at something, it could do something for New York. So I think, this is finally setting the final decision on how we manage these assets that may be out of the capacity revenue stream, not clearing, but the state wants to keep them. We had Secretary Perry at the FitzPatrick Plant yesterday with Congressman Katko and it was very positive. I mean we are gaining momentum, but not only in his opening comments, in the press conference and with our tour in discussion with local officials, is he concerned about the economic benefits of the plant. He's concerned about the reliability and the resiliency on the fuel diversity and he's also commented on their capabilities for low carbon.

So you've seen us go back and forth between ZECs and between other programs to try to save. We've seen the arguments from other stakeholders against it and I think this gives us a path to finally put it to bed.

<Q - Steve Fleishman>: Okay. That's helpful. And just one other question on it, if you were to get into kind of an FRR structure like, do you have any sense on like how long that would be i.e., you know if that's kind of a form of reregulation of the plant, is that for good, is that for you know a set amount of time like the ZECs are?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01441

<A - Kathleen L. Barrón>: Yeah. Steve, I'll jump in on that, that's certainly one of the implementation details that will be worked out through the FERC docket, but it's important to know we're not talking about [ph] reload (37:27) regulation, we're talking about an alternative way to pay the units for capacity, and let the states choose which units they'd like to pay for capacity as opposed to letting RPM select the assets. So it's a step towards the future that Chris identified, that we anticipate will be short-term. The current FRR structure as you know allows units or zones to step out of RPM for a five year period with the option to come back in. And ultimately if we get this to the longer term carbon solution that Chris identified, then these decisions will be made by the market through a carbon price and that will be a longer term structure that will benefit our customers.

<Q - Steve Fleishman>: Got it. Thank you very much.

<A - Christopher M. Crane>: Sure.

Operator

Your next question comes from the line of Julien of Bank of America. Your line is open.

<Q - Julien Dumoulin-Smith>: Hey, good morning.

<A - Christopher M. Crane>: Good morning, Julien, how are you doing?

<Q - Julien Dumoulin-Smith>: Good. Great. Thank you. Just to clarify the last question actually if we can start there. I just want to make sure I'm hearing this correctly. Is your expectation that states would actually move through the motions to file for this FRR or is it rather that your expectation that status quo would maintain itself with respect to just continue to clear assets or attempt to clear assets given wherever your avoided costs might be?

<A - Kathleen L. Barrón>: Julien, it's Kathleen. I think it's the former that we would expect states to be looking very closely at this opportunity, not just because of course of the nuclear [Technical Difficulty] (39:02) the renewable fleet effects, any asset efficiency demand response that's receiving support from customers directly. And so there are a lot of stakeholders who have an interest in making sure that the states are going to be able to do clean capacity procurements and have that capacity recognized by RPM – by PJM rather.

<Q - Julien Dumoulin-Smith>: And you've confidence that you can indeed find a way from a regulatory path to support an FRR implementation including compensation for the units, if that's where it goes in both Illinois and New Jersey, to be clear?

<A - Kathleen L. Barrón>: Yes, sir.

<Q - Julien Dumoulin-Smith>: All right, excellent. Now, let me turn back to the utility side of the equation here where things are booming obviously. Can you comment on the New Jersey side with CapEx? I mean we've talked a lot about New Jersey in the context of the nuclear plants, but obviously the Governor is implementing a lot more than that, maybe energy efficiency filings, offshore wind seems to generate some opportunities at ACE. Just curious how you're thinking about that and what's reflected in the budget as it stands today?

<A - Anne R. Pramaggiore>: Hi, Julien, it's Anne Pramaggiore. How are you?

<Q - Julien Dumoulin-Smith>: Good, thank you.

<A - Anne R. Pramaggiore>: Good morning. On the New Jersey side, obviously with the new legislation, there's a couple of areas that we're looking into, it's subject to – a lot of it's subject to regulatory proceedings that are yet to come. So you would not see what we would be looking at reflected in the budgets or the earnings to-date. But there's an area around energy efficiency, we traditionally have not been involved in energy efficiency programs except for some program funding in the past, and that's one of the things we'll look toward going forward.

So to the extent that there's capital investment in energy efficiency, voltage conservation programs, you could start to see those reflected going forward. We also have opportunity to invest in storage and solar going forward in New Jersey.

But again, these are all subject to proceedings, at the commission before we have a sense of exactly what that looks like. But we think there's tremendous opportunity here especially as we think about utility of the future, the kind of businesses that we can be in looking forward, serving customers with the types of programs and products and services that they like. So we think there's a great platform there, but some work to do with the regulatory agency.

<A - Christopher M. Crane>: The only thing I'd add to that is, we have a very high sensitivity to rates on our customers. As you know that that part of the state has gone through a downturn. And so as we make the investments which we can do efficiently, we're going to keep a constant focus on those rates. So we're not impairing the future development of commercial, industrial or residential customers.

<Q - Julien Dumoulin-Smith>: Excellent. Thank you all very much.

Operator

Your next question comes from the line of Michael of Credit Suisse. Your line is open.

<Q - Michael Weinstein>: Hi, guys. Thanks for taking my call.

<A - Christopher M. Crane>: Hi, Mike.

<Q - Michael Weinstein>: Hey. Can you talk a little bit about what your expectations are for the summer power market in Texas, given I guess it's gotten off to kind of a mild start? And then also talk about the recent acquisition on the retail side that you guys executed with FES and what the implications are for Constellation from that?

<A - James McHugh>: Okay. Hi, Michael. It's Jim McHugh from Constellation. As far as ERCOT summer, what we've seen is some volatility in the forward markets and the weekly markets going into delivery and even in the day ahead markets, we've seen some pricing that exhibited on the ORDC curve, some higher price spikes. In the real-time market, it hasn't come to fruition. So it's led to a large spread between day ahead and real-time. In real-time, we really saw great operating conditions. The wind performed at or better than forecast. There were minimal generation force outages, so the generators all performed very well, and there were some good demand response availability.

But prior to going into the period, we saw weeks trading as high as $800 or $900 and the month of July and August trading in the $200 range. As far as our portfolio, performed well, we're able to take advantage of some of that market volatility we saw in the forward markets. You saw that we executed $200 million of new business this quarter for 2018 on the power side, a good chunk of that is represented by our activity in Texas and what we're able to do and our gen-to-load strategy proved valuable once again. We were able to serve the high load and the high demand with our peaking fleet and the options that we owned.

Going forward, I think we expect that volatility to continue. You'll have continued demand growth of 1 gigawatt to 1.5 gigawatts a year with really some wind and solar build out and very little thermal gas combined cycle generation build out. So that volatility will continue, next summer is trading right around the $100 right now and we would expect you would see the same exhibited volatility on the forward curve between now and delivery period of next summer.

For the acquisition of FirstEnergy, it's a great fit for our portfolio. We would be paying $140 million subject to price adjustments based on market moves before the process is over. But there's 900,000 customers on the C&I side and residential side across six states. It'd be a great fit for our gen-to-load and gen-to-customer strategy that we've been deploying. We'd also be buying some certain power in basis hedges as part of the process. So it's a strong complement to our existing portfolio and it would provide repeatable and sustainable customer business through renewals and brand recognition for us.

<Q - Michael Weinstein>: Hey, just a quick follow-up. I think you said that earlier in the call that you're a little closer to ratable in hedging for 2020 I think it was versus 2019. And I'm just wondering, should I be reading anything into that that you're becoming closer to ratable as you go further out, is that sort of a negative take on the power markets or?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01443

<A - James McHugh>: No, Michael, it's not. It's actually we're just building that position, as we hedged the third year of our three year program, we'll continue to grow that behind ratable position. We're currently about 7% or 8% behind ratable in 2020. We've added some gas hedges and cross-commodity hedges to further expose ourselves to upside in power markets. The concentration of our behind ratable position is largely in NI Hub and ERCOT. So I wouldn't read into that. I think our position is similar and growing to be similar across both those years.

<Q - Michael Weinstein>: Great. Thank you very much.

Operator

Your next question comes from the line of Praful of Citigroup. Your line is open.

<Q - Praful Mehta>: Thanks so much. Hi, guys.

<A - Christopher M. Crane>: Hi.

<Q - Praful Mehta>: So just wanted to get a sense for getting back to the capacity auction on the capacity market reform piece. If the states are required to kind of support the asset both from the ZEC payment as well as [indiscernible] (46:33), are there any winners, losers in terms of states, I think would make it more difficult to get done especially in this timeframe. Are there some states who will be more inclined to get this versus others?

<A - Kathleen L. Barrón>: I can take that one as well. It's certainly going to depend on the state's readiness, how quickly this gets implemented. So I take the question to be one of what kind of transition period might we be looking at, and I think that's going to be a subject of active debate in the paper hearing at FERC, as to whether there needs to be some sort of transition period to allow states to understand what the rules are and take advantage of them. So I think you should look for that to play out as part of the FERC process.

<Q - Praful Mehta>: Got you. Thank you. And then in terms of ERCOT, if the volatility clearly has been high, should we expect that if there are retail players struggling at the back end of extreme volatility that you're looking to expand your retail position or is there any goals that you see to kind of expand your portfolio position in ERCOT at all?

<A - James McHugh>: Hi Praful, it's Jim again. I think we did see going into the summer, one small retailer go out of business with the new collateral posting requirements by ERCOT, which include a look at the forward markets. It might be harder for some of the smaller retail providers to manage their balance sheet if they're undercapitalized through those collateral requirements. For us, I think strategy is the same. We'll look for good value propositions. Our track record with Integrys and Con Ed and what we're looking at now with the FES book will continue to be the same to look for value. As far as the lag effect, you may see the impact of the volatility for the larger players impact maybe in the longer term as the contract tenures and the extended start dates are further out in the curve. So they're currently contracting for load out two or three years forward.

<Q - Praful Mehta>: Got you. Thanks. And just quickly just, I mean, ExGen O&M cost reductions, I noticed their target, I think 75% in 2018, 50% by 2019. Is that all on track right now?

<A - Christopher M. Crane>: It's not only on track, it's Crane, Praful, it's not only on track. We are continuing to work to become more efficient, continue to compete in the markets we're in. We are on track to achieve those if not to exceed those, so we're in good shape.

<Q - Praful Mehta>: Excellent. Good to hear. Thanks so much, guys.

Operator

Thank you so much. I would like to turn the call over back to speaker, Chris Crane. Please go ahead, sir.

Christopher M. Crane

Yes. Thanks. And thanks again for everybody joining the call. As you can see from the strategy that we put together years ago, we're right on track, if not ahead of schedule and we will continue to keep you updated. Look forward to the third quarter calls, but also Dan and Joe and I are getting back out and making sure we drop in and answer any of your questions, so making ourselves available during the third quarter will be a big part of our plan to continue to communicate. We thank you very much and have a good day.

Presentation

Kit Konolige, Senior Utilities Analyst

Good afternoon everyone, this is Kit Konolige from Bloomberg Intelligence, and I'd like to welcome you to our webinar with Stu Bresler from PJM on the results of the May PJM Capacity Auction. Before we get started, just a couple of administrative notes. The presentation will be recorded and will be available for playback later. I believe that there will also be a transcript available later. Just you should be able to look through your email, that you got to login here and connect for those services. You can put in serve [ph] questions for Stu after the -- his discussion by typing in on the screen in front of you. And I'll read through the questions and then present them to Stu for people who haven't seen them. And we'll also have a copy of the slides available later.

As I mentioned, today's speaker is Frederick S. Stu Bresler, and he's the Senior Vice President of Operations and Markets, the guy who knows the details about the capacity auction which is obviously of major importance in setting prices in PJM. And I am the Senior Utilities Analyst at Bloomberg intelligence. What is Bloomberg Intelligence? You see here the sample dashboard page, we do equity research, debt research, research about government and government courts and various other important issues that affect stocks and bonds as well as commodities that we do it globally.

So we are like a large sell-side or possibly buy-side unit, and we attempt to be comprehensive and to use the data in the Bloomberg terminal to come up with hopefully actionable thoughts on securities and -- in the universe, that you all deal with.

So as far as the background for Stu's discussion, PJM prices in the auction, this is the line is the chart of the RTO price, which is the core Midwest largest zone, if you will. So that rose significantly this year, and that coincided with a lot less new build, so that even though demand was down, the prices rose. So I think that's obviously an important directional process that was going on. Here is the view of the different zones over the years. And as you can see, we do have RTO rising and some of the other -- the Eastern and more Western zones fluctuating back and forth somewhat as they have more largely with the differences in the ability to import power into those zones. But we can certainly have Stu address those issues if -- as needed.

Here are the major owners of capacity among publicly traded companies, (inaudible) publicly traded anymore, but there are also as most of you know many private equity investors who are heavily involved in especially newer, but really all over PJM and with legacy as well as new plans.

And with that, I will turn it over to Stu and just saying that I've made a list of topics here that were of some interest to me. And I'll leave it to Stu to address any or all of these and I ask him just to speak to what he feels are the most important takeaways from the auction in May, and maybe to discuss a little bit what the major issues in front of PJM are now and going forward. So, Stu?

Stu Bresler, Senior VP, Operations & Markets

Well, thank you Kit. I appreciate you providing that overview and hello to everyone on the call this afternoon, it's always a pleasure to have the ability to speak to you about the latest happenings with respect to the PJM markets. So Kit asked me to go over some more of the detailed outcomes of the latest RPM base residual auction. As Kit mentioned, this auction was conducted back in May, we posted the results on May 23rd. And the capacity delivery

Bloomberg Transcript

period for which we were procuring capacity in this auction was or is for June 1st, 2021 through May 31st of 2022, so what we refer to as the 2021/2022 delivery year.

So some of the major outcomes, Kit already went through some of the major pricing outcomes obviously, I think the biggest one or the most significant one was the significant increase in the clearing price for the majority of the RTO really what we call the Rest of RTO area of the region. And that clearing price increased from $76.53 per megawatt day in the last auction for 2020/2021 up to about $140 per megawatt day. So fairly significant increase there and we'll go into some of what was behind that. And then Kit hit a couple of the constrained areas of the system, ComEd to the West at about $196 per megawatt day, $195.55 to be exact. And then on the Eastern side of the system, we had the Eastern MAAC region split out. That was the only area where the price actually decreased this year compared to last year.

We had $166 per megawatt day versus $188 last year for 2020/2021. But then the PSEG zone in New Jersey and the PG&E zone, the Greater Baltimore area, each split out right around $200 per megawatt day, PSEG at 204 and PG&E at 200.

And then finally, for the first time in several years, the ATSI LDA which is the First Energy Ohio Territory, split out at a $171 per megawatt day, so about a $31 premium to the RTO. And overall, I think the primary drivers behind the increase in capacity clearing prices for the bulk of the RTO really stem from a couple of things, really I think a couple of things driven by the same underlying factor and that underlying factor is the continuing decline in energy prices.

So if you look at, for example, how we establish the demand curve in these auctions, the demand curve is anchored around a point that is based on the net cost of new entry. So it's the gross cost of new entry minus a three-year rolling average of energy and ancillary service revenues. And in this three year average, the 2014 polar vortex year, which saw the highest energy prices really since probably 2008-2009, rolled off of that three-year average and we picked up 2017, which has significantly lower energy prices. So the energy revenues that go into that net cost of new entry went down, which means the net cost of new entry itself went up, so we essentially saw a shift up in the demand curve.

But then I think also the continually low energy prices also drove some differences in offer behavior from the supply resources that were being offered into this auction. And we did see some fairly substantial differences in offer behavior in various areas of the system, which also went to driving really an increase in the clearing price. And then finally, we did have an overall decrease in the quantity of clear resources, which when you're clearing against a sloped demand curve is consistent with an increase in the clearing price. And as Kit mentioned, part of that reduction was driven by a reduction in both offers and then cleared quantities of new generation in this auction.

We had one combined cycle resource clear that had not cleared in a prior auction for about -- I think it was like 850 megawatts or so. Whereas, in the last several auctions we had anywhere between 2,000 and 5,000 or 6,000 megawatts of new combined cycle megawatts clear.

So a fairly significant reduction. That was not unexpected from my point of view. We have again, over time seen a relatively low capacity prices, relatively low energy prices.

So I think the substantial new generation we saw clearing in the last couple of years was probably just a bit of a lag with resources that are already started down the development process and were clearing for the first time as opposed to a reaction to a more near-term price phenomenon. So not entirely unexpected that we were seeing a slowdown in new generation clearing, especially given the reserve margins that we have seen clearing in these auctions and I'll get to more of that later.

So now all those factors that I just went through that are sort of driving the higher clearing prices again to Kit's earlier point were obviously more than to -- more than enough to offset the lower reliability requirement due to a lower load forecast for the 21-22 delivery year compared to 2021.

So just to hit some more of the highlights of the auction, I think one of the significant things we saw in this auction was an increase in alternative types of resources. So demand response and energy efficiency primarily we saw a 3,300 megawatt increase in cleared demand response from just over 7,000 megawatts to just over 11,000 megawatts. So from

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01447

7,800 megawatts before to about 11,100 megawatts of demand response clearing this auction. And then we saw an increase of 1,100 megawatts in energy efficiency clear in this auction. So significantly increased participation in this auction by demand response, which remember, we are now and have been since last year at 100% capacity performance, which means all these resources have to be available on a year-round basis.

So a significant increase is there. Also significant increases in renewable resources clearing in this auction. We saw the capacity value of wind resources increased from about 530 megawatts last year to over 1,400 megawatts this year and then the capacity value of solar increasing to 570 megawatts this year from about 125 megawatts last year.

So significant increases in the capacity value, from the energy value of those resources, remember wind has a capacity factor of about 13%, solar of about 38%, so the 1,400 megawatts of wind translates to about 8,100 megawatts of nameplate energy capability and the 570 megawatts of solar translates to about 1,600 megawatts of nameplate solar capability. So, significant quantities of those renewable resources clearing in this auction.

A lot has made over the years of our transition to 100% annual resources. We do continue to offer the ability for resources to offer on a seasonal basis and aggregate through the auction. So as part of the auction process, we can match up summer and winter only capability into an annual resource. Our two resources that combined together equate to an annual resource and this year the quantity of cleared resources that aggregated through the auction went from just about 400 megawatts to over 700 megawatts this year. So pretty healthy increase there as well.

From an overall reserve margin standpoint, we procured a reserve margin of about 21.5% this year. Our required reserve margin is about 16.5% or so. So significantly again as has been the case in the past, significantly greater resources clearing in the auction due to that sloped demand curve, which is great for reliability and also great for consumers, because the total cost of the auction goes down further out clear [ph] on that demand curve. Although it is down somewhat from last year. Last year we actually a cleared 23.3% reserve margin. So again, seeing some really kind of expected constriction if you will and the supply is clearing down to 21.5% overall reserve margin this year.

So overall, once again we were pretty pleased with the outcomes, significant sort of again diversity of resources clearing in the auction. We did see a fairly significant decrease in nuclear resources clearing in this auction over 7,000 megawatts decrease this year in nuclear units clearing in the auction, again driven by really nothing more than offer behavior in the auction. We did see that a retirement announcement that Kit already mentioned from FirstEnergy Solutions of about 4,000 megawatts and then there were additional resources, I think Exelon already made a public announcement right after the auction as far as their resources that did and did not clear.

So fairly significant reduction in nuclear resources now, obviously not clearing in one auction does not necessarily mean resources will retire. I think Exelon has said as much in their public announcements about the resource that did not clear, not having a plan to retire at this point. So I have to see how that plays out.

But interestingly, on the other side, we saw coal actually hang in there in this auction. We had a net 500 megawatt increase in the total quantity of coal resources clearing in this auction. So sort of kind of stemming the tide of the decreases in coal that have cleared in prior auctions. And then about 1,000 megawatt increase in overall natural gas resources clearing again the bulk of that was at new combined cycle worth about 850 megawatts or so in this auction.

So continuing sort of shifts in the supply mix in PJM that we see through the auction as well. So I think those are the sort of the major highlights that I would pull out of the auction, just sort of looking back at the points here that are on the slide just to see if there's anything I didn't hit.

The third bullet about forward spark spreads were increasing more recently since -- primarily since last August. I think we got to -- have to see how that drives potentially the continued new entry into the future. I think it's perfectly reasonable to expect that these auctions will lag a little bit, sort of more real-time type of information because they are annual auctions and three years forward in nature.

So I think we saw that lag in the last few years with the new entry that kept clearing. It will probably be a little bit of a delay, so we see whether -- first of all, whether the spark spreads continue to increase and then secondly whether that drives future new entry as well.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01448

There's some additional uncertainty I think surrounding that that we'll get to at the end with some of the other issues that are facing us and the industry at this point. But I think I hit a lot of these -- a lot of these other things that are on here as well other than these other issues. So just (inaudible) that very quickly and then I'll be happy to turn it back over to Kit to get to any questions that are coming in on the phone or on the webinar, but with respect to date level subsidies as it sort of says here on the slide and I think from the standpoint of what could potentially come down the road, you can probably expand that to federal -- additional federal subsidies, given the leaked memo from the White House and what the Department of Energy might decide to do with that.

We'll have to see how these things play out, as you all probably know, PJM has a filing in front of FERC right now that is intended to address this intersection of public policy actions and markets and specifically the capacity market. It was a filing with FERC that proposed two alternatives for dealing with that issue, one is an expansion of the minimum offer price rule which would require subsidized resources, while whether they're new or existing to offer what is determined to be a competitive offering to the auctions that does not include essentially the value of the subsidy.

So that's one option that expanded Mopar [ph] . The other option that PJM actually indicated its preference for, we called capacity repricing, which is an effort to accommodate state public policy decisions by allowing subsidized resources to take on a capacity commitment, but then running a second stage of the auction just to come up with what is the competitive price, where we would take subsidized resources and sort of reprice them in our second stage and determine a clearing price that is intended to represent the competitive level.

We think that might better balance the -- the state desires for their public policy initiatives with the need for a competitive outcome from the auction to ensure that we get efficient entry and exit for the long term, because again it recognizes the state public policy decisions by recognizing the capacity commitment of those subsidized resources, while at the same time endeavoring to ensure that the price that is applied to all resources is one that is based on competitive offers.

So we'll see how FERC deals with that filing. There has been fairly -- a fair amount of back and forth at FERC opinions obviously on all sides of it since we filed it and we ask FERC to make a decision by June 29th. So hopefully FERC will find a way to do that as opposed to requiring more information for PJM or some sort of deficiency notice or something like that, just so that we can have some certainty with what will happen now in the May 2019 auction and going forward. How the potential for Department of Energy action rolls into that I think is to be determined at this point. The lead [ph] to memo referred to a potential for a two-year type of assistance for certain resources while the Department of Energy conducted a study on the national security aspects of basically the fuel security resources on the system.

As you may know, PJM is undertaking an in-depth analysis of the fuel security aspects of resources that are committed as capacity resources in PJM with the idea that if we do see the potential for a fuel security issues in the future, we can put the attributes of what we need for resources to be fuel secure into our capacity market and have the capacity market determine the most cost effective set of resources that have those attributes and are fuel secure through the market mechanism which again we believe is the most efficient and cost effective way to procure resources for the long term.

So that study we hope to be have -- to have finished by the end of August and then engage in stakeholders' discussion on whether we should, and if so, what we should look to incorporate into the RPM auction for May of 2019 and beyond.

So lot going on with respect to political and regulatory actions and efforts and really analysis around what we should be retaining as far as resources that provide the necessary attributes we need on the system like fuel security and we're trying to again balance all these things together and maintain what we believe as really been the successful implementation of the -- and the cost effectiveness of the competitive markets. That's the sort of things happening from the capacity standpoint.

On the energy side, we continue to work through the stakeholder process on price formation enhancements. We're concentrating right now on the reserve markets in shortage pricing, so we have a task force in the PJM stakeholder process that is really digging into the details of proposals we put on the table for how we can enhance how our reserve markets operate and how we do shortage pricing with the idea that if we can get those prices more reflective of the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01449

actions, the operators take to maintain reliability, we would get better energy prices as a result and those are again more comprehensive and more inclusive of the costs of all the resources necessary to maintain system reliability.

So that's really what we're after and making sure that energy prices are as reflective as possible. We're taking sort of a short-term, long-term approach there, trying to get some enhancements to our current synchronized reserve market in place by the winter time. So, getting to the resolution on that by the end of this year. And then enhancements to the operating reserve demand curves and potentially a 30 million [ph] of reserve market in real time by next summer.

So still moving forward on those energy price formation enhancements. And the last one I'll mention is the Fast-Start Pricing that FERC issued at 206, quarter or two a couple of ISOs and RTOs and we have a compliance filing now sitting in front of FERC. FERC has indicated they would act by September. It'd be great if they acted before that, but hopefully no later than September. And hopefully we'll be able to get those enhancements in -- by the winter as well if FERC approves what we filed.

But Kit I know that was pretty rapid-fire, but that's kind of the sort of the scope of the landscape, the way it exists today, it's probably best if I pause at this point and see if we get any questions on the webinar that we'd like to see if we can address.

Questions And Answers

Kit Konolige, Senior Utilities Analyst

Thanks, Stu, that was good. And concise, and to the point, I think it was all of the main questions that I had in mind for the most part. Here's a couple of other questions and some are in the nature of a follow-up. First of all, do you have any sense of where I guess at this point, it's mainly Pennsylvania and maybe still Ohio as States that are being asked to subsidize, especially nuclear plants? Are you aware of any forward momentum in either of those States on -- in the case of the FirstEnergy plants, FES plants in Ohio and the TMI and Beaver Valley in Pennsylvania?

Stu Bresler, Senior VP, Operations & Markets

The short answer to that question is, no. I am not aware of anything that is officially on the table legislatively in either State, Pennsylvania or Ohio. The only action I know of is in Pennsylvania that is in the form of the Nuclear Energy Caucus which is a bi-cameral, bi-partisan group of state legislators in Pennsylvania that has been meeting occasionally to discuss issues with the status of nuclear energy in the State of Pennsylvania. But to my knowledge, there has been nothing foreclosed in the state legislature in either Pennsylvania or Ohio at this point that is under consideration.

Kit Konolige, Senior Utilities Analyst

Okay, fair enough. And then maybe just a little more kind of deeper thoughts on the parent resilience of the coal plants in clearing the auction this time of course, clearing an auction at 140 is obviously more attractive than clearing at 76, let's say. So, is it just -- can you give us a sense of whether it was simply a matter of a higher price was needed to keep in the coal plants that are in the queue already or is something else going on are coal plants getting more cost competitive or are they seeing lower coal prices? Anything, any color you can provide.

Stu Bresler, Senior VP, Operations & Markets

It is actually interesting, if you go down one layer of detail, so let's do that for a minute here. We actually did see several large coal plants that had cleared in the past not cleared this year. But they were more than made up for by increases in the quantity of megawatts clearing from other coal plants. So it appears like what might be happening is, we still have some plants that are just discovering they are economically challenged and so they're starting to not clear

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01450

in the capacity auctions.

But on the other hand, I think the coal resources that are still around have made improvements that can make themselves more efficient. And so we see more of their megawatts clearing at the higher price which I think is a signal that they may very well stick around. So I think we are seeing still that we are going to see some retirements of some additional coal facilities because I think they are finding it more and more difficult, but I do think that there are some coal facilities out there that have again that have made the environmental fixes they needed to make and are making improvements that are making themselves more efficient and they are clearing more of their capacity as a result.

Kit Konolige, Senior Utilities Analyst

Interesting. Yeah, I know that AEP announced that one of their significant plants, I can't remember which one had not cleared and so they're having to think through what they're going to do with it obviously, so that is interesting. How about gas plants? I mean, are there any -- are there any still like old just boiler gas plants that are not clearing or any differentiation in -- by geography, et cetera, or zone where I assume there's always some turnover in which plants clear and which don't but maybe and my impression is generally that people assume I guess that gas plants that's not as big an issue, maybe because they're not as big plants on average.

Stu Bresler, Senior VP, Operations & Markets

Yeah, I don't think there was much that was not the shift that I just described for coal in the natural gas plants. I think the gas plants were relatively stable overall. Again, one new combined cycle clearing and then basically cats and dogs of increases in megawatts from other plants that are clearing, but I'm not aware of any significant natural gas plants that have been clearing in the past that didn't clear this year.

Kit Konolige, Senior Utilities Analyst

Right. And of course, with the -- sorry, well, let me ask you, do you assume that the nuclear plants that haven't cleared are not going to clear in the future, absent some extraneous help of some kind?

Stu Bresler, Senior VP, Operations & Markets

I don't necessarily assume that Kit. I think there is a few that have been cleared in the past, like TMI that has announced retirement, right?

Kit Konolige, Senior Utilities Analyst

Right.

Stu Bresler, Senior VP, Operations & Markets

Exxon announced that their plant didn't clear then. But I think it's too soon to make those kinds of assumptions with other plants that didn't clear this year. Particularly, if we do make some of these enhancements to the energy market pricing and reserve market pricing. It may be enough in the longer term to again have an impact on how these resources offer in the future. So I think there's a lot of moving parts here and it's tough on the basis of one auction to really assume the fate of any particular plan on the basis of that one auction.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01451

Kit Konolige, Senior Utilities Analyst

Right. That's fair enough. Hold on one second. A question just came in here, I think, no, I guess not, okay. Okay. And just then we can wrap it up fairly quickly this time, and -- but let me just ask one final question and that is, I know that of course the staff at PJM is in an ongoing process of projecting what demand is going to be in the future. Are you all seeing any changes in rate of deceleration or any shift towards acceleration at some point, et cetera, or are things pretty much on a pretty even keel like, I would assume a fairly flat projections for power usage in the future.

Stu Bresler, Senior VP, Operations & Markets

Yeah, I mean, it's been flattening for several years as you know Kit, and I think we're -- I don't know if this is going to make sense, but I'll try it anyway. We are seeing a slowdown in the flattening maybe, so it's not -- it has flattened out and it's not -- it can't, it's not going to go -- I don't think anyway, it's not going to go completely flat or negative anytime soon when you look at the long-term load forecast.

On the other hand, we're not seeing a significant uptick at any point in the future either. So we'll have to see how things play out. We are seeing, you know, a steady interconnection of behind the meter solar resources, for example. There is a fair amount of energy efficiency efforts going on out there at the state regulatory level. So we have to see how that plays out in the long term, but I think in the near-term, we've seen the significant sort of deceleration of load growth. It may flatten our hair in the future, but I don't think we're seeing anything really significant in that regard.

But we really want to do our long-term load forecast once a year. So we'll start with the load analysis subcommittee discussions in the fall and then we will be out in -- I think it's late December or early January with the next long term load forecast, it will then go into that May 2019 auction.

Kit Konolige, Senior Utilities Analyst

Right, okay, we'll stay tuned for that. I do have a question that came in now. Is there any reason to think that the EMAC [ph] zone, PSEG zone or ComEd zone might not separate next year and I guess that's kind of directed at -- are there significant transmission projects underway that could change the import and export in those zones?

Stu Bresler, Senior VP, Operations & Markets

Yeah, and the basic answer to that question is, I'm not aware of any transmission upgrades that are significant enough that would in and out themselves cause a lack of price separation there now. You have to combine that with the offer behavior as well. So it's not just the transmission limitation to a given area that determines whether that area binds in the auction or not, it's also the offer behavior of the resources in that area. So again the short answer is to the direct question is, I'm not aware of any real significant transmission upgrades that are going to change the transmission limitations into those areas, but I can't [ph] predict what the offer behavior might be like in future auctions at this point.

Kit Konolige, Senior Utilities Analyst

Sure. More specifically on PSEG zone. I know that this time around there was some discussion I think in your report of the impact of, I think it's largely -- changes in capacity and transmission in New York which I assume is largely related to Indian Point that affected the ability to import in that zone. Is -- I know New York is building a couple of gas plants that are supposedly going to replace them, what's the outlook for that zone, you know broadly speaking in terms of ability to import from New York or export to New York, et cetera.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01452

Stu Bresler, Senior VP, Operations & Markets

Yeah. So the -- what you're referring to is, we changed an assumption in our C-TEL which is the transmission limits into a given LDA. We changed an assumption in our C-TEL calculation for -- in this case it affected the PSEG zone and that assumption was the availability of non-firm imports from particularly the Eastern part of New York.

And the recognition that we made in changing that assumption is that when the Eastern part of PJM peaks, typically the Eastern part of New York is peaking at the same time. And the prior assumption in our C-TEL calculation was that an external zone like New York and we make the same assumption to our West and to our South as well, when we do C-Tel calculation.

If additional non-firm imports from an area that's external to PJM can help increase the C-Tel by backing off flows and what would otherwise be constrained elements, then we assume that external area would have enough energy and we keep increasing those imports. And what we recognized in changing this assumption is because we tend to peak at the same time, and because I don't think Eastern New York necessarily has a lot of reserves available, we basically eliminated that assumption of availability of non-firm imports from New York in the C-Tel calculation and that -- the result of that changed assumption was a decrease in the C-Tel for the PSEG zone, but that was offset somewhat by the fact that the PS calling it real [ph] contract went away, so that helped increase the C-Tel a little bit, but it was more than offset by the decrease in C-Tel from changing that non-firm import assumptions. I don't see a change in the assumption back anytime soon.

Kit Konolige, Senior Utilities Analyst

Right. Well, that's -- I hope you are not changing those kind of assumptions every year, so right that would be (Multiple Speakers) hard to keep up with, right. But I think that's fair, especially given you know the seeming uncertainty of what resources are going to be available in Southern New York over the next few years and we'll have to see how that works out.

Okay. Yeah. So I think that's about it as far as questions go including my own. So anything else to that -- that we should keep in mind about PJM or the power markets overall?

Stu Bresler, Senior VP, Operations & Markets

No, I think we hit the highlights today Kit. I think, yeah, we will keep holding our capacity auctions, so we look forward already to the one in 2019. But in the interim dealing with these fuel [ph] security issues, the energy market price reforms, we had even talked about planning and order 1,000 and all those issues that we're dealing with as well, so there is definitely a lot going on for sure.

Kit Konolige, Senior Utilities Analyst

Right. Keeping you guys busy and meanwhile also having to keep the air conditioners on as summer approaches. We haven't -- remind me, have we had -- is this -- had the last few summers been especially hot or are we due for a real stretch of 95 degree weather here?

Stu Bresler, Senior VP, Operations & Markets

Yeah, I'd say overall for the last few summers, we've had pretty mild weather. I think we got a little bit --

Kit Konolige, Senior Utilities Analyst

Operator

Ladies and gentlemen, thank you for standing by and welcome to the 2018 Q1 Earnings Call. All lines have been placed on mute to prevent any background noise. After the speakers' remarks, there will be a question-and-answer session. (Operator Instructions)

Thank you, Mr. Dan Eggers, Senior Vice President of Investor Relations, you may begin your call.

Daniel Eggers, Senior Vice President of Investor Relations

Thank you, Geneva. Good morning, everyone, and thank you for joining our first quarter 2018 earnings conference call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer; and Jack Thayer, Exelon's Chief Financial Officer. We're joined by other members of Exelon's senior management team and will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, both of which can be found in the Investor Relations section on Exelon's website. The earnings release and other matters which we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material and comments made during this call.

Please refer to today's 8-K and Exelon's other SEC filings for discussions of risk factors and factors that may cause results to differ from management's projections, forecasts and expectations.

Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for reconciliations

Bloomberg Transcript

between the non-GAAP measures and the nearest equivalent GAAP measures. We scheduled 45 minutes for today's call.

I'll now turn the call over to Chris Crane, Exelon's CEO.

Chris Crane, President and Chief Executive Officer

Thanks, Dan, and good morning everyone, and thank you for joining us today. We have had productive few months since our last earnings call, making important steps and reinforcing our value proposition.

At our PHI utilities, we reach settlement in both Pepco Maryland and Pepco DC rate cases. With these settlements, we are now reached constructive settlement in all PHI jurisdictions since the close of the merger and accomplish that legacy PHI is not achieved in many years. This reflects a positive evolution of our engagement lease states. Our employees' hard work to improve system reliability and performance have led to rising consumer satisfaction.

The progress we have made is reflected in our constructive partnership with our regulators, there is always more work to do, particularly on our earned ROEs. But we are encouraged by these developments. In New Jersey, state legislatures -- legislators passed three important energy policy laws with strong majorities on April 12.

Most impactful to Exelon was the New Jersey ZEC program similar to that in New York and Illinois. That will be more fairly compensating our nuclear generating assets in New Jersey for Clean Energy attributes of these plans. In March, our East Coast utilities were battered by three nor'easters that resulted in about 200 million of spending between capital and operating expenses.

Thanks for the tireless efforts of our employees and contractors. We were able to restore power to the effective customers safely and quickly. These storms were challenging and the benefits of our scale were on display in March. We are able to return customers to service days faster than we would have as a standalone utility.

Finally, we had a strong quarter financially. On the GAAP basis, we earned $0.60 per share versus a $1.6 last year on a non-GAAP basis, operating basis we earned $0.96 per share versus 64 last year. Just above the midpoint of our $0.90 to $1 guidance range, while overcoming a $0.06 storm costs through March.

Turning to slide six at the utilities. We continue to execute a top quartile levels across key customer satisfaction and operating metrics. The investments we're making are paying off and improve reliability, which is strengthening our relationship we have with our customers and regulators.

These following numbers, these numbers follow the standard industry pack practice of excluding major storms although the benefits of our scale helped on recovering efforts, which I'll discuss in the next slide. I would note the Pepco DC has achieved a record reliability in the past two years since joining Exelon family of companies.

We continue to make gains as we share best practices across all utilities. We also continue to focus on helping customers in communities becoming more energy efficient, saving energy and money. We have been doing this for years and I'm happy to once again announce that EPA named all five of our eligible companies BGE, ComEd, Delmarva, Pepco and PECO as 2018 Energy Star partners of the year.

Our companies also received -- sustained excellence designation for being main partners three or more years in a row. Safety is always our highest priority and we review our OSHA recordables in the first quarter. We've identified a number of areas for improvement and have implemented a series of actions to get those numbers back on track.

At ExGen nuclear generation this quarter was 40 terawatt hours with capacity factor of 96.5%. Our Texas CCGTs continue to perform well, very well with an economic dispatch match rate of 96.6% ramping up and down to optimize by hour by hour the variability and ERCOT pricing.

Turning to slide seven, I'd like to take a moment to highlight our utilities performance and the outstanding work from our crews as they battered three consecutive -- battled three consecutive nor'easters in March. These storms blanket our

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01456

East Coast utility with heavy wet spring snow and high winds that are especially hard on the system.

Over the span of these storms, we'd faced 1.7 million cumulative customer outages and shared over 1,600 Exelon employees and contractors with our sister utilities. ComEd alone provide an additional 1,200 workers and contract crew members. We also incurred, as I said 200 million of operating capital expenses to help put this in context, we replaced approximately 1,200 power poles and handled more than 1.8 million customer calls. With that context, let me share with you the success story of the combined Exelon utility families.

Because of our employees are trained on common practices. We're able to seamlessly incorporate workers from different utilities more quickly to get work in return service to our customers. Each storm impact to the service territories differently, but the last of the storm -- three storm significantly impacted Atlantic City Electric. We were able to bring in crews and contractors in ComEd, PECO, Pepco, Delmarva and BGE to assist in the restoration effort.

Our scale and performance notably sped up the recovery and allowed us to send over 250 employees and contractors in the New Jersey to aid in the restoration effort. The storms that occurred this quarter, provide a great example of how our model directly benefits our customers. The scale of the Exelon utilities and how we run these businesses continue to contribute to higher quality, more responsive and cost-effective service for our customers.

Turning to slide eight, last call we provided an update on the impact of tax reform. But I want to revisit it, as we have been working with our regulators to pass these savings on the customers. We've identified over 500 million in savings to be returned to our customers related to lower corporate tax rate on our distribution utility operations.

As we have said from the start, the benefit of the lower income tax rate will provide a meaningful savings to our 10 million utility customers. We appreciate the constructive relationship with our state regulators and that are allowing us to pass along these benefits to our customers in the timely fashion.

Turning to slide nine, we made additional progress in establishing compensation for our nuclear generating fleet that recognizes the value of their emission-free generation in the underlying deficiencies and market design. The most significant development was in New Jersey legislation as I spoke of enacting ZEC program into law. Establishing a path forward to preserve the at-risk nuclear plants in New Jersey. I want to thank our team and our partners at PSEG leadership, the leadership in the Senate and the Assembly and the governor for working together to pass this some good [ph] legislation.

Once the governor signs the bill, the ZEC program will go to the BPU for its review of the applications. There is a 330 day deadline for completing the process, putting the program implementation likely at the end of the first quarter in 2019. At that time, we'll start road realizing the New Jersey ZEC revenues. We are pleased that New Jersey has joined New York and Illinois in Connecticut and recognizing the clear environmental attributes of the nuclear generating fleet.

We still see need for more comprehensive solutions to compensate for this Clean Energy, but we think expanding the ZEC program is a key interim step to preserving our most challenged assets, extending the useful lives in the long-term value of this fleet.

Turning to the existing ZEC programs in New York and Illinois, we have had oral arguments in both cases at the federal court levels. In Illinois, the court requested and now waiting for the US government to provide a view on the case. In New York, the decision is with the judges, as they had no outstanding items following the oral argument.

We remain confident in our legal position in both cases and continue to collect the ZEC revenues. With respect to PJM work on price formation, FERC is committed to ruling on PJM's fast start price formation by September, if not sooner. As many parties have requested, PJM is committed to operationally implement the rule as soon as FERC gets approval. FERC's decision on fast start will dictate the process for additional reforms aimed at eliminating flaws in the current pricing formation rules that currently prevent some units from setting price.

In addition, PJM is now set deadlines for stakeholder reviews of reforms to its shortage pricing rules including those related to reserve and operating reserve demand curves. We see these price formation changes is essential to preserving an effective competitive market in PJM and apply the ongoing efforts to design and implement these changes.

Finally, just yesterday PJM committed to study fuel supply vulnerabilities that could arise if the grid became dominated by natural gas generation. In its White Paper PJM called for reforms of its capacity market to better value fuels secure resilient resources. We have seen this is a positive first step where we urge PJM to model the carbon in air pollutant implications of greater reliance on fossil fuels particularly oil-fired power plants to meet electrical demand.

Our states and customers communities expect us to develop policies that will lead to less pollution, not more. So we believe PJM should study emissions consequences as well.

Now, I'll turn it over to Jack to walk through some of the numbers.

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

Thank you, Chris and good morning everyone. Turning to slide 10. We had a strong quarter financially ,delivering adjusted non-GAAP operating earnings of $0.96 per share just above the midpoints of our guidance range of $0.90 to a dollar per share. This compares to $0.64 per share in the first quarter of 2017. Better results from generation offset the storm-related cost pressures of the utilities.

Exelon's utilities delivered a combined $0.47 per share, net of Holdco ,which includes $0.06 of higher storm costs. Since, we've not had significant winter storms like these in years, let me remind you how major storms are treated in our different mid-Atlantic jurisdictions.

In New Jersey and Maryland excluding BGE, we have a tracking mechanism for major storms. So, the costs incurred during the first quarter are deferred as a regulatory asset and will be recovered in the future thereby not impacting our reported earnings.

In Delaware, Pennsylvania, Washington DC and for BGE in Maryland, when we file rate cases. We use an average of major storm costs from previous years, that is included in our rates and assumed in our budgets. In years, when major storms exceed, the historic average Exelon absorbs the additional storm costs but future rates will be adjusted to reflect these costs.

With March, marches [ph] winter storms, we exceeded our storm budgets with which left us $0.06 per share behind plan in the first quarter of 2018. As we look out to the remainder of the year, we will have to find offsets at the utilities to mitigate any additional major storm expenditures, which historically have come in the first and third quarters.

Looking beyond the storm impacts our utility results did benefit from additional revenues associated with resolved rate cases. We would also expect PHI to catch up on some of their normal course O&M expenses over the balance of the year. Generation had a strong quarter relative to plan earning $0.49 per share.

We had good performance from our nuclear assets with better capacity factors than budgeted. We also benefited from lower O&M expenses and favorable spot market prices. We're reaffirming our full year guidance range of $2.90 to $3.20 per share, which you can see on slide 19 and expect to deliver operating earnings of $0.55 to $0.65 per share in the second quarter compared with $0.54 last year.

Turning to slide 11, the $0.96 per share in the first quarter of this year was $0.32 per share higher than the first quarter of 2017. Generation earnings were up $0.32 per share compared to last year with the ZECs representing the most significant source of uplift as we recognize the true -- true-up of the 2017 Illinois ZEC revenues in the first quarter, which added $0.11 per share. And we realized full quarter contributions from Illinois and New York ZEC programs, including the acquisition of Fitzpatrick, which were not in effect during the first quarter of 2017.

Relative to the first quarter of 2017 generation also benefited from higher capacity pricing in New England, the Midwest in the Mid-Atlantic regions. As a whole, the utilities were largely impacted by higher storm costs, which was partially offset by increased electric distribution and transmission revenues due to higher rate base, ComEd increased transmission revenue, BGE rate increases at PHI and favorable weather at PECO.

final
Bloomberg Transcript
Bloomberg

Moving to slide 12, on a trailing 12-month basis, our overall earned ROEs slipped modestly from last quarter, but are near the midpoint of our targeted 9% to 10% earned ROEs that underpin our target returns for 2019 and beyond. The biggest drag in overall ROEs compared to last quarter came from the increased major storm expenses that I discussed earlier.

In total, the storms reduced earned ROEs by 10 basis points for our total utility businesses on a trailing 12 months basis, will remain diligent in managing our operating expenses to dampen the effects from the storm costs.

Turning to the PHI utilities, the absolute levels of earned ROEs still have room for improvement even when we adjust for the 60 basis point drag from the fourth quarter FAS 109 write-off. That said the recently filed settlements at Pepco DC and Pepco Maryland should start to lift Pepco's earned ROEs in the second half of 2018. We also experienced higher O&M in the first quarter than budgeted, which is due to timing issues and should reverse over the remainder of the year and help to lift earned ROEs.

As we look at our earned ROEs for the rest of 2018 for the overall utility. Tax reform is positive to earnings but also creates ROE headwinds this year, due to the timing of equity injections to fund deferred tax returns before the higher equity is reflected in rate cases. The ROE impact is primarily a 2018 timing issue and is already captured in our earnings outlook. We still expect earned ROEs in 2019 to be solidly in the 9% to 10% range.

Turning to slide 13, We've had a constructive regulatory quarter. Starting with the most recent developments, we were pleased to reach a settlement agreements in April at both Pepco DC and Pepco Maryland providing revenue decreases of 24.1 million and $15 million respectively. The decreases include adjustments for forecasted tax benefits to customers with the recent tax reform legislation. The settling parties have proposed a procedural schedule that would place rates in effect by June 1st for Pepco Maryland and July 1st for Pepco DC. We were happy to have reached constructive settlements with key intervenors in both jurisdictions that provide bill relief for customers while also providing a return on our investments and being resolved months earlier than if the cases had been fully litigated.

On March 29, we filed our first case at PECO in three years, where we requested an $82 million rate increase, with the scheduled completion by December 31. The filing is focused on supporting PECO's strong reliability performance, strengthening system resiliency and supporting physical security and cyber security. I should also note that the $82 million is net of $71 million tax credit for 2019 tax reform benefits and that the five year average storm cost in the filing includes the costs incurred in the first quarter.

On April 16, ComEd filed its annual distribution formula rate update with the ICC seeking a $22.9 million decrease to distribution base rates. The decrease is primarily driven by an adjustment or forecasted tax benefits resulting from the recent tax reform legislation. On February 9, we closed out the Delmarva Maryland rate case with a $13.4 million revenue increase effective immediately. Finally, we have outstanding cases in Delaware at Delmarva electric and gas that are scheduled for completion in the third and fourth quarters respectively. More details on the rate cases in their schedules, can be found on slides 22 through 27 in the appendix.

Turning to slide 14. In the first quarter, we invested $1.2 billion of capital at the utilities and are on track to meet our $5.5 billion budget to the benefit of our customers. Considering the significant number of projects that go into our overall capital budget, we thought a more regular update on specific projects would be useful to appreciate how these investments are benefiting our customers and communities.

Today, I'd like to highlight two projects, the first is DPL's Cedar Creek to Milford transmission rebuild. This 75 million project entails replacing approximately 43 miles of 230 kV transmission poles as well as new conductor and optical ground wiring. The 230 kV line is critical for the transmission network in the Delmarva region and will improve reliability by eliminating the potential for outages due to structural failure of the line.

The second project, I'd like to highlight is ComEd's future new substation in Elk Grove. The $90 million green-field substation is expected to be in service by the third quarter of 2021. The project will support transmission line reliability and projected load growth primarily from Data Centers in the Elk Grove village area by adding over 300 MW of additional new capacity.

final
Bloomberg Transcript
Bloomberg

Slide 15 provides our gross margin update for ExGen, which saw some movement within the buckets but total gross margin in each year is unchanged from our last update. For 2018 open gross margin was up $250 million primarily due to strengthening ERCOT spark spreads offset by our hedges. We also had a strong quarter and execution creating $200 million of Power New Business.

2019 and 2020 gross margins are also flat relative to our last disclosure. In both years, open gross margin increased by $50 million on strengthening ERCOT spark spreads which was offset by our hedges. We're also able to execute a $100 million and $50 million of Power New Business in 2019 and 2020 respectively.

We ended the quarter, approximately 6% to 9% 33:39 behind our ratable hedging program in 2018 and 8% to 11% behind ratable in 2019, when considering cross commodity hedges. We remain comfortable being more open when we look at market fundamentals.

Turning to slide 16, we remain committed to maintaining a strong balance sheet and our investment grade credit rating. We are forecasting ExGen's leverage to be 2.5 times debt-to-EBITDA at year-end 2018, which is below our long-term target of three times debt-to-EBITDA. On a recourse debt basis, we are at 2.1 times, which is well below our target. We will continue to manage our balance sheet at ExGen overtime to three times debt-to-EBITDA level, so look for us to focus on debt reduction at both HoldCo and Genco.

I'll now turn the call back to Chris.

Chris Crane, President and Chief Executive Officer

Thanks, Jack. Turning to slide 17. We remain firmly committed to our strategy and see progress in the first quarter, whether it be the rate case settlements of PHI, the benefits of the scale and our storm restoration for establishing ZEC programs in New Jersey, our financial footing is very strong.

Here again is our value proposition. We will continue to focus on growing our utilities targeting 7.4 rate base growth and 6% to 8% EPS growth through 2021. We continue to use free cash flow from ExGen to fund incremental equity needs of the Utilities, pay down debt over the next four years at ExGen and the HoldCo and part fund a faster dividend growth rate.

We continue to focus on optimizing value for ExGen business by seeking fair compensation for carbon free generation fleet in Pennsylvania as we have done with the ZECs in New Jersey, Illinois and New York. And this adoption of price formation in PJM and resiliency initiatives at FERC will also benefit. We continue to close uneconomic plants, sell assets where it makes sense to accelerate our debt reduction plans and maximize value through the gen-to-load match strategy. We continue to sustain strong investment grade credit metrics and grow our dividend consistently a 5% through 2020.

With that operator, we can now open it up for questions.

Questions And Answers

Operator

(Operator Instructions) Our first question comes from line of Gregory Gordon with Evercore.

Gregory Gordon, Analyst

Thanks good morning. Great quarter considering all the storms you had. I've got a few questions.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01460

Unidentified Speaker

Sure.

Gregory Gordon, Analyst

The first is looking at the -- your gross margin slide, you did comment that you had some puts and takes and that the total expected gross margins are the same. I see from looking at the prior quarter's deck that you're sort of NiHub's around the clock pricing is down, mid-Atlantic's a little better, ERCOT's sparks are a lot better. But when you show us the open gross margin and you roll down to the total expected gross margin. How are you thinking about current forwards in ERCOT goal -- rolling into spot pricing, and are you just giving us sort of a theoretical make it mark assuming you can roll all the current run up and spark spreads into spot or is there some, some sort of a holdback there, given the uncertainty with regard to some of the volatility?

Joseph Nigro, Executive Vice President

Hey, Greg. Good morning, it's Jo Nigro. It's a good question, Greg. And as you've mentioned, there is a lot of volatility expected in ERCOT this summer. And for us, it's not as simple as just selling the generation output. As you know, we have a very big load book of business, so we have to take that into account as well, and we look at those scenarios under a lot of different outcomes, be it higher prices and/or lower prices and we try to set up the book accordingly. When you look at the disclosure here, we're simply mark-to-marketing the value of our open position in the open gross margin calculation and there was a large uptick to the tune of about $300 million if it had been a fully open book.

Offsetting that, obviously, is the mark-to-market of our hedges that are on the book given the strong move and the sales we've made. And that next to a gain in the portfolio of about $50 million. As for a holdback, any holdback would be relatively small in the overall total gross margin of the over $8 billion that's expected. And we would do that given some of the uncertainty of outcomes that we expect.

Gregory Gordon, Analyst

Okay, great. Thanks, Jack I've got a couple questions for you. Looking at the slide, where you give the projected sources and uses of cash. As I compare that to the last quarter disclosure, it looks like regulated utility investments, expected investments are up a little bit. But overall, free cash flow profile into the end of the year, actually looks like it's still net-net improved even after slightly higher CapEx. Is that our fair synopsis? And I know it's a small increase, but what are those capital expenditures being directed to?

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

It is a fair Synopsys, and I think the CapEx is really related to storm. Investment, Chris talked about the significant investments that were made in the mid-Atlantic utilities during that storm. So that's why you see the increase and CapEx there, to your point, the overall cash flow profile of the company looks quite strong.

Gregory Gordon, Analyst

Right. And my last question actually goes -- because you didn't put it in this deck back to the Q4 deck, where you had EPS sensitivities related to interest rates and it looks to me like the 30-year is up about 37 basis points since year-end, when you guys put in here the interest rate sensitivity for comment ROE and pension expense since $0.03 in each instance for every 50 basis points at least looking at '19. So is it fair to say that these be sensitivities still hold because

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01461

that would mean your -- you might be as much as a $0.05 ahead of where you were in '19 at the beginning of this year.

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

I think the $0.05 sounds a little high, but they do hold. And as you know we benefit from rising interest rates. Relative to other utilities because of the tied to the formula rate in Illinois, but also because of our significant pension liability. And as interest rates increase the liability shrinks, so no question, this rising environment is helping our costs as well as our revenues and EPS. But a $0.05 does seem a little bit progressive.

Gregory Gordon, Analyst

Okay. Thank you, Jack. That's all I've got.

Operator

And our next question comes from the line of Jonathan Arnold with Deutsche Bank.

Jonathan Arnold, Analyst

Good morning, guys.

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

Great.

Jonathan Arnold, Analyst

Just hoping to follow up on the ERCOT comment. just now. I think I heard you say 300 million is roughly the gross margin. And then with the hedging value, it sort of offset down to 50 was that a 2018 comment. And if so could -- could we get some sort of, sense on '19 and '20 because those sort of hedge spark numbers that you give finding a little difficult to unpack those.

Joseph Nigro, Executive Vice President

Yeah, the comment I made was in relation to '18 Jonathan. But you could think similarly, not in magnitude of dollars, because we haven't seen the absolute price change that we saw in '18. But you had a pick-up in open gross margin in '19 and '20. And similarly, we had a mark-to-market drop in '19 and '20 given that we've sold in obviously at lower prices.

Given that those -- those market prices haven't moved nearly as greatly on the back-end in '19 and '20. You could just the -- that the absolute value of the dollars, isn't going to be as great. I think the other element there, though, is you've seen this market move pretty appreciably in the front end, and rightfully so, given where reserve margins are in the announcements of the retirements. I think you could expect some extreme volatility this summer, and that will be obviously weather-dependent and dependent on unit performance as well as our wind performance. I think the other element though is, if we see some of that volatility that's expected. It wouldn't be unreasonable to think that you would see price appreciation in 2019 and '20 on the back of it, just could because it hasn't moved and as you could see from our disclosures, we're not only carrying a long position in '18, we have quite a bit of power still opened in '19 and '20 as

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01462

well.

Jonathan Arnold, Analyst

Sure. Thank you. Thank you, Joe. But can you just when you look quarter -- first quarter versus year-end you know the effective realized energy price spot number you gave is of down. So just give us a -- remind us of sort of how that works and I think the message is the margins up somehow that indicator goes down.

Joseph Nigro, Executive Vice President

Yeah. And it's slightly different for the baseload regions. I'll call the Midwest and the mid-Atlantic versus the calculation in ERCOT as you know ERCOT, we're trying to give you a view of a spark spread, which is more relevant to our machines. And the formula is laid out here. It's very simple, we take a gas price using Houston ship Channel multiplied by heat rate and add some variable O&M to set the reference price.

What we then do is, we got to add back or subtract from the mark-to-market value. And the way to think about that is that's a dollar amount. So we calculated the reference pricing at unit of dollars per megawatt hour. We've now got a bucket of dollars on a mark-to-market basis that we need to divide by the volume sold to bring it back to that same unit of dollars per megawatt hour. It just so happens in 2018, when you look at the effective realized energy price, it's next to zero. We've seen it in the past to actually go negative in ERCOT if we have a large mark-to-market loss with very small volumes sold and then you could see in the out years in '19 and '20 that's a positive outcome or a positive spark.

Jonathan Arnold, Analyst

With the net-net and then that is that your expected margin is higher. Correct?

Joseph Nigro, Executive Vice President

Yes. Our expected margin in ERCOT is higher in each year, given that we're carrying an open position in all those years. And the market is going higher. Now, that was offset as we mentioned in the first question from Greg with some of the changes on the rest of the portfolio to keep the gross margin on the bottom line balanced.

Jonathan Arnold, Analyst

Thank you. And then just one other little issue. So we noticed that there were particularly low tax charges both PECO and PHI in the quarter. So there something unusual going on there, or should we be thinking as we sort of push those through the year.

Chris Crane, President and Chief Executive Officer

PECO I think it's -- specific and its tax repairs. So as we invest capital for the storms that shows up later in the benefits in tax repairs. Same is true in some -- certain of the PHI jurisdictions.

Jonathan Arnold, Analyst

So what would be of standards? Should we continue the fact through the year, Jack? Or is it really just like a Q1?

final

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

its a Q1.

Jonathan Arnold, Analyst

Okay.

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

And depending on what storm activity we see in Q3 or Q4.

Jonathan Arnold, Analyst

Yeah. Good. Okay, thank you very much guys.

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

Sure.

Operator

And our next question comes from the line of Steven Fleishman with Wolfe Research.

Steven Fleishman, Analyst

Yeah, hi. Curious just -- there's a lot of retail businesses that looks like or on the market these days. How interested might you be in expanding retail through acquisition?

Joseph Nigro, Executive Vice President

Steve, we're always interested --. Good morning. First of all, it's Joe. We're always interested in looking at whatever opportunities exist in the marketplace. As you know, we have a history of acquiring companies and in our recent past, when you look at Integrys and ConEd, for example. And we'll continue to do that to the extent, we can add something like that we think will be accretive to the bottom line and fits with the value proposition that we're trying to bring both to our shareholders and our customers. We're going to be aggressive with doing that. There has been some change of hands with retailers in the near term here. And we will expect that to continue given some that are in the market now and we'll continue (inaudible).

Steven Fleishman, Analyst

Okay. And then just the continued comment on staying more open do to -- your view that power prices are I guess upside you're seeing power prices. How much of that is the potential market reforms versus just expecting better -- better price kind of without them or is it a mix of both?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01464

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

It's a mix of both. I think you have to take the whole picture into account, when you look at our portfolio, from my lens, I think about risk reward and when you look at where the power curve is like for example in the Midwest, now and where gas prices are, we think about it from a heat rate perspective and we see upside to that. And that's driven by some of the reforms that PJM themselves is talking about. And obviously, Joe and a number of folks here at Exelon are working on very closely and we stayed very tied to that.

And then in addition to that, we look at history and changes in the composition of the generation stack and the transmission stack. I still go back to some of the easy examples that we had gas prices two years ago at a $1.70 [ph] and we have power prices that were almost $26. We have gas curves at $0.75 or $0.80 higher than that and you see power prices that are lower than where they were. So it becomes a question of risk reward, when you overlay just the fundamentals of the market itself. And then, obviously some of the regulatory reforms that are out on the horizon.

Steven Fleishman, Analyst

Okay, thank you.

Operator

And our next question from the line of Julien Dumoulin with Bank of America Merrill Lynch.

Julien Dumoulin-Smith, Analyst

Hey, good morning.

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

Good morning.

Julien Dumoulin-Smith, Analyst

Hey. So perhaps to follow-up on the Steve's question a little bit. Can you talk a little bit about expanding margins that are on retail? And just what you're seeing out there, obviously sort of your peers of late have really been adamant in seeing an opportunity there. Just be curious to hear your latest assessment? I know you guys have seen a variety of different dynamics in the retail markets in recent months. So, I'll leave it there.

Joseph Nigro, Executive Vice President

Yeah, Julien. Good morning, it's Joe. I guess I really can't speak to what my competitors are actually achieving. I have an understanding of what they're saying and we know how they're reacting in the market. What I would tell you is, we think about our load serving business across the whole -- wholesale perspective, when we think of polar options as well as our independent retail business, it's tied very closely obviously to our generation portfolio.

I think first of all, the volatility during the quarter, especially in New England and PJM was good to see. We've got an expectation of volumes and margins that are in our disclosure and we're comfortable with those and they remain -- the margins remain in line with what our expectations have been historically for C&I margins. We're comfortable with our projections overall. I will tell you, we've seen some competitive behavior change on the retail side, some folks, I think

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01465

were hurt last year with -- with low volumes and when you get into some of the non-energy charges and how they're calculated on a volumetric basis.

And we've seen some of our competitors move away from fully fixed price contracts in certain markets. And we will continue to offer those products and we're going to remain disciplined to our approach. We spend a lot of time analytically evaluating data and using that data to inform our decisions, both from a generation to load matching strategy, from a pricing perspective and a product development perspective. And as you know, last year we had some challenges in our retail business. We're comfortable where we are now. I will tell you on the wholesale polar option side in the first quarter, we have had some success and I think it's directly attributable to the volatility that we saw in late December and early January and quite frankly in March as well in Eastern PJM with higher prices .

So overall, we're comfortable with what's reflected in the disclosure and we're comfortable with the margins and the volumes and we'll continue to work hard and it is a very competitive marketplace.

Julien Dumoulin-Smith, Analyst

And I just wanted to follow-up on one specific plant here Mystic in New England. A lot of different dynamics playing out right now, but it would seems if you need to clear your assets, at all of the units, if you will, and then keep them around or would you actually look to retire select units here, if they don't actually get picked up with an arm [ph] or otherwise?

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

I think we've been very clear, right. I mean, we announced the acquisition of the Marine Terminal. We have an obligation for capacity that we are going to honor and that's part of the reason that we're driving towards that acquisition of the Terminal. We've also been very clear that absent market reforms. We don't see profitability for these units into the future, and we're working very closely to try to rectify that. I mean, the ISO themselves put out the study recently, saying that there were five assets in New England needed to ensure the reliability to the future, one being the Everett Marine terminal and the others being the Mystic assets. So putting all that together, as we've done in PJM and other areas with the capacity market, I think we take a very prudent approach to how we manage this looking into the future, and we're going to do the same thing in New England, we'll honor the commitment for capacity and we're going to look to get to the right reforms to make these assets more economic in the future.

Julien Dumoulin-Smith, Analyst

All that needs to clear, right?

Joseph Dominguez, Executive Vice President, Governmental and Regulatory Affairs and Public Policy

Julien, this is Joe Dominguez. Actually, no, that's wrong. We don't have to clear the units to participate and in fact, absent successful filing by the ISO on this wafer that they filed last night. To offer a cost of service rate to Mystic, we will not clear. We will not participate in future capacity options.

Julien Dumoulin-Smith, Analyst

Excellent. Thank you.

Operator

And our next question comes from the line of Stephen Byrd with Morgan Stanley.

Stephen Byrd, Analyst

Hi, good morning.

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

Hi, Steve.

Stephen Byrd, Analyst

I wanted to touch on your additional leverage capacity and I guess what I'm thinking about is, as you continue to shift your earnings mix more towards regulated our earnings and you're certainly doing that organically. But I guess, I'm also thinking about in organic waste to do that as well. Could you talk at a high level in terms of what that might mean in terms of different risk profile with rating agencies at different targeted credit metrics et cetera, if you pivot increasingly more towards regulated earnings?

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

So Stephen, I think, I think you know we've been incredibly conservative with our balance sheet in taking that approach and I think it's worked well with the agencies. As we do get more regulated contribution, certainly the earnings mix of the company shifts as does the risk profile. That married with a three times debt-to-EBITDA target at the Genco, which we're well below now I think positions the company quite well. We have in the past spoken with the agencies particularly S&P about upgrading us at the holding company level. And we will continue to pursue that as the mix shifts occurs. I think our case strengthens. So that's kind of conservative approach we're taking.

Stephen Byrd, Analyst

Understood. And then shifting gears to the PJM White Paper, Chris, that you mentioned in your prepared remarks and thinking about fuel resiliency, fuel security. Procedurally, as sort of how do we think about how PJM might approach that from a process point of view? I know it could to take quite a bit of time to do more work, more analytics around that at PJM, but is there anything you can tell us in terms of just thoughts on how that process might unfold?

Joseph Nigro, Executive Vice President

Yes. Stephen, it's Joe and let me just start off with an observation. It's interesting Secretary Perry in the 403 last fall identified a resilience problem in these markets. And as you know that proposal was widely panned with a number of parties indicating that there is no resilience issue. Yet in the last 48 hours, we've seen a filing by the New England ISO to retain Mystic on fuel security resilience grounds. And of course, we saw this White Paper from PJM on Monday, indicating that it too may have a resilience problem that would require capacity market changes.

From our perspective, turning to that White Paper the things that are going to be important is to understand the analytics, the inputs into the analysis that PJM runs, and in particular how they think about the unavailability of natural gas pipeline service and for what duration. What Chris mentioned at the top of the call, is that in addition to those constraints through those modeling parameters. We'd like to see them model environmental impacts associated with

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01467

this fuel mix.

We kept the New England system running this year really on the back of oil-fired units and while we succeeded in keeping the lights on, it was a disappointing outcome for environmentalists in New England, where we burn 2 million barrels of oil. And disasters, as frankly outcome for the stakeholder process in New England where they want to get to lower air pollution, carbon and conventional pollutants emissions.

So we think that needs to be incorporated as well into PJM's analysis and until we get those environmental externalities incorporated, we're not going to have a complete market. So we see this as a positive step forward. We're going to look very carefully at how they intend to model this situation, again the unavailability of gas and for how long. And we think if they do that right. They're going to find that they too like New England have a significant number of fuel constraints on the system. That will require them to preserve fuel secure resources.

Now that that could be a gas plants on Marcellus shale storage. It could obviously be nuclear plants and it could be coal plants but then we need to take another look at that mix, and make sure we're meeting the expectations of our customers and communities in terms of environmental impacts.

In 2018, emissions need to be going down. And any resolution of this issue that results in emissions going up is going to continue to create incentives for state actions and indeed for other federal actions to correct the flaws in this market.

Chris Crane, President and Chief Executive Officer

I want to just follow-up on one thing, I want to make it clear, we are not anti-gas. We think that the consumers in the country have really benefited from the plentiful low-cost gas, but as we look at the transmission system designs in the country. The n-minus one concept that coordinates power flows across our system in the loss of major lines is a design basis. What we need is a design basis threat on the gas system to the electric system and ensure either redundancy in capacity for getting the gas to the plants or limit the dependency on the gas, so we can keep the system up along with what Joe said on the environmental attributes.

So we don't have a combined gas and electric day coordination. We don't have a design basis threat to the gas system that -- that would affect the electric system properly and that needs to be worked out.

Stephen Byrd, Analyst

Very thoughtful response. I mean it seems like the analysis is, as you said, it's important to get the parameters set. That process could take a while. But I appreciate your point about what that analysis could result and thanks so much for the color.

Chris Crane, President and Chief Executive Officer

Sure.

Operator

And our final question comes from the line of Praful Mehta from Citigroup.

Praful Mehta, Analyst

Hi, guys. Thanks so much.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01468

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

Hi.

Praful Mehta, Analyst

So a quick question on price formation. Could you just remind us, what is the impact that you see for price formation for your assets and how does that net out against the assets that are receiving zero emission credits. Is there any net out of that as well?

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

So I'd jump in, what we have talked about is really what PJM has modeled. And as a grouping of two different initiatives, the fast start initiative and the full (inaudible) relaxation for baseloads -- baseload units PJM as modeled a $3.50 impact to energy markets. We haven't published or discussed any numbers different from that. In terms of how it interfaces with the ZEC program remember that the units that we presently have in the ZEC program or in New York, which would be unaffected by that change Clinton, which is in MISO again unaffected by that change. So the only unit presently, we'd be talking about is Quad Cities. And yes, as energy prices go up, either as a result of energy market dynamic changes, policy changes carbon being in the market, there would be essentially an offset to the ZEC payment plans that are participating.

Praful Mehta, Analyst

Okay. That's helpful. And that will apply to New Jersey as well?

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

In New Jersey, the mechanism is going to be different but as prices -- if prices recover for other reasons, the program also will have the BPU look at pricing in future years and potentially make adjustments. The key in all of these states is to preserve these zero emission resources for the customers.

Praful Mehta, Analyst

Got you. And that's helpful. And just quickly that connecting that with capital allocation, right. If you do have the upside from price formation and zero-emission potentially in Pennsylvania as well. You've already kind of laid out a plan, which allocates all the capital into all the different kind of criteria you've mentioned from debt reduction [ph] to dividend, where do you see the incremental capital, if it does come through get allocated in your plan currently?

Jonathan Thayer, Senior Executive Vice President & Chief Financial Officer

Yeah, we have good capital resources today. We have good sources of investments to make for customer satisfaction reliability. So we'll -- we'll continue on that path. But we have to maintain a very strong sensitivity to the consumer impact on excess of capital going on the system. We can install $8 worth of capital and keep rights the same by reducing O&M by $1. And that's what we have to be focused on is customer service reliability and the impact on our consumers. So that would be the -- that will be our approach as we go forward.

Praful Mehta, Analyst

Got you. Thanks. Thanks a lot guys.

Operator

I would now like to turn the call over to Chris Crane for closing remarks.

Chris Crane, President and Chief Executive Officer

So I want to thank everybody again for attending the call and the questions. We are always available for any further details that you want going through then. We had a very good first quarter. We anticipated good 2018. The work that's being done by all our operating groups continue to ensure that we maintain a strong balance sheet and deliver on the value proposition. I won't worry you out with my opinion of the valuation of the stock. We have had some improvement, but we -- as we execute, we expect to see more improvement on that in the following quarters in the year. So with that, thank you very much.

Operator

Ladies and gentlemen, this concludes today's conference call. We thank you for your participation. You may now disconnect.

MANAGEMENT DISCUSSION SECTION

Daniel L. Eggers

GAAP and Non-GAAP Financial Measures

Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures

Please refer to the information contained in the appendix of our presentation and our earnings release for reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures

Christopher M. Crane

Business Highlights

PHI Utilities

- We have had a productive few months since our last earnings call, making important steps in reinforcing our value proposition
- At our PHI utilities, we reached settlement in both Pepco Maryland and Pepco D.C. rate cases
- With these settlements, we are now reached constructive settlement in all PHI jurisdictions since the close of the merger and accomplished that legacy PHI has not achieved in many years
  - This reflects a positive evolution of our engagement in these states
- Our employees' hard work to improve system reliability and performance have led to rising consumer satisfaction

Bloomberg Transcript

- The progress we have made is reflected in our constructive partnership with our regulators
  - There's always more work to do particularly on our earned ROEs, but we are encouraged by these developments

New Jersey

- In New Jersey, state legislators passed three important energy policy laws with strong majorities on April 12
- Most impactful to Exelon was the New Jersey ZEC program, similar to that in New York and Illinois
- It'll be more fairly compensating our nuclear generating assets in New Jersey for clean energy attributes of these plants

East Coast Utilities

- In March, our East Coast utilities were battered by three northeasters that resulted in about $200mm of spending between capital and operating expenses
- Thanks to the tireless efforts of our employees and contractors, we were able to restore power to the effective customers safely and quickly
  - These storms were challenging and the benefits of our scale were on display in March
- We were able to return customers to service days faster than we would have as a standalone utility

GAAP Basis

- Finally, we had a strong quarter financially
- On a GAAP basis, we earned $0.60 per share vs. $1.06 last year
- On a non-GAAP operating basis, we earned $0.96 per share vs. $0.64 last year, just above the midpoint of our $0.90 to $1 guidance range while overcoming $0.06 storm cost through March

Investments

- Turning to slide 6
- At the utilities, we continue to execute at top quartile levels across key customer satisfaction and operating metrics
- The investments we are making are paying off in improved reliability, which is strengthening our relationship we have with our customers and regulators
- These numbers follow the standard industry practice of excluding major storms, although the benefits of our scale, [ph] health (00:04:42) and recovery efforts, which I'll discuss in the next slide

Pepco D.C

- I would note that Pepco D.C. has achieved a record reliability in the past two years since joining Exelon family of companies
- We continue to make gains as we share best practices across all utilities

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01472

- We also continue to focus on helping customers and communities becoming more energy-efficient, saving energy and money

- We have been doing this for years and I'm happy to once again announce that EPA named all five of our eligible companies; BGE, ComEd, Delmarva, Pepco and PECO, as 2018 ENERGY STAR Partners of the Year
- Our companies also received the Sustained Excellence designation for being named partners three or more years in a row

ExGen

- Safety is always our highest priority and we review our OSHA recordables in Q1
- We've identified a number of areas for improvement and have implemented a series of our actions to get those numbers back on track
- At ExGen, nuclear generation this quarter was 40 terawatt hours, with capacity factor of 96.5%
- Our Texas CCGTs continue to perform very well with an economic dispatch match rate of 96.6%, ramping up and down to optimize hour-by-hour the variability in ERCOT pricing

East Coast Utility

- Turning to slide 7
- I'd like to take a moment to highlight our utilities' performance and the outstanding work from our crews as they battled three consecutive nor'easters in March
  - These storms blanket our East Coast utility with heavy wet spring snow and high winds that are especially hard on the system
- Over the span of these storms, we faced 1.7mm cumulative customer outages and shared over 1,600 Exelon employees and contractors with our sister utilities
- ComEd alone provided an additional 1,200 workers and contract crew members

Operating Capital Expenses

- We also incurred, as I said, $200mm of operating capital expenses
- To help put this in context, we replaced approximately 1,200 power poles and handled more than 1.8mm customer calls
  - With that context, let me share with you the success story of the combined Exelon utility families
- Because of our employees are trained on common practices, we're able to seamlessly incorporate workers from different utilities more quickly to get work and return service to our customers

New Jersey

- Each storm impacted the service territories differently, but the last of the three storms significantly impacted Atlantic City Electric
- We were able to bring in crews and contractors from ComEd, PECO, Pepco, Delmarva and BGE to assist in the restoration effort

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01473

- Our scale and performance notably sped up the recovery and allowed us to send over 250 employees and contractors into New Jersey to aid in the restoration effort
- The storms that occurred this quarter provide a great example of how our model directly benefits our customers
- The scale of the Exelon utilities and how we run these businesses continue to contribute to higher quality, more responsive and cost-effective service for our customers

Tax Reform

- Turning to slide 8
- Last call, we provided an update on the impact of tax reform, but I want to revisit it as we have been working with our regulators to pass these savings on to customers
- We've identified over $500mm in savings to be returned to our customers related to lower corporate tax rate from our distribution utility operations
- As we've said from the start, the benefit of the lower income tax rate will provide a meaningful savings to our 10mm utility customers
  - We appreciate the constructive relationship with our state regulators in that are allowing us to pass along these benefits to our customers in a timely fashion

ZEC Program

- Turning to slide 9, we made additional progress in establishing compensation for our nuclear generating fleet that recognizes the value of the emission-free generation and the underlying deficiencies in market design
- The most significant development was the New Jersey legislation as I spoke of enacting the ZEC program into law, establishing a path forward to preserve the at-risk nuclear plants in New Jersey
- I want to thank our team and our partners at PSEG leadership, the leadership in the Senate and the Assembly and the Governor for working together to pass this important legislation

BPU

- Once the Governor signs the bill, the ZEC program will go to the BPU for its review of the applications
- There is a 330-day deadline for completing the process, putting the program implementation likely at the end of Q1 in 2019
- At that time, we will start realizing the New Jersey ZEC revenues
- We are pleased that New Jersey has joined New York and Illinois and Connecticut in recognizing the clear environmental attributes of the nuclear generating fleet
- We still see need for more comprehensive solutions to compensate for this clean energy, but we think expanding the ZEC program is a key interim step to preserving our most challenged assets, extending their useful lives and the long-term value of this fleet

New York and Illinois

- Turning to the existing ZEC programs in New York and Illinois, we have had oral arguments in both cases at the federal appellate court levels

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01474

- In Illinois, the court requested and now waiting for the U.S. Government to provide a view on the case
- In New York, the decision is with the judges as they had no outstanding items following the oral argument
  - We remain confident in our legal position in both cases and continue to collect the ZEC revenues

FERC

- With respect to PJM work on price formation, FERC has committed to ruling on PJM's fast-start price formation by September, if not sooner, as many parties have requested
- PJM is committed to operationally implement the rule as soon as FERC gets approval
- FERC's decision on fast-start will dictate the process for additional reforms aimed at eliminating flaws in the current pricing formation rules that currently prevent some units from setting price

Stakeholder

- In addition, PJM has now set deadlines for stakeholder reviews of reforms to its shortage pricing rules, including those related to reserve and operating reserve demand curves
- We see these price formation changes as essential to preserving an effective competitive mark in PJM and apply the ongoing efforts to design and implement these changes
- Finally, just yesterday, PJM committed to study fuel supply vulnerabilities that could arise if the grid became dominated by natural gas generation
- In its white paper, PJM called for reforms of its capacity market to better value fuel-secure resilient resources

Electrical Demand

- We have seen this as a positive first step where we urge PJM to model the carbon and air pollutant implications of greater reliance on fossil fuels, particularly oil-fired power plants to meet electrical demand
- Our states and customers communities expect us to develop policies that will lead to less pollution, not more, so we believe PJM should study the emissions consequences as well

Jonathan W. Thayer

Financial Highlights

Adjusted Non-GAAP Operating Earnings

- Turning to slide 10
- We had a strong quarter financially, delivering adjusted non-GAAP operating earnings of $0.96 per share, just above the midpoints of our guidance range of $0.90 to $1 per share
- This compares to $0.64 per share in Q1 2017
- Better results from Generation offset the storm-related cost pressures at the utilities
- Exelon's utilities delivered a combined $0.47 per share net of HoldCo, which includes $0.06 of higher storm costs

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01475

- Since we've not had significant winter storms like these in years, let me remind you how major storms are treated in our different Mid-Atlantic jurisdictions

New Jersey and Maryland

- In New Jersey and Maryland, excluding BG&E, we have a tracking mechanism for major storms, so the costs incurred during Q1 are deferred as a regulatory asset and will be recovered in the future, thereby not impacting our reported earnings
- In Delaware, Pennsylvania, Washington D.C., and for BGE and Maryland, when we file our rate cases, we use an average of major storm costs from previous years that is included in our rates and assumed in our budgets
- In years when major storms exceed the historic average, Exelon absorbs the additional storm costs, but future rates will be adjusted to reflect these costs

Storm Budgets

- With March's winter storms, we exceeded our storm budgets, which left us $0.06 per share behind plan in Q1 2018
- As we look out to the remainder of the year, we will have to find offsets at the utilities to mitigate any additional major storm expenditures, which historically have come in the first and third quarters

O&M Expenses

- Looking beyond the storm impacts, our utility results did benefit from additional revenues associated with resolved rate cases
- We would also expect PHI to catch up on some of their normal course O&M expenses over the balance of the year
- Generation had a strong quarter relative to plan, earning $0.49 per share
- We had good performance from our nuclear assets with better capacity factors than budgeted
  - We also benefited from lower O&M expenses and favorable spot market prices

Operating Earnings

- We're reaffirming our full-year guidance range of $2.90 to $3.20 per share, which you can see on slide 19, and expect to deliver operating earnings of $0.55 to $0.65 per share in Q2 compared with $0.54 last year

ZECs

- Turning to slide 11
- The $0.96 per share in Q1 this year was $0.32 per share higher than Q1 2017
- Generation earnings were up $0.32 per share compared to last year, with ZECs representing the most significant source of uplift, as we recognized the true-up of the 2017 Illinois ZEC revenues in Q1, which added $0.11 per share, and we realized full quarter contributions from the Illinois and New York ZEC programs, including the acquisition of Fitzpatrick, which were not in effect during Q1 2017

final
Bloomberg Transcript
Bloomberg

PECO

- Relative to Q1 2017, Generation also benefited from higher capacity pricing in New England, the Midwest, and the Mid-Atlantic regions
- As a whole, the utilities were largely impacted by higher storm cost, which was partially offset by increased electric distribution and transmission revenues due to higher rate base at ComEd, increased transmission revenue at BG&E, rate increases at PHI and favorable weather at PECO

ROEs

- Moving to slide 12
- On a trailing 12-month basis, our overall earned ROEs slipped modestly from last quarter, but are near the midpoint of our targeted 9% to 10% earned ROEs that underpin our target returns for 2019 and beyond
- The biggest drag in overall ROEs compared to last quarter came from the increased major storm expenses that I discussed earlier
- In total, the storms reduced earned ROEs by 10BPS for our total utility businesses on a trailing 12 months basis
  - We remain diligent in managing our operating expenses to dampen the effects from the storm costs

PHI Utilities

- Turning to the PHI utilities, the absolute levels of earned ROEs still have room for improvement, even when we adjust for the 60 basis point drag from Q4's FAS 109 write-off
- That said, the recently filed settlements at Pepco D.C. and Pepco Maryland should start to lift Pepco's earned ROEs in H2 2018
- We also experienced higher O&M in Q1 than budgeted, which is due to timing issues, and should reverse over the remainder of the year and help to lift earned ROEs

Headwind

- As we look at our earned ROEs for the rest of 2018 for the overall utility, tax reform is positive to earnings, but also creates ROE headwinds this year due to the timing of equity injections to fund deferred tax returns before the higher equity is reflected in rate cases
- The ROE impact is primarily a 2018 timing issue and is already captured in our earnings outlook
  - We still expect earned ROEs in 2019 to be solidly in the 9% to 10% range

Pepco Maryland

- Turning to slide 13, we've had a constructive regulatory quarter
- Starting with the most recent developments, we were pleased to reach settlement agreements in April at both Pepco D.C. and Pepco Maryland, providing revenue decreases of $24.1mm and $15mm, respectively
- The decreases include adjustments for forecasted tax benefits to customers with the recent tax reform legislation
- The settling parties have proposed a procedural schedule that would place rates in effect by June 1 for Pepco Maryland and July 1 for Pepco D.C

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01477

- We're happy to have reached constructive settlements with key interveners in both jurisdictions that provide bill relief for customers, while also providing a return on our investments and being resolved months earlier than if the cases had been fully litigated

Tax Reform Benefits

- On March 29, we filed our first case at PECO in three years, where we requested an $82mm rate increase, with a scheduled completion by December 31
- The filing is focused on supporting PECO's strong reliability performance, strengthening system resiliency and supporting physical security and cybersecurity
- I should also note that the $82mm is net of $71mm tax credit for 2019 tax reform benefits and that the five-year average storm cost in the filing includes the costs incurred in Q1

ComEd

- On April 16, ComEd filed its annual distribution formula rate update with the ICC seeking $22.9mm decrease to distribution base rates
- The decrease is primarily driven by an adjustment for forecasted tax benefits resulting from the recent tax reform legislation
- On February 9, we closed out the Delmarva, Maryland rate case with $13.4mm revenue increase effective immediately

Delaware

- Finally, we have outstanding cases in Delaware at Delmarva electric and gas that are scheduled for completion in the third and fourth quarters, respectively
- More details on the rate cases and their schedules can be found on slides 22 through 27 in the appendix

Capital

- Turning to slide 14
- In Q1, we invested $1.2B of capital at the utilities and are on track to meet our $5.5B budget to the benefit of our customers
- Considering the significant number of projects that go into our overall capital budget, we thought a more regular update on specific projects would be useful to appreciate how these investments are benefiting our customers and communities

Milford Transmission Rebuild

- Today, I'd like to highlight two projects
- The first is DPL's Cedar Creek to Milford Transmission Rebuild
  - This $75mm project entails replacing approximately 43 miles of 230 kV transmission poles as well as new conductor and optical ground wiring

final
Bloomberg Transcript
Bloomberg

- The 230 kV line is critical for the transmission network in the Delmarva region and will improve reliability by eliminating the potential for outages due to structural failure of the line

Elk Grove Village

- The second project I'd like to highlight is ComEd's future new substation in Elk Grove
- The $90mm greenfield substation is expected to be in service by Q3 2021
- The project will support transmission line reliability and projected load growth, primarily from data centers in the Elk Grove Village area by adding over 300 megawatts of additional new capacity

Gross Margin

- Slide 15 provides our gross margin update for ExGen, which saw some movement within the buckets, but total gross margin in each year is unchanged from our last update
- For 2018, open gross margin was up $250mm, primarily due to strengthening ERCOT spark spreads, offset by our hedges
  - We also had a strong quarter in execution creating $200mm of Power New Business

Power New Business

- 2019 and 2020 gross margins are also flat relative to our last disclosure
- In both years, open gross margin increased by $50mm on strengthening ERCOT spark spreads, which was offset by our hedges
- We were also able to execute $100mm and $50mm of Power New Business in 2019 and 2020, respectively
- We ended the quarter approximately 6% to 9% behind our ratable hedging program in 2018 and 8% to 11% behind ratable in 2019 when considering cross-commodity hedges
  - We remain comfortable being more open when we look at market fundamentals

Investment-Grade Credit Rating

- Turning to slide 16, we remain committed to maintaining a strong balance sheet and our investment-grade credit rating
- We are forecasting ExGen's leverage to be 2.5 times debt-to-EBITDA at year-end 2018, which is below our long-term target of 3 times debt-to-EBITDA
- On a recourse debt basis, we are at 2.1 times, which is well below our target
- We will continue to manage our balance sheet at ExGen over time to the 3 times debt-to-EBITDA level, so look for us to focus on debt reduction at both HoldCo and GenCo

Christopher M. Crane

Q1 Highlights

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01479

Rate Base and EPS Growth

- Turning to slide 17, we remain firmly committed to our strategy and see progress in Q1
- Whether it'd be the rate case settlements of PHI, the benefits of the scale on our storm restoration or establishing ZEC programs in New Jersey, our financial footing is very strong
- Here again is our value proposition
- We will continue to focus on growing our utilities targeting 7.4% rate base growth and 6% to 8% EPS growth through 2021

FCF

- We continue to use FCF from ExGen to fund incremental equity needs at the utilities, pay down debt over the next four years at ExGen and the HoldCo and part fund a faster dividend growth rate
- We continue to focus on optimizing value for ExGen business by seeking fair compensation for our carbon-free generation fleet in Pennsylvania as we have done with the ZECs in New Jersey, Illinois and New York

PJM and Resiliency initiatives

- And this adoption of price formation in PJM and resiliency initiatives at FERC will also benefit
- We continue to close uneconomic plants, sell assets where it makes sense to accelerate our debt reduction plans and maximize value through the gen-to-load match strategy
  - We continue to sustain strong investment-grade credit metrics and grow our dividend consistently at 5% through 2020

QUESTION AND ANSWER SECTION

<Q - Greg Gordon>: Great quarter considering all the storms you had. I've got a few questions.

<A - Christopher M. Crane>: Sure.

<Q - Greg Gordon>: The first is, looking at your gross margin slide, you did comment that you had some puts and takes and that the total expected gross margins are the same. I see from looking at the prior quarter's deck that your sort of NI Hub's around-the-clock pricing is down, Mid-Atlantic's a little better, ERCOT sparks are a lot better. But when you show us the open gross margin and you roll down to the total expected gross margin, how are you thinking about current forwards in ERCOT rolling into spot pricing? And are you just giving us sort of a theoretical naked mark, assuming you can roll all the current run-up in spark spreads into spot or is there some sort of a holdback there, given the uncertainty with regard to summer volatility [indiscernible] (00:25:21)

<A - Joseph Nigro>: Hey, Greg. Good morning. It's Joe Nigro. It's a good question, Greg. And as you've mentioned, there is a lot of volatility expected in ERCOT this summer. And for us, it's not as simple as just selling the Generation output. As you know, we have a very big load book of business. So, we have to take that into account as well. And we look at those scenarios under a lot of different outcomes, be it higher prices and/or lower prices, and we try to set up the book accordingly.

When you look at the disclosure here, we're simply mark-to-marketing the value of our open position in the open gross margin calculation, and there was a large uptick to the tune of about $300mm if it had been a fully-opened book. Offsetting that obviously is the mark-to-market of our hedges that are on the book, given the strong move and the sales we've made. And that nets to a gain in the portfolio of about $50mm.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01480

As for a holdback, any holdback would be relatively small in the overall total gross margin of the – over $8B that's expected, and we would do that given some of the uncertainty of outcomes that we expect.

<Q - Greg Gordon>: Okay, great. Thanks. Jack, I've got a couple questions for you. Looking at the slide where you give the projected sources and uses of cash, since I compare that to the last quarter disclosure, it looks like regulated utility investments – expected investments are up a little bit, but the overall FCF profile into the end of the year actually looks like it's still net-net improved even after a slightly higher CapEx. Is that a fair synopsis? And I know it's a small increase, but what are those CapExs being directed to?

<A - Jonathan W. Thayer>: It is a fair synopsis and I think the CapEx is really related to the storm investment. Chris talked about the significant investments that were made in the Mid-Atlantic utilities during that storm, so that's why you see the increase in CapEx there. To your point, the overall cash flow profile of the company looks quite strong.

<Q - Greg Gordon>: Great. And my last question actually goes, because you didn't put it in this deck, back to Q4 deck where you had EPS sensitivities related to interest rates. And it looks to me like the 30-year is up about 37BPS since year-end, and you guys put in here the interest rate sensitivity for ComEd ROE and pension expense is $0.03 in each instance for every 50BPS at least looking at 2019. So, is it fair to say that these sensitivities still hold because that would mean you might be as much as $0.05 ahead of where you were in 2019 at the beginning of this year?

<A - Jonathan W. Thayer>: I think the $0.05 sounds a little high, but they do hold. And as you know, we benefit from rising interest rates relative to other utilities because of the types of the formula rate in Illinois, but also because of our significant pension liability. And as the interest rates increase, the liabilities shrink. So, no question. This rising environment is helping our costs as well as our revenues and EPS, but $0.05 does seem a little bit aggressive.

<Q - Jonathan Arnold>: Just hoping to follow-up on the ERCOT comment just now. I think I heard you say $300mm is roughly the gross margin. And then, with the hedging value, it sort of offset down to $50mm. Was that a 2018 comment? And if so, could we get some sort of sense on 2019 and 2020 because the sort of hedge [ph] sparks (00:29:21) numbers that you gave, finding a little difficult to unpack those.

<A - Joseph Nigro>: Yeah. The comment I made was in relation to 2018, Jonathan, but you could think similarly not in magnitude of dollars because we haven't seen the absolute price change that we saw in 2018.

<Q - Jonathan Arnold>: Yeah.

<A - Joseph Nigro>: But you had a pickup in open gross margin in 2019 and 2020, and similarly, we had a mark-to-market drop in 2019 and 2020, given that we've sold in obviously at lower prices. Given that those market prices haven't moved nearly as greatly on the back-end in 2019 and 2020, just the absolute value of the dollars isn't going to be as great.

I think the other element, though, is you've seen this market move pretty appreciably in the front-end and rightfully so, given where reserve margins are and the announcements of the retirements. I think you could expect some extreme volatility this summer and that will be obviously weather dependent and depending on unit performance as well as our wind performance.

I think the other element, though, is if we see some of that volatility that's expected, it wouldn't be unreasonable to think that you would see price appreciation in 2019 and 2020 on the back of it just because it hasn't moved. And as you could see from our disclosures, we're not only carrying a long position in 2018, we have quite a bit of power still opened in 2019 and 2020 as well.

<Q - Jonathan Arnold>: Sure. Thank you, Joe. But can you just – when you look first quarter vs. year-end, the effective realized energy price spark number you gave is down. So, just remind us sort of how that works because I think the message is the margin's up so somehow that indicator goes down.

<A - Joseph Nigro>: Yeah. And it's slightly different for the base load regions, I'll call the Midwest and the Mid-Atlantic, vs. the calculation in ERCOT. As you know, ERCOT, we're trying to give you a view of our spark spread which is more relevant to our machines. And the formula is laid out here. It's very simple. We take a gas price

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01481

using Houston Ship Channel, multiply it by heat rate and add some variable O&M to set the reference price.

What we then do is we got to add back or subtract from the mark-to-market value. And the way to think about that is that's a dollar amount. So, we calculated the reference price in a unit of dollars per megawatt hour. We've now got a bucket of dollars on a mark-to-market basis that we need to divide by the volumes sold to bring it back to that same unit of dollars per megawatt hour. It just so happens in 2018, when you look at the effective realized energy price, it's next to zero. We've seen it in the past to actually go negative in ERCOT if we have a large mark-to-market loss with very small volume sold. And then, you could see in the out-years 2019 and 2020, that's a positive outcome or a positive spark.

<Q - Jonathan Arnold>: But the net-net is that your expected margin is higher, correct?

<A - Joseph Nigro>: Yes. Our expected margin in ERCOT is higher in each year given that we're carrying an open position in all those years and the market is going higher. Now, that was offset, as we mentioned in the first question from Greg, with some of the changes on the rest of the portfolio to keep the gross margin on the bottom-line balanced.

<Q - Jonathan Arnold>: Yeah. Thank you. And then, just one other little issue. So, we noticed that there were particularly low tax charges at both PECO and PHI in the quarter. So, was there something unusual going on there? What should we be thinking as we sort of push those through the year?

<A - Jonathan W. Thayer>: PECO, I think is where it's specific and it's tax repairs. So, as we invest capital for the storms that shows up later in the benefits and tax repairs same is true in certainly the PHI jurisdictions.

<Q - Jonathan Arnold>: So, what would be – should we see continued effect through the year, Jack, or is it really just like a Q1 one-off?

<A - Jonathan W. Thayer>: It's a Q1.

<Q - Jonathan Arnold>: Okay.

<A - Jonathan W. Thayer>: And depending on what storm activity we see in Q3 or Q4.

<Q - Steve Fleishman>: I'm curious just there's a lot of retail businesses that looks like are on the market these days. How interested might you be in expanding retail through acquisition?

<A - Joseph Nigro>: Steve, we're always – good morning, first of all. It's Joe. We're always interested in looking at whatever opportunities exist in the marketplace. As you know, we have a history of acquiring companies in our recent past when you look at Integrys and Con Ed, for example, and we'll continue to do that. To the extent we can add something that we think will be accretive to the bottom line and fits with the value proposition that we're trying to bring both to our shareholders and our customers, we're going to be aggressive with doing that. There has been some change of hands with retailers in the near-term here and we would expect that to continue given some that are on the market now and we'll continue to hunt for them.

<Q - Steve Fleishman>: Okay. And then just the continued comment on staying more open due to your view that power prices are, I guess – upside you see in power prices. How much of that is the potential market reforms vs. just expecting better price kind of without them or is it a mix of both?

<A - Joseph Nigro>: It's a mix of both. I think you have to take the whole picture into account. When you look at our portfolio, from my lens, I think about risk reward. And when you look at where the power curve is, like, for example, in the Midwest now and where gas prices are, we think about it from a heat rate perspective and we see upside to that. And that's driven by some of the reforms that PJM themselves is talking about, and obviously, Joe and a number of folks here at Exelon are working on very closely, and we stay very tied to that.

And then, in addition to that, we look at history and changes in the composition of the Generation stack and the transmission stack. I still go back to some of the easy examples, though. We had gas prices two years ago at $1.70 and we had power prices that were almost $26. You have gas curves at $0.75 or $0.80 higher than that, and you see power prices that are lower than where they were. So it becomes a question of risk reward when you overlay just the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01482

fundamentals of the market itself and then obviously some of the regulatory reforms that are out on the horizon.

<Q - Julien Dumoulin-Smith>: Hey. So, perhaps, to follow up on Steve's question a little bit. Can you talk a little bit about expanding margins on retail and just what you're seeing out there? Obviously, some of your peers of late have really been adamant in seeing an opportunity there. Just would be curious to hear your latest assessment. I know you guys have seen a variety of different dynamics in the retail markets in recent months. So, I'll leave it there.

<A - Joseph Nigro>: Yeah. Julien, good morning. It's Joe. I guess, I really can't speak to what my competitors are actually achieving. I have an understanding of what they're saying, and we know how they're reacting in the market. What I would tell you is, we think about our load serving business across the wholesale perspective, when we think of polar auctions, as well as our independent retail business. It's tied very closely, obviously, to our Generation portfolio.

I think, first of all, the volatility during the quarter, especially in New England and PJM was good to see. We've got an expectation of volumes and margins that are in our disclosure, and we're comfortable with those, and they remain – the margins remain in line with what our expectations have been historically for C&I margins. We're comfortable with our projections overall. I will tell you we've seen some competitive behavior change on the retail side. Some folks, I think, were hurt last year with low volumes. And when you get into some of the non-energy charges and how they're calculated on a volumetric basis, and we've seen some of our competitors move away from fully fixed price contracts in certain markets. And we'll continue to offer those products, and we're going to remain disciplined to our approach.

We spend a lot of time analytically evaluating data and using that data to inform our decisions both from a generation to load matching strategy, from a pricing perspective and a product development perspective. And as you know, last year, we had some challenges in our retail business. We're comfortable where we are now. I will tell you on the wholesale polar auction side in Q1, we have had some success. And I think it's directly attributable to the volatility that we saw in late December and early January, and quite frankly, in March as well in Eastern PJM with higher prices.

So, overall, we're comfortable with what's reflected in the disclosure, and we're comfortable with the margins and the volumes. And we'll continue to work hard, and it is a very competitive marketplace.

<Q - Julien Dumoulin-Smith>: And just wanted to follow-up on one specific plant here, Mystic in New England. A lot of different dynamics playing out right now, but it would seem as if you need to clear your asset at all of the units, if you will, and then keep them around or would you actually look to retire select units here if they don't actually get picked up with an RMR or otherwise?

<A - Joseph Nigro>: Well, I think we've been very clear, right? I mean we announced the acquisition of the Marine Terminal. We have an obligation for capacity that we are going to honor. And that's part of the reason that we're driving towards that acquisition of the terminal. We've also been very clear that absent market reforms, we don't see profitability for these units into the future. And we're working very closely to try to rectify that. I mean, the ISO themselves put out a study recently saying that there were five assets in New England needed to ensure reliability into the future, one being the Everett Marine Terminal and the others being the Mystic asset.

So, putting all that together, as we've done in PJM and other areas with the capacity market, I think we take a very prudent approach to how we manage this looking into the future, and we're going to do the same thing in New England. We'll honor the commitment for capacity and we're going to look to get to the right reforms to make these assets more economic in the future.

<Q - Julien Dumoulin-Smith>: All of it needs to clear, right?

<A - Joseph Dominguez>: Julien, this is Joe Dominguez. Actually, no. That's wrong. We don't have to clear the units to participate. And in fact, absent successful filing by the ISO on this waiver that they filed last night to offer a cost of service rate to Mystic, we will not clear. We will not participate in future capacity auctions.

<Q - Stephen Byrd>: I wanted to touch on your additional leverage capacity. And I guess what I'm thinking about is, as you continue to shift your earnings mix more towards regulated earnings and you're certainly doing that organically, but I guess I'm also thinking about inorganic ways to do that as well. Could you talk at a high level in terms of what that might mean in terms of a different risk profile with the rating agencies, a different targeted credit metrics, et cetera,

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01483

if you pivot increasingly more towards regulated earnings?

<A - Jonathan W. Thayer>: So, Stephen, I think you know, we've been incredibly conservative with our balance sheet in taking that approach and I think it's worked well with the agencies. As we do get more regulated contribution, certainly the earnings mix of the company shifts as does the risk profile. That married with the 3 times debt-to-EBITDA target at the GenCo, which we're well below now, I think, positions the company quite well.

We have, in the past, spoken with the agencies, particularly S&P, about upgrading us at the holding company level and we will continue to pursue that. As the mix shifts occurs, I think our case strengthens. So, that's kind of the conservative approach we're taking.

<Q - Stephen Byrd>: Understood. And then, shifting gears to the PJM white paper, Chris, that you had mentioned in your prepared remarks and thinking about fuel resiliency, fuel security. Procedurally, sort of how do we think about how PJM might approach that from a process point of view? I know it could take quite a bit of time to do more work, more analytics on that at PJM. But is there anything you can tell us in terms of just thoughts on how that process might unfold?

<A - Joseph Dominguez>: Yes. Stephen, it's Joe, and let me just start off with an observation. It's interesting. Secretary Perry in the 403 last fall identified a resilience problem in these markets. And as you know, that proposal was widely panned with a number of parties indicating that there is no resilience issue. Yet, in the last 48 hours, we've seen a filing by the New England ISO to retain Mystic on fuel security resilience grounds, and of course, we saw this white paper from PJM on Monday indicating that it too may have a resilience problem that would require capacity market changes.

From our perspective, turning to that white paper, the things that are going to be important is to understand the analytics, the inputs into the analyses that PJM runs and in particular, how they think about the unavailability of natural gas pipeline service and for what duration. What Chris mentioned at the top of the call is that in addition to those constraints or those modeling parameters, we'd like to see them model environmental impacts associated with this fuel mix. We kept the New England system running this year really on the back of oil-fired units.

And while we succeeded in keeping the lights on, it was a disappointing outcome for environmentalists in New England, where we burned 2mm barrels of oil and a disastrous, frankly, outcome for the stakeholder process in New England, where they want to get to lower air pollution, carbon and conventional pollutant emissions. So, we think that needs to be incorporated as well into PJM's analysis.

And until we get those environmental externalities incorporated, we're not going to have a complete market. So, we see this as a positive step forward. We're going to look very carefully at how they intend to model this situation, again, the unavailability of gas and for how long. And we think if they do that right, they're going to find that they, too, like New England, have a significant number of fuel constraints on the system that will require them to preserve fuel secure resources. Now, that could be gas plants on Marcellus Shale's storage, it could obviously be nuclear plants and it could be coal plants, but then we need to take another look at that mix and make sure we're meeting the expectations of our customers and communities in terms of environmental impacts.

In 2018, emissions need to be going down. And any resolution of this issue that results in emissions going up is going to continue to create incentives for state actions and indeed, for other federal actions to correct the flaws in those market.

<A - Christopher M. Crane>: I want to just follow up on one thing. I want to make it clear. We are not anti-gas. We think that the consumers in the country have really benefited from the plentiful low-cost gas. But as we look at the transmission system designs in the country, the N minus 1 concept that coordinates power flows across our system in the loss of major lines is a design basis.

What we need is a design basis threat on the gas system to the electric system and ensure either redundancy in capacity for getting the gas to the plants or limit the dependency on the gas so we can keep the system up along with what Joe said on the environmental attributes.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01484

So, we don't have a combined gas- and electric-day coordination. We don't have a design basis threat to the gas system that would affect the electric system properly. And that needs to be worked out.

<Q - Stephen Byrd>: Very thoughtful response. I mean, it seems like the analysis, as you said, it's important to get the parameters set. That process could take a while. But I appreciate your point about what that analysis could result in. Thanks so much for the color.

<Q - Praful Mehta>: So, a quick question on price formation. Could you just remind us what is the impact that you see for price formation for your assets? And how does that net out against the asset that are receiving zero-emission credits? Is there any net out of that as well?

<A - Joseph Dominguez>: So, I'll jump in. What we have talked about is really what PJM has modeled. And as a grouping of two different initiatives, the fast-start initiative and the full [indiscernible] (00:48:09) relaxation for baseload units, PJM has modeled $3.50 impact to energy markets. We haven't published or discussed any numbers different from that.

In terms of how it interfaces with the ZEC program, remember that the units that we presently have in the ZEC program are in New York, which would be unaffected by that change. Clinton, which is in MISO, again unaffected by that change. So, the only unit presently we'd be talking about is Quad Cities. And yes, as energy prices go up either as a result of energy market dynamic changes, policy changes, carbon being in the market, there would be potentially an offset to the ZEC payment with the plants that are participating.

<Q - Praful Mehta>: Okay. That's helpful. And that'll apply to New Jersey as well?

<A - Joseph Dominguez>: In New Jersey, the mechanism is going to be different. But if prices recover for other reasons, the program also will have the BPU look at pricing in future years and potentially make adjustments. The key in all of these states is to preserve the zero-emission resources for the customers.

<Q - Praful Mehta>: Got you. That's helpful. And just quickly connecting that with capital allocation, right? If you do have the upside from price formation and zero-emission potentially in Pennsylvania as well, you've already kind of laid out a plan which allocates all the capital into all the different kind of criteria you've mentioned from debt reduction to dividend. Where do you see the incremental capital, if it does come through, get allocated in your plan [ph] covenant? (00:49:54)

<A - Christopher M. Crane>: Yeah. We have good capital resources today. We have good sources of investments to make for customer satisfaction and reliability, so we'll continue on that path, but we have to maintain a very strong sensitivity to the consumer impact on excessive capital going on the system. We can install $8 worth of capital and keep rates the same by reducing O&M by $1. And that's what we have to be focused on is customer service, reliability and the impact on our consumers. So that will be our approach as we go forward.

Christopher M. Crane

Closing Remarks

We're always available for any further details that you want going through Dan

We've had a good first quarter

- We anticipate a good 2018

The work that's being done by all our operating groups continue to ensure that we maintain a strong balance sheet and deliver on the value proposition

I won't wear you out with my opinion of the valuation of the stock

final
Bloomberg Transcript
Bloomberg

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by, and welcome to the 2018 Q1 Earnings Call. All lines have been placed on mute to prevent any background noise. After the speakers' remarks, there will be a question-and-answer session. [Operator Instructions] Thank you. Mr. Dan Eggers, Senior Vice President of Investor Relations, you may begin your call.

Daniel L. Eggers

Thank you, Geneva. Good morning, everyone, and thank you for joining our first quarter 2018 earnings conference call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer; and Jack Thayer, Exelon's Chief Financial Officer. They're joined by other members of Exelon's senior management team who will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, both of which can be found in the Investor Relations section on Exelon's website. The earnings release and other matters which we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material and comments made during this call. Please refer to today's 8-K and Exelon's other SEC filings for discussions of risk factors and factors that may cause results to differ from management's projections, forecast and expectations.

Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures. It is scheduled 45 minutes for today's call.

I'll now turn the call over to Chris Crane, Exelon's CEO.

Bloomberg Transcript

Christopher M. Crane

Thanks, Dan, and good morning, everyone. Thank you for joining us today. We have had a productive few months since our last earnings call, making important steps in reinforcing our value proposition. At our PHI utilities, we reached settlement in both Pepco Maryland and Pepco D.C. rate cases. With these settlements, we are now reached constructive settlement in all PHI jurisdictions since the close of the merger and accomplished that legacy PHI has not achieved in many years.

This reflects a positive evolution of our engagement in these states. Our employees' hard work to improve system reliability and performance have led to rising consumer satisfaction. The progress we have made is reflected in our constructive partnership with our regulators. There's always more work to do particularly on our earned ROEs, but we are encouraged by these developments.

In New Jersey, state legislators passed three important energy policy laws with strong majorities on April 12. Most impactful to Exelon was the New Jersey ZEC program, similar to that in New York and Illinois. It'll be more fairly compensating our nuclear generating assets in New Jersey for clean energy attributes of these plants.

In March, our East Coast utilities were battered by three northeasters that resulted in about $200 million of spending between capital and operating expenses. Thanks to the tireless efforts of our employees and contractors, we were able to restore power to the effective customers safely and quickly. These storms were challenging and the benefits of our scale were on display in March. We were able to return customers to service days faster than we would have as a standalone utility.

Finally, we had a strong quarter financially. On a GAAP basis, we earned $0.60 per share versus $1.06 last year. On a non-GAAP operating basis, we earned $0.96 per share versus $0.64 last year, just above the midpoint of our $0.90 to $1 guidance range while overcoming a $0.06 storm cost through March.

Turning to slide 6. At the utilities, we continue to execute at top quartile levels across key customer satisfaction and operating metrics. The investments we are making are paying off in improved reliability, which is strengthening our relationship we have with our customers and regulators. These numbers follow the standard industry practice of excluding major storms, although the benefits of our scale, [ph] health (00:04:42) and recovery efforts, which I'll discuss in the next slide.

I would note that Pepco D.C. has achieved a record reliability in the past two years since joining Exelon family of companies. We continue to make gains as we share best practices across all utilities. We also continue to focus on helping customers and communities becoming more energy-efficient, saving energy and money. We have been doing this for years and I'm happy to once again announce that EPA named all five of our eligible companies; BGE, ComEd, Delmarva, Pepco and PECO, as 2018 ENERGY STAR Partners of the Year. Our companies also received the Sustained Excellence designation for being named partners three or more years in a row.

Safety is always our highest priority and we review our OSHA recordables in the first quarter. We've identified a number of areas for improvement and have implemented a series of our actions to get those numbers back on track. At ExGen, nuclear generation this quarter was 40 terawatt hours, with capacity factor of 96.5%. Our Texas CCGTs continue to perform very well with an economic dispatch match rate of 96.6%, ramping up and down to optimize hour-by-hour the variability in ERCOT pricing.

Turning to slide 7. I'd like to take a moment to highlight our utilities' performance and the outstanding work from our crews as they battled three consecutive nor'easters in March. These storms blanket our East Coast utility with heavy wet spring snow and high winds that are especially hard on the system. Over the span of these storms, we faced 1.7 million cumulative customer outages and shared over 1,600 Exelon employees and contractors with our sister utilities. ComEd alone provided an additional 1,200 workers and contract crew members.

final
Bloomberg Transcript
Bloomberg

We also incurred, as I said, $200 million of operating capital expenses. To help put this in context, we replaced approximately 1,200 power poles and handled more than 1.8 million customer calls. With that context, let me share with you the success story of the combined Exelon utility families. Because of our employees are trained on common practices, we're able to seamlessly incorporate workers from different utilities more quickly to get work and return service to our customers.

Each storm impacted the service territories differently, but the last of the three storms significantly impacted Atlantic City Electric. We were able to bring in crews and contractors from ComEd, PECO, Pepco, Delmarva and BGE to assist in the restoration effort. Our scale and performance notably sped up the recovery and allowed us to send over 250 employees and contractors into New Jersey to aid in the restoration effort. The storms that occurred this quarter provide a great example of how our model directly benefits our customers. The scale of the Exelon utilities and how we run these businesses continue to contribute to higher quality, more responsive and cost-effective service for our customers.

Turning to slide 8. Last call, we provided an update on the impact of tax reform, but I want to revisit it as we have been working with our regulators to pass these savings on to customers. We've identified over $500 million in savings to be returned to our customers related to lower corporate tax rate from our distribution utility operations. As we've said from the start, the benefit of the lower income tax rate will provide a meaningful savings to our 10 million utility customers. We appreciate the constructive relationship with our state regulators in that are allowing us to pass along these benefits to our customers in a timely fashion.

Turning to slide 9, we made additional progress in establishing compensation for our nuclear generating fleet that recognizes the value of the emission-free generation and the underlying deficiencies in market design. The most significant development was the New Jersey legislation as I spoke of enacting the ZEC program into law, establishing a path forward to preserve the at-risk nuclear plants in New Jersey. I want to thank our team and our partners at PSEG leadership, the leadership in the Senate and the Assembly and the Governor for working together to pass this important legislation.

Once the Governor signs the bill, the ZEC program will go to the BPU for its review of the applications. There is a 330-day deadline for completing the process, putting the program implementation likely at the end of the first quarter in 2019. At that time, we will start realizing the New Jersey ZEC revenues. We are pleased that New Jersey has joined New York and Illinois and Connecticut in recognizing the clear environmental attributes of the nuclear generating fleet. We still see need for more comprehensive solutions to compensate for this clean energy, but we think expanding the ZEC program is a key interim step to preserving our most challenged assets, extending their useful lives and the long-term value of this fleet.

Turning to the existing ZEC programs in New York and Illinois, we have had oral arguments in both cases at the federal appellate court levels. In Illinois, the court requested and now waiting for the U.S. Government to provide a view on the case. In New York, the decision is with the judges as they had no outstanding items following the oral argument. We remain confident in our legal position in both cases and continue to collect the ZEC revenues.

With respect to PJM work on price formation, FERC has committed to ruling on PJM's fast-start price formation by September, if not sooner, as many parties have requested. PJM is committed to operationally implement the rule as soon as FERC gets approval. FERC's decision on fast-start will dictate the process for additional reforms aimed at eliminating flaws in the current pricing formation rules that currently prevent some units from setting price.

In addition, PJM has now set deadlines for stakeholder reviews of reforms to its shortage pricing rules, including those related to reserve and operating reserve demand curves. We see these price formation changes as essential to preserving an effective competitive mark in PJM and apply the ongoing efforts to design and implement these changes. Finally, just yesterday, PJM committed to study fuel supply vulnerabilities that could arise if the grid became dominated by natural gas generation. In its white paper, PJM called for reforms of its capacity market to better value fuel-secure resilient resources.

We have seen this as a positive first step where we urge PJM to model the carbon and air pollutant implications of greater reliance on fossil fuels, particularly oil-fired power plants to meet electrical demand. Our states and customers

final

communities expect us to develop policies that will lead to less pollution, not more, so we believe PJM should study the emissions consequences as well.

Now, I'll turn it over to Jack to walk through some of the numbers.

Jonathan W. Thayer

Thank you, Chris, and good morning, everyone.

Turning to slide 10. We had a strong quarter financially, delivering adjusted non-GAAP operating earnings of $0.96 per share, just above the midpoints of our guidance range of $0.90 to $1 per share. This compares to $0.64 per share in the first quarter of 2017. Better results from Generation offset the storm-related cost pressures at the utilities. Exelon's utilities delivered a combined $0.47 per share net of HoldCo, which includes $0.06 of higher storm costs.

Since we've not had significant winter storms like these in years, let me remind you how major storms are treated in our different Mid-Atlantic jurisdictions. In New Jersey and Maryland, excluding BG&E, we have a tracking mechanism for major storms, so the costs incurred during the first quarter are deferred as a regulatory asset and will be recovered in the future, thereby not impacting our reported earnings.

In Delaware, Pennsylvania, Washington D.C., and for BGE and Maryland, when we file our rate cases, we use an average of major storm costs from previous years that is included in our rates and assumed in our budgets. In years when major storms exceed the historic average, Exelon absorbs the additional storm costs, but future rates will be adjusted to reflect these costs.

With March's winter storms, we exceeded our storm budgets, which left us $0.06 per share behind plan in the first quarter of 2018. As we look out to the remainder of the year, we will have to find offsets at the utilities to mitigate any additional major storm expenditures, which historically have come in the first and third quarters.

Looking beyond the storm impacts, our utility results did benefit from additional revenues associated with resolved rate cases. We would also expect PHI to catch up on some of their normal course O&M expenses over the balance of the year.

Generation had a strong quarter relative to plan, earning $0.49 per share. We had good performance from our nuclear assets with better capacity factors than budgeted. We also benefited from lower O&M expenses and favorable spot market prices.

We're reaffirming our full-year guidance range of $2.90 to $3.20 per share, which you can see on slide 19, and expect to deliver operating earnings of $0.55 to $0.65 per share in the second quarter compared with $0.54 last year.

Turning to slide 11. The $0.96 per share in the first quarter of this year was $0.32 per share higher than the first quarter of 2017. Generation earnings were up $0.32 per share compared to last year, with ZECs representing the most significant source of uplift, as we recognized the true-up of the 2017 Illinois ZEC revenues in the first quarter, which added $0.11 per share, and we realized full quarter contributions from the Illinois and New York ZEC programs, including the acquisition of Fitzpatrick, which were not in effect during the first quarter of 2017.

Relative to the first quarter of 2017, Generation also benefited from higher capacity pricing in New England, the Midwest, and the Mid-Atlantic regions. As a whole, the utilities were largely impacted by higher storm cost, which was partially offset by increased electric distribution and transmission revenues due to higher rate base at ComEd, increased transmission revenue at BG&E, rate increases at PHI and favorable weather at PECO.

Moving to slide 12. On a trailing 12-month basis, our overall earned ROEs slipped modestly from last quarter, but are near the midpoint of our targeted 9% to 10% earned ROEs that underpin our target returns for 2019 and beyond. The biggest drag in overall ROEs compared to last quarter came from the increased major storm expenses that I discussed earlier. In total, the storms reduced earned ROEs by 10 basis points for our total utility businesses on a trailing 12 months basis. We remain diligent in managing our operating expenses to dampen the effects from the storm costs.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01490

Turning to the PHI utilities, the absolute levels of earned ROEs still have room for improvement, even when we adjust for the 60 basis point drag from the fourth quarter's FAS 109 write-off. That said, the recently filed settlements at Pepco D.C. and Pepco Maryland should start to lift Pepco's earned ROEs in the second half of 2018. We also experienced higher O&M in the first quarter than budgeted, which is due to timing issues, and should reverse over the remainder of the year and help to lift earned ROEs.

As we look at our earned ROEs for the rest of 2018 for the overall utility, tax reform is positive to earnings, but also creates ROE headwinds this year due to the timing of equity injections to fund deferred tax returns before the higher equity is reflected in rate cases. The ROE impact is primarily a 2018 timing issue and is already captured in our earnings outlook. We still expect earned ROEs in 2019 to be solidly in the 9% to 10% range.

Turning to slide 13, we've had a constructive regulatory quarter. Starting with the most recent developments, we were pleased to reach settlement agreements in April at both Pepco D.C. and Pepco Maryland, providing revenue decreases of $24.1 million and $15 million, respectively. The decreases include adjustments for forecasted tax benefits to customers with the recent tax reform legislation. The settling parties have proposed a procedural schedule that would place rates in effect by June 1 for Pepco Maryland and July 1 for Pepco D.C. We're happy to have reached constructive settlements with key interveners in both jurisdictions that provide bill relief for customers, while also providing a return on our investments and being resolved months earlier than if the cases had been fully litigated.

On March 29, we filed our first case at PECO in three years, where we requested an $82 million rate increase, with a scheduled completion by December 31. The filing is focused on supporting PECO's strong reliability performance, strengthening system resiliency and supporting physical security and cybersecurity. I should also note that the $82 million is net of $71 million tax credit for 2019 tax reform benefits and that the five-year average storm cost in the filing includes the costs incurred in the first quarter.

On April 16, ComEd filed its annual distribution formula rate update with the ICC seeking a $22.9 million decrease to distribution base rates. The decrease is primarily driven by an adjustment for forecasted tax benefits resulting from the recent tax reform legislation. On February 9, we closed out the Delmarva, Maryland rate case with a $13.4 million revenue increase effective immediately.

Finally, we have outstanding cases in Delaware at Delmarva electric and gas that are scheduled for completion in the third and fourth quarters, respectively. More details on the rate cases and their schedules can be found on slides 22 through 27 in the appendix.

Turning to slide 14. In the first quarter, we invested $1.2 billion of capital at the utilities and are on track to meet our $5.5 billion budget to the benefit of our customers. Considering the significant number of projects that go into our overall capital budget, we thought a more regular update on specific projects would be useful to appreciate how these investments are benefiting our customers and communities.

Today, I'd like to highlight two projects. The first is DPL's Cedar Creek to Milford Transmission Rebuild. This $75 million project entails replacing approximately 43 miles of 230 kV transmission poles as well as new conductor and optical ground wiring. The 230 kV line is critical for the transmission network in the Delmarva region and will improve reliability by eliminating the potential for outages due to structural failure of the line.

The second project I'd like to highlight is ComEd's future new substation in Elk Grove. The $90 million greenfield substation is expected to be in service by the third quarter of 2021. The project will support transmission line reliability and projected load growth, primarily from data centers in the Elk Grove Village area by adding over 300 megawatts of additional new capacity.

Slide 15 provides our gross margin update for ExGen, which saw some movement within the buckets, but total gross margin in each year is unchanged from our last update. For 2018, open gross margin was up $250 million, primarily due to strengthening ERCOT spark spreads, offset by our hedges. We also had a strong quarter in execution creating $200 million of Power New Business.

final
Bloomberg Transcript
Bloomberg

2019 and 2020 gross margins are also flat relative to our last disclosure. In both years, open gross margin increased by $50 million on strengthening ERCOT spark spreads, which was offset by our hedges. We were also able to execute $100 million and $50 million of Power New Business in 2019 and 2020, respectively. We ended the quarter approximately 6% to 9% behind our ratable hedging program in 2018 and 8% to 11% behind ratable in 2019 when considering cross-commodity hedges. We remain comfortable being more open when we look at market fundamentals.

Turning to slide 16, we remain committed to maintaining a strong balance sheet and our investment-grade credit rating. We are forecasting ExGen's leverage to be 2.5 times debt-to-EBITDA at year-end 2018, which is below our long-term target of 3 times debt-to-EBITDA. On a recourse debt basis, we are at 2.1 times, which is well below our target. We will continue to manage our balance sheet at ExGen over time to the 3 times debt-to-EBITDA level, so look for us to focus on debt reduction at both HoldCo and GenCo.

I'll now turn the call back to Chris.

Christopher M. Crane

Thanks, Jack. Turning to slide 17, we remain firmly committed to our strategy and see progress in the first quarter. Whether it'd be the rate case settlements of PHI, the benefits of the scale on our storm restoration or establishing ZEC programs in New Jersey, our financial footing is very strong.

Here again is our value proposition. We will continue to focus on growing our utilities targeting 7.4% rate base growth and 6% to 8% EPS growth through 2021. We continue to use free cash flow from ExGen to fund incremental equity needs at the utilities, pay down debt over the next four years at ExGen and the HoldCo and part fund a faster dividend growth rate.

We continue to focus on optimizing value for ExGen business by seeking fair compensation for our carbon-free generation fleet in Pennsylvania as we have done with the ZECs in New Jersey, Illinois and New York. And this adoption of price formation in PJM and resiliency initiatives at FERC will also benefit.

We continue to close uneconomic plants, sell assets where it makes sense to accelerate our debt reduction plans and maximize value through the gen-to-load match strategy. We continue to sustain strong investment-grade credit metrics and grow our dividend consistently at 5% through 2020.

With that, operator, we can now open it up for questions.

Q&A

Operator

[Operator Instructions] Our first question comes from the line of Greg Gordon with Evercore.

<Q - Greg Gordon>: Thanks. Good morning. Great quarter considering all the storms you had. I've got a few questions.

<A - Christopher M. Crane>: Sure.

<Q - Greg Gordon>: The first is, looking at your gross margin slide, you did comment that you had some puts and takes and that the total expected gross margins are the same. I see from looking at the prior quarter's deck that your sort of NI Hub's around-the-clock pricing is down, Mid-Atlantic's a little better, ERCOT sparks are a lot better. But when you show us the open gross margin and you roll down to the total expected gross margin, how are you thinking about current forwards in ERCOT rolling into spot pricing? And are you just giving us sort of a theoretical naked mark, assuming you can roll all the current run-up in spark spreads into spot or is there some sort of a holdback there, given the uncertainty with regard to summer volatility [indiscernible] (00:25:21)

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01492

<A - Joseph Nigro>: Hey, Greg. Good morning. It's Joe Nigro. It's a good question, Greg. And as you've mentioned, there is a lot of volatility expected in ERCOT this summer. And for us, it's not as simple as just selling the Generation output. As you know, we have a very big load book of business. So, we have to take that into account as well. And we look at those scenarios under a lot of different outcomes, be it higher prices and/or lower prices, and we try to set up the book accordingly.

When you look at the disclosure here, we're simply mark-to-marketing the value of our open position in the open gross margin calculation, and there was a large uptick to the tune of about $300 million if it had been a fully-opened book. Offsetting that obviously is the mark-to-market of our hedges that are on the book, given the strong move and the sales we've made. And that nets to a gain in the portfolio of about $50 million.

As for a holdback, any holdback would be relatively small in the overall total gross margin of the – over $8 billion that's expected, and we would do that given some of the uncertainty of outcomes that we expect.

<Q - Greg Gordon>: Okay, great. Thanks. Jack, I've got a couple questions for you. Looking at the slide where you give the projected sources and uses of cash, since I compare that to the last quarter disclosure, it looks like regulated utility investments – expected investments are up a little bit, but the overall free cash flow profile into the end of the year actually looks like it's still net-net improved even after a slightly higher CapEx. Is that a fair synopsis? And I know it's a small increase, but what are those capital expenditures being directed to?

<A - Jonathan W. Thayer>: It is a fair synopsis and I think the CapEx is really related to the storm investment. Chris talked about the significant investments that were made in the Mid-Atlantic utilities during that storm, so that's why you see the increase in CapEx there. To your point, the overall cash flow profile of the company looks quite strong.

<Q - Greg Gordon>: Great. And my last question actually goes, because you didn't put it in this deck, back to the Q4 deck where you had EPS sensitivities related to interest rates. And it looks to me like the 30-year is up about 37 basis points since year-end, and you guys put in here the interest rate sensitivity for ComEd ROE and pension expense is $0.03 in each instance for every 50 basis points at least looking at 2019. So, is it fair to say that these sensitivities still hold because that would mean you might be as much as a $0.05 ahead of where you were in 2019 at the beginning of this year?

<A - Jonathan W. Thayer>: I think the $0.05 sounds a little high, but they do hold. And as you know, we benefit from rising interest rates relative to other utilities because of the types of the formula rate in Illinois, but also because of our significant pension liability. And as the interest rates increase, the liabilities shrink. So, no question. This rising environment is helping our costs as well as our revenues and EPS, but $0.05 does seem a little bit aggressive.

<Q - Greg Gordon>: Okay. Thank you, Jack. That's all I've got.

Operator

And our next question comes from the line of Jonathan Arnold with Deutsche Bank.

<Q - Jonathan Arnold>: Good morning, guys. Just hoping to follow-up on the ERCOT comment just now. I think I heard you say $300 million is roughly the gross margin. And then, with the hedging value, it sort of offset down to $50 million. Was that a 2018 comment? And if so, could we get some sort of sense on 2019 and 2020 because the sort of hedge [ph] sparks (00:29:21) numbers that you gave, finding a little difficult to unpack those.

<A - Joseph Nigro>: Yeah. The comment I made was in relation to 2018, Jonathan, but you could think similarly not in magnitude of dollars because we haven't seen the absolute price change that we saw in 2018.

<Q - Jonathan Arnold>: Yeah.

<A - Joseph Nigro>: But you had a pickup in open gross margin in 2019 and 2020, and similarly, we had a mark-to-market drop in 2019 and 2020, given that we've sold in obviously at lower prices. Given that those market prices haven't moved nearly as greatly on the back-end in 2019 and 2020, just the absolute value of the dollars isn't

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01493

final

going to be as great.

I think the other element, though, is you've seen this market move pretty appreciably in the front-end and rightfully so, given where reserve margins are and the announcements of the retirements. I think you could expect some extreme volatility this summer and that will be obviously weather dependent and depending on unit performance as well as our wind performance.

I think the other element, though, is if we see some of that volatility that's expected, it wouldn't be unreasonable to think that you would see price appreciation in 2019 and 2020 on the back of it just because it hasn't moved. And as you could see from our disclosures, we're not only carrying a long position in 2018, we have quite a bit of power still opened in 2019 and 2020 as well.

<Q - Jonathan Arnold>: Sure. Thank you, Joe. But can you just – when you look first quarter versus year-end, the effective realized energy price spark number you gave is down. So, just remind us sort of how that works because I think the message is the margin's up so somehow that indicator goes down.

<A - Joseph Nigro>: Yeah. And it's slightly different for the base load regions, I'll call the Midwest and the Mid-Atlantic, versus the calculation in ERCOT. As you know, ERCOT, we're trying to give you a view of our spark spread which is more relevant to our machines. And the formula is laid out here. It's very simple. We take a gas price using Houston Ship Channel, multiply it by heat rate and add some variable O&M to set the reference price.

What we then do is we got to add back or subtract from the mark-to-market value. And the way to think about that is that's a dollar amount. So, we calculated the reference price in a unit of dollars per megawatt hour. We've now got a bucket of dollars on a mark-to-market basis that we need to divide by the volumes sold to bring it back to that same unit of dollars per megawatt hour. It just so happens in 2018, when you look at the effective realized energy price, it's next to zero. We've seen it in the past to actually go negative in ERCOT if we have a large mark-to-market loss with very small volume sold. And then, you could see in the out-years 2019 and 2020, that's a positive outcome or a positive spark.

<Q - Jonathan Arnold>: But the net-net is that your expected margin is higher, correct?

<A - Joseph Nigro>: Yes. Our expected margin in ERCOT is higher in each year given that we're carrying an open position in all those years and the market is going higher. Now, that was offset, as we mentioned in the first question from Greg, with some of the changes on the rest of the portfolio to keep the gross margin on the bottom-line balanced.

<Q - Jonathan Arnold>: Yeah. Thank you. And then, just one other little issue. So, we noticed that there were particularly low tax charges at both PECO and PHI in the quarter. So, was there something unusual going on there? What should we be thinking as we sort of push those through the year?

<A - Jonathan W. Thayer>: PECO, I think is where it's specific and it's tax repairs. So, as we invest capital for the storms that shows up later in the benefits and tax repairs same is true in certainly the PHI jurisdictions.

<Q - Jonathan Arnold>: So, what would be – should we see continued effect through the year, Jack, or is it really just like a Q1 one-off?

<A - Jonathan W. Thayer>: It's a Q1.

<Q - Jonathan Arnold>: Okay.

<A - Jonathan W. Thayer>: And depending on what storm activity we see in Q3 or Q4.

<Q - Jonathan Arnold>: Yeah. Okay. Thank you very much, guys.

<A - Jonathan W. Thayer>: Sure.

Operator

Bloomberg Transcript

And our next question comes from the line of Steve Fleishman with Wolfe Research.

<Q - Steve Fleishman>: Yeah. Hi. I'm curious just there's a lot of retail businesses that looks like are on the market these days. How interested might you be in expanding retail through acquisition?

<A - Joseph Nigro>: Steve, we're always – good morning, first of all. It's Joe. We're always interested in looking at whatever opportunities exist in the marketplace. As you know, we have a history of acquiring companies in our recent past when you look at Integrys and Con Ed, for example, and we'll continue to do that. To the extent we can add something that we think will be accretive to the bottom line and fits with the value proposition that we're trying to bring both to our shareholders and our customers, we're going to be aggressive with doing that. There has been some change of hands with retailers in the near-term here and we would expect that to continue given some that are on the market now and we'll continue to hunt for them.

<Q - Steve Fleishman>: Okay. And then just the continued comment on staying more open due to your view that power prices are, I guess – upside you see in power prices. How much of that is the potential market reforms versus just expecting better price kind of without them or is it a mix of both?

<A - Joseph Nigro>: It's a mix of both. I think you have to take the whole picture into account. When you look at our portfolio, from my lens, I think about risk reward. And when you look at where the power curve is, like, for example, in the Midwest now and where gas prices are, we think about it from a heat rate perspective and we see upside to that. And that's driven by some of the reforms that PJM themselves is talking about, and obviously, Joe and a number of folks here at Exelon are working on very closely, and we stay very tied to that.

And then, in addition to that, we look at history and changes in the composition of the Generation stack and the transmission stack. I still go back to some of the easy examples, though. We had gas prices two years ago at $1.70 and we had power prices that were almost $26. You have gas curves at $0.75 or $0.80 higher than that, and you see power prices that are lower than where they were. So it becomes a question of risk reward when you overlay just the fundamentals of the market itself and then obviously some of the regulatory reforms that are out on the horizon.

<Q - Steve Fleishman>: Okay. Thank you.

Operator

And our next question comes from the line of Julien Dumoulin with Bank of America Merrill Lynch.

<Q - Julien Dumoulin-Smith>: Hey. Good morning.

<A - Jonathan W. Thayer>: Good morning.

<Q - Julien Dumoulin-Smith>: Hey. So, perhaps, to follow up on Steve's question a little bit. Can you talk a little bit about expanding margins on retail and just what you're seeing out there? Obviously, some of your peers of late have really been adamant in seeing an opportunity there. Just would be curious to hear your latest assessment. I know you guys have seen a variety of different dynamics in the retail markets in recent months. So, I'll leave it there.

<A - Joseph Nigro>: Yeah. Julien, good morning. It's Joe. I guess, I really can't speak to what my competitors are actually achieving. I have an understanding of what they're saying, and we know how they're reacting in the market. What I would tell you is, we think about our load serving business across the wholesale perspective, when we think of polar auctions, as well as our independent retail business. It's tied very closely, obviously, to our Generation portfolio.

I think, first of all, the volatility during the quarter, especially in New England and PJM was good to see. We've got an expectation of volumes and margins that are in our disclosure, and we're comfortable with those, and they remain – the margins remain in line with what our expectations have been historically for C&I margins. We're comfortable with our projections overall. I will tell you we've seen some competitive behavior change on the retail side. Some folks, I think, were hurt last year with low volumes. And when you get into some of the non-energy charges and how they're calculated on a volumetric basis, and we've seen some of our competitors move away from fully fixed price contracts in

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01495

certain markets. And we'll continue to offer those products, and we're going to remain disciplined to our approach.

We spend a lot of time analytically evaluating data and using that data to inform our decisions both from a generation to load matching strategy, from a pricing perspective and a product development perspective. And as you know, last year, we had some challenges in our retail business. We're comfortable where we are now. I will tell you on the wholesale polar auction side in the first quarter, we have had some success. And I think it's directly attributable to the volatility that we saw in late December and early January, and quite frankly, in March as well in Eastern PJM with higher prices.

So, overall, we're comfortable with what's reflected in the disclosure, and we're comfortable with the margins and the volumes. And we'll continue to work hard, and it is a very competitive marketplace.

<Q - Julien Dumoulin-Smith>: And just wanted to follow-up on one specific plant here, Mystic in New England. A lot of different dynamics playing out right now, but it would seem as if you need to clear your asset at all of the units, if you will, and then keep them around or would you actually look to retire select units here if they don't actually get picked up with an RMR or otherwise?

<A - Joseph Nigro>: Well, I think we've been very clear, right? I mean we announced the acquisition of the Marine Terminal. We have an obligation for capacity that we are going to honor. And that's part of the reason that we're driving towards that acquisition of the terminal. We've also been very clear that absent market reforms, we don't see profitability for these units into the future. And we're working very closely to try to rectify that. I mean, the ISO themselves put out a study recently saying that there were five assets in New England needed to ensure reliability into the future, one being the Everett Marine Terminal and the others being the Mystic asset.

So, putting all that together, as we've done in PJM and other areas with the capacity market, I think we take a very prudent approach to how we manage this looking into the future, and we're going to do the same thing in New England. We'll honor the commitment for capacity and we're going to look to get to the right reforms to make these assets more economic in the future.

<Q - Julien Dumoulin-Smith>: All of it needs to clear, right?

<A - Joseph Dominguez>: Julien, this is Joe Dominguez. Actually, no. That's wrong. We don't have to clear the units to participate. And in fact, absent successful filing by the ISO on this waiver that they filed last night to offer a cost of service rate to Mystic, we will not clear. We will not participate in future capacity auctions.

<Q - Julien Dumoulin-Smith>: Excellent. Thank you.

Operator

And our next question comes from the line of Stephen Byrd with Morgan Stanley.

<Q - Stephen Byrd>: Hi. Good morning.

<A - Christopher M. Crane>: Hey, Steve.

<Q - Stephen Byrd>: I wanted to touch on your additional leverage capacity. And I guess what I'm thinking about is, as you continue to shift your earnings mix more towards regulated earnings and you're certainly doing that organically, but I guess I'm also thinking about inorganic ways to do that as well. Could you talk at a high level in terms of what that might mean in terms of a different risk profile with the rating agencies, a different targeted credit metrics, et cetera, if you pivot increasingly more towards regulated earnings?

<A - Jonathan W. Thayer>: So, Stephen, I think you know, we've been incredibly conservative with our balance sheet in taking that approach and I think it's worked well with the agencies. As we do get more regulated contribution, certainly the earnings mix of the company shifts as does the risk profile. That married with the 3 times debt-to-EBITDA target at the GenCo, which we're well below now, I think, positions the company quite well.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01496

We have, in the past, spoken with the agencies, particularly S&P, about upgrading us at the holding company level and we will continue to pursue that. As the mix shifts occurs, I think our case strengthens. So, that's kind of the conservative approach we're taking.

<Q - Stephen Byrd>: Understood. And then, shifting gears to the PJM white paper, Chris, that you had mentioned in your prepared remarks and thinking about fuel resiliency, fuel security. Procedurally, sort of how do we think about how PJM might approach that from a process point of view? I know it could take quite a bit of time to do more work, more analytics on that at PJM. But is there anything you can tell us in terms of just thoughts on how that process might unfold?

<A - Joseph Dominguez>: Yes. Stephen, it's Joe, and let me just start off with an observation. It's interesting. Secretary Perry in the 403 last fall identified a resilience problem in these markets. And as you know, that proposal was widely panned with a number of parties indicating that there is no resilience issue. Yet, in the last 48 hours, we've seen a filing by the New England ISO to retain Mystic on fuel security resilience grounds, and of course, we saw this white paper from PJM on Monday indicating that it too may have a resilience problem that would require capacity market changes.

From our perspective, turning to that white paper, the things that are going to be important is to understand the analytics, the inputs into the analyses that PJM runs and in particular, how they think about the unavailability of natural gas pipeline service and for what duration. What Chris mentioned at the top of the call is that in addition to those constraints or those modeling parameters, we'd like to see them model environmental impacts associated with this fuel mix. We kept the New England system running this year really on the back of oil-fired units.

And while we succeeded in keeping the lights on, it was a disappointing outcome for environmentalists in New England, where we burned 2 million barrels of oil and a disastrous, frankly, outcome for the stakeholder process in New England, where they want to get to lower air pollution, carbon and conventional pollutant emissions. So, we think that needs to be incorporated as well into PJM's analysis.

And until we get those environmental externalities incorporated, we're not going to have a complete market. So, we see this as a positive step forward. We're going to look very carefully at how they intend to model this situation, again, the unavailability of gas and for how long. And we think if they do that right, they're going to find that they, too, like New England, have a significant number of fuel constraints on the system that will require them to preserve fuel secure resources. Now, that could be gas plants on Marcellus Shale's storage, it could obviously be nuclear plants and it could be coal plants, but then we need to take another look at that mix and make sure we're meeting the expectations of our customers and communities in terms of environmental impacts.

In 2018, emissions need to be going down. And any resolution of this issue that results in emissions going up is going to continue to create incentives for state actions and indeed, for other federal actions to correct the flaws in those market.

<A - Christopher M. Crane>: I want to just follow up on one thing. I want to make it clear. We are not anti-gas. We think that the consumers in the country have really benefited from the plentiful low-cost gas. But as we look at the transmission system designs in the country, the N minus 1 concept that coordinates power flows across our system in the loss of major lines is a design basis.

What we need is a design basis threat on the gas system to the electric system and ensure either redundancy in capacity for getting the gas to the plants or limit the dependency on the gas so we can keep the system up along with what Joe said on the environmental attributes.

So, we don't have a combined gas- and electric-day coordination. We don't have a design basis threat to the gas system that would affect the electric system properly. And that needs to be worked out.

<Q - Stephen Byrd>: Very thoughtful response. I mean, it seems like the analysis, as you said, it's important to get the parameters set. That process could take a while. But I appreciate your point about what that analysis could result in. Thanks so much for the color.

<A - Christopher M. Crane>: Sure.

Operator

And our final question comes from the line of Praful Mehta with Citigroup.

<Q - Praful Mehta>: Hi, guys. Thanks so much.

<A - Christopher M. Crane>: Hi.

<Q - Praful Mehta>: So, a quick question on price formation. Could you just remind us what is the impact that you see for price formation for your assets? And how does that net out against the asset that are receiving zero-emission credits? Is there any net out of that as well?

<A - Joseph Dominguez>: So, I'll jump in. What we have talked about is really what PJM has modeled. And as a grouping of two different initiatives, the fast-start initiative and the full [indiscernible] (00:48:09) relaxation for baseload units, PJM has modeled a $3.50 impact to energy markets. We haven't published or discussed any numbers different from that.

In terms of how it interfaces with the ZEC program, remember that the units that we presently have in the ZEC program are in New York, which would be unaffected by that change. Clinton, which is in MISO, again unaffected by that change. So, the only unit presently we'd be talking about is Quad Cities. And yes, as energy prices go up either as a result of energy market dynamic changes, policy changes, carbon being in the market, there would be potentially an offset to the ZEC payment with the plants that are participating.

<Q - Praful Mehta>: Okay. That's helpful. And that'll apply to New Jersey as well?

<A - Joseph Dominguez>: In New Jersey, the mechanism is going to be different. But if prices recover for other reasons, the program also will have the BPU look at pricing in future years and potentially make adjustments. The key in all of these states is to preserve the zero-emission resources for the customers.

<Q - Praful Mehta>: Got you. That's helpful. And just quickly connecting that with capital allocation, right? If you do have the upside from price formation and zero-emission potentially in Pennsylvania as well, you've already kind of laid out a plan which allocates all the capital into all the different kind of criteria you've mentioned from debt reduction to dividend. Where do you see the incremental capital, if it does come through, get allocated in your plan [ph] covenant? (00:49:54)

<A - Christopher M. Crane>: Yeah. We have good capital resources today. We have good sources of investments to make for customer satisfaction and reliability, so we'll continue on that path, but we have to maintain a very strong sensitivity to the consumer impact on excessive capital going on the system. We can install $8 worth of capital and keep rates the same by reducing O&M by $1. And that's what we have to be focused on is customer service, reliability and the impact on our consumers. So that will be our approach as we go forward.

<Q - Praful Mehta>: Got you. Thanks. Thanks a lot, guys.

Operator

I would now like to turn the call over to Chris Crane for closing remarks.

Christopher M. Crane

So, I want to thank everybody again for attending the call and the questions. We're always available for any further details that you want going through Dan. We've had a good first quarter. We anticipate a good 2018. The work that's

final

being done by all our operating groups continue to ensure that we maintain a strong balance sheet and deliver on the value proposition. I won't wear you out with my opinion of the valuation of the stock. We have had some improvement but as we execute we expect to see more improvement on that in the following quarters and year.

So, with that, thank you very much.

Operator

Ladies and gentlemen, this concludes today's conference call. We thank you for your participation. You may now disconnect.

Presentation

Kit Konolige, Senior Utilities Analyst

Good morning, everyone. This is Kit Konolige, I'm the Senior Equity Analyst for Electric Utilities at Bloomberg Intelligence. I wanted to welcome you to the webinar as we have a preview of the year's biggest power auction, the PJM Capacity Auction, which is -- runs for several weeks in May and is announced on May 23 this year. I will do some preliminaries and then I'll turn over to our guest, Stu Bresler from PJM.

Just some administrative notes. The presentation will be recorded and you can get a playback later using a link sent to you in the email. At the bottom of the slide window, adjust the volume and size of the screen. You can ask a question, which will answer at the end of the presentation by Stu by typing into your screen to the right of the slides and we will have a copy of the slides, as well as a recording available later.

As I mentioned, today's speakers', besides myself doing the intro will be Stu Bresler, who is the Senior Vice President for Operations and Markets at PJM.

Just a quick add for Bloomberg Intelligence. We are the research -- the markets research arm at Bloomberg. Many of us are former sell-side and buy-side analysts. And our upcoming team of new folks, we cover numerous industries, very numerous companies, we're, in effect, a very large sell-side type of operation.

As far as PJM goes, which obviously we'll be talking about today. Just as a quick reminder, many of you are aware of these figures. The biggest generators in PJM are listed here. As most of you know, PJM is the biggest unregulated power grid in the US.

And here are -- here is a picture of the broad movement of prices in PJM Capacity Auction over the past eight years or so. EMAAC being the eastern zone and RTO being essentially the central zone here. So, obviously, a difference there, which is one of the numerous intricacies of the auction.

So with that, I will turn it over to Stu Bresler, who -- I'm very pleased to have joined us today to talk to a number of the topics that he is suggested. And as I mentioned, Q&A later on. Stu, if you'll go from here.

Frederick Bresler, Senior Vice President of Operations and Markets

Thank you very much, Kit. And at least in my time zone, good morning, everyone. It's a pleasure to have the opportunity to speak with you all this morning.

As Kit said, I will sort of tick down the list of topics that are on the screen. To kind of, at least initialize the discussion, but certainly, I'd be happy to take questions for as long as we have. I do need to end at least my part of the call by 10:45, but I think we'll have plenty of time to hit the major topics, the upcoming Base Residual Auction by then.

So as I'm sure, the listeners are aware, PJM operates a Base Residual Auction for capacity once every year, and we do sell for the delivery year that starts three years forward. So we will be executing a Base Residual Auction for the 2021-2022 delivery year, which runs June 1, 2021 through May 31 of 2022. And as Kit already indicated, the results of that auction will be posted on May 23.

Bloomberg Transcript

So, just kind of hitting the -- again, the list of major topics, going into this auction. I know that the announced retirements of the FirstEnergy plants was or is kind of remains a big issue for folks. The three plants we're talking about are the Perry Nuclear Plant, which has one unit; the Davis-Besse Nuclear Plant, which also has one unit; and the Beaver Valley Plant, which has two units. So four units in total.

The impact is somewhat hard to determine at this point. It did trigger PJM issuing a revised Capacity Emergency Transfer Limit or CETL value for the ATSI Locational Deliverability Area, well, which is the FirstEnergy Ohio transmission zone, if you will, that LDA. And I'll get into the CETL values in one of the later topics.

But I think the most critical point to make, just so everyone has a clear understanding is that, the submission of our retirement notice does not preclude the offering of these units into the upcoming Base Residual Auction. So, retirement notifications are revocable, if you will. The owner can change their mind and rescind a retirement requests. We actually saw that occur with the Exelon announcements or retirement request of their Quad Cities units in the past. So there is a precedent for that, if you will.

I cannot speak to whether or not FirstEnergy will offer the units and obviously at what price, if they choose to offer the units. But I just want to make sure everyone is clear that they are not precluded from doing so, if they choose to.

So, again, the impact is somewhat hard to judge. I guess, it did have an impact on the transfer limit into the ATSI Locational Deliverability Area. And again, I'll come back to that when I get to the transmission limitations that are going into this auction.

I do not know of any other major unit retirements, notifications, leading up to this auction, that's what this second topic. I'm sure you're aware of those that we have received prior to previous auctions, but I don't have any other additional ones that I'm aware of for this upcoming auction.

As far as the outlook for new plants, we note here on the slide that somewhere north of -- just north of 2,000 megawatts or so of new resources cleared in the last BRA for 2020-2021. And we had seen a trend of somewhere around the 5,000 megawatt or so mark clear in the last several auctions prior to that. But, given sort of where we've been clearing on the VRR curve, the surplus of capacity of resources that have been clearing in the auction is certainly not surprising. I don't think to see a moderation of what has been clearing as far as new resources in the auction. Whether that will continue this year, really remains to be seen.

With the FERC order that we received regarding our Minimum Offer Price Rule, that basically invalidated the two kind of alternative MOPR exemptions that being the competitive entry exemption and the self-supply exemption. We no longer post any public data as far as the exemption requests that we received. So, unlike previous years where you can see the quantity of resources that applied for those two exemptions for the Minimum Offer Price Rule, everything is now unit-specific. And so, we don't post any public data regarding the quantity of resources that have applied for unit-specific exception from the Minimum Offer Price that would otherwise be established for new natural gas-fired combined cycle plants.

I can tell you that we did receive requests for a unit-specific exception. Again, as usual, we don't know how many of those will actually offer in the auction and of course, at what offer prices. And again, we don't have any even aggregate values that we put out publicly as far as the quantity of the exceptions that we requested. So, frankly, we just have to see how things turn out, but again, sort of a moderation of the new resources clearing wasn't that bigger surprise to me anyway, given the way the last few auctions had trended. And again, where we're sort of clearing on the VRR curve and the surplus that resulted from that. So, we got to see how things turn out this year as far as penetration and new resources is concerned.

The next topic is the request from FirstEnergy for state and federal subsidies and what's the status of that. At the state level, the resources, at least the ones for which retirement requests or notifications were submitted, are Ohio and Pennsylvania. I know, in Pennsylvania, they had formed a Nuclear Energy Caucus, an NEC, that was a bicameral, bipartisan group of legislators interested in talking about the issues surrounding nuclear plants in Pennsylvania. I don't know of any legislation in Pennsylvania that has been introduced with respect to kind of saving any kind of particular plants thinking of the things that have occurred in both Illinois, and New Jersey. But I simply point out the activity

final
Bloomberg Transcript

that's been going on there with respect to that Caucus.

And similarly in Ohio, I don't know of any legislation that is poised for action in Ohio either with respect to subsidizing any particular plants or any particular class of plants there either. So, as far as I know, nothing on the slate in either of those two states at the state level.

At the federal level, as I'm sure you're aware, FirstEnergy did submit a request to the Department of Energy for action under 202(c) -- Section 202(c) of the Federal Power Act, sort of the emergency capabilities of the Department of Energy to more broadly save nuclear and coal units in PJM. There is a lot of, I think, speculation and there's been a lot of press reporting on what the Department of Energy might do with that request. I think also some speculation that they could -- that there could be action taken by the administration under another law passed back I think in the 1950s regarding supporting certain industries in times of emergencies and that sort of thing. Again, really all kind of speculation at this point, so nothing really I can speak specifically to.

PJM did submit a response to the Department of Energy, as did several other parties to the FirstEnergy request. Basically, the theme of PJM's response was along the lines of, we don't have an immediate reliability concern here, if you will. We do have adequate resources in the PJM region. Speaking specifically to these retirement notifications that we received, and our market structures will continue to ensure that we do have adequate resources on the system in the locations where they are necessary to maintain reliability.

There was some question then about the longer-term issues I think or the sort of the larger issues of resilience. And that, I can assure you, it's something that PJM is addressing as well and we will have more information out publicly very soon about how we plan to move forward with respect to addressing the resilience issues as well. But again, back to the initial question, the initial issue here, as far as I -- as I know at this point, there has not been any action on any request for federal subsidy -- sorry, for subsidies, either at the federal or state level with respect to specifically the FirstEnergy units.

I would note that the New Jersey Legislature did pass the legislation to support the nuclear units in New Jersey. And so, that sort of takes me into the next topic, which is the potential for a two-stage capacity auction to offset the impact of subsidized resources. And this one has been in -- this topic has been a subject of discussion both within the stakeholder process, as well as in other venues and forums as well for quite some time.

As you might be aware, the PJM stakeholder discussion of how to deal with state subsidies to generating units within the market construct sort of reach this conclusion earlier this year. And in February, the PJM Board of Managers taking into account the stakeholder discussion, the votes that have been taken in the stakeholder process, which did not result in a two-thirds stakeholder consensus on either of really two primary proposals to address state subsidies in the capacity market. One of them being an expansion of the Minimum Offer Price Rule to cover really all resources both new and existing with certain exceptions, just like we have with the current Minimum Offer Price Rule.

The alternative being this concept of a two-stage auction, which we called our capacity repricing proposal, whereby we could potentially accommodate state public policy decisions to support certain resources and keep them around for whatever policy objective the state has in mind. And do so through a initial stage of the auction where we would clear the auction on the basis of the offers as they came in, subsidized resources and all. But then execute a second stage of the auction, which would reprice resources that have an actionable subsidy and therefore or thereby, re-executing the auction in that stage two with those offer prices of resources with actionable subsidies changed to be what is determined to be a competitive offer, establish the competitive price that would then be paid to all resources that cleared in stage one, so that's kind of the basic outline of that alternative proposal.

After deliberating on all the input have received that the Board directed PJM management to actually file both proposals with FERC, which is somewhat unprecedented from PJM standpoint, it is not unprecedented from the standpoint of other entities filings with FERC. And we did that back earlier in -- earlier in April. And what we essentially told FERC was, we need a policy decision here. First of all, should we take action in our markets to protect the capacity market, and in particular from the impacts of these subsidies? And then if that threshold question's answer is yes, then which policy direction do we take. Do we move down a Minimum Offer Price Rule expansion path, or do

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01502

we move down more of an accommodation path that involves this repricing concept?

And then sort of once FERC makes a policy decision as to which path to take, again assuming the threshold question answer is yes, that something needs to be done. Then FERC, we believe either one of these proposals is just and reasonable as we filed it and as we proposed it. But if you believe FERC that there is additional work that needs to be done on certain components of it, then we suggest a settlement judge process to gather the stakeholders together for additional engagement to come to resolution on those components with the idea of a settlement filing being made at the end of that process, which we would expect to take a matter of several months.

The idea being to get finality on this issue by the end of this year really in time for implementation of whatever comes out of this process for the next auction in May of 2019 for the 2022-2023 delivery year.

So, the bottom line answer after that long-winded explanation is that, no, the two-stage auction is not in place for this May Base Residual Auction. The two proposals I described are in front of FERC as we speak. I think the comment deadline was extended to somewhere around the first week of May, I believe. And then we will see where that goes, obviously, there will be, I think, probably a couple of rounds of protests and comments on both sides of the equation and we'll see what FERC -- what action FERC takes, some time I would imagine later this spring or maybe early this summer.

So that's where the proposals to deal with subsidies lies. Again, no impact with respect to this upcoming auction, given the fact that, like I said, those proposals are still in front of FERC. And so, we are executing this upcoming May auction in terms of our current PJM tariff.

So the last I think major subject with respect to the upcoming auction then is the major Locational Deliverability Areas that separated last year and sort of the changes in the CETL values that resulted from the planning parameter development for this upcoming auction. I would point to two areas of the system really that had significant changes. Number one, if you look at both the public service, PSEG and also PS-North. So PS and PS-North LDAs, they both experienced a fairly significant reduction in Capacity Emergency Transfer Limit or CETL transfer capability into those LDAs.

The primary reason for that reduction being a change to how we model non-firm imports from New York. And really, basically, just kind of eliminating the ability for non-firm imports from New York in our planning analysis to increase the CETL into those areas. And very briefly, the concept there was that PJM, particularly the Eastern part of PJM where these LDAs are located and New York and particularly the Eastern part of New York, which is directly tied to these two LDAs and really one is a sub LDA of the other, obviously, PS-North is the sub LDA of PS tend to peak at the same time. And so, the availability of non-firm imports from New York to help back off transmission constraints into PS and PS-North during conditions where both systems are really peaking is probably unlikely. And so, the decision through again a stakeholder approved change to our modeling parameters was not to count on non-firm imports in order to help those CETL limits in PS and PS-North going forward.

Now, the reductions in CETL for those two LDAs was somewhat offset, so would have been even bigger, but for the fact that we did have some changes to the DC ties that actually leave the PS and PS-North LDAs. There were a couple where the transmission service was converted or changed, if you will, from firm to non-firm, and then another that was just outlay, outright delayed [ph], if you will, was suspended. And so, not having those firm exports from those LDAs actually helped with the transfer limit and help to offset the reduction by virtue of again that modeling of the non-firm imports from New York. So that's the PS and PS-North LDAs.

The other significant change was an increase in the transfer limit into the ComEd LDA. So the complete opposite end of the PJM system out in Northern Illinois, we do have a couple of baseline 345 kV reconductoring projects in actually the AEP territory, as well as a couple of 345 kV transmission upgrades in ComEd that were included for the first time for this 2021-2022 BRA. And so, those upgrades did increase the Capacity Emergency Transfer Limit into the ComEd zone and it was fairly substantial by about 1,500 megawatts. So it's a fairly substantial increase.

And again, those upgrades are listed in the planning parameters, if you go to the last part of the Excel Spreadsheet in the key transmission policy changes for this particular model. Whether -- actually I should say, the impact of that

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01503

increase in CETL on the results of the auction, really, again, remains to be seen given the way the offers come in both for the RTO, as well as for the offers inside the ComEd LDA itself. So we just have to see how they play out as to whether the ComEd zone binds or not, whether the LDA binds or not in the auction.

And then finally, the last update was, again a reduction, I think it was about 1,300 megawatts or so of the ATSI transfer limit into the ATSI LDA, which was the result of re-evaluating that transfer limit basically as a result of the re-evaluation result of the FirstEnergy unit retirements. So, that was the other significant change to note. So I think that covers the items on the upcoming BRA.

The last topic because I know has generated a lot of interest is the status of the price formation proposals that PJM has been discussing. Again, this is energy and reserve market price formation. So, just very briefly and then we can get onto questions. We are still pursuing really both components of our energy market and reserve price formation proposals. The first component -- a major component is what we believe will be a beneficial enhancement to the LMP calculation and really utilizing what we call integer relaxation in the optimization algorithm for calculating LMPs. So the dispatch would not change, but we think we can arrive at a better set of LMPs that more completely reflects the total cost of certain demand on the system at any given time, and minimize the amount of uplift that results from the market operation, so -- and the price calculation.

So, that is really kind of in front of FERC in a limited sense right now in the fast-start pricing docket. And we intend to not completely get away from the discussion on our stakeholder process, but really see where that docket goes to see where we're at with FERC on that adoption of the integer relaxation approach, and then see if we can move forward with expanding that approach to a larger set of resources, other than just fast our resources.

The second major component of the energy market price formation proposals is reserve procurement, pricing and shortage pricing proposals. And that's really where we intend to focus our stakeholder discussion over the next several months through the senior task force that is currently meeting really every two to three weeks. And really the idea there is to better incorporate into the reserve modeling and the reserve pricing, the actions taken by the PJM system operator. So when they commit resources to maintain reliability, ensuring that those commitments are better reflected in the reserve quantities that we actually procure and price to really ensure that the synchronized reserve market is working, as well as the Cannon [ph] and hopefully implement some reforms there that will better and more transparently price synchronized reserves.

And then the longer-term, we think it's important to add a 30-minute reserve product in real time really to marry up with the 30-minute day-ahead scheduling reserve product that we currently have as part of our day-ahead market. And then also implement substantial reforms to the operating reserve demand curves that are used to price shortage conditions in PJM. Similar really I think to what has been done in ERCOT, we think they have a better approach to establishing those demand curves and we're looking at going down that path for PJM as well. So that's a second major component of the price formation discussion.

We are hoping and really intending that the shorter-term issues reforming the current sync reserve market, potentially some initial changes to the operating reserve demand curve, and those types of changes really getting in by this -- next winter, hopefully by January of 2019. And then the larger changes, the 30-minute reserve product and the full-blown operating reserve demand curve changes by summer of 2019.

As far as the LMP calculation changes, we're going to have to wait and see the timeline on which FERC acts, obviously, well, maybe it's not obvious, I'll take that back. From PJM standpoint, the sooner we get those enhancements in place, the better, but really we're sort of beholden, if you will, to the FERC timeline as far as when we get an order from them and then how fast we can proceed from there.

So that's kind of the status of the PJM price formation proposals as well. Again, we think they're both critically important and we are pursuing both, but one like I said, it's kind of in FERC's hand at this point, the other we're focusing our stakeholder discussion attention on -- at this point for that, at least like I said, the next several months.

So let me turn to a couple of questions that I'm seeing online here, first of all. The first question that I see here, is Pleasants still retiring? Yes, there is a -- if I missed that one, when I said one that we had previously received. Yes, the

final
Bloomberg Transcript

Pleasants unit has submitted a retirement notification as well. So that is still the case.

We have another question here, we have not received any such retirement notification for the Bruce Mansfield plant. So, I figure those are two easy ones I could hit.

There is another question here as to what extent do changes to the cost of new entry impact auction results, particularly in constrained zones? Well, first of all, I don't think there were any real significant changes to the cost of new entry for this year, just the sort of the year-to-year kind of inflationary adjustments, if you will. But in more general sense, the cost of new entry does form the basis for the VRR curve. So, everything else being equal, if you had an increase in the cost of new entry, you would have an upward shift of the demand curve. And then again, all things being equal, you would expect to see higher prices come out of the capacity auction. And then conversely, of course, if you had a decrease in the cost of new entry, you would see a downward shift in the VRR curve, which potentially could result in a decrease in prices.

The other thing that factors in there is not just the cost of new entry itself but also net energy and ancillary service revenues, because the value that actually forms the basis for the VRR curve is the net cost of new entry. And so, even if the cost of new entry stays the same, if you had an increase in average energy revenues over the prior period, that now would decrease the Net CONE, which would have the same effect I described before, and obviously, conversely, if you had a decrease in energy revenues that would increase the Net CONE with a similar effect.

And then, we use the same shape VRR curve for each of the constrained or potentially constrained LDAs as well. And so, the impacts really are similar for, again a constrained or potentially constrained LDA -- a modeled LDA as well.

So those are the three questions I can see on my screen so far. And I'm trying to scroll, but I don't know if I'm doing something wrong or not, but those are the only three I can see at this point. So, Kit, I'd be happy to turn it back over to you. We have about 11 or 12 minutes I think here, where we can take some additional questions if there are any that I can't see on my screen.

Kit Konolige, Senior Utilities Analyst

Sorry about that. Great. Thanks, Stu. Actually, I see a couple of other questions. One is, how will the -- I think there are new Net CONE findings from Brattle, how would they be incorporated into future capacity auctions?

Frederick Bresler, Senior Vice President of Operations and Markets

Right, thanks. So the process there is, we have the Brattle reports and the Brattle recommendations. And again, Brattle is contracted by PJM to perform an independent analysis both of the cost of new entry, and they subcontract with Sargent & Lundy as they are experts on sort of building a bottoms up estimate, the cost of new entry, as well as a review of the shape of the Variable Resource Requirement, the VRR curve, the demand curve we use in the auctions. And they provide -- again, their independent analysis and their recommendations.

And then, PJM also comes out on the basis of what we have learned from Brattle on our own review, comes out with our recommendations on the basis of what we've gotten from Brattle. And PJM posted our recommendations last night, they are on the PJM website on the Reports and Notices page. So you can take a look at them.

You will see that, just in general, PJM is looking to adopt the majority of what Brattle recommended with respect to the cost of new entry. There is a significant reduction in both the combustion turbine and the combined cycle cost of new entry. The primary contributing factor being the change in tax laws, although, there was also an impact of the economies of scale because these resources are getting bigger and bigger, and so on a per megawatt day or per kilowatt year, how you want to look at it, the costs are going down just because the units are getting bigger. And also a small contribution to the reduction from a -- reduction in the cost of capital. So, again, with some small tweaks, the cost of new entry estimates are what they are.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01505

But then there are some other recommendations that Brattle made around shifting the VRR curve back to the left and changing the cap, what establishes that first point on the VRR curve. PJM is not inclined to adopt those recommendations. We largely think that the VRR curve should be maintained the way we have had it up until now, really since last review, as well as maintain the combustion turbine as the reference resource, whereas Brattle would recommend switching to the combined cycle.

So, we are entering now into a stakeholder discussion through August on the Brattle recommendations and PJM's recommendations. And we have a deadline in the tariff to wind up that stakeholder discussion by the end of August and then review with the PJM Board of Managers and make a FERC filing with any PJM changes to our tariff resulting from that process by the end of October. So that would then get into the FERC process, which was -- is timed, such that it can wind up well ahead of the next RPM Auction, the Base Residual Auction in May of 2019.

Kit Konolige, Senior Utilities Analyst

Great. Here's another question following up on the discussion of the two-stage auction concept. Just to be clear, will all the resources that cleared in the first stage receive the higher second price, including the resources that are getting subsidies?

Frederick Bresler, Senior Vice President of Operations and Markets

That was PJM's proposal, yes. That's what we filed with FERC.

Kit Konolige, Senior Utilities Analyst

Okay. Great.

Frederick Bresler, Senior Vice President of Operations and Markets

What comes out of that process, we don't know yet, but that's what PJM filed.

Kit Konolige, Senior Utilities Analyst

Right. Okay. Very good. And as far as FirstEnergy Solutions and the plants -- the nuclear plants -- and Pleasants that they've announced are closing. Is there any obligation they have to PJM to bid or to accept the price to be available under any circumstances, or are they simply now on their own?

Frederick Bresler, Senior Vice President of Operations and Markets

Yeah. Actually, it's a great question. I'm blanking on the timing of the Pleasants retirement notification. But let me just answer the question in general. If the retirement notification comes to PJM after the deadline for an exemption to the must-offer requirement, then the market seller for that resource would need to get a waiver from FERC of the deadline in order to be exempt from offering the resource into the auction. So, if the notification came to PJM ahead of the deadline, then the resource would not have a must-offer requirement. But again, if they came to PJM after the deadline, and the market seller did not get a waiver from FERC, which would be public, then the resource is required to offer.

So, speaking specifically of the nuclear unit retirements we received, the notification from FirstEnergy, they were all after the deadline. So, not only are they not precluded to offer in the auction since they did not receive a waiver from FERC, at least not as of now, they are actually required to offer into the auction. That's a good clarification.

final
Bloomberg Transcript

Kit Konolige, Senior Utilities Analyst

Am I correct in thinking that if they offer a high enough price that it would be unlikely that they would clear?

Frederick Bresler, Senior Vice President of Operations and Markets

Well, yeah, I mean, that's what I said before as I can't speak for what their offer will be. But since we have capacity performance rules in place right now, the overall offer cap is Net CONE times B as opposed to something specifically tied to avoidable cost rates or ACR. So, yeah, I can't speak for what it will be, but it seems plausible that it could be at a level that may not clear, right.

Kit Konolige, Senior Utilities Analyst

Right. And on the Net CONE, again, can the capacity price clear in a constrained zone above Net CONE?

Frederick Bresler, Senior Vice President of Operations and Markets

Hypothetically, yes. So the VRR curve, the middle point is basically the Net CONE value, if you will. So -- and then it's -- I think it's like basically IRM plus 3% I think. And so, if you would clear down closer to the reliability requirement or even below the reliability requirement in a given location, then, yeah -- hypothetically, yes. If that's were to occur, the price would be above the Net CONE value, yes.

Kit Konolige, Senior Utilities Analyst

Right. Okay. And here's one other, it refers to the two-stage bidding structure that you think of as a possibility at this point. Has PJM given or discussed any specific dollar impact possibilities that would result from this or otherwise, given its thoughts on what the goal is on a financial basis for the market affected by these subsidized plants?

Frederick Bresler, Senior Vice President of Operations and Markets

Yeah. I mean, from the energy market price formation standpoint and this is probably true more globally than that, but we don't have a goal as to what prices should be. What we want to make sure of is that, we are setting prices in the most effective manner in order to accomplish the objectives of those prices. And in our minds, the objective, the fundamental principle of locational marginal pricing is that, it should be as transparent and inclusive as possible of the total cost of serving demand on the system, thereby, minimizing out-of-market payments that are necessary. And so, that is our goal, that is our objective is to meet that principle and then whatever price results is the price that results.

We had done some very cursory simulations that we posted last November, everyone is probably familiar with. It was a really -- I used cursory before, it was really -- it was a real approximation as to what could result because all it did is, basically relax the economic minimums on resources that would otherwise not set price because they would be deemed to be inflexible by the price setting program, and then see how the price has changed. So, really was not the full integer relaxation, and it also did not -- because it was not integer relaxation, it did not result in any of the start-up and no load costs being included in the LMPs either. So that was somewhere around $1.02 per megawatt hour on average. But again, it was a very preliminary and cursory kind of evaluation.

Once we, I think, had some finality on what we are going to implement with respect to fast-start pricing at the very least, I think we'll be expected to do some more simulations on that. And then, again, to the extent that I'm further down the road of expanding the resources to which we would apply this integer relaxation approach, we could get more specific (inaudible) that as well.

Kit Konolige, Senior Utilities Analyst

Good enough. I think given the time as promised to, Stu, we will end the session now. And I would just like to thank everyone for joining us on the call. And as a reminder, you will be able to see transcripts and recordings if you follow directions on the email that you got before. And if you have any questions for me and/or Stu, be happy to pass it along.

So thanks again, everyone. Thanks to Stu, in particular, and look forward to doing it again.

Frederick Bresler, Senior Vice President of Operations and Markets

Well, thank you, Kit. And again, (Ends abruptly)

Presentation

Operator

Good morning. My name is Sarah and I will be your conference operator today. At this time, I would like to welcome everyone to the 2017 Q4 Earnings Conference Call. All lines have been placed on mute to prevent any background noise. After the speakers' remarks, there will be a question-and-answer session. (Operator Instructions)

Thank you, Mr. Dan Eggers Senior Vice President of Investor Relations, you may begin your conference.

Daniel Eggers, Senior Vice President, Investor Relations

Thank you, Sarah. Good morning everyone and thank you for joining our fourth quarter 2017 earnings conference call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer; Jack Thayer, Exelon's Chief Financial Officer, and Jos Dominguez, Executive Vice President, Governmental and Regulatory Affairs & Public Policy. We're joined by other members of Exelon's senior management team will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, both of which can be found in the Investor Relations section of Exelon's website. The earnings release and other matters, which we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material and comments made during this call.

Please refer to today's 8-K and Exelon's other SEC filings for discussions of risk factors and factors that may cause results to differ from management's projections, forecasts and expectations.

Bloomberg Transcript

Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures.

I'll now turn the call over to Chris Crane, Exelon's CEO.

Chris Crane, President & Chief Executive Officer

Thanks, Dan and good morning everybody and thank you for joining us today. Let me start by apologizing first for my voice is recovering from the cold, as some of our other speakers are in the same place. So, we'll try to make it through clearly without too much distraction.

2017 was a great year for Exelon and I'd like to take a moment to talk about our business performance and some of our major accomplishments over the past 12 months.

First and foremost I'm pleased to report Exelon delivered $3.97 per share of GAAP earnings and $2.60 per share of operating earnings for 2017. Jack will walk through the details, but I note that the earnings are solidly within the guidance range as we saw high utility performance and cost discipline absorbed $0.09 timing shift from 2017 to 2018 related to the Illinois ZEC contracts and absorbed $0.04 from FERC related accounting changes.

Last week, the Board approved our updated dividend policy targets 5% annual growth for 2018 through 2020, builds on our previous plan of 2.5% growth from '16 through '18 and keeps our recently shared goals of offering competitive dividend growth rate and providing a multi-year visibility.

We're comfortable with the past year dividend growth rate, particularly in light of the significant positive business developments since 2016. We completed the PHI acquisition, increasing our earnings mix from utility operations, the New York and Illinois ZEC programs have preserved an extended useful lives of our most valuable nuclear plants. And consistent with our inherent cost discipline, our forecast of O&M spend will be approximately $725 million per year lower in 2020 from the cost reduction initiatives identified since 2015.

Jack will discuss our capital allocation plan shortly, but we are confident in our ability to grow our dividend competitively on meeting all our other capital commitments. And probably we are able to share more of our financial success with our shareholders throughout this updated dividend policy.

Tax reform passed at year end is clearly a positive for us, allows for significant savings for our utility customers, as the new tax rate flows through into newer bills. ExGen will benefit from lower tax rate and 100% expensing, in total, we see the run rate EPS benefit of $0.10 for 2018. Operationally, we execute well in each area of our business win. And our utilities, we invested total of 5.3 billion of capital and infrastructure and technology to provide a premier customer experience, fewer outages and faster restoration times, that all contributed to higher customer satisfaction scores. In fact our utilities achieved multiple best on record operational metrics and received national recognition for exceptional customer satisfaction. Meeting with our better service and performance, we are also busy on the regulatory front, completing seven distribution and five transmission rate cases in 2017 and receiving a total of approximately 400 million in revenue increases. Timely and fair regulatory outcomes help us to fund the future investment in the grid and improve the customer experience.

Our generation fleet also performed well. The nuclear fleet produced a 157 million megawatt hours on record setting year for Exelon and we brought in to service the two new CCGTs in Texas. I'm pleased to tell you that our fleet performed very well during December and January cold spell in the Northeast, once again demonstrating the value of nuclear generation is highly reliable and carbon free source of power.

On the regulatory and policy front, the ZEC programs in the York and Illinois were implemented, preserving several of our most at risk nuclear stations in the reliability economic and environmental benefits they provide. We will continue to defend these programs as we work on similar programs in New Jersey and Pennsylvania will benefit our customers, our communities and our employees.

final
Bloomberg Transcript
Bloomberg

We also saw recognition of the need to address the resiliency of the power system and effort advancement FERC's order in January, we believe FERC order is an important step in addressing real resiliency and concerns we urge FERC to adopt PJM's proposal around power price formation and adopt a comprehensive resiliency solution that we will realize that will take some more additional time to resolve. Joe Dominguez will discuss this in more detail later in the call.

We can talk about our successes this year without -- we can't talk about our successes this year without noting our strong commitment to corporate responsibility, improving and supporting the communities that we serve, building on prior year's recognitions. In 2017, we were the first utility named to The Billion Dollar Roundtable, which recognizes companyies that spend of over $1 billion with Tier 1 diverse minority-owned suppliers. Being in active part of our community is essential theme of Exelon and this award reflects what we have been aiming to do for years.

In addition, DiversityInc named us one of the top 50 companies for diversity in the U.S. Veterans Magazine named Exelon to its Best of Bests List of Veteran-Friendly Companies. We also made a lot of progress in areas that will bring great value to our communities in 2017. We announced a new job training center in Washington, D.C. modeled after the center we operate in Chicago. We remain to the Civic 50, a list of community-minded companies like Points of Light foundation and singled out as the utility sector leader. Exelon and it's employees set new records including corporate activities committing over $52 million in giving and volunteering more than 210,000 hours in 2017.

Turning to slide six, we'll show you the impact of Exelon's management model that is add on our utility operations. Looking back to the Constellation merger for the legacy Exelon utilities or since the merger with PHI, we have seen material improvement in operations across our utilities. The hard work of our employees and the benefit of our scale are clearly paying off. The utilities primarily operate at first quartile levels across our key success of reliability, safety and customer service. However, this doesn't tell the full story about performance, with many performance at the top decile levels across a number of these measures. And many being the best on record performance in 2017 BGE, ComEd and PHI has the best performance on SAIFI and CAIDI and Pepco and BGE and ComEd on customer satisfaction.

Customer service remains central to the strong utility performance and we did extremely well on this front in 2017. The JD Power's customer satisfaction study, BGE are in the top rank for business electric service among the large utilities in the East and was the best of 11 utilities in the region and was ranked highest nationally among 87 utilities by important professionals. Kudos to the hard work of our utility professionals, who strive every day to provide service levels for our customers.

Turning to slide seven, we also had another strong year of generation in Constellation. Our nuclear assets continue to perform at top tier levels that we had combined capacity factored 94.1 marking over 94% utilization rate for the four of the past five years. In 2017, we had 13 refueling outage with an average duration of 23 days. With the addition of FitzPatrick plant in high utilization we generated a nuclear fleet record of 157 billion megawatt hours.

On the Constellation side, our C&I operating metrics remain strong. 74% customer renewables, average customer duration of more than five years in power contract terms of more than 25 months on average. These statistics speak to our deep customer relationship that has been the bedrock of Constellation business. We continue to see stable unit margins with our C&I customers and our aggressive cost management is helping to further support operating margins.

And now, I'd like to turn it over to Jack to walk through some of the numbers.

Jonathan Thayer, Senior Executive Vice President and Chief Financial Officer

Thank you, Chris, and good morning, everyone. My remarks today will focus on 2017 results, 2018 earnings guidance and annual updates to our financial disclosures. Turning to slide eight, as Chris stated we had a strong year financially and operationally across the company. For the full year of 2017, our adjusted non-GAAP operating earnings were $2.60 per share and comfortably within our guidance range. We are pleased with our full year results, particularly considering the unexpected $0.09 timing drag from the Illinois ZEC contracts that was signed this January rather than in December

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01511

as well as a $0.04 impact from FAS 109 asset impairment related to income taxes for our FERC regulated assets.

For the fourth quarter, we earned $0.55 per share, utilities less holding company EPS was $0.29 per share benefiting from favorable storm expense and lower O&M expenses, which were offset relative to our plan by the FAS 109 impairment. Generation performed mostly in line with our expectations, as our cost customization efforts offset some market softness experienced earlier in the quarter.

Turning to slide nine, we are providing full year 2018 adjusted operating earnings guidance of $2.90 to $3.20 per share. The growth in utility earnings reflects continued rate base growth as we deploy capital, the benefit of our customers as well as improvement in PHI's, earned ROEs. At Exelon Generation, the year-over-year increase is primarily driven by the full year recognition of ZEC revenue from New York and Illinois, the $0.11 recognition of the 2017 Illinois ZEC payments, which is higher than 2017 drag, which is now lower tax rate, the impact of tax reform and cost optimization efforts partially offset by lower energy prices. We expect our first quarter earnings to be in the range of $0.90 to a dollar per share. More detail on the year-over-year drivers by operating company can be found on the appendix starting on slide 59.

On slide 10, we roll forward our outlook for utility CapEx and rate base, which now covers 2018 to 2021. We plan to invest $21 billion into our utilities over the next four years to ensure reliable, more resilient and more efficient transmission and distribution of electricity and gas that improves the customer experience.

Our four-year capital program is up from what we shared with you last year, as we accelerate our gas pipeline replacement programs at BGE and PECO and take advantage of opportunities to further improve reliability and resiliency, all of which allows us to provide our customers with safe reliable service. This results in a capital plan across the utilities with a $5 billion annual run rate.

Turning to rate base, we now project annual growth of 7.4% compared to 6.5% at the last update, which reflects the expanded CapEx budget and the impacts of tax reform. Tax reform will increase rate base by approximately $1.7 billion in 2020 relative to our previous expectations. For your convenience in the appendix, we provided a more detailed analysis of the capital and rate base outlooks by individual utility beginning on slide 27.

Turing to slide 11, equally important to deploying capital strengthen our system is timely revenue recovery. Although $11.5 billion of rate base projected -- rate base growth projected for 2021, approximately 70% is covered either under formula rates or mechanism supporting our ability to make additional investments earn a fair return on our capital. While we do not have mechanisms, we will continue to work with stakeholders to enact and implement these types of tools. I would also note that over 70% of our rate base is in jurisdictions that are decoupled from volumes, improving our earnings visibility and aligning with the ambitious energy efficiency goals in our space.

Slide 12 shows the trailing 12-month blended transmission and distribution earned ROEs at the utilities. Our utilities continue to execute, delivering strong earned returns for the year, in addition to the robust operational performance, Chris already discussed. Over the past year, PHI's earned ROEs improved at Delmarva and Pepco and remain flat at Atlantic City Electric, although I should point out that the FAS 109 impairment costs about 60 basis points of ROE at each utility. We are encouraged by the improvements at PHI and we expect to see further gains, as pending rate cases are resolved throughout 2018.

The legacy Exelon utilities had a strong 2017, earning 10.3% as a group, helped by favourable storm expense in O&M partially offset by the FAS 109 regulatory asset impairment in the fourth quarter of 2017. Improving the earned ROEs at PHI, sustaining strong performance at the legacy Exelon utilities to be a core focus in our efforts to meet our overall utility earnings growth targets. We expect to earn 9% to 10% ROEs across our utilities in 2019.

Turning to slide 13, we remain busy on the regulatory front. Since our last earnings call, ComEd received an order authorizing a revenue increase of over $95 million. Since implementing the formula rate structure, we've recovered 90% plus of our assets, with this year being the 100% to the first time. Pepco filed electric rate cases in Maryland and District of Columbia, with orders expected in the third and fourth quarters of this year respectively. In addition to the recently filed Pepco, Maryland and DC rate cases, we have pending rate cases at Delmarva with orders expected in 2018.

final
Bloomberg Transcript

Combined, we are asking for $133 million of revenues, which reflect recovery on multiple years reliability, smart meter and other capital investments, that have been made to improve performance across these jurisdictions. Later the spring we planned to file a rate case at PECO for the first time in three years, and we'll file our standard formula update at ComEd in April. More details on the rate cases and their schedules can be found on slide 65 through 71 in the appendix.

Slide 14, provides an update on our outlook for utility EPS, where we continue to forecast 6% to 8% EPS growth. Compared to last year, our EPS bands in 2019 and 2020 are both increased. The uplift from tax reform in utilities from the increased rate base has mostly offset in the first couple of years, by the drag from higher holding company expense, since the lower tax rate provides less tax shield. As we look toward the back half of this period, we should start to see net benefit from the change in tax policy. Overall, the combination of strong rate base growth, timely regulatory recovery and tax reform leave us on a path to sustain our leading utility EPS growth.

Slide 15 provides our gross margin update for ExGen and on slide 38, we provide more detail bridges compared to the previous quarter. I should point out that our decision to retire Oyster Creek, a year earlier than previously planned is now factored into all of our disclosures for gross margins, O&M and depreciation expense. With the collective EPS uplift being $0.03 in 2018, $0.07 in 2019 and a penny in 2020, relative to our previous expectations.

Now turning to our gross margin updates, our 2018 total gross margin is flat relative to our last disclosure. As lower Oyster Creek contribution is offset by the inclusion of the Handley Generating Station, the 1265 megawatt figure [ph] in Texas that we bought out of the EGTP portfolio, this serve us cost-effective resource for our Constellation regional operations.

Total gross margin in 2019 is up 50 million since the last quarter, driven primarily by higher West Hub and (inaudible) power prices, strengthening our dark spark spreads and additional generation related to Hadley, partially offset by the early retirement of Oyster Creek. Since we have not previously disclosed 2020 gross margins, let me help with the 2020 disclosures in context by bridging a few changes compared to the 2019 disclosures. Total gross margin is now $300 million and to be bucketed into $150 million reduction to open gross margin, primarily from the already announced retirement of TMI. We have offsets and O&M depreciation expenses closure is net EPS accretive to us.

Secondly a $150 million decrease in the capacity in ZEC line, which largely reflects the roll-off of the robust and previously disclosed PJM capacity prices from June 2018, '19 auction. From a hedging perspective, we ended the quarter approximately 13% to 16% behind our ratable hedging program in 2018, and 8% to 11% behind ratable in 2019, when considering cross-commodity hedges. We remain comfortable being more open, when we look at market fundamentals and particularly as we see opportunity through PJM price formation changes.

Turning to slide 16, our O&M expense outlook is consistent with the third quarter earnings call disclosures. That included our expanded $250 million cost reduction program, plus an additional $50 million and $120 million of O&M savings in 2018 and 2019 respectively, due to the earlier than planned closure of Oyster Creek.

Turning to CapEx. Our nuclear fuel and baseline capital spend projections continue to decline. Our base CapEx benefits from the proactive investments, we have made across the fleet in prior years, further focus on investment priorities and the impact of closing uneconomic plants. Our nuclear fuel expenditures are also falling as we take advantage of well supplied uranium markets and excess fuel processing capacity.

We continue to run an efficient organization, we'll always look for ways to reduce costs and run the fleet more cost effectively, while maintaining the highest premium on safety and reliability. The combination of ZEC programs in New York and Illinois have extended the useful lives of our most vulnerable assets, and we continue to reduce ongoing capital needs for the plants, which we think makes a more compelling case from a long-term value of these assets, which the market still seems slow to reflect.

Turning to slide 17, we're rolling forward the free cash flow outlook for ExGen to cover 2018 through 2021. We expect the cumulative free cash flow to be $7.6 billion, which is $800 million higher than our previous four year outlook. Our forecast takes into account power price forwards at year-end, the current gross margin outlook for Constellation, the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01513

benefit of the cost cuts outlined on the third quarter call. The planned closure of TMI and earlier closure of Oyster Creek, our updated base CapEx and nuclear forecast and the impact of tax reform.

We're also updating how we plan to use ExGen's strong free cash flow generation. We'll invest approximately $700 million in growth capital, which is primarily cited solar projects in support of our Constellation business, the Medway plant in New England and some final payments around the Texas CCGTs. We plan to inject between $3.3 billion and $3.7 billion of capital in the utilities, upon the outsized growth without the need for external equity funding.

With faster dividend growth, we will use approximately $400 million to $600 million of ExGen free cash flow to fund the dividend, not covered by the utilities. We are comfortable with this dividend funding from ExGen, particularly considering that, the four-year needs are less than 10% of our total free cash flow generation. Finally, we plan to retire between $2.7 billion and $3.3 billion of debt, which will be spread between ExGen and holding company's debt. We'll continue to manage ExGen leverage to our three-times debt-to-EBITDA commitment.

Turning to slide 18, we've already shared with you the impact of tax reform on Exelon in our 8-K from January 5th, but we want to highlight that we are clear beneficiary from tax reform and offer a few additional details. We expect to pass through meaningful savings to our utility customers across the different jurisdictions reflecting the lower tax expense recoveries, and the refund and deferred income tax regulatory liabilities, partially offset by the impacts of higher rate base. We are thrilled that our customers, who benefit so much from tax reform.

Our 2018 EPS guidance is inclusive of tax reform and we expect $0.10 per share uplift to 2019 earnings. Generation earnings will benefit from 22% effective tax rate, the utilities will benefit from an increased rate base up $2 billion by 2021, while the lower tax rate will create less tax shield for a holding company interest expense.

We expect to be a very modest cash taxpayer through 2021 and you can see the cash tax rates by year. We expect much stronger free cash flow from ExGen with a lower tax rate and 100% expensing of capital, which will more than cover the additional equity needs the utilities associated with the increased rate base. And we expect the consolidated metrics will remain largely unchanged as a result of tax reform. And ExGen tax reform has a positive impact in 2018 with a more meaningful impact in the outer years, that provides the company with additional financial flexibility.

On the utility side, we do see some modest erosion in FFO to debt, although, all of our utilities remain at/or above rating agency thresholds. We frequently made the case that our generation business provides distinct competitive advantage for the overall company with the ability to recycle significant free cash flows.

Our positive uplift to credit metrics and no need for external equity are additional examples relative to other utilities, that are being pressured due to the tax reforms.

Turning to slide 19, we remain committed to maintaining a strong balance sheet in our investment grade credit rating. I hit on this in the previous slide, but we remain comfortably ahead of our corporate targets for FFO to debt and well above the downgrade thresholds. Looking at ExGen, we are well ahead of our debt to EBITDA targets in 2018.

On a total basis, we expect to be at 2.5 times debt to EBITDA and only 2 times debt to EBITDA from a recourse debt perspective. We will continue to manage our balance sheet in ExGen over time to the three-times debt to EBITDA levels. So, look for us to publish our debt reduction at both holding company and Genco.

Turning to slide 20, as Chris mentioned earlier, the Board has decided to increase the dividend growth rate policy from 2.5% to 5% annually through 2020. Chris spoke to the positive business developments that gave us the confidence to increase our dividend growth rate to be more competitive with utility peers, so I want to take a moment to talk about our financial thought process.

Slide 20 shows the hypothetical portion of the dividend being funded by the utilities. If we assume their piece of the dividend, it's based on a 70% payout ratio on utility less holding company expense. The residual dividend is then covered by ExGen, when you consider that the utilities are growing EPS at 6% to 8% premier and represent the growing majority of our earnings were comfortably growing the dividend at 5% based on 70% utility earnings payout ratio, which keeps space with this earnings growth. On this approach, ExGen is funding around $0.20 of dividend depending on the year, which is a payout ratio in the teens of our 2018 EPS guidance for the business and substantially

final
Bloomberg Transcript

less amount on a free cash flow basis. We are very comfortable committing the small portion of ExGen's financial output excluding the dividend and are excited to be returning more capital to our shareholders through the dividend.

I will now turn the call over to Joe Dominguez to walk you through the latest on our regulatory and policy initiatives.

Joseph Dominguez, Executive Vice President of Governmental and Regulatory Affairs & Public Policy

Thanks, Jack, and good morning, everyone. I'll cover slides 21 and 22 of the materials. Since our last earnings call, we continue to see positive momentum. The policy changes at the state, FERC and RTO [ph] levels, the value of the zero Emission and resilient resources that benefit our customers in the environment most.

As Chris said at the top of the call, we remain focused on three areas. First, ensuring that resilient resources are compensated fairly; second, addressing the price-formation flaws that PJM has identified in its market; and third, preserving and expanding state policy initiatives like the ZEC programs and include nuclear energy within the umbrella state-sponsored clean energy programs. I'll walk through each of these. On resilience, FERC issued its order on January 8th in response to the DOE NOPR. Consistent with Exelon's recognition, the order initiated a new resilience proceedings and directed the RTOs to immediately examine grid resiliency and provide a report to FERC within 60 days.

FERC noted that the report should include any recommended changes to market rules. In our filings at FERC, we urged the commission and the RTOs to view resilience as a broader scope of issues than the traditional reliability concerns that center around electric generation and transmission, unit performance and weather events. In particular, as we've talked about in earlier calls, we urge FERC to consider the risk of a cascading loss of the electric system caused by natural gas infrastructure failure. We expect that the resilience proceedings and crafting a solutions will take some time, as Chris indicated earlier. The FERC's order clearly gives PJM the opportunity to address near-term solutions, including a immediate price formation reforms.

PJM had said it can implement those reforms within the course of this calendar year. Based upon PJM's comments including NDF [ph] testimony before the Energy Committee of the US Senate, a week ago, we expect that PJM will continue to make a strong push for price formation reforms in its March PJM filing.

In terms of next steps, we continue to see two alternative pathways that are going to be work simultaneously. One, achieving a FERC directed PJM filing, as a byproduct of the resilience docket stocked; and two, a stakeholder process at PJM followed by a 206 filing through its existing enhanced liaison committee process. PJM already has the price formation stakeholder process underway and it is scheduled to conclude that process in the third quarter. In the mean time, PJM is pursuing with limited changes to price formation in the (inaudible) docket were filings are due in next week.

In summary, the commission's focus on resilience and the Chairman's call for urgent action, coupled with PJM's commitment with (inaudible) continues to give us confidence that our reforms will be implemented in 2018. With that said, there's a lot of work ahead of us, as PJM continues to engage with stakeholders and refine its proposal.

Turning to the next slide, in our ongoing efforts concerning state policy, that values zero emission nuclear resources, Jack already noted that we've reached an important milestone last month in Illinois, with the completion of the state procurement process in New York ZEC, the Quad Cities and plant [ph]. Now, both the Illinois and New York programs are fully up and running. We remain confident that will successfully defend these legitimate state programs and Federal appeals for this and say for us, because they preserve for our customers the lowest cost and most reliable zero mission resources in the market.

The New York and Illinois policy precedent that we established has been followed now with Connecticut and is under consideration in New Jersey and I will talk about New Jersey in closing. As many of you know, the bill had made it through two committees in the New Jersey legislature in late 2017. Those were unanimous in support of the nuclear

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01515

provisions. However, because then Governor-elect Murphy had indicated a desire for more comprehensive package, a floor vote was not held. Since December, we have continued to work with our partners at PSE, and all stakeholders on new legislation. I can report that we are making good progress and I hope for legislative action in early 2018.

With that, let me turn it back over to Chris.

Chris Crane, President & Chief Executive Officer

Thanks, Joe. Turning to slide 23, we have updated some of the numbers behind our value proposition, which highlighted our strategy and commitment to our shareholders. We will continue to focus on growing our utilities targeting 7.4% rate base growth and 6% to 8% EPS growth through 2021. Rolling forward, another year at above group trajectory. We have continue to use our free cash flow from the ExGen to fund these incremental equity needs at the utilities, pay down debt over next four years at ExGen and the holding company, one part of a faster dividend growth rate. We will continue to focus on optimizing value for our ExGen business, by seeking fair compensation for our carbon-free generation fleet in New Jersey and Pennsylvania, as we have done with the ZECs in New York and Illinois.

We will continue to pursue adoption of price formation of PJM in resiliency initiatives at FERC. Closing uneconomic plants including TMI in 2019 and now in early retirement of Oyster Creek in 2018. Selling assets where it makes sense to accelerate our debt reduction plan and maximizing value through our gen to load match strategy at Constellation. We continue to sustain strong investment grade credit metrics and are now growing our dividend consistently at 5% through 2020.

Finally, turning to slide 24, I want to leave you with some key focus areas for 2018. We will continue to deliver operational excellence across all our businesses, focusing on modernizing the grid and improving our customer experience of utilities, running our generation fleet safely and reliably and staying disciplined in our retail business to capture fair margins. At the utilities, we plan to invest 5.4 billion of capital to benefit our customers, we will file a total of five distribution rate cases with the goal of achieving our targeted 9% to 10% ROE across the utility families in 2019.

In generation, we will work to establish the PJM price formation changes in 2018, we will start working on a broad resiliency initiative, at FERC, which will take more time, we'll continue to defend the Illinois and New York ZECs in courts and we work with our stakeholders to establish fair payment for the environmental attributes of our nuclear plants in New Jersey and Pennsylvania.

Financially, we will begin to grow the dividend, as discussed at 5% annually, continue to execute on our previously announced cost management initiatives and finally we will continue with our corporate responsibility initiatives, including the focus on gender parity issues through our participation as the only energy company in the UN HeForShe campaign, building on last year's expansion of (inaudible) policies in our signing of the president's Equal Pay Pledge. This strategy underpinning the value proposition rolled out a couple of years ago is proving very robust. We are well positioned to capture additional upside and feel confident about the prospects for Exelon in 2018 and beyond. With the many successes we have had in recent years in relative stock outperformance, we still believe our stock is undervalued in absolute terms and in particular compared with our peers. We remain committed to optimize the value of our business and earnings, your ongoing support for Exelon.

Operator, we can now open it up to questions.

Operator

(Operator Instructions) Our first question comes from the line of Greg with Evercore ISI.

Greg Gordon, Analyst

final
Bloomberg Transcript
Bloomberg

Thanks. Good morning. On the stock valuation, Chris, you and I definitely agree. Couple -- couple of questions, just to be clear on the roll-out of the 2020 disclosure, when we look at that, the lower gross margin associated with the TMI shutdown is actually earnings, just to be clear, you said earnings accretive. So we should think about year-over-year sort of negative comp as falling from the other two items, is that correct?

Chris Crane, President & Chief Executive Officer

The TMI, Greg, it is EPS accretive.

Greg Gordon, Analyst

Right. So then that would be offset by the 200 million of energy price and capacity revenues, but then you also have the cost cuttings on page 26 that we have to factor in to come up with sort of a net impact from the Q3 call, right, there was a --

Chris Crane, President & Chief Executive Officer

That's correct. So there is a full breakout of O&M expenses that we detailed in the appendix, you'll see the impact both in '18, as well as '19 and beyond from Oyster as well as TMI.

Greg Gordon, Analyst

Great. And you also said you plan on retiring some parent maturities, now looking at the maturity schedule on page 40, I see that HoldCo -- 6.3 billion of HoldCo debt, there is a 900 million maturity in 2020, 300 million in 2021, should we think about that as the timing or are there or is there other debt that's callable or revolver capacity that you can bring down in the interim?

Chris Crane, President & Chief Executive Officer

So there's -- so Greg, there is both, I apologize I'm turning those slide. So in terms of the holding company maturities, you should expect us to tilt more heavily towards Holding company and in '20 and '21 you will also see us pull -- retire some 365 day paper we have in '18 and that retires in '19. And then you'll see us work down the ExGen maturities as we get out of the curve as well.

Greg Gordon, Analyst

Okay. So I have one for Joe Dominguez and one for Joe Nigro. Joe Dominguez, is it your expectation and clearly you can't speak for PJM, so is it your expectation to sort of get this stakeholder process completed probably, they may go through the enhanced ways on process or in fact they would probably have to go through the enhanced ways on process to get a stakeholder process done in '18 or is it too soon for us to sort of call that. And then the alternative, is it legally viable -- or is it a legally viable possibility that at the end of the resiliency proceedings that the FERC actually has the record in place to call PJM in to change it's tariff?

Joseph Dominguez, Executive Vice President of Governmental and Regulatory Affairs & Public Policy

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01517

Yeah. Let me answer the second question first and just simply say, yes, I think they may have to open a different proceeding, but obviously they get issue 206 order at any point in time and we believe that they have sufficient record on when did you sell, very clearly PJM is going to supplement that record here in March, and I expect that other parties in the response 30 days later will do the same.

Greg, it's my expectation that PJM is going to continue to urge for -- to do exactly that to give it some direction, to come in and resolve the price-formation issues that is identified, but at the same time they have this alternative pathway that they are going to walk down in parallel where they conclude the stakeholder process. And my expectation is that as the owner of the tariff, PJM continues to believe that they have significant price formation flaws and they have said that repeatedly in many forum then the next step for them is to bring into FERC and utilize the enhanced liaison committee process and the stakeholder process doesn't work.

Greg Gordon, Analyst

Thanks. And then for Joe Nigro, the initial auction parameters for the next capacity auction came out several days ago. There was a significant change in core capacity into ComEd and some concern from investors that perhaps that would disadvantage the incumbent generation vis-a-vis capacity price outcomes. Can you give us some color on your thinking there?

Joseph Nigro, EVP and CEO of Constellation Energy Group Inc

Yeah, good morning, Greg. We expected to see an increase in both into Eastern PJM and into ComEd and increase into the import capability and they have been slightly higher than what we expected. There were obviously other variable changes as well when you think about the net tone increase and the impact, all of the things equal that -- that could have on their demand curve and shifting the demand curve out. We're just like everyone else annualizing this, I think at the end of the day that as we've said for years, the big thing is it's going to come down to bidding behavior and it always does. So there's a lot of variables in place here including those changes to the imports, but the bidding behavior won't matter.

Joseph Dominguez, Executive Vice President of Governmental and Regulatory Affairs & Public Policy

Hey, Greg, its Joe Dominguez. If I could just chime in, that seat belt has moved around over the last few auctions. So we're going 1.7 gigawatts the other way now a year ago, we've -- the two auctions ago one gigawatt of that was already in the transmission limit. So we've seen the -- this done separate before with these LCL numbers.

Greg Gordon, Analyst

Okay, thanks guys.

Operator

And your next question comes from the line of Julien of Bank of America Merrill Lynch.

Julien Dumoulin-Smith, Analyst

Hey, good morning. Can you hear me?

Chris Crane, President & Chief Executive Officer

Yeah, good morning.

Unidentified Speaker

Good morning.

Julien Dumoulin-Smith, Analyst

Congratulations again on a healthy set of update here. I wanted to follow-up a little bit more strategically on the ExGen side, obviously well done on Handley, curious as to the thoughts about the design to hold on to the Texas combined cycle. Can we read into some of the commentary around the desire to back that constellation here or is there still kind of a broader thought process around merchant generation here, just kind of wanted to elaborate on that?

Chris Crane, President & Chief Executive Officer

Those assets as we've discussed in the past are highly efficient and they're a very good match for our loan book in Texas and the capabilities that we have, the heap rates on, then the ramping, their capacity factors have been some of the highest for the CCGTs in Texas. So we'll continue to operate in this part of the fleet and be able to reap the benefits of their efficiency as we manage that book in Texas. As always, we look at all of our assets on an annual basis, but the previous review of those assets that they're more valuable in the fleet than not.

Julien Dumoulin-Smith, Analyst

Great. And then secondly, I know you commented on New Jersey with respect to legislation, but can you comment a little bit on how the Oyster Creek development reflects on the profitability of the nuclear units in that region. Just curious if you can give us a little bit of a sense of the latest on those assets and the profitability maybe from an ROE perspective, obviously your peer in the region comments on that in kind?

Chris Crane, President & Chief Executive Officer

The Oyster Creek decision was simply a site specific. The market has tightened over the years in that location, but running at another year with the losses in the investments that we would had to have made was not financially prudent, knowing that the reliability in the system can be sustained in that area without that asset, we're comfortable. And most importantly we have an employee transition program that we're implementing that allows us for those that are not at retirement and wish to retire ability to go into the rest of our vast fleet and continue to pursue their career.

So employee wise right thing to do, moving forward, allowing people to make the transition and economic wise, no sense in continuing for losses for another year. So it wasn't easy decision. The other assets have been openly discussed as the challenges happen in that part of the market and that's why we're pursuing and supporting our co-owner on that that legislative agenda.

Julien Dumoulin-Smith, Analyst

Great, thank you all.

And your next question comes from the line of Stephen with Morgan Stanley.

Stephen Calder Byrd, Analyst

Hi, good morning.

Jonathan Thayer, Senior Executive Vice President and Chief Financial Officer

Good morning.

Chris Crane, President & Chief Executive Officer

Good morning.

Stephen Calder Byrd, Analyst

Just wanted to hit on the retail business and just overall give your sense for the competitive environment in the retail business, any trends you're seeing on that side of the business?

Joseph Dominguez, Executive Vice President of Governmental and Regulatory Affairs & Public Policy

Yeah, good morning, Stephen. It's Joe, I will talk quick briefly about that excuse me. When you see the metrics on our business on slide '17, Jack talked to those in his comments -- prepared comments. We still have the best and the largest customer facing business in the industry and its recently is late December and early January, our generation to load continues to serve us well. The market remains competitive, its too early to see if what if any impact the current cold snap or the previous cold snap add on competitive behavior. As we said all along, we're going to remain disciplined to what we think is fair pricing and not just chase volumes. What we have seen though from competitors, which is kind interesting is two things. One is, we've seen one of our large competitors back away in certain regions from selling a full fixed price for requirements product to their customers and we will continue to do that as we have historically and one that [ph] obviously all the commitments we have.

In addition to that, we've seen some of our competitors try to pass through costs that we've honored through our contract arrangements with our customers as costs that we will bear. So, I want to say, we've seen the competitive aspect of the market change and as I said we remain disciplined, but we have seen some things from competitors that we haven't seen in the recent past, which may or may not lead to different outcomes in the future.

Stephen Calder Byrd, Analyst

That's very helpful color. And just shifting over to the ZEC litigation in Illinois, we continue to sort of like your overall legal position and things like there is some chance that the court might actually kick the decision over the FERC effectively. Is that a fair rating as in terms of a possibility and what's your sense in terms of your outlook, should sort of the decision go back to FERC?

final
Bloomberg Transcript
Bloomberg

Joseph Dominguez, Executive Vice President of Governmental and Regulatory Affairs & Public Policy

It's Joe Dominguez. Let me address the last one. I think all of the five FERC commissioners were asked during -- excuse me the four new commissioners were asked during confirmation earnings, what their view is, concerning the state programs. They've all indicated that they did not see the situation of something, where FERC needed to really put a hold to these programs or claim preemption, but rather that they could use tools like mitigation to address any impacts in the market.

So, we would expect that the matter does go over to FERC consistent with the testimony before, as you have said [ph], the commissioners would indicate that they can mitigate the market through their existing tools and that they would not be in favour of preemption and quite obviously plaintiffs in Illinois feel the same way and they have urged the court not to send it to FERC for that reason.

In terms of your reading of the argument, I think you're exactly right. The FERC [ph] had brought into this question of primary jurisdiction, which is discretionary tool that allows the court had its discretion to send the matter to FERC. At this point, both parties agree to that.

Stephen Calder Byrd, Analyst

Great. That's all I had. Thank you very much.

Operator

And your next question comes from the line of Steve with Wolfe Research.

Steven Isaac Fleishman, Analyst

Hi, good morning. So, just first on the very high level at ExGen. So, obviously you have the gross margin numbers and in 2020 they fall certain amount. Is it fair to say kind of at the high level or the below the line stuff, O&M interest, as you're paying down debt, depreciation as your closing plants. Are all those kind of offset, so you will end up mitigating some chunk of that gross margin hit?

Jonathan Thayer, Senior Executive Vice President and Chief Financial Officer

Steve, so if you look at slide 54, we provide the additional ExGen Modeling Data and as we look at that ExGen's EPS profile out the curve, to your point, the lower depreciation, the lower operating O&M all leads to these retirements being accretive. So, we should see strong and better than last quarter performance anticipated from ExGen, as we look out the LRP.

Steven Isaac Fleishman, Analyst

Okay. And then one other question, just in the event that the energy price formation changes are just done at PJM through the enhanced liaison process. Could you just clarify that the time frame on that and process?

Chris Crane, President & Chief Executive Officer

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01521

So again, this is, as Greg said earlier, ultimately PJM's discretion when pull the trigger on that. But right now, it's said to conclude its stakeholder process in Q3, at that point PJM will have all the input from stakeholders and as usual, however, its proposals long way and at that point in our view we will be in a position to make the filing with FERC.

Steven Isaac Fleishman, Analyst

And then how long FERC takes to rule, I guess depends on that FERC's call?

Chris Crane, President & Chief Executive Officer

That's FERC's call. This is a 206 proceeding, so there is no mandatory clock, like we see in the 205 proceedings.

Steven Isaac Fleishman, Analyst

Yeah, okay. Thank you.

Operator

And your next question comes from the line of Michael with Credit Suisse.

Michael Weinstein, Analyst

Hi, good morning.

Chris Crane, President & Chief Executive Officer

Good morning.

Michael Weinstein, Analyst

Hey, the target for ExGen is still 3.0 debt to EBITDA, is that, I mean, considering that you're already below that, is that something that needs to come down at some point? Or is that, is there a reason why it would increase over time?

Jonathan Thayer, Senior Executive Vice President and Chief Financial Officer

So, Michael, as you see the gross margin expectations for -- an EBITDA expectations for the ExGen business go down that two-times non-recourse or two-times recourse debt to EBITDA, 2.5 times gross debt to EBITDA number will move up. We will be repaying down debt as maturities come, but we will also be shifting our focus to the holding company debt and using the flexibility we have around strong balance sheet to the ExGen to target retirements of a good portion of or good amount of holding company bonds as they mature.

Michael Weinstein, Analyst

I see. What's the, I mean, what's the purpose of having a 3.0 target? Is it, is there something you're trying to achieve in the next-gen at that point?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01522

Jonathan Thayer, Senior Executive Vice President and Chief Financial Officer

I think differentiation from our ITP peers, we have, I believe, the strongest balance sheet in the integrated space. That takes the risk of that overhang that we've seen come pop up from time to time among semesters off the table, positions us to maintain a strong investment-grade rating from all the agencies. It's an important competitive advantage in the Constellation business. And as we clarified the longevity of these nuclear assets. We believe over time that what we trade currently at five-times debt-to-EBITDA, sorry, five-times EBITDA from valuation standpoint, we are making the case that we should be trading in line with our ITP peers, which will be 7 to 8 times. So, I think in the markets not recognizing that now, but certainly it's all part of our strategy to accomplish them.

Michael Weinstein, Analyst

Right. You guys mentioned that the enhanced liaison in process, just wondering, is that something that you simply expect PJM to use, or is that something PJM is telling you they will be using for sure?

Chris Crane, President & Chief Executive Officer

As I said earlier, PJM has made no announcement in that regarding. The point I'm trying to make here is that PJM and a lot of different audiences has now come forward and say, we have major flaw in price formation. And the PJM work historically, where it has significant issues and its market design capacity performance being the most of recent example has used the enhanced liaison committee process mechanism to get matters to FERC for stakeholders category on supporting A particular proposal.

Given the gravity of this issue on the significance of it, and if connection to the resilience issues that FERC is already looking at, and with our expectation that PJM would follow a strong words to the US Senate, to FERC and others and proceed to making a filing at the conclusion of the stakeholder process. That's the point I'm making.

Michael Weinstein, Analyst

Got it. Thank you.

Operator

And our final question comes from Jonathan with Deutsche Bank.

Jonathan Arnold, Analyst

Good morning, guys.

Chris Crane, President & Chief Executive Officer

Good morning.

Jonathan Arnold, Analyst

Strategy-wise, I mean, Chris, Jack you both alluded to the value disconnect and it's how to imagine that you could be doing that much more to execute the current plan, which seems to be going along. What's your level of patients to see

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01523

the market reflect this under the current kind of dual strategy and just, can you give us a refresh on how you're thinking?

Chris Crane, President & Chief Executive Officer

Well, as I've talked about this for a couple years, when patience is probably not at a high point, but we understand it's our responsibility to deliver on these results and improve the thesis of. We took on 5.5 years ago the road to greater regulated revenues coming in, greater certainty around balance sheet, total optimization of the gen to loan match at Constellation, while running a world-class operations and efficient from a cost standpoint, operations.

In today's call reflects that, but let me go a little bit further and take a minute to give you more details on why we see our stock undervalued. Simplistically with a $3.05 midpoint for 2018 EPS, the stock trades at around 12% PE versus our cheapest comp at peg, which is 15%, in a regulated utility complex around 16%. Even on a consensus for 2019 and 2020, we trade around 12 to 13 versus peg roughly around 15 in the utilities, roughly around 15 and 16.

With our dividend growth at a competitive 5% rate, a 3.07% dividend yield, it's similar to much of the others in the group. And our utility operations accounting for 70% of the 2020 EPS. If you are using midpoint of our utility guidance range in consolidated Exelon estimates from the street. We look more similar to the business model to our peers than the 2% to 4% PE multiple discount that's -- we see or suggested.

If you think about our valuation looking at the businesses more specifically, our regulated utilities less holding company expense implies a fair market value of $31 to $32 per share using a consensus PE in 2019 and 2020. When I think about our utilities growth base at 7%, our EPS growth at 6% to 8%, which we expect to continue and we have through this conversation next year, from lower risk T&D utilities having the mechanisms covering 70% of our rate base additions that -- and 70% of our load decoupled, so we have less volumetric risk that collective -- our collective earnings of 9.5% ROE with strong credit metrics exceeding the agency requirements. In doing all this without meeting outside equity to fund any of this growth. I think they should be treated as a premium utilities for the valuation, but the 31 to 32 is based off of a pure valuation, which leaves us with an implied value of ExGen of approximately $4 per share, which we believe is entirely too low.

We implied multiples for the business around six-times PE and five-times EV to EBITDA respectively using our disclosure in the Street's estimates, looking at the IPPs trading at seven to eight times EBITDA today. We struggle to bridge the valuation disconnects, especially when you consider our leverage is well below our three-times debt to EBITDA target at 2.5 times. It is really running at about two-times on recourse debt. Our FFO debt is going to stay north of 40% -- FFO to debt ratio is going to stay north of 40% through the planning horizon, as ZEC programs is New York and Illinois have preserve most of our at-risk nuclear plants and our Constellation business provides a general load match advantage and our discipline around bidding margins is proving wise again, as we are starting the year -- others taking on paying in recent months.

Our free cash flow generation from this business is 7.6 billion over the next four years, which represents more than half of the implied enterprise value at ExGen for the assets with operational visibility well into 2030s. We believe, we have done all a lot of in this, in the past years to create value for the shareholders, where the stock is outperformed. We do not see the share price reflecting anywhere near the value we see, we're focused on executing against the long-term commitments in our value proposition in near-term of 2018 business priorities, which we believe will deliver substantial value to our investors. So, yes, I feel strongly about the stock being achieved.

Jonathan Arnold, Analyst

Sorry, Chirs, but you sound impatient with the market too, to me.

Jonathan Thayer, Senior Executive Vice President and Chief Financial Officer

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01524

Hey, Jonathan, that doesn't even build in the fact that whether its price formation or New Jersey ZECs, there are a lot of incremental catalysts even beyond the robust story, that Chris just described in the valuation, where we currently see. So, this is the strongest, long-range plan that we have had since coming together as Constellation and Exelon and we're excited about the outlook for markets just not paying for it right now.

Jonathan Arnold, Analyst

We kind of agree with you, but I guess, how long do you give us?

Chris Crane, President & Chief Executive Officer

Well, we're not going anywhere. (multiple speakers)

Jonathan Arnold, Analyst

All right. I will decline to ask that again.

Chris Crane, President & Chief Executive Officer

Thanks Jonathan.

Jonathan Arnold, Analyst

Thank you.

Operator

And at this time, I'd like to turn it back over to Chris Crane for any closing remarks.

Chris Crane, President & Chief Executive Officer

Again, I want to thank you all for participating today. I want to thank the team here and the employees of Exelon for really delivering on a strategy that it's taken a few years to get here. But we are operating on all cylinders and appreciate the dedication. So, with that, I will close it up and thank you.

Operator

And that concludes today's conference call. We thank you for your participation and ask that you please disconnect your line.

MANAGEMENT DISCUSSION SECTION

Daniel L. Eggers

GAAP and Non-GAAP Financial Measures

Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures

Please refer to the information contained in the appendix of our presentation and our earnings release for reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures

Christopher M. Crane

Business Highlights

GAAP Earnings

- Let me start by apologizing first for my voice is recovering from a cold as some of our other speakers are in the same place
- So we'll try to make it through clearly without too much distraction
- 2017 was a great year for Exelon, and I like to take a moment to talk about our business performance and some of our major accomplishments over the past 12 months
- First and foremost, I'm pleased to report that Exelon delivered $3.97 per share of GAAP earnings and $2.60 per share of operating earnings for 2017

- Jack will walk through the details, but I'd note that the earnings are solidly within the guidance range as we saw better utility, performance, and cost discipline absorbed $0.09 of timing shift from 2017 to 2018 related to the Illinois ZEC contracts, and absorbed $0.04 from FERC-related accounting changes

Dividend Policy

- Last week, the board approved our updated dividend policy, targets 5% annual growth for 2018 through 2020
- It builds on our previous plan of 2.5% growth from 2016 through 2018 and keeps our recently shared goals of offering competitive dividend growth rates and providing a multi-year visibility
- We're comfortable with the faster dividend growth rate, particularly in light of the significant positive business developments since 2016
  - We completed the PHI acquisition, increasing our earnings mix from utility operations
- The New York and Illinois ZEC programs have preserved and extended the useful lives of our most valuable nuclear plants

Cost Reduction Initiatives

- And consistent with our inherent cost discipline, our forecasted O&M spend will be approximately $725mm per year, lower in 2020 with the cost reduction initiatives identified since 2015
- Jack will discuss our capital allocation plan shortly, but we're confident in our ability to grow our dividend competitively while meeting all our other capital commitments, and probably we're able to share more of our financial success with our shareholders throughout this updated dividend policy

Tax Reform

- Tax reform passed at year-end is clearly a positive for us, allows for significant savings for our utility customers as the new tax rate flows through into lower bills
- ExGen will benefit from lower tax rate and 100% expensing
- In total, we see the run rate EPS benefit of $0.10 in 2019
- Operationally, we executed well in each area of our business line

Capital

- At our utilities, we invested a total of $5.3B of capital in infrastructure and technology to provide a premier customer experience, fewer outages, and faster restoration times
- That all contributed to higher customer satisfaction scores
- In fact, our utilities achieved multiple best on record operational metrics and received national recognition for exceptional customer satisfaction
- Leading with our better service and performance, we are also busy on the regulatory front completing seven distribution and five transmission rate cases in 2017, and receiving a total of approximately $400mm in revenue increases
  - Timely and fair regulatory outcomes help us to fund the future investment in the grid and improve the customer experience

final

Generation Fleet

- Our Generation fleet also performed well
- The nuclear fleet produced 157mm MWh, a record-setting year for Exelon, and we brought into service the two new CCGTs in Texas
- I'm pleased to tell you that our fleet performed very well during December and January cold spell in the Northeast, once again demonstrating the value of nuclear generation as a highly reliable and carbon-free source of power

ZEC Programs

- On the regulatory and policy front, the ZEC programs in New York and Illinois were implemented, preserving several of our most at-risk nuclear stations and the reliability, economic, and environmental benefits they provide
- We will continue to defend these programs as we work on similar programs in New Jersey and Pennsylvania that benefit our customers, our communities, and our employees
- We also saw a recognition of the need to address the resiliency of the power system, an effort advanced with FERC's order in January
  - We believe a FERC order is an important step in addressing real resiliency and concerns
- We urge FERC to adopt PJM's proposal around power price formation and adopt a comprehensive resiliency solution that we will realize that will take some more additional time to resolve
- Joe Dominguez will discuss this in more detail later in the call

Home Suppliers

- We can talk about our successes this year without – or we can't talk about our successes this year without noting our strong commitment to corporate responsibility, improving and supporting the communities that we serve building on prior year's recognitions
- In 2017, we were the first utility named to the Billion Dollar Roundtable, which recognizes companies that spend over $1B with tier 1 diverse and minority home suppliers
- Being an active part of our communities is a central tenet of Exelon, and this award reflects what we've been able to do for years
- And in addition, DiversityInc named us one of the Top 50 Companies for Diversity, and the US Veterans Magazine named Exelon to its Best of the Best List of Veteran-Friendly Companies

New Job Training Center

- We also made a lot of progress in areas that will bring great value to our communities in 2017
- We announced a new job training center in Washington DC modeled after the center we operate in Chicago
- We were named to the Civic 50, a list of community-minded companies by Points of Light Foundation, and singled out as the utility sector leader

final

- Exelon and its employees set new records in philanthropic activities, committing over $52mm in giving and volunteering more than 210,000 hours in 2017

Management Model

- Turning to slide 6, we'll show you the impact that Exelon's management model has had on our utility operations
- Looking back to the Constellation merger for the legacy Exelon utilities, or since the merger with PHI, we've seen material improvement in operations across our utilities
- The hard work of our employees and the benefit of our scale are clearly paying off
- Our utilities primarily operate at first quartile levels across our key successes of reliability, safety, and customer service
  - However, this does not tell the full story of our performance with many performance at top decile levels across a number of these measures, and many being the best on record performance
- In 2017 BGE, ComEd, and PHI had a best performance on (sic) SAIFI and CAIDI; and (sic) PECO and BGE and ComEd on customer satisfaction
- Customer service remains central to the strong utility performance, and it did extremely well in this front in 2017

J.D. Power's

- In J.D. Power's customer satisfaction study, BGE earned the top rank for business electric service among the large utilities in the East
- It was the best of 11 utilities in the region and was ranked highest nationally among 87 utilities in employee professionalism
- Kudos to the hard work of our utility professionals who strive every day to provide service levels for our customers

Nuclear Assets

- Turning to slide 7, we also had another strong year at Generation and Constellation
- Our nuclear assets continue to perform at top tier levels
- Look, we had a combined capacity factor of 94.1%, marking over 94% utilization rate for the four of the past five years
- In 2017 we had 13 refueling outages with an average duration of 23 days
- With the addition of Fitzpatrick plant in high utilization, we generated a nuclear fleet record of 157B MWh
- On the Constellation side, our C&I operating metrics remain strong. 74% customer renewables, average customer duration of more than five years, and power contract terms of more than 25 months on average
  - These statistics speak to our deep customer relationship that has been the bedrock of the Constellation business
- We continue to see stable unit margins with our C&I customers, and our aggressive cost management is helping to further support operating margins

Jonathan W. Thayer

Financial Highlights

Adjusted Non-GAAP Operating Earnings

- My remarks today will focus on 2017 results, 2018 earnings guidance, and annual updates to our financial disclosures
- Turning to slide 8
- As Chris stated, we had a strong year financially and operationally across the company
- For the full year of 2017, our adjusted non-GAAP operating earnings were $2.60 per share, and comfortably within our guidance range
- We're pleased with our full year results, particularly considering the unexpected $0.09 timing drag from the Illinois ZEC contracts that were signed this January rather than in December, as well as $0.04 impact from a FAS 109 asset impairment related to income taxes for our FERC-regulated assets

O&M Expenses

- For Q4, we earned $0.55 per share
- Utilities less holding company EPS was $0.29 per share, benefiting from favorable storm expense and lower O&M expenses which were offset relative to our plan by the FAS 109 impairment
- Generation performed mostly in line with our expectations as our cost optimization efforts offset some market softness experienced earlier in the quarter

New York and Illinois

- Turning to slide 9, we're providing full year 2018 adjusted operating earnings guidance of $2.90 to $3.20 per share
- The growth in utility earnings reflects continued rate base growth as we deploy capital to the benefit of our customers as well as improved improvement in PHI's earned ROEs
- At Exelon Generation, the y-over-y increase is primarily driven by the full year recognition of ZEC revenue from New York and Illinois, the $0.11 recognition of the 2017 Illinois ZEC payments which is higher than the 2017 drag due to the now lower tax rate, the impact of tax reform, and cost optimization efforts partially offset by lower energy prices
  - We expect our first quarter earnings to be in the range of $0.90 to $1 per share
- More detail on y-over-y drivers by operating company can be found in the appendix starting on slide 59

CapEx and Rate Base

- On slide 10, we roll forward our outlook for utility CapEx and rate base which now covers 2018 through 2021
- We plan to invest $21B into our utilities over the next four years to ensure reliable, more resilient, and more efficient transmission and distribution of electricity and gas that improves the customer experience

final
Bloomberg Transcript
Bloomberg

- Our four-year capital program is up from what we shared with you last year as we accelerate our gas main replacement programs at BGE and PECO, and take advantage of opportunities to further improve reliability and resiliency, all of which allows us to provide our customers with safe, reliable service
  - This results in a capital plan across our utilities with $5mm annual run rate

Tax Reform

- Turning to rate base, we now project annual growth of 7.4% compared to 6.5% at the last update, which reflects the expanded CapEx budget and the impacts of tax reform
- Tax reform will increase rate base by approximately $1.7B in 2020, relative to our previous expectations
- For your convenience, in the appendix we provided a more detailed analysis of the capital and rate base outlooks by individual utility beginning on slide 27

Capital Deployment

- Turning to slide 11
- Equally important to deploying capital to strengthen our systems is timely revenue recovery
- Of $11.5B of rate base growth projected through 2021, approximately 70% is covered either under formula rates or mechanisms supporting our ability to make additional investments and earn a fair return on our capital
  - Where we do not have mechanisms, we will continue to work with stakeholders to enact and implement these types of tools
- I would also note that over 70% of our rate base is in jurisdictions that are decoupled from volumes, improving our earnings visibility and aligning with the ambitious energy efficiency goals in our states

ROEs

- Slide 12 shows a trailing 12-month blended transmission and distribution earned ROEs of the utilities
- Our utilities continue to execute, delivering stronger earned returns for the year in addition to the robust operational performance Chris already discussed
- Over the past year, PHI's earned ROEs improved at Delmarva and Pepco and remained flat in Atlantic City Electric
  - Although I should point out that the FAS 109 impairment costs about 60BPS of ROE at each utility
- We're encouraged by the improvements at PHI and we expect to see further gains as pending rate cases are resolved throughout 2018
- The legacy Exelon utilities had a strong 2017, earning 10.3% as a group helped by favorable storm expense and O&M partially offset by the FAS 109 regulatory asset impairment in Q4 2017
- Improving the earned ROEs at PHI and sustaining the strong performance at the legacy Exelon utilities will be a core focus in our efforts to meet our overall utility earnings growth targets
  - We expect to earn 9% to 10% ROEs across our utilities in 2019

ComEd

final
Bloomberg Transcript
Bloomberg

- Turning to slide 13, we remain busy on the regulatory front
- Since our last earnings call, ComEd received an order authorizing a revenue increase of over $95mm
- Since implementing the formula rate structure, we've recovered 90% plus of our [indiscernible] (00:17:28), with this year being the 100% for the first time
- Pepco filed electric rate cases in Maryland and in the District of Columbia, with orders expected in the third and fourth quarters of this year respectively

Pepco Maryland and DC Rate Case

- In addition to the recently filed Pepco Maryland and DC rate cases, we have pending rate cases at Delmarva, with orders expected in 2018
- Combined, we're asking for $133mm in revenues, which reflect recovery on multiple years of reliabilities, smart meter, and other capital investments that have been made to improve performance across these jurisdictions
- Later this spring, we plan to file our rate case at PECO for the first time in three years, and we'll file our standard formula update at ComEd in April
- More details on the rate cases and their schedules can be found on slide 65 to through 71 in the appendix

EPS

- Slide 14 provides an update on our outlook for utility EPS where we continue to forecast 6% to 8% EPS growth
- Compared to last year, our EPS bands in 2019 and 2020 have both increased
- The uplift from tax reform at the utilities through the increased rate base is mostly offset in the first couple of years but a drag from higher holding company expense since the lower tax rate provides less tax shield
- As we look toward the back half of this period, we should start to see net benefit from the change in tax policy
- Overall, the combination of strong rate base growth, timely regulatory recovery, and tax reform leave us on a path to sustain our leading utility EPS growth

Oyster Creek

- Slide 15 provides our gross margin update for ExGen, and on slide 38 we provide more detailed bridges compared to the previous quarter
- I should point out that our decision to retire Oyster Creek a year earlier than previously planned is now factored into all of our disclosures for gross margins, O&M, and depreciation expense, with the collective EPS uplift being $0.03 in 2018, $0.07 in 2019, and $0.01 in 2020 relative to our previous expectations

Gross Margin

- Now turning to our gross margin update, our 2018 total gross margin is flat relative to our last disclosure as lower Oyster Creek contribution is offset by the inclusion of the Handley Generating Station, the 1,265 megawatt peaker in Texas that we bought out of the EGTP portfolio that serves as cost-effective resource for our Constellation retail operations
- Total gross margin in 2019 is up $50mm since the last quarter driven primarily by higher West Hub and NI Hub power prices, strengthening ERCOT spark spreads, and additional generation related to Handley partially offset

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01533

by the early retirement of Oyster Creek

O&M and Depreciation Expenses

- Since we've not previously disclosed 2020 gross margins, let me help with the 2020 disclosures in context by bridging a few changes compared to the 2019 disclosures
- Total gross margin is down $300mm and it will be bucketed into, one, $150mm reduction to open gross margin primarily from the already announced retirement of TMI.
  - We have offsets in O&M and depreciation expenses, so this closure is net EPS-accretive to us
- Secondly, $150mm decrease to the capacity in the ZEC line, which largely reflects the roll off of the robust and previously disclosed PJM capacity prices from the 2018-2019 auction

Hedging Perspective

- From a hedging perspective, we ended the quarter approximately 13% to 16% behind our ratable hedging program in 2018 and 8% to 11% behind ratable in 2019 when considering cross commodity hedges
- We remain comfortable being more open when we look at market fundamentals, and particularly as we see opportunity for PJM price formation chances

O&M Savings

- Turning to slide 16, our O&M expense outlook is consistent with Q3 earnings call disclosures
- That included our expanded $250mm cost reduction program plus an additional $50mm and $120mm of O&M savings in 2018 and 2019 respectfully due to the earlier than planned closure of Oyster Creek

CapEx

- Turning to CapEx, our nuclear fuel and base line capital spend projections continue to decline
- Our base CapEx benefits from the proactive investments we've made across the fleet in prior years, further focus on investment priorities, and the impact of closing uneconomic plants
- Our nuclear fuel expenditures are also falling as we take advantage of well-supplied uranium markets and excess fuel processing capacity

ZEC Programs

- We continue to run an efficient organization and we'll always look for ways to reduce cost and run the fleet more cost effectively while maintaining the highest premium on safety and reliability
- The combination of ZEC programs in New York and Illinois have extended the useful lives of our most profitable assets, and we continue to reduce ongoing capital needs for the plants, which we think makes it a more compelling case for the long-term value of these assets which the market still seems slow to reflect

FCF

- Turning to slide 17, we're rolling forward the FCF outlook for ExGen that cover 2018 through 2021

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01534

- We expect the cumulative FCF to be $7.6B, which is $800mm higher than our previous four-year outlook
- Our forecast takes into account power price forwards at year end, the current gross margin outlook for Constellation, the benefit of the cost cuts outlined in Q3 call, the planned closure of TMI and earlier closure of Oyster Creek, our updated base CapEx and nuclear forecast, and the impact of tax reform

Cash Flow

- We're also updating how we plan to use ExGen's strong cash flow generation
- We'll invest approximately $700mm in growth capital which is primarily sited solar projects in support of our Constellation business, the Medway plant in New England, and some final payments around the Texas CCGTs
  - We plan to inject between $3.3B and $3.7B of capital in the utilities to fund the outsized growth without the need for external equity funding
- With faster dividend growth, we will use approximately $400mm to $600mm of ExGen FCF to fund the dividend not covered by the utilities
- We're comfortable with this dividend funding for ExGen, particularly considering that the four-year needs are less than 10% of our total FCF generation
- Finally, we plan to retire between $2.7B and $3.3B of debt, which will be spread between ExGen and holding company debt
  - We'll continue to manage ExGen leverage to our 3 times debt to EBITDA commitment

Tax Reform

- Turning to slide 18, we've already shared with you the impact of tax reform on Exelon in our 8-K from January 5, but we want to highlight that we're a clear beneficiary from tax reform and offer a few additional details
- We expect to pass-through meaningful savings to our utility customers across the different jurisdictions, reflecting the lower tax expense recoveries and refund of deferred income tax regulatory liabilities partially offset by the impacts of higher rate base
  - We're thrilled that our customers will benefit so much from tax reform

Tax Rate

- Our 2018 EPS guidance is inclusive of tax reform, and we expect $0.10 per share uplift to 2019 earnings
- Generation earnings will benefit from a 22% effective tax rate
- The utilities will benefit from an increased rate base of $2B by 2021 while the lower tax rate will create less tax shield for our holding company interest expense
  - We expect to be a very modest cash taxpayer through 2021, and you can see the cash tax rates by year
- We expect much stronger FCF from ExGen with a lower tax rate and 100% expensing of capital, which will more than cover the additional equity needs to utilities associated with the increased rate base
- And we expect the consolidated metrics will remain largely unchanged as a result of tax reform
- And ExGen tax reform has a positive impact in 2018, with a more meaningful impact in the outer years that provides the company with additional financial flexibility

final
Bloomberg Transcript
Bloomberg

Generation Business

- On the utility side, we do see some modest erosion in FFO to debt, although all of our utilities remain at or above rating agency thresholds
- We frequently made the case that our Generation business provides distinct competitive advantage to the overall company with the ability to recycle significant FCFs
- Our positive uplift to credit metrics and no need for external equity are additional examples relative to other utilities that are being pressured due to the tax reforms

Balance Sheet Items

Debt and EBITDA

- Turning to slide 19, we remain committed to maintaining a strong balance sheet and our investment grade credit rating
- I hit on this in the previous slide, but we remain comfortably ahead of our corporate targets for FFO to debt and well above the downgrade thresholds
- Looking at ExGen, we're well ahead of our debt to EBITDA targets in 2018
- On a total basis, we expect to be at 2.5 times debt to EBITDA and only 2 times debt to EBITDA from a recourse debt perspective
- We'll continue to manage our balance sheet at ExGen over time to the 3 times debt to EBITDA level, so look for us to focus on debt reduction at both holding company and GenCo

Dividend Growth Rate Policy

- Turning to slide 20, as Chris mentioned earlier the board has decided to increase the dividend growth rate policy from 2.5% to 5% annually through 2020
- Chris spoke to the positive business developments that gave us the confidence to increase our dividend growth rate to be more competitive with utility peers, so I want to take a moment to talk about our financial thought process

EPS

- Slide 20 shows the hypothetical portion of the dividend being funded by the utilities if we assume their piece of the dividend is based on a 70% payout ratio on utility less holding company expense
- The residual dividend is then covered by ExGen
- When we consider that the utilities are growing EPS at 6% to 8% per year and represent the growing majority of our earnings, we're comfortably growing the dividend at 5% based on a 70% utility earnings payout ratio, which keeps pace with this earnings growth

FCF

- On this approach, ExGen is funding around $0.20 of dividend depending on the year, which is a payout ratio in the teens of our 2018 EPS guidance for the business and substantially less than that on a FCF basis

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01536

- We're very comfortable committing the small portion of ExGen's financial output to supporting the dividend and are excited to be returning more capital to our shareholders through the dividend

Joseph Dominguez

Q4 Highlights

ZEC Programs

- I'll cover slides 21 and 22 in the materials
- Since our last earnings call, we continue to see positive momentum for policy changes at the state, FERC, and RTO levels that value the zero emission and resilient resources that benefit our customers and the environment most
- As Chris said at the top of the call, we remain focused on three areas
- First, ensuring that resilient resources are compensated fairly; second, addressing the price formation flaws that PJM has identified in its market; and third, preserving and expanding state policy initiatives like the ZEC programs and include nuclear energy within the umbrella of state-sponsored clean energy programs
- I'll walk through each of these

FERC

- On resilience, FERC issued its order on January 8 in response to the DOE NOPR
- Consistent with Exelon's recommendations, the order initiated a new resilience proceedings and directed the RTOs to immediately examine grid resiliency and provide a report to FERC within 60 days
- FERC noted that the report should include any recommended changes to market rules
- In our filings at FERC, we urged the commission and the RTOs to view resilience as a broader scope of issues than the traditional reliability concerns that center around electric generation and transmission unit performance and weather events
- In particular, as we've talked about in earlier calls, we urged FERC to consider the risk of a cascading loss of the electric system caused by natural gas infrastructure failure
  - We expect that the resilience proceedings and entrapping solutions will take some time as Chris indicated earlier

PJM

- But FERC's order clearly gives PJM the opportunity to address near-term solutions, including immediate price formation reforms
- PJM has said it can implement those reforms within the course of this CY
- Based upon PJM's comments, including Andy Ott's testimony before the Energy Committee of the U.S. Senate a week ago, we expect that PJM will continue to make a strong push for price formation reforms in its March filing

Stakeholder Process

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01537

- In terms of next steps, we continue to see two alternative pathways that are going to be worked simultaneously
- One, achieving a FERC-directed PJM filing as a byproduct of the resilience docket; and two, a stakeholder process at PJM followed by a 206 filing through its existing enhanced liaison committee process
- PJM already has the price formation stakeholder process underway, and it is scheduled to conclude that process in Q3
- In the meantime, PJM is pursuing more limited changes to price formation in the fast-start docket where filings are due next week
- In summary, the commission is focused on resilience and the chairman's call for urgent action coupled with PJM's commitment to address market forums continues to give us confidence that reforms will be implemented in 2018
  - With that said, there's a lot of work ahead of us as PJM continues to engage with stakeholders and refine its proposal

Ongoing Efforts

- Turning to the next slide in our ongoing efforts concerning state policies that value zero-emission nuclear resources, Jack already noted that we've reached an important milestone last month in Illinois with the completion of the state procurement process and the awards of ZECs to the Quad Cities and Clinton
- Now both the Illinois and New York programs are fully up and running
- We remain confident that we'll successfully defend these legitimate state programs in federal fuels boards and state boards because they preserve for our customers the lowest cost and most reliable zero-emission resources in the market

New York and Illinois Policy

- The New York and Illinois policy precedent that we established has been followed now in Connecticut and is under consideration in New Jersey, and I'll talk about New Jersey in closing
- As many of you know, a bill had made it through two committees in the New Jersey legislature in late 2017
- The votes were unanimous in support of the nuclear provisions
  - However, because the then Governor-Elect Murphy had indicated a desire for a more comprehensive package, a floor vote was not held
- Since December, we've continued to work with our partners at [indiscernible] (00:32:56) and all stakeholders on new legislation
- I could report that we are making good progress and I hope for legislative action in early 2018

Christopher M. Crane

Q4 Highlights

Rate Base Growth, EPS and FCF

- Turning to slide 23, we have updated some of the numbers behind our value proposition which highlight our strategy and commitment to our shareholders

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01538

- We will continue to focus on growing our utilities, targeting 7.4% rate base growth and 6% to 8% EPS growth through 2021, rolling forward another year at above group trajectory
- We continue to use our FCF from ExGen to fund these incremental equity needs at the utilities, pay down debt over the next four years at ExGen and in the holding company, and fund part of a faster dividend growth rate

ExGen Business

- We will continue to focus on optimizing value for our ExGen business by seeking fair compensation for our carbon-free Generation fleet in New Jersey and in Pennsylvania as we have done with the ZECs in New York and Illinois
- We will continue to pursue adoption of price formation in PJM and resiliency initiatives at FERC
  - Closing uneconomic plans, including TMI in 2019 and now an earlier retirement of Oyster Creek in 2018

Selling Assets

- Selling assets where it makes sense to accelerate our debt reduction plans and maximizing value through our gen to load match strategy at Constellation
- We continue to sustain strong investment grade credit metrics and now growing our dividend consistently at 5% through 2020

Operational Excellence

- Finally turning to slide 24, I want to leave you with some key focus areas for 2018
- We will continue to deliver operational excellence across all our businesses, focusing on modernizing the grid and improving our customer experience at the utilities, running our Generation fleet safely and reliably, and staying disciplined in our retail business to capture fair margins
- At the utilities, we plan to invest $5.4B of capital to benefit our customers, we will file a total of five distribution rate cases with the goal of the achieving our targeted 9% to 10% ROE across the utility families in 2019

Generation

- In Generation, we will work to establish the PJM price formation changes in 2018
- We will start working on a broader resiliency initiative at FERC, which will take more time
- We'll continue to defend the Illinois and New York ZECs in the courts, and we'll work with our stakeholders to establish fair payment for the environmental attributes of our nuclear plants in New Jersey and Pennsylvania

Dividend

- Financially, we will begin to grow the dividend as discussed at 5% annually, continue to execute on our previously announced cost management initiatives
- And finally, we will continue with our corporate responsibility initiatives, including the focus on gender parity issues through our participation as the only energy company in the UN's HeForShe campaign, building on last year's expansion of paid leave policies and our signing of the President's equal pay pledge

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01539

Strategy

- The strategy underpinning the value proposition rolled out a couple of years ago is proving very robust
- We are well-positioned to capture additional upside and feel confident about the prospects for Exelon in 2018 and beyond
- With the many successes we've had in recent years and the relative stock outperformance, we still believe our stock is undervalued in absolute terms, and in particular compared with our peers
  - We remain committed to optimize the value of our business and earnings – your ongoing support for Exelon

QUESTION AND ANSWER SECTION

<Q - Greg Gordon>: On the stock valuation Chris, you and I definitely agree. Couple of questions. Just to be clear on the rollout of the 2020 disclosure, when we look at that, the lower gross margin associated with the TMI shutdown is actually earnings, just to be clear, you said is earnings-accretive. So we should think about the y-over-y sort of negative comp as flowing from the other two items. Is that correct?

<A - Jonathan W. Thayer>: The TMI, Greg, it is EPS-accretive.

<Q - Greg Gordon>: Right.

<A - Jonathan W. Thayer>: So...

<Q - Greg Gordon>: So they now would be offset by the $200mm of energy pricing capacity revenues. But then you also have the cost-cutting on page 26 that we have to factor in to come up with a sort of net impact from Q3 call, right? There was a...

<A - Jonathan W. Thayer>: That's correct. So there's a full break out of O&M expenses that we detailed in the appendix. You'll see the impact both in 2018 as well as 2019 and beyond from Oyster as well as TMI.

<Q - Greg Gordon>: Great. And you also said you plan on retiring some parent maturities now, looking at the maturities schedule on page 40. I see that $6.3B of Holdco debt, there's $900mm maturity in 2020, $300mm in 2021. Should we think about that as the timing or is there other debt that's callable or revolver capacity that you can bring down in the interim?

<A - Jonathan W. Thayer>: So Greg, there's both – I apologize, I'm turning those slides. So in terms of the holding company maturities, you should expect us to tilt more heavily towards holding company in 2020 and 2021. You'll also see us pull – retire some 365-day paper we have in 2018 that retires in 2019, and then you'll see us work down the ExGen maturities as we get out the curve as well.

<Q - Greg Gordon>: Okay. So I have one for Joe Dominguez and one for Joe Nigro. Joe Dominguez, is it your expectation – and clearly you can't speak for PJM – but is it your expectation to get this stakeholder process completed, that they may go through the enhanced liaison process or in fact they would probably have to go through the enhanced liaison process to get a stakeholder process done in 2018 or is it too soon for us to sort of call that? And then the alternative, is it a legally viable possibility that at the end of the resiliency proceedings that FERC actually has the record in place to haul PJM in to change its tariff?

<A - Joseph Dominguez>: Yeah, let me answer the second question first and just simply say yes, I think they may have to open a different proceeding but obviously they could issue a 206 order at any point in time and we believe that they have a sufficient record already to do so. Very clearly, PJM is going to supplement that record here in March, and I expect that other parties in their response 30 days later will do the same. Greg, it's my expectation that PJM is going to continue to urge to do exactly that, to give it some direction, to come in and resolve the price formation issues that it's identified. But at the same time, they have this alternative pathway that they're going to walk down in parallel where they can include the stakeholder process. And my expectation is that, as the owner of the tariff, that PJM

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01540

continues to believe that they have significant price formation flaws, and they've said that repeatedly in many forums, and the next step for them is to bring it to FERC and to utilize the enhanced liaison committee process if the stakeholder process doesn't work.

<Q - Greg Gordon>: Thanks. And for Joe Nigro, the initial auction parameters for the next capacity auction came out several days ago. There was a significant change in import capacity into ComEd and some concern from investors that perhaps that would disadvantage the incumbent generation vis-à-vis capacity price outcomes. Can you give us some color on your thinking there?

<A - Joseph Nigro>: Yeah. Good morning, Greg. We expected to see an increase in both into Eastern PJM and into ComEd an increase into the import capability, and they've been slightly higher than what we expected. There were obviously other variable changes as well when you think about the NETCO increase AND the impact, all other things equal, that could have on the demand curve and shifting the demand curve out. We're still, like everyone else, analyzing this. I think at the end of the day though, as we've said for years, the big thing is it's going to come down to bidding behavior, and it always does. So there's a lot of variables in play here, including those changes to the imports, but the bidding behavior won't matter.

<A - Joseph Dominguez>: Hey, Greg, it's Joe Dominguez. If I can just chime in, that CTEL has moved around over the last few auctions. So we're going 1.7 gigawatts, the other way now. A year ago we've – but two auctions ago, 1 gigawatt of that was already in the transmission limit. So we've seen the zones separate before with these higher CTEL numbers.

<Q - Julien Dumoulin-Smith>: Hey, excellent. Congratulations again on a healthy set of updates here. I wanted to follow-up a little bit more strategically on the ExGen side. Obviously, well done on handling. Curious as to the thoughts about the desire to hold on to the Texas combined cycles. Can we read into some of the commentary around the desire to back start Constellation here or is there still kind of a broader thought process around merchant generation here. Just kind of wanted to elaborate on that.

<A - Christopher M. Crane>: Those assets, as we've discussed in the past, are highly efficient and they're a very good match for our load book in Texas. The capabilities that we have, the heat rates on them, the ramping, they're very valuable and their capacity factors have been some of the highest for the CCGTs in Texas. So we'll continue to operate in this part of the fleet and be able to reap the benefits of their efficiency as we manage that book in Texas. As always, we look at all of our assets on an annual basis, but the previous review of those asset said they're more valuable in the fleet to note.

<Q - Julien Dumoulin-Smith>: Great. And then secondly, I know you commented on New Jersey with respect to legislation, but can you comment a little bit on how the Oyster Creek development reflects on the profitability of the nuclear units in that region? Just curious if you can give us a little bit of a sense of the latest on those assets and the profitability maybe from an ROE perspective. Obviously, your peer in the region comments on that in kind.

<A - Christopher M. Crane>: Yeah. The Oyster Creek decision was simply a site specific. The market has tightened over the years in that location. But running it another year with the losses and the investments that we would had to have made was not financially prudent. Knowing that the reliability of the system can be sustained in that area without that asset, we're comfortable and most importantly we have an employee transition program that we're implementing that allows us, for those that are not at retirement and wish to retire, ability to go into the rest of our vast fleet and continue to pursue their careers. So employee-wise, right thing to do moving forward, allowing people to make the transition; and economic-wise no sense in continuing for losses for another year. So it was an easy decision. The other assets have been openly discussed as the challenges happen in that part of the market, and that's why we're pursuing in supporting our co-owner on that legislative agenda.

<Q - Stephen Calder Byrd>: I just wanted to hit on the retail business and just overall get your sense for the competitive environment in the retail business. Any trends you're seeing on that side of the business?

<A - Joseph Nigro>: Yeah. Good morning, Stephen. It's Joe. I'll talk briefly about that. You see the metrics on our business on slide 7, and Jack talked to those in his prepared comments. We still have the best and the largest

final
Bloomberg Transcript

customer-facing business in the industry. And as recently as late December and early January, our generation to load strategy continues to serve us well. The market remains competitive. It's a little early to see what if any impact the current cold snap or the previous cold snap had on competitive behavior. As we said all along, we're going to remain disciplined to what we think is fair pricing and not just chase volume.

What we have seen though from competitors, which is kind of interesting, is two things. One is we've seen one of our large competitors back away in certain regions from selling a full fixed price full requirements product to their customers, and we will continue to do that as we have historically and we'll honor obviously all the commitments we have. In addition to that, we've seen some of our competitors try to pass-through costs that we've honored through our contractual arrangements with our customers as costs that we will bear. So I won't say we've seen the competitive aspect of the market change, and as I said we'll remain disciplined. But we have seen some things from competitors that we haven't seen in the recent past which may or may not lead to different outcomes in the future.

<Q - Stephen Calder Byrd>: That's very helpful color. And just shifting over to the ZEC litigation in Illinois, we continue to sort of like your overall legal position. It seems like there's some chance that the court might actually kick the decision over to FERC effectively. Is that a fair reading in terms of a possibility and what's your sense in terms of your outlook should sort of the decision go back to FERC?

<A - Joseph Dominguez>: It's Joe Dominguez. Let me address the last one. I think all of the five FERC commissioners were asked during – the four new commissioners were asked during the confirmation hearings what their view is concerning these state programs, and all indicated that they did not see the situation as something where FERC needed to really put a halt to these programs or claim preemption but rather that they could use tools like mitigation to address any impacts in the market. So we would expect that if the matter does go over to FERC, consistent with their testimony before the U.S. Senate, the commissioners would indicate that they could mitigate the market through their existing tools and that they would not be in favor of preemption. And quite obviously, the plaintiffs in Illinois feel the same way and they've urged the court not to send it to FERC for that reason.

In terms of your reading of the argument, I think you're exactly right. [indiscernible] (00:49:49) brought in this question of primary jurisdiction which is a discretionary tool that allows the court at its discretion to send the matter to FERC. At this point, both parties approve that.

<Q - Steve Fleishman>: So just first on the – maybe high level at ExGen. So obviously you have the gross margin numbers, and in 2020 they fall a certain amount. Is it fair to say kind of at the high level all the below the line stuff, O&M, interest as you're paying down debt, depreciation as you're closing plants, are all those kind of offsets so you'll end up mitigating some chunk of that gross margin hit?

<A - Jonathan W. Thayer>: Steve, so if you look at slide 54 we provide the additional ExGen modeling data. But as we look at ExGen's EPS profile out the curve, to your point, the lower depreciation, the lower operating O&M all leads to these retirements being accretive. So we should see strong and better than last quarter performance anticipated from ExGen as we look out of the LRP.

<Q - Steve Fleishman>: Okay, and then one other question. Just in the event that the energy price formation changes are at PJM through the enhanced liaison process, could you just clarify the timeframe on that and process?

<A - Joseph Dominguez>: So again, this is, as Greg said earlier, ultimately PJM's discretion when to pull the trigger on that. But right now it's set to conclude its stakeholder process in Q3. At that point, PJM will have all the input from stakeholders and, as usual, will have refined its proposal along the way. And at that point, in our view, we'll be in a position to make a filing at FERC.

<Q - Steve Fleishman>: And then how long FERC takes to rule – I guess it depends on – that's FERC's call.

<A - Joseph Dominguez>: That's FERC's call. This is a 206 proceeding, so there's no mandatory clock like we see in the 205 proceedings.

<Q - Michael Weinstein>: Hey. The target for ExGen is still 3.0 times debt to EBITDA. Is that, I mean, considering that you're already below that, is that something that needs to come down at some point or is there a reason why it

final
Bloomberg Transcript

would increase over time?

<A - Jonathan W. Thayer>: So Michael, as you've seen the gross margin expectations and EBITDA expectations for the ExGen business go down, that 2 times non-recourse or 2 times recourse debt to EBITDA and 2.5 times gross debt to EBITDA number will move up. We will be paying down debt as maturities come, but we'll also be shifting our focus to the holding company debt and using the flexibility we have around the strong balance sheet at ExGen to target retirement of a good portion of or a good amount of holding company bonds as they mature.

<Q - Michael Weinstein>: I see. I mean, what's the purpose of having a 3.0 times target? Is there something you're trying to achieve with ExGen at that point?

<A - Jonathan W. Thayer>: I think differentiation from our IPP peers. We have I believe the strongest balance sheet in the integrated space. That takes the risk of that overhang that we've seen come pop-up from time-to-time among semesters off the table, positions us to maintain a strong investment grade rating from all the agencies. It's an important competitive advantage in the Constellation business. And as we clarified the longevity of these nuclear assets, we believe over time that while we trade currently at 5 times EBITDA from a valuation standpoint, we are making the case that we should trade in line with our IPP peers, which would be 7 to 8 times. And I think the market is not recognizing that now, but certainly it's all part of our strategy to accomplish them.

<Q - Michael Weinstein>: Right. You guys mentioned the enhanced liaison process. Just wondering is that something that you simply expect PJM to use or is that something that PJM is telling you they will be using for sure?

<A - Joseph Dominguez>: As I said earlier, PJM has made no announcement in that regard. The point I'm trying to make here is that PJM and a lot of different audiences has now come forward and say we have a major flaw in price formation. And that PJM were historically, where it has significant issues in its market design, capacity performance being the most recent example, has used the enhanced liaison committee process mechanism to get matters to FERC or stakeholders who can't agree on supporting a particular proposal. Given the gravity of this issue and the significance of it and its connection to the resilience issues that FERC is already looking at, it would be our expectation that PJM would follow its strong words to the U.S. Senate to FERC and others and proceed to making a filing at the conclusion of the stakeholder process. That's the point I'm making.

<Q - Jonathan Philip Arnold>: Strategy-wise, I mean, Chris, Jack you've both alluded to the value disconnect, and it's hard to imagine that you could be doing that much more to execute the current plan which seems to be going along. What's your level of patience to see the market reflect this under the current kind of dual strategy and just can you give us a refresh on how you're thinking.

<A - Christopher M. Crane>: Well as I've talked about this for a couple of years where patience is probably not the high point, but we understand it's our responsibility to deliver on these results and improve the thesis. So we took on five and a half years ago the road to greater regulated revenues coming in, greater certainty around balance sheet, total optimization of the gen to load match at Constellation while running world-class operations and efficient from a cost standpoint operations, and today's call reflects that. But let me go a little bit further and take a minute to give you more details on why we see our stock undervalued.

Simplistically with $3.05 midpoint for 2018 EPS, the stock trades at around 12% P/E vs. our cheapest comp at PEG, which is 15%, and the regulated utility complex around 16%. Even on a consensus for 2019 and 2020, we trade around 12% to 13% vs. PEG roughly around 15% and the utilities roughly around 15% to 16%. With our dividend growth at a competitive 5% rate, a 3.7% dividend yield is similar to much of the others in the group, and our utility operations accounting for 70% of the 2020 EPS. If you're using midpoint of our utility guidance range and consolidated Exelon estimates from the Street, we look more similar to the business model to our peers than the 2% to 4% P/E multiple discount that we see are suggested.

If you think about our valuation, looking at the businesses more specifically, our regulated utilities less holding company expense implies a fair market value of $31 to $32 per share using a consensus P/E in 2019 and 2020. When I think about our utilities growth base at 7%, our EPS growth at 6% to 8%, which we expect to continue and we have through this conversation next year; from lower-risk T&D utilities having the mechanisms covering 70% of our rate

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01543

base additions and 70% of our low decouples so we have less volumetric risk; that our collective earnings of 9.5% ROE with strong credit metrics exceeding agency requirements, and doing all of this without needing outside equity to fund any of this growth, I think they should be treated as a premium utilities for the valuation, but the $31 to $32 is based off of a peer valuation which leaves us with an implied value of ExGen of approximately $4 per share which we believe is entirely too low.

The implied multiples for the business around 6 times P/E and 5 times EV to EBITDA respectively, using our disclosure and the Street's estimates, looking at the IPPs trading at 7 to 8 times EBITDA today, we struggle to bridge the valuation disconnects especially when you consider our leverage is well below our 3 times debt to EBITDA target, at 2.5 times, and is really running at about 2 times on recourse debt. Our FFO to debt ratio is going to stay north of 40% through the planning horizon as ZEC programs in New York and Illinois have preserved most of our at-risk nuclear plants, and our Constellation business provides a gen to load match advantage, and our discipline around bidding margins is proving wise again as we're starting to hear others taking on pain in recent months.

Our FCF generation from this business is $7.6B over the next four years, which represents more than half of the implied enterprise value at ExGen with the assets with operational visibility well into the 2030s. We believe – we have done a lot of this in the past years to create value for the shareholders while the stock is outperformed. We do not see the share price reflecting anywhere near the value we see. We're focused on executing against the long-term commitments in our value proposition and near-term our 2018 business priorities, which we believe will deliver substantial value to our investors. So yes, I feel strongly about the stock being cheap. Short answer.

<Q - Jonathan Philip Arnold>: You sound impatient with the market to me.

<A - Jonathan W. Thayer>: And Jonathan, that doesn't even build in the fact that whether it's price formation or New Jersey ZECs, I mean, there a lot of incremental catalysts even beyond the robust story that Chris just described in the valuation where we currently see. So this is the strongest, long range plan that we've had since coming together as Constellation and Exelon, and we're excited about the outlook. The market's just not paying for it right now.

<Q - Jonathan Philip Arnold>: We kind of agree with you, but I guess how long do you give us?

<A - Christopher M. Crane>: Well we're not going anywhere.

<Q - Jonathan Philip Arnold>: All right. I'm inclined to ask that again.

MANAGEMENT DISCUSSION SECTION

Operator

Good morning. My name is Sarah, and I will be your conference operator today. At this time, I would like to welcome everyone to the 2017 Q4 Earnings Conference Call. All lines have been placed on mute to prevent any background noise. After the speaker's remarks, there will be a question-and-answer session. [Operator Instructions] Thank you. Mr. Dan Eggers, Senior Vice President of Investor Relations, you may begin your conference.

Daniel L. Eggers

Thank you, Sarah. Good morning, everyone, and thank you for joining our fourth quarter 2017 earnings conference call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer; Jack Thayer, Exelon's Chief Financial Officer; and Joe Dominguez, Executive Vice President of Government and Regulatory Affairs and Public Policy. They're joined by other members of Exelon's senior management team who will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, both of which can be found in the Investor Relations section of Exelon's website. The earnings release and other matters which we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material and comments made during this call. Please refer to today's 8-K and Exelon's other SEC filings for discussions of risk factors and factors that may cause results to differ from management's projections, forecast, and expectations.

Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures.

I'll now turn over to Chris Crane, Exelon's CEO.

Christopher M. Crane

Thanks, Dan, and good morning to everybody and thank you for joining us today. Let me start by apologizing first for my voice is recovering from a cold as some of our other speakers are in the same place. So we'll try to make it through clearly without too much distraction.

2017 was a great year for Exelon, and I like to take a moment to talk about our business performance and some of our major accomplishments over the past 12 months. First and foremost, I'm pleased to report that Exelon delivered $3.97 per share of GAAP earnings and $2.60 per share of operating earnings for 2017. Jack will walk through the details, but I'd note that the earnings are solidly within the guidance range as we saw better utility, performance, and cost discipline absorbed $0.09 of timing shift from 2017 to 2018 related to the Illinois ZEC contracts, and absorbed $0.04 from FERC-related accounting changes.

Last week, the board approved our updated dividend policy, targets 5% annual growth for 2018 through 2020. It builds on our previous plan of 2.5% growth from 2016 through 2018 and keeps our recently shared goals of offering competitive dividend growth rates and providing a multi-year visibility. We're comfortable with the faster dividend growth rate, particularly in light of the significant positive business developments since 2016. We completed the PHI acquisition, increasing our earnings mix from utility operations. The New York and Illinois ZEC programs have preserved and extended the useful lives of our most valuable nuclear plants. And consistent with our inherent cost discipline, our forecasted O&M spend will be approximately $725 million per year, lower in 2020 with the cost reduction initiatives identified since 2015. Jack will discuss our capital allocation plan shortly, but we're confident in our ability to grow our dividend competitively while meeting all our other capital commitments, and probably we're able to share more of our financial success with our shareholders throughout this updated dividend policy.

Tax reform passed at year-end is clearly a positive for us, allows for significant savings for our utility customers as the new tax rate flows through into lower bills. ExGen will benefit from lower tax rate and 100% expensing. In total, we see the run rate EPS benefit of $0.10 in 2019. Operationally, we executed well in each area of our business line.

At our utilities, we invested a total of $5.3 billion of capital in infrastructure and technology to provide a premier customer experience, fewer outages, and faster restoration times. That all contributed to higher customer satisfaction scores. In fact, our utilities achieved multiple best on record operational metrics and received national recognition for exceptional customer satisfaction.

Leading with our better service and performance, we are also busy on the regulatory front completing seven distribution and five transmission rate cases in 2017, and receiving a total of approximately $400 million in revenue increases. Timely and fair regulatory outcomes help us to fund the future investment in the grid and improve the customer experience.

Our Generation fleet also performed well. The nuclear fleet produced 157 million megawatt hours, a record-setting year for Exelon, and we brought into service the two new CCGTs in Texas. I'm pleased to tell you that our fleet performed very well during December and January cold spell in the Northeast, once again demonstrating the value of nuclear generation as a highly reliable and carbon-free source of power.

On the regulatory and policy front, the ZEC programs in New York and Illinois were implemented, preserving several of our most at-risk nuclear stations and the reliability, economic, and environmental benefits they provide. We will continue to defend these programs as we work on similar programs in New Jersey and Pennsylvania that benefit our customers, our communities, and our employees. We also saw a recognition of the need to address the resiliency of the power system, an effort advanced with FERC's order in January. We believe a FERC order is an important step in addressing real resiliency and concerns. We urge FERC to adopt PJM's proposal around power price formation and adopt a comprehensive resiliency solution that we will realize that will take some more additional time to resolve. Joe Dominguez will discuss this in more detail later in the call.

Bloomberg Transcript
Bloomberg
SI-SSA-0015-01546

We can talk about our successes this year without – or we can't talk about our successes this year without noting our strong commitment to corporate responsibility, improving and supporting the communities that we serve building on prior year's recognitions. In 2017, we were the first utility named to the Billion Dollar Roundtable, which recognizes companies that spend over $1 billion with tier 1 diverse and minority home suppliers. Being an active part of our communities is a central tenet of Exelon, and this award reflects what we've been able to do for years. And in addition, DiversityInc named us one of the Top 50 Companies for Diversity, and the US Veterans Magazine named Exelon to its Best of the Best List of Veteran-Friendly Companies.

We also made a lot of progress in areas that will bring great value to our communities in 2017. We announced a new job training center in Washington DC modeled after the center we operate in Chicago. We were named to the Civic 50, a list of community-minded companies by Points of Light Foundation, and singled out as the utility sector leader. Exelon and its employees set new records in philanthropic activities, committing over $52 million in giving and volunteering more than 210,000 hours in 2017.

Turning to slide 6, we'll show you the impact that Exelon's management model has had on our utility operations. Looking back to the Constellation merger for the legacy Exelon utilities, or since the merger with PHI, we've seen material improvement in operations across our utilities. The hard work of our employees and the benefit of our scale are clearly paying off. Our utilities primarily operate at first quartile levels across our key successes of reliability, safety, and customer service. However, this does not tell the full story of our performance with many performance at top decile levels across a number of these measures, and many being the best on record performance. In 2017 BGE, ComEd, and PHI had a best performance on (sic) SAIFI and CAIDI; and (sic) PECO and BGE and ComEd on customer satisfaction. Customer service remains central to the strong utility performance, and it did extremely well in this front in 2017.

In J.D. Power's customer satisfaction study, BGE earned the top rank for business electric service among the large utilities in the East. It was the best of 11 utilities in the region and was ranked highest nationally among 87 utilities in employee professionalism. Kudos to the hard work of our utility professionals who strive every day to provide service levels for our customers.

Turning to slide 7, we also had another strong year at Generation and Constellation. Our nuclear assets continue to perform at top tier levels. Look, we had a combined capacity factor of 94.1%, marking over 94% utilization rate for the four of the past five years. In 2017 we had 13 refueling outages with an average duration of 23 days. With the addition of Fitzpatrick plant in high utilization, we generated a nuclear fleet record of 157 billion megawatt hours. On the Constellation side, our C&I operating metrics remain strong. 74% customer renewables, average customer duration of more than five years, and power contract terms of more than 25 months on average. These statistics speak to our deep customer relationship that has been the bedrock of the Constellation business. We continue to see stable unit margins with our C&I customers, and our aggressive cost management is helping to further support operating margins.

And now I'd like to turn it over to Jack to walk through some of the numbers.

Jonathan W. Thayer

Thank you, Chris, and good morning, everyone. My remarks today will focus on 2017 results, 2018 earnings guidance, and annual updates to our financial disclosures.

Turning to slide 8. As Chris stated, we had a strong year financially and operationally across the company. For the full year of 2017, our adjusted non-GAAP operating earnings were $2.60 per share, and comfortably within our guidance range. We're pleased with our full year results, particularly considering the unexpected $0.09 timing drag from the Illinois ZEC contracts that were signed this January rather than in December, as well as a $0.04 impact from a FAS 109 asset impairment related to income taxes for our FERC-regulated assets. For the fourth quarter, we earned $0.55 per share. Utilities less holding company EPS was $0.29 per share, benefiting from favorable storm expense and lower O&M expenses which were offset relative to our plan by the FAS 109 impairment. Generation performed mostly in line with our expectations as our cost optimization efforts offset some market softness experienced earlier in the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01547

quarter.

Turning to slide 9, we're providing full year 2018 adjusted operating earnings guidance of $2.90 to $3.20 per share. The growth in utility earnings reflects continued rate base growth as we deploy capital to the benefit of our customers as well as improved improvement in PHI's earned ROEs. At Exelon Generation, the year-over-year increase is primarily driven by the full year recognition of ZEC revenue from New York and Illinois, the $0.11 recognition of the 2017 Illinois ZEC payments which is higher than the 2017 drag due to the now lower tax rate, the impact of tax reform, and cost optimization efforts partially offset by lower energy prices. We expect our first quarter earnings to be in the range of $0.90 to $1 per share. More detail on year-over-year drivers by operating company can be found in the appendix starting on slide 59.

On slide 10, we roll forward our outlook for utility CapEx and rate base which now covers 2018 through 2021. We plan to invest $21 billion into our utilities over the next four years to ensure reliable, more resilient, and more efficient transmission and distribution of electricity and gas that improves the customer experience. Our four-year capital program is up from what we shared with you last year as we accelerate our gas main replacement programs at BGE and PECO, and take advantage of opportunities to further improve reliability and resiliency, all of which allows us to provide our customers with safe, reliable service. This results in a capital plan across our utilities with a $5 million annual run rate. Turning to rate base, we now project annual growth of 7.4% compared to 6.5% at the last update, which reflects the expanded CapEx budget and the impacts of tax reform. Tax reform will increase rate base by approximately $1.7 billion in 2020, relative to our previous expectations. For your convenience, in the appendix we provided a more detailed analysis of the capital and rate base outlooks by individual utility beginning on slide 27.

Turning to slide 11. Equally important to deploying capital to strengthen our systems is timely revenue recovery. Of $11.5 billion of rate base growth projected through 2021, approximately 70% is covered either under formula rates or mechanisms supporting our ability to make additional investments and earn a fair return on our capital. Where we do not have mechanisms, we will continue to work with stakeholders to enact and implement these types of tools. I would also note that over 70% of our rate base is in jurisdictions that are decoupled from volumes, improving our earnings visibility and aligning with the ambitious energy efficiency goals in our states.

Slide 12 shows a trailing 12-month blended transmission and distribution earned ROEs of the utilities. Our utilities continue to execute, delivering stronger earned returns for the year in addition to the robust operational performance Chris already discussed. Over the past year, PHI's earned ROEs improved at Delmarva and Pepco and remained flat in Atlantic City Electric. Although I should point out that the FAS 109 impairment costs about 60 basis points of ROE at each utility. We're encouraged by the improvements at PHI and we expect to see further gains as pending rate cases are resolved throughout 2018. The legacy Exelon utilities had a strong 2017, earning 10.3% as a group helped by favorable storm expense and O&M partially offset by the FAS 109 regulatory asset impairment in the fourth quarter of 2017. Improving the earned ROEs at PHI and sustaining the strong performance at the legacy Exelon utilities will be a core focus in our efforts to meet our overall utility earnings growth targets. We expect to earn 9% to 10% ROEs across our utilities in 2019.

Turning to slide 13, we remain busy on the regulatory front. Since our last earnings call, ComEd received an order authorizing a revenue increase of over $95 million. Since implementing the formula rate structure, we've recovered 90% plus of our [indiscernible] (00:17:28), with this year being the 100% for the first time. Pepco filed electric rate cases in Maryland and in the District of Columbia, with orders expected in the third and fourth quarters of this year respectively. In addition to the recently filed Pepco Maryland and DC rate cases, we have pending rate cases at Delmarva, with orders expected in 2018. Combined, we're asking for $133 million in revenues, which reflect recovery on multiple years of reliabilities, smart meter, and other capital investments that have been made to improve performance across these jurisdictions. Later this spring, we plan to file our rate case at PECO for the first time in three years, and we'll file our standard formula update at ComEd in April. More details on the rate cases and their schedules can be found on slide 65 to through 71 in the appendix.

Slide 14 provides an update on our outlook for utility EPS where we continue to forecast 6% to 8% EPS growth. Compared to last year, our EPS bands in 2019 and 2020 have both increased. The uplift from tax reform at the utilities

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01548

through the increased rate base is mostly offset in the first couple of years but a drag from higher holding company expense since the lower tax rate provides less tax shield. As we look toward the back half of this period, we should start to see net benefit from the change in tax policy. Overall, the combination of strong rate base growth, timely regulatory recovery, and tax reform leave us on a path to sustain our leading utility EPS growth.

Slide 15 provides our gross margin update for ExGen, and on slide 38 we provide more detailed bridges compared to the previous quarter. I should point out that our decision to retire Oyster Creek a year earlier than previously planned is now factored into all of our disclosures for gross margins, O&M, and depreciation expense, with the collective EPS uplift being $0.03 in 2018, $0.07 in 2019, and $0.01 in 2020 relative to our previous expectations.

Now turning to our gross margin update, our 2018 total gross margin is flat relative to our last disclosure as lower Oyster Creek contribution is offset by the inclusion of the Handley Generating Station, the 1,265 megawatt peaker in Texas that we bought out of the EGTP portfolio that serves as cost-effective resource for our Constellation retail operations. Total gross margin in 2019 is up $50 million since the last quarter driven primarily by higher West Hub and NI Hub power prices, strengthening ERCOT spark spreads, and additional generation related to Handley partially offset by the early retirement of Oyster Creek.

Since we've not previously disclosed 2020 gross margins, let me help with the 2020 disclosures in context by bridging a few changes compared to the 2019 disclosures. Total gross margin is down $300 million and it will be bucketed into, one, a $150 million reduction to open gross margin primarily from the already announced retirement of TMI. We have offsets in O&M and depreciation expenses, so this closure is net EPS-accretive to us. Secondly, a $150 million decrease to the capacity in the ZEC line, which largely reflects the roll off of the robust and previously disclosed PJM capacity prices from the 2018-2019 auction. From a hedging perspective, we ended the quarter approximately 13% to 16% behind our ratable hedging program in 2018 and 8% to 11% behind ratable in 2019 when considering cross commodity hedges. We remain comfortable being more open when we look at market fundamentals, and particularly as we see opportunity for PJM price formation chances.

Turning to slide 16, our O&M expense outlook is consistent with the third quarter earnings call disclosures. That included our expanded $250 million cost reduction program plus an additional $50 million and $120 million of O&M savings in 2018 and 2019 respectfully due to the earlier than planned closure of Oyster Creek. Turning to CapEx, our nuclear fuel and base line capital spend projections continue to decline. Our base CapEx benefits from the proactive investments we've made across the fleet in prior years, further focus on investment priorities, and the impact of closing uneconomic plants. Our nuclear fuel expenditures are also falling as we take advantage of well-supplied uranium markets and excess fuel processing capacity.

We continue to run an efficient organization and we'll always look for ways to reduce cost and run the fleet more cost effectively while maintaining the highest premium on safety and reliability. The combination of ZEC programs in New York and Illinois have extended the useful lives of our most profitable assets, and we continue to reduce ongoing capital needs for the plants, which we think makes it a more compelling case for the long-term value of these assets which the market still seems slow to reflect.

Turning to slide 17, we're rolling forward the free cash flow outlook for ExGen that cover 2018 through 2021. We expect the cumulative free cash flow to be $7.6 billion, which is $800 million higher than our previous four-year outlook. Our forecast takes into account power price forwards at year end, the current gross margin outlook for Constellation, the benefit of the cost cuts outlined in the third quarter call, the planned closure of TMI and earlier closure of Oyster Creek, our updated base CapEx and nuclear forecast, and the impact of tax reform. We're also updating how we plan to use ExGen's strong cash flow generation. We'll invest approximately $700 million in growth capital which is primarily sited solar projects in support of our Constellation business, the Medway plant in New England, and some final payments around the Texas CCGTs. We plan to inject between $3.3 billion and $3.7 billion of capital in the utilities to fund the outsized growth without the need for external equity funding. With faster dividend growth, we will use approximately $400 million to $600 million of ExGen free cash flow to fund the dividend not covered by the utilities. We're comfortable with this dividend funding for ExGen, particularly considering that the four-year needs are less than 10% of our total free cash flow generation. Finally, we plan to retire between $2.7 billion

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01549

and $3.3 billion of debt, which will be spread between ExGen and holding company debt. We'll continue to manage ExGen leverage to our 3 times debt to EBITDA commitment.

Turning to slide 18, we've already shared with you the impact of tax reform on Exelon in our 8-K from January 5, but we want to highlight that we're a clear beneficiary from tax reform and offer a few additional details. We expect to pass-through meaningful savings to our utility customers across the different jurisdictions, reflecting the lower tax expense recoveries and refund of deferred income tax regulatory liabilities partially offset by the impacts of higher rate base. We're thrilled that our customers will benefit so much from tax reform.

Our 2018 EPS guidance is inclusive of tax reform, and we expect a $0.10 per share uplift to 2019 earnings. Generation earnings will benefit from a 22% effective tax rate. The utilities will benefit from an increased rate base of $2 billion by 2021 while the lower tax rate will create less tax shield for our holding company interest expense. We expect to be a very modest cash taxpayer through 2021, and you can see the cash tax rates by year. We expect much stronger free cash flow from ExGen with a lower tax rate and 100% expensing of capital, which will more than cover the additional equity needs to utilities associated with the increased rate base. And we expect the consolidated metrics will remain largely unchanged as a result of tax reform. And ExGen tax reform has a positive impact in 2018, with a more meaningful impact in the outer years that provides the company with additional financial flexibility.

On the utility side, we do see some modest erosion in FFO to debt, although all of our utilities remain at or above rating agency thresholds. We frequently made the case that our Generation business provides distinct competitive advantage to the overall company with the ability to recycle significant free cash flows. Our positive uplift to credit metrics and no need for external equity are additional examples relative to other utilities that are being pressured due to the tax reforms.

Turning to slide 19, we remain committed to maintaining a strong balance sheet and our investment grade credit rating. I hit on this in the previous slide, but we remain comfortably ahead of our corporate targets for FFO to debt and well above the downgrade thresholds. Looking at ExGen, we're well ahead of our debt to EBITDA targets in 2018. On a total basis, we expect to be at 2.5 times debt to EBITDA and only 2 times debt to EBITDA from a recourse debt perspective. We'll continue to manage our balance sheet at ExGen over time to the 3 times debt to EBITDA level, so look for us to focus on debt reduction at both holding company and GenCo.

Turning to slide 20, as Chris mentioned earlier the board has decided to increase the dividend growth rate policy from 2.5% to 5% annually through 2020. Chris spoke to the positive business developments that gave us the confidence to increase our dividend growth rate to be more competitive with utility peers, so I want to take a moment to talk about our financial thought process. Slide 20 shows the hypothetical portion of the dividend being funded by the utilities if we assume their piece of the dividend is based on a 70% payout ratio on utility less holding company expense. The residual dividend is then covered by ExGen. When we consider that the utilities are growing EPS at 6% to 8% per year and represent the growing majority of our earnings, we're comfortably growing the dividend at 5% based on a 70% utility earnings payout ratio, which keeps pace with this earnings growth.

On this approach, ExGen is funding around $0.20 of dividend depending on the year, which is a payout ratio in the teens of our 2018 EPS guidance for the business and substantially less than that on a free cash flow basis. We're very comfortable committing the small portion of ExGen's financial output to supporting the dividend and are excited to be returning more capital to our shareholders through the dividend.

I will now turn the call over to Joe Dominguez to walk you through the latest on our regulatory and policy initiatives.

Joseph Dominguez

Thanks, Jack, and good morning, everyone. I'll cover slides 21 and 22 in the materials. Since our last earnings call, we continue to see positive momentum for policy changes at the state, FERC, and RTO levels that value the zero emission and resilient resources that benefit our customers and the environment most. As Chris said at the top of the call, we remain focused on three areas. First, ensuring that resilient resources are compensated fairly; second, addressing the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01550

price formation flaws that PJM has identified in its market; and third, preserving and expanding state policy initiatives like the ZEC programs and include nuclear energy within the umbrella of state-sponsored clean energy programs. I'll walk through each of these.

On resilience, FERC issued its order on January 8 in response to the DOE NOPR. Consistent with Exelon's recommendations, the order initiated a new resilience proceedings and directed the RTOs to immediately examine grid resiliency and provide a report to FERC within 60 days. FERC noted that the report should include any recommended changes to market rules. In our filings at FERC, we urged the commission and the RTOs to view resilience as a broader scope of issues than the traditional reliability concerns that center around electric generation and transmission unit performance and weather events. In particular, as we've talked about in earlier calls, we urged FERC to consider the risk of a cascading loss of the electric system caused by natural gas infrastructure failure. We expect that the resilience proceedings and entrapping solutions will take some time as Chris indicated earlier.

But FERC's order clearly gives PJM the opportunity to address near-term solutions, including immediate price formation reforms. PJM has said it can implement those reforms within the course of this calendar year. Based upon PJM's comments, including Andy Ott's testimony before the Energy Committee of the U.S. Senate a week ago, we expect that PJM will continue to make a strong push for price formation reforms in its March filing.

In terms of next steps, we continue to see two alternative pathways that are going to be worked simultaneously. One, achieving a FERC-directed PJM filing as a byproduct of the resilience docket; and two, a stakeholder process at PJM followed by a 206 filing through its existing enhanced liaison committee process. PJM already has the price formation stakeholder process underway, and it is scheduled to conclude that process in the third quarter. In the meantime, PJM is pursuing more limited changes to price formation in the fast-start docket where filings are due next week. In summary, the commission is focused on resilience and the chairman's call for urgent action coupled with PJM's commitment to address market forums continues to give us confidence that reforms will be implemented in 2018. With that said, there's a lot of work ahead of us as PJM continues to engage with stakeholders and refine its proposal.

Turning to the next slide in our ongoing efforts concerning state policies that value zero-emission nuclear resources, Jack already noted that we've reached an important milestone last month in Illinois with the completion of the state procurement process and the awards of ZECs to the Quad Cities and Clinton. Now both the Illinois and New York programs are fully up and running. We remain confident that we'll successfully defend these legitimate state programs in federal fuels boards and state boards because they preserve for our customers the lowest cost and most reliable zero-emission resources in the market.

The New York and Illinois policy precedent that we established has been followed now in Connecticut and is under consideration in New Jersey, and I'll talk about New Jersey in closing. As many of you know, a bill had made it through two committees in the New Jersey legislature in late 2017. The votes were unanimous in support of the nuclear provisions. However, because the then Governor-Elect Murphy had indicated a desire for a more comprehensive package, a floor vote was not held. Since December, we've continued to work with our partners at [indiscernible] (00:32:56) and all stakeholders on new legislation. I could report that we are making good progress and I hope for legislative action in early 2018.

With that, let me turn it back over to Chris.

Christopher M. Crane

Thanks, Joe. Turning to slide 23, we have updated some of the numbers behind our value proposition which highlight our strategy and commitment to our shareholders. We will continue to focus on growing our utilities, targeting 7.4% rate base growth and 6% to 8% EPS growth through 2021, rolling forward another year at above group trajectory. We continue to use our free cash flow from ExGen to fund these incremental equity needs at the utilities, pay down debt over the next four years at ExGen and in the holding company, and fund part of a faster dividend growth rate. We will continue to focus on optimizing value for our ExGen business by seeking fair compensation for our carbon-free Generation fleet in New Jersey and in Pennsylvania as we have done with the ZECs in New York and Illinois.

final
Bloomberg Transcript

We will continue to pursue adoption of price formation in PJM and resiliency initiatives at FERC; closing uneconomic plans, including TMI in 2019 and now an earlier retirement of Oyster Creek in 2018. Selling assets where it makes sense to accelerate our debt reduction plans and maximizing value through our gen to load match strategy at Constellation. We continue to sustain strong investment grade credit metrics and now growing our dividend consistently at 5% through 2020.

Finally turning to slide 24, I want to leave you with some key focus areas for 2018. We will continue to deliver operational excellence across all our businesses, focusing on modernizing the grid and improving our customer experience at the utilities, running our Generation fleet safely and reliably, and staying disciplined in our retail business to capture fair margins. At the utilities, we plan to invest $5.4 billion of capital to benefit our customers, we will file a total of five distribution rate cases with the goal of the achieving our targeted 9% to 10% ROE across the utility families in 2019. In Generation, we will work to establish the PJM price formation changes in 2018. We will start working on a broader resiliency initiative at FERC, which will take more time. We'll continue to defend the Illinois and New York ZECs in the courts, and we'll work with our stakeholders to establish fair payment for the environmental attributes of our nuclear plants in New Jersey and Pennsylvania.

Financially, we will begin to grow the dividend as discussed at 5% annually, continue to execute on our previously announced cost management initiatives. And finally, we will continue with our corporate responsibility initiatives, including the focus on gender parity issues through our participation as the only energy company in the UN's HeForShe campaign, building on last year's expansion of paid leave policies and our signing of the President's equal pay pledge.

The strategy underpinning the value proposition rolled out a couple of years ago is proving very robust. We are well-positioned to capture additional upside and feel confident about the prospects for Exelon in 2018 and beyond. With the many successes we've had in recent years and the relative stock outperformance, we still believe our stock is undervalued in absolute terms, and in particular compared with our peers. We remain committed to optimize the value of our business and earnings – your ongoing support for Exelon. Operator, we can now open it up to questions.

Q&A

Operator

[Operator Instructions] Our first question comes from the line of Greg with Evercore ISI.

<Q - Greg Gordon>: Thanks. Good morning. On the stock valuation Chris, you and I definitely agree. Couple of questions. Just to be clear on the rollout of the 2020 disclosure, when we look at that, the lower gross margin associated with the TMI shutdown is actually earnings, just to be clear, you said is earnings-accretive. So we should think about the year-over-year sort of negative comp as flowing from the other two items. Is that correct?

<A - Jonathan W. Thayer>: The TMI, Greg, it is EPS-accretive.

<Q - Greg Gordon>: Right.

<A - Jonathan W. Thayer>: So...

<Q - Greg Gordon>: So they now would be offset by the $200 million of energy pricing capacity revenues. But then you also have the cost-cutting on page 26 that we have to factor in to come up with a sort of net impact from the Q3 call, right? There was a...

<A - Jonathan W. Thayer>: That's correct. So there's a full break out of O&M expenses that we detailed in the appendix. You'll see the impact both in 2018 as well as 2019 and beyond from Oyster as well as TMI.

<Q - Greg Gordon>: Great. And you also said you plan on retiring some parent maturities now, looking at the maturities schedule on page 40. I see that $6.3 billion of Holdco debt, there's a $900 million maturity in 2020, $300 million in 2021. Should we think about that as the timing or is there other debt that's callable or revolver capacity that

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01552

you can bring down in the interim?

<A - Jonathan W. Thayer>: So Greg, there's both – I apologize, I'm turning those slides. So in terms of the holding company maturities, you should expect us to tilt more heavily towards holding company in 2020 and 2021. You'll also see us pull – retire some 365-day paper we have in 2018 that retires in 2019, and then you'll see us work down the ExGen maturities as we get out the curve as well.

<Q - Greg Gordon>: Okay. So I have one for Joe Dominguez and one for Joe Nigro. Joe Dominguez, is it your expectation – and clearly you can't speak for PJM – but is it your expectation to get this stakeholder process completed, that they may go through the enhanced liaison process or in fact they would probably have to go through the enhanced liaison process to get a stakeholder process done in 2018 or is it too soon for us to sort of call that? And then the alternative, is it a legally viable possibility that at the end of the resiliency proceedings that FERC actually has the record in place to haul PJM in to change its tariff?

<A - Joseph Dominguez>: Yeah, let me answer the second question first and just simply say yes, I think they may have to open a different proceeding but obviously they could issue a 206 order at any point in time and we believe that they have a sufficient record already to do so. Very clearly, PJM is going to supplement that record here in March, and I expect that other parties in their response 30 days later will do the same. Greg, it's my expectation that PJM is going to continue to urge to do exactly that, to give it some direction, to come in and resolve the price formation issues that it's identified. But at the same time, they have this alternative pathway that they're going to walk down in parallel where they can include the stakeholder process. And my expectation is that, as the owner of the tariff, that PJM continues to believe that they have significant price formation flaws, and they've said that repeatedly in many forums, and the next step for them is to bring it to FERC and to utilize the enhanced liaison committee process if the stakeholder process doesn't work.

<Q - Greg Gordon>: Thanks. And for Joe Nigro, the initial auction parameters for the next capacity auction came out several days ago. There was a significant change in import capacity into ComEd and some concern from investors that perhaps that would disadvantage the incumbent generation vis-à-vis capacity price outcomes. Can you give us some color on your thinking there?

<A - Joseph Nigro>: Yeah. Good morning, Greg. We expected to see an increase in both into Eastern PJM and into ComEd an increase into the import capability, and they've been slightly higher than what we expected. There were obviously other variable changes as well when you think about the NETCO increase AND the impact, all other things equal, that could have on the demand curve and shifting the demand curve out. We're still, like everyone else, analyzing this. I think at the end of the day though, as we've said for years, the big thing is it's going to come down to bidding behavior, and it always does. So there's a lot of variables in play here, including those changes to the imports, but the bidding behavior won't matter.

<A - Joseph Dominguez>: Hey, Greg, it's Joe Dominguez. If I can just chime in, that CTEL has moved around over the last few auctions. So we're going 1.7 gigawatts, the other way now. A year ago we've – but two auctions ago, 1 gigawatt of that was already in the transmission limit. So we've seen the zones separate before with these higher CTEL numbers.

<Q - Greg Gordon>: Okay. Thanks, guys.

Operator

And your next question comes from the line of Julien of Bank of America Merrill Lynch.

<Q - Julien Dumoulin-Smith>: Hey. Good morning. Can you hear me?

<A - Jonathan W. Thayer>: Yeah.

<A - Joseph Dominguez>: Good morning.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01553

<A - Christopher M. Crane>: Very. Good morning.

<Q - Julien Dumoulin-Smith>: Hey, excellent. Congratulations again on a healthy set of updates here. I wanted to follow-up a little bit more strategically on the ExGen side. Obviously, well done on handling. Curious as to the thoughts about the desire to hold on to the Texas combined cycles. Can we read into some of the commentary around the desire to back start Constellation here or is there still kind of a broader thought process around merchant generation here. Just kind of wanted to elaborate on that.

<A - Christopher M. Crane>: Those assets, as we've discussed in the past, are highly efficient and they're a very good match for our load book in Texas. The capabilities that we have, the heat rates on them, the ramping, they're very valuable and their capacity factors have been some of the highest for the CCGTs in Texas. So we'll continue to operate in this part of the fleet and be able to reap the benefits of their efficiency as we manage that book in Texas. As always, we look at all of our assets on an annual basis, but the previous review of those asset said they're more valuable in the fleet to note.

<Q - Julien Dumoulin-Smith>: Great. And then secondly, I know you commented on New Jersey with respect to legislation, but can you comment a little bit on how the Oyster Creek development reflects on the profitability of the nuclear units in that region? Just curious if you can give us a little bit of a sense of the latest on those assets and the profitability maybe from an ROE perspective. Obviously, your peer in the region comments on that in kind.

<A - Christopher M. Crane>: Yeah. The Oyster Creek decision was simply a site specific. The market has tightened over the years in that location. But running it another year with the losses and the investments that we would had to have made was not financially prudent. Knowing that the reliability of the system can be sustained in that area without that asset, we're comfortable and most importantly we have an employee transition program that we're implementing that allows us, for those that are not at retirement and wish to retire, ability to go into the rest of our vast fleet and continue to pursue their careers. So employee-wise, right thing to do moving forward, allowing people to make the transition; and economic-wise no sense in continuing for losses for another year. So it was an easy decision. The other assets have been openly discussed as the challenges happen in that part of the market, and that's why we're pursuing in supporting our co-owner on that legislative agenda.

<Q - Julien Dumoulin-Smith>: Great. Thank you all.

Operator

And your next question comes from the line of Stephen with Morgan Stanley.

<Q - Stephen Calder Byrd>: Hi. Good morning.

<A - Christopher M. Crane>: Good morning.

<A - Jonathan W. Thayer>: Good morning.

<Q - Stephen Calder Byrd>: I just wanted to hit on the retail business and just overall get your sense for the competitive environment in the retail business. Any trends you're seeing on that side of the business?

<A - Joseph Nigro>: Yeah. Good morning, Stephen. It's Joe. I'll talk briefly about that. You see the metrics on our business on slide 7, and Jack talked to those in his prepared comments. We still have the best and the largest customer-facing business in the industry. And as recently as late December and early January, our generation to load strategy continues to serve us well. The market remains competitive. It's a little early to see what if any impact the current cold snap or the previous cold snap had on competitive behavior. As we said all along, we're going to remain disciplined to what we think is fair pricing and not just chase volume.

What we have seen though from competitors, which is kind of interesting, is two things. One is we've seen one of our large competitors back away in certain regions from selling a full fixed price full requirements product to their customers, and we will continue to do that as we have historically and we'll honor obviously all the commitments we

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01554

have. In addition to that, we've seen some of our competitors try to pass-through costs that we've honored through our contractual arrangements with our customers as costs that we will bear. So I won't say we've seen the competitive aspect of the market change, and as I said we'll remain disciplined. But we have seen some things from competitors that we haven't seen in the recent past which may or may not lead to different outcomes in the future.

<Q - Stephen Calder Byrd>: That's very helpful color. And just shifting over to the ZEC litigation in Illinois, we continue to sort of like your overall legal position. It seems like there's some chance that the court might actually kick the decision over to FERC effectively. Is that a fair reading in terms of a possibility and what's your sense in terms of your outlook should sort of the decision go back to FERC?

<A - Joseph Dominguez>: It's Joe Dominguez. Let me address the last one. I think all of the five FERC commissioners were asked during – the four new commissioners were asked during the confirmation hearings what their view is concerning these state programs, and all indicated that they did not see the situation as something where FERC needed to really put a halt to these programs or claim preemption but rather that they could use tools like mitigation to address any impacts in the market. So we would expect that if the matter does go over to FERC, consistent with their testimony before the U.S. Senate, the commissioners would indicate that they could mitigate the market through their existing tools and that they would not be in favor of preemption. And quite obviously, the plaintiffs in Illinois feel the same way and they've urged the court not to send it to FERC for that reason.

In terms of your reading of the argument, I think you're exactly right. [indiscernible] (00:49:49) brought in this question of primary jurisdiction which is a discretionary tool that allows the court at its discretion to send the matter to FERC. At this point, both parties approve that.

<Q - Stephen Calder Byrd>: Great. That's all I had. Thank you very much.

Operator

And your next question comes from the line of Steve with Wolfe Research.

<Q - Steve Fleishman>: Hi, good morning. So just first on the – maybe high level at ExGen. So obviously you have the gross margin numbers, and in 2020 they fall a certain amount. Is it fair to say kind of at the high level all the below the line stuff, O&M, interest as you're paying down debt, depreciation as you're closing plants, are all those kind of offsets so you'll end up mitigating some chunk of that gross margin hit?

<A - Jonathan W. Thayer>: Steve, so if you look at slide 54 we provide the additional ExGen modeling data. But as we look at ExGen's EPS profile out the curve, to your point, the lower depreciation, the lower operating O&M all leads to these retirements being accretive. So we should see strong and better than last quarter performance anticipated from ExGen as we look out of the LRP.

<Q - Steve Fleishman>: Okay, and then one other question. Just in the event that the energy price formation changes are at PJM through the enhanced liaison process, could you just clarify the timeframe on that and process?

<A - Joseph Dominguez>: So again, this is, as Greg said earlier, ultimately PJM's discretion when to pull the trigger on that. But right now it's set to conclude its stakeholder process in Q3. At that point, PJM will have all the input from stakeholders and, as usual, will have refined its proposal along the way. And at that point, in our view, we'll be in a position to make a filing at FERC.

<Q - Steve Fleishman>: And then how long FERC takes to rule – I guess it depends on – that's FERC's call.

<A - Joseph Dominguez>: That's FERC's call. This is a 206 proceeding, so there's no mandatory clock like we see in the 205 proceedings.

<Q - Steve Fleishman>: Yeah. Okay. Thank you.

final
Bloomberg Transcript
Bloomberg

Operator

And your next question comes from the line of Michael with Credit Suisse.

<Q - Michael Weinstein>: Hi, good morning.

<A - Christopher M. Crane>: Good morning.

<Q - Michael Weinstein>: Hey. The target for ExGen is still 3.0 times debt to EBITDA. Is that, I mean, considering that you're already below that, is that something that needs to come down at some point or is there a reason why it would increase over time?

<A - Jonathan W. Thayer>: So Michael, as you've seen the gross margin expectations and EBITDA expectations for the ExGen business go down, that 2 times non-recourse or 2 times recourse debt to EBITDA and 2.5 times gross debt to EBITDA number will move up. We will be paying down debt as maturities come, but we'll also be shifting our focus to the holding company debt and using the flexibility we have around the strong balance sheet at ExGen to target retirement of a good portion of or a good amount of holding company bonds as they mature.

<Q - Michael Weinstein>: I see. I mean, what's the purpose of having a 3.0 times target? Is there something you're trying to achieve with ExGen at that point?

<A - Jonathan W. Thayer>: I think differentiation from our IPP peers. We have I believe the strongest balance sheet in the integrated space. That takes the risk of that overhang that we've seen come pop-up from time-to-time among semesters off the table, positions us to maintain a strong investment grade rating from all the agencies. It's an important competitive advantage in the Constellation business. And as we clarified the longevity of these nuclear assets, we believe over time that while we trade currently at 5 times EBITDA from a valuation standpoint, we are making the case that we should trade in line with our IPP peers, which would be 7 to 8 times. And I think the market is not recognizing that now, but certainly it's all part of our strategy to accomplish them.

<Q - Michael Weinstein>: Right. You guys mentioned the enhanced liaison process. Just wondering is that something that you simply expect PJM to use or is that something that PJM is telling you they will be using for sure?

<A - Joseph Dominguez>: As I said earlier, PJM has made no announcement in that regard. The point I'm trying to make here is that PJM and a lot of different audiences has now come forward and say we have a major flaw in price formation. And that PJM were historically, where it has significant issues in its market design, capacity performance being the most recent example, has used the enhanced liaison committee process mechanism to get matters to FERC or stakeholders who can't agree on supporting a particular proposal. Given the gravity of this issue and the significance of it and its connection to the resilience issues that FERC is already looking at, it would be our expectation that PJM would follow its strong words to the U.S. Senate to FERC and others and proceed to making a filing at the conclusion of the stakeholder process. That's the point I'm making.

<Q - Michael Weinstein>: Got you. All right, thank you.

Operator

And our final question comes from Jonathan with Deutsche Bank.

<Q - Jonathan Philip Arnold>: Good morning, guys.

<A - Christopher M. Crane>: Good morning.

<Q - Jonathan Philip Arnold>: Strategy-wise, I mean, Chris, Jack you've both alluded to the value disconnect, and it's hard to imagine that you could be doing that much more to execute the current plan which seems to be going along. What's your level of patience to see the market reflect this under the current kind of dual strategy and just can you give us a refresh on how you're thinking.

<A - Christopher M. Crane>: Well as I've talked about this for a couple of years where patience is probably not the high point, but we understand it's our responsibility to deliver on these results and improve the thesis. So we took on five and a half years ago the road to greater regulated revenues coming in, greater certainty around balance sheet, total optimization of the gen to load match at Constellation while running world-class operations and efficient from a cost standpoint operations, and today's call reflects that. But let me go a little bit further and take a minute to give you more details on why we see our stock undervalued.

Simplistically with a $3.05 midpoint for 2018 EPS, the stock trades at around 12% P/E versus our cheapest comp at PEG, which is 15%, and the regulated utility complex around 16%. Even on a consensus for 2019 and 2020, we trade around 12% to 13% versus PEG roughly around 15% and the utilities roughly around 15% to 16%. With our dividend growth at a competitive 5% rate, a 3.7% dividend yield is similar to much of the others in the group, and our utility operations accounting for 70% of the 2020 EPS. If you're using midpoint of our utility guidance range and consolidated Exelon estimates from the Street, we look more similar to the business model to our peers than the 2% to 4% P/E multiple discount that we see are suggested.

If you think about our valuation, looking at the businesses more specifically, our regulated utilities less holding company expense implies a fair market value of $31 to $32 per share using a consensus P/E in 2019 and 2020. When I think about our utilities growth base at 7%, our EPS growth at 6% to 8%, which we expect to continue and we have through this conversation next year; from lower-risk T&D utilities having the mechanisms covering 70% of our rate base additions and 70% of our low decouples so we have less volumetric risk; that our collective earnings of 9.5% ROE with strong credit metrics exceeding agency requirements, and doing all of this without needing outside equity to fund any of this growth, I think they should be treated as a premium utilities for the valuation, but the $31 to $32 is based off of a peer valuation which leaves us with an implied value of ExGen of approximately $4 per share which we believe is entirely too low.

The implied multiples for the business around 6 times P/E and 5 times EV to EBITDA respectively, using our disclosure and the Street's estimates, looking at the IPPs trading at 7 to 8 times EBITDA today, we struggle to bridge the valuation disconnects especially when you consider our leverage is well below our 3 times debt to EBITDA target, at 2.5 times, and is really running at about 2 times on recourse debt. Our FFO to debt ratio is going to stay north of 40% through the planning horizon as ZEC programs in New York and Illinois have preserved most of our at-risk nuclear plants, and our Constellation business provides a gen to load match advantage, and our discipline around bidding margins is proving wise again as we're starting to hear others taking on pain in recent months.

Our free cash flow generation from this business is $7.6 billion over the next four years, which represents more than half of the implied enterprise value at ExGen with the assets with operational visibility well into the 2030s. We believe – we have done a lot of this in the past years to create value for the shareholders while the stock is outperformed. We do not see the share price reflecting anywhere near the value we see. We're focused on executing against the long-term commitments in our value proposition and near-term our 2018 business priorities, which we believe will deliver substantial value to our investors. So yes, I feel strongly about the stock being cheap. Short answer.

<Q - Jonathan Philip Arnold>: You sound impatient with the market to me.

<A - Jonathan W. Thayer>: And Jonathan, that doesn't even build in the fact that whether it's price formation or New Jersey ZECs, I mean, there a lot of incremental catalysts even beyond the robust story that Chris just described in the valuation where we currently see. So this is the strongest, long range plan that we've had since coming together as Constellation and Exelon, and we're excited about the outlook. The market's just not paying for it right now.

<Q - Jonathan Philip Arnold>: We kind of agree with you, but I guess how long do you give us?

<A - Christopher M. Crane>: Well we're not going anywhere.

<Q - Jonathan Philip Arnold>: All right. I'm inclined to ask that again.

<A - Christopher M. Crane>: Thanks, Jonathan.

<Q - Jonathan Philip Arnold>: Thank you.

And at this time, I would like to turn it back over to Chris Crane for any closing remarks.

Christopher M. Crane

Again, I want to thank you all for participating today. I want to thank the team here and the employees of Exelon for really delivering on a strategy that has taken a few years to get here. But we're operating on all cylinders and appreciate the dedication. So with that, I'll close it out and thank you.

Operator

And this concludes today's conference call. We thank you for your participation, and ask that you please disconnect your lines.

Presentation

Operator

Good morning. Thank you for standing by, and welcome to the Exelon Corporation 2017 Q3 Earnings Conference Call. All lines have been placed on mute to prevent any background noise. After the speakers' remarks, there will be a question-and-answer session. (Operator Instructions)

Thank you, Mr. Dan Eggers, Senior Vice President of Investor Relations for Exelon. You may begin your conference.

Daniel L. Eggers, Senior Vice President of Investor Relations

Thank you, Toni and good morning everyone and thank you for joining our third quarter 2017 earnings conference call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer, and Jack Thayer, Exelon's Chief Financial Officer. They're joined by other members of Exelon's senior management team, who will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, both of which can be found in the Investor Relations section of Exelon's website. The earnings release and other matters which we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material and comments made during this call.

Please refer to today's 8-K and Exelon's other SEC filings for discussion of risk factors and factors that may cause results to differ from management's projections, forecasts and expectations. Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures.

Bloomberg Transcript

I'll now turn the call over to Chris Crane, Exelon's CEO.

Christopher M. Crane, Chief Executive Officer

Thanks, Dan. And good morning and thank you all for joining us. We had a solid third quarter of 2017 with GAAP earnings of $0.85 per share up versus the prior year. Our adjusted EPS was $0.85 as well reaching the midpoint of our guidance. Strong utility in Genco performance more than offset headwinds from the mild summer weather that impacted our PECO, ACE utilities as well as volumes at constellation.

As we head into year-end, we have a lot to be encouraged about. Our regulatory utilities are continuing to execute very well. Running ahead of plan for the year, operationally we're performing in top quartiles across most performance measures. We are registering significant improvements at PHI, even relative to last year. We are doing exactly what we said we would do as part of our merger commitments, improving performance and reliability for our customers.

We are executing on our CapEx program for 2017. We are excited about the valuable technologies, investments we are deploying to our customers benefit. The FERC is making strides to address pressing resiliency needs for the power system, and we see that in a two-step process. Starting with empowering PJM to fixed deficiencies in the power price formation by the summer of 2018 and then a longer-term FERC process to address resiliency.

The Department of Energy's, section 403 filing noted a clause in the current price formation are part of the reason that nuclear units, the most resilient and cost effective zero emission resources in PJM are being less to premature retirements. Given our size of our PJM fleet, each dollar or megawatt hour of distortion caused by a flawed market design, undermines the Genco's economics by approximately $135 million per year on an unhedged basis.

We believe that DOE is focus on price formation will lead to a successful process at FERC that will eliminate these distortions by the summer of 2018. We have not reflected the value of these reforms in our forecasts that we're showing you today, but we do believe that it could be a significant positive for us starting in 2018. Finally, we are executing on our management plan focused on strengthening our operation and continuing to find efficiencies.

To that end, we lowered our cost by 250 million on a run rate basis in 2020, primarily at the Genco including today's announcement, we are lowering our costs, our O&M cost, versus planned by over 700 million annually from initiatives identified since 2015.

We continue to challenge our businesses to evaluate cost in today's announcement savings are part of that ongoing effort. We're confident in our previous announced plans that generate 6.8 million of free cash flow at the Genco through 2020. That will fund our utility growth, grow the dividend and meet our debt reduction commitments. It is this deliberate work that positions us well to face some headwinds. After a series of mild summers and winters, we have seen declining power market volatility which is weighing on the forward prices -- power prices impacting the constellation business. Just as we experienced during the periods of low volatility, we're again seeing less disciplined by some of the wholesale and retail competitors in the market.

As they become more aggressive with their pricing, we have been through low discipline, low volatility periods before, and they end up in the same way. Those without disciplined fail that is when we can grow our market share by winning business at good margins or acquiring low businesses offered for sale. We expect volatility to return to the markets with normal weather conditions, which will benefit our constellation in generation business.

In the meantime, we remain disciplined in our bidding strategy and remain behind our routable hedging in our generation. Last week the Illinois Power Authority shifted its schedule for finalizing the procurement of the Illinois ZEC contracts by one month from late December 2017 to late January 2018. Based on our assumptions this delay will ship $0.09 of EPS from 2017 into 2018. Even with the unanticipated EPS shift, we are narrowing our 2017 guidance to $2.55 to $2.75 per share. Keeping us on path to the midpoint of our original guidance at the utilities -- as the utilities outperform our plan.

final
Bloomberg Transcript
Bloomberg

Moving on to slide six, I want to highlight our excellent operational performance for the quarter. The color block chart continues to show strong top quartile performance across all of the facilities in most categories. I'm particularly want to call out the tremendous improvements in PHI compared to last year with a 22% improvement in reliability with PHI on track for their best year ever in reliability and a 17% improvement in speed of restoration and outages. Performance improvements like these really highlight the benefit going to our customers with the integration of PHI into Exelon.

And finally, as in prior quarters our best-in-class nuclear power fleets performed with very high reliability in the quarter. Moving to slide seven. Now, let me turn to the proposed rule issued by Secretary Perry in September. The orders aimed at protecting our customers from outages resulting from manmade and natural interruptions on the gas system by preserving resilient generation sources, including nuclear. We commend the Secretariat for focusing attention on the need to reform the energy markets and ensure their customers continue to benefit from resilient system.

FERC is currently considering the DOE's proposal, with the first round of comments filed on October 21, reply comments due on November 7th and the final orders scheduled for December 11.

We have shared our perspective on this important policy initiative. First, we think the FERC should direct PJM to evaluate and correct any deficiencies they see in energy price formation, which have put baseload generation assets at a disadvantage. We believe timely action on price formation could be implemented by as early as mid-2018. These reforms will be valuable first step in preserving resilient baseload generation as well as delivering economic and environmental benefits, the nuclear power uniquely provide.

We expect 135 terawatt hours of our generation output in PJM to benefit from price uplift that were layer in over coming years as the existing hedges roll off. Second, we think FERC can take on -- take the time to fully evaluate market reforms that will ensure power supply resiliency. This is a multi-fast that exercises that should take into account the cost and impact to our customers and economy of the long-term interruption of a natural gas fuel supply -- interruption of the natural gas fuel supply.

We believe these are important issues that need to be addressed for our country's future, but they require more analysis to ensure the right reforms are implemented. We are encouraged by the process being made at FERC and PJM, support for price formation changes. Between these efforts and state initiatives, we're optimistic about the path to preserve nuclear power plants and their critical economic environmental and reliability roles that they have in the communities that we serve.

I'll now turn the call over to Jack to take us through the numbers.

Jonathan Thayer, Chief Financial Officer

Thank you, Chris, and good morning, everyone. Turning to slide eight. For the third quarter, our adjusted non-GAAP operating earnings were $0.85 per share, which was at the midpoint of our guidance range of $0.80 to $0.90 per share. Exelon's utilities less HoldCo expenses delivered a combined $0.49 per share versus our plan, utility results were slightly favorable due to lower O&M and reduced storm activity over the third quarter.

Generation earned $0.36 per share, which was a little behind our plan. The third quarter was hurt by mild weather that reduced Constellation load volumes and a lack of price volatility, which reduced optimization opportunities. We did offset some weakness for payable O&M timing.

Turning to slide nine. Our $0.85 per share in the third quarter of this year was $0.06 per share lower than the third quarter of 2016. Overall, utilities benefited from improved earned ROEs and higher rate base, partly offset by adverse year-over-year weather impacts. ExGen was down primarily on lower power prices, lower load volumes due to mild weather and fewer optimization opportunities, partially offset by the addition of New York ZEC revenue and higher capacity prices.

Turning to slide 10, we are updating our 2017 guidance range. We had expected the Illinois Power Authority to finalize procurement for the ZEC programs in December, which based on our assumptions, would have contributed $0.09 of

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01561

EPS in 2017since the revenues are retroactive to the beginning of program on June 1. However, last week, the Illinois Power Authority updated their schedule pushing the final contract date to January 30, 2018.

The delayed timing has no impact on the amount we expect to receive or our free cash flow outlook. But it will change the timing of earnings recognition, shifting EPS into 2018. With that in mind, we are updating our 2017 EPS guidance range, heightening the top and bottom of the range by a nickel. So we're now at $2.55 to $2.75 per share. Strong performance of utilities is allowing us to still target the midpoint of our original guidance range of absorbing the $0.09 of ZEC timing impact.

Moving to slide 11. Our utilities continue to execute delivering strong earned returns in the quarter, in addition to the robust operational performance Chris already discussed. Looking at the trailing 12 month book ROEs, we saw improvement at PHI compared to last quarter across all jurisdictions except ACE, where they roll out favorable weather in the third quarter of 2016 for the less beneficial summer weather this year.

Our efforts to improve operations and the contributions from the rate cases resolved over the past year are driving a better earned ROEs at PHI. For the legacy Exelon utilities, our earned ROEs remained over 10%, but abated a bit from last quarter with less favorable year-over-year weather impacts at ComEd and PECO that you can see on slide nine Waterfall.

Overall Exelon utilities ROEs are still nearly 10%, including PHI. We're proud of the performance of our overall utility business and we still see opportunity to improve our returns at the PHI utilities as we bring their performance to levels more consistent with the rest of our utilities.

On slide 12, we update the status of our rate cases. At Atlantic City Electric, we reached a settlement for the second case in a row. The settlement provides a 4% rate increase, with new rates implemented earlier than what would have occurred if the case was fully litigated. The timing rate making in New Jersey is helping us make beneficial investments for our customers. While still work-in-progress, the investments are having an impact with outages down 33% and average customer outage time down 35%compared to 2011.

We also received an order for Pepco Maryland that granted an electric distribution base rate increase of $32.4 million based on an allowed ROE of 9.5%. The approved electric delivery rates became effective on October 20, 2017. We filed rate cases in the third quarter for Delmarva Delaware electric and gas and expect orders by the third quarter of 2018. We're proud of the hard work from our utilities and regulatory teams. These efforts are helping to bring PHI's earned ROEs for allowed levels while we simultaneously improve performance for our customers. More details on the rate cases and their schedules can be found on slides 34 to 42 in the Appendix.

Turning to slide 13. We regularly update you on our progress on the regulatory front, but another essential aspect of the business is a effectively deploying capital on behalf of our customers. We're currently on course to deploy our targeted $5.3 billion of capital in 2017. We've highlighted on this slide, two of the many notable projects we're developing to benefit our communities and customers.

The first is Pepco's Waterfront Substation. This substation is part of the larger capital grid project and is currently under construction with expected completion in 2017. Once complete, it will improve reliability to existing customers and support the plan growth in the Capitol Riverfront and Southwest Waterfront areas in the next 20 to 30 years. The other project I'd like to highlight is ComEd's Grand Prairie Gateway transmission line that was energized earlier this year.

It's a $200 million, 60 mile-long transmission line in Northern Illinois that provide structural benefits to the market, resulting in lower energy and congestion charges to customers and an increased import capability of approximately 1,000 megawatts. Over the next 15 years, customers collectively will save over $120 million and carbon emissions will be reduced by nearly 500,000 tons. These are just a couple of examples of how we continue to invest prudently across all our utilities and look forward to sharing more as we go forward.

Slide 14 provides our gross margin update for ExGen. Before I get into the market developments impacting gross margins, let me first discuss the impacts from a shift in revenue recognition for the Illinois ZECs from 2017 to 2018, which we also show in the Waterfalls on slide 21 in the appendix. The capacity in ZEC line declines by $150 million in

final
Bloomberg Transcript
Bloomberg

2017 and increases by a $150 million in 2018, offset by $50 million in other capacity declines, which I'll discuss in a moment.

The rest of the bars help to then isolate movements in underline gross margin not related to ZEC timing. In 2017, gross margin is down $50 million compared to last quarter, partially reflecting the effect of the mild summer and reduced optimization opportunities. We are highly hedged for the rest of this year and are well balanced for our generation to load matching strategy.

Turning to 2018 and 2019, separate from the Illinois ZEC timing, our gross margin is down $200 million for each year and can be bucketed into two categories. The first relates business and our unhedged power position. We are lowering our assumptions from MISO and New York capacity prices based on recent spot year options and bilateral fields in the market. This lower the capacity in ZEC line by $50 million on a rounded basis from last quarter.

For 2018, the line shows up as a positive $100 million after the timing uplift from $150 million of Illinois ZECs, while the $50 million decline in 2019 just reflects the lower outlook for past two revenues. During the third quarter, we also saw declines in energy prices, including some adverse news and basis differentials in the PJM East's sum, which costs another $50 million in 2018 and 2019.

However, with the recent rally in power prices, we have already recovered about half of the $100 million of 2019 gross margin declines for Generation. We also see $100 million decline in gross margins in 2018 and 2019 from the Constellation business, reflected in the lower power new business to go live. A series of mild summers and winters have contributed to reduced power market volatility, which in turn is impacting the competitiveness of our load business.

As we've witnessed in prior periods with low price volatility, some of our competitors are mispricing risk in an effort to win business. In the wholesale load business, we're seeing other players mispricing risks as we consider the market risk from weather volatility, basis variability and the likely impact of energy market reforms that Chris talked about earlier. Against this backdrop, we are clearing at margins near the low end of historical realizations.

In the C&I business, the consolidation of the suppliers since the polar vortex has led to better margin discipline with our unit margins holding consistent with prior years. We are however, seeing lower renewal rates compared to last couple of years, moving from something closer to 80% to low 70s%. These lower renewal rates, we still expect our volumes to be flat year-over-year whereas our previous guidance assumes higher renewal rates that will drive volume growth to Constellation in 2018 and 2019. Notably, even against the challenged market backdrop, we're holding volumes and margins flat, which is a testament to the strength of our retail platform and our disciplined approach to bidding business.

The updated gross margins for 2018 and 2019 incorporates C&I renewal rates from the low 70s and the wholesale margins hovering around the bottom end of what we've realized over time. We've been through these periods of low load pricing, lower load price in the past and as previously created opportunities for us. A return to normal weather will inject some power market volatility, which will positively impact forward power prices for Generation. Retailers and wholesalers in mispriced risk have consistently been driven from the business when we go from a period of low volatility to a volatility event.

When the market corrects, we'll be there to win business at good margins and grow volumes and market share, just as we had in the past. Even against the current market backdrop, Constellation continues to generate strong earnings and free cash flow. Our gen-to-load matching strategy remains a competitive advantage relative to our peers, contributing positive margin and providing a vehicle to bring our generation output to market in a disciplined manner.

From a hedging perspective, we ended the quarter approximately 11% to 14% behind our ratable hedging program in 2018 and 10% to 13% behind ratable in 2019 when considering cross-commodity hedges. We remain comfortable being more open when we look at market fundamentals. Spot natural gas prices this year at $3 per Mcf, which is $0.50 higher than last year in spite of mild weather this past winter and summer.

final
Bloomberg Transcript
Bloomberg

However, these higher prices have provided only modest uplift to spot power prices this summer, while the forward prices have decreased slightly. We think that a return to more normal weather and volatility in the market will help reverse this. And as Chris discussed, we see a path to power market reforms that represent real value uplift for us. We're maintaining additional link to be able to monetize these reforms.

Turning to slide 15. We continually challenge our organization to find operating efficiencies and focus on managing our cost. To that end, we're announcing another wave of O&M cost reductions, building on previous years' efforts. We will ramp these new initiatives over the next two years, as shown on the lower-right table, reaching a $250 million annual run rate in 2020. The savings will come primarily from ExGen and the corporate center. If you look at this initiative together with the programs we've announced since 2015, we'll strip out over $700 million of annual run rate cost providing significant earnings of free cash flow benefits.

Turning to slide 16. We appreciate that there have been many puts and takes this year at ExGen that have both benefited and weighed on our free cash flow outlook through 2020. When we take into account the movement in power price forwards through the end of October, updated gross margin outlook for Constellation, the benefit of further cost cuts, the early closure of TMI and exit of EGTP plants and changes to base CapEx in working capital associated with all these business updates, we remain confident in the free cash flow outlook and capital allocation commitments we made at the beginning of the year.

We're also committed to meeting or beating our 3 times debt-to-EBITDA target for ExGen's balance sheet, which we will meet over planning horizon. On the fourth quarter call, we will roll forward the free cash flow outlook for the next planning period. And with that, I'll turn the call back to Chris.

Christopher M. Crane, Chief Executive Officer

Thanks, Jack. Turning to slide 17, I want to take a moment to highlight the contributions made by Exelon and our employees to help the impact by Hurricanes Harvey, Irma and Maria. Exelon utilities sent more than 2,200 employees and contractors and support personnel from our six utilities to help with the recovery efforts at Hurricane, Irma. Our crews travel to Florida and Georgia where they, for more than two weeks, worked in very difficult conditions. We're very proud of our employees and the hard work that they do to help the communities come back from -- after these disasters. A very special thanks to all those who helped in the restoration and support efforts.

Exelon employees also stepped up from a volunteer perspective. Our employees have donated their time and resources to communities impacted by the storms. We also had a number of our Constellation employees in Houston directly displaced by the storms and to see coworkers come to their aid illustrates the value that we embody here at Exelon. Slide 18, we want to reinforce our value proposition, which remains the foundation of our commitment to our investors. We've continued to grow the utilities rate base at 6.5% and the regulated EPS to 6% to 8% annually through 2020, underpinning the capital investments that directly benefit the customers in each of our jurisdictions.

We continue to use free cash flow generated at the Genco to fund incremental equities at the utilities and pay down debt over the next four years at ExGen in the holding company. We're focused on optimizing the value of our ExGen business by seeking fair compensation for our carbon-free generation fleet, closing uneconomic plants, selling assets where it makes sense to accelerate our debt reduction plans, and maximizing our value through gen-to-load matching strategies.

We continue to focus on sustaining strong investment-grade credit metrics and grow our dividend in a stable consistent manner. As many of you are aware, our dividend growth program is for 2.5% annually from 2016 through 2018. We are working with our board and expect to provide an update on a multiyear outlook for the dividend growth plan as part of our planning and budgeting process that are undertaking currently.

Before I go to questions, I want to come back to where we started off in the call. We have a number of positives underlying our outlook. The utilities are growing and executing well. We are confident that the FERC actions around resiliency will facilitate needed power price reforms in PJM that will fairly compensate our generating assets. We

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01564

continue to improve operations where we're finding ways to run our business more efficiently and taking out an additional $250 million in cost as discussed. And we're still on track to generate $6.8 billion of free cash flow through 2020 at the ExGen that will support our utility growth, reduce our debt and facilitate growing our dividend.

Thank you again for your interest and now we're ready for your questions.

Questions And Answers

Operator

(Operator Instructions) And your first question comes from the line of Greg Gordon from Evercore ISI.

Christopher M. Crane, Chief Executive Officer

Hey, Greg good morning.

Greg Gordon, Analyst

So just to summarize here, you gave us a negative adjustment on several -- I think ExGen that totaled $200 million, but since that mark, you've seen $50 million come back and so 2019 is negative $150 million and if you achieved your cost-cutting goals, you essentially have eliminated that. And so we're at the push in 2019 with those offset, is that correct?

Jonathan Thayer, Chief Financial Officer

Yes, Greg. And I think as you think about it and you listen to our comments on the low volatility period we're in, we believe that with the return to normal weather and even potentially future volatility events that, that's decline in Constellation business could prove temporary. Obviously, the $250 million are permanent, cost savings and capitalized all in terms of value creation.

Greg Gordon, Analyst

Okay. So as per your usual protocol, you're using the current forward curves for power -- what the current margin outlook looks like for retail, you're not assuming any changes, no volatility premium coming back in the market, no PJM price reform, et cetera?

Joseph Nigro, Executive Vice President and Chief Executive Officer of Constellation Division

Hi, Greg. Its Joe. Yes, we are using current forward curves for power. I think the big thing to note on the retail side and Jack said this in his script. When we did our planning at the first of the year, our renewal rates for C&I power were up close to 80%. As was the case back in 2012 and 2013, we have seen a downturn in most renewal rates down close to the 70%. And were marking this closer to that 70% number. I think the big thing though is back in 2012 and 2013, we saw power -- C&I power margins dipped below $2 per megawatt hour. And we've said historically our origination margins for that business are somewhere between $2 and $4. We're still within that $2 to $4 range.

So I think the big thing in the takeaway is, were going to serve about 200 million-megawatt hours of load this year across our platform between retail and wholesale and we expect to do the same thing next year. The thing is, were just

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01565

not going to achieve the growth that we expected in our C&I power business. And as Chris said and Jack said, the reason for that is, we don't think it's prudent to chase the market. And were going to remain disciplined what we think value is and that has served us well historically and quite frankly, has allowed us to acquire companies a few times as well. So we'll continue to remain disciplined.

Greg Gordon, Analyst

Great. I -- sorry, go ahead.

Christopher M. Crane, Chief Executive Officer

No, I've just said so, the beginning of the question, all the numbers that you hear are on the gross margin are marked at the end of third quarter. So it's the end of September 29th or 31st, whatever the market closed on.

Greg Gordon, Analyst

Gotcha. One -- two more questions. One, looking at slide 20, your cash flow profile looks slightly better and it looks like it's mainly coming from the utilities and specifically from ComEd. Can you comment on what the changes in the improved cash flow profile there?

Christopher M. Crane, Chief Executive Officer

So it's primarily related to the collection of the ZEC regulatory asset as well as cash taxes.

Greg Gordon, Analyst

Okay. Final question, when looking at you're -- at the value proposition you guys are delivering, if we get PJM price formation improvements and you hit on your other financial goals, you'll start to have an earnings growth profile that looks more comparable to the regulated peer group. They trade at 18 times earnings you're trading at 14 times current expectations. But your dividend growth -- their dividend growth rates average around 5% and yours is 2.5%. I know you said you're reviewing this, but what do you need to see in terms of your financial outlook to be able to close or eliminate that dividend growth half gap, because I think it's one amongst several things that keeps your stock from trading at a higher valuation.

Christopher M. Crane, Chief Executive Officer

Yes, Greg. We do believe were undervalued and everything that were doing is to drive that improvement in valuation. As you can see from the free cash flow, the debt reduction plan, the recovery and rate case, were positioning ourselves much better for a potential to have the board conversation in the upcoming LRP planning process to evaluate the dividend and our expectation is -- and has been since we had to cut the dividend four years ago is to get it back to build the business on a strong balance sheet to get the dividend to be in line with our peers. And that is our pursuit and as you can see from these numbers, things are improving that have us -- able to have a much more positive conversation with the board. Ultimately, it's the board's discretion, but that's where we want to be.

Greg Gordon, Analyst

Thank you very much. Have a great morning.

Christopher M. Crane, Chief Executive Officer

Thanks, Greg.

Operator

Your next question comes from the line of Jonathan Arnold from Deutsche Bank.

Jonathan Arnold, Analyst

Good morning, guys.

Christopher M. Crane, Chief Executive Officer

Good morning.

Jonathan Arnold, Analyst

I wanted to just make sure, at the beginning Chris, I believe you just gave a $1 of market price improvement sensitivity based of your volumes to PJM price reform was $135 million. Did I hear that correctly?

Christopher M. Crane, Chief Executive Officer

Yeah, for a $1 of fully opened position in PJM, a 135 terawatt hours, $135 million. So you can -- that was just the dollar reference.

Jonathan Arnold, Analyst

Okay. So my question is, I mean, as you look at the kinds of reforms that PJM is considering in flexible unit and the like, what's your view of the range of potential uplift when you translated into the ATC basis that we would rather view?

Joseph Nigro, Executive Vice President and Chief Executive Officer of Constellation Division

Hey Jonathan, this is Joe. We're still waiting to see some additional details from PJM. But -- and so were not going to put out a number until we get all of those details. But I have seen the reports that a number of you have compiled on this subject with the range that is somewhere between $2 and $5 ATC movement as a result of the elimination and discrimination. And I think that's the right range to be thinking about and probably with the middle part of that range makes a lot of sense to us.

Jonathan Arnold, Analyst

final
Bloomberg Transcript
Bloomberg

Okay, that's helpful. Thank you for that. And then Chris, you've said, I think earlier in the year, this dividend revisit in the longer-range growth outlook would be a Q1 and I believe what you've just said is pretty consistent with that -- if you do at is part of the LRP. Is that correct?

Christopher M. Crane, Chief Executive Officer

Yeah. I think we've said back in 2016 when we have our dividend strategy, we want to give you a multi-year plan. We gave you '16 through '18, that will be the time in the first quarter to be updating, in my belief and set the boards discussion on where we go with that, but that will be our timing in my mind in our current plans and communicating with all of you.

Jonathan Arnold, Analyst

What should we be expecting you to give us next week the EEI. No, no not the EEI, what items?

Christopher M. Crane, Chief Executive Officer

Yeah. EEI, I think we'll be able to have more of the one-on-one details, get into more of the details on the capital investments and the growth and the rate case strategies as we improve the customer experience at the utilities. Well also have more time to go into the detail on the numbers on the free cash flow, debt reduction plans, and the optimization of gentle load growth. I'm sure more people are going to want to talk in detail about the basis for our 250, and we can do the deep dive on that, but it will be detailed on what you're seeing today and an opportunity to have some one-on-one dialogue about it.

Jonathan Arnold, Analyst

Great, thank you. And then I guess, just one other -- did you have any thoughts? I know it's all a bit moving target you've been talking, but what's your level of confidence that you're going to get to things that you want to see out of the tax reform?

Christopher M. Crane, Chief Executive Officer

Well, its 11:15, I think or 11:30 Eastern when we see the draft, and we'll have to rally together with EEI and take a look at how we as a sector have been positioned, kind of early to say now if you've gone over the last 24 hours, things have been all over the board. So I think to speculate, but we work together in a sector at EEI, and I'm sure Tom Kuhn will be getting us all together and figure out our next steps as the rewrites as they discuss our finalized and getting our input as a sector in there.

We're totally unified at EEI on what we're looking for and what we think will benefit our customers the most in tax reform. So more to come on that, and maybe well have a little bit of insight of that in EEI as we work through the weekend and see the effect on the proposed and still we got to go back to this is proposed. You don't know what's going to happen in D.C., but we'll be ready to talk about it more, as not only a company but as a sector.

Jonathan Arnold, Analyst

Sure and sorry to put you on spot on that on a real-time issue.

Christopher M. Crane, Chief Executive Officer

No, that's okay.

Jonathan Arnold, Analyst

Thank you, guys.

Christopher M. Crane, Chief Executive Officer

Sure.

Operator

Your next question comes from the line of Steve Fleishman from Wolfe Research.

Steve Fleishman, Analyst

Yeah. Hey, good morning, Chris.

Christopher M. Crane, Chief Executive Officer

Hey, Steve.

Steve Fleishman, Analyst

So just curios how are you strategizing on your retail business with respect to these potential DOE, PJM changes? And are you doing things to make sure that you don't have like a big delay in capturing the uptick because of retail hedges, like are you making sure your back to backing your retail and the like, I mean just curious how you're thinking about that?

Joseph Nigro, Executive Vice President and Chief Executive Officer of Constellation Division

Hey Steve, good morning. It's Joe. We are thinking about that and I think the first thing is, when as Jack said in his script and we said for a while, were carrying the longer position relative to our ratable sales plan. So we have the opportunity to capture any upside associated with price increases related to the reforms you're talking about. I think specifically though the retail, there's a couple elements to that. The first one is, we've done some preliminary remodeling and we take into account kind of the seasonality as well as the differences between on and off peak.

So we try to be more surgical and just saying, were going to buyback this. We have a view of the things we need to do. I think as it specifically relates to our retail contracts there is two elements. One is obviously, we have contracts from the books already and we have some hedges on the books already, so there will be a feathering in effect to the value proposition of this. But most importantly, from our perspective, I think one of the things we offer our customers, and it's really important, is transparency. And what I mean by that is, when they are signing a contract with us, they completely understand what they're doing and what the components of that are fixed-price and the components that are going to be passed through in time.

final

Bloomberg Transcript

And I'm not sure that's always the case across the industry. So from our perspective, there's lot of elements, and we are thinking about it and we are really managing our portfolio from a natural long position as well as the seasonality and the products and were keeping the customer in mind.

Steve Fleishman, Analyst

Okay. And just in terms of just the -- that's helpful. In terms of just the power new business change that you made, what -- your sense in terms of making that change is your -- do you feel like you've encompassed kind of a pretty conservative case here at this point, so that this doesn't become like a series of changes?

Christopher M. Crane, Chief Executive Officer

Yes. I think yes. The answer to your question is, yes. We think we've covered it and I'll tell you why. When you look at it, it's really all driven by our loan business. About 60% of it's on our retail C&I business and at about 40% is associated with our wholesale polar business and there's really two elements that is different one on each side. On the retail side, as we said, our renewal rates are lower than we expected them to be, but our margins are well within the range that we expect it. And that's very different when we have these challenges five years ago, where our margins and our renewal rates both dropped pretty appreciably.

On the wholesale side, it's much more of a margin story, where the volumes are there, but the margins are lower than they've been historically. I mean, it's a very competitive environment. Quite frankly, it's being driven by a lot of smaller players on the retail side and not the bigger players. On the wholesale side, we've seen kind of competition across the spectrum. But were confident that we've captured the changes we need to make.

Steve Fleishman, Analyst

Great. And I just finally, I guess in the hindsight, congratulations on adding your Texas gas plants months before all the coal plants shut. But I'm sure you planned that out, but, I'm just curious given that fact just have your thoughts on the Texas kind of market and potential there changed for you? How you're thinking about that?

Joseph Nigro, Executive Vice President and Chief Executive Officer of Constellation Division

It's Joe again. I should go in. And we've talked about this for a while. When you look at ERCOT reports on what they thought reserve margins were going to be. We never really thought they were going to get the generation growth that they expected and in our own modeling, we have sensitivities, we ran some sensitivities looking at the possibility for retirements and if you look at our positioning in ERCOT, we are carrying a long position there relative to our ratable plan as well.

And we see the opportunity for volatility. I think this summer, we've skewed some, obviously with the problems with the Hurricane in August and, quite frankly, the biggest thing down there is we continue to see load growth, which is really important. And we don't see a lot of kind of newbuild of gas generation. You have continued growth on the renewable side, but it's more concentrated in South Texas than it is West Texas and when you put all that together, we see the opportunity for increased volatility, and we think we have a fleet that will benefit that.

Steve Fleishman, Analyst

Thank you.

Your next question comes from the line of Julien Dumoulin-Smith from Bank of America.

Julien Dumoulin-Smith, Analyst

Hey, good morning.

Christopher M. Crane, Chief Executive Officer

Good morning, Julien.

Julien Dumoulin-Smith, Analyst

Hey, so couple of quick questions, may be going back a little bit on some of the previous discussion here. But with respect to the dividend, how do you think about the stability of cash in the various businesses. Obviously, there's a certain legacy here, but how do you think about the stability from ZECs and the retail business and how do you think about that, at least into the conversation around dividend policy i.e., can you bank on cash flows out of businesses that are not utilities and/or think about of a higher payout on the core utilities?

Christopher M. Crane, Chief Executive Officer

Sure. So as we've talked about four years ago, 4.5 years ago now, as we restructure the dividend and put our strategy and our focus on really growing the utility business through the acquisition of BGE and then the acquisition of PHI and it was to theoretically watch the growth in those businesses and have a 70%, 65% to 70% dividend policy, theoretically at the utilities. Now, you know that's going to cycle during different growth periods. But that was the way we had the dividend set to grow. In the first couple of years, we were starting to get closer to that, giving that accomplished in the early 20s and so that's when we came up with the growth policy at 2.5%.

As you can see, the utilities are continuing to grow, although right now, it's taking cash infusion, equity infusion from the Holdco through the Genco. But they're continuing to grow. So our stability of the dividend is very well anchored. Our growth -- potential growth for the dividend is well anchored. As we come through the last couple of years and started to see more reliable or consistent cash flows from the Genco on programs that compensate for the other benefits besides just the energy, you're seeing a potential that can be a dependable cash flow, that can be used for potential return of value to the shareholders.

So that's the way were looking at it and were presenting it to the board, that the cyclical nature of the commodity market will not leave us, but the certainty of certain elements on those revenue streams give us the opportunity to look at the world a little bit differently. So that's how we'll continue to model it, and we've gained greater flexibility with programs like the ZEC.

Julien Dumoulin-Smith, Analyst

Excellent. And then, let me ask you this. With respect to the utilities, right. I know we've had a lot of conversation on the other side of the business. But obviously, you've had some reasonable success of late in ComEd around -- how do you say, scaling some of the smart grid efforts. How do you see the ability to scale that further and obviously, this might be getting ahead of the annual process and the CapEx budget, et cetera. But maybe this is more to Anne and

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01571

thinking about the ComEd prospects beyond 2020 here.

Christopher M. Crane, Chief Executive Officer

So let me start off and I'll let Denis jump in here or Anne on the call. The advent of digitalization of the distribution system and the transmission system is offered us an opportunity for capital investments that directly benefit the customers and drive reliability. We have now put in communications backbones to reach smart meters to help us with fault isolators, fast reclosers, that's the kind of spend, along with replacing antiquated cable and updating the system with new components.

Now, as we go into the 2020 and beyond, there is a significant amount of work being done on what else can be done to develop into the smart city that we can better serve the communities while investing and driving efficiency into the systems. And the work that's being done on microgrids, the experimental work there, to see what the societal benefit in certain microgrids in certain locations.

What we can do to integrate with more of the community is there an assistance within the street light programs or assistance that we can provide with our infrastructure on the meter reading of water or gas or other types of systems is where we'll be going. And I think, this technology is morphing faster than it ever has in our sector and with our design teams, data scientists, the work that were doing on big data, digitization is going to provide us many opportunities for continuing to optimize the system for the customers benefit. Denis, I don't know if I covered it or --

Denis O'Brien, Senior Executive Vice President, Chief Executive Officer - Exelon Utilities

I think -- this is Denis. Chris, I think you covered it pretty well. We're spending about $5 billion year-end capital. We still see opportunities to continue to invest in convergence relative to our systems to build the systems of the future, whether that's billing systems, transmissions data systems or others. We see opportunities to continue invest in resiliency and security. We're seeing opportunities relative to the transmission system as we look at resiliency and security and to build the transmission system of the future. Chris hit on smart cities and other things like that.

And the last thing as you look at the grid of the future and we think about distributed generation, in order to get our system ready for that, that really means, that converting some of our lower-voltage circuits into higher-voltage circuits. And so that's an opportunity for further capital deployment. So we are deploying about $5 billion of capital a year. We see that continuing and see lots of opportunities to continue to invest in utilities as usual.

Julien Dumoulin-Smith, Analyst

But does that enable kind of accelerating CapEx spend overall? And perhaps, that the core of the question?

Christopher M. Crane, Chief Executive Officer

I don't see as its accelerating the plan. I think we're at a point that were managing efficiently the spent that we have. And we also have to balance the impact to the consumer. Spending capital for the sake as spending capital without finding the efficiencies in the delivery into the benefit of the customer, it wouldn't be prudent. Right now, the projects that we have on schedule, the cash flow that support that, are managed well and they do support what our bottom line. It needs to be as the benefit of the customer.

And one thing I'd add to that. Our focus on -- were 18 months into PHI acquisition. Our focus now is to get the performance to the right level. We had our best year ever in reliability at PHI last year, which we only had the company since March. We are going to blow it through that level of reliability this year in a good way. So the first couple of

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01572

years, how do we get the performance to a good place. How do we write the image and reputation, and improve our regulatory outcomes at PHI.

Julien Dumoulin-Smith, Analyst

Excellent. Thank you all.

Christopher M. Crane, Chief Executive Officer

Thanks.

Operator

Your next question comes from the line of Stephen Byrd from Morgan Stanley.

Stephen Byrd, Analyst

Hey, good morning and congratulations on the (inaudible) announcements and the utility performance.

Christopher M. Crane, Chief Executive Officer

Thank, Steve.

Stephen Byrd, Analyst

I wanted to drill into the idea of resiliency laid out by as part of energy. Is there a way for us to conceptually think about the valued resiliency or a framework for assessing how to appropriately value resiliency? It's been a tricky thing, I think, for all of us to really think through the high-level idea to make sense just sort of how to go about trying to value that. Is that any suggestions you have in thinking about that?

Joe Dominguez, Executive Vice President, Government and Regulatory Affairs and Public Policy

Stephen, this is Joe Dominguez. If you've seen our fleeting, you know that we have a multi-phase process where, in the first instance, we need to get analytics from new RTOs. Can they run without pipelines? What's the impact for the consumers? We can move from there to design basis for the system that we think is going to iterate between NERC, FERC and the Department of Energy sometime after we get the data.

In terms of how we ultimately implement that into the system, I think once we've the design basis, is what we are trying to avoid, we will start looking at mitigation solutions, maybe the retention of additional fuel secure resources to avoid this outage risk. But I think it's premature to get there. One way you can think about is, though, you can take a look at the capacity performance program.

We were able to value the cost of incremental reliability associated with dual fuel. So if the design basis ultimately ends up being we need 90 days of fuel, we have a mathematical way of calculating what's the market solution to get dual fuel resources to 90 days of fuel with it. That would probably be the $8 or $10 a megawatt hour in terms of doing that based on the cost we saw in CPAY.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01573

So that's one approach. But from our perspective, we need to drop back here, take a look at the data, make sure we have the right definition of resiliency, the right design basis and then we come back with market solutions or other solutions that we will ensure we have the resources to mitigate that risk and provide the security we need that we provide to our end customers in the nation.

Christopher M. Crane, Chief Executive Officer

And I think the key to that, what Joe said, is a market solution.

Stephen Byrd, Analyst

Understood. Within that market construct that we have that makes sense. So I want to just shift over to the retail business. There is been a lot of discussion on this call around. Just the competitive playing field, if we do see FERC performs on power price formation and if power prices do rise, would you expect to see a bit of a shakeout amongst smaller retail players? You are not backed up by physical generation. You may misprice the upside risk to power prices. How would you assuming again that we do see kind of formation changes we expect? Would you say a shakeout there?

Christopher M. Crane, Chief Executive Officer

Yes. I think history tell us we would ends up in a volatility event and then go back for a number of years. We've seen players whether the big or small, whether they are on the C&I side, the residential side or quite frankly, the power loads on the wholesale side. We've seen folks who aggressively price the risk or the ultimate price to the customer have been hurt. And as I said, earlier, we had opportunities to acquire companies in that type of environment. We've the opportunities to grow our business organically. And we think remaining disciplined to what we're doing is the right thing to do.

We still have almost 25% of the C&I market. We are the number one C&I marketer by a huge amounts, were the third largest residential marketer in the United States and we compete in all the wholesale power options. So the underlying business is strong. The growth we expect were not achieving and I think the discipline will serve us well and we going to have opportunity to capture some of that back when we see the volatility of event.

Stephen Byrd, Analyst

That's great, that's all I had. Thank you.

Operator

And your final question comes from the line of Praful Mehta from Citigroup.

Praful Mehta, Analyst

Thanks.

Christopher M. Crane, Chief Executive Officer

Good morning.

Praful Mehta, Analyst

Good morning. So my question goes back a little bit to the dividend discussion. And what I was trying to connect the dots on was, you're already kind hitting your leverage targets, your free cash flow targets, right now, with the current plan. If you do have price reform and if you do have further ZECs coming from other states, then you have that incremental free cash flow. How should we think about that capital allocation? Is that more to both to the dividend or where do you think that capital allocation goes?

Jonathan Thayer, Chief Financial Officer

First of all, we will look at it in a disciplined way on what is the best way to return value to the shareholders, while maintaining our commitment to the customers. So the plan, as I said, earlier that we started out on over 4.5 years ago is working. We're reducing our debt, we are strengthening our balance sheet, we are reducing our cost, we are able to make solid investments in our utilities, and we've been able to do a part of a dividend increase program as we were doing that.

As you can see, as we get stronger and stronger, opportunities for us to deploy the capital are coming our way, and we'll make sure that we will look at it in a disciplined fashion. If there are more accretive ways to spend the capital in the utilities, and in a low risk area, that will be something we look at. But as we've committed previously, and as we've signaled, it's a conversation that's ongoing right now. There is opportunities to revise the dividend policy and give you another multi-year plan as we work through the LRP planning process and we work with our Board heading into 2018.

Praful Mehta, Analyst

Gotcha. That's very helpful. And secondly, in terms of the ZECs, if you could just touch on how you think ZECs plays out in different states in other states obviously, very high in there. And secondly, how does that fit in with the price formation and the DOE reform. Do you see them interacting? Or do you see them as completely independent?

Joe Dominguez, Executive Vice President, Government and Regulatory Affairs and Public Policy

This is Joe, again. We were pleased to see the upcoming in the Connecticut the other day, where all the different structure, the type of premises the same nuclear units are critical for our customers and we need to preserve them. So that means set forth on policy front there. We're having very productive discussions both in Pennsylvania and New Jersey, we will continue to do that.

In terms of the interaction, I see between programs, if we get an upside in price formation, I think that will ultimately be taken into account in the process. So there will not be a double dip here. If prices increase as result on price formation, the cost of the ZECs or the cost of the support payments will go down. That's anticipated.

Praful Mehta, Analyst

Got it. And do you think that's a dollar-per-dollar adjustment? Or do you think there is some benefit that you do keep?

Christopher M. Crane, Chief Executive Officer

No. I think it's a dollar-per-dollar adjustment.

MANAGEMENT DISCUSSION SECTION

Daniel L. Eggers

Financial Measures

Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures

Please refer to the information contained in the appendix of our presentation and our earnings release for reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures

Christopher M. Crane

Q3 2017 Results

Earnings and Regulatory Utilities

- We had a solid Q3 2017 with GAAP earnings of $0.85 per share, up vs. the prior year
- Our adjusted EPS was $0.85 as well, reaching the mid-point of our guidance
- Strong utility and GenCo performance more than offset headwinds from a mild summer weather that impacted our PECO ACE utilities as well as volumes at Constellation
  - As we head into year end, we have a lot to be encouraged about
- Our regulatory utilities are continuing to execute very well, running ahead of plan for the year

Bloomberg Transcript

Improvements at PHI

- Operationally, we're performing in top quartile across most performance measures
- We are registering significant improvements at PHI even relative to last year
- We are doing exactly what we said we would do as part of our merger commitments, improving performance and reliability for our customers

CapEx Program

- We're executing on our CapEx program for 2017
- We're excited about the value – valuable technologies investments we're deploying to our customers' benefit
- The FERC is making strides to address pressing resiliency needs for the power system
- We see that in a two-step process, starting with empowering PJM to fix deficiencies in the power price formation by the summer of 2018 and then a longer-term work process to address resiliency
  - The Department of Energy's Section 403 filing noted the flaws in the current price formation are part of the reason that nuclear units, the most resilient and cost-effective zero-emission resources in PJM, are being lost to premature retirements
- Given our size of our PJM fleet, each dollar of megawatt hour of distortion caused by a flawed market design undermines the GenCo's economics by approximately $135mm per year on a hedge basis
- We believe that DOE's focus on price formation will lead to a successful process at FERC that will eliminate these distortions by the summer of 2018
- We have not reflected the value of these reforms in our forecast that we'll be showing you today but we do believe they could be a significant positive for us starting in 2018

Cost Management

- Finally, we are executing on our management plan focused on strengthening our operation and continuing to find efficiencies
- To that end, we lowered our costs by $250mm on a run rate basis in 2020 primarily at the GenCo
- Including today's announcement, we are lowering our costs – our O&M cost vs. planned by over $700mm annually from initiatives identified since 2015
- We continue to challenge our businesses to evaluate cost and today's announcement savings are part of that ongoing effort

FCF Generation

- We're confident in our previous announced plan to generate $6.8B of FCF at the GenCo through 2020
  - That will fund our utility growth, grow the dividend, and meet our debt reduction commitments

Constellation and Generation Business Challenges

- It is this deliberate work that positions us well to face some headwinds

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-01578

- After a series of mild summers and winters, we have seen decline in power market volatility, which is weighing on the forward price of power prices impacting the Constellation business
- Just as we experienced during periods of low volatility, we're again seeing less discipline by some of the wholesale and retail competitors in the market as they become more aggressive with their pricing
- We have been through low discipline, low volatility periods before and they end up in the same way
- Those without discipline fail
  - That is when we can grow our market share by winning business at good margins or acquiring low businesses offered for sale
- We expect volatility to return to the markets with normal weather conditions, which will benefit our Constellation and Generation business

Bidding Strategy

- In the meantime, we'll remain disciplined in our bidding strategy and remain behind our ratable hedging in our Generation
- Last week, the Illinois Power Authority (sic) [Agency] shifted its schedule for finalizing the procurement of the Illinois ZEC contracts by one month from late December 2017 to late January of 2018
  - Based on our assumptions, this delay will shift $0.09 of EPS from 2017 to 2018

2017 EPS Guidance

- Even with the unanticipated EPS shift, we're narrowing our 2017 guidance to $2.55 to $2.75 per share, keeping us on path towards the midpoint of our original guidance as the utilities outperform our plan

Operational Performance

Moving on to slide 6, I want to highlight our excellent operational performance for the quarter

The color block chart continues to show strong top quartile performance across all of the utilities in most categories

Integration of PHI

- I particularly want to call out the tremendous improvements at PHI compared to last year with the 22% improvement in reliability with PHI on track for their best year ever in reliability and a 17% improvement in speed of restoration of outages
  - Performance improvements like these really highlight the benefit going to our customers with the integration of PHI into Exelon

Nuclear Power Fleets

- And, finally, as in prior quarters, our best-in-class nuclear power fleets performed with very high reliability in the quarter

Proposed Rule Issued by Secretary

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01579

- Moving to slide 7, now, let me turn to the proposed rule issued by Secretary Perry in September
- The order is aimed at protecting our customers from outages resulting from manmade and natural interruptions on the gas system by preserving resilient generation sources, including nuclear
- We commend the Secretary for focusing attention on the need to reform the energy markets and ensure that our customers continue to benefit from a resilient system
- FERC is currently considering the DOE's proposal, with the first round of comments filed on October 21, reply comments due on November 7, and a final order scheduled for December 11
- We have shared our perspective on this important policy initiative

FERC Should Direct PJM to Evaluate and Correct Deficiencies

- First, we think that FERC should direct PJM to evaluate and correct any deficiencies they see in energy price formation which have put baseload generation assets at a disadvantage
- We believe timely action on price formation can be implemented as early as mid-2018
  - These reforms will be valuable first step in preserving resilient baseload generation as well as delivering economic and environmental benefits that nuclear power uniquely provides
- We expect 135 terawatt hours of our generation output in PJM to benefit from price uplift that will layer in over coming years as the existing hedges roll off

FERC Can Take Time to Evaluate Market Reforms

- Second, we've think FERC can take the time to fully evaluate market reforms that will ensure power supply resiliency
- This is a multifaceted exercise that should take into account the cost and impact to our customers and economy of the long-term interruption of the natural gas fuel supply
- We believe these are important issues that need to be addressed for our country's future, but they require more analysis to ensure the right reforms are implemented
- We are encouraged by the process being made at FERC and PJM support for price formation changes
- Between these efforts and state initiatives, we are optimistic about the path to preserve nuclear power plants and their critical economic, environmental and reliability roles that they have in the communities that we serve

Jonathan W. Thayer

Income Statement

Operating Earnings

- For Q3, our adjusted non-GAAP operating earnings were $0.85 per share, which was at the midpoint of our guidance range of $0.80 to $0.90 per share
- Exelon's utilities less HoldCo expenses delivered a combined $0.49 per share. vs. our plan, utility results were slightly favorable due to lower O&M and reduced storm activity over Q3
- Generation earned $0.36 per share, which was a little behind our plan

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01580

- Q3 was hurt by mild weather that reduced Constellation load volumes and a lack of price volatility which reduced the optimization opportunities
- We did offset some weakness with favorable O&M timing
- Our $0.85 per share in Q3 this year was $0.06 per share lower than Q3 2016
- Overall, utilities benefited from improved earned ROEs and higher rate base, partly offset by adverse y-over-y weather impacts
- ExGen was down primarily on lower power prices, lower load volumes due to mild weather, and fewer optimization opportunities, partially offset by the addition of New York ZEC revenues and higher capacity prices

2017 EPS Guidance

- We are updating our 2017 guidance range
- We had expected the Illinois Power Authority (sic) [Agency] to finalize procurement for the ZEC programs in December which, based on our assumptions, would have contributed $0.09 of EPS in 2017 since the revenues are retroactive in the beginning of the program on June 1
- However, last week, the Illinois Power Authority (sic) [Agency] updated their schedule pushing the final contract date to January 30, 2018
- The delayed timing has no impact on the amount we expect to receive for our FCF outlook
  - But it will change the timing of earnings recognition shifting EPS into 2018
- With that in mind, we are updating our 2017 EPS guidance range, tightening the top and bottom of range by $0.05
- So, we're not at $2.55 to $2.75 per share
- Strong performance of the utilities is allowing us to still target the mid-point of our original guidance range of absorbing the $0.09 of ZEC timing impact

ROE

- Our utilities continue to execute, delivering strong earned returns in the quarter in addition to the robust operational performance Chris already discussed
- Looking at the trailing 12-month book ROEs, we saw improvement at PHI compared to last quarter across all jurisdictions except ACE, where they rolled off favorable weather in Q3 2016 for the less beneficial summer weather this year
  - Our efforts to improve operations and the contributions from rate cases resolved over the past year are driving the better earned ROEs at PHI
- For the legacy Exelon utilities, our earned ROEs remained over 10% but faded a bit from last quarter with the less favorable y-over-y weather impacts at ComEd and PECO that you can see on slide 9's waterfall
- Overall, Exelon utilities ROEs are still nearly 10%, including PHI
- We're proud of the performance of our overall utility business and we still see opportunity to improve our returns at the PHI utilities as we bring their performance to levels more consistent with the rest of our utilities

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-01581

Status of Rate Cases

- We update the status of our rate cases
- At Atlantic City Electric, we reached a settlement for the second case in a row
- The settlement provides a 4% rate increase with new rates implemented earlier than what would have occurred if the case was fully litigated
- The timely ratemaking in New Jersey is helping us make beneficial investments for our customers
- While still a work in progress, the investments are having an impact, with outages down 33% and average customer outage time down 35% compared to 2011
- We also received an order for Pepco Maryland that granted an electric distribution base rate increase of $32.4mm based on an allowed ROE of 9.5%
  - The approved electric delivery rates became effective on October 20, 2017
- We filed rate cases in Q3 for Delmarva Delaware Electric and Gas and expect orders by Q3 2018
- We're proud of the hard work from our utilities and regulatory teams
- These efforts are helping to bring PHI's earned ROEs toward allowed levels while we simultaneously improve performance for our customers
- More details on the rate cases and their schedules can be found on slides 34 through 42 (sic) [35 through 43] in the appendix

Regulatory Progress Update

- We regularly update you on our progress on the regulatory front, but another essential aspect of the business is effectively deploying capital on behalf of our customers
- We're currently on course to deploy our targeted $5.3B of capital in 2017
- We've highlighted on this slide two of the many notable projects we're developing to benefit our communities and customers
- The first is Pepco's Waterfront Substation
- This substation is part of the larger Capital Grid Project that is currently under construction with expected completion in 2017
  - Once complete, it will improve reliability to existing customers and support the plant growth in the Capitol Riverfront and Southwest Waterfront areas for the next 20 to 30 years
- The other project I'd like to highlight is ComEd's Grand Prairie Gateway transmission line that was energized earlier this year
  - It's $200-million, 60-mile long transmission line in Northern Illinois that provides structural benefits to the market, resulting in lower energy and congestion charges to customers, and an increased import capability of approximately 1,000 megawatts
- Over the next 15 years, customers collectively will save over $120mm and carbon emissions will be reduced by nearly 500,000 tons
- These are just a couple examples of how we continue to invest prudently across all our utilities, and look forward to sharing more as we go forward

final

Bloomberg

Impacts From The Shifts in Revenue Recognition

Slide 14 provides our gross margin update for ExGen

Before I get into the market developments impacting gross margins, let me first discuss the impacts from the shifts in revenue recognition for the Illinois ZECS from 2017 to 2018, which we also show in the waterfalls on slide 21 in the Appendix

The capacity in ZEC line declines by $150mm in 2017 and increases by $150mm in 2018, offset by $50mm in other capacity declines, which I'll discuss in a moment

- The rest of the bars help to then isolate movements in underlying gross margin not related to ZEC timing

In 2017, gross margin is down $50mm compared to last quarter, partially reflecting the effect of the mild summer and reduced optimization opportunities

We are highly hedged for the rest of this year and are well-balanced on our generation to load matching strategy

Generation Business

- Turning to 2018 and 2019, separate from the Illinois ZEC timing, our gross margin is down $200mm for each year and can be bucketed into two categories
- The first relates to our Generation business and our unhedged power position
- We're lowering our assumptions for MISO and New York capacity prices based on recent spot year options and bilateral deals in the market
  - These lower the capacity in ZEC line by $50mm on a rounded basis from last quarter
- For 2018, the line shows up as a positive $100mm after the timing uplift from $150mm of Illinois ZECs, while the $50mm decline in 2019 just reflects the lower outlook for past revenues
- During Q3, we also saw declines in energy prices, including some adverse news in basis differentials in the PJM East zone which cost another $50mm in 2018 and 2019
  - However, with the recent rally in power prices, we have already recovered about half of the $100mm of 2019 gross margin declines for Generation
- We also see $100mm decline in gross margins in 2018 and 2019 from the Constellation business, reflected in the Lower Power New Business / To Go line
- A series of mild summers and winters have contributed to reduced power market volatility which, in turn, is impacting the competitiveness of our load business
- As we've witnessed in prior periods of low price volatility, some of our competitors are mispricing risk in an effort to win business

Wholesale Load Business

- In the wholesale load business, we're seeing other players mispricing risk as we consider the market risk from weather volatility, basis variability, and the likely impact of energy market reforms that Chris talked about earlier
- Against this backdrop, we are clearing at margins near the low end of historical realizations

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01583

C&I Business

- In the C&I business, the consolidation of suppliers of the polar vortex has led to better margin discipline, with our unit margins holding consistent with prior years
  - We are, however, seeing lower renewal rates compared to last couple of years, moving from something closer to 80% to the low 70s
- At these lower renewal rates, we still expect our volumes to be flat y-over-y whereas our previous guidance assumed higher renewal rates that would drive volume growth at Constellation between 2018 and 2019
- Notably, even against the challenged market backdrop, we're holding volumes and margins flat which is a testament to the strength of our retail platform and our disciplined approach to bidding business
- The updated gross margins for 2018 and 2019 incorporates C&I renewal rates in the low 70s and wholesale margins hovering around the bottom end of what we've realized over time
  - We've been through these periods of low load pricing – lower load pricing in the past and it's previously created opportunities for us
- A return to normal weather will inject some power market volatility which will possibly impact forward power prices for Generation
- Retailers and wholesalers who missed price risk have consistently been driven from the business when we go from a period of low volatility to a volatility event
- When the market corrects, we'll be there to win business at good margins and grow volumes and market share just as we have in the past
  - Even against the current market backdrop, Constellation continues to generate strong earnings and FCF

Gen to Load Matching Strategy

- Our gen to load matching strategy remain a competitive advantage relative to our peers, contributing positive margin and providing a vehicle to bring our Generation output to market in a disciplined manner

Hedging Perspective

- From a hedging perspective, we ended the quarter approximately 11% to 14% behind our ratable hedging program in 2018 and 10% to 13% behind ratable in 2019 when considering cross-commodity hedges
- We remain comfortable being more open when we look at market fundamentals
- Spot natural gas prices this year are $3 per mcf which is $0.50 higher than last year in spite of mild weather this past winter and summer
  - However, these higher prices have provided only modest uplift to spot power prices this summer, while the forward prices have decreased slightly
- We think that a return to more normal weather and volatility of the market will help reverse this
  - And as Chris discussed, we see a path to power market reforms that represent real value uplift for us
- We are maintaining additional link to be able to monetize these reforms

Other Highlights

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01584

Focus on Managing Costs

- We continually challenge our organization to find operating efficiencies and focus on managing our costs
- To that end, we're announcing another wave of O&M cost reductions building on previous years' efforts
  - We will ramp these new initiatives over the next two years, as shown on the lower right table, reaching $250mm annual run rate in 2020
- The savings will come primarily from ExGen and the corporate center
- If you look at this mix shift together with the programs we have announced since 2015, we'll strip out over $700mm of annual run rate costs, providing significant earnings and FCF benefits

FCF Outlook

- Turning to slide 16, we appreciate that there have been many puts and takes this year at ExGen that have both benefited and weighed on our FCF outlook through 2020
- When we take into account the movement in power price forwards through the end of October, updated gross margin outlook for Constellation, the benefit of further cost cuts, the early closure of TMI and exit of the EGTP plants, and changes to base CapEx and working capital associated with all these business updates
  - We remain confident in the FCF outlook and capital allocation commitments we made at the beginning of the year
- We're also committed to meeting or beating our 3 times debt-to-EBITDA target for ExGen's balance sheet which we will meet over our planning horizon
- On Q4 call, we will roll forward the FCF outlook for the next planning period

Christopher M. Crane

Strategic Business Review

Employee Efforts

- Turning to slide 17, I want to take a moment to highlight the contributions made by Exelon and our employees to help the impacted by hurricanes Harvey, Irma and Maria
- Exelon utilities sent more than 2,200 employees and contractors and support personnel from our six utilities to help with the recovery efforts after Hurricane Irma
- Our crews travelled to Florida and Georgia where they, for more than two weeks, worked in very difficult conditions
- We're very proud of our employees and the hard work that they do to help the communities come back from after these disasters
  - A very special thanks to all those who've helped in the restoration and support efforts
- Exelon employees also stepped up from a volunteer perspective
- Our employees have donated their time and resources to communities impacted by the storms

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01585

- We also had a number of our Constellation employees in Houston directly displaced by the storms and to see coworkers come to their aid illustrates the value we embody here at Exelon

Future Business Drivers

- Slide 18, we want to reinforce our value proposition which remains the foundation of our commitment to our investors
- We've continued to grow the utilities rate base at 6.5% and the regulated EPS to 6% to 8% annually through 2020, underpinning the capital investments that directly benefit the customers in each of our jurisdictions
- We continue to use FCF generated at the GenCo to fund incremental equity needs at the utilities and pay down debt over the next four years at ExGen in the holding company
- We are focused on optimizing the value of our ExGen business by seeking fair compensation for our carbon-free Generation fleet, closing uneconomic plant, selling assets where it makes sense to accelerate our debt reduction plans, and maximizing our value through gen to load matching strategies
- We continue to focus on sustaining strong investment-grade credit metrics and grow our dividend in a stable, consistent manner
- As many of you are aware, our dividend growth as a program is for 2.5% annually from 2016 through 2018
- We are working with our board and expect to provide an update on a multi-year outlook for the dividend growth plan as part of our planning and budgeting process that are undertaken currently

Business Outlook

Before I go to questions, I want to come back to where we started off in the call

We have a number of positives underlying our outlook

The utilities are growing and executing well

We are confident that the FERC actions around resiliency will facilitate needed power price reforms in PJM that will fairly compensate our generating assets

We continue to improve operations where we're finding ways to run our business more efficiently and taking out an additional $250mm in cost as discussed

- And we are still on track to generate $6.8B of FCF through 2020 at the ExGen that will support our utility growth, reduce our debt, and facilitate growing our dividend

QUESTION AND ANSWER SECTION

<Q - Greg Gordon>: So, just to summarize here. You gave us a negative adjustment on several things at ExGen that totaled $200mm. But since that mark, you've seen $50mm come back and so 2019 is negative $150mm. And if you achieve your cost-cutting goals, you'll essentially have eliminated that. And so, we're at a push in 2019 with those offsets. Is that correct?

<A - Jonathan W. Thayer>: Yes, Greg. And I think as you think about it and you listen to our comments on the low volatility period we're in, we believe that with the return to normal weather and even potentially future volatility events, that that decline in Constellation business could prove temporary. Obviously, the $250mm are permanent cost savings and capitalizable in terms of value creation.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01586

<Q - Greg Gordon>: Okay. So, as per your usual protocol, you're using the current forward curves for power. But the current margin outlook looks like, for retail, you're not assuming any changes – no volatility premium coming back in the market, no PJM price performance, et cetera.

<A - Joseph Nigro>: Hi, Greg. It's Joe. Yes, we are using the current forward curve for power. I think the big thing to note on the retail side, and Jack said this in his script, when we did our planning at the first of the year, our renewal rates for C&I power were up close to 80%. As was the case back in 2012 and 2013, we've seen a downturn in those renewal rates down closer to 70%, and we're marking this closer to that 70% number. I think the big thing, though, is back in 2012 and 2013, we saw C&I power margins dip below $2 a megawatt hour. And we've said, historically, our origination margins for that business are somewhere between $2 and $4. We're still within that $2 to $4 range.

So, I think the big thing to take away is we're going to serve about 200mm MWh of load this year across our platform between retail and wholesale, and we expect to do the same thing next year. The thing is, we're just not going to achieve the growth that we expected in our C&I power business. And as Chris said and Jack said, the reason for that is we don't think it's prudent to chase the market. And we're going to remain disciplined to what we think value is and that has served us well historically. And, quite frankly, it's allowed us to acquire companies few times as well. So, we'll continue to remain disciplined.

<Q - Greg Gordon>: Great. Sorry. Go ahead.

<A - Christopher M. Crane>: No. I'm just going to say – so, the beginning of the question, all the numbers in here are – on the gross margin, are marked at the end of third quarter. So it's the end of September 29 or 31, whatever the market closed on.

<Q - Greg Gordon>: Got you. One or two more questions. One, looking at slide 20, your cash flow profile looks slightly better, and it looks like it's mainly coming from the utilities and specifically from ComEd. Can you comment on what the changes in the improved cash flow profile there?

<A - Christopher M. Crane>: So, it's primarily related to the collection of the ZEC regulatory asset as well as cash taxes.

<Q - Greg Gordon>: Okay. Final question. When looking at the value proposition you guys are delivering, if we get PJM price formation improvements and you hit on your other financial goals, you'll start to have a earnings growth profile that looks more comparable to the regulated peer group. They trade at 18 times earnings. You're trading at 14 times, current expectations. But your dividend growth – their dividend growth rates average around 5% and yours is 2.5%. I know you said you're reviewing this, but what do you need to see in terms of your financial outlook to be able to close or eliminate that dividend growth past GAAP because I think it's one amongst several things that keeps your stock from trading at a higher valuation?

<A - Christopher M. Crane>: Yes. Greg, we do believe we're undervalued. And everything that we're doing is to drive that improvement in valuation. As you can see from the FCF, the debt reduction plan, the recovery in rate case, we're positioning ourselves much better for a potential to have the board conversation in the upcoming LRP planning process to evaluate the dividend. And our expectation is – and has been since we had to cut the dividend four years ago, is to get it back to build the business on a strong balance sheet to get the dividend to be in line with our peers. And that is our pursuit. And as you can see from these numbers, things are improving that have us able to have a much more positive conversation with the board. Ultimately, it's the board's discretion, but that's where we want to be.

<Q - Jonathan Philip Arnold>: I want to just make sure – at the beginning, Chris, I believe you just gave $1 of market price improvement sensitivity based off your volumes to PJM price reform was – of $135mm, did I hear that correctly?

<A - Christopher M. Crane>: Yeah. Per $1 of fully open position in PJM, 135 terawatt hours, $135mm. So, you can – that was just a dollar reference.

<Q - Jonathan Philip Arnold>: Okay. So, my question is, I mean, what – as you look at the kinds of reforms that PJM is considering in flexible unit and the like, what's your view of the range of potential uplift when you translate it into the ATC basis that would be relevant for you?

final
Bloomberg Transcript

<A - Joseph Dominguez>: Hey, Jonathan. This is Joe. We're still waiting to see some additional details from PJM but – and so we're not going to put out a number until we get all of those details. But I have seen the reports that a number of you have compiled on this subject with the range that is somewhere between $2 and $5 of ATC movement as a result of the elimination of discrimination. And I think that's the right range to be thinking about and probably with the middle part of that range makes a lot of sense to us.

<Q - Jonathan Philip Arnold>: Okay. That was – that's helpful. Thank you for that. And then, Chris, you've said that, I think, earlier in the year that this dividend revisit and the longer range growth outlook would be Q1. And I believe what you've just said is pretty consistent with that. If you do it as part of the LRP. Is that correct?

<A - Christopher M. Crane>: Yeah. I think we've said back in 2016, when we have our dividend strategy, we want to give you a multiyear plan. We gave you 2016 through 2018 and that that will be the time in Q1 to be updating, in my belief, set the board's discussion on where we go with that. But that would be our timing in my mind and in our current plans and communicated with all of you.

<Q - Jonathan Philip Arnold>: What should we be expecting you to give us next week at EEI?

[indiscernible] (35:28)

<Q - Jonathan Philip Arnold>: What items?

<A - Christopher M. Crane>: Yeah. EEI, I think we'll be able to have more of the one-on-one details, get into more of the details on the capital investments, in the growth and the rate case strategies as we improve the customer experience at the utilities. We'll also have more time to go into the detail on the numbers on the FCF, debt reduction plans, and the optimization of gen to load growth. I'm sure, more people are going to want to talk in detail about the basis for our $250mm, and we can do the deep dive on that. But it will be detailed on what you're seeing today and an opportunity to have some one-on-one dialogue about it.

<Q - Jonathan Philip Arnold>: Right. Thank you. And then I guess just one other, did you have any thoughts – I know it's all a bit of a moving target and you've been talking, but what's your level of confidence that you're going to get to things that you want to see out of a tax reform?

<A - Christopher M. Crane>: Well, it's eleven-fifteen, I think, or eleven-thirty Eastern when we see the draft, and we'll have to rally together with EEI and take a look at how we, as a sector, have been positioned. Kind of early to say now. If you've gone over the last 24 hours, things have been all over the board.

So, I'd hate to speculate but we work together in the sector at EEI, and I'm sure Tom Kuhn will be getting us all together, and we'll figure out our next steps as the re-rights, as they've discussed, are finalized and getting our input as a sector in there. We're totally unified at EEI on what we're looking for and what we think will benefit our customers the most in tax reform. So, more to come on that, and maybe we'll have a little bit of insight of that at EEI as we work through the weekend and see the effect on the proposed – and still, we got to go back to this as proposed. You don't know what's going to happen in D.C. But we'll be ready to talk about it more as not only a company, but as a sector.

<Q - Jonathan Philip Arnold>: Sure. Sorry to put you on the spot on that – on a real-time issue.

<A - Christopher M. Crane>: No, that's okay.

<Q - Steve Fleishman>: So, just how are you strategizing on your retail business with respect to these potential DOE-PJM changes and are you doing things to make sure that you don't have like a big delay in capturing the uptick because of retail hedges? Like, are you making sure you're back to backing your retail and the like? I mean, just curious how you're thinking about that.

<A - Joseph Nigro>: Hey, Steve. Good morning. It's Joe. We are thinking about that. And I think the first thing is, as Jack said in his script and we've said for a while, we're carrying the longer position relative to our ratable sales plan. So, we have the opportunity to capture any upside associated with price increases related to the reforms you're talking about. I think, specifically though to retail, there's a couple of elements to that. The first one is we've done some

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01588

preliminary modeling and we've taken to account kind of the seasonality as well as the differences between on- and off-peak. So, we tried to be more surgical in just saying we're going to buyback this. We have a view of the things we need to do.

I think as it specifically relates to our retail contracts, there's two elements. One is, obviously, we have contracts on the books already and we have some hedges on the books already. So, there will be a tethering in effect to the value proposition of this. But most importantly, from our perspective, I think one of the things we offer our customers and it's really important is transparency. And what I mean by that is when they're signing a contract with us, they completely understand what they're getting and what the components of that are that are in fixed price and the components that are going to be passed through time. And I'm not sure that's always the case across the industry.

So, from our perspective, there's a lot of elements and we are thinking about it, and we are really managing our portfolio from a natural long position as well as the seasonality in the products. And we're keeping the customer in mind.

<Q - Steve Fleishman>: Okay. And just in terms of just the – that's helpful. In terms of just the tower new business change that you made, what – your cents in terms of making that change, is your – do you feel like you've encompassed kind of a pretty conservative case here at this point so that this doesn't become like a series of changes?

<A - Joseph Nigro>: Yeah. I think – yes. The answer to your question is yes. We think we've covered it and I'll tell you why. When you look at it, it's really all driven by our load business. About 60% of it's on our retail C&I business and about 40% is associated with our wholesale polar business. And there's really two elements that are different, one on each side. On the retail side, as we said, our renewal rates are lower than we expected them to be, but our margins are well within the range that we expected. And that's very different when we had these challenges five years ago where our margins and our renewal rates both dropped pretty appreciably. On the wholesale side, it's much more of a margin story where the volumes are there, but the margins are lower than they've been historically. I mean, it's a very competitive environment. Quite frankly, it's being driven by a lot of smaller players on the retail side and not the bigger players. On the wholesale side, we've seen kind of competition across the spectrum, but we're confident that we've captured the changes we need to make.

<Q - Steve Fleishman>: Great. And I just – finally, I guess, in hindsight, congratulations on adding your Texas gas plants months before all the coal plants shut. I'm sure you planned that out. But I'm just curious given that fact just – have your thoughts on the Texas kind of market and potential there changed for you, how you're thinking about that?

<A - Joseph Dominguez>: It's Joe again. I'll keep going. And we've talked about this for a while. When you looked at the ERCOT reports on what they thought their reserve margins were going to be, we never really thought they were going to get the Generation growth that they expected. And in our own modeling, we have sensitivities. We ran some sensitivities looking at the possibility of retirement. And if you look at our positioning in ERCOT, we're carrying a long position there relative to our ratable plan as well. And we see the opportunity for volatility. I think this summer, we skewed some, obviously, with the problems with the hurricane in August and quite frankly, the biggest thing down there is we continue to see low growth which is really important and we don't see a lot of kind of the new build of gas generation. You have continued growth on the renewables side, but it's more concentrated in South Texas than it is West Texas. And when you put all that together, we see the opportunity for increased volatility, and we think we have fleet that will benefit that.

<Q - Julien Dumoulin-Smith>: Hey. So a couple of quick questions, maybe going back a little bit on some of the previous discussion here. But with respect to the dividend, how do you think about the stability of cash from the various businesses? Obviously, there's a certain legacy here. But how do you think about the stability from ZEC's and the retail business, and how do you think about that at least in – into the conversation around a dividend policy, i.e. can you bank on cash flows out of businesses that are not the utilities and/or think about a higher payout on the core utilities?

<A - Christopher M. Crane>: Sure. So as we've talked about four years ago – four and a half years ago now, as we restructure the dividend and put our strategy and our focus on really growing the utility business through the acquisition

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01589

of BGE and then the acquisition of PHI, and it was to theoretically watch the growth in those businesses and have a 65% to 70% dividend policy, theoretically, at the utilities.

Now you know that's going to cycle during different growth periods, but that was the way we had the dividend set to grow. In the first couple of years, we were starting to get closer to that, getting that accomplished in the early 20s. And so, that's when we came up with the growth policy at 2.5%. As you can see, the utilities are continuing to grow, although, right now, it's taking cash infusion – equity infusion from the HoldCo through the GenCo, but they're continuing to grow. So, our stability of the dividend is very well anchored. Our potential growth for the dividend is well-anchored.

As we come through the last couple of years and started to see more reliable or consistent cash flows from the GenCo on programs that compensate for the other benefits besides just the energy, you're seeing a potential that that can be a dependable cash flow that can be used for potential return of value to the shareholders. So, that's the way we're looking at it and we're presenting it to the board that the cyclical nature of the commodity market will not leave us, but the certainty of certain elements on those revenue streams give us the opportunity to look at the world a little bit differently. So, but that's how we'll continue to model it and we've gained greater flexibility with programs like the ZEC.

<Q - Julien Dumoulin-Smith>: Excellent. And then, let me ask you this, with respect to the utilities, right? I know we've had a lot of conversation on the other side of the business, but obviously you've had some reasonable success of late in ComEd around – how do you say – scaling some of these smart grid efforts. How do you see an ability to scale that further? And obviously, this might be getting ahead of the annual process in the CapEx budget, et cetera. But maybe this is more to Anne and thinking about the ComEd prospects beyond 2020 here.

<A - Christopher M. Crane>: So, well, let me start off and then I can let Denis jump in here or Anne on the call. The advent of the digitalization of the distribution system and the transmission system has offered us an opportunity for capital investments that directly benefit the customers and drive reliability. We have now put in communications backbones to read smart meters to help us with fault isolators, fast reclosers. That's the kind of spend along with replacing antiquated cable and updating the system with new components.

Now, as we go into the 2020 and beyond, there is a significant amount of work being done on what else can be done to develop into the smart city that we can better serve the communities while investing in driving efficiency into the systems. The work that's being done on microgrids, the experimental work there to see what the societal benefit on certain microgrids in certain locations. What we can do to integrate with more of the community, is there an assistance within the streetlight programs or assistance that we can provide with our infrastructure on the meter reading of water, gas, other type of systems is where we'll be going.

And I think this technology is morphing faster than it ever has in our sector. And with our design teams, data scientists, the work that we're doing on big data, digitization is going to provide us many opportunities for continuing to optimize the system for the customer's benefit. Denis, I don't know if I covered it or...

<A - Denis P. O'Brien>: I think – this is Denis. Chris, I think you covered it pretty well. We're spending about $5B a year in capital. We still see opportunities to continue to invest in convergence relative to our systems to build the systems of the future, whether that's billing systems, transmissions data systems or others. We see opportunities to continue to invest in resiliency and security. We're seeing opportunities relative to the transmission system as we look at resiliency and security and to build the transmission system of the future. Chris hit on smart cities and other things like that.

And the last thing is you look at the grid of the future and we think about distributed generation in order to get our system ready for that that really means about converting some of our lower-voltage circuits into higher-voltage circuits. And so that's an opportunity for further capital deployment. So we're deploying about $5B of capital a year. We see that continuing and see lots of opportunities to continue to invest in utility of the future.

<Q - Julien Dumoulin-Smith>: And – but does that enable kind of an accelerating CapEx spend overall, maybe perhaps that's the core of the question?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01590

<A - Christopher M. Crane>: I don't see us accelerating the plan. I think we're at a point that we're managing efficiently the spend that we have. We also have to balance the impact to the consumer. Spending capital for the sake of spending capital without finding the efficiencies in the delivery and to the benefit of the customer, it wouldn't be prudent. Right now, the projects that we have on schedule, the cash flows that support that are managed well, and they do support what our bottom line it needs to be as the benefit of the customer.

<A - Denis P. O'Brien>: And the only thing I'd add to that, our focus on – we're 18 months into the PHI acquisition. Our focus now is to get the performance to the right level. We had our best year ever in reliability at PHI last year, which we only had the company since March. We're going to blow through that level of reliability this year in a good way. So, the first couple of years, you're – how do we get the performance to a good place? How do we right the image and reputation and improve our regulatory outcomes at PHI?

<Q - Stephen Calder Byrd>: Wanted to drill into the idea of resiliency laid out by the Department of Energy. Is there a way for us to conceptually think about the value of resiliency or a framework for assessing how to appropriately value resiliency? It's been a tricky thing I think for all of us to really think through that the high level idea makes sense. Just sort of how to go about trying to value that. Is there any suggestions you have on thinking about that?

<A - Joseph Dominguez>: Sure. Stephen, this is Joe Dominguez. If you see our pleading, you know that we have a multi-phase process where in the first instance we need to get analytics from new RTOs – can they run without pipelines, what's the impact to the consumers. We can move from there to a design basis for the system that we think is going to iterate between NERC, FERC and the Department of Energy for some time after we get the data.

In terms of how we ultimately implement that into the system, I think once we have a design basis on what we're trying to avoid, we will start looking at mitigation solutions, maybe the retention of additional fuel-secured resources to avoid this outage risk. But I think it's premature to get there. One way you can think about it though, if you take a look at the capacity performance program, we were able to value the cost of incremental reliability associated with dual fuel. So, if the design basis ultimately ends up being we need 90 days of fuel, we have a mathematical way of calculating what a market solution to get dual fuel resources to 90 days of fuel would be. That would probably be $8 or $10 a megawatt hour in terms of doing that based on the cost we saw in CPAY. So, that's one approach.

But from our perspective, we need to drop back here, take a look at the data and make sure we have the right definition of resiliency, the right design basis, and then we could come back to market solutions or other solutions that'll ensure we have the resources to mitigate that risk and provide the security we need to provide to our customers in the nation.

<A - Christopher M. Crane>: And I think the key to that, what Joe said, is a market solution.

<Q - Stephen Calder Byrd>: Understood. Within the market construct that we have, that makes sense. I want to just shift over to the retail business. There's been a lot of discussion on this call around a competitive playing field. If we do see FERC performs on power price formation and if power price do rise, would you expect to see a bit of a shakeout amongst smaller retail players who don't – who are not backed up by physical generation who may have mispriced the upside risk to power prices? How would you – assuming, again, that we do see the kind of formation changes we expect? Would you see a shake out there?

<A - Joseph Nigro>: Yeah. I think history tells us we would anytime we've seen a volatility event and I can go back for a number of years. We've seen players, whether they're big or small, whether they were on a C&I side and the residential side, and quite frankly, the polar loads on the wholesale side. We've seen folks who've aggressively priced the risks or the ultimate price to the customer have been hurt. And as I said earlier, we've had opportunities to acquire companies in that type of environment. We've had opportunities to grow our business organically, and we think remaining disciplined to what we're doing is the right thing to do.

We still have almost 25% of the C&I market. We're the number one C&I marketer by a huge amount. We're the third largest residential marketer in the United States and we compete in all the wholesale polar auctions. So, the underlying business is strong. The growth we expected, we're not achieving, and I think the discipline will serve us well. And we're going to have an opportunity to capture some of that back when we see a volatility event.

Bloomberg Transcript

<Q - Praful Mehta>: So, my question goes back a little bit to the dividend discussion. And what I was trying to connect the dots on was, you're already kind of hitting your leverage targets, your FCF targets right now with the current plan. If you do have price reform and if you do have further ZECs coming in from other states, then you have that incremental FCF, how should we think about that capital allocation? Is that more to bolster the dividend or where do you think that capital allocation goes?

<A - Christopher M. Crane>: First of all, we will look at it in a disciplined way on what is the best way to return value to the shareholders while maintaining our commitment to the customers. So, the plan, as I said earlier, that we've started out on over four and an half years ago is working. We're reducing our debt, we're strengthening our balance sheet, we're reducing our costs, we're able to make solid investments in our utilities, and we've been able to do a part of a dividend increase program as we were doing that. As you can see, as we get stronger and stronger, the opportunities for us to deploy the capital are coming up our way, and we'll make sure that we'll look at it in a disciplined fashion. If there are more accretive ways to spend the capital in the utilities and in a low-risk area, that would be something we'd look at. But as we've committed previously and as we've signaled, it's a conversation that's ongoing right now with various opportunities to revise the dividend policy and give you another multi-year plan and as we work through the LRP planning process, and we work with our board heading in to 2018.

<Q - Praful Mehta>: Got you. That's very helpful. And secondly, in terms of the ZECs, if you could just touch on how you think ZECs play out in different states. In other states, obviously, very happy there. And secondly, how does that fit in with the price formation and the DOE reform? Do you see them interacting or do you see them as completely independent?

<A - Joseph Dominguez>: Hi, this is Joe again. We were pleased to see the outcome in Connecticut the other day where although, a different structure, the central premise is the same. Nuclear units are critical for our customers, and we need to preserve them. So, definitely a step forward on the policy front there. We're having very productive discussions. Both in Pennsylvania and New Jersey, we'll continue to do that. In terms of the interaction I see between the programs, if we get an upside in price formation, I think that will ultimately be taken into account in the process. So, there will not be a double-dip here. If prices increase as a result of price formation, the cost of the ZECs or the cost of the support payments will go down. That's the anticipated.

<Q - Praful Mehta>: Got you. And you think that's a dollar-for-dollar adjustment or do you think there's some benefit that you do keep?

<A - Joseph Dominguez>: No. I think it's a dollar-for-dollar adjustment.

Christopher M. Crane

Closing Remarks

We're excited about the opportunities ahead of us and our success in delivering on our commitments

We look forward to seeing many of you next week and provide our updates and then our year-end updates in February

- So, thanks again for joining and appreciate your time

MANAGEMENT DISCUSSION SECTION

Operator

Good morning. Thank you for standing by and welcome to the Exelon Corporation 2017 Q3 Earnings Conference Call. All lines have been placed on mute to prevent any background noise. After the speakers' remarks, there will be a question-and-answer session. [Operator Instructions]

Thank you. Mr. Dan Eggers, Senior Vice President of Investor Relations for Exelon, you may begin your conference.

Daniel L. Eggers

Thank you, Toni. Good morning, everyone, and thank you for joining our third quarter 2017 earnings conference call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer; and Jack Thayer, Exelon's Chief Financial Officer. They're joined by other members of Exelon's Senior Management team who will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, both of which can be found in the Investor Relations section of Exelon's website. The earnings release and other matters which we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material and comments made during this call.

Please refer to today's 8-K and Exelon's other SEC doc – filings for discussions of risk factors and factors that may cause results to differ from management's projections, forecast, and expectations. Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for reconciliations between the non-GAAP measures and the nearest equivalent GAAP measures.

Bloomberg Transcript

I'll now turn the call over to Chris Crane, Exelon's CEO.

Christopher M. Crane

Thanks, Dan. And good morning and thank you all for joining us. We had a solid third quarter of 2017 with GAAP earnings of $0.85 per share, up versus the prior year. Our adjusted EPS was $0.85 as well, reaching the mid-point of our guidance. Strong utility and GenCo performance more than offset headwinds from a mild summer weather that impacted our PECO ACE utilities as well as volumes at Constellation.

As we head into year end, we have a lot to be encouraged about. Our regulatory utilities are continuing to execute very well, running ahead of plan for the year. Operationally, we're performing in top quartile across most performance measures. We are registering significant improvements at PHI even relative to last year. We are doing exactly what we said we would do as part of our merger commitments, improving performance and reliability for our customers. We're executing on our CapEx program for 2017. We're excited about the value – valuable technologies investments we're deploying to our customers' benefit.

The FERC is making strides to address pressing resiliency needs for the power system. We see that in a two-step process, starting with empowering PJM to fix deficiencies in the power price formation by the summer of 2018 and then a longer-term work process to address resiliency. The Department of Energy's Section 403 filing noted the flaws in the current price formation are part of the reason that nuclear units, the most resilient and cost-effective zero-emission resources in PJM, are being lost to premature retirements.

Given our size of our PJM fleet, each dollar of megawatt hour of distortion caused by a flawed market design undermines the GenCo's economics by approximately $135 million per year on a hedge basis. We believe that DOE's focus on price formation will lead to a successful process at FERC that will eliminate these distortions by the summer of 2018. We have not reflected the value of these reforms in our forecast that we'll be showing you today but we do believe they could be a significant positive for us starting in 2018.

Finally, we are executing on our management plan focused on strengthening our operation and continuing to find efficiencies. To that end, we lowered our costs by $250 million on a run rate basis in 2020 primarily at the GenCo. Including today's announcement, we are lowering our costs – our O&M cost versus planned by over $700 million annually from initiatives identified since 2015. We continue to challenge our businesses to evaluate cost and today's announcement savings are part of that ongoing effort.

We're confident in our previous announced plan to generate $6.8 billion of free cash flow at the GenCo through 2020. That will fund our utility growth, grow the dividend, and meet our debt reduction commitments. It is this deliberate work that positions us well to face some headwinds. After a series of mild summers and winters, we have seen decline in power market volatility, which is weighing on the forward price of power prices impacting the Constellation business.

Just as we experienced during periods of low volatility, we're again seeing less discipline by some of the wholesale and retail competitors in the market as they become more aggressive with their pricing. We have been through low discipline, low volatility periods before and they end up in the same way. Those without discipline fail. That is when we can grow our market share by winning business at good margins or acquiring low businesses offered for sale.

We expect volatility to return to the markets with normal weather conditions, which will benefit our Constellation and Generation business. In the meantime, we'll remain disciplined in our bidding strategy and remain behind our ratable hedging in our Generation.

Last week, the Illinois Power Authority (sic) [Agency] shifted its schedule for finalizing the procurement of the Illinois ZEC contracts by one month from late December 2017 to late January of 2018. Based on our assumptions, this delay will shift $0.09 of EPS from 2017 to 2018. Even with the unanticipated EPS shift, we're narrowing our 2017 guidance to $2.55 to $2.75 per share, keeping us on path towards the midpoint of our original guidance as the utilities outperform

our plan.

Moving on to slide 6, I want to highlight our excellent operational performance for the quarter. The color block chart continues to show strong top quartile performance across all of the utilities in most categories. I particularly want to call out the tremendous improvements at PHI compared to last year with the 22% improvement in reliability with PHI on track for their best year ever in reliability and a 17% improvement in speed of restoration of outages. Performance improvements like these really highlight the benefit going to our customers with the integration of PHI into Exelon. And, finally, as in prior quarters, our best-in-class nuclear power fleets performed with very high reliability in the quarter.

Moving to slide 7, now, let me turn to the proposed rule issued by Secretary Perry in September. The order is aimed at protecting our customers from outages resulting from manmade and natural interruptions on the gas system by preserving resilient generation sources, including nuclear. We commend the Secretary for focusing attention on the need to reform the energy markets and ensure that our customers continue to benefit from a resilient system. FERC is currently considering the DOE's proposal, with the first round of comments filed on October 21, reply comments due on November 7, and a final order scheduled for December 11.

We have shared our perspective on this important policy initiative. First, we think that FERC should direct PJM to evaluate and correct any deficiencies they see in energy price formation which have put baseload generation assets at a disadvantage. We believe timely action on price formation can be implemented as early as mid-2018. These reforms will be valuable first step in preserving resilient baseload generation as well as delivering economic and environmental benefits that nuclear power uniquely provides.

We expect 135 terawatt hours of our generation output in PJM to benefit from price uplift that will layer in over coming years as the existing hedges roll off. Second, we've think FERC can take the time to fully evaluate market reforms that will ensure power supply resiliency. This is a multifaceted exercise that should take into account the cost and impact to our customers and economy of the long-term interruption of the natural gas fuel supply.

We believe these are important issues that need to be addressed for our country's future, but they require more analysis to ensure the right reforms are implemented. We are encouraged by the process being made at FERC and PJM support for price formation changes. Between these efforts and state initiatives, we are optimistic about the path to preserve nuclear power plants and their critical economic, environmental and reliability roles that they have in the communities that we serve.

I'll now turn the call over to Jack to take us through the numbers.

Jonathan W. Thayer

Thank you, Chris, and good morning, everyone. Turning to slide 8. For the third quarter, our adjusted non-GAAP operating earnings were $0.85 per share, which was at the midpoint of our guidance range of $0.80 to $0.90 per share. Exelon's utilities less HoldCo expenses delivered a combined $0.49 per share. Versus our plan, utility results were slightly favorable due to lower O&M and reduced storm activity over the third quarter.

Generation earned $0.36 per share, which was a little behind our plan. The third quarter was hurt by mild weather that reduced Constellation load volumes and a lack of price volatility which reduced the optimization opportunities. We did offset some weakness with favorable O&M timing.

Turning to slide 9. Our $0.85 per share in the third quarter of this year was $0.06 per share lower than the third quarter of 2016. Overall, utilities benefited from improved earned ROEs and higher rate base, partly offset by adverse year-over-year weather impacts. ExGen was down primarily on lower power prices, lower load volumes due to mild weather, and fewer optimization opportunities, partially offset by the addition of New York ZEC revenues and higher capacity prices.

Bloomberg
SI-SSA-0015-01596

Turning to slide 10. We are updating our 2017 guidance range. We had expected the Illinois Power Authority (sic) [Agency] to finalize procurement for the ZEC programs in December which, based on our assumptions, would have contributed $0.09 of EPS in 2017 since the revenues are retroactive in the beginning of the program on June 1. However, last week, the Illinois Power Authority (sic) [Agency] updated their schedule pushing the final contract date to January 30, 2018. The delayed timing has no impact on the amount we expect to receive for our free cash flow outlook. But it will change the timing of earnings recognition shifting EPS into 2018.

With that in mind, we are updating our 2017 EPS guidance range, tightening the top and bottom of range by $0.05. So, we're not at $2.55 to $2.75 per share. Strong performance of the utilities is allowing us to still target the mid-point of our original guidance range of absorbing the $0.09 of ZEC timing impact.

Moving to slide 11. Our utilities continue to execute, delivering strong earned returns in the quarter in addition to the robust operational performance Chris already discussed. Looking at the trailing 12-month book ROEs, we saw improvement at PHI compared to last quarter across all jurisdictions except ACE, where they rolled off favorable weather in the third quarter of 2016 for the less beneficial summer weather this year. Our efforts to improve operations and the contributions from rate cases resolved over the past year are driving the better earned ROEs at PHI.

For the legacy Exelon utilities, our earned ROEs remained over 10% but faded a bit from last quarter with the less favorable year-over-year weather impacts at ComEd and PECO that you can see on slide 9's waterfall. Overall, Exelon utilities ROEs are still nearly 10%, including PHI. We're proud of the performance of our overall utility business and we still see opportunity to improve our returns at the PHI utilities as we bring their performance to levels more consistent with the rest of our utilities.

On slide 12, we update the status of our rate cases. At Atlantic City Electric, we reached a settlement for the second case in a row. The settlement provides a 4% rate increase with new rates implemented earlier than what would have occurred if the case was fully litigated. The timely ratemaking in New Jersey is helping us make beneficial investments for our customers. While still a work in progress, the investments are having an impact, with outages down 33% and average customer outage time down 35% compared to 2011. We also received an order for Pepco Maryland that granted an electric distribution base rate increase of $32.4 million based on an allowed ROE of 9.5%. The approved electric delivery rates became effective on October 20, 2017. We filed rate cases in the third quarter for Delmarva Delaware Electric and Gas and expect orders by the third quarter of 2018.

We're proud of the hard work from our utilities and regulatory teams. These efforts are helping to bring PHI's earned ROEs toward allowed levels while we simultaneously improve performance for our customers. More details on the rate cases and their schedules can be found on slides 34 through 42 (sic) [35 through 43] in the appendix.

Turning to slide 13. We regularly update you on our progress on the regulatory front, but another essential aspect of the business is effectively deploying capital on behalf of our customers. We're currently on course to deploy our targeted $5.3 billion of capital in 2017. We've highlighted on this slide two of the many notable projects we're developing to benefit our communities and customers.

The first is Pepco's Waterfront Substation. This substation is part of the larger Capital Grid Project that is currently under construction with expected completion in 2017. Once complete, it will improve reliability to existing customers and support the plant growth in the Capitol Riverfront and Southwest Waterfront areas for the next 20 to 30 years.

The other project I'd like to highlight is ComEd's Grand Prairie Gateway transmission line that was energized earlier this year. It's a $200-million, 60-mile long transmission line in Northern Illinois that provides structural benefits to the market, resulting in lower energy and congestion charges to customers, and an increased import capability of approximately 1,000 megawatts. Over the next 15 years, customers collectively will save over $120 million and carbon emissions will be reduced by nearly 500,000 tons.

These are just a couple examples of how we continue to invest prudently across all our utilities, and look forward to sharing more as we go forward.

Slide 14 provides our gross margin update for ExGen. Before I get into the market developments impacting gross margins, let me first discuss the impacts from the shifts in revenue recognition for the Illinois ZECS from 2017 to 2018, which we also show in the waterfalls on slide 21 in the Appendix. The capacity in ZEC line declines by $150 million in 2017 and increases by $150 million in 2018, offset by $50 million in other capacity declines, which I'll discuss in a moment. The rest of the bars help to then isolate movements in underlying gross margin not related to ZEC timing. In 2017, gross margin is down $50 million compared to last quarter, partially reflecting the effect of the mild summer and reduced optimization opportunities. We are highly hedged for the rest of this year and are well-balanced on our generation to load matching strategy.

Turning to 2018 and 2019, separate from the Illinois ZEC timing, our gross margin is down $200 million for each year and can be bucketed into two categories. The first relates to our Generation business and our unhedged power position. We're lowering our assumptions for MISO and New York capacity prices based on recent spot year options and bilateral deals in the market. These lower the capacity in ZEC line by $50 million on a rounded basis from last quarter. For 2018, the line shows up as a positive $100 million after the timing uplift from $150 million of Illinois ZECs, while the $50 million decline in 2019 just reflects the lower outlook for past revenues.

During the third quarter, we also saw declines in energy prices, including some adverse news in basis differentials in the PJM East zone which cost another $50 million in 2018 and 2019. However, with the recent rally in power prices, we have already recovered about half of the $100 million of 2019 gross margin declines for Generation.

We also see $100 million decline in gross margins in 2018 and 2019 from the Constellation business, reflected in the Lower Power New Business / To Go line. A series of mild summers and winters have contributed to reduced power market volatility which, in turn, is impacting the competitiveness of our load business. As we've witnessed in prior periods of low price volatility, some of our competitors are mispricing risk in an effort to win business.

In the wholesale load business, we're seeing other players mispricing risk as we consider the market risk from weather volatility, basis variability, and the likely impact of energy market reforms that Chris talked about earlier. Against this backdrop, we are clearing at margins near the low end of historical realizations.

In the C&I business, the consolidation of suppliers of the polar vortex has led to better margin discipline, with our unit margins holding consistent with prior years. We are, however, seeing lower renewal rates compared to last couple of years, moving from something closer to 80% to the low 70s. At these lower renewal rates, we still expect our volumes to be flat year-over-year whereas our previous guidance assumed higher renewal rates that would drive volume growth at Constellation between 2018 and 2019.

Notably, even against the challenged market backdrop, we're holding volumes and margins flat which is a testament to the strength of our retail platform and our disciplined approach to bidding business. The updated gross margins for 2018 and 2019 incorporates C&I renewal rates in the low 70s and wholesale margins hovering around the bottom end of what we've realized over time.

We've been through these periods of low load pricing – lower load pricing in the past and it's previously created opportunities for us. A return to normal weather will inject some power market volatility which will possibly impact forward power prices for Generation. Retailers and wholesalers who missed price risk have consistently been driven from the business when we go from a period of low volatility to a volatility event. When the market corrects, we'll be there to win business at good margins and grow volumes and market share just as we have in the past.

Even against the current market backdrop, Constellation continues to generate strong earnings and free cash flow. Our gen to load matching strategy remain a competitive advantage relative to our peers, contributing positive margin and providing a vehicle to bring our Generation output to market in a disciplined manner.

From a hedging perspective, we ended the quarter approximately 11% to 14% behind our ratable hedging program in 2018 and 10% to 13% behind ratable in 2019 when considering cross-commodity hedges. We remain comfortable being more open when we look at market fundamentals. Spot natural gas prices this year are $3 per mcf which is $0.50 higher than last year in spite of mild weather this past winter and summer. However, these higher prices have provided only modest uplift to spot power prices this summer, while the forward prices have decreased slightly. We think that a

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-01598

return to more normal weather and volatility of the market will help reverse this. And as Chris discussed, we see a path to power market reforms that represent real value uplift for us. We are maintaining additional link to be able to monetize these reforms.

Turning to slide 15. We continually challenge our organization to find operating efficiencies and focus on managing our costs. To that end, we're announcing another wave of O&M cost reductions building on previous years' efforts. We will ramp these new initiatives over the next two years, as shown on the lower right table, reaching a $250 million annual run rate in 2020.

The savings will come primarily from ExGen and the corporate center. If you look at this mix shift together with the programs we have announced since 2015, we'll strip out over $700 million of annual run rate costs, providing significant earnings and free cash flow benefits.

Turning to slide 16, we appreciate that there have been many puts and takes this year at ExGen that have both benefited and weighed on our free cash flow outlook through 2020. When we take into account the movement in power price forwards through the end of October, updated gross margin outlook for Constellation, the benefit of further cost cuts, the early closure of TMI and exit of the EGTP plants, and changes to base CapEx and working capital associated with all these business updates, we remain confident in the free cash flow outlook and capital allocation commitments we made at the beginning of the year.

We're also committed to meeting or beating our 3 times debt-to-EBITDA target for ExGen's balance sheet which we will meet over our planning horizon. On the fourth quarter call, we will roll forward the free cash flow outlook for the next planning period.

And with that, I'll turn the call back to Chris.

Christopher M. Crane

Thanks, Jack. Turning to slide 17, I want to take a moment to highlight the contributions made by Exelon and our employees to help the impacted by hurricanes Harvey, Irma and Maria. Exelon utilities sent more than 2,200 employees and contractors and support personnel from our six utilities to help with the recovery efforts after Hurricane Irma. Our crews travelled to Florida and Georgia where they, for more than two weeks, worked in very difficult conditions. We're very proud of our employees and the hard work that they do to help the communities come back from after these disasters. A very special thanks to all those who've helped in the restoration and support efforts.

Exelon employees also stepped up from a volunteer perspective. Our employees have donated their time and resources to communities impacted by the storms. We also had a number of our Constellation employees in Houston directly displaced by the storms and to see coworkers come to their aid illustrates the value we embody here at Exelon.

Slide 18, we want to reinforce our value proposition which remains the foundation of our commitment to our investors. We've continued to grow the utilities rate base at 6.5% and the regulated EPS to 6% to 8% annually through 2020, underpinning the capital investments that directly benefit the customers in each of our jurisdictions. We continue to use free cash flow generated at the GenCo to fund incremental equity needs at the utilities and pay down debt over the next four years at ExGen in the holding company. We are focused on optimizing the value of our ExGen business by seeking fair compensation for our carbon-free Generation fleet, closing uneconomic plant, selling assets where it makes sense to accelerate our debt reduction plans, and maximizing our value through gen to load matching strategies.

We continue to focus on sustaining strong investment-grade credit metrics and grow our dividend in a stable, consistent manner. As many of you are aware, our dividend growth as a program is for 2.5% annually from 2016 through 2018. We are working with our board and expect to provide an update on a multi-year outlook for the dividend growth plan as part of our planning and budgeting process that are undertaken currently.

Before I go to questions, I want to come back to where we started off in the call. We have a number of positives underlying our outlook. The utilities are growing and executing well. We are confident that the FERC actions around

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01599

resiliency will facilitate needed power price reforms in PJM that will fairly compensate our generating assets.

We continue to improve operations where we're finding ways to run our business more efficiently and taking out an additional $250 million in cost as discussed. And we are still on track to generate $6.8 billion of free cash flow through 2020 at the ExGen that will support our utility growth, reduce our debt, and facilitate growing our dividend.

Thank you again for your interest and now we're ready for your questions.

Q&A

Operator

[Operator Instructions] And your first question comes from the line of Greg Gordon from Evercore ISI.

<Q - Greg Gordon>: Thanks.

<A - Christopher M. Crane>: Hey, Greg. Good morning.

<Q - Greg Gordon>: So, just to summarize here. You gave us a negative adjustment on several things at ExGen that totaled $200 million. But since that mark, you've seen $50 million come back and so 2019 is negative $150 million. And if you achieve your cost-cutting goals, you'll essentially have eliminated that. And so, we're at a push in 2019 with those offsets. Is that correct?

<A - Jonathan W. Thayer>: Yes, Greg. And I think as you think about it and you listen to our comments on the low volatility period we're in, we believe that with the return to normal weather and even potentially future volatility events, that that decline in Constellation business could prove temporary. Obviously, the $250 million are permanent cost savings and capitalizable in terms of value creation.

<Q - Greg Gordon>: Okay. So, as per your usual protocol, you're using the current forward curves for power. But the current margin outlook looks like, for retail, you're not assuming any changes – no volatility premium coming back in the market, no PJM price performance, et cetera.

<A - Joseph Nigro>: Hi, Greg. It's Joe. Yes, we are using the current forward curve for power. I think the big thing to note on the retail side, and Jack said this in his script, when we did our planning at the first of the year, our renewal rates for C&I power were up close to 80%. As was the case back in 2012 and 2013, we've seen a downturn in those renewal rates down closer to 70%, and we're marking this closer to that 70% number. I think the big thing, though, is back in 2012 and 2013, we saw C&I power margins dip below $2 a megawatt hour. And we've said, historically, our origination margins for that business are somewhere between $2 and $4. We're still within that $2 to $4 range.

So, I think the big thing to take away is we're going to serve about 200 million megawatt hours of load this year across our platform between retail and wholesale, and we expect to do the same thing next year. The thing is, we're just not going to achieve the growth that we expected in our C&I power business. And as Chris said and Jack said, the reason for that is we don't think it's prudent to chase the market. And we're going to remain disciplined to what we think value is and that has served us well historically. And, quite frankly, it's allowed us to acquire companies few times as well. So, we'll continue to remain disciplined.

<Q - Greg Gordon>: Great. Sorry. Go ahead.

<A - Christopher M. Crane>: No. I'm just going to say – so, the beginning of the question, all the numbers in here are – on the gross margin, are marked at the end of third quarter. So it's the end of September 29 or 31, whatever the market closed on.

<Q - Greg Gordon>: Got you. One or two more questions. One, looking at slide 20, your cash flow profile looks slightly better, and it looks like it's mainly coming from the utilities and specifically from ComEd. Can you comment on what the changes in the improved cash flow profile there?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01600

<A - Christopher M. Crane>: So, it's primarily related to the collection of the ZEC regulatory asset as well as cash taxes.

<Q - Greg Gordon>: Okay. Final question. When looking at the value proposition you guys are delivering, if we get PJM price formation improvements and you hit on your other financial goals, you'll start to have a earnings growth profile that looks more comparable to the regulated peer group. They trade at 18 times earnings. You're trading at 14 times, current expectations. But your dividend growth – their dividend growth rates average around 5% and yours is 2.5%. I know you said you're reviewing this, but what do you need to see in terms of your financial outlook to be able to close or eliminate that dividend growth past GAAP because I think it's one amongst several things that keeps your stock from trading at a higher valuation?

<A - Christopher M. Crane>: Yes. Greg, we do believe we're undervalued. And everything that we're doing is to drive that improvement in valuation. As you can see from the free cash flow, the debt reduction plan, the recovery in rate case, we're positioning ourselves much better for a potential to have the board conversation in the upcoming LRP planning process to evaluate the dividend. And our expectation is – and has been since we had to cut the dividend four years ago, is to get it back to build the business on a strong balance sheet to get the dividend to be in line with our peers. And that is our pursuit. And as you can see from these numbers, things are improving that have us able to have a much more positive conversation with the board. Ultimately, it's the board's discretion, but that's where we want to be.

<Q - Greg Gordon>: Thank you very much. Have a great morning.

<A - Jonathan W. Thayer>: Thanks, Greg.

Operator

Your next question comes from the line of Jonathan Arnold from Deutsche Bank.

<Q - Jonathan Philip Arnold>: Good morning, guys.

<A - Christopher M. Crane>: Good morning.

<Q - Jonathan Philip Arnold>: I want to just make sure – at the beginning, Chris, I believe you just gave $1 of market price improvement sensitivity based off your volumes to PJM price reform was – of $135 million, did I hear that correctly?

<A - Christopher M. Crane>: Yeah. Per $1 of fully open position in PJM, 135 terawatt hours, $135 million. So, you can – that was just a dollar reference.

<Q - Jonathan Philip Arnold>: Okay. So, my question is, I mean, what – as you look at the kinds of reforms that PJM is considering in flexible unit and the like, what's your view of the range of potential uplift when you translate it into the ATC basis that would be relevant for you?

<A - Joseph Dominguez>: Hey, Jonathan. This is Joe. We're still waiting to see some additional details from PJM but – and so we're not going to put out a number until we get all of those details. But I have seen the reports that a number of you have compiled on this subject with the range that is somewhere between $2 and $5 of ATC movement as a result of the elimination of discrimination. And I think that's the right range to be thinking about and probably with the middle part of that range makes a lot of sense to us.

<Q - Jonathan Philip Arnold>: Okay. That was – that's helpful. Thank you for that. And then, Chris, you've said that, I think, earlier in the year that this dividend revisit and the longer range growth outlook would be Q1. And I believe what you've just said is pretty consistent with that. If you do it as part of the LRP. Is that correct?

<A - Christopher M. Crane>: Yeah. I think we've said back in 2016, when we have our dividend strategy, we want to give you a multiyear plan. We gave you 2016 through 2018 and that that will be the time in the first quarter to be updating, in my belief, set the board's discussion on where we go with that. But that would be our timing in my mind

and in our current plans and communicated with all of you.

<Q - Jonathan Philip Arnold>: What should we be expecting you to give us next week at EEI?

[indiscernible] (35:28)

<Q - Jonathan Philip Arnold>: What items?

<A - Christopher M. Crane>: Yeah. EEI, I think we'll be able to have more of the one-on-one details, get into more of the details on the capital investments, in the growth and the rate case strategies as we improve the customer experience at the utilities. We'll also have more time to go into the detail on the numbers on the free cash flow, debt reduction plans, and the optimization of gen to load growth. I'm sure, more people are going to want to talk in detail about the basis for our $250 million, and we can do the deep dive on that. But it will be detailed on what you're seeing today and an opportunity to have some one-on-one dialogue about it.

<Q - Jonathan Philip Arnold>: Right. Thank you. And then I guess just one other, did you have any thoughts – I know it's all a bit of a moving target and you've been talking, but what's your level of confidence that you're going to get to things that you want to see out of a tax reform?

<A - Christopher M. Crane>: Well, it's eleven-fifteen, I think, or eleven-thirty Eastern when we see the draft, and we'll have to rally together with EEI and take a look at how we, as a sector, have been positioned. Kind of early to say now. If you've gone over the last 24 hours, things have been all over the board.

So, I'd hate to speculate but we work together in the sector at EEI, and I'm sure Tom Kuhn will be getting us all together, and we'll figure out our next steps as the re-rights, as they've discussed, are finalized and getting our input as a sector in there. We're totally unified at EEI on what we're looking for and what we think will benefit our customers the most in tax reform. So, more to come on that, and maybe we'll have a little bit of insight of that at EEI as we work through the weekend and see the effect on the proposed – and still, we got to go back to this as proposed. You don't know what's going to happen in D.C. But we'll be ready to talk about it more as not only a company, but as a sector.

<Q - Jonathan Philip Arnold>: Sure. Sorry to put you on the spot on that – on a real-time issue.

<A - Christopher M. Crane>: No, that's okay.

<Q - Jonathan Philip Arnold>: Thank you, guys.

<A - Christopher M. Crane>: Sure.

Operator

Your next question comes from the line of Steve Fleishman from Wolfe Research.

<Q - Steve Fleishman>: Yeah. Hey. Good morning, Chris.

<A - Christopher M. Crane>: Hi, Steve.

<Q - Steve Fleishman>: So, just how are you strategizing on your retail business with respect to these potential DOE-PJM changes and are you doing things to make sure that you don't have like a big delay in capturing the uptick because of retail hedges? Like, are you making sure you're back to backing your retail and the like? I mean, just curious how you're thinking about that.

<A - Joseph Nigro>: Hey, Steve. Good morning. It's Joe. We are thinking about that. And I think the first thing is, as Jack said in his script and we've said for a while, we're carrying the longer position relative to our ratable sales plan. So, we have the opportunity to capture any upside associated with price increases related to the reforms you're talking about. I think, specifically though to retail, there's a couple of elements to that. The first one is we've done some preliminary modeling and we've taken to account kind of the seasonality as well as the differences between on- and off-peak. So, we tried to be more surgical in just saying we're going to buyback this. We have a view of the things we

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01602

need to do.

I think as it specifically relates to our retail contracts, there's two elements. One is, obviously, we have contracts on the books already and we have some hedges on the books already. So, there will be a tethering in effect to the value proposition of this. But most importantly, from our perspective, I think one of the things we offer our customers and it's really important is transparency. And what I mean by that is when they're signing a contract with us, they completely understand what they're getting and what the components of that are that are in fixed price and the components that are going to be passed through time. And I'm not sure that's always the case across the industry.

So, from our perspective, there's a lot of elements and we are thinking about it, and we are really managing our portfolio from a natural long position as well as the seasonality in the products. And we're keeping the customer in mind.

<Q - Steve Fleishman>: Okay. And just in terms of just the – that's helpful. In terms of just the tower new business change that you made, what – your cents in terms of making that change, is your – do you feel like you've encompassed kind of a pretty conservative case here at this point so that this doesn't become like a series of changes?

<A - Joseph Nigro>: Yeah. I think – yes. The answer to your question is yes. We think we've covered it and I'll tell you why. When you look at it, it's really all driven by our load business. About 60% of it's on our retail C&I business and about 40% is associated with our wholesale polar business. And there's really two elements that are different, one on each side. On the retail side, as we said, our renewal rates are lower than we expected them to be, but our margins are well within the range that we expected. And that's very different when we had these challenges five years ago where our margins and our renewal rates both dropped pretty appreciably. On the wholesale side, it's much more of a margin story where the volumes are there, but the margins are lower than they've been historically. I mean, it's a very competitive environment. Quite frankly, it's being driven by a lot of smaller players on the retail side and not the bigger players. On the wholesale side, we've seen kind of competition across the spectrum, but we're confident that we've captured the changes we need to make.

<Q - Steve Fleishman>: Great. And I just – finally, I guess, in hindsight, congratulations on adding your Texas gas plants months before all the coal plants shut. I'm sure you planned that out. But I'm just curious given that fact just – have your thoughts on the Texas kind of market and potential there changed for you, how you're thinking about that?

<A - Joseph Dominguez>: It's Joe again. I'll keep going. And we've talked about this for a while. When you looked at the ERCOT reports on what they thought their reserve margins were going to be, we never really thought they were going to get the Generation growth that they expected. And in our own modeling, we have sensitivities. We ran some sensitivities looking at the possibility of retirement. And if you look at our positioning in ERCOT, we're carrying a long position there relative to our ratable plan as well. And we see the opportunity for volatility. I think this summer, we skewed some, obviously, with the problems with the hurricane in August and quite frankly, the biggest thing down there is we continue to see low growth which is really important and we don't see a lot of kind of the new build of gas generation. You have continued growth on the renewables side, but it's more concentrated in South Texas than it is West Texas. And when you put all that together, we see the opportunity for increased volatility, and we think we have fleet that will benefit that.

<Q - Steve Fleishman>: Thank you.

Operator

Your next question comes from the line of Julien Dumoulin-Smith from Bank of America.

<Q - Julien Dumoulin-Smith>: Hey. Good morning.

<A - Christopher M. Crane>: Good morning, Julien.

<Q - Julien Dumoulin-Smith>: Hey. So a couple of quick questions, maybe going back a little bit on some of the previous discussion here. But with respect to the dividend, how do you think about the stability of cash from the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01603

various businesses? Obviously, there's a certain legacy here. But how do you think about the stability from ZEC's and the retail business, and how do you think about that at least in – into the conversation around a dividend policy, i.e. can you bank on cash flows out of businesses that are not the utilities and/or think about a higher payout on the core utilities?

<A - Christopher M. Crane>: Sure. So as we've talked about four years ago – four and a half years ago now, as we restructure the dividend and put our strategy and our focus on really growing the utility business through the acquisition of BGE and then the acquisition of PHI, and it was to theoretically watch the growth in those businesses and have a 65% to 70% dividend policy, theoretically, at the utilities.

Now you know that's going to cycle during different growth periods, but that was the way we had the dividend set to grow. In the first couple of years, we were starting to get closer to that, getting that accomplished in the early 20s. And so, that's when we came up with the growth policy at 2.5%. As you can see, the utilities are continuing to grow, although, right now, it's taking cash infusion – equity infusion from the HoldCo through the GenCo, but they're continuing to grow. So, our stability of the dividend is very well anchored. Our potential growth for the dividend is well-anchored.

As we come through the last couple of years and started to see more reliable or consistent cash flows from the GenCo on programs that compensate for the other benefits besides just the energy, you're seeing a potential that that can be a dependable cash flow that can be used for potential return of value to the shareholders. So, that's the way we're looking at it and we're presenting it to the board that the cyclical nature of the commodity market will not leave us, but the certainty of certain elements on those revenue streams give us the opportunity to look at the world a little bit differently. So, but that's how we'll continue to model it and we've gained greater flexibility with programs like the ZEC.

<Q - Julien Dumoulin-Smith>: Excellent. And then, let me ask you this, with respect to the utilities, right? I know we've had a lot of conversation on the other side of the business, but obviously you've had some reasonable success of late in ComEd around – how do you say – scaling some of these smart grid efforts. How do you see an ability to scale that further? And obviously, this might be getting ahead of the annual process in the CapEx budget, et cetera. But maybe this is more to Anne and thinking about the ComEd prospects beyond 2020 here.

<A - Christopher M. Crane>: So, well, let me start off and then I can let Denis jump in here or Anne on the call. The advent of the digitalization of the distribution system and the transmission system has offered us an opportunity for capital investments that directly benefit the customers and drive reliability. We have now put in communications backbones to read smart meters to help us with fault isolators, fast reclosers. That's the kind of spend along with replacing antiquated cable and updating the system with new components.

Now, as we go into the 2020 and beyond, there is a significant amount of work being done on what else can be done to develop into the smart city that we can better serve the communities while investing in driving efficiency into the systems. The work that's being done on microgrids, the experimental work there to see what the societal benefit on certain microgrids in certain locations. What we can do to integrate with more of the community, is there an assistance within the streetlight programs or assistance that we can provide with our infrastructure on the meter reading of water, gas, other type of systems is where we'll be going.

And I think this technology is morphing faster than it ever has in our sector. And with our design teams, data scientists, the work that we're doing on big data, digitization is going to provide us many opportunities for continuing to optimize the system for the customer's benefit. Denis, I don't know if I covered it or...

<A - Denis P. O'Brien>: I think – this is Denis. Chris, I think you covered it pretty well. We're spending about $5 billion a year in capital. We still see opportunities to continue to invest in convergence relative to our systems to build the systems of the future, whether that's billing systems, transmissions data systems or others. We see opportunities to continue to invest in resiliency and security. We're seeing opportunities relative to the transmission system as we look at resiliency and security and to build the transmission system of the future. Chris hit on smart cities and other things like that.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01604

And the last thing is you look at the grid of the future and we think about distributed generation in order to get our system ready for that that really means about converting some of our lower-voltage circuits into higher-voltage circuits. And so that's an opportunity for further capital deployment. So we're deploying about $5 billion of capital a year. We see that continuing and see lots of opportunities to continue to invest in utility of the future.

<Q - Julien Dumoulin-Smith>: And – but does that enable kind of an accelerating CapEx spend overall, maybe perhaps that's the core of the question?

<A - Christopher M. Crane>: I don't see us accelerating the plan. I think we're at a point that we're managing efficiently the spend that we have. We also have to balance the impact to the consumer. Spending capital for the sake of spending capital without finding the efficiencies in the delivery and to the benefit of the customer, it wouldn't be prudent. Right now, the projects that we have on schedule, the cash flows that support that are managed well, and they do support what our bottom line it needs to be as the benefit of the customer.

<A - Denis P. O'Brien>: And the only thing I'd add to that, our focus on – we're 18 months into the PHI acquisition. Our focus now is to get the performance to the right level. We had our best year ever in reliability at PHI last year, which we only had the company since March. We're going to blow through that level of reliability this year in a good way. So, the first couple of years, you're – how do we get the performance to a good place? How do we right the image and reputation and improve our regulatory outcomes at PHI?

<Q - Julien Dumoulin-Smith>: Excellent. Thank you all.

<A - Christopher M. Crane>: Thanks.

Operator

Your next question comes from the line of Stephen Byrd from Morgan Stanley.

<Q - Stephen Calder Byrd>: Hey. Good morning and congratulations on the cost cut announcements and the utility performance.

<A - Christopher M. Crane>: Thanks, Stephen.

<Q - Stephen Calder Byrd>: Wanted to drill into the idea of resiliency laid out by the Department of Energy. Is there a way for us to conceptually think about the value of resiliency or a framework for assessing how to appropriately value resiliency? It's been a tricky thing I think for all of us to really think through that the high level idea makes sense. Just sort of how to go about trying to value that. Is there any suggestions you have on thinking about that?

<A - Joseph Dominguez>: Sure. Stephen, this is Joe Dominguez. If you see our pleading, you know that we have a multi-phase process where in the first instance we need to get analytics from new RTOs – can they run without pipelines, what's the impact to the consumers. We can move from there to a design basis for the system that we think is going to iterate between NERC, FERC and the Department of Energy for some time after we get the data.

In terms of how we ultimately implement that into the system, I think once we have a design basis on what we're trying to avoid, we will start looking at mitigation solutions, maybe the retention of additional fuel-secured resources to avoid this outage risk. But I think it's premature to get there. One way you can think about it though, if you take a look at the capacity performance program, we were able to value the cost of incremental reliability associated with dual fuel. So, if the design basis ultimately ends up being we need 90 days of fuel, we have a mathematical way of calculating what a market solution to get dual fuel resources to 90 days of fuel would be. That would probably be $8 or $10 a megawatt hour in terms of doing that based on the cost we saw in CPAY. So, that's one approach.

But from our perspective, we need to drop back here, take a look at the data and make sure we have the right definition of resiliency, the right design basis, and then we could come back to market solutions or other solutions that'll ensure we have the resources to mitigate that risk and provide the security we need to provide to our customers in the nation.

final

Bloomberg Transcript

<A - Christopher M. Crane>: And I think the key to that, what Joe said, is a market solution.

<Q - Stephen Calder Byrd>: Understood. Within the market construct that we have, that makes sense. I want to just shift over to the retail business. There's been a lot of discussion on this call around a competitive playing field. If we do see FERC performs on power price formation and if power price do rise, would you expect to see a bit of a shakeout amongst smaller retail players who don't – who are not backed up by physical generation who may have mispriced the upside risk to power prices? How would you – assuming, again, that we do see the kind of formation changes we expect? Would you see a shake out there?

<A - Joseph Nigro>: Yeah. I think history tells us we would anytime we've seen a volatility event and I can go back for a number of years. We've seen players, whether they're big or small, whether they were on a C&I side and the residential side, and quite frankly, the polar loads on the wholesale side. We've seen folks who've aggressively priced the risks or the ultimate price to the customer have been hurt. And as I said earlier, we've had opportunities to acquire companies in that type of environment. We've had opportunities to grow our business organically, and we think remaining disciplined to what we're doing is the right thing to do.

We still have almost 25% of the C&I market. We're the number one C&I marketer by a huge amount. We're the third largest residential marketer in the United States and we compete in all the wholesale polar auctions. So, the underlying business is strong. The growth we expected, we're not achieving, and I think the discipline will serve us well. And we're going to have an opportunity to capture some of that back when we see a volatility event.

<Q - Stephen Calder Byrd>: That's great. That's all I had. Thank you.

Operator

And your final question comes from the line of Praful Mehta from Citigroup.

<Q - Praful Mehta>: Thanks.

<A - Christopher M. Crane>: Good morning.

<A - Jonathan W. Thayer>: Good morning.

<Q - Praful Mehta>: Morning. So, my question goes back a little bit to the dividend discussion. And what I was trying to connect the dots on was, you're already kind of hitting your leverage targets, your free cash flow targets right now with the current plan. If you do have price reform and if you do have further ZECs coming in from other states, then you have that incremental free cash flow, how should we think about that capital allocation? Is that more to bolster the dividend or where do you think that capital allocation goes?

<A - Christopher M. Crane>: First of all, we will look at it in a disciplined way on what is the best way to return value to the shareholders while maintaining our commitment to the customers. So, the plan, as I said earlier, that we've started out on over four and an half years ago is working. We're reducing our debt, we're strengthening our balance sheet, we're reducing our costs, we're able to make solid investments in our utilities, and we've been able to do a part of a dividend increase program as we were doing that. As you can see, as we get stronger and stronger, the opportunities for us to deploy the capital are coming up our way, and we'll make sure that we'll look at it in a disciplined fashion. If there are more accretive ways to spend the capital in the utilities and in a low-risk area, that would be something we'd look at. But as we've committed previously and as we've signaled, it's a conversation that's ongoing right now with various opportunities to revise the dividend policy and give you another multi-year plan and as we work through the LRP planning process, and we work with our board heading in to 2018.

<Q - Praful Mehta>: Got you. That's very helpful. And secondly, in terms of the ZECs, if you could just touch on how you think ZECs play out in different states. In other states, obviously, very happy there. And secondly, how does that fit in with the price formation and the DOE reform? Do you see them interacting or do you see them as completely independent?

<A - Joseph Dominguez>: Hi, this is Joe again. We were pleased to see the outcome in Connecticut the other day where although, a different structure, the central premise is the same. Nuclear units are critical for our customers, and we need to preserve them. So, definitely a step forward on the policy front there. We're having very productive discussions. Both in Pennsylvania and New Jersey, we'll continue to do that. In terms of the interaction I see between the programs, if we get an upside in price formation, I think that will ultimately be taken into account in the process. So, there will not be a double-dip here. If prices increase as a result of price formation, the cost of the ZECs or the cost of the support payments will go down. That's the anticipated.

<Q - Praful Mehta>: Got you. And you think that's a dollar-for-dollar adjustment or do you think there's some benefit that you do keep?

<A - Joseph Dominguez>: No. I think it's a dollar-for-dollar adjustment.

<Q - Praful Mehta>: Got you. That's super helpful, guys. Thank you so much.

Operator

And for closing remarks, I will now turn the call over to Chris Crane.

Christopher M. Crane

Thank you, operator, and thank you all for joining us. We're excited about the opportunities ahead of us and our success in delivering on our commitments. We look forward to seeing many of you next week and provide our updates and then our year-end updates in February. So, thanks again for joining and appreciate your time.

Operator

This does conclude today's conference call. You may now disconnect your lines.

Presentation

Kit Konolige, Senior Utilities Analyst

Good afternoon, everyone, and thank you for joining us today. We have a very interesting and hopefully useful webinar with several folks from PJM, the major unregulated marketplace in the US in power. I'm Kit Konolige; I'm the Senior Utility Analyst at Bloomberg Intelligence. And my guest is Stu Bresler, who is the Senior Vice President for markets at PJM, and he has several folks assisting him as well. We'll turn to Stu in a minute.

Let me first just mention a couple of housekeeping notes. The presentation will be recorded. It will be available immediately after we finished talking live. You can adjust the volume, maximize your screen. To ask a question, you can submit one on the right side of the slides. And then, what I propose to do is, we will go through the questions and ask them after the full presentation. And a copy of these slides will be available for download in the post-event email. In addition to the questions that I'm turning to in a minute, we will -- we have a number of charts and graphs that explore some of the aspects of the PJM structure and the PJM auction coming up.

Just one brief commercial; Bloomberg Intelligence, which I'm a member of now is approaching about 300 members, workers and -- hard workers, and it's -- we're obviously part of a much larger Bloomberg organization, but in some ways, we're quite separate. We are focused on investment considerations, so we're not news. On the other hand, we are not strictly a sell side operation, but we do a lot of the same things that the sell side does.

Basically, we publish research on equity, debt. We have people who are specialized in law of various kinds, litigation, policy, et cetera. So we think it's a very interesting, and ideally it's a very helpful platform to be able to communicate with a lot of our clients.

And with that I will move along to a list of the key topics that I jotted down and I shared with Stu prior to this call and we went through them a little bit and I think these are to my mind questions that clients ask, the questions that I ask and the questions that Stu has heard about. So I know from the past that Stu is very straightforward and thorough in discussing issues that come up such as these and obviously wants to be communicative and transparent about the PJM situation, the PJM auction, capacity auction in particular.

So, with that, let me turn over to Stu Bresler and as I say, if as he is speaking, if you have questions, you can type-in in real time on the right hand side type in a question, and then we'll get to those questions when he's finished his discussion. With that, Stu?

Frederick S. Stu Bresler III, Senior Vice President

Well, thank you, Kit, and good afternoon, everyone. As always it is a pleasure to have the opportunity to speak with you and exchange information regarding the upcoming May RPM Base Residual Auction. We certainly recognize that for our market participants the investor community it's certainly is a significant event during the year with respect to for procurement of capacity in the PJM market, so again, it's our pleasure to be able to have the opportunity to speak to you.

Bloomberg Transcript

With me today, Kit mentioned that I had some -- some of my colleagues with me, I have Adam Keech, who is our Executive Director of Market Operations and Jeff Bastian, who manages our Capacity Market Operations Group, his folks actually have the awesome responsibility of clearing the capacity auctions in PJM. So, you may hear their voices as well during the conversation this afternoon to the extent that they have detailed information that they can supplement and that sort of thing.

So, as Kit indicated, when he had sent me what his thoughts were on what we could cover today, I thought it was a pretty comprehensive list of the kinds of things I would talk about with respect to the factors impacting the upcoming May auction. So, I thought I would hit those topics, because it's -- like I said what I would have talked about anyway and certainly we should have plenty of time for Q&A either as we go along or once I finish with these topics.

So, as you all know the sort of the first step and preparing for the auction in May, at least the first major step that it involves publicly posting information is posting the auction parameters, the planning parameters for the May auction. And we published an initial set of planning parameters by February 1st, leading up to the May auction and then it just about every year -- based on every year so far prior to RPM auctions. We have posted an updated set of planning parameters about a month out and that update occurred last Thursday, April 13th. So you can find if you haven't already, the most up-to-date set of planning parameters for the upcoming auction on our website on the RPM page. I do not expect at this point another update to be necessary before the May auction. Those parameters you see should be the final ones that are posted up there on our website.

But looking at sort of what changed from last auction to this one with respect to those planning parameters, is the major factor that really basically drive the results. We have seen yet another reduction in the forecast peak load for PJM. The forecast peak for 2020-2021, which is the delivery year fullish [ph] well on the basis we do auction in May, decreased about 3,273 megawatts, or about 2.1% from the forecast peak load that was used for the 2019-2020 delivery year.

And again this is a -- surely the result of increased penetration of behind-the-meter solar installations as well as the continued incorporation of energy efficiency efforts. I think the major factors behind the peak load forecast change from one year to the next, and then obviously the underlying econometrics effected as well.

There was a bit of a change in the system-wide forced outage rate. So the reduction in the reliability requirement that we need to meet was slightly less, it was about 2% reduction from last year to this year, about 3,400 megawatts or so from last year to this year.

From the standpoint of the locational deliverability areas, the LDAs, those potentially constrained areas of the PJM system that we will model in this auction, we posted two additional LDAs this year. So all of the LDAs for which we posted a separate VRR curve last year, we did so again this year, but we also added the Dayton and the Duke, Ohio, Kentucky LDAs. And the primary reason for doing so was the potential for at risk generation in those LDA's given some of the public statements we had seen made by market sellers in those areas about the potential to retire certain resources, namely Stuart and Killen in that -- in those areas. I think they're actually in the Dayton zone.

And so with that publicly announced information and then we actually have since received an official retirement request for those resources. We felt it prudent to model those additional LDAs. The updated planning parameters that I mentioned that were posted on April 13th, include adjustments to the transfer limits for really any LDA, but I think those primarily affected were those two based on the removal of those Stuart and Killen units from the network model.

So, again, there is no necessarily requirement or expectation that those LDAs will actually bind and be constrained in the auction does not automatically mean that when we post them, but we felt that again prudent that we model them and they have the potential to do so given the fact that that we saw that potential for that generation retiring before the 2020-2021 delivery year.

We are for the first time this year have had some registration price responsive demand for the upcoming auction, again, we posted that with this latest for the most up-to-date value with its latest set of planning parameters. It is on the order about 600 megawatts that has registered, that does not guarantee necessarily that again it will clear in the auction depends on what the prices were indicated or for that price responsive demand, but again that's a first for this auction compared to prior auctions.

Let me cover with respect to the transfer limits the CETL value, that stands for Capacity Emergency Transfer Limits for the LDAs, because there were some fairly significant changes, both in what was posted initially and then the updates we posted on April 13th, and I thought it might be beneficial to provide some rationale there. Primarily that we're talking about, here are the some of the Eastern LDAs, there is the PS and PS-North LDAs as well as Eastern MAAC.

Those two LDAs and the CETL values, the transfer limit values, which really are in expectation of how much energy could be transferred into an area during a capacity emergency are impacted somewhat by the assumptions on the emergency assistance we could receive from New York ISO. And we have a transmission service contract affectionately [ph] known as the PS-Con Ed Wheel that is ending actually at the end of this month. And between last year and this year we got that final notification that that transmission contract is being canceled, and that change the way we sort of model things up with the Northeastern interface between PJM and New York ISO. And so to make a very long story short, we were a bit optimistic in the emergency assistance that we assumed, we could receive from New York during a capacity emergency when we posted the initial values for PS, PS-North and Eastern MAAC. And as we continue to refine the modeling assumptions -- I'm sorry, because we were optimistic the CETL values we posted for those three LDAs, PS, PS-North and Eastern MAAC were significantly higher than they were for the last RPM auction, last (technical difficulty).

As we refine those assumptions and really model something much more realistic for the amount of energy that would likely be available from the Eastern part of New York ISO in a capacity emergency. We significantly reduced that, again, previously optimistic assumption. And the final values we posted last week on the 13th for Eastern MAAC was much closer to what we actually had for the 2019-2020 auction. I think it's within 15 megawatts or some like that.

The PS, PS-North values came down a lot as well from an initial posting, but they are still a few hundred megawatts higher than what we use last year, because there are some transmission upgrades in the Eastern part and Northeastern part of New Jersey that help the CETL values for PS and PS-North. But again, not nearly the increase we had initially posted with those optimistic assumptions about emergency assistance from New York.

The last one I'll hit is -- actually there is two more. The MAAC LDA, we posted a value for this auction that actually is fairly significantly reduced from last auction, and that is due to a constraint towards the Southwest portion of the MAAC LDA that is affected by a change in really the sort of system configuration in that area. We have seen a change in retirement notifications where resources that were previously retiring, now intend to repower and so therefore back in the model and as a result of the -- sort of the flow changes from that reconfiguration we had a limit down there in the Southwestern portion of MAAC, that reduced that MAAC import capability, that emergency transfer limit.

And then finally there was a reduction in the transfer limit into ComEd of about 900 megawatts or so, and that was due to some increased flows on our transmission constraint AEP feeding into ComEd that caused that that lower transfer capability into the ComEd LDA. So from the standpoint the transmission system modeling, I think that's -- the changes that I would highlight from -- again from last auction to this one.

From the standpoint of potential for new capacity in this auction, what we post out there on the website, which you can go have a look at is the generation that has requested an exception from the minimum offer price rule, which is a pretty good indication of the quality of megawatts that may decide to offer into the auction and that value it's about 12,200 megawatts or so, something like that, is roughly the same as what we've seen in the aggregate for the last several auctions. There is not much of a change to that number. The split is little different between the competitive entry, exception and the self-supply exception, but the aggregate number is about the same.

I would say just from a back of the envelope standpoint, we typically see maybe about half or so of that value that actually request exceptions offer into the auction and then something less than that typically clear. So again, no guarantees whatsoever as to what would happen with this auction, just trying to give you a feel for what we have seen in the past.

As far as generation retirements, what we -- if you go to the retirement page on the PJM website, and you take a look at the next several delivery years, I think we have maybe 3,000 plus megawatts or so, that is already scheduled to retire

final

Bloomberg
SI-SSA-0015-01610

between now and the end of the 1920 delivery year. We don't have anything else out really past that timeframe, as far as already requested future de-activations, but obviously that can change given the results of an RPM auction sometimes. And so it's possible some markets always out there waiting to see the results from 2021 in this instance. But, again, it gives you a decent guidance to what we're seeing between now and then.

This is, as Kit indicated in his PowerPoint, this is the first year where we will require the procurement of 100% capacity performance resources. Last year we cleared to somewhere on the order of 27,000 megawatts or so of base capacity, which has the requirement to perform only during that summer peak period. A lot of that was or some of that anyway was demand response, energy efficiency, others was generation. It remains to be seen obviously what the impact of the 100% CP requirement is. A lot of the generation, not all going to -- lot of the generation that cleared as base capacity last year, submitted offers for both base and capacity performance. And the base capacity offer was simply the more economic one to take, given the fact that we could accept up to a certain cap of base capacity. So, my message I guess is that, a lot of the generation that previously cleared as base has probably CP capability, but didn't clear based on a CP offer last year. So, what CL -- the unavailability if you will of an offer as base capacity affects offer behavior this year to see what impact that 100% CP requirement has.

I probably should hit this before, so I apologize for not doing that. I did mention already the new transmission, I think the major upgrades I would point to that affected this year are those in New Jersey. There's a couple of 345-kV lines that were added in New Jersey that I think affected the PS and PS-North CTEL.

But the impact of the Indian Point closing really had no impact on our transmission modeling for this year's auction, because New York ISO has not yet actually received an official retirement notification from Indian Point and PJM's practice would be not to remove an -- a unit from our transmission model until we receive that official retirement notification. And so we applied our same methodologies to Indian Point from the standpoint of calculating again CTEL values for any LDA that might impact.

Again, we did consider that potential when we look at the potential availability of emergency assistance from New York given the fact that we would likely peak around the same time.

So that was considered, I don't really think it affected it much because we probably would have been able to get much assistance even without Indian Point's closing. But, I guess that from a transmission modeling standpoint, there was no effect.

I already hit the ComEd import capacity, and the next bullet was the -- again the increase in Eastern MAAC and PS-North, those were really reset back to about last year's levels with the exception of the (technical difficulty) PS-North because of the transmission upgrades. So Eastern MAAC again is about the same as it was last year.

The only thing I'll hit as far as the last bullet on, I believe, come back to the second last bullet. The only thing I'll hit on the last bullet; solar, wind, demand response and energy efficiency is we do have the new rules for aggregation of resources where FERC approved PJM's filing of its aggregation proposal, so that resources could offer on a summer only, or winter only basis and we could aggregate them through the auction to make 100% annual CP across the board. And we did post the total value of winter capability that has applied for the ability to submit a winter only offer. They were -- with all wind resources.

And the total winter capacity and connection rates that we essentially awarded for this upcoming auction was about 1,700 megawatts and that 1,700 megawatts was the winter CIR capability already had an annual capacity and connection rates of about 500 megawatt. So the net change, I would say that between what was -- what could already be annual versus what could be winter only was about 1,200 megawatts or so.

So that means that, that would be, I think the amount that would be likely to be able to aggregate winter only resources to make summer only resources, primarily I would think demand response capable of clearing in this auction. But we will only clear those resources to the extent that we can match up equivalent quantities of summer only and winter only, and also dependent on their offer prices compared to obviously where the market clears given their locations. So just to give you again some aggregate indication as to the numbers we're looking at there.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01611

I think that's about it on solar, wind, DR and EE, but again we can go into the Q&A in just a minute here and see if there's anything else you'd like to know there.

That second-last bullet, I know it's a bit of an elf in the room these days, it's the nuclear subsidies and really kind of the issue of subsidies in general. It's very difficult to judge what if any impact that will have on this auction. And I say that for several reasons; number one, the subsidies aren't even in effect yet, we're talking about the Illinois subsidies to the Exelon nuclear units at this point. They actually go into effect on June 1st. And obviously [ph] that's a long time before the 2021 delivery year, but I make that point because they are the subject of a court challenge at this point similar to the -- this AAC [ph] program in New York as well.

So it's -- like I said, it's difficult for me to guesstimate if you will, how that might affect offer behavior we're just going to have to see how things turn out. If you want doing a Q&A, we can get into to the larger discussion on the impact of subsidies to the markets in general, but keeping it to sort of the expectation for this upcoming auction, I like -- don't have anything definitive, I can say there simply because the status of those subsidies, I think still remains a bit up in the air, given the fact that not even effective yet. So. again, from the standpoint of this is auction specifically I just -- I think I just this far as we can go.

So, Kit, I think with that, I'll wrap up hopefully within here is less than 30 minutes from our start time, which leaves us plenty of time for Q&A. I'll turn it back over to you to moderate that.

Questions And Answers

Kit Konolige, Senior Utilities Analyst

Excellent. Okay, that's great. Thank you. As I mentioned before, folks, if you have a question, type it in on the right hand side and it pops up here and we can review those with Stu, you know, the ones that are most interest and we have about half a dozen now.

First, there is one that -- it's a question about the load forecast and basically questions how come it goes down every year. In other words the curve gets redrawn each year that a lower level, is it reasonable to expect that that's going to stabilize at some point or what either particular factors there that we're missing that create that that difference every year or is the modeling biased upwards and has to be adjusted?

Frederick S. Stu Bresler III, Senior Vice President

Yeah, it's a great question, Kit. And I would say that unbeknownst to us at PJM. I would say that several years ago, yes, the forecast was -- was too high, and I think there's several reasons behind that. And remember, now this is a 15-year forward-looking load forecast and several years ago we saw that for several years in a row, we had forecast that were percentage points -- multiple percentage points higher than what we actually saw come in and will be back as it based on our models.

And so we undertook a significant effort a few years ago to make significant enhancements to our load forecasting models. And we started with the relationship between the econometrics and the load and a lot of work on sort of better correlating those with a lot of back-casting to get that relationship closer. And then we also worked to incorporate things like energy efficiency, behind-the-meter, resource integration and I think it's primarily lower voltage solar installations, smaller solar installations. And beyond that, I just think there is a lot going on out there in the retail space that is resulting in less load in aggregate for the same other types of system conditions like weather. And I guess I think there's a lot of energy efficiency efforts that are going on and conservation efforts and all sorts of things.

So, we think based on our most recent back-casting that we have squeezed out a significant amount of the area that we had in the past to the extent that our back-casting now actually floats around either over or under forecasting, because I think we've got an handle on some of these dynamics that we have been changing in the industry. Now where it goes in

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01612

the future, it remains to be seen sort of how the industry dynamics continue to change.

We could -- we can see continued energy efficiency efforts in those types of things, which would continue to result in lighter loads for the same like I said, other types of suited conditions. We could see via all of a sudden a revolution with respect to the technology behind electrification of transportation and see huge increases in load again based on the load requirements to support that particular industry.

So I think it could go either way and even more difficult is predicting what that timing of that would be. In other words, even if we did see a significant increase in electric vehicles would that be necessarily an increase to peak load consumption as opposed to off peak consumptions, but more energy consumption.

So, it really depends on how things continue to evolve. Kit, I think the best I can say is that I think we've gotten a pretty good handle now on the new interplay of the various things that go into the long-term load forecast.

Kit Konolige, Senior Utilities Analyst

Okay, great, Stu, thanks. Question pretty specific to one of your discussions about exceptions to MoPar [ph]. Does a generator need to apply for an exception each year, so that the 12,200 is kind of current year starting from zero kind of number or once you get an exception, can you really look forward to the next year, so there going to be a backlog of plants that didn't bid previously who are still able to bid.

Jeffrey Bastian, Manager, Capacity Market Operations

Yeah, once a resource clears, it no longer need a MoPar exception. So, to answer your question directly, I think resources that in the past have applied for a MoPar exception and either didn't offer or offered but didn't clear would need to apply again the next year, if they wanted to get an exception in the next year. The only ones that don't need to re-apply are the ones that clear in a particular year.

Kit Konolige, Senior Utilities Analyst

Right. Okay, fair enough. On the decline in the CETL [ph] tip from Intren ComED, I think you mentioned it was AEP to ComEd primarily, but in any case, can you discuss a little further what was leading to that and I know you can't predict pricing outcomes and so on, but is it fair to say that that is a significant tightening that in the past as indicated some pretty serious potential for different outcomes?

Frederick S. Stu Bresler III, Senior Vice President

Well, I mean it's about an 18% reduction in the transfer limit into ComEd, and yes, I did say, it was based on the -- an increase loading in the AEP area on a 345-kV transmission facility, that was the actual reliability violation. Now we do have an RTEP upgrade in the works to relieve that that transmission constraint. But for now, it did -- I guess it did result in a reduction in the CETL, it's 926 megawatts for the upcoming BRA. So, yeah, I mean all other things being equal, which is I think is the key, all other things being equal, you might expect ComEd to create a little bit higher than it had in the past. But again, that depends heavily on the offer behavior that we see from resources inside and outside of ComEd as well.

Kit Konolige, Senior Utilities Analyst

Right. Fair enough. Different arena, there has been a proposal in ISO New England, that addresses subsidized generation. Have you guys looked at that proposal with any kind of thought towards what PJM might do. And maybe

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01613

this is a good time because I think as you mentioned, the question of what and "open market does with generation that subsidized" and so presumably changes its behavior because of that is obviously has to be a very significant issue if that's going to be the direction things go and maybe you can just discuss broadly if the New England proposal is relevant that you mentioned that if there are other thoughts that you and the team have -- you know, are considering on where PJM goes if everybody starts subsidizing a significant part of the generating fleet, a very useful outlook kind of discussion.

Frederick S. Stu Bresler III, Senior Vice President

Sure. And I fully expected this topic to come up. I agree, it's an important one. So important that FERC is holding a two-day Technical Conference on May 1st and 2nd in which we'll be obviously an active participant. But I think PJM has heard sort of the complete gamut of opinions on the impacts of subsidies to the wholesale markets.

We hear from some market participants that there is threat of state subsidies is in existential concern with respect to their business model and the markets as a whole because as Dr. Bowering [ph] put it in his latest data, the market report subsidies are contagious and one subsidy suppresses prices and leads to more subsidies, which further surprises prices, which leads to more subsidies and pretty soon you have nothing but state sponsored RMRs and no market left.

Then you hear the complete opposite opinion which is there our subsidies all over the place, this is just one more, it's not even that many megawatts, you're already along and so why would you want to do anything that would counter those subsidies and prop up the price and incentivize additional new entry when you're already clearing at a reserve margin of over 20%. So those are your two south poles.

I think from PJM standpoint, yeah, I think, while it may be the case that yes, we have had subsidies in the past, certainly there are the federal production tax credits for renewables, there are state renewable portfolio standards, which can act similarly to subsidy. There is a local tax abatements and the list goes on and on.

These state actions to preserve resources that may otherwise be economic, maybe significant enough to warrant a serious look at whether or not the markets need to adjust in order to handle the impact of those subsidies and the potential action stands and equally large range as the opinions on the impacts, because those who are in that camp are the real threat to the markets would say the only rationale response here is a minimum offer price rule that applies to any subsidized resource thereby protecting the markets and the price formation in the markets for long-term price formation. The other end of that spectrum by the way is, this is already in the markets, you don't need to do anything and really all the market should procure the residual that is necessary once all these subsidies cause the entry those resources that extremely low offers.

Those again are the two poles. From PJM standpoint, well, we are searching for is a way to recognize that states have legitimate public policy initiatives and objectives that they're looking to achieve, but harmonize the markets, so that they still perform the function that I think everybody agrees, they have been successful in performing which is long-term reliability at lowest reasonable cost to the consumer.

And for PJM's perspective, in the long term, we understand the concerns around efficient price formation, because so much of what the RPM capacity construct is built around is considering the long-term impacts of the year-by-year execution of the market. So that's why we think it is our serious consideration.

Getting to your question finally about the ISO New England proposal -- from just to state at the outset, New England is coming from a very different starting points. New England is really concerned mostly about new entry and subsidized new entry, subsidized -- sorry, suppressing the prices in the four capacity market.

PJM's concern at least what has been presented most recently with respect to state actions has to do more with subsidization of existing resources. New England already has a new unit minimum offer price rule, a new resource minimum offer price rule, there are some renewable exceptions for that rule, but they already have an existing rule. PJM does not have an existing unit minimum offer price rule.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01614

So, again, they're coming out from a different starting point, but having said that, I find their proposal very intriguing, I think it's worth a lot of discussion. I think it's very innovative and I think is a real effort to for lack of a better characterization sort of phase in. The new resources has other resources are willing to exit the market and retire, thereby, sort of, again, the intent being to maintain the supply and demand balance, even as subsidized resources come in and I think it's a fairly elegant way to go about it. I don't pretend to have thought through every potential implication. In fact, I know there are some opinions around this very table as to what those implications might be that frankly we did have to wrestle to the ground. So, like I said, more to discuss, but I think it's a innovative proposal that is very worthwhile that discussion.

PJM put out a sort of a capacity repricing proposal last August at a stakeholder form that we had. We've continued to kind of refine that. We will probably post a revision to it fairly soon here. That I think, again, there is additional discussion again, the idea being that we recognize the quantity of resources that are coming into the market are staying in the market by virtue of state actions, but at the same time try to insulate the price signal that comes out of the capacity market from the suppressive effects of that -- that state action.

So that's it, so what I'd think from a capacity market standpoint, it's looking at various ways to sort of get the right quantity, but maintain the right competitive price at the same time. I think maybe it's possible that the bigger impact here of these state actions are actually in the energy market and the suppressive effect that megawatts that would not otherwise be there are still there around the clock due to state action, and that's a much tougher enough to crack, but we're trying to kick around potential ways we might be able to facilitate things like a sub region of PJM states that wish to recognize carbon price, if you will, and their portion of the region and how we could actually make that fit within to the PJM market construct.

Those kinds of ideas, again, certainly nothing that I would consider a well-formed fully yet but those are the kinds of things we've been working on. So it's a pretty long-winded answer to your question Kit, but it's a big topic right now. We're spending a lot of time on it.

Kit Konolige, Senior Utilities Analyst

Well, no question, I was aware of that meeting and impact there was a kind of lunch panel in DC earlier this week, you may have been familiar with where the -- one of the two FERC members was there and other folks as well. And somebody were saying something to the effect of, well, you're just kind of what you said in describing one view of what could evolve namely everything, it's the potential is therefore a slow motion re-regulation that and, you know, one state gives what's in effect the PPA or a subsidy et cetera to one type of assets and then the next state does the same thing and pretty soon everybody is paying for all their capacity and energy through bilateral contracts or whatever. So it's obviously, if that -- even if we move in that direction at all obviously that can affect the outcome of the remaining merchant plants, so interesting, very interesting topic. Well, you guys have the complex models, so you can just punch it in and do it right?

So, okay, I just want to -- here is a specific question which I personally have wondered about this a little bit, but can you briefly describe determining NetCONE, what's the technology that's modeled there? Is that just a new gas plant for NetCONE?

Jeffrey Bastian, Manager, Capacity Market Operations

Hi, Kit. It's Jeff Bastian. Yeah the NetCONE is the combustion turbine cost that's the reference resource that we use -- I'm sorry, combustion turbine, yes.

Frederick S. Stu Bresler III, Senior Vice President

Yes. Not combined-cycle, combustion turbine.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01615

Kit Konolige, Senior Utilities Analyst

Combustion turbine. Fair enough. Okay. And then I think you described how that's done, right?

Frederick S. Stu Bresler III, Senior Vice President

Yes. What we do there, Kit, is every four years we go back and do sort of a bottoms-up, if you will, reconstruction of the gross cost of new entry for various locations on the PJM system. And then, we do an annual evaluation of the net energy and ancillary service revenues for that reference unit for those various locations on the system. And then that gives us a net cost of new entry for each of those reference units in each of those areas. And the gross CONE is adjusted by WEGF and CPIs, remember. It's some sort of inflationary index.

Jeffrey Bastian, Manager, Capacity Market Operations

Yeah. It's a combination of --

Frederick S. Stu Bresler III, Senior Vice President

Right, so lot of the -- if I should have mentioned this in my overview, a lot of the -- I mean, since a lot -- a few of the NetCONE values were reduced somewhat substantially, 12%, 17% in a couple of cases. That was not a result of the -- any change in the gross cost of new entry because those went up slightly, but there was a fairly significant increase in the energy and ancillary service offset in a couple of locations in PJM, for example in Southwest MAAC that caused a reduction in the NetCONE value.

Kit Konolige, Senior Utilities Analyst

Right. Right. How that -- you obviously have a projected reserve margin for this next auction, the upcoming auction, do you project it out for the years ahead as well?

Frederick S. Stu Bresler III, Senior Vice President

No. We do that on an annual basis. So and it's not a projection, really it's a requirement. We have an installed (technical difficulty) this is a requirement. And if we were to calculate that every year on the basis of updated input parameters like forced outage rates and load forecast there and those types of things and then once a year we reset it.

Kit Konolige, Senior Utilities Analyst

Great. Requested, just reviewing once more the demand response, bidding rule changes, I think this probably addresses the potential for, well, DR has to address the 100%. It has to be a CP and I guess it has to be or may have to be associated with other types of supply, right?

Frederick S. Stu Bresler III, Senior Vice President

Yeah. Demand response as a standalone resource must be annual in order to offer in next auction. In order to offer as a seasonal resource like summer only [ph], for example, it can do that in this auction, but it won't clear unless it can be

final
Bloomberg Transcript
Bloomberg

final

married up with a winter only resource on the basis of location megawatts and offer prices.

Kit Konolige, Senior Utilities Analyst

And do you expect any, well, there is always some impact, but what do you expect the impact to be on demand response and on renewables of the 100% CP requirement. I know -- you know, when you first started talking about it a lot of parties had objections on the ground that it would disadvantage these types of generation, what are you expecting as an actual outcome at this point. Is there going to be any kind of drop off, do you think in those sources or are suppliers adapting to it?

Frederick S. Stu Bresler III, Senior Vice President

Yeah. I mean, like anything else, we'll have to wait and see but I'm happy just to tell you what my thoughts would be or what a reasonable expectation might look like for -- for demand response, it's hard to see how we would get an increase and clear demand response last year to this year, where last year the base capacity category was available. This year it's not everything has to be annual except what can be aggregated or I think can be fairly certain that there is not going to be enough winter only to marry up with what might want to be summer only from a demand response perspective. So again, all things being equal, I would expect to see some level of reduction in clear demand response this year. It's very difficult to estimate by how much until we see how things come in.

With respect to renewables, I don't know that I would expect necessarily a reduction in wind, because of the 100% CP requirement. The requirement for wind to be 100% annual, the hardest -- harder period of the year for winter performance is summer. They actually perform better during the winter peak than they do during the summer peak. So as far as what can qualify as annual versus what can qualify as summer only base, I don't see there -- I don't see necessarily a reason to expect a drop-off there. We may actually see an increase in wind if there is some that actually does aggregate with summer only demand response by being the winter only, but again we want to see how that turns out.

And then, energy efficiency, the majority of the energy efficiency that I cleared before was already CP, because, again energy efficiency is largely a permanent reduction in consumption. So I'm not sure I see much of a reason for a drop-off there either.

Solar; right, solar might be a different story, because, again, it's very difficult for solar to be 100% annual, because it's actually more difficult for solar to perform during a winter peak before the sun comes up than during a summer peak, where it's in the heat of the afternoon.

(Multiple Speakers) So at least directionally those of you, my expectations --

Kit Konolige, Senior Utilities Analyst

Right.

Frederick S. Stu Bresler III, Senior Vice President

-- can be difficult to predict.

Kit Konolige, Senior Utilities Analyst

And to stick with the CP requirement for a second, my impression was in the last auction that there was some general, I don't know if I'd call it surprise, but some folks took note that many generators seem to not have to spend the whole lot

Bloomberg Transcript

of money to harden themselves, if you will, to approach -- to be comfortable with CP requirements. In other words, the backup systems whether it was a committed supply of gas or tanks on on-site et cetera were able to be put into place at a reasonable enough cost that that many generators see and seem to able to bid, you know, not at massively higher prices to recover their costs in that situation. Is that a correct characterization as -- are the fossil generators doing okay as far as complying with CP at a relatively small percent of their prior costs?

Frederick S. Stu Bresler III, Senior Vice President

Yeah. Again, it's difficult for us to really get a whole lot of visibility into what generators might be spending in order to achieve the CP requirements. And we asked the question, we've asked it multiple times and certainly we collectively get back and I think we've actually published in various forms. We've gone back and it's -- certainly it's in the hundreds of millions of dollars of investment that has taken place.

Again, just from what we're able to get back, but I certainly would not claim that is the full story or the full spend, because like I said there is no requirement for us -- for them to tell us what they're spending necessarily.

Having said that, it's going to be very interesting to see what the offer behavior looks like this year. I mean, I mentioned that there were some probably 20,000 plus megawatts of generation that classified [ph] not quite that much, but, you know 1,000 certainly make a -- thousands of megawatts of generation that cleared as base last year.

And a lot of that offered as either CP or base, but the base offer was the more economic one for us to take. Now that has to be 100% capacity performance, it will be interesting to see whether or not they still offer at a higher price for CP or whether -- the raise to the bottom that some of the generators have, I think offered experience with before where they just want to offer some that make sure that they clear kind of takes over.

So it's very difficult, Kit, to get a really good handle on whether the offers we get are really reflective of what costs might be experienced in order to manage CP risks because there is the competitiveness of the market, right, which is they are submitting an offer that they think is going to be competitive with other resources because in some cases, we just want to make sure they get a commitment.

Kit Konolige, Senior Utilities Analyst

Okay. I think that brings us to the end of the questions that I see here, so, and you've certainly answered all my questions. So Stu and team from PJM, really like to thank you on behalf of myself and all the clients we've had on the phone. I think this has been a great, really great (inaudible) position of what's coming up in the ever exciting RPM auctions. So, thanks again and look forward to talking to you soon.

Frederick S. Stu Bresler III, Senior Vice President

Okay. Thank you. And thank you everybody who was on the phone. It's, like I said, always a pleasure to have this opportunity.

Kit Konolige, Senior Utilities Analyst

Take care.

Frederick S. Stu Bresler III, Senior Vice President

All right. Bye-bye.

MANAGEMENT DISCUSSION SECTION

Christopher M. Crane

Business Performance Update

2016 was a monumental year for Exelon, and I'm very proud of what we have accomplished

We made great progress in the ongoing transformation of our company while delivering on our commitments

Earnings

- We performed well financially
- Our 2016 GAAP earnings at $1.22 and our non-GAAP earnings were $2.68, landing near the top of our original guidance range of $2.40 to $2.70

Segment Overview

- At the utilities, we benefited from a hot summer and low storm costs
- At ExGen, the nuclear fleet had its best performance year on record
- And at Constellation, the team executed very, very well
- In 2016, for the first time, our regulated utility, less the holding company, earnings represented more than half of the total earnings and is consistent with our goal for the utilities to be growing the majority of our EPS

Dividend and Acquisition of PHI

Bloomberg Transcript

- And we've implemented a dividend growth strategy of 2.5% annually through 2018
- In March, we closed on the acquisition of PHI, adding $8.3B to our utility rate base and creating a significant geographic footprint covering the Mid-Atlantic region
- The integration of PHI is going better than planned, help by our experience with BGE
- We are working our way through the first of the two cycles of catch-up rate cases at the PHI utilities
- We're seeing additional opportunities to help and improve the business processes in the stakeholder outreach process as we go through those rate cases

ZEC Programs

- The other banner highlight for 2016 was the creation of the ZEC programs in both New York and Illinois
- For years, we have argued that all clean energy resources be treated the same way for their environmental attributes
- We're able to work with a wide range of stakeholders in both states to enact programs that compensate these plans for their environmental attributes
- As a result of these programs, we plan to continue to operate five plants and protect high-paying jobs, preserve needed tax basis in rural communities and maintain irreplaceable emission-free base load power production
  - These programs provide a supplemental cash flow for up to 12 years for some of our most at-risk plants

Illinois Legislation

- Illinois legislation also provides significant benefit for our customers in energy efficiency, additional renewable generation and to benefit lower income customers
- The program also adds to the earnings visibility at ComEd by implementing a decoupling mechanism, supporting energy efficiency investments where we now will be able to earn a return on those investments, and extending the formula rate to 2022

CapEx Deployment

- In 2016, we also found ways to further grow stable revenue streams
- We deployed $5.2B of CapEx at the utilities, growing the rate base by $2B, acquired ConEd Solutions, and will close the FitzPatrick nuclear plant station this spring
- We have completed nine transmission and distribution rate cases, providing revenue increases of $397mm

Employee Recognition

- None of these accomplishments would be possible without the remarkable 34,000 employees that work hard every day to keep the power and gas flowing
- Our workers donated over 170,000 hours to local non-profits, and Exelon donated $46mm, both of which were the most ever for Exelon
- The commitment to our community is clearly part of who we are and shows our engagement beyond the products we deliver every day

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01621

- We also recognize that the support of our employees is essential to high-performing work cultures
  - And that is why Exelon took industry lead on two important initiatives in 2016
- We expanded our paid leave policies to what are truly the best in class, with 16 weeks of maternity leave, 8 weeks for fathers and adopted parents, and 2 weeks of family leave
- We were also the first utility to sign the White House Equal Pay pledge
- Being a good citizen also means supporting our local businesses
- In 2016, our spend with female and minority-owned businesses reached $1.9B, over 200% since 2011, and it represents almost 20% of our sourceable spending
- The team has done a great job making sure we work with our suppliers across all our communities
- Doing the right thing by our employees and communities is the smart thing for business
- And more importantly, it's the right thing to do
- We are proud to be leading the industry forward on these fronts

Utilities Business

- Turning to operations, our utilities had a great year
- The legacy Exelon utilities continued to perform at top quartile on key operating and customer satisfaction metrics
  - These are the foundations of a constructive regulatory relationship
- The efforts at PHI before the merger and our intense focus on operations since then has started to show benefits
- The color blocks are improving even compared to 2015, although we did get some help from favorable weather in 2016
- PHI is still improving
- We're encouraged by the gain so far, and we have plan in place to deliver for our customers and stakeholders
- The color blocks show great performance, but this actually is underselling how well we did in 2016
- We actually had a number of best-evers this year
- ComEd, BGE, PECO had had their best customer satisfaction ever
- ComEd and PHI outage frequency were the best ever
- And BGE had its shortest average outage duration ever
- The benefits of our uniform management model across the utilities, our smart grid initiative, and our continued reliability spending are clearly paying dividends for our customers

Non-Regulated Business Operations

- Turning to our non-regulated business operations, we had a banner year in generation as well
- Our nuclear fleet had its highest ever capacity factor at 94.6% vs. the industry average of 90.4%, which allowed us to produce an additional 7 terawatt hours more and approximately $275mm of revenue than if we had just been average

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01622

- We also had the shortest average refueling duration ever, just over 22 days vs. the industry average of 37 days
  - The fact the entire fleet performed so well against the backdrop of potential plant closures and fighting for ZECs is truly a testament to the professionalism of the workforce, which we all are greatly appreciative of
- Our gas, hydro, and renewable assets also had a good year, strong energy capture on the renewable and the power dispatch on our conventional plants

Constellation Business

- At Constellation, the team performed exceptionally well
- Our customer renewal rate was 77% for electric and 91% for gas
- Equally important, our new business win rate was at 28% last year, and our C&I market share grew to 25%

Jonathan W. Thayer

Financial Results and Guidance

My remarks today will focus on 2016 results, 2017 earnings guidance, and updates to a number of our financial disclosures including gross margin

Going forward, Q4 will be when we update key financial disclosures and roll our hedge disclosures over the year

Operating Earnings

- On slide 8, as Chris stated, we had a very strong year financially and operationally across the company
- For the full year, we delivered adjusted non-GAAP operating earnings of $2.68 per share, near the top end of our original guidance range of $2.40 to $2.70 per share
- Strong performance at both our utility and generation businesses drove these results
- The appendix contains further detail on both our fourth quarter and full-year financial results by operating company on slides 52 and 53

FY2017 Operating Earnings

- Turning to slide 9, we expect to deliver full-year 2017 adjusted operating earnings of $2.50 to $2.80 per share with Q1 in the range of $0.55 to $0.65 per share
- Our 2017 guidance range includes a full-year contribution from PHI, contributions from the FitzPatrick plants after closing, and the partial year impacts of the New York and Illinois ZEC programs that start on April 1 and June 1 respectively
- The growth in utility earnings primarily reflects continued reliability investments at ComEd, plus higher formulaic allowed ROEs, as well as increased rates from the recent distribution rate cases at BGE, ACE, and Pepco Maryland
  - These are partially offset by higher O&M at PECO and BGE related to a return to normal storing costs after a calmer 2016, as well as higher depreciation and amortization driven by CapExs

final
Bloomberg Transcript
Bloomberg

- At Exelon Generation, the y-over-y decrease is primarily driven by the impact of hedging into lower energy prices, partially offset by revenues from the New York and Illinois ZEC programs as well as the new Texas CCGTs coming online this summer
- More detail on the y-over-y drivers by operating company can be found on the appendix starting on slide 55

CapEx

- On slide 10, let's turn to our updated multi-year forecast, and we'll cover 2017 to 2020 and provide a refresh of what we shared with you at the Analyst Day
- For your convenience, in the appendix, we show these updated numbers side-by-side against the Analyst Day numbers
- We'll invest more than $20B into our utilities to the benefit of our customers over the next four years, which is a slight increase since Analyst Day
- Upside comes from the Future Energy Jobs Bill in Illinois, which will allow ComEd to grow rate base and earn a fair rate of return on energy efficiency investments
- We now project rate base growth of 6.5% through 2020

Rate Base Growth

- On slide 11, of the $9B of rate base growth expected through 2020, approximately 75% is covered under either formula rates or other similar types of mechanisms
- These timely recovery mechanisms allow us to make additional investments on the behalf of our customers while supporting our ability to earn our allowed ROE
- Where we do not have mechanisms, we will continue to work with stakeholders to enact and implement these types of tools
- I should also note that following the passage of the Illinois legislation, more than 70% of our rate base is decoupled

Transmission-Distribution Earned Book ROE

- On slide 12, we showed the trailing 12-month blended transmission-distribution earned book ROE at each of the PHI utilities relative to their allowed ROEs
- ROEs at PHI have improved modestly, but there's still much work to be done
- Legacy Exelon utilities had a strong 2016, earning 10.5% as a group, helped by favorable weather and lower-than-normal storm activity
- On a weather-normalized basis, the earned returns or ROEs would be closer to 10.1%
- Improving the earned ROEs at PHI and sustaining a strong performance of the legacy Exelon utilities will be important to meeting our overall utility earnings growth targets
- Going forward, we will provide a slide on a quarterly basis to keep you updated on the progress we're making from an earned returns perspective

Current Rate Cases

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01624

- On slide 13, we have an update on our current rate cases that are still in progress
- Since our last update, we have completed two of the pending rate cases, the Pepco Maryland case was decided in November and we received $52.5mm revenue increase
- In addition, the ComEd annual formula rate filing was settled in December with an increase of $127mm related to approximately $2.4B in capital investments made in 2015
  - Those investments which includes $663mm for smart grid-related work has helped strengthen and modernize the electric system
- We still have four pending rate cases at Pepco and Delmarva, combined we're asking for $216mm in revenues, which reflects recovery on multiple years of smart meter and other capital investments that have been made to improve the reliability of the grid across these jurisdictions
- We expect the final ruling on the Delmarva Maryland case in mid-February, with the remaining cases being completed over the summer
- More details on the rate cases can be found on slide 61 through 66 in the appendix
- Consistent with our previous discussions, we expect to file rate cases in each of the PHI jurisdictions again in 2017, as we continue to close the gap between allowed and earned ROEs

Utility EPS Outlook

- Slide 14 provides an update on our outlook for utility EPS
- The bars are largely the same as in Analyst Day, albeit $0.05 higher in 2017 and 2020
- The increase in 2017 is due to continued cost management efforts; and the increase in 2020 is due to ComEd ROEs and efficiency-related investments
- With a higher 2017 starting point, we now project strong 6% to 8% utility EPS growth through 2020

Gross Margin Disclosures

- Turning to slide 15, we've modified our gross margin disclosures for ExGen
- We now include a new line that carves out capacity and ZEC revenues
- ZEC revenues are the payments Exelon receives in New York and Illinois for the beneficial environmental attributes of our nuclear plants
  - The purpose of this new line item is to clearly call out the portion of our gross margin that is more contracted in nature
- As a result of including ZEC revenues from New York and Illinois, the FitzPatrick acquisition and the reserved – reversal of the shutdown decisions of Quad Cities and Clinton, total gross margin increased by $650mm, $1.05B and $1.1B in 2017, 2018 and 2019 respectively
- Almost all the gross margin changes relate to the fleet updates with changes in power prices, adding $50mm in 2018 and costing us $50mm in 2019

O&M Outlook

final
Bloomberg Transcript
Bloomberg

- Turning to slide 16, on our last earnings call, we announced we were reducing O&M by $100mm in 2018 and $125mm in 2019 at ExGen, adding to the $400mm of savings we've already taken out of the business
- The baseline O&M outlook remains the same from last quarter, although the total O&M cost outlook has increased with the addition of the FitzPatrick, Quad Cities, and Clinton power stations which we break out on the slides for your reference
- Our baseline capital spend is decreasing through 2020, driven by the proactive investments we've made in our nuclear fleet over the years
  - These investments have resulted in best-in-class performance and reduced risks for significant unplanned capital spend in the future

Investments

- On slide 40, we provide greater detail on these investments and the impact they have had on the nuclear fleet since 2010
- We continue to run an efficient organization, and we'll always look for ways to reduce costs and run the fleet more cost effectively while maintaining the highest standards for safety and reliability

FCF

- Turning to slide 17, ExGen will generate nearly $7B of FCF through 2020, which is more FCF for that time period than what was included in our Analyst Day disclosure
- This is primarily driven by the incremental cash associated with the New York and Illinois ZEC programs, partially offset by the impacts of lower power prices in the outer years
- As we've said before, we will use ExGen's FCF to fund utility investment and pay down over $3B of debt through 2020

Balance Sheet

- Turning to slide 18, we remain committed to maintaining a strong balance sheet and our investment-grade credit rating
- We are forecasting to be at 3.3 times debt-to-EBITDA at ExGen by the end of 2017 and have a clear path to our long-term target of 3 times debt-to-EBITDA
  - As we've said before, we will look to retire holding company debt once we've reached the 3 times target at ExGen
- From a recourse perspective, we are already below the 3 times debt-to-EBITDA level at 2.7 times, as shown here on the slide
  - This ratio will continue to decline as well with the paydown of debt to reach our consolidated 3 times target
- The health of our ExGen balance sheet is strong and is continuing to improve

Potential Impacts of Tax Reform Legislation

- Before I turn the call over to Chris, I'd like to spend a few minutes on the potential impacts of tax reform legislation of Exelon, which has been a topic of discussion since the election

final
Bloomberg Transcript
Bloomberg

- Research reports and our peers who have already reported earnings have discussed the impacts to the sector and their businesses
- From a policy perspective, we think simplifying the tax code and lowering rates is the right objective
- We are actively working with our partners at EEI and NEI and on our own to help inform the ultimate tax design
- No legislation has been introduced at this time, so no details on exactly what will be included or how it will be => included is available beyond the short description of the Trump plan or the House blueprint
  - In fact, just last week, Senate Finance Committee Chairman Hatch said he's not planning on using the House legislation as a starting point
- So the Senate will have its own bill, and there's no proposal for that bill at this time
- And President Trump's economic team has stated that they will have their own views on tax reform once they're in place
- At this time, there's no way to know what a tax reform package will look like or how long it will take to advance, which leads us to the mindset that is premature to quantify how tax reform will impact Exelon's financial outlook
- We run a wide range of scenarios to understand the high-level impacts of common themes in the House and Trump plans
- The House blueprint, excluding order adjustment provisions, will be neutral for our utilities, neutral to positive at the GenCo, and negative at the holding company due to the elimination of all interest deductibility
- Order adjustment will be an additional negative at ExGen due to the importation of nuclear fuel, and at that the utilities would raise the cost of imported T&D capital equipment that goes in the rate base
- We've seen significant opposition to both the border adjustment and elimination of interest expense deductibility recently, leaving the fate of these provisions unclear
- To the extent the Trump campaign becomes the basis of legislation and the election is made to take interest deductibility rather than immediately expense capital additions, it could be meaningfully positive to Exelon's earnings
- We see a long path until tax policy has clarity
- We'll continue to advocate for the best interest of our customers and shareholders as legislation is developed

Christopher M. Crane

Closing Remarks

Rate Base and EPS

- This is Exelon's value proposition, and we are not wavering from these commitments
- Strong utility growth, we expect to grow the rate base at 2.5% annually through 2020 – at 6.5%
- Dan caught that one right away, 6.5% annually through 2020, which converts to EPS growth off our 2017 midpoint of 6% to 8% a year
- We will continue to look for opportunities to invest in reliability and customer service

final
Bloomberg Transcript
Bloomberg

FCF

- ExGen is expected to generate nearly $7B of FCF through 2020, which is better than we had budgeted at the Analyst Day
  - We will use this FCF primarily to invest in the utilities, pay down over $3B of debt over the next years
- And we will continue to optimize the value of ExGen through best-in-class operating like we saw in 2016, capturing the benefits of our gen-to-load matching strategy, and fair compensation for our clean energy assets, similar to what we've accomplished in Illinois and New York

Balance Sheet and Capital Allocation Priorities

- We remain focused on the balance sheet and are comfortably exceeding our credit metrics targets over the planning horizon
- And our capital allocation priorities will remain the same:
  - Regulated utility growth
  - Dividend growth
  - And debt reduction
- The leadership team firmly believes we can deliver on these commitments to our shareholders
- Our executive compensation is directly tied to these goals, with the long-term components driven by hitting the multi-year earnings targets at the utilities which ensures we grow this business as we've committed to you
- Meeting our targets improvements in earned ROEs at the utilities, which ensure we turn around the performance of the PHI utilities and maintain a strong investment grade credit metrics, which ensures the financial health of the business, no matter what the commodity price backdrop is

Long-Term Compensation

- Finally, our long-term compensation will be adjusted point per point with the three-year performance relative to the UTY, meaning that we are directly aligned with the long-term shareholders
- I'm proud of everything that this team has accomplished in 2016 and very excited about the plan we have in place for the future

QUESTION AND ANSWER SECTION

<Q - Greg Gordon>: Just a couple of quick questions as you guys were pretty thorough. So, can you give us an update on where you were on some of the tactical decisions you've made to sell down or exit from certain businesses, both the sell-down of the renewables business and the process on Mystic?

<A - Jonathan W. Thayer>: Greg, it's Jack. I'll take that. So, I'll start with the renewables. I think it's been widely reported that that we've been in the markets talking about a joint venture for our renewables business, and that process is going well. We want to maintain a stake in that business as it's important to our overall participation in the energy complex.

We do have a significant amount of project-level debt on those projects. So there is a thinner equity layer on top of that. So the proceeds, while meaningful, will be used for debt reduction. We'd expect that to be a very positive event for the company.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01628

With respect to the Mystic process, that process continues to be underway. We've had broad interest in those assets as they play a key role in that needful market in Downtown Boston. We continue to work with the various stakeholders to draw it to a conclusion. And we look forward to that having a favorable outcome as well here.

<Q - Greg Gordon>: Jack, can you give us any insight as to why it's taken longer than maybe we had initially expected when we – when you first articulated a desire to potentially sell those assets, it was at the EEI last year. And there was the potential for sort of an event early in Q1, and we still haven't seen that. And then, even if you were to get a deal tomorrow, given the lack of a quorum at the FERC, what are we looking at in terms of realistic timing to actually come to a closing of a transaction there?

<A - Christopher M. Crane>: So, if we did openly talk about it after it had been leaked and figured we get that out there, but there is no fire sale here. We need to take our time and go through the process and make sure we obtain the right value for us and for all involved in it, so working through it, and we'll keep you informed when we're at a closure.

<Q - Greg Gordon>: Okay. But assuming you got a price that was accretive to what you think the implied value is today for ExGen, that would accelerate the deleveraging that you're talking about here on slide 18 in the handout, right?

<A - Jonathan W. Thayer>: That's correct, Greg.

<Q - Greg Gordon>: Okay. Fantastic. And the growth rate target for the utility now, that's just clearly a function of having a higher base in 2017, you're $0.05 higher in 2020. So, the headline number is not a reduction in the expectations, it's just algebra, right?

<A - Jonathan W. Thayer>: That's correct. And you'll know with the passage of Illinois legislation and the energy efficiency programs, the solar programs we added to CapEx at ComEd, rather substantively throughout the curve. I think it's also important to note, we have a pretty conservative policy on only putting into our CapEx forecast the utilities, plants that are fully formed for capital investment. So, as time progresses and as we see opportunities to invest in the behalf of our customer, there are the opportunities for that rate base and capital budget to grow in those outer periods.

<Q - Jonathan Philip Arnold>: Can I ask, Jack, I noticed you mentioned that the – that debt reduction target on slide 17 is now ExGen and HoldCo, and I think before it was just ExGen, so just to confirm that – if that is the case. And secondly, how much of the $3B roughly is it going to take to get to the 3x debt-to-EBITDA target? So, how much is therefore left over for HoldCo on the current plan?

<A - Jonathan W. Thayer>: So, Jonathan your first comment is correct. We previously were talking about retiring debt at the GenCo, now we see the opportunity once we achieved 3 times debt-to-EBITDA to retire debt at the holding company. With respect to the debt retired – we'll retire at the holding company, we have $900mm maturity in 2020, where I think you could see us potentially retire debt or some component of debt, and we're looking at opportunities with use of proceeds from a variety of strategic activities that we have ongoing to address the roughly $600mm of ExCorp that's not tied to the mandatory convertibles reissuance of $1.15B in 2017.

<Q - Jonathan Philip Arnold>: What's roughly the timing that you see in this kind of – through 2020 outlook that you'd get to 3x on the GenCo absent an asset sale?

<A - Jonathan W. Thayer>: I think it's – I think – I think we can get there through cash generation I think over the next, say, two to three years. And then, we can – as we get out in the 2019, 2020, we can work against the holding company.

<Q - Jonathan Philip Arnold>: Okay. Great. Thank you. And then, if I could ask one other thing on – can you give us any sort of thoughts around potential for other states to consider New York and Illinois style nuclear measures?

<A - Joseph Dominguez>: Jonathan, this is Joe Dominguez. Right now, active discussions are occurring in Connecticut which is probably the most advanced. We believe those discussions will be started in Ohio, already have been relatively shortly in New Jersey and in Pennsylvania. I think all of the states, as Chris indicated before, states that

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01629

understand the value of the nuclear plants and want to keep these plants operational, and so the level of discussion is at different stages, some with fully formed legislation that's already moving through committee, that's the case in Connecticut, and stakeholder average [indiscernible] (32:16).

<Q - Steve Fleishman>: Great. Just a couple of nuclear questions. First, could you give a sense on the appeal process on the ZECs, I guess, in New York, and when we should know from the court kind of roughly either way on the ruling both, I guess, your motion to dismiss and then an actual ruling?

<A - Joseph Dominguez>: So in the Federal Court action in New York, as you noted, a motion to dismiss has been filed. That's been fully briefed. I know a number of you have asked for the briefing packages, and those are available to anybody who would like them. We feel very strongly about our case and we believe it should be dismissed on that motion. But if it proceeds to trial, that trial will occur through to the balance of Q2, and we would expect a decision sometime this summer.

<Q - Steve Fleishman>: Okay. And then just more broadly on nuclear, there's been talk of the Trump administration wanting to do something for nuclear. Is there any better visibility on what they might be looking at or things that you might be suggesting?

<A - Christopher M. Crane>: There hasn't been any concrete conversations, just a preliminary recognition of what's going on in the marketplace and the need to maintain the diverse power sources, looking at the economics, local economics of them and the benefit to the customer. So just starting, a lot more dialogue will happen with NEI and the administration, and we're staying involved with NEI and also with our own folks interfacing with the administration.

<Q - Steve Fleishman>: Okay, one separate question on tax reform. I know you don't want to get into specifics, but just if we think about your company and the issues you care most about getting fixed or adjusted, are there any particular ones that you're most focused on addressing of the different factors that you mentioned?

<A - Christopher M. Crane>: Yes, we think Jack did a good job framing up why it's really premature for us to get point to point. I spent a lot of time on my own and with the EEI leadership in DC to look at this effect on utilities, utility customers, and what has happened in 1986 tax bill. So there are certain things in the regulated space that create a difference. I'm sure a lot of industries are trying to say they're different. But surely back in 1986, the insurance industry and the utility industry, the regulated utility industry was recognized as an exemption or a different methodology.

So that kind of conversation is happening within the process. It's not right to have a debate across the table until we have a bill, but coalescing under Tom Kuhn's leadership and the EEI executive leadership and board, we're working through those issues. Everybody is for a lower corporate tax rate. That's an easy one. Jack talked about the probability of the blueprint staying the way it is now vs. after the sausage is made. It's something we'll just have to stay engaged and follow. But you reduce an interest deduction from a utility, and that automatically goes on to the customer, and we've got to make sure it's not an unintended tax increase for the customer and we just have to work through those details.

<Q - Julien Dumoulin-Smith>: Hey, maybe quickly following up on the last one here with Steve, can you elaborate a little bit on what the read-through would be from the litigation in New York vis-à-vis Illinois? Would there be an immediate impact, or how are you thinking about this perhaps across the various ways it could play out? And I've got a follow-up back.

<A - Joseph Dominguez>: Julien, this is Joe. The programs in New York and Illinois are very similar. They're both based on paying for the environmental attribute based on the social cost of carbon. And so the read-through is that when we are successful in New York, we think it will be a very helpful precedent to challenge the Illinois legislation.

<Q - Julien Dumoulin-Smith>: Got it, excellent. And then just following up here on Greg's earlier question, just to establish a little bit of a baseline, how are you thinking about your portfolio evolution given the need to backstop the broader retail business? Are basically all combined cycles, broadly taking here, something that could be looked at? And then also at the same time, how are you thinking about the expansion of the retail business? Obviously, there have been

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01630

some headlines out there on that as well.

<A - Joseph Nigro>: Julien, good morning. It's Joe Nigro. Broadly, we look at our asset portfolio on an annual basis and we look across our nuclear fleet through to our fossil and renewable fleet. And strategically, you've seen some of the assets that we've divested through time here, and I will tell you it hasn't had a material impact on managing our retail portfolios, given that we carry a lot of what I would call optionality in our portfolio with the generation assets.

And then additionally, when we need to, we will go to market to augment with additional products. So we're very comfortable where we are and we continue to strategically look at our portfolio. And if the market is willing to pay for something maybe more than we have value on, then we'll take that into account, make the decisions necessary recognizing that we do need to continue to manage our business. And I'm sorry, the question on...

<A - Christopher M. Crane>: Retail growth.

<A - Joseph Nigro>: Retail growth, we're now – our C&I business is, as Jack mentioned or Chris mentioned in the script, we're about 25% of the market share in C&I. Our margins remained stable in that $2 to $4 origination range, and we continue to monitor that very closely. You heard what our renewal rates are and our win rates are, and they're in line with what we've laid out in the Analyst Day, and we're very comfortable with the plan that we have in place as we move through 2017. We'll continue to monitor that, but right now, we're very happy with where we are.

<Q - Julien Dumoulin-Smith>: And you wouldn't necessarily take this out a little further, acquisitive expansions in addition to organic, and maybe that's a good kind of segue into thinking about – what kinds of targets are you thinking about on a volumetric basis for the volumes in aggregate as we move through time?

<A - Joseph Nigro>: We've given you the volumes, and I think previously – and we rolled them out again at the EEI, and we're very comfortable with where we are on the volume scale. I would tell you, you continue to see consolidation in the retail market, you see some generation entrance that have bought entities, existing entities, not really creating their own retail platform, so there's really no change there.

As you know, we've bought a few in the last few years, and we see the consolidation. We'll continue to hunt for those if the opportunity is right, and we see value and it fits our portfolio in what we're trying to achieve with the customer. And we'll remain disciplined with that. With our acquisition a few years ago of Integrys, and recently, last year with ConEd, we've been very happy with that outcome and the way they've integrated into our portfolio, and we'll continue to look for those type of opportunities.

<Q - Michael Weinstein>: I was wondering if you could comment a little bit on the impact or the impacts of lower load growth and capacity performance in the PJM, upcoming PJM capacity auction. And separately, FERC recently rejected the MISO proposal for a competitive retail solution in certain zones. One of the criticisms, I think, FERC had in the rejection was that it was not broad enough throughout MISO. I'm just wondering if there's any potential for some kind of broader forward auction system throughout the entire Midwest ISO.

<A - Joseph Nigro>: Yeah. Good morning, Michael. It's Joe Nigro. I'll take the first question on PJM, and then I'll hand it off up to Joe Dominguez, and he can talk a little bit about the MISO question. From a PJM perspective, there is a lot of moving pieces, the load came in, as was previously announced, down about 3.5 gigawatts or 2%. So, that wasn't unexpected. We cleared about 27 gigawatts of non-CP supply last year or 16% of what cleared, and as you mentioned, that will be 100% CP this year. that's obviously a positive change when you think about price. There were some movement in the import capabilities. We saw it shrink some into the ComEd zone. And we saw it increased slightly into eastern Mass., so that has an offsetting effect in those two areas.

I guess the big thing is it remains around the two biggest variables which are the bidding behavior, and as you know, y-over-y, the energy rents are down, given how low the prices were on coal last year, and then additionally, what the new build is. And we continue to struggle to see how the economics of that new build works, given how marginal it is at best with where the market is on a forward basis. So, putting that all together, there's a lot of moving pieces where our long-standing policy is really not to try to forecast that, but there's a lot of puts and takes that we're evaluating as we go through this.

Bloomberg
SI-SSA-0015-01631

<A - Joseph Dominguez>: And Michael, this is Joe Dominguez, the short answer to your question is, no, I don't see a likelihood that we will see, as a result of this FERC order, an expansion of the proposals for what was effectively Southern Illinois and Michigan across all – with MISO. I could go into a little bit more detail but the answer is no.

<Q - Shahriar Pourreza>: Just real quick on the $0.32 that you're now guiding on ZECs and FitzPatrick, can you – are you embedding any sort of synergies of owning Nine Mile and FitzPatrick within the same portfolio, or you're still kind of looking at this opportunity?

<A - Jonathan W. Thayer>: We're still looking at the opportunity, we're in the process of integrating that plans and that's going quite well. We've got to close the acquisition in March. Obviously, given its proximity to our Nine Mile units, we anticipate that there may be opportunities as we get in there and optimize the operations.

<Q - Shahriar Pourreza>: Okay. Got it. And then, Joe, can you just real quick handicap Pennsylvania, maybe from a potential timing or when we can see something? Are we looking at an adjustment to the RPS to include the nuclear, or is it more of a function of sort of a similar ZEC-type program?

<A - Joseph Dominguez>: I think historically what we've done is we've begun the discussion, and the first stage of the discussion is establishing a recognition that nuclear is the lowest cost and most reliable zero-carbon option for our customers, that's where we are in Pennsylvania. The next stage, I think we'll start getting into different solution sets, and you've identified a few, right. So, you could look at something that's similar to the ZEC programs that have been adopted. You can include nuclear as a qualifying resources and RPSs. And it's way too early for me to handicap where that discussion is going to go. There are a lot of different stakeholders. What's important to us is syncing effectively the first concept, which is that nuclear needs to be treated on a level playing field with other non-emitting resources. That will be the first objective in having that discussion. And then, I think, I can ask, as we move through this and in subsequent calls, we could talk about a bit more about how we handicap the options and outcomes.

MANAGEMENT DISCUSSION SECTION

Operator

Good morning. My name is Stephanie, and I will be your conference operator today. At this time, I would like to welcome everyone to the Exelon Corporation 2016 Q4 earnings call. All lines have been placed on mute to prevent any background noise. After the speakers' remarks, there will be a question-and-answer session. [Operator Instructions]

Thank you. I would now like to turn the call over to Dan Eggers. Please go ahead, sir.

Daniel L. Eggers

Thank you, Stephanie. Good morning, everyone, and thank you for joining our fourth quarter 2016 earnings conference call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer, and Jack Thayer, Exelon's Chief Financial Officer. They're joined by other members of Exelon's senior management team, who will be available to answer your questions after our prepared remarks.

We issued our earnings release this morning along with the presentation, both of which can be found on the Investor Relations section of Exelon's website. The earnings release and other matters which we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material and comments made during the call. Please refer to today's 8-K and Exelon's other SEC filings for discussions of risk factors and factors that may cause results to differ from management's projections, forecasts, and expectations.

Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for reconciliations between non-GAAP measures to the nearest equivalent GAAP measures. We have scheduled 45 minutes for today's call.

Bloomberg Transcript

I'll turn it now over to Chris Crane, Exelon's CEO.

Christopher M. Crane

Thanks, Dan, and good morning to all. Thank you for joining us. 2016 was a monumental year for Exelon, and I'm very proud of what we have accomplished. We made great progress in the ongoing transformation of our company while delivering on our commitments. We performed well financially. Our 2016 GAAP earnings at $1.22 and our non-GAAP earnings were $2.68, landing near the top of our original guidance range of $2.40 to $2.70.

At the utilities, we benefited from a hot summer and low storm costs. At ExGen, the nuclear fleet had its best performance year on record. And at Constellation, the team executed very, very well.

In 2016, for the first time, our regulated utility, less the holding company, earnings represented more than half of the total earnings and is consistent with our goal for the utilities to be growing the majority of our EPS. And we've implemented a dividend growth strategy of 2.5% annually through 2018.

In March, we closed on the acquisition of PHI, adding $8.3 billion to our utility rate base and creating a significant geographic footprint covering the Mid-Atlantic region. The integration of PHI is going better than planned, help by our experience with BGE. We are working our way through the first of the two cycles of catch-up rate cases at the PHI utilities. We're seeing additional opportunities to help and improve the business processes in the stakeholder outreach process as we go through those rate cases.

The other banner highlight for 2016 was the creation of the ZEC programs in both New York and Illinois. For years, we have argued that all clean energy resources be treated the same way for their environmental attributes. We're able to work with a wide range of stakeholders in both states to enact programs that compensate these plans for their environmental attributes. As a result of these programs, we plan to continue to operate five plants and protect high-paying jobs, preserve needed tax basis in rural communities and maintain irreplaceable emission-free base load power production. These programs provide a supplemental cash flow for up to 12 years for some of our most at-risk plants.

Illinois legislation also provides significant benefit for our customers in energy efficiency, additional renewable generation and to benefit lower income customers. The program also adds to the earnings visibility at ComEd by implementing a decoupling mechanism, supporting energy efficiency investments where we now will be able to earn a return on those investments, and extending the formula rate to 2022.

In 2016, we also found ways to further grow stable revenue streams. We deployed $5.2 billion of CapEx at the utilities, growing the rate base by $2 billion, acquired ConEd Solutions, and will close the FitzPatrick nuclear plant station this spring. We have completed nine transmission and distribution rate cases, providing revenue increases of $397 million.

None of these accomplishments would be possible without the remarkable 34,000 employees that work hard every day to keep the power and gas flowing. Our workers donated over 170,000 hours to local non-profits, and Exelon donated $46 million, both of which were the most ever for Exelon. The commitment to our community is clearly part of who we are and shows our engagement beyond the products we deliver every day.

We also recognize that the support of our employees is essential to high-performing work cultures, and that is why Exelon took industry lead on two important initiatives in 2016. We expanded our paid leave policies to what are truly the best in class, with 16 weeks of maternity leave, 8 weeks for fathers and adopted parents, and 2 weeks of family leave. We were also the first utility to sign the White House Equal Pay pledge.

Being a good citizen also means supporting our local businesses. In 2016, our spend with female and minority-owned businesses reached $1.9 billion, over 200% since 2011, and it represents almost 20% of our sourceable spending. The team has done a great job making sure we work with our suppliers across all our communities. Doing the right thing by our employees and communities is the smart thing for business. And more importantly, it's the right thing to do. We are proud to be leading the industry forward on these fronts.

final

Bloomberg
SI-SSA-0015-01634

Turning to operations, our utilities had a great year. The legacy Exelon utilities continued to perform at top quartile on key operating and customer satisfaction metrics. These are the foundations of a constructive regulatory relationship. The efforts at PHI before the merger and our intense focus on operations since then has started to show benefits.

The color blocks are improving even compared to 2015, although we did get some help from favorable weather in 2016. PHI is still improving. We're encouraged by the gain so far, and we have plan in place to deliver for our customers and stakeholders.

The color blocks show great performance, but this actually is underselling how well we did in 2016. We actually had a number of best-evers this year. ComEd, BGE, PECO had had their best customer satisfaction ever. ComEd and PHI outage frequency were the best ever. And BGE had its shortest average outage duration ever. The benefits of our uniform management model across the utilities, our smart grid initiative, and our continued reliability spending are clearly paying dividends for our customers.

Turning to our non-regulated business operations, we had a banner year in generation as well. Our nuclear fleet had its highest ever capacity factor at 94.6% versus the industry average of 90.4%, which allowed us to produce an additional 7 terawatt hours more and approximately $275 million of revenue than if we had just been average. We also had the shortest average refueling duration ever, just over 22 days versus the industry average of 37 days. The fact the entire fleet performed so well against the backdrop of potential plant closures and fighting for ZECs is truly a testament to the professionalism of the workforce, which we all are greatly appreciative of.

Our gas, hydro, and renewable assets also had a good year, strong energy capture on the renewable and the power dispatch on our conventional plants.

At Constellation, the team performed exceptionally well. Our customer renewal rate was 77% for electric and 91% for gas. Equally important, our new business win rate was at 28% last year, and our C&I market share grew to 25%.

Now, I'm going to turn the call over to Jack to provide the financial update.

Jonathan W. Thayer

Thank you, Chris, and good morning, everyone. My remarks today will focus on 2016 results, 2017 earnings guidance, and updates to a number of our financial disclosures including gross margin. Going forward, the fourth quarter will be when we update key financial disclosures and roll our hedge disclosures over the year.

On slide 8, as Chris stated, we had a very strong year financially and operationally across the company. For the full year, we delivered adjusted non-GAAP operating earnings of $2.68 per share, near the top end of our original guidance range of $2.40 to $2.70 per share.

Strong performance at both our utility and generation businesses drove these results. The appendix contains further detail on both our fourth quarter and full-year financial results by operating company on slides 52 and 53.

Turning to slide 9, we expect to deliver full-year 2017 adjusted operating earnings of $2.50 to $2.80 per share with the first quarter in the range of $0.55 to $0.65 per share. Our 2017 guidance range includes a full-year contribution from PHI, contributions from the FitzPatrick plants after closing, and the partial year impacts of the New York and Illinois ZEC programs that start on April 1 and June 1 respectively.

The growth in utility earnings primarily reflects continued reliability investments at ComEd, plus higher formulaic allowed ROEs, as well as increased rates from the recent distribution rate cases at BGE, ACE, and Pepco Maryland. These are partially offset by higher O&M at PECO and BGE related to a return to normal storing costs after a calmer 2016, as well as higher depreciation and amortization driven by capital expenditures.

At Exelon Generation, the year-over-year decrease is primarily driven by the impact of hedging into lower energy prices, partially offset by revenues from the New York and Illinois ZEC programs as well as the new Texas CCGTs coming online this summer. More detail on the year-over-year drivers by operating company can be found on the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01635

appendix starting on slide 55.

On slide 10, let's turn to our updated multi-year forecast, and we'll cover 2017 to 2020 and provide a refresh of what we shared with you at the Analyst Day. For your convenience, in the appendix, we show these updated numbers side-by-side against the Analyst Day numbers.

We'll invest more than $20 billion into our utilities to the benefit of our customers over the next four years, which is a slight increase since Analyst Day. Upside comes from the Future Energy Jobs Bill in Illinois, which will allow ComEd to grow rate base and earn a fair rate of return on energy efficiency investments. We now project rate base growth of 6.5% through 2020.

On slide 11, of the $9 billion of rate base growth expected through 2020, approximately 75% is covered under either formula rates or other similar types of mechanisms. These timely recovery mechanisms allow us to make additional investments on the behalf of our customers while supporting our ability to earn our allowed ROE. Where we do not have mechanisms, we will continue to work with stakeholders to enact and implement these types of tools. I should also note that following the passage of the Illinois legislation, more than 70% of our rate base is decoupled.

On slide 12, we showed the trailing 12-month blended transmission-distribution earned book ROE at each of the PHI utilities relative to their allowed ROEs. ROEs at PHI have improved modestly, but there's still much work to be done. Legacy Exelon utilities had a strong 2016, earning 10.5% as a group, helped by favorable weather and lower-than-normal storm activity.

On a weather-normalized basis, the earned returns or ROEs would be closer to 10.1%. Improving the earned ROEs at PHI and sustaining a strong performance of the legacy Exelon utilities will be important to meeting our overall utility earnings growth targets. Going forward, we will provide a slide on a quarterly basis to keep you updated on the progress we're making from an earned returns perspective.

On slide 13, we have an update on our current rate cases that are still in progress. Since our last update, we have completed two of the pending rate cases, the Pepco Maryland case was decided in November and we received a $52.5 million revenue increase. In addition, the ComEd annual formula rate filing was settled in December with an increase of $127 million related to approximately $2.4 billion in capital investments made in 2015. Those investments which includes $663 million for smart grid-related work has helped strengthen and modernize the electric system.

We still have four pending rate cases at Pepco and Delmarva, combined we're asking for $216 million in revenues, which reflects recovery on multiple years of smart meter and other capital investments that have been made to improve the reliability of the grid across these jurisdictions.

We expect the final ruling on the Delmarva Maryland case in mid-February, with the remaining cases being completed over the summer. More details on the rate cases can be found on slide 61 through 66 in the appendix.

Consistent with our previous discussions, we expect to file rate cases in each of the PHI jurisdictions again in 2017, as we continue to close the gap between allowed and earned ROEs.

Slide 14 provides an update on our outlook for utility EPS. The bars are largely the same as in Analyst Day, albeit $0.05 higher in 2017 and 2020. The increase in 2017 is due to continued cost management efforts; and the increase in 2020 is due to ComEd ROEs and efficiency-related investments. With a higher 2017 starting point, we now project strong 6% to 8% utility EPS growth through 2020.

Turning to slide 15, we've modified our gross margin disclosures for ExGen. We now include a new line that carves out capacity and ZEC revenues. ZEC revenues are the payments Exelon receives in New York and Illinois for the beneficial environmental attributes of our nuclear plants. The purpose of this new line item is to clearly call out the portion of our gross margin that is more contracted in nature. As a result of including ZEC revenues from New York and Illinois, the FitzPatrick acquisition and the reserved – reversal of the shutdown decisions of Quad Cities and Clinton, total gross margin increased by $650 million, $1.05 billion and $1.1 billion in 2017, 2018 and 2019 respectively. Almost all the gross margin changes relate to the fleet updates with changes in power prices, adding $50 million in 2018 and costing us $50 million in 2019.

final

Bloomberg

Turning to slide 16, on our last earnings call, we announced we were reducing O&M by $100 million in 2018 and $125 million in 2019 at ExGen, adding to the $400 million of savings we've already taken out of the business.

The baseline O&M outlook remains the same from last quarter, although the total O&M cost outlook has increased with the addition of the FitzPatrick, Quad Cities, and Clinton power stations which we break out on the slides for your reference.

Our baseline capital spend is decreasing through 2020, driven by the proactive investments we've made in our nuclear fleet over the years. These investments have resulted in best-in-class performance and reduced risks for significant unplanned capital spend in the future.

On slide 40, we provide greater detail on these investments and the impact they have had on the nuclear fleet since 2010. We continue to run an efficient organization, and we'll always look for ways to reduce costs and run the fleet more cost effectively while maintaining the highest standards for safety and reliability.

Turning to slide 17, ExGen will generate nearly $7 billion of free cash flow through 2020, which is more free cash flow for that time period than what was included in our Analyst Day disclosure. This is primarily driven by the incremental cash associated with the New York and Illinois ZEC programs, partially offset by the impacts of lower power prices in the outer years. As we've said before, we will use ExGen's free cash flow to fund utility investment and pay down over $3 billion of debt through 2020.

Turning to slide 18, we remain committed to maintaining a strong balance sheet and our investment-grade credit rating. We are forecasting to be at 3.3 times debt-to-EBITDA at ExGen by the end of 2017 and have a clear path to our long-term target of 3 times debt-to-EBITDA. As we've said before, we will look to retire holding company debt once we've reached the 3 times target at ExGen.

From a recourse perspective, we are already below the 3 times debt-to-EBITDA level at 2.7 times, as shown here on the slide. This ratio will continue to decline as well with the paydown of debt to reach our consolidated 3 times target. The health of our ExGen balance sheet is strong and is continuing to improve.

Before I turn the call over to Chris, I'd like to spend a few minutes on the potential impacts of tax reform legislation of Exelon, which has been a topic of discussion since the election. Research reports and our peers who have already reported earnings have discussed the impacts to the sector and their businesses.

From a policy perspective, we think simplifying the tax code and lowering rates is the right objective. We are actively working with our partners at EEI and NEI and on our own to help inform the ultimate tax design. No legislation has been introduced at this time, so no details on exactly what will be included or how it will be => included is available beyond the short description of the Trump plan or the House blueprint.

In fact, just last week, Senate Finance Committee Chairman Hatch said he's not planning on using the House legislation as a starting point. So the Senate will have its own bill, and there's no proposal for that bill at this time. And President Trump's economic team has stated that they will have their own views on tax reform once they're in place.

At this time, there's no way to know what a tax reform package will look like or how long it will take to advance, which leads us to the mindset that is premature to quantify how tax reform will impact Exelon's financial outlook. We run a wide range of scenarios to understand the high-level impacts of common themes in the House and Trump plans.

The House blueprint, excluding order adjustment provisions, will be neutral for our utilities, neutral to positive at the GenCo, and negative at the holding company due to the elimination of all interest deductibility. Order adjustment will be an additional negative at ExGen due to the importation of nuclear fuel, and at that the utilities would raise the cost of imported T&D capital equipment that goes in the rate base.

We've seen significant opposition to both the border adjustment and elimination of interest expense deductibility recently, leaving the fate of these provisions unclear. To the extent the Trump campaign becomes the basis of legislation and the election is made to take interest deductibility rather than immediately expense capital additions, it

could be meaningfully positive to Exelon's earnings.

We see a long path until tax policy has clarity. We'll continue to advocate for the best interest of our customers and shareholders as legislation is developed.

With that, I'll now turn the call back to Chris for his closing remarks.

Christopher M. Crane

Thanks, Jack.

This next slide should look familiar to you at this point. This is Exelon's value proposition, and we are not wavering from these commitments. Strong utility growth, we expect to grow the rate base at 2.5% annually through 2020 – at 6.5%. Dan caught that one right away, 6.5% annually through 2020, which converts to EPS growth off our 2017 midpoint of 6% to 8% a year.

We will continue to look for opportunities to invest in reliability and customer service. ExGen is expected to generate nearly $7 billion of free cash flow through 2020, which is better than we had budgeted at the Analyst Day. We will use this free cash flow primarily to invest in the utilities, pay down over $3 billion of debt over the next years. And we will continue to optimize the value of ExGen through best-in-class operating like we saw in 2016, capturing the benefits of our gen-to-load matching strategy, and fair compensation for our clean energy assets, similar to what we've accomplished in Illinois and New York.

We remain focused on the balance sheet and are comfortably exceeding our credit metrics targets over the planning horizon. And our capital allocation priorities will remain the same, regulated utility growth, dividend growth, and debt reduction. The leadership team firmly believes we can deliver on these commitments to our shareholders.

Our executive compensation is directly tied to these goals, with the long-term components driven by hitting the multi-year earnings targets at the utilities which ensures we grow this business as we've committed to you. Meeting our targets improvements in earned ROEs at the utilities, which ensure we turn around the performance of the PHI utilities and maintain a strong investment grade credit metrics, which ensures the financial health of the business, no matter what the commodity price backdrop is.

Finally, our long-term compensation will be adjusted point per point with the three-year performance relative to the UTY, meaning that we are directly aligned with the long-term shareholders. I'm proud of everything that this team has accomplished in 2016 and very excited about the plan we have in place for the future.

So, with that, Stephanie, we can open it up for questions.

Q&A

Operator

[Operator Instructions] Our first question comes from the line of Greg Gordon with Evercore.

<Q - Greg Gordon>: Thanks. Just a couple of quick questions as you guys were pretty thorough. So, can you give us an update on where you were on some of the tactical decisions you've made to sell down or exit from certain businesses, both the sell-down of the renewables business and the process on Mystic?

<A - Jonathan W. Thayer>: Greg, it's Jack. I'll take that. So, I'll start with the renewables. I think it's been widely reported that that we've been in the markets talking about a joint venture for our renewables business, and that process is going well. We want to maintain a stake in that business as it's important to our overall participation in the energy complex.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01638

We do have a significant amount of project-level debt on those projects. So there is a thinner equity layer on top of that. So the proceeds, while meaningful, will be used for debt reduction. We'd expect that to be a very positive event for the company.

With respect to the Mystic process, that process continues to be underway. We've had broad interest in those assets as they play a key role in that needful market in Downtown Boston. We continue to work with the various stakeholders to draw it to a conclusion. And we look forward to that having a favorable outcome as well here.

<Q - Greg Gordon>: Jack, can you give us any insight as to why it's taken longer than maybe we had initially expected when we – when you first articulated a desire to potentially sell those assets, it was at the EEI last year. And there was the potential for sort of an event early in the first quarter, and we still haven't seen that. And then, even if you were to get a deal tomorrow, given the lack of a quorum at the FERC, what are we looking at in terms of realistic timing to actually come to a closing of a transaction there?

<A - Christopher M. Crane>: So, if we did openly talk about it after it had been leaked and figured we get that out there, but there is no fire sale here. We need to take our time and go through the process and make sure we obtain the right value for us and for all involved in it, so working through it, and we'll keep you informed when we're at a closure.

<Q - Greg Gordon>: Okay. But assuming you got a price that was accretive to what you think the implied value is today for ExGen, that would accelerate the deleveraging that you're talking about here on slide 18 in the handout, right?

<A - Jonathan W. Thayer>: That's correct, Greg.

<Q - Greg Gordon>: Okay. Fantastic. And the growth rate target for the utility now, that's just clearly a function of having a higher base in 2017, you're $0.05 higher in 2020. So, the headline number is not a reduction in the expectations, it's just algebra, right?

<A - Jonathan W. Thayer>: That's correct. And you'll know with the passage of Illinois legislation and the energy efficiency programs, the solar programs we added to CapEx at ComEd, rather substantively throughout the curve. I think it's also important to note, we have a pretty conservative policy on only putting into our CapEx forecast the utilities, plants that are fully formed for capital investment. So, as time progresses and as we see opportunities to invest in the behalf of our customer, there are the opportunities for that rate base and capital budget to grow in those outer periods.

<Q - Greg Gordon>: Right. I have more questions, but I'll go back in the queue. Thanks.

<A - Jonathan W. Thayer>: Thank you.

Operator

Our next question comes from the line of Jonathan Arnold with Deutsche Bank.

<Q - Jonathan Philip Arnold>: Yeah. Good morning, guys.

<A - Jonathan W. Thayer>: Good morning.

<A - Christopher M. Crane>: Good morning.

<Q - Jonathan Philip Arnold>: Can I ask, Jack, I noticed you mentioned that the – that debt reduction target on slide 17 is now ExGen and HoldCo, and I think before it was just ExGen, so just to confirm that – if that is the case. And secondly, how much of the $3 billion roughly is it going to take to get to the 3x debt-to-EBITDA target? So, how much is therefore left over for HoldCo on the current plan?

<A - Jonathan W. Thayer>: So, Jonathan your first comment is correct. We previously were talking about retiring debt at the GenCo, now we see the opportunity once we achieved 3 times debt-to-EBITDA to retire debt at the holding company. With respect to the debt retired – we'll retire at the holding company, we have a $900 million maturity in

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01639

2020, where I think you could see us potentially retire debt or some component of debt, and we're looking at opportunities with use of proceeds from a variety of strategic activities that we have ongoing to address the roughly $600 million of ExCorp that's not tied to the mandatory convertibles reissuance of $1.15 billion in 2017.

<Q - Jonathan Philip Arnold>: What's roughly the timing that you see in this kind of – through 2020 outlook that you'd get to 3x on the GenCo absent an asset sale?

<A - Jonathan W. Thayer>: I think it's – I think – I think we can get there through cash generation I think over the next, say, two to three years. And then, we can – as we get out in the 2019, 2020, we can work against the holding company.

<Q - Jonathan Philip Arnold>: Okay. Great. Thank you. And then, if I could ask one other thing on – can you give us any sort of thoughts around potential for other states to consider New York and Illinois style nuclear measures?

<A - Joseph Dominguez>: Jonathan, this is Joe Dominguez. Right now, active discussions are occurring in Connecticut which is probably the most advanced. We believe those discussions will be started in Ohio, already have been relatively shortly in New Jersey and in Pennsylvania. I think all of the states, as Chris indicated before, states that understand the value of the nuclear plants and want to keep these plants operational, and so the level of discussion is at different stages, some with fully formed legislation that's already moving through committee, that's the case in Connecticut, and stakeholder average [indiscernible] (32:16).

<Q - Jonathan Philip Arnold>: Okay, great. That's it, thank you.

Operator

Your next question comes from Steve Fleishman with Wolfe.

<Q - Steve Fleishman>: Hi, good morning. Can you hear me okay?

<A - Christopher M. Crane>: Yes, we hear you fine, Steve.

<Q - Steve Fleishman>: Great. Just a couple of nuclear questions. First, could you give a sense on the appeal process on the ZECs, I guess, in New York, and when we should know from the court kind of roughly either way on the ruling both, I guess, your motion to dismiss and then an actual ruling?

<A - Joseph Dominguez>: So in the Federal Court action in New York, as you noted, a motion to dismiss has been filed. That's been fully briefed. I know a number of you have asked for the briefing packages, and those are available to anybody who would like them. We feel very strongly about our case and we believe it should be dismissed on that motion. But if it proceeds to trial, that trial will occur through to the balance of the second quarter, and we would expect a decision sometime this summer.

<Q - Steve Fleishman>: Okay. And then just more broadly on nuclear, there's been talk of the Trump administration wanting to do something for nuclear. Is there any better visibility on what they might be looking at or things that you might be suggesting?

<A - Christopher M. Crane>: There hasn't been any concrete conversations, just a preliminary recognition of what's going on in the marketplace and the need to maintain the diverse power sources, looking at the economics, local economics of them and the benefit to the customer. So just starting, a lot more dialogue will happen with NEI and the administration, and we're staying involved with NEI and also with our own folks interfacing with the administration.

<Q - Steve Fleishman>: Okay, one separate question on tax reform. I know you don't want to get into specifics, but just if we think about your company and the issues you care most about getting fixed or adjusted, are there any particular ones that you're most focused on addressing of the different factors that you mentioned?

<A - Christopher M. Crane>: Yes, we think Jack did a good job framing up why it's really premature for us to get point to point. I spent a lot of time on my own and with the EEI leadership in DC to look at this effect on utilities,

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01640

utility customers, and what has happened in 1986 tax bill. So there are certain things in the regulated space that create a difference. I'm sure a lot of industries are trying to say they're different. But surely back in 1986, the insurance industry and the utility industry, the regulated utility industry was recognized as an exemption or a different methodology.

So that kind of conversation is happening within the process. It's not right to have a debate across the table until we have a bill, but coalescing under Tom Kuhn's leadership and the EEI executive leadership and board, we're working through those issues. Everybody is for a lower corporate tax rate. That's an easy one. Jack talked about the probability of the blueprint staying the way it is now versus after the sausage is made. It's something we'll just have to stay engaged and follow. But you reduce an interest deduction from a utility, and that automatically goes on to the customer, and we've got to make sure it's not an unintended tax increase for the customer and we just have to work through those details.

<Q - Steve Fleishman>: Great, thank you very much.

Operator

Your next question comes from Julien Dumoulin-Smith with UBS.

<Q - Julien Dumoulin-Smith>: Hey, good morning.

<A - Christopher M. Crane>: Good morning.

<A - Jonathan W. Thayer>: Good morning.

<Q - Julien Dumoulin-Smith>: Hey, maybe quickly following up on the last one here with Steve, can you elaborate a little bit on what the read-through would be from the litigation in New York vis-à-vis Illinois? Would there be an immediate impact, or how are you thinking about this perhaps across the various ways it could play out? And I've got a follow-up back.

<A - Joseph Dominguez>: Julien, this is Joe. The programs in New York and Illinois are very similar. They're both based on paying for the environmental attribute based on the social cost of carbon. And so the read-through is that when we are successful in New York, we think it will be a very helpful precedent to challenge the Illinois legislation.

<Q - Julien Dumoulin-Smith>: Got it, excellent. And then just following up here on Greg's earlier question, just to establish a little bit of a baseline, how are you thinking about your portfolio evolution given the need to backstop the broader retail business? Are basically all combined cycles, broadly taking here, something that could be looked at? And then also at the same time, how are you thinking about the expansion of the retail business? Obviously, there have been some headlines out there on that as well.

<A - Joseph Nigro>: Julien, good morning. It's Joe Nigro. Broadly, we look at our asset portfolio on an annual basis and we look across our nuclear fleet through to our fossil and renewable fleet. And strategically, you've seen some of the assets that we've divested through time here, and I will tell you it hasn't had a material impact on managing our retail portfolios, given that we carry a lot of what I would call optionality in our portfolio with the generation assets.

And then additionally, when we need to, we will go to market to augment with additional products. So we're very comfortable where we are and we continue to strategically look at our portfolio. And if the market is willing to pay for something maybe more than we have value on, then we'll take that into account, make the decisions necessary recognizing that we do need to continue to manage our business. And I'm sorry, the question on...

<A - Christopher M. Crane>: Retail growth.

<A - Joseph Nigro>: Retail growth, we're now – our C&I business is, as Jack mentioned or Chris mentioned in the script, we're about 25% of the market share in C&I. Our margins remained stable in that $2 to $4 origination range, and we continue to monitor that very closely. You heard what our renewal rates are and our win rates are, and they're in line with what we've laid out in the Analyst Day, and we're very comfortable with the plan that we have in place as we

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01641

move through 2017. We'll continue to monitor that, but right now, we're very happy with where we are.

<Q - Julien Dumoulin-Smith>: And you wouldn't necessarily take this out a little further, acquisitive expansions in addition to organic, and maybe that's a good kind of segue into thinking about – what kinds of targets are you thinking about on a volumetric basis for the volumes in aggregate as we move through time?

<A - Joseph Nigro>: We've given you the volumes, and I think previously – and we rolled them out again at the EEI, and we're very comfortable with where we are on the volume scale. I would tell you, you continue to see consolidation in the retail market, you see some generation entrance that have bought entities, existing entities, not really creating their own retail platform, so there's really no change there.

As you know, we've bought a few in the last few years, and we see the consolidation. We'll continue to hunt for those if the opportunity is right, and we see value and it fits our portfolio in what we're trying to achieve with the customer. And we'll remain disciplined with that. With our acquisition a few years ago of Integrys, and recently, last year with ConEd, we've been very happy with that outcome and the way they've integrated into our portfolio, and we'll continue to look for those type of opportunities.

<Q - Julien Dumoulin-Smith>: Thank you, gentlemen.

Operator

Our next question comes from Michael Weinstein with Credit Suisse.

<Q - Michael Weinstein>: Hi. Good morning.

<A - Christopher M. Crane>: Good morning, Michael.

<Q - Michael Weinstein>: I was wondering if you could comment a little bit on the impact or the impacts of lower load growth and capacity performance in the PJM, upcoming PJM capacity auction. And separately, FERC recently rejected the MISO proposal for a competitive retail solution in certain zones. One of the criticisms, I think, FERC had in the rejection was that it was not broad enough throughout MISO. I'm just wondering if there's any potential for some kind of broader forward auction system throughout the entire Midwest ISO.

<A - Joseph Nigro>: Yeah. Good morning, Michael. It's Joe Nigro. I'll take the first question on PJM, and then I'll hand it off up to Joe Dominguez, and he can talk a little bit about the MISO question. From a PJM perspective, there is a lot of moving pieces, the load came in, as was previously announced, down about 3.5 gigawatts or 2%. So, that wasn't unexpected. We cleared about 27 gigawatts of non-CP supply last year or 16% of what cleared, and as you mentioned, that will be 100% CP this year. that's obviously a positive change when you think about price. There were some movement in the import capabilities. We saw it shrink some into the ComEd zone. And we saw it increased slightly into eastern Mass., so that has an offsetting effect in those two areas.

I guess the big thing is it remains around the two biggest variables which are the bidding behavior, and as you know, year-over-year, the energy rents are down, given how low the prices were on coal last year, and then additionally, what the new build is. And we continue to struggle to see how the economics of that new build works, given how marginal it is at best with where the market is on a forward basis. So, putting that all together, there's a lot of moving pieces where our long-standing policy is really not to try to forecast that, but there's a lot of puts and takes that we're evaluating as we go through this.

<A - Joseph Dominguez>: And Michael, this is Joe Dominguez, the short answer to your question is, no, I don't see a likelihood that we will see, as a result of this FERC order, an expansion of the proposals for what was effectively Southern Illinois and Michigan across all – with MISO. I could go into a little bit more detail but the answer is no.

<Q - Michael Weinstein>: Okay. Thank you very much, guys.

At this time, we have reached the allotted time for questions. Our final question will come from Shahriar Pourreza with Guggenheim Partners.

<Q - Shahriar Pourreza>: Good morning, guys.

<A - Christopher M. Crane>: Good morning, Shahriar.

<A - Jonathan W. Thayer>: Good morning, Shahriar.

<Q - Shahriar Pourreza>: Just real quick on the $0.32 that you're now guiding on ZECs and FitzPatrick, can you – are you embedding any sort of synergies of owning Nine Mile and FitzPatrick within the same portfolio, or you're still kind of looking at this opportunity?

<A - Jonathan W. Thayer>: We're still looking at the opportunity, we're in the process of integrating that plans and that's going quite well. We've got to close the acquisition in March. Obviously, given its proximity to our Nine Mile units, we anticipate that there may be opportunities as we get in there and optimize the operations.

<Q - Shahriar Pourreza>: Okay. Got it. And then, Joe, can you just real quick handicap Pennsylvania, maybe from a potential timing or when we can see something? Are we looking at an adjustment to the RPS to include the nuclear, or is it more of a function of sort of a similar ZEC-type program?

<A - Joseph Dominguez>: I think historically what we've done is we've begun the discussion, and the first stage of the discussion is establishing a recognition that nuclear is the lowest cost and most reliable zero-carbon option for our customers, that's where we are in Pennsylvania. The next stage, I think we'll start getting into different solution sets, and you've identified a few, right. So, you could look at something that's similar to the ZEC programs that have been adopted. You can include nuclear as a qualifying resources and RPSs. And it's way too early for me to handicap where that discussion is going to go. There are a lot of different stakeholders. What's important to us is syncing effectively the first concept, which is that nuclear needs to be treated on a level playing field with other non-emitting resources. That will be the first objective in having that discussion. And then, I think, I can ask, as we move through this and in subsequent calls, we could talk about a bit more about how we handicap the options and outcomes.

<Q - Shahriar Pourreza>: Terrific, that's all I have. Thanks, guys.

Operator

At this time, I would like to turn it back over to Chris Crane for closing remarks.

Christopher M. Crane

Thanks, everybody, again for joining. And hopefully, we got all your questions. If not, then get a hold of Dan and his group, and we'll fill in any blanks. It was, as I said, a phenomenal year in 2016, and we're looking forward to building on that in 2017. Thanks.

Operator

MANAGEMENT DISCUSSION SECTION

Operator

Good morning. My name is Brandi, and I'll be your conference operator today. At this time, I'd like to welcome everyone to the Exelon Corporation third quarter 2016 earnings conference call. All lines have been placed on mute to prevent any background noise. After the speakers' remarks, there will be a question-and-answer session. [Operator Instructions]

I would now like to turn the conference over to Dan Eggers, Senior Vice President of Investor Relations. Please go ahead.

Daniel L. Eggers

Thank you, Brandi. Good morning, everyone, and thank you for joining our third quarter 2016 earnings call. Leading today's call are Chris Crane, Exelon's President and Chief Executive Officer, and Jack Thayer, Exelon's Chief Financial Officer. They're joined by the other members of Exelon's senior management team, who will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, both of which can be found in the Investor Relations section of Exelon's website. The earnings release and other matters which we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material, comments made during this call, and the Risk Factors section of the earnings release and the 10-Q, which we expect to file later today. Please refer to today's 8-K or the 10-Q and Exelon's other filings for a discussion of factors that may cause results to differ from management's projections, forecasts, and expectations.

Bloomberg Transcript

Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for a reconciliation between the non-GAAP measures to the nearest equivalent GAAP measures. We have scheduled 45 minutes for today's call.

I'll now turn the call over to Chris Crane, Exelon's CEO.

Christopher M. Crane

Thanks, Dan, and good morning to all of you. We appreciate your time and the interest in Exelon in joining the call today.

We hosted our Analyst Day in August, and you have a lot of information that we passed on to understand the business and our value proposition. With that fresh in your mind, today's call will focus on the third quarter results, some business updates, including actions we are taking with recent power weaknesses.

We had a great third quarter across our utilities, Constellation, and our generating fleet. On a GAAP basis, we earned $0.53 versus $0.69 last year quarter over quarter. On the operating basis, we earned $0.91 a share, up from last year's $0.83 per share and well above our guidance range of $0.65 to $0.75 per share. Jack is going to cover the details on earning drivers, but let me make a few observations.

At the utilities, the hot summer weather was a big help, with revenues up on higher volumes of electricity sold and lower costs with less storm activity across the system. The excellent reliability we provided to our customers over a hot summer reinforces the benefits of our capital investment programs. ExGen had a great operational quarter, with the nuclear fleet producing more power ever in a quarter. Finally, Constellation really hit a sweet spot in the third quarter.

The sustained hot weather enabled us to sell high volumes of electricity to customers while limited price volatility brought the cost to serve the customers down, allowing us to profit on both volumes and margins. The continued success at Constellation in the third quarter reinforces the value of our gen-to-load matching strategy.

So if you look at slide six, as we talked about best-in-class operation, at the Analyst Day we emphasized best-in-class operation across all our businesses, which we see as the ticket of entry at the utilities and economic imperative at the generation business, and I'm happy to report that the third quarter was operationally strong.

And our color block charts highlighted operating performance and customer satisfaction for the utilities. Legacy Exelon utilities remain almost entirely first quartile. I'm proud of our customer satisfaction results but am disappointed with our OSHA results, and we are taking corrective actions and should get these numbers back to first quartile shortly.

At PHI, we are encouraged by the process (sic) [progress] (5:02) we are making, although some of this success has been helped by good weather and limited storm activity. We still have a long way to go to meet the reliability commitments we made, but we are working hard to provide the service our customers deserve.

I mentioned already that the nuclear team had a very good quarter with a

capacity factor of 96.3% and no unplanned outage days even with the summer's sustained heat. For the year to date, our nuclear capacity factor is at 94.8%.

Constellation also had a great quarter, completing the acquisition of ConEd Solutions and beginning that integration.

We continue to see a robust renewable rate, with margins and contract durations holding at levels we discussed at the Analyst Day. So I want to thank all of our employees for excellent operations over the quarter and professionalism in what was a very hot summer with fantastic results.

On the regulatory team side, the utilities are very busy as we work through a full load of rate cases at PHI in particular. We've completed one rate case at PHI. The New Jersey BPU unanimously approved the ACE [Atlantic City Electric Company] rate case settlement in August, yielding a good outcome. It brought needed benefits to the New Jersey

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01646

final

customers months earlier than if we would have litigated the case. We appreciate the efforts of all the parties in New Jersey in making this happen.

We are encouraged by the progress that we are making so far, but we're also aware that improving operations and returns at PHI will take time. These are the first sets of rate cases. We plan to refile at each PHI utility again in 2017. It will take two cycles to what we believe align our revenues with the significant capital being deployed to benefit our customers, improve reliability, and help the environment overall.

Talking about our key priorities, for us it's finding an economically sustainable path for our financially challenged nuclear plants. We're currently on very different paths, but expect clarity this quarter in New York and also Illinois. In New York, we're making progress on finalizing the contracts with NYSERDA and expect to have them sign for all three plants in November. This aligns with the expected approval from the New York PSC on the acquisition of the FitzPatrick plant.

We expect the CES from Ginna, Nine Mile 1 and 2 to add approximately $0.08 to $0.10 of EPS. We can expect FitzPatrick to add another $0.02 to $0.08 per share a year depending on the refueling reschedules.

As expected, a group of independent power producers filed a challenge in federal court. The lawsuit does not request a stay or an expedited trial, and we continue to believe that the CES design is sound and that it will withstand any legal judge.

In Illinois, we continue to work with a wide group of parties on a comprehensive energy package that would preserve the Clinton and Quad Cities stations' operating right. It will advance the utility investment aimed at energy efficiency and reliability and will support further growth in renewable energy production in Illinois. The timeline is short for the resolution, with two windows during a six-day veto session in November and the beginning of December.

We remain hopeful that we can reach a constructive solution that truly is in the best interests for our state and our fellow Illinois citizens. But absent of the action during the upcoming veto session, both facilities will close. We are moving forward with the retirement of the plants. We have already notified PJM of our intent to retire Quad Cities, and we'll inform MISO in the beginning of December if the legislation is not passed.

A few years ago, we asked you to wait a while we work through the process in Illinois, and we have appreciated your patience. We are now very close to the ultimate resolution in both Illinois and New York.

So with that, I'll turn the call over to Jack, and he will walk you through the numbers.

Jonathan W. Thayer

Thank you, Chris, and good morning, everyone. My remarks today will cover our third quarter and year-to-date results, our updated 2016 guidance range, progress on our current rate cases, and our gross margin disclosures.

Starting on slide 9, as Chris stated, we had a very strong quarter financially and operationally across the company. For the third quarter, we delivered adjusted non-GAAP operating earnings of $0.91 per share, exceeding our guidance range of $0.65 to $0.75 per share.

Exelon utilities delivered a great quarter with a combined $0.53 per share of operating earnings. This was driven by favorable weather at ComEd and PECO, where cooling degree days were 39% and 37% above normal respectively, as well as lower O&M expense versus plan across all our utilities, primarily due to lower than normal storm activity.

Generation delivered $0.41 per share of operating earnings in the quarter. We had strong performance at our Constellation business, where our generation-to-load matching strategy continued to provide value, and we benefited from a lower cost to serve our customers.

On slide 10, the $0.91 per share in the third quarter of this year was $0.08 per share better than the third quarter of 2015. Upside came from favorable weather across our service territories, the inclusion of PHI, and higher distribution

Bloomberg Transcript

revenues at both ComEd and PECO due to increased capital investment and increased rates respectively. This was partially offset by a decrease in earnings at ExGen, driven primarily by increased taxes due to the inability to use the domestic production activities deduction and lower capacity prices.

On slide 11, our year-to-date earnings of $2.24 per share are $0.11 per share higher relative to the same period last year, driven by performance at the utilities. The primary drivers are favorable weather, increased distribution revenues across all of our utilities due to higher rates and increased capital investment, and the addition of PHI. ExGen is down $0.16 per share from this time last year due to increased decommissioning costs, increased taxes, and share count differential.

Turning to slide 12, we are raising our full-year guidance range from $2.40 per share to $2.70 per share to $2.55 per share to $2.75 per share, reflecting in particular the strong results that we've seen at ComEd and PECO year to date.

Turning to slide 13, we've laid out the schedule for the next six months of activity in all our current rate case proceedings across Exelon utilities. As you know, we filed distribution cases in all of PHI's jurisdictions and expect decisions spread throughout the third quarter of next year, providing needed revenue relief as we continue to make significant investments on behalf of our customers. Our investments in our utilities are needed to improve the customer experience and create value for customers.

As Chris mentioned, in August, the New Jersey Board of Public Utilities approved a settlement authorizing Atlantic City Electric to increase its electric distribution rate by $45 million. The new rates went into effect immediately, which was seven months earlier than expected. This ruling recognizes Atlantic City Electric's commitment to enhancing its energy infrastructure. Over the past five years, Atlantic City Electric has spent approximately $716 million in energy system upgrades to benefit its customers. This settlement is a good start, but there's more work to be done in the other jurisdictions.

We still have rate cases outstanding at the other PHI utilities. In these cases, we're asking for $326 million in revenue requirement increases. These increases reflect recovery on multiple years of smart meter and other capital investments meant to improve the reliability of the grid across all the PHI jurisdictions. We're expecting the Pepco Maryland decision in mid-November, followed by Delmarva Maryland in February.

In addition, ComEd made its annual formula rate filing with the Illinois Commerce Commission in the second quarter of this year, with a decision expected in December. ComEd requested a revenue requirement increase of $132 million related to approximately $2.4 billion in capital investments made in 2015. These investments, which include $663 million for smart grid-related work, help strengthen and modernize the electric system. More details on the rate cases can be found on slides 28 through 33 in the appendix.

Slide 14 provides our third quarter gross margin update, including our 2019 disclosures. We're including the 2019 numbers a couple weeks earlier than our normal course of [ph] DEI (14:25), as we wanted to package together some interrelated updates for you today. Our total gross margin uses September 30 curves and does not include the impact of the CES program in New York or the purchase of FitzPatrick. But we have included these impacts below the line to provide a full picture for 2017 through 2019. We anticipate formally including both of them on our fourth quarter call.

2016 total gross margin increased $50 million during the third quarter, lifted by strong performance, primarily at Constellation. We're highly hedged for the rest of this year and remain well balanced on our generation load-matching strategy.

Total gross margin decreased from the second quarter to the third quarter by $100 million in 2017 and $250 million in 2018. The decline is driven by lower power prices on the unhedged portion of our output. We have seen power prices at NiHub and West Hub for these years move higher since the end of September, with 2017 increasing approximately $0.50 to $0.75 per megawatt hour respectively.

2018 prices have increased approximately $0.20 to $0.50 per megawatt hour respectively. And as a result total gross margin on our unhedged generation has recovered since 9/30 by $50 million. At the end of the quarter, our hedge position was approximately 7% to 10% behind ratable in 2017 and 4% to 6% behind ratable in 2018 when considering

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01648

cross-commodity hedges and reflecting our more positive fundamental view on the power markets. The majority of our link remains concentrated in the Midwest to align with our view of power market upside at NiHub.

Total gross margin in 2019 is $6.8 billion, which is $450 million less than in 2018. The majority of the decline from 2018 is due to $175 million from lower capacity revenues, which we provided at Analyst Day, $125 million from a full year of retirement for Quad Cities, and $200 million from a roll-off of in-the-money hedges versus 2018.

We see multiple reasons why we would expect a better realized power price environment than what's captured in these numbers. First, forwards beyond 2017 and especially beyond 2018 reflect a highly illiquid market with limited real price discovery. Liquidity will improve as we get closer to the delivery year, and that will help prices. In addition, our work on power market shows too many plants continuing to operate even though they're not economically viable. These plants will need to close like we've done with certain of our fossil plants and our planned nuclear retirements.

Second, our generation load-matching strategy and our portfolio management team at Constellation have a proven ability to extract value out of various market conditions. Our Constellation business is set up to profit in periods of extremes. This summer we captured better margin since our contracts are priced using forward summer market volatility. And when we don't see that volatility, such as this summer, we capture additional value. We saw the same thing during the Polar Vortex, a period with extremes but in the opposite direction. Our gross margin projections on this page do not anticipate these events repeating and assume normal weather, leaving the opportunity for additional upside.

And finally, the CES program in New York and the acquisition of FitzPatrick will add $500 million in gross margin in 2019 and annual EPS contributions of $0.10 to $0.18 per year annually starting next year.

Turning to slide 15, even though we don't believe this market will be a reality, we are acting as if it will. We're reducing expected O&M expenditures by $100 million in 2018 and $125 million in 2019 at ExGen relative to what we showed you.

At Analyst Day, adding to the $400 million of savings we've already taken out of the business. We are finding additional savings as we focus our operations and reduce development efforts in generation as we close out the growth CapEx program in 2017. We run an efficient organization but we'll continue to look for ways to reduce cost beyond these reductions. Our focus at ExGen remains on maximizing our cash generation to meet our commitments of funding utility equity needs and debt reduction. These efforts will help keep us on track.

Finally, turning to slide 16, our sources and uses slide, we expect adjusted cash flow from operations of $6.85 billion in 2016. In September the U.S. Tax Court ruled against us on the like-kind exchange issue related to our sale of fossil generation in 1999. The outcome on the merits was not unexpected. We were fully reserved for the underlying claim. However, we do not agree with the decision and particularly disagree with the decision to issue penalties, which we did not think was likely or warranted. The law is very clear that we were entitled to rely upon the opinion of legal counsel. We believe the court came to an erroneous conclusion, and we expect to appeal the decision early next year. We plan to issue approximately $1 billion of long-term debt to support the payment to the IRS.

I'll now turn the call back to Chris for his closing remarks.

Christopher M. Crane

Thanks, Jack.

We do appreciate the time, and we've had a lot to be proud about at the company, but we're not happy with the outlook that we see at ExGen. As Jack talked, we're taking actions. The limited liquidity in the forwards beyond 2017 and the true lack of discipline by uneconomic generators are distorting the market. That said, we're not just going to sit around and wait on the power markets to recover. As we said, we're taking further actions to control our future at ExGen, aggressively managing our costs to prosper even against these forwards, cutting $100 million in cost from 2018 and $125 million from 2019 on top of the $400 million we've already cut across the business. And we're pursuing the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01649

compensation for the zero carbon attributes of our plants, as we've done in New York.

We are optimizing the fleet. All of this brings us back to the value proposition. We're targeting the best-in-class utility EPS growth of 7% to 9% through 2020. The strong free cash flow at ExGen will provide the incremental equity needs at the utilities as we focus on debt reduction at ExGen. We're focused on optimizing the value of our ExGen business by seeking fair compensation from the carbon-free generation fleet and closing uneconomic plants. We will be opportunistically selling assets where it makes sense to accelerate our debt reduction plans and maximize value through the gen-to-load matching strategy, which had another big quarter. We'll continue to focus on sustaining strong investment-grade credit metrics, growing our dividend in a consistent visible manner.

And I thank you for your interest, and now we're ready to take questions.

Q&A

Operator

Certainly. [Operator Instructions] And our first question is from Greg Gordon with Evercore ISI.

<Q - Greg Gordon>: Thanks, good morning.

<A - Christopher M. Crane>: Good morning, Greg.

<Q - Greg Gordon>: I'm looking at the disclosures on the utilities. You raised your guidance range by $0.05 at each of the key utilities, but ExGen also is $50 million better on a gross margin basis. I know you usually think about this in rounding terms, and that's less than $0.05. But as you think about Q4, where do you think you are inside the ExGen guidance range assuming normal operations for the rest of the year?

<A - Jonathan W. Thayer>: Greg, I'd say we're feeling very good on the back of a very strong performance within the Constellation business year to date. There are some timing elements that keep us in that same guidance range. Obviously, the fourth quarter is an important one for that business, and we'll be tracking it closely. But I'd say we feel good about how we're trending, and that's reflected in our comfort in taking the guidance up across the company.

<Q - Greg Gordon>: Thanks. When I look at the delta from 2018 to 2019 in terms of the headwind from capacity, and a lot of this you talked about at Analyst Day, capacity, mark-to-market on power curves, but then the offsetting benefits of lower O&M, lower depreciation, lower taxes. It looks to me based on the fully diluted share count like that's about a $0.15 delta today based on current forward curves. Am I missing something, or is that in the right ballpark?

<A - Jonathan W. Thayer>: Relatively speaking, I think you're in the right direction. I don't want to give 2019 guidance at this point, but that feels right.

<Q - Greg Gordon>: Okay. And then can you give us some sense of timing on the process for the Mystic plants and when we might get some visibility on price and timing to close?

<A - Christopher M. Crane>: I don't think that there has been any public statement on that. We've acknowledged we're selling the plant. Beyond that, Greg, I don't think it's probably right for us to comment on the process.

<Q - Greg Gordon>: Okay. Thanks, guys.

Operator

Our next question is from Jonathan Arnold with Deutsche Bank.

<Q - Jonathan Philip Arnold>: Thanks. Can I just ask about the – you made comments about feeling good around how you're executing in Constellation. Any comments on trends in your margins and renewals? One thing we noticed was that the new business to go for 2019, $950 million, is down a little from what you had for 2018 this time last year,

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01650

yet you've got ConEd Solutions in there, I would guess. So is that some pressure in what you've seen around margins or more conservatism, or how should we think about those numbers?

<A - Joseph Nigro>: Good morning, Jonathan. This is Joe. We feel very strong we're going to be able to deliver on 2019. Part of the reason that number is down is because we've already executed more in that year than we would have at this point last year for 2018, so that's why you see a lower number. Our new business to go, our new business in total, the business we're going to create in total between 2018 and 2019 is roughly the same amount. And we're comfortable that we're going to be able to meet these targets as we've done in the last 40 years.

As to your comment about margins and renewal rates in retail, as I mentioned at Analyst Day, the market has remained stable. Our margins are right in line with what I talked about at Analyst Day. Our renewal rates remain strong. The acquisition of ConEd, although we've only had them for a brief period, has gone well. We're very impressed with the way they run their operation, and we're integrating that into the Constellation business. So the retail business remains very stable and we're happy they're [ph] a part of it (26:11) at this point and continue to monitor it.

<Q - Jonathan Philip Arnold>: Okay, thank you. And then can I ask around the ExGen O&M guidance? Could you give us a little more insight into what's driving the incremental savings? And then perhaps is this – obviously, one of your nuclear competitors is seeing some cost pressures in that business. Can you talk about what your underlying expense profile might be and how much you're having to cut in order to get to these net lower numbers?

<A - Christopher M. Crane>: I'll let Jack fill in the details. On our nuclear fleet overall, in the past 7 to 10 years, we have made significant capital investment to prepare the plants for their extended life. You can see our reliability numbers reflect the investment that's been made. So we do not see any significant increase in capital. Actually, we're seeing a decrease in maintenance capital because of the massive improvements that we've made.

On the O&M side, there has been significant focus not only at Exelon but across the industry with industry initiatives to try to find ways to take what were old processes that were put in place that may be much more efficiently executed with the same results on a much lower cost basis, and that's the initiative that the Nuclear Energy Institute has been performing.

I can't speak to other fleets, but I can tell you that we have a very strong focus on capital, a very strong focus on efficiency. And the last thing we would do is cut into safety or reliability. And that's been a clear focus of mine throughout my whole career, and it will continue to be; run the plant safely, reliably, and very efficiently.

<A - Jonathan W. Thayer>: So, Jonathan, just building on what Chris said, starting with that focus on safety and reliability, as you might imagine, when you contemplate a program that saves $400 million across the company and you're turning over many stones, you identify additional opportunities.

And so among – we've got almost – more than 100 initiatives that we've been looking at, and each will contribute approximately from $1 million to several million dollars. But whether it's corporate efficiencies or organizational design, nuclear fuel savings, contractor costs, insourcing rates, nuclear site security, automation, NRCP reductions, property taxes, organizational design and centralization, such as within our engineering group, outage costs, automation, it's just a long list of activities. And we do have good line of sight on these opportunities. And I think building on the processes that we've put in place to target cost and seek efficiencies, I think our hope is that we may in fact even find more than what we're sharing with you today.

<Q - Jonathan Philip Arnold>: Thanks a lot, guys.

Operator

Our next question is from Steve Fleishman with Wolfe.

<Q - Steve Fleishman>: Hi, good morning, a couple things. First just on the New York ZECs [Zero-Emissions Credit], could you just clarify the thoughts on ZECs versus RECs [Renewable Energy Credit] because the IPPs [Independent Power Producer] that filed the appeal seem to say there is a difference? So could you clarify maybe where they're

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01651

getting that wrong?

<A - Joseph Nigro>: It's Joe Nigro, Steve. We don't think there is really a difference. The program was fashioned after the REC programs. The distinctions that plaintiffs are trying to create in New York are not real. But they face the political problem, of course, that if they describe the lawsuit as also challenging, the renewable programs, that they're going to have a good deal more opposition. But the programs function essentially identically. The ZEC program is based on the cost of keeping resources in the market, just as the renewables credits are the cost of keeping resources in the market, paying for the environmental attributes, recognizing that these assets get both fulsome market revenues as well as attribute payments. But from our perspective, they function pretty much the same way.

<Q - Steve Fleishman>: Okay. And then moving to Illinois, just any more color? Are you feeling more optimistic about being able to get a legislative bill this veto session than let's say a month or two ago?

<A - Anne R. Pramaggiore>: Hi, this is Anne Pramaggiore. I think what we're seeing right now is that there is a bit of an opening of the door. The legislature has a temporary budget in play and Chicago public school funding is behind that. And so I think we see an opportunity in the veto sessions. We're also seeing there's a lot of work to be done to get there. We've got to pull together a coalition to come in with an agreed bill as much as possible, and we're in the process of putting that together now. But we do think that there's the potential that this would be entertained in the veto session.

<Q - Steve Fleishman>: Okay. And then just lastly in the context of what you said about power views and long-term liquidity, to the degree that let's say an Illinois bill passes and it includes benefits for all types of generation, just doesn't that continue on the potential inefficiencies of the markets and keep some of the issues that are causing prices to be lower? So I guess just how are you thinking about hedging and managing your portfolio against the fact that the more of these you get done, the more generation stays around?

<A - Joseph Dominguez>: Steve, this is Joe Dominguez. I'll turn it back over to Joe Nigro in terms of managing the portfolio. Look, the market is what it is. Today, we have over 30 states with renewable portfolio standards that recognize the environmental contributions of virtually every resource in the market that does what our nuclear plants do. So we're seeking to get fair treatment.

At the same time from a policy perspective, we think clearly for many years now that we think the right move is to put the cost of collusion in the market; that is, in the case of climate, establish a price on carbon, and we're going to continue to pursue those things. But obviously, there have been a number of headwinds that have prevented those policies from being fully realized and fully recognizing the impact that carbon has on climate as measured by the Federal government. So we haven't seen programs that trade carbon up to the social cost of climate. We're going to continue to work on those things.

But the plans we have in New York and Illinois we think of as preserving those units for the day where we have that best design in place, and we think that day is going to come eventually. But we need a bridge solution to keep the units that are important to our customers in place, so that they're available once we do have a carbon signal in the market. And that's how we reconcile it, but we have to take this world as it comes to us, and the world currently isn't our most favorite design on putting a price on carbon in the market. We have these separate state programs, and it's important for our customers that these nuclear plants be preserved, and that's what's driving our initiatives. Joe?

<A - Joseph Nigro>: And I would add just from a market perspective and a portfolio perspective a couple of things. One is on the market side, I think the illiquidity of the market is somewhat independent of what Joe was saying. I think it gets into the nature of market participants, as you're well aware. When you think about the financial institutions to start with that added liquidity in this marketplace in years past, we don't see nearly the depth of that.

But what's interesting is that the power markets have been illiquid for quite some time. But when you look at open interest, just on the gas market, for example, we've seen a change there where it's very front-end loaded versus the outer years. And I think what's important with that is, and I'll give you an example. When you look at the price change in the quarter in PJM in particular, versus the end of June versus the end of September, you saw that the price of gas in each of those years when you include these basis prices [ph] such as rate (35:38), fell equally. Yet, we dropped power prices more materially on the back-end of the forward curve than we did in the [ph] nearby (35:48) 2017, and that gets into

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01652

some of the illiquidity in the market.

As it relates to our portfolio, we take all these factors into account, both the same depth we're doing internally with our other assets. We have an estimate of what other folks are going to do with their own assets. We've been very clear that we've been aggressively managing our portfolio as it relates to our ratable plan, and we'll continue down that path.

The last thing I would add is that we talk a lot about the benefits of our generation load strategy and we do it in dollars. It also has a huge benefit from a market perspective because it doesn't force us to go to that illiquid over-the-counter market. We have a strong customer base and a very, very strong load serving business now that matches output of generations of quantity of load very

Well, and we're going to continue to grow that. And we've done it both organically very well and through acquisition of Integrys and ComEd, and that's been a big benefit also.

<Q - Steve Fleishman>: Thank you.

Operator

Your next question is from Stephen Byrd with Morgan Stanley.

<Q - Stephen Calder Byrd>: Hi, good morning. Congratulations on a great quarter and on further cost reductions.

<A - Christopher M. Crane>: Thanks.

<Q - Stephen Calder Byrd>: I wanted to hit on what you mentioned in terms of some of your peers who would appear to need to shut down further plants, and we do see some of those same dynamics. But I was curious from your point of view. What kind of catalysts or drivers should we be thinking about in terms of seeing more rational decisions and further shutdowns? What do you see as some of the key catalysts?

<A - Joseph Nigro>: Stephen, I think the example I would give you is when you look at coal-fired generation. When you look in the Eastern Interconnect between call it 2016 and over the next few years, we see almost 30 gigawatts of coal expected to retire, with almost 2/3 of that being done by the end of next year. The obvious examples are some of the plants that have been announced in Illinois and also in Ohio and the rationalization of that. Obviously, we've taken our own actions with our own power plants. We've seen others do the same thing beyond coal. And we expect more of that will continue if these low prices continue because when we look at it fundamentally, there are plants that are challenged economically that are still running that really the economic rationale isn't there for those to continue to operate.

<A - Jonathan W. Thayer>: Stephen, just to build on that. I think you've heard us make strong comments about a focus on reducing leverage at the GenCo to 3 times debt to EBITDA. I think the reality is in this current pricing environment you're going to start to see others look at their outlooks and look at their leverage statistics and focus their efforts on generating cash. In order to do that, they're going to need to retire money-losing assets. So I think it will force greater discipline on their part. We're already seeing some of that. I think you'll see there's some potential for consolidation and asset optimization around that, and portfolio optimization. So I think we see a pathway for others to be disciplined as we have, but obviously we need to see execution on that in that regard.

<Q - Stephen Calder Byrd>: Those are all great points. I wanted to shift over to the New York ZEC legal challenge. I think you've laid out your points of view in terms of the legal position. In the event that in court the ZECs were either overturned or remanded for substantial modification, can you speak to the impact to the acquisition with Entergy in terms of the transaction impacts?

<A - Joseph Dominguez>: Sure. Stephen, this is Joe Dominguez again. So the way you ought to look at that transaction is: the legal risk will shift to us really around the time we do the outage in January. So post-January, you ought to think about us as effectively being the economic owner of that legal risk, subject, of course, to the approvals. But we're not going to be able to walk away from the transaction if something occurs post-January that changes the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01653

ZEC program. And the logic there is after the outage we effectively have our fuel in the machine and we've paid for the outage costs, so we're going to be the economic owner at that point, again subject to regulatory approvals of the transaction.

<Q - Stephen Calder Byrd>: Understood. And I guess the worst case always is that you do still have plant closure as an option, so your worst case is capped and you still do have the potential for obviously a good outcome.

<A - Joseph Dominguez>: That's right. And we feel very strongly in the merits of the case. Otherwise, we would not have done this.

<Q - Stephen Calder Byrd>: Great, thank you very much.

<A - Christopher M. Crane>: Thanks.

Operator

Our next question is from Shar Pourreza with Guggenheim Partners.

<Q - Shahriar Pourreza>: Hey, Chris and Jack.

<A - Jonathan W. Thayer>: Hi, Shar.

<A - Christopher M. Crane>: Good morning.

<Q - Shahriar Pourreza>: The $0.02 to $0.08 of synergies from FitzPatrick, can you just remind us if that includes any additional synergies of owning FitzPatrick next to Nine Mile?

<A - Christopher M. Crane>: It doesn't, and we'll evaluate that as we get into the integration. There are conversations now in the nuclear integration team on what is the best way to optimize. The security fences are next to each other. It's a very big site. So amalgamation of the complete site might be more expensive than it's worth, but there are other elements on the site that we can look for synergies around the support services and the executive management.

<Q - Shahriar Pourreza>: Okay, got it. I don't know if you could mention the actual – is it enough to be a couple of pennies or anything directionally, or not yet, too early?

<A - Christopher M. Crane>: It's too early. We've got to get in and see and make sure that we maintain our design basis but look at everything possible we can to be more efficient.

<Q - Shahriar Pourreza>: Okay, got it. And then just lastly with the strong results year-to-date, are there any opportunities to pull forward some O&M, and maybe how we should think about it for the fourth quarter?

<A - Jonathan W. Thayer>: I'd say with respect to O&M, we're going to manage our plan tightly. And generally there's not that much opportunity to move things quarter to quarter. The planning required for the bulk of our O&M takes months, if not years. And so I think you'll see us trying to land pretty darn close to what we've shown you in the slides today.

<Q - Shahriar Pourreza>: Okay, great. Congrats on the quarter.

<A - Jonathan W. Thayer>: Thank you.

<A - Christopher M. Crane>: Thanks.

Operator

And we have time for one last question. That is from the line of Chris Turnure with JPMorgan.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01654

<Q - Christopher J. Turnure>: Good morning. I had some questions on Pepco, and I wanted to just get an update on your latest dialogue with interveners in Maryland and DC and just how things are progressing there on their understanding of you guys under-earning by so much and having stayed out of cases for so long there pre-deal.

<A - Denis P. O'Brien>: Hi, this is Denis. Great question. As we're going through the integration, I think things are going very, very well. As we mentioned before, it's going to be a long haul in terms of rate cases being filed every 12 to 15 months for the next five years. We've had some good progress in New Jersey. We're in the throes of the case in Maryland at this point, and I guess we'll know about November 15 the outcome of that. So a little hard to predict. Maryland is somewhat challenging. We are continuing to work on improving its reliability, improving all of our performance levels, as well as working to improve our image, reputation, and brand in Maryland. I think this is going to be one of those things where it's going to take us a few cases to get through to a better level of performance. So we'll see November 14 or 15 where we are, and we're going to make this happen. It just may take us a few cases to do it.

<A - Christopher M. Crane>: And in DC, we're early in the process. We've made our filing. We're in data request now. Over 400, I believe, data requests are coming in. So there's going to be a lot of dialogue there, a lot of questions. I think we'll need to provide the sound answers for the basis of our request.

<Q - Christopher J. Turnure>: Okay. And then excluding weather, were there other drivers behind the outperformance or maybe the guidance increase for the Pepco utilities for 2016?

<A - Jonathan W. Thayer>: Primarily weather related, so hotter than normal temperatures as well as storms relative to what we budgeted came in lighter. So beyond that, I think those were the major drivers.

<Q - Christopher J. Turnure>: Okay, that's all I had. Thanks.

Operator

And that does conclude the question-and-answer portion. At this time, I'd like to turn the conference back to Mr. Eggers for closing remarks.

Daniel L. Eggers

Thank you all for joining us and your time today. I know it's a busy earnings day. We appreciate your interest in Exelon, and we look forward to seeing a number of you at EEI the week after next. Have a great day.

Operator

Thank you. Ladies and gentlemen, this does conclude today's conference call. You may now disconnect your lines.

MANAGEMENT DISCUSSION SECTION

Daniel Ford

All right. Our next presentation is going to be Exelon Corporation. We have Jack Thayer, who is the Chief Financial Officer, who's going to take us through what we think is a very exciting story in Exelon. Jack?

Jonathan W. Thayer

Okay. Thank you. So start-off by quickly flipping through the cautionary statements. You can read them at your leisure and move quickly to our brag slide. So, wanted to start-off by saying good morning to everyone. Glad that there are more people in the room for this presentation than the last one. It was going to look like it was going to be a very rough start.

But what you can see here, we are the only utility in the Fortune 100. We serve more utility customers than any other company in the industry. We have over $30 billion of rate base and that's growing. We're the largest and cleanest competitive power generator with over 90% of our output being carbon-free and we own nearly a quarter of all the nuclear reactors in the U.S. and are the best-in-class for capacity factor, outage days and operating costs. And our Constellation retail platform is the biggest in the U.S. selling nearly 200-terawatt hours of electricity annually and more than 800 Bcf of gas.

Exelon is well-positioned to deliver enduring value over the next five years, and we expect to deliver 6.1% rate base growth across our utilities and that's going to drive 7% to 9% EPS growth one of the best growth stories in our industry. We have $8.2 billion of free cash flow at ExGen to fund utility growth without incremental equity issuance, while also reducing debt.

Importantly, we're optimizing the value of ExGen raising nearly $5 billion by monetizing assets through outright sales or project finance. We secured $0.08 to $0.10 per share a year through the Clean Energy Standard in New York to recognize the carbon-free value of our nuclear plants and we obviously hope to pursue similar opportunities in other states like Illinois.

We're unlocking $0.07 per share of run rate value by closing uneconomic nuclear plants. Our balance sheet is extremely strong, well exceeding investment-grade credit thresholds. And we're growing the dividend to 2.5% through 2018.

In terms of our capital spend, we expect to spend more than $25 billion in utilities over the next five years, which will meaningfully grow our rate base. And as you can see, this represents almost all of our discretionary investment through 2020.

Bloomberg Transcript

In terms of the results of that investment, you'll see us growing our rate base over the next five years, we'll be adding nearly $9 billion of rate base growing to more than $40 billion of rate base by 2020. And to put this in context, our rate base growth over the next five years is equivalent of adding another PHI without having to pay a premium or navigate regulatory approval.

In terms of overall EPS growth, we're targeting EPS growth of 7% to 9% annually through 2020. This is driven by the aforementioned rate base growth as well as improvement in PHI's earned ROEs. We see the utilities providing the majority of our EPS growth throughout this decade, and see the potential for sustaining 5% EPS growth for the five years beyond 2020.

What's underpinning all of this is our proven track record of operational performance. And as you can see here, looking at the time of the CEG merger in 2012, where our utilities were operating in key performance metrics at that time, generally speaking, ranks second quartile, third quartile and in some cases fourth quartile, and by 2015 using the Exelon utility model, almost all of those categories were in the top quartile.

Now, at the far right, you can see PHI, similar circumstances to BGE, which is now operating at top quartile levels, and obviously, underpinning one of our regulatory commitments as part of the PHI transaction was improving PHI's operating performance to top quartile performance. And to the extent that that happens, I'll show you on the next slide that with these improvements, we see significant uplift in regulatory performance and earned ROEs.

So, as you can see, as outage frequency declined, customer satisfaction, which is most correlated to that, improved. The overall earned operating ROEs improved to where in 2015, albeit with the benefit of some mild storm weather, we earned 10.6%. Having been part of the legacy Constellation. I don't know that I ever anticipated that I would see a double-digit earned ROE at the utility. So, you can see why we have a lot of hope, particularly given the composition of PHI within Maryland to enjoy a similar experience.

There is a significant gap, however, in earned versus allowed ROEs across the PHI utility complex, and we've already begun the process of making those filings. We have six distribution rate cases that are currently filed, three transmission formula rate filings, and we're seeking $465 million of revenue increases across all of our jurisdictions. And importantly, we received our first settlement in New Jersey on August 24, and that was on plan and earlier than expected. And we expect to have the remaining cases finished by next summer.

On the GenCo side, we're taking meaningful steps to improve the earnings consistency of this business. Our Constellation business maximizes the value of our portfolio and our generation to load matching strategy provides additional value over what our plants could otherwise get in the open market. And our durable and loyal customer base, and our growing retail business improves the consistency of ExGen's earnings.

PJM capacity revenues also provide us a stable revenue stream consistently of between $1 billion and $1.2 billion per year, and programs like the Zero Emission Credit program in New York, the first of its kind to value nuclear for its carbon-free attributes, recognizes nuclear generation's importance in meeting our nation's carbon goals. The ZEC will preserve our at-risk Ginna and Nine Mile plants, providing up to $350 million of additional cash through 2020, and $0.08 to $0.10 per share in additional earnings. We also announced as part of this that we've reached an agreement to purchase the FitzPatrick plant from Entergy for $110 million, and FitzPatrick is also eligible for the ZEC.

And importantly, we also have a track record of retiring assets that are no longer economically viable. By retiring those assets, we're able to stem the loss of cash and earnings associated with these plants. Clinton and Quad, which are the two at-risk nuclear plants in Illinois that we've announced the shutdowns of, have lost $800 million over the last seven years, and retiring these assets will result in $75 million of cash flow upside in 2019, and $0.07 of run rate earnings improvement.

Finally, we look for ways to monetize our assets. We've raised more than $5 billion from selling assets or project financing them. We sold 3,000 megawatts of Generation at an average price of $600 per kW in 2014, which was a very good price to in part fund the PHI transaction. We've also raised more than $3 billion in non-recourse project finance, and we'll seek to project finance additional assets and quickly recycle the proceeds.

Bloomberg
SI-SSA-0015-01657

Similar to our story on the regulated side, we are a best-in-class operator on the Generation side, by running our assets at top capacity factors, 93% or better. We make roughly $250 million more than if we were running at the 90% average current industry, or current industry average.

We also operate our fleet at a very low cost. And as you can see, we've been working to both improve our O&M spend and reduce costs there, as well as reduce our base capital spend and drive free cash flow from these assets.

On the growth side, after completing the two combined cycles in Texas, and completing a number of smaller investments, you'll see that in 2018 and beyond, we expect to spend about $100 million annually on ExGen growth. So, as you think about the relative mix of CapEx going forward, $25 billion at the utilities, a much smaller amount and shrinking amount at the GenCo. This $100 million represents about 25 megawatts [ph] have had the (08:58) customers solar per year, so you can see the significant focus of our capital program is on growing the utilities.

In terms of ExGen's role within the broader company is really meant to be the source of free cash flow to fund the growth of the utilities without issuing any equity. So, you see $8.2 billion of cumulative cash flow, at ExGen, the aforementioned $2.3 billion of committed ExGen growth and then, you see the $2.7 billion to $3.2 billion of utility investment and the remainder of that cash flow is used to get to our debt reduction targets.

In terms of the nuclear part of our business, obviously, New York sets a backdrop of what is the art of a possible? Governor Cuomo, took the lead there in protecting these nuclear assets and the jobs and economic contributions that come with them as part of a broader goal to for New York to achieve its carbon objectives.

In contrast to that is Illinois, which has two of our assets that we have announced that we'll retire in the absence of legislation. We have until December for the legislature to take up action on those assets for the Clean Energy Standard. But you can see here the significant economic impact, as well as the carbon impact that will come if those assets are retired. We hope that the legislature will be prudent in its actions just as Governor Cuomo has been lauded for his actions in New York, we hope that the legislature in Illinois will reflect on that and take similar action.

In terms of our credit objectives, we have announced a target of three times debt to EBITDA on the ExGen side and you can see we're well above on the Exelon holding company consolidated side are S&P thresholds. In terms of our credit ratings across our various entities and registrants, you can see we have very attractive ratings and an improving credit profile in the ExGen part of our business. This three times debt to EBITDA target incorporates the roughly $3 billion of project finance that we have. If you were to exclude that, we would be meaningfully below the three times debt to EBITDA target that we're seeking.

What this effectively means is, as we grow the utilities, as we invest and deploy capital there, our utilities as they grow in EPS and rate base are able to shoulder more and more of the dividend obligation of the company. So, on the slide here you can see the implied payout ratio of the utilities were to cover all of the dividend plus the interest expense at Exelon HoldCo, and what you can see is if we were growing the dividend 2.5% per annum through 2020, would imply a 77% payout ratio.

I think Chris commented at our Analyst Day that we see this as a potential opportunity for further upside on the dividend that he wanted to get through the rate cycles at PHI to ensure that we were in a good place. But I think in terms of our dividend growth profile with respect to our industry peers, there's potentially more opportunity here.

And all this gets to how we anticipate delivering value to you through our capital allocation policy. At its core, the strong balance sheet is a commitment that we have to all of our stakeholders and that allows us a great deal of flexibility and how we can return capital to shareholders with the free cash flow that we have. We are targeting 2.5% dividend growth through 2018, but we do, as I mentioned, see upside potential beyond that.

We're investing $25 billion of capital over the next five years in utilities, and I think if I was to think about 2019 and 2020, some of the capital that we have profiled there, there may be potential upside beyond that, but we're retiring more than $3 billion of debt at ExGen over the next five years. And we're investing in selective contracted assets, but at a very modest level, so $100 million per annum once we get into 2018 and beyond. And we think this is the right strategy for our markets and our assets, and the right strategy to improve shareholder value and deliver value to our

final
Bloomberg Transcript
Bloomberg

shareholders.

And appreciate your time today and, Dan, happy to take some questions.

Q&A

<Q - Daniel Ford>: Thanks very much. There are some microphones that'll be going around the room for Q&A. Just to start off Jack, can you talk a little bit about why you have covered that the ZEC program will withstand the inevitable core challenges that we'll see, and maybe how they compare to RECs as well?

<A - Jonathan W. Thayer>: Sure. So, obviously, as you could imagine, we have a rather extensive complement of folks that focus on FERC within and they were critical to helping design this program. And so as we think about what we were targeting, we're really – and you mentioned the similarities to RECs – we were really looking to have something that very much felt and looked like a REC. What we didn't want to do is others, whether it was in Ohio, or contracts for differences within Maryland.

We wanted to make certain that we weren't going to run afoul of affiliate issues, that we were not going to run afoul of perceptions of subsidization, and we think we've structured the New York program in a way that it's not limited to assets, specifically within New York, and it's paying assets for their clean energy attributes. And to the extent that FERC finds issue with that, then I think given the parallels between RECs and ZECs, it opens a broader Pandora's box in terms of how clean generation gets compensated in the United States. And so, our expectation is, while there will be challenge because of the implications of the ZEC for other asset classes, that we'll be able to prevail.

<Q - Daniel Ford>: Other questions for Jack?

<Q>: Hi. Thank you. I guess in – upcoming in this month or so, PJM is going to do a backcast of what it would've looked like with 100% capacity performance for the last auction results. Is that coming up? What do you think the impact is? And are there going to be significant offsets to that as we head into the next auction?

<A - Jonathan W. Thayer>: So, there's no question that 100% capacity performance is one of the things where it will have a pretty – we think, a material impact in part because of DR, that on where we see prices clearing. But I don't know that it'll be so significant as to cause a massive uplift, particularly within our ComEd zone which separated. In this most recent auction, we cleared slices of Byron. We would anticipate that all of those slices of Byron would clear in the 100% CP regime. And then, we'll just need to see where that market clearing price is.

And I would say one of the things that we've seen, I think there was concern about how the market would receive the increased cost of CP. I think one of the things we've seen this summer because assets are more reliable because investments have been made, we haven't – even on the back of significant load and weather, we haven't seen dramatic price spikes. So, in terms of how consumers are feeling, these various programs, it looks like the benefit of CP is you're getting improved reliability and avoiding historic price spikes. So, it actually looks like a pretty good outcome for customers, and I think there was concern that it was not going to drive anything more than a price uplift.

<Q>: Hello, hi.

<A - Jonathan W. Thayer>: Hello. Hey, [ph] Rick (18:10).

<Q>: Yeah, hi. You sounded like there is a little hope that Illinois may still reach some kind of a decision on the nuclear program, which you are talking about. So, how do you see that, because so far they have been holding back on this issue, and now there is a small glimmer of hope because of New York. So, how do you see that parallel working out?

<A - Jonathan W. Thayer>: I wouldn't want to read too much into my hope. I think, fair to say, Illinois, has some interesting dilemmas in front of it. There are two veto sessions, one in November, one in December, to the extent the legislature decides to pass legislation on the Clean Energy Standard. We can still keep Quad and Clinton operating. Our flexibility to do that after December is effectively non-existing. And so, I am perhaps speaking with hope in the context of the implications of retiring those assets on our employees and the communities that the plants are located in, because

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01659

it'll be catastrophic, I think. But beyond that, it's completely in the legislature's and the governor's hands as to whether or not they want to save those plants.

<Q>: Could I just follow-up a bit. Do you sense from politicians that they are changing their tune, or do you think that they are still where they were six months ago?

<A - Jonathan W. Thayer>: The beauty of being a CFO is I don't spend any time in Springfield. And so, I am probably the wrong person to prognosticate on this, I think, from just a purely objective. I look at that slide we have, which is we call the Tale of Two Cities slides, where you have New York preserving all of that economic contribution in Illinois has the opportunity to do the same. And again, speaking with hope, I would hope that the prospect of losing that economic contribution, which is hard to replicate would prevail upon legislators to take action. But I don't have any insight as to whether there's appetite for that or not. I am speaking purely from a personal perspective. I'd hate to see these assets retire. We know what the alternative is if no actions taken. We have $0.07 to $0.10 of uplift and we'll have $75 million of cash flow run rate in 2019. But for the people that work at the plants, and for those towns, I hope we don't have to take that action.

<Q>: About total EPS, what portion do you see long-term action making up?

<A - Jonathan W. Thayer>: If you look at the current commodities curve, it's right around 75% or more of our earnings will come from the utility, 25% will come from the merchant part of our business. To the extent that that number becomes more heavily weighted towards the GenCo, that just means power prices have gone up, and we have more free cash flow. So I'm happy to be thrown in that briar patch. But if we just look at the current marks, we're three quarters regulated by 2020, and that married up with the ability of the utility to cover our growing dividend, I think gives us a lot of flexibility in terms of how we return value to shareholders.

<Q>: Hi, thanks. You mentioned in your prepared remarks how you've done asset sales in the past at ExGen. I wonder what your thoughts are on the renewables business, whether the market there is as deep as it had been when the deal closed, were more active, what your thoughts are in terms of possibility selling that business at some point?

<A - Jonathan W. Thayer>: So, a couple of thoughts on the renewables business. We have historically participated in that business and have a reasonably sized wind fleet as well as a fair amount of solar assets, and those have been good investments for us. I think the one challenge in front of us, and it's a purely structural issue, because of bonus deprecation, we're not a cash tax payer until I believe it's 2021. And so, as you think about the economics of renewables and the role of tax incentives as part of that, it's very hard for us to harvest and keep the value of those tax attributes, and so, we have to sell them as tax equity, which makes them candidly less economic for us. So, I would say that's what's underpinning the significant drop in investments at ExGen that you see in 2019 or 2018 and beyond.

In terms of our existing fleet, those are assets that contribute to our EPS. They're very good assets. And we have a history of responding to inquiry if people are inclined. That's underpinned some of the asset sales we've had in the past, and to the extent that there were an opportunity to monetize some of our assets, there are any number of structures that that could entail, I think we'd consider it.

But I'd also say there's, I would say, value in us staying in that business because of our expectations of the role renewables will play in distributed generation at the utilities as part of rate base. And just more broadly, if you look at the stakeholders that within Illinois around the Clean Energy Standard, many of our partners in trying to secure that legislation are very focused on expanding renewable generation. And so we have wind partners, we have community solar partners and others, who I think want to be partnered with like-minded individuals. And so having those credentials in terms of being an operator of renewables, I think, continues to be important to us.

<Q>: Hey, thanks. Just to clarify, so would that mean further future renewable development more under a regulated construct versus merchant? And then I guess just back to the tax equity, I mean kind of what's your sense of the overall market appetite there? I'm getting that it's a little less robust than it was.

<A - Jonathan W. Thayer>: Right.

<Q>: Thanks.

final

Bloomberg Transcript

<A - Jonathan W. Thayer>: So, we have a history of selling tax appetite to – typically, they've been technology companies out on the West Coast that are generating significant profits. To your question on where do we see distributed generation, as you think about our utility of the future, if Anne Pramaggiore, who is the CEO of ComEd, were up here, she would speak to a desire to have community solar. It's the most economic way for our customers in a non-regressive way, in a democratic way to participate in renewables. It's certainly significantly cheaper than rooftop solar, which is both regressive as well as just expensive for the carbon-free generation that's produced.

And we see other opportunities around things like battery storage as well as other aspects that will both improve reliability, but also provide cleaner generation. And part of the reason for us, it's not just a cost issue of why we think it's right to embed that within the regulated construct, but it's also just from a grid security standpoint. As you think about the role of cyber and a two-way grid, I think it's going to be increasingly important for one party to be accountable for that grid security, and part of that means to the extent that we have two-way communication that we're playing a meaningful role in insulating that.

<Q - Daniel Ford>: Jack, the overall presentation and story that you've laid out at your Analyst Day really is one of de-risking the balance sheet, de-risking the business by becoming more regulated and more predictable. Inside of that 25% slice is still ExGen. Can you talk about the slices within that in terms of predictability because I've got capacity, I've got Constellation, those don't have the same kind of commodity ups and downs as we traditionally think about ExGen?

<A - Jonathan W. Thayer>: Right. So, $1 billion to $1.2 billion of capacity per year, as you mentioned, and that's highly visible and knowable out at least through 2019. We'll get the uplift [ph] that were (27:56) we believe uplift from 100% CP in 2020 and beyond.

With respect to the Constellation business, that is a business that has consistently, particularly on the back of the polar vortex, performed limited capital requirements, more liquidity, that's required to participate in that business, as long as it's married to a large generation fleet. And that business has consistently generated a significant cash flow, on an annual basis, 80% renewal rates for our customers, margins that have held faster between $2 megawatt hour and $4 per megawatt hour, on the electric side, around $0.20 an MMBtu on the gas side, growing gas business.

And we've been able to make consolidating acquisitions. We just recently announced and closed ConEd retail business. We bought Entegris' business, and we've been able to opportunely purchase these assets at significant discounts that we perceived a fair value, and they are immediately accretive in cash and cash flow positive, which leaves the commodity exposure. And as you think about that commodity exposure, I would like to believe we're are at a floor. And there are assets that are really struggling in this environment. Our nukes, as a an example that we're retiring, as others look at their fleets and act with discipline and retire certain assets. You'd like to think we're certainly at a floor, if not, there's some opportunity for upside.

And so, as I think about that consistent cash flow coming-off the GenCo, I feel like that's a very attractive and unique aspect of the story, because to your point on de-risking we're trying to take the balance sheet out of the equation. We have one of the premier growth stories on the regulated side, and we have what a lot of our peers in UTY don't have which is a free cash flow generating part of our business that we can redeploy that capital whether it's further growth at the utilities, growing the dividend, or returning capital to shareholders through buybacks or other approaches.

So, I think, the opportunities in front of us with good performance to have a really differentiated story. And one that I think is historically traded at a meaningful discount to peers and to the extent that we can close that gap and get – we're trading three times – three turns light relative to some of the peers, I think there is an opportunity for multiple uplift as well as just EPS growth. And hopefully, that's compelling value opportunity for our shareholders that they can get excited about.

<Q>: All right.

Daniel Ford

All right. Well, if there are no other questions, we do have a breakout session in Liberty 5. So we'll be walking Jack up, and thanks very much the presentation.

Jonathan W. Thayer

Great. Thank you, guys.

MANAGEMENT DISCUSSION SECTION

Unverified Participant

Ladies and gentlemen, please welcome Senior Vice President, Investors Relations, Dan Eggers.

Dan L. Eggers

[indiscernible] (00:14). Good morning, everybody. Thank you for coming to Philadelphia and the 2016 Exelon Investor Day. We appreciate you all coming down, and spending a good part of the – a day with us. We think there is a lot of great information we want to share. It's been almost four years since the last Analyst Day. So plenty of discussion here. A few points of note, number one, keep in mind, that all the traditional regulatory disclosures are included here and in all SEC filings. We will not read them to you as we do on the earnings call. So you can thank us for that.

The second thing I'd point out is all the GAAP and non-GAAP disclosures are in the back of the presentation. So anybody who is dying to resolve for governmental reasons, they're all available for you to use at a later time. Last house-keeping item, in case there is an emergency, exits are behind you, and you can go right or left or if you go out the side, behind the screen there's two more exits. There is plenty of ways to get safely out of here, although we have

Bloomberg Transcript

no intention of that occurring today.

With all that out of the way, we have an exciting day ahead of us. If you look at the agenda, we're going to start off with Chris. We're going to have our full Utility team get up and talk about their business stories. We'll take a break. Bill and Kathleen will talk about policy, Ken and Joe will talk about the ExGen business. Jack will finish up with some financial updates in the presentation. And then we'll do Q&A. We've segmented Q&A in a way that between the businesses, you have a chance to catch up and ask questions specific to the business. And then big picture questions, you can add at the end for Chris, and Jack, and wrap everything together.

So we appreciate you being here. Hopefully it's a great day. It's my great pleasure to turn the microphone over to Chris Crane, our President and CEO.

Christopher M. Crane

Good morning and thank you all for joining us in Philadelphia, one of our hometown cities. It's showing very well with the convention and now with all of you being here. The senior management team is here today to help share the outlook for our business. We have a larger than normal group that we brought in, but wanted to take the opportunity for all of you to get to know and share my confidence in this team and their ability to execute. We've had a meaningful strides, we've made meaningful strides in the shift of our business mix, as we've talked about with you before and today is the chance, especially for our utility leaders all of them to get up and describe where we're at.

The slide behind me, is kind of our brag slide. It's where we are now, where we've come from in the last four years. We're now serving more utility customers than any other company in the country. Over $30 million in utility rate base. We've produced more clean power than any other generator by a significant margin. We owned the biggest retail book in the business and we work with 32,000 very talented and professional employees.

Our ability to be successful rests on leveraging the advantages that this scale gives us. Advancing innovation in both technology and customer service is a high priority of ours going forward, relying on the stability of our utility base is a shift that – that we are making in leading the industry in policy development while maintaining the best-in-class operating culture that you're going to hear a lot more about today. On the next slide, you can see our value proposition that we'll be discussing. Utilities are at the heart of the earnings. Targeting utility, EPS growth, 7% to 9% annually 2016 through 2020. ExGen will produce over $8 billion of free cash flow over the next five years to fund its current growth projects, which are tailing up, meet the equity needs for the utility growth program and retire $3 billion of GenCo debt over that period of time.

So we will run the GenCo to maximize the value of our trademark Exelon operations and continue with our public policy advocacy that we'll talk more about today. We'll continue to find ways to fairly compensate the clean reliable attributes of our nuclear plants and we'll not run money losing plants as we have demonstrated with our announcement in Illinois earlier this year. We're going to protect our investment grade and balance sheet across all the businesses. The capital allocation is really focused on utility growth, dividend growth and debt pay down. And that prioritization, we believe will create value for all you shareholders as we're delivering value to our customers through reliability and better service.

Flipping to the capital investment in the utilities. You can see from this slide, we're delivering on the first point of our value proposition. We're investing over $25 billion in the utilities over the next five years and that does represent a vast majority of our discretionary investment through 2020. Our utility CEOs will be up as we said shortly to discuss the details on that and their approach on the execution thereof of the capital deployment.

On the next slide, driving the strong rate base growth, the CapEx program will raise our rate base growth to 6.1% annually through 2020. So, that's from 2016 to 2020, and this is consistent with the growth that we have seen over the last five years. We will be adding nearly $9 billion in rate base over that period of time. So to put that in perspective, that's like adding a PHI to the portfolio without paying a dividend or navigating the regulatory process to say it nicely.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01664

On the next slide, talking about EPS growth and looking at the range here, we continue to target EPS growth from the utilities at 7% to 9% annually. And we're extending that growth path from our last conversation through 2020. The higher growth comes from the 6 plus percent rate base growth and improved ROEs at PHI which Denis will talk a little bit more about coming up. The growth is frontend loaded as we get through the early rate cases at PHI. We see the utilities providing a majority of the growth of the EPS contribution through the decade, and we see the potential of sustaining that 5% EPS growth four years after 2020.

On the ExGen side, you can see the free cash flow from ExGen supports the overall plan. We do have a strong base at our ExGen. We are talking a lot more today about the utilities to make sure we're sharing that information. We have had more conversations in the past on the ExGen. So it is a big focus today on the utilities but it is – but it's anchored on what we are doing with the ExGen. Over $8 billion of free cash flow will fund the ExGen residual capital that we have in the plan as I said, provide the equity infusion into the utilities so we can avoid the equity markets and pay down roughly $3 billion on debt at the ExGen, which we think will uniquely position us through the commodity cycles to maintain that strong investment grade balance sheet.

The strong free cash flow from the ExGen does underpin our capital prioritization and it benefits the entire company not just the ExGen. Steps to improve the ExGen earnings on the next slide, another key priority is furthering and improving the consistency and the durability of those earnings. We've made significant progress and Joe will talk to you about that and Ken on our gen to load matching strategy which improves our hedging and captures incremental margins above and beyond just the wholesale market.

We're pursuing options for our nuclear plants and ensuring compensation for the clean attributes. You've seen the recent success we've had in New York and Bill and Kathleen will talk more about that, but you've also seen the hard decisions we've had to make in Illinois on the early retirement announcements and there will be more details with Ken and Bill talking about that. We're pursuing competitive power market reforms like the PJM capacity market reforms that have really provided us some consistent cash flows over the last couple of auctions. And we will take the opportunity to monetize some of our merchant assets as we see the market valuing them higher than we can. We've done that nicely in the past and we will continue that. We plan to continue that approach.

So the next slide, we're making all these decisions with a focus on the balance sheet, which you can see is the center to our proposition. Even with the considerable investment that we're making totaling $32 billion over the next five years, we have a strong investment grade credit metrics with headroom at the corporate level, and we're targeting a three times debt-to-EBITDA at the GenCo level, and I'm very confident that we can do that. Delivering through the capital allocation, Exelon's value proposition remains linked to the capital allocation philosophy that we shared with you starting last year, which is center to all our investment decisions.

We're committed to a 2.5% dividend growth through 2018. We will deploy free cash flow from the generation as we've said to fund the utility to modestly invest in contracted assets that have to meaningfully exceed our return thresholds, and as I said, retire the $3 billion of debt at the GenCo. We do have diverging paths for our nuclear plants, and 2016 has been a pivotal year for us in the future for nuclear generation. And this slide shows the two paths that the financially challenged plants are taking. They're driven by weak natural gas prices, the government mandates that we've been talking about for years and the unintended consequences of those preferring renewable over stated outcome, which is low carbon or carbon free generation and a failure to properly compensate them for that carbon free generation.

In New York, with the support of Governor Cuomo and the Public Service Commission, the Innovative Clean Energy Standard Program has been approved, and it will be implemented. The program puts a value on carbon in a benefit of nuclear. Preserves the at risk jobs in upstate New York, and puts us on a course to save the FitzPatrick plant that you heard the announcement about yesterday and that one will not have to close.

On the other hand, the path is different today in Illinois. We have been unable to move a very well designed legislation to preserve the Clinton and Quad Cities plant, which leaves us no choice to proceed with the steps that we must take to shut the units down. For the good of our customers, the communities, our employees and our shareholders we'll continue to work for solutions in our states to preserve these nuclear-generation fleets, but we do need the states to step

final
Bloomberg Transcript
Bloomberg

up and recognize the value of these assets that they contribute to the communities and to the environment. And I will stress that we will not destroy shareholder value. If the plants are challenged, we can't find a path, we will be shutting the plants down.

So finally, we would be nowhere today without the incredible talented workforce that we have at Exelon. We are 32,000 strong now at this point, and today you're going to hear reflections from some of the other leaders on our workforce from a number of perspectives. But I wanted to highlight a few on the culture of the innovation that we're growing, and we've talked about quite a bit here publicly at Exelon. Engaging the employees has been a significant focus of myself and all of our leaders on helping find fixes to the challenges that are in front of us, some that we know about and some that they know about, but allowing them to engage their brains and help in the fixes.

There are some examples here. BGE finding new and badly needed ways for flood protection. The nuclear workers there with the iPad. We have now gone to digital work packages, it may not sound like a lot but a couple of years ago if you went into a nuclear plant, you would see a mechanic or electrician working on a pump with a three ring binder with paper like you wouldn't believe. It was a constant trap and a productivity drag, so we're now on iPads improving efficiency and reducing the chance for error.

ComEd was the first utility that was approved by the FAA to fly drones for operational use, and they're continuing to find other ways of using the drones across the company. On the bottom right-hand side, those two meter readers from the Rockford region, they were hired – as you can see, they're in their early 20s. They were hired to read meters in a very remote area of our service territory. And on their own, without any coaxing or prodding, they developed apps that gave them the most efficient routes, gave them the information on who has a dog, where the meter is at, and it drove the productivity of those meter readers up significantly, but allowing the employees to engage and take on these tests that really benefit us. So we'll be using this app as long as we have meters, but those are on the way out.

The digital worker concept is where we have done a lot of work with innovation fares with the employees, engaging the employees and sharing what can be done from business to business. And some of the things that we're doing in the nuclear plants or on the utility side allowing technology, [ph] the wear (15:51) technology that can help reduce radiation exposure. You send one person in with these wearable devices and they're getting advice from people offsite, onsite. It has helped us better utilize resources, created a much more safer workplace, but the efficiency that's coming into the organization is fantastic. So, we do have a great story to tell and I'm really excited about the prospects of Exelon going further.

But right now, I'd like to turn over to our utility leaders to discuss their businesses in more detail. And as Dan said, we'll be up at the end to answer questions or get into more dialog as you wish. So, right now, I'll turn it over to Dennis O'Brien, our Chief Executive Officer of Exelon Utilities.

Dan L. Eggers

Hi, everybody. We're ready to get on with the Utilities section. As Chris said, it's my pleasure to introduce our entire senior utility management team. Dennis O'Brien, Chief Executive Officer of Exelon Utilities. And then the CEOs of our individual Utilities, Calvin Butler of BGE, Craig Adams of PECO, Dave Velazquez of PHI, and Anne Pramaggiore of ComEd. They all have their moment to go in a second.

But I'll turn it over to Dennis to give his high-level thoughts on the Utility business.

Denis P. O'Brien

Thank you, Dan. Dan is one of our first leaders of IR to realize that the Utilities story was very exciting and we ought to do it first thing for everybody. So, thanks for having that great wisdom and insight, Dan, and welcome to our team.

Good morning, everyone. As the senior member of Exelon from Philadelphia and also as the current Chairman of the Greater Philadelphia Chamber of Commerce, I welcome you to my hometown Philadelphia. It's a great place to live,

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01666

work, and play. And hopefully, you enjoy your time here. And while I'd love to talk to you about living in Philadelphia, we're here today to talk about Exelon and I and my team are here today to talk to you about Exelon Utilities.

I've worked in the Utility business for over 30 years now. And I can't think of a better time to be leading the Exelon Utilities than right now. Over the last few years, Exelon Utilities has grown to be one of the largest family of utility companies in the country. With the help of over 17,000 employees, we provide safe electric and natural gas to more than 10 million customers. And by my count, that's 22 million Americans in the Mid-Atlantic and Illinois that we serve.

This morning, I will provide you with an overview of the scope and breadth of Exelon Utilities along with our strategies for improving operations and financial performance of PHI. As you can see, I have one of the best, if not the best, leadership team in the nation. And following my comments, Anne, Calvin, Craig, and Dave will provide you with a deeper understanding of each of their businesses. Next slide, please.

We've shown you this slide before, but I wanted to show you again because I think it's really important in terms of showing you the scale of our combined utility platform and putting it into perspective. As I mentioned earlier, we have about 10 million customers, which is more than any other utility in the United States.

Over the next three years, we will be investing $16 billion in our utilities to better serve our customers. This is fourth amongst publicly traded utilities. Our rate base of nearly $30 billion is also the fourth largest in the industry even though we are solely a transmission and distribution business. I could continue to walk through the metrics but the message would be the same. Exelon Utilities is amongst the largest utilities in this country. We are leveraging our scale to drive better operational and financial performance. Whether it is from best practice sharing or using our scale to get better pricing from our vendors, our scale is definitely a competitive advantage that we are using to benefit our customers and to achieve high levels of operational and financial performance. Next slide, please.

From 2012 to 2015, we invested about $12 billion to improve reliability, resiliency, and the customer experience. Going forward with the addition of PHI, we will invest more than $25 billion over the next five years. We have finished our planned smart meter deployments in all of our utilities except for ComEd, which will be done in 2018. I am extremely confident in our ability to deploy the $25 billion of capital over the next five years efficiently and effectively to better serve our customers. Our five-year investment strategy is well-developed and our project management capabilities are growing stronger each and every day.

Next slide, please. Our considerable capital investment is in turn driving strong rate base growth. Our rate base growth averaged 6.4% annually from 2012 to 2015, and with more than $25 billion of capital investment through 2020, we expect to see a similar rate of growth. These investments represent prudent proven projects that will improve reliability, safety and customer satisfaction.

Next slide, please. More than 70% of our rate base growth will come into service under formula rates like ComEd's distribution rate, FERC transmission formula rates or capital riders. These timely recovery mechanisms allow us to make additional investments on behalf of our customers while supporting our ability to earn our allowed ROEs. In the jurisdictions that lack these mechanisms, we are working with key stakeholders to enact and implement this type of regulatory recovery tools.

Next slide, please. On the previous slide, I showed you the significant amount of capital spend and rate base growth. The strong rate base growth of all of our utilities, coupled with improving earned ROEs at PHI, will result in a 7% to 9% earnings CAGR through 2020. We plan to solidly land in this growth rate range, putting us as one of the top growth stories in our industry.

Next slide. Chris talked about his brag slide, this would be my brag slide. Our model for driving utility performance is based on working on the following three areas in concert. Operational excellence, financial discipline and regulatory stewardship. We know that we need to do each of these well in order to succeed.

Each of the legacy Exelon utilities has improved the operational performance since the Exelon-Constellation merger. In a short timeframe, BGE has made great strides with operating metrics that were in third and fourth quartile just a few years ago. Through hard work and best practice replication across utilities, we have significantly improved our

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01667

performance in all three of our legacy companies. BGE, ComEd and PECO are operating at first quartile for the most part as seen on this chart. We believe that this improvement in operational performance [audio gap] (25:23 – 25:33)

I have to start over. I'm kidding. Testing – here we go. Okay. I'm going to start over now. I'm kidding here. We believe that this improvement in operational performance has led and will lead to improved ROEs and better treatment by our regulators. As you can see on the right side of this chart, we have much work to do to improve PHI's performance. I am confident that we will apply our high performance model and improve PHI as we did with our legacy companies. You say, Dennis, why are you so confident about the ability to do this? Well, as I mentioned, I've been around for a long time. We have faced these similar challenges at our legacy companies including most recently at BGE. BGE was not performing well, customer satisfaction was low and reliability was in the third quartile.

We worked hard at BGE to improve performance and improve customer satisfaction. Calvin and his team have done an absolutely marvelous job. Calvin and his team have rebuilt our regulatory relationships and have worked diligently on our rate cases. Delivering on operational excellence leads to more favorable regulatory outcomes. Our experience at BGE and our legacy companies gives us great confidence that we will succeed at PHI. Next slide please. The current gap between earned and authorized ROEs at PHI represents a considerable opportunity for us.

Turning around the operational performance at PHI will involve closing these gaps. Earned ROEs of 250 basis points to 500 basis points below allowed returns were our experience in 2015. This under-earning is driven by lack of rate cases in the PHI companies during our merger approval process. Some of our PHI companies have not had a rate case since before our announcement. And during that time, PHI has continued to make significant capital investment. We are going to focus on improving reliability and customer satisfaction, which is essential to get a proper regulatory treatment. This will not happen overnight, but I am confident that we will be able to do it over the next few years. Next slide please.

As I mentioned, improving operational performance and customer satisfaction are the foundation of our approach to getting good regulatory outcomes at PHI. We need to meet the commitments that we made in our merger process. We need to use financial discipline in managing our resources and managing our cost. We are most successful when our objectives are aligned with the objectives of our policy makers. So, with that in mind, we need to better understand the goals and priorities of our regulators, our state and local governments, our customers, and be better partners in achieving those goals.

When we do these things well, we are better positioned with our stakeholders and we get better regulatory outcomes. We have already begun our near-term regulatory strategy work at PHI. Hard to believe, since we've closed the deal we have made rate – nine rate filings. Six distribution rate cases and three transmission formula rates, requesting $465 million in revenues across our PHI jurisdictions. We expect to have by procedure, the first case resolved in November in Pepco Maryland and have all of the cases resolved by next summer. We have some very productive cost going on in some of the jurisdictions and we're optimistic about our current rate cases.

Some of the rate case increases are significant as a percentage of the customers' bill. And we have worked hard with the stakeholders to have them understand the reasons for these increases. We expect to be in a steady rate case diet in all of our PHI companies over the next three years. Next slide please. In addition to filing rate cases, there are existing mechanisms that we can pursue to recover our investments. These mechanisms or trackers for timely recovery of significant capital investments are very efficient ways to do it. Some have been used by other utilities even in the states that we're in.

In Maryland and New Jersey – in our Maryland and New Jersey cases, we asked for more than $200 million of recovery under the state grid resiliency programs, and we are working to resolve issues with the DC PLUG legislation for the recovery of $500 million. We will advocate for more effective mechanisms in all of our jurisdictions for rate recovery. Next slide, please. As I said, I've been in the utilities for a long time. And as a utility, you quickly realize that you're only successful, as successful, as the communities that you serve. Our employees at every level of Exelon realize this, and they are dedicated to the communities in which they live and work.

final
Bloomberg Transcript
Bloomberg

In 2015, our employees volunteered nearly 130,000 hours, up 25% from just three years ago. They participated in 100 company sponsored events, gave more than $8.5 million to charity, and served on 540 non-profit boards. I am proud of our employee's dedication and support to our communities, and I anticipate that the communities that we serve and Exelon will continue to prosper together for years to come. Thank you.

It is now my great pleasure to introduce Anne Pramaggiore. Anne is the President and CEO of ComEd, the largest of our utilities. Anne?

Anne R. Pramaggiore

Thank you, Denis. Good morning. I think I'm actually talking off of this. Welcome, we're glad that you're all here today, and with all these different companies and all the different cities we serve now, there's any confusion just remember this, Chicago is where the Cubs play. Wouldn't have been able to say that a few years ago. Thank you.

We appreciate very much you coming out today and your interest in our business. Denis gave you an overview of the utilities. I'm going to talk about ComEd for a couple of minutes. ComEd's been in the midst of a considerable transformation over the last four and a half years, and we see this as the first phase of an important evolution in the business.

I'm going to kick off the ComEd story with a few vital statistics. Today, we serve 3.8 million customers in Chicago land, making us the third largest utility serving the nation's third largest metropolitan region. This requires massive infrastructure. We have about 90,000 miles of feeders, 1.5 million poles, and about 2,600 substations. This adds up to a rate base of about $10.6 billion at the end of 2015 and it's growing.

To set the framework for the remarks I want to make this morning, I wanted to share my view of the utility as having – Utility business, Distribution Utility business as having three pillars. The first is a constructive and reliable regulatory model. The second is the internal capability to execute on investment plans. And the third pillar is the delivery of outcomes that shareholders experience and for which they perceive value, you, our customers, policy makers alike.

In today's world, we see another element, not previously required in the utility sphere, and that is given the sea changes underway in our business, the utility needs a plan to transform its business architecture. My discussion today will try to layer these pieces together. When we wrapped up 2015, we concluded at ComEd, the biggest investment year in our history. We put $2.5 billion of iron in the ground. It reflects in large part the significant investments we've been making under the Energy Infrastructure Modernization Act or EIMA.

2016 will be our peak year in the EIMA Investment Plan and while those investments will tail-off in the next several years, we'll still see approximately $10 billion in CapEx in our future 2016 through 2020. The comprehensive EIMA legislation was passed in October of 2011 and it's really been a game changer for ComEd. It addresses all three pillars that I mentioned a moment ago: the investment, the regulatory model, and the shareholder value. Under the investment pillar, we've been engaged in the 10-year $2.6 billion investment program to modernize the grid. Half the amount goes to smart grid investments and half goes to more traditional type investments, reliability projects.

As concerns the regulatory model pillar, we were able to persuade policymakers that with this level of investment that was contemplated, it required a regulatory model different from the volatile model that we've been living with for a number of years. So we designed a formula rate that provides greater predictability as well as timely cost recovery. We make an annual filing that both captures the current estimated cost, as well as truce up or reconciles the previous year's actual cost, both O&M and capital.

The ROEs are formulaic and we have the ability to amortize large one-time expenditures that exceed $10 million. The model reduces lag, mitigates volatility and adds transparency. Finally, under the stakeholder outcomes pillar, with the increased system investment, we've committed to meet an array of performance metrics related to reliability and customer service. We can be assessed ROE penalties if we don't meet the targets. They run from about 30 basis points up to about 38 basis points depending on the year. The EIMA program has allowed us to invest and modernize what was an aging high-traffic system to recover our costs and deliver results that customers have taken notice of.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01669

Half of the EIMA spend is in traditional reliability programs as I mentioned. The work we have done includes implementing more than 800 storm hardening and grid resiliency projects, replacing 3,500 miles of underground cable and refurbishing 26,000 manholes. On the smart grid side, we've installed over 2,600 smart switches or distribution automation devices, sectionalizing our system so that no more than 500 customers to 700 customers would see an outage from a single feeder failure, that's the goal with the smart switches or the distribution automation. We've built nine intelligent substations and we're on track to install 4 million smart meters by the end of 2018.

The result is our investments have supported record reliability for the past three years and we're on track to exceed that in 2016. Since 2011, we've seen a 43% improvement in safety and over – we've – our work has resulted in 5.5 million avoided customer interruptions. Our system investments have resulted in 30% reduction in storm restoration times, right, reliability of complaints have dropped 75% and our customer sat is at an all-time high.

Our work extends beyond EIMA and we have a lot of work going on the transmission side of the business. The slide that you're looking at identifies some standard work that we're doing on the transmission side, such as proactive replacement of large transformers and work that reflects the times, a lot of security work around our substations. And in addition, the bottom path of the slide talks about one of our large projects on the transmission side, our Grand Prairie Gateway project. It's a 60-mile high voltage, 345 kV line we're building between two of our existing substations, it will alleviate congestion on the grid and enhance reliability.

We have a formula rate for our transmission, our recovery as well, and we similarly see reduced lag and volatility with that regulatory structure. On our rate base chart, you can see the growth impact of EIMA and the other investments we've been making, in the first four years that 7.7% and then a still robust growth rate of 4.8% running out through 2020.

It's significant that of the approximately $4.2 billion of rate base growth at ComEd over the next five years, 100% will be recovered through existing formula and rider mechanisms that have served us well over the past four-and-half years. But in order to keep ComEd relevant and healthy as the world evolves, we have three significant undertakings on the road ahead. The next generation energy plan, a piece of legislation pending in Illinois right now. The Illinois Commerce Commission Policy Forum, which we expect to see get up and running in the next six months or so. And the distribution formula rate sunset, which happens in 2019, which will draw us back to the legislature to reset the formula rate that we have on the distribution side of the business.

First, as you may know, Exelon and ComEd have proposed to the Illinois legislature a comprehensive next generation energy plan. I can't cover the entire legislation, but I want to touch on a couple elements that I think would be of interest to you. First, the new pricing regime, and second, growth opportunities that we have in this bill.

The pricing regime has three parts. One, we had decoupling into our regulatory structure. Right now we have close to decoupling with the formula rate, but it's not perfect. This would perfect that. We had demand rates which create a more balanced allocation across our customer base, pulling out some latent subsidies we see in the more volumetric pricing that we have today.

And third, we reduced the customer charge or the fixed charge of our bill, which is quite high right now, that gives customers more flexibility to manage their rates. The second element of the legislation that you would find of interest is the growth opportunities. This legislation gives us the opportunity to ramp up our energy efficiency spend, actually close to double it, and then treated as a regulatory asset and earn on it.

We similarly provide a solar rebate in the form of smart inverters, which we then take to our rate base as an earnings opportunity. And finally microgrids. We've about $250 million identified to build a series of microgrids, and that is also classic rate base. So we'll continue to pursue the legislation through the veto session, and we're preparing for both the ICC forum and the sunset which will take place in 2019 neither are far off.

Like our sister utilities, we're working hard to become the best at everything that counts, and this slide demonstrates some of the successes we've had. On execution, 2015 marked the third straight year of record reliability. We've also turned in our best safety performance on record and named one of the America's Safest Companies in 2015 by

final

Bloomberg

Environmental Health and Safety Magazine.

Our state regulatory model comes in for kudos. It was recognized by GridWise Alliance, ranked Illinois number 2 in progress in implementing smart grid technologies, and number one in policy supporting these technologies. And finally on J.D. Power's latest customer satisfaction index, we received a fourth straight record score, while making us, well, not number one in satisfaction, we're the most improved utility across the country over the last five years.

So, I want to wrap up my presentation with some thoughts regarding the future, what functions we think customers will require of us, how we will perform them and what the business model starts to shape up to be in the new world. We expect to be discussing this further in the ICC forums that I mentioned. Our business model is facing the biggest changes in more than a century, largely due to three trends; concern over climate change, interest in the environment, the acceleration of technology, innovation and the increasing digitalization of the economy driving new customer expectations and behavior.

The drivers manifest themselves in our business in the form of a more decentralized system. Demands for clean and leaner resource usage and customized and connected service. And more and more we'll see a trend of third parties coming into our business to try to meet the needs of customers.

Our work starts with dissecting the utilities functionality as envisioned in the future into four tranches. From here, we're making assessments as to what sorts of core competencies policy support and business architecture each layer requires. The first functional tranche is constructing and maintaining the physical grid. Someone has to do it and we've done it for over 100 years. Of course, the grid of 2030 will have much different demands than the grid of today, accommodating intermittent resources and resources controlled by multiple third parties.

The second tranche is the planning and operating function, also a function that we perform today. In the future, the world becomes more complex around this function due to the mix – the supply mix that I talked about and the control issues I mentioned. Similarly, demand becomes far less predictable. This function becomes exceedingly complex, and its success will tie closely to the investment choices made in tranche 1. Automation will be at a premium.

Third is the energy platform tranche, where energy transactions occur at the distribution level to accommodate distributed energy resources. And the fourth tranche is a service and solutions platform. This is where customers go to procure and producers go to market non-energy services and products, smart thermostats, energy efficiency, demand management services.

At ComEd, we're developing a number of projects to help progress towards the future state and test some of our hypothesis. Our key future-oriented project is our Bronzeville community of the future. The foundation for the project is a microgrid being built on Chicago's South Side and right next door to Illinois Institute of Technology, which has an existing microgrid. The ComEd microgrid will have solar and storage resources and will connect to the IIT microgrid, creating – allowing for dispatch between the two microgrids and creating the first microgrid cluster in the world. We will create neighborhood dashboards to facilitate consumer engagement and we will incorporate a number of other smart city elements. The DOE has graced us with three grants for the project and they're watching it closely. This will be our prototype to test the ultimate model we envision for the future.

While Bronzeville is our core prototype, we have highlighted several other projects that test some of our hypothesis about the future. One is infrastructure convergence, leveraging our new communications infrastructure to create efficiencies across multiple lines of infrastructure. This is the foundation for thinking about smart cities. We have installed streetlights in 50 municipalities, connecting them to our AMI communications network, allowing us to monitor outages and brighten and dim streetlights remotely.

We have a partnership with American Water where we are testing our capability to connect water meters to our communications infrastructure, offering meter-reading and data analytic services to the water utility. We're testing superconductor cable with a plan to connect multiple substations in the Chicago business district creating super redundancy and resiliency in Chicago. And finally, our marketplace, we will prototype a transactional web-based platform later this year where customers can buy energy-related products and services.

My sister utilities are doing some very exciting work in this area as well. PECO is testing microgrids. BG&E has the most sophisticated demand management program in the country, and PHI is connecting residential solar.

So I hope I've given you a flavor for what we're doing under our three pillars for customers, for investors, for all our stakeholders, and I appreciate your time. And, I'm going to turn it over to Calvin Butler, who is the CEO and President of Baltimore Gas and Electric. Thank you very much.

Calvin G. Butler

So let me take this opportunity to say good morning to everyone. And as introduced, I'm Calvin Butler, and have the honor of serving as CEO of Baltimore Gas and Electric. So today, I get the opportunity to introduce BGE to you. I've been CEO now of BGE for the last two-and-a-half years, and I have the honor of leading 3,300 amazing employees. For those of you who don't know, BGE is the largest utility located in central Maryland. And as the slide indicates, we've approximately $5 billion in rate base, 650,000 gas customers, and 1.3 million electric customers. We've been serving central Maryland for approximately – for 200 years. Just celebrated our 200th anniversary of the first gas utility in the nation on June 17. Now, as many of you know, a lot has happened in the City of Baltimore over the last couple of years. And we took the opportunity this year to really celebrate not only with our employees, our retirees, our customers, but all of our stakeholders in the city, really got them all engaged in our 200th anniversary.

And what we also – we used this opportunity to take the time to educate our customers and engage them about what we mean and what we do across not only the City of Baltimore, but the entire region. We served as lead sponsor for what we call Light City, and at the end of March of 2016, and in doing so we welcomed 400,000 people from the State of Maryland and the region to downtown Baltimore.

And what that did, in turn helped us continue to connect with our customers and all of our stakeholders across our state. And not only are we continuing to invest in our customers and the community, but we are also taking great strides to identify investments in our infrastructure. We continue to see valuable investment opportunities for our customers across our Electric and Gas Distribution and Electric Transmission businesses, that are driving truly system performance.

Denis talked about the progress and the evolution of BG over the last several years. I will discuss a few examples of the infrastructure investments we are making on the next two slides. First, BG is making $120 million in transmission investments in the Northeast area of our service territory. These investments benefit our customers by addressing potential overload conditions in this portion of our region. The transmission assets go into service in the spring of 2017. Now, it's important to note that BGE's Transmission business has a formula rate with a ROE of 10.5%. So, projects like this that we can identify are attractive to both our customers and our investors.

Second, in our Gas Distribution business, we have a 30-year plan to accelerate the replacement of old gas infrastructure. As mentioned, we're 200-years-old. So, you can imagine that gas infrastructure has some work to be done. And I'm proud to say that the team has accelerated that pace. Over the 30-year plan, these investments benefit our customers by replacing over 1,000 miles in old gas mains, and over 100,000 old gas services with modern infrastructure. The first five years of the plan was approved by Maryland regulators after being enabled through legislation in the 2013 Maryland General Assembly.

It's important to note that the plan has a tracker recovery mechanism, and BGE receives contemporaneous recovery for modernizing the gas system, which also allows us to reduce regulatory lag. The investments we'll be making over the next five years will grow rate base at a healthy clip. But most importantly, improving the reliability and resilience of our system for customers, which will in turn provide steady earnings for investors. So, the chart, as you see to the right, really goes to show you the acceleration or growth of BGE's rate base.

And next slide. In fact, BGE's projected rate base in 2020 will be nearly $2 billion, 40% higher than it was at the end of 2015. Overall, approximately 40% of our rate base recovery over this period is through trackers, with about 60% through the traditional rate base approach. Now, this is important, because as you know, the regulatory environment in

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01672

Maryland, although it has improved and as Denis alluded to, we're really working on developing those relationships as much as we can reduce that regulatory lag is important for the continued growth of our business.

We continue to explore approaches for alternative cost recovery mechanisms that will minimize that regulatory lag. I want to take the opportunity to close here by saying how proud I am to really represent the 3,000-plus employees at BGE. We talked about the transition of becoming an Exelon company and the hard work that was done by the entire team, from our COO, Steve Woerner and Chief Financial Officers and the entire operational team has really embodied what it means to come in through change and really lean in and make a difference in developing those relationships and improving operational performance.

In 2012, the entire leadership team stood together and made a commitment to improve that overall operational performance through working collaboratively with our other Exelon utilities, PECO and ComEd, using best practices and consistent management model approach we delivered on our promises to bring BGE into the top quartile and decile in the many different metrics that we measure our business.

Like ComEd, I'm pleased to report that we continue to improve not only in our reliability, but our customer satisfaction. As Denis alluded to, when you have strong customer satisfaction and we also at the highest we've been in our 200-year history, it directly translates to the financial performance of your company. And we see that each and every day as we work in the communities that we serve. As we look forward to the future, we are excited about sharing the lessons learned with our sister companies at Pepco Holdings and what we can bring to the table and to leverage those best practices.

Now, again, I just wanted to say thank you for your time and allowing me to introduce to BGE. And it is now my pleasure to introduce Craig Adams, my friend and the CEO and President of PECO. Craig?

Craig L. Adams

Thanks, Calvin, and good morning, everyone. As the hometown utility, I'd like to give you a special welcome to Philadelphia. We've had an exciting 14 months here in Philadelphia. First, Vice President, Joe Biden, came to PECO to rollout the White House Energy Report, which contains key energy goals for the nation.

Next, Pope Francis came and paid our city a visit. And we just welcome the Democratic National Convention at our city. And today, we have the honor of hosting Exelon's Analyst Day. Welcome, it just keeps getting bigger. So, PECO is Pennsylvania's largest electric and natural gas utility, serving more than 2 million total customers with $6 billion of rate base. We have a long tradition of very strong operational performance and financial performance. And we feel we're very well-positioned for future success, which I love to discuss.

Next, our capital investment program is going to be quite active with an annual spend increasing from about $550 million a year since 2012 to about $750 million a year between 2016 and 2020. [ph] As you'll later hear, (57:11) a substantial portion of this incremental CapEx was approved by the Pennsylvania PUC and our Long Term Infrastructure Improvement Plans. One plan to accelerate the replacement of our gas infrastructure and the other, our Electric System 2020 Plan to enhance storm hardening and address aging infrastructure.

Further, we're making significant investments in security for NERC CIP compliance, physical substation security and spare transformers. Additionally, we're making significant IT-related investments to transform how we interact with our customer.

As you can see here, PECO, like many other gas utilities, has older distribution mains and services that we're planning to replace as part of our overall risk management effort for gas line safety. And it gives us the added benefit of reducing our carbon footprint by reducing methane leakage. We plan to replace the old gas infrastructure as swiftly as possible, but we want to make sure we do it in an efficient and effective manner.

In 2015, we received approval from the PUC to update our gas LTIIP plan, reducing our pipeline replacement schedule from 34 years to 20 years with CapEx climbing each year as shown here on the slides. We're already seeing operational

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01673

final

improvements with the replacement of this infrastructure have reduced gas links during the winter period. The majority of the gas LTIIP spend qualifies for tax repairs, deductions which will benefit net income as Pennsylvania is a flow-through state for regulatory accounting purposes. We see this investment is critical to our system operations and are pleased that our growth can be recovered either in base rates or in the gas distribution system improvement charge, that this can be used if the gas ROE falls below the current gas DSIC ROE of 9.9% set by the PUC.

System 2020; on our electric system. We successfully completed our electric smart grid implementation last year and now we're focused on our Electric System 2020 Plan, investing $275 million of incremental capital in underground cable, substation upgrades and storm hardening. Even though PECO has first quartile reliability performance for outage frequency and duration, we realize there is much more we can do to mitigate the risk from extreme weather and to address customers with multiple interruptions. Fortunately, the PUC and consumer advocates agreed with us and approved the $275 million LTIIP plan for 2016 through 2020. These costs are also eligible to be recovered through the electric DSIC mechanism if the electric distribution ROE falls below 9.8%.

Now, next I want to talk about our really important economic development project for us. The construction of the post substation project is an example of investment needed to support economic development associated with the growth coming from Pennsylvania's Marcellus Shale region. The project enables one of our large petroleum customers, Sunoco Logistics, to process and ship natural gas liquids from the Marcellus region through the Mariner East pipeline. At its completion, the Mariner East pipeline project is expected to add up to $4.2 billion to Pennsylvania's economy, and supporting more than 30,000 jobs during construction and up to 400 permanent jobs in the Philadelphia region.

Now, as you see here, our investments for the next five years will grow rate base at an annual rate of nearly 7%, growing much faster than the last four years as we focus on further improving reliability. And on this chart, you can see, we currently assume that we will make our first ever FERC transmission formulae rate filing in 2017 for rates effective in 2018, and we're still working on the exact timing of that, but that's in the right timeframe. Also I would like to highlight with the passage of Act 11 in 2012, we are now able to make our electric and gas distribution rate case filings based on a fully projected future test year.

That means, the test year is the same year that the rates go into effect, which reduces regulatory lag by a year. And in note – as noted in prior slides, the electric and gas LTIIP CapEx is eligible for this recovery if the earned ROEs fall below 9.8% and 9.9% respectively. We're going to continue to push to drive our ROEs past the benchmark for Exelon. But, we think that these mechanisms provide useful downside protection for earned income.

And finally, year-after-year, PECO continues to be the best of utilities in the nation in safety performance, electric and gas service reliability and emergency response. And I'm really excited that our 2,600 employees have named us the best midsized utility in the nation according to Forbes Magazine. Our commitment to innovation and developing new programs and services is transforming the energy experience for our customers and the communities we serve. Our continued focus on customer experience resulted in all-time best customer satisfaction, with strong performance in power quality, reliability, customer service and corporate citizenship.

Thank you for the opportunity to tell our story. And now, I'd like to turn it over to Dave Velazquez, President and CEO of Pepco Holdings and my friend.

David M. Velazquez

Thank you, Craig. Good morning. It's been a very exciting year for Pepco Holdings to say the very least, it's also been a very good year. I'm very excited to have the opportunity and the honor to be able to lead Pepco Holdings as we have become part of the Exelon family of utilities. And I will tell you that the entire team at PHI is very much looking forward to and very much excited about the prospect of being able to leverage some of the things that are done at the other Exelon utilities which are going to help us drive our operational performance, help us drive some of the employee programs that we're going to be able to leverage and also some of the other programs that are going to strengthen our ties to the local communities.

Bloomberg Transcript

Just a couple of words about Pepco Holdings. We're actually composed of three legacy utilities; Atlantic City Electric, Delmarva Power and Pepco. We serve Southern New Jersey, the state of Delaware, the Eastern Shore of Maryland, the City of Washington D.C. and then two of the surrounding counties in Maryland, around Washington D.C. We have a little over 2 million customers and we have about $8 billion of rate base.

So, with that of introduction, let me talk a little bit more about the details of our capital plan. You will see on the slide on the left hand side that we have planned over the next five years to invest more than $7 billion into our utilities in both the transmission and also in the distribution systems. Of the expenditures we have, over $2 billion of them are in our transmission system, where we have formula rates at FERC to recover the cost of those investments. Like some of the other utilities, our formula rates allow us a 10.5% return on equity, 10% base return, plus the 50 basis points that were allowed as part of – being part of an RTO.

On the next slide, you will see on the left hand side two graphs that show the progress we've made over the last few years in improving the service that we provide our customers. I'm very, very happy and proud of the work the team has done to drive that performance, but also very mindful of the fact that in the merger proceedings, we made very significant commitments that continue to drive that performance in each of our jurisdictions to even better levels to achieve first quartile and even better performance across all our utilities.

As part of those merger agreements, we also in the agreements agreed to a capital plan going forward in the future for the level of investments that we needed in order to drive those reliability improvements. If you add up all the different merger agreements, those reliability investments that we said we needed to make in order to meet those reliability commitments amount to about $2.2 billion. And you can see on the right hand side of the chart or the right hand side of the page a chart that shows those $2.2 billion of merger commitment-related reliability spend, which is almost 50% of the total spend that we will be recovering through traditional rate base making.

Before I talk more about that, I just wanted to highlight a couple of the projects across the territory that are underway. The first one is a new substation, I'll call, Waterfront Substation, that we're building in the Pepco service territory. It's actually in Southeast D.C., near a new soccer stadium that they're building, that is driving development in the area, not just with the soccer stadium, but increased residential and commercial growth. And it's a new substation designed to serve that area.

The other substation that's shown on that chart, Buzzard Point Substation, was actually built in 1933. And some of the purpose of the Waterfront Substation is to replace some of that aging infrastructure and move service in the area from Buzzard Point up to the Waterfront Substation. Total cost of the project is about $192 million. Over $100 million of that is transmission investment, which again is recovered through formula rates. That project will go in service later next year.

In the Delmarva service territory, in the next slide, I've highlighted a couple of the transmission projects. These projects are part of the almost $600 million that we're going to be spending as part of our five-year plan on transmission in the Delmarva area. There's three different projects we've highlighted. What is really driving primarily the investment in transmission in Delmarva is replacing aging infrastructure. And also, while we're doing it, we're also hardening the system. We're replacing a number of old wooden pole lines with new steel monopole structures that are much more resistant to high winds and storms.

In fact, some of the lines that we're replacing that are shown on this page are almost 70-years-old. So, we've certainly gotten our life out of that and the projects will come in service either late or next year, or the following year.

And then, finally, a highlight of project in our Atlantic City Electric territory. This set of projects is being driven primarily by replacing aging infrastructure and also the potential retirement of generating plant in Southern New Jersey, near the shore. It is a PJM, RTEP project, Regional Transmission Expansion Plan (sic) [Regional Transmission Expansion Planning] project, it involves rebuilding probably 50 miles of transmission line. We'll be doing work in about 11 different substations and the total project pieces will come in service earlier, but the total project will come in service finally sometime in 2020.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01675

So, if we look at all the projects we're doing on the next slide, you can see that we also have some very robust rate base growth, driving about 6.6% annual growth in our rate base over the five year period. I would note that if you look at the transmission growth, the growth in our transmission rate base is approximately double what the rate – overall rate base growth is across the PHI.

On the next slide, if you look at how we are able to recover that, although probably about 25% of our current rate base is covered by either formulas or trackers, if you look at the incremental additions, over half of those incremental additions will be covered under formula rates or trackers. Denis had mentioned, we have a couple programs on the distribution side that allow recovery through tracker mechanisms, and those notable being the D.C. Power Line undergrounding project, which is $1 billion public, private partnership in D.C. to underground, I'll say the most vulnerable lines over headlines that we have in the district to improve storm performance. But in addition to that, in all of our jurisdictions, we're exploring ways either through the regulatory mechanisms that exist or through legislature to help increase the amount of the investments we're making that will be covered under tracker or formula rate mechanisms.

And I wanted to conclude with just a couple comments about the integration. The integration has been proceeding very, very well. We're about four months into it, the first 100 days of the first four months have gone without a hitch. We're on schedule to meet all of our merger commitments that we've made in the various jurisdictions. We're also on schedule to meet our synergy savings and have already begun to realize some of those savings, especially through the supply-enabled savings that we have. I'm very confident that we will be able to meet the $130 million in projected synergy savings by 2020.

And I guess of final note, one of the real benefits of this merger to our communities was our increased operational or our ability to increase our operational performance. And a component of that is our performance in large storm events. And with the – being part of a family of larger utilities, we were able to not only just rely on mutual assistance, but also have access to crews at Philadelphia Electric, Baltimore Gas and even Commonwealth Edison, that not only will be able to come quicker to our territory, but also will be able to work more efficiently as we're able to work under common practices. And we've already begun to implement that and on the slide, I show an example where actually we were able to send Pepco crews up to PECO in the storm in April, and again, because of the common practices we had, they were able to work much more efficiently than neutral assistance.

So at this point, I wanted to turn it back over to Dan, so we can take whatever questions you have. Thank you.

Dan L. Eggers

All right. Thank you, guys, for sharing all of your thoughts and informing the group on your businesses. We'll open up to questions now, so if people have questions for utility team, now is your chance. [ph] Mora? (01:12:20)

Q&A

<Q>: Just wondering on Pepco. I'm not sure the poor returns are just a function of a delay in rate case filings given the core returns even before you guys became involved with these guys. So I was wondering two questions. First, can you talk about what management changes have been made, especially on the regulatory side, and the second question is how have the incentive schemes of the management and employees has been changed at Pepco relative to how they were paid before? Thanks.

<A - David M. Velazquez>: A couple of comments. First, there are tremendous advantages that are being part of the Exelon family. I think we've been able to leverage and learn from the other utilities as we approach this set of rate filings. So as we've approached this set of rate filings, we've actually held sessions with all the different utilities to understand what has been successful in their jurisdictions, what's been successful in our jurisdictions.

I also think through the merger proceedings which were fairly long. It also gave us an opportunity to understand better for some of our stakeholders what was important to them. And we've tried to incorporate some of that as well into the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01676

filings we've made.

Over time, at PHI, especially in the Pepco region, as I showed on the chart, our operational performance has continued to improve. I think as most folks know, there was a time period of, say, around 2010, 2009, when the performance at Pepco was clearly where it didn't need to be. We've been able to improve that performance year-over-year and I think we've seen that reflected in both our customer satisfaction and also in the dealings we've had with various stakeholders who have also recognized those improvements that we've made.

And I think all those things are going to help us get a better set of outcomes. A large part of it is the fact that we have continued to invest in our business to drive our liability improvements and have not been – even with the level of investment we've had, not been in front of the regulators to ask or seek return of any of that.

<A - Denis P. O'Brien>: [ph] Mora (01:14:38) thanks for the question. That's really the million-dollar question with the acquisition. As I talked a little bit about our model for running these businesses, I think it's a high performance model. It's got a basis in terms of producing results, lots of collaboration and team work, with a little bit of a level of mild competition, as we look at each company and say where's your line relative to the other companies and why is it there and when is it going to get to a better place. So in terms of changing a model, part of the change of the model we receive accountability, this is where you need to get there and holding people accountable.

That's worked very well as you see it through the Exelon companies, if you look at the track record over the last couple of years. I want to just highlight a couple of folks. Paul Bonney is here. Where's Paul? Paul was a General Counsel at PECO, doing regulatory for years. Most recently, Paul was in the generation business, wholesale power trading. Paul is the Senior Vice President down at PHI. Paul was one of the most experienced regulatory people that I know in the industry. So that is one of the changes.

Is Tyler Anthony here? Tyler is back here. Tyler is an Exelon person too. Tyler is the COO. Tyler's job is to work with Dave, turn around the operational performance, turn around the customer satisfaction. The whole team's job is to get better operational performance and better financial returns.

<A - Dan L. Eggers>: Julien?

<Q - Julien Dumoulin-Smith>: Thank you. So perhaps the follow-up on that question first. If you look at the delta rates, so you've got a CAGR on the rate base side of about 6% and you've got a 7% to 9% earnings growth. It seems that the bulk of that delta is driven by earnings improvement back at the PHI itself, right. If you look at it, it looks like there's at least $0.10 of earnings improvement, again, that's a minimum, it looks like $0.10 to $0.15, depends. When you think about it, one of the other moving pieces between reconciling the EPS growth and rate base growth outside of PHI, are you effectively saying in order to get within that range that you need to get at least a healthy amount of that ROE improvement, maybe to kick it off?

<A - Denis P. O'Brien>: I don't know if you want, you can.

<A - Dan L. Eggers>: Julien, I'd say that, clearly, it is mathematics behind the PHI turnaround. And we gave you [indiscernible] (01:17:07) slide as far as what the improvement in earned ROE is going to be there. So that's going to be a significant driver and the rate base growth is obviously a very significant driver. But I think if you look at the ROE contributions and the different utilities and using some normalization in ROEs that they comment over time, if you look at the forward curves or interest rates, all those things contribute to better performance or contribution to drive that underlying growth.

<A - Denis P. O'Brien>: Yeah. I just to make a couple more comments. When we've done it, we've taken – it's a complex company, PHI, multi-jurisdictional, nine rig filings within a couple of months here. We have spent a lot of time with the Exelon folks and the PHI team looking at the strategies. They won't happen immediately. They didn't happen at BGE immediately. Over time, at BGE, the returns were 8.5% last year, returned...

<A - Dan L. Eggers>: 10.6%.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01677

<A - Denis P. O'Brien>: 10.6%. You take out some of the weather and some of the other things, a little less than that. We profiled in our plan and I think we've got the flesh on the bones here, a return that is commensurate with what we did at BGE, and I'm pretty confident that we can do that. We're in the first time out of the shoot here. I mean if you look at – take New Jersey, PS has done amazing with their returns in New Jersey. If one company can do it there, then we can do it too. And I'm very, very comfortable about what's in the plan and that we can achieve it.

<Q - Julien Dumoulin-Smith>: And just to clarify, it's effectively assumed in that 7% to 9%?

<A - Denis P. O'Brien>: Correct.

<A - Dan L. Eggers>: It is.

<A - Denis P. O'Brien>: Yes, it is.

<Q - Julien Dumoulin-Smith>: And then, separately, on the regulatory front, just to follow up on that, you talked about steady diet, I think to use your words, of rate cases and PHI. What's the plan to get off that steady diet, whether it's from a regulatory form perspective or otherwise or is it just simply the CapEx flow and your improved ROE just a base and you don't necessarily go in every year?

<A - Denis P. O'Brien>: Yeah. Great question. We're in the early stages of what that looks like. So the first thing here is, look, you get the company, you get the right processes in place, you start to transform the performance. We filed the first rate cases out of the shoot. It's done in the more traditional fashion although we have some riders, some $200 million of riders that I've talked about.

We have teams working on each jurisdiction to say what is available already in that jurisdiction, how do we utilize that better, what do you need in that jurisdiction, what can you get in that jurisdiction. And the answer is a little different in each of the jurisdictions and we're still kind of putting all the flesh on the bones as to what it looks like. Some places, it looks like some more capital riders, some places, it looks like getting a little more structure to the timing of decisions and the timing of when you can put rates in. And so, we're working at all those pieces.

I'd tell you the answer is going to look different in each place, and it's going to have different regulatory and legislative pieces to it as we put it together.

<A - Dan L. Eggers>: Hey, Julien just what we've said big picture is we're going to get through this rate case filing cycle and then we'll do probably another traditional cycle as we get through and probably as we talked about a three-year cycle generally speaking on the PHI side, [ph] again, it's a (01:20:30) reasonable expectation while at the same time working for other solutions. It would make for more time to recover on specific investments.

<A - Denis P. O'Brien>: I just would add one more thing. This is all about your reputation and your relationships. Your rates don't get set in a regulatory environment; they get set in a political regulatory environment. You have to perform well, you have to get your reputation to the right place, and you've got to develop the relationships. And all that's ongoing and it's going to take a little bit of time to put together.

<A - Dan L. Eggers>: Greg.

<Q - Greg Gordon>: Hi.

<A - Dan L. Eggers>: I can't tell who got their hand up first, so I'll just – I'll go there because of I'm not getting – I'm getting totally blinded. Sorry, [ph] Paul (01:21:08). I'll come back to you. I apologize. Right there.

<Q - Greg Gordon>: Can you just spend a little bit of time explaining the lessons you learned in the BG&E turnaround? And as a result of that, what the key things you have to get radar in the Potomac turnaround, in terms of the big wins whether it's labor productivity, the right level of employment, systems? What are the big chunky wins that you discovered were easy to get, hard to get at BG&E that have informed your approach to Potomac.

<A - Denis P. O'Brien>: Yeah. I came from the PECO side and did the integration of the PECO, Unicom deal. So I think each time we go through one of these, we learn a little bit more. The BGE integration went well, but I think we

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01678

learned a really lot. I think, as Exelon, we're mature enough to be able to really learn a lot from it. There's great value in having an Exelon COO in place, that's why we mentioned Tyler. In that, there's a translation when you're having the discussion of we need to do this at BGE, we found out without having the Exelon person there to understand the language and what we're talking about that there were some gaps.

So putting a few Exelon people in at the senior team was important Tyler and Paul are two that I referenced. We learned some other things at BGE too, okay, put in the Exelon approach to project management and came back [indiscernible] (01:22:43) and then, we continued to have issues with capital deployment. And then, when we went back and looked, we hadn't defined the specifications well enough of when we say put this in, this is the specification and expectation of performance. And so, this time, for everything we're putting in, there's a charter of specification and expectation of performance that will be signed off by the line officer and signed off by an Exelon integration officer that is on a full-time assignment in that company.

So there are a couple of the pieces. The other thing is about reputation. And I don't know if you want to jump in and offer some things.

<A - Calvin G. Butler>: Sure, I'd sit back and add two things. First, to Denis' point on the reputation, it's truly an understanding of what not only your customers, but your commissioners and legislators expect of the utility. Don't assume you know. Go out and make those connections and ask the questions. And not only ask it once, but repeatedly go in there and share with them what you're doing and how you're doing it, so there's a shared partnership in getting there.

The second piece is we can't underestimate the cultural transformation that comes from being part of the Exelon companies. Denis alluded to the higher level of accountability and the commitment to meeting the metrics. So in that cultural transformation, you have to understand and make sure you communicate regularly to your employees, not just focus your attention outside, but do just as much of that communication internally to make sure that everyone is pushing in same direction. And the speed in which we operate is the lot different, going to making sure that we're all on the same page.

<A - Denis P. O'Brien>: [ph] Dan – (01:24:29) I have a meeting called an MRM, which is the review of every indicator and every performance process you have, and it's for ours and we laughed about them after, I guess, right.

<A - Dan L. Eggers>: Yeah.

<A - Denis P. O'Brien>: But we have these MRMs and we talk about every level of performance and you know your business inside and out, every aspect of it, the age of every bit of work you have, the backlog, your cycle time, and those things are shaping processes about high expectations and performance, and I think there is something that we learned are very effective tools and we're continuing them.

<A - Dan L. Eggers>: I'd say, Greg, as a newbie to the company, Denis seems very nice, but the intensity of the book, which I've seen is enormous and the amount of the rigor that goes in the analytics, not only for each individual utility, but peering them against each other, is quite significant. So we actually got a copy of the book as we were thinking about the Analyst Day. It's the level of rigor that goes into comparing the utilities and hold into a standard is quite significant. I think that's part of that Exelon culture that kind of permeates out when you bring a new organization [indiscernible] (01:25:37).

<A - Denis P. O'Brien>: I mentioned this earlier. You can't underestimate this. The model is teamwork and collaboration with a little bit of competition. And you can't imagine what it looks like when you say, why is your line the bottom line there.

<A - Dan L. Eggers>: Oh, we could imagine. Yeah.

<A>: We've all had the question, Greg.

<A - Denis P. O'Brien>: Let's talk about that every meeting until it's not the bar.

final

Bloomberg
SI-SSA-0015-01679

<A>: Right.

<A - Dan L. Eggers>: All right. I'd promised [ph] Paul (01:26:06). So we'll go there then [ph] Angie (01:26:07), I'll come back over to you and then Steve.

<Q>: Just three really quick questions. One is [ph] the comment from related plan (01:26:14) and what is the interest rate that you guys embedded in your growth rate. The second one is the level of rate release that you guys are expecting in order to make your goals for your respective utilities and bill impact. Obviously, there is a – what you guys need or what the wholesale rate is? Assuming it's flat, what do you think the bill impact would be?

And then, just finally, Pepco did give some description as to what its goals were in terms of the merger and commitments, which you guys look like you're ahead of. But I wasn't really clear what the – if there was any quantifiable expectation with respect to either outages or – for the other companies, with respect to outages or efficiencies or just in general what the value proposition in a quantifiable way is. Is there one in terms of what customers are going to be getting for all this?

<A - Dan L. Eggers>: So [ph] Paul (01:27:17), on comment ROE, it's a forward strip for the 30 years, so we're not taking a point of view, we're letting the market be what it is. Probably a little more detail to talk about expectations of individual rate cases and we probably would have to kill you after we told you, so not going to really get into that. But we can follow up separately if you want to kind of talk to specific rate cases, just it's a little cumbersome here.

I think on the bill increase side...

<A - Denis P. O'Brien>: Yeah, on the bill increase, look, that's what we're looking at all the time because the customer has to pay the bill. So we show all these charts here, but we're looking at the bill impacts. We think all of the numbers we share with you and all the strategies we've shown you over this five year are manageable from a bill impact, and we're not concerned about the bill impact of any of the numbers that we've shown you. It's something that's going to probably be – you get so many different rate structure in so many companies, but...

<Q>: I'm not asking for the outcome of [ph] rates (01:28:12). Well, just sort of general sense, okay, when we look over this period, and you're talking about 7% to 9%, you're talking about substantial growth. I think it's an understandable question as to just what the range might be that a customer might be seeing in terms of their bill impact over that period of time. If you can't, I mean, we could talk afterwards.

<A - Denis P. O'Brien>: Yeah, yeah.

<Q>: But I just – that's all. I'm not asking for a specific...

<A - Denis P. O'Brien>: I'm still [ph] warning (01:28:35) all these companies, but I think about it in the 2% to 3% bill impact range, overall bill, annually, residential annually overall bill.

<A - Dan L. Eggers>: And, Dave, do you want to talk about some of the operating expectations and performance metrics from the [indiscernible] (01:28:50)?

<A - David M. Velazquez>: Just one comment. Some of the earlier cases are a little higher, the CAGR over the period, 2% to 3%, is a good thing to think about. Yeah, just to comment on that in the appendix for each of the rate cases, if you go through each of the PHI rate cases, we actually show, for the first set of cases, the actual impact on the average residential customer bill. Again, having been out in some jurisdictions for up to three years, they probably range from like 5% to 10%. And again, once you begin to catch up, those numbers will come down.

In each of the agreements we reached in order to get the merger approved in each of the jurisdictions, there were a number of – and each one is a little bit different, a number of guarantees or promises were made as far as improving customer service, improving various metrics, critical in all of those, of course, was the improvements in reliability. And in all our jurisdictions, we have commitments to drive our reliability performance, whether it's frequency or duration of outages into the first quartile, in some cases, even beyond that. And it varies by year, some we achieve that in 2018, 2019, 2020, and there are financial penalties associated which, again, are slightly different in each of the jurisdictions.

final

Bloomberg Transcript

But there are specific financial penalties for not achieving those targets.

And I think the regulators will have the – of all the things we did, that was probably most important to them, and they will probably focus most closely on that. We are currently on plan depending on the jurisdiction on plan or ahead of plan to meeting all those commitments that we have.

<A - Dan L. Eggers>: [ph] Angie, did you have a question still? (01:30:30)

<Q>: So first on Pepco, I mean, I didn't cover the company before the merger happened, but I have this impression that there's plenty of CapEx to be had and that the rate base growth would be actually impressive. I'm not saying that 6.6% is not impressive, but I had hoped for more. Is this just because you're trying to be conservative with your rate base growth assumptions? That's one.

And for ComEd, with 100% of your CapEx being recovered through riders, why are you under-earning or slightly under-earning your allowed ROE?

<A - Anne R. Pramaggiore>: Do you want me to?

<A - David M. Velazquez>: Take them in whatever order you would like.

<A - Anne R. Pramaggiore>: I'll start. Yeah. So we've got – the earned to allowed gap is largely a function of one major structural item that's been in our rates for since I think 2006 or 2007, and that is we had a pension asset that was pushed down from Exelon at an equity rate. We had a big tussle over it in our pre-formula rate case, we earn a debt return on it. So that is a structural gap. It's worth about 50 basis points to 60 basis points. So that kind of always hangs in there.

There's a few other items of compensation that we've not been allowed to recover, and there's a few other odds and ends lobbying cost, things like that, that just legally the law won't allow us to recover. That's the gap. This year, it's about 60 basis points, it's closed over the last – on average, it's been about 130 basis points if you look out over the past five years. So it's narrowing in, and as rate base grows, it's narrower and narrower, but that one structural issue on the pension is just – it's sitting out there and that's the main item.

<A - David M. Velazquez>: And as to your question about the rate base growth at Pepco Holdings, the times I've looked at our capital plan and compared with all the utilities, I actually think it's a fairly robust – it's fairly aggressive plan to be investing that much for the size of the utility we are. And that does translate into, what I would say, I think a fairly healthy over 6.5% rate base growth. But these investments are all, I'll say, kind of traditional investments made in the utility, and therefore, whether it's replacing aging infrastructure, needing new customer growth, issues like that that we're addressing. So I feel very confident that as we go forward through the rate cases that we're going to have or be able to get recovery of them.

<A - Denis P. O'Brien>: Yeah. I would just say – I said it earlier that this $25 billion plan, it's well developed, it's stuff we know, it's stuff we have great confidence in. We've owned PHI for three months, four months here. We're still learning about it. We're in the inside now and figuring out what the opportunities are. Very comfortable with the $25 billion. We're looking at other opportunities, but not developed enough across all our companies relative to transmission resiliency and security and some other things. But the $25 billion that we're talking about over five years, we've got great confidence we will deploy effectively.

<A - Dan L. Eggers>: All right. Steve?

<Q - Steve Fleishman>: Okay. You just kind of answered I think my first question which is, if you look over five years kind of what are things that could be upside to this plan in terms of other spending, so it sounds like maybe more transmission or greater reliability, things like that, any other...

<A - Denis P. O'Brien>: Again, it's been around a long time. I think the one thing resiliency and security are kind of the newest thing on the regulators' and others' mind, and that's some things we're looking at. In this plan here, there's about $450 million for security of our critical assets. We know that for sure, well, that number grow from there. And

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01681

then what investments can we make in our system to make these critical assets less critical, and that's some analysis going on. So if I think about opportunities for the future, they're probably the two biggest ones. And then the other one, Anne talked about a lot of the things we're thinking about with the utility of the future. We're looking at demonstration of microgrids in different places, and as we get through the demonstrations, we'll figure out whether there's bigger opportunities or not.

<Q - Steve Fleishman>: My other question, just I'm not sure how you want to answer this, but just in terms of – it looks like by 2019, is it fair to say that you're pretty much getting to earning your allowed returns or without any of these structural issues?

<A - Anne R. Pramaggiore>: At ComEd?

<Q - Steve Fleishman>: No, overall. Utilities overall in the plan, by then, are you kind of at a point where you're earning the allowed returns in your jurisdictions for the most part, whatever they are?

<A - Dan L. Eggers>: Well, we'd have in the plan as we're in that 2019, 2020 range, we're going to be kind of hitting our stride from an earned ROE perspective across utilities. It doesn't necessarily mean you're earning, you're allowed at all of them, but you're within that band of comfort that we've generally talked about. So kind of within 100 basis points range depending on utilities where you should expect we would be at that point in time.

And with that, I think we're going to break for break. And we'll come back to the generation and policy guys in a second. So thank you all very much.

MANAGEMENT DISCUSSION SECTION

Unverified Participant

Ladies and gentlemen, please welcome Chief Strategy Officer, Bill Von Hoene, and Senior Vice President, Federal Regulatory Affairs and Wholesale Market Policy, Kathleen Barrón.

Dan L. Eggers

So he announced the people who are up here, so Bill Von Hoene and Kathleen Barrón are going to be our next presenters talking about policy and how we think about the current market landscape in a variety of fashion. So I'm going to turn over to them. They're actually in this stage seated because they're going to be a little bit of a tag team between their discussions. And this will be very informative and I think I'll start off with you, Bill.

William A. von Hoene

All right. Great, thanks very much, Dan. Chris mentioned yesterday that we're bringing some folks that we haven't brought historically in with regularity. One of them is Kathleen. A number of you know Kathleen, but a number of you don't. So I just want to give you a brief history on Kathleen.

She has been with the company for six years. She does regulatory affairs, wholesale market policy. She had a very distinguished career at FERC for five years as the number two person in the [ph] lot of apartment (01:37:13) there. Before coming to Exelon, we promised her that she'd do exclusively FERC work and she has become the guru on virtually everything else in the company. So we're very glad to have her including EPA, the PJM and [ph] CP (01:37:25), carbon policy and the like.

Kathleen and I are going to cover five topics today, run through for you, relatively briefly, in the amount of time we have. One is a general overview, which I'll do of some of the company – top company priorities from a policy standpoint. Kathleen is then going to do a deeper dive on our carbon policy principles that we're currently pursuing and

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01682

the infrastructure for that and the framework for that.

I will then talk in a little bit more detail about the ZEC program in New York and some of the developments that have occurred over the course of last couple of days. Kathleen is then going to do a flyby on presidential politics and how we think that may affect policies going forward over the course of the next four years.

And then, finally, as you've seen, Chris did a [ph] – have been yet (01:38:08) on innovation and entrepreneurship and Denis did one on community involvement. I will do one on diversity and inclusion to conclude it.

So Exelon policy priorities. One of the things that I think is evident to all of you and we certainly feel within the company in terms of our value proposition is the very aggressive growth in the utility sphere and in the regulated portion of the company. And this is something we worked on for a number of years and now you can see with the capital investments that we're making, over the course of the next five years, with the anticipated EPS growth and rate base growth, has become a central tenet, the central tenet of the company. And the priority of doing that well and making those investments, obviously, is important to us and important to you and important to all of our stakeholders.

We talked a little bit in the section that preceded us about what is happening in utility space in terms of the capital commitments, the projects we're working on. In order for this strategy to be successful, obviously, we have to have secure fair return and compensation in rate making space. And you've heard from a number of folks that preceded us up here how important this is and some of the elements of that.

So an underlying very large policy concern for us, consideration for us is addressing those kinds of rate issues that have historically kept us from fully realizing the income levels that support the system in a profitable basis. We've had challenges with regulatory lag with appropriate allowances, volatility and some inconsistency in the earnings.

It is a huge priority to have a fair rate structure and one that addresses those things as we become more concentrated in the regulatory world. You can see the seeds of what we're doing in this in the presentations that were made previously. As Denis pointed out of the $10.8 billion in anticipated rate growth during our next five-year period, 70% of that will be recovered through formula and tracker mechanisms, that's the kind of momentum that we want to create. In some instances, we have to pursue this policy incrementally and that's what we're doing in terms of the various – the trackers that get added, riders outside the normal rate formula, alternative rate recovery mechanisms that were referenced in the last presentation.

And in some instances, we're also doing it in a larger way and the EIMA Act that Anne described is one example of that where we have the formula rates and Anne and her team have done a phenomenal job in getting that legislation passed and also executing on it.

Just to give you a sense of how important this policy is and Anne talked about some of the advantages, but on a real-time basis, right now, when you think about how contentious rate making can be, when we're able to effectuate the kinds of policies that are in place at ComEd, this year, we will have a final order before the end of 2016 on a rate case. Our revenue requirement request increases $137 million or $138 million.

We have two interveners in this, because the rate structure and the rate deliberations have been modernized to reflect the value that we bring to the grid. Two interveners, staff proposes a disallowance on that $138 million of $4.8 million, the attorney general $5.6 million, we're going to have a one day hearing if that, an entire day to dispose of these things.

So there's a lot in policy space that we're trying to do to make sure that as we invest in greater amounts in the utilities, that the rate structure and the manner in which we recover fair return corresponds with that.

Second and related element in the utility space that is important for us and, again, you've got some reference of this in the prior presentations is we have a new customer centricity here because of what the demands of the customer base are. They want different products, they want the existing products to be delivered in different ways. It's been digitalized in the way that Anne alluded to. And it's very, very important, it's going to be a part of, as Anne mentioned, the utility future that we're going to have to address. How do we stay relevant in that, how do we stay relevant to our customers, how do we make sure that we're delivering to our customers and receiving a fair return on delivering to our customers the products that they want.

final
Bloomberg Transcript
Bloomberg

The things that they want don't fit neatly into the existing regulatory structure in many circumstances and don't fit in at all in some circumstances. So how do we change that compact as a policy to ensure that as the customer needs and desires evolve that the regulatory framework under which we operate evolves to correspond to it.

Across the countries, we see some historical evolution in this area. You see in the PSEG Solar 4 All program. A solar desire by the customers, how we get it into rate base and recover. The Massachusetts energy bill with regard to storage and renewables is another example. Microgrids at Oncor and San Diego Gas & Electric, Arizona, Virginia and Michigan also advances in the regulatory compact along the lines of addressing new products. We also see resistance to this and we've seen it in our own jurisdictions.

As you may recall, one of the objections in the initial PHI order to what we had proposed was the ownership of solar resources at the utility side and the Maryland Commission is twice denied community solar projects in rate base and public purpose microgrid has – we've just had a result in Maryland that was disappointing relative to what our ask was.

The point I'm trying to raise here is, this is an evolving process, it's probably a journey rather than a destination, but a high policy priority for us, a very high policy priority for us is to be able to respond in a meaningful way to doing the kinds of things that will allow us to provide the customers what they want and for us to receive a fair recovery. There's not a clear path necessarily. One size does not fit all. It will take some time to update the regulatory compact, but a high policy priority.

The ComEd portion of the Illinois legislation, the next generation energy plan is precisely the kind of recipe that we're looking for in there. So those are journeys that we're taking in utility space, very, very important to support the utility centricity that we've talked about creating in the company over the course of the next five years.

The third policy piece we're going to talk out briefly this morning and I'm going to turn it over to Kathleen is how do we achieve policies that are going to give us the proper recognitions of the value of our zero carbon electricity.

Kathleen, I'll turn then to you.

Kathleen L. Barrón

Thank you, Bill. What I'd like to do is just provide a framework on how we think about our advocacy in this space. We start from the premise as we always have that we think competitive markets can achieve society's goals at the lowest cost to consumers and that's even more so when society's goal is to achieve a deeper decarbonization in the power sector.

As we see it, there are really two ways government can go about doing that. One is to pay existing clean or new clean resources more and the other is to require emitting resources to internalize the causes of pollution in their bids into the market. We think both can be done well and we are pursuing both simultaneously.

Bill will talk a little bit more about the ZEC program in New York and give you some more structure around what the Commission did there last Monday. But I think the key point here for us is what the State Commission is doing there is they're saying, we are going to pay the nuclear stations the value to society of having that non-emitting generation running and we're not going to pay any more than that.

And so, what we see is that the state saying that, as long as the nuclear stations can be profitably run, once they're being paid that social cost of carbon and as long as that is cheaper than the alternatives, that the state is paying other zero carbon resources to run, then by definition that we are the most competitive source of carbon abatement in the market, and we shouldn't be pushed out because the revenues that we're receiving today from capacity and energy markets don't adequately compensate us for what we're providing to the grid.

But simultaneously, we are continuing to pursue, as you are aware, a technology neutral price on carbon. We've been doing this in a number of venues over time. One more recent development that I know some of you are following is the effort in the Eastern RTOs led by New England, to develop a way to use the wholesale market to achieve the goals of

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01684

the states in the framework of emission reductions.

This effort is really only beginning to take shape, but there is a growing support both for FERC's authority to accept, a market rule change that reflects the cost of carbon as well as a realization that the markets can achieve the goals that the states have at a lower cost. I was on a panel yesterday with Andy Ott before the National Conference of State Legislatures where he made exactly that point.

So this process that's underway and the wholesale markets will take some time, and does that program that Bill will describe is designed to accommodate that if in the future the market outcomes do reflect the value of carbon abatement or conversely the cost of carbon to customers.

Turning to the next slide. What we're showing here is really what's underlying all of our advocacy, both in the case of our state-specific efforts in New York and elsewhere and on the regional level. The cost impact to our consumers is what we have in front of mind. This slide depicts the cost per ton of carbon avoided for all the clean energy options on the grid at the moment in PJM.

Of course we could have a similar slide for all the regions, but the point is, for the foreseeable future, compensating existing nuclear plants for their carbon abatement value is far cheaper than all the other alternatives. As you can see here the second cheapest is a coal to gas re-dispatch, which of course is happening organically as a result of gas prices. But it could be harvested even more with a relatively modest carbon price.

All the other options here, new build wind, new utility scale solar, new distributed solar, they're all both a, more expensive and b, receiving federal and state subsidies in excess of the social cost of carbon. I think what we saw in New York is a recognition that the significant value to consumers of retaining that environmental attribute of existing nuclear, particularly given the cost of replacements as we've depicted here. So, I'll turn it back over to you Bill to talk about New York program.

William A. von Hoene

Great. Thanks, Kathleen. I think everyone here is fairly familiar with the mechanics of the ZEC program and I don't want to spend a lot of time going through them, we're happy to answer questions when we get into the Q&A area.

But, as you know, this is a very, very significant development for our company and for the nuclear industry in general in the United States. And we're very happy to be at the position that we are through some great work that has been done by the company and some great work by Governor Cuomo and collaboration with officials in New York.

The basic structure, as you know, the load serving entities will purchase zero emission credits from NYSERDA in proportion to their load shares in New York. It's a 12-year program. NYSERDA will have a contract, which we will negotiate over the course of the next month or so with NYSERDA. Then we'll procure from the eligible nuclear facilities which include currently three facilities, but that could expand; six two-year tranches, payments based on megawatts produced. The price will be administratively determined subject to a formula that I think all of you have seen and that we've summarized in other public statements.

I want to talk about two things in particular beyond the mechanics here before I talk about the potential legal challenges to this. One is that this is largely predicated on a formula based on the social cost of carbon as determined by the United States interagency working group. So, what is that and what's the significance of that and what's the legal strength of that calculation?

The group was appointed by President Obama in 2013 and is comprised of 10 different agencies, largely led by the EPA, who have established the social cost of carbon. As you can see in the appendix to our slides, the cost escalates over time during each of the six tranches, because you're closer in time to the potential damage of not forgoing the carbon emissions. Very importantly on this, because some people think it's this funny science that we have and is there going to be a challenge related to this? On Monday, many of you may have seen this, but many of you may not have seen it. On Monday, the Court of Appeals in the Seventh Circuit upheld the use of this social cost of carbon mechanism

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01685

in a challenge of new standards for commercial refrigeration equipment.

So it has very strong support to be used. It's obviously the linchpin of what will happen in New York with regard to the calculation of the payments that we will receive for running the nuclear plants. The second thing I want to talk about in connection with this, which occurred after the generation of the slides of course, is the agreement that was announced yesterday morning in New York, which Chris attended with Governor Cuomo, that we had agreed to secure the FitzPatrick plant, to own the FitzPatrick plant and subject to regulatory approvals, which we think is about a second quarter event of next year.

We will go ahead even though the regulatory approvals will not be finalized and refuel FitzPatrick in January provided that three conditions are met; one that the CES order is in full effect and that is essentially happening, there's some tail to that that will happen in terms of – but not anything meaningful to that the NYSERDA contract is executed; the 12-year contract is executed, which would ensure the regular and really regulated type of income stream for the operation of the plant, as well as for Nine Mile 1 and Nine Mile 2, and for Ginna over the course of the 12-year period, and three that the New York Public Service Commission has issued an order approving our purchase of FitzPatrick as being in the public interest.

We do not anticipate that there will be any issues with any of those pieces, and so we are looking forward to having FitzPatrick in our fleet and being able to operate it under this terrific program. There are number of contingencies or number of ways that the payment can be adjusted. The one that people seem to be most concerned about is what if prices go down? Because we have, essentially, the social cost of carbon is the ceiling for the recovery on this.

We don't anticipate there is going to be a meaningful price decrease, but also, if you look at the appendix, you'll see that the social cost of carbon goes up pretty dramatically in each of the six tranches, so to the extent that we have some degradation in prices in New York, we think that it will be largely offset by that and we are not overly concerned about that.

Now, let's turn to the larger question in connection with this act that I think is on the minds of many of you have written and many other people are talking about this. Does this survive legal challenges? And the legal challenges that people who are familiar with of course are particularly dividend for the use case in the Illinois or in the United State Supreme Court and the new – relating to New Jersey and Maryland contracts' recent ruling on the Ohio proposal. So, we get lot of questions. Will those impact your ability to execute on this? There are other questions that have been raised by folks whether FERC would order mitigation under minimum offer pricing rule? Other theories; are out-of-state plants going to raise a commerce-plus claim or they going to claim that they've been discriminated against.

As you might imagine, given the importance of this to the company, we've gone through these legal theories in great detail and each set of potential challenges and we will have the challenges. We have a road map and a legal defense on this that is very, very strong in our view and we believe it will – we will overcome any challenges that occur. Rather than to try to go through those individually and talking individually about what are the reasons why these challenges will not be successful in our view. I want to leave with you – because I'm a list kind of guy – eight things to think about when you think about all of these challenges; eight pieces of information that, in our mind, will be [ph] dispositive (01:55:00).f

Number one, this program is indistinguishable – essentially indistinguishable from REC programs that have been blessed by everybody across the country. It is a REC program for nuclear. It is a program that reflects zero emission environmental attribute. It's a credit that's tied to production not wholesale market participation. It is a REC. And nowhere in the country has a REC program, on the theories that are being advanced now, ever been successfully challenged.

So that to me is the overwhelmingly important fact to think of about this; not only have the REC programs been – and by the way, have been universally blessed in the states and in federal courts, but four years ago, FERC, in a ruling, said that REC programs and sales of RECs unbundled with electricity fall outside of jurisdiction. This is the number one factor to think about.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01686

Number two, this is not, unlike Ohio, a contract for differences, and it fits squarely within the exceptions to that that you see in the law. Number three, it won't change bidding behavior, the units are price takers and they will remain so. Number four, there are no affiliate contracts associated with this arrangement in anyway whatsoever.

Number five, it's spatially neutral. Out-of-state facilities that meet the standards and provide a value to New York are eligible in subsequent tranches to participate. So the discrimination claim has to confront the fact that the arrangement is spatially neutral. Number six, with regard to MOPR, FERC has never applied MOPR to existing resources, and in fact, has declined to do so with regard to existing units in New York.

Number seven, very importantly from market power standpoint, the New York ISO has submitted comments in connection with this in which they are fully supportive of the arrangement and have concluded and asserted it's a necessary bridge to retaining the zero carbon and does not raise wholesale market concerns. And number eight and this doesn't fall squarely in the legal frame, but obviously, and Denis talked about regulation being regulatory and politically. If you look at the dimension of the public support that we've gotten for this program, it's truly, truly impressive and truly, truly powerful as people try to deliberate over whether it's legal or not.

Mario Cuomo (sic) [Andrew Cuomo], the governor who spearheaded this probably six months ago or eight months ago, would've been viewed as an anti-nuclear governor from a liberal state that has had a number of challenges to the nuclear plants at the Indian Point. He has become the warrior for this and in his speech yesterday, he talked about not only is this important to New York, but it's important in other states across the country because the preservation of these nuclear units is so essential to the carbon reduction goals that we all share. Climate advocates have climbed on, local communities, legislators, a huge labor support, huge number of businesses and conclusions that the cost of not doing this by third-party sources, not by us, but by third-party sources would be in excess of $5 billion during the first tranche.

So this is the palette upon which legal decisions will have to be made and all of those benefits are ones that would have to be discarded in order to invalidate this. I want to say one other thing just parenthetically on regulatory space that is important. As you know, we need to get approval for this transaction with [ph] MG (01:58:30) from FERC, from DoJ, from New York and from the Nuclear Regulatory Commission. HHI analysis of adding FitzPatrick results in no screen failures. So, we don't believe that there will be any basis on which that regulatory approval will not smoothly go through.

In our quick road through, I wanted to turn this over now to Kathleen for some election season observations.

Kathleen L. Barrón

We're five minutes over the limit. So I'm going to be brief. I'm going to just focus on a couple of issues that we're tracking in the election which does not include the Second Amendment. Starting first with climate change, it's easy to forget that in past elections this really wasn't an issue, but it is a significant point of disagreement among the candidates this year, of course. The Republican platform refers to climate change policy as the triumph of extremism over common sense. The candidate is quoted as calling human caused climate change a hoax. And the platform calls for a repeal of the Clean Power Plan, a ban on EPA regulating carbon and the cancellation of the Paris Climate Agreement.

Meanwhile, Secretary Clinton has made global warming a center piece of her domestic and foreign policy agenda, the platform calls for an 80% reduction in greenhouse gases by 2050. And importantly, a 50% clean energy production including nuclear within the next decade. It also states the carbon should be priced to reflect its negative externality and negotiated words to avoid using the words carbon and tax in the same sentence.

As for budget and tax reform, we do think it's likely that a Trump administration would seek to permanently phase out clean energy incentives, while a Clinton Whitehouse would likely seek to expand existing clean energy tax incentives. But given that a number of the secretaries' carbon policies do reflect an intension to treat all clean generation the same, we're hopeful that to the extent there are extensions in the event she should win to clean energy tax incentives that nuclear will be added to the list of clean energy resources that receive that incentive.

Bloomberg
SI-SSA-0015-01687

Let's turn to nuclear waste. We do think that regardless of how the elections turns out there is some traction to – in the house pushed legislation to restart the licensing efforts around Yucca Mountain and in the Senate just sort of follow the Blue Ribbon Commission recommendations to look for ways to identify potential repository sites other than Yucca. So, we think what the exact nature of how that plays out is uncertain, it's likely that there will be critical mass of support to address in the next Congress.

Finally on appointments, in addition to the Supreme Court nominee, which the next President will get to name which will affect the Clean Power Plan, of course. The next President will need to address appointees to all of our regulatory agencies, including FERC, which will be relevant both to the MOPR litigation Bill mentioned and to future efforts to reform wholesale markets to reflect carbon goals.

As of next month, the FERC will have only three sitting commissioners, all of whom are democrats. So, if Secretary Clinton were to win, she would not need to take any action immediately. All of those commissioners would be able to sit until the end of 2017 when Commissioner Honorable's term expires. If President Trump is making these decisions, presumably, he would three new Republican commissioners; one to replace Commissioner Honorable and then the other to fill the other two vacancies.

William A. von Hoene

This is an interesting thing that when we go over our a time, they send a fly up here to buzz right our face they had to get us done.

Kathleen L. Barrón

Nice tactics.

William A. von Hoene

Yeah. Last piece that we're going to talk to is our commitment to diversity and inclusion, and you can read the statistics here on the chart and I just want to say three things about it. Number one, the program is incredibly powerful relative to our competitors. The amount that we spend in diverse spend you see the numbers on here, 70% of which is first tier among suppliers, is really unprecedented in the industry.

This extends – number two, this extends all the way to not only the diverse suppliers in MBE and WBE space, but also to our regular banks, our insurance companies, our advisors, our consultants and the like. Just to give you an illustration with the program that we've implemented, our bank teams are now 44% female and 36% persons of color and those are the major banks that you would expect.

And third, why do we do this? Why is it important? We obviously think it's the right thing to do, but one of the things that I think is really important, it's really enhanced our performance as a company, it's made us better. You look here on the chart you see the amount of money that we have invested with minority and women-owned investment firms; that's our pension money, our nuclear decommissioning trust money. In two of the last three years, the top performer in our very high performing portfolio has been a minority money manager, so we're bringing to the table some new people with new ideas.

The second thing in that regard of why it's important though from your standpoint and I think that you would want to focus on is, particularly as we went through the Pepco merger process and as we go through and comment some of the processes have been implemented by the Commerce Commission, regulators really care about this. They want to know that a company is deeply committed to the communities and to diversity and inclusion. And the stakeholders are increasingly seeing that as a high priority.

final
Bloomberg Transcript
Bloomberg

This is a great calling card for our company because we have a fabulous story to tell and it will reap dividends over time, you may not be able to calculate them with precision, but you will see it in the attitude that we get from people who are deeply concerned with this issue, which include many of the people in whose hands our fate rests.

With that, I see we're at zero on the clock and we have been for a little while, happy to bring up our dear friends Ken Cornew and Joe Nigro to talk about Exelon Generation. Kathleen and I will return for the question-and-answer period when they are done.

Kenneth W. Cornew

Thanks. And I just want to start by saying if there is any doubt both Eggers and FitzPatrick are great additions to our fleet. I'll let that one sink in a little bit.

I'm going to start with a brag slide as well. Yes, a merchant generator is allowed to have a brag slide and our bragging really starts and ends with the over 14,500 employees, who I personally believe are the best operators and marketers of energy in the business bar none. And that truly makes Exelon Generation the industry leader in our competitive market.

We are the largest producer of competitive power in U.S. and we have far and away the lowest carbon intensity among large power producers. And this aligns with our goal of delivering a clean world to our customers and the communities we serve. And we delivered to those customers through Joe Nigro's business. Joe is CEO of Constellation. And we have made Constellation the largest competitive retail provider by far and away in the U.S.

Despite the bragging about the employees in our business, we are keenly aware of the challenges we face in this business. And we're singularly focused on improving economics of our business both operationally and strategically. And this is going to be the subject of mine and Joe's talking points today.

These next charts illustrate the scale of our clean energy business. We've had a consistent strategy over many years of building a significant portfolio of low carbon assets, operating them at world-class levels consistently, and matching that supply to our customers' needs, what you heard from us we call generation to load.

We bring all these elements together through Constellation and we truly optimize the value of this entire fleet together. We enhance margins, we improve efficiency of our hedging program, and we provide credit efficiency in the process. And we consider our wholesale load and our – when you consider our wholesale load in our ConEd Solutions' load to finalize and close on, we pretty much match our supply with load-serving products to our customers, and we've been doing so for the last couple of years.

So this strategy of match gen to load is a longstanding strategy we've had. It started with Constellation way back almost 15 years ago when Constellation New Energy was formed. Actually, even in the 1990s, PECO had a retail business that was forming and Commonwealth Edison also had a retail business that was forming.

So we've been focusing on this kind of strategy for a very long time. We've consistently executed acquisitions and organic growth strategies to achieve the number one position we have today, including our recent acquisitions, as you know, of Integrys Energy Services and ConEd Solutions.

This strategy now more than ever has become the model for the merchant power industry. In turn, it's clearing out weaker hands, it's creating better discipline in the market and in the retail business in particular, and we continue to have good success in our retail business. We'll have Joe talk about that a little more in a few minutes.

And as we stated, we've had this consistent strategy of building a very clean fleet of generation functioning in competitive markets. This is a real competitive advantage for Exelon Generation. Over 90% of our output is carbon free; 90%. 93% of our output is in healthier markets that have a capacity construct. We've been consistent in this strategy of matching our clean energy to products our customers want for a long time, but our eyes are wide open. We know what our current environment looks like. Some of our assets are significantly challenged. Many others are not making as much as we think they should in the marketplace. So, what are we doing about it?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01689

Well, first and foremost, our employees are working tirelessly to improve our situation and working out what we can control. And as always, that starts with safely, reliably, and economically operating our fleet. Our nuclear fleet consistently achieves higher capacity factors than the industry average. A big part of that success is how we plan, maintain and refuel our plants. And as you could see, we really do a heck of a lot better than the industry average in refueling, thus produce a much higher capacity factor at the same time. This translates to several million more megawatt hours a year that Joe and his team get to market and he can get revenues of over $200 million a year from that incremental output versus what an industry average would imply.

And note that we strive for the same levels of operational excellence in our non-nuclear business, our gas business, small amount of oil that we have in our significant renewable business. Our dispatch match is consistently near in the high 90%s achieving almost a 99% level recently. Our wind and solar energy capture is in the mid-to-high 90%s as well. So we strive for the same excellence across our whole fleet.

Our operational advantages also carry thorough into our cost structure. On the upper left part of the this slide, you can see our continued focus on cost and you've heard a lot about this over the last year or so. And incrementally, our plant closures are driving our O&M cost down by 1.3% over the next five years.

We've done a really good job in nuclear fuel spend as well. Some of it, obviously, is the softening of uranium prices in the market, but our portfolio management strategies in nuclear fuel and our ability to renegotiate contracts as we've seen opportunities to do so in the last few years have driven down our nuclear fuel expected spend by almost 8%.

And in the lower left, you can also see our base CapEx declining over the next five years, some of that is winding down our Fukushima upgrades and investments, some of that is also plant closures as well, and we continue to prioritize our capital on what we need to have to operate reliably and safely and not on what's nice to have and we'll continue to do so going forward.

Exelon Generation is in the lockstep with the Exelon strategy to optimize our free cash flow. We expect growth capital to drop substantially as we complete the existing projects and bring them online in the next couple of years, many of those projects are contracted as you can see up there, really, the exception is our Texas combined cycle plants. I can tell you those plants are on schedule and they'll come online next spring and be ready for the summer in Texas.

We're on budget and if you've heard us talk before, we had a real advantage on the cost side with these plants and we're maintaining that advantage with our disciplined project management. And we're still excited about the technology. We think the technology allows us to be the first combined cycles to dispatch with the heat rate advantage we have, and also be there to capture increasing ancillary benefits because of our ramp speeds that others just can't provide in the Texas market.

We admittedly would like market prices to help out and be higher, but we're very confident in the long-term investment we're making here. This is, at this point and any time into future, the last true merchant project we will endeavor on and our focus now is on contracted assets, getting down GenCo debt and returning value so utilities can invest. I want to emphasize that we have been and will remain disciplined in how we optimize the value of our assets. We sold over 3,000 megawatts of assets since 2014 at attractive prices, as Chris mentioned, relative to our view of value. We'll continue to look for those opportunities if they present themselves, and we'll be disciplined about it.

Unfortunately, not all of our plants can survive in this business. We've already closed 1,350 megawatts of fossil generation over the past five years and we've announced the retirement of Clinton, Quad Cities and Oyster Creek nuclear stations in the next three years. Although, we love our fleet of assets, we simply cannot sustain these plants that are losing money without a solution in sight.

I want to take a moment here to commend all Exelon employees, but particularly those employees that operate at those sites. Their innovation, their determination for excellence, their continued strive to operate as efficiently, effectively and at a higher performance level as possible is really commendable. We continue to operate those plants at the highest levels, and Clinton and Quad Cities are among Exelon's best operating plants in our entire fleet. So, I just want to thank our employees for their commitment to excellence and their continued commitment while we work to control what we can and make the hard decisions that we have to make.

final
Bloomberg Transcript
Bloomberg

Summing up all these efforts, Chris went through this slide. Dan likes to repeat these slides, so it really sinks in. So, just so it sinks in, we're going to produce over $8 billion in free cash flow in the next five years at the GenCo and we're going to complete our growth projects in the next couple of years. We're going to be reinvesting $3 billion of that money into our utility growth and we're going to be retiring about $3 billion of ExGen debt at the same time.

I really want to say how excited I am and the whole GenCo is about our recent developments in New York and what Bill just talked about. We're particularly thrilled for our employees, the communities those nuclear plants live in and serve, the state overall, and really, for the nuclear industry in general. It's a big, big accomplishment for the nuclear industry and for our all Exelon employees. This clean energy standard will save over 2,600 jobs in New York. It will contribute $3 billion to New York's economy. It preserves $47 million in property taxes each year for the local communities around New York and the state itself, and it prevents 16 million tons per year of additional carbon emissions into our environment.

And unfortunately, as Chris highlighted, Illinois is a very different situation for us and we've announced our plant closures of Clinton and Quad Cities there. When those plants close, it will mean 4,200 jobs lost. It will mean a shrinking economy and shrinking tax base for Illinois. And it will mean 20 million more additional carbon emissions in the State of Illinois per year. So we'll continue to work on what we can control. We'll continue to work for solutions in our markets, as Kathleen and Bill have highlighted. And we'll relentlessly continue to optimize the value of our fleet.

I want to close by just highlighting how proud we are of our commitment to STEM education. It's a commitment to our young people. It's a commitment to our communities and it's a commitment to our future economy in the United States. Exelon supports and engages in STEM education at all levels. We mentor many students, actually Constellation employees mentor just in one school in Baltimore, 70 students a year; 70 sixth-graders a year; awesome accomplishment and awesome commitment by our employees. We hired hundreds of professional and technical interns each year and really teach them our business and hope to hire them as permanent employees in the future.

We're proud to say we've committed over $8 million in 2015 to STEM education and we're reaching more than 150,000 students across the communities that we serve. We're having a real difference and importance in their lives while we're doing so. So we're very proud of that; just wanted to highlight that.

I'll now turn it over to Joe Nigro. He's the CEO of Constellation. He runs a great business and hopefully he brags about a little bit. Thank you very much.

Joseph Nigro

Thanks, Ken, and good morning. I'm going to spend some time this morning and talk to you about the Constellation business, a leader in the market for over 20 years. We have a leading competitive load provider serving over 200 terawatt hours of load across our wholesale and retail platform to over 2 million competitive customers on the retail side alone.

We also managed the 200 terawatt hours of generation that we're producing across our fleet each year. We also, if you may not know, are the eighth largest natural gas provider in the country. We serve 1.4 TCF of gas across our retail and wholesale platform on an annualized basis. Our operations extended to 48 states. We have 2,000 employees and, most importantly, our employees are serving almost 24,000 volunteer hours a year, which adds up to over 10 hours per employee, which I think is an incredible feat.

If I turn to the next slide, I want to give you some context about who we are as the largest provider of retail electricity at 139 terawatt hours a year across our retail platform. That's a 21% market share. That doesn't include the acquisition of ConEd Solutions, which I'll talk to about in a few minutes. Our market share is 50% higher than our next competitor and almost three times the average of the field and I think that scale gives us competitive advantage.

In addition, our residential business in the short five-year period has grown greatly as well. We are now the fifth largest provider with an 8% market share on the residential side. I think when you think about the consistency and

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01691

sustainability of business. We have that with the scale that we have and I think it's something we can leverage to continue to grow.

If I turn to the next slide, I talk to you about how big we are, but I think we've continued to grow. If you see up top here on the slide, the compound annual growth rate of our load across our wholesale and retail platform from 2014 to 2016 has been over 16%, which is an incredible rate of growth. One of the benefits the merger of Exelon and Constellation, the industrial logic was marrying Generation to a large customer book. And I will tell you from my perspective it's definitely working.

We've been successful growing our retail business in two ways. We've got organic growth and we've also done it through acquisition. In 2014, we acquired the Integrys book of business, which has been widely successful both on the power and gas side as well as the addition of some quality personnel.

We're in the process now of acquiring the ConEd business and we'll expect to close on that later this year and that's also going to be a very value enhancing transaction for us. The purchase price to that transaction was $53 million with about an assumed $130 million of ongoing working capital, and, for that, we're acquiring about 350,000 customers, about 18 terawatt hours of power load across 12 states and the District of Columbia. So we think it's going to be very valuable from us. The bottom of this slide is very important as well, when you look at the growth in our residential customer business, when you look at the growth in our retail load, and you look in the growth on our wholesale load, it all leads to repeatability and sustainability, which is, we think, is very value enhancing.

If I go to the next slide, beyond electricity we have a large natural gas business as well, and we're showing you the retail numbers here. You can see the steady growth in our projections of 11% compounded growth rate over the five-year period. We were successful in two fronts. We grow our business similar to power organically in the gas business, but back in 2014, not only with the acquisition of Integrys, but with the acquisition of ProLiance, we added a big book of gas in the Midwest and that's been successful as well.

And we see opportunity to continue to grow this business in the future, both through organic growth with our customer base and also through continued acquisitions in a market that I would tell you still is very fragmented with a lot of small number of players that we think we have the opportunity with our scale to continue to capitalize on.

If I go to the next slide, this is really the crux of the story, I believe. And I want to spend a few minutes here to talk about the loyalty of our Constellation customers. I got a couple of stories. The first is I want to talk about a customer in the Midwest. It's a producer of coatings in Illinois. They've been a customer of ours through 12 years and they started as a gas customer. We now serve them power and we've also completed energy efficiency projects with them.

Another example is the aquarium in Baltimore, the National Aquarium. They started as a power customer. They've been a long time power customer. We deployed 4.3 megawatts solar deployment with them and, in addition, we've also completed some energy efficiency projects with them. I think when you think about that, it leads to some of the statistics, you're looking at here and what I think is the crux of what is exciting about the constellation strategy of using the generation in our customer book of business to deliver repeatable and sustainable earnings.

When you look at this, we've got an 80% retention rate on power. That's outstanding in and of itself. That means 80% of our customers are renewing with us when their contracts come up for renewal. On the gas side that number is even higher. It's 90% and that's outstanding. When you think about our margins for commercial industrial originations in that $2 to $4 range and they've been stable in that range for a couple of years now on the power side, that's very impressive. And then on the gas side, when you think somewhere around $0.20 an Mcf and with that 90% retention rate, there's a lot of repeatability in the value of our retail business and we think we offer a lot of scale and scope to continue to deliver on that and to continue to grow on that.

I think the other important element is we serve two thirds of the Fortune 100 companies, so we're serving across the spectrum. You saw in a previous slide the large size of our residential base. We serve small businesses across the U.S. and across the country. We have medium and large commercial industrial customers. On the retail side, we serve the government and municipalities. In our wholesales business as well, we've been very successful with co-ops and municipalities. So, I think it's a real big platform that we can continue to grow on which is very important.

final
Bloomberg Transcript

The last thing I would say on this slide is we win new business at a 30% rate, and I think there's a number of reasons for that but I think our consistency, our longevity in the business, our investment grade balance sheet is a big driver of what we offer the customer, and I think it's been a big value proposition.

I think the other side of it is this book of business on the power side is very important for our Generation assets on a number of fronts. The first thing is we're capturing incremental margin that we wouldn't be able to capture in the wholesale markets. And the wholesale markets have some challenges, lack of liquidity, lack of market participants with some of the players backing out, I would argue has led to quotes in market prices that are below what we think are fundamentally we believe the prices should be.

I think another reason that our customers, we've had success both with our renewals and our new business in winning, is the opportunity around really providing competitive pricing, competitive products and really an ease of agreement between us and our customer. When you think about other benefits to the Generation Fleet in particular, I mentioned the margins, but just is equally important, we match our Generation and our load which I'll show you on the next slide very well from a geographic perspective.

In addition to that, there is a lot of optionality inherent in our Generation portfolio. We are a long nuclear operator, but we own dispatch across the power generation stack and these load serving contracts meet that very, very nicely, and marry to that Generation Fleet very well. And then the last thing is, there's a credit efficiency with not having to use the over-the-counter market that we get with these Retail contracts as well.

So if I turn to the last slide, I would tell you, standalone the Constellation business is very strong, but being part of the ExGen family obviously makes it even stronger, and that's what we're trying to represent here on this slide. You can see in almost all our regions that we have a very balanced generation-to-load position. It actually fits very, very nicely. And then you could see we have additional capacity to backstop any other, what I would call, volatile incidents in the market. The one region where we don't have that is in the Midwest, but we've continued to grow our load book in the Midwest through organic growth and also through acquisitions like Integrys, and we will continue to work hard to balance that portfolio as well.

On the bottom of that next slide, there is really two important points here and it talks to some of the value proposition. The first thing is, if you go back to the winter of 2014, it's the most volatile period that we've seen in a number of years. We benefited greatly on the Generation side. If you remember, there were a lot of competitors. We talked about the competitors trying to replicate what we have with this Generation, the load matching strategy. There were a number of competitors that exited the retail market at that time because they were hurt because they didn't have the generation to match. Our Generation performed well and we made quite a bit of money on that side.

I would tell you in 2015, and even now in 2016 in a much lower volatility period, we've had the ability to monetize our load and have been very successful doing that and you see what the value proposition and what that was last year. These numbers area incremental to the margins that we achieve when we make our retail sales, when we make our wholesale load sales. So, this is the incremental value-add when we talk about the proposition of what we're bringing to the table across the Constellation platform. I know a lot of you think about this as a trading business, I don't think about it that way. I think about it as a logistics business, with the opportunity of taking these customer contracts and the Generation output, and really managing around that to create additional value by using our Generation Fleet, capturing anomalies in the market like we did in 2014, like we did in 2015, and really leveraging the scale and scope we have. So, from my perspective, I'm very excited about what the future holds for Constellation.

I think we're going to continue to see consolidation in the retail market and we'll have an opportunity to capitalize on that. We've proven we can grow our business organically. I think the utilities, talked about the evolution of the customer. I think we have an ability to capitalize on that, and I'm really excited about what the future holds for us.

I know I've covered a lot of material and Ken's covered a lot of material in a short period of time, what I'd like to do with that, Bill and Kathleen to come up and join us, and we'll open it up for questions as it relates to the ExGen business, and also, as it relates to the corporate strategy. Thank you very much.

Q&A

<A - Dan L. Eggers>: Steve. Can you pass [indiscernible] (02:30:45)?

<Q - Steve Fleishman>: Just on the Retail business, can you speak to competitive trends – sorry, can you talk to competitive trends? You discussed the business in depth, but do you see increasing Retail competition, lessening competition, what are the trends that you're seeing in it?

<A - Joseph Nigro>: Yeah. I got asked this question last night, and what I would tell you is, coming out of 2012 into 2013 was very much a low point in what I would call the Retail market. And then the winter of 2014 hit and we saw quite a bit of volatility. And as I mentioned, we saw a number of players liquidate their position and get out of the business. It provided an opportunity for us for acquisition. Since then, we've seen commercial, industrial margins improve, and they've remained stable. We've seen residential margins improve and have continued to improve. And we recognized, I think, two things that I think will allow us to continue to see that trend. One is, I think there is just – we've seen some consolidation in the industry, and what I would call some of the more aggressive players have passed on to other things have become less aggressive in selling Retail contracts, which I think adds to stability. And then secondly, I think some of the volatility is still fresh in people's minds and how bad they were hurt by it. And I think people are pricing accordingly and acting just more disciplined than they did previously.

<Q - Steve Fleishman>: Now shift over to FERC, and think of FERC as a instrument to effect carbon-free generation. Could you speak more to FERC's sort of the range of options FERC has, there have been some legal developments that are encouraging in terms of what FERC might be able to do, but just curious, if at present we're so inclined to use FERC, how that could be done?

<A - Kathleen L. Barrón>: Well, I think you're right to acknowledge that the legal developments are relevant question. I think if you'd ask a year ago, whether this is even something that would be considered at FERC you would get a different answer than you would get today. But I think the sort of horizons have been expanded a little bit by the court decision. And that the folks there are really starting to think about what the options are. And I think of them essentially three ways. One, in what think would be the most efficient for consumers would be to put a price on carbon in the energy market, let that show up in the dispatch and achieve the carbon reduction goal, use the power of the market to achieve the carbon reduction goal at the lowest possible costs to consumers.

A second option that will probably get some attention is the idea of the using the capacity market is to sort of think about it from a capacity perspective and to show, to reflect in the capacity market what did the states capacity goals are in terms of the clean generation. That does not allow you to achieve the benefits of colder gas redispatch, efficiency, demand response, things that you would achieve if you use energy markets solutions, by the way it's the one that I will discuss, because folks do look to the capacity markets as a way to achieve some of the things that are not being achieved otherwise.

And then finally, one idea that you may hear about is doing a forward procurement of Clean Energy on a megawatt-hour basis, but essentially through the RTO and doing in a fuel-neutral way, it's another concept that has gotten some attention. But those ideas as well as others are all on display in the New England process which will play out this week as you may be aware and the other RTOs are going to have meeting play during the month to start to talk about some of the concepts.

<A - Joseph Nigro>: Three Mile Island, it hasn't bid the last two auctions and just the factors that you're looking to for that plant to survive and possibly timing as to when we make decision about retirement. So, we started our focus on obviously other plants as you heard us talk about for the last two years. Bill and I led a team inside Exelon to really rationalize our nuclear situation and work on the plants that we thought were most pivotal and needed the most attention. TMI working on that at least a couple of years when we started that. Since that time, we've seen erosion in the Mid-Atlantic price points. We have, as you said, not cleared for two successive auctions in the PJM capacity market, plants committed till the middle of 2018 right now. And we now included in our list of plants that we are focusing on. So we're in the process of evaluating our options for Three Mile Island. I think the New York template is potentially a template for other states to follow and we'll pursue with the same rigor what's needed around Three Mile

final
Bloomberg Transcript

Island to keep it running, or we'll be disciplined about what we do, is it.

<A - Dan L. Eggers>: Praful, right there?

<Q - Praful Mehta>: Thank you. So, quickly on the Retail business, now we hear the benefits of the Integrated platform, right, the Generation and the Retail business and a lot of people are talking about it today. But when we look at transactions and where asset deals are done, and the deal that you just did, most of the price seem to be the working capital adjustment. So how do we rationalize where clearly there are other people also looking at the Integrated platform and saying, hey, retailer is valuable. But then when you do these transactions, the prices are so low for the asset itself, so how do we rationalize that disconnect, I guess?

<A - Joseph Nigro>: My perspective on that is, I think a number of those retailers that have changed hands don't have the other side of the equation, which is the Generation, I think that's the first element. I think there's an intrinsic value that's greater of having these two pieces together, because I think you're de-risking your portfolio, not adding risk to your portfolio, where I think on a standalone retail basis you're getting daint for that, number one. Number two, I think after the polar vortex in 2014, I think what we've saw with the acquisition and we're going through ComEd solutions, I don't think their core business is for some entities. So when you think about ComEd, when you think about Integrys, what they were going through, and why they were sold, I think that has some impact on what the sales price is. I don't think there is one particular story for each one of them that blankets everything. I think some of its unique and some of it is the fact that the generators, the long generators see bigger benefit in having these retail books of business and are being reflected by the standalone entities, and I think it creates more value for.

<A - William A. von Hoene>: And I'll just add to Joe's comment. We're not in the business of looking at acquiring platforms in Retail. We have the most substantial platform in the business. We're interested in the book of customers and what we can provide there. So, there is a valuation difference, if you think about paying for a book versus paying for a platform. We can deliver; we can close and integrate and deliver on value and for entities trying to get out of this business, what they are concerned with is their employees, and they're concerned about getting value, but they are also concerned about getting out. And to the extent we're patient and can participate when that kind of opportunity comes along, we're going to do so, and I think, that's what you're seeing.

<A - Joseph Nigro>: And that scale has served as very well because in the acquisition that we're talking about, we don't pay a lot for the go-forward value of the book. We're paying for the intrinsic value of what's already on the book. And I think, our scale, and scope, and ability to integrate and our ability to close in a timely effective manner, has benefited us well. And I think it's what's creating value when we do these acquisitions.

<A - Dan L. Eggers>: Shar?

<Q - Shahriar Pourreza>: Joe, what is – if you look at slide 115, what would that look like – it's you CAGR slide, 116.

<A - Joseph Nigro>: Okay.

<Q - Shahriar Pourreza>: What does that growth look like sort of beyond 2016? And then, is there sort of a natural ceiling to how much of a natural hedge you're looking at, because in some of your regions, it looks, you're actually short power?

<A - Joseph Nigro>: Yeah. I think there is a continued opportunity to grow this business, and I mean the acquisition of ComEd isn't in these numbers, right. So, growth is, as I mentioned in my prepared remarks, is going to come in two forms. It's going to be organic, and it's going to be through acquisition. So, when you think about the acquisition of ComEd at somewhere around 15 terawatt hours to 20 terawatt hours, that's going to add a growth trajectory onto this. We'll be able to continue to grow our business organically. And I worry less about the short you're talking about, because if you look at all of those regions, we have a back-stop of additional capacity, some of it is uneconomic.

So, what it allows us to do is use that, what I would call, out-of-the-money option to continue to sell these type of contracts, and then we can go-to-market, which is refreshing go-to-market on the buy side and actually buy some things to fill in the gaps, while knowing we have our own natural back-stop to protect this.

final

Bloomberg Transcript

<Q - Shahriar Pourreza>: That's good.

<A - Dan L. Eggers>: Ali, right there.

<Q - Ali Agha>: Two questions. First on the New York ZEC contracts, I've noticed you haven't included those in your numbers yet. Is there a particular milestone, or what needs to happen for you to officially start putting them in your numbers?

<A - Dan L. Eggers>: So, our policy on inclusion of that into our numbers is the next sort of contract hasn't been signed yet. So while we have the order in place and that sort of contract isn't there, so is a process or a protocol, we wouldn't do that until we have the contract in hand, which means we would give you the update in our gross margin disclosures at the third quarter update to our hedge disclosures. If you look at slide 115, the appendix after Jack's section – we should thank you for not jumping ahead and being patient – we actually give you the gross margins and EPS impact of it. So it is in there, it has not been layered into those numbers at this point in time.

<Q - Ali Agha>: Under the contract, okay. Second question, on the Illinois, the two nuclear plants, have we reached the point of no return as far as retirement is concerned, or is there still an opportunity to pull back? And any signs of anything from the Illinois side that could cause you to pull back?

<A - William A. von Hoene>: Yeah. The drop dead date, so to speak, on this is December in terms of the plan. So what happens in December in terms of the notice we have to give on Quad Cities under our merger agreement with Constellation and in terms of what happens in MISO with Clinton, that's kind of the date in which it has to happen. We don't have – we have proceeded consistent with our conclusion that this will not happen, that we will not get legislation in Illinois based on the impasse that we experienced over the course of the year.

The Illinois Legislature will have – currently has three days scheduled in November, and three days scheduled in early December to consider whatever is on the plate after the elections. It is possible that something will happen during that period of time, but we continue to plan for the retirement of the plants because there is no certainty whatsoever that anything will occur.

<A - Dan L. Eggers>: We'll go to Greg.

<Q - Greg Gordon>: Hi. On slide 133, the ExGen Disclosures on the open gross margin, it's down $100 million in 2017, $200 million in 2018, probably your first quarter of debt, but you are also now excluding Clinton, you're not including the [ph] ZEC deal (02:42:41), but you're also now excluding Clinton and Quad. So is there any way for you to give us how much of that delta is just the mark on power forwards and how much is the exclusion of Clinton and Quad?

<A - Dan L. Eggers>: Yes. So, Greg, the gross margin data for how much we backed out for Clinton and Quad is on slide 150, so that probably is going to fill in the gap to where we would have been to where we are right now. So, it's not on the same page, I apologize. So, if you go further in the deck, you'll find them.

<Q - Greg Gordon>: Thanks. And then, if we think about the bottom line earnings impact of retiring Clinton and Quad going from gross margins to EPS, I would presume that the drop-off in costs would make it earnings neutral going to positive as you disclosed, if that's [indiscernible] (2:43:22)?

<A - Kenneth W. Cornew>: So in 2000 – full run rate 2019 number would be about $0.07 a share positive and $75 million of cash flow positive.

<Q - Greg Gordon>: Great. Thank you.

<A - Dan L. Eggers>: All right, [ph] Angie (02:43:31).

<Q>: Thank you. So, I have a question on Retail. So, in the past you guys told us that when you talk about margins, you talk about origination margins. And then, once there is additional margin realized, it doesn't show up in disclosures on margins. So, can you actually talk about how those margins compare at the origination point versus the final realized

final

Bloomberg
SI-SSA-0015-01696

margin for residential and C&I customers?

<A - Joseph Nigro>: Yeah. We tried to show that some with the last slide I was speaking to. And the reason we don't include that in our Retail margin is we think about the Retail margin as the point-of-sale margin. And then what we do is effectively all of the risk and opportunity is managed within our Wholesale business once that sale is made.

So, if you think about what I showed in 2015, we served approximately 200 terawatts hours of load. We added about $250 million of additional value. I would call that somewhere around $1.25 to $1.50 of value, incremental to what the Retail sale was in optimization. When you think about what I showed you in 2014, with the $100 million, a lot of that came off the Generation Fleet, but that was the optimization value around the market itself. So if you consider that, it's somewhere around $1 or so additional above that $2 to $4 price that I gave you.

<Q>: Okay. And then, again, about disclosures. So, there's so many moving parts, right, FitzPatrick, ConEd, Retail to nukes in Illinois, the New York deal. Are we going to get updated disclosures on all of this during the third quarter conference call?

<A - Dan L. Eggers>: So we're going to update things that are closed, so the New York CES will get reflected assuming that sort of it gets done, we'll reflect them in the third quarter disclosures. We're not going to disclose FitzPatrick until we get to closure, a lot closer to closure at this point in time before we put it in there. What we've said previously is it – that we're not doing deals in merchant generation, we only want contracted assets that are EPS and cash flow accretive, and FitzPatrick follows through on those two designations.

Illinois is reflected in our disclosures at this point in time. ConEd, we will – if we get it closed by the third quarter results, we'll put in there for growth in the fourth quarter going to the year-end update. But that's just general course of protocol making sure we own it before we change.

<Q>: And my last question, so when you guys show the impact of New York, of the New York deal, is this for your share of CENG plants or all of the CENG plants?

<A - Dan L. Eggers>: Our share.

<Q>: Okay. Thanks.

Dan L. Eggers

And we've gone fully over Julien, if you're really fast, you can ask your question. But I'm not sure if that's possible. So, okay. All right, you can come back to it. Thank you guys very much.

MANAGEMENT DISCUSSION SECTION

Dan L. Eggers

Okay. I'm going to turn it over now to Jack Thayer, Chief Financial Officer, to do the run-through on the financials. After Jack, we'll have Chris come up and we'll do Q&A for those guys. Thank you, Jack.

Jonathan W. Thayer

Thank you, Dan, and good morning, everyone. You've heard today from Chris and other leaders of our company on how they're positioning their businesses to deliver value to our shareholders, customers and other stakeholders. My remarks will focus on how all these pieces work together to build enduring value for you, our stakeholders. Before I get into that, I want to spend a few minutes on our results for the second quarter. We had a strong quarter financially and we were able to exceed our guidance range even with the modest setback of the recent PGA rig case decision.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01697

For the second quarter, we delivered adjusted non-GAAP operating earnings of $0.65 per share. This compares to $0.59 per share for the second quarter of 2015. Exelon's Utilities delivered a combined $0.36 per share. ComEd, PECO and BGE saw increased distribution revenues during the quarter and we had favorable weather in Northern Illinois.

We had a full quarter of PHI earnings which contributed $0.06 per share. However, we took a negative $0.03 per share charge resulting from disallowances primarily related to Smart Grid contained in BGEs June 3 rate case order, and partially reversed by the PSEs late July ruling on our rehearing request.

Generation had a great quarter, earning $0.35 per share. We benefited from lower cost to serve our customers during the quarter. Our effective Generation to Load strategy continues to deliver strong earnings and consistent results.

For the third quarter, we are providing guidance of $0.65 to $0.75 per share. We're projecting our fourth quarter results to be in line with what we've delivered in the last few years. As a result, we're reaffirming our full year guidance range of $2.40 to $2.70. The appendix contains detail on our second quarter financial results compared to second quarter of 2015 results by operating company on slides 157 and 158.

Next slide, please. Turning back to the focus of today, Exelon's value to stakeholders, you've heard from each of our business heads what they're doing to benefit our shareholders and customers. When you bring together what they've discussed, Exelon is well-positioned to deliver enduring value. Over the next five years, we expect to deliver 6.1% rate base growth across our Utilities. 7% and 9% utility EPS growth, one of the best growth stories in our industry. And $8.2 billion of free cash flow at ExGen to fund utility growth without incremental equity while also reducing ExGen debt.

We're optimizing ExGen value. Having raised nearly $5 billion by monetizing assets through outright sales and project finance. Securing $0.08 per share to $0.10 per share a year through the regulatory efforts to recognize the carbon-free value of nuclear plants, and unlocking $0.07 of run rate EPS by closing uneconomic nuclear plants. Our balance sheet is extremely strong, well exceeding investment grade credit rating downgrade thresholds, and we're growing our dividends at 2.5% per year through 2018.

Next slide. We're aggressively managing costs across our businesses. Through the cost cutting program, we announced last year, we're able to more than offset inflation. Assuming 2% for inflation, our cost should have increased by approximately $700 million from 2016 to 2020. Instead, we're projecting an overall CAGR of negative 1.1% and a negative 1.3% CAGR at ExGen. Even without accounting for the closures at Clinton and Quad Cities, ExGen O&M would be roughly flat and lower than inflation.

Turning to the next slide. Our teams have been focused on optimizing the value of our Generation Fleet in a variety of ways. We're efficiently operating our existing Generation portfolio, running our nuclear plants at industry-leading capacity factors creates value above what other operators do. We deliver more value to our shareholders by running our fleet at best-in-class levels. We make roughly $250 million more by running at 93% or higher capacity factors compared to the 90% current industry average. The team continues to find ways to run the fleet safely and reliably at lower cost.

Our Constellation business maximizes the value of our portfolio including our generating assets. Our Generation to Load matching strategy provides additional value over what our plants could get in the open market. Our durable and growing Retail business with its loyal customer base improves the consistency of ExGen's earnings, and PJM capacity revenues provide us a stable revenue stream consistently between $1 billion per year to $1.2 billion per year.

We look for ways to monetize our assets. We've raised more than $5 billion from selling assets or project financing them. We sold 3,000 megawatts of generation at an average price of $600 per kW in 2014, a very good price due in part on the PHI transaction. We've raised approximately $3 billion from non-recourse project finance, and we'll seek to project finance additional assets and quickly recycle the proceeds.

We have a history of prudently retiring assets when they no longer positively contribute to the value of our fleet. By retiring plants, we're able to stem the cash flow and earnings losses from these units. Clinton and Quad alone have lost $800 million in the last seven years. Retiring these units will result in 2019 run-rate earnings improvement of $0.07 per

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01698

share and avoid $75 million in pre-tax cash loses.

Finally, Bill talked about our success in New York with the Zero Emission Credit program. The program is the first-to-value nuclear for its carbon-free attributes and recognizes existing nuclear generations importance in meeting our carbon goals. The ZEC will preserve our at-risk Ginna and Nine Mile plants providing up to $350 million in additional cash through 2020, and $0.08 per share to $0.10 per share in additional earnings per year. We announced yesterday that we've reached an agreement to purchase FitzPatrick from Entergy for $110 million. FitzPatrick is also eligible for the ZEC, and I mean it this time.

Next slide. These efforts to optimize the value of ExGen, maximize its free cash flow. Over the next five years, we expect ExGen to produce $8.2 billion in free cash flow at current market pricing. I want to highlight something. Importantly, this does not include the incremental $750 million of cash from the ZEC program sighted in the footnote on this slide. With minimal growth capital being invested at ExGen, there is nearly $6 billion that can be redeployed to fund investments in our Utilities and reduce debt at ExGen. To extent we realize more cash flow than we project here, we will look to redeploy that additional cash, primarily by reducing debt at the Holding Company or funding additional investments at the Utilities.

Turning to the next slide. Exelon is committed to maintaining our investment grade credit ratings at each of our businesses. Exelon is significantly above the S&P FFO-to-debt threshold for a ratings downgrade. In addition, we will reduce debt by approximately $3 billion at ExGen, which lowers our debt-to-EBITDA ratio over the next five years. We're targeting a three times debt-to-EBITDA ratio at ExGen, which is significantly less levered than our pure merchant peers.

Next slide. When taken together, we're building enduring value for you, our stakeholders. A vast majority of our capital $25 billion is being invested in our regulated utilities, where we can earn an appropriate and predictable return. This investment drives 6.1% rate base growth resulting in an above industry growth, earnings growth of 7% to 9% and shifts our earnings mix to primarily regulated earnings over time delivering on our commitment to you to provide more stable, durable earnings.

Next slide. In practice, our utilities payout 70% of their earnings to the corporate to help fund the external dividend and Holding Company interest expense. However, if we think conceptually about the dividend payout ratio against our EPS projections for utility-less HoldCo, we see the dividend fully covered this year and then following into the 70% in 2020, as our utility EPS growth outpaces our targeted dividend growth. We see this platform as supportive of dividend durability and pointing towards the opportunity for additional growth in the future.

Next slide. Our strong balance sheet and significant free cash flow from ExGen are the foundation of our capital allocation policy and a key to creating value for our investors. As you've heard throughout the morning, our strong free cash flow at ExGen is redeployed to fund $25 billion of utility growth, retire debt at ExGen, which will improve our already strong credit metrics, and finally invest in select contracted assets where we can meaningfully exceed our return thresholds. Importantly, returning capital to our shareholders by increasing the dividend 2.5% per year through 2018. This is the right strategy for our markets and assets, and the right strategy to build enduring value for our investors.

Now, I'd like to invite Chris Crane and Dan Eggers up for Q&A. Thank you.

Q&A

<A - Dan L. Eggers>: We'll start off with Jonathan right there.

<Q - Jonathan Philip Arnold>: Thanks, Jack. So [indiscernible] (02:57:11).

<A - Dan L. Eggers>: Yeah.

<Q - Jonathan Philip Arnold>: Yeah. All right. I just wanted to ask on the – you folded the parent drag, some of the parent drag on the utilities into the utility EPS forecast, I think. But should we still be expecting $0.10 or so of HoldCo cost beyond 2016, or it was something that kind of in the utility numbers?

final

Bloomberg Transcript

<A - Jonathan W. Thayer>: So, it's incorporated into those utility numbers and assumes that we use our free cash flow to pay down the GenCo balance sheet to the extent we get incremental capital like the $750 million I mentioned from ZEC, that could be used to pay down Holding Company debt, and Dan, I think the number is...

<A - Dan L. Eggers>: Little more than $0.15, John.

<A - Jonathan W. Thayer>: $0.15. So, kind of where we are this year should be in a reasonable assume run rate going forward for HoldCo expenses. They're where they are.

<A - Dan L. Eggers>: Yeah, that's right.

<Q - Jonathan Philip Arnold>: You have the utilities, okay, that was one. And then the other question I had, on the – you're now talking about a target for debt-to-EBITDA at the GenCo around three times. As you look at the plan, do have headroom on that target, because you used to show financial forecast as opposed to just target. So, these deal numbers can of kind of take you somewhat better than that, or not?

<A - Jonathan W. Thayer>: The three times debt-to-EBITDA, there was obviously a lot of focus on leverage in the merchant sector at the end of last year, beginning of this year. And as we think about the right leverage ratio and where the efficient spectrum is for capital, three times feels about right. That implies roughly 32% to 33% [indiscernible] (02:58:56) debt, anything beyond that we feel is better for us to reduce the debt at the Holding Company.

<Q - Jonathan Philip Arnold>: Thank you.

<A - Dan L. Eggers>: Julien, I promised you.

<Q - Julien Dumoulin-Smith>: Thank you. All right. So, slight change in question, looking at the dividend rather. How are you thinking about, maybe it's been more of a Chris question, 2018 onwards, you've got a 2.5% modeled in there. How do you think about the potential increase that especially as you get more into a normal-ish range on the utilities, utilities are clearly growing faster than that.

<A - Christopher M. Crane>: Sure. We don't need to get out in front of the board. As you've seen the numbers modeled, we've anticipated, and for modeling purposes the 2.5% continues after 2018. As we capture the execution on the utilities side, or we've become much more certain with the environmental benefits from the revenues and cash flows from the Generation business, that will inform us on our capability to have a sustainable and increasing dividend policy.

But, we want to execute on those right now, we get the 2.5%, and we have board approval through 2018, we have modeled beyond 2018 just to show we can continue to do that. We want to see the rate cases come in and the recovery on the – or the growth of the $9 billion of rate base over that period of time in gaining certainty.

But as you can see, there is the potential for us. There is – we're not ready to make that commitment yet, because, we got to make the execution. I feel confident, but want to give the operating groups the opportunity to execute, and then we'll continue the discussion with the board. We'll be talking it at our board strategy retreat coming up fairly soon about that potential and how we want to look at it and how they want to look at it themselves.

<Q - Julien Dumoulin-Smith>: Got it. And then second question kind of big picture, you've got the utilities here, you've got the GenCo here, perhaps following the lead here – or following the rest of the sector if you will, moving towards a more regulated profile. Do you think everything within the ExGen business is still core, obviously, you've got a big retail business in matched load. But development side, obviously you're deemphasizing growth in that side, anything that you can divest, cut costs, vis-à-vis SG&A, et cetera?

<A - Christopher M. Crane>: Sure. The cost side, I think Jack covered, we had a negative CAGR. We run the most efficient operation and we're still finding ways to take costs out and improve performance at those assets. That won't change, and that is what is driving a lot of the free cash flow.

On an annual basis, we do an asset rationalization to look at where the markets are valuing assets that would be more than we may value than more see them as valued to us within our portfolio. So, we're in that phase now looking at it

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01700

and they'll make the recommendations on the determination. And if we should go after liquidating any other assets or potentially shutting down any of the peakers that aren't carrying their own weight.

<A - Dan L. Eggers>: And Steve [indiscernible] (3:02:36).

<Q - Steve Fleishman>: Yeah. I guess, a question for Jack or Dan. First, just on ExGen, you give us a lot of visibility on the gross margins and on the O&M, but there's things like interest, depreciation and those other lines, tax rate, that kind of matter. So, is there any just big change events we should be aware of through the period to 2018 for that business on those below-the-line items?

<A - Jonathan W. Thayer>: The only thing that really comes to mind is the – is pension expense. With the decline in rates, we've seen our liability grow fairly significantly. We're 78% funded, so we're in a good place, but that's $0.02 to $0.04 of incremental drag from pension that will mostly be felt at the GenCo.

<Q - Steve Fleishman>: And that's not in the O&M?

<A - Jonathan W. Thayer>: That would be in the O&M, sorry.

<Q - Steve Fleishman>: It's in there already.

<A - Jonathan W. Thayer>: Yeah.

<Q - Steve Fleishman>: Okay.

<A - Jonathan W. Thayer>: Steve, so the tax rate data we gave you, the tax rates we gave you on the first quarter call because the effect of the DPAD adjustment, that's going to be – that will create a little more burden from a tax rate perspective, but you should have that data already. I don't – can't think anything substantial is going to happen on the depreciation side, interest expense to the point we're paying down that $3 billion of debt, kind of the ratability of that going down, that will create some headroom presumably on interest expense.

<Q - Steve Fleishman>: Okay. And just a strategic question for Chris. Just perspective on additional M&A consolidation for the company, obviously you just got Pepco, but during this three-year to five-year period, kind of how does that fit if at all?

<A - Christopher M. Crane>: Right now, we are focused on the integration and the complexity of the integration, the execution on the rate cases, driving the capital projects and the spend. And so, we have seen things going for pretty good size premiums. We see more value and are sticking with our own investments, the $25 billion; we're adding a PHI in the next five years, as I said earlier, without the opportunity for regulatory approval or the opportunity to pay a premium. So, it would have to be something that's really broken for a fixer-upper and it have to be a couple years down the road because we really need to focus on execution here. Thank you.

<A - Dan L. Eggers>: [ph] Anthony (3:05:07)?

<Q>: Just off of Julien's question earlier, if I think about how you've pitched the story today, you've pitched ExGen as more hedged, the natural hedge with the retail business. I mean, is your view in the next five years or in your forecast that there's very little recovery in the power markets and you're taking a more defensive posture in your ExGen versus previously, you guys have talked about upside, the power markets return to normal or if we're at a low here, if we'd bounce back, how much benefit that would be to ExGen? Is it fair to say that while ExGen is core, the ability you'd see upside from there is limited in your five-year forecast?

<A - Christopher M. Crane>: I think 2018 and 2019 have room to come up for sure. We're just using, [ph] whereas we're (3:05:53) we model here the forward strip and show the strong story with the free cash flow and the earnings accretion that we'll get from that, but I don't see 2018 or 2019 being sustainable at these levels without a whole lot more retirement or tightening in the market. So, we do see the potential for upside, but it's just showing it as the market forwards have it laid out now.

<A - Jonathan W. Thayer>: And that's particularly in NiHub.

final

<A - Christopher M. Crane>: Yeah, NiHub.

<Q>: And just switching to the utilities, if I think if you have your work cut out for you in rate case filings, particularly at PHI over the next couple years and you hope that bill impact is probably minimal, what's your assumption of the change in commodity prices in the customer bill during that period?

<A - Christopher M. Crane>: Yeah. I was going to come back to Paul's question that he had for the utilities. What we do at the utilities, is take a five-year view on rates based off of not only the capital, the O&M expenditures, what we predict will be going in for rate cases and when we predict. We also run the sensitivities on the capacity market and on the energy market to make sure that we've got that understood clearly and we're communicating that with the major stakeholders here's what it looks like. So, we don't get into the case of rate shock. When we put this capital in, so we're running the sensitivities, we understand the capacity market gives us a little bit more, we understand the variability, especially 2018, 2019 in the energy market, what can be the consumer take? But there's another side of this story too is, a dollar, if you can spend $8 of capital to save $1 in O&M and its flat to the consumer. So, when we're putting this capital to work in the utility, we have got to be driving efficiency. Anne talked about how many truck rolls did not happen with the smart meter, it's just not put capital in for the sake of getting return, you've got to put the capital in to cut the O&M cost, shifting craft now at ComEd and other places to put that capital in has brought the O&M cost out, brought the CAGR's on O&M to. So, there is a strong focus, Paul, to your question earlier that you cannot put this on the back. And then if you're seeing some big rate shock event which we're not seeing in the out years, what can we do to mitigate that, so it's a high sensitivity. And it's not done, as I said, without driving more efficiency in cutting costs, reducing the over time, reducing – in a storm recovery, reducing the dependency on contractors in a storm recovery or in a normal operation. That's what the technology is being installed for is the resiliency and cut costs.

<Q>: And Chris, just to build on that, if you think about our efficacy for energy efficiency within the ComEd...

<A - Christopher M. Crane>: Yeah.

<Q>: Within the clean energy bill, that will lower customers' consumption, therefore lower their G part of their bill, certainly that's been highly effective within the BGE Zone. So, we are thinking about the totality of the bill in our regulatory policy and how we advocate.

<A - Christopher M. Crane>: So that's a shift in the way we have to analyze, to what Jack said, instead of just focusing on the rate, focus on the total bill. We have actions that are cutting the bill down. We have actions that are cutting the rates down from what they could be by efficiently running the business, endorsing programs and operating properly.

<A - Dan L. Eggers>: Praful and for Greg.

<A - Christopher M. Crane>: I think Andy is going to throw something at you...

<A - Dan L. Eggers>: Yeah. I know.

<Q - Praful Mehta>: Thanks. So I had a quick question on the leverage at the GenCo. Now the $3 billion deleveraging makes sense and we understand the path to it. But as you think about what's going to happen five years, seven years down the road in terms of more renewables coming in, there could be more weakness on the off-peak pricing which could put more pressure on nuclear. So, I guess, the question I'm getting to is, as you think about the optimal leverage and not just the debt-to-EBITDA, but just the amount of debt that you can have at ExGen, are you looking at asset life of nuclear five years, seven years down the road and saying if we didn't get ZECs in other states, for example, and we only have the market, what is the amount of debt that you can bear at ExGen five years down the road, if you're thinking about nuclear asset life being X. So I'm trying to get those pieces.

<A - Christopher M. Crane>: Yeah. So, the most sensitive assets to the renewable build-out are going to be those in the Midwest. And so, we feel that the dual-unit larger sites are durable through that period, but we have the three times debt-to-EBITDA. We have units that are going to run out to 2040. We have a project at Peach Bottom as a pilot plant to add another 20 years onto it. So, we don't want to paint the picture that this is a dinosaur, this is – we're optimizing this fleet right now to be durable either through the REC program or the ZEC program or shutting them down. But there are

final

Bloomberg Transcript

-the other assets are very strong and continue to be. If the renewables continue to collapse the market, we're not the first ones that are going to be hurt. There'll have to be some other market design, because of reliability issues with the units coming up. You can see the conversation that's going on in MISO right now. MISO has been slow to file its plant for Zone 4. That stakeholder process has created a lot of dialogue that they have to work out stuff, but reliability is continuing to deteriorate in that period of time. The State of Michigan just asked MISO to run a reliability study for the State of Michigan because of the issues that MISO is having. So I think there is a view. We'll let Jack answer the view on how we manage the ratios and what's our target. There's also a view that we're going to be running some of these assets for 20 to 30 more years and they're going to be long-lived assets, the market needs them, reliability needs them and the environment needs them.

<A - Jonathan W. Thayer>: I think just to build on that, I think to Chris's point, we do have a differentiated technology with a differentiated output. We believe that that will continue to provide enduring cash flow. Our ExGen business is throwing off more than $1 billion of cash flow a year over the next five years and we expect it to continue to throw that off. That more than provides the security to address any retirements that we might have to make and bring that debt into a very, very manageable level so we can continue to redeploy that ExGen free cash flow to grow the utilities or return value to shareholders in other ways.

<A - Christopher M. Crane>: So the three times debt-to-EBITDA is a conservative move in some eyes and maybe non-conservative in others. But it gives us margin to what is our down rate threshold, which is our FFO to debt. We have a five-year view and we can go further out on that so we can anticipate that degradation and take action that potentially which we do not see the likelihood of it now, that you would bring that debt-to-EBITDA ratio down further to control a decline. But we have a view far enough out that we can do it. I don't think it would be prudent in order to be overly conservative to go more than three times. Use of the balance sheet at this low interest rate environment is a good thing. We just want to size it that we can ride the commodity cycle and not be stressed and allow us to access to the capital markets while providing good cash flows to make investments on the other side.

<A - Jonathan W. Thayer>: And I think just to think about the broader, if you think about that dividend slide, and how much on a theoretical basis of the dividend is being covered by the utilities, we don't – as we grow the utility EPS, we don't necessarily need or were increasingly less reliant on those GenCo cash flows to fund that utility growth.

<A - Dan L. Eggers>: Go to Andy.

<A - Christopher M. Crane>: He's been waving his arm out there. He's going to rush to the stage.

<A - Dan L. Eggers>: [indiscernible] (3:14:50) morning.

<Q - Andrew Levi>: I'm in good shape, it's all right. It's Andy Levi from Avon Capital. I thought you guys gave a really good presentation, actually very, kind of, concise and it's a very simple story. And it's actually interesting value proportion, stock seems cheap. The one question I have is that you look at your utility guidance as you go out several years and obviously very robust growth. But I was just curious, with all the mechanisms that you have for quick recovery, what gets you to the top [indiscernible] (3:15:31) of those ranges and why are the ranges so wide on such a – on our earnings per share of such a low earnings base...

<A - Christopher M. Crane>: [indiscernible] (3:15:40).

<A - Jonathan W. Thayer>: So a couple things and you saw this at BGE. We had – we build into our plans a certain amount or a certain assumption of what we'll spend on storm recovery. The absence of storms can yield a significant positive. The storms that are more significant than expected obviously can lead to the downside of that. We have, in our rate filings, an expectation of what we're going to achieve and build strong cases to achieve that, but commissions are going to have their say and they're going to give us some percentage of our ask – and that can gravitate from year to year. But I think what we're hoping to show, given the preponderance of what's recovered in formulary tracker mechanisms and what we're trying to shift the remainder of our investment program to more of those types of programs that we are trying to limit the volatility and reduce the volatility of those rate case outcomes and ideally demonstrate the regulatory success we're having across the jurisdictions in a way that yields a premium multiple utility.

<Q - Andrew Levi>: What gets you to the top end? And then, I guess for Chris, if you kind of look at, let's say, one of your peers that say – Jim Robo from NextEra, he always kind of likes to say you'd be disappointed if they didn't get to the top end of their ranges. So maybe just focused on the utility, maybe you can kind of talk about to the mid to the top end of your range. And I guess would you be disappointed and is it hard to get, is it hard to get to that top end of that range?

<A - Christopher M. Crane>: You think Denis is an asshole? I taught that range, but he's the nice guy. But, yeah, would be significantly. We've put the hedge, we put the hedge on the band to get the execution out there. I am [audio gap] (3:17:37) on executing on the PHI rate cases, the recovery and the operational improvement. We have learned how to do this and how to go about it. We have proven how to do it and how to go about it. We have a team, David is leading that team. We have put very accomplished individuals into PHI, which will help expedite what we think that recovery period is at PHI versus a year longer than it took us at BGE.

And so, yeah, I'll be disappointed; and yes, there is levers to pull and yes, there is productivity to drive and cost to cut out to bring out. But we do have sight to the capability to get towards the top of that range. It's holding ourselves accountable, it's executing, it's communicating, it's driving the operational improvements and hopefully we've demonstrated for you today that we've got the oversight and the capabilities within the team to do that. We're already seeing the improvement. We're already having some constructive dialogue around rate cases. We're going to continue to do that.

The one thing that we have learned is communications with the regulator on the long view, letting them know where things are going, getting out with the stakeholders if it's the mayors, if it's the governors, if it's the state legislators, never surprise them. Show them what is coming in these rate cases. But the other thing that we don't talk enough about and we have to put in more, we are the economic engine for the communities that we serve. If you look at what BGE showed you on that gas line replacement, that's creating jobs. There's training programs for intercity residents that are going to be trained on how to put those gas lines and gas meters in, letting the legislators know that in all states, we've done a very good job in Illinois showing the economic impact in gaining the support for the infrastructure build-out, that's the same machine we have to build up in the PHI zones and improve on greatly in the BGE zone. And so, we get better buy-in, better stakeholder agreement on the investments that are being made.

<A - Jonathan W. Thayer>: Chris, if I can just – and I think it was [ph] Mora (3:20:19), you asked a question earlier, how is managements incented. In our long-term incentive plan, starting in 2017, there are three metrics that gets measured. It's earned ROE at the utilities, it's EPS growth at the utilities, and it's FFO to debt for the holding company's balance sheet. And so, I think, Andy, you'll agree that management's incentives are aligned with steering towards the top end of that range.

<A - Dan L. Eggers>: Okay, Greg.

<Q - Greg Gordon>: Hi, just to clarify from the question you asked earlier. So, when you look at the utility guidance through 2020, that nets all the parent expense against it. And that's almost all debt, cost of debt, or is there a small component of unallocated cost?

<A - Christopher M. Crane>: It's almost exclusively debt.

<Q - Greg Gordon>: Great. So, to the extent that you do drive to three times debt-to-EBITDA at ExGen, by modeling it myself, I should assume that those incremental dollars for debt reduction are then potentially targeted towards reducing the parent debt. Is that fair?

<A - Christopher M. Crane>: Yes.

<Q - Greg Gordon>: Okay. And if I'm, so if I'm modeling this thing out of your deck, I'm not missing anything. I know this is sort of a follow-up on Steve's question. So, if I model the utility the way you've articulated it and if I go through the back of the deck and cobble together my ExGen model based on the disclosures you've given me, I've got the whole company, I'm not missing any of the financial, anything financially that I should be looking at.

<A - Christopher M. Crane>: I think the important element is we have the $8.2 billion of free cash flow coming off the GenCo with the ZEC, that's an incremental $750 million. So you have $9 billion of free cash flow. We haven't modeled in doing anything with that $750 million. With the addition of FitzPatrick, obviously that's cash flow and earnings accretive as well. So, there's upside that isn't necessarily modeled into these numbers, but we give you the means of making our own assumptions.

<Q - Greg Gordon>: Great. Thank you.

<A - Dan L. Eggers>: [indiscernible] (3:22:15).

<Q>: Hi. So, to what extent is Exelon a organic growth story beyond 2019, 2020 going into the 2020s or now that you've finished the PHI story and acquisition, what's your view of M&A going forward?

<A - Christopher M. Crane>: Yeah. We are targeting prudent investments beyond 2020 to continue to improve the resiliency, reliability and efficiency of the system. We're targeting around the goal is to see if we can keep that around 5%. The 7% to 9% is pretty high on the range if you look at the comps, but we think a good growth range would be around 5% and – but it's going to be efficient capital put to use, the consumers got to benefit from that. And we have the ideas on where we can go on some of the things that Anne talked about as we continue to embrace technology and innovation and what the customer is looking for would give us the opportunities adjusting the regulatory model to go away from the volumetric and get support for that is going to be constructive as we go forward.

The – so I think we have a very near-term high power growth story, but we have a sustainable gross story after that. M&A has dug us out of where we would be is Exelon alone. From the last four years, we would be much more damaged goods today if we did not or would be damaged good today if we did not consummate the merger with Constellation.

The ability to put the load to gen match with that Constellation platform, had some clean-up work to do around how they operated. And I think we're operating very efficiently now. I think we've got the right compensation strategies in place. We've got the right oversight, if you want to say, on the operations. So, we feel good about what's happened with Constellation. We feel really good by bringing BGE into the family and making the improvements that we've been able to do that have -were not capable of before. PHI changed the story. It was tough work. A lot of people in the room worked very hard for two years to get that done. It's transformed us to be able to have a very strong organic story across all the utilities.

Not really looking to jump back into the M&A anytime soon. We have a lot on our plate and we can create value with what we have on our plate. Hopefully today, we demonstrated what I have is confidence in this team to execute. And I don't want to stretch them right now any more with any big deals; they've got an organic story, they've got good balance sheets to manage and execute on.

<A - Dan L. Eggers>: Ali.

<Q - Ali Agha>: Hey Chris, when you look at your valuation on a PE multiple and you compare it to the pure regulated utilities, there's a very wide gap there. So just curious what is your aspiration? Do you think you ultimately should be trading there and does this plan get you there and if the valuation expansion does not happen, are you willing to think outside the box and maybe try some other stuff or is this the 2020 plan and the execution of that is really what the focus?

<A - Christopher M. Crane>: Yeah. Of course, we want to be recognized with a better multiple. We trade at a discount. The hybrid has looked – I think been looked at as not the optimum versus a pure-play regulated. What we're trying to demonstrate here is we have the best hybrid. We have a cash flow machine that's supporting a significant investment without going to the equity markets while continuing to focus on a dividend. So we think it should be expanded.

I will tell you that Dan is here because we did a very poor job communicating in the past what we were doing. As you can hear us talk today, we're very operationally and execution-oriented. We have not done the right job telling the story. What we're telling you today is what we were working on before. It's why we went after PHI. But what we have

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01705

to do as a team is be more sensitive to your questions, your concerns. We need to be explaining the story in a much clearer fashion and continuing to prove through execution that we're getting there. Some of the things that we have been doing or said we're going to do has taken a little bit longer.

Four years ago, we came together as the new Exelon, we went through a tough period. We have continued to evaluate this hybrid model and we've continued to figure out how do we optimize our capital allocation policies or execution that's going to create the value. We've taken a dip in value over the last four years, we're climbing back out now and we think we're climbing back out on a strong platform. We think we have – can show that we have value growth. And what we're doing with this platform that we've built and now we have to execute on it. So, on a regular basis, I asked the question, are you sure these two should be bolted together? I actually had them do a study, a very detailed study, we brought in external folks a while back.

And my opinion was that I think it's going to be better apart. And – but I'll let the team independently – Bill and Jack led the team and they independently looked at it and they brought all the stakeholders together and it is value disruptive at this point to break up to – because, one, you get, might get the expansion on the regulatory side, the EPS expansion there. But the dividend that you are expecting would not be able to be sustained as [ph] you're seeing to do (3:29:11) with the capital investment without equity issuance. And that equity issuance would have the dilutive effect that can't be overtaken by the multiple expansion.

On the other side of the business, Constellation's efficiency to market would be greatly hampered. There are counterparties that they could not transact with or there's counterparties that would be much more expensive for them to transact at.

So, we would be taking this $8 billion free cash flow machine that's helping us build this platform on the regulated side that's creating that earnings accretion and it would hamper both. So when we looked at it together and they came in, now you got to show me this again, I want to go through very number. But it really – this is the best model and it's the best model from here to 2020. I would say, you constantly have to reassess that to make sure you're unlocking the best approach to creating the long-term value. From here to 2020, the cash flow that the Genco's throwing up as they optimize, it's not a dying business, it's a sustaining business and it's allowing us to grow without any dilution on the equity.

So it's a good question, it's something that the board asks me, I ask the team. And it is something we'll continue to evaluate; but I think we got the right mix right now. I think it's the way the team is firing and operating. The Genco, as I said and under Ken and Mike Pacilio's leadership, is doing great performance in cost and in operations. That differentiates us from others; the cash flow coming off. Can't it repeat that enough and then the Utilities execution on the efficient spend of capital and the proper return on the rate case is – says stay together at least for the next five years as we build this model up.

<Q - Ali Agha>: One follow-up, unrelated. Given the New York ZECs coming through, what does that do from your perspective to the EDF put option and do you think that is now more likely to come back on the table given the profitability change over there?

<A - Christopher M. Crane>: We have not heard that from EDF. Bill and I have been in contact to talk to their CEO and their new management in Paris and here in the States. They like our operations, they like our arrangement, they really like the ZEC and the value that's created and they want to try to learn and see if that can be something that it can repeat in Europe. The put process is fairly well defined. It's the value of the assets in the marketplace. And if it is put, it would be put at a price that we would be compensated for in earnings and free cash flow. So, we haven't heard from them and their last comment was we're not doing anything. And we'll continue to be in dialogue with them. Their stuff in the UK as, I think, everybody has read, has been slowed down with the change in the administration. And so, not sure what their cash needs are going to be.

<A - Dan L. Eggers>: I think that we're over our time, we're trying – we're probably over, so let's – we'll catch [ph] after Paul has – (3:33:07), okay, we've run long. So, Chris, I think you had a couple closing remarks and then we'll let you free.

Christopher M. Crane

Yeah. I don't wear a watch so I never knew when we're over time. Now, I think I've said lot of it and I don't want to be overly repetitive. But we have set a vision and we're executing on that vision. I feel really strongly that the team that we presented here in front of you today is the team that can execute. I do realize the skepticism in some of your questions and some of your facial expressions when we talked about the PHI rate case recovery. We've proven we can do that over a couple rate cases at BGE. It takes hard work, it takes customer satisfaction and it takes great communication. So, we do feel that that is achievable and we're going to continue to execute on it.

We had questions about – well, I thought maybe you should be spending more. We're spending three times depreciation right now on capital. That's a pretty good benchmark if you compare us to the others and we want to spend that capital efficiently. As I said, it has got to be to the benefit of the consumer. There is not a model that says you have the license because you have the franchise rights to just throw capital in and put it on the back of the consumer. Everything we do has to be focused on consumer benefit. So, I think we have the right balance on that right now, going forward, and we'll be able to prove that. We do believe that we are more valuable than the market reflects for us today.

We do take part of that on ourselves because we have not communicated properly completely. We have stayed more to our knitting than doing events like this and explaining in detail and getting you to know the team more. So, from here, I think we've got a good baseline on where we're going. You can see what we think over the next five years and then you can hold us accountable to the execution and we'll keep you up-to-date.

As I've said, some of the things that we said we're going to do took a little bit longer. But the team never gave up. PHI was a real slog. We went through New Jersey very quickly. Delaware was a good process to go through. Maryland was a good process to go through. We underestimated what we needed to do in Washington and we caused the delay in the regulatory process there. We recovered from that; we've closed on that; we're building that into the operations into the portfolio now with the PHI.

So the nuclear story, we have been – Bill, Kathleen, Joe Dominguez's team have been working very hard. We said we were going to do something to get these plants compensated or we shut them down. New York, good story, great story New York, story yet to unfold in if we can prevent anything in Illinois, but we're having to take the steps and that creates the value and the accretion.

So, I really do think that as I said, we've got the right team, the right strategy, the right approach to create value instead of having these year-after-year decreases in EPS that we start to see the year-over-year increases. And we can also really focus on how we manage the dividend. So I thank everybody for their time and questions and engagement. And from here it's just us go back to executing and showing you what we have. So thank you very much.

MANAGEMENT DISCUSSION SECTION

Operator

Good morning and welcome to the Exelon Corporation's Q1 2016 Earnings Conference Call. My name is Prasanthi and I'll be facilitating the audio portion of today's – and active broadcast. All lines have been placed on mute to prevent any background noise. For those of you on this stream, please take note of the options available in your event console.

At this time, I would like to turn the show over to Dan Eggers, Senior Vice President of Investors Relations.

Dan L. Eggers

Thank you, Prasanthi. Good morning, everyone, and thank you for joining our first quarter 2016 earnings conference call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer; and Jack Thayer, Exelon's Chief Financial Officer. They are joined by other members of Exelon's senior management team who will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, both of which can be found in the Investor Relations section of the Exelon's website. The earnings release and other matters which we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material, comments made during this call, and our Risk Factors section in the earnings release, and the 10-Q, which we expect to file on May 10. Please refer to today's 8-K, the 10-Q, and Exelon's other filings for a discussion of factors that may cause results to differ from management's projections, forecasts and expectations.

Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for a reconciliation between the non-GAAP measures to the nearest equivalent GAAP measures. We've scheduled 45 minutes for today's call.

I'll now turn the call over to Chris Crane, Exelon's CEO.

Bloomberg Transcript

Christopher M. Crane

Good morning. Thanks for joining us this morning. Once again we had a great quarter financially, where we closed near the upper end of the range even with the milder weather. And operationally, our utilities and plants continue to operate at high levels.

The big news for the quarter is we closed the Pepco Holdings transaction in March. We are excited to have Pepco utilities as part of the Exelon family. We know this has been a long journey and it took much longer than any of us anticipated, but we appreciate the patience of our investors as we pursued the merger. Our employees who worked tirelessly from the inception to the completion of the deal and the many stakeholders who've supported was critical to getting the deal done.

PHI is an important piece of our strategy to become a more regulated company with more stable earnings streams. While we are still in the early stages of integrating PHI, PHI's earnings outlook is consistent, if not better, than what we showed you at EEI. It brings meaningful benefits to our customers, communities in Delaware, District of Columbia, Maryland, New Jersey, including bill credits and reliability investments. More than $500 million in total commitments have been made and will be achieved due to this merger.

We're now focused on integrating Pepco into Exelon. We will bring our management model and our best practices to improve the experience of our customers. The transaction confirms Exelon's role as a leader in the industry. We serve 10 million customers, more than any other utility company. We will spend nearly $23 billion in capital across our utilities and generating business over the next three years, which is the second-highest among our peers. We are the largest pure T&D by rate base and within the top five when including rate base generation.

We are the second-largest generator of electricity in the country, the largest competitor by a factor of nearly two, while producing power at the lowest carbon intensity of any large generator. We are the leader in the retail electric provider in the country serving 139 terawatts. The culture of the industry leadership is found throughout our organization, positioning us very well for the future.

Switching to operational performance. Our first quarter operating performance was strong and we're on track for a strong year. At our legacy utilities, our SAIFI and CAIDI are on track to meet reliability targets; we are in top quartile in both. At the GenCo, our nuclear plants ran at a capacity factor of 95.8%, our solar and wind assets outperformed their energy capture targets.

Switching to Illinois in the nuclear plants. While there is much to celebrate this quarter, we also need to make tough decisions on the future of Clinton and Quad Cities nuclear stations in Illinois. The board has given me authority to go forward with early retirements for Clinton and Quad Cities plants, if for Clinton adequate legislation is not passed during the spring legislative session that is scheduled to end May 31, and if for Quad Cities adequate legislation is not passed and the plant does not clear the upcoming PJM auction. Otherwise, we plan to retire Clinton on June 1, 2017, and Quad Cities on June 1, 2018. This is consistent with planned refueling outage and capacity market obligations.

We committed to our employees, our shareholders and the communities to try to find a path to profitability for our distressed assets. This is because these plants are vital to the communities that they are located in and provide economic and environmental value to the state. The state's own analysis showed that closing Clinton and Quad Cities would result in $1.2 billion in lost economic activity and 4,200 jobs lost, and a significant reduction of supply of reliable electricity for Illinois residents and businesses.

We worked hard over the last few years to find a path to sustainable profitability. To bring $120 million in strategic capital to these plants, we've pursued legislation and regulatory market changes. We've been successful in some areas: the PJM market reforms that were put into place last year, the cost reductions that we've achieved, and the large number of stakeholders who have worked so hard to help in this fight. We have strong allies in our cause, our employees, our plant communities, the bill sponsors and co-sponsors, our partners in labor, and our vendors among others. I want to thank them all very much for their support and regret the impact on this decision that we have on them.

final
Bloomberg Transcript
Bloomberg

But for reasons outside of our control, we have not seen progress in Illinois policy reforms, also the Supreme Court stay creates uncertainty regarding the EPA's Clean Power Plan. Power prices have fallen to a 15-year low in PJM, causing the economics of Clinton and Quad Cities to further deteriorate. These plants have lost $800 million in cash flow from 2009 to 2015. Just to be clear, we are not covering our operating costs or our risks, let alone receiving a return on our invested capital. We've done all we can up to this point and we continue to work through the spring legislative session to enact the much needed reforms. However, without adequate legislation we no longer see a path to profitability and no longer can sustain the ongoing losses.

On a more positive note, we continue to see a pathway to reform in New York where Governor Cuomo, the legislature, the Public Service Commission have recognized a need to preserve the state's nuclear plants. New York is quickly moving forward to implement a clean energy standard that will allow us to continue to operate our challenged Ginna and Nine Mile plants.

I'll turn the call over to Jack to discuss the first quarter results further.

Jonathan W. Thayer

Thank you, Chris, and good morning, everyone. My remarks today will cover our first quarter results, 2016 guidance, update our gross margin disclosures and provide an update on developments since Q4.

I'll start on slide eight. As Chris stated, we had a strong quarter financially and operationally across the company. For the first quarter we delivered adjusted non-GAAP operating earnings of $0.68 per share, near the top of our guidance range of $0.60 per share to $0.70 per share. This compares to $0.71 per share for the first quarter of 2015. Exelon's utilities delivered a combined $0.37 per share. During the quarter, we saw unfavorable mild weather at PECO and ComEd versus planned, which was partially offset by lower bad debt expense at BGE. There are only eight days of PHI included in our results, which had a minimal impact on the quarter.

Generation had a great quarter, earning $0.34 per share. We had strong performance from our nuclear assets with better capacity factors than budgeted. And while weak power prices and lower volatility were a drag, our Constellation team delivered strong results. Our generation to load matching strategy continues to provide value and we benefited from a lower cost to serve our customers.

For the second quarter, we are providing guidance of $0.50 to $0.60 per share. This compares to our realized earnings of $0.59 per share for the second quarter of 2015. The appendix contains details on our first quarter financial results compared to the first quarter of 2015 results by operating company on slide 16 and 17.

Turning to slide nine, we are affirming our full-year guidance range of $2.40 to $2.70 per share which now includes the contribution from PHI and assumes an average of 926 million shares outstanding for 2016. This should help calibrate your segment models.

On slide 10, we are still working through a comprehensive financial plan now that we have closed the PHI deal, but want to address the pieces that we can today. We are reaffirming our earnings growth at our legacy utilities of 7% to 9% per year from 2015 to 2018. On PHI, we are still working through the plan, but see the contribution equal to or better than what we showed you at EEI and consistent with sustaining our 7% to 9% utility growth target.

On slide 11, to meet these growth targets we are going to be busy on the regulatory front. The PHI utilities have been out of rate cases for at least two years. We are continuing to invest $800 million per year to improve reliability and customer service leading to the low-earned ROEs that we show on slide 30 in the appendix. However, by the third quarter, we plan to file distribution cases in all of PHI's jurisdictions and expect decisions in all cases by the middle of next year providing needed revenue release.

Atlantic City Electric and Pepco Maryland have already filed their cases. ACE filed an electric distribution base rate case on March 22 with the New Jersey Board of Public Utilities requesting an $84 million revenue increase and a 10.6% return on equity. It also included PowerAhead, a five-year $176 million grid resiliency plan.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01710

On April 19, Pepco requested a rate increase of $127 million with the Maryland's Public Service Commission. The rate cases include smart meter recovery and a two-year $32 million grid resiliency plan. In addition to reducing the number and length of outages, Pepco's five-year smart grid program is generating nearly $4 in customer benefits for every $1 invested.

In addition, ComEd made its annual formula rate filing with the Illinois Commerce Commission. ComEd requested a revenue requirement increase of $138 million reflecting approximately $2.4 billion in capital investments made in 2015. Those investments, which included $663 million for smart grid-related work has helped strengthen and modernize the electric system, resulting in record power reliability and customer satisfaction, operational savings, and new ways to save on electric bills for ComEd customers. More details on the rate cases can be found on slide 33 – slides 34 through 37 in the appendix.

Slide 12 provides our first quarter gross margin update. In 2016 total gross margin is flat to our last disclosure. During the quarter we executed on $200 million of power new business and $100 million of non-power new business. We are highly hedged for the rest of this year and well-balanced on our generation to load matching strategy. Total gross margin decreased in the first quarter by $150 million in 2017 and $200 million in 2018, as PJM power prices moved approximately $1.60 to $2.10 lower since the beginning of the year. We ended the quarter approximately 5% to 8% behind ratable in both of these years when considering cross-commodity hedges with a majority of modeling concentrated in the Midwest to align to our fundamental view of spot market upside at NiHub.

Power prices have risen since the start of the second quarter and we are timing our hedging activity to lock in the value of the recent price increases while remaining well positioned to capture our fundamental view.

On slide 13, I wanted to give you a quick update on some tax implications that are associated with the completion of the PHI merger. With the inclusion of PHI, we expect to realize $700 million to $850 million of additional cash from 2017 to 2019 related to legacy NOLs and the impacts of bonus depreciation. However, now, as a very modest cash tax payer for 2018, we have less ability to take the domestic production activities deduction, or DPAD, in 2018 which effectively increases our overall consolidated tax rate by as much as 200 basis points or the equivalent of $0.06 to $0.08 per share in 2018. Although this is a one-time negative impact to 2018 ExGen earnings, it comes with significant positive cash flow and we expect to return to normalized tax rates in 2019.

With the variability of interest rates, I'd like to remind you that ComEd's allowed ROE is based on a 30-year treasury rate plus 580 basis points, and thus sensitive to moves in this rate. Every 25 basis point move in treasury rates results in a $0.01 move in EPS.

Before turning the call over to Chris, I wanted to raise a few scheduling points. We'll be hosting an Analyst Day on August 10 in Philadelphia and we'll get details around shortly. Therefore, we will not be having a second quarter earnings call and will release earnings before Analyst Day.

I will now turn the call back to Chris for his closing remarks.

Christopher M. Crane

Thanks, Jack. Just closing out on slide 14, the capital allocation philosophy. I want to cover that before we turn it over to Q&A, and take a moment to reiterate our capital allocation philosophy. Balance sheet strength remains a top financial priority. We have a strong strategy to deliver stable growth, sustainable earnings, and an attractive dividend to our shareholders. We will be growing that dividend at 2.5% each year for the next three years, starting with the dividend payable in June. From a capital deployment perspective, we will continue to harvest free cash flow from the generation business to invest primarily in our utilities to benefit our customers, invest in long-term contracted assets which meet our return requirements, and return capital to our shareholders. This is the right strategy for our markets and our assets.

Thanks and we'll open the line up now for your questions.

Q&A

Operator

[Operator Instructions] And we do have audio question from [ph] Stephen Byrd (17:13).

<A - Christopher M. Crane>: Hey, [ph] Steve (17:15).

<Q>: Start on the Illinois legislation. And wonder if you could speak to the breadth of support that you have for the proposal. And then also if you could just go through the mechanics of if it was implemented, how it'd work? So we can start to think about modeling the impacts.

<A - Christopher M. Crane>: Joe, you want to cover that?

<A - Joseph Nigro>: Sure. [ph] Steve (17:36), the support is the same support we had for the original bill, labor, the host communities. And in addition, we now have the support of some groups that represent climate scientists and others that are concerned with greenhouse gas emissions.

In terms of how the program would work, let me just start with a policy analogy that I think all of you are familiar with. Existing state RPS programs for renewables provide compensation of qualified resources through renewable energy credits, RECs. The REC value is the difference between available wholesale revenues and the costs needed to keep the existing renewables in operation and get new renewables built. All this is done in order to get the benefit of greenhouse gas reductions while protecting customers. If wholesale revenues go up, the needed REC payment goes down. We see that happening every day in REC spot markets.

The ZEC program is designed the same way. It's a payment for the state value of zero emission credits from nuclear plants which represents the difference between the needed revenues and the costs of operating the plants. In the case of the New York and Illinois programs, the way it would work is that experts at the Commissions will determine on a prospective basis the cost of operating the plants plus risks, less available market revenues. And where there is a delta between that, in other words where the costs and risks are not covered by available market revenues, the ZEC program will kick in and provide compensation for greenhouse gas avoidance.

The program is not a PPA or a contractor difference. If revenues or costs are different, there is no true-up. And – so, [ph] Steve (19:26), I think if you have additional questions, perhaps after the call we could work with Dan and Emily to set up a meeting, go through more programmatic details.

<Q>: That's great. That's a great start. Thank you. And then just shifting over to renewables more broadly, could you just speak to your degree of appetite for more acquisitions? It sounds like you'll be a full taxpayer, I believe, in 2019, if I have that correct. But just broadly, what degree of opportunities do you see out there in renewables? Is this an area that you would expect that you'll see further growth in?

<A - Christopher M. Crane>: It is definitely throttled based off of our tax capacity and we are looking at that now. You do get a certain amount of dilution with delaying the benefits of the tax attributes of the project, so we have some projects in the pipeline now and are re-evaluating others to see if they're – they would be viable to go forward in the near-term.

<Q>: Understood. Thank you very much.

Operator

And your next question comes from the line of Steve Fleishman.

<A - Christopher M. Crane>: Hi, Steve.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01712

<Q - Steve Fleishman>: Hi. Good morning. A couple of – first, a logistical question. The Ginna $101 million that you mentioned that you're getting, is that – is kind of a trued-up amount including past years, is that in your guidance for this year? Or is that kind of like a one-time item or how are you treating that?

<A - Jonathan W. Thayer>: Steve, that's in our guidance.

<Q - Steve Fleishman>: Okay. Including any back from prior periods?

<A - Jonathan W. Thayer>: That's correct.

<Q - Steve Fleishman>: Okay. And then a question just – is there any way you can give us some sense on the cash flow or losses from Clinton and Quad Cities, let's say, in your guidance for last year or something of that sort?

<A - Jonathan W. Thayer>: So we've stated that it's greater than $800 million since 2009. There are some variables in there on cash savings going forward or cash losses going forward, power prices coming down, cost cutting initiatives; and we do have an element of overheads that would not be as controllable. So you would see the run rate to be similar to what has happened in the past.

<Q - Steve Fleishman>: Okay.

<A - Christopher M. Crane>: Steve, you know, on this point – so for 2017, the cost exceeded available market revenues or at current [ph] marks (22:12) by $140 million. But I think importantly and Joe raised this point, it's not the whole picture. The closure also avoids millions of dollars in basis and unit-contingent risks that we face by operating the plants. And stated differently, in order to reverse course we need Illinois as well as New York to provide a structure that allows us to cover our cash costs plus normal operating risks in order to reverse this course.

<Q - Steve Fleishman>: Okay. And $140 million that's kind of cash flow? Does that include like CapEx, or is that just kind of cash flow without CapEx?

<A - Christopher M. Crane>: That's cash flow.

<Q - Steve Fleishman>: Okay. One last question just on the – in the event legislation doesn't happen and you need to shut the plants, what – is there any cost related to that?

<A - Jonathan W. Thayer>: As you saw in the K, and we reiterate in the Q, there is some unfunded liabilities on the decommissioning trust. Those numbers are in there at full 100% ownership of the plants. And so the way that we would have to handle that is – you know, you can start out with parent guarantees, but you have to have it funded over a 10-year period, I think 60% by the end of the fifth year, and then the rest by the end of the 10 years.

<Q - Steve Fleishman>: Okay. Those numbers in the K are still good then, so that we just can use those?

<A - Jonathan W. Thayer>: They're updated in the Q.

<A - Christopher M. Crane>: That'll be coming Tuesday.

<Q - Steve Fleishman>: Okay. Thank you.

Operator

And your next question comes from the line of Jonathan Arnold.

<Q - Jonathan Philip Arnold>: Hey, good morning, guys.

<A - Christopher M. Crane>: Good Morning.

<A - Jonathan W. Thayer>: Good Morning.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01713

<Q - Jonathan Philip Arnold>: Just to clarify one thing on the current proposal that I think was emerged last night around the legislation. So originally this applies to all nuclear plants in the state, but is it correct that this would just be Clinton and Quad? And can you just explain how that works in terms of the discussion of the ZEC structure?

<A - Christopher M. Crane>: Joe?

<A - Joseph Nigro>: Sure. Jonathan, all plants could apply, but quite obviously the only plants that would receive revenue under this program would be those where the costs exceed the revenues. And so there is – it's a 20 terawatt-hour cap which has enough room in it to accommodate Clinton and Quad Cities. And our expectation is that Exelon would seek to have those two plants participate. The other plants would not participate.

<Q - Jonathan Philip Arnold>: Okay. And that's sort of nuanced in how the legislation's worded effectively?

<A - Joseph Nigro>: That's correct.

<Q - Jonathan Philip Arnold>: Okay.

<A - Joseph Nigro>: It's the same offer to you, Jonathan; if you'd like, after the call, we could sit down and work through some of the details.

<Q - Jonathan Philip Arnold>: Okay. That'll be great. And is there any...

<A - Christopher M. Crane>: And, Jonathan, just to interject just to make the clear point, they would provide the opportunity to be compensated for cost plus risk.

<Q - Jonathan Philip Arnold>: Okay. That was one thing. The second thing, in your fourth quarter deck, you have this forecast around leverage ratios and the like going out through 2018, which, I believe, was assuming that Pepco would not happen. This was of the ExGen. Can you give us a sense of how that progression would look if you kind of market to the – with Pepco scenario?

<A - Jonathan W. Thayer>: Sure. So, Jonathan, we still anticipate reducing leverage of ExGen by $3 billion over the five-year planning period, albeit this is not to the extend that we would have under the standalone scenario, because ExGen's free cash flow is now being deployed to help fund PHI's capital spending program. And we'll provide more detail on the puts and takes of that at the Analyst Day in August.

<Q - Jonathan Philip Arnold>: So $3 billion is kind of the new ExGen delevering number?

<A - Jonathan W. Thayer>: That's right. That's over the next five years, we have a large maturity. And I believe it's 2019, that we would look to retire at maturity.

<Q - Jonathan Philip Arnold>: Okay. So that's over five years?

<A - Jonathan W. Thayer>: That's correct.

<Q - Jonathan Philip Arnold>: And then the 2.3 ExGen debt-to-EBITDA that you were looking at for 2018, roughly what does that look like now?

<A - Jonathan W. Thayer>: It, over the five-year period, would go to right around three times.

<Q - Jonathan Philip Arnold>: So that's again over five years, rather than three years?

<A - Jonathan W. Thayer>: That's correct.

<Q - Jonathan Philip Arnold>: Okay, great. Thank you. And then I guess you mentioned in the prepared remarks the prices have rebounded...

<A - Jonathan W. Thayer>: So, Jonathan – sorry, just let me correct, 2.7 times at the end of the five-year period.

<Q - Jonathan Philip Arnold>: So whereas you have 2.3 times in 2018, it's now 2.7 times after five years?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01714

<A - Jonathan W. Thayer>: Yes.

<Q - Jonathan Philip Arnold>: Okay, great. Thank you. And then you mentioned that prices have rebounded. So can you give us a rough sense of how the kind of gross margin mark would look if you use more like today's prices?

<A - Joseph Nigro>: Yeah. Jonathan, good morning. It's Joe Nigro. I think if you look at our hedge disclosure at the end of the quarter and then factor in the changes since the end of March, you would see all of that drop in 2017 and 2018 being recovered. We've seen an appreciable move, as you know, in prices since the end of March. We're actually higher in NiHub than we were at the end of the year. We're higher at West Hub than we were at the end of the year, so we would have recovered all that drop and probably adding to it. We calculated that a couple of days ago, but the market has continued to move higher, so we probably have seen it actually go over where it ended the quarter.

<Q - Jonathan Philip Arnold>: Great. Okay. That's it. Thank you very much, guys.

<A - Christopher M. Crane>: Thanks.

Operator

And your next question comes from the line of Julien Dumoulin-Smith.

<Q - Julien Dumoulin-Smith>: Yeah. Hi. Good morning.

<A - Christopher M. Crane>: Good morning.

<Q - Julien Dumoulin-Smith>: So perhaps to follow up on the same theme, can you elaborate a little bit on the balance of the nuclear portfolio that is ex-Clinton, ex-Quad? How you think about their cash flow profile? And if you don't get this legislation, what the prospects are for further rationalization? I don't mean to jump the gun too much here, but just talking about the future a little bit more?

<A - Christopher M. Crane>: So there's varying cash flows by assets depending on their location. They are positive at this point. If you look at the other units that are more challenged, you're looking at Ginna and Nine Mile. One – we know about Oyster Creek and it's coming up in 2019, the other one that has a real focus on it right now is Three Mile Island.

<Q - Julien Dumoulin-Smith>: Got it. And specific to Illinois, is there any commentary around – so let's say we don't get it in 2016 or 2017, does that trigger another set of reviews? Again, not to push it too much.

<A - Christopher M. Crane>: At this point we'll have to watch the capacity auction clearing in the out years. It's tight on energy at some of the assets, but they are positive.

<Q - Julien Dumoulin-Smith>: Got it. Okay, great. And then turning back to the utilities real quickly, can you comment, or I'm curious, if you will, what the earned ROEs embedded at Pepco for 2016 – just what's the baseline on the Pepco side as far as you see it post the close?

<A - Jonathan W. Thayer>: Julien, in terms of – I think we included it on slide, I believe it's 30, the earned for 2015. Obviously, while we're in the pendency period during the rate cases that – obviously, there's regulatory lag, so we're going to see that decline, but we'll have a much deeper dive in the PHI as part of the August 10 meeting. You can see on slide 29 the rate base statistics and I think can work through some assumptions on regulatory lag using that information.

<Q - Julien Dumoulin-Smith>: Got it. And perhaps not to jump the gun too much on the Analyst Day, but what is the thought process on the baseline for a future regulated CAGR?

<A - Jonathan W. Thayer>: I think the thought is the 7% to 9% that we confirmed on the call and PHI is absolutely consistent with that expectation. We, as we mentioned, are seeing improvement relative to what we forecasted or projected at EEI using PHI's internal forecast. And Dennis and team continue to work to identify further opportunities

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01715

around efficiency as well as regulatory policy to work to get those earned and allowed ROEs in line with the success we've experienced within Maryland, Pennsylvania and Illinois.

<Q - Julien Dumoulin-Smith>: Got it. You wouldn't roll it forward though?

<A - Jonathan W. Thayer>: I'm not certain I understand what do you mean roll it forward?

<Q - Julien Dumoulin-Smith>: The 7% to 9%, just roll it forward to CAGR off a 2016 base?

<A - Christopher M. Crane>: We'll address that at the Analyst Day.

<Q - Julien Dumoulin-Smith>: All right. No worries. Thank you.

<A - Christopher M. Crane>: I mean, embedded in there is 7% to 9% through 2018, so just thinking it through, it's in there.

<Q - Julien Dumoulin-Smith>: Got it. Thank you.

Operator

And your next question comes from the line of [ph] Brian Chen (32:25).

<A - Christopher M. Crane>: Hey, [ph] Brian (32:30).

<Q>: Going over to slide 13, the EPS impact that you've laid out in that top table, I just want to verify that that is not including the use of capital from that positive cash flow impact that you've got on the second row right?

<A - Christopher M. Crane>: That's right, [ph] Brian (32:46).

<Q>: Okay. Great. And then I just want to verify that Quad Cities didn't clear in the 2018 and 2019 auction, correct? So the closure of Quad Cities shouldn't have any sort of residual obligation that you have for the 2018, 2019 capacity [ph] through (33:03)?

<A - Christopher M. Crane>: That's correct.

<Q>: Great. Thanks a lot.

Operator

And your next audio question comes from Praful Mehta.

<Q - Praful Mehta>: Hi, guys.

<A - Christopher M. Crane>: Good morning.

<Q - Praful Mehta>: Good morning. So just on the leverage a little bit, just to ensure we understand both at the holding company level and at ExGen. You've kind of talked about the ExGen debt and what you see over the 20 – the five year period. How are you looking at holding company debt given the leverage you've assumed post Pepco transactions? Is there any objective to delever a little bit at the holding company as well?

<A - Jonathan W. Thayer>: So Praful, as you've heard us comment in the past, we do target at 20% FFO to debt on a consolidated basis and that was one of the benefits of adding PHI to the Exelon family. And so we will certainly be looking at our leverage ratios at the GenCo. I think you'll also see us consider to the extend we have available cash at the holding company as well, we just need to see as we get further out what the realized power prices are and what the free cash flow coming off of the GenCo is in those five years.

final
Bloomberg Transcript
Bloomberg

<Q - Praful Mehta>: Got you. And just so if you think about from the sources/uses perspective, the source is primarily out of ExGen coming to fund CapEx at the utilities and then deleveraging both at ExGen and the parent. Is that a fair way to think of it or is there some cash generation coming out of the utilities as well over the next two year, three year period?

<A - Jonathan W. Thayer>: I would say, on a net basis, utilities are consumers of cash. So you're correct. That ExGen cash flow as well as debt raise at the utilities is the primary source for funding the significant CapEx that we see, $25 billion over the next five years at the utilities.

<Q - Praful Mehta>: Got you. Thank you. And then just finally, we saw that the power new business and the to-go business, the EBITDA, or the growth margin of that is going from $250 million in 2016 up to about a $1 billion by 2018. Could you just give us a little bit of context of what's driving that significant ramp-up in that side of the business?

<A - Joseph Nigro>: Yeah. Hi. It's Joe Nigro. That's pretty standard shape that we have. If you go back and look at disclosures over the years, you would expect to see much less new business in the prompt years – in the prompt year, in this case 2016, than you would in the out years, for example, in 2017 and 2018. Embedded in that power new business is things like the execution of our retail business and the margins associated with that. So as we get closer to the swap period more and more of those contracts get layered in, we begin to reduce that bucket of power new business.

I mean, there's other elements of our business that follow that same timing shape, so this isn't unique in the sense of seeing a ramp up between the prompt year to two years forward and we're very comfortable with the numbers that we've put out there.

<Q - Praful Mehta>: Got you. Thank you so much guys.

Operator

[Operator Instructions] And this does conclude today's conference call. You may now disconnect.

Christopher M. Crane

Thank you.

Presentation

Kit Konolige, Senior Utilities Analyst, Bloomberg Intelligence

Good morning. It's Kit Konolige. I'm the U.S. Utilities Analyst at Bloomberg Intelligence. Very glad to have you here and to have Stu Bresler, join us. Stu is the Chief of Markets at the

PJM Interconnection. So, he is going to talk to us about the upcoming PJM auction, which is many of you know is arguably the year's most important event, when it comes to pricing electricity.

So, here we have the speakers myself, Stu.

Here is his bio, you can go into it. Basically, it says that he has been preparing for 20 years for this position. And he is in charge of markets, which includes capacity, real-time, day-ahead, renewables, transmission rights, all the complexities that go into PJM price setting.

Here are a couple of the housekeeping notes that I'll let you take a look at, and we can go into that in more detail later, if you like. A little add for BI, again, I'll let you read this at your convenience. Basically we are the research unit, equity, fixed income, government and other specialized aspects in Bloomberg.

The key topics that I suggested to Stu and that he will speak to as he -- he can and as he should, include supply and demand and the upcoming auction, the impacts, if any of the Ohio PPAs that we are just put in to place, any changes of note for 2016 in the auction parameters. I'm interested in new capacity coming online and what's retiring the Clean Power Plan, certainly is I think an issue for lots of folks as well as the growth curve and -- and the -- and the upcoming challenges.

So, that's enough for me by way of introduction. Let me turn it over to Stu, and I would just mention to everyone, you're able to type in questions as we proceed, and we can put those questions to Stu, as he finishes up his prepared remarks. Stu?

Frederick S. "Stu" Bresler III, Senior Vice President

Well, thank you very much Kit, and good morning to everyone. Kit and company, thank you very much for having me this morning. It certainly is a pleasure to be able to -- to speak to your -- your audience in this kind of a setting. I hope that the -- the discussion is beneficial and informative as we go forward.

So, I'm not going to say anything more about myself. You know, Kit put my -- my bio up and that's what, I guess, kind of speaks for itself. But I do have responsibility for operations of the markets, here at PJM. So, the conduct of the upcoming RPM Base Residual Auction does fall within my area of responsibility.

I thought Kit put -- put together a pretty good list of subjects for this kind of a discussion this morning, certainly -- certainly a list of kind of current events, specifically as it relate to the upcoming auction.

Bloomberg Transcript

So, just diving right into the list, as far as the status of the FERC proceedings, when it comes to the Ohio power purchase agreements. I'm going to assume that folks on the -- on the call and the webcast this morning have a tertiary understanding of what's happened in Ohio. And as a result of the Public Utilities Commission of Ohio approval of the stipulations that were filed by both FirstEnergy and AEP, there are a couple of outstanding dockets at FERC, requesting FERC action specifically in relation to those power purchase agreements.

The first -- the first set of dockets is in -- is in relation to the PPAs themselves, and actually asks FERC to revoke the market-based rate authority exemption for FirstEnergy and AEP specific to the power purchase agreements between their affiliates. Basically, on the basis that the market-based rate exemption was based on the fact that retail competition exists in the State of Ohio, and therefore, customers on a captive to the utilities or their affiliates.

The argument is essentially and I'm not -- I'm not going to argue either way as I just trying to lay out objectively. Here the argument essentially is that because the retail rate riders associated with the power purchase agreements would result in a charge that is non-bypassable. So, it would apply to all retail customers regardless if they take service from the utility or from an alternative supplier that is not choice. And therefore these power purchase agreements should be subject to their view of the FERC. So, that's in a very small nutshell, the essence of the argument and that sort of the first set of dockets, it's outstanding at FERC.

Just to complete the thought, PJM did intervene in that docket, on our filing essentially said that these power purchase agreement should not be able to fall through what, you can characterize as a regulatory gap. They are wholesale power purchase agreement so they do not fall in the jurisdiction of the Ohio Commission and as such, FERC should review them because frankly somebody should. So, I was kind of, you know, the essence of PJM's position in that docket.

The second set of docket that is a -- was a complaint filed by a set of really generation suppliers in PJM, against PJM. That essentially said the minimum offer price rule that is currently in existence in PJM is insufficient.

You know probably these are some explanation. So, for those of you, who have followed PJM for some time, you'll remember that, when New Jersey and Maryland had initiated programs in their states to subsidize new generation development. PJM proposed and FERC approved a minimum offer price rule for new generation, such that if new generation was receiving out-of-market subsidy such as a state program or a state subsidy. And that generation was -- the new generation was subject to a basically an offer price floor and the -- the base offer price floor was the net cost of new entry, unless the resource could demonstrate that its actual costs were less than that.

There are a couple of exceptions. For example, self-supply by entities like Public Power and such is exempt from the minimum offer price rule as long as that entity can demonstrate that it is within a couple of net-short or net-long thresholds. And there is also a competitive entry exemption. So, there is no minimum offer price rule applicable to new generation that is offered purely on a competitive basis with no out-of-market subsidy type payments.

So, that's an existence for new generation, the complaint as per dealt [ph] to the PPAs essentially said, we should expand that to include existing generation. That was essentially a thrust of the complaint.

PJM filed response to that complaint, as did others. And PJM's response essentially was, FERC this is a longer term issue, if you choose to adopt a broader minimum offer price rule on such a short-term, near-term basis without the benefit of thorough debate and consideration by an open stakeholder process, you risk putting in bad rules with unintended consequences.

So, FERC, we would like you to kick this back to the PJM stakeholder process and give us a compliance deadline by which to compact you with rules that are as well thought out as we possibly can within the timeframe given.

However, FERC, we said if you feel the need to do something for this auction, there are a couple of more targeted approaches you can take, such as first of all, acting in that other docket, where you were requested to review the power purchase agreements that would actually be the preferred approach or secondly, you could hypothetically given your relatively broad discretion in responding to a complaint, apply something or some requirements on just these units that have the subject of these power purchase agreement.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01719

We have recognized in our filing the -- the sort of the downfalls of doing that, it could be seen as being discriminatory and that sort of thing. But again, if -- if FERC felt the need to do something for this auction that targeted approach was better than again taking the risk of implementing broader rules on such a -- such a quick timeframe.

So, those two complaints remain outstanding at FERC. FERC has not acted on either one at this point. I have no -- for lack of a better term intelligence to offer as to what FERC's timeframe would be for acting on either one as 206 complaints. I don't believe FERC has a statutory obligation to act within a certain amount of time. And so we like the rest of the industry are basically in a -- in a waiting period at this point.

That's what I have on the -- on the status of the Ohio PPAs from the standpoint of the -- of the FERC process. Like I said, they've already been approved in Ohio and remains to be seen, whether there's any further action taken by any of the opponents of those PPAs in other, you know, judicial avenues, if you will.

So, just moving on very quickly to our other states likely to consider something similar to this. What as, I think, again if you're following the industry, you know, and there is always different flavors to these things. But Exelon has been proposing in Illinois, I guess the best word would be recognition of the environmental benefits of the assets they have there and has been proposing or pushing for Illinois legislation that could act in a similar fashion depending on how it's done. That seems to be stalled in Illinois given the very significant ongoing debates on budget issues in Illinois. But, you know, it's one we are watching closely that state as well. But like I said, as far as I know there hasn't been any progress since -- since like I said it stalled last year, the year before, I think it was last year.

And the other thing I would note is that, back to Ohio Dayton Power and Light has made a filing with the Ohio Commission for a PPA arrangement similar to what the Ohio Commission just approved for AEP and FirstEnergy, and PJM will be continuing to follow that proceeding as well. But that's -- that's everything I know that, that might be going on. I don't have any -- anything else to offer as far as any other states.

Kit, I assume you'd like me to kind of keep going through the list, and then we'll open up to questions at the end. I'm going to take silence as acquiescence, I'm going to keep going. I assume I'm still connected by the way. Alright, having said that, Kit, will be helpful if the -- if somebody could, let me know that I'm still connected. I've been talking for 10 minutes.

Operator

Stu, you are still connected. Stu, this is the customer support, you are still there.

Frederick S. "Stu" Bresler III, Senior Vice President

Okay, great. Thank you very much.

Operator

You are welcome.

Frederick S. "Stu" Bresler III, Senior Vice President

Okay. So, okay, I'll keep going with the -- the upcoming Base Residual Auction and the parameters for this maze auction, which is for the 1920 delivery year. The first thing I would point out is, I41M [ph] extremely pleased that we are executing this maze auction under identical rules, do what we executed in last year's auction.

I have been doing this job for quite a while certainly since RPM was implemented and frankly, I think this is probably the first year, where that's been the case, that we're operating an auction under the identical rules as the previous year.

final
Bloomberg Transcript

So, I41M very pleased to report that.

As for the parameters themselves, the first thing I would point out and I know this, we're going to come back to this later in the agenda as well, is that the load forecast for the -- for the RTO is down for this auction compared to last. It's just over 4,000 megawatts or about 2.6% below the load forecast that utilized in the Base Residual Auction for '18-'19. And that is a function of update to the methodology that we are utilizing on our load forecast model.

In this instance it's primarily the accounting for energy efficiency measures given, what we are seeing in actual loads versus forecasts and the other inputs the load forecast, like economic forecasts and that sort of thing. So, we have updated our methodology to take account of that and we believe it will be as a result more accurate going forward.

So, as a result of the reduction in the load forecast of that 2.6%, the overall reliability requirement for the delivery year is about 3,000 megawatts less than last year about 2.2%. The reliability requirement reduction is not quite as big as the load forecast adjustment, because there was a slight increase in the required reserve margin as a result of an increase in average forced outage rate and that was primarily caused by what we saw during the polar vortex and the significant increased forced outage rate during the cold weather.

We had some relatively high forced outage rate even in the winter of 2015 as well, when we saw some cold weather in February and March of 2015. Things got better this year in 2016 in the winter, frankly, the weather wasn't quite as bad.

That's really the sort of the load and reliability requirement changes. As far as the locational deliverability areas was constrained or potentially constrained areas of PJM that we will model in the auction, they are the same as what we modeled last year. So, you know, MAAC, Eastern MAAC, Southwest MAAC are ones we always have to model. We will keep public service, PS North, the Pepco zone, DPL-South, the ATSI Zone, which is FirstEnergy's transmission zone in Ohio. The Cleveland sub-area of ATSI and then Northern Illinois, the ComEd Zone and then as well as the Baltimore Zone inside Southwest MAAC and the PPL Zone. Again these are all exactly the same locational deliverability areas that we Are modeled in the last two BRAs.

The reliability requirements for each of these models LDAs are lower overall, primarily due to the lower peak load forecasts. The exception is the PPL locational deliverability area, which is Central Eastern Pennsylvania and that reliability requirement for that PPL locational deliverability area is actually increased and that was because of an increase in the winter peak load, and the PPL Zone, I think is now one of the only winter peaking zones left in PJM. That winter peak actually increased. So, that's the only locational deliverability area, where the reliability requirement increased.

And then last but not least, with respect to imports of capacity from outside PJM, there will be no imports able to clear in the auction that did not get a -- an exception from the capacity import limit. And that is because once the exceptions are taken into account, there simply is no simultaneous capacity import capability left. And so the total capacity import limits exceptions totaled just under 5,000 megawatts and no more than that will be able to clear in the auction.

The last point as far as changes and the parameters is with respect to the capacity emergency transfer limit, so those transfer limit into these LDAs. The vast majority stayed within typical year-to-year fluctuations just because of, you know, changes to transmission system configuration and that sort of thing.

The only exception was the PPL again, locational deliverability area that transfer limit increased by 1,630 megawatts and that significant increase was because of a significant transmission upgrade. There has been another West Coast transformer added in parallel with the existing ones, will significantly increase the import capability into that PPL Zone, well that was the only significant change with respect to transfer limits into the modeled locational deliverability areas in the BRA.

That's the high level summary of the changes in the parameters leading up to BRA. As far as new capacity coming into PJM this year compared to last year, we have a net increase in generation capability of about 3,300 megawatts for this upcoming delivery year '16-'17. That is about 4,500 megawatts of new and increased capability coming in, netted against about 1,200 megawatts of generation is going to retire, prior to the delivery year compared to last year.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01721

So, again a net of about 3,300 megawatts increase in generation capability for this upcoming '16-'17 delivery year. That compares to '15-'16, where going in the '15-'16, we actually had a net decrease in generation capability. We had really the significant impacts of the Mercury and Air Toxics Standards hit in April, May of 2015, which resulted and really that was the -- the tipping point for retirement of the significant quantity of coal assets. Now we did have increases in generation capability as well for '15-'16, but retirements outstrip the additions by about between 1,000 and 2000 megawatts for '15-'16. So, we had a net decrease going into this current delivery year. We have again a net increase in generation capability going into the '16-'17 delivery year.

Then moving on to the Clean Power Plan impacts on PJM. We are, as you may be aware, undertaking another analysis on the potential impacts of the Clean Power Plan. We did an impact analysis, when the draft Clean Power Plan was released last year. So, we are updating that analysis on the basis of the finalized Clean Power Plan. We expect to have that analysis out in the June, July timeframe. The analysis really was requested primarily by our state commission. In the PJM region, we have an organization called the Organization of PJM States Incorporated or OPSI, and it's through that OPSI organization that the states are made a request for this type of analysis. Frankly, if I would have done some level of analysis anyway, but given the --

Kit Konolige, Senior Utilities Analyst, Bloomberg Intelligence

Right now, it's unmuted. Okay, okay thanks.

Frederick S. "Stu" Bresler III, Senior Vice President

Given the fact that the Clean Power Plan relies on states to determine compliance plans. We really took a lot of our keys from the states as to what they needed to see, but various assumptions and various compliance approaches would mean as far as impacts on the system and, you know, what analysis we will do. So, we're -- we're adding some other sensitivities as well. Again, we expect to have that analysis out sometime in the fall of the summer.

The only thing I would add to that is, just as a sort of a hints as to coming attraction it was the more that low gas prices are forecasted for longer into the future, the smaller the impact of the Clean Power Plan itself becomes [ph]. And so if I were to characterize sort of the some of the outcomes of our analysis, that's one of the things we're seeing as -- as we go through it.

Other than that, I don't have too many conclusions to draw as far as the impacts of the Clean Power Plan on PJM. For right now, you know, it's stayed by the Supreme Court, while the court challenges tell you that the stay really itself has no impact on PJM. Certainly I guess the timeframes could be squeezed for states to come up with compliance plans, if the uncertainty dragged on, given the stay. But, you know, for PJM standpoint, there isn't much of an impact of the stay on us directly, but obviously we will have to deal with -- with whatever compliance plans come out once the court decisions are finalized. But the uncertainty is always that, especially for -- for markets, where -- where folks, who are trying to get a handle on, what's coming down the pike in the future. And, you know, frankly, our hope I think like everybody else's is that the uncertainty is removed as quickly as possible so that -- so people can know what they are dealing with and, you know, the compliance plans can actually be worked on and put in place. Assuming that the Clean Power Plan is upheld, if you will, obviously it is not that we have to deal with that, too.

As far as moving on to the PJM load growth curve, yes, we have seen several reductions now in load growth projections or forecasts by PJM going out into the future. At this point, we think that we have captured the outstanding elements that we were previously not capturing, it's actually kind of been a two stage process. We worked on better corporation of the economic forecasts in our -- in our last -- forecast last year, this year again we implemented or incorporated much more significantly the energy efficiency assumptions going forward. But by their, you know, the decrease in load growth continues to occur in the future really depends on, you know, how much that -- those -- those contributing factors continue to -- continue to have an impact.

final
Bloomberg Transcript
Bloomberg

And that's very difficult to say. I mean, our load growth forecast is based on other forecasts. And so really it's how good are those other forecasts are going to determine how -- how accurate and what happens to our load growth forecast on into the future. So, it's extremely difficult for us to -- to project, you know, what's going to happen with our forecast in the future until we see what's going to happen with some of these other -- some of these other input.

In you my -- my personal opinion, if you will, I would expect in the future these kinds of, you know, changes to the starting point the result in a different growth forecast going out in the future to be of smaller magnitudes at least for the -- at least for the near-term next several years. Because again, I think we have incorporated these changes into our -- into our processes much better. But we will continue to do the type of backcasting that led us to this for -- on an ongoing basis and adjust as we need to, if we see that they are not actually capturing, you know, what they need to capture.

So, that -- that is -- that is something we are committed to going to see, while to make sure that our forecasts are as accurate as can possibly be. So, having said that, let we just quickly hit some of the future PJM -- future challenges for PJM. I already hit the declining load growth that's a -- that's a challenge in several different ways. We know it's a challenge for utilities, the challenge for PJM, just from the standpoint of, you know, recovering our costs of operation, but it's also more operationally and in the -- the long-term planning sense, a challenge from the standpoint of accurate forecasting.

Really part and parcel with that, if you talk about renewable and distributed resource integration, some of that has a lot to do with, what we see as actual load growth from the PJM perspective. So, if -- for example, we see a continued significant penetration of behind-the-meter solar or other behind-the-meter type applications that looks what to PJM like, less load growth.

And so depending on how much of that we see, you know, it's going to change what our forecast look like both in the planning and the operational rounds. We are working as hard as we can to get as much advance information as we can about that, so that we can, again make our forecasts as accurate as possible, as well as work with the entities in our footprint to integrate what happens if that distribution level as well as possible.

We are going to have continuing challenge with the change in fuel mix. You know, we're undergoing a, you know, a fuel swap unlike anything industries ever seen from coal to natural gas. So, that's going to continue to be a challenge, really in one primary specs, from the standpoint of the coordination of the gas and electric industries.

The ability for those two industries do work well together is going to be extremely important given the increasing penetration of natural gas resources to the efficiency with which we can dispatch those resources. And so we're going to continue to work with the, you know, gas industry participants in our region and really nationally through forums like -- like NAESB in order to do whatever we can to help -- help those two industries work more closely together in a more coordinated way.

And then last but not least, I can't talk about the future without talking about cyber security and resiliency. So, on the front of everybody's minds and certainly it's on the front of our mind, given our primary mandate, which is reliability of the grid. And so we are working on multiple fronts to defend against intrusions, to prepare, so if -- if something does happen, the system is resilient and can be maintained haven't (inaudible), where we see something that actually has a disturbance effect on the system that we can bring about it, well, bring it back as quickly as possible.

So, we work with our -- our participants, we work with government agencies and many other constituents and stakeholders in that arena to do all those things to defend and then prepare and then drill and make sure we are ready for whatever might hit us, hopefully, nothing ever does, but we have to be prepared. So, that's going to continue to be a future challenge for certainly the foreseeable future.

So, with that Kit, I'll wrap up. Hope I didn't take too long and certainly, I'd be happy to take whatever questions anyone has on really and you said that.

Kit Konolige, Senior Utilities Analyst, Bloomberg Intelligence

final

Bloomberg Transcript

That's great, Stu. Thank you very much. Apologies for the disconnect earlier. I -- there are a number of questions that folks have written in both before and during your comments. So, let me jump right in. One that sounds very interesting to me is, how do you see the evolution of PJM and the markets generally with regard to their impact on nuclear. You mentioned that Exelon is looking to Illinois to get some special consideration for some of their plant in Illinois. One of the plants that the Ohio PPA addresses is they were especially [ph].

So, clearly some nukes are struggling. They closed in New England. Does PJM think in terms of the category of nuclear is something that needs to be addressed specifically or is that just, you know, one of -- one of numerous factors that goes into the supply, stack and, you know, something survive better than others?

Frederick S. "Stu" Bresler III, Senior Vice President

Yeah, Kit. It's a great question, Kit. And the short answer to it, although I'll expand on this one as you want. The short answer to it, is no, we don't. We do not make those kinds of policies, certainly to the extent that policies are implemented in that regard, we would be the implementer, and no likelihood of that policy. But, you know, that the markets themselves don't automatically have that kind of consideration. And so, yeah, there are some nuclear assets that are struggling economically, that's been very public, you know, so they made very public by the owners of those assets, you know, you see happening in New York, you've seen it happening like we already mentioned in Illinois. As you point out one of the -- the PPA resource of the nuclear unit.

So, that is a reality we're going to have to -- where we are going to be confronted with, I'll put it that way, and it's really bigger than that. There is -- there is subsidies in a whole lot of different forms that are out there. And in the purest sense, you know, subsidies are bad for markets because they distort what would otherwise be the most accurate price signal for new investment.

And so yes, we are going to have to continue to evolve in order to address and incorporate those -- those kinds of things in our markets. Exactly, how that's going to play out is difficult to say at this point. What I can tell you is that, PJM is preparing a paper on resource investment in organized market and one of those -- well, there's -- there's really two primary aspects to that -- to that paper that we are going to put out in the next month or so. One of them is, how well the new market do at incentivizing efficient entry and exit of -- of capacity resources.

But the second part is, what are the impacts of subsidies on those markets? What forms do they take and what impacts can they have? So, I think that will be, hopefully, a very informative piece for the industry to absorb and we hope it will advance the discussions with respect to how should market take those types of externalities into account.

Kit Konolige, Senior Utilities Analyst, Bloomberg Intelligence

Okay. That's -- that's great, Stu. And as long as we're talking about different slices of resources. I know you did address this, some maybe you can go into a bit more detail. The obvious preference by states for more rooftop solar. Let's say and in general, renewables, for example, look to the west the PJM, we have a lot of wind that, you know, pass an impact clearly on at least the energy markets there. Can you address, you know, what you see as an impact on the capacity auction of renewables and, you know, what -- what if anything PJM is doing as a policy matter to, you know, implement the desire for more renewables?

Frederick S. "Stu" Bresler III, Senior Vice President

Yeah, sure. And in a high level, you know, those again fit into the same kind of category as really any other subsidy. Now, again our regulator has decided that they do not fit in the category of other types of generation where, you know, a minimum offer price rule should apply. There's probably many reasons behind that, like the -- the relative, you know, size of those resources compared to other resources that may have a larger impact on the outcome of the markets.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01724

But again, PJM is not a policymaker from the standpoint of PJM doing anything to fulfill what certain entities, whether it be Federal or State reliability, I'm sorry, renewable resource mandates might be. They are inputs to the markets that we execute and they will have an impact on the markets that we execute. So, you know, part of the -- of that paper, I just mentioned, part of that subsidy discussion what it -- what we need to explore is, for the policymakers, again PJM not being a policymaker, but being an educator hopefully or a provider of -- of information to the policymakers is, you know, what do you want these markets to do. Thus when you adopt a market paradigm, then the market needs to be allowed to work if it's going to provide the price signals that are going to incentivize efficient resource entry and exit.

And, you know, when you start perturbing the market results with externalities like primarily subsidies, it interferes with the markets ability to do that. And if that's what the policymakers want, then that's what the policymakers want. But, you know, I think from PJM standpoint, our goal is to make sure that we contribute to the decisions and contribute to the discussion with as much, you know, objective information as we can provide as to what those impact look like.

Kit Konolige, Senior Utilities Analyst, Bloomberg Intelligence

That's great. Thank you. On a slightly different area and again one that you -- you certainly addressed to some extent already. I think it's interesting to me and -- and other folks that even while the growth curve is flattening, growth in demand and there, you know, depending on the LDA, you know, there is good reserve margins. We're still getting new entrants, new people, people building new plants, mainly gas plants in the regions with very low gas prices, I guess, intuitively that makes a certain amount of sense. Can you address how you see over the past couple of years or so and into this auction? How you see retirements versus additions going on and I guess kind of core question what -- why are there any additions at all if -- if there are plants that are retiring?

Frederick S. "Stu" Bresler III, Senior Vice President

Well, I mean there is -- there is additions, I think because there are plants that are retiring. So, I think that the bottom line is, what the market result in and I'm sorry, if I'm stating the obvious, is that the economic resources are the ones that are going to actually get committed. So, what we see is new resource additions being more economic than maintaining or more likely investing to the extent necessary in existing plants to keep them around. But I think, that at a high level is what we were seeing. So, we're continuing to see retirement of some resources and we're continuing to see penetration of new resources to take their place. And I think that's just the -- the result of the way the markets are intended to operate.

I want to go back to renewable question for one quick second, because I -- there's something I should have mentioned then I didn't. And it really reflects PJM's primary responsibility in this area. And that is in implementing the market operations really from the standpoint of -- of renewable resources our primary responsibility is to ensure that they are provided the capacity, value associated with the reliability they provide. So, you know, so the wind resources typically 30% capacity factor, solar 38%, I think and these are high level averages. But, that -- that I think is our primary responsibility is that to the extent these resources are committed to provide reliability service to the region making sure that they are -- that they are provided with the reliability credit, given the benefit they provide. So, that -- that -- I should have mentioned that with respect to the renewables.

But again on the -- on the retirement versus additions question, I really think it just becomes a question of supply and demand economics.

Kit Konolige, Senior Utilities Analyst, Bloomberg Intelligence

And -- so just if I want to add a little bit, so in one of, I guess, the key drivers and tell me if this is wrong, is that older coal plants tend to retire, because it's expensive to keep them retrofitted and running and their marginal production cost can be higher than the very low gas prices and -- and the gas plants that we're seeing built are in regions, where gas is a

final
Bloomberg Transcript
Bloomberg

$1 or $1.5 for the next five years let's say. And, so between capacity payments and the spark spread, a gas plant like that can presumably be quite economically attractive to -- to a new builder in a relatively short period of time. I mean, like is that the primary dynamic we are seeing with entrants and departures?

Frederick S. "Stu" Bresler III, Senior Vice President

Yeah, I think hit the nail on the head. I mean the retirements we've seen thus far, the older, smaller coal-fired generators primarily were on a, you know, per megawatt of installed capacity basis retrofits to make them environmentally compliant are extremely expensive. Maybe I shouldn't use terms like that. They are more expensive than it is to, you know, build the new gas plant in these areas, where gas is -- is cheap now and its forecast to be cheap for quite some time.

During the last -- the last four as I've seen have gas price is low, you know, below 4 bucks after 2027 or some like that. I mean that's -- I think that's just what the market expects. We'll see what plays out, but that's what the market expects at this point.

Kit Konolige, Senior Utilities Analyst, Bloomberg Intelligence

That sounds right. Okay, great. Well, I think we've run through the questions that have been written in and that I had in my mind. And Stu, I want to thank you very much for, you know, on extremely informative and extensive discussion of and obviously very important event coming up PJM auction in May. And I'll just say to folks on the line, we will be getting out to you with information about replay and other details, you may want to follow-up on. So with that, let me thank, Stu again and thank everyone on the line. And everyone can disconnect now.

Kit Konolige, Senior Utilities Analyst, Bloomberg Intelligence

Bye Kit. Take care.

Presentation

Joseph Nigro, EVP, Exelon, CEO, Constellation

Good morning. I'm just going to spend a few minutes and give a quick overview of the Exelon business. I'll start with just a brief overview of the company. On one side, you have the Exelon Utilities, and then on the other side, you have the Exelon Generation business. We think it's -- the model is right where we have an opportunity to leverage our integrated business model across the regulated and unregulated platform. And when you combine these entities, we're creating value across all of our business lines.

I'll start with the three large urban utilities, and really as you know, we have about 8 million utility customers in those three service territories. And the benefit of that business is the stable growth it provides. I'm going to spend most of my comments today though talking about the generation company. And on one side, you see our power generation fleet. We have about 32 gigawatts of power gen with 19 of it being nuclear. We produce about 220 million megawatt hours a year of electric output.

And then in the middle there, you see the Constellation business, the business that I run. And what that is, is our competitive wholesale and retail business. By output, we're the largest merchant generation company in the country. And then when you think about commercial industrial power marketing, we're the number one commercial industrial power marketer in the country. And in addition to that, we are a top 10 natural gas marketer. And we think integrating the power generation and our customer-facing business creates a lot of value. And with that, I'll turn to the next slide.

And what you have here is a pictorial of what is the core strategy for Exelon Generation Company, which is marrying our generation fleet to load. We serve approximately over 150 terawatt hours of electric load across the country, and we're pretty balanced in most areas. You could see in the Midwest, we produce a lot more generation than we have load, although we have added a substantial amount of load to our fleet in the Midwest recently with the acquisition of Integrys last year, about a year ago.

I think there is two key elements to this though. Last year, in the winter, on the back of the increased volatility of natural gas prices and power prices, we were able to capitalize on that with our generation fleet, and it really provided a great backstop to our load-serving book. We've really been 180 degrees from that this summer on the back of very low natural gas prices. And as such, we were able to monetize our load book of business. So we're very comfortable in both market environments, capitalizing on it, and we think that the platform of generation to load really provides a substantial amount of value.

Bloomberg Transcript

This is a picture of -- I'm going to transition briefly to capacity performance, and this is a picture we provided in an 8-K after all three auctions were done. Overall, we believe the auctions were success. Most importantly, we think we're improving reliability across the powerful, and that's the most important thing. But I think when you look at it, we've cleared a lot of megawatts. The ComEd zone and the Eastern MAAC units cleared at a higher price than the rest of poor price.

And we think the biggest thing was really the bidding behavior of the participants in the auction. I think the recognition of the risks you are taking, the penalty risks you're taking for non-performance are really important. And why it's important is, to drive for that improved reliability and I think you see that with the prices that are represented here. And then on the bottom part of the chart, you see the volumes that we cleared on the three respective auctions.

There is really two other key points I think. There was -- bidding behavior was the big driver and the recognition of the penalties, but I think also there was less new generation cleared than people expected, and I think that was one element of it. And then the other element was demand response, the lion's share of it, cleared as a base product as opposed to a capacity product and then we have some read-through value as we transition to 100% CP two years from now.

The last piece I'm going to touch on just briefly is our view of the power markets. And what you have here is a picture of NiHub, and market relative to our view and we're showing you 2016 and 2017. If we extended this to '18, '19, you even see a greater difference.

And what this is comparing is what we believe the view of -- what we believe the price of power should be at NiHub for these calendar years versus where the market is trading. And really in the last six months or so, our view of price hasn't changed. What we have seen is the market price come off. And you could see there, in 2016, we think there is about a dollar of upside, and when you get into '17, depending on the date somewhere between $2 and $3, and as you move out on the curve, it's materially higher.

We think that's driven by a couple of things. The biggest is, there is really a lack of liquidity on the forward curve, especially when you're talking about NiHub. But as you get into the out years, I think that's also very true from the buy side and West Hub. In addition to that, one of the things that we're struggling to understand is, you have a contango fuel market, a contango gas basis market, contango coal market and yet you have a backward dated [ph] power curve and NiHub and given the changing composition in the dispatch stack, what this is -- why we believe when we model our own fundamentals, we see value relative to where the market is trading today.

And with that, I'll turn it over and be happy to field some questions.

Questions And Answers

Steve Fleishman, Analyst

Great. Thanks. Thanks guys. We're solidly back on schedule. So maybe just to kick off the questioning, I guess, first for Joe on, you mentioned very much that NiHub is very cheap, you don't really mention PJM West. So maybe kind of view the differences there. And if -- I guess if the issue is kind of lack of forward liquidity, why is that okay if PJM West, not NiHub? I guess that's a bigger hub, but maybe just some views there.

Joseph Nigro, EVP, Exelon, CEO, Constellation

I think, Steve, there is a couple of things. First is PJM West Hub is -- we think is more fairly priced than NiHub. I would add though there is a tremendous amount of seasonality associated with that. And what I mean by that is we believe the winter periods are probably fairly priced and carry the rate premiums and some periods in the off-peak hours and the non-winter months at West Hub actually still -- we still see upside relative -- the market relative to our fundamental view.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01728

I think the big thing though is, you do have more market liquidity at West Hub, but as you go beyond a year, two years, let's say, 2017, now the liquidity falls off quite substantially. I think the other thing to note is most of the new generation that's being built is more impactful to West Hub than it would be, for example, to NiHub.

And I think what we see is more of the coal retirement happened or are happening in the western part of PJM. So when you overlay the new generation on the eastern side with the retirements on the western side, we actually see the basis between those two locations becoming closer together, and the market currently isn't reflecting that. That's part of the reason we see the increased value at NiHub. And then you just have less liquidity on the forward curve at NiHub compared to West Hub. So I think all of those things factored together drive what we're saying. It's not just one variable.

Steve Fleishman, Analyst

Okay. And Shahid, just maybe a question on the newbuild question. So in the panel before, which you weren't listening to, but one of the comments was just that don't see the economics for newbuild, but then you just bought a newbuild plant. And so do you see that differently or was that just kind of a special situation in terms of opportunity and generally you don't see the newbuild economics.

Shahid Malik, President, Energy Resources & Trade

So it's always preferable if you can buy a combined cycle or a unit that's been operating for a while, you have less construction risk and to be able to earn earnings from day one. Those assets are pretty competitive, so when you compare that with building new and you look for specific opportunities. For us, we felt -- and we've been looking for some time frankly to grow our portfolio and we haven't found the right assets to do that.

This one came along, we're very excited by it because actually we think there is good load growth in that area. It's a constrained zone. We believe it will have a strong spot spread because of the cheaper Marcellus gas and the load growth that we expect in that region. And so actually we do think it's a good asset. We think we'll be successful in constructing it and we think it's going to be well located. Plus it also helps in how we manage our portfolio with respect to the other parts of that business. So yeah, we feel pretty good about that, Steve.

Steve Fleishman, Analyst

Let me ask that question just another way, which is just that kind of at a high level, would you be interested in doing more of those at, let's say, the same rough valuation?

Shahid Malik, President, Energy Resources & Trade

So when we look at our investments, we clearly look at what are the alternatives for those dollars. Do we spend on the regulated side, the deregulated side, do we give money back to our shareholders. So we have a very stringent internal hurdle metrics that we look at just to make the investments. And as you can tell, for last couple of years, we haven't made a lot of investments in the hub side. We had a lot of upgrades, we've had some improvements in our base fleet, but we haven't stepped out to build new generation. These circumstances look very favorable to us. They passed [ph] all our internal hurdles and our internal metrics. And so, yeah, if the right opportunity came along, Steve, we would certainly look at it.

As I mentioned though, we are now in the process of building two new combined cycles, Salem [ph] Power Plant in New Jersey, it's slightly different animal for us in that it's replacing all megawatts with new efficient megawatts. It's replacing megawatts on an existing Brownfield site, which makes it cheaper from an infrastructure standpoint. And so that's a different animal. So yes, I would say that we would look at them, but generally our preference right now will be

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01729

to look at those assets that have been -- that are currently running and probably often on a discount to newbuild.

Steve Fleishman, Analyst

Okay. I'll ask one more question and then I'll kind of -- I'll open up to the audience. So I think as you guys know, we put out a report last week that talked about kind of supply demand work that we do. And in PJM, I guess one of the more controversial conclusions we came to was that supply demand is loosening. And I'm just curious, I'm not sure how much you've had a chance to look at what we did, but just overall, would you agree that's true or not, and if you had to use that were different than ours, what would they be?

Joseph Nigro, EVP, Exelon, CEO, Constellation

Yeah. I did look at it briefly, Steve. And I think like I said, I think in general, when you look at it, we expect a fair amount of new generation to be built as well. We saw, I think, in the previous three capacity auctions about 5 gigawatts of new combined cycle points clear each year. I think this year it is a little less than that. So call it close to 20 gigawatts in total that we expect. We've retired about 25 gigawatts of coal, we are re-powering some assets, there's continued -- I would say, continued development of renewables and load growth is probably somewhere -- it's less than 1% clearly when you look at it.

So I think when we put all that together, I think the big driver is you are getting -- you have a change in composition of the dispatch stack. I think this summer, quite frankly it was a little bit of an anomaly. We had obviously very, very low M3 gas prices, and if gas prices were sustained at a $1.15 per (inaudible) we are going to be having a very different conversation obviously. I think also we didn't see what's, call it, the peak loads that we would have expected and the coincident peaks across the power pool that we've seen in years past. So I think some of the volatility got masked.

I think it's fair to say though when you put all that together, as we've said, we think the West Hub is generally fairly priced with the seasonality I mentioned. And there is upside in NiHub, but I think that the other relative point is, with that, you are going to get increased volatility and we serve a pretty big book of load in PJM, as you saw in the slide I presented, and we're comfortable with that given our generation backstop and our ability to do that. And I think you're going to see that and I think there is opportunity to capture value both when the market is volatile for the high side, like it was in the winter of '14, but also to the downside like we saw this past one year [ph].

Shahid Malik, President, Energy Resources & Trade

And I'll just add a little bit to what Joe said and (inaudible) contradicting my friend here, but Steve, we did look at your report yesterday and one that previously, and I think you fairly accurately represent potential newbuilds and the stock spreads are very strong. Particularly if you have access to that cheap gas, which I think is very helpful. Maybe some more retirements, not necessarily because of environmental, but also because of economics.

And the previous analysts talked about some of the pressure on some of the base load units, nuclear, small single site nuclear units that are out there as well as some of the disadvantage of coal that frankly we don't expect to be around that much longer. So maybe on the retirement side, you might see some more of those primarily for economic reasons.

Steve Fleishman, Analyst

Any questions from the audience? Making it very easy. Maybe just on capacity, I mean, obviously the auctions overall, I think, were a success and whatever is going on with supply demand, the capacity side obviously gives you a lot of cash visibility. What do you see kind of beyond this? It seems like next year we got more full CP and demand response. So question, do you think this is just beginning, continue with kind of higher auction pricing?

Joseph Nigro, EVP, Exelon, CEO, Constellation

I think one thing you know is expect the unexpected. We've seen a lot of volatility in capacity results, but I think the point you made is a relevant point as we transition from into the 80% procurement for the recently completed '18-'19 auction.

By the time we get out to it, I think it's 2021. I think there is a lot of puts and takes that will be associated with that. There is talk of how PJM is going to forecast load in future, the changes to the BRR curve.

I think that Joe is out on how demand response is going to be able to participate with the capacity performance product. I'm not sure it will be quite the quantity we've seen in years past.

But I think at the end of the day, there is two elements that are really important. I think the first is recognizing to ensure reliability, the penalty structures needed to change, and I think folks recognized that and we saw that in the prices that cleared in '18, '19. And then the second element is the bidding behavior of the participants really matters. And I think they recognized that with the increased volatility or the risk of higher penalties and associated with non-performance. You had to prepare your plants to perform in those hours when they are most needed and I think the prices need to reflect that and we would expect that to continue.

Shahid Malik, President, Energy Resources & Trade

So I was a little surprised in the 2018, '19 auction frankly that there was such a small discount between the base product and the premium product, the CP product. And I would attribute that to being a relatively new market construct and I believe and I think the company believes that some folks in the industry that did bid on the price risk relative to the base and we could see some continued widening of that spread over the next few years. I'm not sure what it means for the absolute price of capacity and I wouldn't want to predict that, but I would say that's one element that we should keep an eye on.

The other element, in addition to the puts and takes that Joe mentioned, is that energy prices, electric prices stay low, then the way the formula in PJM works is that capacity prices have to rise because the net of the two adds up to a number that provides the incentives for generators to maintain their power plants and to build new power plants. So there is a constant dynamic between energy price and capacity price, particularly in those northeastern markets. So if one is weak, the other one should be strong. Generally I feel pretty good about the construct. I think that there's still some more learning that participants will have to go through, to get comfortable with it, make some refinements of people putting tactics, but I think PJM had a good start and I think the industry responded.

Steve Fleishman, Analyst

Okay. Questions in the audience?

Unidentified Participant

(inaudible)

Shahid Malik, President, Energy Resources & Trade

Yeah. It was a pretty good site move for us. And as you know, over the last two years, we've focused a lot of our attention and development dollars on our utility business, which has performed pretty well. But we still have a pretty strong balance sheet, good opportunities on the power side. It's not that we haven't wanted to spend on the power side, but we haven't found the opportunities that really worked for us.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01731

So to answer your question, and to follow up on what Steve said, it's unlikely that we'd want to build a whole bunch more right now. We'd certainly look for selective assets that we could pick up to add to our portfolio either to improve our diversity, to improve the efficiency or to increase the amount of base capacity that we have.

With respect to consolidation, the reason I mentioned that is because I believe that the economics of industry today are causing some companies some financial problems, particularly those companies that have high debt and highly leveraged and the cash flow isn't coming in as they might have expected since power prices are relatively low. So I think some companies are going to be forced to make a decision, do I continue funding the leverage that I've put on with the lower cash flows or do I exit. And I think we're seeing signs of folks, particularly smaller portfolios, smaller power plants, looking to exit. And Paul [ph] mentioned that in the previous panel that we're seeing every opportunity that's out there and so we -- there seem to be quite a lot out in the market right now.

Whether we'd be interested in buying another portfolio our size or not, I guess probably not, but we certainly look for selective assets rather than a big portfolio. Does that answer your question?

Joseph Nigro, EVP, Exelon, CEO, Constellation

I would just echo similar comments. I mean, we have seen consolidation on the power generation side and I would expect that we continue to see consolidation. I think another important element for Exelon is, in 2014, we acquired two retail companies. And I think you're going to see continued consolidation on that side of the business as well. And I think that would be an area where we would have interest in acquiring assets on the retail side given the nice match for the generation output.

Steve Fleishman, Analyst

On that topic, I know Shahid, that Ralph almost gave a little bit of a hint to potentially having interest in the retail business. So curious kind of where your thoughts are there right now because that was definitely new for PEG.

Shahid Malik, President, Energy Resources & Trade

Right. So I've run a retail company. I'm comfortable with the retail business, I understand the operational risk I believe. And our operational risks around retail business, I'm sure Joe will be happy to describe. Principally for companies in our space, it's credit risk and getting it built out on time and getting paid. So generally PSEG has always considered different vehicles for getting its output to market, and one that's worth mentioning in the past has been the wholesale market. As you -- as the market and the industry develops, you've seen less liquidity in the out years and you are definitely seeing more -- and less liquidity out there. And as a result of that, (inaudible) vehicles work in order to get your megawatts out would be a good potential option.

So we've considered in the past, we are considering it right now and we'll see whether it makes sense for us in the future. If we do it, it would be a defense strategy, something that basically helps us to sell megawatts in our territory. I don't expect it to be significant in any way, what moves the needle for us from a learning standpoint, but it's more of a vehicle for us to move megawatts from our power plants.

Steve Fleishman, Analyst

Okay. I want to make sure we had a chance since Jack is here to maybe talk a little bit about Exelon's news last night with Pepco. So maybe Jack, if you could just kind of address that.

Jonathan W. Thayer, Chief Financial Officer

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01732

Certainly. So as many of you saw, we've had (Technical Difficulty) the commission will make a ruling whether (Technical Difficulty). You also know that we had a communication with the mayor (Technical Difficulty) we are working towards a settlement. And that (Technical Difficulty) so in that regard, that is the first indication from the mayor support for the transaction and I believe that (Technical Difficulty)

Steve Fleishman, Analyst

Well, maybe just views on chances that a settlement can get done, are there other important parties involved like the Public Council, which is the opposition, and kind of how long would you let this. If there is not something happening, how long would you let this go before you'd kind of say it's over?

Jonathan W. Thayer, Chief Financial Officer

So maybe I'll start with the last question that has the (Technical Difficulty) we are actually committed to pursue with reasonable efforts the transaction with Pepco (Technical Difficulty). Obviously it's a transaction we like. It's one that's we believe (Technical Difficulty) to a more regulated footprint and (Technical Difficulty) more balance sheet base. To the extent that we were able to secure a settlement with relevant parties, we would (Technical Difficulty) at this point.

That said, again, we believe it's a transaction that is (Technical Difficulty) and valuable for our shareholders. We will need substantial support as far as the settlement from the key stakeholders. (Technical Difficulty) determine who those key stakeholders are, but clearly the mayor is a major driving force. (Technical Difficulty) others in support of the deal. In the absence of that, I think you know the outcome. To the extent that we are able to get a settlement and we see a pathway (Technical Difficulty) basis, getting the transaction (Technical Difficulty) and approved, then we think (Technical Difficulty).

Steve Fleishman, Analyst

Okay. Anybody else have questions for Jack on this before we go back? You guys are being easy, okay. Maybe just one more question for the panel on just, Joe, you touched on this a little bit on natural gas prices because obviously those are very important that you expect it to get better. And it sounds like you expect gas basis to moderate as well. Could maybe each of you give your views there and a little more define why you expect it to get better, and how do you know the LNG is actually going to leave the country so to -- for example, in your view?

Joseph Nigro, EVP, Exelon, CEO, Constellation

Yeah, I think -- I will start with what I think the easier one is first. I think from a gas basis perspective, and I'm talking about M3, we see the market improving already when you look at like 2016, you had a slight discount to Henry Hub and by the time you get out to '18, '19, you're at a premium. And I think that's really predicated on the build-out of takeaway capacity from that area to other parts of the country. I don't think we differ from that in any way. I think we think the market structure, the way it's priced is right.

When I talk about our upside fundamentally on the power side, at NiHub we're using market fuel prices. So we're not adding to that anything that overlay the view. I do -- we do believe though on the Henry Hub side of it, there is some upside to natural gas prices.

And I don't think anyone can debate we continue to get more and more efficient on the supply side. The technology is getting better and better, increasingly efficiency. I think the cost of drilling, given all the capital cuts both on the oil and gas side comes down, but I do think when you look at the prices, you see that there will be a supply -- a small supply response to that, and I think if you dial back the clock, call it 12 to 24 months, you would have expected to continue to grow production. And I know I think just given where prices are, we think that that may flatten some.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01733

But more importantly, I think it's on the demand side. I think the LNG, the 7.5 to 8 Bcf that has been contracted will get exported. We've seen a pickup of power generation as the consumption of natural gas with the turnover to more of a gas stack. You're seeing increased exports to Mexico and we think that will continue.

And when you look at it over the four or five-year horizon, there is probably an additional somewhere between 16 and 20 Bcf of additional demand in all these different buckets. And we think that will be a driver and we're not talking about material upside here in the near term, but as you go out through time, I don't think it's unreasonable to think we could see some upside to price, and that will be in addition to what we're seeing on the power side.

Shahid Malik, President, Energy Resources & Trade

I would echo a lot of what Joe said. I think wild card frankly though is what are the producers going to do and you probably have a good handle on that when your other panels are going on tomorrow, Steve, but as I was preparing for this presentation and conference today, I look back at the last time I did this a year and a bit ago in Houston. And at the time, the predictions for Marcellus production for 2015 were about 16 Bcf a day while today we are at 20 Bcf. And so the production guide has really gone on a binge in the last couple of years.

And the question we have is when the hedges roll off, what will they do with production and will they reduce production. Not just because gas prices are low, but because oil prices are low. And certainly we've seen signs of that, and Joe alluded to the supply side being important as well. So I think that's been a wild card, but I think the trend both domestically and internationally are for less drilling, less production at these high prices -- at these low prices.

So on the demand side though, which I think we have a reasonably good handle on, at the utility, we're seeing a lot more use by our customers for natural gas as a result of low prices. So they're switching from oil, they're switching from electricity and they're using more gas. So customers are using, or power companies are using a lot more gas to generate than they were previously. So it's demand right there as well.

We're seeing industry come back in a significant way, particularly in the south, but also increasingly (inaudible) continent and northeast. And chemicals industry is, in particular, big consumers of natural gas. We're excited to have them.

The other wild card of course is exports and contracts have indeed been signed to export gas, LNG. And the question is, will they specifically be very short or will they be replaced by purchases elsewhere to cover those short sales. And I think that Joe is out on that. It depends a lot on what world crude oil prices do. (inaudible) take some produces out of business and then raise the price. And I think you could see LNG prices and gas prices rise as well.

And I also think where if this -- this business is cyclical. And I remember 10 years ago when gas prices were $2, well, guess what, we are at $2 again and the power industry hasn't gone out of business. Our industry in many ways has gotten better and better. And so I think that you will see these cycles of -- but the challenge for companies like ours is, how do you manage through the cycles and how do you have most efficient machines, how do you have the lowest cost and how do you invest so you can be successful in the markets that you choose to be in.

Steve Fleishman, Analyst

I'm going to ask one more question to close it up. So in our panel before, I guess, Bob Flexon talked about with a 20% free cash flow yield, rather buy my stock than necessarily buy other companies right now. Both of your stocks, at least relative to the pure independent generators, have held up relatively well. So given that there is a lot of assets and portfolio on the markets, do you have interest in growing the generation side of your businesses still? Do you have room to do it? You are both pretty big in PJM at least and do you see maybe more of a competitive advantage to actually win these days?

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-01734

Joseph Nigro, EVP, Exelon, CEO, Constellation

Steve, I think we are investing into new state-of-the-art efficient combined cycle plants in Texas and they are being built on -- both being built on existing sites. We think they provide a competitive advantage and match very well to our load business. I think from our perspective though, we would have to think long and hard about adding additional merchant generation, I think you mentioned in PJM, (inaudible) it's going to be difficult for us to do that. To the extent we can keep our book of business balanced between our load and power generation business, we may have some interest, but I think right now where we are, we are very comfortable with the portfolio we would continue to look to consolidate retail entities and acquire retail entities. And to the extent then we needed to backstop that with generation, we would look at it as necessary.

Shahid Malik, President, Energy Resources & Trade

I think that from PSEG's standpoint, we would like to grow the company, we would like to grow it on the regulated side as well as the deregulated side. The alternative of course is to give money back to our shareholders in the form of dividends or share buybacks or whatever companies like that do with their cash. Firstly, we intend to maintain a strong balance sheet, intend to maintain a very strong credit rating because we think it helps us.

And actually I think we're able to take advantage of that in periods like this. We start seeing some assets coming to market, but a good strong asset that you previously wanted to own, but didn't want to pay the price for. So we think that there will be opportunities, Steve. We'll certainly look at them all.

Whether we execute on them really depends on the situation at the time and the particular asset, but we have room to grow. As I said, I think we prefer existing generation unless there is a unique situation such as in New England where there is a seven-year new capacity lock, we might think differently. But we'd evaluate each asset, each portfolio of assets, likely not big, probably very small in the context of how does it fit our portfolio and can it add value long-term for our shareholders.

But we are in this business for the long haul. It's not like we intend to come out of it in the next two or three years. So we have to figure out how we deploy our capital. Letting our fleet to run down and be inefficient and ineffective is not an option for us. We've got to figure out how we invest smartly to improve our efficiency, so we can be effective in the marketplace.

Steve Fleishman, Analyst

Great. Well, Joe, Shahid, thank you very much. Great panel. Appreciate it.

MANAGEMENT DISCUSSION SECTION

Operator

Good morning. Thank you for standing by. At this time, I'd like to welcome everyone to the Exelon Corporation Quarter Two 2015 Earnings Conference Call. Your lines have been muted to prevent any background noise. After the speakers' remarks, there will be a question-and-answer session. [Operator Instructions] Thank you.

I'd now like to turn today's conference over to Francis Idehen. Thank you, you may begin.

Francis Idehen

Thank you, Ali. Good morning, everyone, and thank you for joining for our second quarter 2015 earnings conference call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer; Joe Nigro, CEO of Constellation; and Jack Thayer, Chief Financial Officer. They are joined by other members of Exelon's senior management team, who will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, each of which can be found in the Investor Relations section of Exelon's website. The earnings release and other matters which we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties.

Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material, comments made during this call, and in the risk factors section on the 10-K which we filed in February, as well as in the earnings release and the 10-Q, which we expect to file later today.

Please refer to the 10-K, today's 8-K and 10-Q, and Exelon's other filings for a discussion of factors that may cause the results to differ from management's projections, forecasts and expectations. Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for a reconciliation between the non-GAAP measures to the

nearest equivalent GAAP measures.

We've scheduled 45 minutes for today's call. I'll now turn the call over to Chris Crane, Exelon's CEO.

Christopher M. Crane

Thanks, Francis, and good morning, everybody. Thanks for joining. We're pleased to report another strong quarter with our earnings coming in at $0.59 per share, surpassing our guidance of $0.45 to $0.55 per share. You'll hear more from Jack in a minute on the specifics, and Joe Nigro will also provide some color around the performance.

We've seen a number of positive developments that affect various business this quarter. The two primary catalysts for us this year are the PHI acquisition and the capacity market auctions. We received approval from the merger since our last call in Maryland in May, and leaving D.C., Washington, D.C. as our only outstanding jurisdiction to close the merger, which we expect to hear from soon and we're looking forward to a positive outcome there. Upon closing the merger, our focus will shift to the integration of PHI Utilities into the Exelon Utilities to align our operations to better serve the PHI customers base.

Another major catalyst is the capacity performance revisions that have been made. While we continue to believe that FERC came to the right conclusion, putting reliability at the center of its planning process to ensure that customers in the region are well served, we always were aware that DR and Energy Efficiency were in the 2018-2019 auction. The most recent change that allows DR and Energy Efficiency to provide – to participate in the transition auctions, we believe to be non-material to the outcome.

We are disappointed in the delay, but we think that we'll be on the right track into recognize the value of our highly reliable fleet going forward. And we remain confident that the capacity construct is the best way to protect the grid as we await further clarification on the timing of these transition auctions. I think we're getting that in the last days. So, by the September timeframe, we should have clarity on the value proposition, along with the reliability measures being enacted.

In Illinois, the legislative session ended without a resolution on the market redesign for the Low Carbon standard, the Low Carbon Portfolio standard. We were disappointed that we were not able to get this outcome before the session ended, but understand where the state is focused right now on its budget priorities. The nuclear plants provide significant value to the state and its economy, and it's mostly important to its consumers.

Looking ahead, we have certain regulatory and operational triggers in September that require us to make some tough choices on the specific assets this fall, particularly in light of the continued pressure on the power markets. So we are continuing on with our disciplined plan on evaluating the assets and their likelihood to stay within the stack, and we'll bring that to closure with our decision in September.

Despite these market challenges, we continue to find ways to create value in our Constellation business, which Joe is going to talk about shortly. Part of our resilience to the power market weakness is driven by our ability to capitalize on our generation to load strategy. And this quarter, we showed the benefit from the lower cost to serve load. And the – increasing our utility business has been able to reduce the overall volatility at the enterprise level and deliver growth.

You can expect that even more to be true over time. Not only is it shifting our business mix with the acquisition of PHI, but it also, with our infrastructure improvement investments, we're investing $16 billion in our existing utilities over the next five years, which provides respectable growth rates, and roughly another $7 billion with the addition of PHI.

I want to remind everybody that we can perform well even with a rising interest rate environment, which is typically a headwind in our industry. This is because our EPS is positively correlated to interest rates, due to both ComEd's formula rate and ROE being tied to the 30-year Treasury rate, as well as the discount of our pension – discounting the rates of our pension liability. Overall, we are positive the company is able to provide more stable and durable earnings streams for our shareholders with our operational expertise in driving performance across the enterprise.

With that, I'll turn it over to Joe, who will discuss the markets. He's followed by Jack on the financial performance.

Bloomberg

Joseph Nigro

Thank you, Chris. Good morning, everyone. The Constellation business has continued to perform well in 2015 as a result of our generation to load matching strategy. My comments today will address market events during the second quarter, and what they mean for our commercial business going forward, including our hedging strategy in our updated disclosures.

Starting with slide four, the spot power markets in the second quarter have been defined by mild weather and lower natural gas prices, which drove the price in power considerably lower than in 2014 across all of PJM. The impact of low spot market conditions has carried through to the forward markets, with prices down approximately $0.45 per megawatt hour in 2016 and $1 per megawatt hour in 2017, at both PJM West Hub and NiHub since the end of the first quarter. The lack of liquidity in the forward markets has exacerbated the drops in power prices and heat rates, with the forward markets exhibiting volatile price moves on very little trading volumes for calendar 2017 and beyond, especially at NiHub.

During the quarter, our hedging activities for 2016 to 2018 were executed through our retail and wholesale load businesses rather than on the over-the-counter market. Our fundamental view of power prices has not changed, but given the drop in market prices, there is a greater gap between the market and our fundamental view due to current natural gas prices, expected retirements, new generation resources, and load assumptions.

Moving to slide five, I will discuss the forward market and its impacts on our hedging profile. During the second quarter we maintained our behind ratable strategy and increased our cross-commodity hedge position to increase exposure to power price upside. We have successfully used this behind ratable hedging strategy in the past when our view showed upside in the market. We are 4% to 5% behind ratable in 2016 and 2017, and 7% to 8% behind ratable if you will remove our cross-commodity hedges at NiHub. We are confident in our ability to adjust our hedging strategies to capitalize on our fundamental view.

Turning to slide six, I will review our updated hedge disclosure and some key changes since the end of the first quarter. In 2015 we have a net $50 million increase to total gross margin since the end of the first quarter, driven primarily by strong performance and execution. We executed on $200 million of power new business and $50 million of non-power new business during the quarter. Based on 2015 performance to date and expectations for the full year, we have increased our power new business target by $50 million.

Our generation to load strategy was successful last year during the extreme polar vortex conditions, and it's serving us well this year under weaker load and price conditions. It is further augmented by strong performance from our portfolio optimization activities and our Integrys acquisition.

For 2016, we saw prices decrease across most regions, decreasing around $0.45 per megawatt-hour in both the Mid-Atlantic and the Midwest. This resulted in a decrease in our open gross margin of approximately $200 million, which was offset by our hedging activities. During the quarter we executed $100 million of power new business and $50 million of non-power new business, and are raising our power new business targets by $50 million additional due to commercial opportunities, for a gross margin increase of $50 million in 2016.

For 2017, prices decreased by approximately $1 per megawatt hour in both the Mid-Atlantic and Midwest. This resulted in a decrease of $300 million in our open gross margins. Despite the drop in prices, our total gross margin is only down $50 million due to our hedged position and an increase in our power new business target of $100 million in case we have line of sight into additional commercial opportunities.

Since the beginning of the year, prices have fallen due to mild weather, lower gas prices, lower load demand in the Midwest, and a lack of liquidity in the markets. Prices have fallen more in 2017 and beyond than in 2016. Although this weakness in the spot market has impacted forward markets, we are confident in our fundamental view of the gas and power markets and are positioning our portfolio to take advantage of this.

Bloomberg

Now I'll turn it over to Jack to review the full financial information for the quarter.

Jonathan W. Thayer

Thank you, Joe, and good morning, everyone. We had another strong quarter. My remarks will cover our financial results for the quarter, third quarter guidance range, and our cash outlook. Starting with our second quarter results on slide seven, Exelon exceeded our guidance range and delivered earnings of $0.59 per share. This compares to $0.51 per share for the second quarter of 2014. Exelon's Utilities delivered combined earnings of $0.25 per share and were flat to the second quarter of last year.

During the quarter, we saw favorable weather at PECO and unfavorable weather at ComEd. Cooling degree days were up nearly 37% from the prior year and 47.4% above normal in Southeastern Pennsylvania, and down 34% from the prior year and 21.6% below normal in Northern Illinois.

Distribution revenues at ComEd and BGE were higher quarter-over-quarter. In addition, BGE had a decrease in uncollectible accounts expense compared to the second quarter of 2014. Exelon Generation had another strong quarter, delivering earnings of $0.36 per share, $0.09 higher than the same period last year. As Joe mentioned, our generation to load matching strategy continues to prove effective. We benefited from a lower cost to serve both our retail and wholesale customers, and had strong performance from our portfolio management team.

In addition, compared to the second quarter of 2014 we had fewer outage days at our nuclear plants, which had a positive contribution from the Integrys acquisition, higher realized nuclear decommissioning trust fund gains, and received additional benefits quarter-over-quarter from the cancellation of the DOE spent nuclear fee. These positive factors were partially offset by higher tax and interest expense. More detail on the quarter-over-quarter drivers for each operating company can be found on slides 18 and 19 in the appendix.

For the third quarter, we are providing guidance of $0.65 to $0.75 per share. Accounting for the impact of the increased share count and the debt associated with the Pepco Holdings transaction, and assuming the transaction closes in the third quarter, we are narrowing our full-year guidance from $2.25 to $2.55 per share, to $2.35 to $2.55 per share. Our guidance does not assume that bonus depreciation is extended.

Slide eight provides an update on our cash flow expectations for this year. We've simplified the format of our slide to provide a clearer view of our cash flow at each operating company, including explicitly showing free cash flow. We project cash from operations of $6.6 billion. We project free cash flow of $900 million at Generation in 2015. 80% of our total growth capital expenditures are being invested in our utilities over the next three years, which will provide stable earnings growth.

In June we completed the debt portion of our financing for the Pepco transaction by issuing $4.2 billion in senior notes, with the majority of these proceeds being used to fund the transaction. Strong market demand allowed us to upsize the offering, enabling us to pull forward some future-planned corporate debt issuances. We issued across the tenor spectrum with an average maturity of approximately 14 years and an average weighted average coupon of 3.79%.

Earlier this month we completed the settlement of the equity forward transaction. The combination of these financings allows us to close the merger quickly upon receiving approval from the D.C. Public Service Commission. Our balance sheet remains strong and gives us the ability to invest and grow our business.

As a reminder, the appendix includes several schedules that will help you in your modeling efforts. Thank you, and we'll now open the line for questions.

Q&A

Operator

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01739

[Operator Instructions] And our first question will come from the line of Greg Gordon with Evercore ISI.

<Q - Greg Gordon>: Good morning.

<A - Christopher M. Crane>: Hi, Greg.

<Q - Greg Gordon>: Couple of questions. First, when you talk about commercial opportunities, in the context of your comfort level raising your guidance for power new business/to go, are we talking about sort of the inherent counter-cyclicality of the margins in that business in the low wholesale environment, i.e., are we moving closer off the $2 floor in margins and closer to the $4 sort of peak of the cycle margins that you see in that business historically, or is it simply new customers, more volumes than you had projected in either the gas or the electric business?

<A - Christopher M. Crane>: Joe?

<A - Joseph Nigro>: Yeah, Greg. In this specific instance, specifically for 2016 where we're raising our power new business/to go by $50 million and 2017 by $100 million, it's really – it's not related to those load margins. It's more specifically related to some proprietary structured commercial opportunities that we have really solid line of sight into on the wholesale side of the business, quite frankly.

To your point though, I think it's important to note we have raised our targets each – $50 million each quarter for 2015, for a total of $100 million so far year-to-date. And a lot of that has been driven by really three things. One is the monetization of loads that we sold at higher prices last year. So, we have seen increased value from that load-serving business, some of our optimization activities. And then we went in, as you saw from our disclosures last quarter, we went in with a short bias with a backstop of our own generation, and given the results of market prices in 2015 to date, that's performed well.

We would only look to raise those targets, the power/to go targets or non-power/to go targets, if we have good line of sight into specific opportunities. And in this case, we do.

<Q - Greg Gordon>: Okay. Follow-up to that. If these are fairly chunky opportunities and you win them, will we get a sort of a discrete disclosure or would that just – would we get – would you just update it on a quarterly basis as per your usual, moving from to go to, into the hedges?

<A - Joseph Nigro>: Yeah. Yeah. We'll disclose that when the negotiations are complete.

<A - Christopher M. Crane>: And Greg, it will be in the MD&A disclosure [ph] in our interview (19:24), when it occurs.

<Q - Greg Gordon>: Okay, great. Second question. In light of economic conditions in Texas, most of your investors would probably rather see you pull the plug on this gas-fired project that you're pursuing. What gives you the confidence that the through-the-cycle economics of that investment are still worth going forward in this environment?

<A - Christopher M. Crane>: So as we said, we've got a very good deal on acquiring these assets on our brownfield site. Minimal infrastructure investment. They still have a double digit IRR with these market forwards. If you just projected we stay here for 10 years, and then plug the fundamentals in after, we're still at a double-digit IRR. This is a solid investment. These are going to be dispatched first. They're the highly efficient, air-cooled, and at the right price.

<Q - Greg Gordon>: Concise answer. Thank you. Take care.

<A - Christopher M. Crane>: All right.

Operator

And your next question will come from the line of Steve Fleishman, Wolfe Research.

<Q - Steven Isaac Fleishman>: Yeah. Hi, good morning.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01740

<A - Christopher M. Crane>: Good morning.

<Q - Steven Isaac Fleishman>: First to Jack, clarification. So in the updated 2015 guidance, are you including some amount of POM, both the business and the financing costs? And if so, is it positive or negative within the year?

<A - Jonathan W. Thayer>: So Steve, we are including – we are including the equity and the debt associated with the PHI acquisition. So for share count purposes, that incorporates a weighted average share base of 892 million shares. It does assume the third quarter close of PHI. But there is a measure of dilution this year that's related to the increased share count, the debt, and as we pursue rate cases on PHI, improve their revenues and earnings, we'll see the accretion that we anticipate with that transaction in future periods.

<Q - Steven Isaac Fleishman>: Okay. So just to clarify, when you net for this short period into year-end, when you net POM revenue and the financing cost, it's actually – your numbers would have been higher in this guidance if you hadn't included that.

<A - Jonathan W. Thayer>: Modestly, Steve.

<Q - Steven Isaac Fleishman>: Okay. But then we'll get the...

<A - Jonathan W. Thayer>: It [indiscernible] (22:02), but not materially so.

<Q - Steven Isaac Fleishman>: But the future accretion guidance that you gave, I think, at the last quarter, or recent commentary, that's still good for future years?

<A - Jonathan W. Thayer>: The impact on rate cases and the deferral of those rate cases modestly impacts the accretion, but we're still at the – as we disclosed at the last quarter, we're still at the sort of bottom end of the range in 2017 that we gave.

<A - Christopher M. Crane>: And so, it's 2018 to get to that – more to that midpoint of the run rate that we talked about.

<Q - Steven Isaac Fleishman>: Right. But you said that – you clarified that, I think, the last call or so. That's not new. Okay.

<A - Christopher M. Crane>: Yes. So, $0.15 in 2017, and you'll see us head to the upper end in 2018.

<Q - Steven Isaac Fleishman>: Okay. Second question is just with respect to the power views. I kind of feel like just, the last few calls you've been a little bit more mixed on your power views. You're a lot more bullish right now, at least, I guess, with respect to NiHub. Is that mainly just a fact that you had to pull back as of Q2 end, and so you're just more bullish because the starting price is lower, or are you more bullish even if the prices had stayed flat?

<A - Christopher M. Crane>: It's, the prices have gone lower. We're more bullish, they're non-sustainable at this level.

<A - Joseph Nigro>: Yeah. And, Steve, what I would say is, our view of the absolute value of power price hasn't changed quarter-over-quarter, and what's changed is we saw a material drop in the back end of the power curve and I'm talking to NiHub, but it's attributable to West Hub as well, but our upside is really baked at NiHub where we see material upside as you move out into that 2018, 2019 timeframe.

We see upside as well in that 2016, 2017 period, and what's changed is the market has fallen so much, quarter-over-quarter; our absolute view of power price hasn't changed. So that spread has gone wider. And when we look at our fundamental models at NiHub, in particular, we see a lot of value that's still to be derived, and that's due to the changing dispatch stack and some of the other things that we've talked about previously.

<A - Christopher M. Crane>: Talk about the lack of liquidity.

<A - Joseph Nigro>: Yeah, the liquidity piece of it is a big part of it, Steve. We had a $0.40 – approximately $0.40 a megawatt-hour drop in PJM, in West Hub and NiHub in calendar 2016. That's the most liquid period on the forward

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01741

curve. When we've pulled data and we have access to and look at what's going on in the out-years, 2018, 2019, 2020 where we saw a material drop in prices, there is absolutely nothing trading at NiHub.

There had been some few sporadic trades at West Hub, and you see the market set prices off of those trades. And our view is through time, that spread relationship between the West Hub and NiHub is going to collapse because of the retirements on the western side, the new builds on the eastern side, and that's why we think there is material upside. But our fundamental absolute view on power price hasn't changed. It's just the way the market reacted quarter-over-quarter.

<Q - Steven Isaac Fleishman>: Okay. Thank you very much.

Operator

And your next question will come from the line of Daniel Eggery (sic) [Daniel Eggers] (25:35) with Credit Suisse.

<Q - Dan L. Eggers>: Hey, good morning, guys. On Pepco, could we just talk about the process? So assuming that the D.C. decision comes soon, what is the process for closing from this point, and what bearing does the Maryland appeal have on your ability to close right now?

<A - Christopher M. Crane>: I'm going to get Darryl Bradford to cover that.

<A - Darryl M. Bradford>: Hey, Steve.

<A - Christopher M. Crane>: It's Dan.

<A - Darryl M. Bradford>: I'm sorry. Dan, we expect to – assuming a acceptable order from the D.C. Commission, we expect to close promptly after that order. Our contract would indicate that that will take place within 48 hours of approval by the D.C. commission.

And we don't think that the Maryland motion should be any bar to us closing. We don't believe that that motion has any merit whatsoever. As you know, the alleged conflict of interest of one of the commissioners having a preliminary interviewing discussion, which she stopped, with a non-party, isn't a basis under Maryland law to question the independence of that decision, let alone to stay the proceedings.

No court in Maryland and no commission in Maryland has ever suggested there's a conflict with the commissioner of any agency having a conversation with a non-party. Particularly where, as here, Exelon is one of some 45 board members, 140 members in an agency that includes public interest groups like Public Citizen, which was a party below and was the first one to raise this conflict issue.

So we don't think that that motion has any merit. We filed a response yesterday with the court, and we plan to go ahead and close promptly after the D.C. commission issues an order, assuming that that order has acceptable conditions. And we have faith that the D.C. commission will do the right thing. We think we've put in a strong case with a lot of benefits for customers and protections for customers. And we look forward to a prompt closing.

<Q - Dan L. Eggers>: Okay. Got it. And then I guess just on the nuclear plants in Illinois with PJM, I guess, probably moving the closure date to October. That's still probably before Illinois can act legislatively. With the drop in the forward curves, is there a practical way where you can look at those plants and think that they stay economic without some sort of legislation in Illinois? And does that force your hand come October?

<A - Christopher M. Crane>: The capacity market fixes, focused on reliability, will not be enough to keep all the units economically viable. It does give us some support for the investments that we continue to make on the assets to maintain the reliability but it's not totally there. We need a market fix in Illinois to stop the non-competitive nature of the market. And short of the legislation to fix that, we will have to make decisions on retiring assets that are not economically viable.

As we talked about previously, we have requirements around notification to PJM of our intent to retire units. It's an 18-month notification. We also have commitments around when we have to notify of our availability for the 2018-2019

final
Bloomberg Transcript

auction in participation on that. And very importantly, we have to order and design cores that – fuel cores that take a while for us to – or 2019-2020 auction instead of 2018-2019, 2019-2020 auction, our participation there. And we have to order the cores, and there's a long lead time there. Are we going to run for an additional year or are we going to run for a longer period of time? And that's a very expensive decision to make.

So, at least on the PJM [audio gap] (30:34) we'll make the decision, the final decision, if we're going to do that, in the September timeframe. We've been in consultation with the Board and we'll continue to consult with the Board, and where management's made their decision we'll pass that to the Board for the final approval in that timeframe, and continue with the outreach to our stakeholders.

<Q - Dan L. Eggers>: Chris, just given the fact that you're not going to have legislation realistically done before September, and you kind of laid out the other challenges, doesn't it – what would cause you to not close the plants come September, based on the fact pattern you just laid out for us?

<A - Christopher M. Crane>: If the units clear the 2018-2019 auction, that would show that they're financially viable. That is a long shot in our opinion, just because of the cost structure and how the forwards have continued to collapse at the bus at a couple of these units. We've got the transmission constraints, we've got the overproduction and importation of wind that not only drops the spot but continues to collapse the forward curve. The disconnect between NiHub and the bus at some of these units is $6, $7. And we have worked very closely with all the stakeholders involved for over a year and a half on trying to come to resolution, and it is the time that we'll have to make the decision after we see what happens with the capacity auctions.

We don't take the decision lightly. We understand the effect that we have on the communities and potential effect on employees, but this has been a long-term issue that we've been evaluating and trying to come to resolution, and we're staying within the timeline. Actually, we extended our timeline last year to give more time to come up with the proper market fixes, and to be compensated adequately for operating these units versus subsidizing a low-cost market.

<Q - Dan L. Eggers>: And I don't mean to beat this to death [indiscernible] (32:49) for this, but would closing a Quad or a Clinton show up noticeably as accretive to you guys on 2017 numbers?

<A - Christopher M. Crane>: We don't – we have not looked at that, and don't look at it. We analyze the plants as a standalone in their own economics, so it's about a plant losing money. We have not evaluated; others have and others have talked about the impact to consumers on those units closing. The state itself did that assessment, and there is some material impact on the consumer, but we have not evaluated anything specific to Exelon.

<Q - Dan L. Eggers>: Okay, very good. Thank you.

Operator

Your next question will come from the line of Jonathan Arnold with Deutsche Bank.

<Q - Jonathan Philip Arnold>: Good morning, guys.

<A - Christopher M. Crane>: Hey.

<A - Jonathan W. Thayer>: Good morning.

<Q - Jonathan Philip Arnold>: One – just – given your comments about liquidity in the forward curve, is it fair to assume that you've probably not done much in the way of 2018 hedging yet? Because ordinarily you would have been a couple of quarters into it. Just curious if you could give us any insight?

<A - Joseph Nigro>: Yeah, Jonathan. We are behind our ratable sales plan in 2018. As you know, we have a very big load-serving book of business, so we've captured opportunities, both in our retail and wholesale load-serving businesses to the extent possible, in 2018. And in addition, at times, as we've spoken about in other years, we used the gas market as well. But to sell straight OTC power in 2018, we've not done much, if any, of that at all.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01743

<Q - Jonathan Philip Arnold>: Okay. And then just to revisit the commercial opportunities comment. Can you give us any insight as to what kind of opportunities you're talking about? And is it, are they the result of others pulling back from the market, or just successful discussions with potential clients I guess?

<A - Christopher M. Crane>: It's early on that one, Jonathan. We'll do the full disclosure when we complete the negotiations.

<Q - Jonathan Philip Arnold>: Okay. Sorry to re-ask that. And then, Chris, at the outset, you made the comment that you saw the inclusion of DR in the transition auctions as being, I think you said, nonmaterial to the outcome?

<A - Christopher M. Crane>: Yes.

<Q - Jonathan Philip Arnold>: Could you share a bit more of your kind of logic and thought process behind that statement?

<A - Christopher M. Crane>: Yeah. Joe?

<A - Joseph Nigro>: Jonathan, it's Joe. First of all, we lost over $1 billion of market cap post the announcement of that, of the inclusion of DR in 2016-2017 and 2017-2018. And we really thought it was a little bit of an overreaction. As Chris mentioned, we're disappointed in the delay, but we don't believe there's going to be a material impact to either of those transition auctions. As you're aware, DR was already included in 2018-2019 and beyond.

The reason why we don't think it's a material impact in the transition auctions is really related to how the auctions themselves cleared on the base residual, and the separation in price in 2016-2017 on one side, and then the amount of DR that clears in the 2017-2018 auction, and when we put that all into our models, it's very similar to what we've read, quite frankly, from a lot of what's been written by the equity community, that it's going to be a limited impact.

<Q - Jonathan Philip Arnold>: Okay. Thank you for that.

Operator

And your next question will come from the line of Julien Smith with UBS.

<Q - Julien Dumoulin-Smith>: Hi. Good morning.

<A - Jonathan W. Thayer>: Hey, Julien.

<Q - Julien Dumoulin-Smith>: Hey. So, first quick question and it does kind of rehash a little bit here, but on the fundamental upside you're talking about, just to be clear, what does that assume in terms of retirements, just to be clear? Your own retirements, particularly as you're thinking about the life of your portfolio here in the back half of the year?

<A - Christopher M. Crane>: Yeah. We have not evaluated the potential retirement of any our assets on market-forward prices. And, so this is just based off of fundamentals of what has been announced, and what we see for retirements, what we see for the economic viability of the existing fleet in what they would have to clear to stay viable going forward. So it's not a sustainable market forward with the asset mix that's currently in. It has nothing to do with any forward decision we would make.

<Q - Julien Dumoulin-Smith>: Right. So just to be clear, nuclear retirements would be incremental to your fundamental upside?

<A - Christopher M. Crane>: We don't know that. We have not analyzed it and I wouldn't want to project one way or the other. It's, there are two different things. The nuclear asset retirement is based off of the economic viability of the asset on the stand-alone. And we have had losses and free cash flow losses in the trailing five years of some significance. And we project going forward with these market forwards, them to be even worse than they were a year ago, which is driving us to make that decision. It is not based off of any potential impact on the market forwards or the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01744

rest of the fleet's viability.

<Q - Julien Dumoulin-Smith>: Got it. And then two subsequent questions here. First, in terms of the FCF losses, what would you estimate those as being, both for the eastern portfolio and for the ComEd portfolio as it stands today? And then secondly, tied into that, as you evaluate the remaining life of some of these assets, would you imagine layering one announcement after another? So I suppose specifically, there's a timing issue related to ordering new cores. I imagine certain units have to get those orders in before others. Could we see one nuclear retirement and then subsequently, depending on what happens in the legislative arena, et cetera, see further announcements later this year, in trying to reconcile the bigger issues around FCF deficit?

<A - Christopher M. Crane>: Yeah. We've discussed fairly openly the units, the affected units. PJM's rules require us an earlier notification than MISO's rules. And so, we would be moving forward, if we have to, on PJM units before MISO units. We don't project a MISO decision until beginning of next year, looking at the opportunities we have with that unit either through legislation or other mechanisms, to secure the required revenues that we need there.

We've talked about New York units. We're still working with our partners in our stakeholders in New York to look at, is there a viable way beyond – a reliability must-run situation to maintain economic viability there? And the final asset that's been in discussion is Oyster Creek, which we've already had an agreed-upon early retirement date at the end of 2019. So, short of the – short of a, some type of failure that was a costly failure on the unit, we would run into that period to allow adequate transition, utilization of the fuel, and adequate transition of our employee base to other facilities.

<Q - Julien Dumoulin-Smith>: Got it. But just to be clear about the MISO unit there, depending on the success this year in the legislative arena, would that drive that decision?

<A - Christopher M. Crane>: It would have a – it would heavily weight our decision.

<Q - Julien Dumoulin-Smith>: Great. Thank you.

Operator

And we have time for one final question. Your final question will come from the line of Chris Turnure with JPMorgan.

<Q - Christopher J. Turnure>: Good morning, guys. I wanted to get a little bit more color on the Pepco approval process here, and the court challenge, than what you've already talked about. Do you have any sense of the precedent, or a precedent, for actually staying a commission order? Obviously you disagree with the merit of this case. But you do you have any precedent there, and what would be the path forward if it was not stayed, and you got the decision out of D.C.?

<A - Darryl M. Bradford>: Thanks. It's Darryl again. Yeah, the precedent on a stay is very clear in Maryland. It's an extraordinary remedy. It is rarely granted. You have to show a likelihood of success on the merits. And the motion does not, on the merits of the underlying merger, raise any issues whatsoever. The only issue that raises is this specious purported conflict claim, which we think is very, very weak. So, we don't think they've attempted to meet that.

They would also have to show irreparable harm, which – they spend a paragraph trying to satisfy that. It's really not very persuasive, in our view. They would have to show that a stay is in the public interest. And, of course, not only has the Maryland Commission, but the New Jersey Commission, the FERC, the Delaware Commission have all found that this merger is in the public interest. And they'd also have to show that the hardships favor them, and in our pleading we lay out why disrupting – the hardship of potentially disrupting a $7 billion merger outweighs any hardships that would occur from the grant of the stay.

So we think it's an extraordinary remedy. We don't think that they've come close to meeting those standards in any respect. And the law is also very clear that in Maryland, it's not a balancing. They have to satisfy each and every one of those elements, and in this case, in our view, they haven't satisfied any of them. So, that leaves us in a position where, upon D.C. approval, and assuming that the court agrees with the pleading we filed yesterday and doesn't grant a stay,

final
Bloomberg Transcript

that promptly upon the D.C. Commission joining the other commissions in finding that this is in the public interest, and assuming that any conditions it imposes are not unduly burdensome, that we would close promptly.

<Q - Christopher J. Turnure>: Okay. Great. That's very helpful. And then, is there – or my understanding is that D.C. has to rule by the end of August. Is there any flexibility around that timing? Can they extend that again?

<A - Darryl M. Bradford>: Yeah. There is no clock in D.C., so they are not under any time constraint. Generally, the D.C. Commission has ruled within 90 days of something being fully briefed and submitted to them. This was fully briefed at the end of May. So that 90 days would end at the end of August. I think that's where that date comes from. Obviously, we're hopeful that sooner is better than later, but that will be up to the D.C. Commission, and they'll rule when they have finished their work. They are, I think, acutely aware that a lot of people are looking for a decision from them, and they understand that. But they will take the time that they deem necessary in order to do their job right.

<Q - Christopher J. Turnure>: Okay. And then if I could, real quick, Joe, I just wanted to follow up, you've mentioned lack of liquidity in the forward markets a couple of times on the call here. Is this a lack of liquidity that exceeds just the general nature of these markets and what you've seen historically? Has that increased, and if that is the case, do you have an opinion as to why there might be so few trades going on out there?

<A - Joseph Nigro>: Yeah, I think it's probably worse than it has been historically. And I think some of it is, there is just no natural buyers out on, that far out on the forward curve, as I said. The back end of the forward curve was dropped much more than in like 2016, where there were more natural buyers, whether we talk about retail or speculators or other participants. So I think with some of the folks that used to participate in the markets not doing that, some on the banking side and others, I think it's had a material impact.

<Q - Christopher J. Turnure>: Great. Thanks a lot.

Operator

Thank you. And that will conclude today's conference call. We appreciate your participation. You may now disconnect.

MANAGEMENT DISCUSSION SECTION

Hugh D. Wynne

Good afternoon. Thank you all for joining us today. It's my pleasure to introduce to you, Chris Crane, President and Chief Executive Officer of Exelon, positions that he's held since Exelon's merger with Constellation in 2012.

Previously, Mr. Crane was the President and Chief Operating Officer of Exelon Corporation. His background is on the power side of the business, having become President of Exelon Generation in 2008 and Exelon's Chief Nuclear Officer in 2004. Including his 15 years at Exelon, Mr. Crane has accumulated over his career more than 30 years of experience in nuclear generation, having worked at nuclear power plants across the country, including Browns Ferry, Comanche Peak and Palo Verde, the nation's largest. So, I'll turn it over to you.

Christopher M. Crane

Thanks, Hugh. Pleasure to be here. Thank you for all coming. I'm going to start with a little bit of an overview of the company for those that you haven't seen it. We – let's get cautionary statement as required by the lawyers.

So we have two main businesses that we operate under our competitive business and our regulated business. Exelon Generation is comprised of multiple segments. The first being the power generation side, which is our fossil fleet, renewable, and then is the nuclear generation side, which out of the 33 gigawatts of power provides 19 gigawatts of our capacity. We're the largest nuclear operator in the country and the third largest in the world. We also have a substantial footprint in natural gas. Our renewable portfolio continues to grow under that segment and we will continue to find investments in that.

The other business segment that's in Exelon Generation is our Constellation business. This is our commercial arm. It's the leading competitive energy provider in the U.S. We service over 2.5 million customers there. We have a wholesale and retail customer base and manage our portfolio through the Constellation. We also have customer-facing businesses within the Constellation business that allows us to optimize our products that we bring to the market.

On the Exelon Utilities side, our utility is our regulated platform, which is composed of Commonwealth Edison in the Chicago area, PECO Philadelphia Electric in the Southeast Pennsylvania, and Baltimore Gas and Electric. We have made significant investment in infrastructure and we'll continue over the next five years with an investment of approximately $16 billion into the wires business. It's upgrading the systems, putting in the smart grids and the new technology to drive not only higher levels of reliability but also customer satisfaction. And so together both of these segments, the Generation Company and the Utilities, make us the largest competitive integrated – one of the largest competitive integrated companies in the country.

Bloomberg Transcript

I talked a little bit about our Chicago, Philly and Baltimore, but, as you can see, we do have a national footprint going across the country. We operate power plants in 24 states nationally. Our fossil plant spans from the South, Southeast, up into the Northeast in the New England area. And we are currently developing multiple power plants, highly efficiency gas, combined cycle gas turbines in Texas, where we also have existing assets. You'll notice that our renewables span in many territories, largely in the Midwest, West and the South, as you can see from the index.

These are – the renewable assets are largely contracted assets, and primarily wind and solar at this point. We're actively growing that portfolio over the last six years since we've gotten into the business and today, we have 1.6 gigawatts of renewables. We do operate across the seven major regional transmission operating areas through our – although our largest footprint remains in PJM, in ERCOT and also in New England. And our Constellation business via the wholesale and retail gas and electric operations actually does have a footprint in 48 states and in Canada, giving us a customer reach that is unrivaled.

Our strategy, let me give you a sense of how that comes together through the primary business. First, overall, the overarching strategy for all our business is operational excellence. The way we operate our plants, the service level we provide to our customers is the biggest driver of value and relevance that we can create in the marketplace. Primarily look at our Utilities to provide the stable earnings and the dividend support, while our competitive business remains exposed to the power market recoveries and also the capacity markets.

I'll talk about managing commodity risk through our Constellation business. We continue to do this while we're extending our market share through acquisitions. In that part of the business last year, we picked up two portfolios, ProLiance and Integrys, that give us even more scale and presence across the country.

Another way we manage our commodity risk besides the retail outlets is also targeting contracted revenues with our incremental investment there by reducing the volatility. We're additionally, we're very mindful of the evolving energy landscape. As many of you have seen, there's a lot of what is termed as disruptive technologies that potentially pose some kind of market entry and we're trying to look at those as enabling technologies. If it's renewables, distributed generation, it'll all play a role in the change in the customer behaviors. We'll call for our utilities to adjust the classical utility model and move more to a modern model that people wanted to have distributed generation we need to figure out how to service that.

The integrity of the grid will remain a challenge for us as going forward as policies evolve around things like distributed generation and adequate recovery mechanisms for investments. We have taken some specific actions at each one of our businesses to remain both innovative and respond to rapid changing world. Within our generation business, we're doing some partnering with other institutional and commercial industrial customers deploying fuel cells, looking at power – excuse me, solar panels, battery storage, and energy efficiency to meet the needs that the customers want. As we pursue a regulated growth at the utilities, we're seeking innovative solutions through policy advocacy in making sure that we capture what the value is to the customer that the grid really provides while preserving an ability to get a return on our investment. And so we think this does advantage us on the competitive integrated model.

One of the latest transactions that we have been working on is the acquisition of Pepco, its PHI Holdings. Many of you have been following the proceedings of our merger, we believe that we're coming near to the end of the process. We have received regulatory approvals in six of the seven jurisdictions and we're waiting for regulatory approval in Washington, D.C. over the next 60 to 90 days.

Our – the geography of the location of PHI utilities fits nicely within what we exist and have between Philadelphia and Baltimore. It essentially makes a contiguous system from D.C., all the way through Maryland, into Delaware, South Jersey, and Philadelphia. It allows us to create opportunities to improve customer reliability, storm response, and ultimately, driving cost savings. The acquisition itself will drive utility earnings to around – average around 65% of the overall earnings. And you can see that the 61% to 67% on the bottom right hand side.

Adding the PHI capital program alongside of the Exelon Utilities' capital program, as I said, will add an additional spend over the next five years of $6 billion to $7 billion, which by 2017, our rate base or total that we are allowed to get the regulatory recovery on, our earnings will be at over $34 billion. So the change in the pro forma mix supports the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01748

incremental leverage that we're putting on at the holding company, while allowing us to main high quality credit metrics and giving us flexibility to continue to invest across all of our businesses.

At the end, it's a highly accretive transaction. We expect it to be within $0.15 to $0.20 accretion, probably on the $0.15 side of that by 2017. And as we move through rate cases, we'll continue to drive that, and as we're driving efficiency to the $0.20.

I talked about the regulatory approval process. You can see Virginia, FERC, New Jersey, Maryland are all done. Delaware has approved this settlement, but the order will not be issued till June 2. The Department of Justice has clocked out. We don't think we have any more work there on the Hart-Scott-Rodino. So we're down to the final, which is the District of Columbia, and we think we've made adequate progress there to expect a positive order. The Maryland order was very positive. So the closing will come in the third quarter we believe and hopefully on the earlier side of that.

So from a policy and business priorities, we have a number of objectives, which I've discussed some of them on the most recent earnings call, but our advocacy effort in Illinois has been focused on protecting the reliability and the environmental benefits of our 11 nuclear plants. We're currently competing against other subsidized generations. So the desire is to create a low carbon portfolio standard. There's a bill that's in the House and the Senate right now. Illinois has its own problems with its budget. So there's been some distraction for that, but we see that as a solution.

We also in Illinois have an Energy Plan for Illinois' Future, which promotes energy efficiency on the utilities side, drives innovation through pilot – a few pilot microgrids, testing out microgrid controllers. We received a grant from the DOE to develop the first controlling system for a microgrid, and we'll continue to make sure the utilities are treated in an equitable manner.

In PJM, right now, the capacity performance discussion remains in process. We believe that PJM's response to address FERC's questions that came up in the original filing should resolve those comments. And we're pleased by the active attempt by both FERC and PJM to make the necessary design changes in order to ensure reliability. We expect the decision from FERC in a few weeks and that will allow PJM to set up and by August have the auctions for the capacity performance in place.

We're also working to finalize a contract at one of our facilities in New York, the Ginna facility, which is under a reliability mandate to continue to operate for – till 2018 to ensure that the necessary system modifications can be made to ensure reliability as required right now to keep stability of the grid.

So we do believe that we're well positioned for a strong future on multiple fronts. Our integrated business model provides the ability not only to invest in both the regulated and competitive business, but also change the way that we serve our customers in the evolving energy market. We'll continue to diversify our business to capitalize on the changes within the industry, while optimizing our portfolio through the commodity cycles that we see. We have a very strong record – track record on operational excellence and we see that as how we continue to drive relevance and shareholder value.

Our financial strength gives us the access to the capital markets, maintaining an investment grade as a competitive power generator allows us greater flexibility in our transactions, counter-party transactions. And lastly, as I discussed, we continue to advocate for policies that both value the benefits of clean power generation and protect the integrity of the grid.

So with that, I'll jump with you.

Q&A

<Q - Hugh D. Wynne>: Great. Thank you, [ph] Doug (15:02). Please use your index cards to write down any questions you have. We'll pick them up and put them to Chris. I was surprised in preparing for your presentation today...

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01749

<A - Christopher M. Crane>: That's always a problem when you're surprised.

<Q - Hugh D. Wynne>: Yeah. Well, I shouldn't have been surprised, perhaps, but I was. I was looking at the valuation of Exelon Corporation comparing it to the valuation of the regulated utilities, the valuation of the competitive and hybrid utilities. And what struck me is that on 2017 earnings, which would take you out to a timeframe when some significant portion of your hedges would have rolled off, the company seems to be trading at sort of a 10% discount to most of its competitive and hybrid peers, and it's also trading at a 10% discount relative to the regulated names. And on other metrics such as EBIT, EBITDA, price to book, price to cash flow, the discount is even larger. I'm sure that's an annoyance. I was wondering if I could get your view on what's driving that and what are you doing to try to rectify it?

<A - Christopher M. Crane>: So we're the most levered to a commodity recovery, natural gas, heat rates, electric energy prices, and we're also the most levered to the PJM capacity market. We're the most levered to the 111(d), but we think that we have to show site to accomplishing that to get the full valuation. We – having the certainty of those cash flows coming in will actually de-risk us and create less variability on the commodity cycle. So we recognize that. We understand that the regulateds are now being valued on the low interest rates and that too will change when we see as interest rates continue or will start to increase.

So we need to prove to the market that these leverage points that we have can actually create value. And as they come to fruition, we should start to see that first with the capacity market changes, then with the coal units coming off and the Eastern Interconnect as those prices respond, as we've talked about for the last couple of years. And as interest rates increase, we think we should at least hold our own, if not, improve.

The issue with our earnings on the utilities side, now, 50% of the earnings come from the ComEd business. ComEd is a recovery mechanism. Its return on equity is 580 basis points above the 30-year treasury. With the 30-year treasury down to 0.25% today, it's decreased the earnings power. As interest rates come up, actually, we become more profitable. And so, we need to make sure we're getting that story to the market.

The other aspect of interest rates rising is the liability and the expense that we have to take on our pensions. So we're uniquely positioned on an interest rate recovery for our regulated side to – that should offset the concern. And as I said, at least maintain if there's equilibrium in the multiples or improve our multiple on that side.

<Q - Hugh D. Wynne>: It seems when you go through the list of levers to higher gas prices, higher capacity prices, obviously, terrific leverage to the clean power plan, and index to ROE in Illinois that, if anything, you should be looking at an in-line valuation as opposed to discounted one. Is the market telling us something about the hybrid structure? Is there a view that that's not the type of portfolio of businesses and risks that the market wants them?

<A - Christopher M. Crane>: Well, even within some of the hybrids, we're trading at a discount. So I wouldn't take that as the message. That's something that we've had a couple of discussions. Today, we're meeting with our investors. How durable is this model? And you see others going away from the competitive integrated, but where we can truly differentiate ourselves. If you were one of the more recent ones that's spinning off, the quality of those assets, the commercial business that's doing wholesale and retail, is nowhere comparable to ours. So having the base load assets in nuclear, the cost advantages that we can have with those, having capability for the Mid Merit and the peaking, our hedging capabilities, we see that that business is a strong business.

And the other thing that's not recognized is that business is what is funding the utility growth, $16 billion over five years without equity being issued. So it's a very good engine for growing. We have done – as you would expect, we on a regular basis on our strategy look at our structure. Is it the Holdco structure with the competitive integrated? What are we doing within the generating company as far as structures? How are we managing our assets? And the most recent study, which say, apples-to-apples, if we were to spread or break the businesses apart, not only would we not have the capability to fund that $16 billion going into the wires companies, which is very good – will be good return on rate base, but also it would have about a $3.5 billion destruction on total value. If you look at cost of capital, cost of equity, counter-party limitations on counter parties being below investment grade, you wouldn't split the companies and try to expect to maintain investment grade. The FFO to debt hurdles that would be put on by the rating agencies would make it very, very tough.

What we've seen from other separations, the requirements for capital to be posted for the nuclear assets, the most recent one was a couple hundred million for two units. We have 24 units hanging up that much cash on a balance sheet just as negative impact. So we think it's the right model. We think we differentiate ourselves from others. We think we have to show that these catalysts that we have for change that are going to come to fruition and then, our valuation should improve.

<Q - Hugh D. Wynne>: Is the market possibly expressing some concern about the durability of the cash flows from ExGen? I think the average term of your nuclear operating licenses on that fleet is about 15 years. Are you getting a discount for that?

<A - Christopher M. Crane>: I'm not sure how many investors look out 15 years. It is where we haven't had any question on that. There's near-term value upside, but to address what does the company look in two decades, that's a lot of the work that we're doing on the diversification, how we look at the investments we're making, contracted assets, or durable assets. Our expansion in natural gas, right now we're the fifth largest in the marketplace on merchant natural gas storage.

Our transmission capacities that we contract for, where our gas portfolio management desk has grown considerably, we're doing well in gasses along with electricity. That drives us into optionality around projects like our LNG facility that we're permitting and that would be a fully contracted asset. Making investments like that will continue to provide avenues for future earnings. There is some inevitability in decades to come that there'll be less nuclear units, partially because of age and partially because of economics. As we look at those units today, the smaller single site, Ginna, Oyster Creek, they're not going to be able to compete. But we have a pilot project that we've started with the Nuclear Energy Institute, Department of Energy, and EPRI, or Electric Power Research Institute, to extend the life of the plants beyond 60 years to 80 years. The larger dual-unit sites would be great candidates for that.

People look at how can you have a nuclear plant run for 60 years. It's not the plant that was built 60 years ago. The concrete is the same. The reactive vessel is the same, but there's considerable investment. As you've seen and noted from our CapEx that we put in our turbines on our dual-unit sites. All our sites have new turbines, new generators, new transformers. We're constantly upgrading or changing pipe and pumps and valves.

So your active components have all been, continue to be upgraded and changed out. Our control systems are not the old control systems of the 1960s. We have state of the art digital controls on most of our reactor protection and turbine control systems. So it is a natural potential that we can do that. If the economics of the units are being compensated for their environmental benefits and their reliability benefits, we think there's an avenue to continue to drive those.

<Q - Hugh D. Wynne>: Maybe you could comment a little bit about some of the efforts you've been making to improve the economics at Ginna, but also at Clinton and Quad Cities. Where have you gotten to in New York? What are you expecting the outcome to be in Illinois?

<A - Christopher M. Crane>: So, in New York, we have a reliability negotiated deal that has been approved partially. We have to go back to RGE and we're negotiating one point – or two points that FERC wanted, but essentially we have a contract to run that at cost with a risk premium through 2018. Unless New York does something around 111(d), that unit will be challenged to run after 2018. If it doesn't have a contract for reliability, it's losing money. So it only makes sense to take it off. We'll work with New York on that.

Clinton, we've done a lot around the costs on Clinton. Clinton used to load a reactor core for 24 months. And when energy prices were higher, the cost of a refueling outage was $30 million to $40 million. Because of fuel costs are down, energy costs are down, we actually are loading a core every year, so that saves some money. We've done some other things. But the reality for Clinton is, if there is not a low-carbon portfolio standard that comes out in Illinois, the MISO market is not designed to support a competitive generator like that and the capacity market just doesn't work. There was Zone 4 and MISO is where that plant is at. There was a significant jump in the capacity prices. There was next to nothing that was getting paid. It went to $150 a megawatt day. I think that increased the profitability by $10 million on an annual basis. It's just not significant.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01751

Quad Cities, again, it's the low power – the low carbon portfolio standard that will be required to support that. We don't think the capacity performance plan on its own can do that. It might. And if it did through this next auction, that would be a great thing, because we're recovering our full costs and we're getting a risk premium on top of that. So it's a profitable unit.

The Illinois legislature, if it takes it up this session, that would be great, but we are on a clock to make an announcement or a decision in September and we will make that. If it doesn't clear, we don't have a bill. And if it doesn't clear, the capacity auction will have to take the next steps in announcing its early demise.

<Q - Hugh D. Wynne>: Now, let's talk about the PJM capacity auction. Do you see the more stringent definition of availability that's implicit in the capacity performance product, as creating a sustainably higher capacity price, which at least in my mind would require some kind of ongoing recurring cost of providing capacity? Or do you think that there'll be sort of a one-off adjustment with a bunch of capital expenditures that will allow people to meet the new requirement? And then, once those capital expenditures are made, they'll be treated as a sunk cost and the capacity price will fall to a level that reflects sort of the ongoing variable cost of providing it?

<A - Christopher M. Crane>: Many of the units that have cleared previously in the capacity auction have been run on very low O&M. And you saw their availability during the Polar Vortex, when they weren't able to come up. I think the requirement of maintaining a dual-fuel, the requirement and the penalties for the non-performance will drive expenditures in maintenance and maintenance practices that some of the gas units and the coal units have not seen before.

<Q - Hugh D. Wynne>: And so what will be the sustainable implication of that do you think for capacity prices?

<A - Christopher M. Crane>: I think if we have the interim auctions, we have a cap on that. I think it's 0.8. And so that will be the seed capital to get the units, the maintenance and the required capital to – if it's oil tanks or whatever. I think that there may be, in the future, a slightly – could be a potential slightly less, but it's going to be increased over the past benchmarks or averages for capacity clear, just because of the cost of maintenance.

And it's all about bidding behavior. We look at it as we're going to take a risk to bid in. So we're going to bid in a risk premium. Others, hopefully, we have seen some lack of discipline in the capacity market in the past. If people don't understand the risk of this commitment and they don't put a risk premium in, you could see a reduction there. But I think the additional maintenance and getting paid for the risk will keep it at an adequate level.

<Q - Hugh D. Wynne>: Are we talking about something that's bigger than the bread box or -

<A - Christopher M. Crane>: Well, it's -

<Q - Hugh D. Wynne>: $10, $50 maybe?

<A - Christopher M. Crane>: I think we see a long run that could go 160 to in the 200s, which would be greater than what we've seen. I think it was at 116 or 110, I forget what it cleared. 120 cleared. So there's some improvement.

<Q - Hugh D. Wynne>: 160 to 200s, okay. And if that expectation were fulfilled, what kind of EPS impact would you be expecting?

<A - Christopher M. Crane>: So that $10, [ph] Andy's (31:00) got this number up top there. What's the EPS number?

<A>: $10 is $0.05.

<A - Christopher M. Crane>: Yeah, $10 is $0.05. So if you go up from 120 to 160, you get [ph] 20% of cash (31:12).

<Q - Hugh D. Wynne>: Okay. The other short-term upside that you mentioned to earnings was the Pepco deal, $0.15 to $0.20, $0.15 by 2017. I think $0.20, you said if the cost efficiencies come through. Is that incremental to a 2014 base or are you measuring off of an earlier base?

<A - Christopher M. Crane>: 2014.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01752

<Q - Hugh D. Wynne>: 2014. Okay. Had a couple of questions around that deal. I guess the first one was can you make any comments around the D.C. Public Service Commission approval for the Pepco transaction? What your expectations are?

<A - Christopher M. Crane>: Well, the process as designed is very thorough. And I think that we met the test that that commission needs to ensure that this is in the best interest of the consumer, not only financially but reliability. And so, we feel comfortable that that's a good commission. They rule by the law. They've got a past precedent of following the law and we – you can always be surprised, but we feel like we've made the test and they'll process it properly. They could ask for more, they could ask for more spend, they could ask for more concessions, that's their option and we would have to weigh our ability to meet those requirements as we read them.

<Q - Hugh D. Wynne>: A related question is what are the costs to consider in the – complying with the most favored nation provisions in other jurisdictions?

<A - Christopher M. Crane>: So just the Maryland approval, we priced out where we thought New Jersey and Delaware would be. The Maryland approval across all jurisdictions increased by $11 million, so it was not significant. We're still within a reasonable range. The incremental increase in that does not have a meaningful effect on earnings per share. It's more balance sheet space we use at the holding company, which could prevent us from doing other things, but it's still a very good and accretive deal.

<Q - Hugh D. Wynne>: I wonder if we might get into some of the longer-term potential earnings upside, specifically, could you perhaps comment on some of the evolving changes in the eastern end of PJM? I'm thinking about what are your expectations for the gas price, particularly as you're looking at a gas price that's sort of anomalously low as production from the Marcellus has been bottlenecked into that region, and also the implications of a declining conventional fleet in response to MATS and potential of the clean power plan?

<A - Christopher M. Crane>: So, on the gas, we went through last year a significant portion of it with a negative basis and we've seen that basis collapse more recently and is actually a premium to the hub. But we long run see gas $4, $4.50, and that's $1 in gas improvement for us is about $800 million in earnings. So we're significantly levered to recovery in gas. We look at the economics around gas, and the infrastructure investments that are being considered to alleviate that congestion in that area, we think that that is supportive of a higher gas price in the long run. The Governor in Pennsylvania has just tasked a committee to look at how do we expedite that so it continues to have the economic development support that Pennsylvania has enjoyed over the last couple of years. A lot of rigs have laid down, a lot of things have slowed and the jobs have had an impact. So we feel good about the gas price and we'll continue to follow that.

So on the retirements, the early retirements, we'll continue to see I think heat rate expansions around that, and we believe that there is upside with that. Eventually, new units will come back in, but you'll have the cost of those new units where most of these are coming off are fully depreciated, minimal CapEx and OpEx going into them. So we think that that is an advantage on top of a more rigorous clean energy standard around carbon would be a positive thing for us.

<Q - Hugh D. Wynne>: So let's talk a little bit about the dynamics of coal to gas switching and that'll give us kind of a segue into carbon. Do you think that $1 move in the gas price in that part of the world, Eastern PJM, would be reflected in a sort of commensurate move in the power price? Or do you believe that power prices currently are being sustained by the operating costs of some of these Appalachian coal burning plants?

<A - Christopher M. Crane>: Yeah, I think that's the case on the west hub. I think it's fairly priced based off of those units, as some more of them come off. I think there's 6 gigawatts to 9 gigawatts more to come off. That will be – that support will be less impactful. I think natural gas – so with the shrinking coal fleet, when is gas on the margin, when is coal on the margin? That's yet to be seen, but we do think that that is an upside.

<Q - Hugh D. Wynne>: And then under the – well, let's talk a little bit about northern Illinois and then we'll move on to the clean power plan. How would you characterize the dynamics in northern Illinois? Do you see any potential changes in the shape of the curve, the hours that gas and coal run the margin, or is that fairly much a steady state

final
Bloomberg Transcript

market?

<A - Christopher M. Crane>: So we've got a transition period here where some of the coal is going to gas. They'll have a – there'll be more of a capacity play for those that are doing it, but it will – we definitely think there is still that $3 to $5 upside as we transition through that switching. There is not a lot of installed gas capacity at this point in NI-Hub. If there were, there's not the demand to develop it at this point either. So we see lower costs, unscrubbed or uncleaned coal going over to natural gas, a conversion – an internal conversion that would drive them less energy efficient and, as I said, more of a capacity play within the area and prices should respond to that.

<Q - Hugh D. Wynne>: Now, under the clean power plan, the objective of the EPA is in large part to reduce CO2 emissions of the existing fleet in the short-term by substituting gas-fired generation for coal. It's possible that in the revised plan that comes out in August, we'll see a longer compliance deadline, but that'll probably still be the backbone, I think, of the medium term CO2 reductions. Have you all had any insight into how the states in which you operate are likely to implement the clean power plan? How that transition will be achieved? What the economic impact will be for you?

<A - Christopher M. Crane>: Yeah. That is the low carbon portfolio standard approach that we're taking in Illinois. It is an interim bill until the final plan comes up, but we see the final plan being somewhat designed around what we're prototyping with this current bill. We're in early discussions in Pennsylvania with the administration there on how that could work. We have had conversations on how we could make that happen with organizations like the Environmental Defense Fund, EDF, and others that working at coalition that builds a market response design is critical. There's some potential problems with 111(d) that have to be fixed for us to get fully recognize the value of what we're providing and give the states the right guidance. Under the rate reduction, you can actually take a nuclear unit out and replace it with a gas unit and be within compliance.

So the mass methodology, the rate methodology has to be coached properly that you cannot have an increase, and the mass methodology is a much better methodology to ensure that. So we've been working with the EPA as a company, and along with the Nuclear Energy Institute, on making sure some of these unintended consequences are adequately addressed. We think there's more work that can be done around creating the regulation that recognizes the regional fixes. And so how do you enhance a RGGI and how do you develop a Regional Greenhouse Gas Initiative around multiple states? So we're working within the states, but we need the regulation to have a few flaws adjusted.

<Q - Hugh D. Wynne>: Do you see the states moving in the direction of putting a price on carbon? I guess we're primarily concerned about Illinois and Pennsylvania, of course, but -

<A - Christopher M. Crane>: There is a potential for that. That to us a mass base reduction program with the price on carbon is the easiest one to get your head wrapped around. And it, feel like it's the most transparent, but also putting a price on carbon in some states is heresy. So allowing the states that we operate in primarily we think that that would be an approach that'd be taken, with the exception of our development in our existing assets in Texas, which are all natural gas. We don't see Texas going that way any time soon. But the meaningful states with the nuclear assets, New York, Pennsylvania, New Jersey, Maryland, they're going to be all leaning towards the compliance and agree with the regulations.

<Q - Hugh D. Wynne>: Do you think that there'll be a move to try to formulate a regional trading scheme for carbon emissions, or do you think that's impractical?

<A - Christopher M. Crane>: I think it could be difficult if not endorsed properly within the regulation. There is, as you see in California and others attempted. It's a potential, but it will come with – it's more complex.

<Q - Hugh D. Wynne>: And not that it's of equal importance to you, but in Texas do you see the state going in the direction of CO2 permits that they issue or how are they going to avoid a price-based program?

<A - Christopher M. Crane>: I don't know. Some states are talking about not even filing.

<Q - Hugh D. Wynne>: Right. Yeah.

final

<A - Christopher M. Crane>: So the EPA will give you the plan in that case.

<Q - Hugh D. Wynne>: Okay. I'm trying to think if there's other important issues here that we want to – one of the things that we've been hearing a lot about at this conference is sort of the development of the power industry over maybe the coming decade. Ted Craver at Edison International sort of expressed the view that the pace of change in the power industry was accelerating and has been accelerated obviously by the declining cost of renewable, but also by the evolution of distributed generation and energy storage. He's gone so far as to kind of express doubts about the longevity of a central station system with a radio transmission infrastructure to complement it. Do you have a view as to where the business is heading in terms of its structure? Will there be new model utilities in the future that we haven't seen in the past?

<A - Christopher M. Crane>: I think there is going to be a new model. I think the demise of central station generation is a little overstated. If you're in a state like California that doesn't have a sensitivity around prices, you can see more of that happening than not. But renewables, some renewable prices have come down, but they're still heavily subsidized. And the problem within some areas is they're not matching their renewable portfolio to their load profile. So yesterday, you had negative prices from 8:00 a.m. through 5:00 p.m. of $62 – greater than $62 in California. That really doesn't make a lot of sense. It may in California, but I don't think it's going to play in the Midwest and other industrial areas.

So I mean one of the things that we've seen with RGGI here in New York is, it's stalled a little bit because the reality of the costs of this new technology and whose going to pay for it is becoming clear. This cannot be – there has to be a social benefit to subsidizing or developing the microgrids of the distributed generation. It's a story of haves and have-nots. Now, the people that are getting the solar panel on their house have a credit rating greater than 750. They're selling it back on to the grid at net metering, which means they're deferring or removing their distribution charges, which is not equitable because that's following on the other customers.

So we have to get this right. We model – first of all, we model it as non-economic, that would say you're going to have rationality or people are going to be rational in the market. We don't see that happening. So we plugged in 10% renewable – or 10% distributed generation over 10 years. But even some of the best analysts around that that are driving the environmentalists will tell you, you can't do it without central station, without gas backup. Battery technology is advancing, but not economically and not large enough. If you want to start your air conditioner or your heat pump at your house, you need a surge capacity of 28, 29 kilowatts just to be able to turn that motor the first time and get it up and running. A 7-kilowatt battery pack on your wall is not going to support you coming off. There is two, you can put them in parallel, but its still – and how many cycles can it handle?

So we have a technology organization. We have a ventures organization. We're investing in battery technology to stay close to it. We have people scouring the national labs all the time. That will be the game changer. Is it as big as shale? I read an article today that said solar's as big as shale. Well, maybe if it's over-subsidized and overdeveloped, it will have the negative pricing effects that are the suppression of prices, but it's difficult to see the economics improve enough that you will never have, the freedom that you can go away from that.

<Q - Hugh D. Wynne>: So you're not typically concerned about a structural change to the utility model. I guess, in the short- to medium-term, you probably are much more concerned about negative prices, low off-peak prices, the kind of persistent flattening of peaks that you're seeing. Or am I putting words in your mouth?

<A - Christopher M. Crane>: No, I think you're right. But that said, what I talk to all the utility CEOs about is, this model of you talking about your rate payers, they're your customers. Your customers want certain services. They want reliability. They – in some places, they're going to want peak demands or dynamic pricing. They're going to want to manage their energy needs themselves. This is generations coming in that are much more astute to technology. And although disposable income on electricity and natural gas is greatly reduced over the last couple of decades, it's something that everybody targets and focuses on.

So as a utility, maintain relevance and look at where you want, what your customers want, and make those investments. The smart grid and the communications backbone to the smart grids start that. How do we can help control the street lights across the cities. There's controllers on that. You can bring them up. You can bring them down. There's energy

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01755

efficiency moves on that. There's communications with customers. If people want and there's a societal benefit of a microgrid because of highly reliability needs, we're working on a pilot right now that has a hospital, but also a critical facility for the Chicago Police and it's tied in with the Illinois Institute of Technology. You can get to the point you say that power can never go off. And so how do you put a microgrid that's tied to the grid with a grid controller.

You've got to advance technology. And Ted is right. We have not seen – I have not seen technology change in my 30-some odd years as fast as it is now. And a lot of these guys that are older than me say this is incredible. Its technology is going to change our world. We can stay relevant if we serve the customer. The thought that New York was having that you would take and have somebody separate, be the distribution system operator, like the transmission system operator, that's a threat. And if you're the person saying no, no, no, instead of saying, okay, here's the facts, here's the economics, but if you want it, here's the price and we'll help you get there. That's the difference.

<Q - Hugh D. Wynne>: So do you see the roll out of these technologies on the distribution grid as having a material impact on your investment opportunities, or do you think it's going to be a little bit like what you were describing on the generation side, a very long term expensive change that probably doesn't materially affect you so much?

<A - Christopher M. Crane>: So what we're investing in now, the $16 billion is mostly technology going in to harden the system, fault detectors, fault re-closers, isolators, smart meters, communication protocol. It is driving reliability and customer satisfaction. Now, that's where we have to go. That's where we have to get the technology in and make the customer experience much better. The storm fronts that come through, getting the technology that actually predicts based off of the direction of the storm, the speed, the velocity that which it's travelling, we can now start to zero in on, where the trucks go, how many poles we think we need, big data analytics, things like that are how you get out in front of it. Some of the other stuff that you hear on the distributed generation side, the economics aren't going to be there, but people may want.

Hugh D. Wynne

Great. I think we ran out of time, but I appreciate the time you spent with us.

Christopher M. Crane

Okay. Thanks. Appreciate it.

MANAGEMENT DISCUSSION SECTION

Operator

Good morning. My name is Britney, and I will be your conference operator today. At this time, I would like to welcome everyone to the Quarter One 2015 Earnings Conference Call. All lines have been placed on mute to prevent any background noise. After the speakers' remarks, there will be a question-and-answer session. [Operator Instructions]

Thank you. Mr. Francis Idehen, you may begin your conference.

Francis Idehen

Thank you, Britney. Good morning, everyone, and thank you for joining for our First Quarter 2015 Earnings Conference Call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer and, Jack Thayer, Exelon's Chief Financial Officer. They're joined by other members of Exelon's senior management team, who will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, each of which can be found in the Investor Relations section of Exelon's website. The earnings release and other matters which we'll discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties.

Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material, comments made during this call, and in the risk factors section sections of the 10-K, which we filed in

Bloomberg Transcript

February as well as in the earnings release in and the 10-Q which we expect to file later today.

Please refer to the 10-K, today's 8-K and 10-Q and Exelon's other filings for a discussion of factors that may cause the results to differ from management's projections, forecasts and expectations. Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for a reconciliation between the non-GAAP measures to the nearest equivalent GAAP measures.

We've scheduled 45 minutes for today's call. I'll now turn the call over to Chris Crane, Exelon's CEO.

Christopher M. Crane

Thank you, Francis. And good morning, everyone, and thanks for joining the call. Before I go into the prepared remarks, I want to first start by addressing the situation in Baltimore. As a company with a significant presence in Baltimore, we're monitoring the unrest with great concern. As you know, Maryland's Governor, Larry Hogan, has declared a State of an Emergency and Mayor Stephanie Rawlings-Blake has declared city-wide curfew through into next week. We join the rest of the business community in recognizing the issues that Baltimore is dealing with and needs to address so this great city can heal itself and get back onto economic growth for all.

Moving on to the quarter, I'm very pleased with our financial performance. We delivered earnings of $0.71 per share, surpassing our guidance range of $0.60 to $0.70, and Jack is going to describe our performance in greater detail.

I would like to focus my remarks on our priorities and how we are strategically pursuing value for customers and shareholders. We continue to operate in a challenging market environment, particularly on the generation side of our business, but our gen-to-load match strategy continues to create value, as seen in the first quarter hedge disclosure.

Our advocacy efforts are focused on creating channels to capture value for our communities and customers we serve and for our shareholders. I'll touch on those directly. In our regulated business, we are redefining the role of the utility of the future, in part by making needed infrastructure investments to modernize the grid. Over the next five years, our LRP has $16 billion of capital that will create approximately a 6% CAGR, with another potential $7 billion at PHI.

Installing smart meter technology to enable customers to make informed choices about their energy consumption and promoting energy efficiency investments and innovation and resilient technologies at our utilities is a way that is progressive and equitable across all customer types. You can see this reflected in the Energy Plan for Illinois' Future bill that we recently proposed through ComEd in Illinois.

With these efforts, we are bringing improvements to the lives of the customers in a way that creates value for the company. Our merchant business faced challenges, primarily due to policies and market design shortcomings that have failed to fairly value the benefits of nuclear. As a result, we focused our advocacy efforts on ensuring reliable environmental and economic benefits of nuclear power are not taken for granted and that these plants are operated on a level playing field.

In Illinois, we are working with state legislators on the Low Carbon Portfolio Standard that values each of these benefits. The bill unanimously was approved by the Senate Energy Panel and the Public Utilities Committee and will now go the Senate floor. We hope the same will happen in the House and that the bill will be approved within this legislative session.

From a reliability perspective, we are pleased that FERC has granted the waiver to allow PJM to delay the capacity auction in order to further review PJM's CP proposal. It is clear from this action that FERC appreciates that the older rules are not sufficient to ensure reliability and that changes must be made. We look forward to a positive outcome.

We continue to work through the process of finalizing a contract with RG&E for our Ginna facility. As these events play out, we continue to do our best operating the plants and the utilities at high levels of efficiency, hedging our generation output through strong portfolio management while we expand our footprint and our profits in retail, power and gas operations. As you can see, we are doing things on both sides our business; we're tapping into multiple

final
Bloomberg Transcript
Bloomberg

channels to create upside and drive value for our customers and for our investors.

This leads me to our proposed merger with PHI. As you know, we've obtained regulatory approval from FERC, Virginia and New Jersey. We've reached a global settlement in Delaware that is pending Commission approval. That leaves Maryland and the District of Columbia. In Maryland, we've reached a partial settlement with several critical parties. We presented that settlement to the Maryland Public Service Commission and expect a decision from them on May 15. In the District, we've completed our evidentiary hearings and we're now filing briefs and the Commission will commence its deliberations.

We have said from the beginning that this merger and the commitments we have made clearly demonstrate this merger is in the public interest and should be approved by the regulatory commissions. While there's no guarantee that the Public Service Commission will approve the proposal, and there's no guarantee that they will not impose conditions that would frustrate the transaction, we believe that the settlement and commitments that we have made in the proceeding are more than meet the statutory requirements for the merger approval, and we will look forward to orders approving the merger. We expect the merger to close late in the second quarter or in the third quarter.

In summary, we're creating value today while actively pursuing public policy changes that recognize the benefits provided by our clean reliable assets and we're working on all those fronts.

I'll now turn it over to Jack, who will cover the financial performance for the quarter.

Jonathan W. Thayer

Thank you, Chris, and good morning, everyone. We had a strong first quarter to start the year. My remarks will cover our financial results for the quarter, second quarter guidance range and update our hedge disclosures and cash outlook. I'll start on slide four.

Starting with our first quarter results on slide four, Exelon exceeded our guidance range and delivered earnings of $0.71 per share. At Exelon Generation, once again we realized the benefits of our generation to load matching strategy. Quarter-after-quarter, this strategy has paid dividends in a broad array of market conditions.

During the first quarter, despite experiencing lower power prices than during the same period in 2014, we benefited from a lower cost to serve customers. We are realizing strong margins in our load business from contracts we executed last year after the Polar Vortex. In addition, our gas business performed above our expectations during the quarter due to favorable weather. While our nuclear plants performed better than they did at this time last year, we did have some nuclear outages that negatively impacted our quarterly earnings by approximately $0.04 relative to plan.

That being said, we continue to push our plants to perform at our standard highest levels of performance. Our portfolio management team performed strongly and was able to more than offset these losses. On balance, Generation earned $0.35 per share during the quarter. Exelon's Utilities delivered combined earnings of $0.39 per share, an $0.08 increase over the first quarter of last year.

Although we did not see a repeat of the Polar Vortex of 2014, with sustained extreme cold and wind-chill, we faced a very cold winter with heating degree days 14% to 19% above normal in ComEd's and PECO's service territories. In fact, it was colder in Philadelphia this winter than the previous winter. Cold weather, a lack of severe storms and increased distribution rates at BGE drove utility results this quarter. More detail on quarter-over-quarter drivers at the Utilities can be found in the Appendix on slide 16.

For the second quarter, we are providing guidance of $0.45 per share to $0.55 per share. This compares with our realized earnings of $0.51 per share in the second quarter of 2014. We are reaffirming our full-year guidance of $2.25 to $2.55 per share. Since our last call, both PECO and ComEd have filed rate cases this year. On March 27, PECO filed an electric distribution rate case with the Pennsylvania Public Utility Commission requesting a $190 million revenue increase and a 10.95% return on equity. This is PECO's first rate case filing since 2010 and the first-time filing based on a fully projected future test year.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01759

In addition, if the PAPUC approves the new System 2020 plan, an additional $275 million will be spent during the next five years to install advanced equipment and reinforce the local electric system, making it more weather resistant and less vulnerable to storm damage. We expect the PAPUC to rule by the end of the year on the rate case and System 2020 plan with new rates going into effect in January of 2016.

On April 15, ComEd filed its Annual Formula Rate Filing with the Illinois Commerce Commission. ComEd requested a revenue decrease of $50 million. This reduction is a result of a continued focus on cost management and operational efficiencies that are being realized from a stronger, more reliable grid with fewer outages.

EIMA and the smart grid investments are working. Since 2012, there have been more than 3.3 million avoided customer interruptions including 1.2 million in 2014, due largely to increased investments in distribution automation or digital smart switches that automatically route power around problem areas. Outage avoidance has saved customers an estimated $175 million. More detail on each of these rate cases can be found in the Appendix on slides 20 through 22.

I will now turn to our first quarter gross margin update on slide five. During the quarter, we saw a drop in natural gas prices, while power prices were steady and heat rates expanded further. The market is finally incorporating the change in the generation stack due to coal retirements as evidenced by the heat rates seen today. Approximately 10 gigawatts of coal plants in PJM have or will retire this year, with the majority of retirements occurring in April and May.

We hedged close to a ratable amount during the quarter in both the Mid-Atlantic and Midwest regions. At the end of the quarter for 2016 and 2017, we remain considerably behind ratable in the Midwest, where we continue to see upside. Total gross margin is unchanged or relatively unchanged across 2015 through 2017 from our fourth quarter disclosures.

As I mentioned, Constellation had a good quarter and executed $200 million in power new business and $100 million in non-power new business. In addition, we raised our power new business target by $100 million because we have line of sight for continued success in the balance of the year. This increase was offset by our nuclear outages, resulting in a net $50 million improvement in 2015 total gross margin.

Slide six provides an update on our cash flow expectations for this year, projected cash from operations of $6.7 billion. I'd like to point that we've increased our CapEx projections at ComEd by $200 million. In finalizing the investment plan for 2015, ComEd identified incremental opportunity to invest in infrastructure, including grid resiliency and security, storm hardening and smart grid. These investments will continue to improve the reliability of ComEd's system. As a reminder, the Appendix includes several schedules that will help you in your modeling efforts.

Thank you. And we'll now open the line for questions.

Q&A

Operator

[Operator Instructions] Your first question comes from the line of Daniel Eggers with Credit Suisse.

<Q - Dan L. Eggers>: Hey. Good morning, guys.

<A - Christopher M. Crane>: Good morning, Dan.

<Q - Dan L. Eggers>: I've been hearing a lot of concern about the Pepco acquisition and probably some of the Maryland comments, both out of the MEA and Governor's Office. Can you just share your thoughts in how you guys address maybe the market power considerations or issues that are raised and how you guys move past that to get this deal done?

<A - Christopher M. Crane>: Yeah, there are some that have mentioned a loss of competition. And as all know, Pepco Maryland and BG&E do not compete. Each will be standalone in the future, as they are now, rate cases will be decided by the Public Utility Commission in Maryland. We work at the will of the Commission. The benefits that we show by bringing PHI into the Exelon Utilities with best practice sharing, being able to leverage procurement and the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01760

commitments that we made, we think meet the test to the benefit of the consumer.

So the Governor has not taken that position. The Governor has stayed neutral since, as he said, he's come into this late in the process. So there were rumors that he was against it; that was clarified with a letter that he sent to the Commission saying he has faith in the Commission that they'll do the right thing and he's neither for or against, he's neutral on it. And that's the support that we've gotten from Montgomery County and Prince George's County is significant. Those were the major customer bases where majority of the Maryland customers are and we have a strong support from both counties.

<Q - Dan L. Eggers>: Okay. And I guess just to play devil's advocate. If Pepco were not to tell you guys to get funded, the equity component of that transaction well in advance, how would you guys use that capital if you ended up having it back to deploy in a different direction?

<A - Jonathan W. Thayer>: Dan, it's Jack. Obviously, we don't anticipate that to happen. We anticipate getting a successful outcome here. To the extent that the terms of approval were onerous or we were rejected outright, we would look to cash settle the equity, the forwards that we had issued, and we would look to utilize the capital raise from the convertibles to either fund growth at the business or return value to shareholders through other means.

<Q - Dan L. Eggers>: Okay. And I guess just maybe one last question, the prioritization of capital. Obviously the ERCOT CCGTs are out there, but there's been more conversation about prospectively the LNG project that you guys are an early investor in as well as these stories about the UK office. Can you just clarify how you guys are prioritizing those capitals and maybe address any of the issues that might be around what we've been hearing in the media?

<A - Christopher M. Crane>: Yeah, you can see based off of our capital spend, our highest priority is in the regulated investments. We're making, as I said, $16 billion of investment over the next five years, with another potential $7 billion with Pepco, being PHI coming in. So, that we see is a good solid investment needed for the infrastructure for the customers and benefit to shareholders.

The CCGTs in Texas are still a very good investment, very positive NPV. It continues to match our generation to load strategy, as we continue to grow that load book in Texas in ERCOT. We said at the beginning, we're getting these at a very good terms. They're under $700 a KW on our brownfield site where we'll have expense advantages of combining them with our existing facilities. And the nature of those plants, the efficiency and the flexibility of them, they'll dispatch well in that ERCOT market. So that's still a positive investment.

Annova is a good strong option. We're the fifth largest in the handling merchant gas. We have core competencies around our gas portfolio and continuing to grow out the gas business is a logical move we believe. But the nature of that project is contracted. It would be a contracted long-term type arrangement that de-risks it significantly. If we are successful in obtaining contracts and permits then we would make the investment to continue to develop out our gas business. So that's the strategy around utilities. The strategy around competitive electric and gas continue to be the primary.

The story in the UK, is not an equity story at all. Exelon Nuclear Partners has been invited in to the bidding process to be the operator on a couple of projects potentially in the UK. We have a very small office that we rent month-to-month that those folks are working out of. Part of the process of doing that is understanding more the UK market. So there's been some due diligence around that, but we have no plans right now on becoming an equity owner in the UK at this point. That was a clarification needed to be made.

<Q - Dan L. Eggers>: Thank you. I appreciate it.

Operator

Your next question comes from the line of Jonathan Arnold with Deutsche Bank.

<Q - Jonathan Philip Arnold>: Hi. Good morning, guys.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01761

<A - Christopher M. Crane>: Good morning.

<A - Jonathan W. Thayer>: Good morning.

<Q - Jonathan Philip Arnold>: Just quick one on Illinois. Christopher, you're saying you still think that you're hopeful that you'll get things across the finish line in the spring session. There's been talk that there might be slippage into the veto session and obviously with the PJM auction delayed maybe the state would want to wait, see the outcome. What's behind your conviction that we're still on for the spring?

<A - Christopher M. Crane>: There's a hearing today that will be continuing to address the issue. So, it is being discussed, it's being worked, even with all of the other business that has been going on in Springfield around budget. So as I said, we got strong support, unanimous support out of the Senate Energy and Public Utilities Committee in March, unanimous. And there's hearings in both the House and the Senate this week to continue to discuss it. So we remain positive, cautious, but positive that we'll be able to get something through in this session. If we don't, and if the likelihood is that we're not going to get a build and we have to address the long-term profitability of the units, and we'll decide that as we see the legislative session end.

<Q - Jonathan Philip Arnold>: Okay. That's great. And then one other issue and Dan asked about the UK and you responded about the nuclear operator bidding process. There was also a story that you'd been linked to looking at an investment in a CCGT, which appeared to be similar next generation technology like you're working on in Texas. Any comments on that?

<A - Christopher M. Crane>: Yeah, I learned about that when you did, in the clippings. So, there is market intelligence that's going on at a lower level in the organization, but there is no plans to enter into equity positions at this point in the UK.

<Q - Jonathan Philip Arnold>: Great. Thanks for reiterating that. That's all I have.

Operator

Your next question comes from the line of Greg Gordon with Evercore ISI.

<Q - Greg Gordon>: Thanks. Good morning, guys.

<A - Christopher M. Crane>: Good morning.

<Q - Greg Gordon>: Your expected generation guidance for 2015 through 2017 in New England is 2X, 2X plus today versus what it was in the fourth quarter release. You haven't acquired any assets. So can you explain how you've been able to double your expected generation in that market and the flow through impact it's having on your expected gross margin, which looks like it's up marginally over the next two years, but then down marginally in 2017?

<A - Joseph Nigro>: Greg, good morning. It's Joe. I'll speak to that. And you're right on we noticed that our expected generation in New England in all years has increased appreciably. And as such, that generation percentage hedged has declined with that increased output of generation.

Very simply, we had disclosed in Q4 2013 that we had worked with a fuel supplier to restructure a contract that we have. And if you remember, back then our generation had dropped by about 50% in the quarter-over-quarter at that time. That contract restructuring has been terminated and it will be effective at the end of June this year and the contract itself will revert back to its original terms and conditions.

It has two impacts. One, you're seeing the generation impact and the hedge percentage impact. And the notification of that termination was at the end of the first quarter of this year, so really you're seeing it flow through on an immediate basis. The gross margin impact was very minimal across the horizon. And as such, just mechanically when you look at the hedge disclosure, the dollars of the termination of the contract restructuring as well as the increased value of the generation output and the margin associated with that is all flowing through the open gross margin line and it's very

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01762

minimal. So really it's a volume change that you see with real dollar impact.

<Q - Greg Gordon>: So then what's the economic rationale for termination if it's more or less NPV neutral? Are these fuel contracts for gas plants that have optionality associated with price volatility? Are they base load? Why would you terminate that contract if it wasn't increasing the NPV appreciably?

<A – [0D6FFV-E]Joe Nigro – Exelon Corp.> I can't say too much due to the confidentiality of the nature of the agreement. But what I will say is the contract termination was the right of the supplier, held that right. And from our perspective, as I said, the impact economically was very muted. I can't speak to the supplier's perspective on why they terminated, but it's related to a long-term supply arrangement that we have.

<Q - Greg Gordon>: Okay. Thank you.

Operator

Your next question comes from the line of Julien Dumoulin-Smith with UBS.

<Q - Julien Dumoulin-Smith>: Hi. Good morning.

<A - Christopher M. Crane>: Good morning.

<A - Jonathan W. Thayer>: Good morning.

<Q - Julien Dumoulin-Smith>: So I wanted to focus on the CP product, if you could. First, with regards to your expectations on future retirements, I'm curious, do you see the CP product as proposed driving retirements as you go to 100% CP market? Is that conceivable? And what kinds of units? And then subsequently, obviously with Supreme Court here waiting on the DR decision, how do you see that ultimately impacting the base in CP products of any eventual auction here? And does it appreciably impact CP, or is it more of an impact on the base auction?

<A - Joseph Nigro>: Julien, It's Joe. I think to your first question around retirements, we don't see a material impact. I mean, I think the rationale is first and foremost obviously to improve the reliability on the system. And to do that, you need a couple of – well, you can go about that in a couple of ways. One is the hardening of the units themselves, which have a cost associated with it. The second thing is to make sure you have firm fuel on site for these units and there's a cost to do that.

When you look at the economics of all that, we don't believe there's going to be a material impact to retirements. I will sit and here say, though, given this structure that's been laid out, if it is implemented, I would expect that you would see an increased risk premium effectively in the marketplace, given the fact that the penalty structure is changing, rightfully so, to ensure reliability, but I don't think outright there will be a material impact on the retirement side.

<Q - Julien Dumoulin-Smith>: And on demand response?

<A - Joseph Nigro>: I guess from a DR perspective, there's a lot of flux around the rules, but sitting here looking at this auction, we would expect to see the demand response activity will continue in the way it has. And then as you see – as rule changes through time, if it is to change whether it becomes a retail product as opposed to a wholesale product, we'll have to see how that plays out.

<Q - Julien Dumoulin-Smith>: Okay. Fair enough. And then just turning to the renewals business, obviously the YieldCo phenomenon continues to evolve. Have you given more thought about the degree to which this business is core as we've seen the market evolve?

<A - Christopher M. Crane>: Julien, with respect to the renewables part of our business?

<Q - Julien Dumoulin-Smith>: Exactly. Just – not creating a structure yourself, but ultimately whether you could garner better value in the public markets of late?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01763

<A - Christopher M. Crane>: As you know, we have an extensive business, both on the solar as well as wind renewables part of our business. And how we've improved the returns on that business over the last number of years has been through the extensive use of project financing as a means of returning capital to the corporate coffers to reinvest, either in the growth of the utilities or fund some of our other expansionary efforts around, as an example, the peaker that we're building in New England or the combined cycles we're building in Texas.

Certainly, we do watch and we do evaluate and consider the potential impact on value that a YieldCo could have on our assets from the perspective of YieldCos as potential buyers of those assets or through the potential to create our own YieldCo. And we continue to evaluate that. Within our project financing efforts, we have retained that option to be able to do that.

I think one of the key elements, though, to a successful strategy around the YieldCos is having a significant and visible pipeline of assets that you could drop down. And we have, I think, a good amount of assets. We have elements like our Annova LNG facility, that we if decide to pursue that and we had a long-term off-take agreement that would provide attractive revenues that could fit in that type of structure. But at this point, we don't have any plans to pursue such a structure and continue to have a candidly wait-and-see approach.

<Q - Julien Dumoulin-Smith>: All right. So more of a retain the business, build it out and then see down the line, rather than monetize it?

<A - Christopher M. Crane>: Absolutely. So you see us continuing to deploy wind investments. We have a project that we're developing down in Texas, [indiscernible] (32:23). You continue to see us work down on a path on the Annova LNG project, to secure a long-term off-take and you see us continue to, through our Constellation business, continue to pursue opportunities to grow the solar side of our business.

<Q - Julien Dumoulin-Smith>: Great. Well, thank you for the time.

Operator

Your next question comes from the line of Neel Mitra with Tudor, Pickering.

<Q - Neel Mitra>: Hi. Good morning.

<A - Christopher M. Crane>: Good morning.

<Q - Neel Mitra>: Just wondering on the HoldCo side, how much more debt are you able to support after the Pepco acquisition closes now that you're more regulated?

<A - Christopher M. Crane>: Neel, as you know, we have significant debt issuance forthcoming that will be used to finance at the holding company the PHI transaction that we would look to bring to market once we have visibility around a successful path in Maryland. We continue to evaluate the balance sheet capacity and the space that we have at that holding company. As you know, we've said we'll utilize that holding company as a potential vehicle to finance regulated growth. I think an important element of this is the interplay between the growing earnings mix of our utilities business relative to our merchant exposure and how the rating agencies perceive us.

And so to the extent that the rating agencies continue to evolve in their thinking around the risk embedded in our business, and CS is a less risky credit, I would say that's the biggest mover of balance sheet capacity. Obviously, some elements around, whether its capacity performance, the Illinois Clean Energy legislation that would be additive to the company's cash flow and earnings would also be helpful to our ability to add further leverage to the holding company.

<Q - Neel Mitra>: Got it. And then assuming Pepco closes, what's the latest update as to when the dividend is fully funded by the regulated side?

<A - Jonathan W. Thayer>: So we project that towards the latter part of the decade into 2020 timeframe, but we'll continue to evaluate that based off of rate case outcomes.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01764

<Q - Neel Mitra>: Okay. Great. And then...

<A - Jonathan W. Thayer>: And, Neel, that's specific to, from a free cash flow standpoint, the utilities being able to, not just from a payout ratio standpoint, but from a free cash flow funding standpoint. Chris' point on the latter part of the decade is when that cash would be available to potentially consider growing the dividend.

<Q - Neel Mitra>: Great. And then last on the Illinois legislation, if something isn't reached by the end of May, what are the options to maybe keep the process going through 2015? Or is it kind of done through the rest of the year if you don't have an outcome by May?

<A - William A. von Hoene>: We expect the session to – this is Bill von Hoene – conclude at the end of May. It conceivably could be extended. If the budget impasse continues, it's unlikely that the energy legislation would be considered during that period of time. There is a six day session, veto session, in November and into early December which requires a supermajority on any votes that pass during that period of time. So that would be the next time the legislature would convene after the conclusion of this regular session.

<Q - Neel Mitra>: And a supermajority which require a 60% vote, is that correct?

<A - William A. von Hoene>: That's correct.

<Q - Neel Mitra>: Okay. Great. Thank you.

<A - William A. von Hoene>: The point on that, though, in May of 2014 we committed not to make any decisions based off of the economics for a year. We're coming to the end of that year and we need to make decisions that start the planning process if we do not see a success there.

Operator

Your next question comes from the line of Angie Storozynski with Macquarie.

<Q - Angie Storozynski>: Thank you. So I wanted to focus again on Illinois. So it seems like you guys have bullish energy prices in Illinois and that's why you're not hedging much of your portfolio. You're also bullish on capacity prices, at least in PJM. You just had this spike in MISO capacity. So how does that add up because on the one hand if capacity prices rise, then you have less of a volatility in on peak power prices and that's potentially lower heat rates, so how does it reconcile with your outlook on heat rate?

<A - Joseph Nigro>: Good morning. This is Joe. I think that what I would say is if we talk just about energy prices in Northern Illinois for a minute, using prices as of the end of the quarter, we do still see heat rate expansion. We don't think the market is priced in or the upside really driven by the back of the changing dispatch stack. And if you think about two different timeframes like 2016, 2017, we probably see less upside than we do when you get out to the 2018, 2019 time period and it's probably to the tune of $1 to $2 accordingly.

And just as importantly, we also have a view that we think that natural gas is underpriced at this point, which would, in addition to that, would drive prices higher net-net because you would see a slight heat rate decline with the rise in natural gas, but net-net it would be a positive outcome. And your point is right, that from a hedging perspective, we continue to remain behind our ratable hedging plan in the Midwest to the tune of about 10% in 2016 and 2017 approximately, just given those views.

<Q - Angie Storozynski>: And you also think that the carbon legislation in Illinois is not going to have any negative impact on forward energy prices in Illinois?

<A - Joseph Nigro>: No, we don't.

<Q - Angie Storozynski>: Okay. And secondly in ERCOT, so you keep saying that you have a cost advantage for the new build and you clearly do. But forward curves are showing on peak spark spreads of $15, $16. So the conclusion or your dedication to the project is driven by your outlook on where these sparks are going to go as opposed to what we're

final
Bloomberg Transcript

seeing. And so can you give us at least a sense what is kind of spark spreads you're assuming in your calculations when you think that the IRR of the projects is still interesting?

<A - Kenneth W. Cornew>: Angie, it's Ken. We continue to be comfortable with our investment in these plants because of, as Chris said, the cost advantage, the technology advantage, meaning the heat rate efficiencies and the responsiveness of the plants. We've seen spark spreads bounce around a lot in ERCOT. The lack of volatility recently has driven them down. Our long-term fundamental views are what I would say conservative and we're still confident in the investments, very confident, actually.

<Q - Angie Storozynski>: Okay. Thank you.

Operator

And your final question comes from the line of Shahriar Pourreza with Guggenheim Partners.

<Q - Shahriar Pourreza>: Good morning.

<A - Christopher M. Crane>: Good morning.

<Q - Shahriar Pourreza>: Just sticking with the RSSA, with Ginna, is there an update on the filing? And then just counter with the EDF put option, how should we think about under an assumption that you may own the remaining portion of this plant? Is there an option that you can get an expanded RSSA contract if the timing works?

<A - William A. von Hoene>: The RSSA contract – this is Bill von Hoene. The RSSA contract was approved by FERC effective April 1, but with two adjustments being required in the contract which has been sent back and a compliance filing will be made by Ginna to reflect that. And there will be a process by which the contract itself will be evaluated and potentially settled through a FERC procedure. So that is going to go forward for probably the balance of the year based upon precedent in other circumstances, although the ability to collect on a cost-based rate is effective now.

The put is exercisable by EDF January 1, 2016. We do not know and don't speculate as to what would happen in connection with that. With regard to the potential extension of the RSSA agreement, it's predicated on the period of time that's necessary for the New York system to find alternative ways to deliver the same reliability that Ginna currently is required to deliver. So we would not anticipate, in the absence of the failure of the New York system to do so, that there would be any basis for extension of the agreement.

<Q - Shahriar Pourreza>: Got it. And then just one last thing, just sticking with the Illinois carbon portfolio, have you quantified what could potentially be available under the cap using, let's say, the 2014 rates? And then additionally, am I correct to assume that there's an opportunity to breach that cap if somehow the credits are being constrained?

<A - William A. von Hoene>: No. The cap is the same essentially 2% cap that goes on energy efficiency and RPS. And I think that's been calculated by a number of folks. There's no provision by which the cap could be breached under the legislation as it's currently proposed.

<Q - Shahriar Pourreza>: Got it. And then you haven't quantified what could be available under the program using pre-existing rates, right?

<A - William A. von Hoene>: No, we have not.

<Q - Shahriar Pourreza>: Okay. Thanks so much.

Operator

Your next question comes from the line of Paul Ridzon with KeyBanc.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01766

<Q - Paul T. Ridzon>: Hi. A quick question on Illinois. With the Attorney General's Office kind of weighing in on the MISO auction, is that entering the discussion in the legislature?

<A - Christopher M. Crane>: There has been attention, not surprisingly, to the MISO auction in connection with the legislative deliberations, and I think it's relevant in the minds of the number of legislators. From our standpoint, however, it has virtually no impact on the health of our plants. The Clinton plant was a price taker in the auction and which had sold in advance a significant portion of the power, the benefit of the auction result is only about $13 million, so that's far short of what would be necessary and doesn't obviate the need for the low carbon portfolio standard for that plant and elsewhere.

<Q - Paul T. Ridzon>: Thank you.

Operator

Your next question comes from the line of Ali Agha with SunTrust.

<Q - Ali Agha>: Thank you. I wanted to clarify, I may have missed this. I think you were mentioning that on the forward prices versus fundamental view, if I heard you right you said you thought Midwest was probably about $2 lower than where the fundamental view would be. I want to confirm that. And what's your thinking on Mid-Atlantic or PJM right now forward versus fundamental?

<A - Joseph Nigro>: Yeah, this is Joe. What I said was there's two components to our view. The first is just fundamentally we still expect to see heat rate expansion in Northern Illinois across the time horizon. So, if you look at calendar 2016, 2017 and beyond, we would expect to see heat rate expansion, and that's probably in that $1 to $2 range. But additionally, we see gas price upside, which would also increase the power price beyond that upside. So that would effectively raise the heat rates as well and – or effectively raise the power price as well.

So there's two components to our view and, as such, we're behind our ratable plan in 2016 and 2017 from a hedging perspective to the tune of approximately 10%. And it's important to note that there's some seasonality associated with that in our hedging profile within a given year reflects that, meaning we see time buckets that are more valuable relative to the market than others.

On the West Hub side, we see that heat rates and power prices are generally in line with our fundamental forecast, and we don't see quite as much opportunity. But, again, there's seasonality associated with that and our hedging profile takes that into account.

<Q - Ali Agha>: Got it. And, Joe, one other thing, on the retail side, a quick update on the competitive environment and the $2 to $4 margin that we've historically been benchmarking, just to give us a sense of where we are as new contracts are rolling in.

<A - Joseph Nigro>: Yeah, I think in general our load business has done very well, whether we're talking about our retail book of business on the commercial industrial side or our Polar procurement business on the wholesale side. After the Polar Vortex last year, we saw, I would say, folks maybe pricing the risk more prudently from our perspective as it relates to managing a retail contract. That's one element of it. And then from the margin perspective, using that $2 to $4 benchmark that you laid out there, we're well in line in the range of that $2 to $4, whereas we were sitting here a year, year-and-a-half ago, we were struggling to be even at the low end of that range. So we've see improvement across the board, both from a risk pricing perspective and a margin improvement perspective in our load business, both wholesale and retail.

<Q - Ali Agha>: Got it. Thank you.

Operator

Your next question comes from the line of Travis Miller with Morningstar.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01767

<Q - Travis Miller>: Good morning. Thank you. This is a bit of a follow up to that last question, but how long do you expect this magnitude of a load matching benefit that you've got in this quarter to extend? Can we think about this extending through the full year and beyond, or was there something in the quarter that gave you even more benefit on the load matching side relative to what we could see later in the year and ongoing?

<A - Joseph Nigro>: Yeah, I think there's a couple of answers to that question. And I think the most important one is we're seeing the changeover in the generation stack that we expected to see with retirements and low gas prices. And you've seen the heat rate expansion that we've been talking about for some time. In addition to that I think what you're going to see going forward is increased volatility and both upside volatility and downside volatility. And I think that has an impact on load serving contracts because you need to make sure that they're priced accordingly.

So we've got the benefit of, I would call it, lower load serving costs in the first quarter and they've come down on a mark-to-market basis for the balance of the year, but our expectation is given that market volatility, we expect to see that that would pass through to continuing to see appropriate risk premiums in our load serving business and appropriate margins.

<Q - Travis Miller>: Okay, great. Thanks a lot.

Operator

And your final question comes from the line Michael Lapides with Goldman Sachs.

<Q - Michael J. Lapides>: Hey, guys. Just want to circle back a little bit on PJM. We keep seeing a lot of announcements or people attempting to get new combined cycles build. We've obviously had a lot clear over the last few years. Gas base is still – is pretty low, meaning still pretty wide in parts of PJM relative where Henry Hub is or even when Pepco is. Just curious your multi-year thoughts about whether lots of plants actually do get built, meaning or do a lot just disappear by the wayside? And what this means not only for, I don't know, your view of are we kind of at newbuild economics in PJM so the concept of building merchant combined cycle in PJM makes sense to you here, just broader thinking about gas plant economics in that market?

<A - Joseph Nigro>: There's a couple of questions there. Let me try to pick them off one-by-one. I think the first one is as it relates to the turnover [indiscernible] (49:25) I think it's clear that we're going to see retirements of generation assets. In our fundamental modeling, we have an add back of an appreciable number of gas-fired generators in PJM, with most of them, say, on the Eastern side of PJM because that's where the economics are more favorable than a territory like NI Hub, for example. You're talking about a long-term investing asset with a build of a combined cycle plant, and you're looking at a market with spark spreads that's a much shorter dated time horizon. In PJM, unlike some of the other markets, the capacity price comes into play as well and is part of the equation.

Clearly, we don't see newbuild economics work on the Western side of PJM. On the Eastern side of PJM, it's a much more marginal exercise. I think where spark spreads are and where capacity price is, if you use last year as a benchmark for example, I think you can say that's a marginal calculation. There was some talk, if you go back a year ago, that people were going to be able to lock in gas contracts for 20 years at well under Henry Hub at M3 gas or that Mid-Atlantic type gas. I would tell you I haven't seen that and I don't think that's going to be the case, so there's an element of making sure that you understand what the dynamics of the cost of production are as well.

But I think net-net, fundamentally what we see is a turnover of the stack, our fundamental forecast reflects that. So we have an appreciable add-back of combined cycle plants. And when we take that all into account, as I said previously, we still see upside to the heat rate at NI Hub and we're generally in line with where the market heat rate is West Hub.

<Q - Michael J. Lapides>: Got it. And one real quick follow up, if you don't mind. You all talked a little bit about what the resolution on nuclear fuel means. Can you talk about what that means for fuel costs on a per megawatt hour basis for a typical nuclear plant, like how material is the change on a dollar per megawatt hour? I mean, are we talking $0.05 or $0.50, just trying to get my arms around it.

MANAGEMENT DISCUSSION SECTION

Francis Idehen

Good morning, everyone, and thank you for joining for our Fourth Quarter 2014 Earnings Conference Call. Leading the call today are Chris Crane, Exelon's President and Chief Executive Officer; Jack Thayer, Exelon's Chief Financial Officer; Joe Nigro, CEO of Constellation; and Bill von Hoene, Exelon's Chief Strategy Officer. They are joined by other members of Exelon's senior management team, who will be available to answer your questions following our prepared remarks.

We issued our earnings release this morning along with the presentation, each of which can be found in the Investor Relations section of Exelon's website. The earnings release and other matters that we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties.

Actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's material, comments made during this call, and in the risk factors section of the earnings release and the 10-K, which we expect to file later today.

Please refer to today's 8-K and the 10-K and Exelon's other filings for a discussion of factors that may cause the results to differ from management's projections, forecasts and expectations. Today's presentation also includes references to adjusted operating earnings and other non-GAAP measures. Please refer to the information contained in the appendix of our presentation and our earnings release for a reconciliation between the non-GAAP measures to the nearest equivalent GAAP measures.

We've scheduled 60 minutes for today's call. I'll now turn the call over to Chris Crane, Exelon's CEO.

Bloomberg Transcript

Christopher M. Crane

Good morning. And thanks for everybody joining. We had another strong year of operations in 2014 which we're very pleased with given the challenging weather conditions at the start of the year. At the Utilities, each OpCo achieved top-decile performance for safety and top-quartile performance for outage frequency and duration. The nuclear fleet ended the year at 94.2% capacity factor which this marks our 15th year in a row being over 92%. Gas and hydropower dispatch match was at 97% and our renewable energy capture was at 95%.

On the financial side, we delivered $2.39 a share, in line with our recent year full-year guidance. Exelon Generation delivered a strong year for performance in what was a volatile year. And our generation to load-matching strategy drove strong results during an unexpected mild summer.

The Utilities performed well in light of severe storms and continuing challenging interest rate environment. 2014 was an active year for us, and in addition to selling several assets, we continue the process of recycling capital and strengthening our balance sheet.

I'll highlight some of our major investments for the year. We grew across the enterprise. From the utility growth perspective, we announced the PHI merger and continued on with our infrastructure upgrade plans, spending $3.1 billion of utility investment.

On the merchant side, we announced a state-of-the-art CCGT newbuild in ERCOT and we added 215 megawatts in nuclear, wind and solar capacity during the year. At Constellation, on the retail side, we completed the acquisition of Integrys retail and ProLiance.

We also made investments in adjacent markets and emerging technology to continue to prepare for an evolving marketplace. Bloom Energy and our micro-grid investments are good examples of that.

We also had a number of major regulatory developments in 2014 that affect both the Utilities and the Generating business. On the Generating side, we've seen progress in Illinois nuclear discussions, with four reports released last month which highlight the reliability, the economic and the environmental benefits of the nuclear plants to the State.

PJM Capacity Performance Proposal has been submitted to FERC. We strongly support the steps being taken to ensure reliability in the region. We expect a continuing discussion on the EPA's Clean Power Plan over the next several months.

On the utility front, we had two positive outcomes for ComEd and BGE rate cases. ComEd received 95% or more from our ask on the last three consecutive rate cases and BGE achieved its first settlement since 1999. And these outcomes highlight our continued commitment to the customers we serve. Bill is going to go into greater detail on the advocacy issues towards the end of the call.

These policy initiatives on the horizon present a potential material upside to earnings as value of our fleet is more appropriately recognized by the market. However, I do want to underscore that the management team is focused on EPS growth and our capital deployment efforts. We invest in prudent growth of the utilities where we can add value for our customers, and within our merchant business, we look for opportunities to earn robust financial returns. Our recent announced peaker in New England is a great example of that.

Our continued investments in both the Utilities and the Generation business demonstrates our commitment to long term growth initiatives across the enterprise that will bring value to our customers and drive future earnings.

Now, let me turn it over to Jack to discuss our financial expectations for 2015.

Jonathan W. Thayer

Thank you, Chris, and good morning, everyone. We provided information on our fourth quarter financial results in the appendix of today's materials on slide 17 and 18. I'll spend my time this morning on 2015 earnings guidance and our

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01771

O&M forecast.

Turning to slide three. We expect to deliver adjusted operating earnings in the $2.25 to $2.55 range, which is the same as our 2014 guidance and earnings of $0.60 to $0.70 per share for the first quarter. Our guidance does not include the earnings from the Pepco Holdings acquisition, but does reflect all asset divestitures to date.

As you know, we sold several assets last year, the proceeds of which are being used to partially finance the PHI acquisition and to recycle capital on the merchant side of our business. The lost contributions from these divestitures result in an earnings impact of $0.12 per share relative to last year. In future years, there's minimal earnings impact, in particular as the capacity revenue from Keystone and Conemaugh runs off. The modest lost earnings from the divested plants will be meaningfully offset by the accretion from our Pepco merger and earnings from other growth projects.

For 2015, the earnings impact from these divestitures of $0.12 combined with an additional refueling outage at Nuclear of $0.02 and increased pension and OPEB cost at ExGen of $0.02 are modestly offset by higher capacity prices of $0.07, the full-year benefit of the elimination of the DOE fee at Exelon Nuclear of $0.04 and by higher earnings at ComEd of $0.03.

As you know, at EEI, we gave earnings projections for Exelon's three utilities through 2017. Since that time, we have adjusted the midpoints of that guidance down by a total of $0.05 per share due to the impacts of treasury yields at ComEd and bonus depreciation impact on EPS. We still expect a healthy 5% to 6% CAGR on utility earnings from 2014 to 2017, and the cash benefits from bonus depreciation will help accelerate and fund utility investments. For reference and deeper analysis, more detail on the year-over-year drivers by operating company can be found in the Appendix on slides 19 through 22.

As Chris mentioned, our capital investment plan is significant and positions us to grow earnings over time. Over the next five years, we are investing $16 billion in capital at our existing utilities and plan for more than $6 billion of investments at the Pepco utilities. We believe these investments are prudent and will improve reliability and our customers' experience.

As you know, the Pepco transaction is expected to add $0.15 to $0.20 per share of earnings on a steady-state basis in 2017 and beyond. In addition to growing earnings, the Pepco acquisition shifts our earnings mix to a substantially more regulated weighting with 61% to 67% of earnings coming from the regulated side in the 2016 through 2017 period.

On the ExGen front, our focus is deploying capital for growth that achieves attractive financial returns and generates both earnings and cash flow. These investments span the energy value chain and include conventional generation like our Texas CCGTs and a new-build peaker in New England that cleared the most recent capacity auction and investments in our Distributed Energy platform. Above and beyond our existing plan, we see additional opportunities and have the free cash flow to deploy capital to earn attractive incremental returns on both the regulated and merchant sides of our business.

Starting in 2016, we expect to have up to $1 billion in incremental annual capacity we can deploy to invest in our utilities, merchant growth and other opportunities. At the utilities, we are evaluating the potential to increase our investments in utility infrastructure including grid resiliency and security, storm hardening, and new smart-grid-enabled technologies.

Of course, our capital investment in utilities has to be prudent and help meet the evolving expectations of our customers. These investments will benefit customers by improving reliability and system performance and allow them to better understand and manage their energy usage and costs. At ExGen, capital deployment across the business will be driven by the ability to earn robust financial returns.

Slide four shows our 2015 O&M forecast relative to 2014. We project O&M for 2015 to be $7.225 billion, an increase of $275 million over 2014. The increase at ComEd and BGE is due to inflation and increased budgeting for storm cost which results in incremental year-over-year O&M growth. ExGen's increase is related to a combination of factors. The inclusion of three months of CENG O&M relative to 2014, an additional planned nuclear outage compared to 2014, increased pension costs, and projects at Constellation and Generation including Integrys and growth in our Distributed

final

Energy business. Overall, we expect a basically flat O&M CAGR over the 2015 to 2017 period. We remained disciplined on cost even as we seek to grow our business.

Since our presentation at EEI, we have increased our CapEx projections for 2015 across the company by approximately $325 million. The increase is primarily at ExGen and reflects investments to build contracted generation including at 80-megawatt wind facility in Texas and an up to 50-megawatt biomass plant in Georgia which we announced yesterday. Additionally, we have increased 2015 budgeted CapEx for our Texas CCGTs advancing the timing of the capital spend. The total cost of the project has not changed.

Now, I'll turn the call over to Joe Nigro for a discussion of markets and our hedge disclosures.

Joseph Nigro

Thanks, Jack, and good morning. The Constellation business continues to perform at high levels. We finished 2014 strong and are seeing solid results so far in 2015 as a result of our generation-to-load-matching strategy and our ability to use multiple channels to market.

My comments today will address market events during the fourth quarter and what they mean for our commercial business going forward, including our hedging strategy, the New England ISO capacity market results and our updated hedge disclosures.

During the fourth quarter, we experienced a decline in prices across the energy complex, as oil and natural gas both realized steep losses in the spot market. Power prices followed gas lower in the second half of the quarter as expectations of extreme weather subsided.

The primary driver weighing on prices was the contraction of winter premiums as the markets focus moved away from last year polar vortex and on to higher natural gas production in storage estimates. NI Hub and West Hub around-the-clock prices were down $1.50 to $3 for calendar years 2016 and 2017 from the end of the third quarter to the end of the fourth quarter. In response, we have positioned the portfolio to better align with our fundamental view that we expect to see seasonal power price upside, primarily at NI Hub, and began to build a long position into the forward years.

This is similar to how we've positioned the portfolio the last few years when our fundamental view showed power market upside. When the market is volatile, our generation-to-load-strategy allow us to optimize the portfolio to lock in additional value.

During the year, we aggressively pursued load-following sales when we observed appropriate risk premiums and increasing margins. We are very highly hedged in 2015 and not impacted from the large downturn in near-term power prices. In fact, we were very aggressive in hedging our PJM East and New England portfolios early in the fourth quarter when higher risk premiums were priced into the market.

The remaining length in 2015 is mostly in our Midwest position and focused in the months and time buckets where we believe the forward market is still undervalued. As I mentioned, we began to build a long position in the forward years because we see upside in our view versus market.

During the fourth quarter, we dropped further behind our ratable plan and added approximately 5% to our hedge percentages for 2016 and 2017 versus a normal quarter of an 8% sales. The majority of our behind ratable position remains in the Midwest where we continue to see upside in power prices driven by coal retirements. Not only did we adjust our deviation to ratable during the quarter, but we also adjusted our seasonal hedging strategies, holding length in undervalued months. We will continue to hold the long position based on our market views.

Last year at this time, we talked about hedging the natural gas to take advantage of our bullish view on heat rates. Those views have materialized over the past 12 months, and we have shifted our hedging strategy out of these cross-commodity hedges in order to lock in the higher market-implied heat rates.

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-01773

In January of last year, natural gas sales represented over 10% of our hedges. Currently, they are less than 2% in any given year. Going forward, our hedging strategies and positions will continue to reflect where we see upside versus current market prices, both from our view of heat rate expansion and natural gas price increases.

We've got a lot of questions recently on oil markets, and I'd like to spend a minute on what the sharp decline in pricing means for our business. We are not materially impacted by oil pricing, mostly due to the fact that our gross margin is primarily driven by our large base-load position. However, we do experience some minor impacts, including the potential for lower peak power pricing during heavy load conditions, the potential for lower load growth in ERCOT and lower pricing in our up-stream business. The current pressure on oil prices is more pronounced in the near-term delivery period as longer term prices in the $65 to $70 per barrel range still reflect global demand growth.

Before I turn to our gross margin update, I want to provide an update on the recent Capacity Auction in New England. On February 4, ISO New England released the results of its ninth Forward Capacity Auction for the planning year 2018-2019. The clearing price indicates that the new pay-for-performance capacity construct works and will attract development of new resources needed in the region. This includes our recently announced 195 megawatts in dual-fuel peaking facility at our existing West Medway site which we expect to have on-line by the summer of 2018.

Turning to slide six, I'll review our updated hedge disclosure and the changes since the end of the third quarter. In 2015, total gross margin is unchanged. The impact of the divestiture of Keystone and Conemaugh was offset by the acquisition of Integrys and the expectation of favorable portfolio performance. We executed on $100 million of power new business and $50 million of non-power new business during the quarter. Based on 2015 performance to date and expectations for the full year, we have increased our power new business target by an additional $50 million.

For 2016-2017, total gross margin decreased by $200 million and $250 million respectively, largely driven by the impacts of lower market prices on our open position. The divestiture of Keystone and Conemaugh was offset by the addition of Integrys in these years. We also executed on $50 million of both power and non-power new business in 2016.

Overall, the commercial business is performing extremely well across all of our business lines. We will continue to implement hedging strategies that reflect our fundamental view of increases in both power and natural gas markets and optimize our portfolio.

Now, I'll turn it over to Bill.

William A. von Hoene

Thanks very much, Joe, and good morning, everyone. As Chris referenced in his opening statements, there are a number of developments playing out on the policy front that affect our customers and our businesses. These issues are not necessarily earnings impactful in 2015 but they may have a material impact on the company beyond this year. And so we're going to spend a few minutes this morning sharing with you our perspectives on the issues.

I'll start with three issues affecting the Generation business in policy space. First on the capacity market reform front that Chris referenced. We have been involved in PJM's stakeholder process to develop a proposal that will harden the power supply system to help it withstand extreme weather events and ensure reliability for customers.

We believe the proposal that now sits before FERC is constructive and, if approved, will address the gaps in system reliability. The proposal has many similarities to the pay-for-performance market design which FERC approved in New England a couple of years ago. It's a no-excuses approach that provides fair compensation to reliable assets that do perform and penalizes suppliers that do not.

We think this is a win-win for our customers and for our Generation business. We have invested billions of dollars in our fleet over the years to make it the most reliable set of generating assets in the country and we think that the fleet will fare well in a pay-for-performance system. All told, we view developments on the capacity reform front as decidedly positive, and we are expecting a ruling from FERC by April 1.

Bloomberg
SI-SSA-0015-01774

Second, let me talk briefly about the discussions that are ongoing in Illinois. As Chris referenced, and as you all have seen by now, the State of Illinois report on potential nuclear power plant closings was issued earlier this year in response to House Resolution 1146.

As stated in that report, the right energy policy for Illinois should guarantee reliability and improve the environment while creating and retaining jobs, growing the local economy and minimizing costs. It is difficult to envision such a policy without nuclear as a critical part of the energy mix.

The report offers an independent assessment of the substantial economic, environmental and reliability benefits that Illinois' six nuclear plants bring to the state and lays out five options to address the current situation. Establishment of the cap-and-trade program, imposition of a carbon tax, adoption of a low carbon portfolio standard, adoption of a sustainable power planning standard or reliance on market and external initiatives to make the corrections.

We are supportive of any of the options that reward all carbon-free resources equally, but doing nothing simply is not a viable economic option if we are to maintain the operations of those plants that are at risk. As we've stated repeatedly, we do not seek a bail out. This is about addressing market flaws to properly value resources that are of great importance to the State of Illinois. The State has an opportunity to implement needed change and we will work with policy-makers and stakeholders during the coming months to come to an appropriate conclusion soon.

Third, on the Generation front, a brief discussion of the environmental policy. As you know, the EPA's Clean Power draft was issued last year. While it is well-intentioned, it fell short in our view of addressing the importance of nuclear to achieving our national environmental goals. We continue to work on improving the plan.

Notwithstanding the shortcomings of the initial proposal however, we view the environmental discussion as progressing in the right direction. Furthermore, the EPA debate and the State's roadmaps to implementing the plan are inextricably linked to the discussion around nuclear energy in Illinois that I just referenced. As any solution must contemplate the State's ability to comply and to do so cost effectively without the clean attributes of nuclear, that will be impossible.

The final ruling on the EPA's Plan has been pushed back to later this summer. Like many, we want clarity on the issue. However, we would rather, the time be taken for the agency to get this right and design a rational emissions reduction policy for the country than to rush it through. We are confident that the EPA will issue a final rule that appropriately values our assets.

The question that arises from all of these pieces is how do they fit together and will the resolution of these three policy issues translate to market-based compensation sufficient to maintain the economic viability of our challenged assets. That is what will play out over the next few months or longer.

In the aggregate and individually, we view these potential policy changes as a positive driver for the Exelon fleet. If the PJM reforms are adopted, this should benefit all of our PJM Nuclear assets. However, we have been clear that there is no silver bullet. Each plant has to stand on its own economic merits and it is unlikely that the PJM reforms in isolation will ensure the survival of each plant. One clear example of this is Clinton which is not in PJM and therefore will not be properly valued as a result of the PJM capacity market reforms.

These plants need to be fairly recognized for both their unparalleled reliability and for their zero carbon attributes. Anything short of that recognition is insufficient and that is why we have been working diligently and simultaneously on all the fronts I have referenced.

The fact is there is no other technology that produces reliable, zero-carbon electricity. All of the alternatives are intermittent and far more expensive than keeping these plants in operation. Our customers will pay more if these assets are retired prematurely and need to be replaced. We think policymakers get this and also understand what it means to lose these plants in terms of jobs and costs. We are optimistic that they will take the steps needed to ensure fair treatment of the units because it is clearly in the customers' and the states' interest to keep these plants open.

Finally, on the regulatory front, let me turn to a non-Generation matter, which is, of course, the Pepco transaction, which we announced last year. Getting the merger with Pepco across the finish line is, of course, a very high priority

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01775

for the company, and things are progressing according to plan. We continue to anticipate a closing sometime in the second or third quarter of this year.

We are pleased to have received approval from New Jersey earlier this week, and as you know, we have already received approvals from FERC and the State of Virginia. In Delaware, as noted in the letter to the Commission that you have seen, we are close to a settlement, and if a settlement is reached, there may be an adjustment in the schedule. We are continuing the process to review – of reviewing the remaining jurisdictions of Maryland and Washington, D.C.

We believe the merger is in the public interest, and we expect that the combined company will bring significant value to customers given our top-tier operational performance and the merger commitments we have made. We look forward to completing the regulatory process and closing the transaction on schedule.

Thank you. And now, we will open up the floor for questions.

Q&A

Operator

[Operator Instructions] Your first question comes from Greg Gordon of Evercore ISI.

<Q - Gregory Harmon Gordon>: Thanks. Good morning, guys.

<A - Christopher M. Crane>: Hey, Greg.

<Q - Gregory Harmon Gordon>: Jack, can you comment again on the – can we revisit the comments you made on the earnings guidance for the Utilities? Because as I look at the $0.20 to $0.30 from BGE, $0.35 to $0.45 from PECO, and $0.45 to $0.55 from ComEd, if I just take the exact midpoint there, that's $1.15 versus $1.25 at the midpoint of the EI. So that's a $0.10 delta, not a $0.05 delta. Is there a reason why I am miscalculating that?

<A - Jonathan W. Thayer>: No, Greg. The $0.05 delta was with respect to 2017. The 2015 guidance, to your point, is down $0.10. Some of that is just a mere factor of rounding. We speak in terms of $0.05 increments. And I would say 2015 guidance is down on a relative basis, $0.05 year-over-year, although the rounding would indicate that it's down $0.10. It's just a matter of how we rounded up or rounded down in our expectations.

<Q - Gregory Harmon Gordon>: Okay so the earnings power out in 2017 of your three utility businesses is $0.05 lower than your prior expectation, not $0.10?

<A - Jonathan W. Thayer>: That's correct. And I think importantly there, you see the sensitivity we have to interest rates, primarily ComEd. You see the impact of the bonus depreciation which has the obvious EPS impact of lowering rate base and lowering expected earnings. But also the cash flow of savings related to that is a contributor to the $1 billion of incremental capital we see in 2016 and beyond that we can deploy to grow both our Utilities business as well as our Merchant business.

<Q - Gregory Harmon Gordon>: Okay. Another question, because I think there is a bit of an apples-and-oranges going on in terms of the discussion. Now that you've given us an earnings guidance for this year that includes the $0.12 dilution from the Generation – from the asset sales that you are using to fund the Potomac transaction, as we roll into – if we assume that that deal closed precisely on 12/31, is it accretive by $0.15 to $0.20? Or is it accretive by $0.15 to $0.20, all things equal off this base? Or is it more accretive because you are also offsetting the dilution from the asset sales you used to fund the deal?

<A - Jonathan W. Thayer>: The $0.15 to $0.20 number, Greg, that we referenced incorporates the net dilution associated with the asset sales. That said, as I mentioned in the script, the earnings contribution from those assets, while admittedly $0.12 this year, because of the failure of Keystone and Conemaugh to clear capacity markets, the contribution from those assets diminished meaningfully out the curve.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01776

The $0.15 to $0.20 that I referenced, we would anticipate in 2017. So that's why we're – while you mentioned the close in 12/31, obviously, per Bill's comments, we're anticipating a Q2 and Q3 close. We wouldn't expect to see that – all of that $0.15 to $0.20 until 2017. We will be certainly achieving part of that during the 2016 period.

<Q - Gregory Harmon Gordon>: Got you. I get it. So the math on the earnings contribution from the assets sold, they would've been significantly less than a $0.12 contributor out in time.

<A - Jonathan W. Thayer>: Correct.

<Q - Gregory Harmon Gordon>: Okay. One more question, just in a little bit of the weeds on the forecast for O&M. You did call out increased O&M, predominantly at BGE, ComEd and ExGen. Then you say that through 2017 you expect 0.2% growth. Specifically at ExGen, as we get out into 2017 is that growth rate pro-rata across all the businesses? Is ExGen's O&M roughly static? Because I know you are adding assets to the mix in 2017, and I'm wondering whether there is a significant increase in O&M associated with that, or whether the totality of the O&M is still only growing nominally inclusive of those new asset additions.

<A - Jonathan W. Thayer>: It's pretty ecstatic, Greg. Certainly, we are adding those assets. The operating costs of which will increase. We added Integrys. We added ProLiance. We have announced in recent months both a waste-digesting plant out in LA, a pulp and biomass facility down in Georgia partnered with P&G. We're looking for incremental opportunities in that space.

We're offsetting that in part with activities that we're pursuing broadly across the company to drive lower operating costs, both within the embedded businesses, the Constellation, the Power Generation business, the Nuclear business as well as our Business Services Corporation. So, on a kind of blended basis, we see relatively flat O&M further out the curve.

Obviously, wage inflation is a component of that. Interest rates have been a meaningful factor of that and driving pension costs and the growth in the liability side of that higher. So as CPI oscillates, as interest rates move, that will continue to be candidly something a little bit outside our control, but obviously something we're trying to focus on other things to offset.

<Q - Gregory Harmon Gordon>: Great. Thank you, guys.

<A - Jonathan W. Thayer>: Thank you.

<A - Christopher M. Crane>: Thank you.

Operator

Your next question comes from the line of Dan Eggers from Credit Suisse.

<Q - Dan L. Eggers>: Hey. Good morning, guys.

<A - Christopher M. Crane>: Good morning, Dan.

<Q - Dan L. Eggers>: Just following up on Greg's question on the Utility outlook. If you go back to a year ago when you guys gave guidance, I think that all these expectations are down about $0.15 today from where they were a year ago. Can you just bridge for me what has changed, a year-to-year basis? And then if you thought about interest rates normalizing or pension normalizing, how much of the $0.15 erosion could you reasonably get back?

<A - Jonathan W. Thayer>: I don't know that, Dan. I can track you back to year-end 2013. But clearly, you've seen a material degradation in the interest rate environment. As an example, in 2014, the average 30-year was 3.34%. The interest rate for 30 years today is 2.63%. So just even within on an average basis of full year, the continued decline of interest rates and our sensitivity to that through the formula rate at ComEd has been significant. For sensitivity sake, 25 basis points up or down in interest rates. It's $9 million improvement or detriment to our expected revenues at ComEd.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01777

Obviously, the same element is impacting us from a pension liability side, marry that with a change in the mortality tables and longer expected lives of our pension and OPEB participants. And that's the headwind. And that's a headwind that we passed through, through the formula rate within ComEd, but we have to go through rate cases at PECO and we have to go through rate cases at BGE to recapture that.

And then I guess the final element that's changed, I think, is given our load sensitivity at PECO and given some of our longer-term load sensitivity at BGE and ComEd, as we've continued to experience zero, in some instances negative load growth, that's been a headwind as well.

That said, we continue to see meaningful opportunities to deploy capital in that space. We see an opportunity to drive our customers' reliability and experience, and importantly, we see opportunities to earn a fair rate of return in those businesses and as we're delivering and evolving array of services to our customer, even perhaps improve upon what we're allowed to earn.

<Q - Dan L. Eggers>: Okay, got it. I guess just on the deployment of capital conversation, what are you guys seeing in the ERCOT markets at this point in time underlying the newbuild decision? It seems like sparks have eroded since those plants were announced. And obviously with maybe an economic slowdown because of oil and gas drilling, there's a little bit of concern in the market, I suppose, over demand growth.

<A - Kenneth W. Cornew>: Hey, Dan. It's Ken. We are very comfortable with our decision to invest in our combined-cycle plants in Texas, and there are several reasons for it. First, the technology we've chosen, we think puts us in a significant competitive advantage. Again, as you know, with the position and the stack we would have, as well as the ramping capability of the units.

Also, cost advantage. Given we own these sites, we have an advanced cost position that we don't think could be matched in the market. Importantly, we made this investment on our long term fundamental views. And without talking about a every assumption in our fundamental views, they're not drastically different than the environment we're seeing right now. We didn't make a bet on massive load growth in Texas. We are very conservative in our assumptions.

And the last thing I'll say, Dan, is we have a significant load business in Texas as well. And having these plants and this capability and matching that capability with our load business is something. I think you're seeing it right now. We've proven that that is a value proposition that Exelon brings to the table and we expect that the investment in these plants will really enhance that value proposition in Texas.

<Q - Dan L. Eggers>: Okay, thanks, Ken. I guess, Bill, can you just walk us through what kind of timeline we need to see in Illinois as far as draft legislation on carbon action and progression to get something done before the recess in the summer?

<A - William A. von Hoene>: Yeah, Dan. As you know, the recess is scheduled or at least currently scheduled for the end of May. And what we anticipate is that legislation consistent with the policy solutions outlined in the 1146 report will be introduced in the General Assembly sometime within the next month. We are actively working with legislators, regulators and stakeholders with that in mind.

So I would expect to see something surface within the next month and that will give ample time to the legislature to consider it. There will be hearings related to 1146 or possibly to the legislation specifically that will accompany that. But if this gets introduced as we anticipate within the next 30 days or so, it will give an opportunity to go through the full discourse in the legislature before the recess in May.

<Q - Dan L. Eggers>: Okay. Thank you, guys.

Operator

Your next question comes from Jonathan Arnold from Deutsche Bank.

<Q - Jonathan Philip Arnold>: Yes. Good morning, guys.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01778

<A - Christopher M. Crane>: Hey, Jon.

<A - Jonathan W. Thayer>: Good morning.

<Q - Jonathan Philip Arnold>: A quick one, first, just on Illinois, following up on Dan's question. Is there a sponsor that has yet emerged or sponsors? Or are you still working that out?

<A - William A. von Hoene>: Jonathan, there has been nothing publicly announced. There will be a significant number of sponsors and it will be by partisan. But that won't be revealed until the legislation itself is actually announced.

<Q - Jonathan Philip Arnold>: Well, as you've just said, you're expecting it to be broadly supported?

<A - William A. von Hoene>: Correct. We anticipate Republican and Democratic sponsors in significant numbers.

<Q - Jonathan Philip Arnold>: In both Houses? Or is it going to emerge in one House and then go to the other?

<A - William A. von Hoene>: The mechanics, it has not yet been determined what the mechanics will be, but there will be adequate support and sponsorship in both Houses to run it through the legislature.

<Q - Jonathan Philip Arnold>: Great. Then if I could also just revisit the question on the regulated guidance – sorry to do this. But, Jack, when I look at the $1.11 starting point for 2014, which was pretty consistent with the EEI slide, and your statement that 2017 is only down by $0.05 in the midpoint, which would imply $1.35 versus $1.40, I think where I'm having confusion is that you'd said – you'd called out an 8% CAGR at EEI. But now you are saying 5% to 6%. But seems to me the $1.11 to the $1.35 would be more like 6% to 7%. And 5% to 6% implies a bigger reduction. Can you speak to that at all?

<A - Jonathan W. Thayer>: I think, Jonathan, we're talking about 100 basis points. And to be candid, the rounding issue comes into play. So I think I'd focus more on the $0.05 of degradation from EEI's 2017 expectation to where we sit today. And not...

<Q - Jonathan Philip Arnold>: Perfect. Okay.

<A - Jonathan W. Thayer>: And...

<Q - Jonathan Philip Arnold>: [indiscernible] (42:02)

<A - Jonathan W. Thayer>: ...some of that is an issue of the timing of capital deployment and other elements. And I think we feel good about 5% to 6% growth. Ideally, we'll endeavor to deliver higher growth about $1 billion of incremental spend in 2016 and beyond is potentially a driver of that incremental growth.

<Q - Jonathan Philip Arnold>: But the $0.05 is what we should really focus on?

<A - Jonathan W. Thayer>: Yeah.

<Q - Jonathan Philip Arnold>: Got it. Thank you.

Operator

Your next question comes from Steven Fleishman from Wolfe Research.

<Q - Steven Isaac Fleishman>: Yeah. Hi. Thank you. So not to beat a dead horse with that, does your viewpoint on the utility include any of the $1 billion being reinvested in it? Or that would now be in additive?

<A - Jonathan W. Thayer>: No, no. It's additive.

<Q - Steven Isaac Fleishman>: Great. And then...

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01779

<A - Jonathan W. Thayer>: It's incremental.

<Q - Steven Isaac Fleishman>: Thanks. And then just with respect to the Illinois legislation, I know there's other aspects of this, not just on nuclear plants. So maybe you could give us a little bit a better sense of what else might be addressed in this legislation. I'm assuming it's also renewables. But is there other aspects that would likely be in this?

<A - William A. von Hoene>: Steve, this is Bill. The legislation that we're referencing in the nuclear is stand-alone for the time being. There are going to be undoubtedly additional energy-related initiatives. There was a group that convened last week called the Clean Jobs Coalition, which was an environmentally directed group of a number of agencies and entities, which indicated that they will introduce legislation that will relate to energy efficiency to renewable standards and also to a cap-and-invest system that would be implemented in connection with 111(d). So we anticipate that that will be legislatively active, and there undoubtedly will be a variety of other things that will be considered as well.

<Q - Steven Isaac Fleishman>: Okay. Just lastly, and maybe to Joe, on your point of view in your hedging, just to clarify, it sounds like you are particularly focused on future NI Hub prices being too low. Is that fair?

<A - Joseph Nigro>: Yes. Steve, I think there's two elements. I think you're correct. When you think about the expansion opportunities, heat rates, I think that's primarily in NI Hub. I think from our perspective as well, we actually see upside to the natural gas market especially – maybe to a lesser extent in 2016 and more so as you move out into 2017 and 2018 on the back of demand pickup and where prices are today. And that would be true, for example, both at West Hub and NI Hub.

You can see in the quarter that we sold less than our ratable plan approximately 5% of our portfolio – total portfolio whereas an average quarter we would sell about 8%. And we rotated out of a lot of the gas shorts that we had because of the big heat rate move we had.

So as we move forward, as we build a position that falls behind ratable, it's going to be done more on, I'll call it, a flat price basis where we're just going to take the power that we would have normally sold and just hold it in our portfolio and we'll tailor that to locations and time buckets. NI Hub will be a big piece of that, but we'll be looking at other areas as well depending on what we see in the gas market.

<Q - Steven Isaac Fleishman>: Okay. Thank you.

Operator

Your next question comes from Julien Dumoulin-Smith from UBS.

<Q - Julien Dumoulin-Smith>: Hi. Good morning.

<A - Christopher M. Crane>: Good morning.

<Q - Julien Dumoulin-Smith>: So I wanted to ask a little bit of a bigger picture question here around the direction of the company, vis-à-vis Utility versus Merchant. As you think about that decision point, you've obviously made a couple of decisions over the past years, Pepco namely, how are you thinking about positioning the company towards the Merchant side of the business? Specifically as you think about, a, potentially expanding nuclear; and then, b, specifically expanding into Texas, are either of those avenues palatable or desirable under a Merchant expansion? And then more broadly, is a Merchant expansion desirable at this point in time?

<A - Christopher M. Crane>: So we continue to look at both sides. The Utility business, as we've talked about, we can operate utilities well. We can drive efficiencies in. We can improve the customer experience while we're getting returns. We're in a unique situation with ComEd on the formula rate at some historically low interest rates. We're not running from the investment in utility business. We think interest rates will normalize and it will be at the right place for the return. So we'll continue to make prudent investments and operate the utilities well there.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01780

On the Merchant side, it's all about the value proposition and looking at these specific investments. If a nuclear plant came available and we could fold it into the portfolio and see are adequate returns, we would surely have the scale and the scope to put one in. We don't see any out there right now, but newbuild is not an option. So that's the only way we get it as an acquisition.

As we've said before, we do think Texas is one of the more interesting markets to invest in right now, and that's why we're proceeding with organic growth down there. We do look at assets that come up from time to time. In the ERCOT market, most have been overvalued from our perspective in the long term fundamentals. That's why building these new technology units makes more sense to us.

So we'll continue to look for opportunities on both sides of the business and use the balance sheet prudently to make the investments. But one thing that we've – in the last couple of years, as we do our asset valuations on an annual basis, recycling capital has become a focus and we'll continue to watch that. If we see assets that others have more value on and we can deploy that capital into other arenas, we will not be shy of any divestiture.

And that's what we did this year with divesting assets and having the opportunity to use that capital into what we think is something that would be strategically valuable for us with Pepco, and also having – creating a balance sheet space to make the investments in new units. So we're still very confident in the model and confident in the investment thesis. And if low interest rates are hard on pensions and they're hard on the formula rate, but in the long run we see those coming back, and we still think it's a good investment thesis.

<Q - Julien Dumoulin-Smith>: All right, great. And then secondly, if you could comment more specifically around Ginna in New York, obviously there's been some development there. What's your latest expectations, if you can elaborate?

<A - Joseph Dominguez>: Chris, do you want to me take that?

<A - Christopher M. Crane>: Joe is going to grab it.

<Q - Julien Dumoulin-Smith>: Great.

<A - Joseph Dominguez>: Julien, it's Joe Dominguez. We continue negotiating the RSSA with our counterparties up there in New York. I think you'll see developments become public on that within the next few days to a week.

<Q - Julien Dumoulin-Smith>: Got you. Fair enough. Thank you. Good luck.

<A - Joseph Dominguez>: Thanks.

<A - Christopher M. Crane>: Thanks.

Operator

Your next question comes from Stephen Byrd from Morgan Stanley.

<Q - Stephen Calder Byrd>: Morning. Wanted to – I think I had heard on the call that Keystone and Conemaugh have not cleared in the PJM auction. And if that's correct, I wondered if you could just elaborate on the rationale. I thought of those as large, well-operating coal plants. I'm just curious. What was the driver behind that?

<A - Joseph Nigro>: And, Stephen, this is Joe. Good morning. There's a couple of reasons for that. First of all, as you know, under the mechanisms afforded in the PJM model, you can calculate an avoided cost rate on each of your units. And we take the opportunity with our fossil unit in particular, and all of our fossil units to do that. And that sets what I could call a cost base-line. And recognizing what we need from a cost perspective on those units. We take that into account in our bidding strategy and we have a host of other assets that we have to look at in particular to make sure that we're looking at this in a proper sense from a total portfolio basis. And in a way, that math worked for Keystone and Conemaugh in particular, it just didn't clear given where the clearing prices were for that particular option.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01781

<A - Kenneth W. Cornew>: So Steve, just a little add to that. It's Ken. There are substantial costs at the plant associated with environmental upgrades. That associated with the – avoids the energy benefits that were very low from that 2009 to 2013 period drove the avoided cost rates up at those plants. And as we said before, the market works when participants bid their costs and that's what we do.

<Q - Stephen Calder Byrd>: Okay, great; thank you. Just shifting over to the Utility, in terms of achieving the growth rate that you've laid out, what kind of load growth assumptions – your latest thinking that's driving that growth?

<A - Christopher M. Crane>: Denis, did you get that?

<A - Denis P. O'Brien>: Yeah, Chris. The load growth is really flat to slightly positive for the next few years. What we're seeing for the last couple was flat to slightly negative. We see the next five years or so, flat to slightly positive.

<Q - Stephen Calder Byrd>: Okay. And that's driving the change in terms of the outlook from flat to negative, to flat to positive, what's your – just at a high level view of what would drive that improvement in load growth?

<A - Denis P. O'Brien>: I think it's just the general economic health of each of the service territories that we serve.

<Q - Stephen Calder Byrd>: Okay. Thank you very much.

Operator

And our final question comes from Hugh Wynne from Sanford Bernstein.

<Q - Hugh D. Wynne>: Thanks. The $435 million asset impairment charge this quarter, how does that break down between Keystone, Conemaugh, and then Upstream assets and other?

<A - Jonathan W. Thayer>: Hugh, in total of overall long-lived asset impairments that we had during the year, we had a wind impairment that was $0.06, we had a lease impairment that was $0.02, we had Quail Run assets held-for-sale impairment of $0.04, Keystone and Conemaugh was $0.29 of that, Upstream was $0.09 for a total of $0.50.

On the flip side of that, we had $0.28 of gains related to the sale of Safe Harbor, the sale of Fore River, gain on the sale of West Valley. So overall, on a net basis, it's about $0.22 negative impact on the year.

<Q - Hugh D. Wynne>: Okay. Then my question for Bill. Bill, you're a lawyer, and you were talking about the potential implications of the Clean Power Plan, EPS Clean Power Plan. I just wanted to get your views as to the likelihood that the Plan survives at all. I understand there's been challenges as to whether EPA has authority to regulate CO2 under 111(d) in the first place. And then secondly if it does, whether that authority extends to energy efficiency and renewables. Is this Clean Power Plan going to be with us in the long run? Or do you think it's going to be whittled down or overturned altogether?

<A - William A. von Hoene>: Well, one thing that we can be abundantly certain of is that there will be litigation respecting whatever the final rule will be. But the basic tenets, Hugh, of the underpinnings of the rule are legally sound. The ability to regulate carbon emission has been already ruled upon by the United States Supreme Court. And our expectation is that there will be litigation and there may be modifications that result from that, but the basic underpinning of the rule will survive and will have impact that will be significant in that scope.

<Q - Hugh D. Wynne>: Great. Thank you very much.

Operator

I would now like to turn the call back over to our presenters.

Christopher M. Crane

So, thank you very much, everybody, for joining. As we've laid out from an operation standpoint, very strong year. We continue to run well, continue to watch cost and contain where we can. The Constellation, the Generation business has done a very good job in this marketplace and we continue to feel very strongly that that will continue to be supported.

The Utilities side, the Utilities are operating well, as I said. We see the investment thesis is right. We know the sensitivity to the interest rates, but don't think that's a long term sustainable issue, and we'll continue to keep investing. Thanks.

Operator

We've reached the end of today's call. You may now disconnect.

MANAGEMENT DISCUSSION SECTION

Operator

Good morning. My name is Amy, and I'll be your conference operator today. At this time, I would like to welcome everyone to the Second Quarter 2014 Earnings Call. All lines have been placed on mute to prevent any background noise. After the speakers' remarks, there will be question-and-answer session. [Operator Instructions] Thank you.

Mr. Ravi Ganti, you may begin your conference.

Ravi Ganti

Thank you, Amy. Good morning everyone and thanks for joining our second quarter 2014 earnings conference call. Leading the call today are Chris Crane, Exelon's President and CEO; Jack Thayer, Exelon's Executive Vice President and CFO; and Joe Nigro, CEO Constellation.

We are joined by other members of Exelon's senior management team, who will be available to answer your questions following our prepared remarks. We issued our earnings release this morning along with the presentation, each of which can be found in the Investor Relations section of Exelon's website.

The press release and other matters that we discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. The actual results could differ from our forward-looking statements based on factors and assumptions discussed in today's earnings release, comments made during this call and in the risk factors section of the earnings release.

Please refer to today's 8-K and Exelon's other filings for a discussion of factors that may the cause the results to differ from management's projections, forecasts and expectations. This presentation also includes references to adjusted operating earnings, which is a non-GAAP measure. Please refer to the information contained in the appendix of our presentation, and the earnings release for reconciliation between the non-GAAP measures to the GAAP earnings.

Bloomberg Transcript

We have scheduled 60 minutes for this call. I now turn the call over to Chris Crane, Exelon's CEO.

Christopher M. Crane

Thanks, Ravi. Good morning to everybody and thank you for joining. We had a good quarter overall, but before I get into those details, I wanted to start today's call by reemphasizing Exelon's long-term strategy. Our strategy is to continue to leverage our integrated business model to create value, invest for growth and explore ways to diversify our business into other areas of the energy value chain.

The utilities provide stable earnings and dividend support, and allow us to reinvest in projects to strengthen the infrastructure. Our competitive business provides commodity upside and the platform to diversify into adjacent markets. On the regulated side, the Pepco Holdings transaction provides an opportunity to accelerate our regulated growth and provide stable cash flows, earnings accretion and dividend stability.

The geographic fit and the operational synergies provide us the opportunity to deliver better customer service. On the GenCo side, we continue to look for ways to grow in the existing markets we serve and diversify into other related areas. Our partnership with Bloom Energy Fuel Cells is aligned with our goals of keeping up with our customer needs and the growth demand for distributed generation.

Our acquisition of the Integrys Energy Services business allows us to expand our regulated – our retail footprint further in an industry that continues to mature, consolidate and provide hedging diversification benefits for our existing portfolio.

Similarly, our interest in the Annova LNG is another example. We are significant participants in natural gas market, managing approximately 1.4 trillion cubic feet of gas on an annual basis. This project fits nicely in this business and aims to develop midscale LNG facility near Port of Brownsville, Texas. And it's in early stages, screening for development with very little financial commitment for us at this moment, but has significant potential upside. So you can expect that we will continue to look for and find diversification opportunities that leverage our expertise and strengths.

Moving on to the quarterly results. We posted a solid quarter with operating earnings of $0.51 per share, which is just over the upper end of our guidance range. For the full year, we are reaffirming our guidance range of $2.25 to $2.55 a share, which we provided to you at the beginning of the year. Jack is going to go into more details about the earnings and our financial performance in his remarks.

On the operational front, we've had a solid operational performance at our nuclear fleet this quarter. We achieved 91.8% capacity factor while completing five refueling outages during the second quarter. After completing our spring refueling outages, we ran at 98.8% for the month of June. These capacity factors include our ownership share of the CENG plants, which became integrated into the Exelon operations platform on April 1.

Our Gas renewable fleets had a strong quarter as well, with fossil-hydro dispatch match at 99.2%, and our solar and wind energy capture at 94.7%. ComEd and PECO had significant storms around the end the quarter, and on the last day of the quarter, we had severe weather, including multiple tornadoes in Illinois that caused service interruptions to over 420,000 customers in the ComEd service territory. PECO faced two storms on July 3 and 8 that left more than 400,000 customers without power. In the matter of three days or a little less, the power was restored to over 99.9% of those affected, demonstrating the storm response capability of our organization. I'd like to thank those personnel that were involved for their quick and rapid response.

On the regulatory side, ComEd filed its most recent annual distribution and transmission formula rate update in April. BGE filed its electric and gas distribution rate in early July. In early June, the EPA came out with its much anticipated draft rule for greenhouse gas regulations for existing power plants that set limits on emission by 2030. We see this as a potential positive for Exelon and we are pleased that the rule recognizes the critical importance of the nation's nuclear generation as vital to achieving the proposed standard.

final
Bloomberg Transcript
Bloomberg

final

While it's too early to draw sweeping conclusions about state-by-state impact, given the complexity of the rule and the time reported to the states to respond, we think that our clean baseload nuclear fleet is well positioned to take advantage of the potential changes in the stack composition and the generation mix that this rule will achieve.

Let me give you a quick update on the Pepco holdings transaction. So far, we have submitted filings with FERC, Virginia, D.C., New Jersey and Delaware. We continue to expect this transaction will close in the second to third quarter of 2015. We've made progress on the funding acquisition as well – funding the acquisition as well. We had a successful equity issuance in June and assets sales are proceeding, including our sale of our ownership in Safe Harbor that is expected to close in the third quarter. Jack is going to go into more of the specifics around this area.

Touching upon the state of the power markets, despite the recent pullback due to mild weather across the U.S. and the higher gas production and injection rates, the forward power prices are still higher year-to-date. 14 gigawatts of coal assets that are set to retire in the PJM footprint by next year are still operating. Current weather and expected gas storage levels are going to dictate the forward power prices in the near term.

We saw high spot volatility in the markets during the first six months of the year and have seen higher risk premiums and margins for wholesale and retail load products. We aggressively hedged during the quarter and move close to our ratable hedging strategy, capturing the upside prices we saw during the quarter. Joe Nigro is going to go into more details in his comments.

On the PJM auction results, as you know, the auction cleared at $120 a megawatt day. It was higher than most anticipated, due to primarily the rule changes around lower imports, lower demand response and participants' bidding behavior. We think the results are encouraging for our plants to clear. But there is an opportunity for further improvements in the market rules in the future, such as firm fuel commitments, anti-speculation rules and with the recent court ruling looking for clarity on the role of demand response energy efficiency in the capacity markets.

Our nuclear units, Oyster Creek, Quad Cities and Byron, five in total, did not clear the auction. For Quad Cities and Byron, these units are important for grid reliability, environmental and from an economic standpoint, are especially critical in helping Illinois meet its environmental goals in light of the recent EPA rules. To that extent, Illinois House passed the House Resolution 1146 in May, recognizing the value of nuclear energy for its reliability and its carbon-free benefits and urged the exploration of opportunities to avoid closing nuclear plants.

We have agreed not to make any decisions about retiring these units until June of next year to allow for the Illinois legislature time to enact market-based reforms at the state level. This could be items such as joining REGI [Renewable Energy Group, Inc.] or Clean Energy Standard. However, as we've said in the past, if we're unsuccessful and we do not see a path to sustained profitability for these units in question, we will be forced to retire them to avoid long-term losses.

I do want to be clear again about one thing. We are not looking and do not want contracts for subsidies from Illinois, only contracts that recognize the environmental benefit and the reliability of the assets. To wrap up, we're confident in our fleet operations and our portfolio management to deliver our earnings expectations for the full year. A key area focus for us during the second half of this year is to continue working through regulatory approvals to close the PEPCO transaction.

We will continue to look for opportunities to invest in assets that add value to Exelon and to its shareholders and ways to diversify our portfolio.

With that, now I'll turn it over to Joe Nigro to share his views on the commodity markets.

Joseph Nigro

Thank you, Chris. Good morning, everyone. I wanted to take some time to talk about power market developments this quarter, as well as year-to-date. I will also touch on our generation hedging strategy, discuss the results of this 2017-2018 PJM capacity auction, provide an update on load margins, and finally tell you how this translates to our

Bloomberg Transcript

gross margin forecast.

Moving to slide 3, the spot power markets in the first half of the year have been defined by volatility. We have had six months of very constructive spot market signals, followed by July weakness, due to weather conditions. In the first quarter of this year, the polar vortex led to higher spot prices in PJM, as we observed the growing reliance on resources such as natural gas units, demand response and oil peakers.

Throughout the second quarter, we saw spot power prices clear higher than what saw during the same period in 2012 and 2013. Expanding heat rates have been observed under most load conditions. These higher delivered heat rates can be attributed to the change in generation stack.

During July, we've experienced unusually mild weather, leading to lower spot power and delivered natural gas prices across the board. Cooling degree days are trending approximately 10% below normal at a national level, and 35% below normal in the NiHub area. Due to lack of weather-related demand in July, spot prices in PJM have been clearing lower than the previous two years.

Moving to slide 4, I'll discuss the forward market and its impact on our hedging profile. It has been a volatile year for forward power prices. The second quarter of 2014 was a continuation of the trend we saw in the first quarter in terms of an increase in both power prices and heat rates at the NiHub and West Hub markets. During the second quarter, forward NiHub around the clock prices for 2015 and 2016 increased approximately $2 to $3 per megawatt hour, while West Hub prices increased by close to $2.

A lot of the increase was in line with our long-held belief that power prices should increase, given the ongoing changes to the generation stack associated with coal plant retirements and an increased reliance on natural gas supply and other high-priced non-baseload resources.

During the second quarter we were able to take advantage of the rising power prices and move our behind ratable strategy as well as our cross commodity hedge position closer towards ratable. We have been operating behind our ratable hedging strategy for some time, as we felt the upside in the market at both NiHub and West Hub warranted a more open position.

During the quarter we captured the running forward prices, increasing our hedge generation by approximately 11% in 2015 and 9% in 2016. We also took advantage of market conditions by reducing the amount of our portfolio that was hedged with natural gas from near 10% to below 5% in both 2015 and 2016. In total, we reduced our power price exposure in 2015 and 2016 by 17% and 12% respectively. Our generation suite is now hedged between 92% and 95% in 2014, 75% and 78% in 2015, and 46% and 49% in 2016.

Since the end of the second quarter we have seen forward markets soften due to the weather-related weakness in the spot market. Forward prices for natural gas, natural gas basis and power are down during the month of July. The move down is largely driven by a decline in the prices for the winter delivery months.

Specifically, Tetco M3's natural gas basis has declined heavily in the winter months, which has led to a corresponding decrease in both West Hub and NiHub power prices. Spot natural gas basis prices were strong in Q1, driven by weather conditions, but were lower in Q2 as weather-driven demand backed off. The forwards responded accordingly with 2015 gas basis prices increasing through the first part of the year, only to decline during May and June.

Our gas basis view is split into a short-term and long-term view. Over the next two years, we expect volatility to continue, while longer term we expect stability in the Mid-Atlantic basis, driven by the development of the infrastructure to transport gas away from the Marcellus Shale area, expanding LNG exports to Mexico, industrial expansion and gas demand for power generation.

With respect to the forward power market, we still see upside price opportunity in certain non-winter months in seasons where we believe the markets are undervalued. While we have moved our hedging strategy closer to ratable, and more neutral across the calendar years in 2015 and 2016, we think there's an opportunity to benefit from power price upside in those delivery periods.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01787

We will continue to set our hedging strategy according to this view.

Fundamentally, our view of power price upside has not changed. We understand that there are very short-term factors that can impact spot and forward prices. As we saw in the winter and then again in July of this year: weather by itself can have a significant short-term impact on the market. However, our view is grounded in the fundamental changes that are taking place in the market.

Specifically, we expect about 30 gigawatts of coal generation to retire across the eastern interconnect by next year, of which approximately 14 gigawatts will be in PJM. Changes in the supply stack and more disciplined load pricing are just a few of the fundamental market changes we have witnessed this year.

Before moving on to our gross margin update, I want to touch on the PJM capacity auction and then an update on our retail margins. The PJM auction cleared at $120 per megawatt day in both the RTO and MAAC regions. The RTO clearing price doubled from the previous year's auction, indicative of tighter supply/demand fundamentals following coal retirement announcements. The clearing prices were primarily driven by 3,000 megawatts of lower imports, 1,400 megawatts of lower demand response and participant bidding behavior. These drivers were partially offset by nearly 6,000 megawatts of new generation that cleared.

There are further potential market design changes that we will continue to monitor, which will impact future capacity prices as well. Some examples of this include uncertainty regarding the impact on capacity and energy markets of the D.C. Circuit Court vacating FERC Order 745, as well as FERC and PJM working to curb speculation about potential changes to the shape of the demand curve and potential changes due to cold weather reform.

This was the first auction that we bid in some of our nuclear units after ACRs, and as a result, Quad Cities' Units 1 and 2, Byron Units 1 and 2 and Oyster Creek did not clear. As Chris mentioned, the failure of these units to clear will be a key factor in our decision on whether or not to shut down the plants. Our nuclear plants rely on the capacity market for revenues and without those revenues their economics will be stressed even more. We have committed that no decision will be made on any of our Illinois units before June of 2015.

Moving on to our load margins. So far this year, we began to see increases in both our wholesale and retail load margins as providers become more disciplined in their pricing assumptions. We have and will remain disciplined in our risk premiums and will not chase volume for the sake of volume. We continue to see an improving retail market developing through longer-term contracts from competitor consolidation.

As many of you may have heard, yesterday we announced an agreement to acquire Integrys Energy Services, a leading retail power and natural gas provider serving 1.2 million customers across 22 states and the District of Colombia. The Integrys portfolio adds further scale to our retail power and natural gas business and provides generation and load matching benefits to our portfolio. We expect the transaction to close in the fourth quarter of this year or the first quarter of 2015.

Turning to slide 5, I will review our updated hedge disclosure and some of the significant changes given the events of the second quarter. Focusing on 2014, we have a net $50 million increase to gross margin since the end of the first quarter, driven primarily by the elimination of the DOE nuclear waste fee, partially offset by an extended outage at Salem.

As I mentioned before, our portfolio management teams performed very well in managing our portfolio generation and load, given the volatile market. This contributed to us executing on $100 million of our power new business targets, and $50 million of our non-power new business targets during the second quarter.

For 2015, we saw prices increase across most regions, increasing around $2 per megawatt hour in the Mid-Atlantic and the Midwest. This along with the DOE fee resulted in an increase in our open gross margin of $450 million. Given our hedge position and our execution of $100 million of power new business, our total change in gross margin was an increase of $300 million.

For 2016, prices increased by $2 to $3 per megawatt hour. This resulted in an increase of $600 million in our open gross margin with a hedge position of between 40% to 50% for the quarter and an execution of $100 million in power

final

Bloomberg

SI-SSA-0015-01788

new business, our total change in gross margin was an increase of $450 million.

Overall, the first half of 2014 has resulted in higher prices from where we began the year, while mild weather, increased gas production and following natural gas basis prices have challenged power prices during July. While the volatility in the market is likely to persist, we are also confident that gas and power markets are fundamentally stronger than where they were just a year ago at this time.

Now I'll turn it over to Jack to review the full financial information for the quarter.

Jonathan W. Thayer

Thank you, Joe, and good morning, everyone. I'll cover Exelon's financial results for the quarter, our third quarter guidance range and update our cash outlook for 2014, including a discussion of the financing for the Pepco Holdings acquisition. I'll start on slide 6.

As Chris mentioned earlier, Exelon delivered second quarter earnings of $0.51 per share, exceeding our guidance range of $0.40 to $0.50 per share. This compares to earnings of $0.53 per share in the second quarter of 2013. The key drivers of the reduction in earnings quarter-over-quarter were lower realized energy prices at Exelon Generation, offset by increased distribution revenue at the utilities.

The cost of the expanded outage at Salem during the second quarter is offset by the elimination of the DOE nuclear waste fee. I'll go into greater detail on the quarter drivers at each of the utilities in a few moments. For the third quarter, we are providing guidance of $0.60 to $0.70 per share.

In April, Exelon received the operating licenses for the CENG nuclear fleet and began operating those plants. Prior to closing, Exelon and Generation each accounted for its investment in CENG under the equity method of accounting. After the close, we moved to a consolidated method of accounting and recorded all assets, liabilities and EDF's non-controlling interest in CENG at fair value on Exelon and Generation's balance sheet as of April 1. Ongoing operations will be included in the consolidated Exelon and Generation financial statements. However, these accounting changes do not materially change the earnings and cash flow for Generation and Exelon.

For the full year, we are reaffirming our guidance range of $2.25 to $2.55 per share. This guidance includes the impact of the elimination of the DOE nuclear waste fee, and is partially offset by increased outages, primarily in the nuclear fleet at Calvert Cliffs and Salem. These outages and their impacts are expected to be a $0.12 per share drag for the year. As we stated before, the full year benefit of the fee expiration is around $150 million per year, or approximately $0.11 per share. We do not expect Congress to act to reinstate this fee in the immediate future, and therefore have removed it from all years of our gross margin disclosures.

Turning to utilities on slide 7, they delivered combined earnings of $0.25 for the quarter. Before explaining the drivers of each utility, let me provide a brief update on our latest load forecast.

In general, we are seeing load growth year-over-year at ComEd and PECO, while BGE growth is flat to 2013. ComEd is seeing positive load growth of 0.8% across all three customer classes, led by 1.2% in the residential sector. PECO's overall load growth of 0.7% is led by 1.2% growth in the large commercial and industrial sector, and offset by a decline in load in the small commercial and industrial sector. You can find our latest full-year load estimates in the appendix on slide 18.

For the second quarter, ComEd earned $0.13 per share compared to $0.11 per share in the same quarter last year. The increase is primarily related to higher distribution revenue, due to rate base growth from higher capital investment. PECO's earnings were $0.10 per share for the quarter. This is up $0.01 per share from the second quarter of 2013, due to decreased income tax expense primarily due to additional tax repair benefits from February and July storms, and redemption of preferred securities, which resulted in a reduction of preferred dividends.

As Chris mentioned earlier, PECO had to two significant storm events in early July. Combined, these storms had a total incremental O&M cost of $10 million to $20 million, and incremental capital cost of $10 million to $20 million.

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-01789

Despite these storms and the ice storm in February, we are comfortable that PECO can still meet its full year guidance range.

BGE delivered earnings of $0.02 per share in the first quarter, a decrease of $0.01 from the same period in 2013, due to increased O&M costs primarily due to bad debt expense and labor, contracting and materials, partially offset by increased distribution revenue.

Earlier this month, BGE filed a rate case with the Maryland PSC, asking for increases of $117.6 million for electric, and $67.5 million for gas. We expect the final order in late January 2015, with new rates going into effect shortly thereafter. As you know, ComEd filed its annual formula rate case in April, and we expect a decision from the ICC by December 12, and the new rates will go into effect in January of 2015. More information about the filings can be found in the appendix on slides 19 and 20 for ComEd and BGE respectively.

Slide 8 provides an update of our cash flow expectations for this year. We project cash from operations of $6.975 billion. This compares to $6.2 billion last quarter. The variance is primarily driven by proceeds from divestitures and a decrease in OPEB contributions. As you know, we had a busy quarter working on financings for the Pepco Holdings acquisition. On May 30, 2014, we announced that we had entered into a $7.221 billion bridge loan facility to support the transaction and provide flexibility for timing of permanent financing.

We executed the first portion of the permanent financing with a successful equity issuance via a forward sale, which priced on June 11. We issued $1.2 billion of mandatory convertible units and $2 billion in equity forward contracts. Each of these transactions included green shoots, the proceeds of which may be utilized for accretive growth opportunities. As a result of the equity issuances, we reduced the bridge loan facility to $4.2 billion.

We're well down the road with our asset sale program. In May we sold our Safe Harbor hydro facility to Brookfield Capital for $613 million, or $375 million after tax, with an expected close in the third quarter. We're also proceeding with efforts to divest Fore River, Quail Run, Hillabee and Keystone/Conemaugh. We anticipated raising greater than $1 billion in after-tax proceeds from the divestitures, with the excess proceeds funding future investment and growth.

As a reminder, I'd like to point out a few changes made to the presentation of the projected sources and uses of cash in the first quarter, due to the consolidation of CENG into Exelon. For the fourth quarter of 2013 we showed 100% of CENG cash flows net of distributions reflected in the cash from operations line and the CENG distribution to EDF in the other line. Starting in the first quarter, we have kept the CENG distribution to EDF in the other line. However, we now include 50% of CENG's CapEx in investing, while leaving all other CENG cash flows net of distributions in cash from operations. As a reminder, the appendix includes several schedules that will help you in your modeling efforts.

Now, before I open the call for Q&A, I want to acknowledge that this is Ravi Ganti's last call as VP of IR. Ravi is moving back east to become the Senior Vice President and Chief Commercial Risk Officer. I want to thank him for representing Exelon through the past two years. I also want to welcome Francis Idehen as the new VP of IR. Many of you on the phone have met Francis and we at Exelon are excited to have him in this new role.

That concludes my remarks. Operator, we'd like to turn it over to Q&A.

Q&A

Operator

Yes, sir. [Operator Instructions] Your first question comes from the line of Dan Eggers with Credit Suisse.

<A - Christopher M. Crane>: Hey, Dan.

<Q - Dan L. Eggers>: Can we talk a little bit more about what's going on in the retail markets, A, as far as what kind of margins and profitability you guys saw in the quarter? And then with the Integrys acquisition, how you think about the scale of selling power through retail channels relative to other ways of hedging your exposure?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01790

<A - Christopher M. Crane>: Joe will take that.

<A - Joseph Nigro>: Good morning, Dan. The retail market remains very competitive. As you know, there's a number of participants in all the areas that we're in. I would say, however, since January, we have seen improvement in all of the retail markets. And it's really happened on two fronts, from our perspective.

The first is just the premiums, the risk premiums charged to serve load, and I'm talking both in the retail markets as well as on the polar side, have gone up with the increased volatility we've seen in the market. And then in addition to that, we have seen our margins on the C&I origination on the power side expand as well. And I think both of those things are positive. We had been saying for some time that we expected to see this happen because we couldn't get our hands around where the market was trading at effectively.

I think from the Integrys perspective, it's a really good fit for our portfolio from the standpoint of: their core products are power and gas, which dovetail nicely into our existing retail business. The 22 states that they're in also fit nicely with the geographies that we're in. And it is just a natural opportunity for us to grow the business as you see some of the competitors scale back.

<Q - Dan L. Eggers>: So, Joe [indiscernible] (32:38) -

<A - Christopher M. Crane>: The only thing I'd add to that, Dan, is the nature of the business is still very competitive, as Joe said. There's dozens and dozens of participants that are still in markets like Northern Illinois. We expect upon closure that our combined footprint would be about 29%. I think it's been over-reported in a few outlets. And so 28% to 29%. But there, again, as the contracts come up, they'll be processed in a very competitive way. So we feel strong about the acquisition and we still think it supports a very competitive market.

<Q - Dan L. Eggers>: You guys have historically talked about $2 to $4 margins for the retail business. Where are you seeing new business fall within that continuum?

<A - Joseph Nigro>: Dan, we've mentioned previously in the last six months that at one point we were slightly below that $2 to $4 threshold for C&I originations. We're now back over that $2 threshold at, call it, low to mid-$2 and we've seen improvement. And then, as I mentioned, in addition to that, on top of that, we've seen the actual risk premiums increase. So the increase has been really on two fronts, but our margins alone are above that $2 threshold.

<Q - Dan L. Eggers>: Yeah. And I guess just one other question. After the Pepco deal there was talk about looking to buy more generation assets prospectively as well, and maybe the asset sale is freeing up even more balance sheet room. Can you just walk through the criteria you guys expect as you look at buying assets in this market and then with the volatility in power markets we've seen in the last few months, how is that maybe affecting decisions or where you might want geographic exposure?

<A - Christopher M. Crane>: We continue to look at growing both sides of the business, either through on the generation side, either through acquisitions or potential development projects. But they have to pass the test of accretion and over the period, in a value proposition, a positive NPV contribution to earnings and free cash flow or EPS. We participate as assets come. More recently, assets have been going at higher valuations than we would put them in the portfolio for. But we'll continue to watch as things come to market and run them through our models.

They need to be generally in the markets that we're serving and trying to grow into. Some of the asset optimization that we're going through now is carried back on a few of the assets that don't have the good well-run assets, good employee base, highly reliable, but they don't have the value creation in our portfolio. So continuing to optimize the assets as we go forward.

As we've said previously, really interested in the Texas market. We see the economy there strengthening. We see the demand, although not as fast as previously reported, presenting opportunities for further growth in wholesale and retail opportunities which would, with our business model we try to match as much as we can the generation to the load in the portfolio.

<Q - Dan L. Eggers>: Okay. Thank you, guys.

Your next question comes from the line of Steven Fleishman with Wolfe Research.

<Q - Steven I. Fleishman>: Yes, hi. Good morning. Just first on the guidance for this year, have you incorporated any of this bad July weather or August forecast in the range or not?

<A - Jonathan W. Thayer>: Yes.

<Q - Steven I. Fleishman>: Okay, good. And that's in your Q3 forecast as well?

<A - Jonathan W. Thayer>: I think four of us said yes at once there, so we're pretty firm on making sure there's clarity.

<A - Christopher M. Crane>: Yes on the second one, as well.

<A - Joseph Nigro>: Yes on the second one.

<A - Jonathan W. Thayer>: Yes on the second one.

<Q - Steven I. Fleishman>: Okay. Good. And then just going back to the TEG transaction, retail. Can you give us maybe any sense of a metric of what kind of valuation you might have paid for that business?

<A - Joseph Nigro>: Well, as we mentioned in the press release, Steve, we paid $60 million for Integrys and then assumed the working capital of approximately $180 million or so. I would say on an EBITDA multiple basis, it's close to or less than 2 times on an EBITDA multiple basis.

<Q - Steven I. Fleishman>: Okay. And then this might be a bit of farfetched question, but just curious because you've been growing your renewables business at a decent amount and contracted generation. What's your kind of take on this yieldco trend and is this something you'd want to kind to sell your assets to, given that you can probably sell them for a lot now, or you want to keep trying to grow the business? Just how are you thinking about it?

<A - Christopher M. Crane>: We like the business on the projects that you can get for the right value. It is on the renewables a free cash flow play and with the current tax rules that are there, it's a tax play. We've leaned more towards project financing and we think that fits our needs better than a yieldco in the long term, what we see for the tax environment for these assets going forward. So we're not heading towards yieldco or pushing assets into the yieldcos. We're more continued development in project finance the assets.

<Q - Steven I. Fleishman>: Okay, thank you.

Operator

Your next question comes from the line of Greg Gordon with ISI Group.

<Q - Greg Gordon>: Thanks. A couple questions. First, I know you had a good update on cash flow, in part from tax. Were those tax inflows contemplated as possible at the beginning of the year and you just excluded them from your guidance because of you were uncertain on timing, or were they something new that developed over the quarter? And then should we assume a normal effective tax rate in the subsequent quarters and in the next couple years?

<A - Christopher M. Crane>: Greg, I'd say some elements were, I would say, on the opportunity side. So we had some visibility. We had about $100 million improvement based on tax reimbursement for our decommissioning trust funds. The safe harbor sale allowed us to accelerate some tax credits. So that pulled forward about $175 million.

So we have had some elements that we had some visibility might come to fruition and with some successful settlements with the IRS as well as some very successful sale of safe harbor, have created an incremental opportunity there.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01792

On the effective tax rate side, we would anticipate about a 31% to 32% consolidated effective tax rate on operating earnings for the year. On the GAAP side, mark-to-market earnings kind of causes that to have some variability around it. But for modeling purposes, I think you can safely assume the 31% to 32%.

<Q - Greg Gordon>: And in subsequent years, is that a reasonable bogey or is it, should we assume something higher in lieu of any one time tax monetizations?

<A - Christopher M. Crane>: I think that's a fairly reasonable level.

<Q - Greg Gordon>: Okay. So consistent at that level?

<A - Christopher M. Crane>: Yes.

<Q - Greg Gordon>: Okay. And then can we talk a little bit about gas and gas basis? Working here with Jon Cohen, we watch not just the strip, but the monthlies and you've still got a pretty positive winter basis and a pretty negative summer basis at Tetco M3, but then at the Chicago City Gate, basis hasn't been nearly as volatile. What is going on in the real-time market, and what is your point of view – Exelon's point of view on how we ought to think about gas basis?

<A - Joseph Nigro>: Yes, morning, Greg. It's Joe. I think from a gas basis perspective, your point is right on. We've seen the Nov-March strip for next year and the M3 basis drops since the end of June, about $0.50. And versus its high in early May, it's dropped almost $1. And to your point, really the summer period since the end of June for that M3 basis hasn't fallen at all. We've dropped some since the high at the end of May. Chicago has been much more stable.

From our perspective, there's a couple of things. Obviously, the strong Q1 spot prices had a big impact on driving the forward prices higher, both in the winter and summer periods. We're seeing an impact that dragged through to the forward curve on what's going on in the spot market. I mentioned in my prepared remarks how we're 35% down on cooling degree days in Chicago and 10% nationally. That's having an impact in the gas market, both at Henry Hub and the drag through the basis.

I think specifically, the M3 basis, we're going to continue to see some of this volatility in the next two years or so as we continue to produce more gas at the Marcellus Shale. We're producing about 15 bcf a day in Marcellus, and we just don't have the takeaway capacity to move that gas efficiently.

As you get out to towards 2017, we really expect that gas demand, the supply/demand balance at Marcellus to come into much better equilibrium, when you think about some of the pipeline reversals with Transco and Texas Eastern and the Rockies Express, which will provide an uptick and more stability to that gas basis.

<Q - Greg Gordon>: So, when you guys roll out, when will you guys roll out how you've positioned yourselves for 2017 vis-à-vis hedging and would we expect that to be reflect – that perspective to be reflected in your positioning when you do so?

<A - Joseph Nigro>: Yeah. I think the way I would answer that is first is, we'll roll out 2017 like we do every year at EEI. And we do have – our ratable program for 2017 began this year. We are impacted by gas basis just like everyone else on our open position. But I would also say as we convert to power sales obviously, we don't have as big an impact on – the gas basis doesn't have as big an impact on us, and once we sell the power, because we have so much long baseload nuclear generation that it's not impacted once the power is sold.

<A - Christopher M. Crane>: But 2017 will come out at EEI.

<Q - Greg Gordon>: Thank you, gentlemen.

Operator

Your next question comes from the line of Jonathan Arnold with Deutsche Bank.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01793

<Q - Jonathan P. Arnold>: Good morning, guys.

<A - Christopher M. Crane>: Good morning.

<Q - Jonathan P. Arnold>: Could I just ask you to give us an update on how you see the whole kind of discussion in Illinois around these market-based solutions playing out? I guess you said you won't take any action on plants until middle of 2015. The legislature is going to come in for a veto session in November, and then be back in the early part of next year. What's going on currently, if anything, and how is this actually going to move forward?

<A - Christopher M. Crane>: Get Joe Dominguez to cover his actions there.

<A - Joseph Dominguez>: Sure. What's going on currently is that the Illinois stakeholders are taking a look at the 111, the proposed rule, which obviously provides a strong signal to the states to preserve nuclear as part of their compliance plan. The other thing that is happening is as part of the resolution that Chris mentioned at the outset, state agencies are drafting a number of reports that'll look at the economic value of the units to the local communities, jobs, the value of the energy produced, the value of the low carbon resources. And so we expect those reports to be completed sometime around November or December, positioning us for a discussion of solutions in the spring session.

So I think the first time we'll see the actual legislation in different proposals will be in the spring. As Chris mentioned, we're looking for a market solution. To the extent that low carbon resources and [ph] hamster (46:09) liability are attributes that society needs, we'll expect to be compensated for those attributes, and we'll expect that compensation really at all of the plants, and not just the plants that are in jeopardy.

So that's our go-forward plan and I think that's the timing.

<Q - Jonathan P. Arnold>: So the next thing we will probably see will be these reports coming out towards the end of the year?

<A - Joseph Dominguez>: That's right.

<Q - Jonathan P. Arnold>: And then would you say that the stakeholders' interest in this is entirely dependent on 111(d) or does it kind of run – is there a chance we move on this regardless of what happens with the EPA and carbon?

<A - Christopher M. Crane>: The state has long positioned itself as focused on environmental issues and they have individually, as a state taken, actions in advance in 111(d), and looking at different programs that they may be able to participate in. We see this as helping them with a roadmap on going forward. So there is an interest within the state for that. There's also an interest within the stakeholder body to secure the long-term viability of these assets. They're greatly, highly critical to the economy, local economy in which they're located in, serving as tax bases, job bases, economic support for the community. So it's a multifaceted view, but the environmental support has been a long-term focus for the state.

<Q - Jonathan P. Arnold>: Okay. Thanks, Chris. And can I just ask, a similar idea but different topic, on the various avenues you're pushing for in terms of PJM market structure reform? Could you give us an update on which of those is getting the most traction and what your expectations are around timing and process there as well?

<A - Christopher M. Crane>: Joe, you want to comment?

<A - Joseph Dominguez>: Sure. So, there's some unfinished business around the speculation reforms that had been proposed in advance of the last auction and FERC has set up some sessions to deal with that. We think that will ultimately revive some of those speculation reforms for FERC approval in advance of the next auction. The other issue that is gaining a lot of attention, is an examination of the winter reliability situation, I think has revealed some gaps in the capacity product that we have purchased thus far on behalf of consumers.

So I think PJM is going to be looking at something that procures some additional commitments around high-availability resources. I think that's going to look a lot like resources that have firm fuel, like our nuclear plants. And I think it's going to be a carrot and stick approach where there will be additional compensation paid to those units for enhanced reliability, and there's also going to be some enhanced penalties. And I think, as an early model one might

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01794

look to in that regard, is what New England has done. I think PJM is going to look very carefully at that, so there'll be some more money in the system, but also some more penalties for people who don't perform.

I think generally speaking, PJM wants to be out of the business of managing fuel supply for gas generators. That's become a big issue. It will become a bigger issue, as the stack changes, and the other thing we saw is, obviously, generator non-performance in the winter, which really threatened the reliability of the system. So I figure we will see a proposal sometime in the next month from PJM with action bringing something to FERC, potentially by the end of the year, depending on what the analytics look like.

<Q - Jonathan P. Arnold>: Would that run on the typical PJM BRAs schedule with an auction in the second quarter, or you see that happening on a different timeframe?

<A - Christopher M. Crane>: Well, I think in the long run it'll do just that. It'll be part of the BRA and the planning parameters we see going into the BRAs. But there is a question about these next few winters, before we could catch up to the BRA schedule. So I think there's going to need to be something that will be supplemental for the coming winters. But again, we need to see what PJM proposes, but I don't think it's just purely the BRA play. I think it's going to affect the next few winters as well.

<Q - Jonathan P. Arnold>: Okay, so the next month or so, you think that proposal emerges?

<A - Christopher M. Crane>: Yes.

<Q - Jonathan P. Arnold>: Great. Thank you very much.

Operator

Your next question comes from the line of Hugh Wynne with Sanford Bernstein.

<Q - Hugh de Neufville Wynne>: Good morning.

<A - Christopher M. Crane>: Good morning.

<Q - Hugh de Neufville Wynne>: I wanted to follow up on some of the discussion regarding Illinois's response to 111(d). I think that I heard mentioned that that rule provides an incentive to preserve the capacity of the nuclear fleet, and at one point, I also heard mentioned the possibility that Illinois might join REGI. Could you comment more directly on what you've heard regarding the strategies of Illinois and Pennsylvania with respect to their possible response to 111(d), their state implementation plans?

<A - Christopher M. Crane>: Well, I'd say, just first of all, it's very preliminary. So I think there's a couple things that folks are looking for. It's pretty clear that if you lose nuclear plants, your ability to comply with any carbon regime going forward is going to be jeopardized. The plants produce a tremendous amount of zero carbon energy, and so if you lose those, you're going to see a big uptick in carbon emissions. And we've seen that in states where plants have actually retired. I think that's been fully recognized.

What the vehicle for compliance will be is going to be the subject of discussions for, I would guess, at least a year and possibly longer. So I just think it's too early to speculate on where they're going to go. I think some stakeholders see what's been done in the REGI states and find that appealing. There's a lot of green before we get to a solution on that.

<Q - Hugh de Neufville Wynne>: Right.

<A>: I think the other thing to add is, in conversation, that this is a very complex rule and it takes time to digest it. I think the state wants to ensure they understand the allotment or reduction goals that they were given, that they ensure that they're given a fair shake in that, but it will be, as Joe said, take a while.

<A>: And if I can just add, you asked about Pennsylvania as well. There, I think the administration has not been predisposed to joining REGI. But the other candidate for governor has indicated as part of his platform that he would

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01795

join REGI if he is elected. So let's see what the election results look like in November, and that will probably chart the path there.

<Q - Hugh de Neufville Wynne>: Could I just ask a question on that front, the portion of your fleet that's in New York, and in Maryland, of course, is already governed by REGI. Is it important to you and are you making initiatives to see that the rest of your fleet is also governed by similar rules, or do you feel that PJM can operate flexibly with different state implementation plans in different states?

<A - Christopher M. Crane>: Yes, I think we believe the latter. I think REGI is a good choice, but it's just one of the choices. Clean Energy Standard could work. A dispatch model where we price in carbon and the dispatch of resources through the RTOs could work. There are a lot of solutions out there. We have supported the REGI platform and the modelable improvements and we'll continue to support those states that are interested in that model. But it's not the only solution.

<Q - Hugh de Neufville Wynne>: Great. Thank you very much.

Operator

Your next question comes from the line of Angie Storozynski with Macquarie Capital.

<Q - Angie Storozynski>: Thank you. Good morning. So I wanted to go back to the questions about Integrys. So I know a lot of questions have been asked. But have you incorporated the projected uptick in volumes and margins to your retail business in your gross margin projections?

<A - Joseph Nigro>: No, Angie, we have not.

<Q - Angie Storozynski>: Okay. So the follow-up question is how should we think about it? I mean how big of a swing could it be? And also is this portfolio short power?

<A - Joseph Nigro>: First of all, I think the first question is the uptick in volume would probably be approximately 15% to our retail power volumes. And our existing Constellation retail power volumes, on the gas side the uptick in volume would be approximately 30% to the existing Constellation volumes.

<Q - Angie Storozynski>: Okay. And I'm just trying to figure out if this very long multiple has to do with the fact that the portfolio was short, the 2 times EV to EBITDA?

<A - Jonathan W. Thayer>: Angie, this is Jack. Clearly, Integrys didn't own generation to support that portfolio. They had acquired and hedged it via the open market. It fits nicely with our generation footprint in the states they're active, and this would be an incremental avenue for us to hedge our generation -

<A - Joseph Nigro>: And I would add to that, Angie. The purchase is a mark-to-market exercise, so regardless if they were long or short, it would be an exercise in just marching to market whatever positions they had on. It's hard to speculate and provide any more information to that.

<Q - Angie Storozynski>: Okay. That's fine. Now, should we expect that you will give us an updated projections for volumes and then margins for the retail business during the EEI?

<A - Joseph Nigro>: Yes. That is correct. We will update it for EEI.

<Q - Angie Storozynski>: Okay. Then, given the correction in solar power curves since June 30, could you give us a sense roughly how they're going to swing? We are seeing currently in your total gross margin for 2015 and 2016 versus what you're showing us on the slides?

<A - Joseph Nigro>: Yes, if you look at our sensitivity tables that we provide in our hedge disclosures, we show you a $5 change in power prices for 2014, 2015 and 2016 respectively for PJM West and for NiHub. And we're roughly down about $3 in 2015 and 2016, respectively. So just backing into the math, it's approximately $150 million in 2015

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01796

and approximately $250 million in 2016, and you can see that in the sensitivity tables we provide.

<Q - Angie Storozynski>: Okay. And then, again, going back to the retail business. So I mean just to reconcile your views, so you are expecting, as we do, a growing volatility in power prices and yet you are bulking up your retail business, which tends not to do well in a volatile power price environment. So are you comfortable with the strategy because you're still long power, or is it that you think that you're the last man standing in the retail business and thus, you will be paid for this additional risk that you're assuming?

<A - Christopher M. Crane>: It's definitely not the last man standing. It's a pretty effective market with many participants in it. So I think Joe could continue to cover the strategy; touch that.

<A - Joseph Nigro>: Yes, I think, Angie, there's a couple of things. I think the first is intrinsically we believe in the logic of matching generation and load, and there's a number of reasons to do that: it's beneficial for us because we don't have to take our power output to the over-the-counter market; the optionality of our units is efficiently matched with these load contracts; the locations in which we're selling the load contracts matches nicely to our generation output generally.

I think the second, the other side of it is the volatility piece. These contracts are renewing in a relative frequent period that such the price and the volatility is reflected in those contracts. So it's not like we're being exposed to that. If you go back six months ago, we were saying we didn't think the market was accurately pricing the volatility in the right way, and when it was impacting the way we were executing our own quantities of retail. We have seen that improve, and we thought it would improve and we're comfortable with it because it's an efficient hedge for our total portfolio. And the margins have continued to expand.

<Q - Angie Storozynski>: Okay, and my last question, not related to the generation business ones. So we're still missing a filing in Maryland for your Pepco acquisition. I mean is there any reason why you're waiting to file in Maryland?

<A - Christopher M. Crane>: Yes, as we previously said, we have multiple filings in at Maryland, and we had to time ourselves in our workload, so we prepared the other ones first. Maryland's on the clock. It's 225 days, so we'll be filing that one very shortly, but it's just the execution of the work we already have. We're in front of the commission in Maryland, and the work that we needed to do in front of the other commissions.

That'll be it, Operator.

Operator

Thank you. Thank you. If there are no further questions at this time, I would like to turn the call back over to Ravi Ganti.

Ravi Ganti

Thank you, Amy. That brings us to the end of the call. Thank you for joining us. If you have any follow up questions, please contact the IR department. Thank you.

Operator

Thank you. This concludes today's conference call. You may now disconnect.

MANAGEMENT DISCUSSION SECTION

Operator

Good morning. My name is Brandy and I will be your conference operator today. At this time, I would like to welcome everyone to the Exelon Acquisition of Pepco Holdings Incorporated Conference Call. [Operator Instructions] Thank you.

Mr. Ravi Ganti, Vice President of Investor Relations, sir, you may begin your conference.

Ravi Ganti

Thank you, operator. Good morning, everyone. Thank you for joining us. Earlier this morning, we made two announcements. Exelon plans to acquire Pepco Holdings in an all-cash transaction and our first quarter 2014 earnings results. Materials and presentations related to the earnings and the acquisition are available on the Investor Relations section of our website.

Our discussion on today's call contains forward-looking statements and estimates that are subject to various risks and uncertainties. You should refer to the first two slides of today's presentation as well as information in Exelon's SEC filings for a discussion of factors that may cause the results to differ from management's projections, forecasts and expectations. Leading the call today are Chris Crane, Exelon's President and CEO; Joe Rigby, Chairman, President and CEO for Pepco Holdings and Jack Thayer, Executive Vice President and CFO, Exelon. We have scheduled 60 minutes for today's call. After the prepared remarks, we will open the floor for our Q&A session.

With that, I turn the call over to Chris, CEO, Exelon.

Christopher M. Crane

Bloomberg Transcript

Thanks everybody for joining us this morning. Before we get to the topic that we'll focus on today's call, our acquisition of Pepco Holdings, I want to spend a minute on our earnings for the quarter. We delivered on our financial expectations with earnings of $0.62 a share, which was within the range for our quarter. Our earnings for the quarter would have been $0.12 higher without the large outage in January – the outage at Calvert Cliffs, our nuclear facility, and the impact of the severe ice storm in the PECO service territory.

We are providing guidance of $0.40 to $0.50 per share for the second quarter operating earnings. We're on track to deliver on our financial goals for the full year. We've provided prepared remarks on the market portfolio strategy and financial results along with our earnings release this morning. You can contact IR for any follow-up questions. We do have Ken Cornew and Joe Nigro in the room if there is specifics that we want to touch on.

Now I'll move on to the topic that is the focus today. We're extremely pleased to announce that we have reached an agreement to acquire Pepco Holdings. We're doing this call from Washington D.C. and I'm very pleased to be here today with Pepco's CEO, Joe Rigby, joining the call to share his views on the transaction and what it means for Pepco, the 2 million customers in the D.C., Delaware, Maryland, and New Jersey area.

We think this deal is the right deal at the right time for Exelon. This is a strategic acquisition that results in a leading Mid-Atlantic electric and gas utility platform with a contiguous footprint that will serve almost 10 million customers in six states. This acquisition will add further sources of stable regulated cash to our portfolio and leverages our position as a leader in operating large urban utilities. Exelon will pay a cash consideration of $27.25, that translates to a 27.7% (sic) [24.7%] upfront premium based on last Friday's closing. We have committed financing via our bridge line in place to fund the acquisition and our strong balance sheet will enable us to source permanent financing for the purchase price using balance mix of debt and equity along with cash on our balance sheet. Jack will talk through more of the financial details later, but let me give you a few initial thoughts.

This transaction is highly accretive beginning in our first year of full operations as a combined company. It's accretive to the tune of $0.15 to $0.20 per share on a steady state basis. It maintains Exelon's balance sheet flexibility to continue to pursue further growth investments across all of our businesses, and it preserves the upside in Exelon's value that we still see fundamentally expected to gain from the continued recovery in the power markets which have been strong since the first of the year. For Pepco Holdings' customers, this transaction results in direct consumer benefits and enables further sharing of operational best practices across a larger suite of utilities.

Let me turn your attention now to slide 5, to talk more about the strategic benefits of this combination. The geographic fit of Pepco utilities within the Exelon utilities is second to none. There is a natural overlap of our operations in the Mid-Atlantic that will enable us to realize cost savings and improved reliability for all of our customers. And when it comes down to storm restoration, as we've had recent examples on how PECO, BG and ComEd worked together to ensure that we got the lights back for our customers in the face of some of the worst storms we've ever seen in the last few years.

This sizable utility platform also provides an opportunity for us to streamline processes, drive savings and improved efficiency in our day-to-day operations. We can drive performance through our metrics-based operating model. The acquisition also supports our belief in the value of an integrated utility model with a balanced mix of regulated and non-regulated cash flows and allows us to continue to have the upside for the shareholders from a power price recovery.

We've started to see recovery in the power markets, as I have mentioned, come to fruition, and the utilization of our balance sheet to particularly fund this acquisition maintains a leverage to a significant upside of the power prices.

On slide 6, we show the map of what our service territory will look like post-merger. We've worked in close proximity to Pepco, Atlantic City Electric and Delmarva Power for many years and we're pleased with the prospects of making them part of the Exelon utilities.

Slide 7 provides some key facts related to the transaction. As I mentioned before, we are paying $27.25 per share for Pepco Holdings in an all-cash transaction. There are no significant changes to our operation or governance from the company, and I look forward to working very closely with Joe and Pepco management team as we work for the

final
Bloomberg Transcript
Bloomberg

regulatory approval process and the integration planning. Our plan is to obtain all required shareholder and regulatory approvals to close the transaction in the second quarter to third quarter of 2015.

Slide 8 provides some additional context around the timeline for the regulatory process. A joint team for regulatory folks from both Exelon and Pepco are prepared to continue working together and in conjunction with stakeholders in the various jurisdictions, secure all the necessary approvals. We expect all the regulatory filings to be made in approximately the next 45 days. While only Maryland has a stated clock on the regulatory process, we believe our experience learned from the Exelon – Constellation merger will position us to secure the needed approvals by, as I said, the second quarter to third quarter of next year.

I'd like to now invite Joe Rigby to give his thoughts about the transaction, how it brings value to PHI shareholders and customers.

Joseph M. Rigby

Thanks, Chris. And I want to thank you and your great team for helping make this transaction happen. This is a great day for the Pepco Holdings family, for shareholders, employees, customers, and our communities. We're excited to join the Exelon team and to become part of a larger well -capitalized company that has better scale to invest in infrastructure, people in the local communities.

Our shareholders will receive an attractive premium of 24.7% for the purchase of their shares by Exelon. Chris Crane and Exelon are committed to building upon our significant improvements in system reliability, customer service and outage restoration. Exelon has experience in large urban cities like ours and is a valued corporate citizen. We share a culture of continuous improvement, accountability, safety and commitment to our community.

Our customers will directly benefit as a result of this transaction including $100 million in customer benefits across Pepco Holdings service territories, for rate credits, low-income assistance and energy efficiency programs, a commitment to further improve system reliability and enhanced storm restoration capabilities. This is a tremendous opportunity, and Exelon is the right partner for taking Pepco Holdings to the next level.

I'd now like to turn the call over to Jack Thayer, CFO of Exelon, to discuss the financials of the transaction. Jack?

Jonathan W. Thayer

Thank you, Joe. Good morning, everyone. It's an exciting day for Exelon and our shareholders. The financial overview of the transaction begins on slide 11. The acquisition of Pepco Holdings adds significant value for our shareholders. As Chris mentioned, it's significantly earnings accretive in the first full year after closing. The deal will increase earnings by $0.15 to $0.20 per share in 2017. The rapid growth of rate base, retained synergies and earnings at Pepco's three utilities combined with our financing plans for the transaction drives sustainable earnings accretion.

As you know, Exelon has committed $15 billion in capital to ComEd, PECO and BGE to grow their rate bases over the next five years. The addition of the Pepco utilities to the Exelon family will add an incremental $8.3 billion in regulated rate base, growing our rate base faster than we could on our own. This in turn will increase our regulated earnings, add stable cash flows and add to our financial strength. Additionally, the utility earnings from the pro forma company can fully support the Exelon dividend by 2015.

The integration of the two companies will result in more than $250 million of net synergies over the first five years of which we can expect roughly one-third will be retained. Our past experience gives us confidence that we can deliver on these synergy targets. The Constellation integration resulted in significant savings, and we believe we can achieve meaningful savings for customers and shareholders in this case as well. This deal brings substantial benefits to our shareholders and the contemplated financing approach preserves the upside to be gained from a power market recovery.

Bloomberg
SI-SSA-0015-01801

On slide 13, you can see the earnings accretion, the rate base growth and continued strong credit metrics as well as the more balanced business mix on a pro forma basis with operating earnings, pro forma for the transaction.

On slide 13 provides an overview of our financing plans. Our strong balance sheet coupled with the regulated nature of the transaction and the visibility into recurring utility cash flows affords us the opportunity to finance roughly 50% of the acquisition price with debt at Exelon Corporate, taking advantage of a historically low interest rate environment. The remaining portion of the transaction will be funded with a mix of common stock, mandatory convertible securities and up to $1 billion of cash from the sale of non-core assets at Exelon Generation.

Our investment grade credit ratings at all Exelon and Pepco registrants are expected to be maintained. We have a bridge financing in place for the full amount of the acquisition, which provides significant flexibility for the timing of permanent financing. That is particularly important, given the long lead nature of the regulatory approval process. Going forward, the combined company will continue to have a strong liquidity profile supported by $9.5 billion in revolving credit facilities. Importantly, this transaction delivers growth for the company, and our financing strategy maintains balance sheet capacity for continued growth investment on both the regulated and merchant sides of our business.

And now, I'll turn the call over to Chris for concluding remarks before Q&A.

Christopher M. Crane

Thanks, Joe and Jack. We've talked with all of you over the last few years, and we've been relentless in our commitment to deliver value to our shareholders in all aspects of the business. We have taken actions to create flexibility to invest in growth, while maintaining a strong investment grade balance sheet. You all know our fundamental view in the upside of power prices, which we are starting to enjoy seeing come to fruition, that has not changed. We've positioned ourselves to further benefit from the market recovery. We also believe in the need for strong infrastructure investment in our utility platforms. As Jack has mentioned, we are investing $15 billion in rate base over the next five years at ComEd, PECO and BGE. We now have a unique strategic opportunity to add Pepco Holdings to our company and continue to grow and diversify our regulated footprint.

This truly is an exciting time for Exelon, and we're pleased to have had the time to discuss this with you this morning. And again, I want to thank Joe Rigby personally and his team for allowing this transaction to go forward. The culture of the companies are very similar, and we look forward to learning from the Pepco organization and sharing some of the things we've learned over the past few years as we've improved the performance of our operation, as they have also.

With that, I'll open it up for questions.

Q&A

Operator

[Operator Instructions] And your first question is from Dan Eggers [Credit Suisse].

<Q - Dan L. Eggers>: Hey. Good morning, guys.

<A - Christopher M. Crane>: Good morning, Dan.

<Q - Dan L. Eggers>: Chris, you've been talking for a while about ways or opportunities to deploy capital and all the alternatives that were out there with the goal of visible earnings and consistency and repeatability. Can you just walk through how you came to a regulated utility acquisition like this versus maybe renewal investments? And some of the things you've talked about maybe how the returns compare to this versus what else you would have seen in the market?

<A - Christopher M. Crane>: Sure. We're in the market on all sides, the renewable opportunities that are coming to the market, the conventional generation opportunities; we continue to hunt for value in that area. We've seen some of

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01802

the conventional stuff go at a higher premium that we're not willing to commit to but we'll stay in that market. As Jack said, we have considerable flexibility that's been created on the balance sheet by this acquisition. And it will not deter us from looking at opportunities when there is a willing partner on the other side to sell their assets. It is in a large part, opportunistic.

We were able to find a partner that saw the strategic sense in creating scale. And so, it's more about timing and opportunity, but we are still looking on a regular basis at anything that comes to the market or in conversations with folks that we think should come to the market. But we'll continue to work on that. This will not deter or distract us from any of the power side. We'll have an integration organization that will be led under Bill von Hoene, but it will lean heavily on the Exelon utilities to come up with the integration plan.

In the meantime, under Ken Cornew and Joe Nigro's leadership, we'll continue with the GenCo strategy independently, as we operate these businesses independently and we think there will be future opportunities that will come our way and we'll be able to integrate them into our platform equally as efficiently as we will do this transaction.

<Q - Dan L. Eggers>: Okay. So, I guess maybe Jack, you can walk through how the balance sheet works that you're able to add that level of debt and still keep a lot of flexibility apparently for other investments and what kind of assurance you've gotten from the Agency so far?

<A - Jonathan W. Thayer>: Sure, Dan. As you're aware, historically, the rating agencies have looked at Exelon Corporate and Exelon Generation on a combined basis. And our target FFO to debt metrics, if I was to pick one agency, S&P, as an example, have largely viewed the corporate entity and the merchants part of our business as one and the same.

With the acquisition of Pepco Holdings and the rebalancing of the earnings mix and the rerating of the risk perception related to Exelon Corporate, what it affords is the opportunity to add significant incremental leverage at the holding company that absent this transaction we would not have otherwise been able to do. So as we think about adding $3.5 billion of corporate debt at the holding company in an historic interest rate environment where we can lock in long-term rates at very attractive levels, we see that married up with the opportunity to invest in growing rate base at Pepco Holdings and the opportunity to marry that up with a strong operating overlap. We see this as a uniquely opportune time to tap the debt markets, but also add a highly accretive investment to our overall mix.

<A - Christopher M. Crane>: Let me add one thing to that, Dan, just to go back to some of the things we've talked about. When we started to communicate last fall our investment in the utility business, the $15 billion, part of the strategy here is to have the utilities be able to cover our commitment to the shareholders on the dividend within the next couple of years. So we've right sized the dividend appropriately for the business. The utilities will be able to service the debt and the dividend as needed at the holding company and we can have more flexibility on free cash flow off of the Generation business to continue to grow that side of the business.

So from a strategic approach, this advances where we were heading and strengthens our view on the strategy and the structure of the entity while being able to use that commodity base somewhat more cyclical to capture the upsides where we see fit.

<Q - Dan L. Eggers>: Okay. And I guess just going back to my first question and I'll stop it. When you look at kind of the value return of this to shareholders relative to the other options that have been out in the market, can you just maybe give a context of how the comparability of accretion or net value return worked for this deal relative to the other places where you could have deployed capital that you've seen or that you see in the market today?

<A - Christopher M. Crane>: Yeah, I'll take a couple of the typical CCGTs that you would have $750 million to $1 billion that have gone across the market. You can see accretion of a couple pennies at best on those type of assets for something like this, where we are using some equity, and using more debt, you can see the accretion of $0.15 to $0.20, it's powerful. And so, I think you could probably get fairly strong accretion if we were dealing with a fleet of assets to come in. On the renewable side, the investment thesis is not as much about EPS, as it is about free cash flow, that helps enable us to do other things. So, Jack, if you want to provide any clarification any more, go ahead.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01803

<A - Jonathan W. Thayer>: Sure. Dan, I think as Chris mentioned, here we have a growing – or an opportunity to invest in growing rate base, and opportunity for sustained investments – and continued investment further rate base opportunities versus, as Chris mentioned, once you get through the tax attributes of renewables investment, it really does have a very modest, and in some cases, negative EPS contribution further out the curve. And there it's about velocity of return of capital and seeking out further opportunities to invest relative to here, we have a sustained opportunity to invest in infrastructure in a way that earns us very attractive returns that on a standalone basis, that the incremental leverage at the holding company, makes that much more beneficial when it comes to dropping EPS down to the bottom-line for our shareholders.

<Q - Dan L. Eggers>: Okay. Thank you, guys.

<A - Christopher M. Crane>: But just to be clear, this does not preclude us from other growth opportunities on the other side of the business. It's a good opportunity at the time that we're able to take advantage of and it further moves our strategic focus down the road as we've discussed previously. Next question?

Operator

Certainly. Your next question coming from Greg Gordon [ISI].

<Q - Greg Gordon>: Thanks. Hi guys.

<A - Christopher M. Crane>: Hey Greg.

<Q - Greg Gordon>: I've got one question on the merger and one question on the quarter. So, on the transaction, obviously Mr. Rigby and his team, despite doing a pretty good job running their business have had a hard time getting the type of rate relief they've needed to move their earned returns on equity up to their authorized return. When you think about the base case forecast which you're using to give us the accretion numbers, what do you assume the ROE trends are and how much different are they under the Exelon merger case than they are under the standalone Potomac case?

<A - Jonathan W. Thayer>: Greg, it's Jack. I'll answer that question. In terms of what we've assumed in our operating model when calculating the synergies, very much akin to Pepco Holdings' projections that they used and recently rolled out in their communications at their Analyst Day. It's very consistent with the IBIS projections for the company on a going-forward basis. So to the extent that we are able to, through synergies to speed the opportunity to earn allowed ROEs that we're able to through continued performance improvements and improved storm response and other elements to earn higher allowed ROEs from our jurisdictions in New Jersey, Delaware, Washington D.C. and Maryland that would all be upside to the transaction. Obviously, that's something that we'll be targeting, as we're integrating the companies and integrating PECO's utilities into our operating model. But for right now, in our transaction economics, we just assume that Pepco continues on the path that it was and is now.

<A - Christopher M. Crane>: Joe, do you want to – Joe?

<A - Ravi Ganti>: Well, I'll let Joe provide some color to that.

<A - Joseph M. Rigby>: No. I think as we went through the due diligence process that as Jack mentioned that obviously, we provided all the information and I think what I'm hearing, Jack say is that there was no kind of remarkable upside that was assumed and the opportunity I think to realize the synergies and to be able to work that into the forecast, I think is going to have a positive impact on the actual earned ROEs.

<Q - Greg Gordon>: Thank you, guys. Now segueing into the quarter, looking at slide 9, which is the 2013 versus 2014 comparison at ExGen, did you pick up the negative deltas into $0.09 from lower realized energy prices, higher procurement costs, $0.05 from nuclear and fossil output. So can you explain to us how we should think about this because clearly, the retail business probably was on the wrong side of power price volatility in the quarter in terms of having a lot of demand and having to manage variable load risk? And at the same time, your lowest cost resources were not available. So, can you kind of break down what happened that was sort of uniquely in the retail book in that sort of

final
Bloomberg Transcript

$0.09, then I think it's probably simpler when we think about the $0.05 just in terms of outage days, but can you explain to us exactly what happened?

<A - Christopher M. Crane>: I'll have Joe take that.

<A - Joseph Nigro>: Hey Greg, there is a number of things that are moving around when you think about – I assume your question is Q1 2013 versus Q1 2014?

<Q - Greg Gordon>: Correct.

<A - Joseph Nigro>: When you think about it, the best thing is we had – when you think about the way we hedge our portfolio, we had substantially lower energy benefit in PJM. Our growth in the Midwest and the Mid-Atlantic quarter-over-quarter when you think about 2014 versus 2013, the big driver in the Midwest was the roll off of the ComEd swap. In 2014, we're still in the first quarter in 2013.

In the Mid-Atlantic, it was just driven by energy prices. There was an offset to capacity that was a positive pickup, but didn't reduce that at all from the lower energy benefit. In addition to that, as you see on the slides, we had some increase in nuclear output in [indiscernible] (28:46) output. In 2014, again, we had a roll off of a long-term contract in the Midwest in Kincaid that played into that as well.

And then when we get into the other regions, there's a lot of moving pieces associated with it. In New England, with a restructuring of our fuel contract from Mystic, we had a lot less generation output in New England than we did in 2013. And then in ERCOT, just like everyone else, we faced some continuing outages in the first quarter as well as some gasoline availability down there that drove some [indiscernible] (29:18). So there's a number of moving pieces. On the retail side, it wasn't a material quarter [indiscernible] (29:25).

<Q - Greg Gordon>: Okay. So when I think about the $0.09, there is not a meaningful portion of that, let's say where you were upside down in your retail book, it's other factors like the roll-off of contracts?

<A - Joseph Nigro>: Our retail book – we manage it as we talked to you about previously. We manage all the finance risk inherent in our portfolio in our wholesale book of business. So when you think about it, what we're doing is reflecting all of that in our hedge disclosure and you see that. I would tell you that we face the same load charges at PJM, for example, that everyone else did in the first quarter. But we also had an offsetting benefit of having generation and having the generation to load strategy did benefit us some, although we did incur net cost to serve load, but that includes our wholesale load as well.

<Q - Greg Gordon>: Okay. Thank you.

<A - Christopher M. Crane>: Next question, please.

Operator

Yes, sir. [Operator Instructions] Your next question comes from Steve Fleishman [Wolfe Research].

<Q - Steve I. Fleishman>: Yeah. Hi, good morning.

<A - Christopher M. Crane>: Hey, Steve.

<Q - Steve I. Fleishman>: Hi. Could you maybe just be a little more explicit on the financing plan for the different pieces and how much stock versus converts versus debt? And then also the asset sales that you might most likely look at?

<A - Jonathan W. Thayer>: Sure, Steve. This is Jack. So with respect to the financing side of the equation as we've discussed, we'll use a mix of convertibles as well as straight common. We're still finalizing, and we'll finalize the mix of that as we go to market. And we'll size that so that we're tapping the substantial liquidity that exists in both those instruments and leverage the opportunity to tap different investor bases as we do so. Clearly the benefit of the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01805

mandatory convert is the equity credit we receive while retaining opportunity to share in the upside related to share performance during the duration of the convert.

On the asset sales side, as we mentioned, we anticipate roughly $1 billion of proceeds from asset divestitures that we would use to fund this transaction. We would anticipate that those assets are in our non-core elements of our business. So, when we think about maintaining the exposure to a power recovery, where that exists most significantly is within our nuclear fleet. We would be looking to sell certain fossil assets that have appreciated considerably in value. And given the valuation methodologies in terms of how we're valued relative to IPPs or private equity firms, those assets candidly are likely to be more valuable in a private equity firm or IPPs' hands, who can use significantly more leverage than we can in our capital structure. And the loss of earnings associated with those assumed divestitures is incorporated into the $0.15 to $0.20 of earnings accretion calculation. So, clearly we see that as an opportunity to sell assets that on a relative basis contributes less earnings to our overall EPS and invest those proceeds in a growing utility investment.

<Q - Steve I. Fleishman>: Okay. And just a clarification on the asset sales. Are those assets that likely had debt on them as well, so that we should use the $1 billion as like a mix of debt and equity or is the $1 billion replacing what otherwise would be equity issuance for the deal?

<A - Jonathan W. Thayer>: The debt that we have is at Exelon Generation. So there's not a planned level of specific debt. We would anticipate that that $1 billion of proceeds is in lieu of equity used in the transaction.

<Q - Steve I. Fleishman>: Okay. And last question on this. Will you probably wait till you have – are close to all approvals to execute on these funding plans?

<A - Jonathan W. Thayer>: The bridge is in place for the duration of the approval process. We have the opportunity to issue at any time during that bridge being in place and I think we'll, as we get further into the integration process into the regulatory approval process, we'll stare down and look at when is the appropriate time to look to issue equity. Certainly we have some big valuation events coming up, the upcoming capacity auction, a summer with a tightening supply-demand mix and an upcoming winter as well. So we have a lot of flexibility around when we might think about tapping the equity markets and the convert markets.

<A - Christopher M. Crane>: Just one more thing to add on to that, Steve. The asset rationalization was going forward with or without this. On the annual basis, we look at core assets, their valuation, market valuation. We look at non-core assets and we had determined that we were going to adjust the portfolio regardless of this.

<Q - Steve I. Fleishman>: Okay. Thank you.

<A - Christopher M. Crane>: Thank you.

Operator

Our next question comes from Julien Smith (sic) [Julien Dumoulin-Smith] [UBS Securities].

<Q - Julien Dumoulin-Smith>: Hi, good morning.

<A - Jonathan W. Thayer>: Good morning, Julien.

<Q - Julien Dumoulin-Smith>: So a quick question, if you will, kind of going back to Dan's first starting point here. What is the ideal composition of regulated versus merchant? I mean if you think about the company down the line, are you going to follow your peers on the diversified side and become more regulated, or ultimately, do you think about yourselves as having a meaningful commodity kicker yourself?

<A - Christopher M. Crane>: Yeah. We still are very supportive of the commodity side of the business. This is not a mandatory diversification that we had to do because of any balance sheet tightening. It is about creating value and the opportunity that we have with it. There is not a fixed 65%, 55% regulated to merchant. What we learned in the last downturn of the commodity cycle that we're coming out of is that we need to make sure that our commitments are sized

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01806

to be able to be sustainable and that the investment thesis and the strategy from both sides of the business can stand on their own.

So what we want to have is regulated revenue that continues to grow at a reasonable CAGR as we make our investments in that side that support any debt or dividend requirements that we have at the holding company, which we think is a rational strategy on how we should size and pursue and invest going forward. We do not want to over lever as a holding company that to point that the utility businesses that we're investing in or acquiring would not be able to service that requirement. We don't want to size the dividend to a point that it can't be reasonably serviced to provide value back to the shareholders and we also want to have the flexibility, which this transaction maintains for us to be able to invest in the merchant side, the competitive side of the business, in electric and gas assets as we go forward.

<Q - Julien Dumoulin-Smith>: Great, excellent. Now second question here, a little bit – going back to the balance sheet, when it comes to credit metrics, I'd be very curious, how much incremental leverage beyond the transaction does this create by shifting your regulated profile?

<A - Jonathan W. Thayer>: Julien, as you might anticipate, we've been in dialogue with the agencies and in the re-risk rating of the company pro forma for this transaction and the ability for both utility as well as merchant cash flows to service the debt at the holding company, we had left ourselves room to make further incremental investments, whether they'd be regulated or merchant in nature. So, we clearly could have leaned more heavily on the fixed income markets and made this transaction even more accretive. We felt the appropriate and balanced approach was to leave ourselves powder because as we've experienced from time-to-time particularly in moments of significant volatility, whether it'd be in the retail business or whether it'd be in other parts of the merchant chain, it's generally good to have powder, should opportunities present themselves.

<Q - Julien Dumoulin-Smith>: Then how does that jive with dividend expectations, I mean obviously it's a more regulated profile, what's the thought process?

<A - Jonathan W. Thayer>: I think the thought process is post this transaction, the utility can be 100% funded – or sorry, the dividend can be 100% funded from the utility. This speeds that path – we were already on that path. This clearly speeds that and it gives our Board of Directors significant flexibility around how they – with Chris' guidance, may choose to return capital to shareholders.

<Q - Julien Dumoulin-Smith>: But you're not committing to pay out off of the utilities or anything like that?

<A - Jonathan W. Thayer>: We are not.

<Q - Julien Dumoulin-Smith>: Okay. Great. Well, thanks again, guys. Good luck.

<A - Christopher M. Crane>: Thanks.

<A - Jonathan W. Thayer>: Thank you.

<A - Christopher M. Crane>: Next question please.

Operator

Your next question comes from [ph] Paul Rizzon. (40:02)

<Q>: Good morning.

<A - Jonathan W. Thayer>: Good morning, [ph] Paul. (40:04)

<Q>: First of all, congratulations, Joe, it's a nice swan song.

<A - Joseph M. Rigby>: You bet. It's a great opportunity for all of our stakeholders. Exelon is a great, great company. We're very excited about this.

final

Bloomberg
SI-SSA-0015-01807

<Q>: I'm just wondering. I know Pepco and BGE tried to get married once and Exelon's got a history in New Jersey. Have you had any dialogue with regulators?

<A - Christopher M. Crane>: We've had some initial outreach with regulators to explain what this value proposition is for their stakeholders. So, we learned a lot from some things that worked and some things that haven't worked in the past. We've put that into our regulatory strategy in Maryland when we were able to secure the acquisition at Constellation and BGE in 10.5 months. Our regulatory team is ready to approach this one in the same way with making sure we get our filings in. There's no delay on that, making sure we engage and open the dialogue up with the regulators. The regulators have a tough job to do. They have to prove that this is in the best interest of the consumer, but we believe that we have prepared a package that shows that, by our commitments that we're making and we'll engage. I wouldn't expect to hear a reaction from any regulator publicly. They have to see what we put in writing, what we offer, they have to go through the process. This is a tough job for them to do, but we, at the end of the day, see a success path or we wouldn't be doing it.

<Q>: Again, just a follow-up question, shifting gears, can you just give us an update on Illinois and any movement on legislation that would kind of ascribe a little more value to the value of nuclear?

<A - Christopher M. Crane>: Yeah, that story has gotten away from us. We've continued to say we are not looking for legislation for a bailout of the competitive nuclear fleet in Illinois. We believe that is a market issue that our units are not being compensated for the firm fixed fuel that they provide in the capacity market and we're not being compensated for the clean carbon free generation that they're providing. So our focus on creating value for the nuclear fleet is more around market design and at a federal level. We pushed hard that above – and for a few years talking about the unintended consequences of the PTC and the concentration of excess wind generation and the pricing issues that it has in the Midwest, primarily, that is still what we're pushing on. We said a couple of years ago it was going to be a problem, it has become a problem. There is a few ways that we can get compensated for that, that as you all know we're working on the market issues and the capacity market in PJM, those changes coming to fruition, some of the short-term changes. And the work that we need to do in the stakeholder community to recognize the vulnerability that the grid has – will be incurring with a dependency on gas and we saw that during the polar vortex. So, when we load a core, we load it for 18 months to 24 months. It can run through any weather situation. It's not dependent on fuel being delivered on an hourly basis or wind blowing and so, that's the stuff we're working on.

We believe in a competitive market. We don't believe in a subsidized market. We need to be compensated for the value proposition on the plant and that should not be a bailout from the state.

<Q>: Thank you.

<A - Christopher M. Crane>: Next question, please.

Operator

Your next question comes from Jonathan Arnold [Deutsche Bank].

<Q - Jonathan P. Arnold>: Hi. Good morning, guys.

<A - Christopher M. Crane>: Good morning.

<A - Jonathan W. Thayer>: Good morning.

<Q - Jonathan P. Arnold>: Just curious, as you sort of think about the company post this transaction and the business mix issues you've addressed, does this give you the capacity to be a little less hedged and sort of bet more heavily on your favorable view of the markets? And maybe this would be an opportunity to just update us on what you – how you're seeing liquidity in those forward curves...

<A - Christopher M. Crane>: From a macro level in servicing our commitments on the value of the dividend and making sure we maintain a strong balance sheet, this does contribute to that focus. I'll let Joe talk about the liquidity

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01808

and where we're at with the hedging strategy.

<A - Joseph Nigro>: Hey, Jonathan, good morning. There is a couple of things with that. We have seen liquidity begin to pick up in the marketplace post the first of the year. That's true pretty much across all the regions, and in particular, important for us. We have seen liquidity improving [indiscernible] (45:31). And we believe a lot of that is on the back of what happened in January and February with the polar vortex and some of the price appreciation, and more importantly, the volatility appreciation we saw and some of the retailers coming back to the market.

I think from a hedging perspective, you really have already see us take the approach of being less hedged. If you look at our disclosure, normally this – when you look at 2015, by the end of the first quarter of 2014, we should have been about 75% hedged. Our total portfolio is approximately 65% and we've been clear that about 10% of that is in natural gas. So, we really have about 20% incremental exposed to the power market and we have about half of that, so about 10% incremental as to where we should be in 2016, exposed to the power market. So, we've really looked at already beginning to be more aggressive and we work very closely taking into account what our balance sheet commitments are and making sure that we're aligned to all of that.

<Q - Jonathan P. Arnold>: So, there is an angle that this is giving you, having a more regulated base, but it gives you the ability to take a little more risk in the merchant business?

<A - Christopher M. Crane>: Jack, you want to.

<Q - Jonathan P. Arnold>: [indiscernible] (46:52)

<A - Christopher M. Crane>: Yeah, I agree with that.

<A - Jonathan W. Thayer>: Jonathan, clearly, the message on our side is, we have faith and belief in the power recovery. We have maintained substantial exposure to that power recovery. We're seeing in the first quarter and you saw in our hedge disclosure the meaningful uplift and impact of improving prices. We've seen significant improvement in prices subsequent to that and anticipate further market recovery, particularly in the NiHub market as we go further out the curve.

From a balance sheet flexibility standpoint, we already retained considerable flexibility in our ability to lag ratable where we didn't leave fundamentals supported of current marks. We've exercised that perspective, and most importantly, we've been right in exercising that perspective. And as Joe mentioned, we continue to keep that considerable exposure in place as we anticipate further market recoveries. So, in all instances, while this does improve our earnings mix of regulated versus merchant, we do anticipate, as the power market recovers, we'll get to that roughly balanced 50-50 mix that Chris has communicated as being roughly optimal for our business.

<A - Christopher M. Crane>: And just to be clear, as I said earlier, the strategy that we were moving to is to have a value return proposition through our dividend that is funded to a more classical or typical methodology with the regulated entities dividending up to the Holdco and in those entities servicing any debt that would be at the Holdco. So naturally that does allow us – that those commitments are made that allows us flexibility on the generating side to merge as the analytics would tell us to on being able to capture the upside or if we think we're high that we can – we could hedge out further.

<A - Jonathan W. Thayer>: Yeah. Chris, certainly just one caveat. Certainly in the near term, both the merchant and utility cash flows will support the holding company debt as we see growth in the earnings power at the utilities that the utilities will shoulder more of that.

<A - Christopher M. Crane>: Right. It's the long term, right.

<Q - Jonathan P. Arnold>: Okay. Could I ask when you say $250 million, just this detail on the merger stuff, $250 million of net synergies, is that net of tax, net of cost to achieve, net of something else, can you just kind of frame that number?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01809

<A - Jonathan W. Thayer>: That is separate and distinct from cost to achieve. So as we think about cost to achieve and then the realization of those synergies, we'd expect to retain, roughly a third of the overall savings. We'll get to a run rate synergy number of approximately $120 million to $140 million. We'd anticipate that our customers are the net beneficiaries of two-thirds of those savings and that we would keep roughly a third for the benefit of our shareholders.

<Q - Jonathan P. Arnold>: Okay. So, that run rate is that 2017, that's the number in the 2017, $0.15 to $0.20. Is that?

<A - Jonathan W. Thayer>: I would say.

<Q - Jonathan P. Arnold>: or is that further out.

<A - Jonathan W. Thayer>: First of all, yes, and second of all as you do the math, you'll see synergies is a very small element of the accretion in this transaction. It's really the opportunity for incremental leverage at the holding company that this transaction affords. It's the monetization of certain assets at a higher value than what would be implied in our PE multiple. And synergies are an important but very modest contributor to that $0.15 to $0.20.

<Q - Jonathan P. Arnold>: Okay and how should we think about the customer fund? Is that something you would sort of fund upfront as almost part of the purchase price or something that would kind of be funded over time?

<A - Christopher M. Crane>: It is intended to be given upfront after approval as we integrate, so it is part of the cost to achieve.

<Q - Jonathan P. Arnold>: Okay. I think that's – could I just ask one other thing and I'm sorry if you've touched on this, but what kind of assumption are you making about earned returns at the Pepco Utilities?

<A - Jonathan W. Thayer>: Jonathan, in term of earned returns, our internal forecasts are very much akin to the internal forecasts of Pepco Holdings. It's very much in line with the consensus estimates as you look with IBIS in terms of – from a synergy standpoint, if that allows us to speed, getting closer to that earned return to reduce the regulatory lag. If the operational benefits and uplift from improved operations, supports higher allowed returns, all of that will be upside to the economics that we've communicated to you as part of this presentation.

<Q - Jonathan P. Arnold>: Okay. Thank you very much, guys.

<A - Jonathan W. Thayer>: I think we have time for one more call.

<A - Christopher M. Crane>: Yeah.

Operator

Yes. Your next question comes from Michael Lapides.

<A - Jonathan W. Thayer>: Good morning, Michael.

<A - Christopher M. Crane>: Michael?

Operator

If your line is on mute, please un-mute your line.

<A - Ravi Ganti>: Okay. We have.

<A - Jonathan W. Thayer>: I think, operator, if you'll go to the queue for the last and final caller.

Operator

Bloomberg
SI-SSA-0015-01810

Yes, sir. One moment. Your next question is from Ali Agha.

<Q - Ali Agha>: Good morning. [Suntrust Robinson Humphrey]

<A - Jonathan W. Thayer>: Good morning.

<A - Christopher M. Crane>: Good morning, Ali.

<Q - Ali Agha>: Chris, one question. How comfortable are you with the new regulatory jurisdictions you are getting into? Obviously Maryland, you're very familiar with, but the other ones have been challenging to say the least, and I'm sure you've been observing them. So what gives you sort of confidence that you can handle those different than the way they've been handled in the past?

<A - Christopher M. Crane>: Well, we think the way that Joe has taken the company, Pepco, in the last couple of years, significant investment in reliability, continued to develop a stronger relationship in his tenure in the position, we're comfortable in the direction they're heading. We understand the expectations of the regulator, and we'll continue on the path that Joe has taken the company in the last few years.

The regulatory process is not easy in any jurisdiction. And as I mentioned earlier, there's a significant responsibility upon the regulator to make sure that the utilities are providing the service level at the right economic point and with reliability and safety of the system. We have to prove that we can do that in this case to gain approval, and then we have the responsibility of maintaining our operations at that level to continue. So we believe in, we're strongly supportive and believe what Joe has done and what the Pepco team has been doing in their service areas, as the path to continue on and we believe as has been shown, the Pepco standalone that things are very much improving.

<Q - Ali Agha>: A separate question, in the past you told us about that $2 to $4 uplift that you believe fundamentals justify in the forward curves, where do you think we are in that today?

<A - Christopher M. Crane>: Yeah, Joe will talk about this.

<A - Joseph Nigro>: As Jack mentioned earlier, we see material improvement since year-end in the forward curve. And if I look at NiHub, we're up about $5.50 in and around the cost base since the first of the year and we're up about $7.50 at West Hub. You see in our hedge disclosures, that we're up about $200 million and $400 million respectively in hedged gross margin, through 3/31 2015 and 2016. We're up about another $300 million in 2015 and approximately $400 to $450 million in 2016 since 3/31.

When you think about the upside, there's a big seasonal shape to it at this point, given that we've seen a big move in the winter gas basis and the underlying winter power prices. But we still think in the 2015, 2016 time period there's less than $2 of upside remaining at NiHub, but there's still upside on an annualized basis.

At the West Hub, we think that most of it us priced in, but it's very seasonally driven. As you get out to 2017 and 2018, we see a little more upside at NiHub than we do in 2015 and 2016 and a little more upside at West Hub than we do in 2015 and 2016. So, it's really seasonally driven at this point and we're taking an opportunity as we do hedge into the power price move to make sure that we're matching where we think the market has moved, so our hedging is matching. We're aligned to our views in what the market has done.

<Q - Ali Agha>: Got it. Last question, Chris, and I'm picking up from what you guys were saying. I mean the markets are moving, the commodity prices are moving in your favor, your thesis seems to be coming together. Stock's been obviously rallying as a result of that. From a timing perspective, do you think perhaps – was this the right time to be adding more regulated mix given that this is a 12-month to 15-month approval process? Kind of has its own levels of uncertainty associated with that, you have let this thing run the way it had been running and has been running?

<A - Christopher M. Crane>: Yeah. We're not distracting or deterring ourselves from the upside of the commodity market. With the way that this is being structured with opening up more of the balance sheet using a view by the rating agencies of the Holdco utilities allows us to do some cheap debt at this time to pick up more regulated revenue. There is an equity component, but it is not a significant component. If you did the math and Jack was explaining it earlier this

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-01811

morning, it's less than 10% of our share count that would equity would be issued for, you've still got somewhere of 90% of whatever the upside is that's coming from the power market.

So you have to be opportunistic. You have to be able to create value. This deal creates a significant accretion in earnings per share. It allows us structurally to be looked at differently by the rating agencies and we get to still when anything would come to the market that was a relative value deal, we'd still be able to transact on it and continue to grow on that side of the business. So there was, if you can create value with accretion like this, I think the time is whenever it comes available. And if this was to distract us from the upside of the commodity recovery and the power recovery, we wouldn't have done it, but we can do both.

<Q - Ali Agha>: Good enough. Thank you.

Ravi Ganti

Thank you. That brings us to the end of the call. Thank you very much.

Operator

Thank you. This does conclude today's conference call. You may now disconnect your lines.

Exelon®

SI-SSA-0015-01813

Cautionary Statements Regarding Forward-Looking Information

This presentation contains certain forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995, that are subject to risks and uncertainties. The factors that could cause actual results to differ materially from the forward-looking statements made by Exelon Corporation, Exelon Generation Company, LLC, Commonwealth Edison Company, PECO Energy Company, Baltimore Gas and Electric Company, Pepco Holdings LLC, Potomac Electric Power Company, Delmarva Power & Light Company, and Atlantic City Electric Company (Registrants) include those factors discussed herein, as well as the items discussed in (1) Exelon's 2017 Annual Report on Form 10-K in (a) ITEM 1A. Risk Factors, (b) ITEM 7. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) ITEM 8. Financial Statements and Supplementary Data: Note 23, Commitments and Contingencies; (2) Exelon's Second Quarter 2018 Quarterly Report on Form 10-Q in (a) Part II, Other Information, ITEM 1A. Risk Factors; (b) Part 1, Financial Information, ITEM 2. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) Part I, Financial Information, ITEM 1. Financial Statements: Note 17; and (2) other factors discussed in filings with the SEC by the Registrants. Readers are cautioned not to place undue reliance on these forward-looking statements, which apply only as of the date of this press release. None of the Registrants undertakes any obligation to publicly release any revision to its forward-looking statements to reflect events or circumstances after the date of this presentation.

SI-SSA-0015-01814

Non-GAAP Financial Measures

Exelon reports its financial results in accordance with accounting principles generally accepted in the United States (GAAP). Exelon supplements the reporting of financial information determined in accordance with GAAP with certain non-GAAP financial measures, including:

- ***Adjusted operating earnings*** exclude certain costs, expenses, gains and losses and other specified items, including mark-to-market adjustments from economic hedging activities, unrealized gains and losses from nuclear decommissioning trust fund investments, merger and integration related costs, impairments of certain long-lived assets, certain amounts associated with plant retirements and divestitures, costs related to a cost management program and other items as set forth in the reconciliation in the Appendix
- ***Adjusted operating and maintenance expense*** excludes regulatory operating and maintenance costs for the utility businesses and direct cost of sales for certain Constellation and Power businesses, decommissioning costs that do not affect profit and loss, the impact from operating and maintenance expense related to variable interest entities at Generation, EDF's ownership of O&M expenses, and other items as set forth in the reconciliation in the Appendix
- ***Total gross margin*** is defined as operating revenues less purchased power and fuel expense, excluding revenue related to decommissioning, gross receipts tax, JExel Nuclear JV, variable interest entities, and net of direct cost of sales for certain Constellation and Power businesses
- ***Adjusted cash flow from operations*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding capital expenditures, net merger and acquisitions, and equity investments
- ***Free cash flow*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding certain capital expenditures, net merger and acquisitions, and equity investments
- ***Operating ROE*** is calculated using operating net income divided by average equity for the period. The operating income reflects all lines of business for the utility business (Electric Distribution, Gas Distribution, Transmission).
- ***EBITDA*** is defined as earnings before interest, taxes, depreciation and amortization. Includes nuclear fuel amortization expense.
- ***Revenue net of purchased power and fuel expense*** is calculated as the GAAP measure of operating revenue less the GAAP measure of purchased power and fuel expense

Due to the forward-looking nature of some forecasted non-GAAP measures, information to reconcile the forecasted adjusted (non-GAAP) measures to the most directly comparable GAAP measure may not be currently available, as management is unable to project all of these items for future periods

SI-SSA-0015-01815

Non-GAAP Financial Measures Continued

This information is intended to enhance an investor's overall understanding of period over period financial results and provide an indication of Exelon's baseline operating performance by excluding items that are considered by management to be not directly related to the ongoing operations of the business. In addition, this information is among the primary indicators management uses as a basis for evaluating performance, allocating resources, setting incentive compensation targets and planning and forecasting of future periods.

These non-GAAP financial measures are not a presentation defined under GAAP and may not be comparable to other companies' presentation. Exelon has provided these non-GAAP financial measures as supplemental information and in addition to the financial measures that are calculated and presented in accordance with GAAP. These non-GAAP measures should not be deemed more useful than, a substitute for, or an alternative to the most comparable GAAP measures provided in the materials presented.

Non-GAAP financial measures are identified by the phrase "non-GAAP" or an asterisk. Reconciliations of these non-GAAP measures to the most comparable GAAP measures are provided in the appendices and attachments to this presentation, except for the reconciliation for total gross margin, which appears on slide 46 of this presentation.

SI-SSA-0015-01817

The Exelon Value Proposition

- **Regulated Utility Growth** with utility EPS rising 6-8% annually from 2017-2021 and rate base growth of 7.4%, representing an expanding majority of earnings
- **ExGen's strong free cash generation** will support utility growth while also reducing debt by ~$3B over the next 4 years
- **Optimizing ExGen value by:**
  - Seeking fair compensation for the zero-carbon attributes of our fleet;
  - Closing uneconomic plants;
  - Monetizing assets; and,
  - Maximizing the value of the fleet through our generation to load matching strategy
- **Strong balance sheet is a priority** with all businesses comfortably meeting investment grade credit metrics through the 2021 planning horizon
- **Capital allocation priorities targeting**:
  - Organic utility growth;
  - Return of capital to shareholders with 5% annual dividend growth through 2020[1],
  - Debt reduction; and,
  - Modest contracted generation investments

(1) Quarterly dividends are subject to declaration by the board of directors

SI-SSA-0015-01818

2018 Business Priorities and Commitments

- Maintain industry leading operational excellence
- Effectively deploy ~$5.4B of 2018 utility capex
- Advance PJM power price formation changes in 2018
- Prevail on legal challenges to the NY and IL ZEC programs
- Seek fair compensation for at-risk plants in NJ and PA
- Grow dividend at 5% rate
- Continued commitment to corporate responsibility

Exelon.

Best in Class at ExGen and Constellation

Exelon Generation Operational Metrics

- Continued best in class performance across our Nuclear fleet:
  - Capacity factor for Exelon owned and operated units was 94.1%[1]
  - This was the second consecutive year over 94% and the fourth out of the last five years topping 94%
  - Most nuclear power ever generated at 157 TWhs[2]
  - 2017 average refueling outage duration of 23 days, just over the Exelon record of 22 days set in 2016
- Strong performance across our Fossil and Renewable fleet:
  - Renewables energy capture: 95.8%
  - Power dispatch match: 98.8%

Constellation Metrics

- 74% retail power customer renewal rate
- 24% power new customer win rate
- 90% natural gas customer retention rate
- 25 month average power contract term
- Average customer duration of more than 5 years
- Stable Retail Margins

Note: Statistics represent full year 2017 results
(1) 2017 capacity factor includes FitzPatrick for the Exelon period of ownership and operation (March 31 to December 31, 2017) and excludes impacts of Salem
(2) Reflects generation output at ownership

SI-SSA-0015-01830

Exelon Generation: Gross Margin Update

	June 30, 2018			Change from March 31, 2018		
Gross Margin Category ($M)[1]	**2018**	**2019**	**2020**	**2018**	**2019**	**2020**
Open Gross Margin[2,5] (including South, West, Canada hedged gross margin)	$4,700	$4,050	$3,800	$100	$100	-
Capacity and ZEC Revenues[2,5,6]	$2,300	$2,050	$1,900	-	$50	$50
Mark-to-Market of Hedges[2,3]	$400	$400	$300	$100	$(50)	$50
Power New Business / To Go	$150	$600	$800	$(200)	$(50)	$(50)
Non-Power Margins Executed	$350	$150	$100	$50	-	-
Non-Power New Business / To Go	$150	$350	$400	$(50)	-	-
Total Gross Margin*[4,5]	**$8,050**	**$7,600**	**$7,300**	**-**	**$50**	**$50**

Recent Developments

- Strong second quarter executing $200M of Power New Business in 2018 and $50M in both 2019 and 2020
- Capacity and ZEC Revenues include the favorable impact of NJ ZEC revenues in 2019 and 2020
- Behind ratable hedging position reflects the upside we see in power prices
  - ~10-13% behind ratable in 2019 when considering cross commodity hedges

(1) Gross margin categories rounded to nearest $50M
(2) Excludes EDF's equity ownership share of the CENG Joint Venture
(3) Mark-to-Market of Hedges assumes mid-point of hedge percentages
(4) Based on June 30, 2018, market conditions
(5) Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.
(6) 2018 includes $150M of IL ZEC revenues associated with 2017 production. 2019 and 2020 include the favorable impact of NJ ZEC revenues.

SI-SSA-0015-01831

Driving Costs and Capital Out of the Generation Business

Adjusted O&M* ($M)[1,2]

Capital Expenditures ($M)[1,3,4]

Cost optimization programs and planned nuclear plant closures drive lower total O&M

(1) All amounts rounded to the nearest $25M
(2) O&M and Capital Expenditures reflect removal of Oyster Creek and TMI in 2018 and 2019, respectively, and is adjusted for retaining Handley Generating Station
(3) Capital spend represents cash CapEx with CENG at 100% and excludes merger commitments
(4) 2018E growth capital expenditures reflects a ~$175M shift of cash outlay from 2017A to 2018E related to timing of payments for the CCGT projects in Texas

Exelon.

SI-SSA-0015-01832

Historical Nuclear Capital Investment

Nuclear Non-Fuel Capital Expenditures[1] ($M)

Nuclear Capacity Factor[5]

Significant historical investments have mitigated asset management issues and prepared sites for license extensions already received, reducing future capital needs. In addition, internal cost initiatives have found more cost efficient solutions to large CapEx spend, such as leveraging reverse engineering replacements rather than large system wide modifications, resulting in baseline CAGR of -0.8%, even with net addition of 2 sites.

(1) Reflects accrual capital expenditures with CENG at 50% ownership. Assumes Oyster Creek and TMI retirements in October 2018 and September 2019, respectively. All numbers rounded to $25M.
(2) Baseline includes ownership share of Salem all years. CENG is included at ownership share starting in 2014 (full year)
(3) FitzPatrick included starting in 2017 (9 months only)
(4) Growth represents capital that increases the capacity of the units (e.g., turbine upgrades, power uprates), and capital that extends the license of a site (e.g., License Renewals)
(5) Includes CENG beginning in April 2014 and FitzPatrick beginning in April of 2017, excludes Salem and Fort Calhoun
(6) 2017 industry average excluding Exelon was not available at time of publication

Exelon.

SI-SSA-0015-01833

ZEC & Energy Policy Updates

ZEC Updates

New Jersey:

- Governor Murphy signed the NJ ZEC bill into law on May 23rd
- Implementation of the program is scheduled to be completed around the end of Q1 2019

Illinois:

- Oral arguments for the 7th Circuit occurred on January 3, 2018, with requests for supplemental briefings
- Supplemental briefings were filed on January 26, 2018
- Court issued order on February 21, 2018, inviting the U.S. Government to provide its views
- U.S. Solicitor General responded in support of the case on May 29th
- On September 13, the 7th Circuit affirmed dismissal of the ZEC complaint, upholding the legality of the IL ZEC program

New York:

- Oral arguments for the 2nd Circuit occurred on March 12, 2018
- No outstanding items following oral arguments
- Currently awaiting court decision

FERC Capacity Order

- On June 29, 2018, FERC issued an order rejecting both capacity repricing and MOPREx, but finding that the existing tariff is not just and reasonable
- FERC established a paper hearing proceeding to develop a new, two-part approach:
  - **Alternative FRR**: enables states to establish asset specific FRR arrangements that would allow them to compensate those assets directly and remove the associated load from the RPM auction
  - **MOPR**: if FRR is not elected, an expanded MOPR would apply to all existing and new resources with out-of-market support, with no or few exceptions
- FERC has extended the deadline for filing comments to October 2, with replies due on November 6
- FERC aims to reach a final decision by early 2019
- On August 30, FERC granted PJM's request to delay its 2019 capacity market auction from May to August 2019

PJM Price Formation

- PJM fast start proceeding was initiated by FERC (Docket No. EL18-34) and has now been fully briefed
- FERC has committed to providing a decision in September 2018
  - If FERC approves in September, without changes, then PJM could implement the changes in winter 2018/2019
- After assessing FERC's fast start decision, PJM will determine path forward for full integer relaxation
  - PJM has not set a definitive timeline for stakeholder deliberations
- Deliberations regarding scarcity pricing and reserves reforms are ongoing in Q3 and Q4 for early 2019 action

SI-SSA-0015-01834

Financial Overview

Exelon.

ExGen's Strong Available Cash Flow* Supports Utility Growth and Debt Reduction

2018-2021 Exelon Generation Available Cash Flow and Uses of Cash* ($B)

Redeploying Exelon Generation's available cash flow* to maximize shareholder value

(1) Cumulative Available Cash Flow* is a midpoint of a range based on December 31, 2017, market prices. Sources include change in margin, tax sharing agreement, equity investments, equity distributions for renewables JV and Bluestem tax equity, and acquisitions and divestitures.

Exelon.

SI-SSA-0015-01838

Impacts from Tax Reform

Tax Impacts

	2018	2019	2020	2021
Cumulative Incremental Rate Base from Tax Policy Changes	$0.9	$1.4	$1.7	$2.0
ExGen Effective Tax Rate	22%	22%	22%	21%
Consolidated Effective Tax Rate	18%	19%	20%	20%
Consolidated Cash Tax Rate	1%	4%	3%	3%

Key Takeaways

- Changes in federal tax policy are expected to increase run-rate EPS by $0.10 per share in 2019
- Utility rate base is expected to be $1.7B higher in 2020 than prior disclosures
- Generation cash flows will benefit from a lower tax rate and full expensing of capital with an effective tax rate of 22% in 2018-2020, and 21% in 2021
- Projected Exelon FFO/Debt is largely unchanged with ExGen metrics stronger and modest deterioration at the six regulated utilities, which remain at or above rating agency thresholds

2018 ExGen S&P FFO/Debt %*

Reflects the increased free cash flow* as a result of tax rates decreasing to 22% from an expected 33% in 2018

2018 Exelon S&P FFO/Debt %*(1,2)

Impact of tax reform on Exelon's metrics is largely neutral given offsetting impacts between ExGen and utilities

(1) Due to ring-fencing, S&P deconsolidates BGE from Exelon and analyzes solely as an equity investment
(2) Exelon Corp downgrade threshold (red dotted line) is based on the S&P Exelon Corp Summary Report; represents minimum level to maintain current Issuer Credit Rating of BBB at Exelon Corp

Exelon.

SI-SSA-0015-01839

Tax Reform Producing Significant Customer Bill Savings

DPL

- DPL has filed to provide over **$40M** in annual distribution tax savings to customers
- DPL has also filed to provide **$12M** in annual transmission tax savings, in addition to another **$4M** pending approval from FERC

ACE

- ACE has filed to provide **$23M** in annual distribution tax savings to customers
- ACE has also filed to provide **$11M** in annual transmission tax savings, in addition to another **$4M** pending approval from FERC

ComEd

- ComEd has filed to provide **$201M** in annual distribution tax savings to customers
- ComEd has also filed to provide **$69M** in annual transmission tax savings, in addition to another **$17M** pending approval from FERC

Pepco

- Pepco has filed to provide over **$70M** in annual distribution tax savings to customers
- Pepco has also filed to provide **$13M** in annual transmission tax savings, in addition to another **$5M** pending approval from FERC

BGE

- BGE has filed to provide **$103M** in annual distribution tax savings to customers
- BGE has also filed to provide **$18M** in annual transmission tax savings, in addition to another **$5M** pending approval from FERC

PECO

- PECO has filed to provide **$72M** in annual distribution tax savings to customers
- PECO has also filed to provide **$20M** in annual transmission tax savings

Utility customers across our jurisdictions will benefit from tax reform, saving over $675M annually through planned and approved transmission and distribution bill adjustments

Raising Dividend Growth Rate to 5% Annually through 2020

Dividends per Share[1]

Assuming a steady 70% payout ratio on Utility less HoldCo earnings, ExGen's contribution to the Exelon dividend represents a modest payout on earnings and free cash flow

(1) Quarterly dividends are subject to declaration by the board of directors
(2) Total projected Dividend per Share (DPS) figures are illustrative of a 5% growth annually applied to the 2017 dividend. Implied Exelon Utilities contribution is based on a 70% payout on the midpoint of the EPS guidance band for Exelon Utilities less HoldCo. Implied ExGen contribution is based on the remaining balance between the illustrative total annual DPS and the Implied Exelon Utilities contribution.

Exelon.

SI-SSA-0015-01842

2017 Exelon Recognition and Partnerships

Sustainability

Dow Jones Sustainability Index
Exelon named to Dow Jones Sustainability Index for 12th consecutive year

Newsweek Magazine's Green Rankings
Newsweek Magazine's Green Rankings recognized our leadership in sustainability, where we ranked third among utilities, No. 12 in the U.S. 500 and 24th among the Global 500

Carbon Reduction
A recent U.S. Environmental Protection Agency report noted Exelon's generation fleet had the lowest rate of emissions among the 20 largest public or privately held energy producers. Fortune also recognized Exelon as the second-lowest carbon emitter of all Fortune 100 companies

Land for People Award
Received the Trust for Public Land's national "Land for People Award" in recognition of Exelon's deep support of environmental stewardship, creating new parks and promoting conservation

Corporate & Foundation Giving

$52.1 million
Last year, Exelon and its employees set all-time records, committing more than $52.1 million to non-profit organizations and volunteering more than 210,000 hours

Civic 50
Exelon was named for the first time to the Civic 50, recognizing the most community-minded companies by Points of Light, the world's largest organization dedicated to volunteer service

Corporate Recognition

2017 Laurie D. Zelon Pro Bono Award
For exemplary pro bono service and leadership

Kids in Need of Defense Innovation Award
Exelon's legal department and the Baltimore chapter of Organization of Latinos at Exelon (OLE) for their work with unaccompanied minors from Central America

Diversity & Inclusion

HeforShe
Exelon joined U.N. Women's HeForShe campaign, which is focused on gender equality. Pledge includes a $3 million commitment to develop new STEM programs for girls and young women and improving the retention of women at Exelon by 2020

Billion Dollar Roundtable
Exelon became the first energy company to join the Billion Dollar Roundtable, an organization that promotes supplier diversity for corporations achieving $1 billion or more in annual direct spending with minority and women-owned businesses

CEO Action for Diversity & Inclusion
Exelon joined 150 leading companies for the CEO Action for Diversity & Inclusion™ , the largest CEO-driven commitment aimed at taking action to cultivate a workplace where diverse perspectives and experiences are welcomed and respected

Workforce

DiversityInc Top 50
DiversityInc. named Exelon as one of the Top 50 companies for excellence in diversity.

Indeed.com "50 Best Places to Work"
Indeed.com ranked Exelon No. 18 on its "50 Best Places to Work."

Human Rights Campaign "Best Places to Work" For the third consecutive year, HRC's Corporate Equality Index gave Exelon a perfect rating on its best places to work for LGBTQ

2017 U.S. Veterans Magazine's "Best of the Best"
Most veteran-friendly companies

Historically Black Engineering Schools
Top Supporter recognition for five consecutive years

(5) Financing cash flow excludes intercompany dividends
(6) ExGen Growth CapEx primarily includes Texas CCGTs, W. Medway, and Retail Solar
(7) Dividends are subject to declaration by the Board of Directors
(8) Includes cash flow activity from Holding Company, eliminations, and other corporate entities

Consistent and reliable free cash flows

Operational excellence and financial discipline drives free cash flow reliability

- ✓ Generating $6.1B of free cash flow*, including $2B at ExGen and $3.9B at the Utilities

Supported by a strong balance sheet

Strong balance sheet enables flexibility to raise and deploy capital for growth

- ✓ $1.4B of long-term debt at the utilities, net of refinancing, to support continued growth

Enable growth & value creation

Creating value for customers, communities and shareholders

- ✓ Investing $5.9B of growth capex, with $5.5B at the Utilities and $0.4B at ExGen

Note: Numbers may not add due to rounding

Exelon Debt Maturity Profile[1]

As of 6/30/18

($M)

LT Debt Balances (as of 6/30/18) [1,2]	
BGE	2.6B
ComEd	7.9B
PECO	3.0B
PHI	6.1B
ExGen recourse	6.8B
ExGen non-recourse	2.1B
HoldCo	6.3B
Consolidated	34.7B

Exelon's weighted average LTD maturity is approximately 14 years

(1) Maturity profile excludes non-recourse debt, securitized debt, capital leases, fair value adjustments, unamortized debt issuance costs and unamortized discount/premium
(2) Long-term debt balances reflect Q2 2018 10-Q GAAP financials; ExGen debt includes legacy CEG debt

	Exelon Consolidated Effective Tax Rate	18%	19%	20%

(1) Based on June 30, 2018, market conditions and hedged position. Gas price sensitivities are based on an assumed gas-power relationship derived from an internal model that is updated periodically. Power price sensitivities are derived by adjusting the power price assumption while keeping all other price inputs constant. Due to correlation of the various assumptions, the EPS impact calculated by aggregating individual sensitivities may not be equal to the EPS impact calculated when correlations between the various assumptions are also considered.

SI-SSA-0015-01847

Exelon Utilities Trailing 12 Month Earned ROEs*

Q2 2018: Trailing Twelve Month Earned ROEs*

Note: Represents the 12-month period ending June 30, 2018. Earned ROEs* represent weighted average across all lines of business (Electric Distribution, Gas Distribution, and Electric Transmission). Size of bubble based on rate base.

Exelon Generation Disclosures

Data as of June 30, 2018
These disclosures were presented on August 2, 2018, and are not being updated at this time

SI-SSA-0015-01850

Portfolio Management Strategy

Strategic Policy Alignment

- Aligns hedging program with financial policies and financial outlook
  - Establish minimum hedge targets to meet financial objectives of the company (dividend, credit rating)
  - Hedge enough commodity risk to meet future cash requirements under a stress scenario

Three-Year Ratable Hedging

- Ensure stability in near-term cash flows and earnings
  - Disciplined approach to hedging
  - Tenor aligns with customer preferences and market liquidity
  - Multiple channels to market that allow us to maximize margins
  - Large open position in outer years to benefit from price upside

Bull / Bear Program

- Ability to exercise fundamental market views to create value within the ratable framework
  - Modified timing of hedges versus purely ratable
  - Cross-commodity hedging (heat rate positions, options, etc.)
  - Delivery locations, regional and zonal spread relationships

Protect Balance Sheet | **Ensure Earnings Stability** | **Create Value**

SI-SSA-0015-01851

Exelon.

Components of Gross Margin Categories

Gross margin linked to power production and sales

Open Gross Margin

- Generation Gross Margin at current market prices, including ancillary revenues, nuclear fuel amortization and fossils fuels expense
- Power Purchase Agreement (PPA) Costs and Revenues
- Provided at a consolidated level for all regions (includes hedged gross margin for South, West and Canada[1])

Capacity and ZEC Revenues

- Expected capacity revenues for generation of electricity
- Expected revenues from Zero Emissions Credits (ZEC)

MtM of Hedges[2]

- Mark-to-Market (MtM) of power, capacity and ancillary hedges, including cross commodity, retail and wholesale load transactions
- Provided directly at a consolidated level for five major regions. Provided indirectly for each of the five major regions via Effective Realized Energy Price (EREP), reference price, hedge %, expected generation.

"Power" New Business

- Retail, Wholesale planned electric sales
- Portfolio Management new business
- Mid marketing new business

Margins move from new business to MtM of hedges over the course of the year as sales are executed[5]

Gross margin from other business activities

"Non Power" Executed

- Retail, Wholesale executed gas sales
- Energy Efficiency[4]
- BGE Home[4]
- Distributed Solar

"Non Power" New Business

- Retail, Wholesale planned gas sales
- Energy Efficiency[4]
- BGE Home[4]
- Distributed Solar
- Portfolio Management / origination fuels new business
- Proprietary trading[3]

Margins move from "Non power new business" to "Non power executed" over the course of the year

(1) Hedged gross margins for South, West & Canada region will be included with Open Gross Margin; no expected generation, hedge %, EREP or reference prices provided for this region
(2) MtM of hedges provided directly for the five larger regions; MtM of hedges is not provided directly at the regional level but can be easily estimated using EREP, reference price and hedged MWh
(3) Proprietary trading gross margins will generally remain within "Non Power" New Business category and only move to "Non Power" Executed category upon management discretion
(4) Gross margin for these businesses are net of direct "cost of sales"
(5) Margins for South, West & Canada regions and optimization of fuel and PPA activities captured in Open Gross Margin

SI-SSA-0015-01852

ExGen Disclosures

Gross Margin Category ($M)[1]	2018	2019	2020
Open Gross Margin (including South, West & Canada hedged GM)[2,5]	$4,700	$4,050	$3,800
Capacity and ZEC Revenues[2,5,6]	$2,300	$2,050	$1,900
Mark-to-Market of Hedges[2,3]	$400	$400	$300
Power New Business / To Go	$150	$600	$800
Non-Power Margins Executed	$350	$150	$100
Non-Power New Business / To Go	$150	$350	$400
Total Gross Margin*[4,5]	**$8,050**	**$7,600**	**$7,300**

Reference Prices[1]	2018	2019	2020
Henry Hub Natural Gas ($/MMBtu)	$2.93	$2.81	$2.68
Midwest: NiHub ATC prices ($/MWh)	$27.39	$26.04	$25.16
Mid-Atlantic: PJM-W ATC prices ($/MWh)	$35.93	$31.38	$30.36
ERCOT-N ATC Spark Spread ($/MWh) *HSC Gas, 7.2HR, $2.50 VOM*	$8.91	$9.70	$8.43
New York: NY Zone A ($/MWh)	$30.80	$28.21	$28.55
New England: Mass Hub ATC Spark Spread ($/MWh) *ALQN Gas, 7.5HR, $0.50 VOM*	$4.89	$5.12	$5.83

(1) Gross margin categories rounded to nearest $50M
(2) Excludes EDF's equity ownership share of the CENG Joint Venture
(3) Mark-to-Market of Hedges assumes mid-point of hedge percentages
(4) Based on June 30, 2018, market conditions
(5) Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.
(6) 2018 includes $150M of IL ZEC revenues associated with 2017 production. 2019 and 2020 include the favorable impact of NJ ZEC revenues.

Effective Realized Energy Price ($/MWh)[4]			
Midwest	$30.00	$29.00	$29.00
Mid-Atlantic[2,6]	$39.50	$38.00	$38.00
ERCOT[5]	$1.00	$3.50	$2.50
New York[2,6]	$37.00	$33.00	$30.00
New England[5]	$6.00	$1.50	$12.00

(1) Expected generation is the volume of energy that best represents our commodity position in energy markets from owned or contracted for capacity based upon a simulated dispatch model that makes assumptions regarding future market conditions, which are calibrated to market quotes for power, fuel, load following products, and options. Expected generation assumes 14 refueling outages in 2018, 11 in 2019, and 14 in 2020 at Exelon-operated nuclear plants and Salem. Expected generation assumes capacity factors of 94.2%, 94.9% and 93.9% in 2018, 2019, and 2020, respectively at Exelon-operated nuclear plants, at ownership. These estimates of expected generation in 2019 and 2020 do not represent guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years.
(2) Excludes EDF's equity ownership share of CENG Joint Venture
(3) Percent of expected generation hedged is the amount of equivalent sales divided by expected generation. Includes all hedging products, such as wholesale and retail sales of power, options and swaps.
(4) Effective realized energy price is representative of an all-in hedged price, on a per MWh basis, at which expected generation has been hedged. It is developed by considering the energy revenues and costs associated with our hedges and by considering the fossil fuel that has been purchased to lock in margin. It excludes uranium costs, RPM capacity and ZEC revenues, but includes the mark-to-market value of capacity contracted at prices other than RPM clearing prices including our load obligations. It can be compared with the reference prices used to calculate open gross margin in order to determine the mark-to-market value of Exelon Generation's energy hedges.
(5) Spark spreads shown for ERCOT and New England
(6) Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.

SI-SSA-0015-01854

(1) Based on June 30, 2018, market conditions and hedged position; gas price sensitivities are based on an assumed gas-power relationship derived from an internal model that is updated periodically; power price sensitivities are derived by adjusting the power price assumption while keeping all other price inputs constant; due to correlation of the various assumptions, the hedged gross margin impact calculated by aggregating individual sensitivities may not be equal to the hedged gross margin impact calculated when correlations between the various assumptions are also considered; sensitivities based on commodity exposure which includes open generation and all committed transactions; excludes EDF's equity share of CENG Joint Venture

SI-SSA-0015-01855

ExGen Hedged Gross Margin* Upside/Risk

(1) Represents an approximate range of expected gross margin, taking into account hedges in place, between the 5th and 95th percent confidence levels assuming all unhedged supply is sold into the spot market; approximate gross margin ranges are based upon an internal simulation model and are subject to change based upon market inputs, future transactions and potential modeling changes; these ranges of approximate gross margin in 2019 and 2020 do not represent earnings guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years; the price distributions that generate this range are calibrated to market quotes for power, fuel, load following products, and options as of June 30, 2018. Gross Margin Upside/Risk based on commodity exposure which includes open generation and all committed transactions. Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.

Additional ExGen Modeling Data

Total Gross Margin Reconciliation (in $M)[1]	2018	2019	2020
Revenue Net of Purchased Power and Fuel Expense*[2,3]	**$8,500**	**$8,075**	**$7,750**
Other Revenues[4]	$(200)	$(175)	$(200)
Direct cost of sales incurred to generate revenues for certain Constellation and Power businesses	$(250)	$(300)	$(250)
Total Gross Margin* (Non-GAAP)	**$8,050**	**$7,600**	**$7,300**

Key ExGen Modeling Inputs (in $M)[1,5]	2018
Other[6]	$250
Adjusted O&M*	$(4,625)
Taxes Other Than Income (TOTI)[7]	$(375)
Depreciation & Amortization*[8]	$(1,125)
Interest Expense	$(400)
Effective Tax Rate	**22.0%**

(1) All amounts rounded to the nearest $25M
(2) ExGen does not forecast the GAAP components of RNF separately, as to do so would be unduly burdensome. RNF also includes the RNF of our proportionate ownership share of CENG.
(3) Excludes the Mark-to-Market impact of economic hedging activities due to the volatility and unpredictability of the future changes to power prices
(4) Other Revenues reflects primarily revenues from JExel Nuclear JV, variable interest entities, funds collected through revenues for decommissioning the former PECO nuclear plants through regulated rates, and gross receipts tax revenues
(5) ExGen amounts for O&M, TOTI, Depreciation & Amortization; excludes EDF's equity ownership share of the CENG Joint Venture
(6) Other reflects Other Revenues excluding gross receipts tax revenues, includes nuclear decommissioning trust fund earnings from unregulated sites, and includes the minority interest in ExGen Renewables JV and Bloom. Other for 2018 is favorable due to NDTF realized gains that may not occur in 2019 and 2020.
(7) TOTI excludes gross receipts tax of $150M
(8) 2019 Depreciation & Amortization is flat to 2018 and 2020 is favorable $50M due to nuclear plant retirements

Appendix

Reconciliation of Non-GAAP Measures

SI-SSA-0015-01859

Projected GAAP to Operating Adjustments

- **Exelon's projected 2018 adjusted (non-GAAP) operating earnings excludes the earnings effects of the following:**
  - Mark-to-market adjustments from economic hedging activities
  - Unrealized gains and losses from NDT fund investments
  - Certain merger and integration costs
  - Impairments of certain wind projects at Generation
  - Certain costs related to plant retirements
  - Costs incurred related to a cost management program
  - Generation's noncontrolling interest, primarily related to CENG exclusion items
  - One-time impacts of adopting new accounting standards
  - Other unusual items

SI-SSA-0015-01860

GAAP to Non-GAAP Reconciliations[1]

$$\text{Exelon FFO/Debt}^{(2)} = \frac{\text{FFO (a)}}{\text{Adjusted Debt (b)}}$$

Exelon FFO Calculation[2]

GAAP Operating Income
+ Depreciation & Amortization
= EBITDA
- GAAP Interest Expense
+/- GAAP Current Income Tax (Expense)/Benefit
+ Nuclear Fuel Amortization
+/- GAAP to Operating Adjustments
+/- Other S&P Adjustments
= FFO (a)

Exelon Adjusted Debt Calculation[1]

Long-Term Debt (including current maturities)
+ Short-Term Debt
+ Purchase Power Agreement and Operating Lease Imputed Debt
+ Pension/OPEB Imputed Debt (after-tax)
- Off-Credit Treatment of Non-Recourse Debt
- Cash on Balance Sheet * 75%
+/- Other S&P Adjustments
= Adjusted Debt (b)

(1) Due to the forward-looking nature of some forecasted non-GAAP measures, information to reconcile the forecasted adjusted (non-GAAP) measures to the most directly comparable GAAP measure may not be currently available; therefore, management is unable to reconcile these measures
(2) Calculated using S&P Methodology. Due to ring-fencing, S&P deconsolidates BGE from Exelon and analyzes solely as an equity investment

SI-SSA-0015-01861

GAAP to Non-GAAP Reconciliations[1]

$$\text{ExGen Debt/EBITDA} = \frac{\text{Net Debt (a)}}{\text{Operating EBITDA (b)}}$$

$$\text{ExGen Debt/EBITDA Excluding Non-Recourse} = \frac{\text{Net Debt (c)}}{\text{Operating EBITDA (d)}}$$

ExGen Net Debt Calculation

Long-Term Debt (including current maturities)
+ Short-Term Debt
- Cash on Balance Sheet
= Net Debt (a)

ExGen Net Debt Calculation Excluding Non-Recourse

Long-Term Debt (including current maturities)
+ Short-Term Debt
- Cash on Balance Sheet
- Non-Recourse Debt
= Net Debt Excluding Non-Recourse (c)

ExGen Operating EBITDA Calculation

GAAP Operating Income
+ Depreciation & Amortization
= EBITDA
+/- GAAP to Operating Adjustments
= Operating EBITDA (b)

ExGen Operating EBITDA Calculation Excluding Non-Recourse

GAAP Operating Income
+ Depreciation & Amortization
= EBITDA
+/- GAAP to Operating Adjustments
- EBITDA from Projects Financed by Non-Recourse Debt
= Operating EBITDA Excluding Non-Recourse (d)

(1) Due to the forward-looking nature of some forecasted non-GAAP measures, information to reconcile the forecasted adjusted (non-GAAP) measures to the most directly comparable GAAP measure may not be currently available; therefore, management is unable to reconcile these measures

Cautionary Statements Regarding Forward-Looking Information

This presentation contains certain forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995, that are subject to risks and uncertainties. The factors that could cause actual results to differ materially from the forward-looking statements made by Exelon Corporation, Exelon Generation Company, LLC, Commonwealth Edison Company, PECO Energy Company, Baltimore Gas and Electric Company, Pepco Holdings LLC, Potomac Electric Power Company, Delmarva Power & Light Company, and Atlantic City Electric Company (Registrants) include those factors discussed herein, as well as the items discussed in (1) Exelon's 2017 Annual Report on Form 10-K in (a) ITEM 1A. Risk Factors, (b) ITEM 7. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) ITEM 8. Financial Statements and Supplementary Data: Note 23, Commitments and Contingencies; (2) Exelon's Third Quarter 2018 Quarterly Report on Form 10-Q in (a) Part II, Other Information, ITEM 1A. Risk Factors; (b) Part 1, Financial Information, ITEM 2. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) Part I, Financial Information, ITEM 1. Financial Statements: Note 17; and (2) other factors discussed in filings with the SEC by the Registrants. Readers are cautioned not to place undue reliance on these forward-looking statements, which apply only as of the date of this press release. None of the Registrants undertakes any obligation to publicly release any revision to its forward-looking statements to reflect events or circumstances after the date of this presentation.

SI-SSA-0015-01867

Non-GAAP Financial Measures

Exelon reports its financial results in accordance with accounting principles generally accepted in the United States (GAAP). Exelon supplements the reporting of financial information determined in accordance with GAAP with certain non-GAAP financial measures, including:

- ***Adjusted operating earnings*** exclude certain costs, expenses, gains and losses and other specified items, including mark-to-market adjustments from economic hedging activities, unrealized gains and losses from nuclear decommissioning trust fund investments, merger and integration related costs, impairments of certain long-lived assets, certain amounts associated with plant retirements and divestitures, costs related to a cost management program and other items as set forth in the reconciliation in the Appendix
- ***Adjusted operating and maintenance expense*** excludes regulatory operating and maintenance costs for the utility businesses and direct cost of sales for certain Constellation and Power businesses, decommissioning costs that do not affect profit and loss, the impact from operating and maintenance expense related to variable interest entities at Generation, EDF's ownership of O&M expenses, and other items as set forth in the reconciliation in the Appendix
- ***Total gross margin*** is defined as operating revenues less purchased power and fuel expense, excluding revenue related to decommissioning, gross receipts tax, JExel Nuclear JV, variable interest entities, and net of direct cost of sales for certain Constellation and Power businesses
- ***Adjusted cash flow from operations*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding capital expenditures, net merger and acquisitions, and equity investments
- ***Free cash flow*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding certain capital expenditures, net merger and acquisitions, and equity investments
- ***Operating ROE*** is calculated using operating net income divided by average equity for the period. The operating income reflects all lines of business for the utility business (Electric Distribution, Gas Distribution, Transmission).
- ***EBITDA*** is defined as earnings before interest, taxes, depreciation and amortization. Includes nuclear fuel amortization expense.
- ***Revenue net of purchased power and fuel expense*** is calculated as the GAAP measure of operating revenue less the GAAP measure of purchased power and fuel expense

Due to the forward-looking nature of some forecasted non-GAAP measures, information to reconcile the forecasted adjusted (non-GAAP) measures to the most directly comparable GAAP measure may not be currently available, as management is unable to project all of these items for future periods

SI-SSA-0015-01868

Non-GAAP Financial Measures Continued

This information is intended to enhance an investor's overall understanding of period over period financial results and provide an indication of Exelon's baseline operating performance by excluding items that are considered by management to be not directly related to the ongoing operations of the business. In addition, this information is among the primary indicators management uses as a basis for evaluating performance, allocating resources, setting incentive compensation targets and planning and forecasting of future periods.

These non-GAAP financial measures are not a presentation defined under GAAP and may not be comparable to other companies' presentation. Exelon has provided these non-GAAP financial measures as supplemental information and in addition to the financial measures that are calculated and presented in accordance with GAAP. These non-GAAP measures should not be deemed more useful than, a substitute for, or an alternative to the most comparable GAAP measures provided in the materials presented.

Non-GAAP financial measures are identified by the phrase "non-GAAP" or an asterisk. Reconciliations of these non-GAAP measures to the most comparable GAAP measures are provided in the appendices and attachments to this presentation, except for the reconciliation for total gross margin, which appears on slide 42 of this presentation.

SI-SSA-0015-01870

The Exelon Value Proposition

- **Regulated Utility Growth** with utility EPS rising 6-8% annually from 2017-2021 and rate base growth of 7.4%, representing an expanding majority of earnings
- **ExGen's strong free cash generation** will support utility growth while also reducing debt by ~$3B over the next 4 years
- **Optimizing ExGen value by:**
  - Seeking fair compensation for the zero-carbon attributes of our fleet;
  - Closing uneconomic plants;
  - Monetizing assets; and,
  - Maximizing the value of the fleet through our generation to load matching strategy
- **Strong balance sheet is a priority** with all businesses comfortably meeting investment grade credit metrics through the 2021 planning horizon
- **Capital allocation priorities targeting**:
  - Organic utility growth;
  - Return of capital to shareholders with 5% annual dividend growth through 2020[1],
  - Debt reduction; and,
  - Modest contracted generation investments

(1) Quarterly dividends are subject to declaration by the board of directors

SI-SSA-0015-01871

2018 Business Priorities and Commitments

- Maintain industry leading operational excellence
- Effectively deploy ~$5.4B of 2018 utility capex
- Advance PJM power price formation changes in 2018
- Prevail on legal challenges to the NY and IL ZEC programs
- Seek fair compensation for at-risk plants in NJ and PA
- Grow dividend at 5% rate
- Continued commitment to corporate responsibility

SI-SSA-0015-01872

Key Updates

Cost Reductions

Committing to $200M in additional cost reductions with a targeted run-rate date of 2021:

- $100M at ExGen
- $100M at Business Services Company – approximately 50% of savings will be allocated to ExGen

Savings due to our focus on improving efficiencies, eliminating redundancies, and leveraging innovation and technologies

More than $900M in announced savings between 2015 – 2021 relative to original plan

ZECS

Seventh and Second Circuit Court of Appeals Uphold ZEC Programs:

- On September 13, the Seventh Circuit Court of Appeals affirmed the dismissal of the Illinois ZEC complaint, upholding the legality of the program
- On September 27, the Second Circuit affirmed dismissal of New York ZEC complaint
- On October 9, the Seventh Circuit denied the petitioners' request for rehearing

New Jersey:

- Board of Public Utilities completed meetings and hearings on implementation of ZEC program
- On September 20, utilities filed tariff changes to recover ZEC related charges
- ZEC applications are due on December 19

Market Reforms

FERC Capacity Market Proceeding:

- On October 2, stakeholders filed comments in response to FERC's request in its June order
- Exelon joined a coalition proposal supported by rate payer advocates, attorneys general, environmental organizations, renewable advocates and other nuclear generators
- Reply comments submitted on November 6
- PJM requests FERC action in January 2019 to provide adequate time for the August 2019 PJM capacity auction

Fast Start:

- PJM fast start pricing has been fully briefed; awaiting decision from FERC

ACE[7]		CF			IT	RT		EH	IB RB				$109.3M[1]	10.10% / 50.22%	Q3 2019

CF	Rate case filed	RT	Rebuttal testimony	IB	Initial briefs	FO	Final commission order
IT	Intervenor direct testimony	EH	Evidentiary hearings	RB	Reply briefs	SA	Settlement agreement

Note: Based on current schedules of Illinois Commerce Commission, Maryland Public Service Commission, Delaware Public Service Commission, Public Service Commission of the District of Columbia, New Jersey Board of Public Utilities, and Pennsylvania Public Utility Commission and are subject to change

(1) Revenue requirement includes changes in depreciation and amortization expense and other costs where applicable, which have no impact on pre-tax earnings
(2) BGE briefing schedule will be determined during or at the end of the evidentiary hearing
(3) As permitted by Delaware law, Delmarva Power implemented interim rate increases of $2.5M on October 16, 2017, and implemented $5.8M full allowable rates on March 17, 2018, subject to refund. Per Settlement Agreement filed on June 27, 2018. Includes tax benefits from Tax Cuts and Jobs Act.
(4) As permitted by Delaware law, Delmarva Power implemented interim rate increases of $2.5M on November 1, 2017, and implemented $3.9M full allowable rates on March 17, 2018, subject to refund. Per partial Settlement Agreement filed on September 7, 2018. Includes tax benefits from Tax Cuts and Jobs Act.
(5) On October 18, 2018, the presiding Administrative Law Judges issued the Recommended Decision that the Settlement Agreement reached with all active parties be approved without modification. The black box settlement does not stipulate any ROE, Equity Ratio and Rate Base. The rate case settlement agreement is subject to PaPUC approval expected in December, with rates effective January 1, 2018.
(6) Reflects $60.7M increase and $21.7M STRIDE reset. Test year updated for May-July 2018 actuals and reflects long-term debt issuance made in September 2018.
(7) Procedural schedule as proposed by the Company. ACE plans to put interim rates in effect nine months after the filing date, subject to refund, as allowed by the regulations.
(8) Original filing amount was ($22.9M). Recent discovery period removed additional ($1.2M) of revenue requirement to limit issues in the proceeding.
(9) Reflects $96M revenue requirement less an estimated $71M in 2019 tax benefit
(10) Per Settlement Agreement filed on April 17, 2018. Includes tax benefits from Tax Cuts and Jobs Act.

Exelon.

Best in Class at ExGen and Constellation

Exelon Generation Operational Metrics

- Continued best in class performance across our Nuclear fleet:
  - Capacity factor for Exelon owned and operated units was 94.1%[1]
  - This was the second consecutive year over 94% and the fourth out of the last five years topping 94%
  - Most nuclear power ever generated at 157 TWhs[2]
  - 2017 average refueling outage duration of 23 days, just over the Exelon record of 22 days set in 2016
- Strong performance across our Fossil and Renewable fleet:
  - Renewables energy capture: 95.8%
  - Power dispatch match: 98.8%

Constellation Metrics

- 74% retail power customer renewal rate
- 24% power new customer win rate
- 90% natural gas customer retention rate
- 25 month average power contract term
- Average customer duration of more than 5 years
- Stable Retail Margins

Note: Statistics represent full year 2017 results
(1) 2017 capacity factor includes FitzPatrick for the Exelon period of ownership and operation (March 31 to December 31, 2017) and excludes impacts of Salem
(2) Reflects generation output at ownership

SI-SSA-0015-01884

Exelon Generation: Gross Margin Update

	September 30, 2018			Change from June 30, 2018		
Gross Margin Category ($M)[1]	**2018**	**2019**	**2020**	**2018**	**2019**	**2020**
Open Gross Margin[2,5] (including South, West, Canada hedged gross margin)	$4,800	$4,300	$3,900	$100	$250	$100
Capacity and ZEC Revenues[2,5,6]	$2,300	$2,050	$1,900	-	-	-
Mark-to-Market of Hedges[2,3]	$350	$250	$250	$(50)	$(150)	$(50)
Power New Business / To Go	$100	$550	$800	$(50)	$(50)	-
Non-Power Margins Executed	$400	$200	$150	$50	$50	$50
Non-Power New Business / To Go	$100	$300	$350	$(50)	$(50)	$(50)
Total Gross Margin*[4,5]	**$8,050**	**$7,650**	**$7,350**	**-**	**$50**	**$50**

Recent Developments

- Open Gross Margin ("OGM") is up in 2018 due to higher NiHub, West Hub, and NY Zone A prices, partly offset by weaker ERCOT spark spreads
- 2019 and 2020 OGM is up due to stronger ERCOT spark spreads and higher West Hub prices; 2019 OGM is also up on higher NiHub and New York Zone A prices
- Mark-to-Market of Hedges is down in all years on higher prices, offset by the execution of Power New Business in 2018/2019
- Executed $50M of Non-Power New Business in all years
- Behind ratable hedging position reflects the upside we see in power prices
  - ~9-12% behind ratable in 2019 when considering cross commodity hedges

(1) Gross margin categories rounded to nearest $50M
(2) Excludes EDF's equity ownership share of the CENG Joint Venture
(3) Mark-to-Market of Hedges assumes mid-point of hedge percentages
(4) Based on September 30, 2018, market conditions
(5) Reflects Oyster Creek retirement in September 2018 and TMI retirement by September 2019
(6) 2018 includes $150M of IL ZEC revenues associated with 2017 production. 2019 and 2020 include the favorable impact of NJ ZEC revenues.

Driving Costs and Capital Out of the Generation Business

Adjusted O&M* ($M)[1,2]

Capital Expenditures ($M)[1,3,4]

Cost optimization programs and planned nuclear plant closures drive lower total O&M

(1) All amounts rounded to the nearest $25M
(2) O&M and Capital Expenditures reflect removal of Oyster Creek and TMI in 2018 and 2019, respectively, and is adjusted for retaining Handley Generating Station
(3) Capital spend represents cash CapEx with CENG at 100% and excludes merger commitments
(4) 2018E growth capital expenditures reflects a ~$175M shift of cash outlay from 2017A to 2018E related to timing of payments for the CCGT projects in Texas

Exelon.

SI-SSA-0015-01887

Historical Nuclear Capital Investment

Nuclear Non-Fuel Capital Expenditures[1] ($M)

Nuclear Capacity Factor[5,6]

Significant historical investments have mitigated asset management issues and prepared sites for license extensions already received, reducing future capital needs. In addition, internal cost initiatives have found more cost efficient solutions to large CapEx spend, such as leveraging reverse engineering replacements rather than large system wide modifications, resulting in baseline CAGR of -0.8%, even with net addition of 2 sites.

(1) Reflects accrual capital expenditures with CENG at 50% ownership. Assumes Oyster Creek and TMI retirements in October 2018 and September 2019, respectively. All numbers rounded to $25M.
(2) Baseline includes ownership share of Salem all years. CENG is included at ownership share starting in 2014 (full year)
(3) FitzPatrick included starting in 2017 (9 months only)
(4) Growth represents capital that increases the capacity of the units (e.g., turbine upgrades, power uprates), and capital that extends the license of a site (e.g., License Renewals)
(5) Includes CENG beginning in April 2014 and FitzPatrick beginning in April of 2017, excludes Salem and Fort Calhoun
(6) Industry average is for major operators excluding Exelon and includes 3 months of Fitzpatrick prior to Exelon acquisition

Exelon named to Dow Jones Sustainability Index for 13th consecutive year.

Newsweek Magazine's Green Rankings
The Newsweek Green Rankings evaluate corporate sustainability and environmental performance. Exelon ranked in the top three among utilities, No. 12 on the U.S. 500 and No. 24 on the Global 500 list among the world's largest publicly traded companies.

Land for People Award 2017
Received the Trust for Public Land's national "Land for People Award" in recognition of Exelon's deep support of environmental stewardship, creating new parks and promoting conservation.

Diversity and Inclusion

HeforShe
Exelon joined U.N. Women's HeForShe campaign, which is focused on gender equality. Pledge includes a $3 million commitment to develop new STEM programs for girls and young women and improve the retention of women at Exelon by 2020.

Billion Dollar Roundtable
Exelon became the first energy company to join the Billion Dollar Roundtable, an organization that promotes supplier diversity for corporations achieving $1 billion or more in annual direct spending with minority and women-owned businesses.

CEO Action for Diversity & Inclusion
Exelon joined 150 leading companies for the CEO Action for Diversity & Inclusion™ , the largest CEO-driven commitment aimed at taking action to cultivate a workplace where diverse perspectives and experiences are welcomed and respected.

Community Engagement

$52.1 million
Last year, Exelon and its employees set all-time records, committing more than $52.1 million to non-profit organizations and volunteering more than 210,000 hours.

Points of Light, "The Civic 50" 2017
Exelon was named for the first time to the Civic 50, recognizing the most community-minded companies by Points of Light, the world's largest organization dedicated to volunteer service.

2017 Laurie D. Zelon Pro Bono Award
Exelon's legal department was honored by the Pro Bono Institute (PBI) with the 2017 Laurie D. Zelon Pro Bono Award.

Kids in Need of Defense Innovation Award
Exelon's legal department and the Baltimore chapter of Organization of Latinos at Exelon (OLE) for their work with unaccompanied minors from Central America.

Workforce

DiversityInc Top 50 Companies 2018
Exelon ranked No. 32 on DiversityInc's list of Top 50 companies for diversity and 4th for the top 18 companies in hiring for veterans.

Indeed.com "50 Best Places to Work" 2017
Indeed.com ranked Exelon No. 18 on its "50 Best Places to Work."

Human Rights Campaign "Best Places to Work" 2011-2018
Exelon earned the designation of "Best Place to Work" on HRC's Corporate Equality Index for a seventh consecutive year in 2018, receiving a perfect score of 100.

The Military Times Best for Vets 2013-2018
For the sixth year in a row, Exelon received this recognition for its commitment to providing opportunities to America's veterans.

Historically Black Engineering Schools 2013-2017
Exelon was recognized as a top corporate supporter of the nation's historically black engineering programs.

SI-SSA-0015-01895

Climate Leadership Council - Founding Members

Exelon is a founding member of the Climate Leadership Council (CLC) – an effort to promote a carbon fee-and-dividend program.

Corporate Founding Members

AECOM, Allianz, bp, Exelon, ExxonMobil, GM, Johnson & Johnson, MetLife, P&G, PEPSICO, Santander, Schneider Electric, Shell, TOTAL, Unilever

NGO Founding Members

CONSERVATION INTERNATIONAL, The Nature Conservancy

The Four Pillars of a Carbon Dividends Plan:

- **Gradually Increasing Carbon Tax**: Fee would be applied at the point where fossil fuels enter the economy (i.e. wellhead, mine, refinery or port), start at $40/ton and increase 5% a year (the increase could be 10% for years when emissions fail to fall aggressively enough)
- **Carbon Dividends**: Americans would receive a monthly dividend check -- ~$2,000/year to begin, gradually increasing over time as revenue increases; 70% of Americans would be net beneficiaries
- **Border Carbon Adjustments:** Imports and exports would be subject to a border adjustment
- **Significant Regulatory Rollback:** Much of EPA's regulatory authority over greenhouse gases would be phased out. Carbon emitters would be protected against federal and state tort liability suit to the extent emissions are covered (e.g., carbon but not methane)

Ending Cash Balance*[2]									**1,725**

(1) All amounts rounded to the nearest $25M. Figures may not add due to rounding.

(2) Gross of posted counterparty collateral

(3) Figures reflect cash CapEx and CENG fleet at 100%

(4) Other Financing primarily includes commercial paper, expected changes in money pool borrowings, tax sharing from the parent, debt issue costs, tax equity cash flows, capital leases, and renewable JV distributions

(5) Financing cash flow excludes intercompany dividends

(6) ExGen Growth CapEx primarily includes Texas CCGTs, W. Medway, and Retail Solar

(7) Dividends are subject to declaration by the Board of Directors

(8) Includes cash flow activity from Holding Company, eliminations, and other corporate entities

Consistent and reliable free cash flows

Operational excellence and financial discipline drives free cash flow reliability

- ✓ Generating $6.1B of free cash flow*, including $1.8B at ExGen and $4.2B at the Utilities

Supported by a strong balance sheet

Strong balance sheet enables flexibility to raise and deploy capital for growth

- ✓ $1.5B of long-term debt at the utilities, net of refinancing, to support continued growth

Enable growth & value creation

Creating value for customers, communities and shareholders

- ✓ Investing $5.9B of growth capex, with $5.5B at the Utilities and $0.4B at ExGen

Note: Numbers may not add due to rounding

SI-SSA-0015-01898

Exelon Debt Maturity Profile[1]

LT Debt Balances (as of 9/30/18) [1,2]	
BGE	2.9B
ComEd	8.3B
PECO	3.3B
PHI	6.1B
ExGen recourse	6.7B
ExGen non-recourse	2.1B
HoldCo	6.3B
Consolidated	35.7B

Exelon's weighted average LTD maturity is approximately 15 years

(1) Maturity profile excludes non-recourse debt, securitized debt, capital leases, fair value adjustments, unamortized debt issuance costs and unamortized discount/premium
(2) Long-term debt balances reflect Q3 2018 10-Q GAAP financials; ExGen debt includes legacy CEG debt

	Exelon Consolidated Effective Tax Rate	18%	19%	20%

(1) Based on September 30, 2018, market conditions and hedged position. Gas price sensitivities are based on an assumed gas-power relationship derived from an internal model that is updated periodically. Power price sensitivities are derived by adjusting the power price assumption while keeping all other price inputs constant. Due to correlation of the various assumptions, the EPS impact calculated by aggregating individual sensitivities may not be equal to the EPS impact calculated when correlations between the various assumptions are also considered.

SI-SSA-0015-01900

Exelon Utilities Trailing Twelve Month Earned ROEs*

Q3 2018: Trailing Twelve Month Earned ROEs*

Note: Represents the twelve-month period ending September 30, 2018. Earned ROEs* represent weighted average across all lines of business (Electric Distribution, Gas Distribution, and Electric Transmission). Size of bubble based on rate base.

Exelon Generation Disclosures

Data as of September 30, 2018
These disclosures were presented on November 1, 2018, and are not being updated at this time

SI-SSA-0015-01902

Portfolio Management Strategy

Strategic Policy Alignment

- Aligns hedging program with financial policies and financial outlook
  - Establish minimum hedge targets to meet financial objectives of the company (dividend, credit rating)
  - Hedge enough commodity risk to meet future cash requirements under a stress scenario

Three-Year Ratable Hedging

- Ensure stability in near-term cash flows and earnings
  - Disciplined approach to hedging
  - Tenor aligns with customer preferences and market liquidity
  - Multiple channels to market that allow us to maximize margins
  - Large open position in outer years to benefit from price upside

Bull / Bear Program

- Ability to exercise fundamental market views to create value within the ratable framework
  - Modified timing of hedges versus purely ratable
  - Cross-commodity hedging (heat rate positions, options, etc.)
  - Delivery locations, regional and zonal spread relationships

Protect Balance Sheet | **Ensure Earnings Stability** | **Create Value**

ERCOT[5]	($2.00)	$2.00	$1.00
New York[2,6]	$36.00	$32.00	$30.00
New England[5]	$7.00	$6.00	$25.50

(1) Expected generation is the volume of energy that best represents our commodity position in energy markets from owned or contracted for capacity based upon a simulated dispatch model that makes assumptions regarding future market conditions, which are calibrated to market quotes for power, fuel, load following products, and options. Expected generation assumes 14 refueling outages in 2018, 11 in 2019, and 14 in 2020 at Exelon-operated nuclear plants and Salem. Expected generation assumes capacity factors of 94.3%, 94.6% and 93.9% in 2018, 2019, and 2020, respectively at Exelon-operated nuclear plants, at ownership. These estimates of expected generation in 2019 and 2020 do not represent guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years.
(2) Excludes EDF's equity ownership share of CENG Joint Venture
(3) Percent of expected generation hedged is the amount of equivalent sales divided by expected generation. Includes all hedging products, such as wholesale and retail sales of power, options and swaps.
(4) Effective realized energy price is representative of an all-in hedged price, on a per MWh basis, at which expected generation has been hedged. It is developed by considering the energy revenues and costs associated with our hedges and by considering the fossil fuel that has been purchased to lock in margin. It excludes uranium costs, RPM capacity and ZEC revenues, but includes the mark-to-market value of capacity contracted at prices other than RPM clearing prices including our load obligations. It can be compared with the reference prices used to calculate open gross margin in order to determine the mark-to-market value of Exelon Generation's energy hedges.
(5) Spark spreads shown for ERCOT and New England
(6) Reflects Oyster Creek retirement in September 2018 and TMI retirement by September 2019

ExGen Hedged Gross Margin* Sensitivities

- $5/MWh	-	$(5)	$(30)
Nuclear Capacity Factor			
+/- 1%	+/- $10	+/- $35	+/- $30

(1) Based on September 30, 2018, market conditions and hedged position; gas price sensitivities are based on an assumed gas-power relationship derived from an internal model that is updated periodically; power price sensitivities are derived by adjusting the power price assumption while keeping all other price inputs constant; due to correlation of the various assumptions, the hedged gross margin impact calculated by aggregating individual sensitivities may not be equal to the hedged gross margin impact calculated when correlations between the various assumptions are also considered; sensitivities based on commodity exposure which includes open generation and all committed transactions; excludes EDF's equity share of CENG Joint Venture

SI-SSA-0015-01906

Additional ExGen Modeling Data

Total Gross Margin Reconciliation (in $M)[1]	2018	2019	2020
Revenue Net of Purchased Power and Fuel Expense*[2,3]	**$8,525**	**$8,125**	**$7,800**
Other Revenues[4]	$(200)	$(175)	$(200)
Direct cost of sales incurred to generate revenues for certain Constellation and Power businesses	$(275)	$(300)	$(250)
Total Gross Margin* (Non-GAAP)	**$8,050**	**$7,650**	**$7,350**

Key ExGen Modeling Inputs (in $M)[1,5]	2018
Other[6]	$250
Adjusted O&M*	$(4,625)
Taxes Other Than Income (TOTI)[7]	$(375)
Depreciation & Amortization*[8]	$(1,125)
Interest Expense	$(400)
Effective Tax Rate	22.0%

(1) All amounts rounded to the nearest $25M
(2) ExGen does not forecast the GAAP components of RNF separately, as to do so would be unduly burdensome. RNF also includes the RNF of our proportionate ownership share of CENG.
(3) Excludes the Mark-to-Market impact of economic hedging activities due to the volatility and unpredictability of the future changes to power prices
(4) Other Revenues reflects primarily revenues from JExel Nuclear JV, variable interest entities, funds collected through revenues for decommissioning the former PECO nuclear plants through regulated rates, and gross receipts tax revenues
(5) ExGen amounts for O&M, TOTI, Depreciation & Amortization; excludes EDF's equity ownership share of the CENG Joint Venture
(6) Other reflects Other Revenues excluding gross receipts tax revenues, includes nuclear decommissioning trust fund earnings from unregulated sites, and includes the minority interest in ExGen Renewables JV and Bloom. Other for 2018 is favorable due to NDTF realized gains that may not occur in 2019 and 2020.
(7) TOTI excludes gross receipts tax of $150M
(8) 2019 Depreciation & Amortization is flat to 2018 and 2020 is favorable $50M due to nuclear plant retirements

Appendix

Reconciliation of Non-GAAP Measures

SI-SSA-0015-01908

Projected GAAP to Operating Adjustments

- **Exelon's projected 2018 adjusted (non-GAAP) operating earnings excludes the earnings effects of the following:**
  - Mark-to-market adjustments from economic hedging activities
  - Unrealized gains and losses from NDT fund investments
  - Impairments of certain wind projects at Generation
  - Certain costs related to plant retirements
  - Costs incurred related to a cost management program
  - Non-cash impacts pursuant to the annual update of asset retirement obligations
  - Adjustment to the remeasurement of deferred income taxes as a result of the Tax Cuts and Jobs Act (TCJA) and changes in forecasted apportionment
  - Generation's noncontrolling interest, primarily related to CENG exclusion items
  - One-time impacts of adopting new accounting standards
  - Other unusual items

SI-SSA-0015-01909

GAAP to Non-GAAP Reconciliations[1]

$$\text{Exelon FFO/Debt}^{(2)} = \frac{\text{FFO (a)}}{\text{Adjusted Debt (b)}}$$

Exelon FFO Calculation[2]

GAAP Operating Income
+ Depreciation & Amortization
= EBITDA
- GAAP Interest Expense
+/- GAAP Current Income Tax (Expense)/Benefit
+ Nuclear Fuel Amortization
+/- GAAP to Operating Adjustments
+/- Other S&P Adjustments
= FFO (a)

Exelon Adjusted Debt Calculation[1]

Long-Term Debt (including current maturities)
+ Short-Term Debt
+ Purchase Power Agreement and Operating Lease Imputed Debt
+ Pension/OPEB Imputed Debt (after-tax)
- Off-Credit Treatment of Non-Recourse Debt
- Cash on Balance Sheet * 75%
+/- Other S&P Adjustments
= Adjusted Debt (b)

(1) Due to the forward-looking nature of some forecasted non-GAAP measures, information to reconcile the forecasted adjusted (non-GAAP) measures to the most directly comparable GAAP measure may not be currently available; therefore, management is unable to reconcile these measures
(2) Calculated using S&P Methodology. Due to ring-fencing, S&P deconsolidates BGE from Exelon and analyzes solely as an equity investment

SI-SSA-0015-01910

GAAP to Non-GAAP Reconciliations[1]

$$\text{ExGen Debt/EBITDA} = \frac{\text{Net Debt (a)}}{\text{Operating EBITDA (b)}}$$

$$\text{ExGen Debt/EBITDA Excluding Non-Recourse} = \frac{\text{Net Debt (c)}}{\text{Operating EBITDA (d)}}$$

ExGen Net Debt Calculation

Long-Term Debt (including current maturities)
+ Short-Term Debt
- Cash on Balance Sheet
= Net Debt (a)

Exelon®

Cautionary Statements Regarding Forward-Looking Information

This presentation contains certain forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995, that are subject to risks and uncertainties. The factors that could cause actual results to differ materially from the forward-looking statements made by Exelon Corporation, Exelon Generation Company, LLC, Commonwealth Edison Company, PECO Energy Company, Baltimore Gas and Electric Company, Pepco Holdings LLC, Potomac Electric Power Company, Delmarva Power & Light Company, and Atlantic City Electric Company (Registrants) include those factors discussed herein, as well as the items discussed in (1) Exelon's 2017 Annual Report on Form 10-K in (a) ITEM 1A. Risk Factors, (b) ITEM 7. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) ITEM 8. Financial Statements and Supplementary Data: Note 23, Commitments and Contingencies; (2) Exelon's First Quarter 2018 Quarterly Report on Form 10-Q in (a) Part II, Other Information, ITEM 1A. Risk Factors; (b) Part 1, Financial Information, ITEM 2. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) Part I, Financial Information, ITEM 1. Financial Statements: Note 17; and (2) other factors discussed in filings with the SEC by the Registrants. Readers are cautioned not to place undue reliance on these forward-looking statements, which apply only as of the date of this press release. None of the Registrants undertakes any obligation to publicly release any revision to its forward-looking statements to reflect events or circumstances after the date of this presentation.

SI-SSA-0015-01916

Non-GAAP Financial Measures

Exelon reports its financial results in accordance with accounting principles generally accepted in the United States (GAAP). Exelon supplements the reporting of financial information determined in accordance with GAAP with certain non-GAAP financial measures, including:

- ***Adjusted operating earnings*** exclude certain costs, expenses, gains and losses and other specified items, including mark-to-market adjustments from economic hedging activities, unrealized gains and losses from nuclear decommissioning trust fund investments, merger and integration related costs, impairments of certain long-lived assets, certain amounts associated with plant retirements and divestitures, costs related to a cost management program and other items as set forth in the reconciliation in the Appendix
- ***Adjusted operating and maintenance expense*** excludes regulatory operating and maintenance costs for the utility businesses and direct cost of sales for certain Constellation and Power businesses, decommissioning costs that do not affect profit and loss, the impact from operating and maintenance expense related to variable interest entities at Generation, EDF's ownership of O&M expenses, and other items as set forth in the reconciliation in the Appendix
- ***Total gross margin*** is defined as operating revenues less purchased power and fuel expense, excluding revenue related to decommissioning, gross receipts tax, JExel Nuclear JV, variable interest entities, and net of direct cost of sales for certain Constellation and Power businesses
- ***Adjusted cash flow from operations*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding capital expenditures, net merger and acquisitions, and equity investments
- ***Free cash flow*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding certain capital expenditures, net merger and acquisitions, and equity investments
- ***Operating ROE*** is calculated using operating net income divided by average equity for the period. The operating income reflects all lines of business for the utility business (Electric Distribution, Gas Distribution, Transmission).
- ***EBITDA*** is defined as earnings before interest, taxes, depreciation and amortization. Includes nuclear fuel amortization expense.
- ***Revenue net of purchased power and fuel expense*** is calculated as the GAAP measure of operating revenue less the GAAP measure of purchased power and fuel expense

Due to the forward-looking nature of some forecasted non-GAAP measures, information to reconcile the forecasted adjusted (non-GAAP) measures to the most directly comparable GAAP measure may not be currently available, as management is unable to project all of these items for future periods

SI-SSA-0015-01917

Non-GAAP Financial Measures Continued

This information is intended to enhance an investor's overall understanding of period over period financial results and provide an indication of Exelon's baseline operating performance by excluding items that are considered by management to be not directly related to the ongoing operations of the business. In addition, this information is among the primary indicators management uses as a basis for evaluating performance, allocating resources, setting incentive compensation targets and planning and forecasting of future periods.

These non-GAAP financial measures are not a presentation defined under GAAP and may not be comparable to other companies' presentation. Exelon has provided these non-GAAP financial measures as supplemental information and in addition to the financial measures that are calculated and presented in accordance with GAAP. These non-GAAP measures should not be deemed more useful than, a substitute for, or an alternative to the most comparable GAAP measures provided in the materials presented.

Non-GAAP financial measures are identified by the phrase "non-GAAP" or an asterisk. Reconciliations of these non-GAAP measures to the most comparable GAAP measures are provided in the appendices and attachments to this presentation, except for the reconciliation for total gross margin, which appears on slide 44 of this presentation.

Exelon: An Industry Leader

$21B
Being invested in utilities through 2021

$52M
In 2017, Exelon gave approx. $52 million to charitable and community causes

#1
zero-carbon energy provider in America

210 TWh
Customer load served

35,200
Megawatts of total power generation capacity

10M
Six utilities serving 10M electric and gas customers, the most in the U.S.

34,600
employees

$33.5B
Operating revenue in 2017

FORTUNE 100
Exelon is a FORTUNE 100 company

2M (Approx.)
Exelon's Constellation business serves residential, public sector and business customers

11,470
transmission line miles for utilities

9.5M
Smart meters installed

Note: All numbers reflect year-end 2017

Exelon.

SI-SSA-0015-01919

The Exelon Value Proposition

- **Regulated Utility Growth** with utility EPS rising 6-8% annually from 2017-2021 and rate base growth of 7.4%, representing an expanding majority of earnings
- **ExGen's strong free cash generation** will support utility growth while also reducing debt by ~$3B over the next 4 years
- **Optimizing ExGen value by:**
  - Seeking fair compensation for the zero-carbon attributes of our fleet;
  - Closing uneconomic plants;
  - Monetizing assets; and,
  - Maximizing the value of the fleet through our generation to load matching strategy
- **Strong balance sheet is a priority** with all businesses comfortably meeting investment grade credit metrics through the 2021 planning horizon
- **Capital allocation priorities targeting**:
  - Organic utility growth;
  - Return of capital to shareholders with 5% annual dividend growth through 2020[1],
  - Debt reduction; and,
  - Modest contracted generation investments

(1) Quarterly dividends are subject to declaration by the board of directors

SI-SSA-0015-01920

2018 Business Priorities and Commitments

- Maintain industry leading operational excellence
- Effectively deploy ~$5.4B of 2018 utility capex
- Advance PJM power price formation changes in 2018
- Prevail on legal challenges to the NY and IL ZEC programs
- Seek fair compensation for at-risk plants in NJ and PA
- Grow dividend at 5% rate
- Continued commitment to corporate responsibility

Exelon.

Best in Class at ExGen and Constellation

Exelon Generation Operational Metrics

- Continued best in class performance across our Nuclear fleet:
  - Capacity factor for Exelon owned and operated units was 94.1%[1]
  - This was the second consecutive year over 94% and the fourth out of the last five years topping 94%
  - Most nuclear power ever generated at 157 TWhs[2]
  - 2017 average refueling outage duration of 23 days, just over the Exelon record of 22 days set in 2016
- Strong performance across our Fossil and Renewable fleet:
  - Renewables energy capture: 95.8%
  - Power dispatch match: 98.8%

Constellation Metrics

- 74% retail power customer renewal rate
- 24% power new customer win rate
- 90% natural gas customer retention rate
- 25 month average power contract term
- Average customer duration of more than 5 years
- Stable Retail Margins

Note: Statistics represent full year 2017 results
(1) 2017 capacity factor includes FitzPatrick for the Exelon period of ownership and operation (March 31 to December 31, 2017) and excludes impacts of Salem
(2) Reflects generation output at ownership

SI-SSA-0015-01932

Exelon Generation: Gross Margin Update as of May 2, 2018

Gross Margin Category ($M)[1]	March 31, 2018			Change from December 31, 2017		
	2018	2019	2020	2018	2019	2020
Open Gross Margin[2,5] (including South, West, Canada hedged gross margin)	$4,600	$3,950	$3,800	$250	$50	$50
Capacity and ZEC Revenues[2,5,6]	$2,300	$2,000	$1,850	-	-	-
Mark-to-Market of Hedges[2,3]	$300	$450	$250	$(50)	$50	-
Power New Business / To Go	$350	$650	$850	$(200)	$(100)	$(50)
Non-Power Margins Executed	$300	$150	$100	$100	$50	-
Non-Power New Business / To Go	$200	$350	$400	$(100)	$(50)	-
Total Gross Margin*[4,5]	**$8,050**	**$7,550**	**$7,250**	**-**	**-**	**-**

Recent Developments

- Open Gross Margin is up in all years due to strengthening ERCOT spark spreads, partly offset by lower NiHub prices
- Mark-to-Market of Hedges is down in all years due to higher prices, mostly offset by the execution of Power New Business
- Executed $200M and $100M of Power New Business in 2018 and 2019, respectively
- Behind ratable hedging position reflects the upside we see in power prices
  - ~8-11% behind ratable in 2019 when considering cross commodity hedges

Note: Data as of March 31, 2018 – These disclosures were presented on May 2, 2018 and are not being updated at this time
(1) Gross margin categories rounded to nearest $50M
(2) Excludes EDF's equity ownership share of the CENG Joint Venture
(3) Mark-to-Market of Hedges assumes mid-point of hedge percentages
(4) Based on March 31, 2018, market conditions
(5) Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.
(6) 2018 includes $150M of IL ZEC revenues associated with 2017 production

Exelon.

SI-SSA-0015-01933

Driving Costs and Capital Out of the Generation Business

Adjusted O&M* ($M)[1,2]

Capital Expenditures ($M)[1,3,4]

Cost optimization programs and planned nuclear plant closures drive lower total O&M

(1) All amounts rounded to the nearest $25M
(2) O&M and Capital Expenditures reflect removal of Oyster Creek and TMI in 2018 and 2019, respectively, and is adjusted for retaining Handley Generating Station
(3) Capital spend represents cash CapEx with CENG at 100% and excludes merger commitments
(4) 2018E growth capital expenditures reflects a ~$175M shift of cash outlay from 2017A to 2018E related to timing of payments for the CCGT projects in Texas

Exelon.

SI-SSA-0015-01934

Historical Nuclear Capital Investment

Nuclear Non-Fuel Capital Expenditures[1] ($M)

Nuclear Capacity Factor[5]

Significant historical investments have mitigated asset management issues and prepared sites for license extensions already received, reducing future capital needs. In addition, internal cost initiatives have found more cost efficient solutions to large CapEx spend, such as leveraging reverse engineering replacements rather than large system wide modifications, resulting in baseline CAGR of -0.8%, even with net addition of 2 sites.

(1) Reflects accrual capital expenditures with CENG at 50% ownership. Assumes Oyster Creek and TMI retirements in October 2018 and September 2019, respectively. All numbers rounded to $25M.
(2) Baseline includes ownership share of Salem all years. CENG is included at ownership share starting in 2014 (full year)
(3) FitzPatrick included starting in 2017 (9 months only)
(4) Growth represents capital that increases the capacity of the units (e.g., turbine upgrades, power uprates), and capital that extends the license of a site (e.g., License Renewals)
(5) Includes CENG beginning in April 2014 and FitzPatrick beginning in April of 2017, excludes Salem and Fort Calhoun
(6) 2017 industry average excluding Exelon was not available at time of publication

Exelon.

SI-SSA-0015-01935

ZEC & Policy Updates

New Jersey ZEC

- On April 12, 2018, the NJ ZEC bill passed both the Senate and Assembly with bipartisan support
- Governor Murphy signed the bill on May 23rd
- With the Governor's signature, the BPU will begin the process of implementing the bill, including approving utility tariffs, developing a selection methodology, and reviewing applications for participation in the program
- Implementation of the program is scheduled to be completed around the end of Q1 2019

Illinois & New York ZEC Legal Challenges

Illinois:

- Oral arguments for the 7th Circuit occurred on January 3, 2018 – Judge requested supplemental briefings from parties
- Supplemental briefings were filed on January 26, 2018
- Court issued order on February 21, 2018, inviting the U.S. Government to provide its views
- Parties are awaiting response from the U.S. Solicitor General and further action by the court

New York:

- Oral arguments for the 2nd Circuit occurred on March 12, 2018
- No outstanding items following oral arguments
- Currently awaiting court decision

PJM Price Formation

Fast Start:

- Fast start NOPR was initiated by FERC (docket # EL18-34) and has now been fully briefed
- FERC has committed to providing a decision in September
  - If FERC approves by September, PJM believes it could implement the changes for the 2018/2019 winter

Baseload:

- PJM is in the midst of a stakeholder process scheduled to conclude in the 3rd quarter
- After completing the stakeholder process and receiving FERC's decision on the fast start docket, PJM will announce its process for moving forward

ExGen's Strong Available Cash Flow* Supports Utility Growth and Debt Reduction

2018-2021 Exelon Generation Available Cash Flow and Uses of Cash* ($B)

Redeploying Exelon Generation's available cash flow* to maximize shareholder value

(1) Cumulative Available Cash Flow* is a midpoint of a range based on December 31, 2017, market prices. Sources include change in margin, tax sharing agreement, equity investments, equity distributions for renewables JV and Bluestem tax equity, and acquisitions and divestitures.

SI-SSA-0015-01940

Exelon.

Impacts from Tax Reform

Tax Impacts

	2018	2019	2020	2021
Cumulative Incremental Rate Base from Tax Policy Changes	$0.9	$1.4	$1.7	$2.0
ExGen Effective Tax Rate	22%	22%	22%	21%
Consolidated Effective Tax Rate	18%	19%	20%	20%
Consolidated Cash Tax Rate	1%	4%	3%	3%

Key Takeaways

- Changes in federal tax policy are expected to increase run-rate EPS by $0.10 per share in 2019
- Utility rate base is expected to be $1.7B higher in 2020 than prior disclosures
- Generation cash flows will benefit from a lower tax rate and full expensing of capital with an effective tax rate of 22% in 2018-2020, and 21% in 2021
- Projected Exelon FFO/Debt is largely unchanged with ExGen metrics stronger and modest deterioration at the six regulated utilities, which remain at or above rating agency thresholds

2018 ExGen S&P FFO/Debt %*

Reflects the increased free cash flow* as a result of tax rates decreasing to 22% from an expected 33% in 2018

2018 Exelon S&P FFO/Debt %*(1,2)

Impact of tax reform on Exelon's metrics is largely neutral given offsetting impacts between ExGen and utilities

(1) Due to ring-fencing, S&P deconsolidates BGE from Exelon and analyzes solely as an equity investment
(2) Exelon Corp downgrade threshold (red dotted line) is based on the S&P Exelon Corp Summary Report; represents minimum level to maintain current Issuer Credit Rating of BBB at Exelon Corp

Exelon.

SI-SSA-0015-01941

Tax Reform Yields Significant Customer Bill Savings

DPL

- MD PSC accepted DPL's proposal to provide **$14M** in annual tax savings to customers
  - $3.86 decrease on the average residential monthly bill
- DPL has filed plans with DE PSC to provide **$26M** in annual tax savings to customers
  - $2.99 and $4.77 decrease on the average residential monthly bill for Electric and Gas, respectively

ACE

- ACE has filed a request with NJ BPU to provide **$23M** in annual tax savings to customers; expected to be approved by July
  - $2.37 savings on residential monthly bills

ComEd

- ICC approved ComEd's petition seeking approval to pass along approximately **$201M** in annual tax savings to customers
  - ~$3.00 decrease on the average residential monthly bill

Pepco

- Pepco has filed a request with the DC & MD PSC to provide **$70M** in annual tax savings to customers
- Pepco has filed settlements which include these savings as adjusted in its proposals to the commission

BGE

- MD PSC accepted BGE's proposal to provide approximately **$103M** in annual tax savings to customers
  - $2.91 decrease on the average residential monthly electric bill
  - $5.41 decrease on the average residential combined natural gas and electric bill

PECO

- Approximately **$72M** in annual tax savings to customers

Utility customers across our jurisdictions will benefit from tax reform, saving over $500M annually through planned and approved bill adjustments

Note: Currently includes only distribution-related customer savings amounts

Maintaining Strong Investment Grade Credit Ratings is a Top Financial Priority

Exelon S&P FFO/Debt %*[1,4]

ExGen Debt/EBITDA Ratio*[5]

Credit Ratings by Operating Company

Current Ratings [2,3]	ExCorp	ExGen	ComEd	PECO	BGE	ACE	DPL	Pepco
Moody's	Baa2	Baa2	A1	Aa3	A3	A3	A2	A2
S&P	BBB-	BBB	A-	A-	A-	A	A	A
Fitch	BBB	BBB	A	A	A-	A-	A	A-

(1) Due to ring-fencing, S&P deconsolidates BGE from Exelon and analyzes solely as an equity investment
(2) Current senior unsecured ratings as of May 2, 2018, for Exelon, Exelon Generation and BGE and senior secured ratings for ComEd, PECO, ACE, DPL, and Pepco
(3) All ratings have a "Stable" outlook, with the exception of ACE, which is on "Positive" outlook for Moody's
(4) Exelon Corp downgrade threshold (red dotted line) is based on the S&P Exelon Corp Summary Report; represents minimum level to maintain current Issuer Credit Rating at Exelon Corp
(5) Reflects net book debt (YE debt less cash on hand) / adjusted operating EBITDA*

SI-SSA-0015-01943

Exelon

Raising Dividend Growth Rate to 5% Annually through 2020

Dividends per Share[1]

Assuming a steady 70% payout ratio on Utility less HoldCo earnings, ExGen's contribution to the Exelon dividend represents a modest payout on earnings and free cash flow

(1) Quarterly dividends are subject to declaration by the board of directors
(2) Total projected Dividend per Share (DPS) figures are illustrative of a 5% growth annually applied to the 2017 dividend. Implied Exelon Utilities contribution is based on a 70% payout on the midpoint of the EPS guidance band for Exelon Utilities less HoldCo. Implied ExGen contribution is based on the remaining balance between the illustrative total annual DPS and the Implied Exelon Utilities contribution.

SI-SSA-0015-01944

2017 Exelon Recognition and Partnerships

Sustainability

Dow Jones Sustainability Index
Exelon named to Dow Jones Sustainability Index for 12th consecutive year

Newsweek Magazine's Green Rankings
Newsweek Magazine's Green Rankings recognized our leadership in sustainability, where we ranked third among utilities, No. 12 in the U.S. 500 and 24th among the Global 500

Carbon Reduction
A recent U.S. Environmental Protection Agency report noted Exelon's generation fleet had the lowest rate of emissions among the 20 largest public or privately held energy producers. Fortune also recognized Exelon as the second-lowest carbon emitter of all Fortune 100 companies

Land for People Award
Received the Trust for Public Land's national "Land for People Award" in recognition of Exelon's deep support of environmental stewardship, creating new parks and promoting conservation

Corporate & Foundation Giving

$52.1 million
Last year, Exelon and its employees set all-time records, committing more than $52.1 million to non-profit organizations and volunteering more than 210,000 hours

Civic 50
Exelon was named for the first time to the Civic 50, recognizing the most community-minded companies by Points of Light, the world's largest organization dedicated to volunteer service

Corporate Recognition

2017 Laurie D. Zelon Pro Bono Award
For exemplary pro bono service and leadership

Kids in Need of Defense Innovation Award
Exelon's legal department and the Baltimore chapter of Organization of Latinos at Exelon (OLE) for their work with unaccompanied minors from Central America

Diversity & Inclusion

HeforShe
Exelon joined U.N. Women's HeForShe campaign, which is focused on gender equality. Pledge includes a $3 million commitment to develop new STEM programs for girls and young women and improving the retention of women at Exelon by 2020

Billion Dollar Roundtable
Exelon became the first energy company to join the Billion Dollar Roundtable, an organization that promotes supplier diversity for corporations achieving $1 billion or more in annual direct spending with minority and women-owned businesses

CEO Action for Diversity & Inclusion
Exelon joined 150 leading companies for the CEO Action for Diversity & Inclusion™ , the largest CEO-driven commitment aimed at taking action to cultivate a workplace where diverse perspectives and experiences are welcomed and respected

Workforce

DiversityInc Top 50
DiversityInc. named Exelon as one of the Top 50 companies for excellence in diversity.

Indeed.com "50 Best Places to Work"
Indeed.com ranked Exelon No. 18 on its "50 Best Places to Work."

Human Rights Campaign "Best Places to Work" For the third consecutive year, HRC's Corporate Equality Index gave Exelon a perfect rating on its best places to work for LGBTQ

2017 U.S. Veterans Magazine's "Best of the Best"
Most veteran-friendly companies

Historically Black Engineering Schools
Top Supporter recognition for five consecutive years

(1) All amounts rounded to the nearest $25M. Figures may not add due to rounding.

(2) Gross of posted counterparty collateral

(3) Figures reflect cash CapEx and CENG fleet at 100%

(4) Other Financing primarily includes expected changes in money pool borrowings, tax sharing from the parent, debt issue costs, tax equity cash flows, capital leases, and renewable JV distributions

(5) Financing cash flow excludes intercompany dividends and other intercompany financing activities

(6) ExGen Growth CapEx primarily includes Texas CCGTs, W. Medway, and Retail Solar

(7) Dividends are subject to declaration by the Board of Directors

(8) Includes cash flow activity from Holding Company, eliminations, and other corporate entities

Consistent and reliable free cash flows

Operational excellence and financial discipline drives free cash flow reliability

- ✓ Generating $6.1B of free cash flow*, including $1.9B at ExGen and $4.1B at the Utilities

Supported by a strong balance sheet

Strong balance sheet enables flexibility to raise and deploy capital for growth

- ✓ $1.4B of long-term debt at the utilities, net of refinancing, to support continued growth

Enable growth & value creation

Creating value for customers, communities and shareholders

- ✓ Investing $5.9B of growth capex, with $5.5B at the Utilities and $0.4B at ExGen

	Pension Expense	-	$0.03	$0.03
	Cost of Debt	($0.00)	($0.00)	($0.01)
	Share count (millions)	969	972	975
	Exelon Consolidated Effective Tax Rate	18%	19%	20%

(1) Based on December 31, 2017, market conditions and hedged position. Gas price sensitivities are based on an assumed gas-power relationship derived from an internal model that is updated periodically. Power price sensitivities are derived by adjusting the power price assumption while keeping all other price inputs constant. Due to correlation of the various assumptions, the EPS impact calculated by aggregating individual sensitivities may not be equal to the EPS impact calculated when correlations between the various assumptions are also considered.

SI-SSA-0015-01949

Exelon Generation Disclosures

Data as of March 31, 2018
These disclosures were presented on May 2, 2018, and are not being updated at this time

SI-SSA-0015-01950

Portfolio Management Strategy

Strategic Policy Alignment

- Aligns hedging program with financial policies and financial outlook
  - Establish minimum hedge targets to meet financial objectives of the company (dividend, credit rating)
  - Hedge enough commodity risk to meet future cash requirements under a stress scenario

Three-Year Ratable Hedging

- Ensure stability in near-term cash flows and earnings
  - Disciplined approach to hedging
  - Tenor aligns with customer preferences and market liquidity
  - Multiple channels to market that allow us to maximize margins
  - Large open position in outer years to benefit from price upside

Bull / Bear Program

- Ability to exercise fundamental market views to create value within the ratable framework
  - Modified timing of hedges versus purely ratable
  - Cross-commodity hedging (heat rate positions, options, etc.)
  - Delivery locations, regional and zonal spread relationships

Protect Balance Sheet | **Ensure Earnings Stability** | **Create Value**

SI-SSA-0015-01951

Exelon.

Components of Gross Margin Categories

Gross margin linked to power production and sales

Open Gross Margin

- Generation Gross Margin at current market prices, including ancillary revenues, nuclear fuel amortization and fossils fuels expense
- Power Purchase Agreement (PPA) Costs and Revenues
- Provided at a consolidated level for all regions (includes hedged gross margin for South, West and Canada[1])

Capacity and ZEC Revenues

- Expected capacity revenues for generation of electricity
- Expected revenues from Zero Emissions Credits (ZEC)

MtM of Hedges[2]

- Mark-to-Market (MtM) of power, capacity and ancillary hedges, including cross commodity, retail and wholesale load transactions
- Provided directly at a consolidated level for five major regions. Provided indirectly for each of the five major regions via Effective Realized Energy Price (EREP), reference price, hedge %, expected generation.

"Power" New Business

- Retail, Wholesale planned electric sales
- Portfolio Management new business
- Mid marketing new business

Margins move from new business to MtM of hedges over the course of the year as sales are executed[5]

Gross margin from other business activities

"Non Power" Executed

- Retail, Wholesale executed gas sales
- Energy Efficiency[4]
- BGE Home[4]
- Distributed Solar

"Non Power" New Business

- Retail, Wholesale planned gas sales
- Energy Efficiency[4]
- BGE Home[4]
- Distributed Solar
- Portfolio Management / origination fuels new business
- Proprietary trading[3]

Margins move from "Non power new business" to "Non power executed" over the course of the year

(1) Hedged gross margins for South, West & Canada region will be included with Open Gross Margin; no expected generation, hedge %, EREP or reference prices provided for this region
(2) MtM of hedges provided directly for the five larger regions; MtM of hedges is not provided directly at the regional level but can be easily estimated using EREP, reference price and hedged MWh
(3) Proprietary trading gross margins will generally remain within "Non Power" New Business category and only move to "Non Power" Executed category upon management discretion
(4) Gross margin for these businesses are net of direct "cost of sales"
(5) Margins for South, West & Canada regions and optimization of fuel and PPA activities captured in Open Gross Margin

Exelon.

Effective Realized Energy Price ($/MWh)[4]			
Midwest	$29.00	$29.00	$30.00
Mid-Atlantic[2,6]	$38.00	$38.50	$39.50
ERCOT[5]	$0.00	$2.00	$1.00
New York[2,6]	$35.50	$31.50	$29.00
New England[5]	$5.50	$4.00	$10.00

(1) Expected generation is the volume of energy that best represents our commodity position in energy markets from owned or contracted for capacity based upon a simulated dispatch model that makes assumptions regarding future market conditions, which are calibrated to market quotes for power, fuel, load following products, and options. Expected generation assumes 14 refueling outages in 2018, 11 in 2019, and 14 in 2020 at Exelon-operated nuclear plants and Salem. Expected generation assumes capacity factors of 93.9%, 94.9% and 93.9% in 2018, 2019, and 2020, respectively at Exelon-operated nuclear plants, at ownership. These estimates of expected generation in 2019 and 2020 do not represent guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years.

(2) Excludes EDF's equity ownership share of CENG Joint Venture

(3) Percent of expected generation hedged is the amount of equivalent sales divided by expected generation. Includes all hedging products, such as wholesale and retail sales of power, options and swaps.

(4) Effective realized energy price is representative of an all-in hedged price, on a per MWh basis, at which expected generation has been hedged. It is developed by considering the energy revenues and costs associated with our hedges and by considering the fossil fuel that has been purchased to lock in margin. It excludes uranium costs, RPM capacity and ZEC revenues, but includes the mark-to-market value of capacity contracted at prices other than RPM clearing prices including our load obligations. It can be compared with the reference prices used to calculate open gross margin in order to determine the mark-to-market value of Exelon Generation's energy hedges.

(5) Spark spreads shown for ERCOT and New England

(6) Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.

SI-SSA-0015-01954

ExGen Hedged Gross Margin* Sensitivities

Gross Margin* Sensitivities (with existing hedges)[1]	2018	2019	2020
Henry Hub Natural Gas ($/MMBtu)			
+ $1/MMBtu	$95	$385	$635
- $1/MMBtu	$(70)	$(360)	$(595)
NiHub ATC Energy Price			
+ $5/MWh	$40	$190	$330

- $5/MWh	-	$(20)	$(45)
Nuclear Capacity Factor			
+/- 1%	+/- $30	+/- $35	+/- $35

(1) Based on March 31, 2018, market conditions and hedged position; gas price sensitivities are based on an assumed gas-power relationship derived from an internal model that is updated periodically; power price sensitivities are derived by adjusting the power price assumption while keeping all other price inputs constant; due to correlation of the various assumptions, the hedged gross margin impact calculated by aggregating individual sensitivities may not be equal to the hedged gross margin impact calculated when correlations between the various assumptions are also considered; sensitivities based on commodity exposure which includes open generation and all committed transactions; excludes EDF's equity share of CENG Joint Venture

SI-SSA-0015-01955

ExGen Hedged Gross Margin* Upside/Risk

(1) Represents an approximate range of expected gross margin, taking into account hedges in place, between the 5th and 95th percent confidence levels assuming all unhedged supply is sold into the spot market; approximate gross margin ranges are based upon an internal simulation model and are subject to change based upon market inputs, future transactions and potential modeling changes; these ranges of approximate gross margin in 2019 and 2020 do not represent earnings guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years; the price distributions that generate this range are calibrated to market quotes for power, fuel, load following products, and options as of March 31, 2018. Gross Margin Upside/Risk based on commodity exposure which includes open generation and all committed transactions. Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.

SI-SSA-0015-01956

Additional ExGen Modeling Data

Total Gross Margin Reconciliation (in $M)[1]	2018	2019	2020
Revenue Net of Purchased Power and Fuel Expense*[2,3]	**$8,525**	**$8,025**	**$7,700**
Other Revenues[4]	$(200)	$(175)	$(200)
Direct cost of sales incurred to generate revenues for certain Constellation and Power businesses	$(275)	$(300)	$(250)
Total Gross Margin* (Non-GAAP)	**$8,050**	**$7,550**	**$7,250**

Key ExGen Modeling Inputs (in $M)[1,5]	2018
Other[6]	$150
Adjusted O&M*	$(4,550)
Taxes Other Than Income (TOTI)[7]	$(375)
Depreciation & Amortization*[8]	$(1,125)
Interest Expense	$(400)
Effective Tax Rate	**22.0%**

(1) All amounts rounded to the nearest $25M
(2) ExGen does not forecast the GAAP components of RNF separately, as to do so would be unduly burdensome. RNF also includes the RNF of our proportionate ownership share of CENG.
(3) Excludes the Mark-to-Market impact of economic hedging activities due to the volatility and unpredictability of the future changes to power prices
(4) Other Revenues reflects primarily revenues from JExel Nuclear JV, variable interest entities, funds collected through revenues for decommissioning the former PECO nuclear plants through regulated rates, and gross receipts tax revenues
(5) ExGen amounts for O&M, TOTI, Depreciation & Amortization; excludes EDF's equity ownership share of the CENG Joint Venture
(6) Other reflects Other Revenues excluding gross receipts tax revenues, includes nuclear decommissioning trust fund earnings from unregulated sites, and includes the minority interest in ExGen Renewables JV and Bloom
(7) TOTI excludes gross receipts tax of $125M
(8) 2019 Depreciation & Amortization is flat to 2018 and 2020 is favorable $50M due to nuclear plant retirements

SI-SSA-0015-01959

Projected GAAP to Operating Adjustments

- **Exelon's projected 2018 adjusted (non-GAAP) operating earnings excludes the earnings effects of the following:**
  - Mark-to-market adjustments from economic hedging activities
  - Unrealized gains and losses from NDT fund investments to the extent not offset by contractual accounting as described in the notes to the consolidated financial statements
  - Certain merger and integration costs
  - Certain costs related to plant retirements
  - Costs incurred related to a cost management program
  - Generation's noncontrolling interest, primarily related to CENG exclusion items
  - One-time impacts of adopting new accounting standards
  - Other unusual items

Cautionary Statements Regarding Forward-Looking Information

This presentation contains certain forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995, that are subject to risks and uncertainties. The factors that could cause actual results to differ materially from the forward-looking statements made by Exelon Corporation, Exelon Generation Company, LLC, Commonwealth Edison Company, PECO Energy Company, Baltimore Gas and Electric Company, Pepco Holdings LLC, Potomac Electric Power Company, Delmarva Power & Light Company, and Atlantic City Electric Company (Registrants) include those factors discussed herein, as well as the items discussed in (1) Exelon's 2017 Annual Report on Form 10-K in (a) ITEM 1A. Risk Factors, (b) ITEM 7. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) ITEM 8. Financial Statements and Supplementary Data: Note 23, Commitments and Contingencies; (2) Exelon's First Quarter 2018 Quarterly Report on Form 10-Q in (a) Part II, Other Information, ITEM 1A. Risk Factors; (b) Part 1, Financial Information, ITEM 2. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) Part I, Financial Information, ITEM 1. Financial Statements: Note 17; and (2) other factors discussed in filings with the SEC by the Registrants. Readers are cautioned not to place undue reliance on these forward-looking statements, which apply only as of the date of this press release. None of the Registrants undertakes any obligation to publicly release any revision to its forward-looking statements to reflect events or circumstances after the date of this presentation.

Non-GAAP Financial Measures

Exelon reports its financial results in accordance with accounting principles generally accepted in the United States (GAAP). Exelon supplements the reporting of financial information determined in accordance with GAAP with certain non-GAAP financial measures, including:

- ***Adjusted operating earnings*** exclude certain costs, expenses, gains and losses and other specified items, including mark-to-market adjustments from economic hedging activities, unrealized gains and losses from nuclear decommissioning trust fund investments, merger and integration related costs, impairments of certain long-lived assets, certain amounts associated with plant retirements and divestitures, costs related to a cost management program and other items as set forth in the reconciliation in the Appendix
- ***Adjusted operating and maintenance expense*** excludes regulatory operating and maintenance costs for the utility businesses and direct cost of sales for certain Constellation and Power businesses, decommissioning costs that do not affect profit and loss, the impact from operating and maintenance expense related to variable interest entities at Generation, EDF's ownership of O&M expenses, and other items as set forth in the reconciliation in the Appendix
- ***Total gross margin*** is defined as operating revenues less purchased power and fuel expense, excluding revenue related to decommissioning, gross receipts tax, JExel Nuclear JV, variable interest entities, and net of direct cost of sales for certain Constellation and Power businesses
- ***Adjusted cash flow from operations*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding capital expenditures, net merger and acquisitions, and equity investments
- ***Free cash flow*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding certain capital expenditures, net merger and acquisitions, and equity investments
- ***Operating ROE*** is calculated using operating net income divided by average equity for the period. The operating income reflects all lines of business for the utility business (Electric Distribution, Gas Distribution, Transmission).
- ***EBITDA*** is defined as earnings before interest, taxes, depreciation and amortization. Includes nuclear fuel amortization expense.
- ***Revenue net of purchased power and fuel expense*** is calculated as the GAAP measure of operating revenue less the GAAP measure of purchased power and fuel expense

Due to the forward-looking nature of some forecasted non-GAAP measures, information to reconcile the forecasted adjusted (non-GAAP) measures to the most directly comparable GAAP measure may not be currently available, as management is unable to project all of these items for future periods

SI-SSA-0015-01969

Non-GAAP Financial Measures Continued

This information is intended to enhance an investor's overall understanding of period over period financial results and provide an indication of Exelon's baseline operating performance by excluding items that are considered by management to be not directly related to the ongoing operations of the business. In addition, this information is among the primary indicators management uses as a basis for evaluating performance, allocating resources, setting incentive compensation targets and planning and forecasting of future periods.

These non-GAAP financial measures are not a presentation defined under GAAP and may not be comparable to other companies' presentation. Exelon has provided these non-GAAP financial measures as supplemental information and in addition to the financial measures that are calculated and presented in accordance with GAAP. These non-GAAP measures should not be deemed more useful than, a substitute for, or an alternative to the most comparable GAAP measures provided in the materials presented.

Non-GAAP financial measures are identified by the phrase "non-GAAP" or an asterisk. Reconciliations of these non-GAAP measures to the most comparable GAAP measures are provided in the appendices and attachments to this presentation, except for the reconciliation for total gross margin, which appears on slide 44 of this presentation.

SI-SSA-0015-01971

The Exelon Value Proposition

- **Regulated Utility Growth** with utility EPS rising 6-8% annually from 2017-2021 and rate base growth of 7.4%, representing an expanding majority of earnings
- **ExGen's strong free cash generation** will support utility growth while also reducing debt by ~$3B over the next 4 years
- **Optimizing ExGen value by:**
  - Seeking fair compensation for the zero-carbon attributes of our fleet;
  - Closing uneconomic plants;
  - Monetizing assets; and,
  - Maximizing the value of the fleet through our generation to load matching strategy
- **Strong balance sheet is a priority** with all businesses comfortably meeting investment grade credit metrics through the 2021 planning horizon
- **Capital allocation priorities targeting**:
  - Organic utility growth;
  - Return of capital to shareholders with 5% annual dividend growth through 2020[1],
  - Debt reduction; and,
  - Modest contracted generation investments

(1) Quarterly dividends are subject to declaration by the board of directors

SI-SSA-0015-01972

2018 Business Priorities and Commitments

- Maintain industry leading operational excellence
- Effectively deploy ~$5.4B of 2018 utility capex
- Advance PJM power price formation changes in 2018
- Prevail on legal challenges to the NY and IL ZEC programs
- Seek fair compensation for at-risk plants in NJ and PA
- Grow dividend at 5% rate
- Continued commitment to corporate responsibility

Best in Class at ExGen and Constellation

Exelon Generation Operational Metrics

- Continued best in class performance across our Nuclear fleet:
  - Capacity factor for Exelon owned and operated units was 94.1%[1]
  - This was the second consecutive year over 94% and the fourth out of the last five years topping 94%
  - Most nuclear power ever generated at 157 TWhs[2]
  - 2017 average refueling outage duration of 23 days, just over the Exelon record of 22 days set in 2016
- Strong performance across our Fossil and Renewable fleet:
  - Renewables energy capture: 95.8%
  - Power dispatch match: 98.8%

Constellation Metrics

- 74% retail power customer renewal rate
- 24% power new customer win rate
- 90% natural gas customer retention rate
- 25 month average power contract term
- Average customer duration of more than 5 years
- Stable Retail Margins

Note: Statistics represent full year 2017 results
(1) 2017 capacity factor includes FitzPatrick for the Exelon period of ownership and operation (March 31 to December 31, 2017) and excludes impacts of Salem
(2) Reflects generation output at ownership

SI-SSA-0015-01984

Power New Business / To Go	$350	$650	$850	$(200)	$(100)	$(50)
Non-Power Margins Executed	$300	$150	$100	$100	$50	-
Non-Power New Business / To Go	$200	$350	$400	$(100)	$(50)	-
Total Gross Margin*[4,5]	**$8,050**	**$7,550**	**$7,250**	**-**	**-**	**-**

Recent Developments

- Open Gross Margin is up in all years due to strengthening ERCOT spark spreads, partly offset by lower NiHub prices
- Mark-to-Market of Hedges is down in all years due to higher prices, mostly offset by the execution of Power New Business
- Executed $200M and $100M of Power New Business in 2018 and 2019, respectively
- Behind ratable hedging position reflects the upside we see in power prices
  - ~8-11% behind ratable in 2019 when considering cross commodity hedges

Note: Data as of March 31, 2018 – These disclosures were presented on May 2, 2018 and are not being updated at this time
(1) Gross margin categories rounded to nearest $50M
(2) Excludes EDF's equity ownership share of the CENG Joint Venture
(3) Mark-to-Market of Hedges assumes mid-point of hedge percentages
(4) Based on March 31, 2018, market conditions
(5) Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.
(6) 2018 includes $150M of IL ZEC revenues associated with 2017 production

Exelon.

SI-SSA-0015-01985

Driving Costs and Capital Out of the Generation Business

Adjusted O&M* ($M)[1,2]

Capital Expenditures ($M)[1,3,4]

Cost optimization programs and planned nuclear plant closures drive lower total O&M

(1) All amounts rounded to the nearest $25M
(2) O&M and Capital Expenditures reflect removal of Oyster Creek and TMI in 2018 and 2019, respectively, and is adjusted for retaining Handley Generating Station
(3) Capital spend represents cash CapEx with CENG at 100% and excludes merger commitments
(4) 2018E growth capital expenditures reflects a ~$175M shift of cash outlay from 2017A to 2018E related to timing of payments for the CCGT projects in Texas

Exelon.

SI-SSA-0015-01986

Historical Nuclear Capital Investment

Nuclear Non-Fuel Capital Expenditures[1] ($M)

Nuclear Capacity Factor[5]

Significant historical investments have mitigated asset management issues and prepared sites for license extensions already received, reducing future capital needs. In addition, internal cost initiatives have found more cost efficient solutions to large CapEx spend, such as leveraging reverse engineering replacements rather than large system wide modifications, resulting in baseline CAGR of -0.8%, even with net addition of 2 sites.

(1) Reflects accrual capital expenditures with CENG at 50% ownership. Assumes Oyster Creek and TMI retirements in October 2018 and September 2019, respectively. All numbers rounded to $25M.
(2) Baseline includes ownership share of Salem all years. CENG is included at ownership share starting in 2014 (full year)
(3) FitzPatrick included starting in 2017 (9 months only)
(4) Growth represents capital that increases the capacity of the units (e.g., turbine upgrades, power uprates), and capital that extends the license of a site (e.g., License Renewals)
(5) Includes CENG beginning in April 2014 and FitzPatrick beginning in April of 2017, excludes Salem and Fort Calhoun
(6) 2017 industry average excluding Exelon was not available at time of publication

ZEC & Policy Updates

New Jersey ZEC

- On April 12, 2018, the NJ ZEC bill passed both the Senate and Assembly with bipartisan support
- Governor Murphy signed the bill on May 23rd
- With the Governor's signature, the BPU will begin the process of implementing the bill, including approving utility tariffs, developing a selection methodology, and reviewing applications for participation in the program
- Implementation of the program is scheduled to be completed around the end of Q1 2019

Illinois & New York ZEC Legal Challenges

Illinois:

- Oral arguments for the 7th Circuit occurred on January 3, 2018 – Judge requested supplemental briefings from parties
- Supplemental briefings were filed on January 26, 2018
- Court issued order on February 21, 2018, inviting the U.S. Government to provide its views
- U.S. Solicitor General responded in support of the case on May 29

New York:

- Oral arguments for the 2nd Circuit occurred on March 12, 2018
- No outstanding items following oral arguments
- Currently awaiting court decision

PJM Price Formation

Fast Start:

- Fast start NOPR was initiated by FERC (docket # EL18-34) and has now been fully briefed
- FERC has committed to providing a decision in September
  - If FERC approves by September, PJM believes it could implement the changes for the 2018/2019 winter

Baseload:

- PJM is in the midst of a stakeholder process scheduled to conclude in the 3rd quarter
- After completing the stakeholder process and receiving FERC's decision on the fast start docket, PJM will announce its process for moving forward

Impacts from Tax Reform

Tax Impacts

	2018	2019	2020	2021
Cumulative Incremental Rate Base from Tax Policy Changes	$0.9	$1.4	$1.7	$2.0
ExGen Effective Tax Rate	22%	22%	22%	21%
Consolidated Effective Tax Rate	18%	19%	20%	20%
Consolidated Cash Tax Rate	1%	4%	3%	3%

Key Takeaways

- Changes in federal tax policy are expected to increase run-rate EPS by $0.10 per share in 2019
- Utility rate base is expected to be $1.7B higher in 2020 than prior disclosures
- Generation cash flows will benefit from a lower tax rate and full expensing of capital with an effective tax rate of 22% in 2018-2020, and 21% in 2021
- Projected Exelon FFO/Debt is largely unchanged with ExGen metrics stronger and modest deterioration at the six regulated utilities, which remain at or above rating agency thresholds

2018 ExGen S&P FFO/Debt %*

Reflects the increased free cash flow* as a result of tax rates decreasing to 22% from an expected 33% in 2018

2018 Exelon S&P FFO/Debt %*(1,2)

Impact of tax reform on Exelon's metrics is largely neutral given offsetting impacts between ExGen and utilities

(1) Due to ring-fencing, S&P deconsolidates BGE from Exelon and analyzes solely as an equity investment
(2) Exelon Corp downgrade threshold (red dotted line) is based on the S&P Exelon Corp Summary Report; represents minimum level to maintain current Issuer Credit Rating of BBB at Exelon Corp

Exelon.

SI-SSA-0015-01993

Tax Reform Yields Significant Customer Bill Savings

DPL

- MD PSC accepted DPL's proposal to provide **$14M** in annual tax savings to customers
  - $3.86 decrease on the average residential monthly bill
- DPL has filed plans with DE PSC to provide **$26M** in annual tax savings to customers
  - $2.99 and $4.77 decrease on the average residential monthly bill for Electric and Gas, respectively

ACE

- ACE has filed a request with NJ BPU to provide **$23M** in annual tax savings to customers; expected to be approved by July
  - $2.37 savings on residential monthly bills

ComEd

- ICC approved ComEd's petition seeking approval to pass along approximately **$201M** in annual tax savings to customers
  - ~$3.00 decrease on the average residential monthly bill

Pepco

- Pepco has filed a request with the DC & MD PSC to provide **$70M** in annual tax savings to customers
- Pepco has filed settlements which include these savings as adjusted in its proposals to the commission

BGE

- MD PSC accepted BGE's proposal to provide approximately **$103M** in annual tax savings to customers
  - $2.91 decrease on the average residential monthly electric bill
  - $5.41 decrease on the average residential combined natural gas and electric bill

PECO

- Approximately **$72M** in annual tax savings to customers

Utility customers across our jurisdictions will benefit from tax reform, saving over $500M annually through planned and approved bill adjustments

Note: Currently includes only distribution-related customer savings amounts

Maintaining Strong Investment Grade Credit Ratings is a Top Financial Priority

Exelon S&P FFO/Debt %*[1,4]

ExGen Debt/EBITDA Ratio*[5]

Credit Ratings by Operating Company

Current Ratings [2,3]	ExCorp	ExGen	ComEd	PECO	BGE	ACE	DPL	Pepco
Moody's	Baa2	Baa2	A1	Aa3	A3	A3	A2	A2
S&P	BBB-	BBB	A-	A-	A-	A	A	A
Fitch	BBB	BBB	A	A	A-	A-	A	A-

(1) Due to ring-fencing, S&P deconsolidates BGE from Exelon and analyzes solely as an equity investment
(2) Current senior unsecured ratings as of May 2, 2018, for Exelon, Exelon Generation and BGE and senior secured ratings for ComEd, PECO, ACE, DPL, and Pepco
(3) All ratings have a "Stable" outlook, with the exception of ACE, which is on "Positive" outlook for Moody's
(4) Exelon Corp downgrade threshold (red dotted line) is based on the S&P Exelon Corp Summary Report; represents minimum level to maintain current Issuer Credit Rating at Exelon Corp
(5) Reflects net book debt (YE debt less cash on hand) / adjusted operating EBITDA*

SI-SSA-0015-01995

Raising Dividend Growth Rate to 5% Annually through 2020

Dividends per Share[1]

Assuming a steady 70% payout ratio on Utility less HoldCo earnings, ExGen's contribution to the Exelon dividend represents a modest payout on earnings and free cash flow

(1) Quarterly dividends are subject to declaration by the board of directors
(2) Total projected Dividend per Share (DPS) figures are illustrative of a 5% growth annually applied to the 2017 dividend. Implied Exelon Utilities contribution is based on a 70% payout on the midpoint of the EPS guidance band for Exelon Utilities less HoldCo. Implied ExGen contribution is based on the remaining balance between the illustrative total annual DPS and the Implied Exelon Utilities contribution.

SI-SSA-0015-01996

2017 Exelon Recognition and Partnerships

Sustainability

Dow Jones Sustainability Index
Exelon named to Dow Jones Sustainability Index for 12th consecutive year

Newsweek Magazine's Green Rankings
Newsweek Magazine's Green Rankings recognized our leadership in sustainability, where we ranked third among utilities, No. 12 in the U.S. 500 and 24th among the Global 500

Carbon Reduction
A recent U.S. Environmental Protection Agency report noted Exelon's generation fleet had the lowest rate of emissions among the 20 largest public or privately held energy producers. Fortune also recognized Exelon as the second-lowest carbon emitter of all Fortune 100 companies

Land for People Award
Received the Trust for Public Land's national "Land for People Award" in recognition of Exelon's deep support of environmental stewardship, creating new parks and promoting conservation

Corporate & Foundation Giving

$52.1 million
Last year, Exelon and its employees set all-time records, committing more than $52.1 million to non-profit organizations and volunteering more than 210,000 hours

Civic 50
Exelon was named for the first time to the Civic 50, recognizing the most community-minded companies by Points of Light, the world's largest organization dedicated to volunteer service

Corporate Recognition

2017 Laurie D. Zelon Pro Bono Award
For exemplary pro bono service and leadership

Kids in Need of Defense Innovation Award
Exelon's legal department and the Baltimore chapter of Organization of Latinos at Exelon (OLE) for their work with unaccompanied minors from Central America

Diversity & Inclusion

HeforShe
Exelon joined U.N. Women's HeForShe campaign, which is focused on gender equality. Pledge includes a $3 million commitment to develop new STEM programs for girls and young women and improving the retention of women at Exelon by 2020

Billion Dollar Roundtable
Exelon became the first energy company to join the Billion Dollar Roundtable, an organization that promotes supplier diversity for corporations achieving $1 billion or more in annual direct spending with minority and women-owned businesses

CEO Action for Diversity & Inclusion
Exelon joined 150 leading companies for the CEO Action for Diversity & Inclusion™ , the largest CEO-driven commitment aimed at taking action to cultivate a workplace where diverse perspectives and experiences are welcomed and respected

Workforce

DiversityInc Top 50
DiversityInc. named Exelon as one of the Top 50 companies for excellence in diversity.

Indeed.com "50 Best Places to Work"
Indeed.com ranked Exelon No. 18 on its "50 Best Places to Work."

Human Rights Campaign "Best Places to Work" For the third consecutive year, HRC's Corporate Equality Index gave Exelon a perfect rating on its best places to work for LGBTQ

2017 U.S. Veterans Magazine's "Best of the Best"
Most veteran-friendly companies

Historically Black Engineering Schools
Top Supporter recognition for five consecutive years

Ending Cash Balance*[2]									**2,025**

(1) All amounts rounded to the nearest $25M. Figures may not add due to rounding.

(2) Gross of posted counterparty collateral

(3) Figures reflect cash CapEx and CENG fleet at 100%

(4) Other Financing primarily includes expected changes in money pool borrowings, tax sharing from the parent, debt issue costs, tax equity cash flows, capital leases, and renewable JV distributions

(5) Financing cash flow excludes intercompany dividends and other intercompany financing activities

(6) ExGen Growth CapEx primarily includes Texas CCGTs, W. Medway, and Retail Solar

(7) Dividends are subject to declaration by the Board of Directors

(8) Includes cash flow activity from Holding Company, eliminations, and other corporate entities

Consistent and reliable free cash flows

Operational excellence and financial discipline drives free cash flow reliability

- ✓ Generating $6.1B of free cash flow*, including $1.9B at ExGen and $4.1B at the Utilities

Supported by a strong balance sheet

Strong balance sheet enables flexibility to raise and deploy capital for growth

- ✓ $1.4B of long-term debt at the utilities, net of refinancing, to support continued growth

Enable growth & value creation

Creating value for customers, communities and shareholders

- ✓ Investing $5.9B of growth capex, with $5.5B at the Utilities and $0.4B at ExGen

SI-SSA-0015-01999

Exelon Debt Maturity Profile[1]

As of 3/31/18

($M)

LT Debt Balances (as of 3/31/18) [1,2]

BGE	2.6B
ComEd	7.9B
PECO	2.9B
PHI	5.8B
ExGen recourse	6.8B
ExGen non-recourse	2.2B
HoldCo	6.3B
Consolidated	34.5B

Exelon's weighted average LTD maturity is approximately 14 years

(1) Maturity profile excludes non-recourse debt, securitized debt, capital leases, fair value adjustments, unamortized debt issuance costs and unamortized discount/premium
(2) Long-term debt balances reflect Q1 2018 10-Q GAAP financials; ExGen debt includes legacy CEG debt

Exelon.

EPS Sensitivities

		2018	2019	2020
ExGen EPS Impact* (1)	Henry Hub Natural Gas			
	+ $1/MMBtu	$0.15	$0.32	$0.50
	- $1/MMBtu	($0.15)	($0.31)	($0.47)
	NiHub ATC Energy Price			
	+ $5/MWh	$0.06	$0.16	$0.26
	- $5/MWh	($0.05)	($0.16)	($0.26)
	PJM-W ATC Energy Price			
	+ $5/MWh	$0.02	$0.08	$0.13
	- $5/MWh	($0.01)	($0.07)	($0.12)
Interest Rate Sensitivity to +50 BP	ComEd ROE	$0.03	$0.03	$0.04
	Pension Expense	-	$0.03	$0.03
	Cost of Debt	($0.00)	($0.00)	($0.01)
	Share count (millions)	969	972	975
	Exelon Consolidated Effective Tax Rate	18%	19%	20%

(1) Based on December 31, 2017, market conditions and hedged position. Gas price sensitivities are based on an assumed gas-power relationship derived from an internal model that is updated periodically. Power price sensitivities are derived by adjusting the power price assumption while keeping all other price inputs constant. Due to correlation of the various assumptions, the EPS impact calculated by aggregating individual sensitivities may not be equal to the EPS impact calculated when correlations between the various assumptions are also considered.

SI-SSA-0015-02001

Exelon Generation Disclosures

Data as of March 31, 2018
These disclosures were presented on May 2, 2018, and are not being updated at this time

SI-SSA-0015-02002

Portfolio Management Strategy

Strategic Policy Alignment

- Aligns hedging program with financial policies and financial outlook
  - Establish minimum hedge targets to meet financial objectives of the company (dividend, credit rating)
  - Hedge enough commodity risk to meet future cash requirements under a stress scenario

Three-Year Ratable Hedging

- Ensure stability in near-term cash flows and earnings
  - Disciplined approach to hedging
  - Tenor aligns with customer preferences and market liquidity
  - Multiple channels to market that allow us to maximize margins
  - Large open position in outer years to benefit from price upside

Bull / Bear Program

- Ability to exercise fundamental market views to create value within the ratable framework
  - Modified timing of hedges versus purely ratable
  - Cross-commodity hedging (heat rate positions, options, etc.)
  - Delivery locations, regional and zonal spread relationships

Protect Balance Sheet | **Ensure Earnings Stability** | **Create Value**

SI-SSA-0015-02003

Exelon.

Components of Gross Margin Categories

Gross margin linked to power production and sales

Open Gross Margin

- Generation Gross Margin at current market prices, including ancillary revenues, nuclear fuel amortization and fossils fuels expense
- Power Purchase Agreement (PPA) Costs and Revenues
- Provided at a consolidated level for all regions (includes hedged gross margin for South, West and Canada[1])

Capacity and ZEC Revenues

- Expected capacity revenues for generation of electricity
- Expected revenues from Zero Emissions Credits (ZEC)

MtM of Hedges[2]

- Mark-to-Market (MtM) of power, capacity and ancillary hedges, including cross commodity, retail and wholesale load transactions
- Provided directly at a consolidated level for five major regions. Provided indirectly for each of the five major regions via Effective Realized Energy Price (EREP), reference price, hedge %, expected generation.

"Power" New Business

- Retail, Wholesale planned electric sales
- Portfolio Management new business
- Mid marketing new business

Margins move from new business to MtM of hedges over the course of the year as sales are executed[5]

Gross margin from other business activities

"Non Power" Executed

- Retail, Wholesale executed gas sales
- Energy Efficiency[4]
- BGE Home[4]
- Distributed Solar

"Non Power" New Business

- Retail, Wholesale planned gas sales
- Energy Efficiency[4]
- BGE Home[4]
- Distributed Solar
- Portfolio Management / origination fuels new business
- Proprietary trading[3]

Margins move from "Non power new business" to "Non power executed" over the course of the year

(1) Hedged gross margins for South, West & Canada region will be included with Open Gross Margin; no expected generation, hedge %, EREP or reference prices provided for this region
(2) MtM of hedges provided directly for the five larger regions; MtM of hedges is not provided directly at the regional level but can be easily estimated using EREP, reference price and hedged MWh
(3) Proprietary trading gross margins will generally remain within "Non Power" New Business category and only move to "Non Power" Executed category upon management discretion
(4) Gross margin for these businesses are net of direct "cost of sales"
(5) Margins for South, West & Canada regions and optimization of fuel and PPA activities captured in Open Gross Margin

SI-SSA-0015-02004

ExGen Disclosures

Gross Margin Category ($M)[1]	2018	2019	2020
Open Gross Margin (including South, West & Canada hedged GM)[2,5]	$4,600	$3,950	$3,800
Capacity and ZEC Revenues[2,5,6]	$2,300	$2,000	$1,850
Mark-to-Market of Hedges[2,3]	$300	$450	$250

Mid-Atlantic[2,6]	98%-101%	74%-77%	41%-44%
ERCOT	81%-84%	61%-64%	34%-37%
New York[2,6]	99%-102%	73%-76%	39%-42%
New England	81%-84%	32%-35%	39%-42%
Effective Realized Energy Price ($/MWh)[4]			
Midwest	$29.00	$29.00	$30.00
Mid-Atlantic[2,6]	$38.00	$38.50	$39.50
ERCOT[5]	$0.00	$2.00	$1.00
New York[2,6]	$35.50	$31.50	$29.00
New England[5]	$5.50	$4.00	$10.00

(1) Expected generation is the volume of energy that best represents our commodity position in energy markets from owned or contracted for capacity based upon a simulated dispatch model that makes assumptions regarding future market conditions, which are calibrated to market quotes for power, fuel, load following products, and options. Expected generation assumes 14 refueling outages in 2018, 11 in 2019, and 14 in 2020 at Exelon-operated nuclear plants and Salem. Expected generation assumes capacity factors of 93.9%, 94.9% and 93.9% in 2018, 2019, and 2020, respectively at Exelon-operated nuclear plants, at ownership. These estimates of expected generation in 2019 and 2020 do not represent guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years.

(2) Excludes EDF's equity ownership share of CENG Joint Venture

(3) Percent of expected generation hedged is the amount of equivalent sales divided by expected generation. Includes all hedging products, such as wholesale and retail sales of power, options and swaps.

(4) Effective realized energy price is representative of an all-in hedged price, on a per MWh basis, at which expected generation has been hedged. It is developed by considering the energy revenues and costs associated with our hedges and by considering the fossil fuel that has been purchased to lock in margin. It excludes uranium costs, RPM capacity and ZEC revenues, but includes the mark-to-market value of capacity contracted at prices other than RPM clearing prices including our load obligations. It can be compared with the reference prices used to calculate open gross margin in order to determine the mark-to-market value of Exelon Generation's energy hedges.

(5) Spark spreads shown for ERCOT and New England

(6) Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.

SI-SSA-0015-02006

ExGen Hedged Gross Margin* Sensitivities

Gross Margin* Sensitivities (with existing hedges)[1]	2018	2019	2020

- $5/MWh	$(40)	$(185)	$(330)
PJM-W ATC Energy Price			
+ $5/MWh	-	$65	$150
- $5/MWh	$10	$(55)	$(140)
NYPP Zone A ATC Energy Price			
+ $5/MWh	-	$20	$45
- $5/MWh	-	$(20)	$(45)
Nuclear Capacity Factor			
+/- 1%	+/- $30	+/- $35	+/- $35

(1) Based on March 31, 2018, market conditions and hedged position; gas price sensitivities are based on an assumed gas-power relationship derived from an internal model that is updated periodically; power price sensitivities are derived by adjusting the power price assumption while keeping all other price inputs constant; due to correlation of the various assumptions, the hedged gross margin impact calculated by aggregating individual sensitivities may not be equal to the hedged gross margin impact calculated when correlations between the various assumptions are also considered; sensitivities based on commodity exposure which includes open generation and all committed transactions; excludes EDF's equity share of CENG Joint Venture

SI-SSA-0015-02007

ExGen Hedged Gross Margin* Upside/Risk

(1) Represents an approximate range of expected gross margin, taking into account hedges in place, between the 5th and 95th percent confidence levels assuming all unhedged supply is sold into the spot market; approximate gross margin ranges are based upon an internal simulation model and are subject to change based upon market inputs, future transactions and potential modeling changes; these ranges of approximate gross margin in 2019 and 2020 do not represent earnings guidance or a forecast of future results as Exelon has not completed its planning or optimization processes for those years; the price distributions that generate this range are calibrated to market quotes for power, fuel, load following products, and options as of March 31, 2018. Gross Margin Upside/Risk based on commodity exposure which includes open generation and all committed transactions. Reflects Oyster Creek and TMI retirements by October 2018 and September 2019, respectively. 2018, 2019 and 2020 are adjusted for retaining Handley Generating Station.

Exelon.

Additional ExGen Modeling Data

Total Gross Margin Reconciliation (in $M)[1]	2018	2019	2020
Revenue Net of Purchased Power and Fuel Expense*[2,3]	**$8,525**	**$8,025**	**$7,700**
Other Revenues[4]	$(200)	$(175)	$(200)
Direct cost of sales incurred to generate revenues for certain Constellation and Power businesses	$(275)	$(300)	$(250)
Total Gross Margin* (Non-GAAP)	**$8,050**	**$7,550**	**$7,250**

Key ExGen Modeling Inputs (in $M)[1,5]	2018
Other[6]	$150
Adjusted O&M*	$(4,550)
Taxes Other Than Income (TOTI)[7]	$(375)
Depreciation & Amortization*[8]	$(1,125)
Interest Expense	$(400)
Effective Tax Rate	**22.0%**

(1) All amounts rounded to the nearest $25M
(2) ExGen does not forecast the GAAP components of RNF separately, as to do so would be unduly burdensome. RNF also includes the RNF of our proportionate ownership share of CENG.
(3) Excludes the Mark-to-Market impact of economic hedging activities due to the volatility and unpredictability of the future changes to power prices
(4) Other Revenues reflects primarily revenues from JExel Nuclear JV, variable interest entities, funds collected through revenues for decommissioning the former PECO nuclear plants through regulated rates, and gross receipts tax revenues
(5) ExGen amounts for O&M, TOTI, Depreciation & Amortization; excludes EDF's equity ownership share of the CENG Joint Venture
(6) Other reflects Other Revenues excluding gross receipts tax revenues, includes nuclear decommissioning trust fund earnings from unregulated sites, and includes the minority interest in ExGen Renewables JV and Bloom
(7) TOTI excludes gross receipts tax of $125M
(8) 2019 Depreciation & Amortization is flat to 2018 and 2020 is favorable $50M due to nuclear plant retirements

Projected GAAP to Operating Adjustments

- **Exelon's projected 2018 adjusted (non-GAAP) operating earnings excludes the earnings effects of the following:**
  - Mark-to-market adjustments from economic hedging activities
  - Unrealized gains and losses from NDT fund investments to the extent not offset by contractual accounting as described in the notes to the consolidated financial statements
  - Certain merger and integration costs
  - Certain costs related to plant retirements
  - Costs incurred related to a cost management program
  - Generation's noncontrolling interest, primarily related to CENG exclusion items
  - One-time impacts of adopting new accounting standards
  - Other unusual items

Cautionary Statements Regarding Forward-Looking Information

This presentation contains certain forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995, that are subject to risks and uncertainties. The factors that could cause actual results to differ materially from the forward-looking statements made by Exelon Corporation, Exelon Generation Company, LLC, Commonwealth Edison Company, PECO Energy Company, Baltimore Gas and Electric Company, Pepco Holdings LLC, Potomac Electric Power Company, Delmarva Power & Light Company, and Atlantic City Electric Company (Registrants) include those factors discussed herein, as well as the items discussed in (1) Exelon's 2016 Annual Report on Form 10-K in (a) ITEM 1A. Risk Factors, (b) ITEM 7. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) ITEM 8. Financial Statements and Supplementary Data: Note 24, Commitments and Contingencies; (2) Exelon's Third Quarter 2017 Quarterly Report on Form 10-Q in (a) Part II, Other Information, ITEM 1A. Risk Factors; (b) Part 1, Financial Information, ITEM 2. Management's Discussion and Analysis of Financial Condition and Results of Operations and (c) Part I, Financial Information, ITEM 1. Financial Statements: Note 18; and (2) other factors discussed in filings with the SEC by the Registrants. Readers are cautioned not to place undue reliance on these forward-looking statements, which apply only as of the date of this press release. None of the Registrants undertakes any obligation to publicly release any revision to its forward-looking statements to reflect events or circumstances after the date of this presentation.

SI-SSA-0015-02020

Non-GAAP Financial Measures

Exelon reports its financial results in accordance with accounting principles generally accepted in the United States (GAAP). Exelon supplements the reporting of financial information determined in accordance with GAAP with certain non-GAAP financial measures, including:

- ***Adjusted operating earnings*** exclude certain costs, expenses, gains and losses and other specified items, including mark-to-market adjustments from economic hedging activities, unrealized gains and losses from nuclear decommissioning trust fund investments, merger and integration related costs, impairments of certain long-lived assets, certain amounts associated with plant retirements and divestitures, costs related to a cost management program and other items as set forth in the reconciliation in the Appendix
- ***Adjusted operating and maintenance expense*** excludes regulatory operating and maintenance costs for the utility businesses and direct cost of sales for certain Constellation and Power businesses, decommissioning costs that do not affect profit and loss, the impact from operating and maintenance expense related to variable interest entities at Generation, EDF's ownership of O&M expenses, and other items as set forth in the reconciliation in the Appendix
- ***Total gross margin*** is defined as operating revenues less purchased power and fuel expense, excluding revenue related to decommissioning, gross receipts tax, Exelon Nuclear Partners, JExel Nuclear JV, variable interest entities, and net of direct cost of sales for certain Constellation and Power businesses
- ***Adjusted cash flow from operations*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding capital expenditures, net merger and acquisitions, and equity investments
- ***Free cash flow*** primarily includes net cash flows from operating activities and net cash flows from investing activities excluding certain capital expenditures, net merger and acquisitions, and equity investments
- ***Operating ROE*** is calculated using operating net income divided by average equity for the period. The operating income reflects all lines of business for the utility business (Electric Distribution, Gas Distribution, Transmission).
- ***EBITDA*** is defined as earnings before interest, taxes, depreciation and amortization. Includes nuclear fuel amortization expense.
- ***Revenue net of purchased power and fuel expense*** is calculated as the GAAP measure of operating revenue less the GAAP measure of purchased power and fuel expense

Due to the forward-looking nature of some forecasted non-GAAP measures, information to reconcile the forecasted adjusted (non-GAAP) measures to the most directly comparable GAAP measure may not be currently available, as management is unable to project all of these items for future periods

SI-SSA-0015-02021

Non-GAAP Financial Measures Continued

This information is intended to enhance an investor's overall understanding of period over period financial results and provide an indication of Exelon's baseline operating performance by excluding items that are considered by management to be not directly related to the ongoing operations of the business. In addition, this information is among the primary indicators management uses as a basis for evaluating performance, allocating resources, setting incentive compensation targets and planning and forecasting of future periods.

These non-GAAP financial measures are not a presentation defined under GAAP and may not be comparable to other companies' presentation. Exelon has provided these non-GAAP financial measures as supplemental information and in addition to the financial measures that are calculated and presented in accordance with GAAP. These non-GAAP measures should not be deemed more useful than, a substitute for, or an alternative to the most comparable GAAP measures provided in the materials presented.

Non-GAAP financial measures are identified by the phrase "non-GAAP" or an asterisk. Reconciliations of these non-GAAP measures to the most comparable GAAP measures are provided in the appendices and attachments to this presentation, except for the reconciliation for total gross margin, which appears on slide 46 of this presentation.

Exelon: An Industry Leader

$21B
Being invested in utilities through 2021

$52M
In 2017, Exelon gave approx. $52 million to charitable and community causes

#1
zero-carbon energy provider in America

210 TWh
Customer load served

35,200
Megawatts of total power generation capacity

10M
Six utilities serving 10M electric and gas customers, the most in the U.S.

34,600
employees

$33.5B
Operating revenue in 2017

FORTUNE 100
Exelon is a FORTUNE 100 company

2M (Approx.)
Exelon's Constellation business serves residential, public sector and business customers

11,470
transmission line miles for utilities

9.5M
Smart meters installed

Note: All numbers reflect year-end 2017

Exelon.

SI-SSA-0015-02023

The Exelon Value Proposition

- **Regulated Utility Growth** with utility EPS rising 6-8% annually from 2017-2021 and rate base growth of 7.4%, representing an expanding majority of earnings
- **ExGen's strong free cash generation** will support utility growth while also reducing debt by ~$3B over the next 4 years
- **Optimizing ExGen value by:**
  - Seeking fair compensation for the zero-carbon attributes of our fleet;
  - Closing uneconomic plants;
  - Monetizing assets; and,
  - Maximizing the value of the fleet through our generation to load matching strategy
- **Strong balance sheet is a priority** with all businesses comfortably meeting investment grade credit metrics through the 2021 planning horizon
- **Capital allocation priorities targeting**:
  - Organic utility growth;
  - Return of capital to shareholders with 5% annual dividend growth through 2020[1],
  - Debt reduction; and,
  - Modest contracted generation investments

(1) Quarterly dividends are subject to declaration by the board of directors

SI-SSA-0015-02024

2017 Milestones and Accomplishments

Financial

- Delivered FY 2017 GAAP earnings per share of $3.97 and adjusted operating earnings per share* of $2.60, within our guidance range
- Updated dividend policy to 5% growth annually through 2020
- Tax reform legislation will benefit our utility customers through lower bills after committed rate adjustments while our shareholders benefit from additional utility rate base growth and lower tax rates at ExGen
- Expanded cost management program from 3rd quarter 2017 will save an incremental $250M annually by 2020
- Effective capital deployment at ExGen:
  - Creation of Renewables JV with Hancock
  - ExGen Renewables IV project financing
  - Exit of EGTP portfolio

Operational

- Utilities performed largely at first quartile levels with especially strong results across key metrics:
  - BGE, ComEd and PECO achieved 1st decile performance in the System Average Interruption Frequency Index (SAIFI)
  - BGE and ComEd achieved 1st decile performance in the Customer Average Interruption Duration Index (CAIDI)
  - PHI achieved best ever performance on SAIFI and CAIDI
- Invested $5.3B of capital into our utilities to improve reliability, replace aging infrastructure, and enhance customer experience
- Total Exelon utilities collectively earned 9.5% ROE in 2017, the mid-point of our long-term range
- Achieved 94.1%(1) nuclear capacity factor, producing a record 157 TWhs of nuclear generation

Regulatory & Policy

- Successful dismissal of legal challenges of NY and IL ZEC programs in federal district court; appeals process is ongoing
- FERC recognized need to better understand the status of resilience of system. Created "Grid Resilience in Regional Transmission Organizations and Independent System Operators" order to seek input from RTOs on how market rules may need to be changed
- Completed distribution rate cases providing $283M in revenue increases and another $114M of rate increases for FERC transmission assets

Employees & Community

- 2017 awards and recognitions include: Billion Dollar Roundtable, Civic 50, Top 50 Companies for Diversity, Best Places to Work in 2017, CEO Action for Diversity & Inclusion, and UN's HeForShe
- Exelon and our employees set a new record in corporate philanthropy and volunteerism, committing over $52M in giving and volunteering 210,000 hours
- Recognized by Dow Jones Sustainability Index for 12th consecutive year and by NewsWeek Green rankings for 9th consecutive year
- 2,200 employees, contractors and support personnel from Exelon's six utilities mobilized to assist residents in the southeastern U.S. impacted by Hurricane Irma

(1) Capacity factor excludes impacts of Salem

Best in Class at ExGen and Constellation

Exelon Generation Operational Metrics

- Continued best in class performance across our Nuclear fleet:
  - Capacity factor for Exelon owned and operated units was 94.1%(1)
  - This was the second consecutive year over 94% and the fourth out of the last five years topping 94%
  - Most nuclear power ever generated at 157 TWhs(2)
  - 2017 average refueling outage duration of 23 days, just over the Exelon record of 22 days set in 2016
- Strong performance across our Fossil and Renewable fleet:
  - Renewables energy capture: 95.8%
  - Power dispatch match: 98.8%

Constellation Metrics

- 74% retail power customer renewal rate
- 24% power new customer win rate
- 90% natural gas customer retention rate
- 25 month average power contract term
- Average customer duration of more than 5 years
- Stable Retail Margins

Note: Statistics represent full year 2017 results
(1) 2017 capacity factor includes FitzPatrick for the Exelon period of ownership and operation (March 31 to December 31, 2017) and excludes impacts of Salem
(2) Reflects generation output at ownership

Exelon Generation: Gross Margin Update

	December 31, 2017			Change from September 30, 2017	
Gross Margin Category ($M)[1]	**2018**	**2019**	**2020**	**2018**	**2019**
Open Gross Margin[2,5] (including South, West, Canada hedged gross margin)	$4,350	$3,900	$3,750	$450	$200
Capacity and ZEC Revenues[2,5,6]	$2,300	$2,000	$1,850	-	-
Mark-to-Market of Hedges[2,3]	$350	$400	$250	$(300)	$(50)
Power New Business / To Go	$550	$750	$900	$(150)	$(100)
Non-Power Margins Executed	$200	$100	$100	-	-
Non-Power New Business / To Go	$300	$400	$400	-	-
Total Gross Margin*[4,5]	**$8,050**	**$7,550**	**$7,250**	**-**	**$50**

Recent Developments

- In 2018, Total Gross Margin is flat compared to September 30, 2017, with the retention of Handley Generating Station adding $50M, offset by the early retirement of Oyster Creek which lowers Gross Margin by $50M
- In 2019, Total Gross Margin is up $150M on a combination of higher power prices, strengthening ERCOT spark spreads, and additional generation from Handley, partly offset by early retirement of Oyster Creek which lowers Gross Margin by $100M
