PSEG ANNOUNCES 2014 RESULTS

$2.99 NET INCOME PER SHARE

Operating Earnings of $2.76 Per Share Exceeds Guidance of $2.60 - $2.75 Per Share

Company Provides 2015 Guidance of $2.75 - $2.95 Per Share

(February 20, 2015 – Newark, NJ) Public Service Enterprise Group (PSEG) reported today 2014 Net Income of $1,518 million or $2.99 per share as compared to Net Income of $1,243 million, or $2.45 per share for 2013. Operating Earnings for the year 2014 were $1,400 million or $2.76 per share compared to 2013 Operating Earnings of $1,309 million or $2.58 per share.

PSEG also reported Net Income for the fourth quarter of 2014 of $476 million, or $0.94 per share. This compares to fourth quarter 2013 Net Income of $200 million, or $0.39 per share. Operating Earnings for the fourth quarter of 2014 were $247 million, or $0.49 per share compared to fourth quarter 2013 Operating Earnings of $248 million, or $0.49 per share.

"We are delighted with our results. Our strategy has transformed our business mix and resulted in continued growth in earnings. PSEG reported operating earnings for 2014 above the upper end of guidance," said Ralph Izzo, chairman, president and chief executive officer. "Our financial performance is a direct result from disciplined capital allocation. We are seeing the benefits of an expanded capital program contributing to double-digit earnings growth from our regulated company, PSE&G, which has grown to represent 52% of 2014's operating earnings while Power's successful management of its gas supply arrangements supported better than anticipated earnings. Our utility customers have benefited from improvements in reliability and our ability to pass along savings in gas costs. Our Board's recent decision to meaningfully increase the common dividend by 5.4% to the indicative annual level of $1.56 per share is an expression of confidence in our outlook, the continued growth of our utility and an acknowledgment of our strong financial position."

PSEG believes that the non-GAAP financial measure of "Operating Earnings" provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends. Operating Earnings exclude the impact of gains/(losses) associated with Nuclear Decommissioning Trust (NDT) investments and Mark-To-Market (MTM) accounting as well as other material one-time items. The table below provides a reconciliation of PSEG's Net Income to Operating Earnings (a non-GAAP measure) for the full year and fourth quarter. See Attachment 12 for a complete list of items excluded from Net Income in the determination of Operating Earnings.

"Our core strategy – focused on operational excellence, financial strength and disciplined investment – is expected to yield a third year of growth in operating earnings over the coming year." Izzo continued, "For 2015, we are initiating Operating Earnings guidance of $2.75 - $2.95 per share. The hard work and dedication of the men and women of PSEG have been a major factor in our success and provide me with confidence in our ability to achieve our goals."

The following table outlines PSEG's 2014 operating earnings by subsidiary and expectations for 2015.

E = Estimate

Operating Earnings Review and Outlook by Operating Subsidiary

See Attachments 6 and 7 for detail regarding the quarter-over-quarter and year-over-year earnings reconciliations for each of PSEG's businesses.

PSE&G

PSE&G reported operating earnings of $160 million ($0.32 per share) for the fourth quarter bringing full year operating earnings to $725 million ($1.43 per share). On a comparative basis, PSE&G reported operating earnings of $144 million ($0.29 per share) and $612 million ($1.21 per share) for the fourth quarter and full year 2013, respectively.

PSE&G's earnings in the fourth quarter benefited from a reduction in operating expenses and a return on its expanded infrastructure capital program which more than offset the impact of mild weather on sales. PSE&G's successful management of its investment program allowed it to earn its authorized return for the full year as it maintained its focus on satisfying the needs of customers.

PSE&G's investment in transmission infrastructure increased quarter-over-quarter earnings by $0.02 per share. The transmission earnings improvement in the fourth quarter was less than the increase experienced during the first three quarters of the year, and reflects the impact on rate base from an expansion of bonus depreciation at the end of the year. Tight control of operating expenses and lower pension costs together resulted in a quarter-over-quarter increase in earnings of $0.04 per share. A continued improvement in gas volume and demand – which improved quarter-over-quarter earnings by $0.01 per share – was offset by a similar decline in electric volume and demand. Weather, which was mild relative to conditions experienced in the prior year, reduced earnings comparisons by $0.01 per share. Earnings were reduced by $0.02 per share due to the absence of a tax-related change which benefited earnings in the prior year's fourth quarter.

Economic conditions continue to exhibit signs of improvement in the service area. On a weather-normalized basis, gas deliveries are estimated to have increased 1% in the quarter and 3.1% for the year. Demand continues to benefit not only from the improvement in the economy and but also from lower commodity prices. On a weather-normalized basis, electric sales are estimated to have declined by 2.3% in the fourth quarter and increased by 0.3% for the year. The decline in the quarter is impacted by a number of winter storms at the end of 2013 that increased residential consumption, and decreases in demand this quarter from large customers. The increase for the year is indicative of improving economic conditions partially offset by continued customer conservation.

PSE&G announced that it would provide its residential gas customers with a credit against their bill for the months of February and March. The credit is an extension of the bill credits PSE&G provided its residential customers for gas usage in November, December and January. With these credits, a typical residential customer would experience savings on their bill over the five months of approximately $210, or about 31%.

An increase in revenue of $182 million under PSE&G's transmission formula rate went into effect on January 1, 2015. The increase in revenue will provide PSE&G with recovery of and a return on its forecast of transmission related capital expenditures through the year. Each year, transmission revenues are adjusted to reflect an update of data that was estimated in the formula rate filing. The adjustment for 2015 will include the impact of the extension of bonus

depreciation, which was enacted after the formula rate filing was made, and is estimated to reduce our 2015 revenue increase as filed by approximately $21 million. PSE&G's investment in transmission grew to $4.5 billion at the end of 2014 to represent 39% of the company's consolidated rate base of $11.4 billion.

PSE&G's operating earnings for 2015 are forecast at $735 million - $775 million. Operating earnings will be influenced by an increase in transmission revenues and construction activity associated with the Energy Strong capital program approved in 2014.

PSEG Power

PSEG Power reported operating earnings of $91 million ($0.18 per share) for the fourth quarter of 2014, bringing full year operating earnings to $642 million ($1.27 per share). On a comparative basis, PSEG Power reported operating earnings of $115 million ($0.23 per share) and $710 million ($1.40 per share) for the fourth quarter and full year 2013, respectively.

PSEG Power's operating earnings in the fourth quarter were influenced by the known decline in capacity revenues, lower market prices for energy offset by the monetization of its gas supply position and a reduction in operation and maintenance expense.

A decline in average PJM capacity prices to $166/MW-day from $244/MW-day on June 1, 2014 reduced Power's quarter-over-quarter earnings by $0.09 per share. A decline in the average price received on energy hedges and lower market prices were more than offset by strong margins on gas sales to increase Power's quarter-over-quarter earnings comparisons by $0.01 per share. Operation and maintenance (O&M) expenditures were lower than levels experienced in the year-ago period, which was heavily influenced by outage related work. A decline in O&M improved quarter-over-quarter earnings comparisons by $0.05 per share. Higher levels of depreciation and interest expense along with miscellaneous items combined to reduce quarterly earnings comparisons by $0.02 per share.

Power's output increased 3.1% in the quarter from year-ago levels. For the year, output increased 1.3% to 54.2 TWh. The fleet's flexibility in response to volatile markets was demonstrated in the quarter and throughout the year as 2014's output represented the third highest level in the fleet's history as a merchant producer. The nuclear fleet produced 29.1 TWh (54% of total generation) operating at an average capacity factor during the year of 89.3%. Hope Creek experienced its second best year operating at a 97.9% capacity factor which partially offset the impact of an extended refueling outage at Salem 2. The market is rewarding efficient combined cycle gas units. The gas-fired combined cycle fleet (CCGTs) set a generation record during the year. The fleet produced 16.5 TWh (30% of total generation) during the year with record levels of output from the Bergen Station and Linden 1. The coal fleet produced 7.4 TWh (14% of total generation). The peaking fleet's responsiveness during the abnormally cold weather experienced early in the year led to full year production of 1.2 TWh (2% of total generation).

Power is forecasting an improvement in output for 2015 to 55 – 57 TWh. The improvement – largely at nuclear -- takes into consideration the Peach Bottom uprate and a forecast increase in output at the Salem station. Following completion of the Basic Generation Service auction in New Jersey in early February 2015, Power enters the year with 100% of its baseload generation hedged. Approximately 75% - 80% of anticipated annual production is hedged at an average price of $52 per MWh which compares with average hedge prices in 2014 of $48 per MWh. Power has hedged approximately 50% -- 55% of its forecast generation in 2016 of 55 – 57 TWh

at an average price of $52 per MWh. For 2017, Power has hedged 25% -- 30% of forecast production of 55 – 57 TWh at an average price of $52 per MWh. Power assumes BGS volumes will represent approximately 11.5 TWh in each of 2015 and 2016 – consistent with 2014's deliveries under the BGS contract.

Power's operating earnings for 2015 are forecast at $620 - $680 million. Results for the full year will be affected by a decline in capacity revenues, an increase in the average price received on energy hedges, Power's role as agent for LIPA's generation portfolio, and a modest increase in operation and maintenance expense.

PSEG Enterprise/Other

PSEG Enterprise/Other reported a loss in operating earnings for the fourth quarter of $4 million ($0.01 per share) compared to an operating earnings loss of $11 million ($0.03 per share) for the fourth quarter of 2013. The results for the fourth quarter brought the full year 2014 for PSEG Enterprise/Other to $33 million ($0.06 per share) versus Operating Earnings loss in 2013 of $13 million ($0.03 per share).

The difference in operating results quarter-over-quarter primarily reflects the absence of tax payments and other items in the fourth quarter of 2013. For the year, the operating contract for PSEG Long Island contributed $0.02 per share to earnings, in line with expectations.

For 2015, operating earnings for PSEG Enterprise/Other are forecast to be $40 - $45 million. Results will be influenced by contractual payments associated with the operation of PSEG Long Island, and income on the lease portfolio including the renegotiation and extension of the lease on the Grand Gulf nuclear generating facility.

Forward Looking Statement

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC), including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or the price of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulation, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,

- any deterioration in our credit quality or the credit quality of our counterparties,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- delays or unforeseen cost escalations in our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- increases in competition in energy supply markets as well as for transmission projects,
- any inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies, and
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws. The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

4th Quarter & Year-end 2015

February 19, 2016

SI-SSA-0015-12616

Forward-Looking Statements

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute “forward-looking statements” within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words “anticipate,” “intend,” “estimate,” “believe,” “expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in Item 1A. Risk Factors, Item 7. Management’s Discussion and Analysis of Financial Condition and Results of Operations (MD&A), Item 8. Financial Statements and Supplementary Data—Note 12. Commitments and Contingent Liabilities, and other factors discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or ongoing low pricing of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulations, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators, including prudency reviews and disallowances,
- any deterioration in our credit quality or the credit quality of our counterparties,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations or increase the cost of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- delays or unforeseen cost escalations in our construction and development activities, or the inability to recover the carrying amount of our assets,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- increases in competition in energy supply markets as well as for transmission projects,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies,
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- an extended economic recession,
- an inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce, and
- changes in the credit quality and the ability of lessees to meet their obligations under our domestic leveraged leases.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws. The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-12617

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Operating Earnings exclude gains or losses associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting, and other material one-time items. PSEG presents Operating Earnings because management believes that it is appropriate for investors to consider results excluding these items in addition to the results reported in accordance with GAAP. PSEG believes that the non-GAAP financial measure of Operating Earnings provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends.

PSEG is presenting Adjusted EBITDA because it provides investors with additional information to compare our business performance to other companies and understand performance trends. Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization and major maintenance expense costs at Power's fossil generation facilities. This information is not intended to be viewed as an alternative to GAAP information. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income to reconcile to Operating Earnings and Adjusted EBITDA with a reference to that slide included on each of the slides where the non-GAAP information appears.

These materials and other financial releases can be found on the pseg.com website under the investor tab, or at http://investor.pseg.com/

SI-SSA-0015-12621

PSEG 2015 – A Year of Successful Deployment of Capital and Strong Operating Performance

- **Strong 2015 financial performance – at upper half of guidance**
  - ✓ Operating earnings of $2.91 per share, up 5.4%, the 3rd consecutive year of growth
  - ✓ PSE&G achieved 9% growth in earnings, at the upper end of guidance
  - ✓ PSEG Power's operating earnings in line with guidance

- **Continued operational excellence**
  - ✓ Power generation up 2% for the year led by record CCGT production and solid nuclear performance
  - ✓ PSE&G recognized for the 14th consecutive year as the Mid-Atlantic region's most reliable electric utility; named Electric Light & Power's Utility of the Year for 2015

- **Disciplined capital investment – producing results**
  - ✓ PSEG capital program invested $3.6 billion in 2015 at PSE&G (75%) and Power (25%)
  - ✓ PSEG Power announced $2.0 billion of investment in new, gas fired generation and continuing capacity expansion work at fossil units
  - ✓ PSE&G's GSMP ($905 million over 3 years) approved for gas infrastructure replacement
  - ✓ Energy Strong investments continue ($556 million spent through 2015 of the original $1.22 billion program)
  - ✓ Energy Efficiency II Extension approved (~$95 million)

SI-SSA-0015-12622

PSEG Annual Dividend – Increased 5.1% to $1.64 per share

Continuing an improved rate of growth in the dividend, building on a 109-year history of returning cash to the shareholder

SI-SSA-0015-12632

PSE&G – Q4 Operating Highlights

Operations

- ✓ Q4 weather dominated by warmest December on record; average December temperature of 47.8°F resulted in heating degree days that were 31% below Q4 2014 and normal
- ✓ Low natural gas prices continue to benefit weather normalized gas sales, up 2.1% for Q4 and up 2.2% for full-year 2015
- ✓ Electric sales rose 0.8% in Q4 and 0.5% for the year on a weather adjusted basis, reflecting improved economic conditions in the quarter

Regulatory and Market Environment

- ✓ FERC formula rate revenue increase of $146 million effective January 1, 2016; update for bonus depreciation adjustment would lower revenue by $27 million
- ✓ PSE&G will credit residential gas customers with ~$155 million in BGSS bill credits this winter
- ✓ PSE&G recognized for the 14th year as the Mid-Atlantic region's most reliable electric utility; named Electric Light & Power's Utility of the year for 2015

Financial

- ✓ PSE&G earned its authorized return in 2015
- ✓ PSE&G's 2016 operating earnings guidance range is $875 - $925 million, a 14% increase over 2015 operating earnings of $787 million
- ✓ Investment in transmission increased to 43% of rate base at year-end 2015, as rate base expanded by 14% to $13.4 billion

* HEDGE PERCENTAGES AND PRICES AS OF DECEMBER 31, 2015, UPDATED WITH 2016 BGS AUCTION RESULTS. REVENUES OF FULL REQUIREMENT LOAD DEALS BASED ON CONTRACT PRICE, INCLUDING RENEWABLE ENERGY CREDITS, ANCILLARY, AND TRANSMISSION COMPONENTS BUT EXCLUDING CAPACITY. HEDGES INCLUDE POSITIONS WITH MTM ACCOUNTING TREATMENT AND OPTIONS.

SI-SSA-0015-12642

PSEG Power – Q4 2015 Operating Highlights

Operations

- ✓ Q4 output down 1% over Q4 2014; full-year 2015 generation up 2% to 55.2 TWh on nuclear and CCGT production gains
- ✓ Nuclear fleet capacity factor of 90.4% for 2015; nuclear output of 30 TWh was 3rd best run
- ✓ New CCGT all-time production total of 18.4 TWh for 2015, up 11% over 2014's record output of 16.5 TWh on record performance at Linden 1&2 and Bethlehem Energy Center

Regulatory and Market Environment

- ✓ 2016 BGS auction priced at $96.38/MWh vs. $99.54/MWh in 2015
- ✓ 2016 expected generation output 54-56 TWh; BGS load projected at 11-12 TWhs
- ✓ Power cleared a new 485 MW CCGT unit at its existing Bridgeport Harbor site; Construction of the ~$550 million unit expected to begin 2017 for target completion in 2019
- ✓ Construction has commenced at Keys and Sewaren 7 for targeted 2018 in-service

Financial

- ✓ Power's total debt as a percentage of capitalization at year-end was 27%
- ✓ Power's FFO/Debt at December 31 remains strong
- ✓ Power's 2016 operating earnings guidance range is $490 - $540 million; adjusted EBITDA guidance for 2016 is $1.32 billion to $1.40 billion

SI-SSA-0015-12643

PSEG

PSEG Financial Highlights

- **Introducing 2016 operating earnings guidance of $2.80 - $3.00 per share**
  - ✓ Focused on maintaining operating efficiency and customer reliability
  - ✓ PSE&G earnings forecast to grow 14% to comprise >60% of 2016's operating earnings
- **PSEG capital spending forecast of $11.5 billion over 2016-2018 up 21% over the 2013-2015 period, to be invested in PSE&G (72%) and Power (27%)**
- **PSE&G infrastructure investment in reliability/resiliency/replacement continues**
- **PSEG Power making $2.0 billion investment in new generation in PJM and New England, improves fleet efficiency and geographic diversification**
- **Increased 2016 common dividend by 5.1% to $1.64 per share**
- **Financial position remains strong:**
  - ✓ Bonus depreciation extension will add $1.7 billion to cash over the 2016-2019 period
  - ✓ Positive cash from Power and increasing cash flow from operations at PSE&G supports dividend growth and funds capital spending program without the need to issue equity
  - ✓ Debt as a percentage of capitalization was 43% at December 31

Forward-Looking Statement

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute “forward-looking statements” within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words “anticipate,” “intend,” “estimate,” “believe,” “expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC), including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or the price of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulation, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- any deterioration in our credit quality or the credit quality of our counterparties,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- delays or unforeseen cost escalations in our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- increases in competition in energy supply markets as well as for transmission projects,
- any inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies, and
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-12652

GAAP Disclaimer

PSEG presents Operating Earnings in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings is a non-GAAP financial measure that differs from Net Income because it excludes gains or losses associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting, and other material one-time items. PSEG presents Operating Earnings because management believes that it is appropriate for investors to consider results excluding these items in addition to the results reported in accordance with GAAP. PSEG believes that the non-GAAP financial measure of Operating Earnings provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends. This information is not intended to be viewed as an alternative to GAAP information. The last slide in this presentation includes a list of items excluded from Net Income to reconcile to Operating Earnings, with a reference to that slide included on each of the slides where the non-GAAP information appears.

These materials and other financial releases can be found on the pseg.com website under the investor tab, or at http://investor.pseg.com/

Full-year Earnings Summary – EPS exceeded guidance

Twelve Months ended December 31

$ millions (except EPS)	2014	2013
Operating Earnings	$ 1,400	$ 1,309
Reconciling Items, Net of Tax	118	(66)
Net Income	$ 1,518	$ 1,243
EPS from Operating Earnings*	$ 2.76	$ 2.58

*See Slide 32 for Items excluded from Net Income to reconcile to Operating Earnings.

SI-SSA-0015-12656

PSEG – 2014 Highlights

- **Strong 2014 financial performance – exceeded upper end of guidance**
  - ✓ Achieved operating earnings of $2.76 per share, up 7% compared to $2.58 per share in 2013
  - ✓ PSE&G achieved double-digit growth in earnings, adding to 5 years of 18% compound annual growth
  - ✓ PSEG Power's operating earnings exceeded the high end of guidance
- **Continued operational excellence**
  - ✓ PSE&G's control of O&M supported results
  - ✓ Power generation up 1.3% for the year led by record CCGT production and strong Hope Creek performance
  - ✓ PSE&G recognized for the 13th consecutive year as the Mid-Atlantic region's most reliable electric utility
- **Disciplined capital investment – producing results**
  - ✓ Transmission projects in construction – on schedule and on budget
  - ✓ Energy Strong investments underway – gas mains replacement prioritized
  - ✓ Power announced a new $100-$120 million investment in the PennEast Pipeline
  - ✓ Filed Energy Efficiency II extension with NJBPU ($100 million)

SI-SSA-0015-12657

PSEG Annual Dividend – Increased 5.4%

An improved rate of growth in the dividend, building on a long history of returning cash to the shareholder

PSEG Annual Dividend Rate

Payout Ratio	63%	66%	43%	44%	43%	44%	50%	58%	56%	54%	55%**

*INDICATED ANNUAL PSEG COMMON DIVIDEND RATE PER SHARE.
**2015 PAYOUT RATIO REFLECTS THE INDICATED ANNUAL DIVIDEND RATE DIVIDED BY THE MIDPOINT OF 2015 OPERATING EARNINGS GUIDANCE OF $2.75-2.95 PER SHARE.

PSEG 2015 Earnings Guidance – Anticipates Another Year of Growth

2015 guidance reflects continued increased level of investment, and assumes normal weather and unit operations

PSE&G – Q4 Operating Highlights

Operations

- ✓ Q4 weather was warmer than both Q4 2013 and normal: Heating degree days were 4.2% lower than Q4 '13 and 0.7% lower than normal
- ✓ Gas sales were up 1% for Q4 and up 3.1% for the year on a weather normalized basis
- ✓ Electric sales were down 2.3% in Q4 but up 0.3% for the year on a weather adjusted basis

Regulatory and Market Environment

- ✓ Construction of major transmission lines continues on schedule and on budget
- ✓ FERC approved formula rate revenue increase of $182 million, effective January 1, 2015
- ✓ Energy Efficiency extension filing pending at NJBPU
- ✓ PSE&G extended BGSS gas rate credits through March 2015; this winter's total PSE&G bill credit is ~$210, or a 31% savings for the average gas customer (Nov 2014-Mar 2015)
- ✓ PSE&G recognized for the 13th year as the Mid-Atlantic region's most reliable electric utility
- ✓ PSE&G ranks "Highest in Customer Satisfaction with Large Business Electric Service and Business Natural Gas Service in the East" according to a 2015 J.D. Power study

Financial

- ✓ PSE&G earned its authorized return in 2014

		2015	2016	2017
Base Load (Nuclear and Base Load Coal)	Volume TWh	36	36	36
	% Hedged	100%	80-85%	40-45%
	Price $/MWh	$52	$52	$52
Intermediate Coal, Combined Cycle, Peaking	Volume TWh	21	19	19
	% Hedged	40-45%	0%	0%
	Price $/MWh	$52	$52	$52
Total	Volume TWh	55-57	55-57	55-57
	% Hedged	75-80%	50-55%	25-30%
	Price $/MWh	$52	$52	$52

* Hedge percentages and prices as of February 12, 2015. Revenues of full requirement load deals based on contract price, including renewable energy credits, ancillary, and transmission components but excluding capacity. Hedges include positions with MTM accounting treatment and options.

SI-SSA-0015-12677

PSEG Power – Q4 2014 Operating Highlights

Operations

- ✓ Q4 output up 3.1% over Q4 2013; YTD generation up 1.3% to 54.2 TWh
- ✓ Nuclear capacity factor of 84.5% for Q4, completed refuelings at Salem 1 and Peach Bottom 2
- ✓ For 2014, nuclear capacity factor was 89.3%; Hope Creek at 100% capacity factor in Q4 and 97.9% for the year – the 2nd best run in its history
- ✓ CCGT fleet set an all-time production record of 16.5 TWh in 2014; Bergen 1 & 2 and Linden 1 also set generation records for the year

Regulatory and Market Environment

- ✓ 2015 BGS auction priced higher at $99.54/MWh vs. $97.39/MWh in 2014 and $92.18 in 2013 – for the PSE&G contract
- ✓ 2015 anticipated base load output hedged at an average price of $52/MWh vs. 2014 average hedge price of $48/MWh
- ✓ 2015 BGS load projected at 11 TWhs
- ✓ Power markets adjusting to heightened volatility, winter peak demand, less liquidity
- ✓ PJM's Capacity Performance Proposal filed at the FERC; decision expected April 2015

Financial

- ✓ Power's total debt as a percentage of capitalization at year-end was 31%
- ✓ Power's FFO/Debt was 59% at December 31

SI-SSA-0015-12678

PSEG

PSEG Financial Highlights

- **Introducing 2015 operating earnings guidance of $2.75 - $2.95 per share**
  - ✓ Focused on maintaining operating efficiency and customer reliability
  - ✓ PSE&G expected to contribute over 50% of 2015 operating earnings
- **Energy Strong Infrastructure Spend**
  - ✓ BPU authorized $1.22 billion for system resiliency improvements over 2014-2017
  - ✓ Gas mains replacement prioritized in 2014; ~$350 million capital spend expected to be completed in 2015
- **Executing existing transmission capital spending program on schedule and pursuing new RTEP, FERC 1000, and 345 kV projects**
- **Financial position remains strong:**
  - ✓ Positive cash from Power and increasing cash flow from operations at PSE&G supports dividend growth and funds capital spending program without the need to issue equity
  - ✓ Debt as a percentage of capitalization was 42% at December 31
- **Increased common dividend 5.4% to indicative annual rate of $1.56 per share**
  - ✓ Increasing regulated earnings mix supports growing dividend

CORPORATE PARTICIPANTS

Kathleen Lally *Public Service Enterprise Group - VP of IR*

Ralph Izzo *Public Service Enterprise Group- President and CEO*

Ralph LaRossa *Public Service Electric and Gas - President and COO*

Bill Levis *PSEG - President & COO, PSEG Power*

Shahid Malik *PSEG - President PSEG Energy Resources & Trade*

Caroline Dorsa *Public Service Enterprise Group Inc. - EVP, CFO*

Kim Hanemann *Public Service Electric and Gas - VP, Delivery Projects and Construction*

CONFERENCE CALL PARTICIPANTS

Michael Lapides *Goldman Sachs - Analyst*

John Cohen *ISI - Analyst*

Kit Konolige *BGC Partners, Inc. - Analyst*

Julien Dumoulin-Smith *UBS Investment Bank - Analyst*

PRESENTATION

Kathleen Lally ***- Public Service Electric and Gas - VP of IR***

I'm going to ask you to start to take your seats. We're about to begin. And now there'll be people coming in. That's great. Thank you. Good morning. I know there'll be more people coming in as we start. But we have a very full agenda today. And I want to -- I don't want to be the person who gets us started late.

Good morning, I'm Kathleen Lally, Vice President of Investor Relations for Public Service. And believe it or not, this is the eight annual IR presentation I've put on for PS. And I'm very happy you're here in the room or on the webcast.

Ralph Izzo, Chairman, President and CEO will provide you with some opening remarks and overview of public service enterprise and strategy.

Ralph will take questions at the end of the day. So following him this morning will be Ralph LaRossa, President, Chief Operating Officer of Public Service Electric and Gas. And his colleague Kim Hanemann Vice President of Transmission for PS. And prior to Kim updating you on the transmission investment program that she has underway, we have a short video that we're going to show you which highlights the work that she and her team do for Public Service.

When Kim concludes, there will be a Q&A that she and Ralph will have with regard to the utility's, operations and capital programs. And following that Q&A, we'll have a break, a short 15-minute break.

After the break, I know you all want to hear from Bill Levis and Shahid Malik who will update you on PSEG Power's operations, and where we stand. And together, after Shahid concludes his comments, we will have a Q&A on the power sector of the morning.

Following that Q&A, Caroline will give you an update. Caroline Dorsa. Executive Vice President and Chief Financial Officer will give you an update of the financial picture for the company.

After which, Ralph will summarize the morning's events, and Caroline and Ralph Izzo will be available for Q&A as well every other member of the Public Service team here today.

We hope to conclude at noon or a little bit after noon. And again, welcome this morning. And with that, I'll turn it over to Ralph Izzo.

Ralph Izzo - ***Public Service Electric and Gas - President and CEO***

Thank you, Kathleen, and good morning all. Thanks for being here at this bright and early hour. We have lots of things to talk about today. And all of it I think I would categorize as being excellent moves.

We have a strong story to tell you both on the power side of the business, as well as the utility side of the business, but let me take it one step at a time if I might.

It's my personal belief that a robust strategy can be demonstrated to be as such if one sticks with it, and it delivers successful outcomes over an extended period of time. That while tactics may change, strategic decisions once set, ought to be strong enough where one stays the course and realizes the results that you anticipate once you set that course.

And that's been the case for us. Our strategy begins with a very, very basic premise. That at the core of our business is operational excellence. That if we deliver safe, reliable, clean, economic energy to our customers, that we will generate strong cash flows by doing that. And we can take those cash flows and invest them in a disciplined manner in assets and services that are desired by our customers.

So you've seen us for the past five years do just that. We have had strong operational results that I'll go into in a moment, and I will mention that those strong operational results are not without their challenges and their hiccups, as we've obviously experienced in Ewing Township, New Jersey this past week with a very tragic situation resulting from a gas leak and subsequent ignition.

In addition to growing utility, we focused on getting the most of our generation assets and what have been a challenging set of wholesale power markets.

And throughout that timeframe, while growing utility and getting the most out of our generation assets, we've been, I believe an excellent steward to the balance sheet that allow us to continue to support and sustain the growth in the dividend which I know is important to so many of our shareholders.

So we simplify the business. This is a fundamentally different view of PSEG than one we've shared in years past. And we now take a look at our regulated earnings from PSEG where we spent $10 billion and capital over the past five years and you'll see that we are growing that capital program as Ralph will point out to you, by almost 30%, 40%, if I'm not mistaken over the next five years.

40% higher than what we predicted in this meeting just a year ago. And all of those investments are directed at reliability, or the energy master plan, the public policy of the state of New Jersey.

And that's going to produce double digit rate base growth and double digit earnings growth through 2016 for the utility. So the utility growth story is one that is built upon a foundation of reliability and energy services and our customers' needs with a balance sheet that supports it without the need for additional equity.

On the competitive generation side, Shahid and Bill will tell you about the incremental growth that we're proposing there, and the way in which our diverse set of assets has allowed us to do better than simplistic expectations based upon the forward price curve would have you believe. And we'll give you a little bit more detail on that.

So let's talk a little bit about this notion of operating with excellence to produce financial strength that leads to the opportunity to invest in a disciplined manner. Last year, Power, once again, set a record at our Linden combined cycle units and our Salem 2 unit.

Ninth year in a row of over 90% capacity factor for our nuclear plants. PSE&G for the 12th consecutive year, the most reliable utility in the mid Atlantic region, and I think since we put these slides together, was named number two by JD Power for customer satisfaction for electric utilities in the eastern part of United States.

PSEG Long Island went live on January 1, and I think January 2nd we had our first snow storm if I'm not mistaken, we've had four since then. And the team has done an outstanding job managing through one of the most difficult winters in years and continues to this day to get great reviews from most decision makers and customers out on Long Island.

THOMSON REUTERS

SI-SSA-0015-12686

And you're going to hear, I think a very positive story today, at least one that we're quite proud of in terms of our continued O&M cost control. We're not a company that every three years reintroduces our latest program to bring down cost in the business. This is something we pay attention to, day in and day out. And Caroline will have a great story to tell you about how our control -- how our management of our pension assets is contributing to that right now.

So continued strong cash flows in power, something we've talked about for years on end, outstanding cash flow, both cash from operations, and free cash flow, powers main CapEx is behind it, the discretionary CapEx that we are using power right now is opportunistic on combined cycle expansions, and nuclear expansions that we think are value creating for our shareholders.

And then the increasing part of the story is the cash generation at the utility primarily because of the constructive regulatory environment at FERC in recognition of the need to enhance the bulk power system.

Our pension, what a difference a few years make. It's now more than fully funded, and instead of being a cost on the income statement, is actually a modest income generator on the income statement.

We increased our dividend by 2.8% and we reiterate our dividend guidance to you which is that the condition of the balance sheet and our expectation for future earnings are such that we believe we can sustain modest growth, have an opportunity for modest growth in that dividend going forward.

The investment decisions we're making, once again, transmission is the largest component of our program.

You'll hear from Kim Hanemann later on how she successfully deployed $1.7 billion in transmission capital last year and how that spend -- we expect to see continue out into the next five year period.

We'll talk a little bit about energy strong, we do not have resolution of that as of today, we'll give you a little bit more detail in my slides and then Ralph will go into further detail on that. But in the past year, we received a $400 million program approval from the BPU on solar and both have solar loan and solar extension programs. And then Bill will walk you through some of the up rates at nuclear and our advance gas investments at our combined cycle units.

So this is a nice slide for me to be able to present here. The first derivate has a positive sign in front of it which I think makes us all smile a bit. Thank you for those of you who are shareholder and for those of you who are thinking of being shareholders.

Our earnings guidance, we reiterate is $2.55 to $2.75. As Caroline and I mentioned on the call, this assumes a normal weather year throughout the year and we're comfortable with this $2.55 to $2.75 as the range looking ahead for the next nine months.

I do want to focus your attention on the metamorphosis that's taken place in our business over the last five years. Before that, I, having just boasted about the positive sign on the earnings for the past three years, I will not allow ourselves to ignore the fact that despite the last three years of earnings growth, those earnings have started with the number two and there were years in the not too distant past for those earnings started with the number three.

Having said that, look at the change that's taken place in the mix of earnings in this company. And the quality of earnings in this company where the utility represented 20% of the earnings just five years ago and now represents at the midpoint of the guidance, would represent over half of the earnings this year.

It comforts me to know that Bill Levis will not tolerate that however in every year, he's -- I'm going to make sure that power is still representing more than 50% of the earnings of this company. And Bill actually delivered on that promise last year. So a little friendly spirited competition inside the family is always something that I welcome because it is a friendly competition.

But the utilities investment in transmission has driven that shift in what the character of PSEG is. But equally important to me, and one that I think goes a little bit unnoticed in these meetings, is the way in which the character PSEG has changed. You will see that not only have we seen 18% compound annual growth rate in PSEG, that's well understood I think by many of you in the room, but the component of PSEG that's represented by FERC regulations, is over 35% and going to north of 40% as we look at the rate base in years to come. So the regulatory diversity that we see within

© 2014 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-12687

PSEG has been substantial as well. I think that transmission is representing about 60% or 70%. Ralph will have the numbers of our capital deployment in the next few years.

So let's go to that. If I look at how PSEG deployed capital in the past five years, you see we had $11.3 billion in capital. The utility represented 75% of that, and of that 75%, transmission was less than 50%./ And if you can just keep those three numbers in your head, as I shift to the next five years, the 11.3 billion goes up by "only 5%."

But instead of the utility being 75%, it is now 90% and instead of transmission being less than 50%, you could see, to 70% of our investment. And then there's a continued investment in maintenance capital in the distribution business, slightly less investment in solar going forward, but nonetheless, a sizable one.

And some growth investments in power as well as maintenance capital in power, but the main story here is a $10 billion capital program in the utility. And Ralph will give you more detail on where that is being spent as we go forward.

And this capital deployment is not one of hits and starts. It's one of continuous steady growth. We've seen 23% annual compound growth in the utility over the past five years. And even if you were to just take a three-year average, you could see that steadiness in the growth of that capital deployment from a $600 million average capital deployment, to a $1.7 billion to $1.8 billion capital deployment on the three year average basis and last year, of course being our highest level of capital deployment, being $2.2 billion with 1.7 of that 2.2 billion coming in transmission with FERC formula rate treatment.

Now as for Energy Strong -- I cannot deny the fact that when I think back to the success we had, reaching an agreement on the solar program, and I think about the urgency behind Energy Strong, I can only use the word, disappointed, that we don't have resolution of that.

Having said that, I am hopeful that we will get resolution of Energy Strong. If we don't get a settlement on that, I am hopeful that the BPU will recognize what 100 towns have recognized, what every labor union in the state of New Jersey has recognized, what the New Jersey Chamber of Commerce has recognized, what the New Jersey hospital association has recognized. I was down with the EEI meeting over the past few days, I cannot tell you how many different sectors of policy makers congratulated us on our foresight for our willingness, our desire, our eagerness to make New Jersey resilient to these kind of storms in the future, and yet, we stand here today with no distribution enhancements having been made over the past 16 months since Sandy took effect.

So the arguments are so compelling. To harden the 29 sub stations that were affected by Irene and Sandy -- we're not using a crystal ball here, we're using history as a teacher to say these facilities were affected by the storm and needs to be strengthened. These gas metering and regulating stations were affected by the storm, these overhead lines were critical assets that need to be hardened. So this $2.6 billion program is an essential thing for the state of New Jersey for our customers. And perhaps it's just the fact that Ralph LaRossa and I were the ones who still have vivid memories of a whole range of customer problems that occurred during Sandy from the senior citizens who couldn't stay in their homes without electricity, to the distraught parents who didn't know what to do with autistic children who they had in their home, or didn't have electricity for days and how to manage through that.

Ralph got a call from a heart surgeon who wanted to know whether or not he can count on doing two transplants during the course of the day on back up generation. We had calls from the Secretary of Energy and the President of the United States wondering when gasoline would be flowing again in the United States.

And yes, we did have stay at home parents saying, if you don't get my life back on in the next day or so, my teenagers are going to come live you. So we did have the gamut of those experiences. But the heart wrenching, the gut wrenching ones stay with us. And it's mind boggling. We've come from a company that says we want to be energy strong, to a state that says, it wants to be stronger then the storm, to some counterparties and this is not the BPU staff. I must give the BPU staff credit for being quite reasonable in the discussions.

But some of the counterparties who are saying, "Storm? What storm?" And it's just a -- short term memory is very frustrating to have to contend with. But notwithstanding that, we still have a process underway, and we're hopeful that that process will bear settlement, but if it doesn't, then we have confidence that the testimony we put forth will be recognized, as it has been recognized in discussions by the staff and ultimately by the commissioners.

So with that though, it's not just about the utility because even with the Energy Strong discussions going on, as I said, we have a great story to tell in terms of the other capital programs that Ralph will share with you.

THOMSON REUTERS

In power, never has the diversity of our asset base proven itself more valuable. When you look at us from a fuel point of view, we look mostly like a natural gas company. When you look at us from energy produced point of view, we look mostly like a nuclear company. And when you look at us from the point of view of picking load following -- or base load, we look like all of the above.

And it's because of that diversity of assets, and actually within any one part of that pie, our coal units sometimes look like gas units, and our gas units sometimes look like oil units. That Bill and Shahid had been able to do the following. So this is a slightly different view of PSEG Power, and a completely different slide that we want to share with you. And let me spend just a moment with this slide.

If you look on January 1, 2011, at what we had hedged, and what the forward price curve said we should have been able to do for the rest of 2011, it would have said that we should have been able to have a power gross margin of about $50.50 a megawatt hour. But instead, because of the flexibility of our assets and our ability to run them well, we produce $52 per megawatt hour.

And 2012, when there was no winter, that $45 became, I think $45.50. But in 2013, when we had some very challenging and volatile energy markets, the 43.50 got turned into $47.

So our naturally long position and the diversity and flexibility of our assets, puts us in a position where we don't stand -- over the 12 months, and we do dynamically hedge the book, separating the part from the base load hedging that we do to produce results that are better than what the market anticipated. And we didn't just chose these years because they were years where the orange bar was better than the blue bar. We just simply didn't want to drive people crazy to go back in time to the invention of the light bulb, or shall I say, the beginning of deregulation.

So as we look forward to '14 and beyond, we're really going to do more of what we've done in the past five years, but a little bit more of it in play instead of investing $8.4 billion in PSE&G, we're going to invest $10 billion in PSE&G, we're going to continue those strong credit rating, thus improve credit ratings, and we're going to be able to use that strong balance sheet and that utility growth and earnings to offer up consistent and sustainable growth in that dividend.

We no longer have to monetize and de-risk the holdings portfolio, that's already been done, but we have some impressive investment capacity to deploy, and the opportunities that even go beyond what Ralph is going to show you, and Bill is going to talk about without any need for new equity.

So a bigger capital program at the utility, continued modest opportunities in power to expend profitably, sustainable growth in the dividend, and no new equity needed with a great, great degree of confidence.

So looking back and looking forward, how did we do all this? Well, yes, there's no question about it, our earnings did drop by about 15% over the last five years while the PJM-West price dropped by 60%. So a 15% decline in earnings, versus, 60% decline in energy prices, how did we do that? Well we said we can't afford to grow O&M at 2.4%, we grew it at 1.5%. We grew the rate base by almost $4 billion. We got another 200 million -- megawatt hours -- I did get the unit right, out of our nuclear plants.

Despite having reduced O&M far below what we expected to spend, we were able to preserve the equivalent availability of our combined cycle units. And we grew dividend from $1.29 to $1.44. Now I know the temptation is enormous for you to ask us to fill in that earnings box for '16, but we don't do that, we only guide to the current year. Sorry to be stubborn about that, but we're not looking at a 60% reduction in wholesale power prices going forward the next few years. In fact, that forward price curve is predicting flat prices.

And not only are we seeing flat prices in the forward price curve, but our forecast for O&M growth, that is correct, those parenthesis are not a typo, it's negative 0.5% O&M compound annual growth over the next three years.

And an additional $3.3 billion in utility rate based the lion share of that occurring in the transmission business and an additional 0.9 terawatt hours in nuclear generation, and a slight growth in combined cycle equivalent availability even while holding that O&M growth to a negative number. And by '16, we expect to have the $0.07 of PSEG Long Island fully baked into our numbers so that dividend growth should be both consistent and sustainable over that three-year period.

Let's take a look over the past 10 years. 3% compound annual growth over that time frame despite what happened in energy markets and this year's 2.8%, 2.7% is just continuing that and with a very, very healthy payout ratio being slightly over half of the earnings of the company at the new point of this year's guidance.

SI-SSA-0015-12689

So, our highlighted points I hope you'll take away throughout this morning, is that we are going to not only continue, but we are going to expand the investment in PSE&G, that is primarily driven out of a constructive regulatory environment at FERC.

One which recognizes the importance of; number one, reliability of the bulk power transmission system, and number two, the need to make that transmission system even more robust than it is today for a variety of public policy reasons.

We have a very constructive situation at PJM and at FERC that allows us to be able to talk about some of the transmission investments that we will, a little later in the day. That is supported by a continued robust cash flow from PSEG Power with minimal capital requirements there at Power that yields attractive free cash flow that can provide the equity needs of the utility. That, coupled with PSEG's own strong cash flows allow us to meet these customer needs for enhanced reliability and state goals for solar and energy master plan targets. So that strong financial profile continues out into the future.

What you'll hear from Kim Hanemann and Ralph and Bill is that, this is not a promise for a change. This is a promise to expand upon a track record that we've demonstrated, both operationally, and financially in terms of returning cash to shareholders in the form of improved earnings and the utility and as well as in form of growing the dividend.

So with that, I will stop and turn it over to Ralph, and promise to come back later on to answer any questions you might have. Ralph?

Ralph LaRossa *- Public Service Electric and Gas - President and COO*

Good morning, everybody. Before I start, I do want to recognize what Ralph said in the beginning, and that was the incident that happened in Ewing -- certainly a tragedy for the customers there. But something we will look at very hard, do a complete investigation and when we're completed, make sure that our processes and procedures are such that we don't see that type of incident again. We'll work real hard to make sure that that takes place. So again, our thoughts and prayers go out to the folks who were impacted there.

To tell you a little bit about what we're going to do here today, I'm going to give you a quick update on the company, a little bit of background, give you a very high level review of our financial performance over the last five years, looking back.

Again, to point out what Ralph said earlier which is the trust the performance that we've had, and trust what we're telling you about where we're going in the future. That future is all about capital investments. I'll both review the historical and talk a little bit about where we see that growing in the near term.

Quick update on Energy Strong, but I think Ralph did a great job of summarizing where we are. So some of my comments will be a little more limited on that.

And then Kim is going to give you a great in depth review of our transmission growth that's taken place. And again, the take away that we hope you'll leave here with today is that this is a company who has executed on its capital plans, no brand new announcements that we're starting new businesses, doing different things, but we're executing upon what we've got in front of us, and we've gained a tremendous amount of experience both from a regulatory standpoint and from a construction standpoint that we think we can continue to leverage as we go forward.

So again, our strategy, as Ralph has teed up in the earlier slides is very consistent. We focus on operational excellence, that operational excellence allows us to have a strong balance sheet, a strong income statement as you see, and strong earnings as we go forward.

And then taking that strong financial position and reinvesting back in the system and specifically around areas that public policy drives us to. So when you look at everything that we've done, go back to the 2003 blackout, we followed the policy of FERC to invest in transmission, we had Sandy that we've come up and we try at this end of the spectrum where we're tried to make the investments associated to be strong, and in the middle, we really focused on the policy in the state of New Jersey to develop renewables and energy efficiency programs.

So you put that whole piece together, and you see a little bit about how we've grown utility over the past five years.

This is a chart that you've seen many times in these presentations. I'm going to point out a few things that I think are very important. One, at the top line, we talked about where our growth is coming from, and a lot of companies will grow by continuing to grow their customer base. We're at about

THOMSON REUTERS

0.6% on our customer base growth across both our gas and electric system, so not a lot happening on that front. New Jersey as you all know, is a very dense state, not a lot of opportunities to grow the population there.

And then if you look at the actual sales of our product, specifically on electric side, what we delivered, and you go back 2009, that number was about 41.9 or 41,900 gigawatt hours. So on an actual basis, on a throughput, that's been basically flat to down.

So the growth that we've gotten in our company and that come by additional products through the pipes or through the wires, it's been by layering in these additional programs that have returned us on a contemporaneous basis, the earnings that you see.

The other thing I'd point out is at the bottom of the screen, really the renewables and energy efficiency and the way we've executed on that program, we do as Ralph mentioned, have an opportunity to continue to make some investments on the solar front so put that together with our transmission and our truck -- we put together our transmission story and again take away the execution that we've been able to achieve.

The basis for all these is our reliability and 12 years in a row I think that was a pretty strong and consistent story, 12 years of recognized reliability and the award that you see there for our storm response is driven by our response during Sandy. It was given to us by PA Consulting. Ralph also mentioned that we've kind of changed our focus and we're beginning to focus a little bit more not just away from reliability but in addition to reliability focused on the customers side and we're really striving to improve our JD Power scores and we did come in second into the -- for this year in the business sector on the electric side of our business.

But we continue to look to grow that, it's certainly focus for us in New Jersey and as I'll mention later on Dave Daly's doing a great job of bringing that focus to the customers of Long Island.

So with that strong operational excellence comes that financial strength that we talked about and it's shown here in the slide regarding our earnings growth that we've seen in the utility. Again, the growth has not come through the throughput, it's come from the additional programs that we've layered on and executed upon.

The challenge if you look back as many of the utilities in the country to be able to execute this way, we've gone as you can see here from $0.63 of share to $1.21 over five year period. The double digit growth we project that will continue to go on and you'll see that in the upcoming slide for next year.

We didn't just rolled the topline, we mentioned and Ralph mentioned the O&M control that we have in the company and I do want to recognize that Ralph and Caroline and her team for the great work that they've done on the pension. We -- or the within the enterprise, the utility has the greatest burden from a pension standpoint and we've managed through some big ups and downs in the markets and interest rates over these five or six years here and been able to keep that O&M flat.

In addition to the work that was done on the pension side, the operating team has done a fantastic job of holding their end of the bargain up by going through not their day to day activities but within a year are number of storms whether it be Sandy, Irene, the different snow storms that hit us and the other challenges that we've seen even this year with our system and the cold weather that we've had and the snaps that we've had to manage our own end flats throughout that same period. So topline growth and a good job from everybody on the expense side to manage that.

So the topline growth can be seen here and it's all about the rate base. If we go back to 2009, we had about $1 billion in our rate base on the transmission side of the business and that has grown to just over 3.7 billion.

And as we sit here in 2013 we layered in that solar energy efficiency that we talked about, again, focused on meeting the RPS standards in the state of New Jersey and the energy efficiency goals of the state and again, trying to align ourselves with public policy.

A little more detail on that you can see here where that's been --came from over that timeline and I found a transmission side, and I'll touch on that in a second but this is really within the state of New Jersey, the renewables portfolio of $700 million investment that has been executed on, those are the separate programs that existed in the state and that we've completed.

At the bottom there's 2013, there is an opportunity as you see in our slides going forward for about $300 million of CapEx in those programs on the solar front.

© 2014 Thomson Reuters. All rights reserved. THOMSON REUTERS

Energy efficiency, we're almost done with those programs, we expect to continue to have conversations about where we might go with this state and the policy makers on energy efficiency. We continue to believe that's the best solution for customers and we are able to deploy about $300 million over the same timeline on the energy efficiency front. And we do not forget about the distribution assets, there was a big push for us to continue to expand on the distribution side and we put about $1 billion for work through the -- specifically with the prior administration as we have some challenges coming out of 2008 with job growth and we were able to step up and put some money for work on the distribution system.

So as Ralph mentioned, the plan that we have is to continue to grow, a 40% increase in our CapEx plans, again driven from transmission. And let me just try to vey simply explain why we think that's going to continue not just in the near term and what we're telling you here but why there'll be continuous opportunities.

And if you could drive in the New York metropolitan area or any of the--you could drive in a congested area, know that when road disruption is done and as highways expand from two lanes to three, everybody's happy where the congestion point was before.

But somebody is really unhappy where it goes from three back down to two. And the transmission system is no more complicated than that. When we've started to build the transmission system out and the Susquehanna-Roseland line came into New Jersey, it started to create opportunities for electrons to flow and that congestion points just move.

So the regional transmission expansion plan that PJM has is all about continuing to widen the lanes from two to three. So whether you're on a highway or you're on a wire, that opportunity exist as you start to expand your system and we've continued to see that taking place in New Jersey and specifically in the footprint that we have at PSE&G.

So you saw and Kim will give you a little more detail about the 345 line that we're going to be building out in Northeast New Jersey, the incremental CapEx is about $1 billion associated with that program so you start to see that layered in here that may or may not if we continue to see the low growth on the transmission system that may or may not continue to create congestion points that need to be expanded as we go forward. It's very simple but just think about as every day when you drive on your highways it's the same thing on the transmission system.

So no point to look at that same information that I just walked you through on the total CapEx, this is on an annual basis and the flat line that's here is where we told you last year. So these were the plans not the proposed but the plans and approved programs that we had in place, it was indicated by the black line and now what we've done is we've layered in that additional CapEx that we just talked about and you can see here the years that we expect to make those investments.

If we're successful in having the -- in the conversations we're having about energy strong we layered that on top. So this is potential with energy strong in addition to what we've seen there. So I want to make that very clear, the capital program grew without the energy strong program by 40%.

Again, we believe this is the right investment to make, we think it's aligned with policy and this is the plan that we currently have in place to make that investment.

Well a couple of things I'll point for you here, you can look at the way it's layered in; there's a lot of engineering work that needs to be done in the upfront stages whenever you're rebuilding substations so you see that a lot of that -- some of that is back and loaded in addition to that there's a lot of outages on our transmission system that we required associated with the transmission works so you can have full with transmission assets out of service and your substations out of service at the same time to coordinate those outages, we need to layer that work in on the backside of this program as well.

So all together, from an operational standpoint, we're going to be able to execute on programs that are about the same size as we've executed in 2013 and that we've proven that we've been able to accomplish and in addition to that we'll be able to manage the system from an operational standpoint so we keep the reliability and the redundancy in the system that's required.

So, I think Ralph really touched on the energy strong and the reasons for doing it quite a bit but I will address to just a minute and again, thank the operational guys for keeping the lights on during the Super Bowl this year. That was quite a nerve-wracking day as much fun as it was, it was a little nerve-racking but in just threw in the analogy because what we did in preparation for that Super Bowl is what we're talking about doing as part of energy strong. It's all about building in redundancy and resiliency into the grid whether you're preparing for a storm, whether you're preparing for a cyber-issue, whether you're preparing for a physical attack, this is all about building resiliency and redundancy into the grid, and that's what this program is all about and Ralph told you that in number of different ways and using number of different examples but whether we're preparing for the next Sandy or preparing for next bad actor that comes into the grid, whether it's cyber or physical or any other things that you might be reading about

THOMSON REUTERS

in the newspapers, this type of a program is going to continue to reinforce our system in a way that brings that operational excellence that we care about so much and our customers care about so much, to the consumers in New Jersey.

So back to what we know, of the growth that we have in the $10 billion of capital that we have in the program, it's very straightforward. We have about 70% of it that's going to be done on the transmission side; 68% to be exact, all of that is covered under our formula rates, the 3% or about the $300 million that we're looking at on the renewables front is covered under contemporaneous return and the remaining distribution rate base is just about aligned with our depreciation expenses and continues -- if we consider a company that's managing a low growth to no growth situation and managing its expenses, its CapEx to meet depreciation and managing its O&M will put together a program that continues to allow us to achieve our allowed ROEs in the State of New Jersey. Very simple math.

We can't forget and we show this slide every time that we have discussions about our capital program, what does this mean for the customers, what does this mean for the folks like my parents who are fixed income, who are living in the State of New Jersey, retired. The bottom line is that their bills will remain flat to down all through this expansion program that we've got on the capital side, taking advantage of the lower commodity costs that we've had.

Never happy when [Bill] has more challenges in front of him from a commodity standpoint. But there's no guy that I wouldn't -- that I -- there's probably nobody else I'd be okay with losing to than Bill if we're going to have a little friendly competition about the earnings. So customers can afford this. The investments that we're making are prudent and needed for the customer as we go forward to continue reliability. It's a good overarching story that we have.

So I'm going to sit down for a minute and Kim's going to talk to you about all the fun things that we've been doing on the transmission front. Again, take a look at this from the standpoint of the experience that we've gained both on the regulatory front, on the permitting and on the construction front. It's a pretty impressive story and then I'll come back up on again and try to wrap it up and show you what it means for us and talk a little bit about what we've achieved at Long Island.

(video playing)

Kim Hanemann *- Public Service Electric and Gas - VP, Delivery Projects and Construction*

Good morning. Okay, starting off, this just takes a little bit of look at our history. Back in 2009, Ralph talked about transmission being about 15% of our rate base. We were doing about $270 million a year. We've grown up for this past year. It's now 36% of our rate base and we did $1.7 billion in capital projects last year.

Early years, 2009, 2010 was our ramping up years. We were hiring our engineering, we were permitting. And in 2013, all five major projects were in construction and we're well along with execution now.

You've seen this slide before. This shows the five major projects in service dates. Our first group of them will go into service this year and then the remaining three will be going into service next year. I'll now give you a little bit more detail on each one of them.

Susquehanna-Roseland, we saw it in the film a lot. $790 million projects in service date of, June of '15 for the Western end, June of '14 for the Eastern end. This project from a construction point of view is our most challenging. We went through wetlands, highlands, residential areas, Picatinny Arsenal, the National Park.

Our team, with this project, learned how to navigate the process with the environmental impact studies. We implemented very complex environmental mitigation plans and a very robust environmental compliance program during construction.

During construction on the Western end, I think I employed every snake monitor on tri-state area. I think I had 18 snake monitors because apparently, our foundations are great snake hibernacula and they den in over the winter there.

So this project actually also involved two GIS gas switchgear substations that allows us to construct the station on a much smaller footprint. Our Hopatcong station was just energized last week. Our Roseland station will be energized next month. And this project is well positioned to come in ahead of schedule.

THOMSON REUTERS

Northeast Grid, this is a $907 million project with the June of '15 in service date. This project involved intense municipal permitting. We had to go and get approval from 15 municipalities to construct this project. That's all been completed. This is a big construction year for this project as well and we're well positioned for next June of '15 with this project.

North Central Reliability Project, this is a $390 million project with a June of '14 in service date. We are actually essentially complete with the construction and commissioning now. We're now into demolition of the old assets and we've switched towards punch list items.

One of the things you might notice in some of the pictures is the uniqueness of the structure designs. Our structures don't look the same. Our challenge in New Jersey is our projects are actually designed to fit the right of way we have. So you see some different construction designs here for these towers so they meet all code requirements regarding audible noise, electric field stuff. That's where you'll see some uniquely different designs as well.

So this was our first large project in construction. We developed a very good construction outreach to the public. We also have used all of our lessons learned from the first one through to the rest of our large projects.

Burlington-Camden, $399 million project with June of '14 in-service date. Once again, this project was probably our most complicated regarding construction sequencing and outage planning. We required over 200 planned outages in order to construct this project. And our commissioning plan has over 600 unique steps too, so very complex. One of the things with projects like we have is we have to keep the lights on for the rest of our system as we construct these new assets and place them in service.

Mickleton-Gloucester-Camden, $435 million June of '15 in-service date. This project involves intense permitting with the railroad, half of the overhead structure, the five miles of the overhead is actually built as on the railroad right of ways as overbuild so structures will actually -- the circuits will surely be going over the railroad.

Everything all years ramping up on this one, but we're navigating our process well. We have about 16 miles of underground, a lot of high water cable in this whole area, so we had to develop some pretty complex dewatering techniques in order to install that pipe cable in these high water cable areas.

So this is my sixth child, newly announced, newly born in December PJM approved this project, $1.2 billion project with June of '18 in-service date. The project involves 30 miles of underground, 30 miles of double circuit overhead. This project addresses high fault current in the northern part of the state and also improves transfer capabilities in the northern part of the state.

We'll construct this project in three sections -- a northern section between Marion and Bergen. That will be probably in by '16, probably staged in-service; a southern section down between Linden and Bayway; and a central section that involves all of the underground with the Newark Bay river crossing. This project as Ralph mentioned is $1 billion additional into our five-year capital plan.

This is same chart Ralph showed, but this is just showing the transmission portfolio. So black line is what we told you about last year. The blue bars are updated forecasts from 2014 to 2018. There's a $2 billion increase over the last year's plan to 2013 to 2017 for this one. It's made up of the 345kV or 69kV program, the other PJM approved projects or transmission and life cycle which is really asset-based replacement.

And really the foundation for our success is our people, our processes and the environment. I have a diverse, well-rounded team. I have engineers, geologists, biologists, financial people. Our culture is clear. My team knows their mission is on time, on scope, on budget execution of these projects. We've had a very successful recruitment, retention and development strategy working with our HR team. We have a very strong relationship with our unions and our suppliers both internal and external trade unions to execute this portfolio.

When you look at our processes, we're a cradle to grave project execution organization. We start with permitting, design, construction commissioning. So we have all the capabilities within our organization to do that.

We've been able to grow this quickly because our processes are improvable, scalable and executable. So we've learned from one and we grow it to apply it to the next project, the next model. And very much about best practice and lesson learned sharing. If we learned something on one project, we want to make sure the rest of the projects in our portfolio benefit from that.

We have improvements driven biometrics. As Ralph has often told us, what gets measured, gets paid attention to. So my team, we measure a lot in projects. We have key project milestones that everyone knows about, and it's really shared with all of our key business partners as well. And when

THOMSON REUTERS

you look at the environment, when I look at linear transmission projects, environment and environmental regulations and ability to navigate that process has the greatest impact on your schedule and your [plots] on your project.

So we have a very collaborative relationship with our regulators. We know it's important to the DEP, to Fish and Wildlife. We have employed some as you've seen some innovative construction and design techniques to avoid and minimize environmental impacts with the helicopter fuel cell designs, micropile designs, all those things, to minimize the impact.

And we also have a very robust environmental compliance program. So you get a permit from a regulatory agency, it has a lot of conditions that you have to abide by when you execute. And you need to make sure whether it's soil erosion control, that kind of thing, sediment control, you need to make sure you do that. And if I go to a regulator for my next permit, I better well be doing what I said I was going to do on my last project. So we have a very robust environmental compliance program for that. So I think our team is very well positioned to do more the same wherever it is.

And I turn it back to you, Ralph, right?

Ralph LaRossa - ***Public Service Electric and Gas - President and COO***

Thanks, Kim. While we're preparing for this, we were trying to decide how much I would talk and Kim. And I think when we got to the word -- what did you say? We realized I could not pronounce it, so we decided that Kim would definitely be the one to deliver that message.

All joking aside, Kim and our team has done a fantastic job. And I think that the history that we have here is going to make dividends for us down the road. And what it really turns into from a learning standpoint is that we believe that we can continue to execute very well on the regional transmission expansion plan that PJM provides to us and that has been assigned to us -- the 345kV line being the next major challenge that we have in front of us.

But I figured also it opens up opportunities for us to as these open windows that the RTOs, the Regional Transmission Authorities are putting in place and they allow us to bid on project in different locations both at PJM; we are a member of MISO, so that would be an opportunity for us to become a qualified transmission developer in the MISO region to develop and execute on some of these projects there; the experience that we've gained with the regulators and folks in New York to give the opportunity to expand in New York region as well.

And then there's other opportunities as the FERC order 1000 or the entire FERC process grows on the transmission side for us to position to take advantage of those opportunities that present themselves.

So with the experience of Kim's team being able to work in highly congested areas and environmentally sensitive areas and areas that have been tough to permit, we think we have a really unique skillset that we'll be able to leverage as we go forward.

Well, those are our future. Opportunities I think we have in front of us this year is continued growth to execute on our known capital plans to execute on our earnings or O&M expense plan that we have in front of us and to achieve the earnings that Ralph has talked about in that continued 10% growth with the new utility space at PSE&G.

So I'm going to switch over for a second, and for those of you who are living in Long Island or vacationing in Long Island, this will be the most important part of the day for you. In the back of the room is Dave Daly who is leading our organization. Dave will give you his cellphone number and any information that you need. On a customer standpoint, Dave has done a great job and I'll talk a little bit about where we are and where we're going on Long Island on the next slide.

But just to reiterate what we've said in the past, we have a contract in place now for 12 years that can be expanded by eight which is very straightforward. We're being paid a management fee. There's no capital at risk. There's no other items that are at risk to be able to execute and manage the program and manage the system on Long Island for LIPA who will remain the owner of the assets.

We've gone through that process and over the last 12 months or so, worked with the State of New York, the regulators there including the DPS to put a program in place that gives us additional scope and responsibility, allows us to use our brand on Long Island. We've agreed to a rate freeze on the distribution side of the business for three years. There's additional ups and down that have taken place from a commodity standpoint at Long Island. And we'll hear and see more about that in the future. But we're helping them to manage and think through that a little bit differently.

© 2014 Thomson Reuters. All rights reserved. THOMSON REUTERS

And then there's an opportunity for us to invest behind the meter. That's what Utility 2.0 is all about. The State of New York is going down a path where they're looking for other opportunities for the utilities as a whole for the entire industry to invest behind the meter. And we're going to be afforded that same opportunity on Long Island with the customer basis there.

What does that mean? It could mean smart meters. It could mean combined heat and power. It could mean energy efficiency solutions for hospitals, energy efficiency solutions for universities, but that provides us for another potential growth platform in the Long Island region.

How we've done so far? Well, we've had a successful transition. We set our sight pretty straightforward. We wanted to make sure that we were able to pay people. They were all paid after we got -- after we took over in the first couple weeks. We want to make sure the bills went out and came back. That was accomplished. And finally we wanted to make sure that we got off to the right foot on an operational stand point.

And again, Ralph alluded to this, we did -- prepared for our storm, and we saw something come up on January 2, if you recall that was a warnings of a blizzard, it turned out to not be as much of an operational challenge but it really gave us the ability to tests our processes and procedures and really show to the community both the political community and the customer community that we were able to communicate and get out in front of -- and provide them with some experiences that they had not experienced in the recent past. So we think we're off to the right start in Long Island, and we continue to look for opportunities for us to grow that business in the -- in that geographic area.

So with that, I think we're going to just open it up for any questions that you might have. And then we'll take a break.

QUESTION AND ANSWER

Ralph LaRossa *- Public Service Electric and Gas - President and COO*

Yes. Can you get the mics around?

Unidentified Audience Member

Just a quick -- just two quick questions. One is on the O&M growth of minus 0.5%, does that include pension, [just what are] the pension assumptions and inflation assumptions in that and how you can achieve that?

Unidentified Company Representative

Okay. So on the pension front, Caroline is going to touch on that a little bit more, and she gets up in some detail but that does include the pension as we look forward (inaudible).

Unidentified Audience Member

Without pension what would it be?

Unidentified Company Representative

I wouldn't know that off [the top of my head], I don't think we have that, yes.

Unidentified Audience Member

And inflation, what assumption is in for inflation? Is that --

THOMSON REUTERS

SI-SSA-0015-12696

Ralph LaRossa - ***Public Service Electric and Gas - President and COO***

Well, we have -- just from a labor stand point which is the major component, we our contract [pulls] for anything, from 2% to 2.5% increases for our union employees, and that's what's built in for the bulk of our labor, and then we just have our normal CPI that we look at.

Unidentified Audience Member

What are you doing to achieve it I guess? How are you getting cost down with [labor cost increasing]?

Ralph LaRossa - ***Public Service Electric and Gas - President and COO***

Kim alluded to the fact that [we have to] make sure that we measure, and measure, and measure and pay attention. So we look at all of our processes, we continue to look for opportunities for us to improve on them. And as a result we're able to take cost out of the business.

Unidentified Audience Member

Okay. Then just on transmission, setting aside reliability and redundancy and security, just focusing on the transfer capability, could you tell us what this actually does operationally in terms of cost either for customers or just market impact? I mean, I just -- I just sort of wondering there's a lot of investment, what does that mean bottom line in terms of savings or whatever that transfer capability increase is?

And then just in terms of FERC Order 1000, are you concerned about competition from private equity guys or guys with a more leverage model competing either of any of your projects or in terms of your opportunities that you're looking outside? How do you think about that issue.

Ralph LaRossa - ***Public Service Electric and Gas - President and COO***

Sure, sure.

Unidentified Audience Member

Okay.

Ralph LaRossa - ***Public Service Electric and Gas - President and COO***

So two things, just from a pause stand point, what the auction process that PJM has is what you see from an impact. So I won't -- I won't estimate what that might be or what potentially will happen associated with transmission. But the process that PJM goes through the capacity auctions, the other process they have, that clearly will give you the signal for what the price impacts are for any of the transmissions being built across PJM, not just specifically within our footprint. So that -- everything other than that would be just as estimate on my part, and I'm -- it's not my area of expertise.

As far as the potential for competition, the rules in PGM are pretty specific regarding [write our first refusal] for those that have the [right of ways]. And again, if you look at our footprint and what's known within our PSE&G footprint that there really isn't an opportunity for a lot of competition based upon the way the rules are written today.

It may happen but based upon what we know and what we see, there's not a tremendous opportunity for folks to come in over the top on us. There is though again, these projects that we've shown to you is all about what's been assigned to us already. So we've already been awarded these contracts. There's no projections in here about what we think might happen. This is just what we've actually been assigned and what we expect to construct.

THOMSON REUTERS

The opportunity for us to expand outside of that, these are all just potential upsize for us, we're going to continue to look at where that is. And we think we have a unique skill set. We think that skill set brings with it some opportunities. We think the regulators and the folks that [want these] things out for bid will look at us and say, that's a company that you can trust, that executes on what it says, and we expect that to give us some advantages that others might not have.

Caroline Dorsa - ***Public Service Enterprise Group Inc. - EVP, CFO***

I'll just address that pension question. I will go into it in more detail in my section later in the day. But the growth rates that you saw for O&M, the negative numbers, do include pension and you'll see that in guidance from Bill as well as Ralph's guidance. So they are embedded in our total guidance and in our subsidiary guidance.

As you know from looking at our [deck] and as you listen to our call, we had a significant change from expense to modest very small amount income. So if you didn't have that sort of a swing, you wouldn't have the kind of numbers you have here. What you have would be a small change in the upper direction. But what I can tell you is that number in terms of what that growth could be is less than what you saw last year in terms of a CAGR. And that reflects the fact as Ralph said, that there's operational focus on cost all across the business.

So while we're happy for our pension and it's real, what I can tell you is the fundamentals of the business had even less growth than what we had shown last year when we gave you the O&M CAGR.

Oh, we've always had pensions, and all of our numbers have always included pension, all the time.

Unidentified Company Representative

Great. Ralph, over here.

Unidentified Company Representative

Yes.

Unidentified Audience Member

Good morning. Quick follow up on CapEx here, could you discuss a little bit more about what the change versus the prior forecast was, the $3 billion change? It seems like $2 billion came from transmission as a $1 billion in other, could you talk perhaps about chunky projects within that outside of the Bergen line you also discuss?

Ralph LaRossa - ***Public Service Electric and Gas - President and COO***

Well, yes, I mean, it will begin into a lot more detail, and I can talk to you about any of the different breakers that are being upgraded at the different stations. There's a number of different things. If you look at the PGM [art top] plan, it outlines those in an individual basis. So there's different assets that are being upgraded on a regular basis within that process.

Unidentified Audience Member

Anything outside of the Bergen line in your mind that is particularly to be following here?

Ralph LaRossa - ***Public Service Electric and Gas - President and COO***

THOMSON REUTERS

SI-SSA-0015-12698

No, I think it's just -- it's just more of the same. When PJM looks at where there's constraints and where there's opportunities from a reliability stand point, they're looking for all of the companies within its footprint to put that capital to work.

Unidentified Audience Member

And I'd be curious, could you comment a little bit more on the life opportunity just as it relates to Utility 2.0 and some of the other investments? Is that included perhaps also in your CapEx?

Ralph LaRossa *- Public Service Electric and Gas - President and COO*

There's absolutely nothing included in here except for what's known on the transmission side. So that's -- the potential on the Utility 2.0 is for us to make investments and like I said, energy efficiency and all the behind the meter solutions that the policy makers in New York may want to have.

Unidentified Audience Member

Do you have any sense of scale as to when you find out in any kind of --

---

Unidentified Company Representative

I think you'll be hearing from the PSC as a whole for New York that they will be starting some proceedings and I think that we'll maybe a little bit in front of it because we're not regulated by the PSC, but they provide oversight. So they may want to try some things with us as we move forward.

Unidentified Audience Member

Thank you.

Michael Lapides *- Goldman Sachs - Analyst*

Hey, Ralph. Michael Lapides of Goldman Sachs. I want to ask are there earning streams or major revenue streams at the utility that aren't necessarily driven by rate base? And the only reason why I ask that question because I'm looking at the rate base guidance that both you and Ralph have shown on the slide so far. That $13.7 billion of rate base come 2016 timeframe. I mean, if I just do kind of -- I don't know, back of the envelop math and assume 50-50 cap structure and kind of a weighted average blended or we have 11%, I get around $750 million of net income from rate base. But given your guidance for 2014, I am struggling to see where the double digit potential earnings growth come from, unless there are other earning sources outside that is driven by rate base.

Ralph Izzo *- Public Service Electric and Gas - President and CEO*

The only other revenue that we have is our appliance service business which is not substantial I think from the analysis that you just did on the back of the envelop to move that needle. I don't know if I exactly followed where you were going with that. But I think we talked about our earnings growth for next year. And I think that's pretty clear where that's coming from.

Unidentified Audience Member

Ralph, maybe just to follow up on Michael's question. From an earned ROE perspective what are your expectations, I guess more importantly at the distribution utility to sustain that level of EPS growth?

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

Ralph LaRossa - ***Public Service Electric and Gas - President and COO***

So our allowed ROE if you -- again, if you go back to 2009 and when we came out [less every case] 2009, 2010, I think it's really important to realize that that throughput was exactly or about the same as it was today, our [ROE] was about what it was today. And we've been -- we've been investing at the distribution level at depreciation level.

So if you take those three pieces together, we're around our allowed ROE. That's the way we set the business up. That's why we continue to look at it. So if you just do the back of the envelop math based upon that, [that's] the capital that we have in the distribution system.

Unidentified Audience Member

And I guess one other question you're showing you're kind of flat bills on many year basis even with the huge amount of CapEx, can you just walk through some of the offsets as to what's mitigating the rate increase? I know energy is part of that, what else is going --

Ralph Izzo - ***Public Service Electric and Gas - President and CEO***

The other thing is that we have a lot of old clauses that are coming off the bill. There was some NUG contracts that were existing that are out there that are going to be rolling off the bill, some of the subsidize generation that existed in the past years that really had a large impact on the customer's bill, really drove the price up, that's going to be coming off as we go forward. I think that's the major piece that you see rolling off when you look and the securitization is rolling off the bill as well from the past.

Unidentified Audience Member

Two questions, one is you have mentioned right that there's some credits which start to go off. Am I right those credit is just automatically get off the -- if they don't approve energy strong, the prices will automatically start going down for the customers, is that correct? You don't have to go in -- there's no room created like extra room and all that.

Ralph LaRossa - ***Public Service Electric and Gas - President and COO***

Oh, no, they go down, right? Those are clauses that are just passed through. So there's no earnings that we would keep if that goes away. But the impact from energy strongly is miniscule as it related to where the prices were in 2008.

Unidentified Audience Member

Okay. And second, based on your transmission CapEx that you provided, I know that you give us 36% of rate basis of 13%. But what kind of rate base percentage does it get to in '16 or '17, is it above 50% or something like that?

Ralph LaRosssa - ***Public Service Electric and Gas - President and COO***

Yes. So [Kathleen] just has it at the top of her head. Just slightly in excess of 40.

Unidentified Audience Member

In excess of 40. Okay.

Ralph LaRossa - ***Public Service Electric and Gas - President and COO***

THOMSON REUTERS

SI-SSA-0015-12700

Just above it.

Unidentified Audience Member

Okay. Thank you.

Ralph LaRossa *- Public Service Electric and Gas - President and COO*

Okay. If there's no more questions I -- one more? Okay.

Unidentified Audience Member

[I needed one]. I was just kind of curious if you could comment on some of the articles that have been showing up in the journal about substation vulnerability, any particular -- what are you guys doing in terms of hardening this critical asset within your infrastructure?

Ralph LaRossa *- Public Service Electric and Gas - President and COO*

So again, some of the articles that have seen in the paper -- you're referring to what happen in the West? So what we're doing [with] overarching everything that is -- and we talked about whether [the interest rate is in and building] redundancy and resiliency into the system. There's nothing more that you can do to improve the reliability for the customer and then to make sure that they've got all the paths for those electronics to flow through. So that's our number one focus.

From a plan security stand point, we've been in the forefront for a number of years in New Jersey on that. We have our Security Department as Mike Paszynsky and our cyber security group that's lead through our IT Department have been doing a fantastic job of being out front, whether it's in our State's Homeland and Security programs or involvement with the local authorities. So we continuously monitor that, continuously update, whether it would be cameras or a higher fences or more guards or something different. We learn a lot from Bill's organization, who does a lot at the nuclear front. So we leverage all those best practices and bring them to the table. But overarching everything, you have to bring more resiliency, redundancy into the grid.

Ralph Izzo, ***Public Service Enterprise Group – President and CEO***

As we were hearing so many people ask, what are you doing as the result of what's going on in the west. [John McCovoy] and I were sitting there, we were just -- we were just keep shaking our heads as if people just woke up in April of '13 to the possibility of physical risks to their assets. I mean, [is our memory -- our memory is that] short? Can I take it back about 13 years ago to something that happen not too far from here, we've invested over [quarter of a billion dollars] in the Security Command Center.

We have cameras and diagnostic equipment. At some point though, Civil Defense becomes the responsibility of government. And it's just irresponsible -- we've been on a critical infrastructure, [was the] majority for 13 years [in some of our] assets. We're not going to give that information to [Rebecca Smith, but she's just insane].

So John, [I send it to Senator Murkowski] it was like -- she was hearing things for the first time. And oh, we had a problem in the East Coast [and we have to defend] our infrastructure. So my team is far too shy. We have done everything and then some that a private entity should do and at some point Civil Defense is the responsibility of the government.

Ralph Izzo *- Public Service Electric and Gas - President and CEO*

That was good. That was good.

THOMSON REUTERS

John Cohen *- ISI - Analyst*

Hi, thanks. It's [John Cohen from ISI]. Just -- if you were to think that we are an environment of flat demand growth for awhile and that we're at an inflection point for distributed generation. It would seem to me that high voltage transmission is the asset type that has the potential to become the most useless in the future. So we're investing -- you've invested $4.5 billion in transmission and other 6.8 to come, these are 100-year assets. I mean, if you thought that demand wasn't growing and there's going to be a ton of new combining power solar, some of those become redundant potentially within the next 10 years. And is FERC thinking about this? Is PJM thinking about it?

Ralph LaRossa *- Public Service Electric and Gas - President and COO*

Well, I think we should all be thinking about it. But the way I think about it is that, distributed generation is a single point of failure. And if you want a reliable system, you want redundancy. And if folks chose to put distributed gen in as a redundant source, that's a choice that they're making. But -- unless we're going to put two or three distributed generators at our home, you still -- I would think we've learned one lesson over the last 10 years is that people demand redundancy and resiliency in the delivery of electricity.

So I do believe that distributed generation will have a place to play. It will have opportunities for people that want to pay for that extra layer of redundancy. It may give us opportunities to better utilize the resources such as combined heat and power where it make sense. But if we're going to build out the environmental solutions that we're talking about whether it would be wind and solar and other things, transmission system is even more important to have as a backbone to the entire grid. And I could go into a long conversation about why that's needed but to just go back to my highway example, you just need to make sure that you don't have those choke points. And if the choke point from my house is the generators sitting on the side of it, that becomes a problem.

Anything else? Okay. Then we're going to take a 15-minute break? Great. Thanks.

(Break)

PRESENTATION

Kathleen Lally *- Public Service Electric and Gas - VP of IR*

Just like to call your attention. We were going to resume the presentations. If you can take your seats.

Kathleen Lally *- Public Service Electric and Gas - VP of IR*

Bill has a naval whistle. He's getting ready. So please take your seats. Oh, great. Thank you. We are -- we're going to resume with presentation of PSEG Power by Bill Levis, President of PSEG Power and he will be followed by Shahid Malik who will -- who is President of ER&T within Power. And I know this is a part of the day that you're all looking forward to. And it's as important as the utilities growth profile is in terms of its capital spending. What power has able to do with its assets is also critically important to PSEG.

With that, I'll turn it over to Bill.

Bill Levis *- PSEG - President & COO, PSEG Power*

Well, thanks, Kathleen, good morning everybody. I'm actually glad to see most folks came back from the break because I get -- after reading here all the pieces from many of you here in this room, I'm thinking I'm [in a dying] business. And I'm just here to tell you that I'm a live and well, that I survived this same sort of death of the business in the '90s and came out stronger and better. And the fact that there are so many folks that don't like our business now, I think it's the ideal time to be in favor. And I think is I'm typically contrary on how I do things anyway.

THOMSON REUTERS

SI-SSA-0015-12702

So I'm going to talk a bit about the Power organization supplemented by Shahid our energy resources and trading organization and how it is we've create value above the normal hedge prices for the price curve.

So you saw this slide from Ralph, and if you were here last year, you saw it in this presentation last year too. And I think you should take comfort in that because we do. This is our business and it helps significantly when we explain to our employees and get them align on where we're going and how we get there that things look the same.

It also helps bringing in new employees because we can sell whether this we're doing. And we can get the right mix of new employees because we're not selling them something that maybe different than what -- how they view our company.

So it is important that we are predictable, and predictable in the strategy is an important piece of that too. And as Ralph, talked about it, it's all about excellence. And in simple terms we make electricity. And to the extent that we can do it safety, reliably, more cost competitively in environmentally responsible fashion, we win. And it's all about winning that our mix competition work.

So these are the items I'm going to touch on the agenda today. And when I'm done, I hope you have a better understanding of how does that we do create value from the different revenue streams that we have and why I think we're actually pretty well positioned for the future, whatever that may bring.

So how is it we create value? And if you look at the headline there, it talks about responding to changing markets and regulations. It does not say predicting, it does not say how [are you predicting our view]? But to understanding what's ahead of you and what could be ahead of you in playing the hand that you're dealt. And essentially by being able to think ahead proactively play defense I call it, we can be ready for whatever comes our way. Whether it's hot weather, whether it's cold weather, whether there's transmission outages and the like in the organization knows how to respond to all those sets of conditions so we can make money when prices are high, we can make money when prices are low. So even when gas prices are high and gas prices are low with different strategies to go for each scenario.

So at the end of the day, it all begins with safety for our business. Ralph, talked about being a nuclear company. We recognize our responsibilities in that area. And it's a focus area each and every day.

Safety also helps us to establish the behaviors we want in the organization for just doing the right thing. And it's doing the right thing that has let this company be 100 plus years old.

And we measure safety and industrial safety performance. And actually I'm proud to report Salem's safety performance last year, the first time in its history. And it's I think no coincidence that they had their best operational performance with that. So we understand how these two items go hand in hand. And it sets the foundation for who we are and what we do.

We take that safety and environmental focus, and by the way, environmental, I'm a big believer that your waste stream is a big measure of efficiency. So in fact better environmental performance, more cost efficient operation because your waste stream is less and you're more efficient in using the resources that you have. And we've had demonstrated that in a number of areas in our company where focus on this has actually improved our cost competitiveness.

And then we use the diversity that we have with different plant types, different fuel types to respond to the [hand that we're dealt] and be able to respond to the conditions in the market place. And in particular you see two notes developments in the Linden combined cycle plants that set a generation record last year. That was despite having a failure of one of its units that we didn't have for five weeks in the year because we had a compressor failure there. And then Salem 2 having a record generation year for 2013.

Under the financial header we talk enough a lot by getting the most out of our existing fleet. Initially that simple strategy was, increased output, extend the life. And we've done that through our generating assets, especially the ones that we're going to rely on well into the future.

We take advantage of their location also in the ancillary area which has been an area we're paying more and more attention to as things like removable generation start penetrating the market place and there's a demand for more ancillary type services. So it's also an advantage area of a number of our units.

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. THOMSON REUTERS

And then you can see that's on the revenue side and in on the cost side have done a number of things to maintain O&M growth to 1.6% over that 2009 and 2014 time period. And I would tell you, when we talk in our organization we don't talk about cost control, we talk about efficiency because you can control cost and do stupid things. And we are here for the long haul to make sure that doesn't happen. And that's why can show what the commercial availability [were combined] cycles [location] now because we're going to make the right investments to make sure they're available to service well into the future.

And at some point the sites that we have are available for expansion. And we're actually taken steps today to make sure we're ready for when that occurs. And the regulatory side, we have a strong regulatory performance. You've see it in the performance indicators we have with our nuclear plants. You see it in the environmental performance with our [fossil] plants.

That is important for a number of reasons I outlined but it also gives us a seat at the table when there's the opportunity to talk about rules in the future. And although we talk about being a non-regulated entity, I have more friends and help than you can imagine. All those rules have the potential to be expensive and getting them right is critical. So we're planning in all those avenues to make sure that the rules are right and it get the desired outcomes that we're looking for.

So this is starting to look like more the same. It's intended to be that way. And in fact when I talk to our people at the beginning of the year (inaudible) what's the strategy for the year? And it's more of the same better. And then I have to get a little inspiration and motivation around that because it doesn't inspire people all the time but if -- but our people do understand that. And I actually follow that up with the caveat that I have than objective to run a boring business which sets people back a little bit. But then we define boring as predictable, reliable, there 24/7, no surprises, being able to manage our future [and not that we didn't have] to react to it, and people understand what that means. And if you do it well, you also get an occasional weekend and a night off too which is also helpful.

So we maximize the value, as Ralph talked about operational excellence. It's pure and simple. If you're the best of what you do, you're going to make it. And that's our focus each and every day. We call it an operational excellence model. We have it in our nuclear plants. We have it in our fossil plants. And it's underway actually at our trading organization to make sure [there's process] rigor and discipline and those key things that make a difference in our business.

So that predictability is important. So we want to get predictable results. At the same time we also want to build a culture of continuous improvement. So if you look at how are our incentive structure is, essentially we have to beat the best and get better to get full credit, to get paid. And that's the culture we want to continue to instill in the organization. So -- although we may be boring, we're going to be talking good at it at the same time and better than -- better than everybody else.

And what does that results in our workforce being a little more involved and engaged, our workforce understanding the business. So when they see, well, a coal plant hasn't run as much, what can we do to help? And we talk about there's an opportunity to use resources at various places in the company because there's more work here now. Our workforce volunteers to participate in that. And they've been very helpful in improving quality and reducing cost for many of those maintenance activities that we have.

In the financial order, what does that mean? It means we meet our commitments. Meeting our commitments is important. It's all about credibility. And in fact last year, we not only meet that, we exceeded the expectations that were set.

And then going forward, maintaining competitive market is critical. It's an important underpinning and foundation of how it is that we make money and getting the market rules rate is important. And I think we made some progress this last year in some key areas Shahid will talk more about them. But more importantly I think this cold weather has got people's attention.

We had some pretty tight days here in the January time period. And I think it's causing self reflection on many folks [parts but] did we get this planning right? And in my opinion, we were worried so much about the summer time that we forgot that the winter time was actually the more critical time period. And the winter time shows the need in value of diverse fuel types. And if you think about from a customer stand point, in the summer time if you lose power, you're uncomfortable. And winter time if you lose power, a lot more serious things can occur.

So I think this has the attention of the right people. I'm seeing more dialogue (inaudible) actually encouraged by what I see happening. But remember room is not built in a day and this market won't be fixed in a day either and different markets had different challenges that Shahid will talk about.

On a discipline investment side, we're able to seize an opportunity last year in advance gas path. We saw an opportunity to upgrade our combined cycles. I'll show a side about the particulars of that in a minute. The important point on this one is though, this was a project that we approved in

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

August of last year. And when we saw the Linden failure of an air compressor, we took the opportunity then to move that power upgrade forward for that Linden facility.

So we were able to respond rapidly to what was a bad situation and make it better so all -- our both Linden one and two that's will be available with this upgrade by the summer time. In fact one of the Linden units is finishing currently and it will be really available here at the end of March.

We're going to continue to seek new opportunity in target markets. We are also part of the [Life] project. We're in a transition year in particular. Shahid's organizations are going to be responsible for unit dispatch and fuel procurement. So we are underway with our transition and we take over that service in January of next year.

And then there's this note here about early site permit. And you would ask why would you think about new nuclear? Well, like I said, I don't predict the future. But fortunately in the '90s when there was some tough times in the nuclear business, some people thought about this question then and actually put in place the process that's being used today for those plants that are being built in South Carolina and Georgia.

There's another important thing that's happening as a result of this. And that is as we're going through the post-Fukushima type things, we've come up with a new model essentially to predict the flooding impacts. This model actually is -- will show that there is a fair amount of conservatives than the old method. And so, to get this through and approved, [we'll essentially] I think we need to do on our existing sites (inaudible).

So it's a proving ground for some models, some new methodologies, we're being able to look at the regulatory issues and having a seat at the table is an important piece going forward I believe.

You see we did complete 18 or 19 Megawatt of solar last year. That 4 Megawatt are shown under construction, actually went commercial yesterday. And there's a robust pipeline of solar projects being developed and actually we have exclusivity agreements with a number of folks to bring more of those into the fold.

So 2013 did have us challenges last year, and they presented themselves first of all, we were still recovering from Super Storm Sandy if you recall. And we had a number of units not back in service at the beginning of last year. And we [that cold] if you remember in the middle of January and we had about six weeks or so of pretty extreme weather. It's interesting that how folks [were they get -- sometimes] they get cold in the North.

And so, with [Ralph's] point about history, we do a short memories in many years and especially in the [winter] last year. I think folks got cut short when they got cold. We also saw -- Ralph talked about their transmission [bills] going on. That creates other interesting opportunities and challenges because it creates congestion at different places. And also creates different basis challenges depending on what work is going on, not only transmission wise but unit wise. And we saw a fair amount of volatility there last year in that area.

So we saw lower gas prices but pressure on dark spreads and [we didn't see lowest] recovery. And despite those various challenges, you [saw winners that] we came up. And how did we do that? We put together a pretty aggressive and optimize schedule for unit recovery and sometimes you get lucky.

So we knew how important Linden was to us. We basically took that Linden and put it together twice, had it available for service January 12, it got [cold] January 14. I guess that I didn't predict the weather. But obviously you know that sooner is better than later relative to a unit like that that's very profitable.

And we went through a process right after Hudson returned first on gas and later on coal. And [apparently] went through that to get these units back in a timely but still in a financially responsible fashion. And I think the most important part of that work is they were available when needed. And the quality of the work were shown because they're higher viability throughout the year.

We took advantage actually of low cost gas, and Shahid will talk a little bit more about that. So we're actually some of our shorter periods became more profitable for us than they did before because of good [spark spreads], good expansion as a result to that. We were able to switch between coal and gas and Hudson play last year just because of what the low price of gas was, which helped us capture value. We also optimize inventory on coal with one of our coal contracts allows us to sell coal. And then also look at inventory -- inventory levels and got those in the right threshold and then -- and got some earnings opportunity that were made sense. But the real point at the bottom which is important is the flexibility we have to be able to respond to what happens in a real time.

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

So what does that mean? That meant at the beginning of the year where we thought we'd be 535 to 600. We upgraded that in the third quarter to 630 to 685 and ended up at 710. And you can see the transfer of solar source to that, that's worth about $15 million. So at the end of the year we still exceeded that guidance.

Now, how do we do that? There's some notes at the bottom there and Shahid will talk some more about these but volatility is important. And being able to predict it is impossible. But responding to it is important. And we -- being able to do that [in the winter when it] was cold and in the extreme heat in the summer was important. And also that shows up basis volatility at times and having [load serving] contracts in addition hedges or the block hedges are important in dealing with that.

Lower gas cost meant better run time for our combined cycles, fuel flexibility means we switch them when we can. But I want to highlight how important what I call dialogue conversation in understanding the market is here.

So one of the areas we had been working on extensively is essentially teamwork between our Fossil organization and our ER&T organization. So that our ER&T folks understand fossil plant operations to some extent, limitations and opportunities and likewise the folks in the Fossil organization understand the job that they're ER&T organization is doing every day. And I'll just give you two examples of how that plays out.

Every day we make a decision do we run our units through the night or not. And if you were to quick economic calculation, it's a pretty simple decision to make with the pricing power, with the price of gas (inaudible) decision but it's actually a little more complicated than that because every time you cycle (inaudible) you incur some additional maintenance cost at some point. So what did that worth?

But more important than that is the conversation happens as what do we think the peak is going to look like in the morning. And if we come off, what's the slight risk that we don't come back and we miss that potentially valuable time period in the morning? And it's managing that volatility on a day to day basis that those decisions are made.

So we actually have a score card metric that look at our ability to make that decision every day. Do we make the right decision or make the wrong decision? And there are numerous decisions like that that get made every day.

Last fall our folks saw an opportunity to capture some value in New England because folks saw the price of power increasing there and wanted to capture some of that. So discussion with the Fossil organization (inaudible) if we're going to go this (inaudible) discuss as how much do you lock in but then we have to be able to deliver on that. And so, we pulled an outage forward in our station in New England to -- from [schedule mid spring] to the fall to make sure that would run reliably during this winter time period were essentially we grab some of the value that we saw last fall. That's the dynamic hedging program that Ralph talked about before that we use with our [mid merit] plans. And so, that pulling that outage forward making those improvements has allowed for that unit to run at 70% capacity factor so far this year.

Just to remind of where we are, first bullet is we are [near loads]. Why is that important? Because I read this discussion about when our locational advantages gone away, it's never going away. The question is what's it going to be worth? Because as Ralph talked about highways, this is the most energy intensive area [the country] where we live. And at some point there's going to be congestion. It's just a matter of when that is. Whether that's an issue on the system or extreme heat or cold, but at some point, there's going to be that congestion which is volatility which is opportunity.

The other point I would make is after HEDD, High Electric Demand Day, are some of these units do get retired? I'm going to show you a slide next that basically shows you how we're poised for that. And in fact that we maintain fuel diversity and actually improved efficiency post this time period.

So looking forward it is important for us to maintain fuel diversity and you don't need to see the various color mixes (inaudible) but other than notice the mix and see them all there. And being able to do load serving along with block hedge is important. And doing an environmental responsible fashion and you see upgrades from [pitch pot and the AGP] and the like.

Kalaeloa is an interesting story. By the way it's a 208 Megawatt combined cycle unit in the island of Oahu. The only combined cycle unit there. And it is an interesting test case to see the impact of renewables on the grid and what the value of ancillary services might be. And that's going to play out for us in the next couple of years as we renegotiate our power purchase agreement with the utility there.

So the other item that I want to point out here, as you see actually the capacity goes down but generation goes up. And that generation goes up will be cleaner and more efficient.

THOMSON REUTERS

SI-SSA-0015-12706

So a reminder again about this asset based that we had and where it is and Shahid will show a similar slide, my message to you is this is -- I look at base load generation, is it pays the bills for us? It does allow for a steady stream of cash, allows us to -- with good operations, allows us to hedge this 100% of base load that we talked about. We are picking units that do provide a hedge for operational purposes, but more importantly take the opportunity for real time pricing. And then we have our mid merit units in the middle that we dynamically hedge and look for opportunities for intraday, intra-month and intra-year. The other item to point out is the 60% of our fleet has fuel flexibility that we can switch between oil, gas, coal gas and the like.

So you see this whole purple dot there on the right. That's our [C-warn] station. And C-warn is an interesting example, if I were up here last year, I would have told you I didn't think I've see that dot on the map this year. It was one of the site's most heavily impacted by Hurricane Sandy. It was our oldest plant. And it was not clear to me that we will make things best when we need to restore that plant.

[Now, this plant] got a pretty proud history. And they've a little chalk board in the cafeteria where they write number of successes starts. And all four units are [call for Sandy] and the number on the board at that time was 247 consecutive start where they've been called and then it came online when expected.

And so, we have meet with the folks [on the site], laid out the challenges for the people. And we left and then the plant manager rallied its folks and he wrote the number 248 on the board. And it was about what do we going to do folks to get to 248? And our folks figured it out. To be able to addressed what needed to be fixed and get that unit back. And so that it run during that extreme heat conditions of the summer last year.

So when you want to know what makes up that difference between that $100 million, it's those kinds of examples and I have a ton of them that are $2 million formally and $6 million examples, where our people deliver on those sorts of things every day.

So nuclear is a foundation of our success. And as I said, it's a foundation of how we hedge. And just a couple of reminders, Hope Creek is a boiling water reactor, licensed until 2046, Salem -- and that's 100% owned and operated by us. Salem pressurized water reactor 57% owned by us. And you can see the Peach Bottom facility. But what is really important on this slide, EPU for Hope Creek is done.

Steam generator replacement for Salem is done. Reactor head replacement for Salem is done. Our spent fuel storage facility where it will give us a 60 years of fuel storage is done. And with that essentially, a lot of the capital spend that we talk about is behind us. In addition we've settled with DEO so we get recovery for the program that we have.

So it is all about managing our business day to day because those large expenditures are behind us. The other note as you see, [Peach Bottom unit two] fall outage is when EPU will be put in for that unit and available in January of '15 and then the next fall for unit three.

So you saw our strong nuclear operations helps us in many, many ways. It's a significant earnings contributor. And I'll show you slide where we stand from a cost perspective. But the other thing that these units have gone for them, they're going to be around for a number of years. And that allows us to continue to attract top quality staff to her organization.

And if -- I mentioned I think last year that we were replacing a third of our people every five years. That's actually accelerated. If you look over the last three years, we've replaced one-third of our plant staff. And like everything else, we got new people, come new ideas, new challenges and new opportunities to do things and I think we're benefiting from the new generation coming. And this idea of how you can use technology is an important piece of that.

Fukushima action plan has been submitted. We actually start on implementing that in our fall [sale outage]. You've heard of the phrase, it’s not an acronym, It just stands for the approach on how this is being done. If we were successful as an industry, we won't need any more regulators after that because I think we've copied everything that can go wrong and we have a different way to deal with it at this point. And that's actually our push going forward as we should be done. And [flex] will give us that opportunity I believe.

A reminder again in the Peach Bottom upgrade, and just to note on the bottom [about these various huge] organization and how they impact our business. The institute of nuclear power operations, it has excellence, it's underpinning. And so, a lot of work going on with INPO right now to make sure excellence and efficiency sit in the same sentence in looking at our industry and how we do certain things and how can we work efficiently to do them.

NEIs, our Nuclear Energy Institute the group that works with members of Congress and the NRC, a lot of focus there to make sure that the regulations that we have are safety focused. And not causing unduly burdens and other unattended consequences that weren't meant to happen.

THOMSON REUTERS

SI-SSA-0015-12707

Electric Power Research Institute to make sure the research is focused in the right areas. So you will start hearing about life beyond 60 hear pretty soon because number of these nuclear plants I believe will be able to operate beyond 60 years. The USA Alliances and alliance of single unit operators that they can share best practices and also technical expertise to help so technically challenged problems. It's the opportunity there for single unit operator to be able to get the benefits of being a fleet and we're active in all of those.

So we talked about locational advantage and how that helps us from the revenue side and this is where we stand on the cost side and [this looks at all in] cost that is fuel capital and O&M. And you can see where we stand relative to the others, essentially 30% -- greater than 30%, better than [the] average, top quartile in this particular area. The other item of notice the units that were challenged economically, and that's just on there in that far left 50 number you see. So a single unit average is about $50 all in cost.

Fossil organization continue to show improvement last year. The items of note here combine cycle, continued strong output, improved output from coal last year as the market required it. I put up [E4P] that is a measure how well did our units do during peak times at peak period. And to the extent that you did better than the -- submitted in the capacity market and there's folks who didn't, there's a pool of money here that's provided among the winners I call it and we've won five years in a row now. On the peaking side, you see the start success. Just to give an idea, over 3,300 successful starts last year, that means we're starting a peaking nearly about 10 times a day.

So significant investment and attention in a combined cycle units, they are becoming the workforce for us. So we have done a fair amount of work with some outside help to make sure that all the efficiency items are appropriately identified, categorized, prioritized and we're working through those. In addition to that, training our people on them. So we've see plant simulators with computers to help us in that area. And outage work is focused on the -- this heat rate improvements that you see.

Those improvements that you see, that's worth about $17 million. And that two goal line that's worth about another $5 million. And the second gas line at [BEC] we want to get a little more fuel flexibility up there [too] so that gas line is actually complete, being commissioned currently, so we'll have two sources of gas that we expect to provide some advantages in the shorter periods.

So a little more about advance gas path and what it is. That's Linden 1, Linden 2, BEC and Bergen 2. It can -- the total investments of about $190 million, $120 million of that which is capital. And you can see the specific numbers for each of the unit. And as I said, in those Linden megawatt of 63 will be available here this summer. And there's two things for us, it improves heat rate, you see a 1.2% improvement. It also extends the maintenance life.

So these starts and stops that I talked about all the time, we get a 25% extension in plant life before this to be replaced. And it's a significant help for us into the future.

With all that, this is our slide that shows you can increase and improve generation and reduce emissions at the same time. And by focusing on both many part of this are benefited and we think it's one of the unique features of our fleet here. And so, you can see how generation is actually gone up through the years, emissions have gone down significantly. Mercury is not on here but it would show greater than 80% reduction also.

And a simple example of how you can respond to changing conditions, half a dozen years ago, we used to do many environmental tests. And since all the units were in the money all the time, it almost didn't matter when you did them or how long it took you to do them. But when the market change, this started becoming a significant impact on us from a cost [if we happen to run these units] off cost to do environmental testing.

So if you think about where were doing, we're running these units to see how much they [would polute in the case] they were called to run. So we worked significantly with our regulator and others and looked at the testing we were doing, how could we do it better, how can we do it different, and what testing really needed to be done. We reduced to the amount of testing we had [to by] 80%.

And the remaining testing we've figured out how to do with technology for the most part and that was using this continuous emission monitoring system. And if you get these things to work right and get them to certified, you can use them in [lou] of people having to climb up stacks and putting in proves and those sorts of things. So the clear case to me where the environment benefited and our cost to reduce (inaudible) were $5 million to $7 million a year for us depending on what market conditions are.

So this a picture of our capital expenditures and I think you can see it clearly that the numbers are done and they're done for the reason I describe before, we have most the environmental projects [and we have the] big nuclear projects are behind us. You see a pretty steady maintenance capital

THOMSON REUTERS

SI-SSA-0015-12708

about $200 million a year. And in the year 2014, the big numbers there for the growth there your pitch bottom [upper AGP], and even [black star]. So when we lost our [ATDD] units, one other things that the grid also lost was black star capability because 18 of units provided that service.

So as a result of that (inaudible) had to go out through a procurement and an RFP and we were able to bid and win on that and converting four of our units to black star units. So that's about $16 million of investment for us this year to have that available for next year. The [common FCR] substantially complete this year with some small payments next year. The other regulatory items you see going forward are essentially Fukushima.

So this is our O&M picture in the Power organization. And like I said, it is focused on efficiency has been I would say, retentless but continuing in our organization. And we've done a number of assessments at our Fossil plants. We've taken those same team of people to our nuclear plants. We have productivity studies, outage efficiency initiatives and the like. And numerous work with the supplier organization to work with suppliers and get different prices and actually to leverage spend across the enterprise.

And we're doing a much better job and all that is helping us to adequately control cost. And if you think about the number of people that we're hiring essentially the folks that were coming in are really under also a different benefit package (inaudible) folks that are retiring for the most part.

And from the growth perspective and -- we talk about good locations, they're good locations, they will be good locations in the future. And we're getting ready for that, ready for that means that [designs on the Shale for picking] units design on the Shale for combined cycle units. I've talked a little about what we're doing for nuclear but we even have a pilot program going on at our [Bone Kent] facility where we're having essentially the slight decommissioned at no cost to us because vendor thinks that it can make them money up on the salvage area. So we're going to see who that goes. And if that's successful we'll take that to some other sites.

On the solar front, we currently on 88 Megawatt of operating solar facilities. One under construction that is actually complete now. And if you look at this [pride seven] projects, they're in six different states. And we now are partner with several different developers and [EEPC] folks. And continue to pursue a pipeline of what we call high quality projects. And we have our definition of what that looks like. And the note that it does provides some post -- good strong EBITDA, post construction period.

So this is an -- I think an important slide when we talk about shaping the rules in the future. So if you operate your plants well, you have credibility with the regulator, then you get to have a seat at the table to determine how the rules are established in the future. And we do that in a number of different places. [Nearly the other items] I point out here.

So Chair of emergency preparedness working group, why is that important? Because that's an [extra on] regulation that's coming. Security working group, why is that important? The biggest increase in cost that we see (inaudible) from security. So as a result of our [CNO's] engagement and involvement in this, we were able to bring down a couple of NRC commissioners to come look at first hand some of the impact of regulation on operations. And frankly it was eye opening to them and that shows what was envisioned at the time to what actually occurred.

And so, we've had -- as a result of that good discussion and dialogue about security and the -- and this simple thing like [force on force drill] that we just went through is modified as a result of this meeting. So these involvements in this committees are useful and it help us.

On the market side, we're very involved in New England. In fact as we talk about the capacity market design there where one of our members is in the key organization that's going to help [us on] that particular area. [Why is that important at 316B]? That's have an impact on our facilities [over our] key player in that organization. And the USA Alliance I talked about already.

But at the end of the day, what separates us I think, and it's about people. And we all have the same machines, we all work in the same market place. And it's a matter of how you leverage your operation and knowledge in machines operations, knowledge of the market place, bringing those together and [there's people] to do that in the end.

So we've had significant work with our HR organization, it provides some tremendous support in the management development, organization of development area. And it's about making our place a fun place to work, albeit boring but it's still fun because we provide opportunities for folks to make a difference.

And if you look at what it is that our folks do every day, the number of decisions that they have to make, they're not locked behind the desk, it actually is pretty exciting work because they're solving problems every day. And it's about how we enable our people and challenge them to get the most out of them that the most rewarding as I watch this developed.

THOMSON REUTERS

It also means that the training and development, succession plan, development plans are very, very active. But the other benefit [this is our people] then become spokes persons for us I the community. And there's no better advocate for what we do than our employees.

So [as I] mentioned, license renewal is done for our nuclear plants, we did that with zero contentions. Remember where we are? And not too many folks can say that. And we were able to do that because we had strong community support because our employees have been valuable members of the community for a long period of time. They're in position to influence and they carry our message for us, and you can ask anything more than that.

And I mentioned the shared resources business. This is a voluntary effort. And we're going to have 120 people from our Fossil plant (inaudible) support a nuclear outage here next month, on a volunteer basis because folks recognizing importance of nuclear operations, how we need to do better in outage cost. And they recognize that everybody can play a role in that.

So with that, I'm going to turn things over to Shahid. He's going to talk about a little more about how we maximize the value in the market place and we'll be available for questions.

Shahid Malik ***- PSEG - President PSEG Energy Resources & Trade***

Thank you, and good morning. He's right that it has been fun and I had more fun in the last three months than I've had for my whole career. This is very, very exciting as you know. And I'm going to talk a little bit about that. But what I'd like to do today was firstly thank you for coming and extend my warm welcome to you as well.

If you recall a year ago, Bill and I talked about I believe that PSEG Power, location, our commercial skills and the breath of our portfolio would allow us to differentiate ourselves from our competition. Well, we believe that this has actually occurred. And frankly we're thrilled as we read reports, that many of you recognized that we are different from others and that we have a very strong platform. And our focus is actually on improvement. Bill talks about continually improvement and our focus is on sustaining that advantage over the long-term.

And so, what I'd like to do is I'd like to describe the actions that we're talking to maximize that portfolio of value and also to position ourselves for the future in the areas of asset management, commercialization of the fleet, and also operational excellence which is very important to us.

So let me start out then by reminding you of the mission. We have three major goals. Firstly, to optimize our assets for our customers and our shareholders. Secondly, to prudently manage risks.

Thirdly, to directly engage with the regulatory agencies in order to protect our assets and also to ensure that we have a robust competitive market in the markets that we're operating in, and if we execute properly, as I believe we have been really maintained that competitive advantage, and that's an advantage that's allowed us to protect the value of the business through this down cycle and also to grow it when attractive opportunities come along.

So, I'm going to spend the next 20 to 30 minutes just outlining how we've dealt with the events of the past year and more importantly how we're positioning ourselves for the future and the talk into three sections starting with the review of the energy markets that we operate in and what the trends appear to be. I would like to describe how our location, our plant type and our commercial activities give us that competitive advantage that we believe. And finally I'd like to outline why we believe we that we have a long term sustainable advantage in this merchant generation space.

As Ralph mentioned earlier on, we don't predict prices but it does appear to look at these three charts starting with the top left chart, that Natural Gas prices have stabilized between the $3.50 to $5.50 of range. It looks like the economics of gas production, the increased demand for gas for heating and for cooling, the increased demand for gas of general industry and you've -- there's always reports in the newspaper that our industry particularly the chemical industry coming back in the United States and also the increased demand for power generation will start to soak up some of the excess supply coming from the shale fuels.

In the short term, as you know, gas stocks are a five-year low and we see up in price pressure from restocking. In fact as we read in the Wall Street Journal this morning and talking about winter's toll in gas inventories and how it may last, they conclude with the [up shot] is that rebuilding storage to summer will be a slog even if temperatures are normal.

So I think we've seen some up of the pressure in the short term at least and in the long term we see that LNG exports will completely chip away that gas production even if that production rises with new discoveries such as the Utica Field.

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. THOMSON REUTERS

And while the overall price may increase, there will still be regional disparities and if you have access to shale gas as we do then you can get a price advantage against your competition.

Similarly, the power market in the top right chart appears to have stabilize and in some regions such as New England power prices have moved that much faster than their fuel imports. Of course some of this has -- have been driven by recent extreme weather conditions but it does appear to be enough reason for power prices to continue a cyclical increase in New England and also in the rest of the Northeast.

Now, we don't plan for higher prices, we plan for the market that's given to us. As Bill mentioned earlier on, so what we have to do is make sure that many environment we're able to take advantage of the difference between our fuel and the power and also manage the volatility and the risk associated with it.

Now these power prices, the immediate drivers here as have been previously alluded to be appear to be high fuel prices. There are clearly an increase in the amount of power plant retirements as they reach the end of their lives and also commonly held view frankly that power prices and power markets have been overstocked.

High power prices are hugely beneficial as you know for a base load nuclear fleet but we're not relying on them. And if you look at that bottom left hand chart which indicates the spark spread at PJM; the spark spread indicates the difference in price between the price of power and the price of natural gas, that has also started to stabilize and they start falling which is good news for all gas line and power plants.

And as I'll discuss later PSEG enjoys a higher spark spread due to our access to Marcellus gas in the level indicated on this chart; and for us all of it is very encouraging and may it really be an inflection point in the merchant sector.

Turning to the generation front, this chart on the left from PJM shows a cumulative amount of generation, the activation notices, that total just over 14 gigawatts of capacity shutting down by 2017, really driven by environmental rules but also we believe the reality is poor cash flow. We and others predict that the final number will actually be well over 20 gigawatts driven more by economics of negative cash flow for coal plants and also most likely for the negative cash flow that we'll see from some single five nuclear power plants as well.

This right hand chart, an information comes from PJM again, predicts that reserve margins will fall to 18% within three years. This reserve margins as you can see from the shaded area are met in large part by demand response and by renewables. And this is a major concern frankly since demand response can be helpful in reducing load with the supplies tight but can't increase electricity supply nor the ancillary services that are needed to bolster the grid in times of need.

And the industry and I believe some of the regulatory agencies are increasing it's taken the view that DR should be treated more as an energy product and not as a capacity product. Similarly renewables are a hostage to the weather and grid operators have to estimate how reliable they actually will be in the event of a need in the system.

And UBS, a front that UBS recently hosted the Brattle group in December to new Brattle's comprehensive analysis of PJM retirements. Now with the report -- very good report and the impact of the various coal shutdowns and market prices.

Brattle's conclusion was that on peak power prices could rise by at least $3 to $4 per megawatt hour from these levels and could rise as much as $9 to $11 per megawatt hour under certain circumstances by 2020. And by the way, I really must commend all of you at Wall Street analysis and analyst teams the various conferences you host that could [detain a lot] in your analysis, the insight of these informative opinions are really a major source of information and also adds to our strength because from time to time management reads these stuff and they call me up and say they well, are they right? And I wouldn't tell you what I can say but suffice to say that you all did a great job keeping us on our toes and thank you for the hard work. If you could upgrade us again, that will be appreciated even more but thank you anyway.

Let me move on the regulatory front and this is really very important for us and we believe that we're making headway on several key market design issues that have been transversely affecting the generation sector. I'd like to highlight four areas.

First, the threat of subsidized generation has been resoundingly defeated in federal court. Although the verdict is under appeal, we believe that this removes a major overhang in our IPP sector.

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

Secondly, the poor state of the generation market has forced PJM to reexamine and improve their market design so that they can start sending the correct market price signals. And they're looking hard, very hard now at energy price formation and how they should scale back to their suppression of price signals which really has led to a dire lack of investment over the years particularly I might say in New England.

So that's an important area that's being looked at very carefully by all the ISO service and of course we have to sit in the table trying to make sure that those correct inputs are given.

Thirdly and very importantly for us, PJM and the New England ISO are also trying to improve their capacity markets in each of their regions. The capacity market, the auction in New England last month which is going from bust to boom inside two years reflect frankly the desperate state of that markets design which only now at least we're improving.

And our friends at Morgan Stanley issued a research note on January asking has New England market become the new Texas. Quite encouraging. So in addition to that -- both ISOs and recognizing that the power grid that really relies on demand response for a major cut of their reserve margin cannot really be robust power grid.

So, tightening the standards for what qualifies to the capacity market, a strict measurement verification, the requirements in New England for demand response to [bid in the day] ahead energy markets and PJM's goal to prevent demand response from gaining the incremental capacity options are expected we believe to have an impact on future capacity values.

And as you may have followed in the press like last week, FERC did approve several of these measures as requested by PJM and we believe that this does bode well for the integrity of the capacity market and there are additional rule makings that are also being examined by -- so like at this time that we believe will support not just the PJM market but also the New England market.

And fourth, gas to electric coordination is improving but still need detention as the event of these past weeks are clearly borne out. And in the interest of all stakeholders to better manage this inter-player and we're really pleased that Ralph LaRossa who's Chairman of the American Gas Association this year has played an active role on behalf of the industry to help make that happen.

At the same time I'd like to acknowledge PSEGs regulatory teams who are actively involved in every issue and helping us as Bill mentioned to have a seat at the table when all these decisions are being made.

So let me move on now and talk about what we believe is our competitive advantage that we have in the merchant generation space. Let me start then with our power assets, they bring us great diversity both geographic, fuel type and economic dispatch-wise.

So this is the dispatch step for our PJM power plants where the bulk of our operations are and it shows the breadth of our operation up and down the cost curve. On the left axis, you can see the relative cost for megawatt hour of running these plants and the more efficient plants are those that are on the bottom left hand side of the chart.

These plants typically base load nuclear and are base load coal plants which includes our Pennsylvania generation and as you saw earlier on nuclear fleet performs very well and last year had over 90% capacity factor. [Alignment] there is that all the time really helps us in the commercial arm, give us great confidence to sell against them.

Similarly, our share of two coal plants in Western PA that burn local Appalachian coal, so we have price advantage on Western PJM because of this. And the shale translations are very well run and Conemaugh is being upgraded with an SCR this year and that means that by next year both our plants, the Keystone and Conemaugh will have full environmental controls.

In the middle as we move over, we have an intermediate fleet, 3200 megawatts worth of combined cycles plus the oil field coal plants. The green circles reflect our combined cycles and these have been moving down over the years as we gain access to Marcellus gas and as we improve the operating characteristics of these units.

I still mentioned over the next three years we will operate these units plus the units in New York with advanced gas path operates which will improve the heat rates, increase our output and also allows us to capture additional ancillaries of this revenue.

These operate -- these upgrades and the location on the grid for our combined cycle I believe will continue to make them the units to beat in PJM, nobody else is going to be able to beat them, I don't believe.

THOMSON REUTERS

SI-SSA-0015-12712

Now on the right hand column of the high heat rate units, this includes our peakers that typically don't run very often but are incredibly valuable in volatile markets. These total nearly 5,000 megawatts of deal fuel, oil or gas generation that can really take advantage of the gas and power volatility which as you know has been exceptionally strong last summer and also these past winter.

And of course in the trading desk, we are really acutely aware of what changes in commodity prices do to the relative economics of these power plants and so we have these wide bed of options and that gives us a significant advantage in choosing which plant to dispatch depending on the market conditions of fuel at that location and in order to meet the goods requirement.

So the result, we are aggressive in managing the dispatch of our plants and we're willing to switch fuels until we start quicker than even before to maximize our revenues. So whether it's switching to more economic fuel of psyching the units at night we're doing our own self scheduling in order to get a place in the dispatch and we're very actively managing the fleet to the benefit of our bottom line.

Another competitive advantage that we have is our very strong natural gas tradition in the Northeast and I talked about this before. PSEG has one of the largest gas transportation, gas storage and gas procurement operations in the country.

Last year, we've bought over 140 BFC of gas through our power generation as well as over 200 BCF for our New Jersey residential customers. Now the lower cost supplies for us have come from the Tennessee 300 line in the Northeastern part of Pennsylvania and the trans (inaudible) line in Central PA. And we also by the way have significant Texas Eastern capacity in Southwestern PA which is where a lot of the new gas element on Marcellus shale is taking place.

And this winter, we've seen incredible volatility in the gas price due to a number of factors but principally due to extreme weather conditions in the Northeast and very strong New England markets as well. Despite this we've maintained gas supply to all our customers for heating and we've been able to buy additional gas for our power plants to sell into these very high electric prices and to capture significant value.

And again in 2013, which is very important for us, we're very proud that the service that we provide for our residential utility customers in New Jersey allows them to have the lowest consumer gas price in the state. As well as four5 consecutive months of gas bill credits from last December to this March and as a customer of PSEG I'm hoping to get that gas credit increasing Ralph.

So you can see that our storage assets, pipeline contracts and also on the people dimension are experienced traders and marketers and also by being short in a long gas market gives us tremendous location advantage and when you add that to our strong electrical portfolio in PJM, we believe that we have an unmatched position in the New Atlantic in the Northeast.

As previously mentioned, instead of being 100% dependent now on gas from Canada and from the Gulf Coast, we are in a very fortunate position of being able to buy our gas locally from Pennsylvania or from wherever is the cheapest source. And this chart shows you the spread last year between Marcellus gas and in this case the alternative for us Henry Hub.

If we could clearly, we would buy all of our gas from the Marcellus which prices are best represented by the orange line and decidedly we can't buy everything from the Marcellus but over 25% of our gas generation does indeed come from this area where discounts in the past year to Henry Hub which is represented by orange line of having quite large depending on the season.

At some points in a year, we've been able to buy gas well below the market since we are a buyer of last resort for many of these producers and marketers which allows our customers to get an expensive gas --- inexpensive gas. And also in the summer time, when heating demand is low allows our generation to use this discounted gas and to provide us with the largest stock spread in the stock spread margin that PJM would indicate.

Now, as I previously mentioned we're located in the premium power market next to the largest load pocket in America and when we talk about the locational value of our assets, we reflected some of that value as being the positive metric basis that's inherent in our position.

Basis reflect the premium that our asset receive relative to the PJM West price and most of our competitors receive. And basis is impacted by a variety of factors principally by the absolute level of prices, by the amount of load in the region, by the way in which the units are dispatched according to the relative fuel economics on that day and crucially by the amount of electric and gas transmission into the region.

And each of these elements as you know has changed over the last few years and we expect changes in the future as PSE&G, our utility, and others build both electric and gas transmission into the eastern PJM region.

THOMSON REUTERS

As a result, we expect forward basis will continue to be pressured but will remain positive. However very important is to note basis we believe will remain very volatile in prompt periods driven by factors such as weather and operational outages.

And if you look at these three charts I have up here, the top left chart shows the future annualized basis. It looks pretty mild in fact averaging between $3 to $6 per megawatt hour. Our BGS sales, our sales -- default sales in New Jersey and much of our base load forward hedging receives these values.

But the top right and the bottom right chart really show you what's happening in the day ahead in the real time market which is when we sell of the rest of our fleet. Basis prices have regularly spiked over $50 per megawatt hour. In fact yesterday morning, according to the official 7 o'clock, and there was a $50 spread -- $55 spread between PJM and PS North in favor of PS.

And as you can see, if these prices spike all the time, we have to be in position with our units and with our commercial skills to take advantage of that and so if we time it right which we really can do and then in this period of time which can measure several thousand megawatts is able to receive some of these high prices.

This volatility, it's hugely impactful to our business and a considerable source of income that most of the -- others can't replicate and this represents in effect the auction value of having a gas fleet and if you could monetize the auction value, then that's very helpful to our position.

Now on the next two slides, you have to bear with me, we have some funky charts here. On the next two slides we wanted to demonstrate the flexibility of the portfolio and how we're able to leverage the assets when market conditions permit.

As I think you read January 7 was a record cold day in the Northeast, PJMs record, our gas customers have a record and we're the largest gas send out for -- in PSEG's history for our residential customers. In fact the whole week was freezing and they had prices as you can see from this chart in blue had cleared at a $58 premium [MCF] for gas and then the $300 per megawatt hour range for power.

As the day commenced, power started to spiked. Our prices started to spike for both gas and then power due to that really cold weather that we were having and we saw extreme huge demand from the marketplace but also there are operational problems as a result of this cold weather.

In fact on the gas side in the Marcellus, some wells had froze off. In addition, one of the major pipelines into the region [Tetco] had compression problems which cut deliveries in fact they even cut deliveries to us unfortunately.

And for the oil gas curtailments as well as operational issues at the Marcellus and some of the customer demand we saw record amounts throughout the state.

And on electric side, there were multiple operational issues throughout the industry and frankly as some of the older equipment finally gave out under the stress of yet another harsh winter day. And PJM estimated that up to 40,000 megawatts or roughly 20% of its fleet was not available during this period because of the intense weather conditions and the operational problems.

Even at our New Jersey coal plants, we have difficulty with frozen coal and we are forced to burn expensive natural gas or to switch to oil. Fortunately, we were able to secure enough gas for our residential and our commercial customers plus we were able to buy some incremental gas because of the great relationships that we have with the pipelines and producers and also because of the fact that we have a bunch of storage in the ground as well that we can pull when we need to.

Now, at PJMs request, we brought on all of our generation, everything was running that was available and for which we had fuel. We even switched our peakers to all oil and it was the cheaper fuel and so that our combined cycles could run more on gas to increase their peak firing output.

And during their time, the diversity of our fleet and the different types of fuel that we could use was a huge beneficial factor in our operation not just this day but also in fact through the winter.

So in the first chart, you can see here the price of day ahead power in blue and the real time price in red and the price in red as you can see is several times higher. In fact, reaching over $1800 per megawatt hour.

© 2014 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-12714

In the second chart, you can see what the average daily basis was. It was over $50 to $60 per megawatt hour each of that constraints -- east of the Conemaugh basis. That $50 to $60 average masks however the inter-hour volatility that was going on which was significantly higher than the $50 to $60 basis we're seeing for that day.

So, if you think about the third chart -- in the third chart you can see how generations was stacked and the output coming from nuclear in blue, from coal in purple and combined cycle gas in yellow. This black dotted line that we have there that represents the hedges that we put on in the periods before delivery date and that we design to cover or projected load against our generation.

Of course, as we turned on more and more by unit due to our fuel flexibility we're starting to produce a large surplus of electric that we could sell into the marketplace, that's the orange and gray area. That surplus is something like 2,000 to 3,000 megawatts per hour during that period.

Now, while this was an extreme day for us, this volatility is becoming more and more common especially during stressed periods of time back in the winter and the summer and although we're very pleased to say that we had no service interruptions, gas oil power to residential customers have to kept the lights on and kept our customers warm, it was a pretty stressful period and the fact of the matter is we're going to see more and more of those as the weather continues to have extreme events during the year.

But the takeaway from me to you on this one is that you can see how crucial fuel diversity and flexibility in the fleet is. If you have a suite of power plants along the dispatch stack together with the diversified fuel mix, that will allow you to position your fleet and you can gain significant value from the volatility that we saw.

This next chart really shows a similar story, I'm not going to go through it but the important points to note here is that we know we have not just the winter peak but we also have a summer peak as well and increasingly we appear to be seeing more operational problems and more stress in the system during the winter when there's huge demand for heating load as well as for electric generation.

So I'd now like to move on and show you why we believe PSEG Power has a sustainable advantage at least through the next two years.

So the time forward that liquidity is much diminished due to the exit of the banks from the power markets, this BGS construct provides a very useful forward sales record for much of our generation and this is also -- the BGS auction is the auction whereby the utility in New jersey buy electricity to supply the default customers and it blends prices every three year period.

And this is proven to be very advantageous actually, the customers in the state added three significant reviews to the volatility of their electric bills. From the sellers perspective as well, we also like this construct because the load obligation is very well correlated to our units output, it's a good liquidity event and it also provides us an opportunity to hedge some of our forward basis exposure. And last month we were a successful participant in the auction again as the chart shows prices did move up a little bit about $5 in the PSEG zone due primarily though to higher transmission and renewable costs. We did also collect a higher risk premium that reflected volatility as seen on the wholesale markets.

One of the questions that we get quite regularly is what's the possibility of lots of load as we see more municipal aggregation around the country and also in New Jersey, and I will tell you that certainly for this year, we don't expect much switching to take place given the very narrow differential between BGS and retailers prices in fact head room continues to shrink for third party retailers and we expect that trend to continue as retailers that remain grade price's to cover their risk, that suffered from huge volatility this year and as you can probably guess they are raising their prices so that they don't take the consequences that they're facing in the first period of this year.

For PSEG, BGS sales now account for about a quarter of our hedges going forward. This is not a bad thing for us so the relative value to us frankly of BGS has dropped over the years. We continue to supplement the BGS sales with shorter duration for requirement contract in other markets particularly the adjacent markets and the Philadelphia and Eastern PJM regions and those markets as you can imagine are very well correlated as well to out power plant.

So there's frankly a little risk but also in fact the privilege could quite a bit more profitable in the recent months than the BGS auctions. So we're very happy with our diversified sales effort. And we're also happy with our participation in BGS this last month and we look forward to serving the utilities with their electric needs for the rest of the year.

So another leg of our hedging of course is the energy markets that we're selling to. Last year, I mentioned that we had adopted a more consistent monthly hedge program whereby at any one point in time we try and sell about two-thirds of our base load plants output for the next three years in

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. THOMSON REUTERS

numbers that's about two-thirds or 4400 megawatts for three years and this table only reflects that energy hedges, I'll talk about capacity hedges in a little bit.

But of course the capacity market allows us to hedge up to three years forward and this hedging locks in predictable future cash flow while leaving the remains of our fleet open to capture some of our short term volatility I just talked about.

And as I mentioned previously we focused on capturing value so we'll hedge just for the sale of hedging, we will not hedge at loss and we'll fine tune our hedging depending on the relative economics of our fleet. In addition, we give our trading teams considerable flexibility in the timing of the sales and the instruments that they can use in order to maximize hedging margin.

And as Ralph mentioned earlier, we do have a dynamic hedging activity while we position our fleet to take advantage of that market volatility but also to manage our closed hedge positions for operational reasons.

So we actually manage these positions and by doing that we do create significant amount of value on monetizing the auction value of the fleet.

Turning now to capacity markets, a major sustainable advantage that we believe we have is the revenue that we receive from these capacity markets which as you can tell from our location is quite a bit higher than in the past -- of the PJM's last year.

And of course, capacity markets are prevalent in all the three markets that we operate in,; in PJM , in New York and in New England; and they continue to evolve and the revenue that we receive allows us to continue investing in our plants and we also regularly examine why we should build new generation in each of these chosen markets.

And in PJM, we just received as you know, the parameters for the upcoming auction, the 2017-2018 auction which will take place in May. We believe that for the [RTO], this was constructive compared to last time around in particular important of being capped and importantly demand response will be held to a higher performance standard than in previous years.

As you know, PJM is becoming much more selective in how demand response is called and we believe that PJM is going to stop the harsh undermining of that capacity market construct. And we believe this will have a significant impact on the margin but much of the operating reserve in fact is held in the form of demand response.

And finally for us, as you know, the bulk of our generation is located in the congested PSEG and eastern MAAC zones which will continue to be premium markets for the foreseeable future due to the huge load pocket of New York city right next door.

And lastly, as I previously stated, a lot of our long term sustainable advantage is to do our location and operational excellence. Overall it's that we're very fortunate to have a very strong gas trading group that can take advantage of the massive Marcellus and Utica shale fields.

And this chart shows you what the forecast for natural gas looks like for the gas that we purchase for our power plants. Recall that about a quarter of our power generation gas needs are met by Marcellus gas. And this chart clearly shows you the Forward Strip that gives us a sustained fuel price advantage for the foreseeable future.

The Forward Strip, the Leidy Gas projects the discount against henry Hub, against TETM3 and against 26 which are our alternative gas procurement areas.

Although, you can't see it in its annualized press chart, another factor you should be aware of though is that the discounts with Marcellus gas, that discount is actually at its highest in summertime, right at the very time that our power plants demand and it's throughput that it's highest.

So we're getting biggest discounts at the time when we need the power the most and need the gas the most. So we believe then that this is a pretty important factor and that the Marcellus will continue to provide us significant discounts especially in the summer, in shoulder months to PSEG.

A lot of the scenario of course is passed on to our residential customers and that's why they're seeing this terrifically low prices compared to other parts of the country. But the remainder is captured in two areas for PSEG Power, firstly, our gas trading activity and the dynamic hedging that we referred to as well as in the procurement of discounted gas for our New Jersey and New York power plants.

THOMSON REUTERS

SI-SSA-0015-12716

So in summary then, we believe that PSEG Power has one of the best stories in the merchant generation space. We've weathered this downturn in the sector as well as anybody and we're very encouraged by the constructive signals from the marketplaces, prices seem to stabilize plus we're seeing a very encouraging push from the ISOs to improve that market design. We have a clean fleet, we have outstanding operations and we have a locational advantage that's unmatched in the marketplace.

And we believe that this gives us not just the competitive advantage over others but also a sustainable advantage for the long term.

So thank you very much for your attention, I'd like to take your questions now and I think Kathleen's got the mike. Thank you very much.

Bill Levis *- PSEG - President & COO, PSEG Power*

Let's start on the back.

QUESTION AND ANSWER

Kit Konolige *- BGC Partners, Inc. - Analyst*

Hi, it's' Kit Konolige from BGC. I think if I heard it correctly you mentioned that the -- you're encouraged by the RTOs -- the outlook in RTOs as a result of the rules changes for the parameters and looking forward to the auction. Should we expect that -- those encouraging signs to show up in higher prices that -- for the RTO or -- and or the PS and PSEG zones?

Bill Levis *- PSEG - President & COO, PSEG Power*

This is a trick question or ...

Kit Konolige *- BGC Partners, Inc. - Analyst*

I'm pretty sober.

Bill Levis *- PSEG - President & COO, PSEG Power*

I think it's important that when we say encouraged, we still have a long term view and I don't expect instant results tomorrow and this thing to be fixed tomorrow. If we think about the market, they have not been around that long really.

The important part to me is that constructive dialogue is happening, some recognition of the limitations of some of those products are being seen and now it's a matter of giving the right value of those going forward.

So, I'm not sure, I'm not going to predict what this capacity market is going to produce just like you but remember we're here for the long term and in fact we're having a constructive dialogue and we feel good about it at this point at least to really think the important issues are starting to get talked about at this point.

Kit Konolige *- BGC Partners, Inc. - Analyst*

Let met follow that with the real longer term question which is regarding fuel diversity, is there anything in the [Hopper], at the ISO level that say -- or at FERC that would address what sounds like a kind of developing significant issue that the demand for gas, for heating and for electricity at the

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-12717

same time in the winter could be raising questions about whether you want to have all the incremental power plants in the country being gas buyer in the future.

Bill Levis *- PSEG - President & COO, PSEG Power*

There's nothing may: I'm not aware of anything in the Hopper per se, certainly, what happened this past winter is let's say a number of us were paid to have oil on site to be able to deal with gas shortages, whether PJM will continue that act remains to be seen.

But I would say there's discussion of ideas, nothing has come up an annual vote or any (inaudible), I don't know, Shahid.

Shahid Malik *- PSEG - President PSEG Energy Resources & Trade*

That's right. There's nothing in the Hopper but I think the industry has to recognize that the gas pipeline system was really designed for the LDC, for heating demand and now with certain, if you add all these electric gas plants what does that mean for constraints particularly in cold weather periods?

So I'm sure the recognition is that -- I know that the recognition at FERC and at the various RTO level is trying to figure out if this can be short term event or this can be a long term. I think if you're increasing this that we'd have to be better prepared for -- with diverse fuel for the future and potentially something like what's happening in New England in terms of paying generator to have found oil on hand, might be something that other RTOs contemplate.

But there's nothing that's begin definitively defined at this point.

Bill Levis *- PSEG - President & COO, PSEG Power*

I will tell you one particular concept we are pushing as a -- this financial service area and in particular the value of reactive power to the grid is more and more incremental power -- incremental type resources coming that's going to be more and more important. We don't think that's perfectly valued in the marketplace at this time and it's something could benefit base load generation.

Kit Konolige *- BGC Partners, Inc. - Analyst*

Thanks. Can you quantify the MCF volume that was available for Marcellus gas historically for 2013?

Shahid Malik *- PSEG - President PSEG Energy Resources & Trade*

We procured 140 BCF of gas but of the full generation but the oil that was from Marcellus, I don't have the exact number at hand, I don't k now if Kathleen does but it's something we can get you afterwards.

Kit Konolige *- BGC Partners, Inc. - Analyst*

Right, but I guess I'm more interested in the portion of that procurement that would have been available just for the merchant operation.

Shahid Malik *- PSEG - President PSEG Energy Resources & Trade*

Of the 140 BCF? Well, essentially all of it is merchant. So that 140 BCF goes to our fleet, a piece of that came from the Marcellus, a piece of that and the majority of it came from other sources. The 200BCF that I also talked about is pure gas that we purchased for our utility customers.

Bill Levis *- PSEG - President & COO, PSEG Power*

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-12718

So if you saw that 0.6BCF per day, essentially during the times of the winter and most of that will go to utility because they get first take on the gas. We will get more and more of that during the shoulder periods where heating low turn is great. So it's a variable number not as much in the winter as it is on the shorter time.

Shahid Malik - ***PSEG - President PSEG Energy Resources & Trade***

Just a clarification, Will, we also act -- when we talk about roughly a quarter of our fleet gets benefit from Marcellus gas it varies during the year. So in the winter periods, we don't get a lot of that Marcellus gas, we're able to obtain a lot more of it in the shoulder months and in the summer.

Unidentified Audience Member

Good morning, so just to follow up on that I think I heard you said in the prepared remarks that you'd have some Marcellus gas available during the crux period in January and February. Did I get that right?

Shahid Malik - ***PSEG - President PSEG Energy Resources & Trade***

You did.

Unidentified Audience Member

And can you quantify that in any fashion?

Shahid Malik - ***PSEG - President PSEG Energy Resources & Trade***

Caroline will kill me, so I better not.

Unidentified Audience Member

I know you'll pass on that. And then I also I want to ask on the BGS, could you -- as you disaggregate the pieces, can you give us a flavor of what -- on your numbers the delta and the premium was between this year and last year?

Shahid Malik - ***PSEG - President PSEG Energy Resources & Trade***

So we got to try and break down on what we were able to file the BGS for. I think what -- I think the key message from this current auction is that finally power prices in the wholesale market are reflected now in the BGS price going forward, that's number one.

Number two, there was an increase in the transmission and the renewables as a result of all the increased flowed out that we're seeing in the state and as a result of increased RPS standards and the third being obviously is that there was an increase in volatility and therefore an increase in the riskiness of this particular sale.

And that we and others were able to find a higher value in that sale price to that and extract to that a margin further.

Unidentified Audience Member

Given of the $6 of -- we have left, there was a couple of it or $3 kind of premium?

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

Shahid Malik - ***PSEG - President PSEG Energy Resources & Trade***

That's competitive and I'd rather not talk about that, if you don't mind?

Unidentified Audience Member

Okay, no problem.

Shahid Malik - ***PSEG - President PSEG Energy Resources & Trade***

Thank you.

Unidentified Audience Member

And then just finally, given that -- this --you've obviously had a historical position that you're not keen on the retail business but if you see a bunch of some of the more -- that we could come back as just drop out and pricing improve, is that something that could change as you look forward?

Shahid Malik - ***PSEG - President PSEG Energy Resources & Trade***

Never say never but probably not. Retail business is very different from the wholesale business and I think we've said before that we look at retail if it helps us defensively, other points in offensively; so maybe, in our fleet, close to our state to help our power plants.

But generally, success in retail relies on a couple of factors and I used to run a retail business, I know that. One of them is scale, and to really be effective in this business where margin is very, very narrow, you have to have really low cost per megawatt hour and you can only do that if you have a wide scale and regional scale.

Secondly is our diversity which that scale gives you and thirdly, you need to have a first class system because you're dealing with hundreds of thousands (inaudible) the customers and to build that infrastructure is hugely expensive.

So generally unless you already have a position or able to buy a company for a real cheap price, it isn't something that really fits with the tactic that we're going on.

Bill Levis - ***PSEG - President & COO, PSEG Power***

It is -- my boss reminds me the business you make pennies in and you lose dollars on and unless something stops and we changes that form, I'm not sure I'll take this office to [park.]

Unidentified Audience Member

Question, from a power -- take power perspective, how do you think about -- how will the transmission that PSE&G is adding around your plants and the system of it next year for your -- maybe impact the commercial aspects of your business, even more power that you're getting to the region, does it affect in [stores] all that -- just some sense to that?

Bill Levis - ***PSEG - President & COO, PSEG Power***

I think if you look at the PJM planning parameters, you get a pretty fair idea what folks think will be able to come in to the areas, there's also that transmission built. And certainly we talked about in the office, sometimes we eat each other's lunch or cut each other's throat in this business but I

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-12720

think it's important at least from my perspective to hear the more reliable that power source is, the more places it goes, the better off that we are because that means folks in the end will use more electricity.

And as electricity becomes more important to people's life, it happens to be the product that we make. So I think there's a long term benefit in that, there can be some short term pain but what I felt was we really have a level playing field competitively, I'll have my plants compete with anybody else's [specific] place in the country.

Shahid Malik *- PSEG - President PSEG Energy Resources & Trade*

So what's interesting on that couple of things. Firstly, think about gas transmission, all the extra gas transmission that's coming to the marketplace since November in 1.2 BCF. Everybody's expectation was that gas prices and the gas basins would collapse and that fact we've seen higher gas prices that we've ever seen in history.

And so it's interesting that transmission by itself whether gas or electric, doesn't overcome the other constraints that there are and the increased demand that can happen because of the weather. That's why although that forward basis for power has been falling over the years, we should think about the volatility of that set, we're not an hour revenue comes from, we believe that will continue to remain particularly when market's distressed.

Unidentified Audience Member

Maybe - can I just follow up because maybe I'll -- (inaudible) so in theory your region has the premium price, other regions are lower except maybe -- New York is higher, there -- it's not simple to have more cheaper power you can get into the region with the premium price?

Shahid Malik *- PSEG - President PSEG Energy Resources & Trade*

No it really isn't. There's a whole lot more to this than just that, frankly.

Michael Lapides *- Goldman Sachs - Analyst*

Hey guys, Michael Lapides from Goldman. Can you talk about what you're seeing, PJM-wide but especially in MAAC and eastern MAAC and even in New Jersey, in terms of new gas fired generation development being done by some of your peers or your competitors. Just kind of touch on maybe what do you think is already clear in prior auctions and what amounts kind of -- when you look at PJM and stuff that's in oasis, what you think is likely coming in this upcoming auction or the next few years beyond that?

Bill Levis *- PSEG - President & COO, PSEG Power*

I think what we'll talk about is what's already cleared and what will clear in this upcoming auction, we're no sure. We know what the variables could look like but I'm not going to share what I think will happen and not happen there as we develop our own strategy for how we're going to bid in the upcoming auction.

But in past auctions, I think for everything's worth with the Hess plant cleared in New Jersey and it is being built, the CPV plant has cleared, not sure if whether that's in construction at this point and the Calpine plants and plants in Delaware are also cleared, we didn't expect those to make the marketplace.

Julien Dumoulin-Smith *- UBS Investment Bank - Analyst*

Julien here with UBS. Just wondering to follow up a little bit on these questions. First, could you perhaps quantify a little bit within the context of the guidance just what that gas uplift is today that you guys does on the power side that you're able to capture? I know it's a tough question but does that...

THOMSON REUTERS

Shahid Malik - ***PSEG - President PSEG Energy Resources & Trade***

You mean, for last year?

Julien Dumoulin-Smith - ***UBS Investment Bank - Analyst***

Or rather what you're thinking for this year if you can...

Shahid Malik - ***PSEG - President PSEG Energy Resources & Trade***

So I think we can arrange a four to eight sets and I believe the number is still consistent by Caroline, that's what we're giving as the range? That's what we expect the gas uplift to be when we put our forecasting for this year.

Julien Dumoulin-Smith - ***UBS Investment Bank - Analyst***

And -- sorry to just speak, to clarify that, does that include the uplift from the last couple -- thus far in the first quarter?

Shahid Malik - ***PSEG - President PSEG Energy Resources & Trade***

What we say is that the...

Bill Levis - ***PSEG - President & COO, PSEG Power***

We will talk about it at the end of the first quarter.

Shahid Malik - ***PSEG - President PSEG Energy Resources & Trade***

There's 12 months in a year, we've gone through two months. We would hope to see some additional volatility later in the year to match up with the forecast that we have but if somewhere as the past and the next winter will pass then we'll see what that brings us in terms of cyclical earnings.

Bill Levis - ***PSEG - President & COO, PSEG Power***

Yes, and that uplift actually has two pieces to it because we also -- that gas causes impact about it, we're negotiating a new gas contract with the past year. So there's some that I would say certain and there's other that -- to be determined.

Julien Dumoulin-Smith - ***UBS Investment Bank - Analyst***

And then perhaps a more structural question, as you're thinking about the gas constraint that we've seen thus far, how do you think about it prospectively here in the context of new gas pipeline itself over the next few years? To what extent is this structural or is this just a function of the extreme weather and what extent are you going to see new pipeline or are you ready to see new pipeline when do you see these kind of peter out?

Shahid Malik - ***PSEG - President PSEG Energy Resources & Trade***

THOMSON REUTERS

SI-SSA-0015-12722

I think there are few types (Audio Gap) and clearly whether it's something a big part about -- clearly problems with retirements that are more than anticipated when that hasn't helped, you're seeing quite a few operation problems as well as they're trying to get to the end of that working lines and frankly, as an industry, we'll have to invest as much as we should probably over the years.

Bill Levis *- PSEG - President & COO, PSEG Power*

And I think of them and then somebody's going to build a gas pipeline is going to have the same challenge we talked about in capacity markets, you're going to build an extra capacity and it's -- so who's going to pay for it on the developer and want some certainly in it before I go ahead and start building.

Unidentified Audience Member

I guess looking at the 2013 number and you have $100 million of better performance in the year than you would have expected because of the gas issues and fleet diversity. How much of that $100 million you guys saw in '13 do you think is repeatable and already embedded in expectations and are you seeing trends right now in the industries where you've gotten better running the assets and diversity that could give you prospectively more opportunity going forward than you've seen so far?

Shahid Malik *- PSEG - President PSEG Energy Resources & Trade*

So we did bank in, we did see a significant benefit in 2013 from our gas operation whether it was trading or uplift for our power plants that we base in a considerable amount for this year in that forecast. We will have our earnings for the first quarter in three weeks' time like as Caroline would say then exactly what that was.

Bill Levis *- PSEG - President & COO, PSEG Power*

Yes, so I tried to -- I'd say alluded to what we thought was sustainable going forward and then you can make estimates on what you think that might be.

Unidentified Audience Member

And try to guess you have given the factors as if the draw in gas this year with the coal [battiness] or stuff, does that affect how seeing -- you're able to take advantage of the firm transportation or shifting from gas to power in the spring this year because maybe more like access to going the stores before you can start putting the plants or you think it will be seasonally about the same as last year?

Shahid Malik *- PSEG - President PSEG Energy Resources & Trade*

Well, our first goal is to meet requirements with the utility customer. We have a relationship with our utility, an honest relationship where we send supply in gas to them. We operate under the framework of an agreement we did with the state regulatory body, the BPU and so everything we do from the [get go] is to make sure that our customers get the lowest price.

So if there is additional storage capability or pipeline capability over and above what we previously agreed as our modus operandi for getting gas to the customers and storing gas for the winter then our generation plants will benefit.

But directionally you are right that particularly as we get to the summer and the spring shoulder period, we should start seeing more benefit from Marcellus than we would do in the winter.

THOMSON REUTERS

SI-SSA-0015-12723

And I just have one last question just, it was interesting to show the comparison of the cash cost for your nuclear assets versus the industry. Can you -- we've seen a lot of inflation of the last five or 10 years in nuclear for that -- you've talked all about it being security driven. What are your expectations from nuclear inflation going forward as you've kind of gotten through all these security dollars being spent?

Bill Levis *- PSEG - President & COO, PSEG Power*

I think Caroline will show you what we're expecting for spend going forward and see what it sit that we expect but this is a real rally inquire for the business at this point and nuclear operators understand that we got to turn this around in order to stay in business. So I think that mandate is clear and there's fair amount of work going in the industry to just -- to do that.

And like I said, we've been here before. We went through this in the 90s, we're - many folk predicted our demise and we came out stronger and better and I'm expecting the same here too because we provide an important service to the grid that's needed in our energy and security as a nation.

Unidentified Audience Member

I just want to follow up on that risk premium issue, I mean, a lot your competitors are sort of like wishing or at least hoping for a substantial increase in risk premium because of the polar vortex impact so to speak. We have the BGS option and although you weren't willing to quantify it specifically as per [Jonathan's] question, you look at ACE and [JCP&L], it doesn't look like there really was much have won and I'm wondering in terms of an uplift like we're now going to be paying a higher premium because of the risk factors. Do you see that changing? I mean, it doesn't sound like you guys are -- you don't have any valued guidance as my understanding but do you see any of that changing or how do you account for that? I'm just wondering.

Shahid Malik *- PSEG - President PSEG Energy Resources & Trade*

Do we see that risk in the volatility changing?

Unidentified Audience Member

Well do you see it changing in terms of the forward price, right? In other words, I mean, we didn't see that with the BGS auction it appears or at least not very much and I'm just wondering if are you thinking that might change now or do you -- what accounts for that or what's your thought -- if you could just elaborate a little further on that.

Shahid Malik *- PSEG - President PSEG Energy Resources & Trade*

Yes, so first if we take JCP&L and the other territories, they won't experience it in the same kind of volatility as in the Northern part of the state. Number one, so you you'd expect the risk premium to be lower anyway.

Secondly, the reason why that prices didn't go up the transmission increase was not as high for those markets as they were for the PS.

The second part of your question with respect to do we expect this volatility to reflect -- to be reflected in higher forward prices. We've been a little surprised over the years about how prices haven't moved up faster than they have done and while we don't predict prices, we are in the belief that it probably have been over-solved relative to what they should have been.

We think that the market is a seeing a lot of upper pressure in the short term but I think they spoke some skepticism out there as it how much this will translate into '15 and '16 and beyond. We have seen some increases in price but they haven't been significant and I think time will tell if somebody's retirements in this market reform changes, where some of the environmental rules really do stop putting upward pressure on these prices. And If I have to place my bet, I would say, that there's a high tendency for prices to move up than to go down.

THOMSON REUTERS

SI-SSA-0015-12724

Okay, but you're certain the polar vortex, again, one of your competitors has issues associated with the expense associated with the services that PJM may be billing. I'm wondering if you could elaborate a little bit on what the impact might be on you guys with respect to that issue so this may call -- because of all there's strange stuff and now that sort of socialized.

And then also on demand response, given how generation performed during the polar vortex, like coal and stuff a lot of them wasn't very good. Demand response was actually -- to think that it was there, I mean to a certain degree from a reliability perspective, are you guys thinking at all about getting involved in that business or how do you see that product either with your portfolio or impacting your portfolio going forward?

Shahid Malik *- PSEG - President PSEG Energy Resources & Trade*

Yes so with respect to demand response, we have no intention at this time to enter into demand response market. And in terms of its performance during that period of time it was cold and the rules for the -- are that it can be called on a voluntary basis, and it did perform but very small amount to the 3000megawatts on this very, very cold day particularly that January seventh day that I talked about.

And your first question with respect to uplift which is essentially the difference between the cost of your fuel input versus the price you received for your power and if you're called out of merit by PJM so, we as-- all the generators have seen some benefit from uplift both in this period of time and in prior periods of time. I will tell you that there-- the problem with that is figuring out what your fuel cost was and if we could have bought fuel at $4 throughout this period of time of course it will be terrific but clearly we couldn't and didn't. So for us and for others there will be some elements of uplift but it will not be a hugely factor.

Unidentified Audience Member

But your point on this uplift, this is not a new issue in PJM, it manifested itself a little bit more during this period of time but some of those things are drivers out of merit dispatcher or -- are units that run because it provide reactive power or units that run because they provide reactive power or units that run because they provide black start and it's about getting those services properly priced in the marketplace so we don't have to have out of merit dispatcher so we can have the market provide the right signal for all these services that are provided at the grid.

Shahid Malik *- PSEG - President PSEG Energy Resources & Trade*

That's correct. But the (inaudible) half of course looking at that right now is in PJM to figure out how the dispatch model can be amended such that these units that are called out of merit don't just get enough of the payment that's on this [arbitry] that -- so that they know what the true cost and the true price opportunity is for them. If they're included in the dispatch model then it will be much better for everyone that uplift will go away. That's PJMs call. Did that help?

Unidentified Audience Member

Thank you. Just coming back to your guidance on the PS zone energy price basis, because of your hedging or plant location, how much of your sales, the end of capturing that basis in?

Shahid Malik *- PSEG - President PSEG Energy Resources & Trade*

So all of our sales capture some or all of that basis. As I mentioned, if you consider out BGS in our hedging, captures that $3 to $6 from -- then going in our basis because it's forward and it captures our forward [core].

The rest of it from 4400 megawatts up to 10,000 megawatts can capture some role of the remaining volatility that we see out there. I can't be precise because it depends on the marketplace and the time and how much generation is available, how much fuel have been available to capture that generation as well. But it's above that $3 to $6 range and we expect it to continue to be volatile going forward.

Unidentified Audience Member

Thanks.

Unidentified Audience Member

Hi, after the polar vortex and kind of going through that stress, have you kind of looked back in your hedging strategy and said, hey, we're doing this the right way or does it make you say, maybe we should make adjustments to it to -- we left too much money on the table possibly or how does that sort of looking back there does that mean any changes or you can say, hey we're doing it right?

Shahid Malik ***- PSEG - President PSEG Energy Resources & Trade***

Well we did look at it, in fact we looked at it before the polar vortex and we looked at it after the polar vortex especially as all about --as this is all the volatility in our risk limits and I will tell you that we wish we hadn't hedged anything in (inaudible) looking back. It would have been great to be completely open but -- which counter on a business like that. You could or have some predictability in forward earnings.

I think one of the key messages that we present is that our fleet has to be ready all the time to take advantage of the opportunity and the first line (inaudible) guys do a great job of that.

And secondly, we're using options a lot more aggressively than we have been in the past because that allows you to limit your downsize instead of hedging out $50 and eating it or maybe doing much more on the options side of gas and power.

And the third thing is having a diverse hedging platforms. So we're not just hedging in PJM we're hedging more in other parts of the region as well, the Northeast as well. So yes, it's evolving but I would say that we're not expecting a radical change, we'll continue to have a radical hedging strategy. We're doing our traders to have some flexibility within that so that when they see situations like the polar vortex, they're able to go back and unwind some of those hedges for financial operational reasons. And we saw some of that in the last period of time.

Unidentified Participant

Getting the hook.

PRESENTATION

Kathleen Lally ***- Public Service Electric and Gas - VP of IR***

Yes, I'm sorry. We're going to move on to Caroline which is the financials presentation. Thank you.

Caroline Dorsa ***- Public Service Enterprise Group Inc. - EVP, CFO***

All right, good morning everyone. I did have the chance to chat with you a little bit about the financial profile following my colleagues' conversations about the business. One of things that I think about every time I'm in these kinds of meetings and thinking about my own remarks is how easy it is for me to get up here and talk to you about our financial profile. When I have operating colleagues who make my job as easy as possible who are always optimizing the cash flow of their businesses and that allows me to optimize the cash flow as you roll it all up. So all of their efforts really do make my job very easy.

© 2014 Thomson Reuters. All rights reserved. THOMSON REUTERS

Let me talk to you a little about where our financial position is then I'll do a little bit of a recap of some of the things that were important in 2013 that I want to point and then talk about our forward-looking positions because I really like the forward-looking position that we have. We have a great balance sheet and lots of opportunity for new investment.

And as Ralph said at the beginning none of that strings are metrics and none of that requires us to issue equity, still with a nice position to be able to look at new opportunities in terms of how much would I do, not can I afford to do it.

So 2013's financial positions and I'll talk a little bit about this. As you know we did exceed our upwardly revised guidance, pension is fully funded now, and the strong balance sheet also came along with credit rating upgrades which we're very pleased to see.

2014 and beyond, continuing a positive earnings trend as Ralph mentioned earlier, O&M growth which I will talk about, the ability to look to new investments, growth in the PSE&G investments with contemporaneous return, and I'll show you some rate base growth numbers as well, the balanced hedge profile, the continued strong cash from operations in both businesses over the long term period, and the ability to increase the dividend and have that opportunity for sustained and continuous growth in the dividend again in the context of the financial strength that we have.

So just a quick recap on the numbers. As you can see and as you know, we exceeded both the initial and the upwardly revised guidance. If you remember the guidance we gave for each of the businesses when we created the upwardly revised guidance, we actually beat that in both of the businesses.

And as you know and as Bill showed you in his slide we also beat that at Power even if you adjusted for the fact that we moved Kalaeloa and Solar over to Power at the end of the year. So the fundamentals beat the guidance for all the reasons that Bill and Shahid just talked about. And as you know from what Ralph and Kim talked about, so much money put to work at the utility enabled us to really deliver really strong performance there as well.

So I want to break it down just a little bit for you in terms of 2013. I do it because I want to just point out the dynamics of the business that you can see from our '13 results because they really do create the framework that I hope you'll consider as you think about the dynamics of each of our business's financial profile going forward into '14, '15 and '16.

So here is a look at Powe’rs 2013 cash flows. You can see the cash from operations at about $1.3 billion. The capital investment, in here I followed the 10k view so this is capex from nuclear fuel because that's the way it shows on the cash flow statement which is industry's standard practice, leading to free cash flow of $700 million.

We issued net new debt at Power of $200 million this year. The important thing I point out there is Power's debt levels are still below the levels that we had in 2011. So on our net based it's over a long term period of time, Power's leverage has been really well managed to be low. Again, it gives us lots of opportunities going forward.

So with the free cash flow of the net debt issuance, [able to] dividend to the parent and still have incremental cash on hand which you know we pull at the parent as well. So a nice picture, ending with net cash generation because of that very strong cash from operations and that limited need for capital expenditures.

If you look over at the utility, same sort of picture. In terms of the construct, obviously very different in terms of how we're deploying the cash. We think about it by looking at all the cash flows that come from the businesses and then where is the best place to deploy, and we've been focused very much on deploying it in growth. We have more growth opportunity at the utility than we have at Power, but we are funding growth opportunities at Power as Bill spoke to.

So PSE&G, cash from operations adjusted already for securitization. Significant. And so what I like about this slide as we talked last year about PSE&G and Power both being very strong cash from operations generators versus what it was a few years ago when you didn't see as much from the utility. And now you see it right here on the slide for 2013.

So $1.4 billion of cash from operations generated incremental net debt issue you would expect that with the utility capital program of over $2 billion. Small capital contribution from the parent, think of this as just what I just said, we generate cash in both businesses and we put that cash to work in the place that generates the best return. So we make the contribution into the utility, maintains its capital structure, and then make over $2 billion in capital investments.

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

So all of that clears, still leads us with the kind of investment capacity we're happy to look at going forward. So invested over $2 billion using $1.4 billion of internally generated cash.

So putting the two pieces together, this is really just rolling everything up the way we've typically showed it to you for 2013 sources and uses. There you see the two businesses and their cash generation, the net debt issuances between Power and the utility, and then you see that the utility is where most of that capital investment is going, and after Power's capital investment, you still have plenty of room there, shareholder dividend covered.

Of course something I know you know about us already, because we say it all the time, no equity issuance in that picture, and plenty of investment capacity to go. So 2013's picture, not too different from 2012's picture in terms of strength of our business. What's different is that continued strong and a little bit higher investment for PSE&G.

So let's now turn to the picture going forward, because obviously this meeting really is about how we look going forward more than anything.

Here's picture of the growth spend and the total spend, our capital investment for the '14 through '16 period. You can see total capital investment '14 through '16 for approved programs only, 7.4 billion. And then importantly if you deconstruct that just a little bit the way we like to show it, over 70% of that is growth related investment.

The biggest piece is the utility, as you can see there, between Solar and new business and transmission growth, you've got a significant amount of dollars going into utility growth, and then you've got the Power growth that relates to the AGP and the spend on the Peach Bottom uprate with total growth investment over that period, 5.4 billion out of our 7.4 billion. So we're really pleased to have those opportunities and the ability to fund them.

Of course we continue to invest, maintain our plans, both in the utility and in Power. And so we take a pause there on the 7.4 billion and then add what the potential could be if Energy Strong happens. So we have a great program over 7 billion to put to work most of it in growth, and if there's Energy Strong, this is at the filed position, so if there's Energy Strong, it could be a higher level of more growth investments.

But where we stand right now, we have plenty to do and a very significant proportion of that is growth related.

So what does it mean for how to think about rate base? We've done this math before to just do the pieces between where we landed 2013's rate base, how we see the rate base going forward. Again I'll give you '13 base to '16 and then show you at filed position what Energy Strong could add.

So a couple of bars here that are worth taking a moment to take a look at. So we ended 2013 at a rate base of 10.4 billion, 6.6 billion of that distribution, and 3.8 billion transmission distribution includes Solar by the way, just to reconcile to the slide you saw from Ralph.

Remember last year, we ended the year at a $9 billion rate base. So a very significant growth in the rate base and a year-over-year basis, and as Kim mentioned, we ended the year with transmission at 36% of that total rate base.

As we rolled forward and we look at what that will mean for rate base in 2016, you can see the Solar and new business as to rate base as well as the transmission growth. So remember rate base growth, capital expenditure is not the same so for transmission we're showing what goes in to rate base because it's either growth in rate base projects or it is projects going into service. So those two numbers should be different as we're doing a working progress on the rate base in transmission.

So what that gives you is a growth rate on approved programs of double digit, 10% growth in rate base and then obviously the opportunity for more if there's Energy Strong, it just puts you a little higher in the double digit world.

By the time we get to 2016, we're looking at a rate base of 13.7 billion, just based on approved programs, if you do the math, you'll find the CAGR on transmission it's just about 20%. And you'll find that transmission as a percentage of that rate base is a little bit more than 45%.

So as we continue as Ralph talked about remaking the company as we have the mix between Power and utility, we're also balancing that rate base between transmission and distribution by the very significant growth that we have in the transmission rate base. And the opportunity to do more if there's Energy Strong even gives us a bigger rate base and it would be a growth base approach.

There was one question earlier about how do I think about the rate base growth that I'm seeing if I look at ending rate bases relative to earnings and square with utility growth, let me just remind you of two things. Under our formula rates, we show you here ending rate base, 2013 and ending in

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

2016. Under formula rates remember your earnings expectations come from average rate base so you have to take a look at average rate bases when you're doing earnings growth relative to rate base growth.

The other thing to keep in mind is we do book equity AFUDC on transmission spend before it goes into rate base, and so that's another line you have to consider when you're looking at utility earnings as you're going forward and modeling from rate base. So keep those two things in mind as you're doing your modeling and I'll think you'll find everything that we're saying is completely consistent with the forecast that we're giving you.

So a nice picture for rate base growth and of course this picture supports the double digit earnings growth that we've talked about from a 2013 base out through 2016 as well as year-over-year as you know from our guidance, '13 to '14. Again, all based on approved programs that we know and transmission hardening of course being in this base now as we talked about last year and how we folded into the base and as I think we mentioned on the fourth quarter call, the transmission hardening spending that we are doing in 2014 was part of our formula rate filing with FERC and is part of that $171 million in approved incremental revenue for transmission that's baked into this year's guidance.

Okay. So let's go back and look at the sources and uses that we always look at for the '14 to '16 period wrapping all of that together. You look at the left side as we've done before, I think we did a similar sort of look last year. Look at approved programs, so all the things I just mentioned on the last slide, and then on the right, look at with Energy Strong at the file position.

So for approved programs, you see the cash from operations both businesses continue to be strong but you do see PSE&G generating more cash from operations than Power exactly as we expected as we talk about last year and as you would expect completely consistent with the incremental capital investment we're putting to work at PSE&G in either contemporaneous or formula rate like rate making mechanisms.

But Power still continues to be a strong cash from operations generator for all the reasons about this sustained local advantage that we see and our ability to run the assets very efficiently and control the O&M.

So PSE&G would issue net debt as you would expect us to do consistent with keeping our regulatory capital structure, and so both businesses generating cash and then we put the money to work very significantly at PSE&G the capital investment that I mentioned, Powers capital investment, shareholders dividend. And what you see is based on just looking at approved programs put Powers net debt as "use of cash" what does that mean? That means Power even becomes slightly less levered than we end at 2013.

So all of this clears based on a cash generation that we have and continues to keep Power in a very lean position.

If we had Energy Strong, just giving you the example at the file position, then you would see Power's debt growth slightly still well within our metrics and not a problem at all. You would see incremental capital investment of course at PSE&G, Powers wouldn't change and you'd see the cash from operations go up as well because of the contemporaneous nature assumed here for the Energy Strong investments.

Other cash flow, as you see there, a little bit of short term debt, nothing significant as well as the cash on hand that we ended at 2013 risk, still clears obviously shareholder dividend and absolutely no need to issue equity could handle all of Energy Strong at the filed position.

So a nice position to be in, both businesses significantly contributing and we don't see that changing going forward. So what does that mean relative to metrics and we talk about metrics for Power on a regular basis with you all. Our key credit metric as you know that we focus on is Power's FFO to debt, Funds From Operations to debt, we're very pleased to show this chart.

It's a great place to be so let me set the frame. In prior years we've talked to you about our trough metric, floor metric of 35% FFO to debt. But as we see the business evolve and the utility becoming a bigger and bigger part of the business, we know that that gives us the opportunity to really look at within our credit spectrum, a metric of 30% FFO to debt. It goes right along with a larger amount of regulated business in our mix.

Notice of course that it doesn't mean we get anywhere close to it based on the approved program so this is not about changing the level because we need to, it's about really being realistic about what kind of trough level we could have if we wanted to make even more investments in things like Energy Strong or other transmission investments.

The changing mix of our business gives us that room. We're still going to manage the company in the same way in terms of not putting any of those metrics risk. And you can see as we ended 2012 and ended 2013, we've got FFO to debt metrics that are well, well in advance of that number.

© 2014 Thomson Reuters. All rights reserved. THOMSON REUTERS

Over the '14 to '16 period, let's just call out taking a look at the box in the right, we estimate based on our modeling from approved programs, cash from ops or funds from ops, whichever metric that you use, they'll each average about 1.1 billion in the years 2014 through 2016 just for Power. And that's supported by so many of the things that Bill and Shahid talked about. The capacity revenues, our hedging approach, our O&M control, we see that continuing out through the planning horizon which is why you see us put up here the average of the metrics being close to 50% in FFO to debt in that three-year period.

And this is not about one year being a spike and one year being a trough, this is about consistency of investment capacity. What that really means when we look at this chart is that we have room to do even more. So everything that's baked in, the 40% increase in the utility programs, the transmission work that Kim is taking on, the new 345 line, things that we've identified that add to those numbers, we still have room to do more, whether that more is Energy Strong, whether that more is more transmission, whether that more is something else, we have a lot of balance sheet flexibility to put to work and we're pretty excited about the change to do that.

So great opportunities to deploy cash. So one place that we're not deploying cash this year, and I'm really happy to say that you are all -- we've already talked about a little bit, is pension. Now we've deployed a lot of cash into the pension trust over the last few years as you know. We have made significant contributions since the market downturn in 2008. And that has really paid off for us.

So last year when we were here we talked about a funded ratio of about 83%. We talked pension expense having come down from prior years because we had put over $1 billion into the trust. We have a long term asset allocation. We actually haven't changed that allocation in many, many years and you know it because we disclosed it in our 10k. We have an asset allocation that's about 70% equities, 30% fixed income.

We stay with that strategically because we think that makes sense for a long term active population with remaining average service lives of nine or so years on a weighted average basis. And that really has paid off for us in the last few years and particularly in 2013.

So our pension trust had a return of about 20% in 2013 and when you net that against benefit payments, that enabled us to end the year with a fully or more than fully funded pension at 106%.

We're very happy to have that kind of result. We're sticking with that kind of investment allocation over the long term. Our assumptions for rate of return are 8%, that's a reasonable long term assumption but it's really terrific to have a 20% single year return. And I'll just remind you of something that usually comes up every time we talk about pension returns and how to think about the market returns, we are one of the companies and I was told by our actuaries it's about a third of the companies and industries that have active pension plans.

We don't move the ending asset balance for purposes of determining the starting asset balance to apply the 8% return on when you calculate pension expense.

So what does that mean? That means when there's a significant market upturn in which we participate, we get the entirety of that asset value as our starting asset value for pension expense. And so when the markets do well, you'll see our pension expense do better, then you'll see companies [too] smooth, and of course goes the other way and you've seen that when we had the market downturn but we obviously benefit from that in this picture right now with the kind of market returns we have last year.

So for expense, as we've talked about before, we had a $110 million of pension expense net of utility capitalization. So if you look at our foot note in the 10k you'll see the gross number, this is the number that hits the P&L. It's a little bit more than 50-50 to the utility but close so more like a 55-45 in terms of utility versus Power.

But as we look now into 2014, because of the impact of two factors, both the discount rate coming up from 4.2 last year to 5.0 this year which it did for most companies and people do their discount rates usually to the corporate market, really flowed out over how you pay your pension benefits over the long term period, your actuaries model.

We got a benefit there of about 40 million from the net change and the discount rate, plus the single biggest benefit of course is the investment return. And then the other is really about the things that you amortize for plan design changes or [actuary] gains or losses outside of carter.

So when you put all of that together, although we had seen pension expense coming down over the past few years from about 160 million which is where we were in 2009, what we now have is the opportunity, and we will have this in 2014 and it's baked in our guidance, pension income. So the swing that I mentioned on the earnings call for those of you who heard of 125 million is the change going from 110 million in expense to 15 million in income this year.

THOMSON REUTERS

SI-SSA-0015-12730

And just rolling forward normal assumptions of discount rates of the forward curves, so just like Shahid used it to forward curves for his market I used the forward-curve here on a long term rate of return that we used of 8% consistent with our long term asset allocation, right now we see pension income continuing through our planning horizon and that's what's baked in to our numbers, that's baked into all the O&M numbers that you saw.

And I already had a couple of questions about how to think about volatility if interest rates move, different from the forward-curve or rates of return move. First thing to keep in mind is none of that changes this year's pension expense, right. As you all know this year's pension expense is established based on the results of the end of 2013 and the discount rates at the end of 2013.

So this year's pension expense doesn't move. But if you look that the kind of the two factors that most people look after changes in pension expense, if there's a 1% difference in the rate of return relative to the long term expectation, that impact is less than a penny of share on a net basis for us after capitalization. And if there's about 25-basis point move in the discount rate relative to expectations, that's about a [penny a share].

But again over the long term, we see nice profile for pension. And as I started the slide, the most important thing to keep in mind as well as when we look at that FFO in that investment capacity, none of it has to go here because of the nice funded position that we already have.

So the ongoing cost control really does bear out. And as I mentioned earlier, it is a combination of pension so that one-time swing that you see but the persistence of pension income in our plan so the swing is one-time, the persistence of income goes across the period, gives us this very nice picture of a reduction in O&M on a CAGR basis. And importantly, as I mentioned earlier, this reduction we still are seeing cost control matter in the businesses of course, it can't just be pension, it's the ongoing cost control that Bill and Ralph and Shahid and Kim do every day that helps us have this picture.

You can see that reduction carries across all of our businesses, transmission distribution, Power, the other down there and that's a slight increase down there, that is in large part driven by the expense for PSEG Long Island but that is covered in the [$0.03 of] share that we've talked about that we'll be making for PSEG Long Island and you know that transmission expenses are covered in the formula rate as well.

So a nice picture of O&M control over a long term period with the transmission cost being recovered in the formula rates and the small amount down below covered in the PSEG Long Island and both businesses benefitting from expense control and the impact of pension on that as well.

So bring that all together in terms of how to think about 2014, this is our operating earnings guidance, exactly the same as we gave it to you on the earnings call a month ago, you can see regulated earnings depending on the low or the high end so we just gave you the boundary points, 53% to 55% of total earnings.

And as Bill and Ralph and Ralph mentioned, the challenge if Power does better, it's less that's great. So we'll end up with a bigger picture. But nice I think opportunities and both of our businesses to deliver, we're really happy to give you this operating earnings guidance range and you can see the ranges for each of the businesses, this assumes the pension number that I mentioned because it doesn't change for 2014, it does assume normal weather and normal unit operations, not made any modifications or anything related to anything for quarters, and we'll obviously talk about the first quarter when we have those results when we talked to later on in April.

And so all of that of course comes together for one other very important thing for our shareholders and that's the dividend. We're very pleased to have announced the 2.8% increase in the dividend in 2014 over 2013, consistent with our long term 10-year dividend increase CAGR of about 3%, so we see this dividend increase is consistent with that, and we absolutely see the opportunity for consistent and sustainable dividend growth back to the sources and uses in slide there's obviously clear room to do that without putting any pressure whatsoever on our metrics.

Two other points to note on this slide that I know sometimes we'd like to look at, PSE&G's earnings per share relative to the dividend per share, what I show here in the 139 to 147 is PSE&G's earnings guidance range converted to EPS, and you can see from the indicative annual rate of $1.48 of this year's dividend where PSE&G's earnings contribution would be, and you can see it's almost right on top of the dividend level.

Again, we still take all the cash from all the businesses and allocate it so we're doing reinvestments in PSE&G, that's for sure. But the regulated utility business, it's such a significant contributor to the dividend strength that we just pointed out so you can see it there as well.

And then at the bottom another metric obviously that's important to look after dividend is payout ratio. And as you can see from our payout ratio of 2014 just using the mid-point of the guidance based on the indicative dividend rate, it still keeps our payout ratio in a nice position, again, speaking to the sustainability of the dividend story and the opportunity for future dividend growth.

THOMSON REUTERS

SI-SSA-0015-12731

So lastly I just want to spend a moment on the longer term outlook and sensitivities. So we usually have given you this page, it looks similar in prior years, [there's] just a slight modification this year to really try to address some of the -- in the context some of the kinds of questions that you were asking Bill and Shahid for '15 and '16, so of course from '14 we gave you the guidance for both of our businesses.

For '15 and '16 we've typically given you sensitivities. We updated the sensitivities for Power, be a bit more consistent with what we see as about an estimate of standard deviation of the key metrics that we show here, so whatever you put in for your forward curve estimates relative to our hedge position, keep in mind we're about 45% to 55% hedged in 2015 and 20% to 30% hedged in 2016.

So if you look at the 53 to 55 kilowatt hours that we estimate for each year, you look at the hedge percentages that we have, and then apply our estimate of standard deviation, this is the way we d it. You take the forward-curve, you look at the standard deviations as we're citing them here. You can see the EPS ranges for Power based on the application of those estimates of volatility against the open position.

Each one is independent so there's not a correlation, we've done each one independently. And so about a standard deviation of about $0.75 changes per mcf in natural gases having about the impact of $0.04 to $0.07 in 2015, $0.12 to $0.15 in 2016 because we are more open, same sort of thing for changes in Spark Spreads and Dark Spreads, again independent, so one is independent of the gas price change, so the gas price change doesn't assume changes in Spark Spreads and -- Spark Spread, one is independent as well.

Nuclear capacity factor as we typically provide. And then down below just straightforward utility math on how to think about changes of incremental investment, changes in sales, and changes in O&M and ROE, pretty straightforward calculations there as well. So just to give you some sense of how to think about the volatilities going forward the way we see them against the open positions and the hedge positions that we have.

So finally, just to sum up, guidance of $2.58, guidance of $2.40 to $2.55 exceeded by our results of $2.58 in 2013, double digit earnings growth is our guidance for PSE&G both this year over 2013 as well as the CAGR of 2013 through 2016 driven by the transmission investments and driven solely by approved programs not assuming anything for Energy Strong.

Power will continue to have the operational excellence, focused their market expertise and the financial strength coming into this year and the ability to see the continuation of strong cash flow generation gives us the balance sheet to support the programs that we want to support and the opportunity to look at new programs that were identified here today which we're excited about having the potential to look at without needing to issue equity, and the ability to have the robust dividend that we have and the opportunity for future and sustained dividend growth.

So with that, thank you very much and I'll invite Ralph to come back up and join me. And we'll be happy to take your questions if you have any.

QUESTION AND ANSWER

Unidentified Audience Member

Thanks. First is a point of clarification on the ending rate base number, does that include [quip] on which you're earning a contemporaneous return or are those numbers completely exclusive of CWIP?

Caroline Dorsa *- Public Service Enterprise Group Inc. - EVP, CFO*

Okay. Thanks, Paul. So for those projects where the CWIP is -- we have CWIP in rate base, those five major projects that Kim talked about, those projects are in the rate base. For other projects we're making the investments but those are not yet in service, they're not in the rate base.

Unidentified Audience Member

Okay. And then second question, when I look at your O&M slide, I mean it looks like each of the pieces, the O&M saving is greater than 0.5%, yet for the company as a whole it's 0.5%. So I don't quite understand why it wouldn't be more like somewhere between 0.7% and 0.9% saving.

THOMSON REUTERS

Caroline Dorsa - ***Public Service Enterprise Group Inc. - EVP, CFO***

Right. So just a little bit of rounding going on there, but specifically to your point that other at the bottom is actually growing a bit and that's the piece that's picking up PSEG Long Island expenses which are growing between '13 and '14, and so that actually is a positive growth but it's such a small number but it does just [affect the] round. So that's why you see it.

But as I said, those PSEG Long Island expenses are covered in the $0.03 of share that we make.

Unidentified Audience Member

And also just looking at the bars and again it's hard -- it looks like the bulk of the savings that you're looking at for the CAGR achieved really in '14 and then you're sort of flattish from '14 through '16, is that a good way to think about it?

Caroline Dorsa - ***Public Service Enterprise Group Inc. - EVP, CFO***

Yes. So the impact of the one-time benefit right of pension, you see that swing, happens between '13 and '14 but when you get out to the end of '16, you still have O&M lower than '13's number. So that's obviously why it looks the way it does, you got one-time coming down, it comes up a little bit, you still end up in a spot that's lower in '16 and it ended in '13.

Unidentified Audience Member

Thank you.

Caroline Dorsa - ***Public Service Enterprise Group Inc. - EVP, CFO***

Sure.

Unidentified Audience Member

Good morning. Caroline, on the slide with the FFO metrics, is the 50% number you're sharing that reasonably consistent through time or does it move in one way or the other between the three as you're capturing there?

Caroline Dorsa - ***Public Service Enterprise Group Inc. - EVP, CFO***

Right. So it's not identical in any of the periods but you're not seeing anything getting anywhere near either the 30 or last year's 35. You are still high. I'm not going to give you the specific numbers but you're still very high with lots of room in every year including 2016.

Unidentified Audience Member

And last year you showed at how it would look if Energy Strong was in that for example, and you just do that math for us roughly.

Caroline Dorsa - ***Public Service Enterprise Group Inc. - EVP, CFO***

Well so what we're showing here is Energy Strong filed position so I can't really speculate on what that would be. What I can tell you is we have plenty of room to have Energy Strong without putting a strain on the credit metrics so I'm not worried about it.

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-12733

Unidentified Audience Member

But that slide showing the 50%, that excludes Energy Strong I think or --

Caroline Dorsa *- Public Service Enterprise Group Inc. - EVP, CFO*

That's correct. That's approved only. Right.

Unidentified Audience Member

Okay.

Caroline Dorsa *- Public Service Enterprise Group Inc. - EVP, CFO*

That's approved programs only, but there is so much room that I'm not worried about whatever outcome might be. The ability to have that within the metrics for Energy Strong if we get it, no problem.

Unidentified Audience Member

So my math suggests that that implies somewhere between $1.4 billion and a $1.5 billion of balance sheet capacity in excess of the flow. And so if that's roughly right and we look at the utility dividend is going to be -- the dividend is going to be covered by utility earnings already in 2014, how should we think about your view around dividend growth beyond 2014? Is it likely to going to grow closer to where the utility is growing? Similar to what we have now does it depend on Energy Strong? Some color around that.

Caroline Dorsa *- Public Service Enterprise Group Inc. - EVP, CFO*

So I'm passing the microphone now.

Ralph Izzo *- Public Service Electric and Gas - President and CEO*

So, [Jonathan], last year when we set up here, we talked about a $7 billion capital program with the utility and this year we talked about a $10 billion capital program with utility. In addition this year we're talking about opportunities not only in New Jersey and at FERC, and at [MISO] and maybe even New York State. So you should think about us aggressively looking for opportunities to deploy that balance sheet in a robust fashion.

And if we can't find those opportunities, but I think we've demonstrated we can. We will look at ways to return that capital to the shareholder, we absolutely will.

Caroline Dorsa *- Public Service Enterprise Group Inc. - EVP, CFO*

Question?

Unidentified Audience Member

Caroline, could you maybe give us a sense of where you see the weighted average ROEs for all your transmission projects roughly now in terms of the whole business?

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

Caroline Dorsa - ***Public Service Enterprise Group Inc. - EVP, CFO***

Sure. So transmission as you know under our formula rates, right earns 11.68 and we have Susquehanna-Roseland that earns 12.9. We have one other project that earns 11.9, I'm not going to remember the right one, Kim will remember. Sorry?

Kim

[Northeast].

Caroline Dorsa - ***Public Service Enterprise Group Inc. - EVP, CFO***

Northeast grid, that's right. 11.9. And then the others are in the 11.68. So it's just a matter of -- if you're thinking about whether you're doing -- I don't know if you're doing capital expenditures going forward or you're doing rate base, it's just a matter of when you're [sliding] in, right, Susquehanna-Roseland, as Kim said, a portion of it will be energized this year and the remaining portion next year.

If you look at our slides we give you the spend to date and we give you the estimated total. And so northeast grid and Susquehanna-Roseland will be the ones to look for averaging in, and the rest you should look at 11.68 for transmission.

Unidentified Audience Member

And then maybe looking at the PSE&G side, the allowed ROE is 10.3. Should we assume that's what you can earn or because of the pension and some of the other things that you're doing? Is it possible over this period you can earn better than that?

Caroline Dorsa - ***Public Service Enterprise Group Inc. - EVP, CFO***

So assume we are in the authorized return and keep in mind it's 10.3 on the base, you manage the capital investments to earn that, and of course the Solar recently was 10.0.

Ralph Izzo - ***Public Service Electric and Gas - President and CEO***

This is Steve. I think one of the risks that we want to make sure people done succumb to is if you think about the utility today and where it was five years ago there's been this actually it was 18% CAGR in its earnings.

And one has been asked, how did that happen? And Ralph, I believe I pointed this out, I stepped out of the room for a few minutes we spoke, it really happened in three ways. First well if you think about the last time we had a rate case, our load since then is a tiny bit down, we call it flat. Our O&M is a tiny bit or we'll call it flat. So that business is pretty much been frozen in time at that 10.3% allowed return. So that's step one.

Step two then is we deployed capital. And we deployed it in two ways. We deployed maintenance capital to match the depreciation so we kept that business frozen in time. And then we deployed capital in a bunch of ways on the distribution system that had contemporaneous returns. And they have these arcane titles like [SIP 1 and SIP 2]s that not for state implementation plan, it was a soft-C that's good for capital infrastructure plan.

So we spent a couple billion dollars doing that with contemporaneous returns at 10.3%. And we did a bunch of things at the state level in the renewable in energy efficiency space that also had a 10.3% return although the most recent Solar filing had a 10% return.

So we added a bunch to the rate base of the distribution level was given contemporaneous return at 10.3. So it stayed at 10.3 business at the distribution level.

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

But then we took transmission which was I think 20% of rate base and now we've driven it to almost 45% of rate base with this 11.68% plus return. So the utility growth has been strong, we're very proud of it, all of it has gone to ease the things that were part of state policy or that were needed for reliability but always at the allowed returns. I just think that that's an important realization to hold on to.

Unidentified Audience Member

Hi. A couple of various areas. What should we expect about the timing of the next rate case of PSE&G?

Ralph Izzo ***- Public Service Electric and Gas - President and CEO***

(Inaudible) it depends on a lot of factors. I think in the fourth quarter call we said that our whether normalized load growth was up by 2% something, but recognizing we're comparing to a period in time where 90% of our customers didn't have electricity for a few days, i.e., Sandy.

And on an annualized basis we were down 1.5%. So notwithstanding the heroics of Ralph's O&M control when we have a negative load growth of 1.5%, you cannot swim against those river currents forever.

Secondly, a lot depends on any new business that we have to put into the rate base which makes up some of the differential that [Julian] asking about it before in terms of how the pie has changed from last year to this year.

So it really does depend upon our ability to offset O&M versus load growth. And that is the heart of the issue around why we cannot do an Energy Strong or other type programs and spend the money and then go in later on for rate case. The old regulatory lag was partially moderated by load growth. We're just not seeing that.

I think anywhere in the industry and particularly in this part of the country. So the answer is we will have to go in for rate case. At some point it's been five years since we have our last one but I don't know when, it a lot depends upon what happens with load.

Unidentified Audience Member

And it sounded -- Ralph, was I hearing you correctly that your tone had changed a little bit about, you used to say expected a settlement in Energy Strong and maybe less so now?

Ralph Izzo ***- Public Service Electric and Gas - President and CEO***

Yes. I think you did hear my tone changed. If you had said to me last February that we would be here in March without a settlement, I would have given you ridiculous odds and taken that wager. Having said that, the compelling argument behind the need for I think is the strong if not stronger than ever, and the support [forward] has grown over time, so I do the whole lot of confidence in the staff and then the commission, but I've been disappointed in some of the counterparties in the settlement discussions and some of the -- really unreasonable positions they have taken.

Unidentified Audience Member

And on capital investment outlook, clearly the utility and especially the transmission program are getting the bulk of that and it looks like the capital spend at Power continues to scale down. Is there any prospect that you're looking at either further incremental investments on the existing assets in Power or looking at new assets at Power?

Ralph Izzo ***- Public Service Electric and Gas - President and CEO***

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-12736

So we are always looking at incremental investments at Power whether it's additional peak or expanding the combined cycling as expanding [nuclear units] using existing sites where market conditions indicate, a bigger investment than what we have. We always look at asset acquisitions. We've always been able to avoid the winner's curse.

However as Bill said, we really want to bore you. We want you to never be surprised by what we do, and we want you to be able to account on things that we say, we've done in the past and we predict we'll do in the future. So you should not expect to see a significant or any departure from the kind of organic growth of the utility leading the way for us into the future.

Unidentified Audience Member

All right. Final questions. Speaking of winner's curse, did you look at the PGW acquisition and what do you think of that as a business proposition?

Ralph Izzo ***- Public Service Electric and Gas - President and CEO***

So I adore my team, they are a fabulous management team but we did look at that a few years ago. And somebody brought it back then more recently and then someone I think uttered the word, and it wasn't in my presence but somehow I got wind of it and, no, we didn't look at the [PGW].

Unidentified Company Representative

(Inaudible -- microphone inaccessible) 30 companies.

Ralph Izzo ***- Public Service Electric and Gas - President and CEO***

Well, and we did not make 31 -- and I -- let me just leave it at that be the challenges associated with PGW. It would make my -- [inasmuch] towards retail look like enthusiasm for that. So, no, we didn't look at that.

Unidentified Audience Member

With the pension working out so well for you, have you guys thought about annuitizing that at all or locking it in? And maybe just like the part on the Power segment which is going to have more volatile earnings as opposed rates or it seems like there might be reasons to do that. Any thoughts on there?

Caroline Dorsa ***- Public Service Enterprise Group Inc. - EVP, CFO***

Yes. And -- no. Well we think that the long term asset allocation that we have serves us well. We did make changes to the pension plan a number of years ago in that. Then just more recently a few years ago, to moderate the benefits and we have a cash balance plan, but we do still have by having a cash balance plan. We do still have a defined benefit plan.

So we have decided not to take any pure immunization strategies because they now obviously you have to take down your assumed rate of return to be something very much lower if you take down and put bonds -- the biggest contributor to your pension trust. But we like the long term asset allocation. We think it served us well and we think that's exactly what we'll stay with.

Unidentified Audience Member

Hey guys. Just want to follow-up on [J's] question about rate cases, but more about a specific issue that's impacted the other New Jersey electric utilities. Can you talk about your views about this consolidated tax adjustment docket that's under way in New Jersey? It doesn't seem like it's going anywhere but it's a very big issue in the Jersey Central Power and Light rate case. It was a driver back in the Atlantic City electric rate case a couple of years ago.

© 2014 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-12737

Can you talk a little bit about what is it, what's going on, has this just get dealt with, and what is it just means from a regulatory policy for you guys?

Ralph Izzo - ***Public Service Electric and Gas - President and CEO***

So Caroline can give you more specifics around how it's less and less of an issue for us as we move further away from the [leases] that we have in various other PSE&G holdings resources type of investments. But to be quite candid with you, [Mike], we don't know anymore about it than we do at this point in time. I know on a percentage basis it's bigger for one utility in the State of New Jersey than this for us.

And on an absolute dollar basis it certainly is bigger for another utility than it is for us and you know who those utilities are.

Having said that, I think the last three rate cases that I've been associated with, we paid through the [nose] for consolidated taxes, the same consolidated taxes over and over again, because when you do the black box settlements you don't put it away once and for all.

So we'd like to see it resolved even though a rational point of view we'd say that it's become less of an issue for us. It conceivably has not disappeared because of prior decisions being more black box than putting it to bed once and for all.

Caroline Dorsa - ***Public Service Enterprise Group Inc. - EVP, CFO***

So just to put everybody on the same page in terms of what are we talking about, when we talk about consolidated taxes pretty straightforward theory, and the theory is if you are part of a consolidated group and to the extent that the consolidated group has losses that allow it to reduce its effective tax rate, that the utility should share in that because the utility contributes income to the consolidated group.

What's missing from that picture is that the utility the way we and probably everybody else run it but certainly re-run it, the utility doesn't put the capital at risk in those investments. So by talking about combining the outcomes, you're really talking about sharing one of the outcomes that compensates for the risk taking to a party that didn't take the risk. And that's why we don't think the issue makes sense and that's why I think, I don't know if it's 49 other states or 48 other states don't have it, because it really isn't the way to think about what's really going on in an entity that's taking a shareholder risk to potentially have return and might have losses. We of course never take those risks in the utility and that's why don't think it's a reasonable kind of an adjustment to make.

Unidentified Audience Member

Thank you. Quick one here. As it relates to the CFO you described just now on the Power side, you lowered it from 35 to 30. I've been very curious a little bit more on the thought process there and then also just as you think about the long term leverage at that some subsidiary -- is 30% the right number or is it just for this period of time?

Caroline Dorsa - ***Public Service Enterprise Group Inc. - EVP, CFO***

Yes, so thanks, Julian. So I think it is the right number. And the reason that we think it is the right number is given the profile of how the business has changed, and now I'm talking about PSE&G Inc. As PSE&G has become much more heavily the utility, so the regulated and the certainty and the reliability of the regulated part of our business moving up as Ralph shoed on his opening slide to being potentially more than half of the business this year given our guidance that the 30% FFO to debt metric does makes sense for Power because of the strength of the rest of the business.

As I said, that doesn't mean that -- to be very clear, we don't need to take it down to that level to afford the things we're talking about doing as you can see with approved programs, only those metrics are still very, very high.

But we know that given the mix of our business and how much it's changed, both in Ralph's slide from the beginning, it's very, very significant change in the mix of our business. It gives us the flexibility to consider investments, and right now those investments are in the regulated business. We've consider investments down to that trough level, you've never seen us run the business down to the trough levels we've set before.

THOMSON REUTERS

SI-SSA-0015-12738

We really set them -- it's not a target, it's a floor. And I think you've seen us be able to stay well above that and continue to have financial flexibility. But given the mix of the business, it is the right way to think about the floor.

Unidentified Audience Member

Got you. And then putting forward if you think about the rate base CAGR you talked about, through '16 if you will, but you provided also capex for a couple of years thereafter, how do you think about that rate base CAGR attacking on those extra couple of years? Is it still in that 10% ballpark? It looks like there's a '17 uptake there.

Caroline Dorsa ***- Public Service Enterprise Group Inc. - EVP, CFO***

Yes. So we gave you the 10% range based on approved programs or the rate base CAGR. Two things, so we gave you that five-year projection to give you a sense of how much we have to do, obviously as the rate base itself becomes bigger, adding similar amounts of capital expenditures wouldn't give you the same growth rate, but I caution about going far-out and saying, well then there must be something different going on in the growth rate.

Because as we've shown last year versus this year, when we rolled forward that five-year program, we've added more things to the base so I gave you the three-year because I think the three-year is more how you should think about the near term planning and then we'll roll forward the next five years, next year.

So based on facts, in fact your CAGR, but out years, there's another our [temper] too between now and when those things would come to pass.

Ralph Izzo ***- Public Service Electric and Gas - President and CEO***

So Julian, around that -- we're not willing to give too much precision there in a distant future but I think what I would ask you to focus on as Ralph LaRossa's slide that had last year's capex for five years , and this year's slide which shows the bars, the five years, and to Caroline's point, the opportunities continue to arise primarily the result of the deregulated market where transmission planning is no longer the purview of a handful of engineers doing integrated planning from [Power plant] to meter.

And PJM in taking its responsibility seriously to meet the reliability of the system and not being able to forecast and predict the amount of [coaler] time that had been taking place, so the HEDD that are going out or the new units that are being built in places that are close to Marcellus but not close to load and all the complexity goes with that, continues to afford us opportunities to invest.

So we're showing you the approved programs, the approved projects for five years. But I don't want to say that's the end of it, but by the (inaudible) I don't want to promise that there is more, I'm just pointing throughout [your effort] every year coming back and saying there's more work to be done.

Bill Levis ***- PSEG - President & COO, PSEG Power***

Okay. Well it looks like [we've done] a lot of rates. (Inaudible) doesn't have to keep retractions on. Just giving the microphone to Kathleen.

So I'm going to repeat a couple of things that you heard this morning and then thank you for being with us. The utility is running quite well. And not withstanding its outstanding operations, we're reminded everyday of the risks and challenges in running a combined electric and gas business so I don't want to look past what occurred and [knowing] just this past week.

We are earning our allowed returns in every facet of the business in transmission and energy master plan areas and core distribution. And we have the opportunity for additional investment, in New Jersey through FERC and PJM, in MISO, through FERC Order 1,000 and in New York State, although obviously those investments were not been made as PSE&G.

THOMSON REUTERS

SI-SSA-0015-12739

Just 12 months ago we told you about a $7 billion capital program that today has become a $10 billion capital program. And those are all approved with 70% of that coming from transmission in FERC which gives rise to the double digit rate base growth and earnings growth that Caroline and I were just describing over the next three years.

Power too is running well. Bill walked you through the asset performance. And I hope that you recognized this recurring theme that this flexibility of the fleet allows us to make money in so many ways, off of our low cost base load generation, it allows us to make money off of our fuel arbitrage opportunities through our [location] advantages, through our ability to manage risk in volatility, and our continuing successful efforts like growing the dividend.

So having said all of that, we then take a look at the balance sheet, we take a look at earnings trajectories that we do look beyond this year even though we'd only guide until this year. We look not only in what that number looks like to us, but we consider where its coming from.

So we're telling you that we can support this robust investment program, we have the opportunity for consistent and sustainable in the dividend. We don't need new equity and as Caroline clearly pointed out, we have the capacity to far more and within Ralph's blue bars, with Bill's orange growth component or any other part of the cartoons that we showed today, so thank you for being with us.

If you are a customer, thank you for being a customer. If you're an investor, thank you for being an investor. And if you're interested, thank you for interest. Have a great day, folks.

Forward-Looking Statement

Certain of the matters discussed in this communication about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC), including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com.

These factors include, but are not limited to:

- adverse changes in the demand for or the price of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulation, including market structures and a potential shift away from competitive markets toward subsidized market mechanisms, transmission planning and cost allocation rules, including rules regarding how transmission is planned and who is permitted to build transmission in the future, and reliability standards,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators,
- changes in federal and state environmental regulations that could increase our costs or limit our operations,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to balance our energy obligations, available supply and risks,
- any deterioration in our credit quality or the credit quality of our counterparties, including in our leveraged leases,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- delays or unforeseen cost escalations in our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient coverage or recover proceeds of insurance with respect to such events,
- cybersecurity attacks or intrusions that could adversely impact our businesses,
- increases in competition in energy supply markets as well as competition from certain transmission projects,
- any inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements, and
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies and changes in customer behaviors, including energy efficiency, net metering and demand response.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws. The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

GAAP Disclaimer

PSEG presents Operating Earnings in addition to its Income from Continuing Operations/Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings is a non-GAAP financial measure that differs from Income from Continuing Operations/Net Income because it excludes gains or losses associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting, and other material one-time items. PSEG presents Operating Earnings because management believes that it is appropriate for investors to consider results excluding these items in addition to the results reported in accordance with GAAP. PSEG believes that the non-GAAP financial measure of Operating Earnings provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends. This information is not intended to be viewed as an alternative to GAAP information. Slide A at the end of this presentation includes a list of items excluded from Income from Continuing Operations/Net Income to reconcile to Operating Earnings, with a reference to that slide included on each of the slides where the non-GAAP information appears.

SI-SSA-0015-12744

PSEG INTRODUCTION & OVERVIEW

Ralph Izzo

CHAIRMAN, PRESIDENT AND
CHIEF EXECUTIVE OFFICER

PSEG

We make things work for you.

SI-SSA-0015-12745

PSEG's Strategy – delivering results

Our businesses' focus on cost-effective, reliable operations yields strong cash flow

We are funding growth-oriented investments aligned with customer needs and state energy policies

We are enhancing the competitiveness of our environmentally well-positioned generation business

The results of our financial strategy support a credit profile capable of meeting our corporate objectives and providing sustained dividend growth for our shareholders

SI-SSA-0015-12746

Two complementary businesses

Strong asset platform, performing well and positioned for the future

PSEG

PSE&G	PSEG Power LLC
Electric & Gas Delivery and Transmission	**Regional Competitive Generation**
Strategy: Positioned to meet customers' needs as we respond to state and federal energy policy and economic growth objectives **Value Proposition:** A $10 billion infrastructure program - focused on transmission – that produces double-digit rate base growth through 2016	**Strategy:** Fuel diverse fleet is geographically and environmentally well positioned, with investments to enhance competitiveness **Value Proposition:** Provides substantial free cash flow in current environment and poised for price recovery
2013 — Assets $20B Operating Earnings $612M	2013 — Assets $12B Operating Earnings $710M

SI-SSA-0015-12747

ASSETS AND OPERATING EARNINGS ARE FOR THE YEAR ENDED 12/31/2013.
PSE&G AND POWER DO NOT ADD TO TOTAL DUE TO PARENT, PSEG LONG ISLAND AND ENERGY HOLDINGS ACTIVITY.
SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/NET INCOME TO RECONCILE TO OPERATING EARNINGS.

Delivering on commitments and pursuing opportunities for growth

Operational Excellence	• Power: Record 2013 output at Linden CCGT and Salem 2; nuclear capacity factor greater than 90% for 9th straight year • PSE&G: Mid-Atlantic Reliability Award (12th consecutive year) • PSEG Long Island: Went "live" on January 1, 2014 • PSEG: Cost-control benefits continue
Financial Strength	• Strong cash flows supported credit rating increases • Pension more than fully funded • Dividend increased
Disciplined Investment	• PSE&G ✓ Transmission capital program execution and growth ✓ Energy Strong program under discussion ✓ Solar 4 All Extension and Solar Loan III programs • Power: Investments to enhance the fleet's competitiveness – 130 MW Nuclear uprate, 150 MW CCGT uprate and efficiency improvement

SI-SSA-0015-12748

Operating Earnings Guidance

Building on the successful implementation of our strategy

SI-SSA-0015-12749

PSEG

SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/NET INCOME TO RECONCILE TO OPERATING EARNINGS. E = ESTIMATE.

Operating Earnings Mix

Long term investment program has driven increased earnings contribution from stable, regulated business

Power's diverse fuel mix and dispatch flexibility continues to generate earnings and free cash flow

PSE&G's investment in transmission has diversified its asset base and, coupled with other investments and cost controls, supported compound annual earnings growth of ~18% over 2009 – 2013

SI-SSA-0015-12750

PSEG

*SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/ NET INCOME TO RECONCILE TO OPERATING EARNINGS; DISCONTINUED OPERATIONS REFLECT TEXAS. E=ESTIMATE ** 2014 PERCENTS USE MIDPOINT OF EARNINGS GUIDANCE.

Maintaining a robust capital program focused on growth

PSEG 2009 - 2013 Capital Spending $11.3 Billion	PSEG 2014 - 2018E Capital Spending $11.8 Billion

NOTE: POWER 2009–2013 ACTUALS ARE RESTATED TO INCLUDE SOLAR CAPITAL SPEND. POWER CAPITAL SPENDING EXCLUDES NUCLEAR FUEL. E=ESTIMATE

SI-SSA-0015-12751

PSEG's business profile has been transformed through significant growth in utility capital spending

SI-SSA-0015-12752

Energy Strong Proposal recognizes need to strengthen and harden the distribution system

- Energy Strong is:
  - ✓ A $2.6 Billion investment program over 5 years as the first phase of a 10-year, $3.9 Billion infrastructure program
  - ✓ Proposal is based on contemporaneous recovery of investment, subject to NJ Board of Public Utilities (BPU) review
- Energy Strong proposal would harden 29 electric substations, modernize the gas distribution system, make the grid smarter, and improve the system's ability to communicate with customers
- Over 100 New Jersey municipalities support Energy Strong
- Proposed Energy Strong program would create approximately 5,800 jobs and stimulate NJ's economy

SI-SSA-0015-12753

PSEG Power – Value-advantaged through asset diversity, fuel flexibility, location and installed environmental controls

Fuel Diversity
Total MW: 13,450

Energy Produced
Total GWh: 54,264

Energy Market Served
Total MW: 13,450

- Gas
- Pumped Storage
- Nuclear
- Oil
- Coal*
- Solar

- Load Following
- Peaking
- Base load

SI-SSA-0015-12754

PSEG Power – Our diverse fleet and flexible portfolio allow us to capture opportunities arising from market volatility

SI-SSA-0015-12755

*AT THE BEGINNING OF EACH YEAR. **EXCLUDES BGSS.

Balance Sheet Strength

2009 – 2013: Reduced risk profile and transformed business mix

- Invested $8.4 billion in PSE&G
- Improved credit ratings
- Monetized and de-risked Holdings' portfolio

2014 – Forward: Strong cash flows and increasingly regulated business mix fully support:

- PSE&G's $10B approved investment program through 2018
- Consistent and sustainable dividend growth
- Additional investment capacity to deploy in opportunities beyond those in the current capital plan
- No need to issue equity

SI-SSA-0015-12756

Where we're going … actions taken to focus on more predictable growth

12 time Mid-Atlantic ReliabilityOne award winner

and Outstanding Response to a Major Event

SI-SSA-0015-12765

PSE&G's operating earnings grew ~18%

over the 5-year period with increased investment, cost control and supportive rate mechanisms

*SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/NET INCOME TO RECONCILE TO OPERATING EARNINGS.

SI-SSA-0015-12766

Focus on controlling O&M and lower pension costs support decline in expenses

SI-SSA-0015-12767

PSEG

* EXCLUDES REGULATORY CLAUSES ** INCLUDES $40M IMPACT FROM SUPERSTORM SANDY. E = ESTIMATE

PSE&G's rate base has grown ~9% annualized with investment focused on meeting customers' requirements

Growth in rate base is driven by investments with constructive recovery mechanisms

SI-SSA-0015-12768

Successfully worked with regulators to develop multiple solutions for New Jersey's energy and economic development goals

RENEWABLES – creative solutions to install solar generation: $0.7B

- Solar Loan I – 2008
- Solar Loan II – 2009
- Solar 4 All – 2009
- Solar Loan III – 2013
- Solar 4 All Ext – 2013

ENERGY EFFICIENCY – assisting customers with controlling energy usage: $0.3B

- Carbon Abatement – 2008
- Energy Efficiency – 2009
- Demand Response – 2009
- Energy Efficiency Ext – 2011

DISTRIBUTION – improving the electric and gas delivery infrastructure: $1.0B

- NJ Capital Infrastructure Program 1 (CIP 1) – 2009
- NJ Capital Infrastructure Program 2 (CIP 2) – 2011
- Energy Strong – Pending

Invested ~$2.0B through 2013; plan to invest additional ~$0.3B through 2018 in approved programs

SI-SSA-0015-12769

NOTE: SPENDING THROUGH 2013 UNLESS INDICATED OTHERWISE

A 40% increase to $10 billion, in our 5-year investment program, with further opportunity from Energy Strong

PSE&G's Capital Expenditures

2013-2017E
$7.0 Billion

2014-2018E
$10.0 Billion

■ Distribution ■ Solar/Energy Efficiency ■ Transmission

SI-SSA-0015-12770

PSE&G's capital program has been expanded and continues to focus on delivering energy solutions

E = ESTIMATE

SI-SSA-0015-12771

PSE&G's capital program could expand further with the addition of Energy Strong

E = ESTIMATE

SI-SSA-0015-12772

Energy Strong filing for resiliency and hardening to support customers' needs in the wake of Superstorm Sandy

- Filed 5-year $2.6 billion capital program with NJ Board of Public Utilities (BPU) in February 2013
- Program addresses system resiliency and hardening by:
  - Protecting distribution substations from severe storms
  - Making the electric grid smarter and easier to repair
  - Adding backup distribution lines and system redundancies
  - Moving overhead distribution lines underground
  - Modernizing the gas distribution system
- Currently in confidential negotiations with Staff of BPU and major intervenors; hearings conclude March 7, 2014
- Anticipate a final order following either settlement or litigated decision by the end of April 2014

SI-SSA-0015-12773

Over 70% of PSE&G's $10 billion investment program will be recovered through contemporaneous mechanisms

2014-2018E PSE&G Capital Spending by Recovery Method

$10.0 Billion

Clause Recovery Mechanisms

- Solar/Energy Efficiency

FERC Formula Rates

- Transmission

Traditional Recovery Mechanisms

- Distribution Base Rates

SI-SSA-0015-12774

The Energy Strong impact to customer bills is expected to be fully offset

OUT-YEAR BGS/BGSS, SBC, AND DISTRIBUTION RATES HELD CONSTANT AT CURRENT 2014 RATES.
RATES RELATED TO ELECTRIC RESTRUCTURING: SECURITIZATION (STC), NON-UTILITY GENERATION CHARGE (NGC), & TRANSITIONAL ENERGY FACILITIES ASSESSMENT (TEFA), ARE REDUCED TO ZERO BY 2017. THE RGGI RECOVERY CHARGE (RRC), SOLAR PILOT RECOVERY CHARGE (SPRC), AND CAPITAL ECONOMIC STIMULUS INFRASTRUCTURE INVESTMENT PROGRAM EXTENSION (CIP II) BILL IMPACTS ARE INCLUDED IN THEIR RESPECTIVE GAS AND ELECTRIC BARS AND FORECASTED IN OUT-YEARS BASED UPON LATEST ESTIMATE. ENERGY STRONG BILL IMPACTS ARE BASED UPON CURRENT FORECAST.

VICE-PRESIDENT DELIVERY PROJECTS AND CONSTRUCTION

PSEG

We make things work for you.

SI-SSA-0015-12776

Transmission has delivered, and has grown to represent ~36% of rate base

Transmission represented ~36% of rate base at YE 2013 up from ~15% at YE 2009

SI-SSA-0015-12777

PSE&G's existing major transmission

investment program remains on schedule and on budget

Major Transmission Projects

	Approved ROE	Inclusion of CWIP in Rate Base	100% Recovery of Costs Due to Abandonment	Project Estimate Up To ($ Millions)	Expected In-service Date
Susquehanna-Roseland	12.93%	✓	✓	$790	June 2014 / June 2015
Northeast Grid Reliability	11.93%	✓	✓	$907	June 2015
North Central Reliability	11.68%	✓	✓	$390	June 2014
Burlington–Camden 230kV	11.68%	✓	✓	$399	June 2014
Mickleton–Gloucester–Camden 230kV	11.68%	✓	✓	$435	June 2015

SI-SSA-0015-12778

Susquehanna-Roseland consists of constructing 150 miles of 500kV circuit (46 miles in NJ) with two new 500kV GIS switching stations at Roseland and Hopatcong

Project Estimate Up To*	Through Year-end 2013	Expected In-service Date
$790M	$661M	June 2014 / June 2015

- PJM RTEP project b0489
- ROE of 12.93% (including 1.25% incentive)
- 100% CWIP in rate base during development
- 100% recovery of prudently incurred costs due to abandonment

Customer Benefit: Improves reliability and reduces congestion

Project Status: Major permitting & siting complete, outside plant construction in progress, inside plant construction is complete and commissioning is in progress

SI-SSA-0015-12779

PSEG

*PROJECT IS SHARED WITH PPL. PROJECT ESTIMATE REPRESENTS PSE&G'S CONSTRUCTION RESPONSIBILITY FOR THE NJ PORTION.

Northeast Grid Reliability consists of upgrading approximately 50 overhead circuit miles of 138kV transmission line to 230kV, constructing ~18 miles of new underground 230kV lines, and converting/upgrading 12 existing stations to 230kV operation

Project Estimate Up To	Through Year-end 2013	Expected In-service Date
$907M	$228M	June 2015

- PJM RTEP project b1304
- ROE of 11.93% (including 0.25% incentive)
- 100% CWIP in rate base during development
- 100% recovery of prudently incurred costs due to abandonment
- Project estimate has increased ~$12M associated with hardening related scope changes as a result of Superstorm Sandy

Customer Benefit: Improves reliability and increases transfer capability

Project Status: Nearing completion of engineering/design and licensing/permitting phase. Outside and inside plant construction are in progress

SI-SSA-0015-12780

North Central Reliability consists of upgrading 55 circuit miles of 138kV transmission line to 230kV, and converting six existing stations to 230kV operation

Project Estimate Up To	Through Year-end 2013	Expected In-service Date
$390M	$349M	June 2014

- PJM RTEP project b1154
- ROE of 11.68%
- 100% CWIP in rate base during development
- 100% recovery of prudently incurred costs due to abandonment

Customer Benefit: Improves power quality and increases transfer capability

Project Status: Major permitting & siting complete, outside and inside plant construction is essentially complete, commissioning is in progress

SI-SSA-0015-12781

Burlington-Camden 230kV consists of upgrading 37 circuit miles (30 miles of overhead and 7 miles of underground) of 138kV transmission line to 230kV, converting the existing stations to 230kV operation

Project Estimate Up To	Through Year-end 2013	Expected In-service Date
$399M	$301M	June 2014

- PJM RTEP project b1156
- ROE of 11.68%
- 100% CWIP in rate base during development
- 100% recovery of prudently incurred costs due to abandonment

Customer Benefit: Addresses voltage reliability and increases transfer capability

Project Status: Major permitting & siting complete, outside plant construction is complete, and inside plant construction and commissioning is in progress

SI-SSA-0015-12782

Mickleton-Gloucester-Camden 230kV

consists of upgrading 10 circuit miles of overhead transmission, installing ~16 circuit miles of new 230kV underground, 10 circuit miles of new 230kV overhead, and modifications/upgrades at five existing stations

Project Estimate Up To	Through Year-end 2013	Expected In-service Date
$435M	$122M	June 2015

- PJM RTEP project b1398
- ROE of 11.68%
- 100% CWIP in rate base during development
- 100% recovery of prudently incurred costs due to abandonment

Customer Benefit: Addresses thermal reliability and increases transfer capability

Project Status: Major permitting & siting complete, outside and inside plant construction in progress

SI-SSA-0015-12783

Bergen-Linden Corridor is a recently approved project which will provide a double-circuit 345kV line to maintain reliability

Project Estimate Up To	Through Year-end 2013	Expected Completion Date
$1,200M	-	June 2018

- PJM RTEP project b2436
- 30 miles of underground cable
  - New ~ 23 miles
  - Reconductor (Upgrade of 138 to 345) ~7 miles
- 13 miles of double circuit overhead conductor (replacing double circuit 138 with double circuit 345)
- 11 station upgrades to 345kV

Customer Benefit: Addresses thermal and short-circuit reliability

Project Status: Engineering

SI-SSA-0015-12784

Planned transmission spend of $6.8 billion

is driven by PJM reliability projects, 69kV conversions and life-cycle replacement projects

E= ESTIMATE

SI-SSA-0015-12785

PSE&G's processes and culture are the foundation for project execution success

People

- Diverse, well-rounded team
- Culture with a focus for on-time, on-scope and on-budget execution
- Successful recruitment, development and retention strategies
- Strong unions and supplier relationships

Process

- Cradle to grave project execution organization
- Processes designed to be scalable, repeatable and improvable
- Emphasis on best practices and lessons learned sharing
- Improvements driven by performance metric management

Environment

- Collaborative relationship with regulatory agencies
- Innovative design and construction practices to minimize environmental impacts
- Robust environmental compliance system

SI-SSA-0015-12786

PSE&G's demonstrated ability to successfully execute large projects leaves us well positioned to pursue new opportunities

- Future RTEP as identified by PJM
- Near-term participation in RTO competitive open planning windows
  - PJM
  - MISO
  - NYISO
- Anticipate participating in future competitive solicitations under FERC 1000

SI-SSA-0015-12787

PSE&G's 2014 operating earnings

to benefit from increased investment in transmission and on-going cost control

SI-SSA-0015-12788

PSEG LONG ISLAND

Ralph LaRossa

CHAIRMAN OF THE BOARD
PSEG LONG ISLAND

SI-SSA-0015-12789

PSEG

We make things work for you.

PSEG was selected to operate Long Island Power Authority's (LIPA) electric transmission and distribution system for 12 years starting in 2014

- Pursuant to the Operating Services Agreement (OSA), all expenses and capital costs to operate the system are pre-funded by LIPA and passed through to their customers
- Compensation consists of a fixed fee and an incentive fee
  - Fixed compensation fee for 2014 with scheduled increases in 2015 and 2016
  - Starting in 2015 PSEG Energy Resources and Trading (ER&T) begins managing fuel/energy contracts
  - PSEG Long Island expected to contribute $0.03 to operating earnings in 2014 increasing to $0.07 per share in 2016 including contribution at ER&T
- Potential for an 8-year extension of the OSA

SI-SSA-0015-12790

PSEG Long Island commenced operations

on January 1, 2014

Key elements of Operating Services Agreement

Increased PSEG scope and control	Use of PSEG brand as PSEG Long Island	3-Year rate freeze (2013-2015)
Performance metrics	NY Department of Public Service oversight	Potential for "Utility 2.0" investment

Early performance

Successful transition to PSEG Long Island	Stakeholder communication	Winter storm response

SI-SSA-0015-12791

2014 PSEG POWER & ER&T Business Review & Outlook

MARCH 2014

PSEG

We make things work for you.

We have the
energy
to make things better
... for you, for our investors
and for our stakeholders.

SI-SSA-0015-12792

PSEG POWER

William Levis

PRESIDENT AND CHIEF
OPERATING OFFICER
PSEG POWER

PSEG
We make things work for you.

SI-SSA-0015-12793

PSEG Power strategy

Excellence in operating our units safely, reliably, cost-competitively and in an environmentally, responsible manner

SI-SSA-0015-12794

Agenda

- Delivering Value
- Fleet Advantage, Location, Flexibility and Fuel Diversity
- Nuclear Operation
- Fossil Operation
- Financial Performance
- Expansion Opportunities
- Regulatory
- Engaged Workforce

SI-SSA-0015-12795

PSEG Power creating value by responding to changing markets and regulations

Safety/Environmental Focus Fleet Diversity/Efficiency Focus	Financial/Economic Focus	Regulatory Focus
• Nuclear units continue to achieve strong operational results, operating at over 90% capacity factors for the 9th consecutive year • Fleet diversity across the dispatch curve and fuel types provide flexibility to meet changing conditions • Linden CCGT and Salem 2 nuclear unit achieved record output in 2013	• "Getting the most out of existing fleet" • Locational advantage • O&M control programs have delivered a CAGR of 1.6% between 2009 and 2014 • Sites offer competitive advantage for expansion	• Strong regulatory performance • Industry leadership in the changing business environment

SI-SSA-0015-12796

PSEG Power Delivering on priorities

Operational Excellence	• Maximize value of existing generating plants through implementation of the Operational Excellence Model (OEM) • Workforce engagement and development	• OEM implemented and achieving measures • Resource sharing program initiated
Financial Strength	• Deliver on Business Plan Commitments • Maintain competitive markets and improve constituent communication on issues important to Power	• Exceeded earnings guidance in 2013 • Ongoing effort in key markets showing success • Successful court outcome against subsidized generation
Disciplined Investment	• Successfully complete the Advanced Gas Path (AGP) uprates • Seek new opportunities in target markets (PJM, ISO-NE, NYISO) • Develop our renewables business (solar) • Maintain new nuclear option by successfully managing the Early Site Permit (ESP) process	• Accelerated schedule for AGP to maximize opportunity • LIPA contract for fuel and generation dispatch • Completed 19 MW solar project, 4 MW project under construction, established robust pipeline • Nuclear ESP is expected in 2015

SI-SSA-0015-12797

PSEG Power met 2013 challenges

Storm and weather challenges	+	Market challenges	=	Value delivered
• SuperStorm Sandy impacted our generating sites • Cold and hot weather extremes created challenging operating environment, but also presented opportunities		• Unit outages and planned transmission outages resulted in pressure on basis • Lower gas cost impacted dark spread pressuring coal unit dispatch • Load impacted by economy		• Optimized unit dispatch across fleet during storm recovery • Expedited return from storm outages, restored margin opportunities • High availability when needed • Achieved fuel cost savings • Captured value through coal/gas switching, unit flexibility • Coal & oil sales optimized inventory • Flexibility of portfolio captured real-time basis opportunities

SI-SSA-0015-12798

PSEG Power exceeded 2013's earnings guidance

OPERATING EARNINGS FOR PSEG POWER IN 2013; SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/NET INCOME TO RECONCILE TO OPERATING EARNINGS. *ASSETS TRANSFERRED TO POWER AT YEAR-END 2013.

SI-SSA-0015-12799

PSEG Power has generating assets

in three competitive markets

- Assets near loads
- Low cost portfolio
- Fuel flexibility with gas cost advantage
- Poised to benefit from volatility in real-time markets
- Fleet will maintain diversity and efficiency after HEDD
- Most sites suitable for expansion

SI-SSA-0015-12800

PSEG Power will maintain diversity and efficiency after a realignment of the fleet due to HEDD

Objective 2013 → 2017

- Maintain fuel diversity
- Maintain load-serving capability
- Maintain low cost structure
- Environmental improvement
- Peach Bottom (PB) uprate
- Advanced Gas Path (AGP)
- Kalaeloa and Solar transfer adds ~200MW of capacity

Fuel Diversity

Energy Produced

SI-SSA-0015-12801

Power's PJM assets along the dispatch curve reduce the risk of serving full requirement load contracts and can take advantage of volatile market conditions

	Base Load Units	Load Following Units	Peaking Units
Energy Revenue	X	X	X
Capacity Revenue	X	X	X
Ancillary Revenue		X	X
Dual Fuel		X	X

- Base Load ensures cash flow certainty
- Load Following provides ability to serve load shape

- Peaking takes advantage of real-time prices and reduces operational risk
- Dual fuel flexibility for >60% of fleet

SI-SSA-0015-12802

PSEG Power Nuclear is a critical element of our success

Hope Creek	Salem Units 1 and 2	Peach Bottom Units 2 and 3

• Operated by PSEG Nuclear
• PSEG Ownership: 100%
• Technology: Boiling Water Reactor
• Total Capacity: 1,178 MW
• Owned Capacity: 1,178 MW
• License Expiration: 2046
• Next Refueling
  • Spring 2015
	• Operated by PSEG Nuclear
	• PSEG Ownership: 57%
	• Technology: Pressurized Water Reactor
	• Total Capacity: 2,365 MW
	• Owned Capacity: 1,358 MW
	• License Expiration: 2036 and 2040
	• Next Refueling
	  • Unit 1 -- Fall 2014
	  • Unit 2 – Spring 2014
		• Operated by Exelon
		• PSEG Ownership: 50%
		• Technology: Boiling Water Reactor
		• Total Capacity: 2,251 MW
		• Owned Capacity: 1,125 MW
		• License Expiration: 2033 and 2034
		• Next Refueling
		  • Unit 2 – Fall 2014
		  • Unit 3 – Fall 2015
		• Uprate: 130 MW in 2015/2016

SI-SSA-0015-12803

PSEG Power Nuclear is core to the fleet and has competitive advantages

- Continued strong nuclear operations: nine consecutive years of >90% capacity factor
- Significant earnings contributor
- Top quartile of cost performance/MWh
- One third new staff, recruitment of the best new and experienced talent, and attractive training program
- Fukushima action plan in response to NRC staff review
  - ✓ FLEX* plan submitted with implementation starting with Fall outage
- Peach Bottom extended power uprate, 130 MW Power's share, scheduled in service 2015/2016
- Active and influential participation at INPO, NEI, EPRI, USA Alliance

*STRATEGY KNOWN AS THE "DIVERSE AND FLEXIBLE MITIGATION CAPABILITY" OR FLEX, ADDRESSES RECOMMENDATIONS OF THE NUCLEAR REGULATORY COMMISSION'S FUKUSHIMA TASK FORCE.

SI-SSA-0015-12804

Power's nuclear fleet is well positioned

with significantly lower-than-average US cost structure

*SOURCE: ELECTRIC UTILITY COST GROUP
** SOURCE: PSEG NUCLEAR

SI-SSA-0015-12805

PSEG Power's Fossil Fleet Performance

has shown improvement

- Fossil Capacity Factor rebounded with market
- Peaking Units maintain high start success

- Coal EFORp improving
- CC EFORp less than 1% in 2013
- Consistent recipient of EFORp payments

SI-SSA-0015-12806

PSEG

*LM6000 AND 7EA UNITS

PSEG Power improvements achieved in combined cycle fleet efficiency

Combined Cycle Operating Heat Rate

Actions Taken to Create Value

- Operational Excellence Model
- Training programs
- Unit testing initiative
- Outage work to restore efficiency
- Second gas line at BEC

- Heat rate improvement 2008-2013 translates to meaningful fuel savings at current market prices

- Advanced Gas Path (AGP) investments 2014 through 2018 to provide additional fuel savings

SI-SSA-0015-12807

Investing to expand CCGT capacity and improve efficiency

PSEG Power - CCGT Uprate Project

- Expand Power's CCGT fleet, one of the largest gas-fired portfolios in PJM, with incremental base and peaking MWs
- Retrofit Bergen, Linden and BEC with Advanced Gas Path (AGP) components at cost of ~$120M over 2014 - 2018

AGP Project Benefits

- ✓ CCGT capacity uprates of ~150 MW:
  - Linden (63 MW – 2014)
  - Bergen (31MW – 2015)
  - BEC (58 MW – 2017-18)
- ✓ Increases Efficiency - Combined Cycle (CC) heat rate improvement ~ 1.2%
- ✓ Upgrades technology and extends maintenance outage cycles

SI-SSA-0015-12808

PSEG Power's fleet is among the lowest emitting in the industry

- Mercury reduced 80% across the timeframe above
- More efficient testing and improved operational flexibility through utilization of Continuous Emission Monitoring System testing
- Cost control through testing coordination program

SI-SSA-0015-12809

PSEG Power's capital expenditures for environmental requirements are essentially complete*

SI-SSA-0015-12810

*BASED ON CURRENTLY KNOWN AND QUANTIFIABLE ENVIRONMENTAL REQUIREMENTS. E=ESTIMATE

PSEG Power's focus on costs

has resulted in

moderate increase

in O&M for

six years

Power O&M Expense*

2009 to 2014 CAGR = 1.6%

Cost control actions taken:	
• Fossil plant assessment • CCGT material condition assessment • Contract renegotiations	• Nuclear maintenance productivity study • Nuclear outage efficiency initiative • Materials management

SI-SSA-0015-12811

PSEG

*EXCLUDES IMPACTS FROM STORM RECOVERY COSTS
E=ESTIMATE

PSEG Power is well-positioned for growth when market conditions warrant

Available locations		Our sites possess infrastructure advantages
• Bergen • Burlington • Essex • Edison • Kearny	• Hudson • Linden • Sewaren • Bridgeport Harbor	• Electric Transmission Interconnections • Access to Gas Pipelines • Space • Emissions

SI-SSA-0015-12812

PSEG Solar Source owns 88 MW of operating solar facilities and has one project under construction

Hackettstown (Mars)
New Jersey (2 MW)
COD September 2009
Thin film panels – fixed tilt
Investment $13 million
15 year PPA with Mars, Inc.

Queen Creek
Arizona (25 MW)
COD October 2012
Polycrystalline - single axis tracker
Investment $79 million
20 year PPA with SRP

Wyandot
Ohio (12 MW)
COD May 2010
Thin film panels – fixed tilt
Investment $45 million
20 year PPA with AEP

Milford
Delaware (15 MW)
COD December 2012
Polycrystalline - fixed tilt
Investment $49 million
20 year PPA with DEMEC

JEA
Florida (15 MW)
COD September 2010
Thin film panels – fixed tilt
Investment $59 million
30 year PPA with JEA

Badger I
Arizona (19 MW)
COD November 2013
Polycrystalline - single axis tracker
Investment $50 million
30 year PPA with APS

Shasta
California (4 MW)
Expected COD March 2014
Polycrystalline - single axis tracker
Investment $13 million est.
20 year PPA with PG&E

- Continue to seek high quality projects with creditworthy off-takers.
- Solar portfolio delivers strong EBITDA post-construction period.

Shahid Malik

PRESIDENT, PSEG ENERGY RESOURCES & TRADE

PSEG

We make things work for you.

SI-SSA-0015-12816

Portfolio Management Strategy

Optimize value of assets

Manage risk vs. reward

Directly engage with regulatory agencies

SI-SSA-0015-12817

Agenda

Market Review

PSEG's Competitive Advantage

PSEG's Sustainable Advantage

SI-SSA-0015-12818

Market Review: Prices have stabilized

- Energy and gas prices appear to have stabilized
- Environmental restrictions may tighten market
- Insufficient gas infrastructure continues to place upward pressure on fuel prices during seasonal peaks

SI-SSA-0015-12819

F=FORWARDS AS OF 12/31/2013

Market Review: New generation in PJM not keeping pace with coal retirements

Cumulative Generation Retirements*

Forecast Reserve Margin (PJM January 2014)

- PJM forecasts a declining Reserve Margin through 2018, which may improve forward prices
- Brattle estimates energy prices could rise at least $3-4/MWh from today's prices

SI-SSA-0015-12820

PSEG

*PJM AS OF FEBRUARY 20, 2014
SOURCE OF CHART DATA: PJM

Market Review: Regulatory framework showing signs of improvement

	ISSUE / POLICY	REGULATORY GAINS
PJM	SUBSIDIZED GENERATION (NJ and MD)	• Comprehensively defeated in federal court (appeals currently pending)
	DEMAND RESPONSE RULES	• PJM and ISO-NE enacted stricter rules of eligibility and deployment
	ENERGY PRICE FORMATION	• Concerted drive to improve price formation for generation and ancillary services • Waiver of price caps during extreme market conditions
NYISO	TRANSMISSION	• Significant progress made to relieve bottling of upstate generation
ISO-NE	CAPACITY	• Improvement in price formation to better reflect tight supply conditions • Implementation of sloping demand curve in Forward Capacity Auction (FCA) 9
	ENERGY	• Demand response required to participate in Day Ahead markets
FEDERAL	GAS to ELECTRIC	• Better coordination between pipelines and ISO's will promote efficiency
	ENVIRONMENTAL REGULATIONS	• HEDD, HAPS/MACT may lead to tightening of supply in 2015+ timeframe

SI-SSA-0015-12821

PSEG Power: Enjoys real and competitive advantages in the merchant generation space

Market Review

PSEG's Competitive Advantage

- Fuel Flexibility
- Heat Rate Diversity
- Access to Marcellus Shale Gas
- Trading & Asset Flexibility
- Volatile Power Basis to PJM-West
- Location

PSEG's Sustainable Advantage

SI-SSA-0015-12822

Competitive Advantage: Heat Rate Diversity & Flexible Dispatch

SI-SSA-0015-12823

Competitive Advantage: PSEG's extensive gas asset portfolio gives unparalleled access to Marcellus Shale gas

SI-SSA-0015-12824

Competitive Advantage: ~25% of Power's gas for generation comes from Marcellus

- Our combined cycle and peaking assets have been able to take advantage of locational gas price volatility driven by production and logistical constraints
- Lower cost shale supply provides additional savings during periods of lower residential gas demand

SI-SSA-0015-12825

Competitive Advantage: Locational advantage from short term basis volatility

PS Zone Annual Basis to PJM-W

PS Zone Day Ahead On Peak Monthly Basis to PJM-W

- Annual basis benefits baseload units
- Intermediate units flexible to seasonal opportunities
- Combined Cycle and Peaking units positioned to optimize daily and hourly volatility

PS Zone Real Time On Peak Hourly Basis to PJM-W

ANNUAL FORWARD BASIS TO PJM-WEST AS OF 12/31/2013.

Competitive Advantage: Trading & Asset Flexibility

PSEG Zone LMP's on January 7, 2014

On Peak Basis to PJM-W on January 7, 2014

Hourly Generation and Load on January 7, 2014

- High gas market at $58/MMbtu setting power prices in PS zone on 1/7/14
- Higher basis to generation
- Base load and load following generation sufficient to cover load and hedge obligations
- Additional steam and peaking generation available above day ahead commitment to gain value from real time market
- Fuel flexibility with coal/gas/oil optionality among available units

SI-SSA-0015-12827

Competitive Advantage: Trading & Asset Flexibility

PSEG Zone LMP's on July 18, 2013

On Peak Basis to PJM-W on July 18, 2013

Hourly Generation and Load on July 18, 2013

- High demand in constrained northern NJ
- Base load and load following generation sufficient to cover load and hedge obligations
- Additional generation available above obligations to gain value from real time market spikes
- Gas advantage in procuring low cost shale supply to capture savings

SI-SSA-0015-12828

PSEG Power: Enjoys real and sustainable advantages in the merchant generation space

Market Review

PSEG's Competitive Advantage

PSEG's Sustainable Advantage

- Positive cash-flow hedging into the long-term
- Robust capacity market pricing in one of the most concentrated load pockets in the US
- Long-term access to discounted Marcellus gas

SI-SSA-0015-12829

Sustainable Advantage: BGS Auction provides excellent opportunity to forward hedge our generation

BGS sales account for about a quarter of our forward portfolio of hedges

SI-SSA-0015-12830

PSEG

$/MWH; BGS PRICES REFLECT PSE&G ZONE; RESULTS FOR 2012-2014 WILL BE THE NEW BLENDED PRICES BEGINNING JUNE 1, 2014.

Sustainable Advantage: Hedging strategy designed to protect gross margin while leveraging the portfolio

		2014	2015	2016
Base Load (Nuclear and Base Load Coal)	Volume TWh	35	35	35
	% Hedged	100%	75-80%	30-35%
	Price $/MWh	$48	$51	$53
Intermediate Coal, Combined Cycle, Peaking	Volume TWh	20	19	19
	% Hedged	35-40%	0%	0%
	Price $/MWh	$48	$51	$53
Total	Volume TWh	53-55	53-55	53-55
	% Hedged	75-80%	45-55%	20-30%
	Price $/MWh	$48	$51	$53

HEDGE PERCENTAGES AND PRICES AS OF FEBRUARY 11, 2014. REVENUES OF FULL REQUIREMENT LOAD DEALS BASED ON CONTRACT PRICE, INCLUDING RENEWABLE ENERGY CREDITS, ANCILLARY, AND TRANSMISSION COMPONENTS BUT EXCLUDING CAPACITY. HEDGES INCLUDE POSITIONS WITH MTM ACCOUNTING TREATMENT AND OPTIONS. EXCLUDES SOLAR AND KALAELOA.

SI-SSA-0015-12831

Sustainable Advantage: PJM's capacity market is expected to continue to recognize locational value

$/MW-day	2012 / 2013	2013 / 2014	2014 / 2015	2015 / 2016	**2016 / 2017**
Power's Average Prices	$153	$244	$162	$167	**$166**
Rest of Pool Prices	$16	$28	$126	$136	**$59**
Power's Capacity (MW)	10,400	10,600	10,300	9,000	8,600

2017/2018 RPM Auction Influenced By:

- Updated Demand Curve
- Environmental Retirements
- Minimum Offer Price Rule
- Updated Transfer Capabilities
- New Build/Cost of New Entry
- Demand Response

SI-SSA-0015-12832

Sustainable Advantage: Fuel advantage continues throughout the curve

Forward curve shows that Marcellus shale supply averages over $1.50/MMbtu discount year-round through 2018

SI-SSA-0015-12833

2013 AVERAGE 6/1/13-12/31/13; F= FORWARDS AS OF 12/31/13. LEIDY BASIS FROM ICE/BROKER QUOTES

PSEG Power: Enjoys real and sustainable advantages in the merchant generation space

Market Review

- Gas, Power, Spark Spreads
- Regulatory construct

PSEG's Competitive Advantage

- Fuel flexibility
- Heat Rate diversity
- Access to Marcellus Shale gas
- Asset flexibility

PSEG's Sustainable Advantage

- Positive cash-flow hedging into the long-term
- Robust capacity market pricing in most concentrated load pocket in US
- Long-term access to discounted Marcellus gas

SI-SSA-0015-12834

PSEG Power's Value Proposition

- Well-positioned fleet of merchant generating assets concentrated in PJM market
- Advantaged by low cost structure, fuel diversity and dispatch flexibility
- Low environmental capital requirements
- Capacity uprates to enhance value of nuclear and combined cycle stations
- Consistent hedging strategy recognizes asset flexibility
- Continue to meet commitments and to provide free cash flow

2014 Financial Review & Outlook

MARCH 2014

PSEG

We make things work for you.

We have the
energy
to make things better
... for you, for our investors
and for our stakeholders.

SI-SSA-0015-12836

PSEG

Caroline Dorsa

EXECUTIVE VICE PRESIDENT AND
CHIEF FINANCIAL OFFICER

PSEG

We make things work for you.

SI-SSA-0015-12837

Strong financial position to support our business initiatives

2013 Financial Position

- ✓ Exceeded upwardly revised 2013 earnings guidance
- ✓ Pension fully funded
- ✓ Strong balance sheet and upgraded credit ratings

2014 and Beyond

- ✓ Continued positive earnings trend in 2014
- ✓ Controlled O&M growth
- ✓ Balance Sheet and Cash Flow support investments without equity issuance
- ✓ Growth in PSE&G investments with contemporaneous returns
- ✓ Diversified Power assets with a balanced hedge profile
- ✓ Growth in PSE&G Cash from Operations, with continued significant Cash from Operations/FFO at Power
- ✓ Increased Dividend by $0.04 to indicative annual rate of $1.48 for 2014
- ✓ Opportunity for consistent and sustainable dividend growth

SI-SSA-0015-12838

Exceeded upwardly revised guidance

in both businesses

PSEG Operating Earnings		
$ Millions (except EPS)	**2012**	**2013**
PSE&G	$528	$612
PSEG Power	$663	$710
Other	$45	($13)
Operating Earnings	$1,236	$1,309
*Operating EPS**	**$2.44**	**$2.58**

Upwardly Revised Earnings Guidance (Nov 2013)	**$2.40 - $2.55**
Earnings Guidance (Feb 2013)	**$2.25 - $2.50**

*SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/NET INCOME TO RECONCILE TO OPERATING EARNINGS.

NOTE: 2012 OPERATING EARNINGS RE-STATED FOR TRANSFER OF ASSETS FROM PSEG HOLDINGS TO PSEG POWER.

SI-SSA-0015-12839

In 2013, Power had significant free cash flow

SI-SSA-0015-12840

In 2013, PSE&G invested over $2B, using $1.4B of internally generated cash flow and debt, while maintaining its capital structure

(1) PSE&G CASH FROM OPERATIONS ADJUSTS FOR SECURITIZATION PRINCIPAL REPAYMENTS OF ~$220 MILLION.

SI-SSA-0015-12841

In 2013, Power's Free Cash Flow supported PSE&G's capital program and shareholder dividend

(1) PSE&G CASH FROM OPERATIONS ADJUSTS FOR SECURITIZATION PRINCIPAL REPAYMENTS OF ~$220 MILLION.
(2) OTHER CASH FLOW INCLUDES HOLDINGS NET CASH FLOW AND PARENT CASH.

SI-SSA-0015-12842

PSEG growth spend of ~$5.4B represents ~72% of total investment with Energy Strong potentially enhancing the profile

PSEG EXECUTIVE PROFILES

SI-SSA-0015-12854

PSEG

We make things work for you.

Ralph Izzo

CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER
PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED

Ralph Izzo was elected chairman and chief executive officer of Public Service Enterprise Group Incorporated (PSEG) in April 2007. He was named as the company's president and chief operating officer and a member of the board of directors of PSEG in October 2006. Previously, Mr. Izzo was president and chief operating officer of Public Service Electric and Gas Company (PSE&G).

Since joining PSE&G in 1992 Mr. Izzo was elected to several executive positions within PSEG's family of companies, including PSE&G senior vice president – utility operations, PSE&G vice president – appliance service, PSEG vice president - corporate planning, and PSE&G vice president - electric ventures. In these capacities he broadened his experience in the areas of general management, strategic planning and finance.

Mr. Izzo is a well-known leader within the utility industry, as well as the public policy arena. He is frequently asked to testify before Congress and speak to organizations on matters pertaining to national energy policy.

Mr. Izzo's career began as a research scientist at the Princeton Plasma Physics Laboratory, performing numerical simulations of fusion energy experiments. He has published or presented over 35 papers on magnetohydrodynamic modeling. Mr. Izzo received his Bachelor of Science and Master of Science degrees in mechanical engineering and his Doctor of Philosophy degree in applied physics from Columbia University. He also received a Master of Business Administration degree, with a concentration in finance from the Rutgers Graduate School of Management. He is listed in numerous editions of Who's Who and has been the recipient of national fellowships and awards. Mr. Izzo has received Honorary Degrees from the New Jersey Institute of Technology (Doctor of Science), Thomas A. Edison State College (Doctor of Humane Letters), Bloomfield College (Doctor of Humane Letters), and Rutgers University (Doctor of Humane Letters).

Mr. Izzo serves as chair of the New Jersey Chamber of Commerce, and on the Rutgers University Board of Governors, the board of directors for The Williams Companies, the New Jersey Utilities Association, the Edison Electric Institute (EEI), the Nuclear Energy Institute (NEI), the National Center on Addiction and Substance Abuse at Columbia University (CASA), and The Center for Energy Workforce Development. He is also a member of the Columbia University School of Engineering Board of Visitors and the Princeton University Adlinger Center for Energy and the Environment Advisory Council, as well as a member of the Visiting Committee for the Department of Nuclear Engineering at MIT.

SI-SSA-0015-12855

J. A. Bouknight, Jr. (Lon)

EXECUTIVE VICE PRESIDENT AND GENERAL COUNSEL, PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG SERVICES CORPORATION, EXECUTIVE VICE PRESIDENT AND PSEG POWER

J.A. Bouknight, Jr. ("Lon") was named executive vice president and general counsel in January, 2010. He had been Executive Vice President – Law since November 2009. In his current position, he has general supervisory responsibilities for the law department, office of the corporate secretary, business assurance and resilience, and Federal public affairs and sustainability.

Mr. Bouknight was a partner in the Washington law office of Steptoe & Johnson, where he served as a member of the regulatory and industry affairs department and as former chairman of the firm. His practice focused on the electric power and natural gas industries and on antitrust and competition issues in both regulated and unregulated industries.

From 2005 to 2008, Mr. Bouknight served as executive vice president and general counsel of Edison International, a major electric company based in California.

A graduate of Wofford College and Duke University School of Law, Mr. Bouknight has authored a number of articles and lectured extensively on energy industry and competition topics.

SI-SSA-0015-12856

Caroline Dorsa

EXECUTIVE VICE PRESIDENT AND CHIEF FINANCIAL OFFICER

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG POWER LLC AND PSEG SERVICES CORPORATION

Caroline Dorsa was named executive vice president and chief financial officer for Public Service Enterprise Group Incorporated (PSEG) in April 2009. She is also the executive vice president and chief financial officer of Public Service Electric and Gas Company (PSE&G), PSEG Power and PSEG Services Corporation.

Ms. Dorsa is responsible for all financial functions, including Internal Audit Services and Investor Relations. Given the array of financial instruments which serve as the primary means of selling wholesale energy to customers, Ms. Dorsa also has responsibility for the Risk Management function, which provides independent oversight of the PSEG Power trading organization. In addition to her financial responsibilities, Ms. Dorsa leads the Information Technology and Procurement organizations. She is a member of PSEG's Executive Officer Group.

In her role as chief financial officer, she has overseen the execution of the Company's financial strategy, which has involved a significant deleveraging of the balance sheet and enhancement of the company's financial strength. The company is in the midst of a major capital investment program focused on deploying more than $6 billion over three years to ensure the reliability and efficiency of the energy generation and distribution system in New Jersey. PSEG has an uninterrupted record of paying dividends to shareholders for 105 years.

Ms. Dorsa had been a member of the PSEG Board of Directors for six years, and a member of PSEG's Audit, Corporate Governance and Finance Committees before joining the company's management. Her previous management position had been with Merck & Co., where she was senior vice president – global human health, strategy and integration. Prior to this, Ms. Dorsa served as senior vice president and chief financial officer at Avaya, Inc. Earlier in her career, she held a range of financial positions at Merck, including serving as vice president and treasurer of the company for over 12 years. She was also the Secretary of the Finance Committee of Merck's Board of Directors.

Before joining Merck, Ms. Dorsa worked for Mayor Edward Koch of the City of New York promoting economic development in midtown Manhattan.

Ms. Dorsa is a member of the Junior Achievement of New Jersey State Board of Directors. She is a member of the Board of Directors and the financial expert for the Finance and Audit Committee of Biogen Idec (NASDAQ: BIIB), a biopharmaceutical company located in Cambridge, MA. Ms. Dorsa is also a member of the Board of Directors and Chairman of the Audit Committee of Joule, a privately financed solar fuels company based in Bedford, MA.

Ms. Dorsa holds a B.A. from Colgate University and an M.B.A from Columbia Business School.

SI-SSA-0015-12857

Thomas P. Joyce

PRESIDENT AND CHIEF NUCLEAR OFFICER
PSEG NUCLEAR

Thomas P. Joyce was named president and chief nuclear officer of PSEG Nuclear (Nuclear), in October 2008. He had been senior vice president – operations of Salem/Hope Creek for Nuclear, since June 2007. Mr. Joyce was also vice president – Salem, since January 2007, and previously assumed the role of PSEG Nuclear's site vice president as part of the Nuclear Operating Services Agreement between PSEG and Exelon Corporation in 2005.

PSEG Nuclear's Salem and Hope Creek Generating stations comprise the second largest commercial nuclear power facility in the United States. Together the units provide enough electricity for three million homes. Together the plants also provide 49 percent of New Jersey's electricity.

Mr. Joyce has more than 38 years of experience in commercial nuclear power operations. Under his leadership as president and chief nuclear officer, Salem and Hope Creek combined to set a new site generation record in 2009. In 2011, the stations also received approval from the Nuclear Regulatory Commission (NRC) to extend their operating licenses an additional 20 years. Reinforcing the company's strong ties to the local community, the license renewal approvals did not encounter any formal legal contentions like many other plants across the country.

While leading Salem, the station completed two successful reactor vessel head replacement outages. Salem Unit 1 completed its outage capturing the world record for shortest head replacement outage.

Prior to coming to PSEG Mr. Joyce was site vice president at Exelon Nuclear's Braidwood Station. During his tenure the station achieved overall performance improvements and retained their excellent INPO rating. The plant completed a refueling in 15 days, 14 hours – setting a record for outage efficiency among U.S. pressurized water reactors. Before serving at Braidwood he held leadership positions at Exelon's Byron, Dresden, and Zion Stations, and in the corporate offices of both Exelon Corporation and Exelon Nuclear.

Mr. Joyce holds a Bachelor of Science degree in nuclear engineering from the University of Missouri at Rolla, and a Master of Business Administration degree from the Keller Graduate School of Management. While at Byron, he earned his senior reactor operators (SRO) license.

A recognized leader in the nuclear industry, Mr. Joyce currently serves as chairman of the Utilities Service Alliance (USA). The organization is comprised of eight of America's leading electric utilities operating 14 nuclear reactors located at 10 stations. Its two major objectives are to improve individual plant and fleet performance and to reduce operating and maintenance costs. Mr. Joyce also chairs the Nuclear Energy Institute's (NEI) Emergency Preparedness Working Group and the EPRI Nuclear Power Council.

SI-SSA-0015-12858

Ralph A. LaRossa

PRESIDENT AND CHIEF OPERATING OFFICER

PUBLIC SERVICE ELECTRIC AND GAS COMPANY

Ralph A. LaRossa was named president and chief operating officer of Public Service Electric and Gas Company (PSE&G), in October 2006. Prior to this position he was vice president - electric delivery for PSE&G. In addition to his responsibilities with PSE&G, he also oversees the communications and state governmental affairs organizations.

On January 1, 2014, Mr. LaRossa became Chairman of the Board of PSEG Long Island, a subsidiary of Public Service Enterprise Group (PSEG), which manages the electric transmission and distribution systems on Long Island and in the Rockaways.

Mr. LaRossa joined PSE&G in 1985 as an associate engineer and advanced through a variety of management positions in the utility's gas and electric operations. In 1998 he received Gas Industry Magazine's Outstanding Manager of the Year Award. PSE&G is New Jersey's largest electric and gas utility.

Mr. LaRossa is a graduate of Stevens Institute of Technology and has completed the Harvard Business School's Program for Management Development. He serves on the board of directors for the American Gas Association (AGA), New Jersey Utilities Association (NJUA), New Jersey Performing Arts Center (NJPAC), Partnership for a Drug-Free NJ, Choose New Jersey, and Bergen County's United Way. He also serves on the board of trustees for Montclair State University and the Newark Alliance.

SI-SSA-0015-12859

Shahid Malik

PRESIDENT

PSEG ENERGY RESOURCES & TRADE

Shahid Malik was elected President of PSEG Energy Resources & Trade (ER&T) in December, 2011. PSEG operates one of the most balanced portfolios in the country, both in terms of fuel mix and market segment (base load units, load following units and peaking units), and Mr. Malik is essentially responsible for managing these assets and taking them to market. He oversees PSEG's generation portfolio and the purchase and sale of all energy commodities.

Mr. Malik has an extensive background in the energy industry across the oil, gas, electric and renewable energy sectors in Europe and the United States. Previously, he was with Pittiglio, Rabin, Todd & McGrath (PRTM) in Pittsburgh, PA and was responsible for all aspects of growing the global energy practice, with a primary focus on the North American utility sector. Prior to that he served as President & CEO of Strategic Energy, Great Plains Energy's unregulated retail marketing subsidiary and a provider of energy and services to business clients in North America. He was accountable for the Company's strategy and operations and led a successful turnaround of the company, achieving significant growth in products and services while reducing costs.

Mr. Malik's career has included Executive Leadership positions with several energy companies including Entergy Corporation, Reliant Energy and BP Oil Company. In addition, he served on the Board of Directors of South Jersey Industries (NYSE: SJI) immediately prior to joining PSEG.

Mr. Malik has been in the energy business for more than 20 years, since receiving his Economics degree from Manchester University in England and an MBA from Rice University, Houston. He sits on the Executive Committee of the Board of Trustees of Newark Museum.

SI-SSA-0015-12860

Margaret M. Pego, SPHR

SENIOR VICE PRESIDENT – HUMAN RESOURCES AND
CHIEF HUMAN RESOURCES OFFICER
PSEG SERVICES CORPORATION

Margaret M. Pego was named senior vice president – human resources and chief human resources officer of PSEG Services Corporation in December 2006. Prior, she had been vice president – human resources. Ms. Pego joined PSEG in 1974, and has held a variety of management positions in the human resources department.

Ms. Pego holds a Bachelor of Arts degree in business administration from William Paterson College, and a Master of Business Administration degree with a concentration in management and labor relations from Seton Hall University. In addition, she holds a certificate in EEO studies from Cornell University, and has completed the Human Resources Executive Program at the University of Michigan. She is also certified as a senior professional in human resources.

Ms. Pego was named one of 2013's HR Top 10 Breakaway Leaders by Evanta, a leading organization that fosters leadership development and collaborative exchange among North America's top executives.

Ms. Pego is active in several local and national organizations, including the EEI Chief HR Executive Advisory Committee; the American Gas Association HR Policy Committee; the Conference Board Advisory Council of HR Management – Council of HR Executives; and the Society for Human Resources Management. In addition, she is a member of the board of trustees of the College of Saint Elizabeth, Rutgers Business School and she is first vice chair of the Children's Specialized Hospital board and chair of the board's HR committee. She is the former Chair of the Center for Energy Workforce Development (CEWD) Executive Council. She is a former member of the Supreme Court of New Jersey Attorney Ethics Committee. Ms. Pego is a 2002 Leadership New Jersey fellow, 1997 TWIN Honoree, 2006 Executive Woman of New Jersey Honoree and 2008 NJ Best 50 Women in Business Honoree.

SI-SSA-0015-12861

William Levis

PRESIDENT AND CHIEF OPERATING OFFICER

PSEG POWER

William Levis is president and chief operating officer of PSEG Power, a position he's held since June 2007. PSEG Power is a major, merchant power producer in the U.S. with four main subsidiaries: PSEG Nuclear, PSEG Fossil, PSEG Energy Resources and Trade (ER&T) and PSEG Power Ventures.

PSEG Power operates one of the most balanced portfolios in the country, both in terms of fuel mix and market segment (based load units, load following units and peaking units). Its low-cost, load following fleet is geographically well positioned in competitive markets. Its 13,450 MWs represent a diverse fuel mix which includes 44 percent natural gas, 27 percent nuclear, 18 percent coal, 9 percent oil, 1 percent solar, and 1 percent pumped storage.

Before coming to PSEG, Mr. Levis was Exelon Nuclear's vice-president – Mid-Atlantic operations. During his years at Exelon, Mr. Levis oversaw significant improvements, setting records for total annual megawatt production and establishing efficiency records for refueling outages. Prior to joining Exelon, Mr. Levis worked at Ontario Hydro's Pickering Plant and held several positions over a five-year period with Carolina Power and Light's Brunswick facility. During this time, the station was removed from the NRC Watch List and set new records in the areas of safety, production, and cost.

Mr. Levis has a Bachelor of Science degree in marine engineering from the U.S. Naval Academy and holds an SRO (senior reactor operator) certification. He retired as a commander in the Naval Reserves and attained his professional engineer license in 1985.

Mr. Levis serves as a member of Pennsylvania Congressman James Gerlach's Service Academies Selection Committee. He is also a member of Nuclear Energy Institute's (NEI) Board of Directors, and serves as a member of the Institute of Nuclear Power Operations (INPO) National Nuclear Accrediting Board. He is a member of the Philadelphia Archdiocese Catholic Charities Appeals Board and its Operations Committee, and is a member of the CEO Council for Growth based in Philadelphia.

SI-SSA-0015-12862

Richard P. Lopriore

PRESIDENT

PSEG FOSSIL

Richard P. Lopriore was elected president of PSEG Fossil in May 2007. He versees operations for 13 generation facilities spanning four states. He is also responsible for the oversight of two service groups: Laboratory & Testing Services, and Maintenance & Repair Services. Additionally, he is responsible for Construction, Capital Projects and Engineering.

The PSEG Fossil fleet is comprised of natural gas, coal and oil-fired electric generating units that contribute about 9,700 megawatts of electricity to PSEG Power's generation portfolio. This includes an ownership interest of 1,000 megawatts in three jointly-owned facilities.

Under Lopriore's leadership, nine LM6000 peaking units were constructed. Fossil also outfitted its two New Jersey coal plants with about $1.5 billion in new pollution control equipment resulting in substantial reductions in emissions. These plants are among the cleanest, most responsible coal stations in the country.

Mr. Lopriore instituted an in-depth Operational Excellence Model (OEM), one of the first programs in the nation to drive standardization across a Fossil fleet. The program resulted in consistent improvement in operating results, reliability and fleet performance and the achievement of all-time generation records. He also revamped PSEG Fossil's training program. Two industry-first, award-winning mobile training trailers were developed to take training directly to the work sites reducing costs and increasing productivity.

Mr. Lopriore has been a valuable part of the electric generation industry for more than 40 years. Prior to joining PSEG Fossil, he had been senior vice president - mid-Atlantic operations for Exelon Nuclear, responsible for oversight of the Limerick, Peach Bottom, Oyster Creek and Three Mile Island stations. During his tenure, Three Mile Island achieved INPO 1 status (2007).

From 1997-1999, Mr. Lopriore was an Executive Advisor for Ontario Hydro Nuclear Power Plant's recovery and performance improvement program.

Mr. Lopriore joined Exelon as plant manager of Byron Stations in 1999 and was promoted to site vice president in 2001. In 2003 he became corporate vice president - operations support at Exelon's nuclear headquarters, responsible for both the Midwest and mid-Atlantic regions. He then became vice president - operations, Midwest boiling water reactors in 2004 responsible for the Dresden, LaSalle County, Quad Cities and Clinton nuclear plants.

Prior to Exelon, Mr. Lopriore held several key management positions at the Brunswick Nuclear Plant in North Carolina, including plant manager. At Vermont Yankee, he achieved an operational SRO certification for Boiling Water Reactors.

Mr. Lopriore received his Bachelor of Science degree from Southern Vermont College and is a member of the American Nuclear Society.
He also served in the National Guard.

SI-SSA-0015-12863

Kim C. Hanemann

VICE PRESIDENT – DELIVERY PROJECTS AND CONSTRUCTION

PUBLIC SERVICE ELECTRIC AND GAS COMPANY

Kim C. Hanemann is vice president-delivery projects and construction, for PSE&G, where she is responsible for ensuring the on-time, on-scope and on-budget execution of all large utility construction projects, which includes overseeing project management, project controls, and licensing and permitting. Her organization also includes a mobile construction workforce.

Ms. Hanemann joined PSE&G as an engineer in 1986. She has held numerous leadership positions in both electric and gas field operations as well as in utility support operations. She was named a director in 2007, overseeing three different groups (Transmission Engineering and Construction, Utility Operations Support, and Delivery Projects and Construction) before her promotion to vice president in 2010.

Ms. Hanemann holds a Bachelor of Science degree in mechanical engineering from Lehigh University and an MBA from the Rutgers Graduate School of Management.

PRESENTATION

Operator

Ladies and Gentlemen, thank you for standing by. My name is Angela and I am your event operator today. I would like to welcome everyone to today's conference: Public Service Enterprise Group's first quarter 2015 earnings Conference Call and Webcast.

(Operator Instructions)

As a reminder, this Conference Call is being recorded today, Friday, May 1, 2015, and will be available for telephone replay beginning at 1 o'clock pm Eastern today, until 11.30 p.m. Eastern on May 8, 2015. It will also be available as an audio Webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen Lally ***- Public Service Enterprise Group Inc - VP of IR***

Thank you, Angela. Good morning. Thank you all for participating in our earnings call this morning.

As you are aware, we released our first quarter 2015 earnings statements earlier today. The release and attachments are posted on our website as mentioned, www.pseg.com, under the investor section. We also posted a series of slides that detail operating results by Company for the quarter. Our 10-Q for the period ended March 31, 2015 is expected to be filed shortly.

I won't go through the full disclaimer statement or the comments we have on a difference between operating earnings and GAAP results, but as you know, the Earnings Release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligations to do so, even if our estimate changes, unless of course we are required to do so.

Our release today also contains adjusted non-GAAP operating earnings, as well as a new non-GAAP disclosure of adjusted EBITDA for PSEG Power. Please refer to today's 8-K or the other filings for a discussion of factors that may cause results to differ from Management's projections, forecasts, and expectations, for a reconciliation of operating earnings and adjusted EBITDA to GAAP results.

I'd now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group, and joining Ralph on the call is Caroline Dorsa, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions.

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

Thank you, Kathleen, thank you, everyone, for joining us today.

PSEG performed extremely well in the first quarter. Earlier this morning we reported operating earnings for the first quarter of 2015 of $1.04 per share. That's a 3% increase over the first quarter of 2014's operating earnings of $1.01 per share. PSE&G continues to achieve best-in-class growth as we expand investments that are helping meet our customers needs and helping New Jersey achieve important goals.

PSE&G invested $599 million in the first quarter, as part of its planned capital investment for 2015 of $2.6 billion in upgrades to the electric and gas distribution and transmission systems. PSE&G's capital program is on schedule and on budget.

The Susquehanna-Roseland 500 KV transmission line is expected to be fully operational later this month. This will be a major achievement. SR's 2015 operational date is 12 years after the August 2003 blackout, and almost a decade after PJM identified the critical system needs required to upgrade aging infrastructure and relieve overloaded power lines. SR's completion is testament to the cooperative relationship between PSE&G and PPL Energy, and the capabilities shown by PSE&G in navigating the lengthy permitting and licensing process at both the federal and state levels.

PSE&G's investment in transmission represented 39% of its year-end 2014 rate base, and it is forecast to grow to represent in excess of 50% of rate base in five years. The New Jersey Board of Public Utilities recently approved an expansion of PSE&G's successful energy efficiency programs. The investment of $95 million over the next three years will decrease energy costs for participants and lessen the environmental effect of energy supply. At the same time given the structure of the program, PSE&G should be able to fully earn its authorized return of 9.75%.

In addition, the recommendation by PJM staff earlier this year to award PSE&G a share of the work required to upgrade reliability at artificial island would increase spending on transmission anywhere from $100 million to $130 million. The AI investment, artificial island investment, was not included in our capital program as described in our March investor conference, so this is additive to our prior forecast for utility investment opportunities.

We await the BPU's action later this year on PSE&G's request to invest $1.6 billion over the next five years to continue its long term program to modernize its gas systems. PSE&G's gas system modernization program would support the replacement of approximately 160 miles of cast iron and unprotected fuel gas mains per year. The replacement program would reduce the risk of leaks, and it would reduce the release of methane gas.

PSE&G has been replacing and modernizing its gas pipe as part of the energy strong program. Approval of the gas system modernization program would support the extension of this work and continue to provide a direct boost to New Jersey's economy with the creation of more than 500 jobs. We continue to believe that this is the optimal time to move ahead with this work, given the sizeable savings customers continue to realize from low gas prices. Spending on this program would further enhance PSE&G's already strong growth platform.

The first quarter results for power demonstrate the quality of this asset mix. PSE&G's power earnings continue to benefit from strong operations and the capable management of its gas supply. The fleet's dispatch flexibility and diverse fuel mix supported operations during this past Winter.

The gas fired combined cycle gas turbines fleet availability improved quarter-over-quarter, following the conclusion of work at Linden in 2014, to increase its capacity and with the continued focus on operations. This improvement availability aided the fleet's ability to respond to market conditions, and power continues to benefit from the management of its gas storage and transportation agreements, which also provide substantial savings to PSE&G's residential gas customers.

In a related development, a Federal Energy Regulatory Commission has granted PJM's request to delay the RPM capacity auction. The delay provides more time for the FERC to consider PJM's proposed changes to the auction structure. We believe PJMs original net CONE offer cap proposal was just and reasonable, but we support PJMs proposed alternative offer cap, which the FERC agrees would allow for bids up to approximately 85% of net CONE.

The FERC's approval of the proposed changes would recognize the need for increased investment to maintain system reliability. The weather conditions experienced over the past two years exposed the critical need to maintain and improve on the resiliency of our infrastructure. The need to replace aging equipment, and maintain the level of service demanded by our customers.

THOMSON REUTERS

SI-SSA-0015-12881

On a separate matter, I'm pleased with the outcome of the settlement we reached with our insurers over claims related to superstorm Sandy losses. Its been more than two years since the storm affected our operations, but in the end we have been fully compensated for the insurable spending we made on Sandy related repairs.

Our business model is working the way it should. Operational excellence produces the financial strength that allows us to invest in a disciplined way for growth. Our balance sheet is strong. The financial capability supports our current plans to invest $13 billion through 2019, and it is sufficient to support an expansion of this investment program without the need to issue equity.

PSE&G's investment program is expected to yield double digit growth in rate base through 2019, as the earnings contribution from our regular to business exceeds 50% of our consolidated earnings. PSEG Power's investment program is expected to enhance fleets efficiency and reliability as we continue to look for opportunities to expand power's fleet. The successful implementation of our investment plans will provide PSEG with a strong foundation to deliver customer satisfaction and shareholder value.

Based on the strong start to the current year, both operationally and financially, 2015 would represent the third year of growth in PSEG's operating earnings, but given that it is still early in 2015, we are maintaining our forecast of operating earnings for the full year, of $2.75 per share to $2.95 per share. We have a proven strategy, and a key contributor to our success is the dedication of our employees to meeting the needs of customers in a safe, reliable manner. Their skills and talents are what will propel us to achieve our long term goals.

With that I'll turn the call over to Caroline, who will discuss our financials in greater detail.

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Thank you, Ralph, and good morning, everyone.

As Ralph said, PSEG reported operating earnings for the first quarter of $1.04 per share, versus operating earnings of $1.01 per share in last year's first quarter. We've provided you with a reconciliation of operating earnings to income from continuing operations and net income for the quarter on Slide 4.

As you can see on Slide 8, PSEG Power provided the largest contribution to earnings. For the quarter, Power reported operating earnings of $0.55 per share, compared with $0.58 per share last year. In addition, Power reported adjusted EBITDA of $626 million, compared to $651 million last year.

PSE&G reported operating earnings of $0.47 per share, compared with $0.42 per share last year. PSEG Enterprise Other, or the parent, contributed operating earnings of $0.02 per share, compared with $0.01 per share for the first quarter of 2014. The water fall chart on Slide 9 takes you through the net changes in quarter-over-quarter operating earnings by major business, and I'll now review each company in a bit more detail.

Let's turn to PSE&G. As shown on Slide 11, PSE&G reported operating earnings for the first quarter of 2015, or $0.47 per share, compared with $0.42 per share last year. PSE&G's earnings for the first quarter reflect the benefits of the increase in revenue associated with the expansion of its capital program, an increase in demand for gas, and the recovery of insurable storm costs from the settlement of Sandy related insurance claims.

PSE&G's expanded investment in transmission added $0.03 per share to earnings for the quarter. PSE&G is expected to invest $1.6 billion on transmission in 2015 and under PSE&G's formula rate, an increase in transmission revenue of $182 million was effective at the start of the year. This increase in revenue provides for recovery of known costs and appropriate returns associated with PSE&G's expanded transmission investments.

The winter weather was significantly colder than normal, and colder than a year ago. Of course, the gas weather normalization clause negates the impact of weather on earnings from PSE&G's gas distribution business, however, growth in customer demand for gas normalized for weather added $0.01 per share to earnings. Quarter-over-quarter earnings comparisons also benefited from a decline in operation and maintenance expense of $0.01 per share.

Decline in O&M reflects the distribution portion of PSE&G's share of the Sandy related insurance settlement, and a decline in storm related repair costs from the higher levels experienced in 2014s first quarter. Together, these more than offset the impact on O&M from an increase in pension expense.

Economic indicators in the service area are modestly better than a year ago. Employment and housing indicators show signs of slow but steady improvement. Electric demand has also shown modest improvement, and I stress the word modest in characterizing demand growth. On a weather normalized basis, Electric sales are estimated to have improved by 0.2% in the quarter and the improvement was lead by a 0.6% growth from the commercial and industrial sector which offset a decline in demand from residential customers.

THOMSON REUTERS

Gas deliveries, on the other hand, continue to benefit from sustained low commodity prices, and signals of a recovery in the economy. Weather normalized gas deliveries in the quarter grew by 0.4%, based on a 1% improvement from the residential sector.

PSE&G extended bill credits that it had provided for residential gas usage for the prior five months through April. The April Bill credit cut the average bill for the typical residential customer by 32%.

PSE&G received approval from the New Jersey BPU in April 2015 to increase its investment in energy efficiency. PSE&G will invest an additional $95 million over a three year period, at an authorized return on equity of 9.75%. The approval will allow PSE&G to expand its energy efficiency initiatives under several popular programs, and the structure under the agreement for revenue and cost recovery should allow PSE&G to fully earn its authorized return.

We're maintaining our forecast with PSE&G's operating earnings for 2015 of $735 million to $775 million. PSE&Gs earnings for the full year will be driven by the recovery of cost associated with higher levels of capital spending.

Let's now move to PSEG Power. As shown on Slide 15, PSEG Power reported operating earnings for the first quarter of $0.55 per share, and adjusted EBITDA of $626 million, compared with $0.58 per share and adjusted EBITDA of $651 million for the first quarter of 2014. Adjusted EBITDA excludes the same items as our operating earnings measure as well as income tax expense, interest expense, depreciation and amortization, and major maintenance at Power's fossil generation facilities.

PSEG Power's strong operating results in the first quarter reflect an improvement in availability of its gas fired combined cycle fleet, higher prices on its hedged energy output, and the monetization of its gas supply. Together, these helped offset the impact on earnings from a decline in capacity revenue and lower wholesale market prices for energy.

An increase in the average price received on energy hedges, coupled with an increase in the percent of energy hedged in the first quarter relative to a year ago fully offset the impact of lower wholesale market prices on earnings. The expected decline in average PJM capacity prices to $168 per megawatt day from $242 per megawatt day last year reduced power's quarter-over-quarter earnings by $0.09 per share.

Higher gas send out to commercial and industrial customers and strong margins on sales to the off system market in a response to the extreme weather conditions experienced throughout the quarter added $0.04 per share to quarter-over-quarter earnings. The absence of a charge in the prior year improved earnings comparison by $0.03 per share, and lastly, earnings comparisons were reduced by $0.01 per share due to an increase in O&M expense. The changes in adjusted EBITDA are directly parallel to changes in earnings per share on a quarter-over-quarter basis. The Earnings Release on Slide 16 provide you with detailed analysis on the impact on Power's operating earnings quarter-over-quarter from changes in revenue and cost.

Let me now just take a moment to mention our inclusion of adjusted EBITDA as both new disclosure and new guidance. We know that many of you track one or both operating earnings and EBITDA for Power, and we thought that by giving you our EBITDA on the same basis as operating earnings and adjusted for fossil major maintenance expenses, this would give you a better window into Power's cash flow generation potential and value over the long term.

We took out major maintenance at our fossil plants as this is a periodic cost versus the ongoing run rate. As I mentioned, the changes in operating earnings align with the changes in adjusted EBITDA. In other words the reduction in EPS of $0.03 per share associated with lower wholesale energy market prices and slightly higher O&M equates directly to the $25 million reduction in adjusted EBITDA from $651 million in 2014's first quarter to $626 million in this quarter. So, plan to talk about adjusted EBITDA every quarter as we go forward, to insure we provide you with a consistent view as many of you use this for modeling purposes.

Now let's turn for a few minutes to Power's operations. Essentially this is a tale of two winters. As you remember the past winter was one of the coldest on record and actually colder than 2014s winter, but this past winter was also characterized by improved availability of gas supply and fewer days of extreme weather than the year ago period, which resulted in dramatically lower wholesale energy prices than a year ago, when the market reflected scarcity pricing for a much longer period of time.

The decline in wholesale energy prices in the first quarter of 2015 from the first quarter of 2014 affected the financial performance of Power's assets that were open to the market. An increase in the average price received on energy hedges of about $4 per megawatt hour on approximately 76% of generation hedged helped secure power's margins during the first quarter.

The net impact of the higher hedge price was offset somewhat by the need to meet increased demand under load following contracts at fixed prices, the net impact on profitability of power's load following contracts, however is not as severe as in the year ago period, for the reasons I just mentioned. Once again, power's ability to monetize its gas supply position offset these market -- energy market impacts, resulting in only a slight decline in adjusted EBITDA for the quarter, as I mentioned, to $626 million from last years $651 million.

THOMSON REUTERS

SI-SSA-0015-12883

The flexibility and fuel diversity of Power's fleet supported strong operations in the cold weather conditions experienced in the first quarter. Output of 14.5 Terawatt hours was in line with year ago levels. The nuclear fleet operated at an average capacity factor of 95%, producing 7.8 Terawatt hours of output, or 54% of generation, and this is just a slight decline from year ago levels.

Production from the combined cycle fleet increased to 3.9 Terawatt hours, or 27% of generation, and this represents a 16% increase in output versus 2014's first quarter. An improvement in the availability at Linden following work to increase the station's capacity and the availability of the Bethlehem, New York facility with an increase in gas supply, lead to higher production from the combined cycle fleet.

The combined cycle fleet's operation was also aided by its use of oil as back up supply to maintain operations during important critical periods. The coal stations performed in line with prior period, producing about 2.5 Terawatt hours of energy or about 17% of generation. Finally, output from the peeking fleet declined in response to fewer days of extreme weather.

Power's maintaining its forecast of output for 2015 of between 55 and 57 Terawatt hours, a 1-5% increase over 2014's output of 54.2 Terawatt hours. Approximately 70% to 75% of anticipated production for the April to December period of this year is hedged at an average price of $52 per megawatt hour. For 2016, power has hedged between 50 and 55% of its forecast production of 55-57 Terawatt hours, at an average price of $51 per megawatt hour, and for 2017, power has hedged 25-30% of its forecast generation of 55 to 57 Terawatt hours, at an average price of $52 per MegaWatt hour. The hedge data 2015 and 2016 continues to assume volumes hedged under BGS represent approximately 11-12 Terawatt hours for each year.

We continue to forecast operating earnings for Power in 2015 of $620 million to $680 million. The forecast of operating earnings represents a forecast of adjusted EBITDA of $1.545 billion to $1.645 billion for the full year, which compares to the $1.584 billion of adjusted EBITDA in 2014.

Results for the remainder of the year will be heavily influenced by an increase in the average price of hedged energy and the expected decline in year-over-year capacity revenue. I want to remind you that the average price power schemes for its PJM capacity is expected to remain at $168 per megawatt day for the capacity year, which begins on June 1 of 2015.

At the same time, the number of Megawatts of capacity for which power receives revenue in PJM is expected to decline by 1800 Megawatts, and this reflects primarily the retirement of the HEDD units, which we've talked about before. Slide 17 provides more detail on generation in the quarter, as Slide 21 provides detail on power's hedge position.

Now let me briefly address the operating results from Enterprise Other. For the first quarter, PSEG Enterprise Other reported operating earnings of $0.02 per share, compared with operating earnings of $0.01 per share last year. The difference in operating income is primarily the result of favorable interest in other income, the contribution to income from PSEG Long Island, and the lease portfolio was steady quarter-over-quarter. We continue to forecast full year operating earnings for 2015 from PSEG Enterprise Other of $40 million to $45 million.

Finally just a word on the settlement of the Sandy insurance claims. As Ralph mentioned earlier, we're very pleased that we were able to reach a settlement of claims with our insurers for coverage of superstorm Sandy related losses. The settlement provides for total recovery of $264 million, an amount that fully compensates PSEG for insurable spending on Sandy-related repairs.

PSEG received $50 million of this amount over the 2012-2013 period, which you probably remember our talking about. Over the remaining $214 million, PSEG recognized $159 million pretax in the first quarters result under a partial settlement reached with insurers, and we will recognize an additional $54 million pretax in the Second Quarter.

Power's share of the settlement proceeds are not included in operating earnings or adjusted EBITDA in the first quarter. As you'll recall, those expenses when incurred, were not included in power's operating earnings at the time. This settlement fully closes out the claim related to Sandy.

PSEG closed the quarter with $1 billion dollars of cash on its balance sheet, with debt at the end of March 31 of 2015 representing 41.5% of consolidated capital. The level of cash on the balance sheet is high relative to normal conditions, and this reflects the cash impact of bonus depreciation on taxes and includes the receipt of Sandy related insurance proceeds, all both occurring of course at a time during the year when seasonal influences on demand have a favorable impact on cash balances.

We remain in a position to finance our current capital program without the need for the issuance of equity, and we look forward to seeking additional growth investments. We continue to forecast operating earnings for the full year of $2.75 to $2.95 per share.

So, that concludes my comments, and I'll now turn the call back over to Angela, our operator, to open up the line for questions.

(Operator Instructions)

Your first question comes from Dan Eggers with Credit Suisse.

Dan Eggers *- Credit Suisse - Analyst*

Good morning. Ralph, I was wondering if could you share your thoughts on the artificial island outcome? It went back and fourth quite a bit. You got part of the project, but not all of what was originally awarded. How is that effecting your thoughts about future investment in transmission outside of the standard footprint opportunity?

Ralph Izzo *- Public Service Enterprise Group Inc - Chairman, President & CEO*

Thanks, Dan. Good morning.

You know, we have a complaint pending with FERC on the way in which PJM followed the process, and I have met with the FERC commission telling them that we're a little bit concerned with both the unevenness with which FERC Order 1000 is being implemented nationwide, and the fits and starts with which it's being implemented specifically within PJM, and we specifically filed that before PJM's staff recommission came out, because we didn't want it to be viewed as a case of either potentially sour grapes if we didn't win, or beating of our chest if we did win.

So I think the best face you could put on this is that it's a nascent program that's undergoing some growing pains. I have some broader concerns about it, that the success with any market is in the fact that you have multiple buyers and multiple sellers, and you have visibility to pricing and their needs of customers. And this thing has not had any of those characteristics associated with it, and it's hard for me to imagine that it will be the case when it gets applied nationally.

Having said that, we're going to proceed with the complaint. So, it doesn't change our enthusiasm for transmission investment, and the importance of that as it pertains to customer reliability, but the FERC Order 1000 component transmission investment I think still has significant work to be done.

Dan Eggers *- Credit Suisse - Analyst*

Thanks, and one other question. With CP hopefully advancing at this point, how are you guys looking at maybe generation related investment opportunities, and is there something you could do prospectively with repowering some of the old HEDD sites, if you're getting paid more for reliability than you have in the past?

Ralph Izzo *- Public Service Enterprise Group Inc - Chairman, President & CEO*

Yes, Dan. That's definitely on the table.

The FT4 engines, as you know, had problems with high energy delivery date NOx requirements, and with some SCR improvements, we believe that those would be economically viable, and our plan would be, depending upon FERC's decision, if we think the auction could achieve the kind of prices that would justify those improvements, we would go ahead and make those improvements.

Dan Eggers *- Credit Suisse - Analyst*

Do they seem more viable than maybe Bridgeport did earlier this year, because of lower capital dollars and maybe a little better visibility?

Ralph Izzo *- Public Service Enterprise Group Inc - Chairman, President & CEO*

The only thing they have in common is they are both Power Plants. As you know Bridgeport, is a combination of spark spread and capacity markets, and HEDD upgrade for SCR, sorry for the alphabet soup, is 99.9% about capacity payments.

They are highly inefficient units, and we would only use them for reliability. You wouldn't expect any energy margin from them, so I could better answer that question once FERC decides on the rules, but at this point in time I'd just say they are not directly comparable.

Dan Eggers - *Credit Suisse - Analyst*

Got it. Thank you guys.

Operator

The next question comes from Michael Weinstein with UBS.

Michael Weinstein - *UBS - Analyst*

Hi guys.

Caroline Dorsa - *Public Service Enterprise Group Inc - EVP & CFO*

Good morning.

Michael Weinstein - *UBS - Analyst*

Real quick question, about wondering if you could talk about the possibility of getting a [low carbon] portfolio standard in New Jersey, and how that might impact CapEx?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Yes, thanks, Michael. So I don't see a separate and independent low carbon portfolio standard in New Jersey in the near term.

I believe, if I'm not mistaken, the state's official response and comments to the EPA 111d proposal was questioning actually the legality of the EPA's ability to implement the program. So, looking at sort of the progress we've made on the RPS in this state, I believe New Jersey is intent to proceed along those lines, as opposed to doing something more comprehensive in the form of using an energy efficiency standard or a carbon standard.

As you know we have consistently, and still feel this way, believed that a nationwide carbon program is required, and that states going alone creates all sorts of economic distortions. That doesn't change our view, however, that there is a need for the carbon standard nationwide.

Michael Weinstein - *UBS - Analyst*

And have you guys specifically mentioned what you're going to do with proceeds from Sandy insurance recoveries?

Caroline Dorsa - *Public Service Enterprise Group Inc - EVP & CFO*

This is Caroline. Good morning, Michael. So, no we haven't specifically earmarked them for things. Of course, money that I mentioned we're getting reimbursed on a lot of money that was spent for Sandy recovery, so this fully compensates us.

That money is in large part already spent, so the dollars that come in here really just support the strength of the balance sheet that we have, and reinvestment that we're making in new things at the utility, and potentially an opportunity to Power. So, just gives you more strength to pursue more growth opportunities, and I'm very pleased to have the settlement behind us.

Michael Weinstein - *UBS - Analyst*

Thank you very much.

Caroline Dorsa - *Public Service Enterprise Group Inc - EVP & CFO*

Sure.

Operator

Your next question comes from Paul Patterson with Glenrock Associates.

Paul Patterson - *Glenrock Associates - Analyst*

Good morning.

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Good morning, Paul.

Paul Patterson - *Glenrock Associates - Analyst*

Just a few quick things. I notice that the deficiency letter, that the response that PJM made to it was they didn't seem to have a problem with stop loss limits on the penalties removed, and I think you guys and maybe Exelon -- I'm not sure, and tell me if I'm wrong, are not opposed to that, whereas some generators are, and I'm just wondering if you could give us a feel as to what you think might happen if those limits are removed?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Well if the limits are removed -- in general, Paul, I think that the greater the potential for reward, which comes along with greater risk, the better it is for us.

We have a high performing fleet, and what's important is both halves of that sentence. A, the first half being that they're high performing, and second, that it's a fleet. So, the interchange ability of assets that do clear the auction with assets that don't clear the auction, the fuel flexibility, the different technologies we have, all gives us greater and greater confidence about the ability of the assets to perform.

So to the extent that penalties become tougher, or limits get removed, one would only expect that the reward would be commensurate with that risk, and we would perform well in that environment.

Paul Patterson - *Glenrock Associates - Analyst*

Right, no I can see that. I guess I'm wondering if you have any sense as to quantifiably, or just obviously approximates or just general idea about how much that might impact?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

No, we don't try. Even when the rules are clear, we don't predict the outcome of the auction.

THOMSON REUTERS

SI-SSA-0015-12887

Paul Patterson - *Glenrock Associates - Analyst*

(Laughter).

I think that actually settles the second question that I had, then, and that's it, I guess. Thanks so much.

Caroline Dorsa - *Public Service Enterprise Group Inc - EVP & CFO*

Thanks.

Operator

Your next question comes from Travis Miller with Morningstar.

Travis Miller - *Morningstar - Analyst*

Good morning, thank you.

Caroline Dorsa - *Public Service Enterprise Group Inc - EVP & CFO*

Good morning.

Travis Miller - *Morningstar - Analyst*

Looking at the Slide 19, want to make sure I clearly understand this. The power fuel costs, look at that oil and gas line.

So generation in the quarter was up, and yet saw a substantial reduction there in that fuel cost. Wonder if you could just go through that, and how sustainable that is? If it's vortex related, or something else?

Caroline Dorsa - *Public Service Enterprise Group Inc - EVP & CFO*

Yes so you're exactly right, Travis. You think about where gas prices were last year, and where gas prices are this year, they are lower, and so you see that come right through that line. Of course oil prices are lower too, but gas is the predominant fuel here, and you're seeing that directly come into that line.

Remember I also mentioned that the prices for wholesale energy were lower, and that goes along with it, right? So get lower gas prices and lower power prices preserves in spark spread for us, and that what also commented on the value that our hedges provided this year on a year-over-year basis because of that reduction, but that is directly related to the observable market price for gas versus last year.

Travis Miller - *Morningstar - Analyst*

Is any of that gas monetization benefit in that number, in terms of reducing the fuel costs?

Caroline Dorsa - *Public Service Enterprise Group Inc - EVP & CFO*

No, no, this is just the pure fuel cost, in cost of goods sold.

THOMSON REUTERS

SI-SSA-0015-12888

Travis Miller - ***Morningstar - Analyst***

Okay, and is it sustainable? Do you think you'd see trends like this over the next couple quarters?

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

So that's really gas price forecast question right? So we really just use what's in the forward curve when we think about gas prices going forward.

The important thing to keep in mind, though, is we've got the base loaded is hedged in the current year, so we're really talking about this happening in the combined cycle, and therefore the ability to preserve the spark spread, regardless of how gas moves, protects us to an extent. But other than using the forward curve, it's really hard to predict gas prices.

Travis Miller - ***Morningstar - Analyst***

Thanks so much.

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Sure.

Operator

Your next question comes from Shar Pourreza with Guggenheim Partners.

Shar Pourreza - ***Guggenheim Partners - Analyst***

Good morning.

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Good morning.

Shar Pourreza - ***Guggenheim Partners - Analyst***

So if you take your energy strong program, combine it with gas modernization, what is that -- how many miles does that cover, as far as replacement of the cast iron steel pipes, and sort of where do you see that program expanding to?

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

So I believe it's about 150 miles per year, and it would take us 30 years. So the gas system is closer to 4,100 miles, but it would take us 30 years at that spending rate to replace everything.

Shar Pourreza - ***Guggenheim Partners - Analyst***

Okay, got it. And one reminder, what are your transmission ROE's right now?

© 2015 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-12889

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

So it varies, Shar. Our base ROE is 11.18%, we get a 50 basis point RTO membership adder for 11.68%. We had, I guess we still have a couple projects that get anywhere from 25 to 125 basis points in addition. However, our last four or five projects we filed for have not received any incremental ROE incentive component.

So long winded answer, but there is no one simple number. It starts at 11.18%, and it goes up to 12.75% or something like that. That being the Susquehanna-Roseland project, being the only one that got that big an adder.

Shar Pourreza - ***Guggenheim Partners - Analyst***

Got it, and if you'd think about it from a weighted average, it's still within the range of reasonableness that you're seeing?

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

It comes out to about 11.8%, which is just a fraction of a bip outside of the range.

Shar Pourreza - ***Guggenheim Partners - Analyst***

Perfect thanks so much.

Operator

The next question comes from Jonathan Arnold from Deutsche Bank.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Well good morning, guys.

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

Good morning John.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Could you, I think you said that the amount of this hurricane Sandy recovery that was left in the operating numbers of the utility was $0.03, roughly, in the first quarter, but there would be some amount in the second quarter, but I don't think you gave us a break down of how much was it power and how much was utility?

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Right, so sure John. So the impact to PSE&G's earnings for the first quarter benefited $0.01 to the benefit of O&M from the Sandy recovery that goes to PSE&G. The remaining piece of the settlement that we had -- the remaining about $54 million, we have to go through the allocation process, and we will do that and discuss how that will flow when we do the second quarter results.

So a couple things to remember. On the power side, we don't flow it through operating earnings, that's below the line, which you can see in the reconciliation. We don't do that because power spend was below the line as well, and on the utility side, remember that the recoveries we got, including a portion of the $50 million -- a small portion of that, was for PSE&G in the past, goes primarily to balance sheet, because a lot of the spend for storm recovery that's recoverable under our policies, capital spend and that's on the balance sheet.

© 2015 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

So there's balance sheet and regulatory asset offset, and just $0.01 of impact for the P&L from the first quarter, for Sandy at PSE&G, and we'll do the second quarter piece when we do the second quarter results.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Okay, but it sounds like it's unlikely to be that material to the year in the context of the guidance?

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

I think that's right, in the context of the guidance, correct. So you've seen that we're almost done with the Sandy settlement being booked, with just $54 million to go, and you've got a big piece already booked in the first quarter, and the P&L impact for operating earnings purpose was just $0.01, so proportionately you're thinking of it the right way.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Okay thank you and just one other topic. We've obviously, it's very -- just recently, we're seeing the change in the dispatch or generation stack with some of the coal plants no longer there. What are you guys seeing in terms of just day-to-day, as you come into this front end of the summer? Are there noticeable changes in operations or the units of the shopping just not really participating already, what are you seeing in the Markets?

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

No, I think one of our slides shows you the capacity factors, and we had a slight dip in nuclear capacity that was purely related to an outage at sale on that, it wasn't planned for and otherwise the units would have been at or better than last year in terms of nuclear. Our gas unit's picked up the slack from some of that, as well as some of the lower prices that Travis paid attention to earlier, but the base load coal units (inaudible) our strong winter season.

Gas prices were not below that faithful $1.90 number of 2012 that resulted in some of the dispatch of those, and of course our New Jersey coal units as well as our Connecticut coal units did run a little bit during the winter months, because of the unavailability. The hedging is our peakers, using the demand at the level they would be called upon. So really no change in terms of the number this year. Remaining a kind of fundamental shift in the market that we haven't over the past four or five years.

Jonathan Arnold - ***Deutsche Bank - Analyst***

I was actually a bit more curious about the post mid April date, when (inaudible) into effect. It's obviously not in quarter, whether there's anyone that could just talk about more realtime?

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

I don't think so. I think if anything the forward price curve would suggest that we'll continue to see robust capacity factors for our combined cycle gas turbine units, and the nuclear units will run flat out, and that's pretty much the same.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Well, thank you very much.

THOMSON REUTERS

SI-SSA-0015-12891

Your next question comes from Michael Lapides with Goldman Sachs.

Michael Lapides - ***Goldman Sachs - Analyst***

Hi guys, congrats on a great start to the year. Two items. One on the regulated side.

Can you just highlight for us what's different in CapEx known for the next few years for today, versus what you talked about at the Analyst day? Several moving parts, just want to make sure we have them all.

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

Sure, Michael. The one thing that's different -- so what we like to have shown you in the March meeting is what's been approved, so notwithstanding our complaint in front of FERC, the $120 million, Caroline correctly described it as $110 million to $130 million in artificial island was not included in the March investor presentation, as baked in.

Similarly, so that's the only change of things that have been finalized and are now part of the plan. The other piece that's significantly different is that we filed -- have not received approval -- for $1.6 billion over the next five years in this gas system modernization program, and that's not in the utilities capital program that we showed you in March.

Michael Lapides - ***Goldman Sachs - Analyst***

Got it. The other question, thinking about your coal plants in New Jersey, so moving over to power. Not running a lot, haven't been for a year or two. Just where are you, if at all, in the process of thinking about whether these plants will remain economic? And if not, kind of how on the edge are they or are they clearly economic? And when you look out for the next three to five, five to seven years, they're a core part of Power's fleet?

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

Could you just hold on a second Michael? I want to get my controller off the floor. He fell down. (Laughter)

No, you know, obviously those plants have made significant environmental commitments to them, and the capital requirements going forward on those plants from any kind of regulatory point of view is minimal. The real question will be their age and their ability to perform in a CP market, and the rules there just aren't known. So to the extent that the risk reward profile of CP changes our thinking on those plans, then we would have to address that issue, but as of now we're happy to run them on coal in the winter and on gas in the summer, and they do just fine for us.

They are part of an overall fleet, and that fleet has multiple dimensions to it that work well for us. But I'd say that the new factor in the calculus will be what does CP mean?

Michael Lapides - ***Goldman Sachs - Analyst***

Got it. Last question. Can you just remind us the amount of the HEDD units in terms of Megawatts, that are going or went off line?

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

1500.

Michael Lapides - ***Goldman Sachs - Analyst***

Thank you, Ralph. Much appreciated.

PSEG ANNOUNCES 2015 FIRST QUARTER RESULTS

$1.15 PER SHARE OF NET INCOME

STRONG OPERATIONS YIELD $1.04 PER SHARE OF OPERATING EARNINGS

Settlement Reached on Sandy-Related Insurance Claims

Company Maintains 2015 Operating Earnings Guidance of $2.75 - $2.95 Per Share

(May 1, 2015 – Newark, NJ) (NYSE – PEG) Public Service Enterprise Group (PSEG) reported today Net Income for the first quarter of 2015 of $586 million, or $1.15 per share as compared to Net Income of $386 million, or $0.76 per share, in the first quarter of 2014. Operating Earnings for the first quarter of 2015 were $529 million, or $1.04 per share, compared to Operating Earnings for the first quarter of 2014 of $515 million, or $1.01 per share.

“PSEG performed extremely well in the first quarter” said Ralph Izzo, chairman, president and chief executive officer. He went on to say “PSE&G is delivering on the promise of its expanded distribution and transmission investment program, while the reliable performance of PSEG Power’s generating assets and its gas market expertise during one of the coldest winters on record helped us deliver value for our customers.”

PSEG believes that the non-GAAP financial measure of “Operating Earnings” provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends. Operating Earnings exclude gains or losses associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting, and other material one-time items. The table below provides a reconciliation of PSEG’s Net Income to Operating Earnings (a non-GAAP measure) for the first quarter. See Attachment 10 for a complete list of items excluded from Net Income in the determination of Operating Earnings.

PSEG CONSOLIDATED EARNINGS (unaudited)
First Quarter Comparative Results
2015 and 2014

	Income ($millions)		Diluted Earnings Per Share	
	2015	**2014**	**2015**	**2014**
Operating Earnings	$529	$515	$1.04	$1.01
Reconciling Items	57	(129)	0.11	(0.25)
Net Income	**$586**	**$386**	**$1.15**	**$0.76**
		Avg. Shares	**508M**	**508M**

"A key contributor to our success is the dedication of our employees to meeting the needs of customers in a safe, reliable manner. The first quarter results represent a strong start to the year – operationally and financially – and positions 2015 as the third consecutive year of growth in PSEG's operating earnings. At this time, we are maintaining our forecast of operating earnings for the full year of $2.75 - $2.95 per share," said Izzo.

The following table outlines expectations for operating earnings in 2015 by subsidiary:

2015 Operating Earnings Guidance
($ millions, except EPS)

	2015E
PSE&G	$735 - $775
PSEG Power	$620 - $680
PSEG Enterprise/Other	$40 - $45
PSEG Operating Earnings	$1,395 - $1,500
Earnings Per Share	$2.75 - $2.95

Operating Earnings Review by Subsidiary

See Attachment 5 for detail regarding the quarter-over-quarter reconciliations for each of PSEG's businesses.

PSE&G

PSE&G reported operating earnings of $242 million ($0.47 per share) for the first quarter of 2015 compared with operating earnings of $214 million ($0.42 per share) for the first quarter of 2014.

SI-SSA-0015-12895

PSE&G's earnings for the first quarter reflect the benefits of the increase in revenue associated with the expansion of its capital program, colder than normal weather and the recovery of storm costs from the settlement of Sandy-related insurance claims.

Returns from PSE&G's expanded investment in transmission added $0.03 per share to earnings in the quarter. The winter weather, which was significantly colder than normal and colder than a year ago, had a favorable impact on gas volume and demand. The impact of weather on gas usage was offset in the weather-normalization clause and did not impact earnings. Growth in customer demand for gas (normalized for weather) added $0.01 per share to earnings. Earnings comparisons also benefited from a quarter-over-quarter decline in operation and maintenance expense of $0.01 per share. PSE&G's share of Sandy-related insurance settlement proceeds as well as a decline in storm-related repair costs from high levels experienced in 2014's first quarter more than offset the impact on O&M from an increase in pension expense.

Economic indicators in the service area are modestly better than a year ago. Employment and housing indicators show signs of slow, but steady improvement. Electric demand has also shown modest improvement. On a weather-normalized basis, electric sales are estimated to have improved by 0.2% in the quarter. The improvement was led by 0.6% growth from the commercial and industrial sector which offset a decline in demand from residential customers. Gas deliveries continue to benefit from sustained low commodity prices and signals of recovery in the economy. Weather-normalized gas deliveries in the quarter grew 0.4% based on a 1% improvement in demand from the residential sector.

PSE&G extended bill credits through April 30, 2015 for its residential gas heating customers. The April bill credit, which cut the average April bill for the typical residential gas customer by about 32%, was an extension of the credits PSE&G provided for residential gas usage for the five months of November 2014 through March 2015.

PSE&G received approval in April 2015 from the NJ Board of Public Utilities (BPU) to increase its investment in energy efficiency. PSE&G will invest an additional $95 million over a three year period at an authorized return on equity of 9.75% on several popular programs that expand energy efficiency initiatives to hospitals, multi-family housing and government and non-profit facilities.

PSE&G's capital program remains on schedule. PSE&G invested $599 million in the first quarter as part of its planned capital investment for 2015 of $2.6 billion in upgrades to the electric and gas distribution and transmission system.

The forecast of PSE&G's operating earnings for 2015 remains unchanged at $735 - $775 million. Operating earnings for the full year will be heavily influenced by the recovery of costs associated with higher levels of capital spending.

PSEG Power

PSEG Power reported operating earnings of $278 million ($0.55 per share) for the first quarter of 2015 and adjusted EBITDA of $626 million compared with operating earnings of

SI-SSA-0015-12896

$293 million ($0.58 per share) for the first quarter of 2014 and adjusted EBITDA of $651 million.

PSEG believes that the non-GAAP financial measure of “Adjusted EBITDA” is useful in evaluating Power’s operating performance because it provides investors with additional information to compare our business performance to other companies and understand performance trends.

Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization and major maintenance expense at Power’s fossil generation facilities. See Attachment 10 for a complete list of items excluded from Net Income in the determination of Adjusted EBITDA.

PSEG Power’s strong operating results in the first quarter reflect an improved availability of its gas-fired combined cycle fleet, higher prices on its hedged energy output, and the monetization of its gas supply which together helped offset the impact on earnings from a decline in capacity revenue and lower wholesale market prices for energy.

An increase in the average price received on energy hedges coupled with an increase in the percent of energy hedged in the first quarter relative to a year ago fully offset the impact of lower market prices on earnings. The expected decrease in average PJM capacity prices to $168/MW-day from $242/MW-day reduced Power’s quarter-over-quarter earnings by $0.09 per share. An increase in total gas send-out to commercial and industrial customers and strong margins on sales to the off-system market in response to the extreme weather conditions experienced throughout the quarter added $0.04 per share to quarter-over-quarter earnings. The absence of a charge in the prior year for the potential over-collection of revenues improved earnings comparisons by $0.03 per share. An increase in O&M expense reduced quarter-over-quarter earnings by $0.01 per share. An increase in costs associated with early site work at Hope Creek in preparation for its second quarter re-fueling outage and in pension expense more than offset a decline in maintenance expense at the fossil stations.

The flexibility and fuel diversity of Power’s fleet supported strong operations in the cold weather conditions experienced during the first quarter. Output of 14.5 TWh was in line with year-ago levels. The nuclear fleet operated at an average capacity factor of 95%, producing 7.8 TWh of output or 54% of generation, a slight decline from year-ago levels. Production from the combined cycle gas fleet (CCGT) increased to 3.9 TWh of generation, 27% of generation, from 3.4 TWh in the first quarter of 2014. An improvement in availability at Linden following work to increase the station’s capacity, and the availability of Bethlehem (NY) in the quarter, led to increased production from the CCGT fleet. The CCGT fleet’s operation was also aided by its successful use of oil as a back-up supply to maintain operations during critical periods. The coal stations performed in line with the prior period producing 2.5 TWh of energy, 17% of generation, as output from the peaking fleet declined in response to fewer days of extreme weather.

Power is maintaining its forecast of output for 2015 of 55 – 57 TWh, a 1% - 5% increase over 2014’s output of 54.2 TWh. Approximately 70 – 75% of anticipated production for the

SI-SSA-0015-12897

April – December period is hedged at an average price of $52 per MWh. For 2016, Power has hedged 50% - 55% of its forecast generation of 55 – 57 TWh at an average price of $51 per MWh; for 2017, Power has hedged 25 – 30% of its forecast generation of 55 – 57 TWh at an average price of $52 per MWh. The hedge data for 2015 and 2016 continues to assume volumes hedged under BGS represent 11 – 12 TWh per year.

Power's operating earnings for 2015 are forecast at $620 - $680 million. The forecast of operating earnings represents adjusted EBITDA for the full year of $1,545 million - $1,645 million. Results for the remainder of the year will be heavily influenced by an increase in the average price of hedged energy and the expected decline in year-over-year capacity revenue.

PSEG Enterprise/Other

PSEG Enterprise/Other reported operating earnings of $9 million ($0.02 per share) for the first quarter of 2015 compared with operating earnings of $8 million ($0.01 per share) operating results for the first quarter of 2014. The difference in operating income is primarily the result of favorable interest and other income.

The forecast of PSEG Enterprise/Other full year operating earnings for 2015 remains $40 million - $45 million.

Sandy Insurance Settlement

PSEG reached a settlement with its insurers of claims for coverage of its Superstorm Sandy-related losses. The settlement provides for recovery of an additional $214 million over the $50 million of proceeds recovered over 2012-2013 for total recovery of $264 million, and the final settlement fully compensates PSEG for spending eligible for insurance recovery on Sandy-related repairs. The results for the first quarter of 2015 reflect the impact of a partial settlement reached with certain insurers for $159 million pre-tax. PSEG Power recorded $133 million in the first quarter for the settlement (but not included in Operating Earnings and Adjusted EBITDA) while PSE&G recorded $26 million. The remaining $54 million of insurance proceeds will be recognized in the second quarter's financial results.

########

Forward Looking Statement

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC), including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or the price of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulation, including market structures and transmission planning,

SI-SSA-0015-12898

- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- any deterioration in our credit quality or the credit quality of our counterparties,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- delays or unforeseen cost escalations in our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- increases in competition in energy supply markets as well as for transmission projects,
- any inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies, and
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws. The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

Forward-Looking Statement

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute “forward-looking statements” within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words “anticipate,” “intend,” “estimate,” “believe,” “expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC), including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or the price of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulation, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- any deterioration in our credit quality or the credit quality of our counterparties,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- delays or unforeseen cost escalations in our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- increases in competition in energy supply markets as well as for transmission projects,
- any inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies, and
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-12911

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Operating Earnings exclude gains or losses associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting, and other material one-time items. PSEG presents Operating Earnings because management believes that it is appropriate for investors to consider results excluding these items in addition to the results reported in accordance with GAAP. PSEG believes that the non-GAAP financial measure of Operating Earnings provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends.

PSEG is presenting Adjusted EBITDA because it provides investors with additional information to compare our business performance to other companies and understand performance trends. Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization and major maintenance expense costs at Power's fossil generation facilities. This information is not intended to be viewed as an alternative to GAAP information. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income to reconcile to Operating Earnings and Adjusted EBITDA with a reference to that slide included on each of the slides where the non-GAAP information appears.

These materials and other financial releases can be found on the pseg.com website under the investor tab, or at http://investor.pseg.com/

Net Income	$ 586	$ 386
EPS from Operating Earnings*	$ 1.04	$ 1.01

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings.

SI-SSA-0015-12914

PSEG – Q1 2015 Highlights

Strong Operating Earnings

- ✓ Operating earnings of $1.04 per share vs. $1.01 per share in Q1 2014
- ✓ Power benefited from higher prices on its hedged output, monetization of its gas supply and improved performance from CCGTs
- ✓ Increased earnings contribution from PSE&G's investment in transmission

Operational Excellence

- ✓ PSEG Power CCGT units improved fleet availability; nuclear capacity factor at 95%
- ✓ Diversity and location of Power's fleet provided flexibility to participate in market
- ✓ PSE&G maintained high system reliability during a record-setting cold winter

PSEG Disciplined Capital Investment

- ✓ Increased common dividend to indicative annual rate of $1.56 per share
- ✓ BPU approved Energy Efficiency Extension II for additional $95 million investment
- ✓ Transmission projects in construction – on schedule and on budget
- ✓ S-R expected to be fully energized in May (Hopatcong to Susquehanna)
- ✓ Settlement reached on Superstorm Sandy-related insurance claims fully compensates PSEG for repairs covered by our policies

SI-SSA-0015-12915

PSEG – Maintaining 2015 Guidance

2015 guidance reflects continued increased level of investment, and assumes normal weather and unit operations

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings. E = Estimate.

PSE&G
2015 Q1 Review

PSE&G – Q1 EPS Summary

$ millions (except EPS)	Q1 2015	Q1 2014	Variance
Operating Revenues	$ 2,002	$ 2,145	$ (143)
Operating Expenses			
Energy Costs	892	1,045	(153)
Operation & Maintenance	412	462	(50)
Depreciation & Amortization	247	227	20
Total Operating Expenses	1,551	1,734	(183)
Operating Earnings/Net Income	$ 242	$ 214	$ 28
EPS from Operating Earnings/Net Income	$ 0.47	$ 0.42	$ 0.05

SI-SSA-0015-12921

PSE&G EPS Reconciliation – Q1 2015 versus Q1 2014

* Operating Earnings is equal to Net Income.

SI-SSA-0015-12922

PSE&G – Q1 2015 Operating Highlights

Operations

- ✓ Coldest Q1 in over 45 years: Heating degree days were 5.7% above last winter and 25% above normal
- ✓ Weather normalized electric sales: Slight overall improvement of 0.2%, led by the commercial and industrial segment
- ✓ Gas deliveries continue to benefit from low commodity prices and modest economic growth, weather adjusted deliveries grew by 0.4%, led by a 1% advance in the residential segment

Regulatory and Market Environment

- ✓ BPU approved $95 million Energy Efficiency Extension II in April; investment over next 3 years
- ✓ Gas System Modernization Program filed with the BPU in February; first phase proposes to spend $1.6 billion over 5 years to replace aging cast iron and unprotected steel pipes
- ✓ PSE&G extended BGSS gas rate credits through April 2015; this winter's total PSE&G bill credit is ~$236, or a 32% savings for the average gas customer (Nov 2014-April 2015)
- ✓ Susquehanna-Roseland transmission line expected fully in service for Summer 2015

Financial

- ✓ PSE&G invested ~$600 million in T&D upgrades during Q1 as part of its full-year, $2.6 billion investment program
- ✓ PSE&G operating earnings* for full-year 2015 are forecast at $735 million to $775 million

* Operating Earnings is equal to Net Income.

PSEG Power – Generation Measures

Generation by Fuel (GWh)**

Quarter ended March 31

Fleet Capacity Factors (%)

Quarter ended March 31

	2014	2015
Combined Cycle		
PJM and NY	49%	55%
Coal*		
NJ (Coal/Gas)	21%	17%
PA	83%	91%
CT	73%	68%
Nuclear	100%	95%

* Includes figures for Pumped Storage. Also includes natural gas fuel switching intervals. ** Excludes Solar and Kalaeloa

SI-SSA-0015-12928

PSEG Power – Fuel Costs

PSEG Power – Fuel Costs

	Quarter ended March 31	
($ millions)	2014	2015
Coal	$87	$82
Oil & Gas	365	247
Total Fossil	452	329
Nuclear	62	55
Total Fuel Cost	$514	$384
Total Generation (GWh)	14,565	14,538
$ / MWh	35.29	26.41

PSEG Power – Gross Margin Performance

- ✓ Hedging profile captured returns amid lower price volatility than in Q1 2014
- ✓ Q1 spot prices significantly lower across PJM, ISO-NE, and NYISO versus year ago
- ✓ Capacity prices were lower year-over-year
- ✓ Access to lower-cost Marcellus gas continues to benefit spark spreads

Q1 2015 Regional Performance		
Region	**Gross Margin ($M)**	**Comment**
PJM	$623	Higher prices on hedged output offset lower wholesale market prices and a decline in capacity revenue
New England	$51	Hedging profile improved margins offsetting lower market prices
New York	$13	Higher volumes with improved fuel availability

SI-SSA-0015-12930

Hedging Update

Contracted Energy*

		Apr-Dec 2015	2016	2017
Base Load (Nuclear and Base Load Coal)	Volume TWh	26	37	37
	% Hedged	100%	80-85%	40-45%
	Price $/MWh	$52	$51	$52
Intermediate Coal, Combined Cycle, Peaking	Volume TWh	17	20	20

	% Hedged	70-75%	50-55%	25-30%
	Price $/MWh	$52	$51	$52

* Hedge percentages and prices as of March 31, 2015. Revenues of full requirement load deals based on contract price, including renewable energy credits, ancillary, and transmission components but excluding capacity. Hedges include positions with MTM accounting treatment and options.

SI-SSA-0015-12931

PSEG Power – Q1 Operating Highlights

Operations

- ✓ Q1 output flat with Q1 2014 at 14.5 GWh
- ✓ Nuclear fleet's capacity factor at 95%
- ✓ CCGT production up 16% to 3.9 TWh on improved availability at Linden

Regulatory and Market Environment

- ✓ PJM's Capacity Performance (CP) proposal pending at FERC
- ✓ FERC granted PJM request to postpone Reliability Pricing Model (RPM) auction for the 2018/2019 delivery year
- ✓ Base load output in 2015 hedged at an average price of $52/MWh vs. 2014 average hedge price of $48/MWh
- ✓ 2015 BGS load projected at 11-12 TWh
- ✓ Bergen and Peach Bottom 2 capacity uprates scheduled to add 96MW for Summer 2015

Financial

- ✓ Power's total debt as a percentage of capitalization at March 31 was 31%
- ✓ Power's operating earnings* for full-year 2015 are forecast at $620 million to $680 million, and Adjusted EBITDA** at $1.55 billion to $1.65 billion

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings; Includes the financial impact from Mark-to-Market positions with forward delivery months.
** See Slide B for a reconciliation of Adjusted EBITDA to Operating Earnings and Net Income. E = Estimate.

SI-SSA-0015-12932

PSEG

PSEG Financial Highlights

Maintaining 2015 operating earnings guidance of $2.75 - $2.95 per share

- ✓ Focused on maintaining operating efficiency and customer reliability
- ✓ PSE&G expected to contribute over 50% of 2015 operating earnings

Infrastructure Spend

- ✓ PSE&G T&D spend for 2015 expected to be $2.6 billion
- ✓ PSE&G received approval in April 2015 from the NJ Board of Public Utilities (BPU) to invest an additional $95 million over a three-year period on Energy Efficiency programs
- ✓ Utility's Gas System Modernization Program filed with the BPU in February; first phase proposes to spend $1.6 billion over 5 years to replace aging cast iron and unprotected steel pipes
- ✓ Power's AGP and nuclear uprate programs ongoing

Financial position remains strong

- ✓ Positive cash from Power and increasing cash flow from operations at PSE&G supports dividend growth and funds capital spending program without the need to issue equity
- ✓ Debt as a percentage of capitalization was 41% at March 31

Increased common dividend 5.4% to indicative annual rate of $1.56 per share

- ✓ Increasing regulated earnings mix supports dividend growth

SI-SSA-0015-12934

PSEG Sandy-related insurance settlement proceeds

($ millions, pre-tax)	Pre-2015	Q1 2015	Q2 2015E	Total
PSEG Power	$44	$133	TBD	TBD

PRESENTATION

Operator

Ladies and gentlemen, thank you for standing by. My name is Brandy, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group second-quarter 2015 earnings conference call and webcast.

(Operator Instructions)

As a reminder, this conference is being recorded today, Friday July 31, 2015 and will be available for telephone replay beginning at 1pm eastern today, until 11:30pm eastern on August 7, 2015. It will also be available as an audio website on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen Lally ***- Public Service Enterprise Group Inc - VP of IR***

Thank you, Brandy. Good morning, thank you for participating in our earnings call this morning. As you are all aware, we released second-quarter 2015 earnings statements earlier today. The release and attachments as mentioned are posted on our website at www.pseg.com under the investors section. We also posted a series of slides that detail operating results by company for the quarter, and the first half of the year. Our 10-Q for the period ended June 30, 2015, is expected to be filed shortly. I won't go through the full disclaimer statements or the comments we have on the difference between operating earnings and GAAP results. However, as you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligations to do so, even if our estimate changes, unless of course we are required to do so.

Our release contains adjusted non-GAAP operating earnings. Please refer to today's 8-K or other filings for a discussion of factors that may cause results to differ from management's projections, forecasts, and expectations, and for a reconciliation of operating earnings to GAAP results. I'm now going to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer, Public Service Enterprise Group; and joining Ralph on the call is Caroline Dorsa, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions.

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

Thank you Kathleen, and thank you everyone for joining us today. Earlier this morning we reported operating earnings for the second quarter of 2015, of $0.57 per share, a 16% improvement over the $0.49 per share earned in 2014's second quarter. The results for the quarter bring operating earnings in the first half of 2015 to $1.61 per share, a 7% increase over operating earnings of $1.50 per share earned in 2014's first half. Slides 4 and 5 contain the detail on the results for the quarter and the first half. Our businesses are performing well and meeting the challenges of today's low energy price environment. The results for the quarter and the first half of the year demonstrate the importance of strong operations and providing our customers with safe, reliable, low-cost energy. PSE&G invested $1.3 billion during the first half of the year, as part of its planned capital program for 2015 of $2.6 billion. This included upgrades to the electric and gas distribution and transmission system. PSE&G's focus on improving the resiliency of the grid and increasing operational efficiency has also translated into strong performance in a number of areas of customer satisfaction, including price, billing and payment, corporate citizenship, and field service. PSE&G was recently assigned a share of the transmission upgrade work at Artificial Island. Decision will increase PSE&G's transmission-related capital spending by $100 million to $130 million over the next four years. This project will add to PSE&G's robust pipeline of projects that will drive high single-digit growth in PSE&G's earnings over the three year period ending in 2017.

The New Jersey Board of Public Utilities has begun proceedings related to PSE&G's proposed $1.6 billion gas system modernization program. The investment would provide for a continuation of the work underway to replace 800 miles of cast iron and bare steel pipe over five years to advance reliability and reduce the potential for harmful emissions of methane gas. Approval would also provide a direct boost to New Jersey's economy. We continue to believe that this is the right time to move forward with this work, given the sizeable savings customers continue to realize from low gas prices. PSEG Power's earnings demonstrate the strength of its asset mix. Recent economic investments have increased the capacity of existing nuclear and fossil units, and have improved the fleet's operating efficiencies. The completion of upgrade work at the gas-fired Bergen combined cycle unit yielded an increase in capacity of 31 megawatts. Just as the completion of the first phase of the Peach Bottom upgrade, which achieved 100% output at the new rating in May, providing an additional 65 megawatts for Power's share of this nuclear unit.

In addition, Power recently announced plans to construct and operate a new 755 megawatt combined cycle unit at the Key's Energy center in Maryland at a cost of $825 million to $875 million. The investment is in keeping with Power's overall strategy of investing in efficient capacity in its core markets. All three investments will enhance Power's ability to perform on the PJM's recently approved capacity program. Capacity performance, with its emphasis on performance, is an example of how customer demands for reliability are increasing. The size of PSEG Power's fleet, the diversity of the fleet's fuel mix and its dispatch flexibility, should support performance under the new capacity standards. The real impact of the changes in the RPM capacity should be felt over time, as the market recognizes the need for increased investment to maintain system reliability, particularly in light of anomalous weather patterns.

We are focused on executing our investment strategies and expanding our infrastructure in a disciplined manner. A manner that supports the goals of customers and shareholders alike. PSE&G's investment program is expected to yield double digit growth in rate base through 2019, as the earnings contribution from our regulated business should continue to exceed 50% of our consolidated earnings. PSEG Power's investment program is expected to enhance the fleet's efficiency and reliability, as we continue to look for opportunities to expand that fleet. The potential investment in Artificial Island, actually the recently approved investment in Artificial Island, the announced acquisition of the Keys Energy Center, and the gas system modernization program, if approved, would expand our previously announced capital program for 2015 through 2019, by 15% to 20%, or $2.2 billion.

Based on the strength of our results for the first half of the year and the outlook for the remainder of the year, we are updating our earnings guidance for 2015. We have narrowed our range for guidance to $2.80 to $2.95 per share from its original $2.75 to $2.95 per share. Our financial position remains strong, the growth in capital spending can be financed without the need to issue equity. We intend to utilize our financial strength to pursue investments that enhance operating efficiency, support our market position and seek to improve on the high levels of reliability expected by our customers, as we increase shareholder value. With that, I'll turn the call over to Caroline who will discuss our financials in greater detail.

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Thank you, Ralph, and thank you everyone for joining us today. As Ralph said, PSEG reported operating earnings for the second quarter of 2015 $0.57 per share, versus operating earnings of $0.49 per share in the last year second quarter. We provide you with a reconciliation of operating earnings to income from continuing operations and net income for the quarter, on slide 4. And we've also provided you with a waterfall chart on slide

10 that takes you through the net changes in quarter over quarter operating earnings by major business, and a similar chart on slide 12, provide you with changes in operating earnings by each business on a year-to-date basis.

Now I'll go review each company in a bit more detail, starting with PSE&G. PSE&G reported operating earnings for the second quarter of 2015 of $0.33 per share, compared with $0.30 per share for 2014's second quarter, a 10% improvement. Results for the quarter are shown on slide 14. PSE&G's operating results for the second quarter continued to benefit from the expansion of the capital program and the impact of warmer than normal weather on demand.

Returns from PSEG's expanded investment in transmission added $0.04 per share to earnings in the quarter. An increase in revenue at the start of the year under its transmission formula rate provides PSE&G the opportunity to continue to earn its allowed return on its transmission investments. Electric demand benefited from the more favorable weather conditions during the quarter. That is, the weather was hotter than normal and warmer than last year. As well as the recovery of costs associated with PSE&G's capital infrastructure programs. Together, these improved earnings comparisons in the quarter by $0.01 per share. Gas deliveries continue to grow in response to sustained low prices. The growth in gas deliveries also increased earnings comparisons by $0.01 per share. The improvement in earnings associated with this growth and revenue was partially offset by an increase in pension expense, as well as higher storm-related expenses. With those increases totaling an impact of $0.02 per share. An increase in taxes and other items reduced quarter-over-quarter earnings by $0.01 per share.

Economic indicators in the service territories such as employment and housing, are showing signs in improvement. Modest growth and electric demand is reflective of the improvement in economic conditions. On a weather normalized basis, electric sales grew by 0.2% for the quarter and about the same year to date. Growth in demand by residential and commercial customers is partially offset by a decline in demand from industrial customers. Weather normalized deliveries of gas grew 2.7% during the first half of the year, in response to sustained low prices, something you'll recall we saw last year as well. PSE&G as part of it's annual BGSS filing with the New Jersey BPU requested a further reduction of $70 million in annual revenues, reflecting its lower cost of gas supply. When placed into effect, the BGSS rate will be reduced to $0.40 per therm from $0.45 per therm, effective October 1 of this year. And including this reduction, the typical residential gas customer has experienced a reduction in his or her bill of $792, or 47% since January of 2009. PSE&G has maintained a steady level of capital expenditures, investing $1.3 billion in the first half of the year as part of its annual planned capital program of $2.6 billion in upgrades to the electric and gas distribution and transmission systems. The capital investment associated with PSE&G's share of recommended upgrades to the transmission system at Artificial Island will increase the investment in transmission by $100 million to $130 million during the 2016 to 2019 timeframe. We are updating our forecast for PSE&G's operating earnings for the year from $735 million to $775 million to $760 million to $775 million, given year-to-date results. Operating earnings for the full year will be influenced by the summer weather, and of course the recovery of costs associated with higher levels of capital spending. Now let's turn to Power.

PSEG Power reported operating earnings of $0.22 per share for the second quarter of 2015, and adjusted EBITDA of $301 million. Compared with operating earnings of $0.17 per share, and adjusted EBITDA of $276 million for the second quarter of 2014. Power's operating results for the second quarter benefited from improved operations at its nuclear and fossil generating facilities, as well as higher prices on its hedged output, and a decline in the cost of its gas supply. The benefit to earnings from the improvement in operations more than offset the impact on earnings from an expected decline in capacity revenue and the lower wholesale market prices for energy. Higher average prices on energy hedges, coupled with a reduction in the cost of supply, more than offset the impact on earnings of lower wholesale market prices for energy. These items combined to increased quarter-over-quarter earnings comparisons by $0.10 per share. In addition, a 10% improvement in the output over the prior year increased quarterly earnings comparisons by $0.02 per share. So this improvement and margin was partially offset by the expected decline in PJM capacity revenues, which reduced Power's quarter-over-quarter earnings by $0.08 per share. The reduction in capacity revenues reflects the impact both of a lower average capacity price and the retirement of capacity that we've talked about before, the capacity that's no longer complaint with environmental regulations.

Higher levels of O&M and depreciation expense were offset by a decline in taxes of $0.03 per share, and other items, to net improve quarter-over-quarter earnings by $0.01 per share. The lower effective tax rate in the quarter of approximately 23% versus last year's 31% was anticipated, and we continue to estimate that the tax rate for the full year will approximate 38%, which is about the same rate as you saw in 2014. The increase in adjusted EBITDA for the quarter is in line with the change in earnings per share that I just went through on a quarter-over-quarter basis. The average price for capacity declined in the quarter to approximately $168 per megawatt day and $217 per megawatt day. In addition, the amount of capacity that cleared the PJM capacity auction for the 2015, 2016 capacity year, which we've discussed over the past few years, was reduced by about 1,800 megawatts to 8,800 megawatts. This reflects the retirement in May of this year, of the HEDD peaking capacity that didn't meet New Jersey's nitrous oxide emission standards. As we move through the second half of 2015, the average price received on PJM capacity will remain stable, relative to the average price received during the second half of 2014, at about $168 per megawatt day. However, you should continue to expect on a year-over-year basis a decline in capacity revenues during the second half of the year, specifically related to that retirement of the capacity under HEDD.

THOMSON REUTERS

SI-SSA-0015-12943

The fuel diversity and flexibility of Power's fleet was demonstrated once again in the quarter. Our output increased 10% over year ago levels to 13.2 terawatt hours. The nuclear fleet operated at an average capacity factor of 86%, producing 7.1 terawatt hours of output, or about 54% of our generation. And this level of output represents a 9% improvement from year-ago levels. The performance on the nuclear fleet reflects the absence for some major repairs and sale on two in 2014, which led to this year to fewer outage related days in the second quarter.

Production from the combined cycle gas fleet increased 26% this year to 4.6 terawatt hours of generation, or 34% of our total generation as the fleet's capacity factor improved to 61% from 49% in the year-ago quarter. Linden's availability improved versus 2014, as the result of upgrade and maintenance work that was occurring in the year-ago quarter. Dispatch of the combined cycle fleet was also supported by the availability of low-cost gas. Dispatch of the coal fleet however, was hurt by a decline in the price of gas, and lower wholesale energy prices. Output from the coal fleet declined to 1.3 terawatt hours, or 10% of generation during the quarter. Wholesale market energy prices have been affected by a decline in the price of gas, and anomalies in the dispatch of generation associated with the volatility in pricing. Strong production of low-cost gas from Marcellus Basin and the lack of sufficient takeaway capacity, not unexpectedly, has resulted in a lower price for gas. The impact on power prices from the lower cost of gas has been further compounded this summer by repair work on electric transmission lines in the Maryland/DC area, and differentials on load given the warmer than normal weather in southern PJM, versus the more normal demand experienced in the northern part of PJM.

That inability to dispatch energy to meet demands as a result of transmission constraints, hurt the wholesale market price for power in our region. This situation is alleviated during periods of more normal weather-related demand in the areas serviced by PSEG Power. So the dynamics affecting the power markets were not wholly unexpected, given that lack of gas transmission takeaway capacity in the Marcellus Basin, and the work underway to alleviate the constraints on electric transmission to the south of us. Power's cycle fleet continued to benefit from is access to this low-cost gas supply during the second quarter. And since power prices held up and we continue to access lower cost gas, the combined cycle fleet experienced an expansion of spark spreads. And Power's fleet will continue to benefit from low gas prices, and a somewhat open gas position.

As we look to the full year, the improvement and availability of Power's gas-fired and nuclear fleet, combined with incremental operating capacity at the Peach Bottom 2 nuclear plant, and the gas-fired Bergen station, should allow Power's fleet to produce energy at the upper end of our forecasted output for the year of 55 to 57 terawatt hours. This level of output represents a 1% to 5% increase over 2014's output of 54.2 terawatt hours. Approximately 70% to 75% of anticipated production for the second half of the year is hedged at an average price of $53 per megawatt hour. The average price on Power's energy hedges remains the same, approximately $4 per megawatt hour higher that the average price received on energy hedged during the second half of 2014. Both 2016 and 2017, Power's forecast output will remain stable at approximately 55 to 57 terawatt hours. Of this, Power has hedged 55% to 60% of 2016's forecasted generation at an average price of $51 per megawatt hour, and about 30% to 35% of 2017's forecasted level of generation, hedged at an average price of $50 per megawatt hour. As Ralph mentioned, Power has acquired the rights to develop the 755 megawatt gas-fired combined cycle Keys Energy Center in Maryland. And the addition of Keys, which represents an investment of approximately $825 million to $875 million is targeted to enter commercial service in 2018. The plant's location we believe will complement Power's fleet in the core market and add to a fleet capable of meeting PJM's new capacity performance standards.

The forecasted range of Power's operating earnings for 2015, even with lower wholesale energy prices, remains $620 million to $680 million, as guided. And for adjusted EBITDA it remains unchanged as well at $1.545 billion to $1.645 billion. Results for the remainder of the year will be influenced by higher average hedge prices, that decline in capacity revenue that I mentioned, and wholesale energy market prices.

Just a quick note on Enterprise and Other, operating earnings for PSEG Energy Holdings and enterprise in the second quarter of 2015 were $12 million or $0.02 per share versus operating earnings of $7 million or rounded $0.02 per share for the second quarter of 2014. The improvement in operating income for the second quarter reflects higher earnings from PSEG Long Island. Lower O&M expense and higher interest income at the parent. And we continue to forecast full-year operating earns for PSEG, Enterprise / Other, of about $40 million to $45 million. PSEG closed the quarter ended June 30, 2015, with $597 million of cash on it's balance sheet, with debt at the end of the quarter representing 41.9% of consolidated capital. During the quarter, PSE&G issued $350 million of 10-year secured medium term notes at an interest rate of 3%, and $250 million of 30-year secured medium term notes at an interest rate of 4.05%, and we also redeemed $300 million of maturing medium term notes, yielding 2.7%.

As Ralph mentioned, we've updated our forecast operating earnings for the full year to $2.80 to $2.95 per share, given the strong operating results at both businesses in the first half of the year. Estimates of PSEG Power's adjusted EBITDA remain unchanged at $1.545 billion to $1.645 billion.

Finally, just on a personal note, as you know, I announced a week ago my plans to retire from PSEG during the fourth quarter. I've really enjoyed working with all of you, and as I will move on I know that PSEG has an outstanding management team led by Ralph Izzo, with a strong balance sheet and lots of opportunities to deploy in the future, and possesses a really solid foundation for further growth.

With that, we're now ready for your questions, and I'll turn it back to you, Brandy.

(Operator Instructions)

Your first question is from Daniel Eggers with Credit Suisse. Please proceed with your question.

Daniel Eggers - *Credit Suisse - Analyst*

Good morning, guys. Can we just talk a little bit about the Keys plant and your thought process on the capital allocation on that front? Given the fact you looked at a variety of other brown-fueled type projects and generation that haven't passed muster from your cost capital perspective?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Yes, Dan, so I think in general we're somewhat cautious about injecting new supply into a market where demand isn't growing much. Most of the investments you've seen us make have been kind of upgrades to existing units, and we've talked a lot about the replacement of existing units. This one is a little bit unique for us in that it's not an existing asset. And this is a new development project. I think what makes this one a good fit for us is its location, it's in southwestern [Maryland] where we've seen some seasonal basis advantages. Number two, I think we're ahead of the market in terms of the future delivery of gas to that region, which will put a 6,400 heat rate unit in a very, very strong competitive position. And number three, this one went beyond the usual forecasting of forward price risk, and included an element of construction risk that we believe ourselves particularly well suited to manage, given the project work we've done both in power and in the utility and how well that has all worked out. So for a combination of reasons we were able to see clear to some value creation here that was different from other opportunities where people outbid us. So I think what you hear me saying is that we remain cautious on injecting copious amounts of new supply in a market that's not growing, but this was a fairly special situation that we thought fit our portfolio very nicely.

Daniel Eggers - *Credit Suisse - Analyst*

And given kind of your history of being pretty conservative on using capital, is your view effectively that the energy value of the assets going to make sense since you don't have a lock on capacity that you would have had if you would have done Bridgeport or something else?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

That's right. We did talk about in the past how we were attracted to the seven year lock on capacity in New England, and this one obviously is more about sparks and energy margins than it is about a one year price on capacity. But it will be clearly a CP eligible unit.

Daniel Eggers - *Credit Suisse - Analyst*

Okay, and I guess Caroline, what, you've talked in the past about how much balance sheet capacity you thought you had to redeploy. How much do you think you have left with the Keys investment? Because there's more merchant, does that lower the amount more meaningfully than just the dollars going into the project?

Caroline Dorsa - *Public Service Enterprise Group Inc - EVP & CFO*

No Dan, so we still have plenty of capacity when I think about, remember the slide we showed in March and we've talked about before, we have capacity in multiple billions of dollars both in Power and in parent, parent mostly for regulated. When I look at where we land at the end of the second quarter, actually similar to what we've talked about before, Power ends with debt to cap of 31%. FFO to debt numbers well above floor level. So we didn't relax our standards here in doing the analysis for Keys, we'll be able finance that on Power's balance sheet. And that doesn't use it up, right? We talk about those balance sheet capacities, remember I've mentioned before that, that's the most conservative way to look at them because we look at them assuming they don't start contributing any FFO back. And when this goes in service it certainly will. So when we looked at Keys, we didn't look at it from the perspective of, if we do Keys we can't do anything else. We looked at it from the perspective of, Keys is a real good project and by no means does it use up all of our balance sheet capacity. So we can still continue to look at new opportunities for Power as well. So I feel really comfortable that it's one balance sheet deployment, but it's not the only one we'll be able to do in either business.

THOMSON REUTERS

Daniel Eggers - *Credit Suisse - Analyst*

So this wouldn't preclude the HEDD upgrades or something else?

Caroline Dorsa - *Public Service Enterprise Group Inc - EVP & CFO*

No, not at all. Those are other things that we may be considering.

Daniel Eggers - *Credit Suisse - Analyst*

Caroline we'll have you on the third quarter earnings call, so I won't to say goodbye yet, but thank you, guys.

Caroline Dorsa - *Public Service Enterprise Group Inc - EVP & CFO*

Thanks, Dan. Next question.

Operator

The next question comes from Julien Dumoulin-Smith.

Julien Dumoulin-Smith - *UBS - Analyst*

Hi, good morning.

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Hi, Julian.

Julien Dumoulin-Smith - *UBS - Analyst*

So perhaps to follow up on investment opportunities here, I'd be curious, obviously we're moving forward or PJM is moving forward with Artificial Island at this point. I'd be curious to get your perspective on the future of FERC 1,000 or FERC 1,000-like investments in PJM. And specifically within that, your views on the use of cost caps and just other mechanisms to be more clinical competitive. To what extent do you and yourself and others continue to leverage those kinds of negatives to win as we saw with the Artificial Island example and to what extent do you see that as impeding your ability or enhancing your ability to win et cetera?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

So I believe that PJM published announcements that the identification of this project proceded the creation of 1,000. So PJM did not feel obligated to adhere to the strict terms of the task on order 1,000 which is a point that maybe we would beg to differ on. But Julien, there's no way to make this process look pretty. This was a painful process. And -- I'd like to chalk it up to the growing pains associated with order 1,000. My concern, and I've expressed this to FERC and to PJM, is that we may be heading for a ubiquitous dumbing down of the transmission system, as opposed to robust solutions that have advantages over the long-term. The cheapest solution in the short-term may not be the cheapest solution in the long-term. And I don't want to get into a full-fledged debate over how you make comparisons across two projects. I still believe, based on everything, that not only did we have a more robust solution but we had a lower cost solution. So this is going to be challenging. I think efficient markets work when you have

THOMSON REUTERS

good information available to both suppliers and buyers, and these are technically detailed, painful reviews, done by a handful of assessors on the basis of a fairly robust set of business. It doesn't lend itself to the transparency you see at the NYMEX on what is happening in the gas markets. So I don't mean to give a speech. But it's showing some real challenges in terms of me having confidence that over the long-term order 1,000 will yield a strong transmission system that won't be constantly second guessed or challenged either in the Courts or over the long-term in the field, as we head towards cost solutions as it comes to the short-term risk cost solutions.

Julien Dumoulin-Smith - ***UBS - Analyst***

Got it. And to complement that last question, PJM's talked about reducing their load forecast this cycle given some adjustment for efficiency in solar, et cetera. I'd be curious, does that impact your, A, your current spending plans, but B, your prospective plans as you're thinking about transmission? Obviously you guys are on both sides of power and the business. How does that change your business at all? If you can elaborate.

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

Yes, I think that PJM is still reviewing its forecast. And of course load growth is an important consideration in how one designs your delivery system. But don't underestimate the significant role played by the location of load and the location of supply. In having to design the transmission system. I would contend, but I couldn't prove it to you on this call, that the reason why we've have had such a strong need for transmission deployment is the fact that we no longer have an integrated system where utility planners go from generation all the way to the meter. And PJM has had to respond to changes in supply, both in terms of unexpected retirements, and unexpected injection of new supply. And that results in a need for an even more robust transmission system than one that you can plan from generation to user. Now, for Power, we had nearly all of this forecast in our fundamental model already. So when we looked at something like Keys and when we looked at whatever else we might be bidding in RPM, we do scenario analysis that includes diminished demand as well as a more robust growth. One way of saying, it's not a single variable model. It's not just what's being demanded. Where is the load, where is the supply, and what's happening to the infrastructure that connects all involved?

Julien Dumoulin-Smith - ***UBS - Analyst***

Excellent. Well, thank you. Best of luck, Caroline. We'll talk to you soon.

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Thanks, Julien, next question.

Operator

Your next question is from Travis Miller with Morningstar Inc.

Travis Miller - ***Morningstar - Analyst***

Good morning, thank you.

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

Hi, Travis.

© 2015 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-12947

Travis Miller - ***Morningstar - Analyst***

Well, just a follow-up on that transmission discussion, when you think about the investments you're making, what's on the table, how close do those investments get us to next generation grid? A grid where you can have distributed generation, smart type of grid, is that what you're talking about there in terms of robustness and where we need to get to relative to our future?

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

I think that is does get us a long way there. But I think of it more as a building a set of highways so that no matter what happens on one highway you could switch over to another one and not get stuck in a traffic jam. Other people though I think talk about the future grid as being a more flexible grid, so that you don't have to build big highways and you can just direct traffic flows along the back roads intelligently, so that nothing gets clogged. And that's probably not the best analogy. But I think the internet of things is what people speak about in terms of the ability to move power more flexibly. I'm not a big believer in that being an eventual outcome because of the connectivity that you'd need at the last mile, so to speak. I'm more a believer in the types of things that PJM is advocating which is the back haul has to be robust so that people can get on and off, people in the form of power plants can get on and off that back haul system.

Travis Miller - ***Morningstar - Analyst***

Okay.

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

It's a central station dispatch model on a robust high-voltage system that I think is ultimately one that will be economically more efficient.

Travis Miller - ***Morningstar - Analyst***

Sure. Okay. And more specifically on Public Service Enterprise Group Inc Power in the quarter, that re-contracting lower cost to serve, how one time type of stuff is that? I'm guessing a lot of that is the spark spread versus the BGS. The re-contracting part, what are you seeing on that part?

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Sure Travis, this is Caroline, so yes remember that when we talk about re-contracting as well as lower cost to serve. We give you that hedging data, so we give you all the details on our hedging data, and as I just said, we've moved up our hedges a little bit and the prices are basically the same as where we are. So the hedges prove to be very valuable on a year-over-year basis. Remember, last year at about this time, we talked about the fact that we'd taken advantage of some better pricing last year to put on some incremental hedges. Now hedging doesn't last forever, but when we see those opportunities we've layered on hedges as some beneficial prices, so re-contracting is kind of what that benefit is about. The lower cost to serve, obviously there's lower cost to serve in terms of the wholesale market prices. But also, as I mentioned in my remarks, $0.02 of that is our leidy gas access. So having that access to leidy gas after the customers at Public Service Enterprise Group Inc have the first call on that access, that contributed $0.02 a share in this quarter. And you remember, that contributed pennies each quarters of the key quarters, in the summer particularly, for each of the last two years.

That benefit is one that we've never said we expect to continue in perpetuity. But if you look at the delta of leidy gas cost, relative to Henry Hub, you still see benefits. And because we have that access, that's what gives us part of our lower cost to serve is that light access. As I mentioned we have higher spark spreads, we've talked about this last year in the summer, as well as starting in 2013 summer. That our spark spread for our access to that low-cost gas tended to be about 30% or more higher than the sparks seen in the overall market. So some of the things are a hedge position, some things are a little more structural, but together we think they give us a nice position with a combined cycle feed obviously, that operates very well.

THOMSON REUTERS

Travis Miller - ***Morningstar - Analyst***

Okay, got it, thanks so much. And congratulations on the work that you've done. While you were at Public Service Enterprise Group Inc.

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Thank you, Travis. Next question.

Operator

Jonathan Arnold with Deutsche Bank.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Yes, good morning, and my congratulations to Caroline. Thank you for all your help.

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Thank you.

Jonathan Arnold - ***Deutsche Bank - Analyst***

First could we maybe get an update on the gas main replacement program? If I'm not wrong, the first round of settlement talks happened in July, didn't seem there was a whole lot of opposition in the hearing. Any updated thoughts on when we might see that come to a head?

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

Yes Jonathan, thanks for your question. As you know, settlement discretions are confidential so we can't give you a lot of detail. It's encouraging though that we've had them and our hope really is that by year end, or at the very latest early in 2016, we would have this resolved, as you correctly noted it's something that the state recognizes needs to be done. The interventions in the case are not many nor have there been any surprises. And I think lowering the cost of supply from 45 to 40 in October just once again points out the wisdom of doing this now. So, as I've mentioned, as we've done visits with folks I think that the debate and the arm wrestling will be around the length of the program, and the size, but we went out of our way to file conditions that were identical to what was approved. That was approved only 14 months ago.

Our interest rates are exactly where they were then and return expectations are exactly where they were then. So right now, my number one nemesis is summer vacation--. So I think there's a couple more -- for the full, and we still have -- we're well on our way to spending the $250 million for gas that was in energy strong that goes through early 2016. Even if we had an agreement today we wouldn't be able to add a bunch of new work in the next couple of weeks anyway.

Jonathan Arnold - ***Deutsche Bank - Analyst***

And Ralph that might wrap up before these fall dates? Or is that unlike --

© 2015 Thomson Reuters. All rights reserved. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

It's possible. I wouldn't want to bet anything that I held near and dear to my heart on that. What we really want to do is make sure we get this done well in advance of running out of the energy strong money, so we don't have to demobilize the contract, the work force, so we don't put our pencils down on the engineering, so that we just have a continuous flow. So if we got it done in the fall, that would certainly assure that, if we get it done by the end of the year we should be able to do that. If it gets done early in 2016, then we create a bunch of inefficiencies that customers end up paying for.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Okay, great. One other topic, strategically, you've always been of the view that the retail business is not somewhere you want to be. We did notice one of your management power peers who have been of a similar view evolving somewhat in that direction this quarter, citing poor liquidity in the forward curve. I was just wondering whether you're seeing similar challenges in terms of hedging and whether there might be can change of thought on your part?

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

I don't want to send off shock waves in the third quarter call, I'm not a big fan of retail. But my short answer to your question is a qualified yes, I do think that given challenges in hedging and matching those hedges with asset locations and some of the basis challenges one has, the effectiveness of hedges has to be taken into consideration in terms of whether or not some consideration has to be given to that. So I don't know the details behind what Calpine did, but I can certainly understand why they would think about that, given the diminishing liquidity and the effectiveness of hedges in terms of where the consumption is and where the supply is, and where one hedges as well those two. But again, please don't interpret this to expect any announcement in the next few days that Public Service Enterprise Group Inc wants to get in to the retail business. But it is something we are looking at now.

Jonathan Arnold - ***Deutsche Bank - Analyst***

And you're at least exploring some options on that front?

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

That's right. And mostly absolutely from a defensive posture. How do we maximize the effectiveness of our power business as opposed to the retail being in the growth strategy right now.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Okay, that makes it, thank you.

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Next question.

Operator

Your next question is from Michael Lapides with Goldman Sachs.

© 2015 Thomson Reuters. All rights reserved. THOMSON REUTERS

Michael Lapides - ***Goldman Sachs - Analyst***

Hey guys, congrats, and Caroline, congrats on your announcement.

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Thank you.

Michael Lapides - ***Goldman Sachs - Analyst***

One question on CP, everybody -- most people have been pretty bullish in terms of what the impact of CP would be. From a contrarian standpoint, what's the bear case?

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

I have no idea. I'm sorry, Michael, Caroline and I are looking at each other like you take it, no you take it. I guess I'll default to our usual, we don't forecast bullish or bearish prices. The good news is today is July 31 and in 21 days we'll know the outcome. But I don't mean to be flip. I mean the bear case will be massive injection of new supply with an economy growing at 2.3%, demand growing at fractions of that. You'd have to be pretty undisciplined to inject a whole bunch of new supply. But I guess that would be the bear case.

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Maybe there's a bear case of just the single asset. It feels like this is a good product from our perspective.

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

Yes, that would be more of a bear outcome in terms of penalties that you might incur if you didn't perform, right?

Michael Lapides - ***Goldman Sachs - Analyst***

How do you think about -- lots of people talk about the potential higher bid price because lots of assets or portfolios have to have kind of quote unquote embed the risk of having penalties into their bid price. How about the folks like you guys who have really well performing assets? How do you think about what the potential for rewards are if you're on the other side? This is going to be a balancing or settling type market just like New England. How do you think about preparing for what potential rewards could be, where you're not as focused on the penalty side but maybe you're also focused on, hey what's my upside if I'm actually the better performing unit in the market and able to deliver more megawatts than what I cleared?

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

So that happens in two ways, Michael, we do think about that a lot. And what it means for us. One is, I did a UCAP of 90% of what my ICAP is, and I get the other 10% out of that particular unit which has successfully cleared the auction. That's candidly an asymmetric risk or reward relationship right, because your downside is the 90% that you're on the hook for. Your upside is the 10% of over performance, but for somebody like us the most significant upside is in the units that don't clear. And their availability to backstop in the event that somebody else underperforms within the LDA.

So, we never clear 100% of our units, and when we look at our nuclear class, they have a very low forced outage rates, our combined cycle is slightly higher, but still quite low and our peaking units are also very well [established] units. So we'll make some incremental investments in some of the units that don't have the same type of operating profile, but I think really for us we have, not only that sort of even better performance than in the

THOMSON REUTERS

past, but probably more importantly the fact that we have units that don't clear the auction. Some of them with high forced outage rates but will be great insurance policies going forward.

Michael Lapides - ***Goldman Sachs - Analyst***

Got, it thank you, Ralph and Caroline, much appreciated.

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Thank you, next question.

Operator

(Operator Instructions)

Your next question is from Ashar Khan with Visium.

Ashar Khan - ***Visium Asset Management - Analyst***

I'm sorry, my questions have been answered, thank you.

Caroline Dorsa - ***Public Service Enterprise Group Inc - EVP & CFO***

Thank you, next question.

Operator

There are no other questions at this time, please continue with your presentation or closing remarks.

Ralph Izzo - ***Public Service Enterprise Group Inc - Chairman, President & CEO***

Thank you, Brandy. So we tried to do a count, I think this is Caroline's 26th call. I've teamed up with her on 25 I believe there was an August vacation I couldn't change, if I remember correctly. She's going to tire of hearing me say these things, I'm not going to tire of saying these things, and I'm going to do them for every one of the different audiences that we somehow manage to find themselves in front of.

I know you've all met Caroline and been impressed by what she has done for us as a Company. I can only tell you that no matter how high your opinion is of her, you probably only know a fraction of what she's done for us as a Company and what she's done for me as the leader of this Company. Her preparation for these calls is just the tip of the iceberg. Her discipline day in and day out, her knowledge of the business, her knowledge of financial markets, and while all of that is in superstar category, all of that pales in comparison to what a pleasure she is to work with. I can't (inaudible) when we've traveled around, people think that we actually like each other. But we really do like each other And I can remember the earlier days of those visits and those calls she would say Ralph, you focus on the strategic issues, I'll answer the factual questions which was her delightfully professional way of saying, Ralph you'll get it wrong. So Caroline I can't say thank you enough for our shareholders, for our investors, and for me and I know we'll have many opportunities to repeat that in front of employees and customers and various other folks.

PSEG ANNOUNCES 2015 SECOND QUARTER RESULTS

$0.68 PER SHARE OF NET INCOME

STRONG OPERATIONS YIELD OPERATING EARNINGS OF $0.57 PER SHARE

Company Updates Full Year Guidance to $2.80 - $2.95 Per Share

July 31, 2015 (Newark, NJ) (NYSE- PEG) Public Service Enterprise Group (PSEG) reported Second Quarter 2015 Net Income of $345 million or $0.68 per share as compared to Net Income of $212 million or $0.42 per share reported for the Second Quarter of 2014. Operating Earnings for the Second Quarter of 2015 were $289 million or $0.57 per share compared to the Second Quarter of 2014 Operating Earnings of $245 million or $0.49 per share.

"We reported strong results for the second quarter" said Ralph Izzo, chairman, president and chief executive officer. He went on to say, "our businesses performed well. PSE&G's expanded investment program is successfully translating into improvements in customer satisfaction at the same time operational improvements at PSEG Power supported increased output. We are updating our full year guidance to $2.80 - $2.95 per share from $2.75 - $2.95 per share based on the strength of results for both businesses for the first half of the year."

PSEG believes that the non-GAAP financial measure of "Operating Earnings" provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends. Operating Earnings exclude the impact of returns/(losses) associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and other material one-time items. The table below provides a reconciliation of PSEG's Net Income to Operating Earnings for the second quarter. See Attachment 12 for a complete list of items excluded from Net Income in the determination of Operating Earnings.

PSEG CONSOLIDATED EARNINGS (unaudited)
Second Quarter Comparative Results
2015 and 2014

	Income ($ millions)		Diluted Earnings Per Share	
	2015	**2014**	**2015**	**2014**
Operating Earnings	$289	$245	$0.57	$0.49
Reconciling Items	56	(33)	0.11	(0.07)
Net Income	$345	$212	$0.68	$0.42
		Avg. Shares	508M	508M

“Our success is a testament to the hard work and dedication of our employees” said Ralph Izzo who also stated “our strategy is meeting the challenges of today’s low energy price environment. PSEG Power’s construction of the new 755MW gas-fired Keys Energy Center in Maryland will expand our footprint in our core PJM market and serve as a strong operational and financial fit for our portfolio. We remain confident in our ability to meet the needs of stakeholders as we focus on providing safe and reliable energy in a cost-efficient manner.”

Operating Earnings guidance by company has been adjusted to reflect the update of the forecast for the full year:

Operating Earnings
($ millions, except EPS)

	2015E
PSE&G	$760 - $775
PSEG Power	$620 - $680
PSEG Parent/Other	$40 - $45
Total	$1,420 - $1,500
Earnings Per Share	$2.80 - $2.95

Operating Earnings Review and Outlook by Operating Subsidiary

See Attachment 6 for detail regarding the quarter-over-quarter reconciliations for each of PSEG’s businesses.

PSE&G

PSE&G reported operating earnings of $167 million ($0.33 per share) for the second quarter of 2015 compared with operating earnings of $151 million ($0.30 per share) for the second quarter of 2014.

PSE&G’s operating results for the second quarter reflect the benefits of an increase in revenue associated with an expansion of its capital program and the impact of warmer than normal temperatures on demand.

Returns from PSE&G’s expanded investment in transmission added $0.04 per share to earnings in the quarter. More favorable weather conditions during the quarter and the recovery of PSE&G’s investment under its distribution-related capital infrastructure programs improved quarter-over-quarter earnings by $0.01 per share. Continued growth in demand for gas increased quarter-over-quarter earnings by $0.01 per share. An increase in pension expense as well as higher storm-related and other expenses reduced quarter-over-quarter earnings comparisons by $0.02 per share. An increase in taxes and other items reduced quarter-over-quarter earnings by $0.01 per share.

Economic indicators in the service area such as employment and housing are showing signs of improvement, reflecting the slowly recovering economy. Modest growth in electric demand is reflective of this improvement in economic conditions. On a weather-normalized basis, total electric sales grew 0.2% for the quarter and year-to-date. Growth in residential and commercial

sales was partially offset by a decline in sales to industrial customers. Gas deliveries on a weather-normalized basis for the first half of 2015 grew 2.7%. Demand for the first six months of the year represents the trend in gas demand in response to sustained low prices.

On June 1, 2015, PSE&G made its Annual BGSS filing with the New Jersey Board of Public Utilities (BPU) requesting a reduction of $70 million in annual BGSS revenues. When effective, the BGSS rate would be reduced from approximately 45 cents per therm to 40 cents per therm effective October 1, 2015. Including this proposed reduction, the typical residential customer has experienced a 47%, or $792, decline in their annual gas bill since January 2009.

PSE&G's capital program remains on schedule. PSE&G invested $1.3 billion in the first half of the year as part of its planned capital investment for 2015 of $2.6 billion in upgrades to the electric and gas distribution and transmission system. PSE&G was recently assigned work at Artificial Island as part of PJM's approved upgrades to the transmission system. This program will increase PSE&G's investment in transmission by $100 - $130 million over 4 years through 2019.

The forecast of PSE&G's operating earnings for 2015 is now $760 - $775 million versus $735 - $775 million. Operating earnings for the full year will be influenced by summer weather and the recovery of costs associated with higher levels of capital spending.

PSEG Power

PSEG Power reported operating earnings of $110 million ($0.22 per share) for the second quarter of 2015 and adjusted EBITDA of $301 million compared with operating earnings of $87 million ($0.17 per share) and adjusted EBITDA of $276 million for the second quarter of 2014.

PSEG believes that the non-GAAP financial measure of "Adjusted EBITDA" is useful in evaluating Power's operating performance because it provides investors with additional information to compare our business performance to other companies and to understand performance trends.

Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense and interest expense, depreciation and amortization and major maintenance at Power's fossil generation facilities. See Attachment 12 for a complete list of items excluded from Net Income in the determination of Adjusted EBITDA.

Power's operating results for the second quarter reflect an improvement in operations at its nuclear and fossil generating facilities, higher prices on its hedged energy output and a decline in the cost of its gas supply which together helped offset the impact on earnings from an expected decline in capacity revenue and lower wholesale market prices for energy.

The lower average price received on PJM capacity as well as the retirement of peaking capacity combined to reduce Power's quarter-over-quarter earnings by $0.08 per share. This decline in revenue was more than offset by higher average prices received on energy hedges as well as a reduction in the cost of supply. These two items combined to increase quarter-over-quarter earnings comparisons by $0.10 per share. A 10% improvement in output over the prior year increased quarterly earnings comparisons by $0.02 per share. Higher levels of O&M and depreciation expense reduced quarterly earnings comparisons by $0.02 per share, as a decline in taxes and other items improved earnings by $0.03 per share.

Output at Power's generation facilities increased 10% in the quarter over year-ago levels to 13.2 TWh. An improvement in operations at Power's nuclear generating plants and the gas-fired CCGTs more than offset the effect of lower wholesale energy prices on the dispatch of the coal-fired generating fleet. The nuclear fleet operated at an average capacity factor of 86%, producing 7.1 TWh of output or 54% of generation, a 9% improvement from year-ago levels. The performance of the nuclear fleet reflects the absence of major repairs at Salem 2 in 2014 which led to 58 fewer outage related days in the second quarter of 2015 compared to 89 days in the year-ago quarter. Production from the combined cycle gas fleet (CCGT) increased 26% to 4.6 TWh of generation, or 34% of total generation. An improvement in the availability of the Linden Station following uprate and maintenance related work in the year ago quarter and improved spark spreads led to the increased level of output from the fleet. Dispatch of the coal fleet was affected by a decline in the price of gas and lower wholesale energy prices. Output during the quarter declined to 1.3 TWh, or 10% of generation, as output from the peaking fleet responded to the market to make-up the balance.

Power's fleet is expected to produce energy at the upper end of its forecast of output for 2015 of 55 – 57 TWh, a 1% - 5% increase over 2014's output of 54.2 TWh. Approximately 70% - 75% of anticipated production for the second half of the year is hedged at an average price of $53 per MWh. For 2016, Power has hedged 55% - 60% of its forecast generation of 55 – 57 TWh at an average price of $51 per MWh; for 2017, Power has hedged 30% - 35% of its forecast generation of 55 – 57 TWh at an average price of $50 per MWh.

PSEG Power announced in the quarter that it has acquired the rights to develop the 755-MW Keys Energy Center. The plant, which represents an investment of $825 - $875 million, is targeted to be completed in 2018. The combined cycle plant will use state-of-the art generating technology, including a full complement of emissions controls and run on clean, efficient natural gas.

The forecast range of Power's operating earnings for 2015 remains $620 - $680 million. The forecast of operating earnings represents adjusted EBITDA for the full year of $1,545 - $1,645 million. Results for the remainder of the year will be heavily influenced by the expected decline in year-over-year capacity revenue, an increase in the average price of hedged energy and lower wholesale energy prices.

PSEG Enterprise/Other

PSEG Enterprise/Other reported operating earnings of $12 million ($0.02 per share) for the second quarter of 2015 versus operating earnings of $7 million ($0.02 per share) during the second quarter of 2014. The improvement in operating income for the second quarter reflects higher PSEG Long Island earnings, lower operating & maintenance expense and higher interest income at Parent.

The forecast of PSEG Enterprise/Other full year operating earnings for 2015 remains $40 million - $45 million.

Financing

PSEG closed the quarter ended June 30, 2015 with $597 million of cash on its balance sheet with debt at the end of the quarter representing 41.9% of consolidated capital. PSE&G, during the quarter, issued $350 million of 10-year secured medium-term notes at 3.00% and $250

million of 30-year secured medium term notes at 4.05% and redeemed $300 million of 2.7% secured medium term notes.

######

FORWARD-LOOKING STATEMENT

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute “forward-looking statements” within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words “anticipate,” “intend,” “estimate,” “believe,” “expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC), including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or the price of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulation, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- any deterioration in our credit quality or the credit quality of our counterparties,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- delays or unforeseen cost escalations in our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- increases in competition in energy supply markets as well as for transmission projects,
- any inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies, and
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

PSEG Earnings Conference Call

2nd Quarter 2015

July 31, 2015

SI-SSA-0015-12971

Forward-Looking Statement

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute “forward-looking statements” within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words “anticipate,” “intend,” “estimate,” “believe,” “expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC), including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or the price of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulation, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- any deterioration in our credit quality or the credit quality of our counterparties,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- delays or unforeseen cost escalations in our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- increases in competition in energy supply markets as well as for transmission projects,
- any inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies, and
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-12972

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Operating Earnings exclude gains or losses associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting, and other material one-time items. PSEG presents Operating Earnings because management believes that it is appropriate for investors to consider results excluding these items in addition to the results reported in accordance with GAAP. PSEG believes that the non-GAAP financial measure of Operating Earnings provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends.

PSEG is presenting Adjusted EBITDA because it provides investors with additional information to compare our business performance to other companies and understand performance trends. Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization and major maintenance expense costs at Power's fossil generation facilities. This information is not intended to be viewed as an alternative to GAAP information. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income to reconcile to Operating Earnings and Adjusted EBITDA with a reference to that slide included on each of the slides where the non-GAAP information appears.

These materials and other financial releases can be found on the pseg.com website under the investor tab, or at http://investor.pseg.com/

PSEG
2015 Q2 Review

Ralph Izzo

Chairman, President and Chief Executive Officer

SI-SSA-0015-12974

Q2 Earnings Summary

Quarter ended June 30

$ millions (except EPS)	2015	2014
Operating Earnings	$ 289	$ 245
Reconciling Items, Net of Tax	56	(33)
Net Income	$ 345	$ 212

SI-SSA-0015-12976

PSEG – Q2 2015 Highlights

- **Earnings on Track**
  - ✓ Operating earnings of $0.57 vs. $0.49 per share in Q2 2014, up 16%
  - ✓ Increased earnings contribution from PSE&G's investment in Transmission
  - ✓ Updating full-year 2015 Operating Earnings guidance to $2.80 - $2.95 per share – assuming normal weather and plant operations for the balance of the year

- **Operating Review**
  - ✓ PSEG Power generating output up by 10% vs. Q2 2014
  - ✓ PSE&G placed the full 500 kV Susquehanna-Roseland line into service in May

- **PSEG Disciplined Capital Investment**
  - ✓ Gas System Modernization Program Filing – PSE&G's $1.6 billion program over the next 5 years to modernize its gas system; Public hearings completed
  - ✓ Announced the Keys CCGT New Build in Maryland: 755 MW unit targeted for 2018; Estimated cost of $825 to $875 million
  - ✓ Artificial Island – PJM final decision assigns PSE&G a portion of the upgrade project; Program will increase transmission spend by ~$100 - $130 million over next four years

- **Market Developments**
  - ✓ FERC issues order supporting PJM's Capacity Performance product; continuing process of defining parameters for transition auctions to include demand response and energy efficiency

SI-SSA-0015-12977

PSEG – Updating 2015 Operating Earnings Guidance

Full-year 2015 guidance update reflects the strength of results for both businesses for the first half of the year, and assumes normal weather and unit operations

SI-SSA-0015-12986

PSE&G – Monthly Weather Data

SI-SSA-0015-12987

PSE&G – Q2 2015 Operating Highlights

Operations

- ✓ Q2 2015 weather was warmer than Q2 2014 and warmer than normal
- ✓ Economy slowly improving, weather normalized electric sales up 0.2% in Q2: Residential demand up 0.6% and commercial sector up 0.6% in Q2, offset by industrial sales
- ✓ Gas deliveries (weather normalized) up 2.7% YTD, continue to benefit from decline in supply costs

Regulatory and Market Environment

- ✓ Gas System Modernization Program public hearings concluded
- ✓ PJM final decision on Artificial Island/FERC 1000 project assigned PSE&G ~$100 - $130 million of the overall transmission upgrades
- ✓ PSE&G residential gas customers to benefit from another proposed rate reduction this October 1, estimated to save the average gas customer another $52 per year if approved by the BPU, bringing total gas customer savings of 47% (~$792) since 2009

Financial

- ✓ PSE&G made $1.3 billion of capital expenditures in the YTD period ended June 30
- ✓ Updating PSE&G's forecast of operating earnings for the full year to $760 - $775 million from $735 - $775 million
- ✓ PSE&G issued $350 million, 3.00% secured Medium-Term Notes (MTNs) due May 2025 and $250 million, 4.05% secured MTNs due May 2045

PSEG Power – Gross Margin Performance

- ✓ Wholesale energy prices affected by over-supply of natural gas and constraints on electric transmission line
- ✓ Increase of $4/MWh in average hedge price
- ✓ Q2 year-over-year capacity prices reset on June 1 to ~$168/MW-day and remain stable for the next two capacity years; HEDD peaking capacity retired in Q2 2015
- ✓ Fuel flexibility and access to lower cost Marcellus gas continue to benefit margin

PSEG Power Gross Margin ($/MWh)

Q2 2015 Regional Performance		
Region	**Gross Margin ($M)**	**2015 Performance**
PJM	$487	Re-contracting, higher hedge prices, higher volumes and lower gas costs offset the decline in capacity pricing and market pricing.
New England	$18	Higher hedge value offset lower volume and lower prices.
New York	$26	Higher volume offset lower prices.

Hedging Update

Contracted Energy*

		Jul-Dec 2015	2016	2017
Base Load (Nuclear and Base Load Coal)	Volume TWh	18	37	37
	% Hedged	100%	85-90%	50-55%
	Price $/MWh	$53	$51	$50
Intermediate Coal, Combined Cycle, Peaking	Volume TWh	11	19	18

	% Hedged	70-75%	55-60%	30-35%
	Price $/MWh	$53	$51	$50

* Hedge percentages and prices as of June 30, 2015. Revenues of full requirement load deals based on contract price, including renewable energy credits, ancillary, and transmission components but excluding capacity. Hedges include positions with MTM accounting treatment and options.

SI-SSA-0015-12997

PSEG Power – Q2 2015 Operating Highlights

Operations

- ✓ Q2 output up 10%; average capacity factor achieved by nuclear fleet 86%, CCGTs achieved 61%
- ✓ Uprates completed at Peach Bottom (~65 MW) and Advanced Gas Path (~31MW) at Bergen 2
- ✓ Dispatch of coal units affected by decline in price of gas

Regulatory and Market Environment

- ✓ PSEG Power's average capacity pricing for the 2015/2016 capacity year reset to $168 MW/day on June 1
- ✓ Access to Marcellus gas continues to benefit the fleet's cost of gas
- ✓ FERC approved PJM's revised CP auction parameters for the Base Residual Auction (BRA); Transition auctions delayed to allow participation of DR and EE
- ✓ The 2018/2019 RPM auction on schedule; results due August 21

Financial

- ✓ Acquired the Keys 755 MW gas fired combined cycle generating station in Maryland; construction has begun with completion expected in 2018, at an estimated investment of $825 million to $875 million
- ✓ Power made capital expenditure of $360 million in the YTD period ended June 30
- ✓ Power's total debt as a percentage of capital was 31% at June 30
- ✓ Moody's affirmed PSEG Power's Baa1 senior debt rating and Stable outlook in May
- ✓ S&P affirmed PSEG Power's senior unsecured debt rating of BBB+ and revised the outlook to Stable from Positive in May

SI-SSA-0015-12998

PSEG

PSEG Financial Highlights

Updating full-year 2015 operating earnings guidance to $2.80 - $2.95 per share

- ✓ Focused on maintaining operating efficiency and customer reliability
- ✓ PSE&G expected to contribute over 50% of 2015 operating earnings

Infrastructure Spend

- ✓ PSE&G T&D spend for 2015 expected to be $2.6 billion
- ✓ Utility's Gas System Modernization Program (GSMP) filed with the BPU in February; Proposal supports spend of $1.6 billion over 5 years to replace aging cast iron and unprotected steel pipes
- ✓ Keys CCGT in Maryland expected on-line in 2018 expands Power's geographic base
- ✓ GSMP, Keys and Artificial Island potentially increase PSEG's existing $13 billion, 2015-2019E capital program by up to $2.2 billion

Financial position remains strong

- ✓ Positive cash from Power and increasing cash flow from operations at PSE&G supports dividend growth and funds capital spending program without the need to issue equity
- ✓ Debt as a percentage of capitalization was 42% at June 30

Increased common dividend 5.4% in February to indicative annual rate of $1.56 per share

- ✓ Increasing regulated earnings mix supports dividend growth

PRESENTATION

Operator

Ladies and gentlemen, thank you for standing by. My name is Kelly and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group, third-quarter 2015 earnings conference call and webcast.

(Operator Instructions)

As a reminder, this conference is being recorded today, Friday, October 30, 2015, and will be available for telephone replay beginning at 1 PM Eastern time today until 11:30 p.m. Eastern time on November 6, 2015. It will also be available as an audio webcast on PSEG's corporate website at www.PSEG.com. I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen Lally ***- Public Service Enterprise Group Incorporated - VP of IR***

Thank you, Kelly. Good morning. Thank you all for participating in our earnings call this morning. As you are aware, we released third quarter 2015 earnings statements earlier today. As mentioned, the release and attachments are posted on our website at www.PSEG.com, under the investor section. We also posted a series of slides that detail operating results by Company for the quarter. Our 10-Q for the period ended September 30, 2015, is expected to be filed shortly.

As you know, the earnings release and other matters that we discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties and although we may elect to update those forward-looking statements from time to time, we specifically disclaim any obligation to do so even if our estimate changes, unless of course we are required to do so.

Our release also contains adjusted non-GAAP operating earnings. Please refer to today's 8-K or other filings for a discussion of the factors that may cause results to differ from management's projections, forecasts, and expectations, and for a reconciliation of operating earnings to GAAP results.

I would you now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group, and also joining Ralph on the call today is Dan Cregg, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions and we ask that you limit yourself to one question and one followup to give everyone an opportunity to join us on the call. Thank you.

THOMSON REUTERS

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Thanks, Kathleen, and thank you everyone for joining us today. Earlier this morning we reported operating earnings for the third quarter of 2015 of $0.80 per share, that's a 4% improvement over the $0.77 earned in 2014's third quarter. The results for the third quarter bring PSEG's operating earnings for the nine months ended September to $2.41 per share, which represents a 6% increase over the $2.27 per share earned during the first nine months of last year.

Slides 4 and 5 contain the detail on the results for the third quarter and for the nine months. We delivered solid earnings in the third quarter and year-to-date, and we made excellent progress on our objectives for growing our business. PSE&G continues to deliver on the earnings promise of its expanded capital program and PSEG Power achieved solid operational and financial results driven by improved performance from its nuclear and combined cycle fleet.

During the quarter, PSE&G reached an agreement with the staff of the New Jersey Board of Public Utilities and the New Jersey Division of Rate Council that provided for PSE&G to invest $905 million over a three-year period beginning next year to replace aging cast iron gas mains. Approval by the BPU later this year will allow PSE&G to continue the work begun under Energy Strong, supporting a clean, safe, and reliable gas system well into the future.

This agreement follows upon BPU's support earlier this year for a $95 million expansion of PSE&G's investment in energy efficiency programs. PSE&G's focus on improving the resiliency of the grid and increasing operational efficiency has translated once again into PSE&G being recognized as the most reliable utility in the Mid-Atlantic region for the 14th consecutive year. PSE&G's responsiveness was also recognized with receipt of the outstanding outage response time award for restoring customers 30% faster than any other large investor-owned utility. This is by no means the end of the infrastructure replacement needs for PSE&G and its customers.

Turning to PSEG Power. It is increasing its investment in clean, efficient gas-fired capacity. Power cleared a new 540-megawatt combined cycle gas plant at the sea Sewaren station as part of PJM's reliability pricing model base residual auction. The new unit represents an investment of about $625 million to $675 million. The development of new capacity at Sewaren is in addition to Power's announced plans to construct and operate a new 755-megawatt combined cycle unit at the Keys Energy Center in Maryland for between $825 million and $875 million. Both units are expected to achieve operational status in 2018.

PSEG Power's $1.5 billion investment will expand its gas-fired combined cycle capacity in its core PJM market to approximately 3800 megawatts as Power's overall gas-fired combined cycle capacity, which includes facilities in Bethlehem, New York, grows to represent 4600 megawatts. PJM's capacity performance initiative under RPM provided the correct incentives for investment. PSEG Power cleared approximately 8,700 megawatts at an average price of $215 per megawatt day. Auction prices reflected the increased risk of nonperformance associated with the auction's new rules. Power adjusted its bidding strategy to reflect this new reality with an emphasis on availability and reliability under capacity performance. And we believe Power's fleet is well positioned to perform given its dispatch flexibility, diverse fuel mix, and anticipated improvement in efficiency.

The new paradigm underlying PJM's capacity market is one sign of a more constructive regulatory environment for wholesale generating assets. The Federal Energy Regulatory Commission's notice of proposed rule making on energy price formation issued in September is further recognition that rule changes may be required to appropriately compensate generation for the true cost of operation.

Our total planned investment program covering PSE&G and Power for the five-year period ending in 2019 has expanded by 20% since the start of the year and now totals $15.6 billion. Our investments in PSE&G are expected to improve the resilience of the grid as we replace aging equipment and meet customer needs for reliability.

Our investment programs are projected to result in annual double-digit growth in PSE&G's rate base for the coming five-year period. Our investment in PSEG Power should enhance our market position with improvements in the fleet's efficiency and reliability. In a word, we are executing well in a dynamic market.

THOMSON REUTERS

SI-SSA-0015-13007

Based on the strength of our results, we are updating our guidance for 2015's operating earnings. We've narrowed our range for guidance as we've increased the lower end. For 2015, we are now forecasting operating earnings of $2.85 to $2.95 per share, which is different from our prior $2.80 to $2.95 per share.

PSE&G has grown to represent more than half of our operating earnings as Power continues to provide strong free cash flow. We have maintained a disciplined approach to investing as our strong financial position supports growth without the need to issue equity. We intend to utilize our financial strength to meet the high standards for reliability expected by our customers and enhance the returns required by our shareholders.

I'll now turn the call over to Dan to review our operating results in greater detail.

Dan Cregg - ***Public Service Enterprise Group Incorporated - EVP & CFO***

Thank you, Ralph, and good morning, everybody. I'll review our quarterly operating earnings as well as the outlook for full-year results by subsidiary company. As Ralph noted, PSEG reported operating earnings for the third quarter of 2015 of $0.80 per share versus $0.77 per share in the third quarter of last year. For the nine months ended September 30, we reported operating earnings of $2.41 per share versus $2.27 per share last year. We provided you a waterfall chart on slide 10 that takes you through the net changes in quarter-over-quarter operating earnings by major business and a similar chart on slide 12 that provides you with the changes in operating earnings by each business on a year-to-date basis. I'll now review each Company in more detail starting with PSE&G.

As shown on slide 14, the reported operating earnings for the third quarter of $0.44 per share compared with $0.39 per share a year ago. PSE&G's earnings in the third quarter reflect the benefit of warmer than normal weather and an increase in revenue associated with PSE&G's expanded capital program. The improvement in revenue more than offset a moderate increase in operating expenses.

Returns from PSE&G's expanded investment in transmission added $0.03 per share to earnings in the quarter. Weather conditions, which were much warmer than normal and warmer than a year ago, provided PSE&G's earnings $0.02 -- improved PSE&G's earnings by $0.02 per share. Earnings comparisons also improved by $0.01 per share due to an increase in electric demand coupled with revenue recovery and infrastructure related investment programs. And consistent with the first half of the year, PSE&G experienced an increase in pension expense resulting in a reduction in the quarter-over-quarter earnings of $0.01 per share.

Electric sales grew 7% during the third quarter as residential customers responded to temperatures which produced 38% higher temperature humidity index than levels experienced in the year-ago period and 19% higher than normal. On a weather-normalized basis, electric sales advanced 8/10 of a percent in the quarter and 4/10 of a percent for the nine months ended September. Growth for the nine-month period is in line with our long-term expectations for weather normalized electric sales growth.

As Ralph mentioned, PSE&G reached a settlement in principal with the staff of the BPU and the New Jersey Division of Rate Council on the Company's gas system modernization program, or GSMP. The settlement provides for an investment of $905 million over a three-year period beginning in 2016 and under the settlement we would invest $650 million in the program at a 9.75% return on equity with the remaining $255 million investment recovered as part of our next base rate case. And you may recall that we agreed as part of our Energy Strong program to file a base rate case no later than November 1, 2017.

PSE&G with the addition of these investment programs has increased its capital program for the five-year period ending in 2019 to $11.8 billion, and this represents a 10% increase in PSE&G's capital investment plans since the start of the year and should support estimated annual double-digit growth in PSE&G's rate base over this time frame.

PSE&G has also filed an update of its formula rate for transmission at the Federal Energy Regulatory Commission. The update supports PSE&G's ability to earn its authorized return on an expanded capital base and would increase transmission revenues in 2016 by $146 million. Remember, PSE&G's investment in transmission is expected to grow to about 50% of its rate base by the end of 2019 versus approximately 40% at the end of 2014.

THOMSON REUTERS

We've increased our forecast of PSE&G's operating earnings for 2015 given strong year-to-date results and are now forecasting operating earnings of $785 million to $805 million versus $760 million to $775 million previously. Now turning to Power.

Power reported operating earnings for the third quarter of 2015 of $0.33 per share and adjusted EBITDA of $401 million, and that's compared with operating earnings of $0.34 per share and adjusted EBITDA of $386 million for the third quarter of 2014. Power's results for the quarter reflect the impact of strong hedging and increase in operation from the gas-fired combined cycle fleet, and an improvement in spark spreads which offset the effect of an expected decline in capacity prices.

Higher average prices on energy hedges coupled with reduction in the cost of supply more than offset the impact on earnings of lower wholesale market prices for energy, and these items combine to increase Power's quarter-over-quarter earnings comparisons by $0.07 per share.

This improvement in margin in the quarter was partially offset by an expected decline in PJM's capacity revenues which reduce Power's quarter-over-quarter earnings by $0.03 per share. The reduction in capacity revenues reflects the retirement of 1800 megawatts of older inefficient peaking capacity that's was no longer compliant with environmental requirements. The average price received on PJM's capacity in the third quarter was in line with year-ago levels at $186 per megawatt day. Increase in O&M expense reduced quarter-over-quarter earnings by $0.03 per share. This increase in operating expenses primarily reflects differences in timing of outages at PSEGs Power's nuclear facilities and is not an indicator of a higher embedded level of expenses. Lastly, the absence of prior year tax benefits reduced quarter-over-quarter earnings by $0.02 per share.

As Ralph mentioned, in August PJM completed the RPM capacity auction for the 2018 / 2019 year. More than 98% of Power's capacity that cleared the auction met the new capacity performance or CP standards. The price Power will receive for capacity is expected to grow to $215 per megawatt day on average for the capacity year beginning June 1, 2018, from the $168 per megawatt day for the current year.

On slide 28, we have detail on the results of the latest capacity auction, including the number of megawatts that cleared the auction as well as the average price Power expects to receive for its capacity. Power cleared a new efficient combined cycle unit at Sewaren and plans to retire a similar amount of older inefficient steam units at that site. With the results of the latest auction, Power should see growth in its capacity revenues through 2018. The generating fleet's operational flexibility continues to be demonstrated during this period of low energy pricing.

Improved performance from the nuclear fleet and increased production in the gas-fired combined cycle fleet offset a decline in production at the coal fired stations. Our nuclear fleet operated at an average capacity factor of 95% for the quarter, producing 7.8 TWh of output, representing 53% of total generation. This also represents a 3% increase in output. Performance of the nuclear facilities benefited from the absence of repair work at Salem 2 in 2014 and showed improvement year-over-year in spite of an early start to the refueling outage at Peach Bottom 3.

Production from the gas fired combined cycle fleet increased 7% to 5.4 TWh for the quarter, representing 36% of total generation. The fleet operated extremely well running at an average capacity factor of 73% during the quarter in response to market demand. Output also benefited from the completion of capacity enhancement work at the Linden and Bergen stations which added 94 megawatts to the two stations over the past year.

Warmer than normal summer weather had a favorable impact on the dispatch of our peaking fleet as dispatch of our coal-fired assets was affected by lower wholesale energy prices. Wholesale market energy prices during the quarter continue to reflect a decline in the price of gas based on an overabundance of gas supply in the region, strong production of gas from the Marcellus Basin coupled with insufficient take-away pipeline capacity has, not unexpectedly, resulted in lower prices for gas. Power's combined cycle fleet benefited from its access to low cost gas supply in the summer and enjoyed strong spark spreads as power prices held up better than the price of gas.

Power's fleet is expected to produce energy at the lower end of its forecasted range of output for 2015 of 55 to 57 TWh, reflecting reduced expectations for output from our coal-fired stations. This was slightly less than our prior forecast and would provide a nominal increase in output year-over-year. Approximately 80% to 85% of anticipated production for the fourth quarter is hedged at an average price of $52 per megawatt hour.

THOMSON REUTERS

Moving to 2016, Power has hedged 65% to 70% of its forecasted generation of 55 to 57 TWh at an average price of $51 per megawatt hour. For 2017 Power has hedged 35% to 40% of its forecasted generation of 55 to 57 TWh at an average price of $49 per megawatt hour. The percent of energy hedged in 2016 and 2017 is consistent with but at the lower end of the range for Power's prescribed ratable hedging policy. And the forecast for 2016 and 2017 continues to assume that 11 to 12 TWh of annual output are hedged at BGS prices.

Forecast range for Power's operating earnings for 2015 has been narrowed to $620 million to $650 million from the $620 million to $680 million prior range. This forecast of operating earnings represents adjusted EBITDA for the full year in the range of $1.545 billion to $1.595 billion.

Now, turning to enterprise and other where we reported operating earnings of $11 million or $0.03 per share for the third quarter of 2015 versus operating earnings of $22 million or $0.04 per share in the third quarter of 2014. The decline in operating earnings reflects the absence of prior year tax benefits at Energy Holdings partially offset by lower expenses and higher interest income at the parent. And the forecast for enterprise and other full-year earnings for 2015 remains $40 million to $45 million.

And lastly relating to financing, PEG closed the quarter with $271 million of cash on its balance sheet with debt at the end of the quarter representing 41.5% of consolidated capital. PEG's five-year capital program has increased to $15.6 billion with the announced agreements for PSE&G and Power's plans to develop new capacity. PSE&G's capital program represents 75% of our planned capital expenditures with Power's capital program representing 25%. Given our strong balance sheet and expectations for Power's free cash flow generation, we're able to finance our capital requirements without the need to issue equity.

So as mentioned, we are pleased to update our guidance for 2015's operating earnings to $2.85 to $2.95 per share and results in this range would represent the third year of growth in operating earnings. We are now ready for your questions.

QUESTION AND ANSWER

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community.

(Operator Instructions)

Your first question will come from the line of Paul Patterson with Glenrock Associates.

Paul Patterson - ***Glenrock Associates - Analyst***

Can you hear me?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Yes, Paul.

Paul Patterson - ***Glenrock Associates - Analyst***

Last quarter you were discussing potentially exploring the retail market and I was wondering if you had any update on that or any thoughts given the third quarter and what have you?

© 2015 Thomson Reuters. All rights reserved. Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Paul, it's Ralph. We did talk about it and we still are considering different options. Again, to the extent that we think about retail, it's only in the context of the effectiveness of our hedges. This is not an offensive play. This is how do we make sure that assets that we own and operate in places like PS zone and in places like Eastern MAAC and places like Bethlehem, New York, are effectively hedged when the liquid hub is at PJM west.

So it's really just about the effectiveness of hedging and how to make sure that we optimize that. So, one thing we did to make sure we hedge effectively by purchasing the Keys Energy Center. That's not retail. That's a way to get at managing basis differentials and effective hedges. So we are still looking at it, but nothing imminent to announce.

Paul Patterson - ***Glenrock Associates - Analyst***

Okay. And then on the re-contracting and low cost of service, again a good quarter for that. Given where you see things heading into 2016, any thoughts about how that -- how things look with respect to that?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

So that was definitely explicitly stated in Dan's point of you view, right. So we don't out-guess the market. We have a very clear set of guidelines that we give our trading organization in terms of how much they can hedge in terms of max and mins, all based upon calculations of VaR and gross margin at risk, and we allow them to use their judgment in terms of how market sentiment might be affecting near-term prices that may be slightly out of whack with respect to fundamentals, and we allow them to lean a little bit heavier in their hedging as they did last year which benefited us because prices did kind of come up pretty strong after last winter. And as Dan pointed out, right now we're a little bit lighter than we would typically be hedged in 2017, but still within our normal range, not taking a strong point of view that the market has this all wrong, but you can infer from that that we think maybe there's a little bit more bearishness in the market than is normally the case.

Paul Patterson - ***Glenrock Associates - Analyst***

Okay. Thanks a lot.

Operator

Your next question will come from the line of Travis Miller with Morningstar.

Travis Miller - ***Morningstar - Analyst***

Good morning. Thank you.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Hi, Travis.

© 2015 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13011

Travis Miller - ***Morningstar - Analyst***

Real quick one. I want to clarify. Do you guys expect the BPU to decide on that gas replacement program later this year, is that right?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

We're told it's going to be on the November agenda.

Travis Miller - ***Morningstar - Analyst***

November agenda. Okay. Great. And thinking more broadly here, those plants that you retired, what did you see during the summer in terms of how that capacity and ultimately energy at the peak levels was replaced? Were you guys picking up some of that? Were there other areas where you were seeing that replaced?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Our Kearny peaking units did run during the summer. We did have to run our Hudson unit on gas during the summer, but Sewaren, the units that we replaced, did not run during the summer.

Travis Miller - ***Morningstar - Analyst***

Okay. So you're picking up that mostly with your other facilities, is that --?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

That's right. We had some expansion in some of our combined cycle units which ran, our LM6000s ran, but the old steam units that sometimes in the past we had to turn on, we did not have to turn on this year.

Dan Cregg - ***Public Service Enterprise Group Incorporated - EVP & CFO***

A little bit of the peaking units were up as well. Coal units is where our volume was down. Our peakers picked up some of that volume.

Travis Miller - ***Morningstar - Analyst***

Okay. More strategically, how do you think now about enterprise and what you can do there when investments might go there, just that segment in general?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Well, we see really two primary operating subsidiaries in power and in utility, Travis. The earnings that you see at enterprise really are borne out of some residual legacy leases on real estate that are very, very small and of course LIPA which is on an exactly as planned trajectory of starting out at $0.03, going to $0.08 by 2017. This year I think it's about $0.03 or $0.04. Next year that will go up

THOMSON REUTERS

to $0.06 or $0.07 and then $0.07 or $0.08 two years after as per the contract. There are no plans to put a lot up at the parent level in terms of new businesses.

Travis Miller - ***Morningstar - Analyst***

Okay. Great. Thank you very much.

Operator

Your next question will come from the line of Michael Lapides with Goldman Sachs.

Michael Lapides - ***Goldman Sachs - Analyst***

Hey, Ralph. Thank you guys for taking my question. I want to know if we should see what your investment in Power is for the next couple of years as a bit of a strategy shift or a bit of a view in the market? And the reason why I ask that is if I go back over the prior six or seven, six or eight years a lot of what you've done in Power is actually more of the harvest mode. Meaning, once you finish the environmental CapEx on Hudson and Mercer, a lot of what you had done at Power had either been divesting assets or realizing the significant cash flow, the free cash flow, that the remaining assets the large portfolio created.

We're now seeing a little bit of a shift and now you're becoming much more of an investor in new assets, whether it's building on existing sites or buying development projects. Is that a -- do you think the market has changed type of view or is there some other structural view that you're trying to express in utilizing the cash flow that way versus other potential methodologies, either allocating it to the balance sheet or allocating it even more investment at E&G? Just curious.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

That's a very good question, Michael. We do get that from a lot of our investors so I thank you for giving us a chance to answer it. It is definitely not a strategy shift. We believe that both businesses are quite viable, quite strong, and need to be tended to in terms of their investment and growth opportunities. I think if you look at a short enough period of time, you could create whatever strategy you want to from a short enough period of time, but if I just take you back over the last five years, PSE&G made up about 80% of the capital program versus Power being 20%, and if I look ahead five years based on what I know today, that 80/20 becomes 75/25 and it's no more than that.

So, if you think about Power the last five years, we spent $400 million operating nuclear you units. We spent a couple hundred million dollars on peakers. We spent a couple hundred million dollars on advanced gas path upgrades. So, now we're not doing that. Instead, we're going to take an old steam unit that had 550 megawatts of capacity that there was no way it could survive in a CP future and said, okay, instead of retiring that and leaving nothing there and losing the injection rights, let's build a combined cycle unit because we like the way those numbers look. Instead of upgrading, instead of expanding, we're going to build a natural gas combined cycle unit.

As I mentioned before when I was answering Paul's question, there's some changes going on in basis. We want to know how can we manage that better. We saw a great opportunity handling that in the keys investment. At the same time we announced $1 billion in new utility investments between gas system maintenance modernization and energy efficiency, and as we pointed out that program at $300 million a year run rate has 30 years to go. We only got three years of approval. So what we have is do very strong businesses, both worthy of investment, both which we look at where we can maximize the benefit for our customers and achieve the return expectations of our shareholders.

THOMSON REUTERS

SI-SSA-0015-13013

So really nothing has changed. Absolutely understandable why people would ask the question. If you just looked at a three-month window, all the sudden you see, wow, Power's investing $1.6 billion and utility's investing $1 billion. I don't think you should look at narrow short windows like that.

Michael Lapides - ***Goldman Sachs - Analyst***

Got it. One other question. You talk about rate-based growth at the utilities, meaning double-digit rate base growth. Do you expect earnings growth to match rate base growth over time?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

It will be close but it can't match it. The reason for that is quite simple. I am so proud of our utility folks for controlling costs, but even in the best of years you have labor escalation in our union contracts that are like 2.5%. You just look at management wage growth of 2.5%, 3% and then you look at load growth on a weather-normalized basis of 0.4% on the electric side and I think it's 0.8% on the gas side. So you just do the arithmetic and the O&M expense outstrips the growth in load. So that bit of a drag peels away at some of the contemporaneous returns that you go get from the rate-based growth. That's why these things don't match perfectly.

Michael Lapides - ***Goldman Sachs - Analyst***

Got it. Thank you, Ralph. Appreciate you taking my questions.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

No problem. You're welcome.

Operator

(Operator Instructions)

You have a question from the line of Sophie Karp with Citigroup.

Sophie Karp - ***Citigroup - Analyst***

Hi, can you hear me?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Yes. Good morning.

Sophie Karp - ***Citigroup - Analyst***

Good morning. Thank you for taking my question. I wanted to ask you about the nuclear economics as we continue to see very low gas environment obviously in the -- if this prevails do you see any meaningful change in the nuclear economics for your assets and does that change your view of their long-term strategy with respect to those assets?

© 2015 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Sophie, it's an excellent question. Each of our units is over 1,000 megawatts. I think if you look at both fixed and variable O&M, I don't know if we've published the operating cost of them, but it is $37 a megawatt hour both fixed and variable. If you look at nuclear fuel costs it's far, far, far less than that. So given our capacity prices, given our variable O&M costs, our units are absolutely fine. They'd be a lot finer if gas was at $8 and $10 an MMBtu.

As you well know, some of the challenges other units have had is, number one, their size in terms of their ability to spread their fixed cost and, number two, some of the distortions that are created by the production tax credit in particular from wind farms. That's not to minimize the competitive pressures associated with natural gas, but what we're seeing is margin compression and we're nowhere near a point operating at anything but positive margins for those units. I think there will be a period, I don't know how long that will be, of competitive pressure on them, but eventually there's going to be a price on carbon. I don't know if that's going to be under CPP or some other paradigm, and these units will be able to ride through these a little bit more difficult times without any problem and then really benefit from that carbon regimen in the future.

Sophie Karp - ***Citigroup - Analyst***

Thank you. My other question was about transmission investments. Are you looking into any incremental transmission investment opportunities right now maybe through FERC order 1000 or any other transmission investments that are not currently in your plan or have not been contemplated previously?

Dan Cregg - ***Public Service Enterprise Group Incorporated - EVP & CFO***

The FERC 1000 process has been around for a while and I guess I would say has been gaining traction for a while. We've been through the most recent and first opportunity here within [MPJ] and with Artificial Island. So, yes, we are definitely involved in them. I think a lot of the areas in the country are still formulating the best way to move into this new regimen, so I would say that the prognosis for large investments in the very near term in that regard are probably less, but I think over time it is still an area where we think we have the skills and expertise that we can bring to it and we think we can be very successful in that arena.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Sophie, it's important to realize it's $12 billion in the utilities prospective five-year capital program of which I think 60% or 70% is transmission. None of that is subject to FERC order 1000 competition. It's all stuff that doesn't meet the criteria for FERC 1000. The exception as Dan just implied is the $120 million of Artificial Island project that we won that's included in that number.

Sophie Karp - ***Citigroup - Analyst***

Thank you.

Operator

Your next question will come from the line of Gregg Orrill with Barclays.

© 2015 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

Gregg Orrill - ***Barclays Capital - Analyst***

Thank you. Ralph, you've talked about having an excess balance sheet capacity of $2 [million] to $3 [million] against your FFO to debt targets.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Right.

Gregg Orrill - ***Barclays Capital - Analyst***

And where does stock buyback stand in the way you're thinking of using that money? Has anything changed about your thinking?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Sure, thanks, Gregg, for the question. So nothing has changed really. We have this sort of three-tiered prioritization on how to use the balance sheet. Number one is reinvesting in the business and we've been public about the fact that we will bid Bridgeport Harbor combined cycle unit in the upcoming forward capacity market in New England in February. I just mentioned a minute ago that the gas system needs $300 million per year and we have a three-year program. If you subtract three from five that means there's two years that are unfunded in the plan right now.

You may recall, Gregg, that we when we originally filed for Energy Strong goodness gracious 2-1/2 years ago we asked for $3.9 million as the first part of a five-year program and we got $1.2 million approved and it was only put into a three-year program, so that's halfway done already. And if you take 1.5 from 5, that means 3-1/2 years of the five-year program is unfunded, so there's $1 billion plus in investment opportunity there. So just looking at those three, Bridgeport Harbor, gas, and Energy Strong, you're looking at anywhere from $2.5 billion to $3 billion of investment opportunity that we've publicly discussed.

Second thing is, look, let's face it, we know the utility's a steady grower but we know Power's in a commodity cyclical business and we know how important dividends are to our investors and we've been promising consistent growth in our dividend, p so we'd like to make sure that balance sheet has a little bit of an ability to absorb some of the ebbs and flows of the commodity markets, so that's a second priority for us.

And then, third -- but not one that we would never do but something that we talk about all the time, if our cost of capital is a little out of whack because the balance sheet is a little too robust and the investment opportunities are kind of far off, then let's think about share repurchase as a way to get that cost of capital back in line. So that really hasn't changed at all in terms of the three-tier prioritization but perhaps a little more color on the details.

Gregg Orrill - ***Barclays Capital - Analyst***

Thank you.

Operator

Mr. Izzo, Mr. Cregg, there are no further questions at this time. Please continue with your presentation or closing remarks.

THOMSON REUTERS

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Thank you very much. So, look, I hope your take away is the same as the message we were trying to deliver which is the Company is in great shape. Our fleet of plants, our nuclear units, our combined cycle units are running well. The utility is hitting all of its growth targets as it executes its capital program and the balance sheet remains very healthy. So, we hope that you all come out to meet Dan if you haven't met him just yet. He stepped right in and fabulous job for us, and we'll see you in Florida in two weeks. Thanks, everyone. Have a good day.

PSEG **Investor News** **NYSE: PEG**

For further information, contact:

- Kathleen A. Lally, Vice President – Investor Relations Phone: 973-430-6565
- Carlotta Chan, Manager - Investor Relations Phone: 973-430-6596

PSEG ANNOUNCES 2015 THIRD QUARTER RESULTS

$0.87 PER SHARE NET INCOME

Operating Earnings of $0.80 Per Share

Company Updates Full Year Guidance to $2.85 - $2.95 Per Share

October 30, 2015 (Newark, NJ) (NYSE – PEG) Public Service Enterprise Group (PSEG) today reported third quarter 2015 Net Income of $439 million or $0.87 per share as compared to Net Income of $444 million or $0.87 per share for the third quarter of 2014. Operating earnings for the third quarter of 2015 were $403 million or $0.80 per share compared to the third quarter of 2014 operating earnings of $393 million or $0.77 per share.

Ralph Izzo, chairman, president and CEO, said "PSEG reported another good quarter. While the businesses benefited from favorable weather, our results also reflect the benefit from our strategy of increasing investment in infrastructure, a disciplined approach to cost management and the continued availability of low-cost gas supply. Based on our strong results, we are increasing the lower end of our operating earnings guidance yielding a range for the full year of $2.85 - $2.95 per share."

PSEG believes that the non-GAAP financial measure of "Operating Earnings" provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends. Operating Earnings exclude the impact of gains/(losses) associated with Nuclear Decommissioning Trust (NDT), certain Mark-to-Market (MTM) accounting and other material one-time items. The table below provides a reconciliation of PSEG's Net Income to Operating Earnings (a non-GAAP measure) for the third quarter. See Attachment 12 for a complete list of items excluded from Net Income in the determination of Operating Earnings.

PSEG CONSOLIDATED EARNINGS (unaudited)

Third Quarter Comparative Results
2015 and 2014

	Income ($ millions)		Diluted Earnings Per Share	
	2015	**2014**	**2015**	**2014**
Operating Earnings	$403	$393	$0.80	$0.77
Reconciling Items	36	51	0.07	0.10
Net Income	$439	$444	$0.87	$0.87
Average Shares			**508M**	**507M**

“Our position of financial strength allows us to make significant investments in our businesses,” Izzo said. “Since the start of the year, our 5-year capital program has been increased by 20% to $15.6 billion. The increase in spending should produce double-digit growth in PSE&G’s rate base through 2019 from 2014 as we also enhance the competitive position of PSEG Power’s generating fleet with the addition of approximately 1300 MWs of new, efficient gas-fired combined cycle capacity. The investment program should assure customers receive clean, reliable delivery of electricity and natural gas as we also position PSEG to continue to deliver value for shareholders over the long-term.”

Our revised Operating Earnings guidance by company for the full year is as follows:

Operating Earnings
($ millions, except EPS)

	2015E	2014A
PSE&G	$785 - $805	$725
PSEG Power	$620 - $650	$642
PSEG Enterprise/Other	$40 - $45	$33
Total	$1,445 - $1,500	$1,400
Earnings Per Share	$2.85 - $2.95	$2.76

Operating Earnings Review and Outlook by Operating Subsidiary

See Attachment 6 for detail regarding the quarter-over-quarter reconciliations for each of PSEG’s businesses.

PSE&G

PSE&G reported operating earnings of $222 million ($0.44 per share) for the third quarter of 2015 compared with operating earnings of $200 million ($0.39 per share) for the third quarter of 2014.

PSE&G’s earnings reflect the impact of warmer than normal weather, and an increase in revenue associated with an expanded capital program which more than offset a moderate increase in operating expenses.

Returns from PSE&G’s expanded investment in transmission added $0.03 per share to earnings in the quarter. Weather conditions, which were warmer than normal and warmer than the year ago period, improved quarter-over-quarter earnings by $0.02 per share. A slight increase in electric demand coupled with revenue recovery of infrastructure-related investment programs improved quarter-over-quarter earnings by $0.01 per share. An increase in pension expense led to a reduction in quarter-over-quarter earnings by $0.01 per share.

Electric sales grew 7% during the third quarter as residential customers responded to temperatures that were 38% higher than the levels experienced in the year-ago period and 19% higher than

normal. On a weather-normalized basis, electric sales advanced 0.8% in the quarter resulting in weather-normalized electric sales growth of 0.4% for the nine months ended September.

In September 2015, the NJ Board of Public Utilities (BPU) approved PSE&G's filing requesting a reduction of $70 million in annual Basic Gas Supply Service (BGSS) revenues. The change, which was effective on October 1, 2015, reduced the BGSS rate to 40 cents per therm from 45 cents per therm. Including this reduction in gas charges, the typical residential customer has experienced a 47%, or $792, decline in their annual gas bill since January 2009.

PSE&G, in September 2015, reached a settlement in principle with the Staff of the BPU and the NJ Division of Rate Counsel on the company's Gas System Modernization Program (GSMP). The settlement provides for investing $905 million over a three year period beginning in 2016.

PSE&G filed an update of its Formula Rate for transmission at the Federal Energy Regulatory Commission in October 2015. The update, which reflects an increase in the level of PSE&G's investment in transmission, would provide for approximately $146 million in increased annual transmission revenue effective January 1, 2016.

The forecast of PSE&G's operating earnings for 2015 is now $785 - $805 million versus $760 - $775 million. Operating earnings for the full year are benefiting from the recovery of costs associated with higher levels of capital spending. The increase in the forecast is mostly due to warmer than normal weather.

PSEG Power

PSEG Power reported operating earnings of $170 million ($0.33 per share) for the third quarter of 2015 and Adjusted EBITDA of $401 million compared with operating earnings of $171 million ($0.34 per share) and Adjusted EBITDA of $386 million for the third quarter of 2014.

PSEG believes that the non-GAAP financial measure of "Adjusted EBITDA" is useful in evaluating Power's operating performance because it provides investors with additional information to compare our business performance to other companies and to understand performance trends.

Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense and interest expense, depreciation and amortization and major maintenance at Power's fossil generation facilities. See Attachment 12 for a complete list of items excluded from Net Income in the determination of Adjusted EBITDA.

Power's results for the quarter reflect the impact of strong hedging, an increase in operation from the gas-fired combined cycle fleet and an improvement in spark spreads with the availability of low-cost gas supply which offset the anticipated effect of a decline in capacity prices.

Power retired approximately 1800 MWs in the second quarter of older, less efficient peaking capacity that didn't meet NJ's environmental standards. The loss of the revenue on this capacity reduced Power's quarter-over-quarter earnings by $0.03 per share. This decline in earnings was offset by higher average prices received on energy hedges as well as an improvement in spark spreads. These two items combined to increase quarter-over-quarter earnings by $0.07 per share. An increase in O&M expenses reduced quarter-over-quarter earnings by $0.03 per share. The increase in operating expense primarily reflects differences in the timing of outages at PSEG Power's nuclear

facilities, and is not a reflection of a higher embedded level of expense. The absence of prior year tax benefits reduced quarter-over-quarter earnings by $0.02 per share.

Output during the quarter of 14.7 TWh was in line with year-ago levels. The fleet's flexibility continues to be demonstrated as an improvement in output from the nuclear fleet and increased production from the gas-fired combined cycle fleet offset a decline in production from Power's coal-fired stations.

The nuclear fleet operated at an average capacity factor of 95%, producing 7.8 TWh of output or 53% of Power's generation, a 3% increase over year-ago levels. Performance of the nuclear facilities reflects the absence of repair work at Salem 2 in 2014 which was partially offset in the third quarter of 2015 by an early start to the refueling outage at Peach Bottom 3. Production from the gas-fired combined cycle fleet (CCGT) increased 7% to 5.4 TWh, or 36% of total generation, as the CCGT fleet operated at a 73% capacity factor during the quarter in response to improved spark spreads. Output of the CCGT fleet also benefited from the completion of up-rate work which added 94 MWs of efficient capacity at the Linden and Bergen Generating Stations over the past year. Higher summer demand also had a favorable impact on the dispatch of Power's peaking capacity. Dispatch of the coal fleet was affected by a decline in the price of gas and lower wholesale energy prices.

Power's fleet is expected to produce energy at the lower end of its forecast of output for 2015 of 55 – 57 TWh. Approximately 80% - 85% of anticipated production for the fourth quarter is hedged at an average price of $52 per MWh. For 2016, Power has hedged 65% - 70% of its forecast generation of 55 – 57 TWh at an average price of $51 per MWh; for 2017, Power has hedged 35% - 40% of its forecast generation of 55 – 57 TWh at an average price of $49 per MWh. The percent of energy hedged over 2016 – 2017 is consistent with – but, at the lower end of the range for Power's prescribed ratable hedging policy.

PSEG Power cleared a new 540 MW CCGT at Sewaren as part of PJM's Reliability Pricing Model Base Residual Auction. The plant, which represents an investment of $625 - $675 million, is targeted to be completed and supplying energy to New Jersey and the region by the summer of 2018.

The forecast range of Power's operating earnings for 2015 is now $620 - $650 million versus $620 - $680 million. The forecast of operating earnings represents adjusted EBITDA for the full year of $1,545 - $1,595 million. Results for the year have been influenced by the expected decline in year-over-year capacity revenue, an increase in the average price of hedged energy and lower wholesale energy prices.

PSEG Enterprise/Other

PSEG Enterprise/Other reported operating earnings of $11 million ($0.03 per share) for the third quarter of 2015 compared with operating earnings of $22 million ($0.04 per share) for the third quarter of 2014. The decline in operating earnings reflects the absence of prior year tax benefits at PSEG Energy Holdings partially offset by lower operating and maintenance expense and higher interest income at Parent.

The forecast of PSEG Enterprise/Other full year operating earnings for 2015 remains $40 - $45 million.

FORWARD-LOOKING STATEMENT

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute “forward-looking statements” within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words “anticipate,” “intend,” “estimate,” “believe,” “expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC), including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or the price of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulation, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- any deterioration in our credit quality or the credit quality of our counterparties,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- delays or unforeseen cost escalations in our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- increases in competition in energy supply markets as well as for transmission projects,
- any inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies, and
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

PSEG Earnings Conference Call

3rd Quarter 2015

October 30, 2015

SI-SSA-0015-13035

Forward-Looking Statement

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute “forward-looking statements” within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words “anticipate,” “intend,” “estimate,” “believe,” “expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC), including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or the price of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulation, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- any deterioration in our credit quality or the credit quality of our counterparties,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- delays or unforeseen cost escalations in our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- increases in competition in energy supply markets as well as for transmission projects,
- any inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies, and
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-13036

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Operating Earnings exclude gains or losses associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting, and other material one-time items. PSEG presents Operating Earnings because management believes that it is appropriate for investors to consider results excluding these items in addition to the results reported in accordance with GAAP. PSEG believes that the non-GAAP financial measure of Operating Earnings provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends.

PSEG is presenting Adjusted EBITDA because it provides investors with additional information to compare our business performance to other companies and understand performance trends. Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization and major maintenance expense costs at Power's fossil generation facilities. This information is not intended to be viewed as an alternative to GAAP information. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income to reconcile to Operating Earnings and Adjusted EBITDA with a reference to that slide included on each of the slides where the non-GAAP information appears.

These materials and other financial releases can be found on the pseg.com website under the investor tab, or at http://investor.pseg.com/

PSEG
2015 Q3 Review

Ralph Izzo
Chairman, President and Chief Executive Officer

Q3 Earnings Summary – Successful Quarter

Quarter ended September 30

$ millions (except EPS)	2015	2014
Operating Earnings	$ 403	$ 393
Reconciling Items, Net of Tax	36	51
Net Income	$ 439	$ 444
EPS from Operating Earnings*	$ 0.80	$ 0.77

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings.

SI-SSA-0015-13039

Year to Date Earnings Summary – Strong Growth

Nine months ended September 30

$ millions (except EPS)	2015	2014
Operating Earnings	$1,221	$ 1,153
Reconciling Items, Net of Tax	149	(111)
Net Income	$ 1,370	$ 1,042
EPS from Operating Earnings*	$ 2.41	$ 2.27

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings.

SI-SSA-0015-13040

PSEG – Q3 2015 Highlights

- **Operating Earnings of $0.80 vs. $0.77 per share in Q3 2014**
  - ✓ Solid results driven by PSE&G's continuing investment in transmission, weather, and Power's strong hedging and plant operations
  - ✓ Updating full-year operating earnings guidance to $2.85 - $2.95 per share
- **Executing on operational goals**
  - ✓ Continued control of O&M supports full-year expectations
  - ✓ Nuclear operated at a 95% capacity factor; CCGTs operated at 73% capacity factor
- **PSEG's 5-Year Capital Spending program increased 20%**
  - ✓ Agreement reached on GSMP settlement provides for $905 million over 3 years
  - ✓ Power announced $1.5 billion investment in ~1,300 MWs of new CCGT capacity
- **Market developments**
  - ✓ Constructive regulatory environment
    - PJM Capacity Performance
    - FERC NOPR on price formation
  - ✓ Reliability One award recognizes PSE&G as the most reliable electric utility in the Mid-Atlantic Region for the 14th year in a row

SI-SSA-0015-13041

PSEG – Updating Full-Year 2015 Operating Earnings Guidance

Full-year 2015 guidance update reflects the strength of operating results for the first nine months of the year, and assumes normal weather and unit operations

PSE&G
2015 Q3 Review

SI-SSA-0015-13048

PSE&G – Q3 Earnings Summary

$ millions (except EPS)	Q3 2015	Q3 2014	Variance
Operating Revenues	$ 1,766	$ 1,655	$ 111
Operating Expenses			
Energy Costs	740	668	72
Operation & Maintenance	391	366	25
Depreciation & Amortization	231	238	(7)
Total Operating Expenses	1,362	1,272	90
Operating Earnings / Net Income	$ 222	$ 200	22
EPS from Operating Earnings	$ 0.44	$ 0.39	$ 0.05

SI-SSA-0015-13049

PSE&G EPS Reconciliation – Q3 2015 versus Q3 2014

Continued reliability investments are a driver of growth

SI-SSA-0015-13050

PSE&G – Monthly Summer Weather Data

SI-SSA-0015-13051

PSE&G – Q3 Operating Highlights

Operations

- ✓ Growth in transmission revenues added $0.03 per share over Q3 2014
- ✓ Q3 electric sales up 7% on weather that was 38% warmer than Q3 2014 and 19% warmer than normal; Summer 2015 was PSE&G's 5th warmest on record
- ✓ Weather normalized electric sales advanced 0.8% in Q3 and 0.4% for the YTD period
- ✓ O&M remains under control

Regulatory and Market Environment

- ✓ GSMP settlement reached with BPU Staff and Division of Rate Counsel to invest $905 million over 3 years to replace and modernize PSE&G's gas distribution system starting in 2016
- ✓ Energy Strong investments continuing: Gas mains replacement prioritized
- ✓ 2016 FERC Formula Rate filing submitted for ~$146 million in increased annual transmission revenue
- ✓ PSE&G lowered gas rates by $70 million on October 1; Since January 2009, the average residential gas customer has seen annual gas bills decline by 47%, or $792

Financial

- ✓ Updating PSE&G operating earnings guidance to $785 - $805 million, up from $760 - $775 million on recovery of costs related to higher levels of capital spend, and weather
- ✓ PSE&G earned its authorized return
- ✓ Capital investment of ~$2 billion through September 30, as part of $2.9 billion planned for the full year

Coal	170	139
Oil & Gas	623	423
Total Fossil	793	562
Nuclear	162	162
Total Fuel Cost	955	724
Total Generation (GWh)	41,306	42,488
$ / MWh	23	17

SI-SSA-0015-13059

PSEG Power – Gross Margin Performance

- ✓ Capacity pricing of $168/MW-day similar to Q3 2014 on lower megawatts from HEDD retirements
- ✓ Marcellus production and lack of take away capacity dampened local natural gas and power prices during a warmer-than-normal summer
- ✓ Spark spreads improved

Regional Performance		
Region	**Q3 2015 Gross Margin ($M)**	**2015 Performance**
PJM	**$573**	Re-contracting, higher hedge prices and lower fuel costs offset the decline in capacity payments from lower MWs and lower energy prices
New England	**$17**	Lower volumes and lower prices
New York	**$29**	Higher volume offset lower prices

SI-SSA-0015-13060

Developing 1,300 MW of new, efficient CCGT capacity in PJM

- Construction of 755 MW Keys Energy Center to begin this Fall on a new, natural gas fired power plant in Maryland (SWMAAC*) at an estimated cost of $825 to $875 million
- Power cleared a new 540 MW CCGT unit, Sewaren 7 located in New Jersey (EMAAC*), in the recent 2018/2019 RPM auction; the new unit is expected to cost $625 to $675 million and will replace the older Sewaren units upon completion
- Both Keys and Sewaren 7 are targeted to be in-service in 2018

*SWMAAC = SOUTHWEST/EMAAC = EASTERN MID-ATLANTIC AREA COUNCIL LOCATIONAL DELIVERABILITY AREA WITHIN PJM.

SI-SSA-0015-13061

Hedging Update…

Contracted Energy*

		Oct-Dec 2015	2016	2017
Base Load (Nuclear and Base Load Coal)	Volume TWh	9	36	36
	% Hedged	100%	100%	55-60%
	Price $/MWh	$52	$51	$49
Intermediate Coal, Combined Cycle, Peaking	Volume TWh	4	19	19
	% Hedged	35-40%	0%	0%
	Price $/MWh	$52	-	-
Total	Volume TWh	12**	55-57	55-57
	% Hedged	80-85%	65-70%	35-40%
	Price $/MWh	$52	$51	$49

* Hedge percentages and prices as of September 30, 2015. Revenues of full requirement load deals based on contract price, including renewable energy credits, ancillary, and transmission components but excluding capacity. Hedges include positions with MTM accounting treatment and options. **Volumes reflect rounding.

SI-SSA-0015-13062

PJM Capacity Market Pricing

~98% of Power's PJM fleet that cleared the 2018/2019 RPM auction met the new CP standards

RPM – Auction Results				
Delivery Year	2015 / 2016*	2016 / 2017*+	2017 / 2018+	2018 / 2019
Power's Average Prices*($/MW-day)	$168	$172	$177	$215
RTO Prices ($/MW-day)	$136	$59	$120	$165/$150 (CP/Base)
Power's Cleared Capacity (MW)	8,750	8,700	8,700	8,650
PJM Capacity Revenues ($ Millions)				
Calendar Year	2016	2017	2018	Through 5/31/19
Capacity Revenues	$542	$555	$631	$281

2018/2019 RPM Auction Highlights

- Cleared new 540 MW Sewaren 7 CCGT
- CP reflects cost to meet new performance obligation
- EMAAC separated
- CP construct favors portfolio approach

*PSEG POWER'S AVERAGE PRICES AND CLEARED CAPACITY (MW) REFLECT BASE AND INCREMENTAL AUCTIONS.
DELIVERY YEAR RUNS FROM JUNE 1 TO MAY 31 OF THE NEXT CALENDAR YEAR.
+ INCLUDES RESULTS OF CP TRANSITION AUCTIONS FOR '16/'17 AND '17/'18 AS OF SEPTEMBER 10, 2015.

SI-SSA-0015-13063

PSEG Power – Q3 Operating Highlights

Operations

- ✓ CCGT capacity factor of 73% in Q3, YTD CCGT capacity factor of 64%
- ✓ Nuclear capacity factor of 95% in Q3, YTD nuclear capacity factor of 92%
- ✓ Salem 2 refueling underway; Peach Bottom 3 refueling and uprate began late September
- ✓ Q3 output flat vs. Q3 2014, YTD output up 3% from higher nuclear and CCGT performance

Regulatory and Market Environment

- ✓ Capacity Performance auction results and FERC NOPRs continue to be supportive of price formation
- ✓ Supreme Court review of Demand Response (DR) and Maryland subsidized generation
- ✓ Power's average hedge price for 2015 is $52/MWh vs. $48/MWh for 2014

Financial

- ✓ Power to construct a new, $625 - $675 million 540 MW CCGT at Sewaren that cleared the 2018/2019 RPM auction
- ✓ Updating Power's full-year 2015 operating earnings guidance to $620 - $650 million, from $620 - $680 million; Adjusted 2015 EBITDA guidance also updated to $1.545 - $1.595 billion
- ✓ Power's total debt as a percentage of capital at September 30 was 30%

SI-SSA-0015-13064

PSEG

PSEG Financial Highlights

- **Updating 2015 operating earnings guidance to $2.85 - $2.95 per share**
  - ✓Focused on maintaining operating efficiency and customer reliability
  - ✓PSE&G's 2015 operating earnings guidance increased to $785 - $805 million versus 2014 operating earnings of $725 million
  - ✓Power's 2015 operating earnings guidance revised to $620 - $650 million, versus 2014 operating earnings of $642 million

- **PSE&G reached a settlement with BPU Staff and Division of Rate Counsel to invest $905 million over 3 years in its Gas System Modernization Program**

- **Financial position remains strong**
  - ✓At September 30: Consolidated PSEG debt stood at 42% of capital; Power debt was 30% of capital

- **Long history of returning cash to the shareholder through the common dividend, with opportunity for future growth**

SI-SSA-0015-13066

Robust pipeline of investment opportunities

PSEG's Current 5-Year Capital Spending Program
24% Higher than Prior Period

2010 – 2014: $12.6 Billion

2015E - 2019E*: $15.6 Billion

*INCLUDES ALL PLANNED SPENDING. **ENERGY STRONG EXCLUDES RISK AND CONTINGENCY. ***POWER CAPITAL SPENDING EXCLUDES NUCLEAR FUEL. ****INCLUDES PENNEAST PIPELINE EQUITY INVESTMENT OF $0.1B. E=ESTIMATE. DATA AS OF OCTOBER 30, 2015.

PRESENTATION

Operator

Ladies and gentlemen, thank you for standing by. My name is Brent and I'm your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group's fourth quarter 2015 earnings conference call webcast.

(Operator Instructions)

As a reminder, this conference is being recorded today, Friday, February 19, 2016, and will be available for telephone replay beginning at 2 PM Eastern today until 11:30 Eastern on February 26, 2016. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen Lally ***- Public Service Enterprise Group - VP of IR***

Thank you. Good morning, everyone. Thank you for participating in our earnings call this morning. As you are aware, we released fourth quarter and full-year 2015 earnings results earlier this morning.

The release and attachments as mentioned are posted on our website, www.pseg.com under the investor section. We also posted a series of slides that detail our operating results by Company for the quarter. Our 10-K for the period ended December 31, 2015 is expected to be filed shortly.

I don't go through the full disclaimer statement or the comments we have on the difference between operating earnings and GAAP results, but I do ask that you all read those comments contained in our slides and on our website. The disclaimer statement regards forward-looking statements, detailing the number of risks and uncertainties that could cause actual results to differ materially from forward-looking statements made therein. And although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if our estimates change, unless of course required by applicable securities laws.

We also provide commentary with regard to the difference between operating earnings and net income reported in accordance with generally accepted accounting principles in the United States. PSEG believes that the non-GAAP financial measure of operating earnings provides a consistent and comparable measure of performance to help shareholders understand trends.

I'm now going to turn the call over to Ralph Izzo, Chairman, President, and Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer.

At the conclusion of their remarks there will be time for your questions. Given the interest in the call we ask that you limit yourself to one question and one follow-up. Thank you.

Ralph Izzo *- Public Service Enterprise Group - Chairman, President & CEO*

Thank you, Kathleen, and thanks, everyone, for joining us today. This morning we reported operating earnings for the full-year 2015 and I'm pleased to report that it was a year of significant accomplishments.

As you saw this morning, we reported operating earnings for the fourth quarter of $0.50 per share versus $0.49 per share earned in the fourth quarter of 2014 despite the unseasonably mild weather this past December. Results for the full year were $2.91 per share, or 5% greater than 2014's operating earnings of $2.76 per share. This is at the upper half of our guidance of $2.85 to $2.90 per share and it was also higher than the midpoint of our original guidance of $2.85 per share.

Our results reflect the benefits of excellent performance and robust organic growth which offset the impact of low energy prices on earnings. We continue to successfully deploy our strong free cash flow into customer oriented investment programs that have supported growth. 2015's operating earnings represent the third year of growth in earnings.

Let me just mention a few of the year's highlights. PSE&G was named Electric Light and Power's utility of the year and was named the most reliable utility in the mid-Atlantic for the 14th consecutive year. But we're not resting on those laurels.

PSE&G invested approximately $2.7 billion during 2015 on programs to further enhance the system's resilience and its reliability. During the year PSE&G placed in service key backbone transmission lines such as the Susquehanna-Roseland light as well as the Mickleson Gloucester Camden line which is designed to meet the needs of customers today and well into the future.

PSE&G invested over $550 million on programs under its $1.2 billion Energy Strong initiative. These programs are designed to strengthen and protect the electric and gas distribution systems from the impacts of extreme weather.

During the year PSE&G also received approval from the New Jersey Board of Public Utilities to invest an additional $95 million in its award-winning energy efficiency programs and to continue the work begun under Energy Strong replacing aging cast-iron natural gas pipes. The $905 million gas system modernization program represented the 14th multi-year investment program approved by that BPU since PSE&G's last base rate case. And this speaks to the state support of infrastructure investment that meets the needs of customers.

PSE&G's investment program, supportive recovery, revenue recovery mechanisms and tight control of O&M expenses have provided growth in PSE&G's operating earnings of approximately 13% per year for the five-year period ended 2015. During this period PSE&G rate base expanded at a rate of 11% per year and, importantly, we have been able to support this growth as customer bills have declined.

But 2015 was not just a year of PSE&G accomplishments. PSEG Power's strong operating performance supported earnings in line with guidance for the full year despite very difficult market conditions.

The nuclear fleet operated at a capacity factor of greater than 90% for the year and accounted for 54% of the fleet's output. Power's gas-fired combustion turbine fleet set a new record for output. This improves on the prior record established in 2014. The fleet's performance is benefiting from investments that improved its efficiency, increased its capacity and provided greater access to low-cost gas supplies.

The flexibility and diversity of Power's fleet have a lot to provide approximately $500 million a positive free cash flow in 2015 even during soft energy market conditions. Power also plans to invest $2 billion over the next three to four years to add approximately 1800 megawatts of new, efficient, combined cycle gas-fired turbine capacity.

The Keys Energy station which is located in southwestern MAAC will extend Power's footprint in this core PJM market. A new efficient unit at the Sewaren station in New Jersey will replace old, inefficient steam capacity.

THOMSON REUTERS

SI-SSA-0015-13074

And after clearing the most recent capacity auction in New England, Power will construct a new 485-megawatt combined cycle unit at its existing Bridgeport Harbor Station site, giving us an enviable and growing position in both energy and capacity markets in southwestern Connecticut. The addition of these units will transform Power's Generation mix as its ownership of efficient, reliable gas-fired capacity will grow to exceed 5000 megawatts in 2019.

At that time, the combined cycle gas turbine fleet will surpass the size of Power's ownership in nuclear capacity and secure Power's position as a low-cost generator with modern, flexible, clean fleet that remains capable of meeting the demands for reliability in today's market.

Power also grew its investment in contracted solar energy. In 2015, Power added two projects, representing an investment of approximately $75 million in utilities scale grid connected solar energy. In early this year Power announced it will invest an additional $150 million in three new projects that bring its portfolio of solar projects to 240 megawatts DC of clean renewable energy.

All projects in this portfolio are under long-term contracts with credit worthy customers. So as you can see we continue to explore opportunities to expand and optimize Power's fleet, although I will add that we do not see any new generation build in the foreseeable future -- although you never say never but we don't plan any at this point in time.

Our balance sheet continues to provide us with a competitive advantage to finance our capital program without the need to access the equity markets. We ended 2015 with strong credit metrics and the extension of bonus depreciation through 2019 is expected to provide enterprise with an additional $1.7 billion of cash during this period.

Our investment program calls for a 21% increase in capital spending to $11.5 billion for the three years ended 2018 from capital investment during the three-year period ended 2015. Approximately 72% of that amount, or $8.3 billion will be invested by PSE&G on transmission and distribution infrastructure programs that customers require for reliability.

This level of investment is expected to yield growth in PSE&G's rate base for the three years ended 2018, of 10% per year, even after taking into account the impact of bonus depreciation on rate base. The remaining approximate 27% or $3.2 billion of expected capital investment will be made in Power.

The majority of Power's investments will be devoted to expanding its position in new, efficient, clean, gas-fired generating capacity as I mentioned already. All of which, Key, Sewaren and Bridgeport Harbor are expected to exceed our long-standing and unchanged financial return expectations.

With our strong balance sheet we remain in position to increase our capital investment across the Company. We have a robust pipeline of opportunities and plan on providing you with an update of our five year outlook for capital spending at our annual financial conference on March 11.

In total, the investment programs at PSE&G and Power are focused on meeting customer needs and market requirements with an energy platform that is reliable, efficient, and clean. The strategy we implemented is yielding growth for our shareholders as we have met the needs of our customers.

The continued successful deployment of strong free cash flow into customer oriented regulated investment programs is expected to support 14% growth in the utilities earnings to 60% of Enterprise's 2016 operating earnings as results for the full year are forecast at $2.80 to $3.00 per share. Our guidance for 2016 takes into account the impact on demand from the continuation of unseasonably mild weather conditions in January and early February.

The Board of Directors recent decision to increase the common dividend by 5.1% to the indicative annual levels of $1.64 per share is an expression of our confidence in our outlook, the continued growth of our regulated businesses, and an acknowledgment of our strong financial position. We see the potential for consistent and sustainable growth in the dividend as an important means of returning cash to our shareholders.

Of course none of our success would be possible without the contribution made by PSEG's dedicated workforce. I look forward to discussing our investment outlook in greater detail with you on our March 11 annual financial conference. But for now, turn the call over to Dan for more details on our operating results and we will be available to answer your questions after his remarks.

Dan Cregg - ***Public Service Enterprise Group - EVP & CFO***

Thank you, Ralph, and good morning, everyone. As Ralph said PSE&G reported operating earnings for the fourth quarter of $0.50 per share versus $0.49 per share for the fourth quarter of 2014. Earnings in the quarter brought operating earnings for the full year to $2.91 per share, or 5.4% greater than 2014's operating earnings of $2.76 per share and at the upper half of our guidance of $2.85 to $2.95 per share.

THOMSON REUTERS

SI-SSA-0015-13075

And on slide 4 we provide you with a reconciliation of operating earnings to net income for the quarter. We've also provided you with information on slide 10 regarding the contribution to operating by business for the quarter.

And slides 11 and 13 contain waterfall charts that take you through the net changes in quarter-over-quarter and year-over-year changes operating earnings by major business. I'll review each Company in more detail starting with PSE&G.

PSE&G reported operating earnings for the fourth quarter of 2015 of $0.31 per share compared to $0.32 per share for the fourth quarter of 2014, and that's shown on slide 15. PSE&G's full-year 2015 operating earnings were $787 million, or $1.55 per share, compared with operating earnings of $725 million or $1.43 per share for 2014, reflecting growth of 8.6%.

PSE&G's earnings for the fourth quarter benefited from a return on its expanded capital program which partially offset the impact of earnings from unseasonably mild weather conditions and an increase in operating expenses. PSE&G's return on an expanded investment in transmission and distribution programs increased quarter over quarter earnings by $0.03 per share.

Mild weather conditions relative to normal and relative to last year reduced electric sales and lowered earnings comparisons by $0.01 per share. Recovery of gas revenue under the weather normalization clause offset the impact on earnings of the abnormally warm weather on sales of gas, and higher expenses including pension, and other items reduced quarter over quarter earnings comparisons by $0.03 per share.

Economic conditions in the service area continue to improve. On a weather normalized basis, gas deliveries are estimated to have increased 2.1% in the quarter and 2.2% for the year. Demand continues to benefit from an improving economy and also from the impact of lower commodity prices on customers' bills.

Electric sales on a weather normalized basis are estimated to have increased by 0.8% and 0.5% for the fourth quarter and for the year, respectively. The estimated year-over-year growth on electric sales is more representative of our long-term expectations for growth.

PSE&G implemented a $146 million increase in transmission revenue under the Company's transmission formula rates for 2016 on January 1. PSE&G's investment in transmission grew to $5.7 billion at the end of 2015, or 43% of the Company's consolidated rate base of $13.4 billion at year end.

As you know, transmission revenues are adjusted each year to reflect an update of data that was estimated in the transmission formula rate filing. The adjustment for 2016, which we will file in mid-2017, will include the impact of the extension of bonus depreciation which was executed after our transmission formula rate filing.

This adjustment will reduce transmission revenue as filed by about $27 million, but we will accrue that for accounting purposes in anticipation of the reduction of revenue as we report our 2016 results.

We are forecasting growth in PSE&G's operating earnings for 2016 to a range of $875 million to $925 million. And the forecast reflects the benefits of continued growth in PSE&G's rate base and a decline in pension expense.

Turning to Power as shown on slide 19, Power reported operating earnings for the fourth quarter of $0.19 per share compared to $0.18 per share a year ago. The results for the quarter brought Power's full-year operating earnings to $653 million or $1.29 per share compared to 2014's operating earnings of $642 million or $1.27 per share.

Power's adjusted EBITDA for the quarter and the year amounted to $235 million and $1.563 billion respectively which compares to adjusted EBITDA quarter of 2014 of $271 million in adjusted EBITDA for the full year of 2014 of $1.584 billion. The earnings release as well as earnings slide and pages 11 and 13 provide you with a detailed analysis of the impact on Power's operating earnings quarter over quarter and year-over-year from changes in revenue and costs.

And we've also provided more detail on generation for the quarter and for the year on slide 21 and 22. Power's operating earnings in the fourth quarter reflect the impact of strong hedging a tight control and operating expenses which offset an anticipated decline in capacity revenue and the impact of unseasonably warm weather on wholesale energy prices.

A decline in capacity revenue associated with the May 2015 retirement of the high energy demand day or HEDD peaking capacity in PJM reduced quarter-over-quarter earning comparisons by $0.04 per share. An increase in average price received on energy hedges coupled with a decline in fuel costs more than offset the impact on earnings from a reduction in gas sales. These two items together netted to a quarter-over-quarter improvement in our earnings of $0.02 per share.

THOMSON REUTERS

SI-SSA-0015-13076

Power's O&M expense for the quarter was unchanged relative to year ago levels. An increase in depreciation expense and other miscellaneous items was more than offset by the absence of a charge in the year ago quarter resulting in a net improvement in quarterly earnings comparisons of $0.03 per share.

Turning to Power's operations, Power's output during the quarter was in line with year ago levels. For the year, output increased 2% to 55.2 terawatt hours from a level of production achieved by the fleet in 2015 represented the second highest level of output in fleet's history as a merchant generator. Both were supported by improvements in the fleet's availability and efficiency.

The nuclear fleet operating leverage capacity factor of 90.4 for the year, producing 30 terawatt hours or 54% of total generation. Efficient commodity cycle gas turbine capacity was rewarded in the market with an increase in dispatch levels and Power's CCGT fleet set a generation record during the year as each of the Lyndon Station and Dublin energy centers set individual records.

Output from the combined cycle fleet grew 11% to 18.4 terawatt hours or 33% of total output during the year. Lower market demand for our coal units reduced output from those stations to 5.8 terawatt hours for the year or 11% of output and lastly the fleet's peaking capacity produced just under one terawatt hour or 2% of output for the year.

Power's gas fired combined cycle fleet continues to benefit from its access to lower price gas supplies Marcellus region. And for the year, gas from the Marcellus supplied 75% of the fuel requirements for the PJM gas-fired assets. This supply supports higher spark spreads than implied by market pricing and allowed Power to enjoy fuel cost savings in the fourth quarter similar to the levels it enjoyed in the year ago quarter despite weak energy prices.

For the full year Power enjoyed positive spreads relative to the market, year-over-year realized spark spreads in 2015 or lower than what was realized in 2014 given the decline in energy prices. Overall Power's gross margin improved slightly to $38.83 per megawatt hour in the fourth quarter versus $37.40 per megawatt hour of the year ago quarter.

For the year Power's gross margin amounted to $42.25 per megawatt hour versus $42.41 per megawatt hour last year. On slide 24 provides detail on Power's gross margins for the quarter and for the year.

Power's expecting output for 2016 to remain unchanged at 54 to 56 terawatt hours. Following the completion of the basic generation service or BGS auction in New Jersey earlier this month, Power has 100% of its 2016 base load generation hedged.

Approximately 70% to 75% of Power's anticipated total production is hedged at an average price of $51 per megawatt hour. And Power has hedged approximately 45% to 55% of its forecast generation of 2017 of 54 to 56 terawatt hours at an average price of $50 per megawatt hour.

Looking forward to 2018, Power's forecasting improvement in output 59 to 61 terawatt hours with the commercial startup in mid-2018 of the Keys and Sewaren stations that Ralph mentioned earlier. Approximately 15% to 20% of 2018's output is hedged at an average price of $54 per megawatt hour and Power assumes PGS volumes will continue to represent approximately 11 to 12 terawatt hours of deliveries. And this number is very consistent with 11.5 terawatt hours of deliveries we saw in 2015 under the BGS contract.

Our average hedged position at this point in time represents a slightly smaller percentage of output hedged versus what you saw a year ago. At that time Power was able to take advantage of market prices influenced by the colder than normal weather conditions of last winter. Average hedge prices include the impact of recently concluded BGS auction and the auction for the three-year period beginning June 1, 2016 and in May 31, 2019 was priced at $96.38 per megawatt hour.

This contract for one-third of the load will replace the 2013 contract for $92.18 per megawatt hour, which expires on May 31, 2016. We do remind you from time to time that there are items included in the average hedged price which influence Power's revenue but don't support Power's gross margin.

Our average hedged price for 2016 of $51 per megawatt hour reflects an increase in the cost of transmission and renewables associated with serving our full requirements hedge obligations. And based on our current hedged position for 2016, each $2 change in spark spreads would impact earnings by about $0.04 per share.

Power's operating earnings for 2016 are forecast to the range of $490 million to $540 million. The forecast reflects adjusted EBITDA of $1.320 billion to $1.4 billion. Forecast reflects a year-over-year decline in capacity revenues associated with the May, 2015 retirement of the HEDD peaking capacity.

Operating earnings for the year will also be influenced by the re-contracting of hedges at lower average prices and a decline in gas sales. And, most of the decline in Power's operating earnings forecast for the full-year 2016 is expected to be experienced in the early part of 2016.

THOMSON REUTERS

SI-SSA-0015-13077

With respect to Enterprise and other, we reported operating earnings in the fourth quarter of $4 million which compares to a loss in operating earnings of $4 million or $0.01 per share for the fourth quarter of 2014, and results for the fourth quarter brought full-year 2015 operating earnings to $36 million or $0.07 per share compared with 2014 operating earnings of $33 million or $0.06 per share. The difference in quarter-over-quarter operating earnings reflects the absence of the prior year tax adjustments as well as other parent related expenses in 2015.

For the year PSE&G Long Island's earnings contribution to $0.02 per share was in line with expectations and looking forward to 2016 operating earnings for PSEG, Enterprise and other are forecast at $60 million.

Next I want to provide an update on our pension. Beginning with 2016 PSE&G has elected to measure service an interest cost for pension and other post retirement benefits by applying the specific spot rates along the yield curve to the plan's liability cash flows rather than the prior use of a single weighted average rate.

We believe the new approach provides a more precise measurement of service and interest costs by aligning the timing of the plan's liability cash flows to the corresponding spot rates in the yield curve. Change does not affect the measurement of the plan obligations. We estimate this change will reduce 2016 pension and OPEB expense by approximately $34 million and $13 million, respectively, net of amounts capitalized, from what would have been without this change.

Of on a year-over-year basis the pension and OPEB expense is expected to decline by $25 million from 2015 level of expense. We ended 2015 with 91% of our pension obligations funded and a minimal need for cash funding of obligations over the next several years.

With respect to our financial condition, it remains strong. We closed 2015 with $394 million of cash on hand and debt representing 43% of our consolidated capital position and debt at Power representing 27% of its capital base. PSEG capital program for the three years ended 2018 is currently expected to approximate $11.5 billion. This represents a 21% increase over the level of capital invested over the prior three-year period, as PSE&G and Power focus on modernizing their infrastructure to meet the needs of today's marketplace.

We have ample capacity to finance our current capital program. In addition, we estimate the change in bonus depreciation is Ralph mentioned will provide an additional $1.7 billion of cash through 2019 with most of this cash received over the three years ending 2018. And of this amount $1.2 billion of the cash will be at PSE&G and $500 million will be at Power.

As mentioned the forecast for double-digit growth in PSE&G's rate base through 2018 does take into account the impact of bonus depreciation on rate base. And we plan to provide an updated five year view of capital spending at the annual conference on March 11.

Regarding earnings for 2016 of $2.80 to $3.00 per share in line with a 2015 operating results as forecast growth that PSE&G onsets the impact of lower energy prices on Power's operating earnings. The Company remains on solid footing and we continue to focus on operational excellence and remain disciplined in our approach to investment strategy and maintain our financial strength.

The common dividend was recently increased 5.1% to the indicative annual level of $1.64 per share and we believe we can provide shareholders with consistent and sustainable growth in the dividend going forward. And with that we are ready to answer your questions.

QUESTION AND ANSWER

Operator

Ladies and gentlemen we will now begin the question and answer session for members of the financial community.

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Morning, Jonathan.

Jonathan Arnold - ***Deutsche Bank - Analyst***

A couple of questions on the change in pension accounting methodology, can you just give -- is this designed to bring you more into line with standard practice or something -- can you just give us some perspective around what drove that change?

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

I think it will probably increasingly look more like standard practice. In applying an interest rate we had normally done a weighted average rate which is across all of the cash flows, and some recent determination has been made that in looking at the yield curve and the timing of your actual payments and the timing of the interest by virtue of the shape of the yield curve, a more accurate method was to apply the near-term interest rates to the near-term cash flows, and the longer-term interest rates to the longer-term cash flows.

So we've been looking at this for a while and in addition to being a more accurate method, I think you'll start to see this more and more in others.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Your sense is that others are not -- haven't adopted this it yet, but you think it will go that way, is that what you're saying?

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Yes, so our intel from talking to our advisors is we're probably somewhere between 30%, 40%, 50% or so of companies are pursuing and a bunch of the others are investigating the same. We've seen some of this from some of the releases that we've seen from others as well.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Okay. And can you give us a sense -- is the change we're seeing in 2016 something that all else equal just persist to 2017, just a change of basis one piece? And secondly, can you pass out the impact to the utility versus Power?

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

On the second piece it's about half and half is the general way to think about it. And with a yield curve that rises over time you will see a moderation of the benefit of this method over time, but remaining positive based upon all the current assumptions in place through the balance of the five-year plan period. It remains positive but declines over time.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Okay, and can I just throw one other topic -- as the Enterprise, the uptick in 2016, is that mostly the Long Island contract?

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

That's correct, John.

THOMSON REUTERS

Jonathan Arnold - ***Deutsche Bank - Analyst***

We missed the answer. Great, thank you.

Operator

Keith Stanley, Wolfe Research.

Keith Stanley - ***Wolfe Research - Analyst***

Hi, good morning. The $11.5 billion of CapEx over 2016 to 2018, if you take 72% of that at the utility, it seems like utility CapEx for 2016 to 2018 is about maybe I don't know, $750 million higher than what you showed in a chart at EEI. Can you just confirm if I'm reading that right and if so in what areas are you investing more money now over the next three years?

Dan Cregg - ***Public Service Enterprise Group - EVP & CFO***

Keith, the answer is you are correct and we will detail not only that, but the full five years on March 11. But it's the same areas we have been. It's largely transmission related and there's an element of Energy Strong in their as well. But we'll give you the details of that as well as any new initiatives that we plan to pursue in the five-year time horizon on March 11.

Keith Stanley - ***Wolfe Research - Analyst***

Okay. And one other one, what ROE are you assuming at the distribution business at PSE&G in 2016 and what ROE did you earn at distribution last year?

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Remember our ROEs are a blend of an allowed base ROE of 10.3 and then a myriad, 14 to be exact, of various programs that we have had approved since then that range from 9.75 to 10.3 but with a couple of them also the beneficiary of investment tax credit in some of the solar programs. So we are earning our allowed return but you have to do some of the parts so to speak of each of those programs.

Keith Stanley - ***Wolfe Research - Analyst***

So netting out some of those programs you earn 10.3 on, call it core distribution last year, and you're just assuming that you're earning precisely your allowed return and that's what you're saying you earned last year?

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

So on the core distribution, yes the 10.3, and on Energy Strong we're going to earn 9.75 and on solar we're going to earn 10, and on energy efficiency we're going to earn 9.75 -- so that's what I'm trying to point out. And because of -- to varying degrees contemporaneous nature of the returns we do stick to those -- we do accomplish those objectives.

Keith Stanley - ***Wolfe Research - Analyst***

Okay, thank you.

THOMSON REUTERS

Operator

Julien Dumoulin-Smith, UBS.

Julien Dumoulin-Smith *- UBS - Analyst*

Hi, good morning, can you hear me?

Ralph Izzo *- Public Service Enterprise Group - Chairman, President & CEO*

Yes, Julien.

Julien Dumoulin-Smith *- UBS - Analyst*

Excellent. So I want to go back a little bit to the latest BGS auction and ask if you could elaborate a little bit on what exactly drove the year-over-year results? And perhaps at least our perception of a reduction in the risk premium -- can you elaborate on the dynamics that you saw?

Dan Cregg *- Public Service Enterprise Group - EVP & CFO*

Some of the bigger pieces, Julien, are fairly transparent from what you can see from a market perspective. I think we saw a little bit of a decline in the energy prices which is kind of where you start as a baseline for the auction. And then probably the couple other areas where you see the biggest change is against that decline is you've seen a bump on the transmission side and you've seen a bump related to some of the green costs that are involved.

You can track the green costs through the New Jersey SRECs and you can track the transmission. In fact, I think the BPU even sends out some of the transmission costs that ultimately get embedded in. And finally the last big piece which is also fairly transparent is the capacity piece and those auctions take place in advance by virtue of their three-year forward market and the BGS three-year forward market take place in advance of the BGS auction, so those are your biggest movers.

There's other pieces obviously in there, there's ancillary and different components, but those are the biggest pieces that you see related to the changes.

Julien Dumoulin-Smith *- UBS - Analyst*

But just coming back -- clearly some of those big changes move in year-over-year but at least from our calculations it seems as if even adjusting for that there might have been a little bit less of a premium there. I'd just be curious.

Dan Cregg *- Public Service Enterprise Group - EVP & CFO*

We don't really talk necessarily about what kind of a premium you would see in a product but I think you can -- most of those pieces are transparent enough that you can build up and see what the elements of them are and I think on balance you're seeing a bit of a decline on the energy side and you're seeing a bit of a roll up coming out in the other direction related to both transmission [and green].

Julien Dumoulin-Smith *- UBS - Analyst*

Got it. Fair enough. Maybe going back to the last question a little bit more about the utility regulatory, how are you thinking about trackers in a post [rate] case scenario as you think about rolling at least the legacy programs in the base rates, et cetera. Can you kind of talk about perhaps what the subsequent [role] might look like?

© 2016 Thomson Reuters. All rights reserved. THOMSON REUTERS

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Sure. While we are pleased with the success we've had, Julien, over these past seven or eight years with these programs, we have been talking to staff about in particular the gas program which clearly has a multi-decade run that it would need to do all of the work that the system requires of it. I'm talking about replacing the cast-iron -- that we'd like to break away from this incremental approach and into more of a long-standing approach if for no other reason that it would be beneficial to develop the infrastructure, primarily people, that one needs to sustain these programs.

So right now the way we run the programs is we work with contractors and we bring in the folks that are needed and we enter into this conversation six months before the program expires. But will we need more? I'm not quite sure. Well, we have to wait until (inaudible). When can you find out? I'll get back to you as soon as possible.

And that's not the way we typically run 110 year old Company. We like to have training programs bringing people in as an apprentice, and have them climb the technical ladder and have a nice long career and that's a much more efficient way to use customer rates.

So I think that program in particular could be a template for the type of ongoing things we want to do. A close second to that as you may recall in Energy Strong we had put forth a ten year plan that got approved for three years and some of the cleaner technologies whether it's solar or energy efficiency that will be needed to meet the state's own renewable portfolio standard or what eventually becomes of CPP and whatever reincarnation that takes. I think all lend themselves to more programmatic and long-standing programs that we can anticipate and rationally equip ourselves to execute.

So those conversations are going on with the Board staff now, and to their credit their response is well, you should have confidence. You've come in 14 times, and 14 times we said yes -- and that's true. So the question is how much of an investment risk are you willing to make in equipment and training programs and people when the yes is pretty much assured, but has different forms -- half the program, half the duration, and maybe three quarters of the run rate. It's a very constructive dialogue right now, to be continued.

Julien Dumoulin-Smith - ***UBS - Analyst***

Great. Thank you so much, guys.

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Thanks, Julien.

Operator

Praful Mehta, Citigroup.

Praful Mehta - ***Citigroup - Analyst***

Hi, guys.

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Morning.

Praful Mehta - ***Citigroup - Analyst***

Morning. My question firstly you guys sit in a very interesting spot where you own all three assets, coal, gas and nuclear, and it's interesting the trends you highlight with gas capacity factors increasing, coal reducing. My question is how are you thinking about asset lives of these three classes of assets given the market conditions you see now? And what does that mean in terms of leverage levels that you're comfortable with for the Power business?

© 2016 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. THOMSON REUTERS

SI-SSA-0015-13082

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

One of the things that is equally important to the fuel diversity of our assets is the technology diversity and performance features of our assets.

So obviously gas, we have some combine cycle gas turbines which are looking more and more like base load. But we also have a pretty robust and healthy peaking fleet and similarly in our coal assets we have Keystone/Conemaugh, which are roughly described as baseload and Hudson, Mercer and Bridgeport stations have become more peaking with Hudson and Mercer having the additional flexibility of being able to run on gas.

So it's not just a question of fuel diversity, it's what part in the dispatch queue the asset can play and whether it starts, stops features and in that respect our diversity serves us well. Now you probably picked up that we would anticipate retiring the Bridgeport Harbor coal unit in five years provided that we are successful at securing the permits for the new combined cycle unit at Bridgeport Harbor which we don't anticipate any difficulties in doing so given the community benefits agreement we've achieved with some important stakeholder groups in Bridgeport.

And I'll let Dan finish up on the leverage at Power but once again our base FFO to debt expectations are 30% and we'll give you more details when we see you in March but we were well north of that prior to bonus depreciation and with bonus depreciation that number has gotten even bigger, but Dan do you want to say anything?

Dan Cregg - ***Public Service Enterprise Group - EVP & CFO***

Yes, the only thing I would add is obviously from a credit perspective Power's FFO to debts are well above the 30% threshold that we have with the rating agencies to hold our existing rating. So that's not something that we get concerned about it all, we have an awful lot of financial strength there. But I think as you do look forward, we will see a shift in fleet and maybe that's kind of what your question is getting at.

We've got three new efficient combined cycle plants and if you look backwards I said in some of my remarks that we have some of our HEDD units. Those were older peaking units that were retired for environmental purposes and they're going to be replaced by new efficient combined cycle clean gas units. So the fleet really will take on a different look into the future and will be more efficient and will have a better profile and be more competitive.

Praful Mehta - ***Citigroup - Analyst***

Got you. So as you see that fleet profile changing are you seeing leverage levels kind of match that in terms of increasing given the quality of the new gas fleet that you're kind of bringing on?

Dan Cregg - ***Public Service Enterprise Group - EVP & CFO***

I think we'll see some leverage increase by virtue of the spend that we will have but I think we will remain well above where we need to from a rating agency perspective. The debt capacity at Power is extremely strong and is expected to remain that way.

And bonus depreciation helps on that side, too. On the Power side of the Business we have the benefits of bonus depreciation without the detriments of any rate base reduction.

Praful Mehta - ***Citigroup - Analyst***

Yes, absolutely, got it. And then secondly it's a more philosophical question. As you think about the fate of Power with the consolidated business, is there at any point of view that this business needs to be a stand-alone entity or do you kind of see this more as part of the consolidated business in the next two, three-year timeframe as well?

THOMSON REUTERS

SI-SSA-0015-13083

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

So as I've said before, I do see over time, you're not going to get me to pick a time frame. I see these businesses separating. The strategic flexibility of both would be enhanced by doing that.

Some of the tactical benefits of keeping them together right now, which is the financial synergy, the financial complement that Power provides to the utility. We've talked about Power's new plants but for the past five years and for the next five years it looks like the utility will be out-spending Power almost three to one, and Power is a great source of equity for that with its funds from operations.

Secondly, the complement that Power and utility provide on the customer bill is a huge advantage to us, and the support cost synergies that exist with the two companies are a big advantage to us as well. But as Power grows in New England, as it grows in New York state and other places, it will need to use its own FFO for investment opportunities and that free cash flow that remains to help utility will be decreased.

There will be more customers that it will be serving outside of the utility's territory so that complementary nature will decrease, and as they both grow, the corporate overhead -- vital functions that corporate support groups provide will be a smaller piece of the overall operating budget. So I think over time the tactical benefits of staying together decrease, and the strategic advantages of separating will increase. But we're not there today. So -- yet again, continue.

Praful Mehta - ***Citigroup - Analyst***

That's really helpful, and I know you're not talking timing but I guess the benchmark or at least the milestones as we look for is those three factors in terms of the strategic benefits and that I guess reduces in terms of the fit then the probability or likelihood of some timing of separation increases. Is that a fair assessment?

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

So a qualified yes to that. There's no magic date. There are a host of parameters one looks at. What are the market dynamics, what's the composition of the shareholder base?

Are there other triggering events that could accelerate one's point of view of what the tactical benefits are now greatly reduced. So I don't mean to be long-winded on it but you ask a very complicated question albeit wrapped in some shroud of simplicity that the Board of Directors looks at on a regular basis. So I'm just giving you kind of a general point of view on that. But it's fraught with detailed analysis on a pretty regular basis by us.

Praful Mehta - ***Citigroup - Analyst***

Got you. Very helpful, thank you so much.

Operator

Michael Lapides, Goldman Sachs.

Michael Lapides - ***Goldman Sachs - Analyst***

Hey, guys, congrats on a good year. A couple of questions and these may be for Dan because some of them are kind of a little bit down in the weeds or in the nitty-gritty.

Can you talk to us about the earnings or EBITDA contribution that maybe Power gets from things like trading or doing some of the optimization as part of the LIPA deal? And can you talk to us about the overall earnings Power you expect to get over time from the broader LIPA O&M services contract?

© 2016 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13084

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

So even though Dan can answer that, I want to point out that I try to pay attention to these things.

Michael Lapides - ***Goldman Sachs - Analyst***

Totally understood, Ralph. (laughter)

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

So Power's trading group is about $0.01 a share for LIPA and all in LIPA is going to grow to about $0.07 or $0.08 so I think the share will be probably closer to $0.05, and then stepping up to $0.07 or $0.08 -- $0.05 or $0.06 the share, closer to $0.07 or $0.08 next year. But Dan, go ahead and tell him I'm wrong.

Dan Cregg - ***Public Service Enterprise Group - EVP & CFO***

Right order of magnitude.

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Order of magnitude? (laughter)

Dan Cregg - ***Public Service Enterprise Group - EVP & CFO***

It will be $0.07 next year across the Enterprise, but there's just a small piece of that call it a $0.01 or so that's at the Power side of the Business where that's coming from.

Michael Lapides - ***Goldman Sachs - Analyst***

Got it. And do you get a significant margin from things like ancillary revenues or ancillary services in New England; just trying to think about the components not just within BGS but within your broader margin at Power?

Dan Cregg - ***Public Service Enterprise Group - EVP & CFO***

I don't have an ancillary number in front of me, Michael, I don't know that we kind of provided the breakdown of all the different components of how Power makes money. Far and away the biggest pieces are your capacity margin and your energy margin. There's a host of different elements that we work our way through as we manage a portfolio as a whole.

I mean if you're kind of talking somewhere in the bucket of $0.05 a share or something like that on ancillaries that's probably an order of magnitude number. But we haven't broken out a lot of the pieces beyond the biggest pieces, which I think gets folks most of the way home. If you look at your capacity margins we're very transparent about that map and provide that within the Investor Relations decks that we end up pulling together and the same with respect to the energy side of the Business.

Michael Lapides - ***Goldman Sachs - Analyst***

Got it. And finally when we think about the combined cycle fleet at Power I mean you've seen a significant uptick in terms of how much they can run.

© 2016 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13085

Just curious from a physical standpoint, what do you think the -- I guess I'll use the word maximum output level. How high do think they can physically run from a capacity factor standpoint versus where they've been running for the last 12 to 24 months?

Dan Cregg - ***Public Service Enterprise Group - EVP & CFO***

I don't think that there is a physical limit to what they can do. I mean they're ultimately going to be taken off-line for maintenance just like any other facility would. But there's nothing that stops those plants from running as long as they are called.

There's not a refueling outage like you'd see a nuclear plant where you have to shut the unit down to refuel it, but periodically there is major maintenance that goes on at these facilities where the unit needs to be worked on. But I think we'll have the advantages as well with the new units that we have of having a kind of clean and new unit that won't have that effect for a period of time when it starts up.

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Don't forget, Michael, we've also had a couple significant improvement programs on our combined cycles. We've improved the gas path which has actually allowed us to stretch out the major maintenance cycles and modestly improve the heat rates.

And I'll double check the numbers, we'll certainly show them in March, but I think our forced outage rates have dropped even while our capacity factors have gone up, which is always a great sign right it just means that we're taking better care of the machines. So they're running at about 65% to 66% capacity factor now. You never want to promise 100% on any mechanical device but I've not picked up from any of our team that they're worried about us overtaxing these units.

Michael Lapides - ***Goldman Sachs - Analyst***

Got it. And then last one, Ralph, just a little curious, your thoughts on the impact if any of the Ohio PPA contracts and what that means for that competitive market dynamics and design in PJM?

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Yes, so it depends on how that's structured. Clearly there was a situation in New Jersey under what we call the old cat law where the statute mandated that winners of those contracts bid at zero and clear the auction and that was just an egregious attempt to crush artificially capacity prices in the region.

So we are participating in an industry group in Ohio to make sure that whatever is agreed upon doesn't artificially move the market in a way that disadvantages participants who don't have the protection of these contracts. I'd like to think that Ohio has been a long-standing supporter of competitive markets and whatever gets structured out there gets structured in that way.

But while I'd like to think that we're going to carefully monitor what actually is decided to maximize the chance that that is indeed what happens.

Michael Lapides - ***Goldman Sachs - Analyst***

Got it. Thanks, Ralph, thanks, Dan. Much appreciated, guys.

Operator

Gregg Orrill, Barclays.

THOMSON REUTERS

SI-SSA-0015-13086

Gregg Orrill - ***Barclays - Analyst***

Thank you. I was wondering if you could revisit the topic of bonus depreciation? I think you said that $1.3 billion at PSE&G and $1.7 billion overall, was that 2015 to 2018, first of all?

Dan Cregg - ***Public Service Enterprise Group - EVP & CFO***

The $1.7 billion is $1.2 billion to the utility and $500 million to Power, and that runs you out through 2019. That comes through 2018.

Gregg Orrill - ***Barclays - Analyst***

Okay. Part of that at the utility you are going to be accruing into the next case, is that generally the way you're going to deal with the bonus depreciation accounting at the utility?

Dan Cregg - ***Public Service Enterprise Group - EVP & CFO***

I think the way to think about it, Greg, is to the extent of transmission, the impact of that will come through on a contemporaneous basis so we will -- while bonus was approved after we filed our formula rate for the 2016 year, we know that it is there and will accrue that from accounting perspective and we will do that true up in future filings. But as we go forward you'll see that true up every year with respect to the transmission piece of the bonus.

Similarly, with elements related to Energy Strong, with elements rated to GSMP, all the clause related updates, will take place as we file those contemporaneous and near contemporaneous filings, and then the balance of what's left which really sits with the base amount or PSE&G that will await the next rate case.

Gregg Orrill - ***Barclays - Analyst***

Got it. Thank you.

Dan Cregg - ***Public Service Enterprise Group - EVP & CFO***

You got it, Greg.

Operator

Travis Miller, Morningstar.

Travis Miller - ***Morningstar - Analyst***

Hi, thank you. I was wondering if you guys look across your entire CapEx program both Power and PSE&G, what parts of that make you most nervous? And either nervous that you would not meet the budget that you've set out or nervous that you wouldn't meet either the allowed returns or the hurdle rates that you set out for those projects?

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

If we're nervous about anything, Travis, we make sure we take action to fix it so that we don't stay nervous, but I know you know that. I guess I'd say the biggest things that we pay attention to are regulatory and environmental mandates that don't add to the return expectations of our shareholders and quite candidly on occasion don't really benefit customers commensurate with the costs that need to be put into it.

© 2016 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13087

But other than that, as you well know, we show up at a lot of places to make acquisitions and to expand our asset base and invariably lose, so I don't think anyone would ever accuse us of being bullish or undisciplined in how we spend our money. And the good news is that most of that environmental spending is behind us.

So we've talked a lot about today -- we're building three combined cycle units and let's make sure we have the team in place to manage those because they're not all within a city block of each other -- we've got one in Maryland, one in New Jersey, one in Connecticut, and I probably spent an hour and half yesterday with our head of fossil talking about what his needs are and how we can make sure that those are met.

So, I'd say in general, it's mandates that don't produce the customer or shareholder benefit that the regulator thinks they do. Fortunately most of those are behind us and to the extent that if we didn't respond to the expanded construction program in Power, I would be nervous about that, but we are responding. And I guess the proof that I put forth for you on that is we have quadrupled in the past five years that transmission program and we've delivered those projects on schedule and on budget.

Travis Miller - ***Morningstar - Analyst***

Okay, that's great, and Ralph, one more. You mentioned the word retail in the past and I was wondering if you could update if that's still in the lexicon?

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Yes. But it remains in the lexicon as a defensive move to help us make sure we can be more effective in managing our basis risk and Keys is going to go a long way to that. It's not a retail play, so there are things we can do other than retail, but we are disciplined and cautious as you know I'm not a big fan of the retail business.

I think everybody falls in love with it in a declining price environment that's typically when you can make a lot of money in retail. It's when prices rise and people are cut short for whatever reason that life isn't quite so pleasant. So we would look at it purely as a small part of our output purely for defensive purposes and managing basis risks and we're still looking at that and working on that.

Travis Miller - ***Morningstar - Analyst***

Great, thanks so much.

Operator

Stephen Byrd, Morgan Stanley.

Stephen Byrd - ***Morgan Stanley - Analyst***

Hi, good morning.

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Good morning, Stephen.

Stephen Byrd - ***Morgan Stanley - Analyst***

I wondered if you could lay out what the year end rate base was for transmission and then for the utility overall?

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

I don't have that number.

THOMSON REUTERS

Dan Cregg - ***Public Service Enterprise Group - EVP & CFO***

I think 13.4 is the number we provided for utility and I think 43% of that was transmission.

Stephen Byrd - ***Morgan Stanley - Analyst***

Got it. Thank you very much. And on solar you've been continuing to grow there; how do you see sort of the overall market opportunity there, ability to achieve further growth in solar?

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Stephen we've seen -- as I think you're aware we have carved out for ourselves kind of a modest sized portfolio, really it's the 250 megawatts-dc I think consist of 14 or 15 projects. These things range in size from like 5 megawatts to 50 megawatts and many more closer to 5 than to 50, and we have very rigid return expectations. They are supported by 25 to 30 year PPAs and they meet those return expectations.

Generally those returns are not available in some of the larger projects and we've developed a couple partners who are really good about bringing us opportunities that they know we can execute on. So, they are willing to work with us.

I do see that continuing to grow. It's mostly driven by state RPSs and I don't think we have baked in a number in terms of what size that will be. So when we talk about our capital program there isn't a dollar of those projects in there, yet if I look back over the past three or four years we're pretty consistently doing anywhere from $100 million to $200 million of those projects.

Stephen Byrd - ***Morgan Stanley - Analyst***

Great. Thank you very much.

Operator

I'm sorry, please go ahead.

Kathleen Lally - ***Public Service Enterprise Group - VP of IR***

I was going to say I think that brings us to the end. I'm going to turn the call back over to Ralph at this time.

Ralph Izzo - ***Public Service Enterprise Group - Chairman, President & CEO***

Thanks, Kathleen. So looking forward to seeing you all hopefully in two weeks. But really, I hope there are three key points you take away from what Dan and I talked about today.

First of all we are generally excited about Power's positioning. We've long had low-cost nuclear and we've had a pretty good highly efficient combined cycle fleet, but in three years we're going to have just an outstanding, highly efficient combined cycle fleet. And all of our assets are going to be well-positioned, and I mean well-positioned in a broader sense of the word.

They'll be near load, they'll be clean, they'll be diverse fleet and we'll continue to look at opportunities to improve upon that fleet, but you really should recognize that we've talked for a long time now about these three new units and I don't foresee any circumstances at present that would suggest any additional new build on the horizon for us.

SI-SSA-0015-13089

The second point is the utility growth continues. We average 13% growth over the last five years and if you just take our 15 results in the midpoint of the utility guidance for 2016, we're going to grow at 14%. And yet utility bills will go down yet again this year because of the expiration of some charges.

The utility will represent [60%] of earnings at the midpoint and it's doing stuff that is very important to customers and we'll just continue marching along that path. So we had a good year is the final point, and I think you'll find that when we get together on March 11 that the next five years look even better. So I look forward to explaining that further when we see you in New York. Thanks, everyone.

Operator

Ladies and gentlemen that does conclude your conference call for today. You may now disconnect, and thank you for participating.

PSEG ANNOUNCES 2015 RESULTS

$3.30 NET INCOME PER SHARE

Operating Earnings of $2.91 Per Share At Upper Half Of Guidance Of $2.85 - $2.95 Per Share

Company Provides 2016 Guidance of $2.80 - $3.00 Per Share

Common Dividend Increased 5.1%

(February 19, 2016 – Newark, NJ) Public Service Enterprise Group (PSEG) reported today 2015 Net Income of $1,679 million or $3.30 per share as compared to Net Income of $1,518 million, or $2.99 per share for 2014. Operating Earnings for the year 2015 were $1,476 million or $2.91 per share compared to 2014 Operating Earnings of $1,400 million or $2.76 per share.

PSEG also reported Net Income for the fourth quarter of 2015 of $309 million, or $0.60 per share. This compares to fourth quarter 2014 Net Income of $476 million, or $0.94 per share. Operating Earnings for the fourth quarter of 2015 were $255 million, or $0.50 per share compared to fourth quarter 2014 Operating Earnings of $247 million, or $0.49 per share.

“We are very pleased with our strong results in 2015 with operating earnings for the full year at the upper half of our increased guidance” said Ralph Izzo, chairman, president and chief executive officer. “Our results reflect excellent performance and organic growth at the utility. With our strong balance sheet, we are in a position to increase our investment across the company to meet the needs of our customers and shareholders. The Board’s recent decision to increase the common dividend by 5.1% to the indicative annual level of $1.64 per share is an expression of confidence in our outlook, the continued growth of our regulated business and an acknowledgment of our strong financial condition.”

PSEG believes that the non-GAAP financial measure of “Operating Earnings” provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends. Operating Earnings exclude the impact of gains/(losses) associated with Nuclear Decommissioning Trust (NDT) investments and Mark-To-Market (MTM) accounting as well as other material one-time items. The table below provides a reconciliation of PSEG’s Net Income to Operating Earnings (a non-GAAP measure) for the full year and fourth quarter. See Attachment 12 for a complete list of items excluded from Net Income in the determination of Operating Earnings.

Ralph Izzo went on to say, “Continued successful deployment of strong free cash flow into customer-oriented regulated investment programs is expected to support 14% growth in PSE&G’s earnings which will increase the utility’s earnings to 60% of Enterprise’s 2016 operating earnings. Results for 2016 are forecast at $2.80 - $3.00 per share.”

The following table outlines PSEG’s 2015 operating earnings by subsidiary and expectations for 2016.

E = Estimate A= Actual

Operating Earnings Review and Outlook by Operating Subsidiary

See Attachments 6 and 7 for detail regarding the quarter-over-quarter and year-over-year earnings reconciliations for each of PSEG's businesses.

PSE&G

PSE&G reported operating earnings of $156 million ($0.31 per share) for the fourth quarter bringing full year operating earnings to $787 million ($1.55 per share). On a comparative basis, PSE&G reported operating earnings of $160 million ($0.32 per share) and $725 million ($1.43 per share) for the fourth quarter and full year 2014, respectively.

PSE&G's earnings in the fourth quarter benefited from a return on the continued expansion of its investment in transmission and distribution infrastructure which partially offset the impact on earnings of unseasonably mild weather and an increase in operating expenses. For the full year, PSE&G's management of operations and an expanded capital program allowed it to earn its authorized return on rate base.

PSE&G's return on an expanded investment in transmission and distribution programs increased quarter-over-quarter earnings by $0.03 per share. Mild weather conditions relative to normal, and to last year, reduced electric sales and lowered earnings comparisons by $0.01 per share. Recovery of gas revenue under the weather normalization clause offset the impact of the abnormally warm weather on the earnings effect of lower sales of gas. Higher expenses, including pension, and other items, reduced quarter-over-quarter earnings comparisons by $0.03 per share.

Economic conditions in the service area continue to improve. On a weather-normalized basis, gas deliveries are estimated to have increased 2.1% in the quarter and 2.2% for the year. Demand continues to benefit from an improving economy and also from the impact of lower commodity prices on customers' bills. Electric sales, on a weather-normalized basis, are estimated to have increased by 0.8% and 0.5% for the fourth quarter and the year respectively. The estimated year-over-year growth in electric sales is more indicative of our long-term expectations for growth.

PSE&G implemented a $146 million increase in revenue under the company's transmission formula rate on January 1, 2016. Transmission revenues are adjusted each year to reflect an update of data that was estimated in the transmission formula rate filing. The adjustment for 2016 will include the impact of the extension of bonus depreciation which would reduce our revenue increase as filed by $27 million. PSE&G's investment in transmission grew in 2015 to $5.7 billion at year-end, or 43% of the company's consolidated rate base of $13.4 billion at the end of the year.

PSE&G's operating earnings for 2016 are forecast at $875 million - $925 million.

PSEG Power

PSEG Power reported operating earnings of $95 million ($0.19 per share) for the fourth quarter of 2015 and Adjusted EBITDA of $235 million bringing full year operating

earnings to $653 million ($1.29 per share) and Adjusted EBITDA to $1,563 million. Net Income for the quarter and the full year were $149 million and $856 million respectively. On a comparative basis, PSEG Power reported operating earnings of $91 million ($0.18 per share) and Adjusted EBITDA of $271 million for the fourth quarter of 2014 and operating earnings of $642 million ($1.27 per share) and Adjusted EBITDA of $1,584 million for the full year 2014. Net Income in the fourth quarter of 2014 and the full year 2014 were $320 million and $760 million respectively.

PSEG believes that the non-GAAP financial measure of "Adjusted EBITDA" is useful in evaluating Power's operating performance because it provides investors with additional information to compare our business performance to other companies and to understand performance trends.

Adjusted EBITDA excludes the same items as our Operating Earnings measure, as well as income tax expense and interest expense, depreciation and amortization and major maintenance at Power's fossil generation facilities. See Attachment 12 for a complete list of items excluded from Net Income in the determination of Adjusted EBITDA.

Power's results for the fourth quarter reflect the impact of strong hedging and tight control of operating expenses which offset an anticipated decline in capacity revenue, and the impact of unseasonably warm weather on wholesale energy prices.

A decline in capacity revenues associated with the May 2015 retirement of peaking capacity in PJM reduced quarter-over-quarter earnings comparisons by $0.04 per share. An increase in the average price received on energy hedges coupled with a decline in fuel costs more than offset the impact on earnings of a reduction in gas sales netting to a quarter-over-quarter improvement in earnings of $0.02 per share. Power's O&M expense in the quarter was unchanged relative to year-ago levels. An increase in depreciation expense and miscellaneous items was more than offset by the absence of a charge in the year-ago quarter resulting in a net improvement in quarterly earnings comparisons of $0.03 per share.

Output during the quarter was in-line with year ago levels. For the year, output increased 2% to 55.2 TWh, as improvements in availability and efficiency supported growth. The nuclear fleet operated at an average capacity factor of 90.4% for the year, producing 30 TWh (54% of generation). Efficient combined cycle gas turbine capacity (CCGT) was rewarded in the market with an increase in dispatch levels. Power's CCGT fleet set a generation record during the year as the Linden Station and Bethlehem Energy Center set individual records. Output from the CCGT fleet grew 11% to 18.4 TWh (33% of total output) during the year. Lower market demand for our coal units reduced output from those stations to 5.8 TWh for the year (11% of total output) as the fleet's peaking capacity produced 1.0 TWh (2% of total output).

Power is expecting output for 2016 to remain unchanged at 54 – 56 TWh. Following completion of the Basic Generation Service (BGS) auction in New Jersey in February 2016, Power enters the year with 100% of its 2016 baseload generation hedged. Approximately 70% - 75% of anticipated annual production is hedged at an average

price of $51 per MWh. Power has hedged approximately 45% - 55% of its forecast generation in 2017 of 54 – 56 TWh at an average price of $50 per MWh. For 2018, Power has hedged 15% - 20% of forecast production of 59 – 61 TWh at an average price of $54 per MWh. Power assumes BGS volumes will represent approximately 11 – 12 TWh in each of 2016 and 2017 – consistent with 11.5 TWh of deliveries in 2015 under the BGS contract.

The forecast improvement in output for 2018 reflects the commercial start-up in mid-2018 of 1300 MWs of new gas-fired combined cycle capacity at the Keys and Sewaren stations.

PSEG Power cleared a new 485-MW clean, natural gas-fired combined cycle power plant at its existing Bridgeport Harbor Station site. The unit, which represents an investment of more than $550 million, is targeted to be in operation in June 2019.

Power's operating earnings for 2016 are forecast at $490 million - $540 million. The forecast for operating earnings equates to estimated adjusted EBITDA for 2016 of $1,320 million - $1,400 million.

PSEG Enterprise/Other

PSEG Enterprise/Other reported operating earnings for the fourth quarter of 2015 of $4 million compared to an operating earnings loss of $4 million ($0.01 per share) for the fourth quarter of 2014. The results for the fourth quarter brought operating earnings for the full year 2015 for PSEG Enterprise/Other to $36 million ($0.07 per share) versus Operating Earnings in 2014 of $33 million ($0.06 per share).

The difference in operating earnings results quarter-over-quarter primarily reflects the absence of prior year tax adjustments and other items in the fourth quarter of 2014 as well as other Parent related expenses in 2015. For the year, PSEG Long Island contributed $0.02 per share to earnings, in line with expectations.

For 2016, operating earnings for PSEG Enterprise/Other are forecast to be $60 million.

Capital Expenditures

PSEG currently plans to invest approximately $11.5 billion over 2016 – 2018 on capital programs at both PSE&G and PSEG Power. The planned investment program represents a 21% increase over the $9.5 billion invested over the prior three-year period and is expected to be invested in PSE&G (72%) and PSEG Power (27%).

Pension Expense

PSEG, at the end of 2015, changed the approach used to measure service and interest costs for pension and other post-retirement benefits. For 2016, PSEG has elected to measure service and interest costs by applying the specific spot rates along the yield curve to the plans' liability cash flows. This change does not affect the measurement of the plan obligations. PSEG estimates this change will reduce 2016 pension and OPEB

expense by approximately $34 million and $13 million respectively, net of amounts capitalized. On a year-over-year basis, pension expense is expected to decline by $25 million from 2015's level of expense.

Forward Looking Statements

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in Item 1A. Risk Factors, Item 7. Management's Discussion and Analysis of Financial Condition and Results of Operations (MD&A), Item 8. Financial Statements and Supplementary Data—Note 12. Commitments and Contingent Liabilities, and other factors discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or ongoing low pricing of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulations, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators, including prudency reviews and disallowances,
- any deterioration in our credit quality or the credit quality of our counterparties,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations or increase the cost of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- delays or unforeseen cost escalations in our construction and development activities, or the inability to recover the carrying amount of our assets,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- increases in competition in energy supply markets as well as for transmission projects,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies,
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,

- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- an extended economic recession,
- an inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce, and
- changes in the credit quality and the ability of lessees to meet their obligations under our domestic leveraged leases.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

PRESENTATION

Kathleen Lally ***- Public Service Enterprise Group Incorporated - VP of IR***

Good morning, everyone. Good morning. I'll give you a few more extra minutes this morning from our 8 AM start time due to the inclement weather. It's good to see that you were all able to make it in despite the weather. We very much appreciate that effort.

I am Kathleen Lally, Vice President of Investor Relations for Public Service Enterprise Group, and welcome you to our annual financial conference. This is our eighth, I believe -- at least since I've been VP of Investor Relations. And we have a full morning for you.

And what we intend to do -- attempt to do every year is provide you with a very thorough review of our overall corporate strategy and then a review by each major business with the senior business leaders here to present and answer your questions. The intent is to be over by noon.

Ralph Izzo, Chairman, President and CEO, will start out the day. Following Ralph will be Ralph LaRossa, President and Chief Operating Officer of Public Service Electric & Gas. And after Ralph LaRossa's presentation there will be time for Q&A of Ralph LaRossa. And following Q&A there will be a short break.

And after that break we will have the power team present to you; that will be Bill Levis, President and Chief Operating Officer for PSEG Power, followed by Shahid Malik, President of Energy Resources and Trade. Following their presentations there will be time for Q&A of Bill and Shahid.

At the conclusion of that Q&A session Caroline Dorsa, Executive Vice President and Chief Financial Officer, will provide you with the overall view of the Company's financial status. And then following Caroline's presentation there will be further time for Q&A of both Ralph Izzo and Caroline and, of course, any other questions that you have at that time of anyone from the firm in the audience. We hope to conclude by noon today.

So with that I'm going to turn the podium over to Ralph Izzo, Chairman, President and CEO.

Ralph Izzo ***- Public Service Enterprise Group Incorporated - Chairman, President & CEO***

THOMSON REUTERS

Good morning, everyone, and thank you, Kathleen. So let's see here -- I should have checked this earlier. Kathleen left me with the forward-looking statements and the GAAP disclaimer which I won't read.

So many of you I am sure are aware that there are all kinds of studies that have been done about an audience's ability to pay attention. So a four hour meeting probably strains credibility in that regard. So I'm going to ask you to hang with me for four facts and that is what you are going to hear about over the next four hours.

Fact number one, the utility story remains intact. We are going to talk about double-digit rate based growth for the next five years. We're going to talk about a capital program that is at least 10% or probably 20% bigger than the previous five years.

Fact number two, power continues to demonstrate its ability to not only make money, but to generate substantial amounts of free cash flow whether you are in a low gas environment, a high gas environment, a summer dominated environment, a winter dominated environment and we believe, and we will explain why that it is particularly well-positioned in the future CP, capacity performance, market.

Fact number three, we've sizably increased the dividend and we believe this is a sustainable rate of dividend growth that we can deliver.

Fact number four, a 10% to 20% bigger capital program, strong performance of power, an increased dividend and our balance sheet today is stronger than it was a year ago with even better credit metrics and the ability to expand all of the numbers I just recited even further.

Okay, the meeting is adjourned (laughter). All kidding aside, there will be a quiz later on to make sure that all those four facts were understood as a result of the presentations that follow.

So, as is often the case we begin by giving credit to our engaged workforce, our employees. Were it not for the 12,000 of them we would not be able to operate the system -- and by system I obviously mean the electric system, the gas system, the power plants -- reliably and safely and cost-effectively. Bill and Ralph and Caroline will all show you our O&M forecast as well as our O&M performance and I'm quite proud of both of them.

That approach to operations produces a financial outcome that yields the kind of dividend growth we've talked about, the dividend track record that we have, as well as the ability to invest in a very, very robust pipeline. And over the past three years we've been able to do that in a way that we have grown our earnings per share and we've been able to actually change the business mix, and we will talk more about that later on as well.

We now have what I believe is a best-in-class utility growth story with ongoing upside from power markets that may or may not be changes in power markets that are predicted perfectly by the forward price curve, but in terms of temporal changes in power markets that we are able to take advantage of because of the diversity of our assets.

A slide you have seen in the past, but the important number here is to look at the rate base growth that is forecasted now for five years. In the past when we have talked about rate based growth and earnings growth we've talked about a three-year horizon and this year we are telling you that our rate base growth is double-digit for five years.

We will still only give rough guidance on the utility earnings for three years just because of the greater uncertainty around load growth and expense changes over a five-year period.

But the $11 billion infrastructure program is, for the next five years, to be compared with a $10 billion infrastructure program in the previous five years. And an announcement that we are making today that you should have summarized in the release that could fairly easily take that $11 billion to $12 billion due to some gas infrastructure replacement work.

On PSEG Power, of the 20 to 25 words there the word is diverse. Five years ago we were talking about the margins in our coal units and our nuclear units. Today we talk about the margins in our gas units and our nuclear units and the strength of our gas contract infrastructure.

Five years ago we would have talked about the importance of the third quarter and summer performance. Today all the focus is on the first quarter and winter performance.

Five years ago we would have wondered whether or not there would be an LCAPP and what MOPR would do. And now we are eagerly awaiting capacity performance and the diversity and strength of our fleet to do well in that kind of a capacity market.

THOMSON REUTERS

SI-SSA-0015-13112

So there are many ways that I believe we've been delivering on commitments and realizing growth. PSE&G once again, it is almost a routine, 13th year in a row as the number one utility in the Mid-Atlantic region for reliability. Power this year, record output from the combined cycle units and I think a second all-time high out of the Hope Creek unit. Had some challenges at Salem to be sure, we're not hiding from that.

Quite strong performance on PSEG Long Island, earned a full $0.03, demonstrated a very high level of capability in terms of transitioning from one operator to another. And then the cost-cutting benefits that throughout PSEG continued in terms of our O&M growth.

Our earnings performance exceeded guidance. We have strong cash flows yet again; Caroline will show you the numbers in terms of our credit metrics, they are quite strong. And we were able to increase the dividend almost by a factor of -- well, by a factor of 2 in terms of cents per share and almost by a factor of 2 in terms of percentage.

The transmission program, north of $2 billion a year, is on schedule and on budget and continues to demonstrate a need for additional projects, the largest one, one that we announced last year that we can talk further about today is one that goes from the Bergen area through the Linden corridor.

Energy Strong is underway primarily in the engineering phase on the electric side, real work taking place on the gas side in terms of pipe replacement, which is why we have filed for an expansion of that program today because we think the Energy Strong gas component will be complete early in 2016.

An energy efficiency program that I will talk about in some great length later on, but right now I will simply mention that that $100 million program, we have achieved an agreement with the staff in principal, it is being papered this week and we would hope to see that in the BPU agenda in the not too distant future. So very good news to report on energy efficiency.

Power is also busy with its growth program. As you know, we are a 10% owner of the PennEast pipeline, a 1 Bcf a day proposal coming out of the southeastern Marcellus region and our solar source team continues to add 10 and 12 megawatts at a time now with over 120 megawatts DC and close to $300 million on the books.

So the result of those activities has been a slow but steady digging out of the 2012 low point in terms of our earnings and, as you can see here, the business mix shifting decidedly towards the utility as that has continued to grow its earnings by double-digits since 2010.

If I just take a look at the last five years of overall corporate investment and the next five years of corporate investment, at the top line it is not a big difference, $12.6 billion compared to $13 billion.

But once one looks inside the pie what you see is a continuation of the rebalancing of the portfolio that took place over the past five years is expected to continue over the next five years. PSE&G going from $9.8 billion to $10.8 billion, Power going from $2.7 billion to $2 billion over those two respective five-year time frames. So once again, further shifting towards regulated investment as we move forward.

That transformation of the business mix over the last four years was done nonetheless with a strong balance sheet that got ever stronger even in a low power price environment while increasing the dividend. And we have every expectation to be able to continue to do that over the coming five years.

The $16 billion that went towards investments in dividends, one doesn't have to do a lot of rocket science to just take a look at what our current investment portfolio is for the next five years, look at the current dividend, apply some assumptions to the words sustainable growth in that dividend to see that the next five years will be well north of that $16 billion figure -- even while not accounting for the that $1.3 billion in the gas modernization program and the fact that Caroline will show you some statistics that suggest ample, ample -- more than ample dry powder.

So now let's take a look at each subsidiary in turn. So for PSE&G over the past five years using 2009 as a base, 18% compound annual growth year over year in that $10 billion program. And when the bottom -- when the denominator gets bigger the earnings get larger, of course the percentages change, it is just simple arithmetic.

So the 10% to 20% compound -- the 10% to 20% increase in the capital program will not yield an 18% compound growth rate in the earnings of the Company, it is just simple arithmetic. However, the other factor to point out on this slide is the growth in the transmission element of PSE&G now achieving almost 40% and headed towards closer to 50% in the three-year time frame.

THOMSON REUTERS

SI-SSA-0015-13113

What is significant about that is that, as you know, we are under a FERC formula rate for transmission so there is little to no regulatory lag in the annual true up. In fact, either Caroline or Ralph will show a chart I think or two that has about 70% of our utility capital investment is done with some type of contemporaneous recovery mechanism, either formula rates or BPU -- BPU regulated clause recovery.

So that was the past five years. There is something I want to spend a little time here because it is something that we pay a great, great deal of attention to. That is a bit of an eye chart, but what we are showing here on the left are electric rate -- electric bills and on the right gas bills.

Now this is for a typical residential customer and nothing changes over the timeframe. So we don't assume in 2008 a customer used 1,000 kilowatt hours a month and in 2016 they use 500 kilowatt hours a month. So this is a steady usage pattern of customers on both sides of the page and that will come back to be important in just a moment.

And what you can see is that without suppressing the zero the excursions of the electric bill are very, very modest. The largest reason for that of course has been the decline in electric supply costs while electric delivery costs have gone up. Investment in the infrastructure produces reliability benefits, but they do need to be paid for and I am quite proud of the policymakers and the regulators and New Jersey's willingness to have us make those investments.

This is an aging infrastructure, PSE&G's regulated growth story is not driven by load growth, it is driven by an aging infrastructure that needs to be made more reliable and more resilient. So keeping those electric bills reasonably flat on the left-hand side while growing earnings at 18% was no small feat, it was largely driven by those two counteracting forces and good cost control on the part of Ralph LaRossa and his team.

But what is equally if not more important is that 90% of PSE&G customers are combination electric and gas customers and there I'd ask you to take a look at the right side of this slide. We have lowered gas bills by over 40% in that same timeframe so that the combined bill of the customer is down 23% over that timeframe and that does not account for over $400 in bill credits that have taken place at various points in time over the past four-year period.

So earnings have been growing at 18% per year over the last five years and over an eight-year period bills are down 23%. It doesn't get better than that in terms of customer and shareholder shared benefits.

Now as we look to the future, the $11 billion program is in blue, the $12 billion program has the lighter shaded components built on top. The two lighter shaded components amount to about $1.3 billion of additional spend, $1.1 billion of that being the gas program in the current planning period; so the $1.6 billion is a five-year planning program -- a five-year program. It is about $300 million a year if I am not mistaken.

And then the additional $200 million on top of that piece is Artificial Island. So transmission by 2019 is over 50% of the rate base, as I mentioned a moment ago.

Now through 2017 I believe we will continue to have the customer benefits of low gas prices and we will have the additional customer benefit of removal of certain charges that were put on the bill back around 2000 to facilitate the transition to a deregulated power supply business.

So through 2017 we're going to continue to have this dynamic where we'll be able to significantly -- significantly invest in the delivery part of the infrastructure and have little to any impact on the customer bill. In fact, more than likely possible declines in the customer bill if the current gas environment continues. But I don't want anyone to take that to the bank; certainly minimal impact on the customer bill through 2017.

The issue arises that the need to invest in the infrastructure doesn't end in 2017 and that continues. Our strategy on doing more beyond 2017 is built around that previous slide and the caveat I gave you a moment ago. Throughout this slide what is consistent is volume. What we need to do going forward after 2017 is change the volume.

The importance of the discussions we are having with the BPU staff on energy efficiency is not about the penny per share that results from every $100 million we invest at PSEG. The importance of that conversation is that I believe we've achieved a very sane regulatory outcome with the staff where we argue that we needed to be guaranteed the loss recovery on our distribution business of revenues -- the recovery of lost revenue on our distribution business.

At first the staff's position was not to do that, but I believe we've achieved a meeting of the minds whereby the tariff would be structured that would allow us the opportunity if the program is administered efficiently to earn that lost revenue.

THOMSON REUTERS

SI-SSA-0015-13114

I won't go any further now because the settlement is still in the final stages and I am sure there are some details that the parties wouldn't want fully disclosed at this point. But that is a substantial breakthrough in terms of philosophy from my point of view. No, it doesn't guarantee us the lost revenue, but it gives us the chance to operate in a way to achieve that lost revenue.

Now why does that matter? It matters for two reasons. Number one, as we invest heavily in that distribution and transmission infrastructure it will allow us to target the most vulnerable customer populations in terms of the bill impacts to make sure that those bill impacts are mitigated through energy efficiency. That will be critically important in continuing the kind of successful track record we have had over the past eight years.

And equally important, the second reason, it opens up a whole new area of rate base for us, an area that benefits the customer, an area that benefits the environment and an area that we believe can bring value to the shareholder.

So the value of the energy efficiency program as a change in perspective is probably more important than the $100 million size of the program. And with successful implementation of that I can assure you, you will see us doing much, much more of that particularly as we look past 2017 and the absence of the tailwinds on the customer bills.

So now let me turn my attention to PSEG Power, and here Power's fleet just continues to perform. In energy markets low natural gas prices, our contract infrastructure has just combined with our combined cycle units, our Bergen, our Linden units to achieve phenomenal results.

The Bergen units achieved records last year; one of the Linden units achieved a record last year. As a result we are expanding those units by close to 160 megawatts through advanced gas path technology enhancements.

Capacity markets, as we take a look at the changes that are anticipated to come out of FERC in the early part of April, at least that have been proposed by PJM, play right into the strength of our nuclear units, our combined cycle units both with very, very low forced outage rates.

And the fact that we have a robust fleet that can always backfill should the current rules be accepted whereby a unit doesn't perform on those rare occasions that the slack can be picked up by other units that perhaps don't clear that market.

If we look at environmental regulations from an air point of view, all of our units are ready for 2015 and beyond. And then would you look at the location, yes, we do not see the $15 and $20 basis differentials consistently of the past. However, we still see positive basis differential but it has changed.

If anyone takes a look at the forward price curve and believes that they can simply garner a $3.00 to $4.00 basis differential every day for the year, that is not the way the system operates. The system is borderline insane in the wintertime.

Shahid Malik and his team and Bill Levis and his team do a fabulous job of capturing $100 basis differentials for a couple of hours in the winter, watching that go away, partially negative in the shoulder months and slightly positive in the summer.

But it is the diversity and strength of this fleet that allows us and our hedging approach and our ability to start assets and stop assets. It allows us to benefit from the dynamic of the market and the volatility inherent in what is now a gas market that becomes tight in winter months due to the heating load demands.

So changes in market rules we believe we will continue to play to power strength. We don't have a one size -- we don't have a single dimension to our fleet, we have the ability to perform well in the capacity market as demand response has greater challenges imposed upon it, as the hold back provision of RPM is removed and as we see increasing emphasis at FERC on energy price formation. And a decreased reliance I believe in the future on simple uplift payments to meet the needs of very narrow load pockets.

Notwithstanding the growth at the utility, Power has taken every opportunity it can to continue to tuck-in a few megawatts here and there and those few megawatts add up to hundreds of megawatts over time, whether it is in the solar side, whether it is peaking units at New Haven and Kearny or whether it is the advanced gas retrofit or whether it is the 300 megawatts at our nuclear units that have taken place over the past five years.

So when you combine that story from the utility and Power what it allows for -- product continuation of over 100 years of paying that dividend and a departure from the prior five years of a 2.5% growth rate to 1 that eclipses 5% this year.

THOMSON REUTERS

SI-SSA-0015-13115

And the message we are sending you is that, unlike the period of 2010 to 2011 when we had a step change in that dividend to reset, we believe that this dividend growth rate is sustainable given what we know about current power markets and the utility growth program. We do not commit to a specific number; we simply believe that we have the potential here for consistent and sustainable growth in this dividend as shown here.

Okay, so the focus for each business doesn't change from year to year. Our nuclear assets have a 60-year wife expectation and we hope one day to be able to tell you about an 80-year life expectation. It does not make sense with assets like that to come in and change one strategy every three months on a quarterly call or every year at an investor conference.

So the utility is all about a $2.4 billion annual capital program, executing that on schedule, on time and making sure that those investments meet the reliability needs of the customer. Doing that while controlling costs and making sure that we continue a strong and constructive partnership with our regulators, our environmental regulators, our state economic regulators and our federal economic regulators.

And we will continue to look for incremental growth opportunities that are consistent with state policy as espoused in the energy master plan and with services that we believe our customers will value.

At PSEG Power the units have to be available when called upon to run. It is as simple as that. And then our commercial operations need to make sure that they understand which units need to be running when to take advantage of the dynamics in the market. And then of course over the longer term to make sure that we are participating in any growth opportunities and development of market rules.

We will continue executing on Long Island. The $0.03 last year should grow to about $0.07 or $0.08 by 2016 as we take over greater and greater responsibility for managing that system in accordance with the existing contract, nothing new there.

So I'm going to turn this over to Ralph LaRossa in a second, but I'm just going to do one last review before the final exam. Fact number one, the utility growth story remains intact. 10% to 20% increase in capital program in the next five years versus the last five years.

Number two, Power's fuel diversity, its technology diversity, its location, its environmental footprint allows it to be a strong winner in all manner of markets -- summer dominated, winter dominated, low gas, high gas, and now looking to the future, a more robust performance market as it pertains to capacity.

Number three, strong growth in the dividend that we believe we have the opportunity to maintain consistently and sustainably over the future.

And number four, with all of that the balance sheet has never been stronger, the credit metrics have never been stronger and there is room for more. With that, Ralph, you are up.

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company***

Thanks, Ralph. So I am going to start off a little bit by borrowing from both Ralph and Bill Levis. Bill has said in the prior years here more of the same. I think you are going to see that from the utility this year, just more of the same -- a little bit more but a lot of the same.

And from Ralph's standpoint, I think what I really wanted to touch on was the fact that we are building on exactly what he said earlier, which is that value proposition. We just want to be a well-run utility focused on operational excellence and that continues to grow based upon aligning ourselves with the public policy.

And you will see that all of our programs that we've executed on, those that we continue to execute on and those we hope to execute on in the future are all aligned with that public policy that we have spoken about in the past.

As Ralph said, it all starts with our employees. We've talked about the circle a number of different times in the prior years here and I will just continue that discussion today. Our employees have executed very well, both in New Jersey and in Long Island. But specifically in New Jersey the team has worked really well over the past several years.

THOMSON REUTERS

SI-SSA-0015-13116

And as a result of that effort that they have made on a continuous basis they've really been rewarded by customers with some solid recognition which I will touch on a little bit. That solid recognition has turned into an earnings growth story that supported by, again, those public policymakers who allow us to continue to invest.

And as a result of those -- of that good financial outcome we continue to pour back into the system both in traditional and maybe less and less traditional ways.

So you have seen this slide many times in the past, but again, for maybe anybody who doesn't know much about our service territory, just draw a straight line between that George Washington Bridge and the Ben Franklin Bridge, pack in 2.2 million people, about 30 miles on each side of that line and you have our service territory in New Jersey.

It hasn't changed much, load growth has been relatively flat between zero and 1% and that we project to continue in the future. The one load growth that is not mentioned on here but that you have seen in other publications is specifically from PJM. And where they see that our peak load over the next 10 years will be about a 0.6% increase year over year. So you put that altogether and it is between 0.5% and 1% depending upon the different commodity that we are supplying.

We have continued to execute also on our renewables and energy efficiency programs. I think that is really important and we will touch on that a little bit, again aligns with that public policy that is so important in the state of New Jersey.

But let me go back to operational excellence. Our employees -- well, we've been recognized, as Ralph said, for 13 years with the Mid-Atlantic award for most reliable utility.

I think it's days like yesterday that probably make us the most proud. Maybe it didn't seem like a big weather event from an electrical standpoint or from a gas standpoint. But we had seven cast-iron mains break yesterday that we repaired. We had a number of outages throughout our service territory driven by tracking across different assets that we have and we had electrical failures as a result.

And those employees responded on an on-time basis, responded very well, very safely and throughout all of that, if you monitor our Twitter account as we go through, you will see that we had more compliments than we did negative reactions from customers. On a day like yesterday very important for us.

And we try to build on that day in and day out rather than just having the big wins on some of the big events that we have had. And as a result of that, we are very proud to say we've been recognized by J.D. Power in both the electric and gas businesses, the best customer service for large business customers in the East.

So I think we are not 100% positive of this, but we are pretty sure that we are the first utility to win that award at the same time from both the gas and the electric side. We are still double checking a few facts on that. But just a good recognition of the work that we have done.

And while that has been going on on the large customer basis, we have also shown some very big improvements on the residential side of our business and we hope to see the results of the J.D. Power survey that is coming out in the first half of 2015.

That has resulted in that steady and predictable performance that Ralph mentioned earlier. Again, all driven by making investments where it matters from a public policy standpoint. Take us back to 2009 and you followed that growth all the way through and it is that over -- about approximately 18% growth in the earnings of the utility.

Where does that come from? Well, it has really been the investment in our capital programs. A lot of rebuild and some new build that has taken place specifically in the transmission side of our business.

You can see on the left-hand side that is where we were in 2010 to 2014, what we have executed on. And if you look forward what is really important is that is going to continue as we go into the 2015 to 2019 timeframe.

What you see up here does not include any investment in Artificial Island, does not include any investment in the gas modernization that you have in front of you, the press release, this is exactly what is known at this point and what we are planning to execute upon. I will give you a little more detail about those other programs as we go forward in the presentation.

THOMSON REUTERS

So let's start off with the transmission and some of the large projects that we have done. Last year Kim Hanemann, who is here with us today, walked you through a lot of the details as to what we have been working on and what we have accomplished. The good news is there is a lot completed, the bad news is that means Kim doesn't need to come up here and go over the details of that in any level of detail.

And really what we are proud to show you is that we have completed two of our major projects, two of the five that we started out with, the North-Central reliability project and our Burlington Camden project in the southern part of the state. Those projects are effectively completed.

We have two programs that -- one that will be completed and two that will be partially complete this year. That is that southern -- the Mickelton Gloucester line and then that Northeast Grid Reliability Project.

On the Susquehanna Roseland line we are ready to go. Most of our work is completed going out through Pennsylvania. We just need to make the connection as soon as PPL finishes their portion of the project through the national park out at -- in the Shawnee area right by the Delaware Water Gap.

We also have a robust group of projects that we are planning to go ahead with for the remainder of the next five years. It goes into two major categories, one is a very large project called Bergen Linden, 345 project, which will be building out our transmission along the eastern portion of our service territory from the north to the south. That project is underway and I will go into a little bit of detail on that. And then we also have our large RTEP program, 69 kV programs and so on which will balance out that portfolio on the transmission side.

I will start with the Bergen Linden corridor. Any of you that may travel through Bergen County and come into New York City through Hoboken, you will see this project ongoing right next to our Hudson generating station, that is our Marion substation. What you see there is a pile installation that we started in the spring time.

I happened to take that train line this past Saturday and the project is well along -- well past that. The transformer is in place. A lot of our temporary transformers are in place and the project is continuing on schedule and on budget. A lot of permitting that is going to be required there, a lot through the Meadowlands area and, again, a lot of it is -- while a little bit complicated is on schedule and plans to meet all of our targets.

Talk a little bit about some of the other details in our transmissions. PJM continues to assign different RTEP projects, regional transmission expansion projects, for us. Those projects are all in our plan and continue on process.

Our 69 kV system upgrades that we have done in coordination with the Board of Public Utilities where we are moving some of our 26 kV projects into the 69 grid, those projects are continuing. Transmission lifecycle projects where we are replacing a number of our different assets, specifically our underground cables which are beyond our useful life and some of our larger transformers, those projects are ongoing.

And then we are going to continue to work on transmission hardening to build the resiliency into the grid. Last year I spoke a little bit about the work that we had ongoing at Sewaren switching station and the efforts that we had in place there.

Sewaren switching station was the area where we were under a lot of water as a result of the SuperStorm Sandy efforts. And it just really epitomized for us the efforts that were needed to raise our substations and switching stations.

That transmission project in Sewaren is completed and is in service right now. And we continue to do that along the entire coast where we were impacted by SuperStorm Sandy and that hardening will continue to progress over the next four or five years.

So in addition to the transmission side of the business we have also done a lot of work in the distribution side, both through the normal process of pipes and wires, but also in the energy efficiency and renewable side.

If you look back over the last -- since 2008 in the timeline that is there, we spent over $2 billion on projects within our distribution footprint, about $700 million in solar on the renewable side, $300 million in energy efficiency programs, about $700 million in our electric distribution infrastructure and about $450 million in our gas distribution infrastructure.

THOMSON REUTERS

SI-SSA-0015-13118

Those are projects above and beyond our base capital that have all had contemporaneous returns because all of those efforts were aligned with public policy that was important to the state of New Jersey. We also have ongoing right now about another $1 billion worth of investments, again, aligned with that public policy that is so important to the state of New Jersey.

About $185 million ongoing in solar. Ralph mentioned the fact that we have reached the tentative settlement with -- the settlement in principle with the Board of Public Utilities on the energy efficiency which will translate into about another $95 million in addition to about $5 million that we have left in energy efficiency. We have about $500 million left to go on our Energy Strong work and electric delivery and about $300 million in the gas delivery side.

So putting that altogether, quite a bit. And then if you fast forward to where we think we are going to be and the additional work that you have that we discussed a little bit in the press release, about $1.6 billion worth of additional gas distribution work that we see in the next five years going forward.

So let me take a little bit of time and go through each one of those individual programs. First I will touch on the Energy Strong and where we are. It is broken up into about six different categories which you have in front of you and the spend that we have.

What I wanted to really focus on was the right hand side of this page, which is what we have executed on in just the first year. $150 million worth of work that was completed in 2014.

If you recall, the settlement that we reached with the Board of Public Utilities was about halfway through the year. So to get that much work completed in the time frame that we had was quite an effort that was made by a number of folks in our organization.

The biggest amount of money that was spent was on the gas distribution side. And again, if you look at the details there, a lot of that is driven by it is a much simpler, much more easy to execute project than we have had on the electric side.

The electric business, you have to order the equipment, you have to make sure you have all your permits and you have to bring all that equipment in before you start to make the installations. The gas business is basically taking some pipe and making sure that we have folks available to start to install that pipe and make the connections at the customer's homes.

So were able to execute on that very quickly and that is what gives us the confidence that we will be able to execute on the gas modernization program that we have and that we've proposed to the state and filed today.

A little detail about what has been completed in each one of these areas. We have begun work on 16 of the substations that were in the flooded areas, 29 of them are ongoing through engineering work and design. We have worked on a lot of our overhead system, both from a reconfiguration standpoint as well as from different relay protection schemes that we've put in place.

Those projects have been prioritized based upon input that we've received from basically our large customer support group and a lot of our important customers such as hospitals and police stations and municipal buildings as well.

The gas work that I mentioned about 110 miles have been completed, 5,300 services have been repaired. That is not just doing the work in the street but all 5,300 of those services that were completed involved us going into customers' homes, changing out meters and making sure that we upgraded that pressure as we went along the way.

And a little bit of work that's been done on our gas meter and regulating areas, but that work will begin just like the electric system, it takes a little bit of time for us to order the equipment to have it in place. So good progress being made in Energy Strong. It is all on schedule, on budget and great execution work by our team in the fields as we have mentioned in the past.

I will switch over to the Energy Efficiency program. Ralph mentioned that we have reached that agreement in principle. I will say that the agreement comes out with a 9.75% ROE, that is the one area that we've -- I feel pretty confident getting into that level of detail.

The rest of the settlement I wouldn't go into a lot of detail because we are still working out where we are actually going to spend some of those funds and where it is going to be. So whether we put $10 million into the hospital program, $15 million into the hospital program and so on and so forth,

THOMSON REUTERS

SI-SSA-0015-13119

that is a level of detail that we are working out. And to give you a timeline, I would expect it to be on a BPUs agenda in the next two months or so, not in the upcoming meeting.

The filing that you have in front of you on gas modernization, take a little bit of time to explain to you what the -- sanity between -- about why we filed the way that we did. First of all, our cast-iron and bare steel system in New Jersey is aging.

We currently have about a 100-year replacement program for our facilities. This filing will take us down to a 30-year replacement for our gas infrastructure on an ongoing basis. So we'd be able to complete all of our cast-iron and bare steel in 30 years if we were to adopt a program of this size spending about $300 million a year.

We came up with about $300 million a year because we thought that that was about what we can physically get completed in any given year. Somewhere between $300 million to $500 million is possible depending upon the size of the mains, the exact infrastructure that is being replaced.

But the ability for us to execute on a program of that size is really driven by whether or not we have the workforce. And the certainty in the workforce is going to be driven by the length of the program. So we've put in place a filing that we have a five-year program so that we can get the certainty for our own employees, but also for the contractors that work for us, so that we can execute on the program on a long-term.

The only constraint that we currently have is whether or not there is enough people to operate a machine in New Jersey. Machine operators are at a premium, laborers are at a premium. It sounds a little bit crazy with the job market the way it is, but that is the facts. There's just not a lot of folks that are in that business right now. And the more certainty that we provide to them and to the unions that supply those workers the better it is going to be which is why we put the program in place for five years.

So we think that when you look at from a public policy standpoint, reductions in methane emissions, when you look at an aging infrastructure that needs to be replaced, and when you look at certainty in the workforce, this is completely aligned with everything from a public policy standpoint in New Jersey and, again, executes on what we have done in the past.

The other open item from us from a capital standpoint is additional transmission work. I mentioned earlier in the program that -- the pie charts that I showed you earlier did not include artificial islands as well as the gas infrastructure. The Artificial Island program is about $200 million of additional transmission if we were able to be successful in that bid that we made.

As many of you know, we have put in a filing contesting that process at the FERC, questioning some of the steps that have been taken by PJM. We did that in advance of the decisions being made simply to make sure that the rules are right. It is extremely important for us to make sure that the FERC Order 1000 rules are implemented effectively and in a manner that we can execute on if we choose to bid on other projects.

We have become a qualified transmission developer in the MISO region. We have an application that has been deemed complete in the NYISO region so we can continue to execute potentially in the New York State area. And we obviously have been executing transmission projects in PJM outside our footprint such as Susquehanna Roseland.

PJM has had three open windows so far. The first open window, all of the projects that we had that were identified have been canceled because of generation retirements and other topology changes that have happened in the system.

The second open window, we were awarded to projects that were around $20 million, both of those projects are embedded in the other transmission work that I mentioned to you. But that $20 million of additional transmission is a small amount, but was -- all those projects are on our footprint. All of the other incumbent transmission owners received and were awarded the projects on their footprints.

They have just -- PJM just recently closed another open window, it is a little longer-term window looking at potential projects that are out 15 to 20 years. And we put in bids on all those projects just this past Friday and we will see where that goes.

But again, I think that it's such a long time frame from that open window and with the changes in the topology on the generation I'm not sure exactly when they will be awarding those projects even if they will do that in the next two to three years.

But we have put in all those bids and why it is real important for us to make sure that that process stays consistent and that is why we put the complaint that we did into FERC, not to complain about where we were in the selection process but simply to get those rules right.

THOMSON REUTERS

So you put those pieces together and that is what our capital program looks like from 2015 to 2019, you see nice growth there from $9.8 billion to $12.1 billion. That $12.1 billion greater than the $10 billion that you saw in the earlier slide driven by the gas system modernization program as well as the Artificial Island. So if we were able to get those two additional capital expenditures that is what our programs will look like over the upcoming five years.

While we have made these investments on the capital side of our business, we've also controlled our costs on the O&M side. A lot of great work that has been done by Caroline's team and all of the folks that work on our pensions to continue to keep those costs in check. You see the results of that in a lot of the lines and the bar charts that are exemplified on a chart there.

But overall our business has been able to manage those O&M costs to less than 1% growth, actually 0.3% growth over that timeframe from 2009 to 2015. So a really good story there driven by, again, a lot of great work that has been done on our pension programs and our other pension and employee benefit obligations.

Put together the capital and the O&M and you get the earnings that we have had since 2009 in our projection for our 2015 guidance, which is between $735 million and $775 million of earnings for this upcoming year. So a pretty straightforward story driven by continuous investment in our capital programs, focus on operational excellence, and continued execution of those programs that we have identified.

I will switch my hat for just a little bit here and talk about Long Island. Ralph mentioned the good work that has been done. Dave Daly is here who is leading our organization in Long Island. Dave and his team have done an absolutely fantastic job of executing a change out in management, taking over the operating agreement from National Grid.

I think their efforts have been outstanding, the improvements that they've made in their J.D. Power scores have been outstanding, and the feedback that we've received from our single customer, which is truly LIPA in Long Island, has been very positive.

If you were to ask the other 1.1 million customers I think you would also find out that it has been very positive. We have done some things that have been a little bit different. We have trimmed trees that haven't been trimmed in the past. We've upgraded systems that haven't been upgraded in the past.

And all of those efforts have turned out and resulted in better customer satisfaction led by the implementation of our outage management system which, while it hasn't been tested fully yet, has performed very well in the small storms like we had yesterday.

So that is the story for us in the utility -- continued growth in New Jersey, continued execution in Long Island and all driven by some just really great people that are doing a great job day in and day out. So questions. Yes.

QUESTION AND ANSWER

Paul Fremont, Nexus Asset Management

If you were to compare the 2014 to 2018 spend that you outlined last year and sort of overlay for the same time period what the equivalent spend would be over the same period this year, could you give us a comparator in terms of how much that spend has changed with and without sort of your proposed spending on the gas system upgrade?

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company***

Is that a one year that you are looking for?

Paul Fremont, Nexus Asset Management

Like a four year.

THOMSON REUTERS

SI-SSA-0015-13121

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company***

Yes I think it's -- well, if you really look at the chart that we provided, which is the past four years and the prior four years, I will take you back to -- I guess it is on page 27. That is probably the best indication of where we have been and where we are going without the gas infrastructure. Is there any more detail that you would --?

Paul Fremont, Nexus Asset Management

I was just hoping for sort of the total capital spend that you had elaborated last year over sort of the equivalent four years that overlap versus the spending that you are proposing at today's meeting.

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company***

Yes, I mean we could probably give you some different timelines in there. But this is the best way to --.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

(Inaudible) five years to the future five years there is growth in it, as I said before, 10% to 20%.

Dan Eggers, Credit Suisse

So, Ralph, I guess the first question is the gas main replacement cycle going from 100 years to 30 years. Some of those pipes have more life than 30 years probably. And then what do you think is the right ultimate balance of what is the replacement cycle of those assets over time?

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company***

So -- yes, it is a great question. We believe the best thing to do for all of our gas pipes is to focus on the small diameter cast-iron and specifically with the higher pressures. We have been able to remove from our system just about all the high-pressure up through 6-inch cast-iron. We have a little bit of 8-inch cast-iron left, but it starts to build on the high pressure after 12-inch size.

The reason for that is really simple, cast iron mains were driven with different wall thicknesses -- as you get to a larger diameter main you have a larger wall thickness that's built in. So we've focused on that, we will continue to focus on the high-pressure.

Then you start to talk about utilization pressure which is less than 1 pound of pressure that is in the individual pipes. I would tell you that we've seen a lot of breaks in the 4-inch and 6-inch low-pressure cast-iron so when you look at our inventory we will focus there.

When you get to the 36-inch low-pressure cast iron like those that pipes that are actually outside of our headquarters building in Newark, those pipes could probably last for quite some time and they will be at the back end of the replacement cycle.

But we will always monitor that. We take a look at our inventory on a regular basis. We plot every single one of our breaks. And then we also look across the system to see if there is a vintage issue or a size issue that is starting to pop up and we are getting to the end of the life of any one of those particular assets.

THOMSON REUTERS

Dan Eggers, Credit Suisse

And I guess one other question just on the O&M cost inflation 0.3% for the last I guess six years now. What is the outlook from here? I mean obviously pension has helped some of the things, but if you think about go forward how should that inflation play out?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

So we don't really forecast any of the O&M size. I mean Caroline is going to touch on that a little bit in her deck. But I think our goal is to continue to keep that as flat as possible. It ties right back into the chart that Ralph made at the beginning which talks a lot about the customer bill. So we're going to continue to focus on keeping that as flat as possible. But the core operations, because of the focus on the CapEx, has been relatively flat.

Leslie Rich, JP Morgan

Of the transmission projects that you list on page 29, are those all approved? All this RTEP and 69 kV?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

Yes, so, I think the way to think about that is they are approved for those that can be approved. Some of those projects are such as the lifecycle projects are projects that we've identified. There is two categories within our transmission work if you look at an RTEP project, one is the baseline project and one is the supplemental project.

I would say that if you wanted to look at what was, quote, approved, those were all the baseline projects. Some of the supplemental projects you get approval as you go and there is reviews in the annual true up for each one of the formula rate filings that we have made.

So the projects such as the 69 kV, we have gone through the New Jersey Board of Public Utilities. We have said we are going to move this 26 kV line from sub transmission to transmission. They have agreed with that concept, we go execute on it and then it is rolled into the formula rates on an annual basis. Some of the lifecycle ones are reviewed each year as we go through.

Leslie Rich, JP Morgan

And then on the gas infrastructure spending, Energy Strong had a component that was gas infrastructure. So does the new plan that you proposed today -- is on top of that and what is the appetite of New Jersey for a spending program of this magnitude?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

As Ralph mentioned in his upfront, to get the Energy Strong port -- the gas portion of Energy Strong we expect to be completed in the beginning of 2016. The desire of many policymakers in the state is to continue that program so we reduce that 100-year replacement cycle to the 30-year replacement cycle.

I think the question will be the length of the program as we look forward. I think that has been consistent if you looked at a number of the different filings that we have made. What is different about this is really trying to attract the workforce. And I know that the President of BPU is very concerned about the workforce, trying to create some certainty there. So we again have tried to align this program with that.

I think the other thing that you will see in the filing that we have made to make it more of the same, we have filed for a 9.75% ROE, we are not trying to re-create the wheel on the ROE that we have put in place for the filing, we just want to work with the Board to make this a smooth transition of -- actually as a continuation of what we have done during Energy Strong.

THOMSON REUTERS

Ashar Khan, Visium Asset Management

I guess you guys have done a great job with the expansion and investment. Does acquisition have a role in PSE&G as you look forward in this five-year cycle? I guess the slide back shows the Company having a $6 billion capacity to acquire stuff. So is that a role as you look around you guys? is acquisition a part of building PSE&G in the next five years?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

I think there is a guy in the room with one more stripe than me that could probably answer that question for you and he will answer it the same way he always does. But I would tell you that we've tried to, again, I think just look at the work that Dave and his team have done out in Long Island and said that we are ready if an opportunity pops up.

Michael Lapides *- Goldman Sachs - Analyst*

Hey, Ralph, Michael Lapides of Goldman Sachs. We have seen in a lot of the other RTOs a wave starting in New England but migrating over to the Midwest ISO and then the Southwest Power Pool of FERC 206 cases challenging authorized ROEs.

Just curious when you meet with customer groups, customer advocates, other interveners or potential interveners whether you think an RTO wide or a specific New Jersey only challenge to the FERC transmission ROEs could come over the next year or so. And how you think about your earnings sensitivity to, I don't know, every 25 or 50 basis points in authorized ROEs on transmission.

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

So Caroline has an actual slide right in her deck that talks right about those increases on a percentage basis, I will let her answer that as she is going. More generically to any ROE challenges, I think it is really conversation about where interest rates are going.

And if you look at the timing of a lot of the complaints that have come in in the past it is more as those interest rates were continuing to drop. We stabilized and a lot of folks would look at the futures and say that interest rates are coming back up so I am not sure whether or not that timing makes sense.

But when we meet with customer groups it is something that is on their mind from a standpoint of just keeping the bills flat and, again, the story that we have if you look at our total bill -- our total bills have stayed flat over the year. So our conversations are mostly around a bill, not around any individual ROE for an asset.

Paul Fremont, Nexus Asset Management

On the call I think you guys had talked about a possible delay in the 2017 rate case filing. When you talk about delay, is that just into later in that year and also --?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

Yes. So I will be real careful about that. We absolutely did not say anything about a delay on the call and I went back and read exactly what the boss said a few times. And he did not say anything about a delay, it was just whether or not the timing of the window from which we were going to -- the test year period, when that was actually going to fall on.

So whether it is going to be a 3 and 9, a 2 and 8, a 6 and 6 I don't know but the timeline of the months of what we're going to look at is really what Ralph was referring to, not that there would be a delay. We are very comfortable with having a rate case in 2017 and we also want to be very cognizant of the impacts on the customer bills as we go forward.

THOMSON REUTERS

Julien Dumoulin Smith - UBS

Hey, good morning back here. First question, you talk about expanding the energy efficiency in principle. And while I appreciate you can't talk about the details too precisely, can you elaborate just as you broadly think about peak demand load growth? You talked about 0.6%, but kind of extrapolating and taking down and incorporating the elements in the energy efficiency program what do you see that number trending towards?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

Yes, so, the number that we have in here takes into account what we think we are going to see on energy efficiency. The PJM number, if you go into the details on their website actually has separate tables about demand response and energy efficiency, so you can see what they think will happen in each one of the different zones.

So I don't necessarily think that a lot of the work that we are doing here is focused on dropping peak demand, it is trying to reduce the overall usage for a customer so their total bill goes down.

Julien Dumoulin Smith - UBS

Got it. And then I suppose throwing a Long Island question your way -- what is your reaction to I suppose REV? At least we got some initial indications last week. What kinds of opportunities does Public Service see both specifically within PS Long Island or some other subsidiaries to take advantage of that?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

So, there is nothing in our plan that talks about any additional CapEx for Long Island or any additional investment or earnings. What is in the plan is just the OSA, the core OSA. There may be some opportunities for pieces around the edges I would say, for lack of a better term, some opportunities to earn for putting programs in place, some additional fees that we might be able to get as part of the REV.

But I think that the policy makers in New York are being very careful to work with the incumbent utilities, staying focused there and then we will see what opportunities result from those conversations.

Julien Dumoulin Smith - UBS

But, to be clear, it seems relatively immaterial in terms of the grand scheme of things --.

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

Around the edges.

Julien Dumoulin Smith - UBS

Okay, great. Thank you.

THOMSON REUTERS

Steve Fleishman – Wolfe Research

Yes, Ralph, just all the transmission projects that you listed, are those all included in your capital plan and your kind of high-single-digit earnings target, etc.?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

Yes, every one of those projects. So the first five that we've been talking about for a number of years, they are in there up to the date that the work is completed obviously and then that large BLC project was also included.

Steve Fleishman – Wolfe Research

How about the ones below that one though?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

They are included in that same -- in that pie chart.

Steve Fleishman – Wolfe Research

And then on the -- and then just to clarify the gas modernization program is not included in that plan --?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

Not included in the forecast because obviously that work wouldn't start until 2016. But on that last pie chart we tried to give you an idea about what the total CapEx would be with that in there.

Steve Fleishman – Wolfe Research

Okay, thanks.

Kathleen Lally *- Public Service Enterprise Group Incorporated - VP of IR*

Any other questions? Andy. This will be the last.

Unidentified Audience Member

THOMSON REUTERS

SI-SSA-0015-13126

Andy Levi – Avon Capital

Hi, good morning. Just two quick questions. Just as far as the state of New Jersey, or maybe even PSE&G, what do you think needs to be done to attract more business to the state and technology businesses, whatever it may be, to try to kind of bring some top line (multiple speakers).

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

I will turn my hat around again.

Andy Levi – Avon Capital

(Multiple speakers) top-line growth? And then the second question just on the actual rate case that you discussed, what is the opportunity like the energy efficiency program to ultimately as it gets closer to possibly settle it before making a full filing?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President & COO, Public Service Electric and Gas Company*

Sure. So let me first talk about economic development in New Jersey. Just -- this is my own opinion, this has nothing to do with -- from a company standpoint. I think we need to focus on a few core industries. And we are having conversations around that.

I do a little work on a volunteer basis with Choose New Jersey, which is part of the economic development work that the Governor has put in place. And I think those -- you will see us focus a little more on the ports, a little more on healthcare and a little more on higher ed in New Jersey as three real pockets of industry growth. But to be determined.

I think the biggest win for us as a company, a win for the state and a win for the Transportation Trust Fund in New Jersey is to focus on the ports. But we could talk off-line about that.

From a rate case standpoint, I think if you look at the track record, other than the JCP&L rate case in New Jersey most cases settle. We will approach that as we get a little bit closer.

Ralph Izzo *- Public Service Enterprise Group Incorporated - Chairman, President & CEO*

Thanks, Ralph. I just want to give one Paul one clarification -- he's gone. So Paul asked the question of what was the 2015 through 2018 four-year period CapEx overlap. So what we are showing here for 2015 through 2018 is $365 million more than what we showed last year. And if you include Artificial Island and gas it is $1.35 billion more.

And Steve asked the question about the high-single-digit earnings growth. Remember, that is using 2014 as the base year. So it includes the growth to 2015, which we have given here and then 2016 and 2017.

Kathleen Lally *- Public Service Enterprise Group Incorporated - VP of IR*

Any other questions? We do have time. If not we will move to a short break. We'll be back here at about -- just before 9:30. Thank you very much, everyone.

(Break in progress).

THOMSON REUTERS

Bill Levis *- Public Service Enterprise Group Incorporated - President & COO, PSEG Power*

Well, good morning and welcome back. As I like to kid with Ralph LaRossa, all this transmission talk is great, but it is not worth much of you don't have an electron to put on it. And that is what we do in our business is we create those electrons that finishes that second half of the puzzle to keep the lights on for folks.

Starting off this slide much like the others and just wanted to let you know this is more than just a slogan, a logo or a cartoon, that we do live this each and every day. I had the experience recently to listen to an all hands meeting at our nuclear plants. And I listened to one of my officers talk about 2014, the year in review, and he went through each piece there of disciplined investment, operational excellence, financial strength, engaged workforce.

So it did my heart well to know that this does penetrate the organization and is a guidepost for how it is that we make decisions each and every day. And for Power, as you see, that strategy translates itself into a simple excellence in operating our units safely, reliably, cost competitively and in an environmentally responsible manner.

And those aren't words we just say. In fact, we get measured on that each and every day and our incentive comp is based on how we do in that area, myself all the way through the rest of the organization.

So how is it that we do create value? And there's a couple of key words there. You heard Ralph talk about diversity. I would add to that flexibility. I often get asked -- what is the most challenging thing in your business? And I respond simply that it is our ability to respond to change and the pace at which we do that.

Which is why we need an engaged workforce because we want the workforce to move with us and not necessarily try to slow us down when change is necessary. And so, we do that in our organization because of the ability of our people and then the assets that we currently have.

So if you start on the left and you see about nuclear units have performed well for 10 consecutive years. Ralph eluded to our extended outage that we had at Salem last year. The criticism for me in that particular case is that we should have been ready to execute that outage sooner, not the actual work itself that was done.

Our folks did some heroic work actually repairing four reactor cooling pumps and 63 days, transporting them at various places across the country and doing that job safely. We should have been prepared for it ahead of time, however. And that we were not.

So we had an 89.3% capacity factor in Nuclear. The interesting item, the Salem unit that was impacted last year, it had its record generation year in 2013. So while that unit was down some other units stepped up as a result of that. Hope Creek had its second best year ever, record generation from three of our combined cycle plants and our combined cycle fleet.

And a little note on there about some peaking plants that I want to talk a little bit more about later that are becoming more and more important in my mind as the grid also changes around us.

So at the end of the day this is about delivering on our commitments, delivering on our priorities in the operational excellence area. We have had some learnings in our trading organization in the last year and we have taken that model to that group with more detailed processes and benchmarking and some other activities that we have done in the rest of the Power organization that makes us better.

In the disciplined investment area we have completed the work at Linden, and, if you recall, we actually moved our schedule around and brought that work forward. You see the word 63 megawatts an awful lot and the only caveat I put that at 63 megawatts is at 94 degrees and certain humidity conditions in the summer.

And if you think a little bit about how gas units work and compressors work, that means in the wintertime they do better than that. But that is essentially the minimum that needs to be put out to satisfy capacity market requirements.

We will finish the work at Bergen Unit 2 this year and at our BEC unit in 2017 and 2018. You heard Ralph also talk about the solar source portfolio increasing and it has been doing that at a steady pace for the last number of years now.

THOMSON REUTERS

SI-SSA-0015-13128

We did start managing the LIPA contract this year and Shahid's organization -- he will talk a little bit more about that. What that means for us is we gain additional expertise in understanding how to dispatch units into the New York marketplace and also how to get fuel to those units. And in this day and age when we are fighting to get not only gas but oil different places that learning is really invaluable.

And you see this note about nuclear early site permit and many wonder why we would do something like that and it is once again about optionality and flexibility for the future. I am not sure what the new rules of 111-D are going to bring, but certainly if they work out the way I think they should nuclear has got to play an important role in that and there could be an edge to having that early site permit and being ready to go there.

But there has been one other important aspect that has been helpful to us in our business, it gets us a seat at the table with the regulator to talk about rules of the future. And getting those rules in the future can then roll over to rules in the present and we've seen that specifically in some of the Fukushima areas and in particular the flooding analysis where we were early out there and helped shape where the regulations were going in that area.

So every year brings its challenges and certainly 2014 brought them too. If your remember it wasn't too long ago we talked about SuperStorm Sandy and what it did to our assets and it impacted us significantly and we were still recovering from that last year.

The word polar vortex became part of my vocabulary last year and certainly the cold weather brought some challenges to our plants that weren't designed to operate in those kinds of condition, so we learned a number of lessons from that.

In the marketplace transmission build up and the like put more pressure on basis, lower gas cost impacted our prices and obviously load impacted by the economy again. All that being said, we got the units back from the storm, the units were available when they were needed and flexibility we were able to capture in real time.

So what is this year's challenge? I think it is called the Siberian Express now. I am not sure what next year's will be. My point is there's challenges on every front, they go by different names and titles, but for us it is still about operational excellence and having these units available no matter what may come our way.

So the result of all that -- if you looked at where we were last year and said, okay, what should our earnings be? You see the range of $550 million to $610 million, that assumes what I call normal conditions going forward.

And where did we end up? Essentially $60 million over that and that extra value, that extra 10% was gained in those areas that you see where we responded to weather, we responded to basis volatility where it existed, we were able to flexibly switch fuel sources and have access to lower gas cost and the like.

So I will talk a little bit more about that, but if you think about it, that's 10% value that our folks were able to apply over existing market conditions at the time.

So just a reminder of where our assets are and we use this word -- there's a couple of important points in here, one is three competitive markets. So we have the ability to learn from each marketplace its strength and its weaknesses and where we can take those learnings and try to apply them to the other organizations.

And two is we are near load centers. And what does that mean? That means there will always be volatility because you can't predict what it is that will happen, whether a transmission line goes out, a generating unit trips, gas compressor fails in some area, wherever there is load there is the opportunity for volatility.

And we continue to see that and I will show you a slide a little bit more where I will tell you the volatility is getting greater and not lesser as we have been going on here.

We are in good shape for CP going forward and after this high energy demand day rules go into effect which happens this year. Our fleet is actually more efficient, more environmentally friendly and still diverse with respect to fuel types and plant types. And maintain the possibility to expand our sites in all of them.

THOMSON REUTERS

SI-SSA-0015-13129

In fact we're going through a pilot program now where we are essentially having an old unit demolished at zero cost because the vendor doing it thinks they can make money on the salvage. So we we're going to see if that works and take that going forward to get all our sites ready for future expansion.

So just a reminder of where our plants are on the dispatch curve. So on the left there, which I would say is light blue -- I'm not sure how my wife would describe it. If you've seen the argument on the blue and black and yellow and white gold dress business -- created some conversation at my house anyway.

But our baseload units essentially -- those are the things that allow us to pay the bills. So we generate about 54 terawatts of energy on an annual basis, 34 of those terawatts come from our baseload units. And that is our nuclear units and our share of ownership in Keystone and Conemaugh.

In the middle are mid-merit units, you see that is 18 terawatts of energy. And on the right-hand side the peaking plants, it is about 2 terawatts of energy. And if you had this curve available from last year you would notice that it has been clipped and that clip is essentially the high energy demand day units that will be gone after the middle of this year, so about 1,500 megawatts worth.

So when I talk about the baseload units make our money, the mid-merit units and the peaking units is where we take advantage of volatility in the changing marketplace. Because of the flexibility that they offer they allow us to respond to changing conditions rather rapidly.

And a couple of points you see on the bottom, the dual fuel capability exists at 87% of those units currently. So the ability to swap fuel is real and we do that all the time. And once again, the note about being ready for capacity performance and Shahid will talk a little bit about that when he talks a little bit later.

So this represents our fleet basically pre- and post-HEDD and a couple of points to note, fuel diversity still maintained, you just get that by looking at the various colors that are available in 2014 and 2017. Environmental and heat rate profiles I'll show you in a minute improve and also includes a couple of uprates, that is the Peach Bottom uprate and the advanced gas path uprate.

So at the end you see less capacity available; however, what you see is more energy generated and that energy that is being generated is done cheaper because of better heat rates and more efficient units and also the better environmental profile.

Specifically it looks like this for the improvement and heat rate in the environment. So you can see 7% improvement in fleet heat rate from 10.1 to 9.4 and a 20% improvement in the environmental profile from 0.8 to 0.64 for SOx and NOx emissions. Those numbers go on top of what was already a fleet that was among the cleanest in the industry. And you can see where we were in 2014 and the previous slight just adds onto that continuing improving trend.

So you see the footnote at the bottom about mercury reduction also and there is another important bullet there about efficient testing and improved operational flexibility and just a simple example of how operational excellence can play out in this particular area.

So we have to do a number of tests at our fossil units on an annual basis and a five-year basis. And we were finding we had to do many of those tests off costs because it took so many hours to complete that, meaning that we were actually costing us money to run these units because they weren't economic at the time.

So the organization undertook an initiative to let's understand the basis for the test, understand how we could be more efficient and accomplish them. Let's talk with the regulator about how many we need to do and how often and how could we do them better.

The end result of all that effort was annual tests have been reduced by over 90%, five-year test has been reduced by over 50% and we've been able to automate most of it and by using continuous emission monitoring system rather than having to use people to do that. So in the end the environment is better, we are better off economically and we saved ourselves $7 million a year.

And so there are countless examples like that where we are what I call clawing and itching and grabbing every bit we can, but it is that engaged workforce that really drove this initiative and went across the enterprise to help accomplish this.

THOMSON REUTERS

SI-SSA-0015-13130

So a reminder again that Nuclear is a critical element of our success, of that 54 terawatts I talked that were generated, 29 of it comes from our nuclear plant. So 54% of our generation comes from our nuclear plant. And we remind ourselves every day we are a Nuclear Company and the entire enterprise is committed to making the nuclear plant successful.

So just the plants that we own and operate, Hope Creek 100% owner and operator. Of Salem, 57% owner and operator, the rest is owned by Exelon. And our Peach Bottom facility we are a 50% owner, but the facility is operated by Exelon.

You can see the license expiration dates go out to 2046, so we expect to be around a long period of time. That is helpful when we want to go hire people because folks want to know that there is a career in this business and 2046 is a long time from now.

Peach Bottom is undergoing an uprate currently, in fact did most of the -- did all of the actually modification work this last year and are currently working through a resolution of some technical questions related to the steam dryer with the regulator now, but are on track for completing that power upgrade in March of this year.

So I talked about this continued strong nuclear operations, I'm not proud of 89.3% but I will tell you we will do better this year. I will show you in a minute where we stand for cost in the business, I talked about the importance of it from an earnings standpoint to help us pay the bills. And it is a great place to actually bring talent into the organization.

It is the only site in the country where you can see a boiling water reactor, a pressurized water reactor and the opportunity for a new plant all in the same place and you don't have to travel or go to different sites to do that.

The Fukushima actions are well underway at this point. The commitment is to complete them in 2016 and we are well on our way to doing that. Most of the items completed in the last Salem outage, Hope Creek will do most of the items in their upcoming spring outage and then the Salem outage we will do the items there.

One item to note is we were -- we volunteered and/or picked to be the pilot plant to demonstrate to the regulator that the current venting strategies are adequate and therefore the need for a dry well vent or even a filtered vent is not necessary. So we are glad to be able to demonstrate that.

There is an item again about the Peach Bottom uprate and the other note that we are active in various industry forms -- INPO, the Institute of Nuclear Power Operations; NEI, The Nuclear Energy Institute; EPRI, Electric Power Research Institute -- all different bodies that influence how the rules are developed, shaped and implemented in our business.

And the USA Alliance which is a group of single unit nuclear operators that work together to try to get the benefits of a fleet so we can understand where we are relative to others, but without I would say the bureaucracy of being a fleet.

Just a note to show where we stand relative to others and cost. Certainly we are not immune to the cost pressures that are in the business. It is something we talk about every day and we want to make sure first and foremost that our folks do the right thing and the safe thing first and I think we have a pretty good track record of doing that.

But we are, as I said, not immune to knowing what those challenges are out there and we have several initiatives I will show you in just a minute that show you what it is we are doing to try to address that. But you see where we are from a cost structure standpoint and pretty well positioned relative to others in the business.

On the Power side in particular, I don't have the 0.3% growth rate that Ralph LaRossa showed, but we've done a pretty good job in Power to keep those costs and you can see 2.6% over that period of time, maintaining that balance of keeping the plants reliable and also saving money where we can.

So we continuously look at the material condition of our fossil units, our combined cycles in particular because of the workhorses they have become, significant work in renegotiating vendor contracts. One item that went under the radar screen last year is we brought our security force in-house.

This was a contracted workforce that we had at our nuclear plants, costs were increasing 8.6% per year in the security area. And we obviously wanted to do something to address that, so we brought them in-house last year.

THOMSON REUTERS

SI-SSA-0015-13131

And I thought the folks at the nuclear plant did an excellent job supported by HR, IR and the likes, a pretty seamless transition to take that from a contracted workforce to in-house. But it sets us up for future success in helping to maintain cost in that area.

In the nuclear area there's also productivity studies, outage initiatives in place and something also in the materials area as we are seeing different challenges in materials and costs in particular. So we are looking at several things on where else we can buy parts and of our specs writing off. But it is good work in the enterprise going around to address these cost drivers in the Nuclear business.

On the fossil side steady improvement is how I would classify this. So what you see on the top left is fossil generation, you see it going up and it has been going up at 5% per year for a number of years now and it is our prediction that that will continue. You see even it has gone up in all generating sources including coal and we expect that to continue this year.

Just a little note on the peaking part at the bottom. You see the start successes have remained fairly strong. They were just under 5,000 starts of our peaking units last year, which was 1,300 greater than the year before. So we are seeing more and more demand on these type of units. And then the bottom right you see combined cycle generation that had a record generation last year and we expect it will have a record generation this year.

So this is a little bit of history of different things we have done over the years to improve cycle heat rate. So if you looked at 2008 to 2013, by the way, you see that improvement in heat rate, that is about $20 million worth of fuel savings. And if you move forward from 2013 to 2018, AGP and some other things I will talk about in just a minute, that is another $6 million just in fuel savings.

Some of those actions that we have taken to improve them is AGP we've talked about, another gas line at Dominion -- or from Dominion to our BEC plant. That gives us two sources of gas now. So it gives our ER&T organization an opportunity to pick the best source.

Significant work going on with EPRI on the fossil side, in particular looking at the performance of our cooling towers and our HRSGs to improve the heat transfer capability of them. There is also work going on with General Electric and their Big Data initiative. They have some really good life time information on our CTs that we can take advantage of to get trends early so we can fix them before they become problematic.

Unit testing I talked about and we have also got some other things with AGP like auto tuning software and the like that gives our units a little more flexibility in their operations.

Fossil has also done an awful lot in the outage improvement area. We had some lessons learned from our one Linden outage last year, in particular in the contractor oversight area. So the organization took those issues to heart, saw much better performance in the fall and shortened outages and improved costs.

And what we expect to have in place here at the end of this year is a central fleet monitoring headquarters where our engineers will be able to monitor our Fossil plants on a lifetime basis, taking all this data from GE and the like to be able to identify trends early so that we can respond to them quickly.

This is one of the reasons why we can generate some pretty good cash flow out of the business here and our capital needs have declined over time and major items are behind us. There are some small dollars to complete the Conemaugh SCR this year and some small environmental dollars finishing up some Bridgeport Harbor to make sure we are fully compliant with the new MACT rules which we are set up well for.

You see a slight uptick in maintenance dollars, those are mostly at our nuclear plants where Peach Bottom, it is being modernized significantly and our Hope Creek station where we will improve some reliability of some systems and also improve output a little bit as the net generation will improve as a result of that.

And we are not standing still. You don't see $1 billion numbers up here, but there is a number of items that we have done in the last year. I made reference to this BEC gas line; this was something that cost us $8 million, we got paid back in one year.

Linden AGP upgrade I referred to. We were able to compete and win an RFP with Black Start. As a result of HEDD units going away a number of those units were Black Start units, so PJM thought it necessary to go out to the marketplace and procure Black Start capability. We won a couple of those and you can see the level of investment and the revenue source it is that $3 million escalates every year.

THOMSON REUTERS

SI-SSA-0015-13132

Solar source continues to add about $60 million a year investment to its portfolio. Actually this year we expect a little bit more from that, but the continued focus is to make sure we are dealing with credit worthy off takers and appropriately managing the risk of that.

Peach Bottom EPU I referred to, Bergen upgrades I referred to.

One other little item you see under various, this is just an area where our folks pay attention to what is going on in the grid. There is an opportunity every year based on grid conditions to form what is called these interim service agreements where there is extra megawatts available that we can get from our units to bid in incremental capacity auctions. And for this year that happens to be 69 megawatts worth that we will take advantage of.

And you see also the PennEast pipeline on the bottom that Ralph Izzo referred to before.

So, some other items that are on our plate here that we hope to bring to fruition at one time. A lot of discussion about Bridgeport Harbor and not winning that. We are not giving up on it. We are in this business for the long haul and believe that opportunity will present itself again and when it does we will be ready for that.

There is an opportunity for a small uprate at Hope Creek yet. This has to do with a more accurate measurement of feed water flow that is being pursued.

We are also now evaluating given what is going on with the potential for CP and the additional value we see in the ancillary services and peakers in particular, the opportunity to take some of those old FT4 units and put an SCR on them. That work is underway now and we should come to some conclusion here in the next quarter or so if that is something that makes sense for us.

The Bergen 1 uprate, this is not part of AGP, this is actually a different OEM but they have an AGP like upgrade available that is being reviewed.

Our Sewaren Project which had been on the books for a 2 by 1 combined cycle we will I believe modify to a plant similar to Bridgeport Harbor to take advantage of some economies of scale.

And I mentioned the solar projects where there are literally hundreds of megawatts somewhere in the development cycle at this point. And I say that because here is a picture of our solar portfolio currently, a little over 120 megawatts, 10 projects, nine states. The nine states is important because essentially this geographic diversity gives us opportunities to talk with a number of developers in this area, which is why the pipeline has grown so big here just in the last year.

So we make money in other places besides energy and capacity, by the way. And in fact about 10% of what we make is not in energy capacity and exists in these areas that I show up here.

One piece of that is the gas business you have heard Ralph Izzo refer to and Shahid will talk a little bit more about in a bit, provides several advantages and namely the advantage that customers and the utility was that lowering gas bill that you saw on Ralph Izzo's slide before.

But if there is somebody better in the business than John Scarlata who works for Shahid I would like to meet that person, because this individual's knowledge of the gas system and his capabilities and how he can get fuel different places is unmatched I believe. And this provides us opportunity to sell gas off system to others, commercial/industrial customers and also in the opportunities to our own power plants.

Ancillary services, this is actually an area that I have seen double-digit growth here in the last number of years. And it shouldn't actually be a surprise if you think about what is going on on the grid. And you see it play out in particular in places like Hawaii where there is a lot of renewable penetration, you almost get a hockey stick of changes in load. And those plants that respond quickly to changes and load are at a premium and we are starting to see that being priced in the marketplace now.

So those combined cycles that can respond quickly, those peakers that can respond quickly have been called on more and more to do so and we have seen just an increasing revenue source in that particular area.

And the other area that we make some money is the LIPA fuel and energy management area. Last year was our transition year, so we got paid a transition payment, we had to use a lot of that frankly to get the systems and people in place to support it. And now we are in the opportunity to implement that.

THOMSON REUTERS

SI-SSA-0015-13133

And the folks have done a great job supporting Dave Daly and his team in getting fuel to those units out of Long Island here during this challenging winter season. If you noticed the Hudson River is frozen. A lot of fuel used to come up that way. So it means they have got to use other sources to get the fuel to those power plants and the folks have done a nice job of doing that thus far.

So this is a busy slide. And you can all do your own analysis of what it means, but we got the question an awful lot about basis going away and your locational advantage going away. And I am just here to say that it is not going away, it is just different. And there is a couple of ways to look at this.

So, if you look at the top you'll just see how you look at weather on average, whether you are cooler or warmer than normal. And what you see is for the -- if you look at 2014 last year we were slightly cooler in the summer and slightly colder in the winter.

The other interesting part if you look in the winter, we forgot when winter was in this area. And in fact if you look we have had above normal warmer temperatures in the winter for the last half-dozen years. And it was just 2014 where we were slightly below normal.

So sometimes it gets cold up here. And I think in 2014 what you really saw was people forgot that it got cold. And -- because we have been used to mild winters for a period of time. And in fact folks got surprised when weather got cold.

Now it has been cold this winter too, but folks weren't as surprised. But that said, the next slide it talks about, okay, hotter or colder, that's an average perspective of things. How many days was it really hot and how many days was it really cold?

And what you see last year is it was really cold for a lot of days. And if you go back to the summer of 2010, it was really hot for a lot of days.

So what was the impact on the marketplace than? What was the impact on gas, what was the impact on the price of power and the basis volatility.

And I will tell you as you look across the page, volatility is getting greater and not lesser. And I think what you have to think about is the other changes that are happening in the marketplace here, too. You've got big units are going away.

Coal plants are retiring. We're relying more and more on renewable sources of generation, relying more and more on DR as a way to meet reserve margins.

And as we do and as those folk -- they're in the can deliver/cannot deliver, we get surprised and you're near a load center you're going to see more volatility. I think that's what you see going on in our business.

And the bottom line just shows when there is more volatility how do we do as a business. And the fact is we do better, and we do better because we have that flexible, diverse, set of assets that can respond quickly to changing conditions and supported by baseload generation that allows us to hedge out when that opportunity exists.

So I'm just here to say the volatility is not going away. It looks different now; Shahid will show you how it looks different, and that difference is not measured in months or days, sometimes it's in hours and minutes. And the ability to be ready when that hour and minute presents itself is really the key at this point.

So we do an awful lot of work to help shape our business. I mentioned these organizations here before. This just represents where it is that we are involved and we are involved at leadership levels and working levels.

Working level is important, too, because those are the folks who actually write the rules. The folks at the higher levels maybe get a chance to veto them but being at that formative stage is important, too.

So a couple of things I would point out here is UWAG. We are really a leader of that. Why is that important?

It was important in 316(b). And it looks like those rules have turned out -- what it is we were expecting and hoping for and I think it bodes well for our business then.

THOMSON REUTERS

The other item I would point out is under ISO New England, the Chairman and Vice Chair of the supplier sector of New England Power Pool, this gentleman was instrumental in helping getting those capacity rules changed and you saw the impact on the marketplace as a result there. But in the end it really is about people and we do an awful lot of work in that particular area to make sure our people want to be engaged in part of our organization.

Succession planning and talent development is a key part of that. You saw the recent announcement about our Chief Nuclear Officer retiring. That was not a surprise, something we had been planning for and we've got a person in the wings ready to assume and take that position and I'm confident they'll continue to move that organization forward.

We have an opportunity in power to rotate folks between our organization so the fossil folks get to learn a little about nuclear and nuclear learns a little bit about trading even and trading learns a little bit about fossil. It's been invaluable to help with communication and understanding one's jobs.

We share resources between fossil and nuclear during outages. In fact the folks from the fossil organization look forward to going down to support a nuclear outage every spring and fall and we learn a lot about fossil, how I'll say this is a little quicker sometimes in getting some things done. That helps our nuclear folks to perhaps see the world a little differently because the fossil folks live this competitive environment each and every day.

Diversity inclusion I put on here and Ralph has talked before about what we've done employee engagement efforts and the like. In this past year that initiative changed in title to diversity inclusion which we thought was the next important step of employee engagement but with some fairly specific goals that we were measuring our performance on. In fact 10% of our incentive was based on how we did in this particular area.

But in the end this is about getting each and every employee to feel that valued member of a winning team and having everyone fully participate which is how we get that whole value of that engaged workforce. And I think we're making good progress as an organization in that area.

In the end what does it mean? How much money do we make? And you can see our earnings for 2013, 2014 and where our guidance is in the 2015 area and what we been able to do here for the most part is the hedge price in 2014 was $48, it's $52 in 2015.

Essentially that increase in hedge price has allowed to offset the reduction in capacity volume as a result of our HEDD units going away. And I think I laid out the other opportunities that are available and to talk more about hedging and some other items I'll turn it over to Shahid.

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources & Trade***

Thank you, Bill. Good morning everyone.

I'd like to add my very warm welcome as well to you and thank you for coming. I'm glad to be here.

Actually I have to admit that I almost didn't make it to this meeting this morning. As Bill knows I've had a toothache for a couple of weeks and my dentist told me I needed a root canal and he actually scheduled it for today at 9 o'clock. And as you can imagine, I had to think really hard about that.

Would it be better to and less painful to have a session with 200 of our favorite friends from Wall Street or to have a root canal? And I have to tell you it wasn't even close, though, and as you can tell I'm here and I'm very glad to be here.

So seriously the let me talk a little bit about what happened in or business this last year. Everyone knows what happened in the industry with respect to the winter. The winter was exceptionally cold and it led to incredible price volatility as you're aware.

Why did that happen? Well gas supplies ran low, power plants struggled to perform in the extreme cold weather. And as a consequence this led to a major push by many regulatory authorities and the ISOs to improve our industries infrastructure and the results of that frankly will be played out over the next five years.

This is not going to happen overnight, at least in PJM. But the ramifications from what happened last winter together with the imminent retirement of a lot of the coal plants that we're seeing in this region plus a major shift in the relative value of energy commodities, especially oil over the last year, is really changing the shape of the industry today. And as Bill mentioned for PSEG the cold weather was hard on some of our assets, it was hard on some of our people, too, but we executed very well amidst all that volatility.

THOMSON REUTERS

SI-SSA-0015-13135

We are seeing some of the same dynamics playing out this winter, although prices in general are much more muted because I believe the industry is better prepared this time round than maybe they were a year ago. So with a backdrop of all these market and infrastructural changes together with some of these changing regulations that you're seeing I'd like to describe the activities that we're taking to position our Company in the merchant generation space.

So what I'll do is I will split my talk into three sections. First I will kick off with a review of how we handled the events of last year and more importantly, though, I'll talk about emerging commodity trends and what we plan to do about them prospectively.

Also I know that there's a lot of interest in this room about what we're doing to counter the impact of shale gas on the absolute level of power prices in our region as well as to address how we're handling the lower electric basis in PSEG's Zone as well. So I'll talk about those a little bit.

Second I want to describe the commercial attributes of our fleet and how we're positioning the assets to get long-term competitive advantage. And third I'm going to outline some of the tools and levers that we have in our toolkit that continue to make us somewhat unique we believe in this space and frankly give us the confidence to be a lot more bullish about our prospects than we're sometimes given credit for.

So let me get into it and on this slide you can see that the charts reflect natural gas and power prices. The top two charts are for the first quarter of 2014 that reflect wintertime and the bottom two charts are for the third quarter of 2014 reflecting summertime.

Although last winter was the second consecutive year of below-normal temperatures in our region it appears that the generation sector as Bill mentioned had forgotten that it can get cold up here, really cold. As a result in some cases the industry was really not ready to prepared to handle frozen fuel, frozen coal and there were quite a lot of equipment failures as you know last winter.

So as a result of the cold weather in the first quarter of 2014 in the top left chart that blue line that you see there which represents the price of Z6 gas soared in January and it was very high throughout the period with an average price for the quarter of $15.82 per Mcf. Those high Z6 prices directly impacted electric prices in our region as shown in the top right-hand chart with the green line reflecting power prices in the PSEG Zone.

Now the average electric price for the first quarter in our zone, in PSEG's Zone, was $117 per megawatt hour which also incorporated a $27 positive electric basis, that's a basis above PJM's West Hub price. The orange line, by the way, is the Leidy gas price which is a good proxy for Pennsylvania shale gas. And you will note that it was relatively flat and weak throughout this whole period.

As I discussed last year we were able to take advantage of this electric price volatility by optimizing our gas fleet. In addition at this time last year we made the decision to accelerate our ratable hedging program to take advantage of some of this volatility on higher prices. This will prove to be a sizable benefit for us in future years as both Ralph and Bill alluded to earlier on and I'll describe some of that in more detail in a bit.

In the third quarter those bottom two charts you can see that the gas and electric prices and the associated volatility are much less. Those bottom two charts show gas and power prices that were much lower and moved down as mild weather reduced air-conditioning demand.

And note again that shale prices were consistently below Z6 prices. In winter we take advantage of that shale gas price delta for our utility customers and in the summer we take advantage of that discount for our power generation fleet, thereby deriving some of those strong spark spread margins that you've seen in our earnings reports.

Importantly what these two charts inform us of as you well know is that the winter has become a significant driver of earnings for us and together with summer we now have the opportunity to really benefit from a dual peak scenario. If winter is cold we do well, if summer is hot we do well and if both of those two events occur in the same year we will do very well.

And to take advantage of those peaks you need a strong gas and power trading capability. As you know we have one of the largest gas procurement and trading businesses in America and last year we bought over 400 Bcf of gas and our size allows us to leverage prices that benefits our utility customers with low gas prices as well as spread generation fleet.

As I've discussed previously we used to be pretty much 100% dependent on gas coming up from the Gulf Coast or coming down from Canada. Now we're in the fortunate position of being able to source our gas locally from Pennsylvania or from wherever is the cheapest location.

THOMSON REUTERS

SI-SSA-0015-13136

This pie chart I have on my slide shows you where natural gas generation came from in 2014 and you can see that we bought directly bought over 60% from the Marcellus and from the Utica last year. That green slice there, that represents what we buy on a delivered basis from other producers and other marketers. This amount, about a third of the total actually, I would guess came from multiple sources but I would also guess that a good chunk of it came from the Marcellus or the Utica as well.

So as you can see a good proportion of our fuel now comes from local sources predominantly from the Marcellus shale, an area that is flooding the market and the region with a lot of excess gas. Of course we've been fortunate in having access to this gas but we've had to completely revamp the way in which we do business to take advantage of that access.

Okay, so turning now to current trends for gas prices and spark spreads. That top left chart shows you the price of Z6 gas in blue again for January and February of 2015. These high Z6 gas prices set the power price for most of our assets.

The top right chart shows the forward curve, gas curves for Z6 in blue and Leidy gas in orange. And you can see the seasonality of the gas price and the gas demand as reflected in that wavy, cyclical price.

More importantly, you will note that they show a slow but steady expected rise in the price of gas, both Z6 as well as Leidy gas. And I'll discuss that some more in a while.

The bottom chart shows the PJM West and the PS Zone spark spread in yellow and green respectively. As you know the spark spread is the difference between the price of power and the cost of natural gas. The forward spark spread serves as a good proxy for the profitability of our gas plants especially the 3,000 megawatts of combined cycle that we have in our PJM and New York fleet.

What it doesn't show and what Bill alluded to is how profitable our remaining 3,000 megawatts of peakers can be when we're able to buy some of that cheap Marcellus gas in the summer and sell it into a volatile power market. Furthermore, with oil prices so much lower over the last 12 months we enhance our margin even more by using some of that oil rather than gas when absolute gas prices are very high. In fact oil burning has become quite common now in our fleet in winter with the price having fallen so much.

What's also clear from this chart is that spark spreads are high because those numbers on the left, that's a high dollar per megawatt hour spark spread that we're enjoying. And they are high historically but they do appear to have peaked if you believe these forward curves.

The good news is that even if they are peaked they remain very robust. The corollary to this of course is that we do expect a lot more new gas fired generation to be built probably in Western PJM that will start showing up in 2017 to 2019 time frame.

Another key takeaway from these charts is that Leidy gas will still get a sizable discount to Z6 gas and M3 gas enabling companies like ours to improve our spark spread relative to our competition. So you can see that spark spreads using Marcellus gas which is in green are consistently higher than if you only have access to M3 or Z6 gas as denoted in yellow. So we feel good about what's happening with spark spread and our perspective forward prices for our region.

Now why do the forward curves show rising gas prices? Our research shows that Marcellus gas production is going to continue increasing despite low oil and gas prices. We expect some slowdown in new drilling but existing wells, particularly those that have been hedged for several years out, will continue to produce a lot of gas.

And our producer friends have been telling us that technology gains and lower unit cost of production will allow for continued gas production from the Marcellus even at these existing low oil and gas prices. It will be interesting to see what really happens if gas liquids prices follow the trend of oil prices as well.

So the left-hand chart that I have up here shows rising production through 2018 and this is a chart that we put together but we also put it together with some help of some outside consultants and they've corroborated and verified some of these numbers. On the right-hand chart we and others are seeing old pipelines being reversed and new gas pipelines being built. And these pipelines have been built and reversed in order to transport this excess supply from the Marcellus and Utica into higher priced markets, particularly those higher priced markets south of us.

THOMSON REUTERS

This newbuild has already started with the completion of Transco's Virginia southside project that carries gas now into zone 5, that was completed just last December, as well as Transco's Leidy Southeast project that carrying gas to the Mississippi Alabama border. Both projects, just those two, total about 0.8 Bcf a day.

In the southeast we are seeing a re-industrialization and increased industrial demand, therefore gas or chemicals for industry coupled with rising power generation demand as well as exports of LNG should start to soak up some of the excess shale gas that we're seeing in this region and potentially lead to rising prices. Having said that, we do believe that gas prices will still remain relatively low compared to recent history, however. And PSEG's challenge, frankly, is to take advantage of these prices for our gas customers and for our power generation fleet while protecting the absolute level of revenues that we get from converting that gas into electricity.

As you know, the lower the price of gas the lower the price of electricity which directly impacts the revenue for our fleet especially the nuclear units. So forward hedging and management of the basis risk are critical elements of our activity. So until the price of gas rises again we have to protect against absolute price falls and at the same time protect our electric basis.

And we have been. We been aggressively hedging and taking advantage of price spikes to dollar cost average our hedges higher during this time period.

Interestingly enough as you'll see in the slide I'll put up later on the absolute price of power has stopped falling in this region probably reflecting the point where cash costs of many of our competitors in this space are reaching a breakeven point. And any further price reduction will probably reduce output and force even more retirements.

So in short we do not see much more downside to power prices absent the complete collapse of the gas price. In addition we have been aggressively hedging and managing our electric basis risk much more actively than we have in the past.

And talking about basis risk, as you know we sit in a premium power market next to the largest load pocket in America. When we talk about the locational value of our assets we refer to some of that value as being the positive electric basis that's inherent in our location. And as you know basis reflects a premium that our assets receive relative to the PJM West price that many of our competitors receive.

Basis is impacted by several factors. It's impacted by the absolute level of prices, by the amount of load in the region, by the way in which units are dispatched according to relative fuel economics and crucially by the amount of electric and gas transmission capability that's coming into the region. Each of these components has changed and it's no surprise that companies like PSE&G and others have been building both electric and gas transmission into the Eastern PJM region.

As a result we expected and we are seeing forward basis will continue to be pressured but will remain positive in our opinion. As you can see from these charts basis will fall from $6 around the clock in 2014 to about $2 to $3 around the clock in 2016 and beyond according to these forward curves.

Note that that basis has been quite volatile over the years. If you look at 2012 basis was under $1 principally because of some negative basis that the region incurred during the summer months of 2012.

And if you go back in time that basis price has also moved around a fair bit. So it's very important for us that we manage this and we are managing it aggressively.

One thing you should note, though, there are several things that are happening right now that are temporarily we believe depressing PSEG's electric basis that we fully expect to reverse by the 2018 time period. First as I mentioned up to 18 Bcf of this surplus gas will be exported from our region lifting absolute gas and electric prices together with electric basis. Secondly, you may not know this but a lot of the electric price, the PJM West price, about 50% of it, that price is comprised of the LMPs, the locational marginal prices, that are set in the Washington, DC area.

Well the Washington DC area is short of electricity and they are also being caught up with congestion by a particular transmission congestion point in BG&E territory at Bagley Road. Now this line is being upgraded by the utility and will be completed within two years. That will reduce the congestion that we're seeing down there.

THOMSON REUTERS

SI-SSA-0015-13138

There are about 5,000 megawatts of new gas-fired combined cycle being built in this area that will come on at about the same time, 2017 to 2018 time frame. And we believe that this will drive down electric prices in this region and therefore this region's impact on PJM's West price will diminish.

Now we know that these three events are in the works and will reduce the negative basis pressure that we've been experiencing particularly in the low load months, the shoulder months and sometimes even the summer. In the meantime we've been aggressively hedging our basis using the BGS construct as well as FDRs and ARRs and enjoying seasonal basis volatility in the winter and the summer months when our production is at the highest.

In this chart the green columns reflect actual historic basis and dollars per megawatt hours through 2014 and the red columns reflect the basis price that the forward curves we're predicting at the start of each of those years going out to 2018. And two things strike me when I look at those columns.

First forward curves have generally understated forward electric basis including in my opinion 2015 and second that electric basis will remain positive for us during this three-year period. By the way, electric basis for the first two months of this year are hovering around $14 a megawatt hour around the clock.

Now we do expect that there will be times in the year when electric basis becomes negative especially during the shoulder months while basis will continue to be strong in prompt periods when driven by factors such as operational outages or indeed by extreme weather. That basis volatility as Ralph mentioned earlier is extremely impactful to our business.

For example basis was over $50 over several days in February and gave us a considerable source of income that many of the firms can't replicate. Capturing this volatility through our trading teams helps really reflect the option value of our gas fleet.

Turning now to the regulatory front we are making headway in several key market design issues in each of our three ISOs, in particular price formation, capacity market constructs as well as demand response. And they have all been great areas of focus for us or rather areas of great focus for us and I want to comment briefly on each of those three areas.

First accurate price formation is critically important, much more important in fact than capacity markets. Poor price formation has been a concern not only for generators but also for load interest because they've been incurring hundreds of millions of dollars in uplift payments especially in the PJM region.

We've been very active in the PJM stakeholder process pushing this issue and we are seeing some marginal improvement in efficient dispatch of resources now. We've also been very active at FERC on this issue and these efforts are really important as we think that there is significant potential for additional improvements in this price formation especially in PJM which we think and benefit from some of the rule changes that ISO New England has enacted over the last 24 months.

Secondly capacity markets are also going through a lot of change as you know and New England has tried, impressively I might add, to improve its capacity markets. The capacity auction in New England last month was a relative success we believe as the ISO finally recognized that it was in danger of not meeting its minimum reserve requirements again and really took drastic action to improve the market construct. I'm very pleased to say that we and other companies were directly instrumental in highlighting these issues to the ISO and to the FERC and we're pleased, very pleased that they responded.

And third demand response is also undergoing some pressure as the FERC and the ISOs have recognized that a power grid that relies on DR for up to half of its reserve margin cannot be a robust power grid. So we do support the continuing role for demand resources. And I'm not going to opine on the EPSA versus FERC legal matter.

That will play out in the Supreme Court pretty soon but we do believe that DR should be treated as a demand resource. The proper role for DR is for the customer load reductions to be recognized in the load forecasts that are used to determine the level of needed capacity we believe. Furthermore until that legal matter is settled DR should really not participate in any upcoming capacity auctions.

I know tons of other market changes underway as well as you know but the most impactful one for PJM generators is the capacity performance product that I'll review in this next section. In this section, too, I'd also like to describe the commercial attributes of our fleet and how we're positioning the assets to gain competitive advantage for that long term.

© 2015 Thomson Reuters. All rights reserved. THOMSON REUTERS

As you know, the capacity performance proposal creates real-time market performance obligations and incentives for capacity resources. We support the CP proposal as a means to support investments and reliability particularly during times of system stress as we saw in the last two winters. And we are very pleased that PJM is filing a corporate element that really improves the efficiency of capacity markets as well such as allowing bidding up to the net cost of new entry and removal of the 2.5% holdback which in our opinion needlessly suppressed prices over the years.

These elements and others will really help incentivize generators to make needed investments and at the same time to be fairly compensated for providing them the capacity. And we're also pleased that the proposal includes a mechanism for capacity resources to be rewarded for good performance as this provides additional upside for our fleets that are well run such as ours.

As you know the penalty program that PJM is instituting will also include a reward payment for those generators that perform better than their capacity obligation as well. That should allow units like ours that generally run very well an opportunity to gain additional revenue.

Now the CP product that we expect FERC to approve will be on balance beneficial for PSEG. As Bill and I have described, our PJM fleet is characterized by really good high-performing baseload nuclear, baseload coal and very reliable load following combined cycles. In addition we have a very strong portfolio of gas supply contracts as well as oil firing capability at many of our sites.

So PSEG Power is positioned to do really well under this regime from a fuel security as well as an operational performance standpoint. Now although there is substantial risk of high financial penalties for nonperformance we are comfortable with the historical performance of our units. We expect and hope that PJM will enforce their CP requirements rigorously which will benefit well maintained fleets such as ours and hopefully will weed out units that don't perform so well and in some instances are probably artificially depressing the capacity and energy market prices.

So there's no doubt in our mind that we see CP as a win-win for both generators and consumers and we think both groups will benefit over the long term. Better incentives for investors and increased reliability for customers. And these two pie charts I've got up here highlight what we think we are capable of achieving, and even though we don't have a FERC-approved set of rules yet regarding the CP proposal, PJM has asked FERC to give its blessing by April 1.

If you look at these two pie charts you'll see that based on what we know right now about the intended rules we believe that the majority, maybe over 70%-plus of our PJM assets by capacity, will meet CP requirements with minimal extra expense; minimal, by minimal I mean probably just routine capital and maintenance. For the remaining 30% we'll have to carefully consider the requirements for dual fuel as well as reliability targets.

And we'll balance those investment costs against the potential increases in capacity prices versus the potential performance penalties that we might incur during those shortage hours. But of that 30% two-thirds of that, so 20% in total of our fleet megawatts, will probably need some moderate amounts of money to be spent to meet requirements.

Finally for a small proportion of our older units we'll have to decide whether it's worth spending the money on that last 10% or so or just keep them as base capacity at least until the year 2020 when the base capacity product is supposed to go away. So at this time as Ralph mentioned we feel really good about our ability to meet CP standards, both from a fuel capability standpoint as well as an operating performance standpoint.

And between April 1 when FERC is supposed to announce the results of its review of PJM's request and the RPM auction in May we will solidify our capital and O&M plans. And I'm sure that we'll be talking to you a lot more about this later in the year and in a lot more detail as well.

So turning now to the rest of our fleet we manage our Northeast assets as one portfolio and although they are relatively small compared to the PJM portfolio they are profitable and they give us a base from which to grow our business. Actually we believe that these assets are a bit subscale on their own, so the addition of LIPA's 6,000 megawatts of contracted generation to this portfolio has really improved our competitive position and also our potential margin position for our existing fleet. And I'll talk about that shortly.

But in New England we've witnessed a seachange in the market construct driven by firms like ourselves, frankly, who've pushed the ISO to make improvements and at last we're seeing new generation being built as capacity and energy prices move up. As you know, we looked pretty hard ourselves as to whether we should build a new plant on an existing site in Connecticut and we put in a competitive offer last month but did not quite clear the capacity market. We will consider it again for the next auction; as Bill says, this is a long-term market and we're here for a long term.

THOMSON REUTERS

SI-SSA-0015-13140

Now in New York we just don't see many opportunities for competitive generation. The regulatory construct there has not improved much in the last two years. In fact in some cases the regulatory construct sometimes shows three paces backwards and one pace forward.

So as a result we've embarked really on self-help to help us improve our margins and revenue. First as Bill mentioned we built a lateral gas connector to connect our Albany combined cycle to Marcellus gas supplies. And secondly we won the management rights to LIPA's 6,000 megawatts of contracted assets which I'll describe in this next slide here.

And for little risk we're adding a net penny per share of earnings for managing LIPA's assets. We buy the fuel, predominantly oil and gas. We dispatch the plants, we manage the cables and we also do their hedging for them.

We've spent the last 12 months successfully transitioning this business to our Company and we've executed very well so far. Now our goal is more than doing a good job of just buying the fuel and dispatching the power plants of course. Our primary aim is to drive down electricity costs for PSEG Long Island's 1 million residential and business customers and we believe that we'll be able to achieve that.

In addition this contract increases the size of our commodities business and all the synergies and competitive intelligence that derives from them. So eventually we believe that this return from this activity will be much higher in value to PSEG than the penny a share from the annual management fee that LIPA pays us.

And most importantly we believe that we will reduce the electric costs for Long Island's customers over the long term. I know many of you are in the audience live in Long Island so I'm sure you'll all be cheering at that and probably holding me accountable as well.

So what I'd now like to do in the last section is to just outline some of the tools and levers in our toolbox that we believe continue to make us somewhat unique in this space and give us the confidence to be more bullish about our prospects. So a major locational benefit for PSEG are the capacity markets that are present in each of the three ISOs that we operate in: in PJM, in New York and New England. And these capacity markets are evolving very rapidly as you know.

In New England the construct is much better now for the industry. The PJM market also seems better on the whole, particularly with the impact of the CP product.

And even in New York it appears that FERC is eager to reassert its wholesale jurisdiction over that market although there's no sign yet of New York moving to a longer-term forward capacity construct such as in PJM in New England. And these constructs assure us that receiving payment for being in the market and as those prices rise particularly in New England we will see that in the forward earnings at PSEG Power.

As you know last month we received the parameters for the 2018 / 2019 PJM capacity auction which supposedly reflects the impact of new transmission and generation into our region. In particular PJM expects additional transfer capability into PSEG's zone which will likely have some impact on our zonal capacity prices.

For the RTO as a whole, though, the major driver will be the impact of the CP product: how much new generation will be built and also what happens to demand response. And as many people have observed DR accounts for over half of the total reserve margin in PJM.

And PJM is becoming much more selective now in how DR is caught and we believe that PJM is trying to stop DR from undermining its RPM construct. And any reduction in demand response as a result of any federal court decisions that are on the horizon as well as the higher performance standards that PJM is holding demand response to will be quite impactful to regional capacity prices.

There are other positive enhancements to the RPM construct as well, such as the ability to net CONE as I mentioned before. Plus there's other items that I've listed on my slide there.

Another tool in our toolkit is the BGS. This forward sales construct is available for much of our generation in New Jersey and is very helpful at a time when forward liquidity is lower than in prior years. The annual BGS auction whereby the New Jersey utilities buy electricity to supply their default customers blends prices over a three-year period as you know.

THOMSON REUTERS

SI-SSA-0015-13141

And this has proven to be very advantageous for New Jersey customers in the state, as it significantly reduced the volatility of prices. In fact if you look at the price at the dark blue line you'll see for that last four years it doesn't seem to want to go down anymore. And the prices have hovered between $37 to $40 over the last four years.

In general from a seller's perspective we also like the BGS construct. Why? Because the load obligation is very well correlated to our units output, it's a good liquidity event, it provides us an opportunity to hedge some of our forward basis risk and it makes us money over and about selling into the forward wholesale power markets.

Last month we were successful participants again in the BGS auction. And as this chart shows prices moved up about $2 in PSEG's zone due primarily to higher transmission and renewable costs. We did also collect a higher risk premium reflecting the volatility seen in the wholesale energy markets.

BGS sales now account for about a fifth of our forward hedges. And we will continue to supplement these BGS sales with other shorter duration full requirements hedges and sales that we have in other markets that are well correlated to our assets.

Headroom continues to be low for third-party retailers and we expect that trend to continue, frankly. However, we are not seeing signs of reverse migration to the electric utilities unlike in the natural gas world where customers are coming back to enjoy PSE&G's low natural gas prices. And finally we were very happy with our increased participation and increased margins from this year's auction and we look forward to serving the utilities with their electric needs this year.

Talking about hedging as previously described we have a consistent monthly hedge program whereby we lock up about two-thirds of our baseload plants output for the next three years. In numbers that's about two-thirds or 4,400 megawatts for three years. And as prices have fallen over the past five years so have the price of our future hedges as they have indeed for all players in this space.

However, as you saw from the previous slide electric prices seem to have reached a floor despite overall week short-term gas prices. Now we focus on capturing value and we focus on protecting gross margin for the long term. And as I said before we will not hedge at a loss and we fine-tune that hedging dependent on the relative economics of our fleet.

In addition we give our trading team considerable flexibility in the timing of the sales and in the instruments that they can use. And to this last point I mentioned earlier on that we've been aggressive in managing our hedges and when prices spiked a couple of times in this last year we sold more fixed-price power, thereby raising our average hedge price by $4 to $52 from this time a year ago. This increase in hedge price has basically counteracted the reduction in capacity revenues that we've been expecting and is helping us to produce higher earnings than we initially thought.

In addition we have a trading activity that we call dynamic hedging. This is where we position our fleet to take advantage of some of that volatility that Bill referred to earlier on as well as managing our closed positions for both operational and financial reasons. In this way we actively manage those closed positions plus our remaining open positions dependent on our view of the short-term marketplace.

This is value that we don't plan for but we see and we create many millions of dollars in value here by monetizing this option value of our fleet and taking advantage of that volatility in both power and also in gas prices. So as you can see we have a very consistent solid risk management practice that locks up roughly two-thirds of our baseload energy margin for three years but in a thoughtful and value seeking way. We also supplement that with short-term trading activities that adjusts those positions based on operational and value conditions.

So in summary, we're very confident that PSEG Power continues to have one of the best stories in the merchant generation space. For the things that we can control we do: we have a clean fleet, we have outstanding operations, a first-class safety record and a gas and power locational advantage in PJM that frankly is still unmatched by anybody else in the market.

For the things that we can't control we try to influence. We're seeing energy and capacity market constructs improving in all three of the markets to varying degrees that we play in and we're encouraged by the opportunities that are being presented there. We will continue to be active players on the regulatory scene to keep pushing for the best possible competitive market outcomes.

And from a market price perspective, yes we may well see continued price erosion in both absolute and relative power prices but we think not. But if prices do fall we have the tools at our disposal to hedge our assets and to capture a premium from the volatility that many others are not able to do.

THOMSON REUTERS

SI-SSA-0015-13142

So with that I want to thank you for your attention and I will hand the podium over now to Kathleen to moderate your questions. Thank you very much.

QUESTION AND ANSWER

Greg Gordon, Evercore ISI

You've pointed out that power prices haven't fallen that dramatically even though gas prices have fallen. And is that observation more that coal has moved up the stack and gas has moved down the stack, spark spreads are up a lot as you also pointed out, and are you saying that you would expect if we entered into a repeat of what we saw in 2012 where we saw really depressed spot gas prices as we exit this winter that you see some resiliency in power prices because coal is setting the price?

Shahid Malik ***- Public Service Enterprise Group Incorporated - President, PSEG Energy Resources & Trade***

Good question. We are not predicting forward power prices or forward gas prices. We're trying to live with whatever the market gives us.

But what we've observed over the last period of time is that power prices seem to have found some level of floor. And it could be because in fact it almost certainly is because of changes in the dispatch stack. But also I believe there are units out there that just can't operate profitably at much lower power prices and as a result we're seeing a floor being established.

A lot depends on what gas prices actually do. But it appears as though they seem to have reached their bottom and have probably got room to move to the upside rather than continue falling down.

Greg Gordon - Evercore ISI

Great. And then one of the questions I get a lot from investors is there seems to be a consensus that capacity performance product will price higher. The billion dollar question is how much higher.

But there is still a portion of the capacity market that's going to clear under the base product. And is there a scenario where we get a robust capacity performance clearing price but a really low base product clearing price such that the average that you receive isn't that demonstrably higher? Or because of the changes in the DR bidding rules and other aspects could we also see a relatively strong base price?

Shahid Malik ***- Public Service Enterprise Group Incorporated - President, PSEG Energy Resources & Trade***

Again we're not going to predict what we think the capacity price might do for both base and premium. However, I would guess that given what we've seen in some of the changes to the dispatch stack and the retirement of so many units and the additional investment that's going to be have to be made I think we will see an increase, quite a substantial increase in CP prices based on what we're seeing right now.

How that impacts base prices is anyone's guess. A lot depends on what happens to the rules that FERC finally promulgates in conjunction with PJM.

We'll see what happens then. I would be surprised if we see a huge difference in the early years between CP prices and base prices.

Greg Gordon - Evercore ISI

Thank you.

THOMSON REUTERS

Jonathan Arnold – Deutsche Bank

Can I just ask about the comments you made about the FT4 units potential retrofitting with SCRs for capacity performance. Do you expect to make that decision ahead of this coming auction? What would the cost be and where do they stand on dual fuel capability?

Bill Levis ***- Public Service Enterprise Group Incorporated - President & COO, PSEG Power***

Those units currently have dual fuel capability and the rest is TBD at this point. So we have to run it through our process here at this point. But it is an option that has some real possibilities we believe at this point.

Jonathan Arnold – Deutsche Bank

But it could be for this year, is that -- should we take --

Bill Levis ***- Public Service Enterprise Group Incorporated - President & COO, PSEG Power***

I'm not sure what you mean by this year.

Jonathan Arnold – Deutsche Bank

As in for the 2018 / 2019 auction.

Bill Levis ***- Public Service Enterprise Group Incorporated - President & COO, PSEG Power***

Yes, it could be offered potentially in that auction.

Jonathan Arnold – Deutsche Bank

Okay. And then just on the comments you made about risk premium Shahid, you had -- there's a $3 delta on that slide and I think you called out $2 is being attributable to transmission and other issues and then that you also saw an increase in risk premium. Is the other $1 the risk premium roughly?

Shahid Malik ***- Public Service Enterprise Group Incorporated - President, PSEG Energy Resources & Trade***

That's something I can't tell you for competitive reasons. But you can assume some of that is the risk premium, that's correct.

Unidentified Audience Member

Okay, thank you.

Julien Dumoulin-Smith ***- UBS - Analyst***

Hey, good morning. Can you discuss CP in the context of energy markets and just how you think about its impacts in the context of having improved reliability and dispatch?

© 2015 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

And here I'm specifically trying to get at this dynamic between volatile power and gas and specifically CP doesn't seem to hit gas volatility. And so presumably you'd still have some amount of volatility in the power markets but could you elaborate on that a little bit, just what your expectations are of CP on energy markets and also gas volatility?

Bill Levis *- Public Service Enterprise Group Incorporated - President & COO, PSEG Power*

I'll start first. One is I think with the right incentive structure it's a pretty good thing.

The fact is we get paid capacity reserves we should be there when that power is needed. And with the right incentive structure I think it will make sure that those folks who can deliver still participate but the folks will make a decision if they can't deliver they won't. And I think that's good for the market and that's good for prices potentially.

Shahid Malik *- Public Service Enterprise Group Incorporated - President, PSEG Energy Resources & Trade*

I think long-term a couple of things will happen, Julien. One is that the fleet will become more reliable across the industry. That will most likely mean that PJM can have afford a small reserve margin and it probably means that there will be less volatility from units having operational problems.

However, that doesn't discount the probability of volatility from things like being next to a large load pocket such as up here in the Northeast. It doesn't discount the probability of having high volatility because of weather and it doesn't discount the probability of gas pipelines frankly not being able to operate to meet the demands of their LDC customers as well as power generation which will be a lot higher in future years at the very peak moments in the summer and particularly the winter. So I think we'll see continued volatility going forward.

Julien Dumoulin-Smith *- UBS - Analyst*

Can you elaborate just briefly just on the reserve margin side of that? I suppose that's another element lurking in the background it, what are you hearing about that, what is your expectation?

Shahid Malik *- Public Service Enterprise Group Incorporated - President, PSEG Energy Resources & Trade*

We're not hearing anything. I would think actually PJM is trying desperately to try and get this CP product over the finish line because they perceive a real problem from next winter. And as you know FERC last week ruled that they could retain the extra megawatts that they had already bought for this next piece of time but they also ruled that they couldn't buy additional base capacity.

FERC will approve all the things that PJM is looking for. It's hard for us to speculate on what might happen.

We suspect that a good proportion of what PJM is looking for will actually happen and be approved by FERC but we also suspect that FERC will come back and say hey, we want some more information on this and there could be other interveners as well. But going back to your question on reserve margins I think it's fairly -- I haven't spoken directly to PJM about this but if I was in their shoes I would bet that I could afford a lower reserve margin five years hence than I'm paying for for today.

Michael Lapides *- Goldman Sachs - Analyst*

Yes, Michael Lapides of Goldman. I want to make sure I understand something about because a lot of participants are very bullish about the impact of CP and yet when you ask them just generically what you think it costs for a unit that doesn't have dual fuel today to put dual fuel capacity on the numbers aren't staggering.

© 2015 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13145

Lots of people -- there was a study in New England that said $30 to $50 a kW directionally in that range could be a little higher, could be a little lower depending on the unit. If it's inexpensive to add dual fuel relative to what an environmental retrofit would cost, and if everybody who doesn't have it adds it, what drives the bullishness?

Bill Levis - ***Public Service Enterprise Group Incorporated - President & COO, PSEG Power***

I'm not sure I can speak to what others are driving, their thinking, but every units a little bit different. And adding dual fuel can be a matter of do you have a tank on-site or not have a tank on-site, what's the environmental permits one has to get and how many hours can you run sorts of things. So I think every site in every location will be different relative to the cost that it will take to get the dual fuel capability.

The tougher question is some of the older units that what's the level of investment you want to make in them, can you risk having a tube leak in an old coal plant at the worst time and then what is your what I call backup plan for that? Those will be the tougher investment decisions I think to make going forward.

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources & Trade***

Yes, so Michael I think firstly we've seen the adding of fuel tanks and fuel capability to some units, not necessarily ours but I've seen estimates ranging from a couple of million dollars to frankly tens of millions of dollars. Bill alluded to permit limits. That's certainly an operational factor that's going to inhibit some people switching to dual fuel.

But also it's not just about dual fuel it's about performance as well as the asset. So it's making sure that the unit is reliable by doing some proactive preventative maintenance and having in place a system whereby you fix things as soon as they come up. And a lot of folks haven't been able to invest in that because frankly the remuneration hasn't been there from the capacity and energy markets.

So I think it's interesting to see what finally happens. Our belief is that there are folks out there that will need to spend a fair bit of money. We're in the fortunate position of not having to do that and we hope that that will give us an advantage compared to some of our competition.

Bill Levis - ***Public Service Enterprise Group Incorporated - President & COO, PSEG Power***

Some of our units for example were initially designed to have dual fuel capability. We just haven't been using it. It's a matter of restoring that.

In other cases it's a matter of putting all the infrastructure in there to be able to do it. And to Shahid's point we've had some interesting learnings relative to ease of being able to switch from one source to another. And we found some equipment challenges in that area that have to be addressed and for some that may be more expensive than others to deal with.

Rob Howard – Surveyor Capital

This winter we've had some pretty cold days and I was wondering compared to last year's polar vortex and all is the difference and why we haven't seen the spikes as dramatic just better preparedness by the industry or maybe there's cheaper oil, the cold wasn't quite as cold or not quite as widespread? Just wondering maybe how much some of these different factors had a play in it and if one or two of these had gone a little bit differently would that have been enough to really spike things up more dramatically than what we had?

Bill Levis - ***Public Service Enterprise Group Incorporated - President & COO, PSEG Power***

I think there are two things driving it. One is I do think folks are better prepared. We are better prepared and a simple thing like having the units available for oil, we did much more extensive testing on oil coming into the winter season this year than we did last year.

So our units were much better and our operators were frankly better prepared to deal with that. But I see that as a key driver here.

THOMSON REUTERS

SI-SSA-0015-13146

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources & Trade***

Yes, and secondly there's been a change in bidding behavior by some folks that procure the fuel. So last winter we saw folks paying whatever it took to get the fuel then and paying whatever fixed price.

Today they are much more prepared to say I'll buy at the index as opposed to buying at a fixed price. So then the price isn't ratcheted up every single time a transaction is done which is actually healthy for the market. I think it's better that way rather than seeing this very high prices one day and very low prices the next day.

Paul Patterson – Glenrock Associates

I wanted to follow up on Julien's question regarding the impact on the energy market from the CP product. As you know the cost benefit analysis that PJM put out suggested that there be a meaningful decrease in energy prices. Subsequently La Capra, there have been other reports basically indicating that that wasn't accurately done.

I'm just wondering A, where do you guys come down on that and if you do see substantial impact what that impact might be? The second question I have for you is on the PJM independent market monitor's bid cap proposal that would lower the bid cap associated with a complicated mathematical calculation if you see that as having any meaningful impact?

And then just finally on slide 77 you mentioned this impact in Washington, DC of new power plants and transmission impacting PJM West. If you could elaborate a little bit further as to what you see that doing to PJM prices and how much. That's it.

Bill Levis - ***Public Service Enterprise Group Incorporated - President & COO, PSEG Power***

Well I think we'll always stay away from the how much piece. But on your first point on CP and its effect on energy prices Shahid had mentioned during his discussion that actually the most significant issue we see out there that needs to be addressed is that of price formation. If that issue gets addressed I think that will help the energy market significantly.

So that's why we have a lot of work going on in that particular area. The impact of the market monitor statement I think we'll see. And we have our own question relative to what other folks were going to bid at that Safe Harbor provision or not and the Washington, DC business I will let you talk about that Shahid.

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources & Trade***

Absolutely. So with respect to what's happening in DC, I mean as you know we've had low load growth up here but a lot of load growth in the DC area. And as a result you've seen power trying to get from the low cost region which is frankly our area, PSEG Zone and south all the way down into Washington DC area.

Well it works when there's plenty of bandwidth for the transmission system to take that but when there's work being done as there is right now and when there are forced and unforced outages that take place from time to time it causes congestion in those lines, therefore causing DC prices to rise quite significantly. And they have a disproportionate impact on the PJM West price thereby inverting that natural basis.

So we do see a couple of things happening. One, we're seeing some of this transmission congestion being eased as BG&E and Pepco continue with their transmission work and upgrades. And secondly a whole bunch of new generation that's being prepared and planned for, you just need to look at the proposed investment to see Dominion in particular is building two big new combined cycles down there and there are several other independent power plant producers as well that are building new power plants.

THOMSON REUTERS

SI-SSA-0015-13147

In total of about 5,000 to 6,000 megawatts of generation. That will have a sizable impact on prices, probably driving prices down, electric prices down and driving gas prices a little bit higher.

Brian Chin - ***BofA Merrill Lynch - Analyst***

I had a question for you on CP, not to beat a dead horse here, one of the other generators, Dynegy, indicated that they had signed a bilateral contract for $170 per megawatt day recently. To what extent do you believe that that's a valid price point to consider for how we think about CP over the next one or two auctions? And then I've got a follow-up question after that.

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources & Trade***

Did you say $270 or $370? I didn't quite hear.

Brian Chin - ***BofA Merrill Lynch - Analyst***

$170.

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources & Trade***

I know what you said. I was just kidding. I don't know, Brian.

I would be honest with you, you know what prices the capacity market cleared at last year. It was $120 for the RTO which is twice what it was the year before.

This coming year PJM intends to procure 60% to 70% of capacity as this CP capacity. We will engage in forward bilateral, both sales and purchases if we're short and if the number is $170, great.

My suspicion is we probably won't do a lot until the rules are in place but as you know there is a bilateral market both in PJM as well as in New York as well as in New England. And we're active participants in managing our surpluses and deficits around that. $170 for the RTO sounds like a good number, I'll take that to the bank if you think that's right.

Brian Chin - ***BofA Merrill Lynch - Analyst***

And then following up on Paul's question about the Washington, DC transmission line comment, are those upgrades at Bagley, is that incorporated into the CETO; CETL numbers that we see for the next capacity performance auction as well? Does that affect how you think about whether the PJM -- I'm sorry the PSEG zones will continue to be constrained in the future on a regular basis or not?

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources & Trade***

We don't know what inside PJM's blackbox. The utilities themselves have a better idea than we do on the competitive side.

My guess is that PJM has incorporated that or will incorporate that if they haven't already into their forward view of CETO and CETL. So yes I will be very surprised if they weren't aware of it and those transmission upgrades are planned, they are known, they have been approved by PJM. So they are obviously in the works and therefore I would assume that they are accounting for them.

Andy Levy – Avon Capital

Hi, just back on the HEDD units I think it's what about 1,200 megawatts if I'm not mistaken. How much of that 1,200 megawatts realistically have the opportunity to be upgraded and then be able to bid into the auction? And what would be the cost of that because that's where I see I guess potential upside to maybe our thinking because I think most of us don't have -- have those units shutting, so just the thinking on that?

Bill Levis *- Public Service Enterprise Group Incorporated - President & COO, PSEG Power*

The two particular sites that we're looking at there are Edison and Essex. And essentially 400 megawatts site, 500 megawatts site, the cost we're still working our way through and if the cost makes sense and we think we can make money on it then we'll move forward with it.

Kathleen Lally *- Public Service Enterprise Group Incorporated - VP of IR*

We're going to halt any further questions for power until the end because we're right at the appointed hour for Caroline's presentation on the Company's financial position. Thanks.

PRESENTATION

Caroline Dorsa *- Public Service Enterprise Group Incorporated - EVP & CFO*

All right, good morning everyone. Happy to give you a little bit of a financial overview now as always. And don't worry because I know you're worried about Ralph's quiz at the end but my last slide I think is going to help before he comes up to give you the questions.

Okay, so financial review and outlook. Let me start as I usually do with a little bit of a recap of 2014 since we just released our numbers. And this is a nice opportunity for me to talk to you a little bit about how we see 2014 having rolled out in addition to the call discussion that we had last week.

So 2014 I think was a really good year for us. We ended with strong earnings growth and I'll go through that exceeding our guidance; things as you've heard about all this morning are right on track for PSE&G and the capital program. We continue to have a very strong balance sheet with no parent debt and I'll talk a little more explicitly about debt capacity including the parent this time this year and very solid credit metrics.

So where are we going in 2015 and beyond? Third year of anticipated positive earnings growth in 2015 as we know from the guidance that we talked about last week, continuing to control O&M growth even with a little higher on the pension side and I'll talk about that a little bit more. Balance sheet and cash flow, I think this bullet has been in my slides for a number of years and I'm happy to continue to repeat it. Without the need for equity issuance even with the $1.6 billion program that we just announced this morning, as I will show you that does not use up our investment capacity by any means so we have substantial additional capacity to continue to make those investments across our business both in PSE&G and at Power for the growth opportunities that we can see.

We'll see strong cash flow in both of those businesses as we've seen before and that potential for the accelerated dividend growth that we just announced to sustain as we go forward. So just a brief recap on 2014's earnings: Earnings growth of 7% on the full-year basis, exceeding our guidance.

And basically this was all fundamentally driven. Weather between the two companies was essentially flat so it was really quite fundamentally driven.

18% growth in PSE&G's earnings. Now over 50% of our earnings comes from the regulated business and as you know power's results exceeded our guidance and that's what led to our overall earnings results exceeding our guidance at $2.76 relative to our guidance which topped out at $2.75. So a 7% growth this year, 6% growth in the prior year over year and as you know from our guidance which I'll recap in a few minutes still anticipating growth this year as well.

THOMSON REUTERS

So what does that mean in terms of our businesses not just on the earning side but in terms of their cash potential? I'm going to talk about cash flow potential going forward but let's just recap a little bit what our businesses have done. Because one of the things we've talked about many times here and in other forums is that both of our businesses are not just earnings generators, they are positive cash flow generators.

So starting with Power, this is a recap but I thought it was worth just showing the three years prior and then we'll talk about cash from operations for Power going forward. You can see that cash from operations significantly good generation at the Power company. And then cash on a free cash flow basis as we've talked about before ranging from $650 million to $700 million per year.

So our power business generates earnings, it generates cash flow, its capital investment needs are relatively modest. And of course that leaves us opportunity to think about more cash investments for growth. But its required capital investment needs a relatively modest resulting in very significant free cash flow that's available to dividend up to parent, to dividend out to shareholders and to provide more room for incremental investments in the regulated utility.

Of course this significant positive free cash flow also goes along with very significant investment capacity which I'll touch on later. So there's lots of room given what Power's profile is, and how we manage it and what it's been able to deliver to seek more new investment opportunities.

But our other business, PSE&G, has also become a growing contributor to our cash from operations. So if you look back at our financials from 2012 and then up through 2014, you see this number growing from $1 billion to $1.6 billion in cash from operations.

And then of course on the investment side, we've been doing so much in reinvesting that cash to continue to drive the growth in our Company. What's important about this slide and something we've been talking about all throughout the day but I hope this helps boil it down a bit so much of what we been doing in the investments in PSE&G have been with those contemporaneous or formula rate returns.

So what you see is as we put all the money to work on the right side of this graph it's generating cash from operations on the left side of the graph. We have very little that's going to work that isn't in our new investments. Of course they are primarily formula rate or contemporaneous return and that means as we invest our investment capacity we are refilling the pool if you will because those investment start to give us cash back.

That just allows us to talk about an expanded capital program while still talking about incremental opportunity to do more. So it's a nice picture to have both of our businesses be free cash flow cash from operations, positive generators and to have the opportunity to put that money back to work primarily in the regulated utility where it generates even more cash based on its profile but also to seek opportunities to make investments in Power.

So when you combine the story, when you put the picture together, this is our sources and uses for 2014. These are our actual numbers.

You can essentially see them in our 10-K simply adjusted for the securitization cash flows which we always do on the PSE&G side. PSE&G is now the larger generator of cash from operations, something we've talked about trending toward over the past few years.

Again based on the strength of the returns of its capital program. Power's cash from operations as I just mentioned is significant.

And then the PSE&G net debt issuance which I put at the bottom here as the source of cash because I just wanted to show it relative to the investments we're making at PSE&G. And then you can clearly see Power's cash from operations more than handling its cash investment needs leading to significant free cash flow.

Just keep in mind the cash investment that I show here for power if you're reconciling to the 10-K is different from the capital investments because cash for investments also includes nuclear fuel and emissions credits. So that's just a convention of how we show it on the 10-K. So significant cash from operations from both businesses, lots of investment opportunity at PSE&G and still more opportunity going forward.

So let me move from that then and go to the forward look. So on this slide our capital expenditures over the five-year period, if you look at the total program, the $13 billion program for capital expenditures over our five-year period you can see here that as we've talked about earlier, about 70% of our total investment program is really focused on where we're going with growth. And most of that is happening at PSE&G.

So you see the maintenance expenditures for the five-year period for power and PSE&G and then you see the $9.2 billion of growth investments that we have in both businesses. So power growth comprises about $600 million over the period, a little bit more to go on the operate spending, some

THOMSON REUTERS

SI-SSA-0015-13150

Solar Sources spending, AGP uprate the combined cycle as Bill mentioned and also PennEast we put here, even though it is an equity investment in a JV for this purpose we show it here as well.

On the PSE&G side, two separate buckets that we talked about before, growth investments that are related to Energy Strong, solar, and new business. And then $6.7 billion significant to come investments in transmission over the five-year period resulting in that total of $9.2 billion out of our $13 billion or -- 71% of the investments for growth.

I've added then a reconciliation of the potential investments over this same five-year period that Ralph talked about earlier. So the gas infrastructure program that you have the press release for here as well as Artificial Island, those two together over the five-year period could be as much as an additional $1.3 billion leading to a total of $14.3 billion potential over the five-year period.

Now just to do a quick reconciliation because if you look at the press release it talks about a $1.6 billion program as filed. Keep in mind that's a program whose duration would be in total about five years but would not start today, doesn't start obviously now, so you have to think of it is layering in when we finish the gas infrastructure spending in Energy Strong at some point next year and then continuing a bit beyond 2019.

So it's about $1.1 billion of the $1.3 billion is the infrastructure program over the modeling period and then artificial island of about $200 million. So just to tie those things out for you as you look at the five-year spend going forward.

So continuing robust program, again driven by transmission but with growth opportunities, a little bit of Power, Energy Strong at the utility and of course as I just mentioned we'll come back to more room to do even more hence the new filing as of Friday afternoon. So in terms of what that translates into in rate base for PSE&G I thought it would be good just to step through a little bit of where we are now and where we're going with our rate base growth as we go forward. So we ended 2014 with a rate base of $11.4 billion, transmission is about 39% of that rate base and remember we've been talking about this walking up over the past few years.

It was about 35% last year. So our rate base CAGR from 2014 base always basing for the actual through 2017 is 12%. You can see the pieces of what flows into rate base obviously being driven by transmission resulting in a 2017 estimated rate base of $16 billion, about 48% transmission.

And then as we go all the way out to 2019 consistent with the capital program that I just -- the capital expenditures that I just showed on the prior page without the new programs we just filed and without artificial island you can see that getting to slightly in excess of $18 billion, a 10% CAGR on the rate base growth for that full five-year period. And now you can see that transmission is more than 50% of the rate base, something we've been talking about moving toward given the fact that the spend is so heavily weighted toward transmission.

If we have the new program that we just talked about, and Artificial Island, that would move the rate base up to more than $19 billion. It would still be more than half transmission, slightly less in terms of the percentage obviously because most of what would be rolling in there is the gas program. But an 11% CAGR on the rate base, still driven by transmission, still more than half transmission and that's now over a five-year period.

We haven't really talked about five-year period for rate base before. We've typically talked about three and we thought given the extent of the things that we've been talking about today it would make sense to give you a picture of a five-year rate base.

You know, when we thought about doing a five-year rate base one of the things that occurred to us was to take a look at what that has been over the past few years. So I added this slide to the discussion this year to really give you a bit of a comparison on how to think about what we've been doing in rate base growth over the multiyear period. And I think part of the point we've been emphasizing is the continued strength of what we're doing in the regulated utility.

This is a picture of our five-year CAGRs in rate base going back to 2010 and then just rolling it forward every year. I think the point here is of course obvious. We have had a long track record of five-year results of double-digit CAGR in our rate base.

And if I take you back to 2010, that was a rate base that at that point the first calculation of the CAGR was an $8 billion rate base where transmission was just about 16% of the rate base. If you roll forward to 2014 the starting point is over $11 billion in the rate base with transmission at growing more than 40% over -- a 40% bigger rate base with transmission being about 40% of that total.

THOMSON REUTERS

So we have a much bigger rate base that we're talking about, a 40% larger rate base, than we were in 2010 and we're still forecasting double-digit growth in that rate base over the five-year period. So again continuing our track record and that track record continuing for the next five years also is consistent with high single-digit growth in our earnings over the three-year period.

So we haven't given earnings growth forecast for the utility as Ralph mentioned earlier this morning over a five-year period just because things are a little more uncertain on the O&M, etc., but we are giving a three-year guidance for high single-digit growth in the earnings. I've had some questions about how to think about the reconciliation of the double-digit rate base and the high single-digit earnings growth but just a couple of points. Remember we never talked about double-digit earnings growth for more than a three-year period in prior years.

So a couple of things are happening. Keep in mind that bonus depreciation was affected at the end of 2014. That has some annualization effects as you go into 2015, a little more impact in 2015 in the out years than it had in 2014 with a little bit of a pulldown on the earnings.

We're doing a good job I think managing our pension costs over the long term. That's a little more of a near-term, no long-term effect. But we're also watching of course O&M growth as we go forward and of course as Ralph said we haven't had tremendous load growth.

So we never thought that with the base getting bigger it would be double-digit as far as the eye could see. But we're very pleased to have high single-digit growth over the three-year period.

And keep in mind our guidance for 2015 over 2014 at PSE&G and if you look at the growth that's implied in that guidance relative to a high single digit for the three-year period you could obviously do the math and figure out the robustness of the growth that we see beyond 2014 to 2015. So we're very pleased obviously with that story and our ability to sustain that double-digit rate base growth over the five-year period.

So this picture in terms of cash flow goes right all along with that five-year period for rate base growth. And obviously I don't put the numbers in here and I know you'll pull out your rulers and figure it out but I think a couple of points really stand out.

First of all that PSE&G cash from operations just continues to be very, very strong. And that goes right along with the fact of the vast majority of the investments we're making are in contemporaneous or formula rate clause recoveries. Power still continues to generate significant cash from operations and of course PSE&G issues debt consistent with its capital program.

By the way, bonus depreciation does generate about $400 million in cash for us this year. Most of it is at PSE&G. And remember bonus depreciation related to assets put in service in 2014 at 50% or assets put in service in 2015 of a significant magnitude the amount spent in 2014 gets the 50% bonus depreciation.

So the realization of that cash on a real-time basis is really a 2015 event. So PSE&G, significant cash from operations over the period, Power again generating free cash flow as you can see. And if you just look at the planned programs, so here what I mean is excluding the gas filing and Artificial Island, the other thing that you'll see here in terms of the uses of cash is Power net debt.

And that means that Power's net debt is actually going down over the five-year period. Not a lot but a little bit suggesting that we are not using up that investment capacity.

If you flip to the right side where we talk about the potential for the cash flow needs relative to the new programs that I just mentioned you will see that again the investments are higher at PSE&G, the cash from ops is a little bit higher. Power now starts to be slightly issuing net debt but certainly not a lot and not a lot relative to the investment capacity that Power has.

So the picture clears and the bar, the part of the bar that continues to not be here on a year-after-year basis is equity issuance. There's simply so much capacity for us that we don't use it up by making investments. And of course the investments that we're making like the gas filing is a pretty significant investment going forward.

So let's talk a little bit about what that means for the credit metrics. As I said we're not using up all of Power's investment capacity. This picture, similar to one that we've looked at in prior years.

You can see where we landed in terms of FFO to debt at Power. It was well over 60% last year. It's just about -- two years ago, it's just about 60% as we close 2014.

© 2015 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13152

And the number one message it is the average over that 2015 to 2017 period continues to be well in excess of the floor that we set for ourselves at our credit rating of 30% FFO to debt. I will talk about in just one second on the next slide what that translates to into net new investment capacity but I think you understand our story, very strong and consistent on watching those credit metrics and the room that they give us for more investment.

We also give you some guidance here on how to think about the average cash from ops or funds from ops which tend to be similar. Averaging about $1.4 billion over each of the years 2015 to 2017. So signaling that this high credit metric goes along very high cash from ops generation as you would expect since the debt is relatively stable.

And what that means is really potential for significant new growth opportunities and new investments that we will continue to seek across both businesses. So how much capacity do we have? We've talked a lot during the past year in many different forums about power investment capacity as well as parent investment capacity.

As we know in the current environment given the fact that we have no long-term parent debt and we have not had that for a very long time but we know that parent at capacity is truly there, particularly for investments in the regulated business. If we look at our estimate of the average for funds from ops to debt over the period both for Power and then combined because the utility of course has a different profile consistent with its regulated capital structure you can see then both credit metrics are well in excess of the thresholds or the floors that we would set for them for our current credit rating.

So what that means is we have significant investment capacity both at Power and at Parent. And if you think about how this translates because of the utility's 2 to 1 essentially ratio of using this investment capacity, think of it as the equity portion of investments made at PSE&G, then we have the capital structure which is the debt portion, you can see that this capacity if it were fully used at PSE&G and if it were fully used in PSE&G in ways that did not generate clause recovery and therefore cash coming back, so those are two big ifs, the latter being not the way we've been making investments, you could use this capacity for over $6 billion in regulated investments.

You of course can also use certainly the Power capacity for investments in power. And when we talk about capacity again we just think about using it without cash coming back. But of course all of our investments are done to look at and look for cash generation coming back.

So bottom line to this, plenty of investment capacity here. As I showed you on the previous sources and uses slide the $1.6 billion filing for the gas program, even though it would use about spending of about $1.1 billion, as you could see from that prior slide doesn't get anywhere near using up this investment capacity because of the strength of the cash generation of the clause recovery. So lots of opportunity bottom line to seek investments in both businesses going forward.

Let me turn now for a second to pension and O&M because we've had some conversations about this on the side this morning. So pension obviously an important part of our total O&M picture and one that as you know because we don't smooth year-end asset values has sometimes can be a little more volatile for us in down markets which is not what we had last year.

So coming into this year we have a 93% funded ratio on our PBO assets at $5.3 billion and PBO at $5.7 billion. We had a one-year return on our pension trust of about 9% on a three- and five-year compound annualized basis. You can see our returns are double digit on the pension trust. We take a long-term strategy and that has we think significantly paid off for us.

So we have very minimal contributions that we've been making to the trust over the three-year period, less than $50 million in total in the aggregate over this three-year period. We will have a slight increase then to our pension expense in 2015. Given remember where we were last year we actually had pension income so some negative expense of about $0.02.

This year we will have pension expense slightly less than $0.07 and given just carrying out our investment assumptions likely coming back to pension income by 2017. So what turned that around? Obviously not our investment program which continued to deliver in excess of our forecasts, our assumed rate of return of 8%.

Two things that I know you're aware of because everyone who has a pension trust has been talking about them. One is the discount rate. Everybody was forecasting interest rates higher last year at the beginning of the year and I think when everyone forecast interest rates higher they tend to just turn and go lower.

THOMSON REUTERS

SI-SSA-0015-13153

So they ended up lower and so the discount rate ended up at 4.2 versus a year ago's discount rate of 5%. And then as you probably are all aware the Society of Actuaries adopted a new mortality table.

The good news is we're all living longer, the bad news is this has a little bit of impact to pension expense. Those are two things of course not in our control.

The thing that is in our control, how we fund the plan and how we invest the plan, continued to pay off for us. But those two things are the primary -- the drivers really of the changes in our pension expense relative to our plan expectations and the discussion we had last year.

In terms of rolling forward in total to what that means for in the aggregate O&M growth we see and we continue to talk about this a low single-digit growth in O&M over the 2014 to 2017 period 1.4% which is we think a very good number relative to the fact that of course labor and fringe overall is about half of our O&M expense. You can see that for the businesses transmission and distribution if you put those together the utility overall is about 2.2%, Power is about 1%.

Transmission is a slightly negative number given some one-time costs that we had in the transmission O&M for 2014 that put it up just a little bit higher than normal and then some allocation factors between transmission and distribution. But overall that 2.2% in the utility about 1% at Power.

I know you will remember that last year these were negative numbers so negative expense growth. But obviously keep in mind that we have coming into this year if you remember last year's picture it was actually quite a bump down in 2014 because of the swing in pension expense from expense to income and then there was a little bit of growth from 2014 on.

We've not taken that pension benefit in 2014 so now we are in the modest growth as we go from 2014 to 2017. But obviously still a kind of expense growth that we're pretty pleased with given the fact that it reflects ongoing cost management all across the Company not just in the fringe line but of course fundamentally driven by what Ralph and Bill do in the businesses every day.

So wrapping that up in terms of what it means for earnings, this is our guidance for 2015 as we talked about during the earnings call. You can see the growth that we still expect to see at PSE&G and then power's guidance relatively consistent with power's performance in 2014 leading to guidance of $2.75 to $2.95 overall giving us the opportunity for continued growth for a third straight year and regulated mix in earnings you can see down below as well. So we're very pleased to have this guidance reflecting what we really feel are the fundamental strength of both of our businesses and continuing our PSE&G investment program.

Of course earnings is one way in which shareholders get paid and the other of course is the dividend. And so this slide which you've seen before in our decks from the earnings discussion last week showing dividend increase, 5.4% as Ralph mentioned earlier growing from 2014 to 2015 you can see our payout ratio and given where our credit stats are and our cash flow, very comfortable place in terms of payout ratio. And then importantly the opportunity for really meaningful and sustainable dividend growth the message that we're trying to send you today obviously and I think supported by the strength of what our businesses expect to deliver and have delivered pretty consistently over the period, not just in earnings but also in cash.

I also give you just a quick recap of some of the sensitivities that we have talked about many times before. Since we don't give you Power guidance other than this year we like to give you some view of how to think about the sensitivity of the power business to some changes and some key factors like gas, spark spread, dark spread and capacity factors, the things that Bill and Shahid have talked about. Let me just point out for you as a reminder to marry this slide with the slide that was in Shahid's deck about our hedging program.

If you look at the natural gas price changes and their impacts on Power bottom line you can see the implications of the hedging position that we currently have. So changes in gas prices not having a dramatic impact on our earnings in 2015 because we are 75% to 80% hedged as you go out to 2016 and 2017, 50% to 55% hedged in 2016, 25% to 30% hedged in 2017. But do keep in mind it's important when you think about the gas price impact on to earnings that in 2017 even though we're 25% to 30% hedged overall, we are 40% to 45% hedged in the baseload and so obviously that has implications relative to the gas price volatility.

You may remember on the call I talked about a $0.24 impact from a dollar change in gas prices if we were totally open but that's not the case even in 2017 because as Shahid talked about we have already layered on some hedges. Then you can see the factors that swing earnings relative to spark and dark spread and capacity factor and then the estimates 2015 and going forward of how to think about implications for incremental investments in the utility, just multiply by the equity ratio and the return, changes in sales, changes in O&M and then changes in ROE applied to that segment of our business.

THOMSON REUTERS

SI-SSA-0015-13154

Remember transmission getting bigger as we go forward leading to those penny differentials. So a good way to think about volatility for factors as you look to fill in your models on a go-forward basis.

So with that I'll sum up and then will might be happy to take your questions. As I said our guidance exceeded our revised expectations. We continue to anticipate a third year of positive earnings growth and then in terms of what we've been doing in the utility fifth straight year of double-digit five-year growth in rate base and high single-digit earnings growth on a three-year basis.

That's Ralph's point 1, the utility story is intact and continuing. Power's continued focus on operational excellence, market expertise and financial strength, I think as Shahid and Bill told you the power story just continues to deliver.

And then the strong balance sheet and cash flow supporting our capital program and just leaving us continued room to seek out more opportunities. And then the dividend growth consistent with our long history. So those are actually Ralph's four points right there.

So that's something we're pretty proud of and frankly something we look forward to continuing to deliver, seek out more opportunities, continue with our discipline, continuing with operational excellence to allow us to deliver what we've been delivering relatively consistently. So with that, thank you for your time and I know Ralph will come back up and join me at the podium and we'd be happy to take your questions.

QUESTION AND ANSWER

Dan Eggers – Credit Suisse

Well I guess I get the luck of the draw sitting closest to Kathleen to ask a question on slide 101. But when you look at the $6 billion of capital that's available to be reinvested relative to the $1.3 billion of capital sitting out there and that's actually longer than the 2017 time horizon, how are you guys thinking about the balance sheet in that context? And given how it gets less and less efficient given the amount of cash you have available to reinvest, when do you guys start expanding your horizons of what you're willing to do with the capital?

Ralph Izzo ***- Public Service Enterprise Group Incorporated - Chairman, President & CEO***

So thanks, Dan --

Unidentified Audience Member

Everybody wants to know about this, I guess.

Ralph Izzo ***- Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Our prioritization hasn't changed. Bill talked about a $600 million Bridgeport Harbor plant that we didn't clear the auction. That's something we're not going to give up on.

Ralph talked a little bit about REV which we're not active in in New York State but we have our version of that in utility 2.0 on Long Island. There's still a $345 million program that we put on the table there but we won't hear about that until the end of the year.

We took a $10 billion utility program in the last five years and now it's going to be anywhere from an $11 billion to $12 billion. And you should assume that since we've been doing that every year since we've been coming here for the last seven years that that's not going to drop off a cliff.

We've I think delivered on the dividend growth. So it's reinvest in the business, grow the dividend and it would be nice if we'd stop getting penalized for being able to return cash so quickly but I realize that maybe that's me being a little defensive. So it's really more of the same just more and more of the same.

THOMSON REUTERS

Unidentified Audience Member

If I were to jump to slide 64 earlier in the presentation when you guys show the list of PEG Power opportunities for reinvestment, not a lot of those have turned to conversion yet. How do you guys think about the need for visibility to returns and the ability to contract out those future cash flows before you're willing to make some of these investments with either Bridgeport or Sewaren or wherever that capital could go?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Well I want to make sure I interpret that question --

Unidentified Audience Member

So I guess what's going to get you guys over the line to make these investments? Is there a visibility to cash flows that you need that you're not seeing right now or the return threshold is not high enough? And what kind of reforms do we need to see to make you guys more comfortable to spend that money?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

It's more the latter. When we do the modeling of where we think the forward prices are and we start with the market then we bolt-on our fundamental view beyond the three-year horizon that the market ostensibly is liquid although that's becoming a shorter and shorter time frame.

If it doesn't achieve our hurdle rates we don't go forward. So it's really just whether or not -- demand isn't growing very much anywhere in this part of the country. So the supply retirements that were expected to take place by and large have been factored into the market.

So you've got a tiny, tiny growth rate in future demand and I think that's why you see us and others tucking in small expansions to meet that demand growth. And that seems to be the most economically efficient way to do it.

Caroline Dorsa - ***Public Service Enterprise Group Incorporated - EVP & CFO***

We certainly see a lot. So we model a lot, we look at a lot. It's not like there aren't transactions out there but they obviously have to hit the hurdles.

Greg Gordon – Evercore ISI

Very quick follow-up to that question your power team did mention that they consider your portfolio in New York and New England to be subscale. So is there a scenario where you either get rid of that portfolio because it's subscale or you look for opportunities to get to scale?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Yes, and yes. We demonstrated that in Texas. Candidly in Texas the bid and ask spread was quite large in terms of what we were willing to bid and what others were willing to give us for our units.

We've come close on probably three or four occasions so I think we're going to have a little bit more patience, plus just the geographic proximity of New York and New England to our PJM footprint makes us a little more patient.

The answer would be yes we would -- we continue to look for opportunities to get bigger there. But at some point in time you would if that spread between what we that the market was worth and what others thought it was worth got large enough we would sell.

THOMSON REUTERS

SI-SSA-0015-13156

Paul Patterson – Glenrock Associates

I wanted to first of all ask about how you really see merchant expansion. Clearly you guys are doing some sort of low-hanging fruit minimal investment for upside and what have you and you've looked at some other potential opportunities but in terms of merchant exposure in general, are you guys thinking at all perhaps expanding really substantially in it given how much you guys have now become regulated, just where you feel the mix is or where the sweet spot is in that? That's number one.

And then number two, given the Exelon Pepco merger and given the amount of leverage that they seem to be putting on that deal and the BPU's recent approval of that transaction in New Jersey, what do you guys think about the potential of really using more leverage to turbocharge some potential opportunity out there?

Ralph Izzo *- Public Service Enterprise Group Incorporated - Chairman, President & CEO*

Thanks, Paul. So on the first question, a version of that we typically get is what is your optimal regulated, unregulated ratio that you're seeking to achieve and our answer always is there is none. There is no magic ratio we're seeking to achieve.

Bill and Diana Drysdale constantly come up with new opportunities in the purchase power agreement supported renewable solar world and we'll put money there because that seems to achieve our desired return expectations. It looks like the most, the strongest candidates for achieving our return expectations are capitalizing on existing sites, getting another 150 megawatts out of the combined cycles, tucking in a 200 megawatt peaker. Even Bridgeport Harbor, the one that just we tried to do and just missed on that's an existing site.

It's not an existing unit per se, it's a brand-new unit, but it's on an existing site. So it looks like incremental generation additions seem to be the most competitive alternative (technical difficulty) have the earnings per share of the Company we have those opportunities to do that in the form of share repurchase. That is the number three on the priority list of one, two and three reinvesting in the business number one, dividend growth number two and then share repurchase number three.

We're not big fans of that. It seems that people do that and it's not always clear that the market is inefficiently pricing the stock so that you can capitalize on something. If there is that discontinuity in options one and number two aren't available to us then we would use capital that way. But our Board nor I am a real big fan of what we would call financial engineering.

We just look for a really solid operations and good investment opportunities, good from the point of view that they achieve our hurdle rates and a benefit customers. Caroline, you may want to add something --

Caroline Dorsa *- Public Service Enterprise Group Incorporated - EVP & CFO*

No.

Julien Dumoulin Smith - UBS

Just following up on your comments before about the double-digit utility CAGR on the rate base versus the earnings, can you elaborate a little bit more around the bonus depreciation in the pension expense/income? So just throwing rate back at you I would expect that expense swinging to an income would be a benefit as you roll forward from 2014 through 2017.

You talk about bonus depreciation. Can you elaborate what the bonus depreciation impact is and then also in that context talk about the earned ROE implied? So I suppose you earned your ROE to a large extent last year, I suppose that's what you said the other week.

THOMSON REUTERS

SI-SSA-0015-13157

Caroline Dorsa - ***Public Service Enterprise Group Incorporated - EVP & CFO***

Right.

Julien Dumoulin Smith - UBS

It seems as if you're alluding to some amount of compression through that period. Am I hearing you correctly?

Caroline Dorsa - ***Public Service Enterprise Group Incorporated - EVP & CFO***

Sure. So on the bonus depreciation, so the bonus depreciation effect is more in 2015 forward than it was in 2014 because of the implications of the total impact to the formula rate.

So the bonus depreciation impact that we talk about in the 10-K is $21 million for 2015 so it's just shy of $0.03 and that's not the impact that it had in 2014. It was a lower impact in 2014 of about a penny. So it has a little bit of a dampening effect on the growth going forward.

On pension so I tried to distinguish the impact on pension from 2014 to 2015 versus 2014 to 2017 because I did say we would come back to income by 2017, right? The impacts to pension are primarily a 2014 to 2015 effect if you just look absolute. So we have to comparisons we made.

One is to last year when we were talking about pension income just continuing to improve. This year I'm talking about income going back to expense and then coming back around to income by 2017.

So not at the same level as it was last year when we were just forecasting income to continue to grow. But the pension income in 2014 goes to expense and goes back to income by 2017 so it's not a huge driver of the point-to-point.

The point-to-point is just the inflation on the other cost which is still modest on an overall basis obviously for the utility overall at 2.2%, not specifically pension fringe and other costs driven. So bonus depreciation a little dampening on the margin side and then a little bit of O&M cost not primarily related to pension if you're doing point-to-point. And also of course as we've talked about we don't have tremendous load growth as Ralph talked about as well, so that would be a nice boost if we had a little more of that on an ongoing basis.

With that bigger base we've always said it wouldn't be double digit forever. Pretty happy at high single digits and as I mentioned just a few minutes ago if you look at where we are on a 2014 to 2015 basis wherever you want to put us relative to our guidance and you think about high single digit over the three-year period, you can do the backwards math and think about what that means for the years beyond this particular year when pension really does have an impact 2014 to 2015.

In terms of the ROE we're very comfortable with our earned return and very comfortable with our expectations for filing a rate case in 2017 as we agreed under Energy Strong. So I would probably leave it there for the ROE.

Steve Fleishman – Wolfe Research

So sorry to ask the same question again in terms of available capital but when you give the slide with a $4 billion number and then the $6 billion investment number that's versus this minimum threshold of balance sheet. But your Company's generally always had a strong balance sheet and I'm not sure when you say minimum threshold that's really where you'd want to be or not. Maybe you could give a little more sense of when you think about available capital where do you want the Company to be relative to that and just as opposed to a minimum threshold?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

I'll start and then Caroline can pick up. What we've consistently said is we want to be a solid investment grade business. We believe we can be a solid investment grade business and achieve given our business mix now with the utilities that merchant and FFO to debt of 30%.

© 2015 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

So we're not worried about getting down to 31% or 30%. It's not -- we're not putting a band of safety above that and pretending that 30% number is a fabrication and we really want to live at 40%. That's not the case at all.

Caroline Dorsa - ***Public Service Enterprise Group Incorporated - EVP & CFO***

You know, as I said the numbers and the balance sheet capacity are now showing both Power and Parent just to give you a sense of the extent because we know there's been more discussion of parent debt. Keep in mind what that means in terms of investments would be if those investments don't return cash.

So we've had this sort of rich person's problem which we're not really unhappy about which is those utility investments have generated cash flow coming back as we've put the money to work without the lag that you normally would think about in utility investments. You put all the money out then you go for the rate case and figure out what you get back.

So we're very comfortable that that gives us the opportunity to think about over $6 billion if we were to use it all in the utility. We don't mean to imply that the only place we look to use that investment capacity is at the utility per Ralph's earlier comments and what Bill has talked about. We continually search for good assets on the power side that can enhance our portfolio there as well.

The power investment capacity I like to think of as available for either business. The parent investment capacity, generally speaking you would look to us thinking about that more for the regulated side, the equity portion of the regulated side. So Power capacity free for both parent capacity, generally for regulated-oriented investments.

Ashar Khan - ***Visium Asset Management - Analyst***

If I'm looking at this page 103 which shows the O&M slide, I don't know if it's drawn to scale but if I look at it we have taken most of the cost increase over this time period in 2015. And so really the O&M is if one looks at it scale flat from 2015 to 2017, is that what you're projecting that the hits have all been taken in 2015 and we are going forward really it's as you said on earnings it's higher and so on O&M it's flat. Is that the right way to think?

Caroline Dorsa - ***Public Service Enterprise Group Incorporated - EVP & CFO***

Yes, but without giving you specific numbers as I was mentioning it's kind of the inverse of what we had last year. So last year we had a three-year picture of O&M that started with a 2013 base and had a 2014 negative growth because of the significant impact of pension which was without trying to give you too many pension numbers but on a year-on-year basis $0.08 positive between 2013 and 2014.

Now we've got that 2014 to 2015 effect which is significantly driven by what's going on with pension and OPEB because of the discount rate pension and the actuarial as well that does give us that bump. But you're right, then you see a more moderating trend which is how we get the trend of 1.4% over the three-year CAGR. That really, just to reemphasize, that is not about just pension.

That is about ongoing everyday O&M management of both businesses. As Bill mentioned the change in what we're doing with the nuclear security and a lot of other things like that to make sure that pension swings around for some things we can't control; everything else we can control, if we didn't we wouldn't have this picture. So yes you're right and you're trending and it reflects not just what's going on with fringe and pension but what's going on across the Company.

Ashar Khan - ***Visium Asset Management - Analyst***

And if I can have a follow-up question, this was in Power's results slide 49 where you said that I guess last year and this year where the portfolio has this ability to gather nearly 10%, $60 million from the weather basis, fuel, gas costs, spark and dark spreads, ability to perform really well. So can you say that this year should have started off pretty well because we had a very sustained winter and I think we had the added flexibility of low oil

© 2015 Thomson Reuters. All rights reserved. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13159

prices and a lot of our as we were hearing that a lot of our generation has dual fuel capability of using oil and oil tanked and should have been helped. So all this would suggest what I heard with the volatility and prices and all that that we should have started off the year pretty damn good.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

You never disappoint, Ashar. I was wondering who would ask us to have our first-quarter call today. So we'll fill you in I think it's May 1 on that.

Greg Gordon - ***Barclays***

Yes, thank you. You've had some success at the Enterprises and other level on growing the solar business. Where do you see that going forward with the opportunities?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

So, Greg, the solar businesses in the power results nowadays. So the enterprise and other is largely Long Island and any interest finagling that Caroline is able to do that benefits the whole entity. So the Solar Source numbers are in PSEG Power.

That's from a geography point of view. From a substantive point of view we plan to grow it. As I mentioned Bill Levis and Diana Drysdale have attacked a segment of the market that is the 5 to 25 megawatt which doesn't get the same attention as the 600 megawatt and the rooftop but it's ones that now we're in nine different states and we're developing a pipeline of opportunities that are brought to us by developers.

We don't have a big development team and we basically purchase them and own them and operate them for the long term. So we'd like to do more of that. But they are all minimum 20-year PPAs, some of them are 25-, 30-year PPAs.

Caroline Dorsa - ***Public Service Enterprise Group Incorporated - EVP & CFO***

I'd just add because I had the capital numbers in there I just saw the piece that was Power - growth, you can easily back this out. So about half of what is in there for the $600 million is Solar Source, about half. There's AGP and the rest of the Peach Bottom uprate and PennEast but about half is Solar Source.

Michael Goldenberg - Luminus

Ralph, Caroline, just to follow up on Ashar's question, when you issued 2015 guidance was it based on latest available web information up until the date of the call and incorporated or was that guidance done early in the year? Maybe that's --

---

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

So we issued guidance assuming normal weather for the year.

Caroline Dorsa - ***Public Service Enterprise Group Incorporated - EVP & CFO***

That's right.

Michael Goldenberg - Luminus

So it did not incorporate whatever might have just (multiple speakers) thank you very much.

© 2015 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13160

Paul Fremont - Nexus

Just a quick question on I guess the gas spending. Last year I guess when you filed Energy Strong there was a lot of opposition, political opposition and intervener opposition in the case to spending incremental amounts.

Are you expecting similar opposition or the same parties to object in this year's proceeding? And if not what would make this spending different than what you had proposed last year? And for 2017, how much -- if you got everything you asked for how much would rate base go up in 2017?

Ralph Izzo *- Public Service Enterprise Group Incorporated - Chairman, President & CEO*

So there were four critical issues on Energy Strong, Paul. One was allowed ROE, two was recovery mechanism, three was size of the program per year and four was duration of the program.

I think to Ralph's and his team's credit they've said uncle, here's the allowed ROE we've agreed on in the last two sets of discussions we've had. It was 10 months ago that we agreed on a recovery mechanism in Energy Strong so we'll file the same recovery mechanism.

I would hope that 10 months hasn't changed a lot and therefore that's equally acceptable today. But time will tell. So I think Ralph said himself the question will be the size of the program not so much from a run rate per year because whether you turn a 100-year replacement program into a 30-year replacement program to me you're still waiting too long but more in terms of how long we'll be allowed to do that without being asked to come in and refresh the program.

So will that be three years, five years, four years, two years. So my expectation would be that we put in a perfect filing and it should just be agreed to next week but that's probably not reality and there will be some discussion around the duration of the program.

Caroline Dorsa *- Public Service Enterprise Group Incorporated - EVP & CFO*

And then on your question relative to the rate base so think of it this way the numbers that I have here for rate base for the gas program is $1 billion. I quote over the five-year period but it's really 2016, 2017, 2018 and 2019 because we are not assuming that that program starts in 2015.

So it starts somewhere into 2016. So what you really have is four years of rate base growth but the first year is not a full year. So I'd say a little bit less than half of the $1 billion would be in the rate base by the end of 2017.

So that's the right way to think about it because you've got some trailing of the 350 for Energy Strong carrying into 2016, then you start this program partial year, then you have a full year in 2017. So think of it as a little bit less than half.

Ralph Izzo *- Public Service Enterprise Group Incorporated - Chairman, President & CEO*

So in the capital deployment conversations we keep having, I mean obviously the gas system given the increased use of natural gas, given the concern over fugitive emissions is an area that's going to garner continued if not growing attention.

Kathleen Lally *- Public Service Enterprise Group Incorporated - VP of IR*

I think that's all the questions, Ralph. So if you wanted to --

THOMSON REUTERS

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President & CEO***

Yes, so I'm not going to quiz anyone. Obviously we had a little fun with that.

But the four main points that we've tried to bring home are we've taken a $10 billion utility capital program and turned it into what I believe will be a $12 billion program. Right now we're just talking about $11 billion. That's going to give us double-digit rate base growth for five years.

We've done a good job of managing customer bills. We have strong tailwinds on those customer bills out through 2017 with some strong potential for energy efficiency I think once we look out beyond 2017 given the agreement in principle we've reached with the staff recently.

So the utility story is very, very much intact. Power's flexibility just keeps showing up in so many ways. I think we're all looking forward to using that diversity of its assets, the flexibility of the fleet and a new CP-driven RPM auction.

The balance sheet is as strong as it's ever been. There's no need for additional equity, the credit metrics are strong. You see the additional capacity for up to $6 billion in regulated-type investments.

The dividend growth that we just came through with last month is something that we believe is sustainable over the planning horizon. I thank you for being here especially given the challenging weather conditions and as always Kathleen and Carlotta are available for any questions that you have after today and we look forward to seeing you at future conferences. Thank you.

and for our stakeholders.

SI-SSA-0015-13163

Forward-Looking Statement

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute “forward-looking statements” within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words “anticipate,” “intend,” “estimate,” “believe,” “expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC), including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or the price of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulation, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- any deterioration in our credit quality or the credit quality of our counterparties,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- delays or unforeseen cost escalations in our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- increases in competition in energy supply markets as well as for transmission projects,
- any inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies, and
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

GAAP Disclaimer

PSEG presents Operating Earnings in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings is a non-GAAP financial measure that differs from Net Income because it excludes gains or losses associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting, and other material one-time items. PSEG presents Operating Earnings because management believes that it is appropriate for investors to consider results excluding these items in addition to the results reported in accordance with GAAP. PSEG believes that the non-GAAP financial measure of Operating Earnings provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends. This information is not intended to be viewed as an alternative to GAAP information. The last slide in this presentation includes a list of items excluded from Net Income to reconcile to Operating Earnings, with a reference to those slides included on each of the slides where the non-GAAP information appears.

These materials and other financial releases can be found on the pseg.com website under the investor tab, or at http://investor.pseg.com/

Summary and Q&A	
Conference Conclusion	

SI-SSA-0015-13166

STRATEGY – DELIVERING GROWTH

Ralph Izzo
CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER

PSEG
We make things work for you.

SI-SSA-0015-13167

PSEG's Strategy

Investment program delivering results

Operational Excellence: Maintaining reliability and improving performance as we control costs in low price environment

Financial Strength: Strong financial position supports investment program and dividend growth

Disciplined Investment:

- Transformed business mix
- Robust pipeline of opportunities

Results

- Project 3rd year of EPS growth
- Increased rate of dividend growth
- Best in class utility growth rate
- Stable business mix with upside potential from power markets

SI-SSA-0015-13168

Two complementary businesses

A stable platform, each with growth opportunities

Electric & Gas Delivery and Transmission

Strategy: Investments aligned with public policy and customer needs

Value Proposition: An $11 billion infrastructure program – focused on transmission – produces double-digit rate base growth through 2019

2014

Assets $22B
Operating Earnings $725M

Regional Competitive Generation

Strategy: Diverse (fuel and dispatch) fleet geographically and environmentally well positioned, with investments to enhance competitiveness

Value Proposition: Provides substantial free cash flow in current environment and upside from market rule improvements

2014

Assets $12B
Operating Earnings $642M

SI-SSA-0015-13169

ASSETS AND OPERATING EARNINGS ARE FOR THE YEAR ENDED 12/31/2014.
PSE&G AND POWER DO NOT ADD TO TOTAL DUE TO PARENT AND PSEG LONG ISLAND ACTIVITY.
SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/NET INCOME TO RECONCILE TO OPERATING EARNINGS.

Delivering on commitments and realizing growth

Operational Excellence	• PSE&G: Mid-Atlantic Reliability Award (13th consecutive year), top ranked among eastern electric and gas utilities in business customer satisfaction • PSEG Power: Record output from combined cycle units • PSEG Long Island: Demonstrated management and integration capability through a successful transition in first year • PSEG: Cost-control benefits continue
Financial Strength	• Earnings performance exceeded guidance • Cash flows and business mix support strong credit ratings and ability to fully fund robust investment pipeline without issuing new equity • Increased rate of dividend growth in 2015
Disciplined Investment	• PSE&G ✓ Transmission capital program execution and growth ✓ Energy Strong infrastructure program underway ✓ Energy efficiency program extension ✓ Further growth planned – Gas System Modernization Program • Power: Unit uprates, PennEast Pipeline, Solar Source

SI-SSA-0015-13170

Operating Earnings

Disciplined investment program and focus on operational excellence have supported growth

Power's diverse fuel mix and dispatch flexibility continue to generate strong earnings and free cash flow in low price environment

PSE&G's investment program has driven double digit compound annual earnings growth since 2010

SI-SSA-0015-13171

PSEG

*SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/ NET INCOME TO RECONCILE TO OPERATING EARNINGS. E=ESTIMATE
** 2015 PERCENTS USE MIDPOINT OF EARNINGS GUIDANCE.

Robust pipeline of investment opportunities

supports growth objectives

PSEG Capital Spending

2010 – 2014: $12.6 Billion | **2015E - 2019E*: $13 Billion**

2015E–2019E:

- $1.3B of capital for Gas System Modernization Program and Artificial Island would be incremental

*INCLUDES ALL PLANNED SPENDING. **ENERGY STRONG EXCLUDES RISK AND CONTINGENCY. ***POWER CAPITAL SPENDING EXCLUDES NUCLEAR FUEL. ****INCLUDES PENNEAST PIPELINE EQUITY INVESTMENT OF $0.1B. E=ESTIMATE. DATA AS OF MARCH 2, 2015.

SI-SSA-0015-13172

Balance sheet strength supports capital allocation

Timeframe	Actions taken
2010 – 2014: Transformed business mix	• Applied $16 billion towards investments and dividends • Improved credit ratings • Monetized Energy Holdings' portfolio • Strong balance sheet sustained during period of low power prices, while increasing the dividend
2015 – Forward: Strong financial position supports continued growth	• Increased rate of dividend growth in 2015 • $13 billion investment program through 2019 • Gas System Modernization Program and Artificial Island increase capital program by $1.3 billion through 2019 • Financial capability supports further expansion of the current capital plan

SI-SSA-0015-13173

PSE&G's investment program

Meeting public policy goals and customer needs

*SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/ NET INCOME TO RECONCILE TO OPERATING EARNINGS.

SI-SSA-0015-13174

Containing customer bills while investing in the system

PSE&G Typical Residential Customer Bills*

- PSE&G customers' combined electric and gas bills declined 23% over the period.
- Low gas prices drove rate decreases; in addition, gas customers received bill credits of ~$400 in total from 2012 through 2014.

SI-SSA-0015-13175

PSEG

*FOR ALL YEARS THE BILLING ASSUMES 7,200 KWH FOR ELECTRIC AND 1,010 THERMS FOR GAS ANNUALLY. E = ESTIMATE

PSE&G's robust capital investment pipeline

- Planned capital spending expected to drive double digit rate base growth and high single digit EPS growth through 2017
- Transmission expected to grow to >50% of rate base in 2019
- Gas System Modernization Program and Artificial Island investments would be incremental
- Seeking to broaden platform to expand energy efficiency and other investments

SI-SSA-0015-13176

Power's fleet has the desired attributes to be successful in today's and tomorrow's market

Economic Drivers	Outlook	Combined Cycle	Nuclear	Scrubbed Coal	Peakers	Renewable
Energy Margins	• Low natural gas and energy prices • Robust portfolio of gas pipeline contracts	✓	✓	✓	n/a	n/a
Capacity Markets	• Tightened rules proposed for capacity performance	✓	✓	✓	✓	n/a
Environmental Regulations	• Tighter air emissions standards	✓	✓	✓	✓	✓
Location	• Assets in well-designed markets, premium regions • Opportunities on brownfield sites	✓	✓	✓	✓	n/a
	PSEG Power Capacity (GW) Total 13 GW	3.2	3.6	2.4	3.7	0.1

- **Largest nuclear site** in the eastern U.S. and ownership in **large, fully scrubbed coal facilities** at Keystone and Conemaugh provide **economies of scale** that enhance energy margins in current low market, and provide for upside potential if prices improve.
- **Dual fuel peakers** meet reliability criteria in capacity markets and provide option value in energy market. Opportunity exists to repower peakers that do not meet NJ HEDD environmental regulations.

SI-SSA-0015-13177

Power – Growing value by improving market rules and developing investment opportunities

Value Source	Opportunities and Actions Taken
Improving rules will better recognize value of our fleet	• PJM's Capacity market – 2014 limits on demand response and 2015 Capacity Performance proposal • Demand response treatment at U.S. Courts / FERC • Energy price formation at FERC • Increasing air standards through Federal and State regulations
Our footprint provides growth opportunities	• Nuclear and Combined Cycle plant uprates are underway • Brownfield expansions at existing sites ➢ New peakers built at New Haven and Kearny sites ➢ Continue to explore further opportunities • PennEast pipeline - equity investment and gas portfolio enhancement • Solar Source owns ~123 MW*, with significant project pipeline • Continue to seek opportunities to expand the fleet

*PROJECT SIZE IN MEGAWATTS SHOWN IN DC (DIRECT CURRENT), AC EQUIVALENT IS 96 MW.

SI-SSA-0015-13178

PSEG Annual Dividend

An increased dividend growth rate with potential for consistent and sustainable growth given our business mix and financial position

	2011	2012	2013	2014	2015E
Payout Ratio	50%	58%	56%	54%	55%*

*2015E PAYOUT RATIO REFLECTS THE MIDPOINT OF OPERATING EARNINGS GUIDANCE. E=ESTIMATE

SI-SSA-0015-13179

Focus areas over business plan horizon

PSE&G

- **Capital program execution** – Transmission, Energy Strong and additional programs
- **Operational excellence and cost control**
- **Regulatory framework**
- **Continue to develop incremental growth opportunities**

PSEG Power

- **Operational excellence and cost control**
- **Strong performance at Nuclear and Fossil** to maximize fleet value in dynamic markets
- **Monitor and shape market rules** - Capacity markets and environmental regulations
- **Develop growth opportunities**

PSEG Long Island

- **Continue execution** – Integration and achievement of performance metrics

SI-SSA-0015-13180

PSEG's Value Proposition

- A stable platform with predictable earnings and a robust investment pipeline
- PSE&G - Best in class utility performance and growth profile
- PSEG Power - Well-positioned fleet that generates substantial free cash flow in this market environment with upside for improvements in pricing
- Strong balance sheet - Supports strong credit rating, growth objectives and the potential for sustainable dividend growth

SI-SSA-0015-13181

2015 PSE&G Business Review & Outlook

MARCH 2015

PSEG

We make things work for you.

We have the
energy
to make things better
... for you, for our investors
and for our stakeholders.

SI-SSA-0015-13182

PSE&G

Ralph LaRossa

PRESIDENT AND CHIEF
OPERATING OFFICER

PSEG

We make things work for you.

SI-SSA-0015-13183

PSE&G strategy

Building a sustainable platform that balances reliability, customer rates and public policy to ensure growth at reasonable returns

SI-SSA-0015-13184

PSE&G is the largest electric and gas distribution and transmission utility company in New Jersey

	Electric	Gas
Customers Growth (2010 – 2014)	2.2 Million 0.3%	1.8 Million 0.3%
2014 Electric Sales and Gas Sold and Transported	40,737 GWh	2,628M Therms*
Projected Annual Load Growth (2015 – 2017)**	1.1%	0.5%
Projected Annual Load Growth Transmission (2015 – 2017)	0.9%	
Sales Mix		
Residential	32%	60%
Commercial	58%	36%
Industrial	10%	4%

	Transmission	Electric	Gas
Approved Rate of Return***	11.68% ROE	10.3% ROE	10.3% ROE

Renewables and Energy Efficiency Approved Programs	2009-2014	Total Program Plan
Solar Loan Capacity	83 MW	178.5 MW
Solar 4 All Capacity	100 MW	125 MW
Energy Efficiency Annual Electric savings	206 GWh	214 GWh
Energy Efficiency Annual Gas savings	6.5 M Therms	7 M Therms

* GAS FIRM ONLY SALES.
** ESTIMATED ANNUAL GROWTH PER YEAR, ASSUMES NORMAL WEATHER.
*** SOME PROJECTS APPROVED FOR SPECIFIC ROE.

SI-SSA-0015-13185

Mid-Atlantic ReliabilityOne award winner for 13 years in a row

SI-SSA-0015-13186

PSE&G's service and reliability is being recognized by customers

SI-SSA-0015-13187

PSE&G has achieved annual growth in operating earnings of ~18% over the past five years

with implementation of supportive rate mechanisms on our expanded capital program and cost control

SI-SSA-0015-13188

PSEG

*SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/NET INCOME TO RECONCILE TO OPERATING EARNINGS.

PSE&G plans to invest $10.8B over the next five years

PSE&G's Capital Expenditures*

2010-2014
$9.8B

2015-2019E
$10.8B

*INCLUDES AFUDC. E=ESTIMATE.

SI-SSA-0015-13189

PSE&G's existing major Transmission

projects are being completed on schedule and on budget

Major Transmission Investments

Project Roster	Approved ROE	Inclusion of CWIP in Rate Base	100% Recovery of Costs Due to Abandonment	Estimate Up To ($ Millions)	Expected In-service Date
Susquehanna-Roseland	12.93%	✓	✓	$790	June 2014 -June 2015
Northeast Grid Reliability	11.93%	✓	✓	$907	June-Dec 2015
North Central Reliability	11.68%	✓	✓	$390	Completed
Burlington–Camden 230kV	11.68%	✓	✓	$399	Completed
Mickleton–Gloucester–Camden 230kV	11.68%	✓	✓	$435	June 2015

SI-SSA-0015-13190

A robust pipeline of Transmission

investments focus on reliability improvements and replacement of aging infrastructure

Major Transmission Investments

Project Roster	Approved ROE	Program Description	Estimate Up To ($ Millions)	Expected In-service Date
Bergen—Linden Corridor 345kV	11.68%	PJM baseline project receiving CWIP in rate base treatment	$1,200	June 2018
PJM Regional Transmission Expansion Plan (RTEP) – multiple projects	11.68%	PJM mandated system reliability projects	$1,900	Various
69kV Upgrade – multiple projects	11.68%	Upgrade of 26kV to 69kV	$1,500	Various
Transmission Lifecycle – multiple projects	11.68%	Replacement of aging infrastructure	$1,100	Various
Transmission Hardening– multiple projects	11.68%	Reliability projects focused on system resiliency	$650	Various

*INCREMENTAL INVESTMENT IN HARDENING INCLUDED AS PART OF OTHER PROGRAMS.

SI-SSA-0015-13191

Bergen-Linden Corridor is a project which will provide a double-circuit 345kV line designed to maintain system reliability

Project Estimate Up To	Through Year-end 2014	Expected Completion Date
$1,200M	$40M	June 2018

- PJM RTEP project b2436 and b2437 with phased in-service dates
- 30 miles of underground cable
  - New ~ 23 miles
  - Reconductor (Upgrade of 138 to 345) ~7 miles
- 13 miles of double circuit overhead conductor (replacing double circuit 138 with double circuit 345)
- 11 station upgrades to 345kV

Customer Benefit: Addresses thermal and short-circuit reliability

Project Status: Engineering, Licensing and Construction

Marion Substation Pile Installation

SI-SSA-0015-13192

Major Transmission programs focus on reliability and replacing aging infrastructure

- PJM's Regional Transmission Expansion Plan (RTEP) identifies system enhancements needed for reliability
- 69kV system upgrades improve system reliability and provide capacity for future growth
- Transmission Lifecycle is an ongoing program to manage transmission asset life to maintain and improve system integrity and reliability
- Transmission Hardening projects focus on increasing system resiliency

SI-SSA-0015-13193

PSE&G has successfully worked with regulators to develop multiple solutions for New Jersey's energy and economic development goals

RENEWABLES
creative solutions to install solar generation

- Solar Loan I – 2008
- Solar Loan II – 2009
- Solar 4 All – 2009
- Solar Loan III – 2013
- Solar 4 All Ext – 2013

ENERGY EFFICIENCY
assisting customers with controlling energy usage

- Carbon Abatement – 2008
- Demand Response – 2009
- Energy Efficiency (EE) – 2009
- EE Extension – 2011
- EE Extension II – 2015

DISTRIBUTION
improving electric and gas delivery infrastructure

- NJ Capital Infrastructure Program 1 (CIP 1) – 2009
- NJ Capital Infrastructure Program 2 (CIP 2) – 2011
- Energy Strong – 2014

To date we have invested over $2B in the above programs

Over $1B ahead in Energy Strong, Energy Efficiency Ext II* and Solar programs

Gas System Modernization Program would increase potential investment by ~$1.6B

SI-SSA-0015-13194

PSEG

* IF APPROVED.

PSE&G is successfully executing on Energy Strong with ~$150M deployed during the latter half of 2014

Program	Approved	Spend thru 2014
Flood Mitigation	$620M	$19M
Electric Contingency Reconfiguration	$100M	$26M
Electric Advanced Technology	$100M	$10M
Gas Utilization Pressure Cast Iron (UPCI)	$350M	$94M
Gas Metering & Regulating (M&R)	$50M	$1M
TOTAL	$1,220M	$150M

SI-SSA-0015-13195

Energy Strong will provide increased reliability and resiliency

- **Electric Flood Mitigation**
  - Engineering and scheduling began on 16 of the 29 total planned substation projects
- **Electric Contingency Reconfiguration**
  - Over 100 projects have been started and 15 projects have been completed to date, including installation of over 900 poles and 70 reclosers
- **Advanced Technology**
  - A total of 60 relays replaced and 3 remote terminal unit (RTU) has been installed
- **Gas Utilization Pressure Cast Iron (UPCI)**
  - Installed ~110 miles of gas main and replaced ~5,300 services
- **Gas Metering & Regulating (M&R)**
  - Design and engineering completed for all of the eight stations scheduled

SI-SSA-0015-13196

Extension of PSE&G's award winning Energy Efficiency program

- Energy Efficiency Extension II seeks to extend the investment and time frame for three previously approved programs already in the marketplace allowing PSE&G to factor in lessons learned and balance policy issues
- $95M of rate base investment
- If approved, would extend existing programs, two of which have sizable waiting lists:
  - Hospitals
  - Multifamily
  - Direct install – government, non-profit, and small business
- Would allow PSE&G to leverage past investments in people, capabilities, systems and processes

SI-SSA-0015-13197

Gas System Modernization Program of ~$1.6B focusing on aging gas mains

- PSE&G's gas distribution system currently operates and maintains over 4,800 miles of cast iron and unprotected steel main, the largest such system in any single state
- The program provides for investment of ~$1.6B focused on replacing cast iron and unprotected steel main over a five-year period, beginning mid-2016
- Program will replace approximately 160 miles of main per year
  - Requested accelerated clause-based recovery similar to the Energy Strong program with a 9.75% ROE
  - This program is the first phase of a long-term replacement strategy
  - 30-year cast iron and unprotected steel replacement program
- Benefits:
  - Methane emission reduction is estimated at 24,500 metric tons of CO_2 equivalent per year*
  - Higher pressure system allows usage of high efficiency appliances by customers

SI-SSA-0015-13198

PSEG

* EPA SUBPART W METHODOLOGY.

PSE&G's demonstrated ability to successfully execute projects on scope, on time, and on budget leaves us well positioned to pursue FERC 1000 opportunities

- Artificial Island
  - PSE&G's proposal is one of four finalists
  - The proposal includes building 18 miles of 500kV transmission line running from the Hope Creek Generating Station to the Red Lion substation in Delaware
- PJM 2014 Window #2
  - PJM staff has recommended awarding PSE&G two projects to resolve criteria violations in the Sewaren and Mercer areas

SI-SSA-0015-13199

PSE&G continues to receive contemporaneous/ formula rate recovery on ~75% of its investment program

2010-2014 PSE&G Capital Spending by Recovery Method

$9.8B

2015-2019E PSE&G Capital with Potential Upside by Recovery Method

$12.1B

Clause Recovery Mechanisms
- Energy Strong / Infrastructure / Solar / Energy Efficiency
- Gas System Modernization Program

FERC Formula Rates
- Transmission
- Artificial Island

Traditional Recovery Mechanisms
- Distribution Base Rates

SI-SSA-0015-13200

PSE&G has controlled costs

through process improvements and will continue to drive future efficiencies

Cost control actions taken:

- PSE&G is utilizing the Lean Six Sigma discipline to achieve costs savings and process improvements
- Conducted organizational reviews resulting in streamlining of processes through restructuring
- Continued focus on vendor and inventory practices ensuring maximum value
- Successful management of pension

E=ESTIMATE

SI-SSA-0015-13201

PSE&G's 2015 operating earnings

expected to benefit from increased investment in Transmission

*SEE SLIDE A FOR ITEMS EXCLUDED FROM NET INCOME TO RECONCILE TO OPERATING EARNINGS. E =ESTIMATE. DATA AS OF MARCH 2, 2015.

SI-SSA-0015-13202

PSEG LONG ISLAND

Ralph LaRossa

CHAIRMAN OF THE BOARD
PSEG LONG ISLAND

SI-SSA-0015-13203

PSEG

We make things work for you.

PSEG Long Island is focused on improving customer service and reliability

- Provide best-in-class customer service, including building on our new Call Center Technology platform to better serve our customers
  - According to J.D. Power, in 2014 PSEG Long Island showed the most improvement in overall customer satisfaction of any large electric utility, anywhere in the nation
- Work to maintain industry-leading service reliability
- Improve every aspect of the storm response process
  - Leveraged our new Outage Management System to improve storm logistics and outage coordination
- Contributed $0.02* to PSEG's earnings per share in 2014, as expected

SI-SSA-0015-13204

* EXCLUDES THE ENERGY RESOURCES & TRADE CONTRACT, WHICH WILL BE INCLUDED IN PSEG POWER'S RESULTS.

2015 PSEG Power and ER&T Business Review & Outlook

MARCH 2015

PSEG

We make things work for you.

We have the
energy
to make things better
... for you, for our investors
and for our stakeholders.

SI-SSA-0015-13205

PSEG POWER

William Levis

PRESIDENT AND CHIEF OPERATING OFFICER
PSEG POWER

SI-SSA-0015-13206

PSEG

We make things work for you.

PSEG Power strategy

Excellence in operating our units safely, reliably, cost-competitively and in an environmentally, responsible manner

SI-SSA-0015-13207

PSEG Power creating value by responding to changing markets and regulations

Safety/Environmental Focus Fleet Diversity/Efficiency Focus	Financial/Economic Focus	Regulatory Focus
• Nuclear units have performed well for ten consecutive years • Hope Creek recorded its second highest output in its history • Fleet diversity across the dispatch curve and fuel types provide flexibility to meet changing market conditions • Bergen 1 & 2 and Linden 1 individually, and the CCGT fleet in total, set generation records in 2014 • Kearny 13 & 14 have shown increasing output in each year since start-up	• Getting the most out of existing fleet • Locational advantage • O&M control programs have delivered a CAGR of 2.6% between 2009 and 2015 • Sites offer competitive advantage for expansion	• Strong regulatory performance • Industry leadership in the changing business environment

SI-SSA-0015-13208

PSEG Power Delivering on priorities

Operational Excellence	• Maximize value of existing generating plants through implementation of the Operational Excellence Model (OEM) • Workforce engagement and development	• OEM implemented and achieving measures • Resource sharing program between Nuclear & Fossil initiated
Financial Strength	• Deliver on Business Plan Commitments • Maintain competitive markets and improve constituent communication on issues important to Power	• Exceeded earnings guidance in 2014 • Ongoing effort in key markets showing success • Successful court outcome against subsidized generation
Disciplined Investment	• Successfully complete the Advanced Gas Path (AGP) uprates • Seek new opportunities in target markets (PJM, ISO-NE, NYISO) • Develop our renewables business (solar) • Maintain new nuclear option by successfully managing the Early Site Permit (ESP) process	• Accelerated schedule for AGP to maximize opportunity • LIPA contract for fuel and generation dispatch began January 1, 2015 • Completed three projects with one underway, bringing Solar Source's portfolio to 123 MW_{DC} • Nuclear ESP is expected in 2016

SI-SSA-0015-13209

PSEG Power met 2014's challenges

Storm and weather challenges	+	Market challenges	=	Value delivered
• All of the generation sites affected by SuperStorm Sandy were restored to service by mid-2014, with ongoing repairs • Cold weather extremes created a challenging operating environment, but also presented opportunities		• Transmission (outages and build outs) and gas markets resulted in pressure on basis • Lower gas cost impacted dark spread pressuring coal unit dispatch • Load impacted by economy		• Expedited return from storm outages, restored margin opportunities • High availability when needed • Flexibility of portfolio captured real-time basis opportunities • Captured value through coal/gas switching, unit flexibility • Management of gas assets benefited customers and fleet • Achieved fuel cost savings

SI-SSA-0015-13210

PSEG Power exceeded 2014's earnings guidance

2014 PSEG Power Operating Earnings*
($ Millions)

*EXCLUDES IMPACTS FROM STORM RECOVERY COSTS.
SEE SLIDE A FOR ITEMS EXCLUDED FROM NET INCOME TO RECONCILE TO OPERATING EARNINGS.

SI-SSA-0015-13211

PSEG Power has generating assets

in three competitive markets

- Assets located near load centers
- Low cost portfolio
  - Fuel flexibility with gas cost advantage
- Positioned to benefit from volatility in real-time markets
- Readiness for capacity performance (CP) in PJM
- Fleet positioned to maintain diversity and efficiency after HEDD
- Sites suitable for expansion

SI-SSA-0015-13212

Power's PJM assets along the dispatch curve reduce the risk of serving full requirement load contracts and can take advantage of volatile market conditions

	Base Load Units	Load Following Units	Peaking Units
Energy Revenue	X	X	X
Capacity Revenue	X	X	X
Ancillary Revenue		X	X
Dual Fuel		X	X

- Base Load ensures cash flow certainty
- Load Following provides ability to serve load shape
- Readiness for Capacity Performance (CP)

- Peaking takes advantage of real-time prices and reduces operational risk
- Dual fuel capability at 87% of load following and peaking units

SI-SSA-0015-13213

PSEG Power positioned to maintain diversity and efficiency after a realignment of the fleet following HEDD retirements

Objective 2015 → 2017

- Maintain fuel diversity
- Maintain load-serving capability
- Maintain low cost structure
- Improve environmental & heat rate profiles
- Complete
  - Peach Bottom (PB) uprate
  - Advanced Gas Path (AGP)

Fuel Diversity

Energy Produced

E=ESTIMATE

SI-SSA-0015-13214

PSEG Power's fleet is expected to see improvement in heat rate and decline in emissions

- AGP (Advanced Gas Path) investments
- Other Efficiency improvements
- HEDD retirements

SI-SSA-0015-13215

PSEG Power's fleet is among the lowest emitting in the industry

- Mercury reduced 80% across the timeframe above
- More efficient testing and improved operational flexibility through utilization of Continuous Emission Monitoring System testing

SI-SSA-0015-13216

PSEG Power Nuclear is a critical element of our success

Hope Creek

- Operated by PSEG Nuclear
- PSEG Ownership: 100%
- Technology: Boiling Water Reactor

  - Unit 3 - 2016

SI-SSA-0015-13217

PSEG Power Nuclear has competitive advantages

- Continued strong nuclear operations
- Nuclear excellence program
- Top quartile of cost performance/MWh
  - Brought security services in-house
- Significant earnings contributor
- Recruitment of the best new and experienced talent, and attractive training program
- Fukushima action plan in response to NRC staff review
  - FLEX* plan submitted with implementation underway
- Peach Bottom extended power uprate, 130 MW Power's share, scheduled in service 2015/2016
- Active and influential participation at INPO, NEI, EPRI, USA Alliance

*STRATEGY KNOWN AS THE "DIVERSE AND FLEXIBLE MITIGATION CAPABILITY" OR FLEX, ADDRESSES RECOMMENDATIONS OF THE NUCLEAR REGULATORY COMMISSION'S FUKUSHIMA TASK FORCE.

SI-SSA-0015-13218

Power's nuclear fleet is well positioned

with significantly lower-than-average US cost structure

*SOURCE: ELECTRIC UTILITY COST GROUP.
** SOURCE: PSEG NUCLEAR.

SI-SSA-0015-13219

PSEG Power's focus on costs

has resulted in moderate increase in O&M for seven years

Cost control actions taken:	
• Fossil plant assessment • CCGT material condition assessment • Vendor contract renegotiations • Nuclear security services brought in-house to control costs	• Nuclear maintenance productivity study • Nuclear outage efficiency initiative • Materials management

*EXCLUDES IMPACTS FROM STORM RECOVERY COSTS. E=ESTIMATE

SI-SSA-0015-13220

PSEG Power's Fossil Fleet has shown improvement in performance

Fossil Generation

Coal Generation

Peaking Start Success*

- Fossil Generation rebounded with market
- Peaking Units maintain high start success
- Record output from Kearny 13 & 14 peakers

Combined Cycle Generation

- Combined Cycle Generation set record
- Bergen AGP uprate project scheduled for 2015

SI-SSA-0015-13221

PSEG

*LM6000 AND 7EA UNITS E = ESTIMATE.

PSEG Power initiatives result in

continuing improvement in combined cycle heat rate

E= ESTIMATE.

SI-SSA-0015-13222

PSEG Power CCGT/Fossil initiatives

Actions Taken to Create Value

Capacity
- Advanced Gas Path (AGP) investments 2014 through 2018 to provide additional efficient capacity, heat rate improvements
- New lower cost gas line at BEC with Dominion

Performance
- EPRI efficiency initiatives
- GE initiatives for large data analytic
- Consolidation of unit testing
- Auto tuning software

Maintenance
- Ongoing outage efficiency improvement
- Improvements to reliability
- Central fleet monitoring and diagnostic center

SI-SSA-0015-13223

PSEG Power's capital expenditures for environmental requirements are essentially complete*

SI-SSA-0015-13224

PSEG

*BASED ON CURRENTLY KNOWN AND QUANTIFIABLE ENVIRONMENTAL REQUIREMENTS. E=ESTIMATE. DATA AS OF DECEMBER 31, 2014.

PSEG Power's Growth Investments

Site	Project	Cost ($ millions)	Benefits	Status
BEC	Dominion Gas Line	$8	Access to a 2nd, lower cost gas supply: $8-9 million/year increase in margin	Completed
Linden	AGP Upgrade	$69	Increased capacity and improved heat rate: 63 MW capacity increase ~1.2% heat rate improvement	Completed
Linden Kearny	Black Start: Linden 7/8 Kearny 12	$13	New ancillary revenue source: ~ $3 million per year	Linden Completed Kearny Underway
CA / TX / VT	Solar Source Projects	$44	Increased capacity: 21 MW	Completed
Peach Bottom	Peach Bottom EPU (2014 – 2015)	$417	Increased capacity: 130 MW	PB2 March 2015, PB3 in 2016
Bergen / BEC	Future AGP Upgrades: Bergen (2015) BEC (2017-2018)	$98	Increased capacity and improved heat rate: 88 MW capacity increase ~1.2% heat rate improvement	Underway
Various	Interim ISA's*	No cost	Increased capacity: 69 MW	Completed
Eastern PA to Mercer, NJ	PennEast Pipeline	$119	Estimated Earnings in 2019: $13 million	Underway

Total Increased Capacity – 371 MW

SI-SSA-0015-13225

PSEG

* INTERCONNECTION SERVICE AGREEMENTS.

Additional investment opportunities under consideration

Site	Project	Benefits
Bridgeport Harbor	CCGT development	New ISO NE Capacity: 475 MW
Hope Creek	Uprate	Additional PJM Nuclear Capacity: 20 MW
Edison / Essex	SCR retrofit	Continued operation of FT4s Edison: up to ~ 470 MW Essex: up to ~ 330 MW
Bergen	Bergen 1 Uprate (AGP-type uprate)	Additional PJM Capacity: Up to 50 MW
Sewaren	CCGT development	New PJM Capacity: 450 – 625 MW
Various	Additional solar projects under investigation	100's of MW of new solar capacity under evaluation

SI-SSA-0015-13226

PSEG Solar Source owns ~123 MW

of solar facilities* with long term contracted revenues

Hackettstown (Mars)
New Jersey (2 MW)
COD September 2009
Thin film panels – fixed tilt
Investment $13 million
15 year PPA with Mars, Inc.

Queen Creek
Arizona (25 MW)
COD October 2012

PSEG POWER
ER&T

Shahid Malik

PRESIDENT

PSEG

We make things work for you.

SI-SSA-0015-13233

Agenda

Market Review

- Gas, Power, Spark Spreads
- Gas and Power Basis

PSEG Power's Portfolio

- PJM
- Northeast

PSEG Power's Locational and Fleet Strengths

- Robust capacity market pricing
- Advantageous medium-term full requirements opportunity in NJ
- Hedging plan mitigates risk while allowing for upside

SI-SSA-0015-13234

Market Review: 2014 was influenced by extremes in weather highlighting the importance of winter

Q1: Periods of extreme cold temperatures resulted in high gas prices, significant basis differentials, and higher energy demand.

Q3: A cooler than normal summer, combined with increased supply of gas, reduced energy prices and basis.

SI-SSA-0015-13235

Market Review: PSEG's extensive gas asset portfolio gives unparalleled access to Marcellus Shale gas

Power's Gas for Generation in 2014

- PSEG Power maintains a robust portfolio of pipeline and storage assets in the Mid-Atlantic
- PSEG Power's gas for generation was ~100 BCF in 2014, of which >60% was supplied by Shale gas
- PSEG Power procured over 400 BCF in 2014 with ~75% going to PSE&G's utility gas customers
- When gas is surplus to customer needs, PSEG Power sells surplus to others; margins from such sales benefit PSE&G gas customers and PSEG Power

SI-SSA-0015-13236

Market Review: Winter Z6 gas prices retain seasonal volatility; spark spreads have continued to be robust in PJM

FORWARDS AS OF DECEMBER 31, 2014

SI-SSA-0015-13237

Market Review: New pipelines will move significant quantities of Marcellus gas out of the region by 2018

Historical and Expected Marcellus Production

Pipeline capacity grows significantly by 2018

New pipeline investment is expected to increase takeaway capacity from the low cost Marcellus/Utica shale and reduce regional surpluses and increase gas prices by 2018

SI-SSA-0015-13238

Power Basis in Eastern PJM: Expected to be volatile but positive on an annual basis with winter pricing driving value

Electric Basis will remain positive overall and stabilize within 3 years due to:

- Export of ~18 bcf/day of gas which will significantly strengthen regional gas prices
- Easing of transmission constraints in Virginia/Maryland
- Construction of significant new gas-fired generation in VA/MD

ANNUAL FORWARD BASIS TO PJM-WEST AS OF DECEMBER 31, 2014.

SI-SSA-0015-13239

Regulatory Framework: Significant reforms already implemented and new rules being promulgated to improve energy and capacity market designs

	ISSUE /POLICY	OUTCOME
PJM	CAPACITY	• Higher payments for enhanced reliability (Capacity Performance)
	DEMAND RESPONSE RULES	• Stricter rules for eligibility and deployment
	ENERGY PRICE FORMATION	• PJM and FERC forcing improvements to energy price formation; higher caps
ISO-NE	CAPACITY	• Higher prices in recent auction better reflect tight supply conditions • Implementation of sloping demand curve in FCA 9 • Zonal demand curves expected in FCA 10
	ENERGY	• Demand response required to participate in Day Ahead markets • Implemented hourly offers/real time reoffers • Reserve market prices better reflect scarcity prices • 5 minute interval LMP settlements expected Q1 2016
NYISO	CAPACITY	• New Capacity Zone (LHV) leads to more accurate price signals
	ENERGY	• Improvement in price formation during reserve shortage conditions
FEDERAL	DEMAND RESPONSE	• EPSA VS. FERC and national implications
	ENVIRONMENTAL REGULATIONS	• HEDD, CPP, HAPS/MACT will lead to tightening of supply in 2015+ timeframe

SI-SSA-0015-13240

Agenda

Market Review

- Gas, Power, Spark Spreads
- Gas and Power Basis

PSEG Power's Portfolio

- PJM
- Northeast

PSEG Power's Locational and Fleet Strengths

- Robust capacity market pricing
- Advantageous medium-term full requirements opportunity in NJ
- Hedging plan mitigates risk while allowing for upside

SI-SSA-0015-13241

PJM Capacity Performance Proposal: aims to increase electric supply reliability

- **Capacity performance (CP)** proposal places emphasis on reliability, given observed outages during times of extreme weather stress and anticipated retirements; Imposition of higher penalty structure and enhanced opportunities for cost recovery to encourage reliability
- **Generator performance/flexibility is key** objective for units with secure fuel supply capable of meeting more stringent operating standards
- **Elimination of 2.5% holdback offsetting weak demand growth**, making all capacity resources annual products in end state, net CONE bidding safe harbor, and the change in the demand curve (VRR) support price formation and improve resource adequacy

December 2014
PJM Filed
Final CP Proposal

April 2015
Expected FERC Response
to PJM CP Proposal

May 2015
RPM Auction for
2018/2019 Capacity Year

SI-SSA-0015-13242

Capacity Performance: >90% of PSEG's PJM capacity meets the new capacity performance standards with minimal to moderate investment

How does our fleet stack up?*

CP Compliant Assets

* EXCLUDES 205MW OF PUMPED STORAGE

SI-SSA-0015-13243

Northeast Portfolio: New York and New England

New England (972MW)

- Small but dynamic market
- Significant improvement in market construct
- High volatility due to extreme (winter) weather conditions
- Significant siting and permitting challenges
- Gas pipeline infrastructure poses supply challenges/opportunity

New York (774MW)

- Single state ISO
- Investment in new lateral to connect to the Dominion pipeline at Bethlehem Energy Center (BEC) allows for access to fuel supply from Marcellus
- Long Island Power Authority Management Contract

SI-SSA-0015-13244

Northeast Portfolio: Expanding our footprint with PSEG Long Island

PSEG Power acting as an agent for LIPA began January 2015

- Performing ISO bidding for LIPA's 6,000MWs of generation/tolls
- Procuring natural gas and oil for the majority of these assets
- Scheduling two DC transmission cables (ISO-NE and PJM) into Long Island
- Entering into financial hedges to reduce LIPA customer's price volatility

This relationship has provided PSEG Power:

- Additional experience in Eastern NY and Connecticut markets
- Bigger natural gas footprint
- Fee-based services contract

SI-SSA-0015-13245

Agenda

Market Review

- Gas, Power, Spark Spreads
- Gas and Power Basis

PSEG Power's Portfolio

- PJM
- Northeast

PSEG Power's Locational and Fleet Strengths

- Robust capacity market pricing
- Advantageous medium-term full requirements opportunity in NJ
- Hedging plan mitigates risk while allowing for upside

SI-SSA-0015-13246

Capacity Market Pricing: PJM's capacity market is transitioning to recognize operating performance as well as locational value

RPM Auction Results					
($/MW-day)	2013 / 2014*	2014 / 2015*	2015 / 2016*	2016 / 2017*	2017 / 2018
Power's Average Prices	$242	$168	$168	$167	**$165**

REVENUES OF FULL REQUIREMENT LOAD DEALS BASED ON CONTRACT PRICE, INCLUDING RENEWABLE ENERGY CREDITS, ANCILLARY, AND TRANSMISSION COMPONENTS BUT EXCLUDING CAPACITY. HEDGES INCLUDE POSITIONS WITH MTM ACCOUNTING TREATMENT AND OPTIONS. EXCLUDES SOLAR AND KALAELOA.

SI-SSA-0015-13249

PSEG Power's Value Proposition

- Well-positioned fleet of merchant generating assets in attractive markets
- Advantaged by low cost structure, fuel diversity and dispatch flexibility
- Value add from strong gas supply capability
- Significant drive by regulatory bodies to improve market constructs
- Low capital requirements to meet enhanced performance standards
- Organic growth opportunities to increase nuclear and combined cycle generation
- Hedging strategy is responsive to changing market dynamics, providing attractive returns and free cash flow

2015 Financial Review & Outlook

MARCH 2, 2015

PSEG

We make things work for you.

We have the
energy
to make things better
... for you, for our investors
and for our stakeholders.

SI-SSA-0015-13251

PSEG

Caroline Dorsa

EXECUTIVE VICE PRESIDENT
AND CHIEF FINANCIAL OFFICER

PSEG

We make things work for you.

SI-SSA-0015-13252

Strong financial position to support our business initiatives

2014 Financial Position

- ✓ Strong 2014 earnings growth
- ✓ Exceeded earnings guidance
- ✓ Executed major PSE&G capital program
- ✓ Strong balance sheet with no long term Parent debt
- ✓ Solid credit metrics

2015 and Beyond

- ✓ Third year of anticipated positive earnings growth in 2015
- ✓ Controlled O&M growth
- ✓ Balance Sheet and Cash Flow support investment program without equity issuance
- ✓ Substantial additional investment capacity
- ✓ Growth in PSE&G investments with contemporaneous/formula rate returns
- ✓ Consistent and strong cash flow from both Power and PSE&G
- ✓ Potential for accelerated and sustainable dividend growth

SI-SSA-0015-13253

Earnings increase of 7% exceeded guidance

PSEG Operating Earnings		
$ Millions (except EPS)	**2013**	**2014**
PSE&G	$612	$725
PSEG Power	$710	$642
Other	($13)	$33
Operating Earnings	$1,309	$1,400
*Operating EPS**	**$2.58**	**$2.76**

Revised Earnings Guidance (Oct 2014)	**$2.60 - $2.75**
Earnings Guidance (Feb 2014)	**$2.55 - $2.75**

Key Takeaways

- **18% increase in PSE&G earnings**
- **52% regulated earnings contribution in 2014**
- **Power's results exceeded guidance**

SI-SSA-0015-13254

PSEG

*SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/NET INCOME TO RECONCILE TO OPERATING EARNINGS.

Power produced significant and consistent

Free Cash Flow

SI-SSA-0015-13255

PSE&G delivers increasing cash flow due to investment program

(1) PSE&G CASH FROM OPERATIONS ADJUSTS FOR SECURITIZATION PRINCIPAL REPAYMENTS OF ~$215 TO ~$240 MILLION OVER 3 YEAR PERIOD

SI-SSA-0015-13256

In 2014, Power's Free Cash Flow supported PSE&G's capital program and shareholder dividend

(1) PSE&G CASH FROM OPERATIONS ADJUSTS FOR SECURITIZATION PRINCIPAL REPAYMENTS OF ~$240 MILLION.
(2) OTHER CASH FLOW INCLUDES HOLDINGS NET CASH FLOW AND INVESTED CASH
(3) POWER CASH INVESTMENT INCLUDES NUCLEAR FUEL AND EMISSION PURCHASES

SI-SSA-0015-13257

PSEG growth spend represents ~70% of total investment with new PSE&G investment opportunities of over $1B

PSEG 2015– 2019E Capital Expenditures[1]

(1) INCLUDES AFUDC AND IDC; PENNEAST PIPELINE EQUITY INVESTMENT OF~$0.1B IS INCLUDED IN POWER GROWTH. E = ESTIMATE.

SI-SSA-0015-13258

PSE&G's Capital Program drives double-digit growth in rate base through 2019

E = ESTIMATE

SI-SSA-0015-13259

Continuing our track record of 5 year

double digit rate base growth leading to high single-digit growth in earnings through 2017

E = ESTIMATE.

SI-SSA-0015-13260

Substantial internal cash generation

supports our planned growth capital program and potential investment opportunities without the need for equity

PSEG 2015 - 2019E Sources and Uses

(1) PSE&G CASH FROM OPERATIONS ADJUSTS FOR SECURITIZATION PRINCIPAL REPAYMENTS OF ~$260M FROM 2015-2019
(2) OTHER CASH FLOW INCLUDES PSEG LI, HOLDINGS NET CASH FLOW, INVESTED CASH, AND PARENT SHORT-TERM DEBT
(3) POWER CASH INVESTMENT INCLUDES NUCLEAR FUEL AND EMISSION PURCHASES E = ESTIMATES.

SI-SSA-0015-13261

Power's key credit metric remains strong

providing opportunity for incremental investment

- Increased contribution to earnings from the more stable regulated business
- Power's annual Cash From Operations and Funds From Operations each average ~$1.4B over the 2015 to 2017 period supported by:
  - Capacity Revenues
  - Hedged Generation
  - O&M Control
- Financial strength can be used to pursue future growth in both businesses beyond current plans

SI-SSA-0015-13262

E = ESTIMATE

Substantial Investment Capacity to pursue additional growth without the need for equity

Average Funds from Operations /Debt
2015 - 2017

	Power	PSEG
Estimate	~ 55%	~30%
Minimum Threshold	30%	Low - 20's

Total Incremental Investment Capacity
through 2017

Our incremental investment capacity can support over $6B in regulated investments

SI-SSA-0015-13263

Well Funded Pension due to our long term asset allocation strategy

Pension Fund Returns
for the periods ending December 2014

- 2014 Funded Ratio ~93%
- Cumulative pension contributions total less than $50M through 2017 (1)
- Modest pension expense in 2015 with pension income expected by 2017 given fully funded level

Total company pension expense of <$0.07 per share in 2015, expected return to pension income by 2017

SI-SSA-0015-13264

(1) REPRESENTS CONTRIBUTIONS TO QUALIFIED PENSION PLANS.

Controlling O&M growth, with manageable pension impacts and PSE&G continuing to grow its asset base

(1) POWER EXCLUDES IMPACTS FROM STORM RECOVERY COSTS AND POTENTIAL RELATED INSURANCE PROCEEDS.

PSEG Summary

- Our 2014 earnings of $2.76 exceeded our revised operating earnings guidance of $2.60 - $2.75 per share
- Continued third year of anticipated positive earnings trend in 2015 with operating earnings guidance of $2.75 to $2.95 per share
- Continued 5th straight year of expected double digit, 5 year growth in rate base
- Anticipated high single digit earnings growth at PSE&G on three-year basis from 2014 to 2017, driven by transmission investments and planned programs
- Power's continued focus on operational excellence, market expertise and financial strength delivers value in current price environment
- Strong Balance Sheet and Cash Flow support full capital program and new potential opportunities without the need for equity
- Our $0.08 per share dividend increase is consistent with our long history of returning cash to the shareholder through the common dividend, with potential for consistent and sustainable growth

PSEG EXECUTIVE PROFILES

SI-SSA-0015-13270

PSEG

We make things work for you.

Ralph Izzo

CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER
PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED

Ralph Izzo was elected chairman and chief executive officer of Public Service Enterprise Group Incorporated (PSEG) in April 2007. He was named as the company's president and chief operating officer and a member of the board of directors of PSEG in October 2006. Previously, Mr. Izzo was president and chief operating officer of Public Service Electric and Gas Company (PSE&G).

Since joining PSE&G in 1992 Mr. Izzo was elected to several executive positions within PSEG's family of companies, including PSE&G senior vice president – utility operations, PSE&G vice president – appliance service, PSEG vice president - corporate planning, and PSE&G vice president - electric ventures. In these capacities he broadened his experience in the areas of general management, strategic planning and finance.

Mr. Izzo is a well-known leader within the utility industry, as well as the public policy arena. He is frequently asked to testify before Congress and speak to organizations on matters pertaining to national energy policy.

Mr. Izzo's career began as a research scientist at the Princeton Plasma Physics Laboratory, performing numerical simulations of fusion energy experiments. He has published or presented over 35 papers on magnetohydrodynamic modeling. Mr. Izzo received his Bachelor of Science and Master of Science degrees in mechanical engineering and his Doctor of Philosophy degree in applied physics from Columbia University. He also received a Master of Business Administration degree, with a concentration in finance from the Rutgers Graduate School of Management. He is listed in numerous editions of Who's Who and has been the recipient of national fellowships and awards. Mr. Izzo has received Honorary Degrees from the New Jersey Institute of Technology (Doctor of Science), Thomas A. Edison State College (Doctor of Humane Letters), Bloomfield College (Doctor of Humane Letters), Rutgers University (Doctor of Humane Letters), and Raritan Valley Community College (Associate of Science).

Mr. Izzo serves as chair of the New Jersey Chamber of Commerce, and on the board of directors for The Williams Companies, the New Jersey Utilities Association, the Edison Electric Institute (EEI), the Nuclear Energy Institute (NEI), and The Center for Energy Workforce Development. He is the past Chair of the Rutgers University Board of Governors. He is also a member of the Board of Trustees of Peddie School, Columbia University School of Engineering Board of Visitors and the Princeton University Adlinger Center for Energy and the Environment Advisory Council, as well as a member of the Visiting Committee for the Department of Nuclear Engineering at MIT.

SI-SSA-0015-13271

Caroline Dorsa

EXECUTIVE VICE PRESIDENT AND CHIEF FINANCIAL OFFICER

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG POWER LLC AND PSEG SERVICES CORPORATION

Caroline Dorsa was named executive vice president and chief financial officer for Public Service Enterprise Group Incorporated (PSEG) in April 2009. She is also the executive vice president and chief financial officer of Public Service Electric and Gas Company (PSE&G), PSEG Power and PSEG Services Corporation.

Ms. Dorsa is responsible for all financial functions, including Internal Audit Services, Investor Relations and Corporate Development. Given the array of financial instruments which serve as the primary means of selling wholesale energy to customers, Ms. Dorsa also has responsibility for the Risk Management function, which provides independent oversight of the PSEG Power trading organization. In addition to her financial responsibilities, Ms. Dorsa leads the Information Technology and Procurement organizations. She is a member of PSEG's Executive Officer Group.

In her role as chief financial officer, she has overseen the execution of the Company's financial strategy, which has involved a significant deleveraging of the balance sheet and enhancement of the company's financial strength. The company is in the midst of a major capital investment program focused on deploying more than $6 billion over three years to ensure the reliability and efficiency of the energy generation and distribution system in New Jersey. PSEG has an uninterrupted record of paying dividends to shareholders for 108 years.

Ms. Dorsa had been a member of the PSEG Board of Directors for six years, and a member of PSEG's Audit, Corporate Governance and Finance Committees before joining the company's management. Her previous management position had been with Merck & Co., where she was senior vice president – global human health, strategy and integration. Prior to this, Ms. Dorsa served as senior vice president and chief financial officer at Avaya, Inc. Earlier in her career, she held a range of financial positions at Merck, including serving as vice president and treasurer of the company for over 12 years. She was also the Secretary of the Finance Committee of Merck's Board of Directors.

Before joining Merck, Ms. Dorsa worked for Mayor Edward Koch of the City of New York promoting economic development in midtown Manhattan.

Ms. Dorsa is a member of the Junior Achievement of New Jersey State Board of Directors. She is a member of the Board of Directors and the financial expert for the Finance and Audit Committee of Biogen Idec (NASDAQ: BIIB), a biopharmaceutical company located in Cambridge, MA. Ms. Dorsa is also a member of the Board of Directors and Chairman of the Audit Committee of Joule, a privately financed solar fuels company based in Bedford, MA.

Ms. Dorsa holds a B.A. from Colgate University and an M.B.A from Columbia Business School.

SI-SSA-0015-13272

Tamara L. Linde

EXECUTIVE VICE PRESIDENT
AND GENERAL COUNSEL

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG POWER, PSEG SERVICES CORPORATION

Tamara Linda was named executive vice president and general counsel for Public Service Enterprise Group Incorporated (PSEG) in July 2014. She is also the executive vice president and general counsel of Public Service Electric and Gas Company (PSE&G), PSEG Power and PSEG Services Corporation.

As PSEG's chief legal officer, Ms. Linde has responsibility for all legal and regulatory functions, and has general supervisory responsibilities for the office of corporate secretary, business assurance and resilience and federal affairs and sustainability. Ms. Linde is a member of PSEG's Executive Officer Group.

Previously Ms. Linde was vice president – regulatory, PSEG. She has led the company's federal and state regulatory functions, as well as managed corporate, environmental and labor/employment practices within the company. Ms. Linde has served as regulatory counsel on many of the company's most important initiatives in recent years.

Ms. Linde joined the law department of Public Service Electric and Gas Company (PSE&G), as an attorney in 1990 handling a variety of natural gas and electric regulatory and transactional matters. After holding several other legal positions at PSE&G she became general solicitor, in 2000. In that position she was responsible for the regulatory affairs of the PSEG companies including electric, gas and nuclear matters. She has had significant experience working on regulatory matters before various state and federal regulatory agencies on industry issues relating to electric transmission and distribution and energy markets.

Ms. Linde is a member of the New Jersey, New York, District of Columbia and Texas bars. She is past President of the Northeast Chapter of the Energy Bar Association and served as chair of the Energy Bar Association Electricity Regulation and Compliance Committee. Ms. Linde graduated from Seton Hall University School of Law with a Juris Doctorate and from Seton Hall University with a bachelor's degree.

SI-SSA-0015-13273

Ralph A. LaRossa

PRESIDENT AND CHIEF OPERATING OFFICER

PUBLIC SERVICE ELECTRIC AND GAS COMPANY

Ralph A. LaRossa was named president and chief operating officer of Public Service Electric and Gas Company (PSE&G) in October 2006. PSE&G is New Jersey's oldest and largest regulated gas and electric delivery utility, serving approximately 2.4 million customers, nearly three-quarters of the state's population. Prior to this position he was vice president - electric delivery for PSE&G.

In addition, on January 1, 2014, Mr. LaRossa became Chairman of the Board of PSEG Long Island, a subsidiary of Public Service Enterprise Group (PSEG), which manages the electric transmission and distribution systems on Long Island and in the Rockaways. PSEG Long Island serves 1.1 million customers.

Mr. LaRossa joined PSE&G in 1985 as an associate engineer and advanced through a variety of management positions in the utility's gas and electric operations. In 1998, he received Gas Industry Magazine's Outstanding Manager of the Year Award.

Mr. LaRossa is a graduate of Stevens Institute of Technology and has completed the Harvard Business School's Program for Management Development. He serves on the board of directors for the American Gas Association (AGA), New Jersey Utilities Association (NJUA), New Jersey Performing Arts Center (NJPAC), Partnership for a Drug-Free NJ, and Bergen County's United Way. Mr. LaRossa is Chairman of Choose New Jersey, Inc. and serves on its board of directors. He is also the Chairman of Montclair State University and serves on its board of trustees.

SI-SSA-0015-13274

William Levis

PRESIDENT AND CHIEF OPERATING OFFICER

PSEG POWER

William Levis is president and chief operating officer of PSEG Power, a position he's held since June 2007. PSEG Power is a major, unregulated independent power producer in the U.S. with four main subsidiaries: PSEG Nuclear, PSEG Fossil, PSEG Energy Resources and Trade (ER&T) and PSEG Power Ventures.

PSEG Power operates one of the most balanced portfolios in the country, both in terms of fuel mix and market segment (based load units, load following units and peaking units). Its low-cost, load following fleet is geographically well positioned in competitive markets. Its 13,337 MWs represent a diverse fuel mix which includes 45 percent natural gas, 27 percent nuclear; 18 percent coal, 8 percent oil, 1 percent pumped storage, and 1 percent solar.

Before coming to PSEG, Mr. Levis was Exelon Nuclear's vice-president – Mid-Atlantic operations. Prior to joining Exelon, Mr. Levis worked at Ontario Hydro's Pickering Plant and held several positions over a five-year period with Carolina Power and Light's Brunswick facility.

Mr. Levis has a Bachelor of Science degree in marine engineering from the U.S. Naval Academy and holds an SRO (senior reactor operator) certification. He retired as a commander in the Naval Reserves and attained his professional engineer license in 1985.

Mr. Levis is a member of Nuclear Energy Institute's (NEI) Board of Directors and serves as a member of the Institute of Nuclear Power Operations (INPO) National Nuclear Accrediting Board. He is a member of the Philadelphia Archdiocese Catholic Charities Appeals Board and its Operations Committee and is a member of the CEO Council for Growth based in Philadelphia.

SI-SSA-0015-13275

Shahid Malik

PRESIDENT
PSEG ENERGY RESOURCES & TRADE

Shahid Malik was elected President of PSEG Energy Resources & Trade (ER&T) in 2011. PSEG operates one of the most balanced generation and marketing portfolios in the country, both in terms of fuel mix and market segment (base load units, load following units and peaking units), and Mr. Malik is essentially responsible for managing these assets and taking them to market. He oversees PSEG's generation portfolio and the purchase, sale and risk management of all energy commodities.

Mr. Malik has an extensive background in the energy industry across the oil, gas, electric and renewable energy sectors in Europe and the United States. Previously, he was with Pittiglio, Rabin, Todd & McGrath (PRTM) in Pittsburgh, PA and was responsible for all aspects of the global energy business, with a primary focus on the North American utility sector. Prior to that he served as President & CEO of Strategic Energy, Great Plains Energy's retail marketing subsidiary and a provider of energy and services to business clients in North America. He was accountable for the company's strategy and operations and led a successful turnaround of the company, achieving significant growth in products and services while reducing costs.

Mr. Malik's career has included Executive Leadership positions with several energy companies in the US and Europe. In addition, he served on the Board of Directors of South Jersey Industries (NYSE: SJI) immediately prior to joining PSEG.

Mr. Malik has been in the energy business for more than 20 years, since receiving his Economics degree from Manchester University in England and an MBA from Rice University, Houston. He sits on the Executive Committee of the Board of Trustees of Newark Museum as well as the Board of the Electric Power Suppliers Association in Washington DC.

SI-SSA-0015-13276

Derek M. DiRisio

PRESIDENT

PSEG SERVICES CORPORATION

Derek M. Di Risio was named President, PSEG Services Corporation, in July 2014. He is responsible for the coordination and delivery of several centralized services currently residing within PSEG Services Corporation including corporate communications, corporate citizenship, corporate real estate, information technology, procurement, payroll and other transactional services.

Prior to his current role, Mr. Di Risio was vice president and controller of Public Service Enterprise Group (PSEG), Public Service Electric and Gas Company (PSE&G), PSEG Services Corporation, PSEG Energy Holdings (Holdings) and PSEG Power, a position he assumed in December 2006. He was previously vice president and assistant controller, since July 2004.

Mr. Di Risio had been vice president – planning and analysis of Holdings since March 2004, and vice president – controller for Holdings since July 1998. Prior to that he was director – accounting services and responsible for several accounting and planning functions for Holdings, including overall coordination of the business planning process, accounting research and policy development, financial forecasts and analysis.

Mr. Di Risio was also responsible for the budgeting, analysis and reporting process for PSE&G.

Mr. Di Risio joined PSE&G in September 1991 and has held a variety of positions, including assignments with the internal auditing, electric business, and corporate planning departments. He was instrumental in reengineering the Enterprise business planning process, and advancing the use of performance metrics and balanced scorecard measures to improve business results. Prior to joining PSE&G he worked for several firms, including Chase Manhattan Bank.

Mr. Di Risio graduated from Rutgers University with a degree in accounting/computer science, and received a Master of Business Administration degree from the same university. He is a certified public accountant (inactive) and a certified internal auditor. Mr. Di Risio also completed the Program for Management Development at the Graduate School of Business Administration of Harvard University. He served on the Drew University Board of Trustees and is currently a co-chairman of the Board of Directors of the New Jersey All Stars Project Inc.

SI-SSA-0015-13277

Thomas P. Joyce

PRESIDENT AND CHIEF NUCLEAR OFFICER
PSEG NUCLEAR

Thomas P. Joyce was named president and chief nuclear officer of PSEG Nuclear (Nuclear), in October 2008. Mr. Joyce has announced his retirement from PSEG effective the end of March 2015. He had been senior vice president – operations of Salem/Hope Creek for Nuclear, since June 2007. Mr. Joyce was also vice president – Salem, since January 2007, and previously assumed the role of PSEG Nuclear's site vice president as part of the Nuclear Operating Services Agreement between PSEG and Exelon Corporation in 2005.

PSEG Nuclear's Salem and Hope Creek Generating stations comprise the second largest commercial nuclear power facility in the United States. Together the units provide enough electricity for three million homes. Together the plants also provide 49 percent of New Jersey's electricity.

Mr. Joyce has more than 38 years of experience in commercial nuclear power operations. Under his leadership as president and chief nuclear officer, Salem and Hope Creek combined to set a new site generation record in 2009. In 2011, the stations also received approval from the Nuclear Regulatory Commission (NRC) to extend their operating licenses an additional 20 years. Reinforcing the company's strong ties to the local community, the license renewal approvals did not encounter any formal legal contentions like many other plants across the country.

While leading Salem, the station completed two successful reactor vessel head replacement outages. Salem Unit 1 completed its outage capturing the world record for shortest head replacement outage.

Prior to coming to PSEG Mr. Joyce was site vice president at Exelon Nuclear's Braidwood Station. During his tenure the station achieved overall performance improvements and retained their excellent INPO rating. The plant completed a refueling in 15 days, 14 hours – setting a record for outage efficiency among U.S. pressurized water reactors. Before serving at Braidwood he held leadership positions at Exelon's Byron, Dresden, and Zion Stations, and in the corporate offices of both Exelon Corporation and Exelon Nuclear.

Mr. Joyce holds a Bachelor of Science degree in nuclear engineering from the University of Missouri at Rolla, and a Master of Business Administration degree from the Keller Graduate School of Management. While at Byron, he earned his senior reactor operators (SRO) license.

A recognized leader in the nuclear industry, Mr. Joyce currently serves as chairman of the Utilities Service Alliance (USA). The organization is comprised of eight of America's leading electric utilities operating 14 nuclear reactors located at 10 stations. Its two major objectives are to improve individual plant and fleet performance and to reduce operating and maintenance costs. Mr. Joyce also chairs the Nuclear Energy Institute's (NEI) Emergency Preparedness Working Group and the EPRI Nuclear Power Council.

SI-SSA-0015-13278

Richard P. Lopriore

PRESIDENT
PSEG FOSSIL

Richard P. Lopriore was elected president of PSEG Fossil in May 2007. He oversees operations for 13 generation facilities spanning four states. He is also responsible for the oversight of two service groups: Laboratory & Testing Services, and Maintenance & Repair Services. Additionally, he is responsible for Construction, Capital Projects and Engineering.

The PSEG Fossil fleet is comprised of natural gas, coal and oil-fired electric generating units that contribute about 9,700 megawatts of electricity to PSEG Power's generation portfolio. This includes an ownership interest of 1,000 megawatts in three jointly-owned facilities.

Under Lopriore's leadership, nine LM6000 peaking units were constructed. Fossil also outfitted its two New Jersey coal plants with about $1.5 billion in new pollution control equipment resulting in substantial reductions in emissions. These plants are among the cleanest, most responsible coal stations in the country.

Mr. Lopriore instituted an in-depth Operational Excellence Model (OEM), one of the first programs in the nation to drive standardization across a Fossil fleet. The program resulted in consistent improvement in operating results, reliability and fleet performance and the achievement of all-time generation records. He also revamped PSEG Fossil's training program. Two industry-first, award-winning mobile training trailers were developed to take training directly to the work sites reducing costs and increasing productivity.

Mr. Lopriore has been a valuable part of the electric generation industry for more than 43 years. Prior to joining PSEG Fossil, he had been senior vice president - mid-Atlantic operations for Exelon Nuclear, responsible for oversight of the Limerick, Peach Bottom, Oyster Creek and Three Mile Island stations. During his tenure, Three Mile Island achieved INPO 1 status (2007).

From 1997-1999, Mr. Lopriore was an Executive Advisor for Ontario Hydro Nuclear Power Plant's recovery and performance improvement program.

Mr. Lopriore joined Exelon as plant manager of Byron Stations in 1999 and was promoted to site vice president in 2001. In 2003 he became corporate vice president - operations support at Exelon's nuclear headquarters, responsible for both the Midwest and mid-Atlantic regions. He then became vice president - operations, Midwest boiling water reactors in 2004 responsible for the Dresden, LaSalle County, Quad Cities and Clinton nuclear plants.

Prior to Exelon, Mr. Lopriore held several key management positions at the Brunswick Nuclear Plant in North Carolina, including plant manager. At Vermont Yankee, he achieved an operational SRO certification for Boiling Water Reactors.

Mr. Lopriore received his Bachelor of Science degree from Southern Vermont College and is a member of the American Nuclear Society.
He also served in the National Guard.

SI-SSA-0015-13279

Robert C. Braun

SENIOR VICE PRESIDENT & CHIEF OPERATING OFFICER
PSEG NUCLEAR

Robert C. Braun was elected President and Chief Nuclear Officer to succeed Thomas Joyce, upon Mr. Joyce's retirement at the end of March 2015. Mr. Braun will continue to be responsible for the day-to-day operations of PSEG's Salem and Hope Creek Generating Stations. He will report directly to William Levis, and be a member of PSEG's Executive Officers Group. Mr. Braun was named senior vice president and chief operating officer of PSEG Nuclear, in September 2012. He had been senior vice president – PSEG Nuclear since 2009. Mr. Braun joined PSEG Nuclear in March 2007 as vice president of Operations Support. Mr. Braun has more than 30 years of experience in commercial nuclear power operations.

Previously, Mr. Braun was site vice president of Exelon Corporation's Peach Bottom Atomic Power Station. Prior to his appointment at Peach Bottom, he was vice president – nuclear oversight of Exelon's nuclear group headquarters and previously served as plant manager of the company's Limerick Generating Station, where he held a senior reactor operator license. Mr. Braun began his career at Limerick in 1982.

Mr. Braun has a Bachelor of Mechanical Engineering degree from Villanova University and earned his Senior Reactor Operator (SRO) license while at Exelon.

SI-SSA-0015-13280

Margaret M. Pego, SPHR

SENIOR VICE PRESIDENT – HUMAN RESOURCES AND
CHIEF HUMAN RESOURCES OFFICER
PSEG SERVICES CORPORATION

Margaret M. Pego was named senior vice president – human resources and chief human resources officer of PSEG Services Corporation in December 2006. Prior, she had been vice president – human resources. Ms. Pego joined PSEG in 1974, and has held a variety of management positions in the human resources department.

Ms. Pego holds a Bachelor of Arts degree in business administration from William Paterson College, and a Master of Business Administration degree with a concentration in management and labor relations from Seton Hall University. In addition, she holds a certificate in EEO studies from Cornell University, and has completed the Human Resources Executive Program at the University of Michigan. She is also certified as a senior professional in human resources.

Ms. Pego was named one of 2013's HR Top 10 Breakaway Leaders by Evanta, a leading organization that fosters leadership development and collaborative exchange among North America's top executives.

Ms. Pego is active in several local and national organizations, including the EEI Chief HR Executive Advisory Committee; the American Gas Association HR Policy Committee; the Conference Board Advisory Council of HR Management – Council of HR Executives; and the Society for Human Resources Management. In addition, she is Chair of the Children's Specialized Hospital Board, a member of the Children's Specialized Hospital Foundation Board, RWJ Health Care Corporation Board and Rutgers Business School. She is the former Chair of the Center for Energy Workforce Development (CEWD) Executive Council. She is a former member of the Supreme Court of New Jersey Attorney Ethics Committee. Ms. Pego is a 2002 Leadership New Jersey fellow, 1997 TWIN Honoree, 2006 Executive Woman of New Jersey Honoree and 2008 NJ Best 50 Women in Business Honoree.

PRESENTATION

Operator

Ladies and gentlemen, thank you for standing by. My name is Brent and I am your event operator today. Welcome everyone to today's conference, Public Service Enterprise Group first quarter 2016 earnings conference call and webcast. At this time all participants are in a listen-only mode.

(Operator Instructions)

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen Lally ***- Public Service Enterprise Group Inc. - VP of IR***

Thank you, Brent. Good morning, everyone. Thank you for participating in PSEG's call this morning.

As you are aware, we released our first quarter 2016 earnings statements earlier today. The release and attachments are posted on our website at www.pseg.com under the investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended March 31, 2016, is expected to be filed shortly. Please read the full disclaimer statement and the comments we have on the difference between operating earnings and GAAP results.

As you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Although we may elect to update forward-looking statements from time to time, we specifically disclaim

THOMSON REUTERS

any obligation to do so, even if our estimate changes, unless of course we are required to do so. Our release also contains adjusted non-GAAP operating earnings as well as adjusted EBITDA for PSEG Power.

Please refer to today's 8-K or our other filings for a discussion of the factors that may cause results to differ from management's projections, forecasts, and expectations, and for a reconciliation of operating earnings and adjusted EBITDA to GAAP results. I would now like to turn the call over to Ralph Izzo, Chairman, President, and Chief Executive Officer of Public Service Enterprise Group and Joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer.

At the conclusion of their remarks it will be time for your questions. Thank you.

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Thank you, Kathleen. Good morning everyone and thank you for joining us today.

PSEG delivered solid results for the first quarter in the face of rather mild winter temperatures and low prices for natural gas and energy. Earlier this morning, we reported operating earnings for the first quarter of 2016 of $0.91 per share versus operating earnings of $1.04 per share in last year's first quarter. Extreme temperature differences between the first quarter of this year and the first quarter of last year provide the backdrop for this quarter's operating results. The first quarter of 2016 was 10% warmer than normal, and the fifth warmest on record.

The month of March in particular, was extremely mild with heating degree days 25% lower than normal. Weather for the first quarter was also 27% warmer than the first quarter of 2015, but last year was the coldest on record. Our results were strong in the face of this headwind.

PSEG's execution on its expanded capital investment program continues to provide a growing source of earnings. PSEG expected to invest $3 billion in 2016 as part of its five-year, $12 billion capital program. Transmission is the largest part of PSEG's effort, representing 60% of planned spending. PSEG's investment program and a continued focus on controlling costs will help drive our forecasts for double-digit growth in PSEG's 2016 operating earnings.

PSEG's execution of our capital program is expected to yield best in class growth rate in rate base of 8% per year for the five-year period ending 2020. PSEG continues to develop a pipeline of investment opportunities that also meet New Jersey's policy objectives and have customer support. As for PSEG Power, it has been focused on operating in an environment of low gas prices for years. The availability and low price of gas and the need to meet more stringent reliability requirements has added new urgency to the Company's efforts to improve its cost structure and efficiency.

Power's capital program also represents an important response to today's market. Power's $2 billion of investment in three new combined cycle gas turbines will add approximately 1,800 megawatts of clean, reliable, and efficient capacity to its fleet. Construction of the Keys plant in Maryland and the Sewaren unit in New Jersey are on schedule to meet their 2018 operating dates. Bridgeport Harbor is expected to be available for a 2019 commercial operation date.

The addition of this new capacity will transform Power's fleet. Power's baseload nuclear capacity will be complemented by a flexible, low-cost fleet of combined cycle gas units capable of responding to the market. The fleet's carbon footprint is also expected to decline with the addition of the new clean gas-fired capacity as nuclear generation continues to represent approximately 50% of the fleet's output. As I said, we remain focused on operating efficiently and safely.

PSEG Power has made judicious reductions in its nuclear workforce, and is working closely with the industry to identify additional means of reducing its cost structure to assure the availability of this clean nuclear resource well into the future. Our goal is to capture these savings for the year to help offset the impact of low gas prices on earnings. Separately from operations, we were very pleased with some recent actions in defense of competitive markets.

In particular, we were delighted with the US Supreme Court's unanimous decision affirming the fourth circuit's decision in Hughes versus Maryland. Since that decision, the US Supreme Court also dismissed the New Jersey case, allowing to stand a lower court ruling that the so-called LCAPP contracts are unconstitutional. A recent action at FERC is also constructive. I am referring to the orders issued by FERC earlier this week granting the complaints filed by EPSA and others, which called into question some approvals granted by the public utility commission of Ohio.

THOMSON REUTERS

A separate complaint brought by a number of generating companies regarding the scope of the minimum offer price rule under RPM is still pending at FERC. While owners of existing assets with out of market contracts will not be directly restricted in the upcoming base residual auction regarding how they can bid the effective units, the lack of certainty regarding FERC approval of such contracts should at least neutralize some, if not all, of the incentives under the contracts to bid without regard to the units' actual cost of operations. We believe that a competitive market is the best approach for ensuring that there is a supply of electric capacity to meet customer demand at the lowest cost.

Our Company-wide efforts are focused on building an infrastructure that improves system reliability, reduces emissions, and supports the needs of customers. Our strategy is working, and it is made possible by the contribution from our dedicated employees who support our efforts in countless ways. Their focus on the mission of providing safe, reliable energy has allowed us to meet the needs of customers and shareholders. We are maintaining operating earnings guidance for the full year, of $2.80 to $3.00 per share.

Our guidance assumes normal weather for the remainder of the year. As we move forward, the weather and market conditions during the third quarter will be important for both PSEG Power and PSE&G. Current market conditions and the complete absence of a winter, require that we maintain our relentless focus on identifying cost efficiencies and maintaining strong operating performance.

With that I'll turn the call over to Dan, who will discuss our financials in greater detail.

Dan Cregg - ***Public Service Enterprise Group Inc. - EVP & CFO***

Thank you, Ralph. Good morning, everyone.

As Ralph said, PSEG operating earnings for the first quarter of 2016 of $0.91 per share, versus operating earnings of $1.04 per share in last year's first quarter.

On slide 4, we've provided you with a reconciliation of operating earnings to net income for the quarter and we have provided you with information on slide 8 regarding the contribution to operating earnings by business for the quarter. Additionally, slide 9 contains a waterfall chart that takes you through the net changes quarter over quarter, and operating earnings by major business. And on that, I will walk through each company in more detail.

For PSE&G, shown on slide 11, we reported operating earnings for the first quarter 2016 of $0.52 per share, compared with $0.47 per share for the first quarter of 2015. PSE&G's first quarter results reflect the impact of revenue growth associated with an expansion of the capital investment program which more than offset the impact of unfavorable weather conditions on electric and gas demand. Returns on PSE&G's expanded investment in transmission added $0.04 per share to earnings in the quarter, and the first quarter also benefited from the recovery of revenue on PSE&G's distribution investment under its Energy Strong program.

This increase in revenue improved quarter-over-quarter earnings comparisons by a $0.01 a share. As Ralph mentioned, weather in the first quarter was warmer than normal and significantly warmer than conditions experienced last year. The negative impact of the extreme differences in weather on gas demand and revenue quarter over quarter was largely offset by the gas weather normalization clause. A decline in electric sales in revenue, however, as a result of the extreme differences in the weather reduced quarterly earnings comparisons by $0.02 per share.

Lower taxes more than offset an increase in O&M expense due to the absence of insurance recovery of storm costs received in the year-ago quarter. These items together added $0.02 per share to quarter-over-quarter earnings. Economic indicators continued to improve. Employment in New Jersey has increased for 28 consecutive months as the unemployment rate has declined to 4.3%.

And the housing market has also experienced an improvement. However, this improvement in economic growth was outweighed during the quarter by mild weather. The variability and quarterly data for weather normalized electric and gas sales has been high, given the extreme weather conditions, making it difficult to discern a trend in demand when analyzing just the quarterly data. But data for the trailing 12 months indicates weather normalized electric sales were flat for the period ended March of 2016.

In terms of weather normalized gas demand, a 0.3% decline in sales in the first quarter was led by a 1.5% decline in heating demand from the residential sector, which also is influenced by the large weather adjustment quarter over quarter. On a trailing 12-month basis, gas sales increased by

THOMSON REUTERS

SI-SSA-0015-13301

1.8% year over year. PSE&G's capital program remains on schedule and PSE&G invested approximately $725 million in the first quarter as part of its planned $3 billion capital investment for 2016.

Also as you may recall, PSE&G implemented a $146 million increase in annual transmission revenue under the Company's transmission formula rate filing which took effect this past January. This increase in revenue, adjusted to reflect the impact of bonus depreciation and updates of spending in prior years, will be reflected in PSE&G's earnings through the year. We are maintaining our forecast of PSE&G's operating earnings for 2016 of $875 million to $925 million.

Moving to Power. As shown on slide 18, PSEG Power reported operating earnings for the first quarter of $0.36 per share and adjusted EBITDA of $416 million, compared with $0.55 per share and adjusted EBITDA of $626 million for the first quarter of 2015. Adjusted EBITDA excludes the same items as our operating earnings measure, as well as income tax expense, interest expense, depreciation and amortization, and major maintenance expense at Power's fossil generating facilities.

The earnings release and slide 19 provide you with detailed analysis of the impact on Power's operating earnings quarter over quarter. We have also provided you with more detail on generation for the quarter on slide 21. PSEG Power's first-quarter results were impacted by the extremely mild weather conditions experienced this year in comparison to the year-ago period. A decline in capacity revenue associated with the June 2015 retirement of the HEDD, or High Electric Demand Day peaking units at MPJM, reduced quarter-over-quarter earnings by $0.04 per share.

Lower output due to the mild weather conditions, coupled with lower average prices on energy hedges reduced quarter-over-quarter earnings by $0.09 per share. And a weather-related decline in total gas send out to commercial and industrial customers and lower prices combined to reduce quarter-over-quarter earnings on gas sales by $0.12 per share. Lower O&M expense improved quarter-over-quarter earnings by $0.05 per share, and a reduction in interest expense added $0.01 to earnings per share.

Let's turn to Power's operations. Output from Power's fleet declined 9% in the quarter as a result of the reduced demand and lower wholesale market prices. Output from the coal fleet during the first quarter declined one terawatt hour from 2.5 terawatt hours in the year ago quarter, as low gas prices affected dispatch.

Output from the combined cycles declined 0.2 terawatt hours to 3.7 terawatt hours with the decline in demand. The nuclear fleet, however, experienced a 0.6 terawatt hour improvement in output, to 8.4 terawatt hours for the quarter. The fleet operated at an average capacity factor of 99.7% in the quarter, and the nuclear fleet's performance benefited from an improvement in availability at Salem, as well as an increase in capacity at Peach Bottom.

You may recall the extended power upgrade was completed at Peach Bottom last year, and this work added 130 megawatts to our share of the station's capacity. Power's gas-fired combined cycle fleet has access to low cost gas, which continues to provide it with an advantage relative to market prices. However, the lack of demand and lack of volatility in the market given the mild weather, and an excess supply of gas pressured spark spreads which were significantly lower compared to last year's levels.

Overall, Power's gross margin declined to $43.80 per megawatt hour, from $47.32 in the year-ago quarter. Power's revising its forecasted output for 2016 to 52 to 54 terawatt hours from its prior forecast of 54 to 56 terawatt hours. The updated range for output incorporates the impact of the abnormally warm weather in the first quarter. This range also incorporates an anticipated extension of the Salem 1 refueling outage.

A visual inspection during the current refueling outage of Salem 1, which began on April 14, 2016, revealed damage to a series of bolts located inside the reactor vessel. The need to conduct further testing to repair and replace the bolts is expected to extend the refueling outage. To provide context as a rule of thumb, a delay in Salem's refueling outage of 30 days would reduce generation by approximately half a terawatt hour.

Under this scenario, nuclear fleet's capacity factor for the year would be reduced by about a 1.5% to 91% from the current forecasted capacity factor of 92.5% for the year. And the actual outage duration will be determined after ongoing inspection work is completed. As shown on slide 24, approximately 70% to 75% of anticipated production for the April to December period of 40 terawatt hours is hedged at an average price of $49 per megawatt hour.

Our open position for the remainder of 2016 is more than adequate to cover the potential for decline in output at Salem from our original forecast. For 2017, Power is hedged 50% to 55% of its forecast generation of 54 to 56 terawatt hours at an average price of $49 per megawatt hour. For 2018,

© 2016 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13302

approximately 20% to 25% for the forecast generation of 59 to 61 terawatt hours is hedged at an average price of $49 per megawatt hour. The forecast increase in generation in 2018 reflects the commercial operations of the Keys and Sewaren combined cycle units.

The hedged data for 2016 continues to assume PSEG's hedges representing 11 to 12 terawatt hours. As we mentioned to you last quarter, there are items included in the average hedge price which influence Power's revenue but don't support Power's gross margins. Our average hedge price for the remainder of 2016 reflects an increase in cost elements such as transmission and renewables associated with serving our full requirement hedge obligations.

The increase year over year and these non-margin revenue items is approximately 1 to 2 megawatt hours. We continue to forecast operating earnings for Power in 2016 of $490 million to $540 million. And the forecast for operating earnings represents adjusted EBITDA of $1.32 billion to $1.4 billion for the full year, which compares to $1.563 billion of adjusted EBITDA in 2015.

Now I'll briefly address as well, Enterprise and other operating results. For the first quarter we reported operating earnings of $0.03 per share compared with operating earnings of $0.02 per share last year in the first quarter. The increase in operating earnings quarter over quarter reflects contractual payments associated with the operation of PSEG Long Island, and certain tax items at PSEG Energy Holdings.

We continue to forecast full year operating earnings for 2016 from PSEG Enterprise and other of $60 million. Finally, with respect to financings and other, PSEG closed the quarter with $592 million of cash on the balance sheet with debt at the end of March representing 44% of our consolidated capital. During the quarter PSE&G issued $850 million of securities consisting of $300 million of five-year notes at 1.9%, and $550 million of 30-year notes at 3.8%, while redeeming $171 million of long-term debt.

We remain in a position to finance our current capital program without the need for the issuance of equity. We continue to forecast operating earnings for the full year of $2.80 to $3.00 per share.

That concludes my comments and I will now turn the call back over to the operator for your questions.

QUESTION AND ANSWER

Operator

(Operator Instructions)

Your first question from Neel Mitra with Tudor Pickering.

Neel Mitra *- Tudor, Pickering, Holt & Co. Securities - Analyst*

Good morning.

Ralph Izzo *- Public Service Enterprise Group Inc. - Chairman, President & CEO*

Good morning, Neil.

Neel Mitra *- Tudor, Pickering, Holt & Co. Securities - Analyst*

I just had a quick question on the lower generation in the first quarter from the milder weather? Is that actually a net negative, or a positive? Because you could not run your fleet and then procure the power at a lower cost to fulfill the financial hedges?

© 2016 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. THOMSON REUTERS

SI-SSA-0015-13303

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

So the hedges are supplied at a lower cost, even though we have locked in the price. So that's good news. As you know, we are naturally long.

So whenever demand is down, that creates a drag for power. There is a more modest drag on the utility. It has a weather normalization on the gas business, but no such thing on the electric business. So reduced demand due to mild weather would create slight drag there.

Neel Mitra - ***Tudor, Pickering, Holt & Co. Securities - Analyst***

So the open position on Power is hurt because it's not running as much? Is that the way to look at it?

Dan Cregg - ***Public Service Enterprise Group Inc. - EVP & CFO***

Yes.

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

That's right. Lower dispatch prices, you have lower -- less amount of run time.

Neel Mitra - ***Tudor, Pickering, Holt & Co. Securities - Analyst***

Okay. And second question. I know you have a small stake in the PennEast pipeline, can you remind us when you have that going into service? And then, there has been recent reports on a possible delay, what your thoughts are on that?

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Yes. So we have a 10% position. We are now forecasting late 2018.

Neel Mitra - ***Tudor, Pickering, Holt & Co. Securities - Analyst***

And what were you forecasting earlier?

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Late 2017.

Neel Mitra - ***Tudor, Pickering, Holt & Co. Securities - Analyst***

Okay. Great. Thank you.

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

You're welcome, Neel.

Operator

Your next question comes from the line of Paul Patterson with Glenrock Associates. Please go ahead.

Paul Patterson - ***Glenrock Associates - Analyst***

Good morning.

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Good morning, Paul.

Paul Patterson - ***Glenrock Associates - Analyst***

On the Salem plant, and I apologize, I heard you talk about it, but I just want to make sure I understood it. How long is the extended outage that you guys are now expecting?

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

So we don't know yet, Paul. The outage started, I think it was April 14, and that would have been a fairly standard refueling outage. We normally don't give dates on that for obvious reasons due to market sensitivity.

We are in the middle right now of doing some testing to see how many of the bolts are damaged. So until we finish that, we won't know exactly how long the outage is. But I should point out, even when we know, we typically don't announce that to the marketplace.

Paul Patterson - ***Glenrock Associates - Analyst***

Okay. You are still looking at how many bolts, or what percentage of bolts have problems?

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

That's right.

Paul Patterson - ***Glenrock Associates - Analyst***

And is there any bleed through to any other units, do you think or any other sort of sense about this?

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Clearly, Salem 2, we did inspect Salem 2 in 2015. This is an industry problem. It's been around, I think, since 1998. This is not something that is unique to us or unheard of before.

But Salem 2 passed visual inspection in 2015. And Salem 1 was scheduled to have the more intrusive inspection in 2019, but we're a couple years ahead of schedule there. I'll just remind you, Salem 2 is six years younger than Salem 1, to the extent this is a degradation over time, that should have an influence.

THOMSON REUTERS

SI-SSA-0015-13305

Paul Patterson - *Glenrock Associates - Analyst*

Okay. Thank you so much.

Ralph Izzo - *Public Service Enterprise Group Inc. - Chairman, President & CEO*

No problem.

Operator

Your next question comes from the line of Michael Weinstein with UBS. Please go ahead.

Michael Weinstein - *UBS - Analyst*

Hi, Ralph. How you doing?

Ralph Izzo - *Public Service Enterprise Group Inc. - Chairman, President & CEO*

Good.

Michael Weinstein - *UBS - Analyst*

Recently we saw Con Ed enter agreements to purchase gas storage and pipeline assets in Pennsylvania and New York. We have also seen other large utilities making large acquisitions of gas assets and utilities. Given the PennEast interest you have already, what is your view of the current market for gas-related acquisitions? And what's your own interest in expanding further?

Ralph Izzo - *Public Service Enterprise Group Inc. - Chairman, President & CEO*

I would say our interest in expanding further is low to zero. In terms of our position in PennEast, quite candidly, every gas LDC in New Jersey has a position in that, and we just thought that it was important to help participate in bringing those consumer benefits to our gas customers. As you know, PSE&G has almost two million gas customers.

It's a really different business, Michael. I serve on a board of a company that's involved in the pipeline business, I think we are good at the knitting that we do and I would like to stick to that. I am not second-guessing others. Please don't misinterpret. They have their own unique reasons for moving in that direction. Typically, the corporate structure is different, they're mostly MLPs, they have a fairly different financial proposition and they are not without their challenges nowadays, as well.

So that may be great time to buy in. There is a raft of siting challenges associated with this. We are experiencing that in PennEast. There was a major pipeline, I'm sure you're aware of, in New York state that recently had an unpleasant surprise.

Its a very challenging business with fairly different DNA than what we have in our Company. And I like the DNA and the match that our Company has with the operations that we're responsible for.

THOMSON REUTERS

SI-SSA-0015-13306

Michael Weinstein - *UBS - Analyst*

Does the current PEs in the gas utility space on the LDC space, does that also put you off in terms of future opportunities?

Ralph Izzo - *Public Service Enterprise Group Inc. - Chairman, President & CEO*

That's a different subject, but the short answer to that is yes. I mean, I understand that debt is fairly inexpensive, Dan hopefully impressed you with the numbers he reported for our utility. You could make acquisitions accretive at very, very attractive premiums to the target.

But the question we always ask ourselves is, just because money is relatively inexpensive, what are the alternate uses for that? Simply paying a very, very rich premium and still having accretion may not be your best choice. And we've been very clear. Our priorities are, number one, organic growth, and number two, supporting the dividend. And then number three would be share repurchase.

As I have said to many people, paying a 20 plus PE to someone seems to me to be a bad idea when I know a great company that is trading at a 14 or 15 PE, that has the ticker symbol of PEG. Again, I hopefully -- this is second-guessing and critical of other's decisions, but those are the ones I'm comfortable for us.

Michael Weinstein - *UBS - Analyst*

One last question. In terms of the partnership with Vectren for competitive transmission and MISO, do you see any other opportunities to partner with other local utilities for similar types of partnerships?

Ralph Izzo - *Public Service Enterprise Group Inc. - Chairman, President & CEO*

I can't disclose any that we haven't publicly disclosed. But that is an approach that we are eager to pursue. I think that there is a lot of value to be had by combining forces with someone who understands the local transmission grid and system, with our expertise now having put over $2 billion to work on an annual basis for a good number of years in terms of cost and schedule management on transmission construction.

I am very proud of our team and the work that they have done. But we don't know the system everywhere the country. To the extent that we can combine our project management skills and our construction management know-how with people's systems knowledge, that's a win-win for everyone.

Travis Miller - ***Morningstar - Analyst***

Wanted to think a little more about this $0.12 on the lower gas sendout and fixed cost recovery business. How much is that just pure volume and how much is there something else there, either margin contractions there or some other factor there that might not be directly weather-related?

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

I ask Dan if he knows the split between the two. My short answer is it's a combination of both.

Dan Cregg - ***Public Service Enterprise Group Inc. - EVP & CFO***

That's right. Travis, the best way to try to think about where we are from the $0.12 impact that we saw this quarter, is if you were look at each of the last couple of quarters, you would have seen last year and the year before there was a $0.05 and a $0.04 benefit that we picked up additively over the last two quarters. So it's very much the absence of a winter which has impact both on pricing and on volumes.

I think the volumes were down about a third, and when you have that impact, as well as a margin compression, we really also didn't see much volatility which doesn't help in that market. They were all contributions to the delta you saw for this quarter.

Travis Miller - ***Morningstar - Analyst***

Great. That's helpful. And then, Ralph, without too much of a dissertation here --(Laughter) You guys have put a lot of eggs in the transmission basket certainly previously, and for the next three to five years. What are your thoughts on storage and how that might disrupt the transmission plans or alternatively offer you guys investment opportunities that wouldn't be in transmission, but could be in storage?

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Sure. I am still sort of smarting from your suggestion that I am a bit long-winded, Travis. (Laughter)

Travis Miller - ***Morningstar - Analyst***

I am interested in the dissertation, just not this morning.

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

It deserved a comment. Yes. As luck would have it, I literally just came from a presentation two weeks ago by a director of Long's Berkeley Labs on storage, and his claim -- don't ask me his name because I don't remember. He is probably easy to look up. Is that we're at least a factor of two away from grid connected storage that makes economic sense.

And what he has found is that translates into anywhere from a 10 to 20-year timeframe. Of course when you are talking about material signs, research events, it's difficult to put up with precision. We are agnostic, Travis, about what hardware one puts in place to serve customers.

I don't care if it's copper wire, superconducting ceramic wire, lead acid batteries, lithium batteries, flow batteries, I am running out of technologies. I'm blathering and I am starting to tread on dissertation timeframes. But, we would be more than happy to pursue things that have economic merit that provides the reliability our customers are demanding.

THOMSON REUTERS

SI-SSA-0015-13309

Gregg Orrill - ***Barclays Capital - Analyst***

Just around the hedges at Power. You know, you increased some of the hedges over the last quarter. Just wondering where you stand with -- where you would normally be at this point, how you were thinking about that?

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

So, Gregg, as you know, we try not to outguess the forward market. We do, however, we've said in the past, there is a tendency in the market to take a data point from 48 hours ago and a data point from 24 hours ago and extrapolate it for the next three years. And sometimes that emotional response is not as well informed by fundamentals as we'd like.

But we always stay within certain guidelines. We allow our team to drift up a little bit if we think the market is being a bit bullish, and we allow them to drift down if we think the market is being overly bearish. You'll recall, in April of 2014 it was the former. We said we could go ahead and hedge a little bit towards the up side, since the market was being somewhat bullish.

And it's pretty safe to conclude that right now we are drifting towards the bottom of our guideposts, just given the anomalously warm winter we had and the bearishness that's crept into the market. Having said that, that bearishness is not totally unjustified given where gas storage levels are.

Dan Cregg - ***Public Service Enterprise Group Inc. - EVP & CFO***

The other thing to think about, too, Gregg, is that for the BGS auction, to the extent that's a contribution across our hedge horizon, that auction usually takes place every year in February. So you see a little bit of a pickup in that regard in the first quarter's change.

Gregg Orrill - ***Barclays Capital - Analyst***

Fair point. Okay. Thank you.

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Thank you.

Your next question comes from the line of Michael Lapides with Goldman Sachs. Please go ahead.

Michael Lapides - ***Goldman Sachs - Analyst***

Hi, Ralph. Thanks for taking my question. Congrats to a good start on the year.

Can you, on the Salem issue, can you talk a little bit about other plants over the years that have seen similar issues in weather? Any of those turned into any more major related items, or is having issues with kind of baffle bolts a very standard, very common occurrence? I have to be very honest, as a non-nuclear engineer, the word baffle bolts is a little baffling to me.(Laughter)

THOMSON REUTERS

SI-SSA-0015-13310

Dan Cregg - ***Public Service Enterprise Group Inc. - EVP & CFO***

Thanks, Michael, for the question, I'm glad you asked it. To my knowledge, D.C. Cook had an issue in 2010, Indian Point had an issue starting a month or so ago. There have been a handful, I think six or eight European plants.

These are not -- to my knowledge, these are not life-threatening issues. They are literally 800 bolts typically that secure these metal plates, we call them baffles, to the reactor vessel. And they are under pressure. There is a pressure gradient because of the high temperature steam that flows through the holes in these baffles.

You get a mechanical stress, in our case, I think we have 832 bolts. It's typical of pressurized water reactors. That's why I mentioned earlier, to Paul's question, that we would have to look at Salem 2 again at its next refueling outage, although it passed a visual inspection in 2015.

It would not be an issue for Hope Creek because that's a boiling water reactor. I don't want to suggest anything other than we have to complete the inspection. But none of the prior instance has this been an issue that has threatened the plants going forward -- integrity or anything of that nature.

Michael Lapides - ***Goldman Sachs - Analyst***

Got it. And coming to the regulated side, the E&G, you know, as you guys do most years at your Analyst Day, you lay out a CapEx forecast that obviously shows in year three through five somewhat of a decline from years one through two.

Can you talk about the things, your goals in 2016 in terms of actually -- I don't want to call it backfilling, but the types of projects that you could see showing up in the 2018 to 2020 timeframe that might keep CapEx at a more similar level to 2016 and 2017 or even at a higher level? What are the types of projects? What do you have do from the regulatory construct process to get those approved?

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Sure. There are a whole host of them, Michael. There is ongoing renewable portfolio standard commitments that could result in some additional solar work. There are a couple of special projects that we haven't named publicly on the distribution system that involve major customers that would benefit the entire customer base, that we will be pursuing.

There is always new and additional work that comes out of the PJM RTEP; that's the kind of thing you'll see us looking at and potentially announcing in 2016. However, the major backfill in the out years of the plan won't be announced in 2016 because they are pretty new, and that will be a continuation of our gas system modernization plan and a continuation of Energy Strong. The reason we won't announce those in 2016 is because we are only a year and a half into Energy Strong, and we're only six months into GSMP; and those were both three year programs, give or take a few months, on some unique aspects of them.

So you're right to say that we have historically backfilled the years four and five. I think there is a very high probability we will do the same this time. But I think that in terms of the goals for 2016, it will be more, some significant distribution projects that we have and potentially some solar work that -- to keep the state on its RPS targets, you will see us pursuing in the near term.

Michael Lapides - ***Goldman Sachs - Analyst***

Got it. Thank you, Ralph. Much appreciated.

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

You're welcome.

Your next question comes from the line of Praful Mehta with CitiGroup.

Praful Mehta - ***Citigroup - Analyst***

Thank you. Hi, guys.

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Hi.

Praful Mehta - ***Citigroup - Analyst***

So quickly on the storage point. I know it was an interesting debate and you have made a bunch of relevant points. That was really thoughtful. I am trying to understand. You are mentioning storage more from a transmission perspective. Taking back the storage more from a generation perspective, if you didn't have the standard 20-year window horizon as you talked about, how would you think of the implications for your gas fleet and just generally for the markets in general? If you did think storage was coming whenever, 10 years, 20 years down the road, how do you see the implications for the power generations for your fleet and just generally in the US?

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

I think there are three uses for storage. Right? One is to the extent that one has some localized distribution reinforcement that can be more economically achieved through storage rather than substation enhancement. Second, would be your classic arbitrage between peak and off-peak power, which has become less of an economic driver nowadays, just given the abundance of natural gas.

Third, could be sort of a similarity to that, which is to offset the intermittency associated with renewables. But in terms of using batteries as peakers, I think that if you just have to take a look again at the dollars per KW. My goodness, gas engines just keep getting more and more efficient and storage seems to be losing in that race to keep up with them.

I think there are multiple applications. I didn't mean to suggest that we only would consider one. What I was trying to point out is, whether the application is the supply side, or whether it's a customer reliability side or whether it's providing peaking services, other ancillary services -- we don't have a religious fervor around one technology or another. We look at them all the time.

Praful Mehta - ***Citigroup - Analyst***

Fair enough. That's really helpful. And then secondly, from an M&A perspective, there is a number of generation assets clearing the market and potentially more coming, and you have talked about at some point, the separation as well.

So how do you figure all that in? Are you looking to get to the critical mark, is there an opportunity here to acquire some assets and get to a critical mark where you think you can, at some point separate? How are you thinking about that opportunity right now?

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Yes. No. I mean, that's pretty much what we have told the world, right, that we see three very tangible, tactical reasons for remaining integrated. It's the financial synergies between Power's cash generation and Utility's cash needs. It's the customer build synergies between the customer the power serves and the customers that PSE&G serves.

© 2016 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. THOMSON REUTERS

SI-SSA-0015-13312

Power's prices go down, PSE&G's distribution rates go up, quite candidly. Last, but not least, is the benefits of scale associated with the corporate support functions. And as Power continues to pursue growth opportunities outside PGM East, the first two issues become less important, right? You have more customers that are not PSE&G customers that we will be serving in New England and in your state.

You have more need for Power's funds from operations going to Power as opposed to going over to the Utility. And as both companies get bigger, then corporate support synergies become less on a percentage basis. And the reason why I say outside of PGM East, is because we are pretty much preempted from making any acquisitions within PGM East.

Given the slow growth and demand, we are not big fans of Greenfield Development PJM East. You've quickly run into an oversupply situation. Having said all of that, we have demonstrated that we're pretty bad at acquiring assets.

By that I mean, we seem to have a more conservative view of where the market is going and are consistently outbid. Keys being the one expectation to that, which I believe, was largely because of our confidence in our ability to manage construction risks, that perhaps some of the others did not possess and some of the portfolio benefit it brought to us in performance of PJM West. We look all the time at generation assets.

We have an -- I was about to say anti-coal bias. That sounds very political and I didn't mean it that way. But just given the direction of the environmental regulation, you won't see us taking a look at any coal expansions in terms of new assets.

We do look in our target markets, which would be the rest of PGM, New England, and New York state. We just have to get it the right price. And we are going to remain disciplined in what that means for us.

Praful Mehta - ***Citigroup - Analyst***

Got you. That's really helpful. Thank you so much.

Operator

Your next question comes from the line of Asher Kahn with Visium Asset Management. Please go ahead.

Ashar Khan - ***Visium Asset Management - Analyst***

Good morning. And good results. Can I just ask you one thing which Entergy mentioned -- why their outage has lasting a little bit longer is that they didn't have the equipment on site. I didn't know what that meant exactly. But I wanted to ask you, Ralph, do you have the stuff on site to replace so that won't cause a longer outage?

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Hi. So the equipment is not routinely on site. But we are in the process right now of securing that equipment while we do the ultrasonic testing. This is a highly -- my tongue got tied -- highly irradiated area inside the reactor vessel. But we are in conversations with at least two vendors who claim to be able to help us do the work and we are confident we will be able to bring them on site. I mean, as I said, there is at least ten other reactors that had this issue in the past.

Ashar Khan - ***Visium Asset Management - Analyst***

I understand. I was just trying to understand -- they were saying their delay was caused by equipment not being on site.

THOMSON REUTERS

SI-SSA-0015-13314

Michael Goldenberg *- Luminous - Analyst*

Hi. I wanted to ask a question about your 2018 hedging. It wasn't clear, if I look at previous quarters, it seems you hedged very little, about 5% of the output. But if I do the math, I get about a $30 or $31 incremental hedging price. Not understanding if that's the price, or I'm doing something wrong there?

Dan Cregg *- Public Service Enterprise Group Inc. - EVP & CFO*

And your comparison is what, Michael?

Michael Goldenberg *- Luminous - Analyst*

Versus Q4. Sorry. Q4, you were a certain percentage of $54 and now a certain percentage of $49. I am trying to do the simple math, I get incremental hedging down at $31.

Dan Cregg *- Public Service Enterprise Group Inc. - EVP & CFO*

We'd have to go through the individual math. Maybe we can follow up with you on that. But you have a range of output where you are within a high or low band.

So it's going to vary. I know that some of that 2018 output is going to come from BGS, who tends to have a higher price, and then we run a lower price environment as well. So it's going to be some mix of that.

Michael Goldenberg *- Luminous - Analyst*

Got it. Thank you.

Operator

(Operator Instructions)

Your next question comes from the line of Ben Budish with Jefferies. Please go ahead.

Ben Budish *- Jefferies & Co. - Analyst*

Hi, everybody. Good morning.

Ralph Izzo *- Public Service Enterprise Group Inc. - Chairman, President & CEO*

Hi, Ben.

Ben Budish *- Jefferies & Co. - Analyst*

I wonder if I'm reading into your comments, that you made at the beginning of the call, too much about the importance of Q3. It seems like you are guiding us to the low end of the range, and I am curious if a strong Q3 might get us back to the midpoint, or maybe we are looking at sort of below the bottom end and a strong Q3 gets us back within? Is there any more color you can give on that?

© 2016 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13315

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Ben, the range is the range. Historically, what we do is after Q1 we don't modify our numbers or push people up or down and live with the range. After Q2 we may move a nickel one way or the other, if we think there's a definitive bias one way or another.

In terms of verbally guiding. And then typically after Q3, if there's a need we tighten the range one way or the other. With so we're $2.80 to $3.00. It was a tough winter.

And we have got a lot of focus on our operations and our cost efficiencies and the range always assumes that the rest of the year is normal weather. We never assume that the weather is going to suddenly do something different than what the weather service predicts as a normal year.

Ben Budish - ***Jefferies & Co. - Analyst***

Okay. Great. Thank you.

Operator

Mr. Izzo and Mr. Cregg, there are no further questions at this time. Please continue with your presentation or any closing remarks.

Ralph Izzo - ***Public Service Enterprise Group Inc. - Chairman, President & CEO***

Thank you, Brent. So thank you, everyone for being on the call. And the main message I hope you took away is my favorite message, which is steady as she goes.

We have a utility capital program that's proceeding as planned. Power construction programs which we combine cycle units is on schedule and on budget. Operations are strong through the enterprise and the balance sheet is as solid as ever.

Kathleen and Dan have some travels in the next couple of weeks. The three of us have some travels in the next couple of months. Hope we get to see most, if not all, of you during those travels. Thanks a lot and we will talk soon.

Operator

Ladies and gentlemen, that does conclude your conference call for today. You may now disconnect. Thank you for participating.

PSEG ANNOUNCES 2016 FIRST QUARTER RESULTS

$0.93 PER SHARE OF NET INCOME

Operating Earnings of $0.91 Per Share

Company Maintains 2016 Guidance of $2.80 - $3.00 Per Share

(April 29, 2016 – Newark, NJ) Public Service Enterprise Group (PSEG) reported today Net Income for the first quarter of 2016 of $471 million, or $0.93 per share as compared to Net Income of $586 million, or $1.15 per share, in the first quarter of 2015. Operating Earnings for the first quarter of 2016 were $463 million, or $0.91 per share, compared to Operating Earnings for the first quarter of 2015 of $529 million, or $1.04 per share.

"We delivered solid operations this quarter executing on our five-year $16 billion capital program," said Ralph Izzo, chairman, president and chief executive officer. "We experienced extremes in weather conditions in the first quarter of 2016 compared to the first quarter of 2015 which hurt demand and margins. However, continued growth in investment and strong operations helped us withstand these short-term challenges as we focus on growing a reliable, efficient, clean energy infrastructure platform capable of meeting customer requirements."

PSEG believes that the non-GAAP financial measure of "Operating Earnings" provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends. Operating Earnings exclude gains/(losses) associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting as well as other material one-time items. The table below provides a reconciliation of PSEG's Net Income to Operating Earnings (a non-GAAP measure) for the first quarter. See Attachment 10 for a complete list of items excluded from Net Income in the determination of Operating Earnings.

PSEG CONSOLIDATED EARNINGS (unaudited)
First Quarter Comparative Results
2016 and 2015

	Income ($ millions)		Diluted Earnings Per Share	
	2016	**2015**	**2016**	**2015**
Operating Earnings	$463	$529	$0.91	$1.04
Reconciling Items	8	57	0.02	0.11
Net Income	**$471**	**$586**	**$0.93**	**$1.15**
		Avg. Shares	**508M**	**508M**

Ralph Izzo went on to say, "We are maintaining operating earnings guidance for the full year of $2.80 - $3.00 per share. Our guidance assumes normal weather for the remainder of the year. As we move forward, the weather and market conditions, especially during the third quarter, will be important for both PSEG Power and PSE&G. Current market conditions and the absence of a winter require that we maintain our relentless focus on identifying efficiencies and maintaining strong operating performance."

The following table outlines expectations for operating earnings in 2016 by subsidiary:

2016 Operating Earnings Guidance
($ millions, except EPS)

	2016 Estimate
PSE&G	$875 - $925
PSEG Power	$490 - $540
PSEG Enterprise/Other	$60 - $60
Operating Earnings	$1,425 - $1,525
Earnings Per Share	$2.80 - $3.00

Operating Earnings Review by Subsidiary

See Attachment 5 for detail regarding the quarter-over-quarter reconciliations for each of PSEG's businesses.

PSE&G

PSE&G reported operating earnings of $262 million ($0.52 per share) for the first quarter of 2016 compared with operating earnings of $242 million ($0.47 per share) for the first quarter of 2015.

PSE&G's first quarter results reflect the impact of revenue growth associated with an expansion of its capital investment program which more than offset the effect of unfavorable weather comparisons on electric and gas demand.

Returns from PSE&G's expanded investment in transmission added $0.04 per share to earnings in the quarter. First quarter also benefited from recovery on PSE&G's investment in distribution under the Energy Strong program which improved quarter-over-quarter earnings comparisons by $0.01 per share.

Weather was warmer than normal during the first quarter of 2016 and significantly warmer than conditions experienced last year. The negative impact of the extreme differences in weather on gas demand and revenue quarter-over-quarter was largely offset by the gas weather-normalization clause. A decline in electric sales and revenue as a result of the extreme differences in weather reduced quarter-over-quarter earnings comparisons by $0.02 per share. An increase in O&M expense due to the absence of insurance recovery of storm costs received in the year-ago quarter was more than offset by lower taxes which together added $0.02 per share to quarter-over-quarter earnings.

Economic indicators continue to improve. Employment in New Jersey has increased for 28 consecutive months as the housing market has also experienced an improvement. However, weather-normalized electric sales are estimated to have declined 1.8% in the first quarter. Weather-normalized electric sales for the trailing twelve month period were flat for the period ended March 2016. In terms of weather-normalized gas demand, a 0.3% decline in sales for the first quarter was led by a 1.5% decline in heating demand from the residential sector, influenced by the large weather adjustment quarter over quarter. On a trailing 12 month basis, gas sales increased by 1.8%.

PSE&G's capital program remains on schedule. PSE&G invested approximately $725 million in the first quarter as part of its planned capital investment for 2016 of $3.0 billion in upgrades to the electric and gas distribution and transmission system.

The forecast of PSE&G's operating earnings for 2016 remains unchanged at $875 - $925 million.

PSEG Power

PSEG Power reported operating earnings of $184 million ($0.36 per share) for the first quarter of 2016 and adjusted EBITDA of $416 million compared with operating earnings of $278 million ($0.55 per share) for the first quarter of 2015 and adjusted EBITDA of $626 million. Net Income for the first quarter of 2016 was $192 million versus $335 million for the first quarter of 2015.

PSEG believes that the non-GAAP financial measure of "Adjusted EBITDA" is useful in evaluating Power's operating performance because it provides investors with additional

information to compare our business performance to other companies and understand performance trends.

Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization and major maintenance expense at Power's fossil generation facilities. See Attachment 10 for a complete list of items excluded from Net Income in the determination of Adjusted EBITDA.

PSEG Power's first quarter results were impacted by extremely mild weather conditions in comparison to the year-ago period. Significantly lower weather-related demand hurt sales comparisons and wholesale market prices for energy during the first quarter. Power's results, in addition, reflect the impact of the known decline in capacity revenues and average prices on energy hedges. The decline in revenue was greater than a decline in quarter-over-quarter operating expenses.

A decline in capacity revenue associated with the retirement of peaking capacity in June 2015 reduced quarter-over-quarter earnings by $0.04 per share. A decline in output due to milder weather coupled with lower average prices on energy hedges reduced quarter-over-quarter earnings by $0.09 per share. A weather-related decline in total gas send-out to commercial and industrial customers and lower prices in the marketplace and a lack of volatility combined to reduce quarter-over-quarter earnings on gas sales by $0.12 per share. Lower O&M expense improved quarter-over-quarter earnings by $0.05 per share and a reduction in interest expense added $0.01 per share to earnings.

Output from Power's fleet declined 9% in the quarter as a result of reduced demand and lower wholesale market energy prices. Output from the coal fleet during the first quarter declined to 1 TWh from 2.5 TWh in the year-ago quarter. Output from the combined cycle fleet declined 0.2 TWh to 3.7 TWh. The nuclear fleet, however, experienced an improvement in output of 0.6 TWh to 8.4 TWh operating at an average capacity factor of 99.7% in the quarter. The nuclear fleet's performance benefited from an improvement in availability at Salem as well as an increase in capacity at Peach Bottom associated with completion of the extended power uprate work.

Power is reducing its forecast of output for 2016 to 52 – 54 TWh from its prior forecast of 54 – 56 TWh. The revised range incorporates the impact on output of the abnormally warm weather in the first quarter. The range also incorporates an anticipated extension of the Salem 1 refueling outage, which began on April 14, to inspect, repair and replace damaged baffle bolts within the reactor vessel, subject to the results of an ongoing inspection. Approximately 70% - 75% of anticipated production for the April – December period of 40 TWh is hedged at an average price of $49 per MWh. For 2017, Power has hedged 50% - 55% of its forecast generation of 54 – 56 TWh at an average price of $49 per MWh. For 2018, approximately 20% - 25% of forecast generation of 59 – 61 TWh is hedged at an average price of $49 per MWh. The hedge data for 2016 continues to assume BGS hedges represent 11 – 12 TWh.

Power's operating earnings for 2016 are forecast at $490 - $540 million. The forecast of operating earnings and adjusted EBITDA for the full year of $1,320 million - $1,400 million remains unchanged.

PSEG Enterprise/Other

PSEG Enterprise/Other reported operating earnings of $17 million ($0.03 per share) for the first quarter of 2016 compared with operating earnings of $9 million ($0.02 per share) for the first quarter of 2015. The increase in operating earnings quarter-over-quarter reflects contractual payments associated with the operation of PSEG Long Island and certain tax items at PSEG Energy Holdings.

The forecast of PSEG Enterprise/Other full year operating earnings for 2016 remains unchanged at $60 million.

#########

Forward Looking Statement

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or ongoing low pricing of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulations, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators, including prudency reviews and disallowances,
- any deterioration in our credit quality or the credit quality of our counterparties,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations or increase the cost of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- delays or unforeseen cost escalations in our construction and development activities, or the inability to recover the carrying amount of our assets,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- increases in competition in energy supply markets as well as for transmission projects,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies,
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- delays in receipt of necessary permits and approvals for our construction and development activities,

- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- an extended economic recession,
- an inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce, and
- changes in the credit quality and the ability of lessees to meet their obligations under our domestic leveraged leases.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

Forward-Looking Statements

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute “forward-looking statements” within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words “anticipate,” “intend,” “estimate,” “believe,” “expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or ongoing low pricing of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulations, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators, including prudency reviews and disallowances,
- any deterioration in our credit quality or the credit quality of our counterparties,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations or increase the cost of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- delays or unforeseen cost escalations in our construction and development activities, or the inability to recover the carrying amount of our assets,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- increases in competition in energy supply markets as well as for transmission projects,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies,
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- an extended economic recession,
- an inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce, and
- changes in the credit quality and the ability of lessees to meet their obligations under our domestic leveraged leases.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Operating Earnings exclude gains or losses associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting, and other material one-time items. PSEG presents Operating Earnings because management believes that it is appropriate for investors to consider results excluding these items in addition to the results reported in accordance with GAAP. PSEG believes that the non-GAAP financial measure of Operating Earnings provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends.

PSEG is presenting Adjusted EBITDA because it provides investors with additional information to compare our business performance to other companies and understand performance trends. Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization and major maintenance expense costs at Power's fossil generation facilities. This information is not intended to be viewed as an alternative to GAAP information. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income to reconcile to Operating Earnings and Adjusted EBITDA with a reference to that slide included on each of the slides where the non-GAAP information appears.

These materials and other financial releases can be found on the pseg.com website under the investor tab, or at http://investor.pseg.com/

PSEG
2016 Q1 Review

Ralph Izzo

Chairman, President and Chief Executive Officer

SI-SSA-0015-13337

Q1 Earnings Summary – Solid Operating Performance, Results Impacted by Extreme Weather Comparisons

Quarter ended March 31

$ Millions (except EPS)	2016	2015
Operating Earnings*	$ 463	$ 529
Reconciling Items, Net of Tax	8	57
Net Income	$ 471	$ 586
EPS from Operating Earnings*	$ 0.91	$ 1.04

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings.

SI-SSA-0015-13338

PSEG – Q1 2016 Highlights

Solid Operating Earnings – Maintaining Guidance for 2016

- ✓ Operating Earnings* of $0.91 per share vs. $1.04 per share in Q1 2015
- ✓ Power results impacted by extremes in weather comparisons and low prices
- ✓ PSE&G's expanded investment in transmission and distribution drives improvement in earnings

Operational Excellence

- ✓ PSEG Power operations performed well in Q1: Nuclear output up 7.5% on improvement in fleet capacity factor to 99.7%
- ✓ CCGT units improved fleet availability

PSEG Disciplined Capital Investment

- ✓ Increased common dividend 5.1% to indicative annual rate of $1.64 per share
- ✓ Executing on our $16 billion capital program with ~75% directed toward PSE&G infrastructure investments in reliability/resiliency/replacement programs
- ✓ Construction commenced on Keys and Sewaren CCGTs for targeted commercial operation in 2018
- ✓ Power pursuing permits on new 485 MW CCGT plant at Bridgeport Harbor site

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings.

SI-SSA-0015-13339

Maintaining 2016 Earnings Guidance

Guidance assumes normal weather and unit operations

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings. E = Estimate.

PSE&G – Monthly Heating Degree Days

Q1 2016 Winter weather, as defined by heating degree days, was ~27% warmer than Q1 2015 (the coldest winter in 45 years) and ~10% warmer than normal

Source: New Jersey State Climatologist.

SI-SSA-0015-13347

PSE&G's spending drives high single-digit growth in rate base through 2020 with known investments

SI-SSA-0015-13348

Continued identification of investment opportunities focused on improving reliability for our customers

E = Estimate. Data as of March 2016.

SI-SSA-0015-13349

PSE&G – Q1 2016 Operating Highlights

Operations

- ✓ Q1 2016 was the 5th warmest in our records vs. Q1 2015 – the coldest winter in 45 years
- ✓ Heating degree days were 27% below Q1 2015 and 10% below normal
- ✓ Weather normalized electric sales were lower by 1.8% for Q1 but flat on a trailing 12 month basis
- ✓ Weather normalized gas sales were lower by 0.3% for the quarter, led by a 1.5% decline in heating demand from residential segment (influenced by large weather adjustment quarter over quarter); For the trailing 12 months, gas sales have increased by 1.8%
- ✓ O&M remains well controlled

Regulatory and Market Environment

- ✓ Implemented annual increase in transmission revenue of $146 million in January 2016
- ✓ Energy Strong programs continue on-schedule
- ✓ GSMP investment program beginning

Financial

- ✓ PSE&G invested ~$725 million during Q1 as part of its full-year, $3 billion investment program to upgrade the electric and gas transmission and distribution system
- ✓ PSE&G issued $850 million of Medium Term Notes consisting of $300 million of 5-year notes at 1.9% and $550 million of 30 year notes at 3.8%, and retired $171 million of 6.75% long-term debt at maturity
- ✓ PSE&G Operating Earnings* forecast for full-year 2016 is unchanged at $875 million to $925 million

* Operating Earnings is equal to Net Income.

$ / MWh	26.41	11.44

SI-SSA-0015-13356

PSEG Power – Gross Margin Performance

- ✓ Q1 spot prices significantly lower across PJM, ISO-NE, and NYISO versus year ago, driven by abnormally warm weather and related lack of demand
- ✓ Capacity revenue affected by HEDD retirements in Q2 2015
- ✓ Access to lower-cost Marcellus gas continues to benefit spark spreads relative to market

Q1 2016 Regional Performance		
Region	**Gross Margin ($M)**	**Comment**
PJM	$515	Lower prices on hedged output combined with lower wholesale market prices and a decline in capacity revenue from HEDD retirements
New England	$51	Hedging profile improved margins offsetting lower market prices
New York	$12	Higher volumes with improved fuel availability

SI-SSA-0015-13357

Hedging Update

Contracted Energy*

		Apr-Dec 2016	2017	2018
Base Load (Nuclear and Base Load Coal)	Volume TWh	26	36	36
	% Hedged	100%	75-80%	35-40%
	Price $/MWh	$49	$49	$49

	% Hedged	25-30%	0%	0%
	Price $/MWh	$49	--	--
Total	Volume TWh	39-41	54-56	59-61
	% Hedged	70-75%	50-55%	20-25%
	Price $/MWh	$49	$49	$49

* Hedge percentages and prices as of March 31, 2016. Revenues of full requirement load deals based on contract price, including renewable energy credits, ancillary, and transmission components but excluding capacity. Hedges include positions with MTM accounting treatment and options.

SI-SSA-0015-13358

PSEG Power – Q1 Operating Highlights

Operations

- ✓ Q1 output down 9.2% to 13.2 GWh on warm winter weather and lower demand vs Q1 2015
- ✓ Strong nuclear performance: GWh production up 7.5% resulting in a fleet capacity factor of 99.7%
- ✓ CCGT availability remains strong; production down 5% on lower demand

Regulatory and Market Environment

- ✓ U.S. Supreme Court unanimously upheld lower court ruling against Maryland subsidized generation law and subsequently dismissed the New Jersey LCAPP case
- ✓ Base load output in 2016 hedged at an average price of $49/MWh vs 2015 average hedge price of $52/MWh
- ✓ 2016 BGS load projection remains at 11-12 TWh

Financial

- ✓ Power's total debt as a percentage of capitalization at March 31 was 27%
- ✓ Power's 2016 Operating Earnings* guidance range is $490 million to $540 million; Adjusted EBITDA** guidance for 2016 is $1.32 billion to $1.40 billion

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings; Includes the financial impact from Mark-to-Market positions with forward delivery months.
**See Slide B for a reconciliation of Adjusted EBITDA to Operating Earnings and Net Income.

PSEG

PSEG Financial Highlights

Maintaining 2016 Operating Earnings* guidance of $2.80 - $3.00 per share

- ✓ Focused on maintaining operating efficiency and customer reliability
- ✓ Salem Q2 refueling outage extended to replace and repair baffle bolts in reactor vessel
- ✓ PSE&G expected to contribute over 60% of 2016 Operating Earnings*

Infrastructure spend

- ✓ PSE&G T&D spend for 2016 expected to be $3 billion
- ✓ Power has begun construction of its CCGT units in Maryland and New Jersey

Financial position remains strong

- ✓ Positive cash from Power and increasing cash flow from operations at PSE&G support dividend growth and fund capital spending program without the need to issue equity
- ✓ Debt as a percentage of capitalization was 44% at March 31

Increased common dividend 5.1% to indicative annual rate of $1.64 per share

- ✓ Increasing regulated earnings mix supports opportunity for dividend growth

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings.

PRESENTATION

Operator

Ladies and gentlemen, thank you for standing by. My name is Brent, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group's second-quarter 2016 earnings conference call and webcast.

(Operator Instructions)

As a reminder, this conference is being recorded today, Friday, July 29, 2016, and will be available for telephone replay beginning at 2:00 PM today until 11:30 PM Eastern on August 5, 2016. It will also be available as an audio webcast on PSEG's corporate website at www.PSEG.com. I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen Lally ***- Public Service Enterprise Group Incorporated - VP of IR***

Thank you, Brent. Good morning. Thank you all for participating in PSEG's call this morning. As you are aware, we released our second-quarter 2016 earnings statements earlier today.

The release and attachments are posted on our website, at www.PSEG.com, under the investor section. We also posted a series of slides that detail operating results by Company for the quarter. Our 10-Q for the period ended June 30, 2016, is expected to be filed shortly.

I won't read the full disclaimer statement or the comments we have on the difference between operating earnings and GAAP results, but as you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates, that are subject to various risks and uncertainties. And although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if our estimate changes, unless of course we are required to do so.

Our release also contains adjusted non-GAAP operating earnings. Please refer to today's 8-K or other filings for a discussion of factors that may cause results to differ from management's projections, forecasts and expectations, and for a reconciliation of operating earnings to GAAP results.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group. Joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, it will be time for your questions.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

Thank you, Kathleen. And thank you everyone, for joining us today. PSEG's results for the second quarter were characterized by a tough environment for Power markets, but also with continued growth associated with PSE&G's expanded capital program. Earlier this morning, we reported net income for the quarter of $0.37 per share. Operating earnings for the second quarter of 2016 were $0.57 per share. Operating earnings were in line with the $0.57 per share earned in 2015's second quarter.

The results for the quarter bring operating earnings for the first half of 2016 to $1.48 per share, which compares with operating earnings of $1.61 per share earned in 2015's first half. Slides 4 and 5 contain the detail on the results for the quarter and the first half.

PSE&G's execution on its expanded capital investment program continues to provide a growing source of earnings. And Power's prudent management of reductions in O&M minimized the impact of the extended outage at Salem on earnings. PSE&G is on track to invest $3 billion in 2016, as part of its five-year $12 billion capital program. PSE&G's ability to earn its authorized return on investment continues to drive our forecast for double-digit growth in PSE&G's 2016 earnings.

We continue to look for opportunities to grow in a manner that meets customer demand for reliable, efficient and clean energy, and provides it a risk-adjusted return demanded by shareholders. In the past quarter, we have identified more than $500 million of additional investment opportunities at our regulated utility company, PSE&G.

During the past quarter PSE&G requested an extension from the New Jersey Board of Public Utilities of its existing landfill brownfield solar program. The program would add 100 megawatts of grid-connected solar facilities over a five-year period, at a cost of approximately of $240 million. The program would also create 575 direct jobs in New Jersey during the construction period, and allow all customers to share in the benefits of solar. We hope to see a decision on this request during the fourth quarter of this year.

In addition, PSE&G has increased its estimate of distribution capital expenditures over 2016 through 2018 by $300 million, to address what is commonly referred to as new business requests, and to replace certain aging equipment and infrastructure. As I mentioned, these programs together would represent an increase of more than $500 million over PSE&G's current plans to invest $12 billion over the five-year period ended 2020.

PSE&G's robust investment program will ensure that it remains one of the most reliable utilities in the nation, as was demonstrated during periods of intense heat and thunderstorm activity experienced over the past two weeks. The investment program would also improve on PSE&G's growth in rate base, currently forecasted at 8% per year for the five-year period ending 2020.

Now, Power's capital program is also an important response in the needs of today's market, which requires that we operate greater levels of reliability and efficiency. The planned replacement of older generating capacity at the Sewaren and Bridgeport stations, and new capacity at Keys amounts to 1,800 megawatts of new, clean and efficient gas-fired capacity over the next three years.

This will transform Power's fleet, and enhance its competitive position. We will see an increase in capacity. We will see an increase in reliability. We will see an increase in efficiency, and we will see a reduction in carbon emissions.

Although Power has focused on the construction of the new combined cycle units, Power has also committed to improving the efficiency of existing capacity and ensuring its long-term availability. This can be seen through completion of a small uprate at its peaking stations, which added 14 megawatts to capacity. Power also plans to increase the efficiency and capacity of the Bethlehem Energy Center through advanced gas path upgrades of the turbine over 2017 and 2018.

When completed, this work is expected to add 58 megawatts to BEC's capacity. And the recent issuance of a final renewal permit for the Salem station that meets the requirements of Section 316(b) of the Clean Water Act helps to assure the long-term availability of this zero carbon generating resource. Finally, Power has made targeted reductions in its workforce, and continues to identify additional means of reducing its cost structure, to assure the availability and dispatch of the fleet in the current low price environment.

THOMSON REUTERS

The Power market over the short term continues to be characterized by an oversupply of gas. The market however has shown signs of improvement, as gas prices have responded to a decline in production. The improvement in the supply picture, and the development of more outlets for supply has also led to an improvement in forward basis. As we have indicated in the past, we continue to expect basis to be seasonal. That is positive in the winter, and neutral to negative in the summer, until more takeaway capacity goes into operation.

In May, 2016, PJM announced the results of the RPM auction for the 2019 to 2020 delivery year. Power cleared approximately 8,900 megawatts of its generating capacity, at an average price of about $116 per megawatt day. The average price received by Power, while lower than prior auctions, continues to represent a premium to the average price per capacity in the RTO.

Prices in the most recent auction reflect PJM's downwardly revised demand forecast. Changes in the emergency transfer limits due to transmission expansion, and the effects of both new generation and uncleared generation from the prior year's auction. However the results for the RPM auction were in line with our expectations.

Nearly all of Power's cleared capacity in the latest auction complies with PJM's capacity performance requirements, and the fleet is expected to be in a position to meet PJM's requirement that 100% of capacity for the 2020 to 2021 delivery year must meet those CP requirements. On the regulatory front, FERC has approved two of the five recommended steps to improve energy price formation. Further efforts to address transparency and the scheduling of capacity could lead to an improved alignment of prices with costs.

The year has presented challenges. Looking forward to the second half of the year, we're maintaining operating earnings guidance for 2016 of $2.80 to $3 per share, but it will be difficult to reach the upper end of the guidance even with the improvement in the power markets, expectations for warm summer weather, restoration of normal operations at Salem, and ongoing cost control and management of O&M.

Our highly-skilled workforce has met the market's challenges through the right sizing of resources, and by identifying investments that meet customer needs. Our dedication to customer service, our strong balance sheet, and our ability to invest in the future of the Company are expected to drive long-term value creation. With that, I'll turn the call over to Dan, who will discuss our financials in greater detail, and then I will be available for your questions.

Dan Cregg - ***Public Service Enterprise Group Incorporated - EVP and CFO***

Thank you, Ralph, and thank you everyone for joining us today. As Ralph said, PSEG reported operating earnings for the second quarter of 2016 of $0.57 per share, the same as operating earnings of $0.57 per share in last year's second quarter.

A reconciliation of operating earnings to net income for the quarter can be found on slide 4. We've also provided you with a waterfall chart on slide 10 that takes you through the net changes in the quarter-over-quarter operating earnings by major business, and a similar chart on slide 12 provides you with the changes in operating earnings by business on a year-to-date basis.

I'll now review each Company in a little bit more detail, starting with PSE&G. PSE&G reported net income for the second quarter of 2016 of $0.35 per share, compared with $0.33 per share for the second quarter of 2015, for a 6% improvement in earnings. And results for the quarter are shown on slide 14.

PSE&G's operating results for the second quarter reflect the impact of revenue growth associated with an expansion of the Company's capital investment program. Returns on PSE&G's expanded investment in transmission added $0.03 per share to earnings for the quarter. An increase in depreciation and O&M expense of $0.02 per share was partially offset by a decline in taxes and other items. The higher level of depreciation is related to the growth in capital spending, and higher levels of O&M reflect increased spending on vegetation management.

The New Jersey economy continues to show steady growth, and employment levels have shown improvement from a year ago. The variability in quarterly data for weather-normalized electric and gas sales has been high, given extreme weather comparisons. Weather-normalized electric sales reflect growth in residential and commercial customers, which was offset by the continuing decline in the industrial sector and increased energy efficiency measures. So on a trailing 12-month basis, weather-normalized electric sales were essentially flat.

PSE&G's capital program remains on schedule. PSE&G invested approximately $1.4 billion during the first half of the year, as part of its planned 2016 capital program of $3 billion. And as Ralph mentioned, PSE&G has identified investment opportunities, which if approved, will include

© 2016 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13369

PSE&G five-year capital program by approximately $500 million to $12.5 billion, and you should expect the majority of this increase in spending will occur between 2016 and 2018. And once again, all of this growth will be funded without the need to issue new equity.

As you may recall, PSE&G implemented $146 million increase in annual transmission revenue under the Company's transmission formula rate filing, which took effect this past January. This increase in revenue, adjusted to reflect the impact of bonus depreciation and updates of spending in prior years, will be reflected in PSE&G's earnings throughout the year. But I will also remind you that the quarter-to-quarter earnings comparisons associated with PSE&G's investment in transmission are not expected to be even during the second half of the year. The recognition of bonus depreciation for 2015 and some other expenses at the end of the year reduce PSE&G's fourth-quarter 2015 earnings by about $0.04 per share.

The contributions to earnings from the Energy Strong capital program will also be more evident during the second half of the year, given growth in the Energy Strong related spending, and the shape of the rate structure which places more emphasis on demand charges during the third quarter. We are increasing our forecast of PSE&G's operating earnings for 2016 to $900 million to $935 million from $875 million to $925 million. And the change incorporates cost control efforts and a strong start to summer weather.

Now, let's turn to Power. PSE&G Power reported a net loss of the quarter of $11 million or $0.02 per share, compared with net income of $166 million or $0.33 per share for the year-ago quarter. Operating earnings were $0.18 per share for the second quarter of 2016, and adjusted EBITDA was $272 million, as compared with operating earnings of $0.22 per share and adjusted EBITDA of $301 million for the second quarter of 2015. And our adjusted EBITDA excludes the same items as operating earnings, as well as income tax expense, interest expense, depreciation and amortization, and major maintenance at Power's fossil generating facilities.

The earnings release and slide 20 provide you with detailed analysis of Power's operating earnings quarter over quarter. We've also provided you with more detail on generation for the quarter and the first half of the year on slides 22 and 23. Power's operating results for the second quarter reflect the impact of the known decline in PJM capacity revenues and average prices on energy hedges, in addition to the effect of an extended refueling outage at Salem 1.

Declining capacity revenue associated with the June 2015 retirement of feeding capacity in PJM, reduced quarter-over-quarter income by $0.02 per share, and capacity revenue during the second half of 2016 should approximate the revenues received during the last six months of 2015. Earnings comparisons in the quarter were also impacted by the decline in the average price received on energy hedges, as well as lower market prices and gas volumes, which together reduced Power's quarter-over-quarter income by $0.03 per share. And a decline in output reduced income by $0.01 per share.

A reduction in O&M expense improved Power's quarter-over-quarter income by $0.07 per share. This improvement reflects the absence in 2016 of costs incurred during the second quarter of 2015 for the refueling outage at the Oak Creek nuclear plant, which is 100% owned by Power, and major maintenance work at our combined cycle units.

And the quarterly comparisons also benefited from targeted reductions in O&M at Power's nuclear and fossil stations, as well as from changes in the management of work schedules associated with the Salem 1 refueling outage, which minimized the overall cost of the outage. As we mentioned during the first-quarter earnings call, the Salem 1 refueling outage, which began on April 14, would be extended to repair degraded baffle bolts.

The bolt replacement has been completed, and the unit is in the process of returning to service. During the quarter, an increase in depreciation expense was offset by a decline in interest expense, however an absence in 2016 of tax credits received in the year-ago quarter and other tax items contributed to a reduction in quarter-over-quarter income of $0.05 per share.

Turning to Power's operations, output at Power's generating facilities declined 6% in the quarter, as a result of lower wholesale market prices and reduced demand. Output from the gas-fired combined cycle fleet declined slightly to 4.4 terawatt hours from 4.6 terawatt hours, given milder weather conditions relative to the year-ago quarter. Low gas prices impacted the dispatch of Power's coal-fired fleet, and during the quarter the output from the coal fleet declined to 0.9 terawatt hours from 1.3 terawatt hours. Output from the nuclear fleet was largely unchanged in the quarter, with7 terawatt hours in this quarter versus 7.1 terawatt hours in the year ago quarter. The impact of the extended outage at Salem was largely offset by an increase in output at Peach Bottom, and completion of the extended power upgrade at Peach Bottom added 130 megawatts in the aggregate to Power's interest in this station.

Salem 2 was out of service for three days at the end of the quarter, and remains out of service. The unplanned outage at Salem 2 is a result of an electrical fault in the reactor's non-nuclear balance of plant. And the extension of the outage in Salem 1 into July, and the unplanned outage at Salem

© 2016 Thomson Reuters. All rights reserved. THOMSON REUTERS

2 will have a continuing effect on performance in the third quarter. Power's gross margin in the second quarter declined to $38.54 per megawatt hour, from $40.15 per megawatt hour.

Power's margin in the quarter experienced only a modest benefit from the gas-fired combined cycle fleet's access to low-cost gas. A lack of demand and low volatility in the market, given an excess supply of gas, pressured spark spreads. The Power markets over the last month have seen prices move to higher levels, given the impact on the gas supply from hotter than normal weather, and declines in production.

An improvement in load and prices will help margins on baseload units, as an increase in regional gas prices would also support margins at the gas-fired combined cycle fleet. For the year, Power is revising its forecast of output to 50 to 52 terawatt hours from the prior forecast of 52 to 54 terawatt hours. And the updated forecast incorporates the results for the first half of the year, and takes into account the extension of the outage at both units at Salem.

As shown on slide 26, approximately 75% to 80% of anticipated production for the second half of 2016 of 25 to 26 terawatt hours, is hedged at an average price of $50 per megawatt hour. For 2017, Power has hedged 55% to 60% of its forecast generation of 53 to 55 terawatt hours, at an average price of $48 a megawatt hour. And for 2018, Power has hedged approximately 25% to 30% of forecast generation of 58 to 60 terawatt hours at an average price of $46 per megawatt hour.

The forecasted increase in output for 2018 reflects the commercial start-up of a new gas-fired combined cycle capacity at the Keys and Sewaren stations. The percentage of energy hedged for 2017 and 2018 is slightly greater than what we communicated to you earlier this year, and in line with our practice. We've adjusted our forecast to Power's full-year 2016 operating earnings to $460 million $525 million from $490 million to $540 million, to incorporate the results of the first half of the year. The revised forecast represents an adjusted EBITDA of $1.27 billion to $1.375 billion.

Now I will turn to PSEG Enterprise and other. The net income for PSEG Energy Holdings and Enterprise in the second quarter of 2016 was $19 million, or $0.04 per share, versus net income of $12 million and $0.02 per share for the second quarter of 2015. The increase in quarter-over-quarter income reflects contractual payments associated with the operation of PSEG Long Island, and certain tax items at PSEG Energy Holdings. We've raised our forecast for the full year of operations to $65 million.

Our financial position remains strong. PSEG closed the quarter ended June 30, 2016 with $648 million of cash on its balance sheet, with debt at the end of the quarter representing 45% of consolidated capital. And during the quarter, Power issued $700 million of 3% five-year senior notes due in the year 2021.

We do not foresee the need to issue equity to finance our expanded capital program. And as Ralph mentioned, we are maintaining our forecast of operating earnings for the full year of $2.80 to $3 per share. And with that, we will be happy to take any questions.

QUESTION AND ANSWER

Operator

(Operator Instructions)

Jonathan Arnold, Deutsche Bank.

(Operator Instructions)

Travis Miller, Morningstar.

Travis Miller - ***Morningstar - Analyst***

As we look ahead more generally to 2019, 2020 when you guys have your new plant online, and PJM in your region and the other plants that are proposed, what are your thoughts on spark spreads? Obviously, we've seen what's happened in the capacity markets. But what are your thoughts on what happens to spark spreads?

© 2016 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

Travis, by that point we will have three plants up. We'll have one in Connecticut, New Jersey and one in Maryland, and it really will depend upon the infrastructure that is being built in each of those locations. As you know, all of those sites do have gas on the property, but we are seeing an increased importance in regional spark spreads.

Right now in our region we are seeing spark spreads given our access to gas of about $20. Down at Pepco it's pretty close to that, the forwards they are saying it could be as high as $23. We certainly made these investment decisions under the expectation that the combination of either locked in or anticipated capacity prices plus those spark spreads would allow us to recover our cost of capital and then some. As you know, our history is we don't usually pick numbers that are different than what the market is telling us, and right now the local spark spreads, defined region by region, is in the $20 range.

Travis Miller - ***Morningstar - Analyst***

Okay so pretty flat curve that you think?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

I think so. The dynamic will be modified as the infrastructure gets built, but it'll be good now for a good six months or so.

Travis Miller - ***Morningstar - Analyst***

Great, and then you have been benefiting for quite a while on that Marcellus gas basis at Power. When does that cycle off in terms of incremental growth? When does it stop being a net benefit I suppose, relative to the previous years?

Ralph Izzo - ***Public Service Enterprise Group Incorporated – Chairman, President & CEO***

So therein lies the value of a diversified fleet. One would expect that as infrastructure gets built from the region to mostly southeastern markets, that you'll see an increase or decrease in price in other parts of the country which don't have that access, and an increase in price here, which will diminish our regional spark spread advantage. But that should also then help our nuclear plant. So it's been an ongoing source of pride for us, that diversity of technology and fuel allows us to deliver some consistency in terms of the margins that we are able to capture. And of course, one cannot ignore the seasonal variation that will persist, even once the infrastructure gets built.

Travis Miller - ***Morningstar - Analyst***

Sure. Okay, thanks, I appreciate the thoughts.

Operator

Julien Dumoulin-Smith, UBS.

Julien Dumoulin-Smith - ***UBS - Analyst***

So I wanted to ask a bigger picture strategic question about the fate of nuclear in New Jersey, if you can think through that with us. What is your current positioning on the need for support and the price for carbon in New Jersey specifically? Perhaps not just with respect to RGGI, but looking at parallels from New York, how are you positioned in this state?

© 2016 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

Julien, thanks for asking the question, because I want to make sure that there is clarity of understanding around that. There's a lot going on in the nation around nuclear. I don't know the latest numbers, I think 10 to 15 plants are rumored to be at risk of retiring, half a dozen have retired.

Our dilemma is that as active industry participants, frustrated by an absence of carbon value given to nuclear plants, and seeing what is happening around us, is we are trying to engage policymakers in a conversation that nuclear is not getting the credit it deserves. Our challenge is our plants are quite healthy economically, so notwithstanding the importance of carbon, I think the motivation in other markets are some of the near-term economic consequences of shutting those plants, given their lack of profitability. So we don't have that situation.

We're glad we don't have that situation, but it does impair our ability to have the same level of interest and participation in the discussion. So we've been talking about fuel diversity, we've been talking about 90%-plus capacity factors and what it would mean should long-term forces require the replacement of that, whatever those long term forces might be. But it is a difficult conversation to have, given how many pressing problems are staring policymakers in the face right this minute.

So on the one hand, I don't want to go on ad nauseum. We feel strongly that nuclear is not getting the credit, IE, price it deserves, but we cannot and we do not make the claim that our plants are at any kind of economic risk in the near-term, the way others are.

Julien Dumoulin-Smith - ***UBS - Analyst***

Perhaps to expand on that, no specific efforts in New Jersey and/or thoughts on nascent efforts at PJM to perhaps more appropriately price in diversity?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

No, we are having early conversations in both forums about what's that more accurate representation of the value could look like, and we are informing people who don't study this stuff as much as we do about what is being proposed in New York State, and what has been discussed in Connecticut, and what didn't happen in Vermont and Massachusetts and Wisconsin, and what that led to, and what doesn't appear to be happening in Illinois.

So we're not just walking around saying, boy, I wish the world was different. We are talking to people who care about these things about what the consequences have been in places where nothing took place, and what would happen, what's being proposed in other places.

At PJM, I think there is much more of a focus on reliability, associated with such large quantities of baseload power that don't have the seasonal challenges of access to gas and backup fuels. But I think that historically PJM of course has not viewed itself, nor should it, as an implementer of environmental policy. So the conversation can be broader at the state level than the state process at PJM.

Julien Dumoulin-Smith - ***UBS - Analyst***

Got it, and then completely separate question, just in terms of Power. Are you still thinking about expanding the footprint of Power? Obviously you have been through the different diversification efforts. Where you think you are with respect to having an adequate scale in that business, and/or desirability of further investments? I will leave it there.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

So I think Power has some -- has stated his desire to expand in New England, New York and PJM. We think that those are the most efficient markets, given the combination of energy and capacity value in all three of them. We have also said that we do not anticipate any new build, we felt we had three very unique situations, but in the flat demand world, with pretty much an oversupply condition arguably in all three locations, but certainly in two of them, injecting new supply does not appear to be a winning proposition.

© 2016 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

From the point of view of Power's scale, in terms of its reach, I'd like to see it have a little bit more of a robust portfolio outside of PJM than it currently has, but it certainly would be one of the largest, if not the largest independent Power producer on its own, if that's where you're headed with that question. Power doesn't have a lot of megawatts, but it's financial strength and its profitability, I think, are quite unique, and something that we are very proud of. And we work hard to preserve that when making operating and investment decisions.

So the way we would intend in the near-term to grow Power is the way we've been trying to, which is through selective acquisitions of existing supply. As you know, we've not been successful in doing that. The one project we landed was the Keys project, and there probably because our perception of construction risk management was different than others, so I hope that answers your question.

Julien Dumoulin-Smith *- UBS - Analyst*

Absolutely. Thank you very much.

Operator

Praful Mehta, Citigroup.

Praful Mehta *- Citigroup - Analyst*

Just following up on that question on the future of Power, there looks to be clearly some Texas generation that will be in the market soon. Is there an interest in partnering up with Texas, or is Texas not a market that you look to enter?

Ralph Izzo *- Public Service Enterprise Group Incorporated - Chairman, President and CEO*

No you may recall, it was just a few years ago that we exited Texas, and it's not a market that we would want to reenter at this time.

Praful Mehta *- Citigroup - Analyst*

Fair enough. All right, and secondly in terms of capacity prices, I know you mentioned in your prepared remarks that you weren't surprised by the current capacity trend. I wanted to get a sense for how you are looking at long-term capacity prices in PJM, and also, what was driving or what is minimum threshold that you looked at when you were making your investment decisions, that instead of a particular price that you thought capacity prices need to stay at to hit your IRR?

Ralph Izzo *- Public Service Enterprise Group Incorporated - Chairman, President and CEO*

So in terms of longer-term, as you know, we don't forecast prices. What we think will be different about next year's auction than this year's are a couple of factors. Number one is the requirement that 100% of the assets be CP compliant. Number two, we will have a market effect due to a recent announcement, an April announcement by Con Edison, that a wheel that they were party to, they will no longer make use of. That wheel had the effect of the net transfer into our region of about 400 megawatts, which will now no longer be the case.

Also, we don't anticipate the step change in PJM's demand forecast, as that took place prior to the last auction. We have been the primary builder of major transmission, and while we still have a very, very robust transmission program, most of those projects are not involved in significant transfer capability, they are more at the 69 to 230 KV level within the zone.

The second answer of your questions, what do we look at? So we do have an internal rate of return expectation that is obviously well above our utility return expectations, and we look at the combination of energy margin and capacity margin, when making that decision. Suffice to say, obviously the fact that we're going ahead and building the prices that we realized last year in the auction and this year in Connecticut were sufficient

THOMSON REUTERS

SI-SSA-0015-13374

for us to go ahead. So there's no one magic number in terms of capacity that says go ahead and build, it's the combination of capacity and energy together over the long-term that we look at.

Praful Mehta - ***Citigroup - Analyst***

Fair enough. Thanks so much.

Operator

(Operator Instructions)

Brian Chin, Bank of America.

Brian Chin - ***BofA Merrill Lynch - Analyst***

We've seen a number of your peers announce greater investment in utility scale renewables, while I appreciate your earlier comment that you're not looking to expand in Power, I was wondering if you can comment on renewable outlook in the Northeast, given just how quickly renewable costs has been declining, and how improvements in technology have changed the landscape from the last couple years?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

Sure, Brian first of all, we don't have any peers. That's number one. Sorry, just a personal point of view.

Number two in terms of renewables, we've been active on two fronts. On the unregulated side, we have about 300 megawatts that are in 12 or 14 states, I've lost track. And we specifically embarked on a crawl-walk-run strategy, I'd say right now we are jogging, and those projects have done well. Everyone has met there pro formas, in fact most of them have slightly exceeded their pro formas.

Most of our solar investment however has been concentrated on PSE&G, and that has been a blend of rooftop funded solar, where we don't own the assets but we have regulatory assets that support the rooftop, and grid connected. As you know in New Jersey, grid connected is measured in single-digit megawatts as opposed to double or triple digit megawatts.

Notwithstanding the impressive price improvements of these installations, they still are substantially above conventional technology power prices. So our estimates right now are that in New Jersey, people pay anywhere from $4 to $6 a month for solar energy, and that's typical residential homeowner, obviously the average homeowner means that there is a bunch of people pay more, a bunch of people pay less. And all of our customer survey information suggests that is at or above the level that people are comfortable paying.

So our pursuit of solar in PSE&G is really driven by the RPS and the desire to achieve those policy mandated targets at as low a price as possible, and doing things 3 and 4 megawatts at a time on landfills is a lot less expensive than during 2 or 3 kilowatt hours at a time on rooftops. But one has to be careful, even 3 and 5 megawatts at a time as to what the bill impact is.

So we're long-standing fans of solar, we're not apologists for it. But we do have to balance the bill and tax, and so we pursue those opportunities in state in accordance with the RPS, and in other states accordance with those utilities need to meet their RPS and secure those investments through power purchase agreements.

Brian Chin - ***BofA Merrill Lynch - Analyst***

Got it. Thank you very much. That's all I've got.

THOMSON REUTERS

Operator

Shahriar Pourreza, Guggenheim.

Shahriar Pourreza - ***Guggenheim Partners - Analyst***

Most of my questions were answered, but just curious, Ralph, you've, historically on the Power side, you have talked about still having potentially, and let me know if I'm putting words in your mouth, of an interest in the US nuclear business given your diversified fleet at PEG Power, but one of the curtailments of that business has been the mechanisms or lack of mechanisms or the constructs haven't been appropriate. But now that you are looking at some of what's happening in your surrounding states, that environment could be potentially improving. So when you look at Power, you look at its balance sheet and you look at selective acquisitions to increase scale, what you're seeing around you, does it open up the doors of maybe looking at nuclear?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

No, Shar, let me make sure I interpreted the question correctly. In terms of new nuclear power the economics just aren't there. Every indication of the availability of natural gas and the duration of that availability, and the likely price range that we would see would suggest that new nuclear in an emerging Company would not be an economically wise thing to do.

Shahriar Pourreza - ***Guggenheim Partners - Analyst***

No, I think what I am relating to is pre-existing nuclear assets that could potentially have contracted cash flows for the next few years.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

If you had contracted cash flows, and they met the hurdle rate, then we certainly think that nuclear has a long-term future. But as we were saying just a few minutes ago with Julien and Praful, others seem to, invariably when we show up to buy an existing asset, they add a couple dollars to the forward price curve and we don't tend to win. In terms of purchasing existing assets, so much is driven by the winner's curse and your view of where forward prices are going, and our more disciplined approach is saying that we are not smarter than the market. So I would think the practicality of that would be somewhat limiting.

Shahriar Pourreza - ***Guggenheim Partners - Analyst***

Got it. Thanks.

Operator

Michael Lapides, Goldman Sachs.

Michael Lapides - ***Goldman Sachs - Analyst***

Question on the regulated site on E&G and it's actually a handful of questions. First of all, the $300 million increase in distribution CapEx, can you talk a little bit about how you get cost recovery on that, and whether, if it is not being tracked, does that increase the potential for regulatory lag at E&G over the next couple of years?

© 2016 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13376

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

So, Michael, thanks for the question. So two things. Number one part of that $300 is what is called new business, so there is revenue that comes with new business, but equally if not more importantly, as you know, we have to go in for a rate case in November of 2017. So we are doing some things that need to be done, and we are timing them as such as they will fit into the right base for the test year. So they will be covered by the rate case, with minimal if any regulatory lag at all.

Michael Lapides - ***Goldman Sachs - Analyst***

Got it. Another thing, how are you thinking about the ability to manage O&M at E&G over the next really what's in 2016 guidance, but also how you're thinking about it over the next one to two years, maybe 2017, 2018 both core O&M and then when you think about what's happened with interest rates, discount rates, and what it means for the pension component of your O&M at E&G?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

So I will let Dan talk about pension, but we don't look at O&M on, oh, it's time to check out O&M perspective. We look at it every day, so we just extended contracts with six out of our eight unions, not all of them are utility, but our three largest utility unions were included in that six out of eight. And those were all reasonable escalation, they were wage increases of 3% per year, but benefit trade-offs that reduce the overall O&M growth. So we've kept the utility O&M growth to a little over CPI, I think it's been 2%-ish thereabouts, I don't remember exactly CPI, but I know what our O&M growth rate has been, it's been just a little bit over 2%.

And we just pay attention to that everyday. We're not believers in getting inefficient before a rate case and then taking costs out of the business right after it. That first of all is not a great way to build confidence with regulators, and it's not a good way to manage the operation. In terms of pension, lower interest rates are not going to be great for the PBO, but strong market performance, which we've seen, will be. But Dan, you may want to add some more color to that?

Dan Cregg - ***Public Service Enterprise Group Incorporated - EVP and CFO***

I think that's exactly right, and it's a little bit of a wait-and-see. I think a lot of the -- on the PBO site exactly what Ralph referenced, the discount rate is going to be determined really when we get to the end of the year. That's uncertain until we get there, and returns have been doing pretty well. So I think keeping an eye on those things as we move toward year-end, we will track where we go on the pension. And in the interim just try to manage overall O&M spend, whether it is storms, whether it's any requirements we have for inspections or veg management, and trying to manage it as a whole, which I think we've done successfully in the past and we would intend to do in the future is how we will go forward.

Michael Lapides - ***Goldman Sachs - Analyst***

Dan, have you ever talked about what the sensitivity is to every 25 basis points change in the interest rate? For pension O& M, sorry.

Dan Cregg - ***Public Service Enterprise Group Incorporated - EVP and CFO***

Oh, yes, ultimately it's just going to have an impact both on what the obligation turns out to be, and the component of what your returns are. And we do look at that internally to try to see where it goes, but fact of the matter is, at the end of the day, the discount rate is going to be the discount rate. So it's something we need to manage having come at us, because we can't control that as a rate itself.

Michael Lapides - ***Goldman Sachs - Analyst***

Got it. Thanks, I will follow up off-line. Much appreciated.

Jonathan Arnold, Deutsche Bank.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Sorry, I was off-line when you called before. Ralph, you have mentioned some level of interest in the retail business, as a way a path to market I believe. Can you update us on your thoughts there? And obviously a large book that one would imagine would have some geographic interest to you just transacted, with someone else. Was that a bigger type of portfolio than you might be interested in, or any perspective? That would be great.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

Sure, Jonathan, first it's good to hear you, I was a little concerned when you disappeared on us before. We remain interested in retail for defensive purposes, managing basis risk, and not as a significant growth opportunity by any stretch of the imagination. We have looked at some boutique shops including the transaction you just referenced right now. I suspect that we are going to run into the same issues in looking at those types of potential tuck in acquisitions as we do with power plants that our disciplined, some would say conservative approach to pricing these things will result in us perhaps not being able to roll up what we need to roll up from an acquisitive point of view.

So we're starting to turn our attention to just building some capability in-house, because again, our ambitions here are modest, they are defensive and it's conceivable that an organic approach could be quite a bit more profitable from the point of view of return expectations. Sorry, Jonathan I seem to have left a deafening silence.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Sorry, I had the mute button on again. What stage would you describe that internal look at? Have you started to put a team together?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

We have hired some folks and we have started looking around at the systems that we would need that are a little different than the systems we have now. We are preparing to file the necessary documents one needs to be certified or licensed, I forget the exact terminology, to engage in this business. It would be a separate and different function than our current wholesale trading arm.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Okay so it's actually something you're beginning to move on, but starting small.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

Correct.

Jonathan Arnold - ***Deutsche Bank - Analyst***

Okay. Thank you very much.

Anthony Crowdell, Jefferies.

Anthony Crowdell - ***Jefferies LLC - Analyst***

I just had a quick question on the hedge volumes, slide 26. I look at that 2018 hedge volumes, it doesn't look like there was a big change in the percentage hedge from the first-quarter announcement, but the price change went from $54 to $46. Can you provide any clarity on that?

Dan Cregg - ***Public Service Enterprise Group Incorporated - EVP and CFO***

Anthony, I think we were up, the midpoint of those range went up about 5% from the first quarter until now. There's a piece, so it's not a huge move, a piece of it is, as well, that earlier in our overall hedging trajectory more of the volume is PGS oriented. If you think about what that price is, it includes some other non-pure energy items, and as we step further through our hedging, we end up with a little bit more of a block pure energy trades, which tends to have a more moderating effect on the price itself.

Anthony Crowdell - ***Jefferies LLC - Analyst***

Okay. Great. So you're saying earlier in the year when you hedged, I guess the first hedges, you put on are more BGS oriented hedges, and as you move throughout the year and layer on more hedges, that's more of just an energy market?

Dan Cregg - ***Public Service Enterprise Group Incorporated - EVP and CFO***

If you think about when the BGS auction happens in February of 2015, you will have that stub then going into 2018. And then 2016 will have the same effect on 2018, so there's -- just that accounts for a higher percentage of the volume earlier on, and as we step into some of the energy hedges, that number tends to go down a little bit by virtue of the nature of the hedge that we are putting on.

Anthony Crowdell - ***Jefferies LLC - Analyst***

It's like the wedding of Cana, I guess, the better wine first. Thanks for your help.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

Good one. Thanks, Anthony. That's great.

Nobody wants to follow that comment.

Operator

Mr. Izzo and Mr. Cregg, there no further questions at this time. Please continue with your presentation.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President and CEO***

I am told by Kathleen that many of you folks had a very busy morning with some other calls, so I mean I always am grateful for your participation, but a special thank you, today given how much was going on prior to us. So, in keeping with prior practices, let me just summarize what I hope were the key takeaways for you.

The utility growth driven by customer needs and policy maker priorities is really continuing unabated, rather than showing up a year after each investor meeting and telling you about what we have found, we are trying to do a better job of keeping you apprised of things as we look at them, so you heard about a little over $500 million of new stuff that we will be doing, $300 million which we are definitely going to do, and a couple hundred million of which we're waiting for BPU feedback on.

Power remains quite focused on markets and managing its cost, its performance and its investment decisions, which are real disciplined and hear what the market is telling us. Some challenging price environment, some great O&M control. And then third and final take away is that this balance sheet remains strong, there is change in our dividend policy. We continue to have the belief that the opportunity for sustained growth in that dividend continues, and that these expanding investment needs at the utility and opportunities at the utility can be met without any new equity.

I think we are on a little hiatus for a couple of weeks, and we will be back on the road in September, and certainly see all of you early in November at EEI. Thanks very much for joining us. Have a great rest of summer, folks.

Operator

Ladies and gentlemen that does conclude your conference call for today. You may now disconnect. Thank you for participating.

PSEG ANNOUNCES 2016 SECOND QUARTER RESULTS

$0.37 Per Share of Net Income

Operating Earnings of $0.57 Per Share

PSE&G Identifies $500 Million of Additional Capital Opportunities

July 29, 2016 (Newark, NJ) (NYSE- PEG) Public Service Enterprise Group (PSEG) reported second quarter 2016 Net Income of $187 million or $0.37 per share as compared to Net Income of $345 million or $0.68 per share reported for the second quarter of 2015. Operating Earnings for both the second quarter of 2016 and 2015 were $289 million or $0.57 per share.

Ralph Izzo, chairman, president and chief executive officer said "PSEG's second quarter earnings benefited from its expanded investment program and an alignment of costs with current power market dynamics. We remain focused on investments that meet customers' demand for reliable, efficient, and clean energy as well as drive long-term value creation."

Management uses Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Operating Earnings exclude the impact of returns(losses) associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items. The table below provides a reconciliation of PSEG's Net Income to Operating Earnings for the second quarter. See Attachment 12 for a complete list of items excluded from Net Income in the determination of Operating Earnings. The presentation of Operating Earnings is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, Operating Earnings as presented in this release may not be comparable to similarly titled measures used by other companies.

PSEG CONSOLIDATED EARNINGS (unaudited)
Second Quarter Comparative Results
2016 and 2015

	Income ($ millions)		Diluted Earnings Per Share	
	2016	**2015**	**2016**	**2015**
Operating Earnings	$289	$289	$0.57	$0.57
Reconciling Items*	(102)	56	(0.20)	0.11
Net Income	$187	$345	$0.37	$0.68
		Avg. Shares	508M	508M

*See Attachment 12.

Ralph Izzo went on to say, “We are maintaining our Operating Earnings guidance for 2016 of $2.80 - $3.00 per share. However, reaching the upper end of guidance will be difficult even with improvements seen in the power markets, expectations for warm summer weather, normal operations and management of O&M for the remainder of the year. We remain focused on meeting the needs of our customers and maximizing shareholder value by delivering on the promise of our investment program.”

Operating Earnings guidance by company has been adjusted to reflect results for the first half of the year as guidance for the full year remains unchanged:

Operating Earnings Guidance
($ millions, except EPS)

	2016E
PSE&G	$900 - $935
PSEG Power	$460 - $525
PSEG Enterprise/Other	$65 - $65
Total	$1,425 - $1,525
Earnings Per Share	$2.80 - $3.00

Operating Earnings Review and Outlook by Operating Subsidiary

See Attachment 6 for detail regarding the quarter-over-quarter reconciliations for each of PSEG’s businesses. Due to the forward looking nature of Operating Earnings guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

PSE&G

PSE&G reported Net Income of $179 million ($0.35 per share) for the second quarter of 2016 compared with Net Income of $167 million ($0.33 per share) for the second quarter of 2015.

PSE&G’s results for the second quarter reflect the impact of revenue growth associated with an expansion of its capital investment program.

The New Jersey economy continues to show steady growth with employment improving from a year-ago. Weather-normalized electric sales for the 12 months ended June 30, 2016 were slightly lower by (0.2%) compared to the prior period as growth in the number of customers was offset by a continued decline in usage per customer due to increased energy efficiency measures and a decrease in the Industrial sector.

Returns on PSE&G’s expanded investment in transmission added $0.03 per share to earnings in the quarter. An increase in depreciation and O&M ($0.02 per share) was partially offset by a decline in taxes and other items of $0.01 per share.

PSE&G's capital program remains on schedule. PSE&G invested approximately $1.4 billion in the first half of the year as part of its planned capital investment for 2016 of $3.0 billion in upgrades to the electric and gas distribution and transmission system.

PSE&G, in May 2016, filed a petition with the New Jersey Board of Public Utilities (BPU) requesting an extension of its existing landfill/brownfield solar program to construct 100-MW of grid-connected solar facilities. The program represents a capital investment of up to $240 million over a 5-year period. Parties to the proceeding have agreed to a procedural schedule under which we could see a decision by the BPU during the fourth quarter of the year. PSE&G has also increased its estimate of Distribution capital expenditures over 2016 – 2018 by $300 million to address new business requests and replace certain aging equipment and infrastructure. The expansion of capital spending under these programs could represent an increase of over $500 million in PSE&G's planned $12 billion capital spending program over the 5-year period ended 2020.

Finally, as part of its annual BGSS filing with the BPU, PSE&G has proposed a reduction in its basic gas supply rate to 34 cents per therm from 40 cents per therm. If approved, the rate reduction would be effective on October 1, 2016.

The forecast of PSE&G's Operating Earnings for 2016 has been adjusted upward to $900 - $935 million from $875 - $925 million.

PSEG Power

PSEG Power reported a Net Loss of $11 million ($0.02 per share) for the second quarter of 2016 and adjusted EBITDA of $272 million compared with Net Income of $166 million ($0.33 per share) and adjusted EBITDA of $301 million for the second quarter of 2015. Operating Earnings for the second quarter of 2016 were $91 million ($0.18 per share) versus $110 million ($0.22 per share) for the second quarter of 2015.

Management uses Adjusted EBITDA in its internal analysis, and in communications with investors and analysts, regarding Power's financial performance as compared to previous financial results. Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization and major maintenance at Power's fossil generation facilities. See Attachment 12 for a complete list of items excluded from Net Income in the determination of Adjusted EBITDA. The presentation of Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP.

Power's operating results for the second quarter reflect the impact of the known decline in PJM capacity revenues and average prices on energy hedges in addition to the margin effect of an extended refueling outage at Salem 1.

A decline in capacity revenue associated with the June 2015 retirement of peaking capacity in PJM reduced quarter-over-quarter income by $0.02 per share. A decline in the average price on energy hedges as well as lower market prices and gas volumes combined to reduce quarter-over-quarter income by $0.03 per share. A decline in output during the quarter was primarily associated with fossil units due to weak weather-related demand and pricing which reduced income by $0.01 per share. A reduction in O&M expense improved Power's quarter-over-quarter income by $0.07 per share. An increase in depreciation expense was offset by a decline in interest expense. However, an absence in

2016 of tax credits received in the year-ago quarter and other tax items contributed to a reduction in quarter-over-quarter income of $0.05 per share.

Output at Power's generation facilities declined 6% in the quarter. The average capacity factor for the nuclear fleet was 83% in the quarter versus an average capacity factor of 86% in the year-ago quarter as output from the nuclear fleet declined to 7.0 TWh from 7.1 TWh. An extended refueling outage at Salem 1 to repair degraded baffle bolts was the primary cause for the decline in the nuclear fleet's operations. The impact of the outage at Salem was largely offset by an increase in output at Peach Bottom associated with completion of an extended power uprate capital program on both units which added 130 MWs of capacity to Power's interest. The extension of the Salem 1 outage into July and an unplanned outage at Salem 2 will have a continuing effect on third quarter performance. Output from the gas-fired combined cycle fleet declined slightly to 4.4 TWh from 4.6 TWh given mild weather conditions relative to the year-ago quarter. Low gas prices reduced the dispatch of Power's coal-fired fleet during the quarter with output declining to 0.9 TWh from 1.3 TWh.

Power is reducing its forecast of output for 2016 to 50 – 52 TWh from its prior forecast of 52 – 54 TWh. The revised range incorporates the impact of the extended outage at Salem 1 as well as the impact of an unplanned outage at Salem 2. Approximately 75% - 80% of anticipated production for the second half of 2016 of 25 – 26 TWh is hedged at an average price of $50 MWh. For 2017, Power has hedged 55% - 60% of its forecast generation of 53 – 55 TWh at an average price of $48 per MWh. For 2018, approximately 25% - 30% of forecast generation of 58 – 60 TWh is hedged at an average price of $46 per MWh. The hedge data for 2016 continues to assume BGS hedges represent 11 – 12 TWh of output.

The forecast range of Power's Operating Earnings for 2016 has been lowered to $460 million - $525 million from $490 - $540 million. The forecast of Operating Earnings represents Adjusted EBITDA for the full year of $1,270 - $1,375 million.

PSEG is unable to reconcile forecasted Adjusted EBITDA to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains(losses), for future periods due to market volatility.

PSEG Enterprise/Other

PSEG Enterprise/Other reported Net Income of $19 million ($0.04 per share) for the second quarter of 2016 versus Net Income of $12 million ($0.02 per share) during the second quarter of 2015. The increase in quarter-over-quarter income reflects contractual payments associated with the operation of PSEG Long Island and certain tax items at PSEG Energy Holdings. The forecast of PSEG Enterprise/Other Operating Earnings for 2016 has been increased to $65 million from $60 million.

Financing

PSEG closed the quarter ended June 30, 2016 with $648 million of cash on its balance sheet with debt at the end of the quarter representing approximately 45% of consolidated capital. PSEG Power, during the quarter, issued $700 million of 3.0% Senior Notes due June 2021.

######

FORWARD-LOOKING STATEMENT

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or ongoing low pricing of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulations, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators, including prudency reviews, disallowances and changes in authorized returns,
- any deterioration in our credit quality or the credit quality of our counterparties,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations or increase the cost of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- delays or unforeseen cost escalations in our construction and development activities, or the inability to recover the carrying amount of our assets,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- increases in competition in energy supply markets as well as for transmission projects,
- changes in technology, such as distributed generation, storage and micro grids, and greater reliance on these technologies,
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- an extended economic recession,
- an inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce, and
- changes in the credit quality and the ability of lessees to meet their obligations under our domestic leveraged leases.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

PSEG Earnings Conference Call

2nd Quarter 2016

July 29, 2016

SI-SSA-0015-13398

Forward-Looking Statements

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute “forward-looking statements” within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words “anticipate,” “intend,” “estimate,” “believe,” “expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or ongoing low pricing of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulations, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators, including prudency reviews, disallowances and changes in authorized returns,
- any deterioration in our credit quality or the credit quality of our counterparties,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations or increase the cost of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- delays or unforeseen cost escalations in our construction and development activities, or the inability to recover the carrying amount of our assets,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- increases in competition in energy supply markets as well as for transmission projects,
- changes in technology, such as distributed generation, storage and micro grids, and greater reliance on these technologies,
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- an extended economic recession,
- an inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce, and
- changes in the credit quality and the ability of lessees to meet their obligations under our domestic leveraged leases.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws. The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-13399

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Operating Earnings exclude gains or losses associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting, and material one-time items. Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization and major maintenance expense costs at Power's fossil generation facilities. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income to reconcile to Operating Earnings and Adjusted EBITDA with a reference to that slide included on each of the slides where the non-GAAP information appears.

Management uses Operating Earnings and Adjusted EBITDA in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. The presentation of Operating Earnings and Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, Operating Earnings and Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of Operating Earnings and Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

These materials and other financial releases can be found on the pseg.com website under the investor tab, or at http://investor.pseg.com/

SI-SSA-0015-13403

PSEG – Q2 2016 Highlights

- **Solid Results**
  - ✓ Net Income of $0.37 vs. $0.68 per share in Q2 2015
  - ✓ Operating Earnings of $0.57 vs. $0.57 per share in Q2 2015*
  - ✓ Increased earnings contribution from PSE&G's investment in Transmission
  - ✓ Maintaining full-year 2016 Operating Earnings guidance of $2.80 - $3.00 per share

- **Operating Review**
  - ✓ PSEG Power generating output declined by 6% vs. Q2 2015 – reflecting mild weather, low gas prices and impact of extended outage at Salem nuclear facility

- **PSEG Disciplined Capital Investment**
  - ✓ PSE&G identifies more than $500 million of additional capital opportunities through 2020
  - ✓ Solar 4 All Extension II filing made with NJBPU in May with decision expected in Q4
  - ✓ Power's construction of Keys and Sewaren CCGTs on schedule and on budget

- **Market Developments**
  - ✓ RPM auction results for 2019/2020 reflected PJM's downward revisions to the demand forecast and the effects of both new generation and uncleared generation from the prior year's auction

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings.

SI-SSA-0015-13404

Maintaining 2016 Operating Earnings Guidance

Reaching the upper end of our guidance range in 2016 will be difficult even with improvements seen in the power markets, expectations for warm summer weather, normal operations and management of O&M

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings. E = Estimate.

PSE&G
2016 Q2 Review

SI-SSA-0015-13411

PSE&G – Q2 Earnings Summary

$ millions (except EPS)	Q2 2016	Q2 2015	Variance
Operating Revenues	$ 1,350	$ 1,466	$ (116)
Operating Expenses			
Energy Costs	529	544	(15)
Operation & Maintenance	352	368	(16)
Depreciation & Amortization	136	234	(98)
Total Operating Expenses	1,017	1,146	(129)
Net Income	$ 179	$ 167	$ 12
EPS from Net Income	$ 0.35	$ 0.33	$ 0.02

SI-SSA-0015-13412

PSE&G EPS Reconciliation – Q2 2016 versus Q2 2015

SI-SSA-0015-13413

PSE&G – Q2 2016 Weather Data

PSE&G Monthly Weather Summary
2016 vs. 2015 vs. Normal

Q2 2016 heating degree days were ~29% higher than Q2 2015 and ~7% higher than normal

Q2 2016 temperature-humidity index was ~21% lower than Q2 2015 and ~5% lower than normal

SI-SSA-0015-13414

PSE&G – Q2 2016 Operating Highlights

Operations

- ✓ Q2 2016 weather was milder than Q2 2015
- ✓ NJ economy continues to show improvement; but residential and commercial customer growth was offset by greater use of energy efficiency measures and lower industrial activity
- ✓ On a trailing 12-month basis, weather normalized electric sales for both residential and commercial customers were essentially flat, and industrial sales were lower by 2%

Regulatory and Market Environment

- ✓ Solar 4 All Extension II filing has been deemed complete by the BPU for an expected Q4 2016 decision
- ✓ PSE&G residential gas customers to benefit from proposed rate reduction of 7.4% on October 1, estimated savings for the average gas customer of $64 per year if approved by the BPU

Financial

- ✓ PSE&G made $1.4 billion of capital expenditures in the YTD period ended June 30 as part of its full year capital spending projected to be at least $3 billion
- ✓ PSE&G has identified ~$500 million of additional capital opportunities, including the Solar 4 All Extension II filing, to invest in its distribution business beyond the current $12 billion plan in the 2016-2020 period
- ✓ PSE&G's forecast of Net Income and Operating Earnings has been increased to $900 - $935 million from $875 - $925 million*

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings.

	Price $/MWh	$50	$48	$46

* Hedge percentages and prices as of June 30, 2016. Revenues of full requirement load deals based on contract price, including renewable energy credits, ancillary, and transmission components but excluding capacity. Hedges include positions with MTM accounting treatment and options.

SI-SSA-0015-13424

PSEG Power – Q2 2016 Operating Highlights

Operations

- ✓ Q2 output down 6%; average nuclear capacity factor for the fleet was 83% vs. 86% in Q2 2015, as nuclear output declined by 2% to ~7 TWh, primarily reflecting the extended refueling outage at Salem 1 to replace degraded baffle bolts and an unplanned outage at Salem 2 – partly offset by increased output at Peach Bottom related to 130 MWs of recent EPU uprates
- ✓ CCGT availability remains strong; production down 4% on mild Q2 weather and lower demand
- ✓ Dispatch of coal units affected by decline in price of gas; fuel cost per MWh fell by 13% vs. Q2 2015

Regulatory and Market Environment

- ✓ PSEG Power's average capacity pricing for the 2016/2017 capacity year reset to $172 MW/day on June 1
- ✓ The 2019/2020 RPM auction results reflected PJM's downward revisions to the demand forecast and the effects of both new generation and uncleared generation from the prior year's auction
- ✓ Power cleared ~8,900 MW of capacity at an average price of $116 MW/day in the 2019/2020 RPM auction

Financial

- ✓ Power's total debt as a percentage of capital was 32% at June 30
- ✓ Power issued $700 million of 3.00% Senior Notes due 2021
- ✓ Power's forecast of Operating Earnings is revised to $460 - $525 million from $490 - $540 million; Adjusted EBITDA is lowered to $1,270 - $1,375 million from $1,320 - $1,400 million*

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings; See Slide B for a reconciliation of Adjusted EBITDA to Operating Earnings and Net Income.

SI-SSA-0015-13425

PSEG

PSEG Financial Highlights

Maintaining full-year 2016 Operating Earnings guidance of $2.80 - $3.00 per share*

- ✓ Reaching the upper end of our guidance range in 2016 will be difficult even with improvements seen in the power markets, expectations for warm summer weather, normal operations and management of O&M
- ✓ Focused on meeting customer needs for clean, reliable, efficient delivery of energy

Infrastructure Spend

- ✓ PSE&G capital spending on T&D for 2016 expected to top $3 billion
- ✓ PSE&G's Gas System Modernization Program (GSMP) and Energy Strong continue
- ✓ Keys and Sewaren CCGTs construction is on schedule and on budget
- ✓ PSE&G has identified more than $500 million of additional infrastructure spend over the current capital spending plan of $12 billion in the 2016-2020 period

Financial position remains strong

- ✓ Positive cash from Power and increasing cash flow from operations at PSE&G supports dividend growth and funds capital spending program without the need to issue equity
- ✓ Debt as a percentage of capitalization was 45% at June 30

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings.

PRESENTATION

Operator

Ladies and gentlemen, thank you for standing by. My name is Ginger, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group's third-quarter 2016 earnings conference call and webcast.

(Operator Instructions)

As a reminder, this conference is being recorded today, Monday, October 31, 2016, and will be available for telephone replay beginning at 2:00 PM Eastern time today until 11:30 PM Eastern time on November 7, 2016. It will also be available as an audio Webcast on PSEG's corporate website at www.PSEG.com. I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen Lally - *Public Service Enterprise Group Incorporated - VP of IR*

Thank you, Ginger. Good morning. Thank you for participating in PSEG's call this morning. As you are aware, we released third-quarter 2016 earnings statements earlier this morning.

The release and attachments, as mentioned, are posted on our website at www.PSEG.com, under the investors section. We also posted a series of slides that detail operating results by Company for the quarter. Our 10-Q for the period ended September 30, 2016 is expected to be filed later today.

As you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. And although we may elect to update those forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if our estimate changes, unless required to do so. Our release also contains non-GAAP operating earnings. Please refer to today's 8-K or our other investor filings for a discussion of factors that may cause results to differ from management's projections, forecasts, and expectations, and for a reconciliation of non-GAAP operating earnings to GAAP results.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group; and joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions.

Client Id: 77

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

Thank you, Kathleen, and thank you everyone for joining us today. PSEG reported strong results for the third quarter. Earlier this morning, we reported net income for the quarter of $0.64 per share, versus $0.87 per share last year.

Non-GAAP operating earnings for the third quarter of 2016 were $0.88 per share, compared with non-GAAP operating earnings for the third quarter of 2015 of $0.80 per share. For the nine months, we reported net income of $1.94 per share versus $2.70 per share. The non-GAAP operating earnings for the nine months ended September 30th, 2016 are $2.36 per share, which compares with non-GAAP operating earnings of $2.41 per share earned during the nine months ended September 30, 2015.

Slides 4 and 5 contain the details on the results for the quarter and the nine months. We remain committed to our core operating philosophy of operational excellence, investing in a disciplined manner, and maintaining a strong financial position to support the growth expected by our shareholders. PSE&G continues to earn its return on an expanded capital investment program. PSEG Power continues to manage through very difficult energy markets, and we continue to take strong actions to optimize both businesses in this environment.

PSEG Power has decided to retire the Hudson and Mercer coal-fired generation stations in 2017. This is sooner than we would have forecasted just a few short years ago, but became inevitable in the face of changes in the energy market, which were amply demonstrated this summer. While we experienced very warm weather conditions, the abundance of low-cost gas supply, which is a benefit for our customers, kept energy prices low, and is expected to keep power prices lower for longer.

Careful analysis indicated it would be uneconomic to invest the capital necessary to assure the units would comply with PJM's new capacity performance reliability standards. Although the units have been dispatched infrequently, we expect the retirement of Hudson and Mercer to result in a further reduction in the fleet's emissions profile. These retirements continue the evolution of PSEG Power's fleet into a portfolio of reliable, low-cost flexible assets, capable of competing in today's market.

To be clear, retirement will also aid Power's future cash flow and return profile. The addition of 1,800 megawatts of new gas-fired capacity at Keys, Sewaren, and Bridgeport Harbor over 2018 through 2019, will further the transformation of the fleet. From a supply/demand standpoint, I want to remind you that the capacity at Sewaren and Bridgeport Harbor will replace older steam and coal fired capacity that we will retire. The new capacity will improve the fleet's efficiency, and lower its cost structure.

The new units remain on time and on budget. These new units remain profitable, even with the recent declines in market pricing, and continue to meet our hurdles for returns, which of course, are in excess of our return expectations that we place on new utility investments.

By the end of this decade, our nuclear and gas-fired generation facilities will provide more than 90% of our electric output. Our nuclear fleet represents our cleanest energy resource for the foreseeable future, and our gas-fired combined cycle fleet represents an efficient flexible resource. We remain committed to operating the fleet in a safe, reliable manner, and assuring their availability over the long term.

Power continues to focus on running the business efficiently, and has made targeted reductions in its workforce, and continues to identify measures to improve availability and margins in today's market. New investment opportunities for Power do not involve the construction of additional new capacity, but we continue to look for opportunities to diversify the fleet.

PSE&G also continues to identify new opportunities for growth. PSE&G is on track to invest $3 billion in 2016, as part of its five-year $12 billion capital program.

In addition, PSE&G has recently reached a settlement with key parties that provides for an extension of its existing innovative landfill and brownfield solar programs, subject to BPU approval. The settlement allows PSE&G to expand its investment in solar by approximately $80 million, to construct 33 megawatts of grid-connected solar facilities over three years. We believe PSE&G's involvement in grid-connected solar extends the benefit of solar to all of its customers, at a lower cost. We anticipate a decision from the New Jersey Board of Public Utilities by year end.

Client Id: 77

PSE&G is also requesting approval from the BPU to partner with New Jersey Transit in the development of a new $270 million substation, that both would utilize and would enhance the reliability and resilience of facilities damaged by Super Storm Sandy. The new substation would enter service by the end of 2020.

For me, it's hard to believe, but it's been four years since Super Storm Sandy struck. It touched all of our customers, and to date, we've invested more than $900 million under electric and gas programs approved by the BPU, to improve our system's resilience through raising substations, building redundancy, replacing gas pipe, and even trimming trees. The collaboration with New Jersey Transit on construction of a new substation represents a continuation of this type of work.

The agreement to increase our investment in solar, our announced $300 million increase in base capital spend, and PSE&G's anticipated collaboration with New Jersey Transit represent a greater than $600 million increase in PSE&G's capital program. PSE&G's ability to earn its authorized return on investment continues to drive our forecast for double-digit growth in PSE&G's 2016 earnings.

Based on our forecast for the year, PSE&G is expected to represent more than 60% of 2016's consolidated non-GAAP operating earnings. Its investment program continues to drive annual growth in rate base of 8% through the end of the decade, with the potential for up to 10%, with additional programs that we have planned.

We have met significant challenges to our forecasts presented by the lack of winter weather and low energy pricing. Even so, consistent with our comments on the second-quarter earnings call in mid-summer, we're making a slight adjustment to the upper end of our full-year guidance. We are now guiding toward 2016 non-GAAP operating earnings of $2.80 to $2.95 per share, which represents a small reduction from our prior forecast of non-GAAP operating earnings of $2.80 to $3 per share.

We are confident that the investment we're making, along with the focus on operational excellence and a strong balance sheet, will drive long-term success. With that, I'll turn the call over to Dan, who will discuss our financials in greater detail.

Dan Cregg - *Public Service Enterprise Group Incorporated - EVP & CFO*

Great. Thank you Ralph, and thank you everybody, for joining us on the call this morning. As Ralph mentioned, PSEG reported net income for the third quarter of 2016 of $0.64 per share, versus net income of $0.87 per share in last year's third quarter. Non-GAAP operating earnings for the third quarter of 2016 were $0.88 per share, versus non-GAAP operating earnings of $0.80 per share in last year's third quarter, and a reconciliation of non-GAAP operating earnings to net income for the quarter and year-to-date can be found on slides 4 and 5. We've also provided you with a waterfall chart on slide 9 that takes you through the net changes in quarter-over-quarter non-GAAP operating earnings by major business, and a similar chart on slide 10 provides with you the changes to non-GAAP operating earnings by each business on a year-to-date basis.

And I'll now review each Company in more detail, starting with PSE&G. PSE&G reported net income of $0.50 per share for the third quarter of 2016, compared with $0.44 per share for the third quarter of 2015, for a 14% improvement. Results for the quarter are shown on slide 12.

The improvement in PSE&G's net income for the third quarter reflects growth from its expanded investment in electric and gas transmission and distribution facilities. Returns on PSE&G's expanded investment in transmission added $0.03 per share to net income in the quarter, and incremental revenue associated with PSE&G's Energy Strong Infrastructure Program added $0.02 per share to net income in the quarter.

Third-quarter net income comparisons also benefited by an increase in electric demand associated with weather conditions, which were approximately 30% warmer than normal, and 9% warmer than conditions experienced in the third quarter of 2015. The increase in demand associated with the warmer than normal weather added $0.01 per share to third-quarter net income. An increase in depreciation and O&M and other expense was offset by a decline in taxes and other items.

Retail electric sales increased 3.6% in the quarter, reflecting the much warmer summer weather that occurred in 2016. And on a weather normalized basis, total sales were slightly positive versus the third quarter of 2015, with higher sales to residential and industrial customers offset by a decline in sales to commercial customers. As Ralph mentioned, PSE&G's capital program, led by an investment in transmission, is on schedule.

THOMSON REUTERS

SI-SSA-0015-13435

Client Id: 77

PSE&G is expected to invest $1.7 billion in transmission during 2016 as part of a five-year $7.0 billion investment program to upgrade and expand the transmission network. PSE&G's investment in transmission is expected to grow to represent approximately 45% of year-end 2016's rate base. PSE&G recently filed an update of its formula rate for transmission at the Federal Energy Regulatory Commission, and the update, which reflects an increase in the level of PSE&G's investment in transmission would provide for a $121 million increase in annual transmission revenues, effective January 1 of 2017, subject to FERC approval. We are maintaining our forecast for PSE&G's non-GAAP operating earnings for 2016 of $900 million to $935 million.

Now, let's turn to Power. PSEG Power reported net income of $139 million or $0.27 per share for the third quarter of 2016, compared with net income of $206 million or $0.40 per share for the year-ago quarter. Our non-GAAP operating earnings were $0.34 per share for the third quarter of 2016, compared to non-GAAP operating earnings for the third quarter of 2015 of $0.33 per share, and non-GAAP adjusted EBITDA for the third quarter of 2016 was $397 million versus non-GAAP adjusted EBITDA for 2015 of $401 million.

Non-GAAP adjusted EBITDA excludes the same items as our non-GAAP operating earnings measure, as well as income tax expense, interest expense, depreciation and amortization, and major maintenance at Power's fossil-generating facilities. And the earnings release on page 18 provides you with detailed analysis of the impact on Power's non-GAAP operating earnings quarter-over-quarter. We've also provided you with more detail on generation for the quarter, and for nine months of the year, on slide 19 and slide 20.

Power's net income in the third quarter includes one time pretax charges amounting to $114 million pretax, $67 million after tax, or $0.13 per share, related to the early retirement of the Hudson and Mercer generating stations. These one time charges, which are excluded from Power's non-GAAP operating earnings, mainly relate to the write-down of excess coal inventory, and materials and supplies, as well as some other smaller items.

Power's non-GAAP operating earnings for the third quarter reflect a decline in the average price on energy hedges, which was partially offset by lower cost to serve loads, which combined to reduce quarter-over-quarter operating earnings by $0.02 per share. A decline in output during the quarter reduced operating earnings by $0.01 per share, and a reduction in O&M expense improved results by $0.03 per share. Increase in depreciation expense associated with Power's capital program was more than offset by a decline in interest expense and other items, which combined to improve quarter-over-quarter net income by $0.01 per share.

As I mentioned, Power's third-quarter results benefited from a reduction in O&M expense, which added $0.03 per share to net income quarter-over-quarter. Year to date, a reduction in Power's O&M expense has improved net income comparisons by $0.15 per share. Management's proactive response to lower energy pricing has been a major contributor to the decline in O&M, and the timing of outages and major maintenance-related work has also influenced comparisons.

For example, in 2015, the refueling outage at Hope Creek occurred in the spring, and this year Hope Creek's refueling outage is currently under way in the fourth quarter. O&M expense in 2015 was also elevated due to major maintenance-related work at some of the fossil stations.

Although we expect O&M expense in 2016 to decline year over year, we should anticipate an increase in O&M for the fourth-quarter, given the costs associated with the refueling of our 100% owned Hope Creek Nuclear Station. Over the long term, you can expect constant diligence in controlling the growth of O&M.

Now, let's turn to Power's operations. Output at Power's generating facilities declined 4% in the quarter, and the nuclear fleet operated at an average capacity factor of 80% in the third quarter, versus an average capacity factor of 95% in the year-ago quarter, as output declined 12% to 6.9 terawatt hours from 7.8 terawatt hours.

The decline in output reflects the impact of extended outages at the two Salem units, and as we mentioned in our second-quarter earnings call, output in the third quarter would be impacted by the extension of the refueling outage at Salem 1 through July, to complete repair work on the unit's baffle bolts, and repair work at Salem 2 to repair an electrical fault. Both units have since returned to service, and are operating at full capacity.

THOMSON REUTERS

SI-SSA-0015-13436

Client Id: 77

Output from Power's gas-fired combined cycle fleet declined slightly to 5.2 terawatt hours from 5.4 terawatt hours last year. The warmer than normal weather conditions spurred an increase in demand for Power's coal-fired generating stations and peaking fleet, which together experienced an increase in output during the quarter to 2 terawatt hours from 1.6 terawatt hours.

Power markets in the third quarter benefited from hotter than normal weather, which had a favorable influence on the market, and Power was less hedged going into the quarter than a year ago, allowing the fleet to capture some upside in pricing. That said, a decline in Power's gross margin in the quarter to $41.74 per megawatt hour from $42.07 per megawatt hour reflects the impact of lower average prices on energy hedges.

As we have indicated, we continue to expect basis to be seasonal. That is, positive in the winter, assuming normal weather, and neutral to negative at other times of the year, until more gas pipeline take-away capacity goes into operation. Power continues to forecast output for 2016 of 50 to 52 terawatt hours.

The forecast takes into account the extended outage at Salem, as well as refueling outage at Hope Creek, which is currently under way. Power has reduced its forecast of generation output for 2017 and 2018 by approximately 3% to 4%. The revised forecast recognizes the impact of low gas prices on the potential dispatch of the Keystone and Conemaugh coal-fired generating station, with also some impact coming from the he retirement of Hudson and Mercer's coal-fired generating stations in mid-2017.

Approximately 75% to 80% of anticipated production in the fourth quarter of 2016 of 11 to 12 terawatt hours is hedged at an average price of $48 per megawatt hour. The average price for energy hedges for the full year approximates $50 per megawatt hour, and for 2017, Power has hedged 65% to 70% of its revised forecast of 51 to 53 terawatt hours of output at an average price of $47 per megawatt hour, and for 2018 Power has hedged approximately 25% to 30% of its revised forecast of 56 to 58 terawatt hours of output, at an average price of $45 per megawatt hour. The hedge data continues to assume BGS hedges will cover 11 to 12 terawatt hours of output.

The forecast of Power's non-GAAP operating earnings for 2016 has been revised to $460 million to $500 million, and the forecast represents non-GAAP adjusted EBITDA for the full year of $1.270 billion to $1.335 billion. I'd also like to point out that the retirement of Hudson and Mercer will continue to have an impact on Power's net income in the fourth quarter. In addition to the one-time charges recognized in the third quarter, Power expects to recognize incremental depreciation and amortization during the remainder of 2016, of $568 million pretax, and in 2017, Power expects to recognize incremental depreciation and amortization of $946 million pretax, due to the shortening of the expected economic useful lives of Hudson and Mercer.

Until the units are retired, we will continue to record normal O&M and depreciation in our non-GAAP operating earnings. On an annual basis these expenses amount to an estimated $60 million and $50 million pretax respectively. You should also see a reduction in Power's planned capital spending beyond 2017 of approximately $200 million, to reflect the elimination of previously-planned capital improvements at Hudson and Mercer.

Now, I'll turn to PSEG enterprise and other, where we reported a net loss of $0.13 per share for the third quarter of 2016, compared to net income of $0.03 per share for the third quarter of 2015. Our non-GAAP operating earnings for the third quarter of 2016 were $0.04 per share, compared to non-GAAP operating earnings of $0.03 per share for the third quarter of 2015.

During the third quarter of 2016, Energy Holdings completed its review of estimated residual values embedded in the NRG REMA leveraged leases. As a result of current and expected future market conditions, an impairment of $86 million after tax, related to the residual value of these leases, was recorded in net income. The increase in non-GAAP operating earnings quarter-over-quarter results reflect certain tax items at PSEG Energy Holdings, and contractual payments associated with the operation of PSEG Long Island.

The forecast of PSEG enterprise and other full year 2016 non-GAAP operating earnings remains $65 million. PSEG also closed the quarter ended September 30, 2016 with $450 million of cash on its balance sheet, with debt at the end of the quarter representing approximately 45% of consolidated capital. PSEG Power had debt at the end of the quarter representing 28% of capital.

As Ralph mentioned, we've adjusted our forecast for non-GAAP operating earnings for the full year to $2.80 to $2.95 per share, from $2.80 to $3 per share. And with that, we are ready for your questions.

QUESTIONS AND ANSWERS

Operator

(Operator Instructions)

Your first question is from Neel Mitra from Tudor, Pickering. Please go ahead with your question.

Neel Mitra - *Tudor, Pickering, Holt & Co. Securities - Analyst*

Just based off of some of your peers' commentary, could you comment if you're seeing any cost inflation at your nuclear plants, or any upward pressure on pricing, which you're having to contain?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

Yes, Neel. So we have been commenting and participating in industry efforts to reverse the trend of some of the escalations in both O&M and capital, being by the considerations emanating from the NRC. So we're part of an effort delivering the nuclear promise, to take the average industry cost structure of $35 a megawatt hour down to $30 a megawatt hour. We haven't released our specific cost structure, but suffice to say that we operate slightly below the industry average. Yes, there are cost pressures, but there's an active industry effort that we are front and center, and participating to both control that escalation and reverse it.

Neel Mitra - *Tudor, Pickering, Holt & Co. Securities - Analyst*

Got it. And then just moving to the Keys Center, some of your recent commentary is based off of the fact that you like the location in Southwest Mac within PJM. Could you comment on why that's a good location, compared to some other locations in PJM for a new build?

Ralph Izzo- *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

Sure. It's a couple reasons. First of all, it's closer to the -- it is part of the PJM west hub, where we do all of our hedging. So it does lend some balance to the portfolio, which is primarily PJM east, for where most of our assets are located.

It is a load pocket that is experiencing some modest degree of growth. There have been years where it looked like it was going to be about 4%. And it's been consistently the strongest pricing region from an energy market point of view in PJM the past few years.

Neel Mitra - *Tudor, Pickering, Holt & Co. Securities - Analyst*

Okay. Perfect. Thank you.

THOMSON REUTERS

SI-SSA-0015-13438

Client Id: 77

Travis Miller - *Morningstar - Analyst*

At a high level, I know you like to have a strong balance sheet. Where you are right now with the growth projects that you have over the next two to three years, especially on the power side, how do you see that leverage changing? And to the extent that it stays in this range, what's the opportunity to add leverage, perhaps at the parent co, or some other place on the balance sheet?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

The numbers, I'll let Dan fill in, remained on average above 40% for the next three years, given current market expectations. Our floor at Power is an FFO to debt of 30%, and as it's been the case in the past, Travis, our top priority is reinvesting in the business. That predominantly means reinvesting in regulated utility assets, although we continue to look for opportunities to acquire assets in Power that fill out our portfolios in competitive markets that we're interested in, that being New York, New England and PJM.

But number one, use of the balance sheet is reinvesting in the business. Number two is, given the cyclicality of the merchant generation business, to provide support for the dividend in some of those ups and downs, so that we can provide a consistent growth rate in that dividend. And last would be, to repurchase shares, if we were not seeing those growth opportunities, primarily in utility, or had earnings that just dwarfed the growth in the dividend. But Dan, I don't know if you want to add some color to some of those specifics.

Dan Cregg - *Public Service Enterprise Group Incorporated - EVP & CFO*

What I would say, Travis, is we have had a lot of success in finding opportunities to deploy capital, and we even referenced today an excess of $600 million at the utility. So Ralph references reinvesting the capital in the businesses as opportunity number one, and that's what we have been able to do, and having a strong cash flow coming from the Power side of the business, and the ability to provide financing there at the parent is enabling of that growth that we have, throughout the business.

Travis Miller - *Morningstar - Analyst*

Okay. On those generation projects, would you expect to have a higher percentage share of debt or leverage there, such that your entire balance sheet, certainly in a small way, given the relative size, would move toward more leverage? The question there simply is, is there going to be extra leverage at those projects as you go you through the construction phase?

Dan Cregg - *Public Service Enterprise Group Incorporated - EVP & CFO*

Yes, I mean, I think if you take a look at what we're investing into the business on the Power side of the business, and you take a look at what our cash flow is coming from the business, it pretty well supports the ability to build that, A, without any equity at the parent, but without growing that leverage capacity, that leverage utilization at Power.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

To Dan's point, Travis, both Power and the utility can support the capital program without any equity issuance, in any of the forecasts that we're able to come up with.

Travis Miller - *Morningstar - Analyst*

Okay. Great. Thanks a lot.

Operator

The next question is from Angie Storozynski from Macquarie. Please proceed with your question.

Angie Storozynski - *Macquarie Research Equities - Analyst*

So first on the Power side, can you comment on what you're seeing on the Power basis, not the gas basis, but the power basis, for your combined cycle gas plants? It seems like the outputs from your New York and New Jersey units have come down slightly year-over-year despite this hot summer. And we are hearing from other power producers, gas fired producers in PJM, that they're seeing some expansion in the negative power basis, due to some congestion on transmission lines, as well as the gas are running now, often 24/7. Is this a phenomenon that you're actually seeing at your unit?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

Yes, Angie, that is correct. As you know, the basis differentials are very seasonal in nature. They tend to be somewhat strongly negative in the shoulder, -- in the off seasons, the spring and fall, less negative in the summer, and they turn positive in the winter.

It's driven by two factors. You've identified both of them. One is gas basis differentials and transmission congestion. I forget the name of the transmission asset down in the BG&E area that is undergoing some renewal. It's Bagley.

Dan Cregg - *Public Service Enterprise Group Incorporated - EVP & CFO*

Bagley Graceton.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

Bagley Graceton, which according to PJM is scheduled for completion sometime next spring. That's all public information. You should check the PJM Oasis board for confirmation of that, in case I have the date wrong.

And then obviously from a gas point of view, there's a much healthier degree of infrastructure that's bringing gas from the Marcellus to the New York, New Jersey region, than there is going to the PJM west region, which is a bit of a misnomer. It's actually south of here. Until the infrastructure corrects that arbitrage opportunity, you'll continue to see gas-based generation being less expensive to operate up here than it is down there.

But we remain confident that over time the market does correct any anomalies that exist, and arbitrage opportunities that exist, and there's no shortage of projects that are either in permitting or in construction to move gas to the south. As I said, there is a specific transmission project underway to correct the congestion that we're seeing in the BG&E area.

Angie Storozynski - *Macquarie Research Equities - Analyst*

Great. On the utility side, in your prepared remarks, you mentioned the double-digit growth rate, and then you mentioned something about 8%. Can you actually just remind me of your comments, was it about the rate base growth, or was it about the longevity of the current double-digit earnings growth?

©2016 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13440

Client Id: 77

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

So as you know, we don't forecast earnings growth, and what we've been forecasting is that for the next five years, the utility capital program, approved programs, would support an 8% rate base growth, and for programs that are fairly straightforward extensions of existing programs, that 8% becomes 10%. But they've not been approved by the BPU yet.

Of course, as you know, rate base growth is a good indicator of earnings growth, but then one has to add load growth, and subtract O&M growth, and those are the two parts that are tougher to predict. We do a good job of controlling O&M, but I would not want to promise that we will be able to control O&M at a level of zero, which is about where the load has been growing. It's like 0.1%, 0.2%. So suffice to say, that the earnings growth would probably be a net subtraction from that rate-based growth, but we don't give an exact number of what that is.

Angie Storozynski - *Macquarie Research Equities - Analyst*

Thank you.

Operator

Your next question is from Praful Mehta from Citigroup. Please proceed with your question.

Praful Mehta - *Citigroup - Analyst*

First question was on the separation, the generation separation side, the PEG power side. I know we talked about this before, but given how IPPs are trading today, they really seem to struggle, and was wondering if that market context, does it make sense to think about PEG Power being separated, or do you now reconsider and think more keeping PEG Power as part of the whole PSEG family?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

I really don't have a lot new to say about this subject. If we made -- if and when we were to make such a decision, it would not be a market timing decision. It would have to do with the strength of the strategic arguments in favor of separation dwarfing the tactical benefits that we continue to believe dominate the picture today, in terms of staying together.

So sure, you wouldn't try and do something in the middle of economic instability or major macroeconomic disruptions, but we're not market timers. The real question is, do we still have the financial synergies between the businesses, do we still have the build synergy between the business, do we still long-term investors who see the attractiveness of both? Those strategic flexibility questions that we've talked about before.

Praful Mehta - *Citigroup - Analyst*

Fair enough. Thank you. And then going ahead with the nuclear discussion that we were having earlier, there is obviously discussion in New York to support nuclear through this ZEC program. Do you see other states looking to implement something like this, or do you see that as a possibility in New Jersey or Pennsylvania, in terms of support from nuclear or carbon free generation?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

I do. I think that a lot of states are realizing that these are long-lived assets, these being nuclear plants, that provide enormous benefits both from a carbon point of view, from a fuel diversity point of view, from a reliability point of view, and most of our markets are fairly short-term in nature. Even three-year capacity prices don't capture the full benefit of what I expect to be a fairly extensive debate on how carbon is to be priced in the

Client Id: 77

future. So every state may not come up with its own remedy, and regrettably the right remedy would be a national remedy, but we don't seem to have a lot of traction in that regard right now. I do see most of the action focused on a state-by-state level.

Praful Mehta - *Citigroup - Analyst*

Appreciate it. Thank you.

Operator

(Operator Instructions)

Your next question is from Gregg Orrill from Barclays. Please proceed with your question.

Gregg Orrill - *Barclays Capital - Analyst*

First, are you able to provide what your transmission rate base is for year-end 2016 and 2017? And then, what are your thoughts around acquiring nuclear and/or coal assets?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

I'm going to do a little. People scurry around to find the rate base number. I do know that by 2018, it's 50% of the rate base, but I don't know what it is. Dan has the magic numbers, or are you going to fake it too?

Dan Cregg - *Public Service Enterprise Group Incorporated - EVP & CFO*

I think what we've done historically is we have put out numbers for particular years, and then given some ranges in between those years. I think you're heading towards about $7 billion as you approach 2016, and then with the overall growth in capital, you'd see continued increases there. But we'll provide our normal set of numbers within our next update.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

I knew you were going to make it up, Dan. Gregg, your second question, our interest in acquiring coal. We are believers in nuclear, but at the right price, of course, we would be interested. But we're not -- we have no interest in adding coal to our fleet, nor would you see us be a large fleet acquirer. I do think that in general, we've signaled to our investors that our primary investment's in regulated utility, and that's where we continue to put our emphasis.

Gregg Orrill - *Barclays Capital - Analyst*

Thank you.

Operator

Your next question is from Mitchell Moss from Lord Abbett. Please proceed with your question.

©2016 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13442

Client Id: 77

Mitchell Moss - *Lord Abbett - Analyst*

Just a couple of questions. First, just to follow up on Angie's question regarding the combined cycle, how they're running with -- due to transmission gas supply issues. Do you see some of these issues being resolved by 2017, in terms of just gas take-away and transmission, or do you see it longer-term, a 2018 and beyond issue?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

Mitchell, of course we're operating with the same crystal ball you are, which without being too critical of your crystal ball, ours is pretty cloudy. Having said that it's more of a 2018 to 2019 time frame that we think these projects will have take-away capacity impact.

Mitchell Moss - *Lord Abbett - Analyst*

And regarding the REMA leases that you mentioned you took a charge on, have you been involved in any of the negotiations that NRG has mentioned, with bond holders, or with leaseholders as part of any restructuring discussions?

Dan Cregg - *Public Service Enterprise Group Incorporated - EVP & CFO*

No, we haven't, Mitchell. I mean, we are obviously aware as you are, of where the current situations are, and certainly ready for discussions when the time is right, but not as yet.

Mitchell Moss - *Lord Abbett - Analyst*

Do you have a view on whether or not the REMA lease could be broken or restructured in a bankruptcy? Or is it bankruptcy-proof?

Dan Cregg - *Public Service Enterprise Group Incorporated - EVP & CFO*

I think we're going to let that play out and let time tell what's going to happen. I think it's a fairly complicated situation, and we'll let time become our best estimate. We've got some disclosures within our 10-Q, to give you a little bit of sense as to some thoughts on it. I think where it ends is ahead of us yet.

Mitchell Moss - *Lord Abbett - Analyst*

Thanks so much.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, President & CEO*

Just to summarize, hopefully what you heard is that our power capital program remains on budget and on schedule, and based on current prices, is still expected to create some strong value for us. The utility continues to identify new customer-driven investment opportunities, that fuel its growth. Lastly, there's no question we have a relentless focus on cost control. It's part of everyday life at PSEG.

With that, I'll just wish everyone a Happy Halloween. We look forward to seeing you next week in Phoenix, and thanks for joining us this morning. Take care, everyone.

Operator

Ladies and gentlemen, that does conclude your conference call for today. Thank you for participating. You may now disconnect.

PSEG ANNOUNCES 2016 THIRD QUARTER RESULTS

$0.64 Per Share of Net Income

Non-GAAP Operating Earnings of $0.88 Per Share

PSE&G Settlement Supports Expanded Investment in Solar

Full Year 2016 Non-GAAP Operating Earnings Guidance Adjusted to $2.80 - $2.95 Per Share

October 31, 2016 (Newark, NJ) (NYSE – PEG) Public Service Enterprise Group (PSEG) reported third quarter 2016 Net Income of $327 million or $0.64 per share as compared to Net Income of $439 million or $0.87 per share reported for the third quarter of 2015. Non-GAAP Operating Earnings for the third quarter of 2016 were $444 million or $0.88 per share as compared to non-GAAP Operating Earnings for the third quarter of 2015 of $403 million or $0.80 per share.

Ralph Izzo, chairman, president and chief executive officer said “PSEG’s performance for the third quarter continues to demonstrate the benefits from our expanded investment program. A focus on controlling costs supported results as demand was aided by the warmer than normal weather experienced this past summer. Net Income was also impacted by our decision to retire the Hudson and Mercer coal-fired generating stations in 2017. Retirement of these units continues the evolution of PSEG Power’s assets into a portfolio of reliable, low-cost, flexible assets capable of competing in today’s energy market. This decision will allow us to meet market conditions and aids PSEG Power’s future cash flow and return profile.”

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG’s financial performance to previous financial results. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items. The table below provides a reconciliation of PSEG’s Net Income to non-GAAP Operating Earnings for the third quarter. See Attachment 11 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings. The presentation of non-GAAP Operating Earnings is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings as presented in this release may not be comparable to similarly titled measures used by other companies.

PSEG CONSOLIDATED RESULTS (unaudited)
Third Quarter Comparative Results
2016 and 2015

	Income ($ millions)		Diluted Earnings Per Share	
	2016	**2015**	**2016**	**2015**
Net Income	$327	$439	$0.64	$0.87
Reconciling Items*	117	(36)	0.24	(0.07)
Non-GAAP Operating Earnings	**$444**	**$403**	**$0.88**	**$0.80**
		Avg. Shares	**508M**	**508M**

*See Attachment 11

Ralph Izzo went on to say, "We are making a slight adjustment to the upper end of our guidance. Strong third quarter results weren't sufficient to offset the lack of a winter, and we are adjusting our guidance for 2016's non-GAAP Operating Earnings to $2.80 - $2.95 per share from $2.80 - $3.00 per share."

Non-GAAP Operating Earnings guidance by company for the full year is as follows:

2016 Non-GAAP Operating Earnings Guidance
($ millions, except EPS)

	2016 Estimate
PSE&G	$900 - $935
PSEG Power	$460 - $500
PSEG Enterprise/Other	$65 - $65
Non-GAAP Operating Earnings	$1,425 - $1,500
Non-GAAP EPS	$2.80 - $2.95

Due to the forward looking nature of non-GAAP Operating Earnings guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

Non-GAAP Operating Earnings Review and Outlook by Operating Subsidiary

See Attachment 5 for detail regarding the quarter-over-quarter reconciliations for each of PSEG's businesses.

PSE&G

PSE&G reported Net Income of $255 million ($0.50 per share) for the third quarter of 2016 compared with Net Income of $222 million ($0.44 per share) for the third quarter of 2015.

The improvement in Net Income for the third quarter reflects growth from expanded investment in electric and gas transmission and distribution facilities.

Returns on PSE&G's expanded investment in transmission added $0.03 per share to Net Income in the quarter. Incremental revenue associated with PSE&G's Energy Strong investment infrastructure program added $0.02 per share to Net Income in the quarter. Third quarter Net Income comparisons also benefited by an increase in electric demand associated with weather conditions which were approximately 30% warmer than normal and 9% warmer than conditions experienced during the 2015 third quarter. The increase in demand associated with the warmer than normal weather added $0.01 per share to third quarter Net Income. An increase in depreciation and O&M and other items was offset by a decline in taxes and other items.

Electric demand in the third quarter was influenced by weather which was hotter than normal, and warmer than the weather conditions experienced in the year-ago period. Weather normalized sales for the third quarter – led by an increase in the residential sector – are estimated to have increased 0.1% for the quarter.

PSE&G's capital program remains on schedule. PSE&G invested approximately $2.1 billion through September 30 as part of its planned capital investment for 2016 of $3.0 billion in upgrades to the electric and gas distribution and transmission system.

PSE&G has reached a settlement with key parties providing for an extension of its existing landfill/brownfield solar program. The settlement provides for an investment of approximately $80 million to construct 33MWs of grid-connected solar facilities over three years. The settlement is subject to review/approval by the NJ Board of Public Utilities (BPU). PSE&G is also requesting approval from the BPU to partner with NJ Transit in the development of a new $270 million substation that both would utilize, and would enhance the reliability and resilience of facilities damaged by Superstorm Sandy. It is estimated that the new substation would enter service by the end of 2020.

PSE&G filed an update of its Formula Rate for transmission at the Federal Energy Regulatory Commission in October 2016. The update, which reflects an increase in the level of PSE&G's investment in transmission, would provide for a $121 million increase in annual transmission revenues effective January 1, 2017.

The forecast of PSE&G's Net Income for 2016 remains at $900 - $935 million.

PSEG Power

PSEG Power reported Net Income of $139 million ($0.27 per share) for the third quarter of 2016 and non-GAAP Adjusted EBITDA of $397 million compared with Net Income of $206 million ($0.40 per share) and non-GAAP Adjusted EBITDA of $401 million for the third quarter of 2015. Non-GAAP Operating Earnings for the third quarter of 2016 was $170 million ($0.34 per share) compared with non-GAAP Operating Earnings for the third quarter of 2015 of $170 million ($0.33 per share).

Management believes non-GAAP Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense, depreciation and amortization and major maintenance at Power's fossil generation facilities, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure, whether assets were constructed or acquired and accounting methods. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. Non-GAAP Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization and major maintenance expense. See Attachment 12 for a complete list of items excluded from Net Income in the determination of non-GAAP Adjusted EBITDA. The presentation of non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP.

Power's Net Income in the third quarter includes one-time charges amounting to $67 million ($0.13 per share) related to the early retirement of the Hudson and Mercer generation stations. Power's operating results for the third quarter reflect the impact of the known decline in average prices on energy hedges and a decline in operating costs.

A decline in the average price on energy hedges partially offset by a lower cost to serve load combined to reduce quarter-over-quarter Net Income by $0.02 per share. A decline in output during the quarter reduced Net Income by $0.01 per share. A reduction in O&M expense improved Net Income comparisons by $0.03 per share. An increase in depreciation associated with Power's capital program was more than offset by a decline in interest expense and other items which combined to improve quarter-over-quarter Net Income by $0.01 per share.

Output at Power's generation facilities declined 4% in the quarter. The average capacity factor for the nuclear fleet was 80% in the third quarter versus an average capacity factor of 95% in the year-ago quarter, as output from the nuclear fleet declined 12% to 6.9 TWh from 7.8 TWh. An extension of the Salem 1 refueling outage through the month of July to repair degraded baffle bolts and an unplanned outage at Salem 2 due to transformer issues were the primary causes for the reduction in nuclear output in the third quarter. Output from the gas-fired combined cycle fleet declined slightly to 5.2 TWh from 5.4 TWh. The warmer than normal weather conditions spurred an increase in demand for Power's coal-fired generating stations and peaking fleet, which together experienced an increase in output during the quarter to 2.0 TWh from 1.6 TWh.

Power is maintaining its forecast of output for 2016 of 50 – 52 TWh. The forecast for output in 2017 and 2018 has been reduced by approximately 3 – 4%. The revised forecast takes into account the impact of low gas prices on the dispatch of the Keystone/Conemaugh coal-fired generation stations, and the retirement of the Hudson and Mercer coal-fired generation stations in mid-2017. Approximately 75% – 80% of anticipated production in the fourth

quarter of 2016 of 11 – 12 TWh is hedged at an average price of $48 per MWh. For 2017, Power has hedged 65% – 70% of its revised forecast of 51 – 53 TWh of output at an average price of $47 per MWh. For 2018, Power has hedged approximately 25% – 30% of its revised forecast of 56 – 58 TWh of output at an average price of $45 per MWh. The hedge data continues to assume BGS hedges will cover 11 – 12 TWh of output.

The forecast of Power's non-GAAP Operating Earnings for 2016 is now $460 – $500 million. The forecast represents non-GAAP Adjusted EBITDA for the full year of $1,270 – $1,335 million.

PSEG Enterprise/Other

PSEG Enterprise/Other reported a Net Loss of $67 million ($0.13 per share) for the third quarter of 2016 compared to Net Income of $11 million ($0.03 per share) for the third quarter of 2015.

Non-GAAP Operating Earnings for the third quarter of 2016 were $19 million ($0.04 per share) compared with non-GAAP Operating Earnings of $11 million ($0.03 per share) during the third quarter of 2015.

During the third quarter of 2016, Energy Holdings completed its review of estimated residual values embedded in the NRG REMA, LLC leveraged leases. As a result of current and expected future market conditions, an impairment of $86 million, after-tax, related to the residual value of these leases was recorded in Net Income. The increase in non-GAAP Operating Earnings quarter-over-quarter reflects certain tax items at PSEG Energy Holdings and contractual payments associated with the operation of PSEG Long Island.

The forecast of PSEG Enterprise/Other full year non-GAAP Operating Earnings remains $65 million.

Financing

PSEG closed the quarter ended September 30, 2016 with $450 million of cash on its balance sheet with debt at the end of the quarter representing approximately 45% of consolidated capital. PSEG Power had debt at the end of the quarter representing 28% of capital.

Forward-Looking Statement

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our

Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or ongoing low pricing of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulations, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators, including prudency reviews, disallowances and changes in authorized returns,
- any deterioration in our credit quality or the credit quality of our counterparties,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations or increase the cost of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- delays or unforeseen cost escalations in our construction and development activities, or the inability to recover the carrying amount of our assets,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- increases in competition in energy supply markets as well as for transmission projects,
- changes in technology, such as distributed generation, storage and micro grids, and greater reliance on these technologies,
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover insurance proceeds with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- economic recessions,
- an inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce, and
- changes in the credit quality and the ability of lessees to meet their obligations under our domestic leveraged leases.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

Forward-Looking Statements

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute “forward-looking statements” within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words “anticipate,” “intend,” “estimate,” “believe,” “expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or ongoing low pricing of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulations, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators, including prudency reviews, disallowances and changes in authorized returns,
- any deterioration in our credit quality or the credit quality of our counterparties,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations or increase the cost of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- delays or unforeseen cost escalations in our construction and development activities, or the inability to recover the carrying amount of our assets,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- increases in competition in energy supply markets as well as for transmission projects,
- changes in technology, such as distributed generation, storage and micro grids, and greater reliance on these technologies,
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover insurance proceeds with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- economic recessions,
- an inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce, and
- changes in the credit quality and the ability of lessees to meet their obligations under our domestic leveraged leases.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws. The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-13464

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Operating Earnings exclude gains or losses associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting, and material one-time items. Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization and major maintenance expense costs at Power's fossil generation facilities. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income to reconcile to Operating Earnings and Adjusted EBITDA with a reference to that slide included on each of the slides where the non-GAAP information appears.

Management uses Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Management believes Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense, depreciation and amortization and major maintenance expense at Power's fossil generation facilities, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure, whether assets were constructed or acquired and accounting methods. Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. The presentation of Operating Earnings and Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, Operating Earnings and Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of Operating Earnings and Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

These materials and other financial releases can be found on the PSEG website at www.pseg.com , under the investor tab. From time to time, PSEG, PSE&G and PSEG Power release important information via postings on their corporate website at http://investor.pseg.com. PSEG – Q3 2016 Highlights

- **Operating Results in Q3**
  - ✓ Net Income of $0.64 vs. $0.87 per share in Q3 2015
  - ✓ Operating Earnings (non-GAAP) of $0.88 vs. $0.80 per share in Q3 2015*
  - ✓ Increased earnings contribution from PSE&G's investment in Transmission
  - ✓ Updating 2016 Operating Earnings (non-GAAP) guidance to $2.80 - $2.95 per share

- **Operating Review**
  - ✓ PSEG Power generation met demand of the hottest summer weather in our 37 years of data
  - ✓ Returned Salem units in late July following refueling and baffle bolt repairs at Unit 1 and transformer issues at Unit 2
  - ✓ PSE&G maintained high system reliability throughout extreme summer conditions

- **PSEG Disciplined Capital Investment**
  - ✓ PSE&G identified >$600 million year to date of additional capital opportunities through 2020
  - ✓ Recent Solar 4 All Extension II settlement to invest $80 million over 3 years
  - ✓ Power's construction of Keys/Sewaren/Bridgeport Harbor CCGTs continue on schedule and on budget

- **Market developments**
  - ✓ PSEG Power announced retirement of the Hudson and Mercer generating stations (totaling ~1,250 MW) planned for mid-2017 expected to improve its cash flow and return profile
  - ✓ Energy Holdings recorded an impairment of $86 million (after-tax) related to the NRG REMA, LLC leveraged leases residual value

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings (non-GAAP).

PSE&G
2016 Q3 Review

SI-SSA-0015-13474

PSE&G – Q3 Summary of Results

$ millions (except EPS)	Q3 2016	Q3 2015	Variance
Operating Revenues	$ 1,684	$ 1,766	$ (82)
Operating Expenses			
Energy Costs	721	740	(19)
Operation & Maintenance	376	391	(15)
Depreciation & Amortization	137	231	(94)
Total Operating Expenses	1,234	1,362	(128)
Net Income	$ 255	$ 222	$ 33
EPS from Net Income	$ 0.50	$ 0.44	$ 0.06

PSEG Operating Earnings (non-GAAP) do not include any adjustments related to PSE&G's operations.

SI-SSA-0015-13475

PSE&G EPS Reconciliation – Q3 2016 versus Q3 2015

Continued investment in system reliability is a driver of growth

SI-SSA-0015-13476

PSE&G – Monthly Summer Weather Data

Q3 2016 temperature-humidity index was ~9% higher than Q3 2015 and ~30% higher than normal

SI-SSA-0015-13477

PSE&G – Q3 Operating Highlights

Operations

- ✓ Growth in transmission revenues added $0.03 per share over Q3 2015
- ✓ Q3 2016 electric sales up ~4% on weather that was 9% warmer than Q3 2015 and 30% warmer than normal; Q3 was the hottest in the last 37 years of weather data
- ✓ Weather normalized electric sales advanced 0.1% in Q3 and were down (0.8%) for the YTD period
- ✓ O&M remains under control

Regulatory and Market Environment

- ✓ Solar 4 All Extension II settlement reached with BPU Staff and Division of Rate Counsel to invest $80 million over 3 years to develop 33 MWs of grid-connected, landfill and brownfield solar
- ✓ Proposal filed with the BPU for NJ Transit investment partnership to develop a new $270 million substation
- ✓ FERC Formula Rate filing submitted for ~$121 million in increased annual transmission revenue for new rates effective January 2017
- ✓ PSE&G lowered residential gas rates for the 7th straight year on 10/1; since 2009, average residential heating bills have declined by 51%

Financial

- ✓ PSE&G made ~$2.1 billion of capital expenditures in the YTD period ended September 30, as part of its planned spend of ~$3 billion for the full year
- ✓ Maintaining PSE&G's forecast of 2016 full-year Net Income at $900 - $935 million

SI-SSA-0015-13484

PSEG Power – Gross Margin Performance

- ✓ Capacity pricing and MWs were comparable year-over-year
- ✓ Lack of pipeline take away capacity kept pressure on local natural gas and power prices during a summer that exceeded last year's hot weather

Regional Performance		
Region	**Q3 2016 Gross Margin ($M)**	**2016 Performance**
PJM	**$551**	Lower hedge prices partially offset by lower costs to serve
New England	**$13**	Higher prices supported increased volume
New York	**$25**	Lower volumes offset higher prices

Hedges include positions with MTM accounting treatment and options. **Volumes reflect rounding.

SI-SSA-0015-13486

PSEG Power – Q3 Operating Highlights

Operations

- ✓ Q3 output was down 4% vs. Q3 2015, YTD output down 6% from extended nuclear outages at Salem 1 and 2
- ✓ CCGT capacity factor of 74% in Q3, YTD CCGT capacity factor of 63%
- ✓ Nuclear capacity factor of 80% in Q3, YTD nuclear capacity factor of 88%

Regulatory and Market Environment

- ✓ Early retirement of the Hudson and Mercer generating stations totaling ~1,250 MWs in June 2017 resulted in one-time charges in 3Q of $67 million (after-tax) covering impairments and closing costs; remaining capital cost will be depreciated from Q4 2016 through first-half 2017

Financial

- ✓ Updating PSEG Power's full-year 2016 Operating Earnings (non-GAAP) guidance to $460 - $500 million from $460 - $525 million; and full-year 2016 Adjusted EBITDA (non-GAAP) guidance to $1.270 - $1.335 billion from $1.270 - $1.375 billion
- ✓ Power's total debt as a percentage of capital at September 30 was 28%

SI-SSA-0015-13487

PSEG

PSEG Financial Highlights

Updating full-year 2016 Operating Earnings (non-GAAP) guidance to $2.80 - $2.95 from $2.80 - $3.00 per share

- ✓ Strong third quarter results were not sufficient to offset the lack of a winter
- ✓ Focused on meeting customer needs for clean, reliable, efficient delivery of energy

Infrastructure Spend

- ✓ PSE&G capital spending for 2016 expected to top $3 billion
- ✓ Keys, Sewaren and Bridgeport Harbor CCGT construction is on schedule and on budget
- ✓ PSE&G has identified more than $600 million year to date of additional infrastructure spend over the current capital spending plan of $12 billion in the 2016-2020 period

Financial position remains strong

- ✓ Positive cash from Power and increasing cash flow from operations at PSE&G supports dividend growth and funds capital spending program without the need to issue equity
- ✓ Debt as a percentage of capitalization was 45% at September 30
- ✓ Announced retirement of Hudson and Mercer generating stations (totaling ~1,250 MW) planned for mid-2017 expected to improve Power's cash flow and return profile

PRESENTATION

Operator

Ladies and gentlemen, thank you for standing by. My name is Brent, and I'm your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group fourth-quarter 2016 earnings conference call with webcast.

(Operator Instructions)

As a reminder, this conference is being recorded today, Friday, February 24, 2017 and will be available for telephone replay beginning at 2:00 p.m. Eastern today until 11:30 p.m. Eastern on March 3, 2017. It will also be available as an audio webcast on PSEG's corporate website at www.PSEG.com. I'd now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen Lally - *Public Service Enterprise Group Inc - VP of IR*

Thank you, Brent. Good morning, everyone. Thank you for participating in our earnings call today.

As you are aware, we released our fourth-quarter and full-year 2016 earnings results earlier this morning. The release and attachments are posted on our website, www.pseg.com, under the investor section.

We also posted a series of slides that detail operating results by Company for the quarter. Our 10K for the period ended December 31, 2016 is expected to be filed early next week.

Not going to read the full disclaimer statement or the comments we have on the difference between operating earnings and GAAP results, but I do ask that you all read those comments contained in our slides and on our website. The disclaimer statement regarding forward-looking statements details a number of risks and uncertainties that could cause actual results to differ materially from forward-looking statements made therein. And

Client Id: 77

although we may elect to update those forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if our estimates change, unless required by applicable securities laws.

We also provide commentary with regard to the difference between operating earnings and adjusted EBITDA and net income reported in accordance with Generally Accepted Accounting Principles in the United States. PSEG believes that the non-GAAP financial measures of operating earnings and adjusted EBITDA provide a consistent and comparable measures of performance to help shareholders understand our operating and financial trends.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group. Joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer.

(Caller Instructions)

Thank you.

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Thank you Kathleen, and thanks everyone for joining us today. This morning we reported non-GAAP operating earnings for the full year 2016, and as you saw we reported that the non-GAAP operating earnings for the fourth quarter were $0.54 per share versus non-GAAP operating earnings of $0.50 per share earned in the fourth quarter of 2015. Our GAAP results for the full year of $1.75 per share reflect the impact of our decision last year to retire the Hudson and Mercer coal-fired generating units in June of this year.

The non-GAAP operating earnings for the full year of $2.90 per share were closely aligned with 2015's non-GAAP operating earnings of $2.91 per share, and they were solidly within our revised guidance of $2.80 to $2.95 per share, as well as within our original guidance. Our results reflect the benefits of growth through organic investment and control of O&M expense. This helped offset the impact on earnings from low energy prices and record mild temperatures experienced during the first quarter of the year.

Actions we have taken to transition our business mix in response to changing market conditions have supported PSE&G's earnings and will continue to have a positive impact. For 2017 we're forecasting our non-GAAP operating earnings of $2.80 to $3 per share.

Now let me just describe a few highlights from 2016. First off, PSE&G was named by the ReliabilityOne organization as the most reliable utility in the Mid-Atlantic region for the 15th consecutive year.

The utility invested $2.8 billion during 2016 to upgrade and expand its transmission and distribution system. As part of this work to enhance the system's resiliency and its reliability, PSE&G placed into service the 345 KV Northeast grid transmission line.

The utility upgraded 177 miles of gas pipe in more than 80 towns under its three-year $905 million gas system modernization program. As part of this work, PSE&G collaborated with the Environmental Defense Fund to help detect methane emissions. This collaborative effort helped determine which gas pipes to replace first, and that led to a greater reduction in emissions at less cost.

In addition, upgrades to PSE&G's electric distribution system continue under the $1.2 billion energy strong infrastructure program. The utility also received approval during the year to extend its Solar For All program.

The decision by the New Jersey Board of Public Utilities allows PSE&G to build an additional 33 megawatts, that's DC, of solar farms on landfills and brownfield sites in the Utility's service territory. Solar For All with this latest approval grows to represent a 150-megawatt program, that's also DC.

PSE&G's investment program, its supportive revenue recovery mechanisms and tight control of O&M provided for growth of 12.9% in its net income from 2015 to 2016, increasing its contribution to 60% of consolidated non-GAAP operating Earnings. This continues PSE&G's track record of 16% compound annual growth in earnings since 2009.

Client Id: 77

We also made strides in 2016 at PSEG Power. Despite the continuation of difficult power markets, PSEG Power reported non-GAAP operating earnings for the full year within original guidance and in excess of our revised guidance. Management's ability to control expenses in response to market and operating conditions helped offset the impact on earnings of lower volume and pricing, and speaks to the capability of our management team.

Power invested $1.3 billion in capital in 2016. Construction of 1,800 megawatts of new, efficient combined cycle gas-fired turbine capacity within the PJM and New England markets at a total cost of $2 billion remains on time and on budget. Also during the year Power invested approximately $300 million and nearly doubled the size of its portfolio of solar projects to 400 megawatts DC.

During the year Power announced it would be retiring the Hudson and Mercer coal-fired generating stations on June 1, 2017, given the outlook for energy prices and the cost of operating these older stations. Retirement of these facilities will improve the outlook for Power's cash flow and income going forward.

The addition of the new gas-fired capacity and the retirement of Hudson and Mercer will transform Power's generation mix. Coal-fired generation is expected to represent 7% of our fuel mix in 2017, as energy produced from natural gas represents 30% and nuclear fuel generation provides 63% of our energy output. An improvement in the fleet's economic efficiency with the decline in the average heat rate will also benefit the dispatch of Power's assets.

We continue to focus on safe, efficient operation of our base load nuclear fleet. Power's management team has implemented cost reduction measures in coordination with industry groups to help assure these assets operate in a safe and reliable manner.

Controlling costs is vital in the current energy price environment, but even with stringent measures these units face continued challenges. A key element of PSEG's strategy has been to maintain a strong financial position that supports our investment goals.

Our balance sheet continues to provide us with a competitive advantage. We ended 2016 with strong credit metrics, which allow us to pursue investment opportunities for growth.

For 2017 we intend to invest $4.7 billion to enhance the efficiency and reliability of our businesses at PSE&G and at Power. This represents a record amount for PSEG to invest in any one year.

We continue to have the ability to use our financial strength to improve returns. This includes an increase in our capital program, primarily at our regulated utility. Our investment program at PSE&G for the three years ending 2019 will provide for 9% annual growth in rate base.

We plan on providing you with an update of our five-year outlook for capital spending at our annual financial conference on March 6 when we will use our time together to describe what is known and what else may be possible. I truly believe the investment program is exciting for shareholders and customers as it is focused on meeting their needs with a platform that provides reliable, efficient, clean energy at an attractive return.

The strategy we implement over the recent past has transitioned our business mix, as it provided annual growth in earnings. Over the past four years we have achieved annual growth in earnings at PSEG of 4.4%, albeit inclusive of a flat 2016.

We want to outperform our recent past and to do so we must remain focused on our principles of operational excellence, financial strength and disciplined investment. Of course meeting our objectives would not be possible without the significant contribution made by PSEG's dedicated workforce.

The continued successful deployment of free cash flow into regulated investment programs that meet customer needs is expected to support 8.5% growth in our utility Company's net income, at the midpoint of our 2017 guidance. This, then, would represent 66% of Enterprise's forecasted 2017 non-GAAP operating Earnings of $2.80 to $3 per share.

The Board of Directors' recent decision to increase the common dividend by nearly 5%, or $0.08 per share, on an annual basis to the indicative annual level of $1.72 per share is an expression of confidence in our outlook and an acknowledgment of our strong financial condition. We do see the potential for consistent and sustainable growth in the dividend as an important means of returning cash to our shareholders. I will now turn the call over to Dan for more details on our operating results, and will be available for your questions after his remarks.

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

Thank you Ralph, and good morning everyone. As Ralph said, PSEG reported non-GAAP operating earnings for the fourth quarter of $0.54 per share versus $0.50 per share for the fourth quarter of 2015. Our earnings in the quarter brought non-GAAP operating earnings for the full year to $2.90 per share, in line with 2015's non-GAAP operating earnings of $2.91 per share and at the upper end of our revised non-GAAP operating earnings guidance for 2016 of $2.80 to $2.95 per share.

On slide 4 we've provided you with a reconciliation of non-GAAP operating earnings to net income for the quarter. We've provided you with information on slide 10 regarding the contribution to non-GAAP operating earnings by business for the quarter.

Slides 11 and 13 contain waterfall charts that take you through the quarter-over-quarter and year-over-year changes in non-GAAP operating earnings by major business. I'll review each Company in more detail, starting with PSE&G.

PSE&G reported net income for the fourth quarter of 2016 of $0.38 per share and that's compared with $0.31 per share for the fourth quarter of 2015, as shown on slide 15. PSE&G's full-year 2016 net income was $889 million, or $1.75 per share, compared with net income of $787 million, or $1.55 per share in 2015 for year-over-year growth of 12.9%.

PSE&G's net income in the fourth quarter continued to benefit from return on its expanded investment in transmission and distribution infrastructure. Net income for the quarter improved by $0.06 per share based on growth in PSE&G's investment in transmission and the absence of an adjustment for bonus depreciation in the year-ago quarter.

More normal weather conditions relative to unseasonably mild weather in the quarter a year ago improved net income by $0.01 per share. A decline in O&M of $0.03 per share and other expenses was offset by an increase in depreciation and taxes.

At the start of 2017, PSE&G implemented $121 million increase in revenue under the Company's transmission formula rate. Transmission revenues are adjusted each year to reflect an update of the Company's investment program. PSE&G's investment in transmission has grown to represent 44%, or $6.7 billion, of the Company's consolidated rate base of $15.2 billion at the end of 2016.

Economic conditions in the service territory are stable. During the quarter weather normalized electric sales were flat compared to the year-ago period, as an increase in demand from the commercial sector offset a decline in sales to residential and industrial customers.

For the year, continued decline in the industrial sector and increases in efficiency offset the positive impact on sales from growth in residential customers. The experience in 2016 is representative of our long-term forecast for electric sales of under 0.5% per year.

Weather normalized firm gas sales declined slightly during the fourth quarter compared to the year-ago quarter and declined 1.9% for the full year. We believe the decline in weather normalized gas sales for the year is due to the extreme weather conditions experienced over the past two years, driving some imprecision in the weather adjustments, and over the long term we forecast annual growth of 0.5% to 1% in firm gas sales.

PSE&G invested $2.8 billion on its transmission and distribution system in 2016, and is forecast to invest an additional $3.4 billion in 2017. We are forecasting growth in PSE&G's net income for 2017 to a range of $945 million to $985 million, and at the midpoint of that range the forecast represents 8.5% growth in net income for the year.

Client Id: 77

Now let's turn to Power. As shown on slide 20 PSEG Power reported non-GAAP operating earnings of $0.13 per share compared with non-GAAP operating earnings of $0.19 per share a year ago. The results for the quarter brought Power's full-year non-GAAP Operating Earnings to $514 million, or $1.01 per share, compared to 2015's non-GAAP operating earnings of $653 million, or $1.29 per share.

Power's adjusted EBITDA for the quarter and the year amounted to $155 million and $1.201 billion respectively. This compares with adjusted EBITDA for the fourth quarter of 2015 of $218 million and adjusted EBITDA for the full year of 2015 of $1.435 billion. As of this reporting, the calculation of Power's adjusted EBITDA no longer excludes costs associated with major maintenance activities at Power's fossil generating stations.

The earnings release, as well as the earnings slides on pages 11 and 13, provide you with a detailed analysis of Power's operating earnings quarter over quarter and year over year from changes in revenue and cost. We've also provided you more detail on generation for the quarter and for the year on slides 22 and 23.

PSEG Power's net income for the fourth quarter reflects the impact of incremental depreciation and some other expenses of $555 million that's associated with the decision to retire the Hudson and Mercer coal-fired generating units effective June 1, 2017. The Company's fourth-quarter results also reflect the impact of a decline in energy prices on output and margins.

The decline in the average price received on energy hedges reduced Power's quarter-over-quarter net income by $0.05 per share. Improvements in all system gas sales partially offset the impact of reduced output, resulting in a net reduction of $0.01 per share in quarterly net income comparisons.

During the quarter an increase in O&M expense of $0.03 per share associated with the planned refueling outage of Power's 100% owned Hope Creek nuclear station was offset by a decline in taxes and other items. For the full year lower O&M improved Power's net income by $0.13 per share.

Let's turn to Power's operations, and the output from Power's generating facility was 7.6% lower in the fourth quarter compared to year-ago levels. Quarterly comparisons were affected by the planned refueling outage at Hope Creek, by major maintenance on the Bergen 1 gas-fired combined cycle gas turbine unit during the quarter and by market conditions. For the year, output was 6.7% lower than the amount of energy produced in the prior year.

The nuclear fleet operated at an average capacity factor for the year of 86.9%, producing 29.6 terawatt hours of energy representing 57% of Power's total energy output for 2016. If you recall, the refueling outage at Salem 1 in the spring was extended to replace baffle bolts in the reactor, and Salem 2 was removed from service during a portion of the third quarter to repair a main power transformer. The Salem units each operated at capacity factors in excess of 98% in the fourth quarter.

Power's gas-fired combine cycle fleet operated at an average capacity factor of 57% for the year, producing 16.4 terawatt hours of energy representing 32% of Power's 2016 energy output. The coal-fired fleet, primarily Keystone and Conemaugh, generated 4.8 terawatt hours of energy during the year, producing 9% of Power's 2016 energy output, with the remaining output produced from our peaking assets.

Operation of our gas-fired combine cycle fleet for the year has been affected by the timing of outages and market conditions. Although a compression in market spark spreads could continue to influence output from the combined cycle fleet in the upcoming year, we don't forecast a deterioration in the spark spread earned by the fleet, given the availability and pricing of shale gas.

We've seen an improvement in forward zonal market prices over the quarter, particularly for 2018 and 2019 pricing. The improvement stems from an increase in pipeline capacity moving gas from the Marcellus Basin, as well as transmission repair work which has supported movement of electricity. Over the long term, however, the market prices do remain backward dated.

Overall, Power's gross margin declined slightly to $37 a megawatt hour in the fourth quarter versus $38.83 per megawatt hour in the year-ago quarter. For the year, Power's gross margin was $40.40 per megawatt hour versus $42.25 per megawatt hour last year. Slide 25 provides detail on Power's gross margins for both the quarter and for the year.

Power's forecasting output for 2017 of 49 to 51 terawatt hours, a slight reduction from the 51.5 terawatt hours of energy produced in 2016. Following completion of the BGS auction in New Jersey earlier this month, Power enters the year with 100% of its 2017 base load generation hedged and approximately 80% to 85% of anticipated annual production hedged at an average price of $46 a megawatt hour.

The percent of output hedged is higher than what we have typically hedged this time of the year, and the difference is the result of a slightly lower generation forecast for the year. For 2018, we forecast annual production of 55 terawatt hours.

Approximately 50% to 55% of 2018's forecast generation is hedged at an average price of $43 a megawatt hour. And for 2019, Power has hedged 15% to 20% of forecasted production of 60 terawatt hours at an average price of $43 per megawatt hour.

Power assumes BGS volumes will continue to represent approximately 11 terawatt hours in 2017, which is consistent with 2016's deliveries of 11.1 terawatt hours under the BGS contract. The forecast increase in output in 2018 and 2019 reflect the commercial start-up in mid-2018 of 1,300 megawatts of new gas fired combine cycle facility at Keys in Maryland and at Sea Warren in New Jersey, and the mid-2019 commercial start-up of the 485-megawatt gas-fired unit at Bridgeport Harbor in Connecticut.

Moving to retail, Power has received approval to operate as a third-party supplier of retail electric energy in both New Jersey and in Pennsylvania. The forecast for 2017 doesn't assume meaningful contribution from retail sales, but Power's team will begin its marketing efforts.

Power's non-GAAP operating earnings for 2017 are forecast at $435 million to $510 million. The forecast represents non-GAAP adjusted EBITDA for the full year of 2017 of $1.080 billion to $1.210 billion.

Moving to Enterprise and Other. Enterprise and Other reported net income for the fourth quarter of $11 million, or $0.02 per share, which compares to net income of $4 million for the fourth quarter of 2015. For the full year, Enterprise and Other reported a net loss of $20 million, or $0.04 per share, compared to net income in 2015 of $36 million, or $0.07 per share.

Net income in the fourth quarter and the full year 2016 include a pretax charges of $10 million and $147 million respectively related to impairment of leverage lease residual values and an estimated loss as a result of liquidity issues currently facing NRG REMA. Non-GAAP operating earnings for Enterprise and Other in the fourth quarter were $17 million, or $0.03 per share, compared to $4 million in the year-ago quarter. The results for the fourth quarter brought full year 2016 non-GAAP operating earnings from Enterprise and Other to $72 million, or $0.14 per share, compared to $36 million, or $0.07 per share in 2015.

Excluding the issues related to the leases, the improvement in non-GAAP operating earnings reflects the absence of certain corporate expenditures as well as contractual payments associated with the operation of PSEG Long Island and certain tax items. For 2017, non-GAAP operating earnings for Enterprise and Other are forecasted at $35 million.

I'd now like to spend a moment on the subject of tax reform and as you all know, it's very early in the process. But that said, we have evaluated the impact on PSEG of key changes to the tax code that are being discussed that you have no doubt familiarize yourself with over the past quarter. Slide 31 provides an overview of these key issues.

Overall we believe PSEG is well positioned and would benefit from a decline in the federal tax rate due to Power's contribution to earnings and our strong balance sheet. We anticipate any reduction in federal taxes at PSE&G would be passed through to our utility customers, and we also anticipate that customer rates would decrease as excess deferred income taxes are returned to customers.

The payback period, as you know, is unknown at this point. But our strong balance sheet puts us in a position to comfortably manage that return of cash to customers.

You should also expect that our November 2017 distribution base rate filing at PSE&G would reflect any changes in federal taxes that would be known at that time. The proposed changes in federal taxes are expected to improve PSEG's and Power's after-tax earnings and cash flow, and we estimate that given our low debt levels the impact of deductibility of interest expense would be moderate to us versus our peers, as would potential

THOMSON REUTERS

SI-SSA-0015-13501

Client Id: 77

loss of deductibility of our relatively low property taxes paid by Power. We do bear the risk of a border adjustment tax on our nuclear fuel, but on balance we believe we are well positioned for the elements of tax reform that are currently being discussed.

Next I'd like to provide a brief update on our pension. Pension and OPEB expense in 2017 is expected to be $22 million lower than our 2016 level of expense. Contributing to that reduction was a merger of our three qualified defined benefit pension plans and the assets of those plans into a single plan.

As a result, total pretax net periodic benefit costs are expected to decrease by $48 million in 2017 from what they would have been, but for the merger of the plans. This is due to a change in the amortization period for gains and losses for the merged plan resulting in a lower amortization expense than that of the individual plans. Returns on our pension fund in 2016 exceeded our targets, and at year end the pension plan was well funded with no anticipated funding required over our five-year planning horizon.

With respect to financing, as Ralph mentioned our financial condition remained strong. We closed 2016 with $423 million of cash on hand and debt representing 47% of our consolidated capital position.

Debt at Power represents approximately 29% of its capital base. At year end Power's debt position was just over 2.1 times the midpoint of our forecast for Power's non-GAAP adjusted EBITDA for 2017.

During the fourth quarter PSEG issued $700 million of three- and five-year Senior Notes at favorable interest rates. We plan to provide you with an updated five-year view of capital spending at our annual financial conference on March 6.

We are guiding to non-GAAP operating earnings for 2017 of $2.80 to $3 per share, in line with our 2016 operating results, as forecast growth at PSE&G offsets lower energy prices on Power's income. The common dividend was recently increased 4.9% to the indicative annual level of $1.72 per share, which represents the 13th increase in the last 14 years and builds on a 3.9% average annual growth in the dividend over the last 10 years. And with that, we're ready to take your questions.

QUESTIONS AND ANSWERS

Operator

(Operator Instructions)

Your first question comes from the line of Greg Gordon with Evercore. Please go ahead.

Greg Gordon - *Evercore ISI - Analyst*

Hey, good morning. Thank you.

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Good morning, Greg.

Greg Gordon - *Evercore ISI - Analyst*

Please correct me if I'm wrong, but I just was looking at the guidance that you last gave on a segment basis on the Q3 call versus the actual results. And it looks like PSE&G net income came in slightly below the low end of the higher articulated guidance range, but PSE&G Power had a phenomenal

THOMSON REUTERS

SI-SSA-0015-13502

Client Id: 77

year, at least relative to what you thought at the end of the third quarter. Can you compare your last articulated segment guidance against the year-end results and explain where things were consistent with or inconsistent with where you thought you were going to end up the year?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

I'll give that to Dan, Greg. Good morning. I think basically we had a pretty cold December and great O&M control and then a tax issue with the utility, but Dan, you want to -- ?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

That's exactly it, Greg. There was a tax issue that's not a ongoing issue, it was a one-time tax item at the utility that brought them just below. And Power just did a great job of controlling costs as we went through the balance of the year.

Greg Gordon - *Evercore ISI - Analyst*

Okay, great. When we think about the guidance for 2017 then, whatever that -- and I can go over it with Kathleen offline, whatever tax issue you had is normalized in terms of expectations?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

That's exactly right, Greg.

Greg Gordon - *Evercore ISI - Analyst*

Okay, fantastic. When you talk about the -- sorry to focus on the tax stuff because who knows three months from now, we may wind up not having any tax bill at all (laughter). But one of your other competitors that's a large nuclear generator did point out that they thought that there was a significant exposure on border tax on uranium costs since we now unfortunately import the majority of our uranium.

Is that theoretically true? But in the longer term if that were the case, are there domestic sources of uranium that would be quickly brought online to mitigate that?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Greg, as we think about it, we spend about $200 million a year on nuclear fuel and a little more than half of that is sourced outside the US. We share that issue, obviously not to a major extent from the standpoint of the overall impact on Enterprise.

But if you think about a border tax trying to encourage domestic production, I don't know that there's any way it would get you all the way there from the ability to source what the industry needs domestically. That said, that doesn't mean that you wouldn't necessarily have it as part of tax reform. So we're aware of the issue, watching the issue, and that would be an area where it would have an impact on us.

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

And Greg, just at the risk of getting into too much detail, remember when we say nuclear fuel that's our complicated noun to use because there's a whole bunch of processing that goes along with it. So when I say half of it is outside, it doesn't mean that from uranium cake to fuel rod we do half of that in the country and half of it outside the country.

Client Id: 77

All parts of it are touched outside the country. So, if this is an attempt to bring this product into the nation, we don't know how that's going to be doable.

Greg Gordon - *Evercore ISI - Analyst*

Okay. Thank you guys, take care.

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Thanks.

Operator

Your next question comes from the line of Julian Dumoulin-Smith with UBS. Please go ahead.

Julien Dumoulin-Smith - *UBS - Analyst*

Hey, good morning guys.

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Hi, Julian.

Julien Dumoulin-Smith - *UBS - Analyst*

Just to finalize that question, just to make sure I heard you right on the nuclear fuel piece. You should assume the vast majority of the fuel CapEx is subject to the border adjustability tax?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Since the laws aren't written it's going to be tough to say, but there's different components going from uranium to enrichment to fabrication along the way. And those steps are more external than internal to the US. However they would make the determination to apply any kind of a border tax that isn't written as yet, we would apply that against the components of how that comes together.

We're grasping a little bit at trying to define a number around something that doesn't exist. But if we think about it, a little more than half of the aggregate cost seems like it might qualify to be non-domestically sourced.

Julien Dumoulin-Smith - *UBS - Analyst*

Right, got it. Then vis-a-vis your cash taxes, can you remind us exactly where you stand today and what your effective and cash tax rates would be as you look at the forecasted future?

©2017 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. THOMSON REUTERS

SI-SSA-0015-13504

Client Id: 77

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Future would not include any tax reform, I presume. As we think about overall tax profile, we are a taxpayer and get a little close to not being one into this year, depending on where the results go, and then move back into a tax paying position.

Julien Dumoulin-Smith - *UBS - Analyst*

Got it, all right. Then turning to the CapEx bucket, your GSMP program, do you have plans to increase that going into the rate case? Can you remind us of the potential upside there as you see it in terms of the next filing?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

Sure, Julian. (Technical difficulties). At the $300 million a year run rate adjusted for inflation going forward, we think that's a 30-year program. So that means we have 27 more years after this first tranche of GSMP. You remember we were operating at a $300 million a year run rate and we have gained confidence that we can push that number up higher. I'd rather leave the details of that discussion for March 6, but it will be -- we certainly have the capabilities to do more than $300 million a year, which would of course shorten the 27 years proportionately.

Julien Dumoulin-Smith - *UBS - Analyst*

Got it. Thank you very much.

Operator

Your next question comes from the line of Travis Miller with Morningstar. Please go ahead.

Travis Miller - *Morningstar - Analyst*

Good morning, thank you.

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Hi, Travis.

Travis Miller - *Morningstar - Analyst*

I was wondering if you could update us, Ralph, on your thoughts about the retail business? The speed at which you would like to ramp that up, the extent to which you might ramp that up relative to the generation output?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Our philosophy hasn't changed. Remember this is primarily a defensive move on our part. We did make clear that we were looking at possibly trying to find a couple tuck-in niche acquisitions, but we have not.

We've opted to pursue this organically, building the capability in house. We still are targeting between 5 and 10 terawatt hours at its maturity. We have received licenses to market in Eastern Pennsylvania and in New Jersey.

THOMSON REUTERS

SI-SSA-0015-13505

Client Id: 77

We have a head of the operation onboard that we've hired and a couple support folks, and are talking to people about some of the back-office fundamentals that we don't want to build on our own. Don't forget, we still have BGS, which is 11 terawatt hours of our 50 terawatt hours, round numbers, that is essentially a retail product.

What we're looking to do here is to basically claw back some of the BGS that over years had gone away either by some combination of migration or changing of thresholds for the BGS customer. We think that it will help us capture some lost margin and improve our management of basis differentials. I think from the point of view of organic growth I'm pleased with the approach. It makes it harder, but it does make it more profitable if done this way.

Travis Miller - *Morningstar - Analyst*

Got it, thanks. Then within that retail business, would you think about doing anything unique like energy services or C&I energy management, anything like that or are we just talking plain retail?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

No, this is plain retail capturing better margin for our hardware that exists.

Travis Miller - *Morningstar - Analyst*

Got it. Okay. Thanks so much.

Operator

Your next question comes from the line of Michael Lapides with Goldman Sachs. Please go ahead.

Michael Lapides - *Goldman Sachs - Analyst*

Hi, guys. Congrats on a good 2016. I want to come back to the utility and the commentary about CapEx. I think if I read the release correctly, you said $10.2 billion of total CapEx for the entire Company over the next three years and 77% of that is the utility. That's kind of roughly $7.8 billion of utility CapEx.

But then, and I may have misheard this, I thought you said that 2017's CapEx at the utility is $3.4 billion. That would leave $4.5 billion for 2018 and 2019, which implies $2.2 billion a year roughly. That's a pretty big step down in PSE&G's CapEx.

A, I want to make sure I heard that correctly. B, could you walk us through whether that's the number you're likely to lay out at the Analyst Day, or at the Analyst day are you going to update that number? What are things that are not included that could wind up in there when we think about the next couple of years?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Okay, Michael. Well, first of all, good morning. Thanks for the nice words. Yes, you heard the numbers correctly. This is our age-old problem that you now have grown accustomed to where the out years have in the past grown beyond what we predict them to be in the current time frame. What we will do at the Analyst Day is try to explain to you what's been approved, what's about to be filed, what we have confidence in in terms of being a mere extension of existing programs, and we're actually going to expand a little bit at the Analyst Day to give you a little bit more insights

THOMSON REUTERS

SI-SSA-0015-13506

Client Id: 77

into what I'd call our opportunity set, our drawing board, things which we were always working on but we normally don't bake into our bar chart showing five-year growth.

At the risk of doing the preview with details on the News at 11 you are once again going to see a five-year set of numbers that are higher than what we thought they were going to be last year at this time. That just seems to be the natural trend. I wish I would always get it right in terms of the prediction, but the out years are always less certain. So yes, you heard it correctly.

Michael Lapides - *Goldman Sachs - Analyst*

Right. It just seems in this -- and I want to make sure I understand. The CapEx you're likely to layout at the Analyst Day will differ from the $10.2 billion total number that you put in today's release, or will those two, for just the next three years, be the same number and you'll give a lot more detail about drivers and what could change it?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

In terms of three years what we'll show you is stuff that we didn't include and why we didn't include it. Then we'll explain the five-year view for you.

Michael Lapides - *Goldman Sachs - Analyst*

Got it. The only reason I ask is that when I go back over the last decade, it's really years three through five where you show a cliff in the slide deck at the Analyst Day, and then as we got closer to year three and year four those numbers would come up. The only thing that differs from the detail this time is now it's FY2, meaning it's the 2018 number where you kind of assume a $2.2 billion if you just assumed 2018 and 2019 were the combined equal amount of what's left over. I'm just wondering, are we reaching a point where CapEx at PSE&G is starting to moderate?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

So I think that your observations are accurate, that the turnover generally occurred in years -- the flattening occurred in year three and the turnover in four and five. The other observation I'd offer, though, is that this year is a record-breaking year for PSE&G CapEx.

I think it's a combination of GSMP and Energy Strong in tandem and Solar For All in tandem with still some major transmission work going on in the Bergen Linden Corridor that's feeding a record-breaking year so that year four and year five is coming up a little bit earlier this time. But that won't change the 9% growth in rate base, which is off of a higher base and a larger capital program than we've had in the prior years and the prospects for even more to come.

Michael Lapides - *Goldman Sachs - Analyst*

Got it. And one thing, in thinking about rate base calcs, what is the bonus D&A impact on rate base over the next couple of years?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

It's in the numbers that we're providing. I don't have a separate breakout of what the implications of that were. We can get you a little bit of color on those numbers, but we've broken out with the total cash flow aspect is, and then that will ripple through based upon timing.

Your next question comes from the line of Paul Patterson with Glenrock Associates. Please go ahead.

Paul Patterson - *Glenrock Associates - Analyst*

Good morning.

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Good morning, Paul.

Paul Patterson - *Glenrock Associates - Analyst*

Really quickly. The leases, they were, as I understand, last quarter they were all being paid. Is that still the case?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

Everything is still current on them, Paul.

Paul Patterson - *Glenrock Associates - Analyst*

And what is the earnings impact associated with these leases for 2017? Is it anything significant?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

Not a significant contribution to the ongoing earnings, no.

Paul Patterson - *Glenrock Associates - Analyst*

Okay. That's my only question. Everything else has been asked. Thanks.

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

Thanks. Paul.

Your next question comes from the line of Praful Mehta with Citigroup. Please go ahead.

Praful Mehta - *Citigroup - Analyst*

Hi. Thanks so much.

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Good morning.

Praful Mehta - *Citigroup - Analyst*

My first question was on the O&M operation. You said the Q4 Power costs were low and were run efficiently. Wanted to understand, is that a one-time thing? What drove that, and can that be replicated going forward or is that already reflected in your guidance?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

Yes. So our O&M forecast for 2017 is clearly included within the guidance for 2017, and we continue to manage as efficiently as we can within the facilities that we have. I guess the items that I would think about as you move through time, and Ralph referenced maybe some of the operational aspects as opposed to cost specific, but you will see Hudson and Mercer coming off from the standpoint of those units retiring.

And you will see as time moves on with some new units coming on in the retail operation coming together, you will see some costs come back on for more productive purposes. But we have operated the Power business at an extremely efficient O&M trajectory, and if you look over the last five years or so, our O&M is basically debt flat.

Praful Mehta - *Citigroup - Analyst*

Gotcha, and that's helpful. Any perspective on PJM capacity prices? How do you see all the supply that could impact the upcoming auction option, any view on that at all?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Yes, we never forecast what that is going to be, largely because we don't know what that's going to be. I think what we are paying careful attention to, and I suspect everyone on the call is as well, is this first of a kind footnote by PJM that they may have to revisit some of the reliability parameters in PS Zone and the PS North in particular. That's something we all expect to see updated prior to May.

I know that we have lodged some questions with PJM about some of the reliability assumptions made. These seem to emanate from the change in the wheeling circumstances associated with the New York ISO. So no, we don't forecast, we don't predict to the outside world.

We obviously do a lot of analysis inside about what we think may happen. But right now I believe the parameters unfortunately are in a bit of flux and they need to be fixed sooner rather than later.

Client Id: 77

Praful Mehta - *Citigroup - Analyst*

Gotcha. Finally quickly on the tax reform side, you said with the reduction of corporate tax rate, obviously the excess deferred tax liability, whatever you revalue, you'll have to refund back to customers. Can you give us a sense of what that size is and what you expect in terms of time frame if you had to refund that?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

The second question is the harder one to answer because it is not determined yet where that's necessarily going to come from. That could be legislated as part of what ultimately may come out or be left to the regulatory agencies to make that determination. So we don't know.

If you look back to 1986 there was something called the average rate adjustment method which was painfully complex and pushed the excess back on a unit by unit or a class by class as the timing differences changed. It was very structured and very complex, and pushed them back over a long period of time. As it stands right now we don't know what that method is going to be because nothing is in place as yet, but that's just look back to history.

If you take a look, you can see just by going through the overall tax footnotes and looking at the aggregate deferred taxes that we have and grossing up a 35 and pulling down it, whatever rate you think the rate's going to go to. You'd have to determine whether you had a 15%, a 20% rate or something else based upon what gets legislated, but if you're in that range you're probably approaching about $2 billion of excess deferreds, just by doing that math off the footnote of the 10K.

Praful Mehta - *Citigroup - Analyst*

Gotcha. Thanks so much, guys.

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

You're welcome.

Operator

Your next question comes from the line of Anthony Crowdell with Jefferies. Please go ahead.

Anthony Crowdell - *Jefferies LLC - Analyst*

Good morning. I just have hopefully one quick question. The midpoint of the utility guide, $945 million to $985 million, what's the assumption on earned ROE?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

That's not changing this year for any reasons that we could think of, Anthony. We're looking at each other right now say, does somebody knows something that we don't.

The rate case filing for base distribution will go in in November. My guess is those rates will be effective sometime either late in 2018 or January 1, 2019.

THOMSON REUTERS

SI-SSA-0015-13510

Client Id: 77

Our FERC formula rate has already gone through for January 1. Our clauses are all baked in already at varying degrees from 9.75% to 10%, so there's no allowed ROE impact this year that I can think of.

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

Ultimately it becomes the sum product of all those different rates and programs.

Anthony Crowdell - *Jefferies LLC - Analyst*

I guess, have you provided what that sum product is that you're assuming for 2017 or no?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

No.

Anthony Crowdell - *Jefferies LLC - Analyst*

Okay, thank you.

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

You're welcome.

Operator

Your next question comes from the line of Angie Storozynski with Macquarie. Please go ahead.

Angie Storozynski - *Macquarie Research Equities - Analyst*

Thank you. Just a quick question on the Enterprise and Other. Can you help me with modeling of the future earnings [power] of the segment?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

Yes far and away the biggest component there is PSEG Long Island, and that's about a $0.07 to $0.08 benefit in the aggregate. Beyond that there's a little bit of corporate expenses and a little bit of interest, but mainly if you think about that as just being PSEG Long Island you'd be pretty close.

Angie Storozynski - *Macquarie Research Equities - Analyst*

So why was there a step-down between -- why is there a step-down between 2016 and 2019 -- 2017, I'm sorry.

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

Yes, we had a tax benefit that came through this year which is a one-time item which would not be replicated on a go forward basis.

Client Id: 77

Angie Storozynski - *Macquarie Research Equities - Analyst*

Okay. Then for Long Island, should I just keep it flat? Is there any growth embedded in the contract?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

Yes, there's growth basically on a CPI oriented growth. There's no step change that you should expect from that business.

Angie Storozynski - *Macquarie Research Equities - Analyst*

Okay, thank you.

Operator

Your next question comes from the line of Ashar Khan with Visium. Please go ahead.

Ashar Khan - *Visium Asset Management - Analyst*

My questions have been answered. Thank you so much.

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

Hi, Ashar.

Operator

Your next question comes from the line of Andy Levi with Avon Capital Advisors.

Andy Levi - *Avon Capital Advisors - Analyst*

Hey, guys. How you doing?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Hi, Andy.

Andy Levi - *Avon Capital Advisors - Analyst*

Just two quick questions. Just on 2019 on your hedges, the $43 on the base load seems like a very attractive price relative to what shows up on various different -- like Bloomberg for example. Just wondering the time frame when you hedged that and how you were able to get a $43 price, which is very attractive.

THOMSON REUTERS

SI-SSA-0015-13512

Client Id: 77

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

Nothing new there, Andy. What we have always done and continue to do is as we try to capture items like a full requirements contract like BGS, we strip out the capacity component of it and it leaves you with some of the actual non-energy elements that remain in there. As you look that far out, that's a bigger proportion of what the hedged amount is, so that's what it gets you to.

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

But it's consistent with what we've done whenever we give you our hedge [profile].

Andy Levi - *Avon Capital Advisors - Analyst*

That, just make sure I understand it because I'm not that smart at times. So that percent that you show there, that's mainly from BGS? Is that what you're saying?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

About half of it is BGS.

Andy Levi - *Avon Capital Advisors - Analyst*

Half of it is's BGS, got it. Second question is, and I don't know if you disclosed this already, but what is the PSE&G, the utility's, CapEx for 2017?

Dan Cregg - *Public Service Enterprise Group Inc - EVP & CFO*

That was the $3.4 billion.

Andy Levi - *Avon Capital Advisors - Analyst*

$3.4 billion, okay. I did hear that correctly, okay. Then I guess I can discuss the rest with Kathleen afterwards. Thank you very much.

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

She's not going to tell you how we hedge so smartly. She's not going to give away those trade secrets to you.

Andy Levi - *Avon Capital Advisors - Analyst*

Okay thanks.

THOMSON REUTERS

SI-SSA-0015-13513

Client Id: 77

Michael Lapides - *Goldman Sachs - Analyst*

Hey, guys. Real quick follow-up on the balance sheet. You've talked previously about how much balance sheet capacity, or excess balance sheet capacity you maintain. Can you give an update on that?

And if CapEx does start to moderate at the utility some, and we know that once the gas plants come online at Power we'll start seeing CapEx moderate, and probably early, mid next year there as well. How you think about utilizing that balance sheet?

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

So thanks for the follow-up question, Michael, and your arithmetic was right before. I just want to be cautious about the use of moderation for the utility capital program as a general characterization because it's anything but. We'll talk in greater detail about that, and we'll also give you some specifics on residual investment capacity, and there is a healthy amount of residual investment capacity that we'll expand about.

That is the primary reason why we plan to do something a little bit new on the following Monday and talk about the opportunity set, albeit with a heavy dose of qualifying that opportunity set as, this is the stuff that's on the drawing board that oftentimes never gets to a filing, and even after filing oftentimes gets trimmed, right? But we just want to show you the reason why we like having that investment capacity because we're always thinking of things that are important to customers that we can do for them.

Michael Lapides - *Goldman Sachs - Analyst*

Got it. Thank you, Ralph. Much appreciated.

Operator

Mr. Izzo and Mr. Cregg, there are no further questions at this time. Please continue with your presentation or closing remarks.

Ralph Izzo - *Public Service Enterprise Group Inc - Chairman, President & CEO*

Great, thanks, Brent. Thanks everyone for being on the call. We hope the results for 2016 and the outlook for 2017 help you understand that our strategy is successfully meeting the challenges of the market today.

We will be in New York on March 6 at the Stock Exchange and hope you'll join us for our annual review of our business, both the three- and five-year look going forward. Presumably your takeaways, at least what we tried to communicate to you, is that our balance sheet remains strong.

As we just discussed with Michael and with the rest of you, our capacity for growth exists beyond the 9% rate base that we've talked about and the completion of the projects at Power that are going to add 1,800 megawatts of efficient combined cycle. We will give you a little bit more information on the range of utility opportunities and what our ongoing efforts will be to position Power's portfolio for maximum returns.

In the meantime, as much as it pains me to say, please enjoy this wonderful weather. Hopefully we'll see you bundled up in Manhattan in about seven days. Take care everyone.

Operator

Ladies and gentlemen, that does conclude your conference call for today. Thank you for your participation. You may now disconnect.

PSEG ANNOUNCES 2016 RESULTS

NET INCOME OF $1.75 PER SHARE

Non-GAAP Operating Earnings of $2.90 Per Share

Common Dividend Increased 4.9%

Non-GAAP 2017 Operating Earnings Guidance $2.80 - $3.00 Per Share

(February 24, 2017 – Newark, NJ) Public Service Enterprise Group (PSEG) reported 2016 Net Income of $887 million, or $1.75 per share as compared to Net Income of $1,679 million, or $3.30 per share for 2015. Non-GAAP Operating Earnings for the year 2016 were $1,475 million or $2.90 per share compared to 2015 non-GAAP Operating Earnings of $1,476 million or $2.91 per share. Net Income for 2016 was largely impacted by expenses associated with the early retirement of coal-gas units at the Hudson and Mercer generating stations and reserves for a leveraged lease impairment. Net Income for 2015 includes insurance proceeds for the recovery of storm costs.

PSEG also reported a Net Loss for the fourth quarter of 2016 of $98 million, or $0.19 per share. This compares to fourth quarter 2015 Net Income of $309 million, or $0.60 per share. Non-GAAP Operating Earnings for the fourth quarter of 2016 were $279 million, or $0.54 per share compared to fourth quarter 2015 non-GAAP Operating Earnings of $255 million, or $0.50 per share. Net Loss in the fourth quarter reflects the impact of incremental depreciation expense and other expenses of $555 million pre-tax associated with the early retirement of the Hudson and Mercer coal/gas-fired generating stations.

“We delivered strong results in 2016 with full year non-GAAP Operating Earnings solidly within the range of our guidance” said Ralph Izzo, chairman, president and chief executive officer. “Continued growth at our regulated utility and a disciplined approach to expenses across Enterprise supported results. The Board’s recent decision to increase the common dividend by 4.9% to the indicative annual level of $1.72 per share represents confidence in our firm’s investment strategy and an acknowledgment of our strong financial condition.”

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG’s financial performance to previous financial results. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items such as the previously noted Hudson and Mercer retirements and lease impairment.

The tables below provide a reconciliation of PSEG's Net Income to non-GAAP Operating Earnings for the full year and fourth quarter. See Attachment 11 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings. The presentation of non-GAAP Operating Earnings is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings as presented in this release may not be comparable to similarly titled measures used by other companies.

PSEG CONSOLIDATED RESULTS (unaudited)
Full-Year Comparative Results
2016 and 2015

	Income ($ millions)		Diluted Earnings Per Share	
	2016	**2015**	**2016**	**2015**

*See Attachment 11

Ralph Izzo went on to say, "We continue to pursue opportunities to enhance earnings and reduce financial risk. Actions to transition our business mix in response to changing market conditions have supported earnings. For 2017, we forecast non-GAAP Operating Earnings of $2.80 - $3.00 per share. Based on the growth in our regulated utility's investment program, PSE&G's Net Income is forecast to grow 8.5% at the mid-point of 2017's guidance to represent 66% of our forecast non-GAAP Operating Earnings. Our investment program, coupled with the impact from retirement of Hudson and Mercer (which is excluded from our non-GAAP Operating Earnings) is expected to improve the resiliency of our infrastructure and the economic efficiency of our generating fleet. Our ultimate goal is to provide an attractive earnings and dividend profile as we also deliver value to the customer. Our balance sheet remains strong, and we are well positioned to meet our goals."

The following table outlines PSEG's 2016 non-GAAP Operating Earnings by subsidiary and expectations for 2017.

2017 Non-GAAP Operating Earnings Guidance and
2016 Non-GAAP Operating Earnings
($ millions, except EPS)

	2017E	2016A
PSE&G	$945 - $985	$889
PSEG Power	$435 - $510	$514
PSEG Enterprise/ Other	$35 - $35	$72
Non-GAAP Operating Earnings	$1,415 - $1,530	$1,475
Non-GAAP EPS	$2.80 - $3.00	$2.90

E = Estimate A= Actual

Due to the forward looking nature of non-GAAP Operating Earnings guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

Non-GAAP Operating Earnings Review and Outlook by Operating Subsidiary

See Attachments 5 and 6 for detail regarding the quarter-over-quarter and year-over-year reconciliations for each of PSEG's businesses.

PSE&G

PSE&G reported Net Income of $193 million ($0.38 per share) for the fourth quarter bringing full year Net Income to $889 million ($1.75 per share). On a comparative basis, PSE&G reported Net Income of $156 million ($0.31 per share) and $787 million ($1.55 per share) for the fourth quarter and full year 2015, respectively.

PSE&G's Net Income in the fourth quarter continued to benefit from a return on its expanded investment in transmission and distribution infrastructure.

Growth in PSE&G's investment in transmission, and the absence of an adjustment to Net Income for bonus depreciation in the year-ago quarter improved quarter-over-quarter Net Income comparisons by $0.06 per share. More normal weather conditions relative to unseasonably mild weather in the year-ago quarter improved Net Income by $0.01 per share. A decline in O&M of $0.03 per share and other expenses was offset by an increase in depreciation expense and taxes.

PSE&G implemented a $121 million increase in revenue under the company's transmission formula rate on January 1, 2017. Transmission revenues are adjusted each year to reflect an update of the company's investment program. PSE&G's investment in

transmission grew to $6.7 billion of rate base at the end of 2016, or 44% of the company's consolidated rate base of $15.2 billion at the end of the year.

Electric sales, on a weather-normalized basis, were flat in the fourth quarter compared to the year-ago period as an increase in demand from the commercial sector offset a decline in sales to residential and industrial customers. For the year, the continued degradation of the industrial sector and increases in efficiency offset the impact of residential customer growth on sales. Weather-normalized firm gas sales declined slightly during the fourth quarter compared to the year-ago quarter and declined 1.9% for the full year.

PSE&G invested $2.8 billion during 2016 to upgrade and expand its transmission and distribution system. PSE&G upgraded 177 miles of gas pipes in more than 80 towns as it continues work under its three-year $905 million Gas System Modernization Program. Upgrades to the electric distribution system continue under the $1.2 billion Energy Strong infrastructure program.

For the 15th year in a row, PSE&G's work to protect and strengthen the system yielded recognition as the most reliable electric utility in the Mid-Atlantic.

PSE&G's Net Income for 2017 is forecasted at $945 million - $985 million.

PSEG Power

PSEG Power reported a Net Loss of $302 million ($0.59 per share) in the fourth quarter of 2016 versus Net Income of $149 million ($0.29 per share) for the fourth quarter of 2015. For the full year 2016, PSEG Power reported Net Income of $18 million ($0.04 per share) versus Net Income for the full year 2015 of $856 million ($1.68 per share).

PSEG Power reported non-GAAP Operating Earnings of $69 million ($0.13 per share) for the fourth quarter of 2016 and non-GAAP Adjusted EBITDA of $155 million bringing full year non-GAAP Operating Earnings to $514 million ($1.01 per share) and non-GAAP Adjusted EBITDA to $1,201 million. On a comparative basis, PSEG Power reported non-GAAP Operating Earnings of $95 million ($0.19 per share) and non-GAAP Adjusted EBITDA of $218 million for the fourth quarter of 2015 and non-GAAP Operating Earnings of $653 million ($1.29 per share) and non-GAAP Adjusted EBITDA of $1,435 million for the full year 2015.

Management believes non-GAAP Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed

or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization. See Attachment 12 for a complete list of items excluded from Net Income in the determination of non-GAAP Adjusted EBITDA. The presentation of non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Power's Net Loss for the fourth quarter reflects the impact of incremental depreciation and other expenses of $555 million pre-tax associated with the decision to retire the Hudson and Mercer coal/gas-fired generating stations on June 1, 2017. The company's fourth quarter results also reflect the impact of a decline in energy prices on output and margins.

A decline in the average price received on energy hedges reduced Power's quarter-over-quarter non-GAAP Operating Earnings by $0.05 per share. A reduction in output was partially offset by an improvement in off-system gas sales resulting in a net reduction of $0.01 per share in quarterly Net Income(Loss) comparisons. An increase in O&M expense of $0.03 per share associated with the cost of a planned refueling at Power's 100% owned Hope Creek nuclear station was offset by a decline in taxes and other items.

Output from Power's generating facilities was 7.6% lower in the fourth quarter compared to year-ago levels. Quarterly comparisons were affected by the refueling outage at Hope Creek, major maintenance on the gas-fired CCGTs during the shoulder period in the market and lower demand. For the year, output was 6.7% lower. The nuclear fleet operated at an average capacity factor of 86.9% producing 29.6 TWh of energy (57% of total energy output for 2016). Power's gas-fired CCGT fleet operated at an average capacity factor of 57.2% for the year producing 16.4 TWh of energy (32% of 2016's total energy output). The coal-fired fleet (primarily Keystone and Conemaugh) generated 4.8 TWh of energy during the year (9% of 2016's total energy output) with the remaining output produced from Power's peaking generating assets.

Power is forecasting output for 2017 of 49 - 51 TWh – a slight change from 51.5 TWh of energy produced in 2016. Following completion of the Basic Generation Service (BGS) auction in New Jersey in February 2017, Power enters the year with 100% of its 2017 baseload generation hedged. Approximately 80% - 85% of anticipated annual production is hedged at an average price of $46 per MWh. Power has hedged approximately 50 - 55% of its forecast generation in 2018 of 55 TWh at an average price of $43 per MWh. For 2019, Power has hedged 15 - 20% of forecast production of 60 TWh at an average price of $43 per MWh. Power assumes BGS volumes will represent approximately 11TWh in 2017 – consistent with 2016 deliveries of 11.1TWh under the BGS contract.

The forecast increase in output for 2018 and 2019 reflects the commercial start-up in mid-2018 of 1,300 MWs of new gas-fired combined cycle capacity at the Keys Energy Center in Maryland and Sewaren in New Jersey, and the mid-2019 commercial start-up of the 485 MW gas-fired combined cycle power plant at Bridgeport Harbor, Connecticut.

Power's non-GAAP Operating Earnings for 2017 are forecast at $435 - $510 million. The forecast represents non-GAAP Adjusted EBITDA for the full year 2017 of $1,080 – $1,210 million.

Due to the forward looking nature of non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

PSEG Enterprise/Other

PSEG Enterprise/Other reported Net Income for the fourth quarter of 2016 of $11 million ($0.02 per share) compared to Net Income of $4 million for the fourth quarter of 2015. For the full year, PSEG Enterprise/Other reported a Net Loss of $20 million, ($0.04 per share) compared to Net Income in 2015 of $36 million ($0.07 per share). Net Income for the fourth quarter and full year 2016 include pre-tax charges of $10 million and $147 million, respectively related to an impairment of leveraged lease residual values and an estimated loss as a result of liquidity issues currently facing NRG REMA.

Non-GAAP Operating Earnings for PSEG Enterprise/Other in the fourth quarter 2016 were $17 million ($0.03 per share) compared to $4 million in the year-ago quarter. The results for the fourth quarter brought PSEG Enterprise/Other non-GAAP Operating Earnings for the full year to $72 million ($0.14 per share) versus $36 million ($0.07 per share) in 2015.

The increase in non-GAAP Operating Earnings quarter-over-quarter reflects the absence of certain corporate expenditures as well as certain tax items at PSEG Energy Holdings and contractual payments associated with the operation of PSEG Long Island.

For 2017, non-GAAP Operating Earnings for PSEG Enterprise/Other are forecast to be $35 million.

Capital Expenditures

PSEG currently plans to invest approximately $10.2 billion over 2017 – 2019 primarily in PSE&G (77%) and PSEG Power (23%).

Pension Expense

PSEG, at the end of 2016, merged its three qualified defined benefit pension plans and the pension plans' assets into one plan. As a result, total net periodic benefit costs are

expected to decrease by approximately $48 million (net of amounts capitalized) in 2017 from what they would have been without the merger of the plans, and total periodic benefit expense in 2017 is also expected to be $22 million lower than 2016's level of expense. This is due to a change in the amortization period for gains and losses for the merged plan which resulted in lower amortization than that of the individual plans.

FORWARD-LOOKING STATEMENTS

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC), including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;

- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

From time to time, PSEG, PSE&G and PSEG Power release important information via postings on their corporate website at http://investor.pseg.com. Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-13537

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items. Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income to reconcile to Operating Earnings and Adjusted EBITDA with a reference to those slides included on each of the slides where the non-GAAP information appears.

Management uses Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Management believes Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. The presentation of Operating Earnings and Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, Operating Earnings and Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of Operating Earnings and Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

These materials and other financial releases can be found on the PSEG website at www.pseg.com , under the Investors tab. From time to time, PSEG, PSE&G and PSEG Power release important information via postings on their corporate website at http://investor.pseg.com. Investors and other interested parties are encouraged to visit the corporate website to review new postings. PSEG 2016 – Another Year of Successful Capital Deployment

- **Solid 2016 financial performance**
  - ✓ Net Loss of $(0.19) vs. Net Income of $0.60 per share in Q4 2015; Full-year Net Income of $1.75 vs. $3.30 per share in 2015; Decision to retire Hudson-Mercer units resulted in $555 million of incremental D&A in Q4
  - ✓ Non-GAAP Operating Earnings* results of $0.54 vs. $0.50 per share in Q4 2015; Full-year non-GAAP Operating Earnings* of $2.90 vs. $2.91 per share in 2015
  - ✓ PSE&G achieved 13% growth in Net Income over 2015 on increased investment in transmission and distribution
  - ✓ PSEG Power results exceeded revised guidance with stringent control of O&M

- **Operational excellence**
  - ✓ PSE&G recognized for the 15th consecutive year as the Mid-Atlantic region's most reliable electric utility
  - ✓ Nuclear performance stabilized following extended outages at Salem

- **Disciplined capital investment – producing results**
  - ✓ PSEG invested $4.2 billion in 2016: $2.8 billion at PSE&G and $1.3 billion at Power
  - ✓ PSE&G's $905 million GSMP and $1.2 billion Energy Strong infrastructure investments continue
  - ✓ Solar 4 All programs total 158 MW_{DC} with latest extension to provide $80 million for development of 33 MW_{DC} of grid-connected, landfill/brownfield solar over next 3 years

* See Slide A for Items excluded from Net Income/(Loss) to reconcile to Operating Earnings (non-GAAP).

SI-SSA-0015-13551

PSE&G EPS Reconciliation – Q4 2016 versus Q4 2015

Prior quarter results for reconciling items may not add to year-to-date (YTD) totals due to rounding.

SI-SSA-0015-13552

PSE&G – Monthly Heating Degree Days

Q4 2016 winter weather, as defined by heating degree days, was ~38% colder than Q4 2015 (the warmest Q4 in our records) and ~5% warmer than normal

SI-SSA-0015-13553

PSE&G – Q4 Operating Highlights

Operations

- ✓ Electric sales were flat both for the quarter and for the full year on a weather normalized basis; Weather adjusted gas sales declined slightly in Q4 and declined by 1.9% for the full year
- ✓ PSE&G recognized for the 15th year as the Mid-Atlantic region's most reliable electric utility

Regulatory and Market Environment

- ✓ FERC formula rate revenue increase of $121 million effective January 1, 2017
- ✓ PSE&G will file its distribution base rate case with the NJBPU no later than November 1, 2017
- ✓ PSE&G residential gas customers receiving BGSS bill credits totaling ~$47 million during Winter 2016-17; Since 2009, average annual residential gas bills have declined by 53% – or $892 – due to supply rate reductions

Financial

- ✓ PSE&G's 2017 Net Income guidance range is $945 - $985 million, an 8.5% increase to the mid-point over 2016 Net Income of $889 million
- ✓ PSE&G invested $2.8 billion in 2016 capital expenditures to upgrade and expand T&D
- ✓ Investment in transmission grew to 44% of rate base at year-end 2016, as consolidated rate base increased by 12% to $15.2 billion

REVENUES OF FULL REQUIREMENT LOAD DEALS BASED ON CONTRACT PRICE, INCLUDING RENEWABLE ENERGY CREDITS, ANCILLARY, AND TRANSMISSION COMPONENTS BUT EXCLUDING CAPACITY. HEDGES INCLUDE POSITIONS WITH MTM ACCOUNTING TREATMENT AND OPTIONS.

SI-SSA-0015-13563

PSEG Power – Q4 Operating Highlights

Operations

- ✓ Q4 output down 7.6% versus Q4 2015 due to Hope Creek refueling and planned CCGT major maintenance; Full-year generation was 6.7% lower
- ✓ Annual capacity factor for the nuclear fleet of 86.9% produced 29.6 TWh of energy; CCGT fleet had a capacity factor of 57.2%, producing 16.4 TWh of energy
- ✓ Hope Creek refueling outage completed in 27 days during Q4 2016

Regulatory and Market Environment

- ✓ 2017 BGS auction priced at $90.78/MWh vs. $96.38/MWh in 2016 for PSE&G
- ✓ 2017 expected generation output 49-51 TWh; BGS load projected at 11 TWhs
- ✓ Power nearing commencement of construction at Bridgeport Harbor site; target completion in 2019
- ✓ Construction on schedule and on budget at Keys and Sewaren 7 for targeted 2018 in-service

Financial

- ✓ Power's total debt as a percentage of capitalization at year-end was 29%
- ✓ Power's FFO/Debt at December 31 remains strong
- ✓ Power's 2017 non-GAAP Operating Earnings guidance range is $435 - $510 million; Non-GAAP Adjusted EBITDA guidance for 2017 is $1,080 to $1,210 million

SI-SSA-0015-13564

PSEG

PSEG Financial Highlights

- **Introducing 2017 non-GAAP Operating Earnings guidance of $2.80 - $3.00 per share**
  - ✓PSE&G earnings forecast to grow 8.5% to comprise 66% of PSEG's 2017 non-GAAP Operating Earnings
  - ✓ Focused on maintaining operating efficiency and customer reliability
- **PSEG capital spending forecast of $10.2 billion over 2017-2019 to be invested in PSE&G (77%) and Power (23%)**
- **PSE&G infrastructure investment in reliability/resiliency/replacement continues with ongoing GSMP and Energy Strong investments**
- **PSEG Power's $2 billion investment in new generation in PJM and New England, will improve fleet efficiency and geographic diversity**
- **Increased 2017 indicative common dividend by 4.9% to $1.72 per share**
- **Financial position remains strong:**
  - ✓Continuing to pursue opportunities to enhance Operating Earnings and reduce financial risk
  - ✓Positive cash from Power and increasing cash flow from operations at PSE&G supports dividend growth and funds capital spending program without the need to issue equity
  - ✓Debt as a percentage of capitalization was 47% at December 31, 2016

2017 Federal Tax Reform – PSEG is well positioned

Given positive non-utility contribution to earnings and a strong balance sheet, PSEG is well positioned for potential tax reform

Assumption	PSE&G	PSEG Power	PSEG Parent
Reduction of Corporate Tax Rate	Customer rates lowered with reduction in tax rate Return of excess deferred tax liability – impact on cash and rate base growth dependent on payback period	After-tax earnings and cash flow increase One-time non-cash earnings benefit from reduction in deferred tax liability	After-tax earnings and cash flow improve
100% Expensing of Capital Expenditures	Impact on rate base growth comparable to existing bonus depreciation rules	Cash flow improves	
Elimination of Deductibility of Interest Expense and Border Adjustment Tax	Change in cost anticipated to be passed through to customers	Well positioned given low debt balance Uncertainty on Border Adjustment Tax	Well positioned given low debt balance

SI-SSA-0015-13567

PRESENTATION

Kathleen Lally ***- Public Service Enterprise Group Incorporated - VP, IR***

Good morning, everyone. Appreciate you all being here today, either in person here at the New York Palace Hotel or on the webcast. I am Kathleen Lally, Vice President of Investor Relations for Public Service Enterprise Group. And this is our 10th annual financial conference.

We are going to do our standard presentation, so to speak, in terms of order and hope to conclude today's material and meeting by noon. We're going to kick off with Ralph Izzo, Chairman, President, and CEO, who will provide an overview of the Company's results and strategy. Ralph will be followed by Ralph LaRossa, President and Chief Operating Officer of Public Service Electric and Gas. And following Ralph LaRossa's presentation there'll be time for Q&A, after which we will have a short break.

Following the break, Bill Levis, President and Chief Operating Officer of PSEG Power, will provide you with an overview of Power's operations as well as its investments profile. And Bill will also be joined by Shahid Malik, President of Energy Resources and Trade. Following Shahid's presentation, both Bill and Shahid will be available for Q&A.

And then after the conclusion of that Q&A session, Dan Cregg will present the financial picture for the Company. Dan is our Executive Vice President and Chief Financial Officer. And following Dan's presentation, he and Ralph Izzo will be available for Q&A. And we hope to wrap up by noon today. With that, I'm going to turn the podium over to Ralph Izzo.

Ralph Izzo ***- Public Service Enterprise Group Incorporated - Chairman, President, and CEO***

Thank you, Kathleen. We blew right by our forward-looking statement and our GAAP disclaimer, and I simply refer you back to those when you get a chance to read through them.

So by the end of this morning, hopefully you'll walk away from our presentations recognizing that PSEG, in fact, is growing. It's continued its growth path of a very high-quality, low-risk energy infrastructure company.

THOMSON REUTERS

SI-SSA-0015-13573

And that high quality is measured in a variety of ways. It's measured through our operational performance. It's measured in our financial performance. And the infrastructure company designations that you'll see -- we've expanded some of our investment options. Still at the core, still the vast majority of those investments are in our core utility, but we have some interesting things underway in PSEG Power as we moved away from our more traditional uprates to a couple of brand-new combined cycle units in some geographically dispersed locations.

So our operating philosophy remains the same. It's worked well for us; we see no reason to change it at this point in time. At a very high level, it all begins with our employees: setting clear expectations for them, making sure they have the resources to be successful. Success we define as safe, reliable, affordable service; increasingly, one that has minimal environmental impact.

If we do that and we do that well, it produces outstanding financial results -- reflected through the relationship we have with our regulators, reflected through the position we have in the marketplace. That financial strength then gets parlayed into an ability to invest. And hopefully we've demonstrated that ability to invest with a great degree of discipline.

And we define discipline as putting money to work in those areas that benefit our customers and those areas that we have a credible claim to be able to operate with excellence. The results have been three consecutive years of earnings growth; continued growth of the dividend two years in a row of slightly over 5%; what we believe to be best-in-class utility growth; and now, more recently -- and we'll talk in greater detail -- the addition of three combined-cycle units in strategic locations.

Two strong businesses: we speak a lot about the utility, but equally strong and equally important is PSEG Power. You'll see in a moment that we are increasing the size of the utility capital program to $12 billion predicted over the next five years. That will result in high single-digit rate based growth for PSE&G. As you know, we don't forecast earnings out for that period of time. Even though rate-based growth is a key ingredient to that, there are other considerations that one must factor into the earnings equation following the rate-based growth.

In PSEG Power, we still have this -- enormous funds from operation being generated there, even in the current market environment. And the benefits that provides in terms of providing -- meeting the equity needs of PSE&G are something that will continue throughout this five-year period. And Dan will speak more about that later on.

As I take a look at some of the accomplishments we've realized in these three areas, the awards, the accolades for PSE&G continue to roll in. I'm almost embarrassed to list them and to read them -- almost is the key word there. So we list them, but I won't read them. (laughter)

And the financial strength of the Company remains, in terms of being at the upper end of our earnings guidance the last year; having the cash flows to support some very, very healthy credit metrics; and, once again, increasing the dividend by a little over 5% last year. And I think we are one of three companies that have paid a dividend every year for over a century at this point in time.

As we look at the capital program that we have undertaken, you'll see some renewed emphasis in the utility on modernizing the gas system. However, the rest of the infrastructure investment program in the utility should be quite familiar to everyone who has followed us. And Power's program continues to have some modest uprates at its nuclear and fossil facilities, but more importantly is the expansion in the combined-cycle fleet that we will realize in Maryland, New Jersey, and in Connecticut.

I won't read all of the prior year's results here. It is, I hope you will agree, an impressive list. But if I may just direct your attention to 2015. $1 billion in new approvals from the BPU on very important infrastructure programs that will benefit our customers. I congratulate the Board and the staff for realizing in this low gas price, low interest rate environment, now is the time to pay attention to modernizing the gas infrastructure system.

We have the largest cast-iron main program of any utility in the nation. Even at the current ambitious investment rate of $300 million a year, it will take 30 years to replace all that cast-iron main. And we did receive a $922 million approval from the BPU just a few months ago. That was also complemented by yet another energy efficiency program, a $95 million energy efficiency program, which builds upon the highly recognized and successful programs that we had underway previous to this, largely in the hospital sector and in the multifamily dwelling sector.

Power had a great year. We secured, either through acquisition or through bidding in auctions, the rights to build three combined-cycle gas turbine units. Bill Levis will tell you more about that. And our very small but slowly growing unregulated competitive solar business -- all with 25-or-so-year PPAs is now approaching the 300 megawatt DC size, with 17 facilities in 12 different states.

So if we take a look at the capital program, because I think that really is where most of our attention should be directed today, we are seeing over a 10% increase as we look ahead five years compared to the investments we have made in the prior five years. The growth will be both at the utility and at Power. As you can see from the pie

THOMSON REUTERS

SI-SSA-0015-13574

chart here, the primary change in the utility will be some focus on GSMP, which stands for gas system modernization program -- that's the $900 million I referred to just a moment ago.

And you could see Power's growth piece of the pie, the orange segment, has expanded slightly as well. The prior growth was primarily in nuclear uprates, whereas this growth will be largely dominated by the three combined-cycle units that I keep referring to.

If we take a look at what we did over the past five years, we really did transform the business to one where we strengthened the balance sheet; we shifted towards investments in the utility, given the constraints that existed in the wholesale power markets. And as we look forward to the next five years, you'll see much of the same. We'll continue the growth of the dividend. We have a 10% expansion of the capital program that is three-quarters utility, one-quarter power.

The investments in the utility are not gold-plated. They are critically important to what our customers say that they need and what our regulators say that they want to see, be that in energy efficiency, or gas pipe replacement, or transmission investment. And then, of course, some continued investment in Power to not only make the current assets more efficient in the form of advanced gas-path retrofits, but in terms of taking advantage of new and more efficient engines that we can deploy in the three locations I keep referring to. And what you'll see as Dan comes up to present is the same story as we've been fortunate to be able to describe to you in the past: that there is more than plenty capacity remaining on the balance sheet to go beyond the investment opportunities that are contained in the $16 billion program.

So if we take a look at the utility and where it has come from, the stacked bar is the rate base. The light blue is the traditional distribution business -- gas and electric. The dark blue is transmission. As you are all aware, most of our growth in rate base has come from transmission. This has been an important policy objective of the federal government as well as PJM in terms of meeting the reliability needs of customers and decongesting the system.

And you can see with the orange line, PSE&G's operating earnings per share have gone along with that rate-based growth, largely due to the fact that Ralph LaRossa and his team have done a fabulous job of controlling expenses at the utility. If we take a look at what this has meant to customers, it's pretty obvious that whenever you invest in the infrastructure, you're going to give a higher level of service quality. But the trade-off tends to be higher bills.

Here you can see quite the opposite. What we have done in partnership with the regulators -- and I think very wisely so, in partnership with regulators -- is we've taken advantage of the decline in that little green part of the electric bill, which is basically additional charges that were put on the bill coming out of deregulation and various other policy objectives, everything from PURPA and NUG contracts to some tax reform efforts in New Jersey. But by and large it had to do it with stranded asset cost recovery and deregulation.

And as those charges have come off, and as we have seen gas prices come down, we've been able to maintain a fairly steady electric bill for customers. But being a combination electric and gas utility, on the right side of this slide, what you see is what's happened to the gas bill of customers. And when you add these two together over the course of a year, customers' bills have gone down by 28% over this eight-year period, even while we have grown the utility earnings, depending upon the time frame you look at it, anywhere from 11% to 18% per year over this same eight-year period. I've taken different five-year increments in quoting you the 11% to 18%.

So, to be sure, we are very clear with customers, with regulators, and with anyone who is interested in the story that rates would have gone down further had it not been for these infrastructure investments. But one would not make infrastructure investments in a rising price environment to the extent that we have. And these are necessary infrastructure investments. So good news: lower bills for customers, higher service quality, and a system that's ready for decades to come.

As we take a look at Power, here the economic drivers tend to be energy margins, capacity margins; what's happening in environmental regulation; and where are your assets located. And to be sure, energy margins have been compressed, in particular quark spreads. Spark spreads -- we tend to enjoy a very attractive regional spark spread due to our pipeline capacity contracts that we have and that we are able to make use of after fully meeting the needs of PSE&G customers.

Capacity markets we think we are exceptionally well positioned for. The capacity performance rules that we'll put into place have only told half the story in my opinion so far. The half of the story they told so far is what price gets paid at what location. The story that they haven't told so far is what are the risks undertaken by people who operate plants in this regime? And I believe those risks will be greatest for single or few unit operators. We have a fleet, so the risks for us will be less.

Similarly, if you have a fleet of diverse assets, I believe that the risks will be less -- even more so. And that is the case for us. So a diverse set of units and a fleet will position us well for the second half of capacity markets, and that is what is the risk and opportunity associated with capacity performance.

Environmental regulations -- as you've known for many years, our environmental improvements are behind us in terms of capital needs and in terms of location. We continue to enjoy attractive pricing in terms of capacity markets; less so in terms of energy markets of late, just given the proximity to gas markets and the lack of infrastructure to take that gas away from our region, which is nearest to the Marcellus and to markets that can use that gas, particularly the Southeast and southern part of the Midwest.

THOMSON REUTERS

SI-SSA-0015-13575

Okay. So what does this all mean for operating earnings? As we've looked over the past four years and into this year, you see we have grown earnings each of those years. And we have grown the utility's share of those earnings each of those four years. If you just take the midpoint of this year's guidance, we expect the utility to be 61% of those earnings; Power, 35%; and basically, the parent piece includes Long Island, which is the modest contribution, right on schedule, as we predicted.

If you take a look at the dividend, I'll just remind you that the utility will at the midpoint produce 61% of the earnings, and at the midpoint, our payout ratio will be 57%. So the utility will completely cover the dividend. That's why we continue to issue the very qualitative dividend policy that we have, which is that we believe looking out over the next five years, given where the current forward price curve is, given where the investment profile of the business is, given the earnings mix of the Company, that we have the potential for a consistent and sustainable growth in that dividend. And hopefully you saw that consistency just this past February.

So what is each business paying attention to? It begins with operations in both PSE&G and in Power. In PSE&G, it's operations that meets the customers' needs. In Power's case it's operations that meets the markets' needs.

The utility has a significant capital program that it will continue to pursue with diligence. And it's done a fabulous job of delivering its projects on schedule and on budget. And we'll continue to talk to regulators about the most effective way to deploy this capital, both in terms of the infrastructure itself that we want to invest in and the way in which that gets approved and planned for.

We've had a great partnership with the BPU over the past seven years. I think we've had 14 programs approved. And that is a wonderful thing. There's no question about it. And one can't say anything but thank you to the regulatory community for recognizing the importance of these programs. However, the ability to do things 18 months at a time is far less efficient than the ability to plan for something that, for example, has a 30-year horizon to it. Just the ability to train employees, the ability to invest in equipment changes drastically when one has a longer-term horizon for making investments.

At Power, now they, too, have a large capital program that they need to pay attention to. So Bill and his team meet regularly. I meet with Bill regularly to talk about -- okay, where are we on Keys, and Bridgeport, and Sewaren? And so far all the news has been good in that regard.

And we never, ever take for granted maximizing the value of our existing asset base, in particular our nuclear plants and remaining peaking units and combined cycles in Power. All the while, we are eager to see what comes out of FERC's price formation activities and various other market rule discussions that are underway in terms of operational transparency, in terms of setting prices in the marketplace for various uplift purposes, and meeting reliability needs that may or may not be consistent with what prices we're seeing from purely locational marginal pricing outcomes.

And at Long Island, we -- in just two years we've hit, I think, 18 or 19 of the 21 performance factors that we are obligated to achieve. Both years that we've operated there we've earned the bonus payments -- the modest bonus payments that come with the contract. And I expect us to close the gap between being outstanding and being perfect over the next couple of years. No pressure, Ralph. (laughter)

So this is my last slide. I'll leave you with this in terms of our value proposition: I love that second word in that first bullet, and that's the way I want to think of our Company. And hopefully you come out of here today just saying, okay, steady as she goes. Because I think as we go is a pretty good story.

And the stability that we produce, whether it's 100 years of dividends, or a solid earnings growth at the utility, or accolades of 14 years in a row of being the most reliable, or 10 out of the last 11 years of nuclear capacity factors over 90% -- that's what I want our shareholders and our investors to think of us as. And that's the way I want our customers to think of us. And that's the way I want our employees to think of us.

Ralph will come up and talk a lot more about the utility. He has a slide that I absolutely love. It's one of my favorite slides in the deck. I'll ask you to pay attention to it as he shows it to you. It keeps showing you, year after year, how wrong we are about what we will need to do over the next five years. We come here every March and tell you we're going to do X, and then we come back the next March, and it's 1.2X or 1.3X or 1.1X -- where I'm talking about the size of the capital program.

There's no shortage of infrastructure needs that the system screams at us to do. And our team is great at identifying those that have the maximum benefit for customers. And every year we'll show you this slide: here is our five-year program; here's what we said it was last year; and it's bigger.

At Power, pay careful attention to when Bill shows you what is happening to our fleet heat rate, which is the critical measure of fuel efficiency in the fleet and what these investments mean for that. Also pay attention to the one of pie charts he'll show you that shows how the fleet has been repositioned now in terms of these three combined-cycle units, and what they mean for energy margins and capacity payments as well as the geographic diversity it's introduced.

THOMSON REUTERS

SI-SSA-0015-13576

Also as Shahid comes up, I'd ask you to pay careful attention to what he'll have to say about some of the financial stress in E&P markets, and what that may mean for some of the smaller producers in particular, and what that could portend for commodity prices going forward, once we build out some of the pipes that are all underway in the region now but have been a little bit slower to come to fruition than we expected. And then when Dan comes to speak, of course, the credit stats, the strength of the balance sheet, and the additional investment capacity above and beyond this over 10% growth that we've already baked into the numbers.

I'll be back later on to answer any questions you might have. But with that, I think I turn it over to Ralph. And don't be offended, Ralph; I'm going to go get some coffee and some breakfast. I haven't had any, all right? (laughter)

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

Thanks, Ralph. So, Ralph, before you walk out, I think that's the 10th year you've passed it off to me, and every one of those 10 years we try to figure out how to push the button. So it's green, right? We'll get that right.

I don't know if we're doing something right or something wrong, but 10 years is a good run. So we'll stick with that.

I'm going to try to leave you with a couple of things today, if it's okay. One, I believe that PSE&G has built a very strong platform. And hopefully you take away today from this conversation just that -- that we have a very strong platform that we've been able to put together.

Second, I think the story will tell you that we've delivered on our promises. We've done that throughout the five years -- the prior five years and, again, I think if you look back even beyond that to the last 10 years, you'll see that every time we've come here, we've talked about it; and Ralph alluded to the fact that we've delivered on and above our capital expenditure forecasts and, just as importantly, our O&M forecasts.

And third and finally, I think you'll take away that we are really positioned well for growth in the new utility environment. I think the areas that we've been focused on have led us to that path. And I think no matter which way the utility industry goes in the future, this Company is going to be strong for years to come because of the work that's been done over the past 10 years.

So with that, just point you to this slide, and we talk about it every year. Just give you a little bit of an idea about the geographic boundaries that we have. But I think what's most important here is that not only are we the largest electric and gas distribution company in New Jersey, but we've also transformed ourselves into a company that is the largest investor in solar energy.

And even our HVAC business, for those of you that live in New Jersey, is the largest in New Jersey. And that's where we run around, and fix appliances, and take care of your house heaters and water heaters. So it's a very broad platform that we've put together. It's one that doesn't have a lot of throughput growth. As you can see by the numbers there, we've been averaging around 1% a year, if you go back over the prior number of years.

In fact, on a weather-normalized basis, our electric growth was exactly 1.1% last year. So we've been pretty flat in our growth on a throughput basis, but the age of our asset basis provides us with opportunities to grow. And that's where a lot of our activities on the capital side have been focused.

On the bottom part of the page, though, I think that's the area where I was just mentioning -- I think we're really well-positioned for the future. We have established ourselves since 2008 as an entity who continued to provide universal access to cleaner alternative energy solutions for customers. And Ralph talked a little bit about the work that we've done in the multifamily dwellings, the hospital programs.

But I think -- looking back, I think our work on solar has really proved to be one of the biggest changes that we've brought to the industry, where we've been able to put our solar farms on landfills. And I'll talk a little bit more about that as we go forward.

So that platform is not just one based upon our assets and our geographic region, but it's also based on our strategy. And I will tell you that it's all about making sure that we balance our reliability, customer rates, and public policy. Put those three pieces together and we think it's driven a very good outcome for us, all of it based upon the work done by our engaged workforce. Those folks continue to focus on achieving operational excellence. And I will show you this slide in a little bit; maybe I'll pause a second longer, then Ralph can talk about the awards that we've received.

But with those customers being focused on the reliability efforts that we have and the need for resiliency, we've been able to deploy that capital that I just mentioned. And we'll talk about even further as we go ahead. That work that we've done has proven to give us the financial strength that we've brought as a Company. And it's all been based upon the fact that we've delivered on -- that we've had a disciplined investment strategy.

THOMSON REUTERS

SI-SSA-0015-13577

The fact that we've been able to work with our FERC regulators on the transmission side, and as Ralph mentioned a number of times, the BPU and their efforts in working with us to make sure that the spend that we have above and beyond our depreciation levels is recovered through some clause mechanism has really provided us with that ability to have that strong balance sheet and continue to bring the benefit to customers that we can.

So I'll tell you -- look through the last five years and the storyline a little bit. It's one that really started, I'd say to you, back in 2010, when we came out of the last base rate case. Not only did we come out of the base rate case, but we also came out of the change in the administration. We moved from a Democratic administration to a Republican administration under Governor Christie; we settled the rate case; and then we took a pause and looked at the policy that the new Governor and new administration had put in place and tried to align our capital programs with those policies.

Not only did we do that, as you can see in 2011, but we continued to deliver on the reliability results and through some of the awards that we have received. And the whole bottom of the page, if you look out -- I won't keep repeating them -- but those are the types of accolades that the organization has received.

Not only did we focus on those policies, but we responded to some pretty dramatic weather events. Whether it be Hurricane Irene back in 2011, or Superstorm Sandy in 2012, we continued to deliver the results to the customers as they expected and then focused on the infrastructure that was required to build back the system in such a way to provide it as much resiliency as possible. And, again, you see that throughout the deck -- throughout the timeline you see here as we continued to put those assets into place and build out the infrastructure.

So this base track record that we've built, again, focused on operational excellence, having a strong balance sheet with good earnings stream, and maintaining that disciplined investment. Ralph mentioned the 14 programs with the BPU. I believe we started out trying to resolve problems associated with the need for some more blue-collar jobs in this state under the Corzine administration. And we've continued all the way to the point now where we've got a $900 million program that's been approved on our gas system modernization.

Those have been on an incremental basis. But I think the more that we've delivered on those promises and on those programs, the more that the Board has believed that we can continue to do that and will look to work with us to figure ways that we can have longer extended programs, so we're not in there every other week.

Let me just talk a little bit about the operational excellence, and all the awards are there. But I will say -- I'd point to the third bullet there, where we were honored by the Electric Light & Power Magazine as the Utility of the Year in 2015.

And what I really liked about this award -- and we all know about J.D. Power, and we know about the reliability efforts; this one also recognized us for the infrastructure that we've made -- how it was focused on resiliency; the sustainability efforts that we've had; and the fact that we've been able to do it in such a way that we continued to deliver financial strength. It's the one award that we have that pulled together all the different aspects that we have talked about in that platform that we mentioned earlier. So it's meant a lot to us in the organization.

And then take that, and you look at what we've done over the last few years on our earnings growth. Just the past four years, we've had 11% earnings growth. And I will take you back to 2009, which is not on this chart, but we were earning about $0.63 a share in 2009, just before we achieved that settlement on the rate case in 2010 and we started to work with the new administration and some of the programs that they had identified. So it's a long track record that you should feel very confident we'll be able to continue as we move forward.

We've not only delivered on the earnings piece, but we've delivered on achieving our allowed ROEs. And this chart really talks to that quite a bit. And I'll focus on the left-hand side, which is really three buckets of spend that we have. The first one on the left is our transmission spend, where over the last five years we've put to work about 62% of our capital on efforts to rebuild the infrastructure on the transmission side, but in a way that we were able to get a contemporaneous-type return through formula rates that were allowed by the FERC.

On the right-hand side is really where our distribution spend has been, 23% of which has been based upon just meeting our base spend associated with our depreciation levels within the utility. So we align our base spend on the distribution side directly with the depreciation levels that we have. And the other 15% is where we've worked together with the Board of Public Utilities to achieve a contemporaneous return mechanism, put that in place so that we can invest above and beyond those depreciation levels. It's a nice story, a nice balance that we've put together. And it touches every one of the aspects of our system.

So that was around $11.2 billion. As we start to transition to the right-hand side, and we talk a little bit about where we're going in 2016 through 2020, you see basically the same type of story in our plan. We continue to focus on investing in our transmission system. I'll walk you through a little bit of that; keeping our base spend aligned with depreciation levels -- obviously, as you continue to invest in your base rates, that depreciation level goes up. So you'll see there where we grow from the 23% to

THOMSON REUTERS

SI-SSA-0015-13578

the 28%. That's just because we have additional money that's baked in to our depreciation levels. And then we expect to continue to work with the Board of Public Utilities for more contemporaneous return clauses.

The areas that we'll be focused on really do not change. But within some of these they will, and I'll talk to you about each one of those as we go forward. But it's the same that we've had in the past: our transmission system, our electric distribution system, our gas distribution system, and those new areas of solar and energy efficiency.

So this is the slide that Ralph talked about that's -- this is the one you said was a favorite, right? Well, it's my favorite too. Only because it's yours, not because it's mine. I like the awards better, but you didn't want me to talk about that, so.

Let me just tell you what's important about this. I mentioned that we have an opportunity to grow in each one of the areas that we have. And if you look at our 2016 to 2020 spend, which is here -- it's $11.9 billion that was on the prior two slides back, growing from the $11.2 billion. So you could just look at that and say, all right, there's continued growth. But what's really important about this slide is looking at what we told you last year when we were here, and that's the black line. And I'll just talk to you a little bit about those four years.

So what we came here and told you was that between 2016 and 2019, we expected to spend about $8 billion on capital programs. So just look at the four-year piece, because we've shifted one year since we were here a year ago. Take that same time frame and look at what we are now saying that we're going to deliver on the capital side, and it's just about $10 billion.

And it's really comprised of three major areas. One is, as Ralph mentioned, the GSMP settlement that we have with the Board of Public Utilities. There's been some change in our timing of some of our Energy Strong spend. But a lot of it has to do with transmission and some work that we continue to identify on the transmission side. And just yesterday at the TEAC meeting that we had at PJM, the PJM Board identified the fact and has agreed with us -- and if you remember back to our Artificial Island Project that we had put forth and we were competing with LLS Power on. LLS Power's project was selected. We were arguing from it for a long time that that project was going to be a little more expensive, so on and so forth.

Well, yesterday the PJM TEAC Committee agreed with our estimates. And as a result of that, our investment in the Artificial Island program has grown from $120 million to $270 million because of the additional work that's required associated with that project. Now, simple things, but things that are very important to us from a reliability and resiliency standpoint: foundations in the estimate were forgotten. Some of the relay work that was required was forgotten.

So we have worked with PJM. We've gone through that over the last 12 months. And as a result of that, you can look on the PJM website and see that in the TEAC deck that was put out, they've identified the fact that we now need to spend $270 million on that project. So those are the types of things, as we continue to look forward, we have ability for us to fill in, quote, the back end of the plan.

And I think that we not only have the Artificial Island program, but if you look at transmission as a whole -- and I'll dive into each one of the different areas here -- there's opportunities for us. We are finishing up the big five that we talked about, the last one really being our Bergen/Linden project. So we are just about completed with that. We'll have that project completed within this five-year time frame. But the ongoing need for RTEP programs -- that will continue, as we see, going into the future. And there will be additional need even in the five years of the plan.

Additional lifecycle replacements will come up, unplanned-for failures that take place on our system at different times, whether be a transformer that fails or a cable that needs to be replaced on a transmission system. That's not built into our plan as we currently give you. We don't build in an ongoing need for replacements.

Our 69 kV program we continue to upgrade our subtransmission. That's unique to our business, because not many companies in our field have a subtransmission system. We continue to upgrade our subtransmission to transmission. It was the cause of a number of the failures that we had within our grid. And everyone has recognized the need for us to do that, and we're going to continue that program as we go forward.

But we are also -- we have talked a few times these conferences about the opportunities of FERC Order 1000. And yesterday, you may have picked up on it, but Vectren announced that they will be bidding on the first MISO Order 1000 project. And as you could imagine, that project, being one that originates in Vectren's substation in Indiana and crossing the Ohio River into Kentucky, was one that a lot of people were knocking on the door with Vectren to try to partner on.

In their press release yesterday, they identified the fact that they've selected us as the partner. So they noticed our ability to construct, our ability to deliver on our promises, and our project management skills that have been built down in Kim Hanemann's organization within our utility is one that's transferable.

THOMSON REUTERS

SI-SSA-0015-13579

And so it's a small project; it's only about a $30 million project. But I think what's really important is that within the industry, folks have now realized that the skill set that we've built up is transferable and something that we can look forward to expanding outside of our current footprint.

So we thank Vectren for that, for having the confidence in us. The bid will go in in July. The decision on who is selected by MISO for that project won't be announced until December of this year. But it's something we're looking forward to, and again, a good partner -- home state utility in Indiana. I told Ralph that while I was happy about the fact that that it was our first opportunity, I was really happy because my daughter is in school in Indiana. It had nothing to do with why we looked at the project. (laughter)

Let me change from transmission and move a little bit to electric distribution. I think the story here is that there is more to do, and there always will be more to do. Our -- whether it's us or any other company in the industry, none of us really have a plan to proactively replace wood poles. None of us have a plan to proactively replace wires. None of us have a plan to proactively replace the switches that are up on some of those poles.

So what we have put together, and what we have started to do here in the Energy Strong program, is ways for us to work together with the Board of Public Utility and the regulator to do some upgrades as we go along and modernize the entire grid. In the 2016 to 2020 base plan that we've identified, we basically -- that $560 million that you see there ends about halfway through the plan. Just using round numbers, it's about halfway through.

So we think that there's an ability to work with the Board to continue to upgrade some of that electric distribution. This is not in our base plan. These are opportunities for us in the future.

Why do we think that? Pick up the Energy Master Plan that was published in December by the Board. It clearly has identified a completely new section in the Energy Master Plan, which is all about reliability and resiliency in the electric distribution infrastructure as a result of the storms and the need to continue to harden and build resiliency into our grid. For the Board to have identified it and to build in a new section, is clear that this type of work is completely aligned with the policy of the state of New Jersey and its regulators.

So we plan to continue to have conversations about how we can expand that program, and we'll be back in having those conversations. We won't be having them in the next day or two; we won't be having them in the next month or so. But we will be having it in such a time frame that we can continue the program as we get to about halfway through that 2016 to 2020 time frame.

I'll switch to gas distribution. Ralph mentioned it before -- this is probably the most straightforward story that exists, not only in our infrastructure, but in the industry: 4,800 miles of cast-iron and unprotected steel mains. This is an area that clearly we can continue to upgrade our system.

Clearly, it's the right time to do that based upon the commodity prices that we see on the gas side of the business and one that we think is, again, completely aligned with the policy in the state of New Jersey and why we think we have the ability to continue it. In this case, the $905 million ends three years into that 2016 to 2020 time frame. So, again, need for us to go back in and have conversations about it; not something that we will do tomorrow, but something that we will do as we go forward.

And the solar front, I mentioned to you that we have pretty much changed the game within -- I almost would say in the industry, with the ability for us to work with the regulator to develop community solar projects that are in rate base, community solar projects that provide clean energy to all of our customers, not just to those that have it on their rooftops. We put these systems on these old landfill sites, some brownfield sites, and then provide all of the benefits, whether it be the energy itself, or the SRECs, or any tax credits and bonus depreciation back to customers in New Jersey, providing that to all of our customers, again, not just those that have the panels on their homes.

Again, if you look at the 2016 to 2020 base plan that's here, the tail end of that, we have about $20 million that is starting about $60 million this year, and then tailing off about $20 million halfway through the plan, and then going to zero on the back-end that's built in here. We again believe this is the right time for us to start those conversations with the Board about what we can do going forward and where there's more landfills.

We've identified about 13 to 15 additional sites within the state of New Jersey which would give us about another $200 million to $300 million of CapEx opportunities, if we were focused on delivering on those landfills and brownfields that have been identified. So good place for us, again, to have those conversations, completely aligned with the Energy Master Plan, again, that was put down in December of 2015, which calls on the EDCs to continue their solar programs. Completely outlined and, again, available for you to look at and cross-reference on their website.

Let's flip it over to the energy efficiency front. Same story. Look at the 2016 to 2020 plan. About halfway through that $95 million is used up, and we are in the process of having conversations about where we should be looking to build out additional abilities for us on the energy efficiency front. A little bit of a change in policy; if you look at the Energy Master Plan, there is a focus on governmental -- government buildings that they want to continue. The opportunity for us exists there.

THOMSON REUTERS

SI-SSA-0015-13580

A focus on education for customers, opportunities like Opower in some of those other areas where they have abilities to update customers on their usage, and thermostats, and smart thermostats, and different things that we can do for our residential customers. But a big change here is where the Board is really focused on compressed natural gas and electric vehicles. So they've called that out in their updated Energy Master Plan, and that's an area where we think obviously the utilities in the state should play a part.

In fact, South Jersey Gas and New Jersey Natural Gas have installed some compressed natural gas stations in their service territory within rate base. They've been able to do that because the quality of their gas is a little bit different than ours. We are about to change that through some contracts that we have with some of the refineries in northern New Jersey. As we clean up that gas, we'll be able to move forward with some those projects and bring them to the Board for their consideration. So another area with a little bit of a tweak from where we've been in the past.

So you put that all together, and just what I laid out there gives you the opportunity to take that $11.9 billion and potentially grow that another $2 billion. Again, not baked into the plan, but if you -- you know, we hope to be back here, show you another chart that Ralph likes that has a black line below the future. And it's based upon our focus in those areas.

I have talked through a bunch of these. The one area that I haven't, that I just wanted to point out -- which I think is really a good story, not only for us but for the state of New Jersey -- is large customer needs. There's four specific areas that are going to drive some investment. Micro-grid activity that the Board has, again, identified in the Energy Master Plan that they want to pursue; one large project that New Jersey Transit -- that they see a need for building resiliency into the New Jersey Transit grid. We'll have an opportunity to partner with them on that.

Hoboken is another area that's been talked about in the past. We have an opportunity to partner with the city of Hoboken as they build out their infrastructure and focus on rebuilding their micro -- or building their micro-grid that area.

The Camden waterfront: the Camden waterfront is exploding from an economic development standpoint. If you take a ride down there, even if you're going into Philadelphia, take a look to the left. It's really a good news story, again, for the state of New Jersey, but also for us, because we have some underutilized assets down in that end of the state that we will be able to rebuild and revitalize.

And then another story that hopefully will make all of your lives better as you travel around: Newark Airport is going to expand Terminal A. You might have heard some conversation about that. That project in and of itself will deliver an additional 40 megawatts of load for us -- Terminal A at Newark Airport. So hopefully you'll all use it, and maybe we'll make it up to 50 megawatts. We'll see what happens.

But again, all good news stories for us on the capital front. And different than what we've -- not different, but a little bit of an expansion on what we've done in the past.

The capital piece is not the entire story. We also have to continue to look at our cost control on the O&M front. I think what -- the takeaway on this slide is the top right corner. It's the track history we've had: about a 2.5% increase since 2011. We've managed our O&M costs. There was a bump in 2012 and 2013, really driven by some pension expenses that existed at that point. But also that was Superstorm Sandy and the cleanup from Superstorm Sandy as we were, obviously, not able to expect or manage a storm of that magnitude that came through.

The backend of the plan -- you see another little bump. That's really driven by two major regulatory initiatives that the state has taken on. One is inside meter set inspections required on our gas distribution system, and the second is enhanced tree trimming, both of which we totally support from a resiliency standpoint and from a reliability standpoint. But those two programs are driving the additional O&M that you see in the back-end of the plant. Again, our inside plant meter inspections and the tree trimming activities that are enhanced and came out as part of new rules after Superstorm Sandy was -- the lessons learned with Superstorm Sandy was completed.

So we're going to move into starting to put the whole piece together here. We've -- Ralph -- we talked a little bit about all the CapEx. What you see here now is what our rate base looks like. Dan will talk a lot about bonus depreciation when he comes up. But the takeaway here is that the impacts of bonus depreciation have been built into the projections you see here of 8% rate base growth in our current plan.

If you layer in the additional projects that I talked about and some of the opportunities that exist for us, we could potentially grow it from 8% to 10%. But that bonus depreciation impact that was announced last year is built into the numbers that you see here. And Dan will talk a little more about how that impacts both sides of the business moving forward. Clearly, it identifies the ability for us to continue to grow and how -- why we think that the guidance range that was announced a little while back is totally achievable.

THOMSON REUTERS

SI-SSA-0015-13581

I know Ralph talked about this slide, but it's worth repeating. We have done all of this at a time when commodity prices are down and our customers have not been impacted by it. It is a wonderful opportunity that's been agreed to by both -- whether it's our transmission regulators or our distribution regulators, now is the time to make some of these investments. Storms are greater; prices are down. Let's get out there and fix the infrastructure as much is possible. And you can see from this that the opportunity exists for us.

I think, you know, you look at our J.D. Power results and some of the feedback that we get from our customers -- they understand the need for this infrastructure. And they also appreciate that we have done as much as we can to keep prices down, a lot of it driven by the good work that's been completed on supplying us that low commodity fuel.

I won't reiterate what's been talked about in the past, but I hopefully will give you the confidence that we -- the talk that I just walked through here will give you the confidence to believe that we can deliver on the guidance range that we've talked about. It's a very achievable plan and one that we think we have a great opportunity to execute on.

But that's where we are. What we also have to think about in the utility business is where we are going. Ralph talked about delivering dividends for 100 years. We're proud of that, but we are also proud about how we are setting up this Company for the future.

We are a strong pipes and wires company, focused on enhancing reliability and resiliency. We've delivered cleaner energy than ever before. Our focus and efforts on the solar front have proven that out. We've started to provide customers with access to innovative new technologies, whether it be energy efficiency, smart grid that we've built out, distribution automation that we are working on on the electric distribution side. We've started that process and have worked with the regulator to do that -- all of which was done at a time where affordable energy existed. And we've continued to capitalize on that.

So that's the story in New Jersey. I'm going to switch to Long Island and I'm going to do one slide. And that one slide is this. The team on Long Island, led by Dave Daly, has done an exceptional job. We have walked into an environment that was a tough environment, and they have delivered on every aspect of the plan that they had.

They've brought back the earnings through the enterprise, about $0.03 in 2015. Not a big impact, but they've brought that back as promised. And more importantly, they've delivered to the customers in Long Island, who sorely needed it, an improvement in the reliability and the overall operation of the system out on Long Island.

I don't know how many of you are customers out there, and hopefully you can back it up, but I think the team has done -- hey, we got a thumbs up, so. I'll take that. I'll give it to Dave when I get back. But I think they've done a much better job and have communicated a lot better during the recent storm activities that we've had.

Point at the bottom: through the contract that $0.03 grows to $0.07 this year. And again, we fully expect to achieve some additional small incremental improvements above that, based upon the -- some of the incentive contracts that we have in place.

So that's the story in the utility space. Again, I think a proven track record, a good platform to build on and hopefully you can see that there's opportunities that exist in the future.

Questions? Kathleen, I think up here.

QUESTION AND ANSWER

Unidentified Audience Member

Hi. You have said that you're receiving contemporaneous recovery on 70% of your investments. Can you give us some examples of the other 30%, where you're not achieving contemporaneous recovery? What types of returns? How are you getting paid back on that? And why would you go forward and make investments where you're not getting contemporaneous recovery?

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

Well, we would make investments up through our depreciation levels, because that's built into our base rates. So our base rates cover us to make those capital investments up to that level. And the investments that we are making there are the core investments.

© 2016 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13582

We are replacing some cast-iron mains; we are upgrading some of our electric infrastructure. But most of the time that depreciation level does nothing more than cover repairs due to something that broke, whether it be a switch or a pipe that broke in the ground. So that's where we make that investment. That's core to our business.

The contemporaneous returns is where we go above and beyond that. And in that core piece, we delivered a safe and reliable service that we are required to deliver.

Unidentified Audience Member

Just going to page 36. I was just trying to -- over here you have given us the rate base and the net income growth. Could you just help us -- because EPS at the utility is increasing at a pretty hefty pace between 2015 and 2016. I wanted to see what is the correspondent -- I'm trying to eye it through the thing, but you gave the numbers here, but I can't do it exactly. What is the correspondent increase in rate base between 2015 and 2016 that matches that growth?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company*

I don't have that right in front of me. Danny, do you have that rate base piece?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company*

Okay, so Dan will have a little bit more detail in his slide on the rate base growth. But the bulk -- the story to take away there is the transmission investment that we're making is a large bulk of it. The work that we are doing on the Energy Strong front, as we put that into our base rates, is another large part of that; and as we start the investment on the gas program. Because as we go through these contemporary clauses, that gets rolled right into our base rates. Right? So then it --.

Hello, Julien.

Julien Dumoulin-Smith *- UBS - Analyst*

Just following up on the bonus depreciation impact in the numbers, the 8% shown: can you talk about the decrement there from bonus depreciation? How much of an -- what would it have been had it not been for bonus depreciation?

And then, perhaps, just talk about -- is there any kind of reset with the rate case impact? Just if you think about recovery of storm costs, perhaps not previously recovered, et cetera? Just in that net income versus rate base CAGR?

Ralph LaRossa *- Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company*

So I can't quote for you what we would have been. I'll try to get you that number offline. You know the bonus depreciation, right? So you know what our new CapEx is. So we can do the math, and we'll get you that.

I do not expect a reset during the rate case proceedings. I think if you look at what we have and what we have on the O&M activities, it's pretty clear that time is about right for us to go in; it's okay. I think the question will be where we are on the ROEs. We currently have an allowed ROE of 10.3%. The history in New Jersey has been about 9.75%. Some of our additional spend has been at the 9.75% level. We're going to be monitoring some of the rate cases that are pending at the Board, and then we'll have a little better idea.

Julien Dumoulin-Smith *- UBS - Analyst*

Or perhaps just to clarify, if you will: is there any step-up or discrepancy between the rate base and net income CAGR as a function of that rate case -- just of unrecovered spend that you might be just all of a sudden getting in that 30% chunk that is not contemporaneous returns?

THOMSON REUTERS

SI-SSA-0015-13583

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

No, because we've been spending that depreciation level for everything else. There's little bit of storm activity that's in there, but that's not really going to be on the on the CapEx side. No.

Julien Dumoulin-Smith - ***UBS - Analyst***

Okay. All right, great. Thank you.

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

Shahriar?

Shahriar Pourreza - ***Guggenheim Partners - Analyst***

Hey, Ralph. The incremental $2 billion spend above your base plan through 2020 -- how should we think about that? More back-end loaded?

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

Well, as you know, it's all potential, right? And so we don't -- we'd just like to give you an idea now, because again, we've overperformed over the past few years, so we wanted to give you the idea about what's out there. I would say that as I walked you through each one of those categories, the spend that we have in the base plan ends about halfway through. So it would be on that tail end of the five-year plan.

Unidentified Audience Member

Just FYI, service has been really good. So you guys are doing a good job.

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

Yes, we know. (laughter)

Unidentified Audience Member

As far as the rate picture going forward, I know that there's some transition charges, right, that are dropping off. So maybe we can kind of talk about that, and how the CapEx kind of affects rates? And then I guess fuel costs obviously have come down, too, and power prices and things like that. So just as a -- you know, what is the rate picture?

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

Right. So high level, a lot of the transition charges will drop off by the end of this year. In fact, I believe we've stopped recovery on most of those already.

There will be a few more of the NUG contracts that will roll off, but it's not going to be a big incremental change. The fuel side is clearly on the gas side of the business, but we do have the benefit of having a lot of our combined customers. So they are seeing the total bill at the end of the day, and they get the benefit of that.

And then what was the last? There was a third.

Unidentified Audience Member

(inaudible - microphone inaccessible)

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

So I think what we have tried to project out for you is -- you know, we don't see -- we know what we have to do to keep that light. And I think our numbers are -- I don't want to quote it, because I don't really want to get into what we potentially could do during the back end of the rate case. But if our commodity stays where it is, there's continuous headroom in the bill, especially if you look back to 2008, what exists there.

Can you guys fill out J.D. Power scores for us while you're here? (laughter) Dave could use that. Anybody from Long Island that wants to give us a complement, we'll take it so. Here, Greg.

Greg Gordon - ***Evercore ISI - Analyst***

Thank you. So over the last bunch of years, you have spent $7 billion on transmission. And I'm just wondering over the -- I know the reliability of the system has gone up dramatically over that time. But over that period, has there -- can you refresh our memory as to what basis differentials for power have been inside your zone, and what capacity prices have been inside your zone; and what benefit, if any, customers have seen because of this?

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

I think I'm going to leave that to the smart guys on the Power side of the business talk about. But there is -- you obviously see where the interconnections are and what's gone on in different places. There is always a change that could exist based upon -- you know, one of the biggest issues that's out there right now is what's going to happen with the wheel, the content wheel, going forward.

So I think there's so many variables in there that I couldn't say that any one wire that we put up, or any transformer that we were involved in upgrading had direct impact on that. And I'll leave that to this team talk about going forward.

Greg Gordon - ***Evercore ISI - Analyst***

Okay, I'll follow up. Thanks.

Michael Lapides - ***Goldman Sachs - Analyst***

Michael Lapides of Goldman. Transmission authorized ROEs -- we've seen in the Midwest ISO, we've seen in ISO New England specific challenges that have played out over the last two years, 2.5 years in terms of authorized ROEs for transmission. Just curious for your views on whether you expect that for PJM-wide, which is a little more difficult, or specific utility targeting?

I mean, one of your peers in the state had a little bit of that a year or so ago. Just kind of curious about how you think about that process; what intervenors or industrials have said, because they been some of the ones who have pushed it in the other ISOs.

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

Look, we always keep an eye out and monitor what's going on on the FERC front. But there's nothing that has happened in the near term that I could tell you that would trigger me to think differently about where those ROEs are. But I do know that every policymaker that I talked to continues to think that the program that we have on the transmission front makes sense, and are needed for resiliency and reliability in our area. And I have not heard anybody who's looking to disincent us from making those investments.

Unidentified Audience Member

Can you comment a little bit on, given the new CapEx numbers, to what extent in general customer rates may rise over the next few years?

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

Yes, I think that was the same question here. I'll get that for you; I don't remember off the top of my head, but we have a little bit of an idea about what -- if all the commodity stayed flat, where we would be. But a whole bunch of that depends upon when we go in for our rate case and how that's treated.

Steve Fleishman - ***Wolfe Research - Analyst***

A couple questions. First, just on the rate case that you're supposed to file, is there any way that, as part of looking at these other programs, to get automatic recovery mechanisms? And I know, like, the water utilities have like a DISC mechanism. Is there any way -- first of all, is that the kind of thing you want, like a DISC-type thing with the water? And secondly, is there any opportunities, if you're able to get that, that you could somehow avoid filing this rate case then?

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

Well, the rate case was a requirement as part of the -- we stipulated that as part of the Energy Strong settlement, right? So we are prepared and we plan to have the rate case. And it's okay.

I think that the opportunity exists for us to have conversations in there about the capital expansion, but we certainly would like to do that in advance of the rate case. Just thinking about -- we're filing at the end of 2017, have discussions in 2018; next thing you know it's 2019, and you have a -- you know, it's -- those processes tend to take longer than any of us would like.

We want to have some certainty in these programs. So we need to work together with the policymakers to figure out the best way to do that. DISC is a solution. There's a solution in Pennsylvania; there's a solution that was put on the table in Illinois. There's a -- you can go around the country and see the different opportunities that are out there. Because of our long-term need for the infrastructure upgrades that I talked about before, it's just a matter of sitting down with policymakers and figuring out what they feel most comfortable about.

I think the time is right, again, as we mentioned. And we're going to -- you know, regulatory reform is something that we've had conversations about.

Steve Fleishman - ***Wolfe Research - Analyst***

And then just -- I guess this may be irrelevant, but just with the Governor kind of all over the country doing other things, I mean, how does that play into kind of policy stuff, like, trying to deal with -- or is it -- are the key people there every day? Or it's not relevant?

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

No, our regulator -- the President of BPU is there every day. I haven't seen him on the campaign trail. (laughter) So Rick is there. So the staff is there, and they've been doing -- you know, they have been doing -- and the Governor is there. I mean, I won't get into all of that, but he's certainly keeping an eye on things.

Insoo Kim - ***RBC Capital Markets - Analyst***

Hey, Ralph?

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

One more.

THOMSON REUTERS

SI-SSA-0015-13586

Insoo Kim - ***RBC Capital Markets - Analyst***

It's Insoo Kim, RBC. Could you talk about your low annual load growth forecast? I know it has come down since last year's analyst day, and just -- it's interesting.

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

Yes, I guess that was on slide -- the second slide in on page 20, we talk a little bit about the load growth.

Insoo Kim - ***RBC Capital Markets - Analyst***

And do you see the trajectory just continuing to decrease over time? Or is it --?

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

It's been relatively flat if you look at the prior -- with the prior presentations that we've made, somewhere between zero and 1% load growth. A little more was on the transmission side before. Now we're down to about a 0.7% on what we see on the peak load. Again, if you look back over the prior years, that's about what we've seen historically, I'd say the last three to five years, from an actual standpoint.

Insoo Kim - ***RBC Capital Markets - Analyst***

It seems like on the electric -- I guess not -- the non-transmission side on the electric, last year's presentation had -- the 2015 through 2017 was more on the 1% side, and now it's --.

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

Yes, it was closer to the 1%, right? But we had a big bump last year. Last year we were up about 2% on that, 1.1% on a weather-normalized basis, but about 2%. So we saw a little more load growth last year than we had expected. And so with that kind of an increase now, we are working off a little bit of a higher base. So the percentage of growth going out into the fifth year is little bit less.

Kathleen Lally - ***Public Service Enterprise Group Incorporated - VP, IR***

I think with that, Ralph, we're going to take a 15-minute break and resume with the presenters on the Power side of the equation. Thank you.

Ralph LaRossa - ***Public Service Enterprise Group Incorporated - President and COO, Public Service Electric and Gas Company***

Thank you.

(break)

Kathleen Lally - ***Public Service Enterprise Group Incorporated - VP, IR***

Okay, we are going to resume. Bill Levis, President and Chief Operating Officer of PSEG Power is going to provide you a complete overview of his Company. And he will, again, be followed by Shahid Malik, President of Energy Resources and Trade. I'll turn it over to Bill.

THOMSON REUTERS

SI-SSA-0015-13587

Bill Levis - ***Public Service Enterprise Group Incorporated - President and COO, PSEG Power***

Well, thanks, Kathleen. Good morning, everybody. So I have the fun task, A, of first getting everybody back from break; and second of all, to get people excited about a business where power is currently trading for $13.10 in the Northern zone. So we'll see how it is I do as we go through the slides today, but that said -- and maybe it's because I'm a contrarian by nature -- I actually feel pretty good about our business, the things that are going on, and the opportunities that lie ahead for us.

All right. There we go. So I put this slide up, and some of you in the audience might look at this and say: there's that slide again. Ralph Izzo put it up; Ralph LaRossa put it up. But in fact, it is up here because it is one of the basics on how we talk about our strategy in the Company. And it is important in our Company to get alignment across the organization to talk about what it is that we are all about. So when we talk about excellence, it's not just a word, but in fact it's a measure that we put in place that describes or measures how will we do in this area. And it's actually fairly simple.

Top-quartile in key areas, and you do better than you did last year. So top quartile -- make sure we're aware of where our competition is. And doing better than last year ensures that we are continuously improving what it is that we do. And as Ralph pointed out, and Power is certainly a subset of that, operational excellence leads to financial strength, which then gives us the opportunities to make some of the investments in our business that we're going to talk about today.

So we also have a timeline in our business. And you can read the tagline up top about focusing our portfolio with reliable, efficient, and cleaner infrastructure. But if I were to take you back 20 years, I would tell you that the same things applied then.

And in fact, what we did as a company 20 years ago is when we started our Bergen 1 unit, and rebuilding and repowering that unit. We started in the discussion and then built Bergen 2. And then we started with Linden 1, Linden 2, and our Bethlehem Energy Center plant. And it is those plants that today are the workhorses of our fleet and have benefited us tremendously in the environment that we are in today. So in many respects, we are reinventing where we were 20 years ago with a continued mandate -- that knowing that the more efficient you are, the more environmentally friendly you are, the more cost effective you are ensures that you get the opportunity stay in the business.

So if I then reset to 2011 and look at some of the key items there, you see nuclear license extension and uprates. So in fact the licenses for our nuclear plants were extended by 20 years, so for a total of 60 years currently. And we did steam generator replacement at Salem 2 and power uprate at Hope Creek, which resulted in over 180 megawatts of generation added to our fleet.

In 2012 we added 400 megawatts of new peaker capacity. Now we recognize that the peakers we had were older and inefficient, and we know their lifetime was either going to be 2015 or 2017. So we set out early to have replacements for them. And we did it in such a way that we used one technology -- so a design once, build many concept, which allowed us to do all of these projects on time and on budget. In the case of Kearny 14, actually brought it in under budget and a year early. And three of those units also built in New Haven under a rate base return up there.

Bullets underneath that that Ralph LaRossa also mentioned was the Superstorm Sandy. Sometimes you get a curveball along the way, and you know, your plans get disrupted a bit. Certainly they did for us in this case. Five of our fossil plants were underwater and out of commission -- and, through some heroic work of our folks, got all those plants back.

And, in fact, one of our key plants that were impacted was our Linden station. And if you go to the next year, in 2013, the top bullet you see there is record annual output from our Linden combined-cycle plants. So it's just a testament to the work and our ability to respond and face adverse conditions. And it really shows the strength of the team.

The other note that I'd point out in 2013 is this bottom one about Bethlehem Energy Center and the second gas line added. What we noted there is there was some competition in the area that was starting to impact the runtime of that unit. So it made us look a little harder to see what it is we can do to help ourselves in that situation. And I noted that there was another gas line in the area that we could hook up to. We took that opportunity and since then have been able to arbitrage that opportunity to where Bethlehem Energy Center was one of the plants that actually had record output last year.

Look to 2014: once again you continue that theme of record output from our combined-cycle fleet. Given what was going on in the marketplace there, we took the opportunity then to start upgrading those plants with the latest technology. That's the advanced gas path that Ralph referred to previously. And then essentially, in an eight-month period of time, went from idea to completion of that in our Linden 1 and Linden 2 units, which was 63 megawatts additionally.

THOMSON REUTERS

SI-SSA-0015-13588

Underneath that is -- we started then to also provide dispatch services for Long Island. A terrific opportunity for us; adds some numbers to the bottom line and, just as importantly, allows us to expand our skill base with our people, so that they're more knowledgeable of the various fuel types and how to get them where they need to be when they need to be there.

And if we look at 2015, once again, a record combined-cycle output. And in fact, if you look at our units for last year, record output at BEC; record output at Linden 1; record output at Linden 2; record output at Kearny 13; record output in Kearny 14. So just a terrific year from a production standpoint from our units. And in addition to that, a number of exciting growth opportunities that I'll talk about that are mentioned there. More to follow later.

Also finished the AGP uprate on Bergen unit 2, so that's an additional 30 megawatts that is available. We didn't retire our high-energy demand day units, but a little over 1,700 megawatts was retired in the June time period. And this little note at the bottom: our solar business continues to sneak up on us. And we are up to 277 megawatts, and I have a slide that will talk about that in a little bit.

So when we talk about our advantages, we talk an awful lot about the diversity of them: diversity of fuel types, diversity of unit types, and locational advantage. And the left slide just shows the diversity from a fuel perspective. And you can see right now, even before we build the new units, still mostly gas from a capacity standpoint, followed by nuclear and then coal.

And if you look in the middle section there, you can see the diversity in unit types. And that is our baseload, load following, and peaking plants. And what we have seen in the marketplace is the more flexibility and optionality you have in the ability to serve in either one, which is essentially what our combined cycles are able to do, the more opportunities that you have.

And then, if you look on the right-hand side, where our energy is actually produced, that output that you see from 2015 represents a 2% increase over where we were in 2014. And still, over half of what we generate comes from our nuclear plants, a reliable economic baseload source of energy -- and then a bigger portion coming from gas and a lesser portion coming from coal. And even if you look at -- that coal contribution is primarily our investments in Keystone and Conemaugh. And our coal plants, when they run, mostly run on gas.

So this slide is a little different than what you've seen in the past. So a couple of things I'd point out as we talk about our capital investment program: one, on the bottom, is we continue to invest in existing units to make sure that the safety and reliability is not challenged. And so that represents about $200 million a year in continued investment in our facilities.

That orange represents essentially regulatory/environmental requirements. As you can see, that's a fairly small sliver compared to everything else. And so we are in fairly good shape there. The fundamental driver there is 316(b), the Clean Water rule. And during this past year, we got the favorable ruling, actually, about -- relative to our permit for our Salem station, where cooling towers are not required. Once-through cooling is still acceptable, with some minor modifications the need to be made on our service water structure, very similar to how our circulating water structure operates today.

That light blue represents the investment in primarily combined-cycle plants. And we'll talk about in a bit -- you do see a dark blue there, so we're also investing in gas infrastructure. That's the PennEast Pipeline due to come in service at 2018 time period.

So, illustratively, this shows the dispatch stack for our units. So a couple of things I'd like to point out -- and a couple of differences, if you were to look at the presentation from last year: one is if you look on the right-hand side that used to extend up with the retirement of our HEDD units. Those units are now gone.

And two, a subtle change, but if you look at the baseload plants, and you'll see Keys and Sewaren in baseload -- and that is because we expect those combined-cycle plants to run much like baseload plants; so where they are located, the benefits they'll have with heat rate, and the like. So we expect them to operate at capacity factors that actually exceed Keystone and Conemaugh, and they're not too far from our nuclear plants.

The other items to point out here is we are in fairly good shape. We are at capacity performance; minimal investment required to meet that. We have dual-fuel capability at 87% of our load following and peaking units. And our peaking units are there to take advantage where there are spikes and volatility in the marketplace.

So I sometimes -- when I show this picture, I like to look at it with respect to how the Eastern part of the United States looks from space. Because if you look at that corridor between Boston and Richmond, what you'll see is it is the most energy-intensive area in the world. And so our units fit right in there.

So when we say we are located near load centers, that's what that means. That being near load centers helps with the potential for volatility; the flexibility in our units allows us to take advantage of that volatility. And that's how we can maximize the opportunities in the marketplace for our units.

THOMSON REUTERS

SI-SSA-0015-13589

If you also notice where those units are located, it's almost on top of Marcellus Shale. So our proximity to low priced gas and the knowledge of our personnel in this area allows us to get a good portion of our gas from Marcellus, which gives us other economic advantages versus our competitors. And a reminder, again, that we are in good shape for capacity performance standards, mostly because these are dual-fuel capable units.

So a little bit about the investments that we are making. And why are you making them if the price of power is $13.10 today? And, frankly, we do it because it makes good economic sense. So when I go to my boss and say, I want to go spend some money, he doesn't automatically open the checkbook and say, sure, Bill! Whatever it is you want. We also have a Chief Financial Officer that ensures that there's certain economic thresholds that we have to meet. So if I am to compete with the utility, frankly, I have to show a risk-adjusted return that's greater than the utility. And for all of these investments we are able to do that.

So the Keys Center -- pretty exciting for us for a couple of reasons. One is where it is located. And it is actually located where load is growing at a pretty good rate. It is in an area where coal is currently on the margin. Gas infrastructure is just currently being built, and it will be one of the early gas plants in that area for -- so for some period of time, as coal sets a marginal price, we'll have the opportunity, if we are a very efficient gas plant, to take advantage of that.

It also helps mitigate some of our basis risks that we have. And Shahid will talk some more of that. So pretty excited about that; have wanted to get into this area for some period of time, so when that opportunity came up, we were excited that we were able to complete that deal.

In the case of Sewaren, in many respects this is the continuation of what I talked about before, where we have four units currently on that site almost 70 years old. So I would say we got a fair amount of use out of those units over the years. But it is time, frankly, for a more efficient unit to take that place.

So then I'll talk about Bridgeport a little bit, because the two do work in tandem somewhat. So we were disappointed last year when we did not clear the auction in New England. And so it made us look a little harder about, okay, what it is -- what are the things that we need to do to become more competitive? So by looking at these two plants in tandem, and as I talked about before with the peaker strategy -- you know, design once, build many -- we are able to gain a fair amount of synergies by doing these plants in parallel, both from making them as identical as we could, so design it once. Two, from a procurement standpoint, being able to buy two instead of one allows you other different opportunities.

So that allowed us, then, to put in a competitive price that met our investment threshold for Bridgeport Harbor. And although I read in many places folks were disappointed how prices turned out in New England, we were not. Prices ended up where we thought they were going to be. We knew it was going to be competitive, and our investment meets that risk-adjusted return. And that was before bonus depreciation. So bonus depreciation is a little sweetener there for us. And we have the opportunity now to build these things in series and lots of learnings that we'll be able to apply to make that -- ensure that we build these things on time and on schedule.

So you see in-service dates, 2018 for Sewaren 7 and Keys; and Bridgeport Harbor in 2019. Construction work has started at our Keys facility. In fact, foundation work is underway at this time. I expect that work to start in Sewaren within the next month. And in the case of Bridgeport Harbor, permitting work is in progress currently.

So I did want to talk a minute about this bottom bullet here where it says: expanding civic stewardship roles in programs in neighboring communities -- because I will tell you, I think this is a differentiator for us versus our competitors. So I mentioned before power uprates and license renewal for our nuclear plants. We were able to extend the license from our plants and, in fact, got that license renewal right on the heels of Fukushima with no contentions and terrific public support -- because the folks at the nuclear plant are parts of the community. And we recognize the role we have to be members of the community and take those responsibilities fairly seriously.

It is that same sense that allowed in the case of our Sewaren plant, where we had the public hearing for our air permit -- which can be quite contentious -- that nobody showed up for this week. That's a good thing, actually, in our business. So, unfortunately, success for us -- is staying off the radar screen. So no news is good news, typically, for us. So this was a no news is good news for us. That allows us actually to start construction early in the case of Sewaren.

In the case of Bridgeport, New England is also is a fun place to be building things. But our relationship with the community there allowed us to enter into a community benefits agreement with the mayor and the local constituency that we'll get full support to get the air permit, and then -- in exchange for some modest investments in the community.

It is those same things that are driving what we're doing in the Keys area. So our plant manager, Andy Caplinger; our construction Vice President, Kevin Cellars; and our fossil President, Rich Lopriore, have been in people's living rooms, the schools, and as far as the state capitol -- just to explain to people who we are, what we do, and our commitment to the community in the long term. And it has allowed us to essentially have all those permits in place for that unit and get the full support of the community.

THOMSON REUTERS

SI-SSA-0015-13590

So as you watch what's going on in our society now -- and recognizing all politics are local, and it is hard to build anything, because -- you know, various reasons people can get in the way -- we have got some pretty clear sailing on all these projects because of the relationships we've been able to establish in the community. So it is one of those things that, I think, helps separate us from the competition and allow us to be able to build these projects on time and on budget.

So when we are done with that, what you will see is a little different mix here. So on the left you'll see a 13% increase in the amount of capacity that's available. You'll see more gas on a percentage basis. If you look in the middle, recognizing we put some of those plants now in the baseload category, you'll see more baseload than you did before.

But a reminder that those combined-cycle plants can easily move back between load following and base and be able to serve the market in several different areas. And on the right, what you see is an 18% increase in production, up to 65 terawatt of energy produced on an annual basis, with just under 50% now coming from our nuclear plants.

So how do you ensure that, in fact, you'll be able to be the plant that gets selected by the marketplace? It is all about efficiency, and it hasn't been an effort that was started just yesterday, but one that we recognized a long time ago and then working to improve. So what you see here is just where our essentially system heat rate was in 2014, before we started our investments in the advanced gas path. And you see where we'll end up in 2020, with the new units online. That's a 14% improvement in heat rate.

And if you want to do some math, there's a bullet at the bottom that talks about how much savings that is in fuel, with a certain assumption on gas price. But more importantly, the better heat rate you have, you move further to the left in the dispatch stack, and more likely to be called in the marketplace to produce the power that you make.

With improved efficiency also comes a reduction in emissions. And so what you see here is our continued story in reducing emissions from our power plants. So I went back to 2010 to 2016 -- we, up to that point, had a 70% reduction in SO2; almost a 40% reduction in NOx; and we are continuing that forward so that you will see another 20% reduction in both of those by the year 2020, all at a time when we are increasing generation.

And when the -- you will say, but wait a minute, carbon is not on that side. Thank you. It's on this slide. And I'm not a predictor of the future, and I don't know when there will be a price on carbon. But there will be a price on carbon, and we want to be in a position to take full advantage of that when that occurs. So what you see here is that from 2011 to 2016, we essentially reduced our carbon footprint from 1,400 pounds per megawatt. And you can see, we're going to -- from 1,400 to a little over 1,200, and we're going to take that a little over 1,200 to a little over 1,000.

And if you think about the fleet perspective, about 94% of our power comes from either zero-emitting carbon or from new combined-cycle plants or combined-cycle plants that already meet the EPA threshold. So compliance costs for us will be minimal and presents, I think, tremendous upside when carbon finally gets priced into the marketplace.

At our foundation still is nuclear in the critical element of our success. When I describe it, I said, nuclear helps us pay the bills. It's foundational to how we are able to establish our hedging program that Shahid will talk about before. And just a couple of small changes from what you may have seen, if you looked at this last year.

On the Hope Creek side, there's another uprate available. 18 megawatts that we plan to have in the spring of 2018. This is essentially a feedwater flow uncertainty measurement that's been available to a wide number of plants. And a number of plants have used that, and we don't expect many challenges in being able to implement that.

On the Salem side, what I'd point out is for Salem unit 1, we actually go past 40 years of operation this year. So when I talked about license renewals, fairly timely, so that we continue to operate that plant for another 20 years.

That said, you were probably aware that the first nuclear plant has applied or has announced its intentions to apply for renewing its license, or taking it from 60 years to 80 years. That's the Surry plant. There have been some regulatory guidance provided in that area. There are no technical showstoppers from what is that I can see. So we will be following that closely, obviously. And if and when prudent, we'll be pursuing a similar course of action.

In the case of Peach Bottom, I'd just point your attention to the bottom, where the uprates that we have been talking about here for a number of years are done on both units. And we are realizing that 130 megawatts of additional capacity currently. So this does represent a summary of the various growth investments that are going on.

So a couple that I will just point out that I haven't talked about previously is our Bethlehem Energy Center. We still have the advanced gas path upgrade to do there. That one is, frankly, a matter of getting the interconnect in place to be able to do that. And the timing of that works out to the 2017 and 2018 time period.

THOMSON REUTERS

SI-SSA-0015-13591

There is an uprate we will do on our LM 6000s. You see a Kearny 13 and 14; 14.5 megawatts in the spring. A reminder of the PennEast investment that's underway; and this little note again at the bottom about our various solar projects, where we plan to invest almost $250 million over the next two years to support that business.

So this is a bit of what our solar business looks like. We've been in this business now since 2009. And since that period of time, Diana Drysdale, who has headed up that business, and her team have developed, I think, a real niche in the marketplace. So we have put over $0.5 billion to work in this area and a number of plants, anywhere from 2 to 60 megawatts in size -- utility-scale projects. You see them in 12 different states, all done with PPAs, credit-worthy counterparties, lump-sum, full-wrap EPCs. And once again, these investments -- we have investment hurdles for them, and they meet it. And the team has done a nice job you be able to continue to look for opportunities all throughout the country here.

So we will do some additional work in that area to expand the fleet. And now the folks are at work to try to figure out, much like we do with our other power assets, how you maximize the existing ones to look for ways to increase the output, improve reliability, and then look for other revenue sources. And that work is underway in that area.

In addition to that, there is other ways we make money in our business. You'll here Shahid talk a little bit about our gas business, and you heard Ralph refer to it before. So we are a provider of gas to the utility and meet their customer requirements. So we have contracts that help support that, both in capacity and in storage. And when there are off-system sales available after we meet customer needs, we are able to share in those sales with the utility and ourselves. So it provides us an opportunity to, obviously, make some money; but just as importantly, it gives us a deep understanding of the gas business in our service territory.

There are also other ancillary services. Black start reactive power area regulation: area regulation is one of those areas from our combined-cycle plants, where we essentially did some modification to them so they would have the right response time to be able to meet the requirements in PJM. The LIPA fuel and energy dispatch we referred to before. We're also an equity interest in a combined-cycle plant in Hawaii. And a New Haven peaker, as I mentioned, actually in a rate base contract with ISO New England. All told, you add these numbers up, that's $300 million of gross margin for our business that we continue to look for opportunities to expand also.

At the time we are doing this, obviously, we've got to make sure we do this to maintain our costs. And we've done, I believe, a fairly good job of doing that over the years. You can see the 2011 to 2016 picture there, and how we've been able to control costs under 1% a year for that. And it's a result, I would say, of an intense focus throughout the enterprise and of some specific initiatives in the power area. You can see some of those listed in the blue.

Some other items I will tell you about: as the marketplace has changed, and as some plants run more and some plants run less, because, I would say, the working relationship we have with our union, it's allowed us flexibility to move people to where the work is. And so if there's an outage in New York, we are able to move some of our people to New York to help with that outage. Likewise at nuclear to be able to displace contractors with some of our own people.

Given that we are able to do that, we essentially took over the outage-related work on our gas turbine fleet. So our people are performing the work now. That's allowed us to develop expertise in there but, more importantly, also reduce our costs. And we continually benchmark how we're doing outage-wise versus others. And our folks are doing a nice job there.

Our next step in the fossil area is actually an M&D center, a maintenance and diagnostics center, that we put in place. A couple of utilities have done this. But essentially this gives you live-time monitoring of critical and key systems, and early warning of a potential issue. So you're able to schedule repairs and do it in a much more timely fashion. And it also ensures you're doing the right repairs. And if you think about how maintenance is involved in our business, from preventative IU, just at a time-based, you know, some predictive. You would do it when your oil got to some level, or thermography showed you something -- to the point now where any minor trend that you can detect and take early action on, it allows us to be much smarter about how we're spending our maintenance dollars in the future. And I think in many respects it's the future.

So our combined cycles are up and running now. We'll have the rest of the fossil fleet by the first quarter and actually start with a pilot in our nuclear fleete in the first half of the year.

So it's also an exciting opportunity as we bring young people into the organization, because I will tell you, life can be on a computer then. And these folks are pretty well-versed in being able to use it, go up and down and across, and see what's going on in the plants. And it's really helped energize some of the younger folks in our organization. They finally see us putting to use some of the tools that they have been using for their whole lives.

There's also an important initiative going on in nuclear. We've taken some steps, where you see -- moved security in-house; we had a small reduction in force at the end of the year. But on a larger basis, there's an industry effort underway about delivering the nuclear promise. We are actively engaged and involved in that. And I will tell you, it's going to bear some real benefits for the business.

THOMSON REUTERS

SI-SSA-0015-13592

And if you just reflect a little bit on our business, and I started rolling back the clock in the 1990s. And if you remember the 1990s, the death of the nuclear industry was predicted then, too. And the nuclear industry took some pretty strong actions then to essentially, I would say, codify processes, so that we got consistency in how it is that we did business. And we were able to share those lessons with the industry, and the whole industry got better. And by better I mean they got safer, more reliable, and with that became more economic.

It's been 20 years since we refreshed those processes. And quite frankly, some of those tools that I referred to before -- computers and the like -- we don't take advantage of technology near to the extent we could or should. So this is an opportunity for the industry to go do that.

And I'll tell you, there's some terrific work going on in that area to do just that. There's been what's called 10 Efficiency bulletins that have come out. These are small steps, but there's some bigger steps underway that I think will continue to improve safety, reliability, and ultimately the cost structure of the business.

So this is a busy slide. It's meant to be for little bit, because when I mentioned prices were at $13.10, this just represents -- you know, it's interesting; you talk about averages -- so we can always look at the curves and see what the curves tell us, whether it's capacity, energy or the weather. And since these things are built on averages, there's always a plus, and there's a minus. And then even sometimes within the numbers, they don't always tell the whole truth.

So this just looks over the last five years and says there's been a wide range of conditions that have existed in those years. There have been hot summers and no summers. There have been cold winters and no winters. There's been high volatility and little volatility. But what I'll call your attention to is that bottom line that you see there: in those wide range of conditions, we met or exceeded our commitments to the Corporation. And we're able to do that once again because of the flexibility and advantages we have with the fleet that we own; the people that we have, their expertise; and the ability to respond to changing conditions.

So I would certainly prefer power prices be higher than what they are. But I know in the law of averages, that will change, too. So the winter that wasn't means what will happen is people will forget winter happens in the wintertime, and we'll be in a position when winter happens that we'll be able to take advantage of it next time that is.

What you see on the next slide, then, is essentially impacts of two items on our earnings going forward. One is the capacity that I referred to is not there now -- about 1,800 megawatts' worth; and the fact that winter hasn't appeared here yet from when we provided this guidance here in the middle of February.

So I'm going to close with -- we deliver on our commitments, deliver on our priorities. And I think it's a good time to be in this business. And if you looked at the accomplishments we had in 2015, they were formidable: generation up 2%; our nuclear capacity, third-best year ever; record production at essentially most of our gas plants; and, at the same time, our trading organization successfully implemented the contract at LIPA and learned quite a bit in the process.

We met our commitments on earnings, held costs in line, and continued to help influence the marketplaces of markets that are of concern to us. Completed the Peach Bottom EPU, Bergen AGP, and added a fair amount of megawatts to our solar business, and repositioning ourselves for the future -- so that, whatever the future brings for us, I believe we are in fairly good shape to meet those challenges ahead.

Again, anybody encouraged about $13 prices or not? (laughter) Didn't think so. With that, I'll turn things over to Shahid. And then will take questions following his presentation.

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources and Trade***

Thank you, Bill. Good morning, everyone. I'd like to add my warm welcome, and thank you for joining us today. It's great to be here again in New York City -- and even better when I think that this time last year, it was 26 degrees Fahrenheit colder. So it's certainly much better today.

As Bill described, PSEG Power had a solid performance in 2015; but as you are well aware, the merchant industry continues to face some challenges. And there are several reasons for this, but the principal ones, of course, are that the commodity prices are relatively low; and we are seeing reduced demand for electricity as a result of energy efficiency and also as a result principally of low load, because of the mild winter we've been experiencing recently. So these same issues, actually, which extend for a bit of time -- probably going back to last summer -- have also impacted PSEG Power's margins, specifically at our nuclear plants.

At the same time, though, these low gas prices are having the effect of helping our natural gas-fired plants, giving us stronger spark spreads and stronger profitability. And when you marry that with the increased run rates we've been seeing at the combined cycles, we're seeing good performance from an output as well as a profitability standpoint from our gas fleet.

THOMSON REUTERS

SI-SSA-0015-13593

Of course, to neutralize some of the impacts of these low gas and power prices, we've aggressively hedged a large portion of our energy and capacity revenue, giving us at least a three-year window of solid hedge values which will get us through this period of low commodity prices. As Bill mentioned, our overall earnings are expected to be lower in 2016, consistent with lower energy prices and also consistent with hedges that have fallen in price over the last three years.

But we do expect healthier prices and margins in future years, coinciding, actually, with the buildout of our three new combined cycles. So with that backdrop, I'd like to describe the actions that we are taking to position the fleet going forward. And I'm going to split my talk into three sections.

First, I'll kick off with a short review of how last year shaped up, and how we positioned ourselves and handled it. More importantly, I'll talk about the future and what we're going to do this year and forward and, of course, regulatory trends, because this is a very regulated market, as you know.

Second, I'll talk a little bit about the commercial and technological attributes of our fleet and how we are positioning them for the long term, because that's really what this business is about for PSEG Power -- the long term. And third, I'm going to outline some of the strengths that continue to make us somewhat unique in this space and, I think, distinguish us from the rest of the merchant generation industry. I know that all of our competitors say that they are unique, but when you look at the complete package that you had outlined this morning -- and that you'll hear from me and from Dan -- I'm very confident that our story is as good as, if not better, than anybody else out there in the merchant space.

So let's start off by going backwards and looking at 2015. On this slide, the top two charts show natural gas and the power prices in the Northeast during the first quarter of 2015 that reflect winter. And the bottom two charts are the same commodities, gas and power, for the remaining nine months of last year.

In the first quarter of 2015, you'll remember, it was very cold. And in the top left-hand chart you can see that the blue line, which represents the price of Transco's Zone 6 gas, was relatively strong until mid-February and then rose sharply and stayed high until the middle of March. That reflected an average Zone 6 price of around $8.75 per Mcf for that whole quarter.

The orange line, by the way, is an important line for you to look at, because that was the Leidy gas price, which is a good proxy for Pennsylvania shale gas. And you'll note that it was relatively flat and much cheaper than Zone 6 gas throughout this time period. And most of the gas that we bought during this timeframe and, indeed, today is that low-cost shale gas coming from the Marcellus.

As you know, electric prices in our region are correlated with Zone 6 gas, as shown in the top right-hand chart. And that green line reflects electric prices in the PSE&G zone. The average electric price in that quarter for the PSE&G zone was about $64 per megawatt hour, which also included a $12 per megawatt hour positive basis above the West Hub prices.

So as you can imagine, our first quarter of 2015 margins were very strong as power prices rose. And once again we made a decision at that time to accelerate our hedging program to take advantage of higher prices and higher margins. This will prove to be a benefit for us in 2016 as well as in future years, as I'll describe later.

The bottom two charts reflect the last nine months of last year. And clearly, gas and electric prices and any of the associated volatility around those commodities were much less than in the first quarter, and less than in prior summers, too. And of course, as you know, this is due to mild weather; low load; and the continued, I would say, overproduction of shale gas, which drove gas and electricity prices on aggregate lower. As a result we did have a tougher balance of year than we were hoping for.

As you know, this winter, starting from November to February -- I read a report the on the NOAA Webpage the other day saying that this was a record warm winter for the United States this year. As you know, this winter, excluding just a few days in February, has been very mild, with the December to February period averaging around 6 degrees above normal, with reduced heating demand -- therefore driving down those gas and electric prices. As a result, clearly we're not seeing the same revenue that we would normally expect, especially from the nuclear plants, this winter; although our gas plants continued to perform well, and our energy sales and our hedging has protected us somewhat, as I'll describe later.

So when Bill talked about that $13 price that we saw today, that is a price that is therefore for unhedged fuel, unhedged power. Fortunately, we've already hedged a lot of our power for delivery today at much higher prices.

So looking at future trends for gas and electric and also spark spreads, the top left chart shows the price of Zone 6 gas in blue for future years; and, again, the orange line reflects Leidy price. And that blue line reflects the seasonality of gas demand as reflected in the cyclical price that you see there. But more importantly, it shows a slow but steady expected rise in the price of gas, both Zone 6 as well as Leidy gas.

THOMSON REUTERS

SI-SSA-0015-13594

The market is in contango. And actually, in an exquisite piece of timing, our friends at Morgan Stanley last week produced a fairly detailed research report entitled Natural Gas: Time To Get Bullish. And I'm just going to quote from the leading paragraph for you: we are more constructive than the curve, they say. An imminent supply slowdown and ample demand should return the market to balance by year-end 2016 at prices above the strip. But we see 2017 prices [about] $3, well above the current price curve. End of quote.

We agree. And actually, I have seen some other analyst reports from other of our colleagues out there that say the same thing. And we think that gas and power prices have been oversold, especially as we get into the fall and winter of this year.

Now, that top right chart shows the forward price for power at PJM West. And it shows the same seasonality as gas in winters, with some additional seasonality in the summer. Over the entire period, you can tell it's relatively flat, although we do expect prices to move in line with natural gas if prices for natural gas do move up as we think.

And that bottom chart is a very important chart for us. It shows the spark spreads at PJM West in the Public Service Zone in both black and green, respectively. The forward spark spread, while gently sloping downwards, serves as a good proxy for the profitability of our gas fleet, as you might imagine -- especially the 5,000 megawatts of combined cycles that we'll have by the beginning of 2019, plus the 1,200 megawatts of peakers that we have in New Jersey. We expect these forward spark spreads in PJM and New England to remain robust.

And a final point I'd like to make is that although the PS premium to PJM has diminished with the pressure from local shale gas -- and, of course, with additional generation and transmission into our Zone -- we've still been able to extract an annualized premium for our output over that in PJM West. In the near term, that locational premium we enjoyed has shrunk; but we believe that premium will return in the long-term, as gas from the Marcellus gets moved out of the area and this transmission bottlenecks south of our region get resolved.

So the key takeaways from these charts is that the absolute power price, while falling further than I think anybody -- including us -- anticipated, does seem to have found a floor, and that forward gas prices do seem to be moving up. Importantly for us, the spark spread continues to be strong and we expect will remain high enough to make substantial profits from our gas fleet.

Shale gas production, of course, in the Northeast has dramatically changed the dynamics of the energy industry. And it's changing the competitive landscape and putting a lot of pressure on some of our weaker competitors. As Ralph mentioned, PSEG benefits, because we sit right next to the Marcellus field. And we have one of the largest gas procurement and trading activities in America.

Last year, as this chart shows you, we bought over 420 Bcf of gas, with most of it coming locally. Not only is the gas price cheaper now, but also so are the transportation costs. And we need less storage as well. So our all-in fuel costs are dramatically lower than they were just three or four years ago.

The bar chart that I have up here shows how purchases from the Marcellus that are shown in orange have grown over the last five years. In 2010, we used to be 100% dependent on Gulf Coast gas and gas from Canada. Today, over three-quarters of our gas is shale gas bought at a substantial discount to that Gulf Coast gas. Now, this is a higher percentage than what we would normally expect, frankly. And it was, as I mentioned earlier, due to an unexpected and probably exceptional oversupply and overproduction of Marcellus gas in the summer of 2015. Going forward, I think we'd feel that our typical shale purchases for our utility and also for our power fleet would probably more like around two-thirds coming from the shale region.

That pie chart shows you where our natural gas came from. And you can see from the orange and blue slices that three-quarters did indeed come from Pennsylvania and Ohio; and the green slice represents what we buy on a delivered basis from producers and other marketers. And that amount, which is about 1/5 of our total, came from multiple sources. But I'm pretty sure that a good chunk of it came from the Marcellus, too. Only 4% of our gas is coming now from the Gulf Coast. So as you can see, we have continued to buy cheap shale gas and have maintained a cost advantage over our competitors, who don't have the infrastructure to match our access to Marcellus.

Now, our producer friends tell us that technology gains and lower costs will keep gas production high. However, there's a common consensus as well that production growth is going to decline sharply. Our friends expect increasing bankruptcies as lenders eventually bite the bullet and pull the plug on what we now believe are substantial bad loans to this E&P sector. And I was reading a report last month from Deloitte Consulting that estimated that up to a third of US E&P companies would probably go bankrupt this year and stop producing.

Now, as a result of all this, and as a result of the lower gas prices, we are finally seeing some production discipline from the E&P sector. Although we touched nearly 19 Bcf a day of gas production in 2015, in the month of January we saw Marcellus production at 17.4 Bcf a day. And this year we've seen Leidy gas prices rising somewhat from their lows, and gas is not as distressed as often as it was last year.

THOMSON REUTERS

SI-SSA-0015-13595

We do expect this trend to continue and will alleviate some of the pressure that we've been seeing on Zone 6 gas and M3 gas -- and consequently, on the derivative, which is electric prices in the region. Having said all that, we do expect overall 2016 gas prices to remain low, especially in the summer period, but start recovering rapidly as we approach the winter.

And as you know, as Bill referred to, we continue to increase our access to Marcellus gas. And PSEG Power is investing $120 million for a 10% stake in the PennEast Pipeline, which goes from Pennsylvania Marcellus fields into Lambertville, New Jersey, which we expect to come online in the 2017/2018 time frame.

In this chart we see new pipelines being built to transport excess supply into high-priced markets, particularly in the South and the Southeast, where demand for natural gas is booming. In fact, demand for gas is booming everywhere. We see it across our reach here, and we see it across the United States.

And the map shows you the new export pipelines that are anticipated through 2018 -- and this is updated from when I showed it last year. Approximately 6 Bcf has in fact been built and put into service over the last two years, with another 4 Bcf expected in 2016 and another 17 Bcf in the pipeline through 2018. As a result, we expect significant exports from the Marcellus and a firming up of prices in the region.

Although we think that gas prices do have more upside than downside, on a historical basis we probably believe as well that gas prices will still remain relatively low compared to history. But as you know, our business plan and our business model is based on the current forward curves and fundamental analysis, and not on projections in hope of future prices.

So as a result of that, we have to help ourselves, and we have to improve our competitive position despite low commodity prices. And we need to improve our position on the sales side, on the manufacturing side, as well as on the regulatory side. And on the regulatory side, our market structures do continue to improve, although with two steps forward and one step back.

First, there have been significant improvements to the capacity market construct in PJM, as you know, as well as in New England. And the higher payments for increased reliability standards that both FERC and the ISOs are demanding really well match the capability of our fleet with our high-performing nuclear and combined cycles in our region. Secondly, accurate price formation and accurate energy price formation is critically important.

We found it's much more important than getting the capacity market rules right, because poor price formation is a concern not only for generators, but also for load if they see the wrong price signals. And we are seeing a concerted push from FERC to improve electric price formation with various directives and various requests for information to the ISOs. And they are responding, and we are pleased to see that -- PJM as well as New England.

On demand response: the Supreme Court's decision to allow FERC to continue regulating demand response is irritating, I must admit; but it will have a small impact, I believe, on Northeastern electric markets, since DR does have a hard time meeting the increased reliability standards in PJM and New England. We are seeing DR playing a smaller role in regional capacity markets. And in 2020/2021, for that capacity auction, which is next year, the whole of PJM goes to the higher-capacity performance standards. And we believe that DR will have a hard time meeting those standards.

Turning to Ohio, you know, we are troubled -- as you might imagine -- by the moves to effectively subsidize coal plants by the utilities there, and hope that the PUC will not agree to those subsidies. Nevertheless, it is a distraction for the industry and reminiscent of the LCAAP fight in Maryland, which is currently before the Supreme Court.

And lastly, on the environmental side at the bottom, the clean power plant for carbon emissions is up in the air -- literally up in the air -- and has been kicked back to a lower court, as you know, by the Supreme Court. However, even if the EPA ultimately prevails, the CPP wouldn't have gone into effect for quite some time. So we never expected these new regulations to have any short-term impact.

But what we're seeing, though, instead, is that existing rules like MATS, coupled with low gas prices and low power prices, continue to push out these deregulated coal plants from business as well as the deregulated oil plants. And we see these retirements continuing, albeit at a smaller pace than before, because a lot of their retirements already happened in the year 2014 and 2015. But we still see some going forward.

So generally, we view the regulatory framework and landscape as neutral to positive overall. And we do our best to advocate for the competitive markets. And we've been pleased, actually, with some of the outcomes in the critical areas, especially of energy and capacity market reforms. But the major takeaway for us is that in any of these markets, no matter what the regulatory construct is, we have to compete effectively, as Bill said. You need the lowest cost, and you need the best technology.

THOMSON REUTERS

SI-SSA-0015-13596

And as you know, the technology of choice for electricity generation has moved decisively to natural gas. Embedded in the chart on the left-hand side, you'll see that our 2018 spark spreads in these markets are quite high historically; but more importantly, the forward curves indicate that the market expects them to remain robust into the future. As a company we've recognized this. And we've been adding peakers; upgrading our gas units; and as Bill mentioned, we are building three new combined cycles.

Now we are building new, but we've also tried to buy existing gas plants in our chosen markets. Frankly, though, we're just not willing to pay some of the prices that these 10- and 20-year-old assets went for, and decided that for us it was much more important to be selective about our locations; to leverage our existing infrastructure, wherever possible; and to take advantage of new growth opportunities. So ultimately we chose to build new, efficient units in advantaged locations, so that we can be first in the dispatch stack.

I won't repeat what Bill said as to why we believe we are advantaged now by building in these locations, but we do believe that each of them have merits of their own: the Bridgeport, Keys, and Sewaren. I'll talk a bit more about Bridgeport in a second. And here now, on the right-hand side, can see that the list of our existing and proposed gas cycles nicely complement our baseload nuclear fleet and also our peakers. So our aim, as you can tell, is to regenerate our fleet so that we have the most efficient heat rates in quality locations. Because at the end of the day this is a commodity market, and we recognize that. And we know that we have to aim to be the low cost producer.

On one of Bill's slides, he had up there that our fuel savings from all these efficiency improvements will save us about $65 million to $70 million in fuel expense.

And by way of example, the difference between a 7,300 heat rate unit, like our Linden unit, and a 6,500 heat rate unit, like our new Sewaren unit, at $3.00 gas is about [$2.50] advantage per megawatt hour. That's quite a competitive advantage that you get if you're able to produce at a much more efficient rate than a lot of the existing units. And as you know, the heat rates of most of the combined cycles and the coal plants, of course, in PJM and also New England, is well north of 9,000. So hopefully we'll have efficient units in good locations that will be first to be dispatched.

So turning now to the rest of our fleet, as I mentioned before, we manage our Northeast assets as one portfolio. And though they are relatively small, they are profitable; and they do provide us a base to grow our business. In New York state we have our plant at Albany called the BEC, which is very profitable. We have plans to increase output and improve its heat rate with the uprates that Bill talked about.

But in New York State as a whole, we don't really see many growth opportunities for competitive generation. We do see, though, some retirements of steam plants in the West and FitzPatrick Nuclear in the north, and who knows about Indian Point? And we believe that those should capacity prices, meaning that we should see more revenue from our plant in the future. But unfortunately, the regulatory construct in New York hasn't improved much in the past three years. So we're focused on sales help to improve our margins with efficiency uprates and the new gas pipeline connection that Bill talked about.

And last year we took over the management of LIPA's, Long Island Power Authority's, 6,000 megawatts of contracted generation assets. For little risk, our group is adding $0.01 to $0.02 per share of earnings. We buy the fuel; we dispatch the plants; we manage the cables. And we also do the hedging for them.

And we've been doing this for over a year now. And we've learned a lot; we've helped get those power prices lower, we believe, in Long Island. And we've executed very well so far. And LIPA appears to be very satisfied with our performance to date.

In New England over the last three years we've witnessed -- as another New Englander, Bernie Sanders, would say -- we've witnessed a huge change in the market construct, driven by companies like PSEG, who have really pushed the ISO and FERC to make improvements. The market rules for energy and capacity in New England are now among the best in the nation after having been, frankly, for quite some period of time, one of the most difficult regions to do business in.

It's still not a cakewalk from an environmental standpoint, from a permitting standpoint, nor from a fuel procurement standpoint. But we believe that the long-standing good relationships we have with the communities that we serve and that Bill talked about. Plus, our knowledge of the New England markets will help us as we grow our business up here.

Would we like to build a new power plant at last year's capacity price? Yes, of course. But even this year, building a new power plant at Bridgeport to complement our existing oil plant, and existing coal plant, and existing gas peakers at New Haven was, frankly, an easy decision for us. Not only is it a good financial decision, but having a larger portfolio up there actually reduces our penalty risk from New England's version of the capacity performance standard. As Bill mentioned, we'll receive significant guaranteed revenues from the seven-year capacity lock, equivalent to about $40 million per year.

THOMSON REUTERS

SI-SSA-0015-13597

Second, that forward spark spread looks compelling. Third, we get to close down potentially an old coal plant that doesn't run very much but has become a lightning rod for some of the environmentalists as the last remaining coal plant in Connecticut. And finally, we believe it will be very profitable: construction costs have been driven lower by the synergies that Bill talked about between this plant and Sewaren, and bonus depreciation will make it even more profitable.

And it's also important for you to know that we've already started monetizing this asset by forward-selling both capacity and energy. As we have indicated, this plant will cost us between $525 million to $575 million to build. And we've already sold enough guaranteed capacity to the ISO and to others to cover over half of this cost, or about $325 million to date. So we are thrilled with this investment, which we view as relatively low risk and with strong upside potential.

Talking about capacity markets, a major locational benefit for PSEG, of course, are the capacity markets in each of the three ISOs that we operate in: PJM, New York, and New England. In PJM in New England, the construct is much better for the industry and is being reflected now in our future years' earnings. In New York, unfortunately, there is no sign of the state moving to a long-term capacity construct such as in PJM or New England. Plus, New York continues to interfere somewhat in the market structure by selectively picking winners and losers.

But the capacity constructs that we are in assure us that we will receive a payment for being in the marketplace that does allow us to invest in our assets. And as you can see, in PJM, our capacity revenues have been very consistent over the years and actually growing in the last couple of years as well.

Now, last month PJM did publish their parameters for the upcoming 2019/2020 RPM auction, which reflects new methodologies for estimating load as well as updating it for transmission upgrades as well as new generation in the region. With lower load requirements, improved transmission penetration, and higher supply, the market does expect prices to be lower for this upcoming auction than last.

And for the RTO as a whole, we do continue to see coal and oil retirement through 2018 and the already-committed plants that are coming online, mostly in Western and Southern PJM, coming online up to about 2018/2019 time frame. After 2019 we actually see very minimal newbuild, for most IPPs are finding it very hard to get financing for new projects, which will really help supply get back in line with demand in that time period, just when our combined cycles will be hitting the market.

So in the lower box, the capacity prices that I'm showing here for New England also most likely peaked in last year's auction but are still very healthy, with the latest auction clearing at $7.03 a kW month, or about $230 a megawatt day. And to put things into context, that $230 a day is very equivalent to what we're getting in Eastern PJM for the bulk of our PJM assets. So we were not surprised at all by this year's auction results and have internally forecasted to clear between $7 and $8 a kW month. And one last point I'd make on this slide is that over the next three years, we will receive over $2 billion in guaranteed revenues from these capacity sales, giving us some good clarity on our future years' earnings.

Turning to energy sales, we've been actively growing our wholesale origination business and selling more full requirement electric deals to customers. The annual BGS auction is one of our larger full requirement sales during the year, which accounts for about 12 gigawatt hours a year. BGS is a forward sales construct in New Jersey. And despite being very challenging from an operational standpoint, it's a very useful outlook for us at a time when forward-market liquidity is lower than in previous years. So we like the BGS construct.

And BGS sales accounted for about 1/5 of our forward hedges. Last month we participated again in the BGS auction. And as you can see from this chart, prices did move down about $3 in the PSE&G Zone, primarily due to lower energy costs. The auction results, though, were in line with our expectations of sales volumes, although margins were a little bit lower than we might have expected.

Of course, we continue to supplement our BGS sales with similar full requirement sales in other markets that are well correlated to our assets. And these sales have been very profitable for us over the last two years, and we intend to do more.

We've also been exploring the retail C&I electric business to see if it makes sense for us to have an additional outlet for our generation. And we do see this potentially as a small-scale defensive tactic for us, if we should decide to move forward. At this time we've not reached a definitive conclusion on whether, when, or how to enter the market. So all I would say this time is: watch this space.

And moving onto hedging, as you can imagine, forward hedging -- particularly in this price environment -- plays a crucial role in managing our earnings. And we have a consistent hedge program whereby we lock up about two-thirds of our baseload plants' output for the next three years. In numbers, that's about two-thirds of 4,000 megawatts for three years.

And as prices have fallen over the last few years, so indeed have the prices of our forward hedges, as they have in fact for all players in our industry. And as a result, we do expect our earnings in 2016 to be lower than in 2015, consistent with those lower price hedges that we've been seeing over the past four years. Now, we've been

THOMSON REUTERS

SI-SSA-0015-13598

cautiously hedging in this low price environment, holding back somewhat when prices appear to be below fundamental values while taking advantage of price spikes to sell more.

And as I mentioned earlier, the absolute price of power does seem to have stopped falling. And we don't see much, if any, further downside -- unless the price of gas completely collapses, which we believe is, frankly, very unlikely. And the increasing prices and margins will benefit unhedged sales, as we're leveraged very favorably, of course, to upside volatility. In addition, we been aggressively managing our electric basis risk, using all the products that we have available to us, including FTR and basis trading.

So we have a very solid risk management practice at PSEG, which we supplement with short-term trading tactics that will adjust those hedge positions to try and maximize better operational requirements and also for value considerations. So hedging will be -- will continue to be a consistent and powerful contributor to us over the next period of time.

On the electric generation side, Bill spoke about the performance and the reliability of our fleet. And these two pie charts show the makeup of our output and their contribution to our earnings. The first pie chart reflects the total output in 2015 of our generation, with over half in green coming from a nuclear fleet that performs to an average 90% capacity factor. And gas-fired generation, which is the brown slice, is the next-highest contributor, which accounts for about a third or around 18 gigawatt hours a year, with coal and oil making up the balance.

By 2019, we do expect our nuclear and gas output to rise to about 62 to 65 gigawatt hours, which is about a 15% to 20% increase, as a result of our additional investment in gas-fired plants. Although nuclear is still the most profitable megawatt, our gas fleet has become increasingly profitable, and we expect it to provide a much larger share as a proportion of our output and our future earnings.

And the second pie chart shows the contribution to earnings of the components of each of our forward hedges for the next three years. And you can see from the chart that a sizable portion of our earnings are already locked up in the form of capacity revenues and energy hedges. In fact, for the next three years -- for 2016 to 2018 time period -- about 60% of our earnings are already locked up.

We still have operational and execution risk, of course, around that number. But we have a clear line of sight on significant amount of revenues going forward for the next three years. And any uptick in prices or volatility will help that bottom line further, as any unsold generation will benefit if prices rise.

So despite the low price energy environment that you're hearing about, we're, we are very confident that PSEG Power has a strong future in the merchant generation space, both now and in the future. Our location, our geography in the Northeastern markets -- which is very close to load centers -- still gives us premium pricing for our power at the same time it's giving us preferential access to the fuel from the world-class Marcellus field. The three new combined cycles that we're building will significantly increase our fleet's efficiency and will take advantage of the robust spark spreads and capacity markets that we are seeing out there.

Thirdly, the higher operating standards that FERC and the ISOs demand are very well suited, in fact, for the capabilities of our existing fleet. And they'll only get better as we add new megawatts to them. So we don't anticipate spending much capital over the next few years to meet these higher standards. And lastly, geographically we are delighted to be growing in the Pepco region, which is a very attractive and growing part of the world that we've been watching for some time.

Finally, our hedging and short-term trading activities that protected our earnings. And the improved capacity market construct, as you can see, really helps us in that endeavor as well.

So we believe that we're controlling the things that we can control at Power. We have a clean fleet that we are modernizing. We have excellent operations, a first-class safety record, a gas and power locational advantage in PJM that's frankly unmatched by anybody in our industry, together with a strong balance sheet to grow the business and help us through this low commodity price period. So thank you very much for your attention; we're ready now to take your questions. Thank you.

QUESTION AND ANSWER

Unidentified Audience Member

Shahid, hi. Thank you very much for the excellent presentation. You postulated that you think that gas prices are undervalued. Would you care to place a number where you think fair price of natural gas is?

© 2016 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13599

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources and Trade***

I think my boss and his boss would kill me if I did that. But what I would tell you is that all the signs that we are seeing are that gas will continue to be relatively low compared to history. But we have seen cycles of gas prices over the last 10 years hovering between $1.50 to $10. Clearly, like the oil business, it is a cyclical business. We do expect it to be higher. But, we plan our business based on the forecast. The forecast for next year shows Henry Hub price of $2.58. That is what we plan our business around. Does that help?

Unidentified Participant

Excellent. Thank you.

Unidentified Audience Member

Shahid, based on the analysis that came out of PJM, which compared when we go to 100% CP, which will be the next talk next year in May for the year 2020, it showed nearly for the PEG fleet that upside could be like $0.50 per share if one did the math from their sensitivity analysis. Do you believe in that uplift, as they kind of highlighted, going from the 80% to 100% for the zones that which we are in, as something which is a big upside for the power fleet as we go into next year's auction?

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources and Trade***

Well, actually, if you believe in that, I would like you go and buy some shares because I think that would be terrific.

Look, we have done our estimation as to what we think will happen to the capacity prices as a result of the various changes that are going on. Frankly, that seems a little high to us, and probably one that I would have a hard time sharing how we get there. Do I think that companies like ours that have clean slates and a lot of nuclear plants can be successful in those markets and get premium prices? I do believe that.

Having said all that, though, it is pretty clear that what we are seeing in the PJM market is more generation that is of better quality and better reliability. You are seeing increased transmission that has been upgraded and improved, because you have folks like Ralph LaRossa's team. And as a result of that, you are seeing a stronger backbone, a stronger grid. My suspicion is that you will continue to see volatility and you will continue to see some premium prices in various locations. I fully expect PSEG will continue to be a premium location. I can't speculate whether it will be $0.50 a share or not, but hopefully it will be something.

Don't you want to add to that?

Unidentified Company Representative

The CP is just a new construct here, and I think we are going to have to give that some time to play out just to see what that is going to look like the long term. I have talked to several folks who were absolutely delighted when they saw the pricing for that.

But, when asked the second question, is what about the additional risk you have assumed, they did not quite have a good answer for that. So it is going to be a market in the long term where I think you have to have scale to be able to do well. And we will see how the market shakes out with some of the smaller players there.

So, I would not predict what is going to happen in a year, but, like everything we do, we take the longer term and we think we are pretty well-positioned for what might happen there.

Unidentified Audience Member

Just following up a little bit on the comments on power markets and basis, just East/West, we have seen obviously a deterioration East relative to West. What are your thoughts just prospectively, particularly given future gas pipelines that have yet to come into service? Do you expect to see continued downward relative pressure East versus West? I will leave that first.

'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

Unidentified Company Representative

Let me answer that one first, Julian. Thank you for the question. The basis issues that we've been seeing -- actually we've been predicting for some time, principally because we have seen our Company, PSE&G, improve the transmission backbone and made it easier for a generation to come into our space. Plus, we have seen new generation, new gasified generation, being built in the region.

The third dynamic, which we did not anticipate quite as much, was the impact of absolute low gas prices from the Marcellus. And as you know, the Eastern part of MAAC, Eastern part of PJM has become -- the marginal unit is now the gas unit. As a result of those low gas prices, you are seeing Eastern MAAC power prices generally low.

We do believe that as more pipelines are built and more gas that gets taken out of the region, likely prices will increase, which actually is a blessing but also a curse in some respects because, as Leslie Rich pointed out this morning, it is likely gas prices go up, and doesn't that reduce your spark spread. And I said, yes, but it certainly helps my nuclear fleet.

But then, going back to your question, the third piece that we see going out there is that this lower transmission work that is taking place right now in the southern part of PJM as we get into the Baltimore and Dominion zones. And that will alleviate some of the congestion that we are seeing, which will hopefully allow for more flows from north to south, which will reduce the pressure on that basis. Right now, basis is flat to slightly negative at various times of the year, and it is flat to very positive in other times of the year. Because of our hedging, we have been able to take advantage of those positive premiums over the years. And over the next three years, we have positive basis built into our hedges. Does that help?

Unidentified Audience Member

Yes, absolutely. And perhaps to run with that a step further, as you think about gas price sensitivity, you kind of preempted the next question a bit. But how do you think about the evolution of the power business and sensitivity, given the puts and takes of an enlarging combined cycle fleet of pro forma in 2018 and 2019? I know you guys provided sensitivities about $0.12 to $0.16 as a range, but I would be curious how that is evolving.

Unidentified Company Representative

We do have, as you mentioned, a slide in the back which talks about how we view gas price sensitivity to our overall earnings. It is a tough question because, as I said earlier on, what we are trying to do in our business is really gasify our fleet as well as have a strong nuclear fleet. So, if absolute price -- if absolute power prices rise, we do well. If absolute power prices rise, and nuclear fleet as well, gas spark spread might diminish. Then we have some balance in that portfolio.

My belief is that we are going to see more efficient, more reliable generation stack both in PJM as well as in New England, as well as in New York. And over time, you will continue to see some compression in this spark spread. But the fundamental analysis that we've been doing shows it is going to stay fairly robust. And if it stays robust, it is great for our gas business. And also, we don't believe that the power prices done at these levels are sustainable. We just don't see that many plants can survive at these power prices for a long time. So, we do expect some uplift in power prices, too.

And eventually, there will be a price on carbon. As you know, the nuclear fleet that's out there is struggling in many parts of the country. That has to be saved in one way or another. And we believe that is happening. And if you take New York as an example, New York State, they have come up with this pretty neat idea about zero emissions. They are being selective how they might want to use that, but I think that is a path for the future for the nuclear industry.

Unidentified Audience Member

Bill, you had a slide where you talked about other sorts of gross margin. Gas asset optimization was one of them. It was in a bucket of, I think you said, $300 million of gross margin. What are you making there, and what is the outlook?

Bill Levis ***- Public Service Enterprise Group Incorporated - President and COO, PSEG Power***

© 2016 Thomson Reuters. All rights reserved. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13601

If you kind of do a general breakdown of that slide, I would say about two-thirds of that is coming from the gas business itself. And then, the rest of that one-third from the ancillaries is about 50% of that one-third. And then it is equally spread across the other areas.

I think the ancillary service area will become one of more value in the future as renewables continue to penetrate the marketplace. The other items that are needed to keep the grid viable, reactive power and the like, and to be able to respond quickly to load changes, I think those services become more valuable in the future. And then the solar business is also a piece of that that will continue to grow. And you saw the numbers on that.

Michael Lapides - ***Goldman Sachs - Analyst***

Michael Lapides, Goldman. Two questions, one probably more for Shahid, one more for Bill. First of all, can you talk a little bit about where you think the market is, especially in PJM, in terms of the coal plant retirement cycle? Meaning, with prices where they are, do you think there is a whole other wave coming that is less environmentally driven and more strictly price driven. Talk about the market itself and even some of your own units, like [Hudson, Mercer, Key Con], et cetera.

And then Bill, can you touch on what is kind of the outlook over time for the ability to manage nuclear-related O&M costs, and, directionally, what kind of the puts and takes or kind of upside/downside drivers there would be?

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources and Trade***

Let me try and answer the first piece of it with respect to retirements and coal retirements, and I would say two things. One, we saw about 10 gigawatts of coal and oil retirements in 2015. Going forward, there are not that many deregulated coal plants that will face economic stress. There are probably 2 to 3 gigawatts coming up in 2016.

And then going forward, we expect that number to increase on the regulated side, because here's what's happening on the regulated side. If you take out the whole issue around what's happening in Ohio with the various utilities and their requests for PPOs there, if you look at Dominion, for example, Dominion has realized that it makes a whole lot more sense to be burning gas rather than coal for two reasons. One, it's better for their environment down there, and, secondly, it's a whole lot cheaper for their rate payers. So, I think we are continuing to see pressure on the regulated businesses to remove some of that call fleet and replace it and re-gasify it.

On the deregulated side, you are seeing folks like NRG actively moving to try and add gas to their coal plants. So I think you will see the coal element diminishing, and you will see more and more pressure on the coal prices and, frankly, the coal producers. So I do think that coal is going to be facing some hurdles for a long time.

For our own fleet, we have a coal plant at Bridgeport. We have already indicated that in 2021, provided we get all the permits for our new plant, we will retire that plant as well. And Mercer and Hudson run infrequently. But given their location in the PJM grid, they are very valuable capacity resources for PJM. Plus, they have the ability to burn natural gas as well.

Frankly, we don't see that they will have a very large capacity factor going forward. They will run minimally. That's okay. They serve a purpose for the grid right now.

So, to answer your question in a shorter way, I think we see continued pressure on coal, including our own, going forward.

Bill Levis - ***Public Service Enterprise Group Incorporated - President and COO, PSEG Power***

I would just add just one comment relative to our Hudson and Mercer plants. We manage our units as a portfolio. And so Hudson and Mercer provide additional value to us, in that one is a -- I call it a $50 option, basically hedging against perhaps operational risk that we might have. And, perhaps more importantly, looking forward to capacity performance. And as it plays out, is a backstop to us.

Now, that said, we have to do all that we can to manage the cost there so that those units remain viable, too, which is why the ability to move our people around from site to site and then support other units has been important and a big factor in us being able to keep those plants viable moving forward.

Relative to the nuclear O&M question, I am actually encouraged by what I see going on in our business now. And if you think about what has happened in our business that have been drivers of cost, if you go back to 9/11 and security requirements that came about as a result of that, and as we were coming to the tail end of that, the Fukushima accident occurred, and then a whole series of other requirements are now put in place.

© 2016 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13602

So, essentially for the last decade plus, we have essentially as an industry responded to those and put in additional measures and systems and the like to be able to deal with those issues. And there hasn't been a concerted effort, then, to think about what is the most efficient way to go do that because there are timelines associated with that.

Now, what's going on in the business, we are having the opportunity to go reset and say, okay, is the security strategy that we put in place in fact the best one? And we filed, for example, just some interesting technology tools with the computers and the ability to simulate different things now, that we can use that device live-time and come up with more effective strategies with actually less cost. And we have begun to implement those. And I think we will see the same things in Fukushima and the like.

So for example, now that we have the additional systems in for Fukushima, we should be able to more easily change things going forward in our business because there is less risk going forward than more. So, that, and the processes that we have put in place just need to be modernized with the use of technology.

And I said the industry is starting to move on this. I have seen some encouraging items in this area. There is nothing like knowing out there that your future depends on being able to do this to get a little motivation into everybody.

So, I am encouraged by what I see, Michael. And so directionally, we have already seen nuclear industry costs moving down the last two years as an industry.

Unidentified Audience Member

My question kind of surrounds your point of view, I guess, in the sense of being able to take advantage of that point of view on the fuel side. So, can you give us some type of idea, let's say, as far as your gas supply, the ability to lock that in for a prolonged period of time at a certain cost and what the cost of that is?

And then also, basically, how hedged are you on your gas supply? And also, then moving on to nuclear, what you are seeing as far as your nuclear fuel costs, how long the duration of those contracts are, and when they may be falling off, and whether the costs are going up or down?

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources and Trade***

On the gas side, buying long-term gas is akin to buying gas in the ground. So, we can do that. We can go out and buy gas and approach Southwest or a Cabot and say, we would like a whole bunch of gas that we would like to take ownership of. And they won't sell to us at the prices that we are seeing today because they see the same dynamic as we do.

So, the challenge for us is when -- is how much long-term gas we want to buy and how much short-term. I can't give you an idea as to how much we would buy short and long because that is kind of competitive. But for our utility, we do have a series of short-term and long-term contracts, both on storage, transportation, as well as on commodity that cover the utilities requirements to make sure that they -- our utility customers get the best deal that they can for the space.

And, for our power generation business, frankly, we get the leftovers. So, anything that a utility doesn't need in terms of storage, transportation or the commodity, we get that.

So, it's a little bit harder for us to go out and take a long-term play on natural gas for our power plants. We do some of it financially as opposed to physically. It doesn't necessarily get you the same price or the same value as that Marcellus gas. But directionally, it gives you the same uplift.

Bill Levis - ***Public Service Enterprise Group Incorporated - President and COO, PSEG Power***

On the nuclear side, our fuel costs are about $7. They have been at that level for a number of years now. And then we have a series of contracts to go out six, eight years that look at the various aspects of the whole nuclear fuel procurement cycle. That said, we look at what's going on in the world, and we think whether it is the China new-build and the like and the Japanese restart of plants, the potential for rising uranium prices is there.

With that in mind, we actually put in a process handled by our fuel personnel and ER&T where we actually go out and hedge nuclear fuel currently, the uranium and the commodity piece. So keep a close eye on that to make sure we are getting the best value going forward.

THOMSON REUTERS

SI-SSA-0015-13603

Stacy Nemeroff - ***Bloomberg Intelligence - Analyst***

Stacy Nemeroff, Bloomberg Intelligence. I have a couple of questions related to the outlook for the competitive generation industry. It hasn't existed for that long. Is it really sustainable over the long term? What do you see as the structure of the industry in the next 10 to 15 years? And, related, the Company management has discussed the long-term separation of power from the utilities who would be potential buyers.

Bill Levis - ***Public Service Enterprise Group Incorporated - President and COO, PSEG Power***

Will the competitive market survive is a great question. I don't know the answer to it, but what we try to do is make sure we are ready for any and all outcomes that may occur. So, if you think about even some of the -- what I call other sources that we make money, we actually own a regulated asset in New England. Not because that's what I wanted to do, but frankly that was what was available at the time. If we wanted to be in the business, that is the sort of rules that we needed to play by.

We will continue to advocate for and push for competitive markets. I am a big believer they have benefited customers. There's all sorts of data out there that demonstrates that. A simple example, if you look at nuclear plants, for example: a decided difference between those in a merchant world and those in a regulated world relative to their cost structure.

And if you even think about what happened in New England this past time, look what competition did to the price of combined cycle plants. They made us work harder to be able to win that auction and made some other folks do the same thing. I would guarantee, if that were in a regulated rate structure, that would not have happened.

So I think customers benefit from that. Now, whether the nation goes that way, I don't know. But, if the world turns left, we will be ready to turn left with it and be able to take advantage of whatever set of rules come our way. Relative to it has been the Company or not, that is a question for my boss.

So I imagine he is going to get to answer some questions and there will probably be a few around that, and I imagine he will address it at that point.

Unidentified Participant

To follow up on a bunch of things you have said in answer to other questions, like Leslie's question from earlier, you said that you think the Morgan Stanley call on gas is -- you agree with that call. I hope it is right, too, because we are aligned on a bunch of stock picks there. But that would also move your spark spread tighter.

When I look at the sensitivities that you give in the back of your book, that is in Dan's section, you basically imply your net long power. So if your spark spreads decline, you still make more money from the expansion of the power revenue on your base load fleet. Is that a fair summary of your position?

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources and Trade***

Yes.

Unidentified Participant

Okay.

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources and Trade***

Particularly on the nuclear fleet.

Unidentified Participant

Right. So then why not hedge your spark spread? Because you are open. And I think you answered the question partially earlier, with another question, too, in that it is difficult to get deep into the market. So, would you express that on your trading desk if you thought that gas was going higher and spark spreads [were going higher]? Or would you express that in your hedging, or would you not express that because you just want a dollar cost average into the market?

Shahid Malik - ***Public Service Enterprise Group Incorporated - President, PSEG Energy Resources and Trade***

Typically, what we have tried to do is hedge our base load up to three years out. And we have been a little shy of locking in the spark spreads for our gas fleet for a couple of reasons. One, because they have moved around a lot. But more importantly, because we wanted to keep some open for the upside volatility, and also as protection in case some of our fixed-price assets like the nuclear fleet had operating problems.

As our spark spread position grows, we have in fact taken out some future spark spread hedges, and we will probably likely do more. Because although they are very robust, as you know, this market goes up and down. So we will probably take out some more of that. As to where we would do it, we would do it in the hedging portfolio in the group that I manage.

Kathleen Lally - ***Public Service Enterprise Group Incorporated - VP, IR***

I know there might be some additional questions for the power management, but if you can hold them until the end, I would like to introduce Dan Cregg, Executive Vice President and Chief Financial Officer, who will provide you with a complete picture of the Company's financials. Thank you.

PRESENTATION

Dan Cregg - ***Public Service Enterprise Group Incorporated - EVP and CFO***

Good morning, everybody. I'm going to wrap things up today and try to tie together some of the financial aspects of a lot of the things that you have already heard. I guess I would say if you can take away anything from the presentation here today, you will take away the fact that we have a very, very strong financial Company. I think we had a good pipeline of investment opportunities that we have talked about, with some more potential beyond that. And all of that helps create an ability to provide the dividend that we have and provide some potential for growth of that dividend on an ongoing basis.

If I take a look here on the first slide, starting with 2015, we began the year with earnings guidance of $2.75 and $2.95. As time went on, that range closed towards the higher end. And I am pleased to say that we delivered on that promise, with $2.91 of earnings for 2015.

An increasing percentage of those earnings were from the regulated side of the business. We also identified new opportunities to deploy capital. You have seen some of that here today, with some more to go. $3.9 billion in capital in 2015 deployed on both sides of the business, and businesses generating very strong cash flow on both sides.

That cash flow will enable some incremental opportunities to invest. And as Ralph pointed out right at the outset of our meeting, an increase of 5.1% of the dividend, $0.08 year over year, to $1.64 in 2016 as an annual indicative rate. So, strong results in 2015.

Just very quickly on this slide, to look at a couple quick points, the growth year over year that we have seen from an earnings perspective -- 5.7%, 7.0%, and last year 5.4% -- continued increase in the growth of earnings.

And number two, we did what we said we would do. So if you take a look at it vis-a-vis our guidance that we put out, we have either exceeded or been on the higher end of our earnings guidance in each of those years.

The closer look at the breakdown of the earnings that we have seen over the past couple of years goes back to what I said about the earnings mix. On the top line, you see the utility growth; steady growth throughout the past four years. And as you look into the 2016 guidance, [875 to 925], continued growth at the regulated utility, largely a function of the nature of our mechanisms. So, the contemporaneous mechanism that we have in our formula rate for transmission, as well as what we see from a near-contemporaneous basis on the clauses on the distribution side of the business, helps support that. Power, a very strong and sustained earnings in a tough market. And as we have worked our way through those markets, we have maintained strong earnings over the past few years.

Just at the very bottom, if you take a look, you can see the percentage of regulatory earnings as we have gone through those years. So, starting in 2012, 43% of our earnings coming from the regulated side of the business, moving to 2015 at 53%. And as we moved into the 2016, using the midpoints of those ranges by Company, you see a 61% contribution from the regulated side of the business.

THOMSON REUTERS

Looking forward into 2016, our earnings guidance has been issued for 2016. We did that on our fourth-quarter earnings call just a couple weeks ago. $2.80 to $3 per share. And we also have outlined here a substantial opportunity to grow the business. The cash flow remains strong, as I mentioned earlier, further enhanced by bonus depreciation. We've gotten some questions on that. I will touch a little bit more about the details on that as we go forward. And then, looking to dividend increases in the future, all of that is very, very supportive for that as we look ahead.

A little bit more about the $16 billion capital program we talked about today. This is a slide very similar to what we have shown in the past, and it tries to break it apart and give some of the pieces that we see over time.

On the far left-hand side, we show the maintenance capital that is embedded within our business. And Ralph LeRossa talked a little bit about some of the -- just the baseline capital that we are going to do from the maintenance standpoint on the utility side of the business. There is some incremental capital that goes into there, if you remember, on the Energy Strong program. That is a $1.2 billion program. Some of that will work its way into the next rate case.

If you look at the growth investment of $12 billion in the center of this slide, the biggest change that you will see year over year on power, last year that was showing as about $600 million. The power growth in this slide is $2.4 billion, largely attributable to those three combined cycle units that we have talked to you about.

And then PSE&G's distribution growth, $2.6 billion, a little bit of an uplift, largely the energy -- the GSMP pipeline program that Ralph talked about, and continued large growth on the transmission side of the business.

Ralph also talked a little bit about the potential upside on the capital that we have in our plan of the $2 billion. Distribution is about $1.5 billion of that. And the two biggest pieces that he talked about is GSMP and Energy Strong. A continuation of the work that needs to be done for the resiliency of the system is what we see and can identify, but is not an our plans, but is likely to take place in the outer years of our plan. And I will talk about that in a couple of minutes.

The other thing I would say is that potential upside that we have and the pieces that are there do not include anything from the transmission side of the business. So as we move forward and see any transmission opportunities that could come to bear, they are not in that potential upside number. That is not in our plan.

A quick look, maybe a different look, at how the capital plan compares. On the left-hand side, we see the $13 billion plan that we presented to you last year on the right-hand side of $16 billion plan in our current program.

Growth on both sides are helping that. The growth is about 2 to 1 on the power side given the new build that we do have and, on the utility side, continues to be largely driven by transmission, which is contemporaneous, and our clauses, which are on the near-contemporaneous -- treated in the near-contemporaneous mechanism.

But maybe a pause just a second on the bullet on the bottom. You can see that there is a $4 billion increase if you look at the common years of 2016 to 2019, as opposed to a $3 billion shift as we go across the 2015 to 2019, and 2016 to 2020. Obviously the difference there is 2015 and 2020. So as 2015 comes off and 2020 comes on, that delta is about $1 billion. Again, that is largely a function of the way that we plan our business. And we plan what we know.

What we put in our plan is identified investments, known investments. We know more about 2015 then we do about 2020. So, as time goes on, and we identify those investments in build those investments, we have been able to increase from the bars and the lines that both Ralphs talked about earlier today as we move forward. I will touch on that a little bit more in a future slide, but that has been our trend. That has been our track record and I would expect that to continue going forward.

Touch briefly on rate base, kind of seeing how this all works through on the utility side of things. This slide builds the rate base from our current level. You can see $13.4 billion today. To where we find ourselves at the end of the 2020 planning period. Starting on the left-hand side, you can see the split between transmission and distribution currently, about 43% transmission. That is on a 2015 basis. And as time goes on, and we move into the 2018 timeframe, you see distribution growth as well as transmission growth in that rate base. And it results in about a 10% compounded annual growth rate in that rate base to the $17.7 billion number.

Then, we step forward to 2020, continued investments in that rate base grows to $19.5 billion. A little bit less visibility as to exactly what work will be done in those out years, so you can see that growth rate tails off a little bit as it stands now, as we see right now. But, transmission also grows to over half of the aggregate rate base. And then, we talk about the incremental potential capital spend that we just talked about, which could get rate base to about $21 billion at that same 2020 timeframe.

One thing I also would say about this is to put too fine a point on these numbers probably doesn't make sense. This is a rate base number that we get to at the end of every year. Timing of spend will move as we go across the years. I know that you are trying to get to some of the numbers very precisely. Spending later in the year is not going to have as much of an earnings hit -- earnings benefit, I should say, in that year compared to the next year, where that rate base will be there for the full year.

THOMSON REUTERS

SI-SSA-0015-13606

So, sometimes when you are trying to get to them very fine point on some of these numbers and applying the math to get to an earnings number, some of that is going to come into play. I think in 2015, we had a little bit of incremental spend late in the year, as mild as the fall was, that lifted some of our spend, that lifted some of our rate base.

But if you think about it, that rate base was not in our rate base for the entire year. It will be in our rate base for an entire year in 2016.

So you're always going to have some of those movements as you go through some of these numbers. And I think just to put too fine a point on it, to make the math work perfectly, you're never going to get there. And rate base itself is never going to get exactly to earnings because there is other components as well. So, you will see some of those movements.

I guess the bottom line of all this: good line of sight into continued growth for the utility, for investments that we are making to improve the resiliency and the reliability of the system.

So, a quick pit stop to talk about bonus depreciation. On the earnings call, I believe we said that there was $1.7 billion of cash that we would anticipate to bring into the Company through bonus depreciation. That comes from both sides of the business. So you see the split here; it is about 70% utility and it is about 30% power.

It gives us cash flow, but on the utility side, it reduces rate base. And the numbers that Ralph showed earlier, was inclusive of that reduction in rate base. The numbers I just showed you was inclusive of that reduction in rate base. So that is all accounted for in there.

I think we had a question earlier about when does it come to bear. So, when does this reduction in rate base happen? I would say if you have listen to how we have characterized the mechanisms for us to get our revenue, it matches that. To the extent that our revenue is contemporaneous, the impact of the rate base reduction for bonus depreciation will also be contemporaneous.

And even on the transmission side, it may not happen immediately from a cash perspective, as we will file our formula rate. That rate will be set, and we won't get back the cash until two years later, just is how the mechanism works. But if we know that is going to happen, we will accrue that in the current year. So you can think about the accounting impact of that as being contemporaneous for us from a transmission standpoint, and near-contemporaneous to the extent of some of the clauses that we have. So, as we file those clauses, we know that we are going to have the bonus depreciation impact. They go in and they go through that way.

So, yes, rate base reductions to some degree. I would also say I think a question was asked about how that trajectory would line up. On the utility side, $1.2 billion, we think about it as being 2016, 2017, 2018. But really, what the extension did is it started with 2015 being extended, even though it was extended in very, very late December. So some of that 2015 cash flow came to us in 2016. But really, that is a reduction of 2015 rate base. That's how we think about it, and that is how we have incorporated it in our numbers.

So if you think about that number as being fairly ratable across 2015, 2016, 2017 and 2018's rate base, that is pretty close to how that number rolls through.

I guess the good news is we do have visibility to that cash flow, and we won't be coming to the end of the year every December wondering whether or not bonus depreciation is going to be extended. I think we've got some visibility as to what that is going to look like.

And then on the power side, that cash benefit just comes to us as a straight cash benefit. Bill did mention a very small regulatory asset -- a regulated rate base type asset at power that is very, very small and has nothing to do with those numbers.

So, that cash flow ultimately from bonus works its way into our sources and uses. It is big enough for us to have laid out within the 2016 to 2018 timeframe that we show here. Bonus depreciation is included in that light-blue segment that you see. It covers most, but not all, of that because we are showing 2016 to 2018 here. There is a piece that comes through in 2019. In the overall scheme of things, not the biggest part of that number.

Below bonus depreciation on the source -- staying on the sources side, cash from ops both from PSE&G and power, as I mentioned earlier, very strong cash generators on both sides of the business. Power, through its -- those three years, a very big construction cycle that it will be going through, layering in that CapEx is still free cash flow positive. So, very strong cash generation on both sides of the Company make up that bottom blue section under sources.

On top of that, we have the net issuances of debt at both PSE&G and power. PSE&G, easiest way to think about that is our regulatory cap structure is 51.2% equity, 48.8% debt. So as we move forward with PSE&G, that is exactly how that Company is capitalized. And to the extent that the debt is issued to match that, that is the number that you see within the sources side.

THOMSON REUTERS

SI-SSA-0015-13607

Also, we do have a modest amount of debt at the parent. Last November, we had a $500 million term loan that was completed under very attractive conditions. That funding basically looks to the cash flows of both sides of our business. So it is structurally subordinated being at the parent, but the diversity of cash flows and the strength of cash flows from both power and the utility help to support what was a good economic choice for financing for us at the end of last year. We will continue to look at what the best options are to finance the business.

On the right-hand side, we talked a little bit earlier about the maintenance investment and the growth investments. You see the first three years of the five-year numbers I showed you earlier. On the right-hand side, under uses, continue to find investments and ways to invest in the business. And then, last but by no means least, shareholder dividend at the bottom in dark blue, enormously important component of our value proposition to our shareholders.

So, in the next slide, we move into our credit stacks. On the left-hand side of this page, we provide a little bit of data around our FFO to debt, again, staying with the 2016 to 2018 timeframe. We are showing our minimum FFO to debt across those years, and they are well above what we would call our minimum threshold.

So, on the power side, our minimum threshold of 30% FFO to debt, we're currently -- or our minimum threshold and our minimum FFO to debt is in the mid-40s. So, excess debt capacity at power. We do a similar exercise at PSE&G, although it is a little bit more complicated because we have got to put the two businesses together. And, based upon the business mix, we will come to what that minimum threshold is.

So you see there, we have characterized it as high teens. You've got an 18%, 19% minimum threshold there. Given that we are in the low 20%s, also excess debt capacity at the parent level.

On the right-hand side, we show you basically what that means not from a percentage standpoint but from a dollar standpoint. So, a little less than $3 billion of incremental debt capacity, fairly evenly split between what shows up at power by virtue of the math that I just talked about, and which shows up at the parent by virtue of the math I just talked about.

And there is two ways to think about that, how it would translate into an investment for the Company. One, we could take that amount, we can inject it into PSE&G in keeping with the cap structure that I talked about, fairly evenly match it with debt, and a little under $3 billion would turn into $5.5 billion to $6 billion of investment capacity.

Alternatively, we could take the power piece of that, keep that investment at power and it would be the investment because we don't have any incremental equity that would be applied. And you could take that $6 billion number down to about $4.5 billion number. $4.5 billion. So, depending upon how it's deployed, you could get a different number. But in either case, very significant investment capacity that remains, inclusive of everything that is in our five-year capital fund.

And we have included a slide here using 2015 as an example of how we put our forecast together, how the capital that we are talking to you about ends up getting pulled together. The projects that we talk about today are real, known, approved, quantifiable projects. As time moves on, we continue to identify things. But basically, we plan what we know.

If you look here, I reference $3.9 billion of capital spending in 2015. If you go back in time and look at what the number would have looked at from a 2012 standpoint, we had clear line of sight on $1.5 billion of capital to be spent in 2015. As we moved into 2013, $900 million of incremental 2015 capital was identified, and we layered that into our forecast. The same effect happens in 2014 and we move into 2015.

PRESENTATION

Dan Cregg - ***Public Service Enterprise Group Incorporated - EVP and CFO***

So this is one year's example of how we get from the line that Ralph showed on his chart from last year's conference to the bars that was behind that line on Ralph's chart, as we move through time, identify investments and find other ways to deploy capital.

So this is one year, one example, but as we move through time, we see incremental investments over time, and this just gives you a sense as to how that ends up coming together. 2015 was probably a little on the larger side of increases as we move through time, but certainly indicative of the process.

So step over for a second and talk about pension and OPEB obligations. All in all, we are in very good shape here. We mentioned on the earnings call a couple of weeks back that we made a change to one of the calculations within our pension expense calculation. Our previous method applied a single levelized average rate in determining our expense calculation for interest and service costs. The revised method doesn't levelized that rate, but it uses a spot rate across the yield curve. And as

© 2016 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13608

you can imagine, a lower rate in the near term being applied to the near-term cash flows, rolled out over time across the shape of a yield curve, will end up giving a lower expense number for your interest expense and for your service costs.

So this is a treatment that we looked a lot at the tail end of last year. It has been reviewed by the SEC and the big accounting firms. We believe it is a more accurate method, and, frankly, I think we have a tough time from an accounting perspective going back to the old method because this is a more accurate method.

But during periods with a rising yield curve, we will end up with a lower overall expense. And we see that as we go from 2015 to 2016. The delta between the old method and the new method on a pretax basis covering both OPEB and pension is about $47 million pretax. Net net, if you look at the total expense 2015 versus 2016, it is about a $25 million decline year over year. And as we go through time, that benefit to the bottom line will decline over time, which actually makes sense if you think about the shape of a normal yield curve. So that benefit will roll off but will remain a benefit throughout the five-year horizon of our business plan, given the facts as we see them right now. And of course, everything will change based upon interest rates and so on and so forth.

More broad, that change, by the way, does not do anything to the PBO. The PBO remains exactly where it is, and we remain 91% funded against that PBO. So, very modest contributions on a go-forward basis to fund the pension.

More broadly against O&M, I won't spend too much time here. I think Ralph talked a lot about it. Bill talked a lot about it. And Ralph and Bill talked about a lot it back at the shop, too. A lot of attention paid to O&M. It is an important part of what we do on a day-to-day basis. We have not put forth any special programs. This is really in our DNA to watch our cost control, keep an eye on things and manage the business on a day-to-day basis.

One thing I would point out, this slide looks backwards and it looks from 2011 out through 2016. The header looks forward and says that if I took a snapshot of my 2015 O&M and I look outward in my plan out to 2018, in the aggregate our O&M is about flat. We do get a little bit of a help from pension, but even absent that help, we would still be less than 1% overall, 1% growth in O&M on a year-over-year basis. So, good work and not by accident. It is from a lot of attention that we pay to it.

That brings us to the dividend. We show the last five years here and our indicative rate for 2016. We are very, very pleased to announce an $0.08 increase. The other thing, Ralph touched on it but you can see it visually here, we have also overlaid on this slide the green line is PSE&G's stand-alone earnings. So this is the picture matching the words that Ralph said that our dividend in the aggregate, given our indicative rate for 2016, can be covered completely by PSE&G's earnings.

We have also said in the past and we continue to look at the dividend through a whole host of different elements. There is no formula per se that we use to come to the dividend. But we do take some comfort from the fact that we have an increasing contribution from the regulated side of the business. And we also feel good about having the opportunity to once again state that we do see the opportunity for meaningful and sustainable growth in that dividend as we go forward.

Finally, a quick look at sensitivities. And we have talked a little bit about some of those. On the power side, it does reflect the hedges that are in place, and you can see that most clearly in the first line, given the overall change in natural gas prices.

As you move through time, you can see that your sparks and darks do not move too much. So you can also see, based upon Shahid's slide and how hedged we are in that area of the business, that is a more open position.

Maybe just one thing, quickly, on the E&G slide: these are the same elements that we have shown you in the past. On the very bottom of the page, for the transmission and distribution ROEs, sensitivity that we did here, we bumped up. Historically, we showed you 10 bps; we are showing 20 bps. Historically, we have showed you that is $0.01; that is still $0.01. But showing 20 bps, you can see that as we move into the tail end of the plan, you will see that start to come up. So transmission being a little bigger part of our rate base. A delta on ROE would have a little bigger impact. That gets to $0.02 earlier. And as we move through 2019 and 2020, you would expect to see distribution turn exactly the same way.

So in summary, strong 2015 earnings at the top end of our guidance. 2016 guidance set. Rate base continues to grow at the utility. We continue to transform the power fleet and really make it infinitely more efficient. Really, really strong investment capacity for the Company. A lot of growth in the plan and opportunity to grow beyond that with the balance sheet that we have. And, of course, the opportunity for dividend growth.

So with that, I will ask Ralph to come up and join me, and we will take some questions.

QUESTION AND ANSWER

Unidentified Audience Member

Hey, Ralph. There is this fixation on the idea that you are going to split up the Company. You get the question at every conference, on every quarterly earnings call. So I guess I will get it out of the way at the analyst day.

The over-under that -- when I talk to investors is basically that the bet is five years over or under. At what point does the business become non-synergistic? Because right now, they are clearly synergistic, that the cash flows that power is generating fund the very robust capital spend at the utility. At the same time, you are trying to grow power. That makes people little nervous, but you are zigging when people zag, which is probably better than paying 2.5 times book for another utility.

So can you talk about, in your mind, what the key things are that you sort of review in a normal course to decide, are we getting closer to the point where that is realistic, not realistic? And give us some odds on the over-under (multiple speakers).

Ralph Izzo *- Public Service Enterprise Group Incorporated - Chairman, President, and CEO*

I'm sure I am being kind to myself because as I think back over my entire life, there are two things I wish I had not said. Fortunately, neither of them were to my wife. But, one of them was when I allowed myself to be coerced into putting a timeframe on my notion of long-term -- and the second one I won't mention in mixed company, either.

But, Greg, you hit upon some of the things that we think about all the time. So first of all, let me say that what I am about to tell you is no different than the way I viewed this six months ago or a year ago. I don't remember how I viewed it two years ago. But over that time frame, the six- to 12-month time frame, nothing has changed.

There are some very good tactical reasons for keeping the two businesses together today. You hit upon one of the most important ones: the cash generated at power that the utility benefits from without the need to issue equity.

The second is something that Ralph and I showed in terms of the customer build. The overwhelming majority of power's customers are PSE&G people. Not directly. It is through BGS; it is through the wholesale power market. But that lower power price environment is what enables us to invest heavily on the delivery infrastructure.

And the third and probably the least important of the reasons is just the fact that we are a $22 billion market cap Company. I am not sure what the sum of the parts would yield; let's call it 14 and 8, 15 and 7, something like that. Two reasonably sized companies, but all of a sudden you're spending $20 million, $30 million more in corporate support, and that is a dis-synergy that nobody really values. So, very good tactical reasons for staying together.

As I look to the future longer-term, you see that power is a great business. I mean, it is not making VCRs. It is not making black-and-white TVs. It is producing electricity. And it is producing, as Bill Levis said, where satellite pictures show you the most illuminated part of the planet.

So it is going to grow. I don't believe that a strategy for a good business is to hide it behind a rock that is getting bigger and bigger called a utility. So where will power grow? More likely, outside of Eastern PJM. And why is that? Because HHI and various other measures that one would use would really limit power's ability to acquire assets in Eastern PJM. And I am not a big fan of building assets when demand is flat. There is some unique circumstances around Sewaren that we have discussed publicly that made sense to us to go ahead and build them.

So power is going to grow; it is going to grow either by expanding sites like Bridgeport or acquiring assets like Keys. That means a couple of things. That means, number one, power's capital requirements are going to increase. Less cash flow to feed over to the utility. Number two, it is going to be serving customers that don't have a PSE&G bill. Number three, as it grows and the utility grows, that $22 billion market cap company hopefully becomes a $30 billion and $40 billion market cap company. And, therefore, the dysynergies become less important.

Long-winded way of saying all three of the major tactical reasons for staying together become less critical as that movement occurs. And then you start thinking about the strategic reasons. I never want to foreclose any options at that our Board of Directors have or that we have. But we have given you a 10-year time frame where the utility to power investment is kind of like 3 to 1. I think you have a legitimate claim to a really nasty curveball. Suddenly we were to reverse that ratio. And that goes to the strategic flexibility of the two businesses going forward. It might be some strategic flexibility that you would want to exercise in a growing power business that if you are somewhat constrained from doing today.

THOMSON REUTERS

SI-SSA-0015-13610

So I won't give you an over-and-under on the time frame, but that is the logic. And then there could, of course, be disruptive things that occur either in power market designs and strategic alternatives that occur sooner than that that would change that time frame. But that is the logic. That is the logic we have applied also.

I'm going to make Kathleen cringe here. I kind of enjoy pretending to be a physicist once in a while. When I think about how Einstein was trying to explain to people that as you approach the speed of light time stands still, on the one hand, we operate a business that Bill Levis was describing where we are trying to run our nuclear plants for 80 years. On the other hand, every time I have a conversation, whether it is on a daily basis or a weekly basis, people are asking us, what are we going to do about splitting the Company. I try to explain, you don't understand; we move deliberately, slowly, with stability and thoughtfully. And it has served us well, and I would like to continue doing that for the foreseeable future.

Unidentified Audience Member

Perhaps a follow-up on -- well, there is some logic to this. To follow up on Greg's question a bit, can we talk about the dividend and the dividend growth and, specifically, the payout ratio under the context of a future -- again -- a potential five-year, whatever you want to call it, spin? How do you think about the stand-alone structure? Presumably, it would be a spin. There is no cash proceeds from the sale. How do you think about a 90%-ish payout against the utility today and what that might be in the future and how that drives your dividend growth today?

Ralph Izzo ***- Public Service Enterprise Group Incorporated - Chairman, President, and CEO***

Right. Again, we talk about these things and we have a bunch of options. I think Julian and Dan, I welcome your complementing what I -- with an E not with an I -- what I am about to say -- in the word complement.

So I suspect that you would not spin power at its current cap structure. So there is a fair amount of leverage that one could put on the business without going crazy because the business risk profile would change, and the credit markets and the agencies would react appropriately to that. And we are conservative Company, and I think that conservatism has served us well. And I would envision certainly that initial foray out into independence would carry that kind of conservatism.

But you would have some cash. You could save that as a war chest for the utility to diminish its equity needs in the future if it continued its capital program. You can use that to buy back stock and reduce the amount of dividend that one would have to issue overall. Or one could simply use that as a bit of a cushion to continue the dividend growth that one has at the utility. Albeit, if this were to happen at some period in the future, I'm not going to pick the years -- the utility growth exceeds the dividend growth right now. So on a stand-alone basis, you wouldn't want a 93% dividend payout ratio, which is what, right now, the ratio looks like in terms of our dividend to utility.

But if you did this in [10] years and was multiplying the utility growth rate minus the dividend growth rate -- and right now that looks like a number like 5, because of the delta, then you could get that 93% down to a more manageable number for the utility.

So I think there is a lot of different options is the short answer to that question.

Unidentified Audience Member

And perhaps just to follow up on a couple of specifics there, if you can yet. One would be, what do you see as an ideal payout ratio for regulated utility, if you want to go there? Not diversified. And then, separately, what is an appropriate leverage metric or range of metrics as you see for a power business?

Ralph Izzo ***- Public Service Enterprise Group Incorporated - Chairman, President, and CEO***

On the former, it is really largely contingent upon where the credit markets are and what peers are doing. I don't know that you get any credit at the utility if you have a 30% payout ratio and your peers are at 60% and you are yielding some number appreciably different from theirs. So we look at that all the time. We look at what our earnings multiple is, what our yield is and what our payout ratio is. And that is why we don't give a quantitative dividend guidance.

This is not a good sign, but I forgot your second question already.

Unidentified Audience Member

Power leverage.

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President, and CEO***

Oh, power leverage. Yes; my guess is that the business risk profile would change since the power would be sub-investment grade. I would want it to be as strong a sub-investment grade as possible. I don't know -- BB-plus. If you want to keep the relevant ratio of EBITDA to debt of 2 rather than 7. And just keep it a Company with a very solid amount of dry powder.

I don't think it would be an income stock, if that's where you were going. Clearly, what you would allow your investors to do at that point in time is decide where do they want to be. And if they wanted to sell the commodity cyclical growth stock and buy more of the utility to preserve their dividend, then they could do that.

Unidentified Audience Member

Right. And said differently, the threshold for power on a stand-alone basis would not be the same 30% minimum threshold you have today.

Unidentified Company Representative

I think that that would be determined as we go down that road. The other thing just to think about when you're talking about the aggregated amount of the dividend, you are comparing a dividend that is supporting the entire Company, and you are asking about a dividend that on a go-forward basis would be going to a company much, much smaller than that. So from a payout ratio, if you look at it against the utility backdrop, but it is going to a different market cap. So the yield comes into play as well.

Unidentified Audience Member

Unfortunately, a little bit more mundane question, but on the pensions, just trying to understand. I just have a couple of questions around that. First, I guess just maybe a little bit more thinking on changing the methodology, why you did that. I think Entergy did something similar. And I don't know if the rest of the industry is going to go in the same direction.

And then, on top of that, what was the discount rate that was marked, and when did you mark that? What is the timeframe? And then, I have a follow-up after that.

Unidentified Company Representative

On the change, we've -- as I said, we spent the better half of the -- certainly the last quarter of last year and a portion of the quarter before that taking a look at it. And kind of a rough poll, about half of our like companies that are eligible have adopted, too.

There are some -- so one thing I described before is it is a more accurate method. It doesn't force you to make that adoption, but it has been deemed to be a more accurate method. If you have a bond-matching methodology, without getting too technical into the pension, no such determination has been made. So I think it is a subset of companies that are eligible for it to be determined a more accurate method. And among those, we have seen a fair number of them change. Some are maybe awaiting regulatory treatment. We thought that it is a more accurate method. It is a better method. We were going to go forward and make that change. I don't recall the discount rate exactly. It is in the K. We can look it up rather than try to guess at it now.

Unidentified Audience Member

And then, just a follow-up. I understand the benefit of 2016 versus the 2015 expense. And if I remember correctly, the old method that you used was weighted heavily towards the equity market. And so this seems to be more weighted towards the bond market. I don't know if that is accurate. But just (multiple speakers) question because that may be completely inaccurate.

THOMSON REUTERS

But I guess my question really is, what was -- if you kept the old method, what the delta would have been relative to what it is. So not just what it is in 2015, but what it would have been in 2016.

Unidentified Company Representative

Right. As I had given both of those numbers, the $25 million is just a pure year-over-year expense delta. And $47 million is current-year, old-versus-new-method delta on a pretax basis. That's right. And what you were referencing before, I think, was how do you think about your investment mix in the fund. And it is [70%] equity, [30%] fixed. And that remains -- that is not changing by virtue of what we are doing here.

Unidentified Audience Member

I guess two questions on the power strategy. First is just on, at a high level, I don't know if this is for Ralph or even Shahid. But just to the degree that you are able to add new capacity at a good return at full placement cost, a bunch of other people are also doing it -- at least, there is a big backlog of these new projects coming in.

I am struggling with the idea of how is that going to indicate that we are going to see better markets in the future. It just seems like by definition almost it is just directed to be worse. We are going to get a lot of new, efficient plans being built, earning good returns, as proposed, at least, into a market. Usually a market gets better when people stop adding new supply and don't earn good returns on new supplies. So how are you -- since you don't have to do this, and you can kind of move your capital, how do you get comfortable with that in your market view?

Ralph Izzo ***- Public Service Enterprise Group Incorporated - Chairman, President, and CEO***

Sure. Each of the investments we made have different foundational reasons why we moved in that direction. What they share in common is the same financial analysis and the same risk-adjusted return expectations that we have for them.

So as Bill and Shahid mentioned, in the case of Keys, it was a rare opportunity to make an acquisition and not lose out on the winner's curse. Primarily because we apparently have greater confidence and, I would think, even ability to manage the construction risks that scared some other people away from the project. The market dynamics for us really were to the point that Bill mentioned in terms of the low growth in that area and basis risk management challenges that we have experienced, not having anything in Western PJM, which is where -- I guess it is in Southwestern Mac.

In the case of Sewaren, a fairly different story. There, we were retiring megawatt for megawatt from point of view of capacity markets and not harming ourselves there, capturing the benefits of the regional spark spreads that we had. We knew that the old Sewaren unit could not bid into the capacity market. It just really -- it served us well for 60 years, but the duct tape wasn't doing the job that it needed to do for capacity markets. And we knew that somebody else would build, given pricing and PS zone and capacity markets and where regional sparks spreads were.

So we had injection rights. We didn't want to lose those. And we said, all right, if the numbers work, let's go forward.

As we move up to Bridgeport, a similar story there. We have a coal plant that had become a peaker; ran basically in January as a result of gas constraints in winter in that region. We like the seven-year lock. We would rather be a seven-year lock whether it is new or old build. That is a different policy discussion we can have. But we said, okay, if we can get the right price and we do have dual fuel capability at that site, then we will build something. It is a bit more modest in size, a little under 500 megawatts. And it works.

I think, in general, Steve, I would agree with your thesis that new build is not something that would be part of our preferred approach. I tried to make a point of that on the last quarter call. People shouldn't interpret these new plants as a trend or a pattern. I tried to embed that in my answer to Greg's question in terms of where supply and demand are.

But the reality is that there is supply being removed from the market, whether it is HEDD units or coal units. And right now, the benefit of building new is that you are building a 6,100- to 6,500-heat-rate plant with a 30-year life, with manufacturers themselves telling you that, hey, in the next 10 years maybe those heat rates are going to improve by 5% or 10%, but you are not going to see the step function change that you have seen in the prior 10 years. So we think these are really solid assets for the foreseeable future.

THOMSON REUTERS

What that will mean for capacity markets, I think, is that -- I am not going to predict capacity prices. But they have been baked into capacity markets; they have been the result of capacity markets. And what they mean for energy margins is you are going to see some periods of time where you're going to get $12 prices because of $2 gas and 6,000 heat rates; that is what the number comes out to be.

But that won't be the lion's share of the time. And we have a fleet that can now benefit from the point of view of 50% -- over 50% of it being base load, operating at -- $12 per megawatt hour fuel cost to get the benefit of the $30 to $40 days that there will be in that market.

So, in general, I would say not a big fan of building new supply per the reasons you implied. However, these were three special situations that made sense for us.

Unidentified Audience Member

And just one follow-up question on the thought process in terms of the mix of the Company. The Company has done well to consistently produce better results. Utility has grown a lot, and increasingly the multiple has reflected the more of a utility-like stream. As you think about growing power more again, how did you think about that aspect of it in terms of -- a lot of the other peer companies are kind of increasingly exiting or shrinking this business. You are now kind of growing it again. And I know the utility will grow still and maybe faster, but just in terms of the overall valuation of the Company, how did you think about that?

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President, and CEO***

Yes. So I don't want to second-guess or be critical what others are thinking. I am sure a lot goes into it; a lot more than what I am aware of. But I just -- two things that I have said time and time again, and I will repeat them today. One, we don't have a magic ratio of regulated to unregulated. If we get some improvement in gas prices, either because of discipline in terms of the extraction business or because of environmental constraints put on the process or seismological constraints put on the process or we get a price on carbon, all of that will be uplift to our power business without CapEx. And that would be a great thing. And if I come back here next year and say that the utility is 40% of our earnings because power has grown for these reasons, I hope nobody in this room would be grumpy about that.

Number two, it is something I said a moment ago, I don't believe a sensible strategy is to say, let's grow the utility so nobody notices power. Power is a darn good business. It has got great assets in great locations with minimal environmental impact. We have got a team that operates them beautifully, flawlessly. And we are going to seize those opportunities where it makes sense to seize them.

If I ever thought for a second that we just have to grow the utility so as to hide power, then we would spend spin power. But that would be crazy. That is not the reason for spinning power. I don't want to suggest if and when we ever do spin power, it is because we thought that it was something we couldn't hide anymore. I always worry about people taking absurdities and interpreting them as reality.

But it just doesn't make any sense to me to get more regulated so that nobody notices this great business that we have called PSEG Power. We are getting more regulated because the customer bill allows us to get more regulated.

Do you have a question, Kathleen, or are pointing to the --? (Laughter) I was starting to worry.

Unidentified Audience Member

Ralph, a question on the regulated business. And I am just using the numbers you guys put out in the slides, and this may be for you or for Dan. You gave guidance for 2016 rate base of about $15 billion. And the midpoint of your expected earnings guidance for E&G is about $900 million. Just kind of simple rate base math would imply like a 12% to 13% earned ROE. Can you -- just using the data you have put out there, can you just talk about what is driving that and how you view that versus a normal operating environment for E&G?

And then, after you address that, I will have one follow-up on it.

(technical difficulty)

Ralph Izzo - ***Public Service Enterprise Group Incorporated - Chairman, President, and CEO***

THOMSON REUTERS

SI-SSA-0015-13614

So we are keeping a capital base that is consistent with our regulated rate structure. And as we also talked about before, we are a little bit of a hamster on a wheel on a wheel as we try to control O&M. And Ralph has done a great job of that, but still in the last five years it has been at 2%, 2.5%. And over the last five years I think we have seen low destruction overall even though we are expecting out of there to be a .4% growth rate going forward, which is why it wasn't too painful.

To a base rate case submission no later than November of 2017. There are differences between book ROEs and regulatory ROEs, and that may be some of what you are seeing in that regard, Michael. But I will let Dan fill in the rest.

Dan Cregg *- Public Service Enterprise Group Incorporated - EVP and CFO*

The only other thing that I would add is that there is a host of things, obviously, that goes into earnings and where they land. And rate base is certainly one of them and is certainly not an insignificant one. And I said what I said before for exactly that reason. You put too fine a point on exactly what that rate base number is and you try to draw a line and do your math, the lumpiness of it, some of the different elements that come into play, when it comes in, how much you earn on it one year versus another, is going to make that go askew. And our intention here is to try to give an understanding as to how the business is going to grow longer-term, what it is going to look like longer-term, as opposed to trying to put too fine a point on a particular year.

So maybe a lot of moving parts go into it. So I will leave you with that.

Also, the other thing that people maybe have to think about differently as we go forward into this new regime is that bonus depreciation has a pretty sizable impact, but it is not done when the cash comes in the door. So it starts to unwind the other way as time moves on. It will impact -- if you have gotten that much money now, you're going to have some less money later on because you are not getting more money. You are getting the same money sooner. So some of those disruptive forces within the numbers come into play, too.

Unidentified Audience Member

Ralph, a follow-up. How are you and the Board thinking about M&A in the sector in general? And when you talk to the Board, what are some of the things that you are saying are kind of the pros for potentially utility sector M&A and especially PSEG's position for that? And then, what are some of the drawbacks?

Ralph Izzo *- Public Service Enterprise Group Incorporated - Chairman, President, and CEO*

We were approached by quite a few folks in the banking industry; smart people, friends, professional friends, people who I respect. And they told us that we really were missing the boat and that train had left the station -- whatever analogy you want to use. Look at all this action to consolidate. Small-cap companies and the premiums were getting frosty. And I said, look, I get it. I don't want to be left at the station. You find somebody to give us a 40% premium and then we will talk to them tomorrow.

Again, I am sure there is a lot of thinking that goes into these transactions. I have a tough time getting my head around the multiples that people are paying, and we are just not going to do that.

So from the point of view of just using inexpensive debt to get earnings accretion begs the next question: what else could you have done with that inexpensive debt. Maybe you could have been more accretive and actually trade some value.

So I would say that that strategy doesn't make sense to us. Again, there is probably some stuff I am missing, just like people want to understand Sewaren and Keys and Bridgeport. And we had to do some explaining that maybe it wasn't obvious at first blush.

If you look at MOEs, in the integrated space, there are not too many E's out there. So that would solve the premium problem, but you would have to find an appropriate candidate. It is a small space. It is not impossible, but it is small. And then you look at the pure-play IPPs, and, again, I would think that would be a pretty vicious curveball to throw our investors, given the investment profile that we have had and we expect to continue to have.

So you never say never and things could happen. Conversations take place all the time. But certainly in terms of the bulk of the activity of late, which has been acquisition of small- to mid-cap utilities, we have run numbers and it is hard for me to understand.

THOMSON REUTERS

Unidentified Audience Member

Question on if I -- earlier, you guys said that you think power maybe has reached a floor -- power price has may be reached a floor. Quoted some Morgan Stanley report; gas prices going up. But at the same time, the utility has benefited from the low commodity price, the ability to spend a lot higher CapEx. And you haven't seen the customer bills.

Should we say a lot more pushback from regulated, particularly your regulators? If you start seeing this upward trend in power price, the ability to get CapEx approval and some of the transmission spend you had and all the other regulated spend, should that be tapering off as you move out if power starts moving?

And the second question, really out of the blue, any comments on the Supreme Court, like when you get a decision on LCAPP?

Ralph Izzo *- Public Service Enterprise Group Incorporated - Chairman, President, and CEO*

Yes. First of all, let me expand on what Shahid mentioned. Because I don't want to give people the mistaken impression that we manage the business based upon any one particular bank's point of view of what is going to happen in commodity markets. We read all your reports. We make sure we digest them and we understand them. And when there is alignment with what we think might be happening, we test to make sure that is not just serendipity. And when there is misalignment, we try to understand that. And at the end of the day, we manage the business based upon the forward price curve and the disciplined hedging approach.

Other than that, Shahid and Bill know if they want to take a point of view that is outside of the guideposts that we give them, and they believe the market has it wrong, my first question is, explain to me why the market has it wrong. Because anything other than a rational answer to that is guesswork and gambling, and we don't gamble.

So I don't know if power prices are headed up. The forward price curve is in contango. If I remember, I looked at it, I think it was just yesterday, it basically says that there is a pretty bearish look for the rest of 2016. A nice step up in 2017, and that is where prices stay until 2018 and 2019. I think that is more a function of the fact that markets are illiquid out in that time frame. And people are really pulling in their time frames in terms of how far out they're willing to bet.

So you have as much visibility to that forward price curve as we do. We give you our hedge profile, and that is a fairly disciplined approach that we take. We do tell you when we have drifted a little bit below or a little bit above. Typically that is in response to what we think is the short-term nature of the market. And we have seen two great examples of that short-term response on the part of the market. We saw one coming out of the polar vortex, where everyone thought prices were going to be high forever. We drifted up in terms of our guideposts when that happened. And we saw a little bit of last year when people thought that the fact that we were running our air-conditioning units in December, where it meant that global warming was going to scorch the planet; we would never have a winter again. And we drifted down in terms of our hedge profile there.

So -- but always within very clear boundaries of what we allow the trading function to do.

Unidentified Audience Member

Just a little bit -- I know you don't provide forward earnings for either part of the business, but on the utility side we have a rate base growth by which we can get some sense of growth on the EPS side. But am I correct, what you provided us were the building blocks today? And if I heard a little bit of the commentary from the power side also, that it seems like 2016 and 2017 are the kind of the tough years. In 2018, we should get higher EBITDA from the new plants that come online. And then you have already won the CP auction that helps the earnings on the power side.

So it is like a lull and then an upward spike, based on, of course, (inaudible) has to stand there based on power projects coming online and capacity auctions that are there. Would that be a safe summarization of the power's outlook?

Ralph Izzo *- Public Service Enterprise Group Incorporated - Chairman, President, and CEO*

I would say the safe summarization is that we have given you building blocks, but there are some blank spaces that we don't have any better visibility than anyone else that you need to fill in. So you are completely correct on the utility. We have got rate base growth. Ralph has told you what his expectations are for O&M growth. There are some perturbations in there in terms of what might pensions use to make that easier or harder to achieve, where interest rates are going. That might move 10, 25 basis points in terms of expected ROE coming out of a rate case probably for rates effective in 2019.

THOMSON REUTERS

But not a whole big error bar to figure out in utility. Maybe a couple billion dollars more in programs; that will be Andy's question -- in terms of the back end of the five-year plan in terms of additional CapEx.

On the power side, yes, we know what capacity payments are going to be for the next three years. We have given you the hedge profile. You have got to fill in what do you think the spark spread is going to be over that time frame. We have told you what we think the terawatt hours are going to be in terms of production. Yes, that uptick is largely due to the new combined cycle units. All three of them have cleared auctions, so you know at least what they are going to get for half a year, that half a year being the second half of calendar year 2018.

In the case of Bridgeport, you know what it is going to get for seven years, which is kind of nice, in the case of Sewaren and Keys. We will find out more in about a month and a half, I guess, when PJM does their auction.

So those are the unknowns. What will future capacity payments be for the fleet, absent Bridgeport, and what will sparks spreads look like? But you know what the hedge profile looks like, you know how we hedge and you just need to fill that in.

Unidentified Company Representative

Last question.

Unidentified Audience Member

Just switching gears here, if I can. You guys have an equity investment in the PennEast pipeline. What are your thoughts about further gas transmission for the midstream assets? You see a couple of utilities -- DTE and [Exterra], Dominion, and now Con Ed just got an equity investment in the pipeline. Any thoughts about further investment in that part of the business?

Ralph Izzo ***- Public Service Enterprise Group Incorporated - Chairman, President, and CEO***

I don't think you should expect to see us making large investments in that business. I happen to serve on the board of a midstream company. It is a very different business than the one we operate. Our reason for participation in Penn East, quite candidly, is that we would have been the only New Jersey gas utility not to have a position in that. And we just thought that that would be not a very good place to be, given others' desire to bring -- and our desire to bring lower-cost gas to our retail customers in the space. Otherwise, it would not have been a priority investment decision for us; not for any reason but we had other ways to deploy the capital.

So you should not expect to see us go heavily into the midstream business. And, again, I don't want to speak for others why they think it is a business that is consistent with their core set of competencies and skills.

So I think that Kathleen signaled that was the last question. I want to thank you for spending time with us. I hadn't realized until Ralph mentioned it, it is the 10th year that a good part of this team has been doing this together. And the key takeaway I hope you get from this is steady as she goes. Stable, consistent growth in the utility of a fairly attractive magnitude. A very, very healthy power business supported by healthy financial ratios with a bright future in terms of repositioning of that fleet. And we take quite seriously the stewardship: the stewardship for our customers; the stewardship of our employees; and the stewardship of our shareholders.

So thank you very much for your time.

2016 PSEG Investor Conference

NEW YORK – MARCH 11, 2016

PSEG

We make things work for you.

We have the
energy
to make things better
... for you, for our investors
and for our stakeholders.

SI-SSA-0015-13619

Forward-Looking Statement

Certain of the matters discussed in this report about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute “forward-looking statements” within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words “anticipate,” “intend,” “estimate,” “believe,” “expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- adverse changes in the demand for or ongoing low pricing of the capacity and energy that we sell into wholesale electricity markets,
- adverse changes in energy industry law, policies and regulations, including market structures and transmission planning,
- any inability of our transmission and distribution businesses to obtain adequate and timely rate relief and regulatory approvals from federal and state regulators, including prudency reviews and disallowances,
- any deterioration in our credit quality or the credit quality of our counterparties,
- changes in federal and state environmental regulations and enforcement that could increase our costs or limit our operations,
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry,
- changes in nuclear regulation and/or general developments in the nuclear power industry, including various impacts from any accidents or incidents experienced at our facilities or by others in the industry, that could limit operations or increase the cost of our nuclear generating units,
- actions or activities at one of our nuclear units located on a multi-unit site that might adversely affect our ability to continue to operate that unit or other units located at the same site,
- any inability to manage our energy obligations, available supply and risks,
- delays or unforeseen cost escalations in our construction and development activities, or the inability to recover the carrying amount of our assets,
- availability of capital and credit at commercially reasonable terms and conditions and our ability to meet cash needs,
- increases in competition in energy supply markets as well as for transmission projects,
- changes in technology, such as distributed generation and micro grids, and greater reliance on these technologies,
- changes in customer behaviors, including increases in energy efficiency, net-metering and demand response,
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements,
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers, and any inability to obtain sufficient insurance coverage or recover proceeds of insurance with respect to such events,
- acts of terrorism, cybersecurity attacks or intrusions that could adversely impact our businesses,
- delays in receipt of necessary permits and approvals for our construction and development activities,
- any inability to achieve, or continue to sustain, our expected levels of operating performance,
- changes in the cost of, or interruption in the supply of, fuel and other commodities necessary to the operation of our generating units,
- an extended economic recession,
- an inability to realize anticipated tax benefits or retain tax credits,
- challenges associated with recruitment and/or retention of a qualified workforce, and
- changes in the credit quality and the ability of lessees to meet their obligations under our domestic leveraged leases.

All of the forward-looking statements made in this report are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business prospects, financial condition or results of operations. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this report apply only as of the date of this report. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if internal estimates change, unless otherwise required by applicable securities laws.
The forward-looking statements contained in this report are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-13620

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Operating Earnings exclude gains or losses associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting, and other material one-time items. PSEG presents Operating Earnings because management believes that it is appropriate for investors to consider results excluding these items in addition to the results reported in accordance with GAAP. PSEG believes that the non-GAAP financial measure of Operating Earnings provides a consistent and comparable measure of performance of its businesses to help shareholders understand performance trends.

PSEG is presenting Adjusted EBITDA because it provides investors with additional information to compare our business performance to other companies and understand performance trends. Adjusted EBITDA excludes the same items as our Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization and major maintenance expense costs at Power's fossil generation facilities. This information is not intended to be viewed as an alternative to GAAP information. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income to reconcile to Operating Earnings and Adjusted EBITDA with a reference to that slide included on each of the slides where the non-GAAP information appears.

These materials and other financial releases can be found on the pseg.com website under the investor tab, or at http://investor.pseg.com/

SI-SSA-0015-13622

STRATEGY – GROWING HIGH-QUALITY, LOW-RISK ENERGY INFRASTRUCTURE COMPANY

Ralph Izzo

CHAIRMAN, PRESIDENT AND
CHIEF EXECUTIVE OFFICER

PSEG

We make things work for you.

SI-SSA-0015-13623

PSEG's Strategy

Investment program delivering results

Operational Excellence: Maintaining reliability and improving performance as we control costs in low price environment

Financial Strength: Strong financial position supports investment program and dividend growth

Disciplined Investment:
- Balanced business mix
- Robust pipeline of opportunities

Results:
- 3rd year of EPS growth
- Continued dividend growth
- Best in class utility growth rate
- Addition of efficient CCGT capacity enhances market position

SI-SSA-0015-13624

Two strong businesses

A stable platform, each with growth opportunities

PSEG

PSE&G	PSEG Power LLC
Electric & Gas Delivery and Transmission	**Regional Competitive Generation**
Strategy: Investments aligned with public policy and customer needs **Value Proposition:** A ~$12 billion infrastructure program producing high single digit rate base growth through 2020	**Strategy:** Investment program enhances competitive position with addition of efficient, clean, reliable CCGT capacity **Value Proposition:** Provides substantial free cash flow in current environment and upside from market rule improvements
2015 **Assets $24B** **Operating Earnings $787M**	2015 **Assets $12B** **Operating Earnings $653M**

SI-SSA-0015-13625

ASSETS AND OPERATING EARNINGS ARE FOR THE YEAR ENDED 12/31/2015.
PSE&G AND POWER DO NOT ADD TO TOTAL DUE TO PARENT AND PSEG LONG ISLAND ACTIVITY.
SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/NET INCOME TO RECONCILE TO OPERATING EARNINGS

Delivering on commitments and realizing growth

Operational Excellence	• PSE&G: ReliabilityOne Mid-Atlantic Region's Most Reliable Electric Utility (14th consecutive year), Electric Light & Power's 2015 Utility of the Year, ReliabilityOne Outstanding Outage Response Time and Outstanding Customer Engagement • PSEG Power: Record output from combined cycle units • PSEG Long Island: Improved customer service and reliability while managing costs • PSEG: Cost-control benefits continue
Financial Strength	• Operating earnings for 2015 of $2.91 per share at upper end of guidance range • Cash flows and business mix support strong credit ratings and ability to fully fund robust investment pipeline without issuing new equity • Increased dividend in 2015
Disciplined Investment	• PSE&G capital program drives continued rate base growth over the 5-year period (2016-2020) with increased investment in Transmission, Energy Strong, Gas System Modernization Program, and Electric and Gas distribution • Power capital program focusing on growth investments including Keys, Sewaren and Bridgeport Harbor, Nuclear and Fossil uprates, PennEast Pipeline, and Solar Source

SI-SSA-0015-13626

SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/ NET INCOME TO RECONCILE TO OPERATING EARNINGS.

Focus on building a reliable, efficient, clean energy infrastructure

2011	2012	2013	2014	2015

Selected Accomplishments

2011
- Expanded investment programs focused on infrastructure upgrades, energy efficiency, and major transmission projects*
- Sale of Texas generating assets
- Nuclear license extensions and uprates

2012
- Award winning Superstorm Sandy storm response restoring 2.1M customers
- Final federal approval for Susquehanna-Roseland transmission project
- 400 MW of new peaker capacity**

2013
- Expanded Solar investment
- 90% nuclear capacity factor for 9th straight year
- Record output from Linden CCGT and Salem 2 Nuclear Unit

2014
- Energy Strong program approved
- Advanced Gas Path uprates (through 2018)
- PSEG Long Island management contract effective

2015
- Gas System Modernization Project (GSMP) and Energy Efficiency Extension II approved
- New generation build starts Power fleet transformation
- Solar Source portfolio reaches 277 MW_{DC}***

← Cost Control →

SI-SSA-0015-13627

PSEG

* INVESTMENT CONTINUED FOR SUSQUEHANNA-ROSELAND, BURLINGTON-CAMDEN, NORTH CENTRAL RELIABILITY, AND STARTED FOR NORTHEAST GRID AND MICKLETON-GLOUCESTER.
** KEARNY AND NEW HAVEN. *** AS OF MARCH 2016.

Growth in capital spending aligned with customer needs

PSEG Capital Spending

2011 – 2015: ~$14.3 Billion | **2016E – 2020E*: ~$16.0 Billion**

*INCLUDES ALL PLANNED SPENDING. **POWER CAPITAL SPENDING EXCLUDES NUCLEAR FUEL. ***INCLUDES PENNEAST PIPELINE EQUITY INVESTMENT OF $0.1B. E=ESTIMATE.

SI-SSA-0015-13628

Building an efficient, clean, reliable energy platform

Timeframe	Actions taken
2011 – 2015: Transformed business mix	• Applied ~$14.3 billion towards investments • Improved credit ratings • Monetized Energy Holdings' portfolio • Strong balance sheet sustained during period of low power prices, while increasing the dividend
2016 – Forward: Strong financial position supports continued growth	• Continued dividend growth in 2016 • ~$16 billion investment program through 2020 • Utility investments focused on improving reliability and replacing aging infrastructure • Continued investment in reliable and efficient energy infrastructure at Power • Financial capability supports further expansion of the current capital plan

SI-SSA-0015-13629

PSE&G's investment program

Meeting public policy goals and customer needs

SI-SSA-0015-13630

PSEG

*SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/
NET INCOME TO RECONCILE TO OPERATING EARNINGS. DISTRIBUTION RATE BASE INCLUDES SOLAR AND ENERGY EFFICIENCY

Managing the total costs to customers while investing in the system

PSE&G Typical Residential Customer Bills*

- PSE&G customers' combined electric and gas bills declined 28% over the period
- Low gas prices and elimination of transition charges drove rate decreases

SI-SSA-0015-13631

PSEG

*FOR ALL YEARS THE BILLING ASSUMES 7,200 KWH FOR ELECTRIC AND 1,010 THERMS FOR GAS ANNUALLY. E = ESTIMATE

Transforming Power's fleet to maintain strong market position

Economic Drivers	Outlook	Combined Cycle	Nuclear	Scrubbed Coal	Peakers	Renewable
Energy Margins	• Low natural gas and energy prices • Robust portfolio of gas pipeline contracts	✓	✓	✓	n/a	n/a
Capacity Markets	• Tightened rules proposed for capacity performance	✓	✓	✓	✓	n/a
Environmental Regulations	• Tighter air emissions standards	✓	✓	✓	✓	✓
Location	• Assets in well-designed markets, premium regions • Opportunities on brownfield sites	✓	✓	✓	✓	n/a
2016 - PSEG Power Total Capacity 11.9 GW		3.3	3.7	2.4	2.3	0.2
2019 - PSEG Power Total Capacity 13.5 GW *		5.3	3.8	2.4	1.8	0.2

- **Largest nuclear site** in the eastern U.S. and ownership in **large, fully scrubbed coal facilities** at Keystone and Conemaugh provide **economies of scale** that enhance energy margins in current low market, and provide for upside potential if prices improve
- **Dual fuel peakers** meet reliability criteria in capacity markets and provide option value in energy market. Opportunity exists to repower peakers that do not meet NJ HEDD environmental regulations
- **Combined cycle units Keys and Sewaren expected to be operational in 2018, and Bridgeport 5 expected to be operational in 2019,** will enhance emissions performance and have a combined average heat rate of approximately 6,600

SI-SSA-0015-13632

PSEG

*AS OF FEBRUARY 2016 APPROXIMATELY 1.8 GW OF CCGT GENERATION UNDER DEVELOPMENT – KEYS, SEWAREN 7 AND BRIDGEPORT HARBOR 5 , WHICH ARE TARGETED TO GO INTO SERVICE IN 2018/2019 ALONG WITH RETIREMENT OF OLDER SEWAREN UNITS.

Operating Earnings

Disciplined investment program and focus on operational excellence have supported growth

Power's diverse fuel mix and dispatch flexibility continue to generate strong earnings and free cash flow in low price environment

PSE&G's investment program has resulted in an increased contribution to PSEG's earnings

SI-SSA-0015-13633

PSEG

*SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/ NET INCOME TO RECONCILE TO OPERATING EARNINGS. E=ESTIMATE
** 2016 PERCENTS USE MIDPOINT OF 2016 OPERATING EARNINGS GUIDANCE.

PSEG Annual Dividend

An increased dividend with potential for **consistent** and **sustainable** growth given our business mix and financial position

	2012	2013	2014	2015	2016E
Payout Ratio	58%	56%	54%	54%	57%*

*2016E PAYOUT RATIO REFLECTS THE MIDPOINT OF 2016 OPERATING EARNINGS GUIDANCE. E = ESTIMATE

SI-SSA-0015-13634

Focus areas over the business plan horizon

PSE&G
• **Operational excellence and cost control** • **Capital program execution** – Transmission, Energy Strong and GSMP program • **Regulatory framework** – Advocate for regulatory framework that provides support for long-term infrastructure programs • **Continue to develop incremental growth opportunities**

PSEG Power
• **Operational excellence and cost control** • **Timely and on budget construction of new growth opportunities** – Keys Energy Center, Sewaren 7 and Bridgeport Harbor • **Strong performance at Nuclear and Fossil** to maximize fleet value in dynamic markets • **Advocacy of constructive market rules** - Capacity markets and environmental regulations

PSEG Long Island
• **Continue execution** – Achievement of performance metrics

SI-SSA-0015-13635

PSEG's Value Proposition

- A stable platform with predictable earnings and a robust investment pipeline
- PSE&G – Best in class utility performance and growth profile
- PSEG Power – Efficient, low-cost, clean fleet advantaged by asset diversity, fuel mix and location
- Strong balance sheet – Supports stable credit rating, growth objectives and the potential for consistent and sustainable dividend growth

SI-SSA-0015-13636

PSE&G

Ralph LaRossa

PRESIDENT AND CHIEF OPERATING OFFICER
PUBLIC SERVICE ELECTRIC & GAS

PSEG

We make things work for you.

SI-SSA-0015-13637

PSE&G is the largest electric and gas distribution and transmission utility, the largest investor in renewable and energy efficiency, and the largest HVAC and service contract provider in New Jersey

	Electric	Gas
Customers Growth (2011 – 2015)	2.2 Million 0.4%	1.8 Million 0.4%

* GAS FIRM ONLY SALES.
** ESTIMATED ANNUAL GROWTH PER YEAR, ASSUMES NORMAL WEATHER.
*** SOME PROJECTS APPROVED FOR SPECIFIC ROE.

SI-SSA-0015-13638

PSE&G strategy

Building a sustainable platform that balances reliability, customer rates and public policy to ensure growth at reasonable returns

SI-SSA-0015-13639

PSE&G's focus on meeting customer reliability and policy objectives are key to our investment strategy

2011	2012	2013	2014	2015

Selected Accomplishments

2011
- NJ Capital Infrastructure Program 2
- Energy Efficiency extension
- Major Transmission capital projects*
- Hurricane Irene/ October Snowstorm
- Mid-Atlantic ReliabilityOne Award

2012
- Hurricane Sandy storm response (2.1M customers restored)
- Transmission: Final federal approval for Susquehanna-Roseland (S-R) project
- National ReliabilityOne Excellence Award
- Mid-Atlantic ReliabilityOne Award
- EEI's Emergency Response Award

2013
- Solar Loan III
- Solar 4 All Extension
- Energy Strong program filed
- Mid-Atlantic ReliabilityOne Award
- Award for Outstanding Response to a Major Event

2014
- Energy Strong approved
- Transmission: North Central Reliability and Burlington-Camden projects placed in-service
- Bergen-Linden Corridor Upgrade project investment started
- Mid-Atlantic ReliabilityOne Award

2015
- Gas System Modernization Project (GSMP)
- Energy Efficiency Extension II
- Transmission: S-R and Mickleton-Gloucester projects placed in-service
- Mid-Atlantic ReliabilityOne Award
- Recognized for customer satisfaction by J.D. Power for both large electric and gas business service in the East

← Cost Control →

* INVESTMENT CONTINUED FOR SUSQUEHANNA-ROSELAND, BURLINGTON-CAMDEN, NORTH CENTRAL RELIABILITY, AND STARTED FOR NORTHEAST GRID AND MICKLETON-GLOUCESTER

SI-SSA-0015-13640

Building on our track record

Operational Excellence

- Strong reliability record, with plans for further improvement
- Cost control efforts

Financial Strength

- Meeting or exceeding earnings targets
- Maintain solid investment grade credit ratings

Disciplined Investment

- 14 investment programs approved over past seven years
  - ✓ Infrastructure focused
  - ✓ Policy alignment – across administrations – Solar, EE and other
- Win-Win: Job creation, environment benefits, low commodity prices, low interest costs, labor availability, federal tax benefits

SI-SSA-0015-13641

Operational Excellence

Reliability and Customer Service

- Named most reliable electric utility in the Mid-Atlantic region for 14th consecutive year
- Recognized by PA Consulting with the Outstanding Customer Engagement and Outstanding Outage Response Time awards
- Named 2015 Utility of the Year by Electric Light & Power Magazine
- Received Star of Energy Efficiency Award

SI-SSA-0015-13642

Achieved ~11% annual earnings growth

over the past four years through implementation of supportive rate mechanisms on our expanded capital program and cost control

PSE&G Operating Earnings Per Share

SI-SSA-0015-13643

Receive contemporaneous recovery on over 70% of our investments

2011-2015 PSE&G Capital Spending by Recovery Method

Selected Accomplishments

2011
- Hope Creek set annual output record
- Nuclear license extensions and uprates achieved

2012
- Peach Bottom 3 set annual output record
- Additional 400 MW of new peaker capacity at Kearny and New Haven
- Superstorm Sandy recovery initiated

2013
- Record annual output from Linden CCGT and Salem 2 Nuclear Unit
- 90% + nuclear capacity factor for 9th straight year
- Bethlehem Energy Center, 2nd gas pipeline connection added

2014
- Record annual output from Bergen CCGT
- PennEast pipeline investment
- CCGT Advanced Gas Path (AGP) uprate investment completed at Linden 1 & 2, 63 MW
- Established PSEG Long Island fuel management operations for 2015 start-up

2015
- Record CCGT fleet annual output
- Continued growth in fleet with 1,300 MW new CCGT's announced
  - Keys
  - Sewaren 7
- Prepared successful bid for 485 MW Bridgeport Harbor 5
- Projects Completed:
  - Peach Bottom EPU, 130 MW
  - Bergen 2 AGP uprate, 31 MW
- HEDD retirement
- Solar portfolio reaches 277 MW_{DC} as of March 2016

Cost Control

SI-SSA-0015-13663

PSEG Power's value is advantaged

by asset diversity, fuel flexibility and location

2015 Actual

Fuel Diversity*
Total MW: 11,678

- Gas
- Nuclear
- Coal**
- Oil
- Pumped Storage

Energy Market Served*
Total MW: 11,678

- Load Following, 87% dual fuel
- Peaking
- Baseload

Energy Produced*
Total GWh: 55,213

- Gas
- Nuclear
- Coal**
- Oil
- Pumped Storage

* EXCLUDES SOLAR AND KALAELOA.
**INCLUDES NEW JERSEY UNITS THAT FUEL SWITCH TO GAS.

SI-SSA-0015-13664

Power investing $2 billion of capital in new capacity

E=ESTIMATE. DATA AS OF MARCH 2016

SI-SSA-0015-13665

Power's PJM assets are becoming more efficient

	Base Load Units	Load Following Units	Peaking Units
Energy Revenue	X	X	X
Capacity Revenue	X	X	X
Ancillary Revenue		X	X
Dual Fuel		X	X

- Base Load ensures cash flow certainty
- Load Following provides ability to serve load shape
- Readiness for Capacity Performance (CP), successful in CP auction

- Peaking takes advantage of real-time prices and reduces operational risk
- Dual fuel capability at 87% of load following and peaking units

SI-SSA-0015-13666

PSEG

* KEYS & SEWAREN 7 TO BE ADDED TO DISPATCH IN 2018E AND SEWAREN 1-4 WILL RETIRE.

PSEG Power has generating assets in three competitive markets

- Assets located near load
- Low cost portfolio with gas cost advantage
- Positioned to benefit from volatility in real-time markets
- Fleet meets new capacity performance standards
- 1,800 MW of new CCGT capacity under construction in PJM and ISO-NE

SI-SSA-0015-13667

PSEG Power developing 1,800 MW of new, efficient CCGT capacity in MD, NJ and CT

- Constructing the 755 MW CCGT Keys Energy Center in Maryland (SWMAAC*) at an estimated cost of $825 to $875 million
- Constructing a new 540 MW CCGT unit, Sewaren in New Jersey (EMAAC*) at a cost of $625 to $675 million which will replace older Sewaren units
- Constructing a new 485 MW CCGT unit, Bridgeport Harbor 5 (ISO NE), at a cost of $525 to $575 million
- Both Keys and Sewaren 7 are targeted to be in-service in 2018 and Bridgeport Harbor 5 in 2019
- Expanding civic stewardship roles and programs in neighboring communities

*SWMAAC = SOUTHWEST/EMAAC = EASTERN MID-ATLANTIC AREA COUNCIL
LOCATIONAL DELIVERABILITY AREA WITHIN PJM.

SI-SSA-0015-13668

PSEG Power's fleet transformed

with focus on new investment and improvement in efficiency

2020E Projected

Fuel Diversity*

Total MW: 13,100

- Gas
- Nuclear
- Coal**
- Oil
- Pumped Storage

Energy Market Served*

Total MW: 13,100

- Load Following, 87% dual fuel
- Peaking
- Baseload

Energy Produced*

Total GWh: 65,000

- Gas
- Nuclear
- Coal**
- Oil
- Pumped Storage

SI-SSA-0015-13669

PSEG

*EXCLUDES SOLAR AND KALAELOA E = ESTIMATE

**INCLUDES NEW JERSEY UNITS THAT FUEL SWITCH TO GAS.

PSEG Power's fossil fleet expected to see improvements in efficiency

- AGP (Advanced Gas Path) investments
- CCGT material condition assessment
- Unit testing and testing coordination initiatives
- HEDD retirements
- Keys/Sewaren Combined Cycle Development (2018)
- Bridgeport Harbor 5 Combined Cycle Development (2019)
- Heat Rate Improvement converts to potential savings of $60-$65M in fuel expense (assuming $3/MB gas price)

SI-SSA-0015-13670

PSEG Power's fossil fleet among the lowest emitting in the industry

- More efficient testing and improved operational flexibility through utilization of Continuous Emission Monitoring System testing
- With the addition of new units, emissions continue to improve

SI-SSA-0015-13671

E = ESTIMATE

PSEG Power's fossil fleet expected to reduce its carbon footprint

- Carbon emission rates projected to steadily approach EPA national pollution standards for New and Reconstructed Natural Gas Combined Cycle (1,000 lbs CO_2/MWh-gross)

SI-SSA-0015-13672

E = ESTIMATE

Nuclear is a critical element of our success

Hope Creek

- Operated by PSEG Nuclear
- PSEG Ownership: 100%
- Technology: Boiling Water Reactor
- Total Capacity: 1,176 MW
- Owned Capacity: 1,176 MW
- License Expiration: 2046
- Next Refueling
  - Fall 2016
- Uprate 18MW Spring 2018

Salem Units 1 and 2

- Operated by PSEG Nuclear
- PSEG Ownership: 57%
- Technology: Pressurized Water Reactor
- Total Capacity: 2,294 MW
- Owned Capacity: 1,317 MW
- License Expiration: 2036 and 2040
- Next Refueling
  - Unit 1 – Spring 2016
  - Unit 2 – Spring 2017

Peach Bottom Units 2 and 3

- Operated by Exelon
- PSEG Ownership: 50%
- Technology: Boiling Water Reactor
- Total Capacity: 2,502 MW
- Owned Capacity: 1,251 MW
- License Expiration: 2033 and 2034
- Next Refueling
  - Unit 2 - Fall 2016
  - Unit 3 - Fall 2017
- Uprate: 130 MW (PS Share)
  - Unit 2 - March 2015
  - Unit 3 – December 2015

SI-SSA-0015-13673

PSEG Power's Growth Investments

Site	Project	Estimate ($ Millions)	Benefits	Status
Peach Bottom	Peach Bottom EPU (2014 – 2015)	$403	Increased capacity: 130 MW	PB2 & PB3 completed in 2015
Linden/ Bergen/ BEC	Advanced Gas Path Uprates (AGP): Linden -- 63 MW Bergen -- 31 MW BEC – 58 MW	$120	Increased capacity and improved heat rate: ~152 MW capacity increase ~1.2% heat rate improvement	Completed: Linden (2014) Bergen (2015) Planned: BEC 2017/2018E
Kearny 13 & 14	LM6000 Engine Throttle Push	--	Increased capacity: 14.5 MW	2016E
Maryland	Keys, 755 MW CCGT	$825 - $875	Geographic diversity within PJM; highly efficient gas fired unit in SWMAAC	2018E
Sewaren	Sewaren Unit 7, 540 MW CCGT	$625 - $675	Improved efficiency and reliability; replaces Sewaren 1-4 steam units	2018E
Bridgeport, CT	Bridgeport Harbor 5, 485 MW CCGT	$525 - $575	Highly efficient gas fired unit in ISO-NE	2019E
Eastern PA to Mercer, NJ	PennEast Pipeline	$123	Estimated Earnings in 2019: $13 million	Underway
Various	6 Solar Projects	$241	2016/2017E increase renewable capacity by 136 MW_{DC}/105 MW_{AC}	2016/2017E

Total New Capacity – 2,200 MW

E = ESTIMATE.

SI-SSA-0015-13674

A position in renewable energy – Power's Solar Source

Solar Source portfolio

- Utility scale solar projects in 12 states in operation or under construction
- Long-term PPA's with creditworthy counterparties
- Lump sum, full wrap EPC* agreements

Asset Optimization

- Maintain high equipment availability
- Minimize operating expenses
- Seek additional revenue streams

SI-SSA-0015-13675

* EPC = ENGINEERING PROCUREMENT & CONSTRUCTION. E = ESTIMATE.

PSEG Power has other attractive sources of revenues to round out a robust portfolio

Gas Asset Optimization

- Large wholesale provider to PSE&G and others
  - Storage capacity of approximately 75 Bcf (in the Gulf and market regions)
  - Firm transportation of 1.3 Bcf/day on seven pipelines
- Off-system sales margins shared with residential customers
- Commercial & Industrial gas sales

Ancillary Services – Black start, reactive power, area regulation

LIPA fuel and energy dispatch management – Began management of 10-year contract in 2015

Kalaeloa, HI – 50% equity interest in a 208 MW combined cycle oil

New Haven Peakers – 129 MW, rate based contract with ISO-NE

SI-SSA-0015-13676

PSEG Power has demonstrated ability to control O&M

Cost control actions taken:

- Fossil plant assessment
- CCGT material condition assessment
- Vendor contract renegotiations
- Nuclear security services brought in-house to control costs
- Nuclear maintenance productivity study
- Nuclear outage efficiency initiative
- Materials management
- Nuclear excellence initiative
- Nuclear staff – Right sizing

*EXCLUDES IMPACTS FROM STORM RECOVERY COSTS. E=ESTIMATE

PSEG

*SEE SLIDE A FOR ITEMS EXCLUDED FROM NET INCOME TO RECONCILE TO OPERATING EARNINGS. E = ESTIMATE.

PSEG Power – Delivering on priorities

Operational Excellence

- Fuel and technology-diverse fleet produced 55 TWh, 2% higher than 2014
- Nuclear capacity factor exceeded 90%; output of 30 TWh, close to 30.3 TWh is third best ever, record set in 2009
- Production records set at BEC, Linden and the CCGT fleet in total; Kearny 13 & 14 CTs
- Successful implementation of LIPA contract for fuel / generation dispatch.

Financial Strength

- Achieved earnings guidance in 2015
- Cost control programs held O&M to a 0.8% CAGR between 2011 and 2016
- Successful ongoing effort to influence outcomes in key markets showing success, e.g., price formation

Disciplined Investment

- Completed Peach Bottom EPU and AGP at Bergen 2; AGP planned for BEC in 2017/2018
- Repositioning the fleet with three new CCGTs:
  - Keys (2018)
  - Sewaren 7 (2018)
  - Bridgeport Harbor 5 (2019)
- Solar Source's portfolio is 277 MW_{DC}

SI-SSA-0015-13680

PSEG POWER
ER&T

Shahid Malik

PRESIDENT
ENERGY RESOURCES & TRADE

PSEG
We make things work for you.

SI-SSA-0015-13681

Agenda

Market Review

- Commodity markets: Gas, Power and Spark Spreads
- Marcellus gas review and PSEG Power's natural gas position
- Regulatory framework

PSEG Power's Portfolio

- Technology, locational and fleet strengths
- PJM portfolio
- Northeast portfolio

PSEG Power Marketing and Hedging Tactics

- Robust hedging strategy and execution (energy and capacity) leads to significant guaranteed revenue for next three years

SI-SSA-0015-13682

Market Review: Markets in 2015 were affected by abnormal weather conditions

Q1: Periods of extremely cold temperatures resulted in high gas prices, significant basis differentials, and higher energy demand

Q2-Q4: A normal summer and mild December, combined with increased supply of gas, reduced energy prices and basis

SI-SSA-0015-13683

Market Review: Q1 2016 impacted by weather but forward gas and electric prices retain seasonal volatility

SI-SSA-0015-13684

Market Review: PSEG's extensive gas asset portfolio provides unparalleled access to Marcellus Shale gas

- PSEG Power maintains a robust portfolio of pipeline and storage assets in the Mid-Atlantic
- Marcellus Shale gas production reached 18.8 BCF/day in 2015
- PSEG Power procured over 423 BCF in 2015 with approximately 50% going to PSE&G's utility gas customers
- PSEG Power's gas for generation was 150 BCF in 2015, of which >75% was supplied by Northeast Shale gas
- Severe financial stress among the natural gas producer industry is expected to reduce production growth until gas prices rebalance to higher levels
- Investment in the PennEast pipeline expected to provide more access to Marcellus for PSEG

SI-SSA-0015-13685

Market Review: Completion of new pipeline infrastructure expected to move significant quantities of Marcellus gas out of the region by 2018

Pipeline capacity grows significantly by 2018

- Significant amount of new pipelines have already been built and more are in the advanced planning and development stage through 2018
- Gas production and pipeline takeaway capacity estimated to reach equilibrium in 2018 timeframe based on new pipeline development

SI-SSA-0015-13686

Regulatory Framework: New capacity and energy market designs in PSEG's core markets (PJM and New England) will better reward reliable generation units

	ISSUE /POLICY	OUTCOME
PJM	CAPACITY	• Higher payments for enhanced reliability (Capacity Performance) and lower energy revenues have raised absolute and relative value of capacity
	ENERGY PRICE FORMATION	• FERC is driving ISO's to improve their pricing constructs and rules – NOPRs addressing critical RTO issues
	DEMAND RESPONSE RULES	• Stricter rules for eligibility and deployment; focus returns to wholesale reliability/comparability after SCOTUS ruling
	STATE INTERVENTION	• LCAPP: Awaiting Supreme Court decision • Ohio PPA: Challenged at the local level by the IPP industry, PJM and FERC
ISO-NE	CAPACITY	• Continued tightness in capacity markets • Zonal demand curves ordered for FCA 11 (2021) • Nuclear and coal units under pressure; closure of Pilgrim nuclear plant
	ENERGY	• Proposed gas pipelines are receiving regulatory approvals slowly • 5 minute interval LMP settlements and fast start pricing expected Q2 2017
NYISO	CAPACITY	• Retirement of Fitzpatrick and Ginna and Western steam plants tighten market, but NYPSC directed to develop a clean energy standard that recognizes the value of nuclear
	ENERGY	• Improvement in price formation during reserve shortage conditions
FEDERAL	ENVIRONMENTAL REGULATIONS	• CPP rules stayed by SCOTUS • Some states will still prepare implementation plans for 2020+ timeframe

SI-SSA-0015-13687

PSEG Power's Portfolio: Our fleet is well positioned in key markets

Right Location

with robust spark spreads

Right Technology

Plant	Heat Rate	Capacity
BERGEN 1	8.3	638
BERGEN 2	7.3	591
LINDEN 1	7.3	621
LINDEN 2	7.3	621
BEC	7.3	757
KEYS NEW	6.9	755
BRIDGEPORT HARBOR NEW	6.5	485
SEWAREN NEW	6.5	540
TOTAL COMBINED CYCLE	**7.2**	**5,008**

SI-SSA-0015-13688

PSEG

*ON PEAK SPARK SPREADS FOR CALENDAR YEAR 2018 CALCULATED WITH 7.5 HEAT RATE USING FOLLOWING GAS SOURCES: PJM WEST = HH, PEPCO = TRANSCO Z6 NON-NY, MASS HUB AND ZONE G = ALGONQUIN, PS ZONE = LEIDY. FORWARDS AS OF JANUARY 18, 2016. CAPACITY IN MEGAWATTS

PSEG Power's Portfolio: New York and New England

New York (757 MW)

- Single state ISO
- Multiple gas supplies to BEC gives fuel flexibility and access to Marcellus
- Long Island Power Authority Management Contract

New England (976 MW plus 485 MW new build)

- Small but dynamic market
- Significant improvement in market construct
- Ongoing potential for volatility in extreme (winter) weather conditions
- PSEG Bridgeport Coal plant retirement in 2021
- Gas pipeline infrastructure poses supply challenges/opportunity

+INCLUDES 485 MW NEW BUILD
*SUMMER INSTALLED GENERATING CAPACITY AS OF DECEMBER 31,2015

SI-SSA-0015-13689

Capacity Market Pricing: PJM's capacity market is transitioning to recognize operating performance as well as locational value

PJM's RPM Auction Results				
($/MW-day)	2015 / 2016*	2016 / 2017*+	2017 / 2018+	2018 /2019
Power's Average Prices	$168	$172	$177	$215
Rest of Pool Prices	$136	$59	$120	$165/$150 (CP/Base)
Power's Cleared Capacity (MW)	8,750	8,700	8,700	8,650
PJM Capacity Revenues ($M)	$537	$546	$562	$679

2019 Onwards RPM Auction Impacted By:

- Capacity Performance
- Convex Demand Curve
- Change in Net CONE
- Change in PJM Parameters
- Demand response rules
- Elimination of 2.5% Holdback
- Reduction in Load Forecast
- Environmental Retirement

ISO New England's FCA Auction Results				
($/MW-day)	2015 / 2016	2016 / 2017	2017 / 2018	2018 / 2019
Power's Average Prices	$113	$104	$232	$315
Power's Cleared Capacity (MW)	773	777	848	831
NEPOOL Capacity Revenues ($M)	$32	$29	$72	$96

2019/2020 FCA auction cleared at $231/MW-day resulting in $112M in capacity revenues for 1,333 MW

*PSEG POWER'S AVERAGE PRICES AND CLEARED CAPACITY (MW) REFLECT BASE AND INCREMENTAL AUCTIONS.

SI-SSA-0015-13711

PSEG Summary

- 2015 earnings of $2.91 were at the upper end of our upwardly revised operating earnings guidance of $2.85 - $2.95 per share
- Forecast growth at PSE&G supports our 2016 guidance of $2.80 to $3.00 per share
- Forecast high single-digit rate base growth at PSE&G on five year basis from 2015 to 2020, driven by investment in transmission and approved programs
- Power's investment program and continued focus on operational excellence with financial strength delivers value in current price environment
- Strong Balance Sheet and Cash Flow support current capital program and investment in new opportunities without the need for equity
- Our indicative $0.08 dividend per share increase for 2016 is consistent with our long history of returning cash to the shareholder through the common dividend, with opportunity for consistent and sustainable growth

Ralph Izzo

CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED

Ralph Izzo was elected chairman and chief executive officer of Public Service Enterprise Group Incorporated (PSEG) in April 2007. He was named as the company's president and chief operating officer and a member of the board of directors of PSEG in October 2006. Previously, Mr. Izzo was president and chief operating officer of Public Service Electric and Gas Company (PSE&G).

Since joining PSE&G in 1992 Mr. Izzo was elected to several executive positions within PSEG's family of companies, including PSE&G senior vice president – utility operations, PSE&G vice president – appliance service, PSEG vice president - corporate planning, and PSE&G vice president - electric ventures. In these capacities he broadened his experience in the areas of general management, strategic planning and finance.

Mr. Izzo is a well-known leader within the utility industry, as well as the public policy arena. He is frequently asked to testify before Congress and speak to organizations on matters pertaining to national energy policy.

Mr. Izzo's career began as a research scientist at the Princeton Plasma Physics Laboratory, performing numerical simulations of fusion energy experiments. He has published or presented over 35 papers on magneto hydrodynamic modeling. Mr. Izzo received his Bachelor of Science and Master of Science degrees in mechanical engineering and his Doctor of Philosophy degree in applied physics from Columbia University. He also received a Master of Business Administration degree, with a concentration in finance from the Rutgers Graduate School of Management. He is listed in numerous editions of Who's Who and has been the recipient of national fellowships and awards. Mr. Izzo has received Honorary Degrees from the New Jersey Institute of Technology (Doctor of Science), Thomas Edison State University (Doctor of Humane Letters), Bloomfield College (Doctor of Humane Letters), Rutgers University (Doctor of Humane Letters), and Raritan Valley Community College (Associate of Science).

Mr. Izzo serves as nominating committee chairman of the New Jersey Chamber of Commerce, and is on the board of directors for The Williams Companies, the New Jersey Utilities Association, the Edison Electric Institute (EEI), and the Nuclear Energy Institute (NEI). He is also a member of the Board of Trustees of Peddie School, Columbia University School of Engineering Board of Visitors and the Princeton University Adlinger Center for Energy and the Environment Advisory Council, as well as a member of the Visiting Committee for the Department of Nuclear Engineering at MIT. Mr. Izzo is a former Chair of the Rutgers University Board of Governors and the New Jersey Chamber of Commerce.

.

SI-SSA-0015-13725

Daniel Cregg

EXECUTIVE VICE PRESIDENT AND CHIEF FINANCIAL OFFICER

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG POWER LLC AND PSEG SERVICES CORPORATION

Daniel J. Cregg was named executive vice president and chief financial officer for Public Service Enterprise Group Incorporated (PSEG) and its subsidiaries in October 2015.

Mr. Cregg is responsible for all financial functions, including Internal Audit Services, Investor Relations and Corporate Development. Given the array of financial instruments which serve as the primary means of selling wholesale energy to customers, Mr. Cregg also has responsibility for the Risk Management function, which provides independent oversight of the PSEG Power trading organization. In addition to finance, Mr. Cregg is responsible for the Strategy and Planning function. He is a member of PSEG's Executive Officer Group.

Prior to his current position, Mr. Cregg was vice president – finance for PSE&G, a role he assumed in June 2013. In 2006, Mr. Cregg was named vice president – finance for PSEG Power. In that capacity and in previous financial roles for Power, Mr. Cregg held leadership positions related to financial reporting and forecasting, investor communications, financings, rating agency interactions, external reporting, cash forecasting, financial valuations, competitive intelligence, and fundamental market modeling, with critical responsibilities in Power's development and strategic planning activities.

Previously, Mr. Cregg was director of PSEG corporate development. He joined PSEG in 1991 with overall responsibility for tax planning, strategy and compliance for PSEG Energy Holdings, including domestic and international tax structuring work for PSEG Global and PSEG Resources.

Before joining PSEG, Mr. Cregg spent five years with the accounting and consulting firm of Deloitte and Touche, providing consulting services to a wide range of clients with an emphasis on the energy industry.

Mr. Cregg holds a Master of Business Administration degree from the Wharton School of the University of Pennsylvania and is a graduate of Lehigh University, where he received a bachelor's degree in accounting.

SI-SSA-0015-13726

Tamara L. Linde

EXECUTIVE VICE PRESIDENT AND GENERAL COUNSEL

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG POWER, PSEG SERVICES CORPORATION

Tamara Linde was named executive vice president and general counsel for Public Service Enterprise Group Incorporated (PSEG) in July 2014. She is also the executive vice president and general counsel of Public Service Electric and Gas Company (PSE&G), PSEG Power and PSEG Services Corporation.

As PSEG's chief legal officer, Ms. Linde has responsibility for all legal and regulatory functions, and has general supervisory responsibilities for the office of corporate secretary, business assurance and resilience and federal affairs and sustainability. Ms. Linde is a member of PSEG's Executive Officer Group.

Previously Ms. Linde was vice president – regulatory, PSEG. She has led the company's federal and state regulatory functions, as well as managed corporate, environmental and labor/employment practices within the company. Ms. Linde has served as regulatory counsel on many of the company's most important initiatives in recent years.

Ms. Linde joined the law department of Public Service Electric and Gas Company (PSE&G), as an attorney in 1990 handling a variety of natural gas and electric regulatory and transactional matters. After holding several other legal positions at PSE&G she became general solicitor, in 2000. In that position she was responsible for the regulatory affairs of the PSEG companies including electric, gas and nuclear matters.

She has had significant experience working on regulatory matters before various state and federal regulatory agencies on industry issues relating to electric transmission and distribution and energy markets.

Ms. Linde is a member of the New Jersey, New York, District of Columbia and Texas bars. She is past President of the Northeast Chapter of the Energy Bar Association and served as chair of the Energy Bar Association Electricity Regulation and Compliance Committee. Ms. Linde currently serves on the Board of the PSEG Foundation as well as the Community Foundation of New Jersey. Ms. Linde graduated from Seton Hall University School of Law with a Juris Doctorate and from Seton Hall University with a bachelor's degree.

SI-SSA-0015-13727

Ralph A. LaRossa

PRESIDENT AND CHIEF OPERATING OFFICER

PUBLIC SERVICE ELECTRIC AND GAS COMPANY

Ralph A. LaRossa was named president and chief operating officer of Public Service Electric and Gas Company (PSE&G) in October 2006. PSE&G is New Jersey's oldest and largest regulated gas and electric delivery utility, serving approximately 2.4 million customers, nearly three-quarters of the state's population. Prior to this position he was vice president - electric delivery for PSE&G.

In addition, on January 1, 2014, Mr. LaRossa became Chairman of the Board of PSEG Long Island, a subsidiary of Public Service Enterprise Group (PSEG), which manages the electric transmission and distribution systems on Long Island and in the Rockaways. PSEG Long Island serves 1.1 million customers.

Mr. LaRossa joined PSE&G in 1985 as an associate engineer and advanced through a variety of management positions in the utility's gas and electric operations. In 1998, he received Gas Industry Magazine's Outstanding Manager of the Year Award.

He is a graduate of Stevens Institute of Technology and has completed the Harvard Business School's Program for Management Development.

Mr. LaRossa is the Chairman of the American Gas Association (AGA) and currently serves on the board of directors. Mr. LaRossa is also Chairman of Choose New Jersey, Inc. and serves on its board of directors. In addition, he is a member of the board of directors for the New Jersey Utilities Association (NJUA), New Jersey Performing Arts Center (NJPAC) and Montclair State University, for which he is immediate past chair of the university.

SI-SSA-0015-13728

William Levis

PRESIDENT AND CHIEF OPERATING OFFICER

PSEG POWER

William Levis is president and chief operating officer of PSEG Power, a position he's held since June 2007. PSEG Power is a major, unregulated independent power producer in the U.S. with four main subsidiaries: PSEG Nuclear, PSEG Fossil, PSEG Energy Resources and Trade (ER&T) and PSEG Power Ventures.

PSEG Power operates one of the most balanced portfolios in the country, both in terms of fuel mix and market segment (based load units, load following units and peaking units). Its low-cost, load following fleet is geographically well positioned in competitive markets. Its 11,898 MWs represent a diverse fuel mix which includes 41 percent natural gas, 32 percent nuclear; 20 percent coal, 5 percent oil, 1 percent pumped storage, and 1 percent solar.

Before coming to PSEG, Mr. Levis was Exelon Nuclear's vice-president – Mid-Atlantic operations. Prior to joining Exelon, Mr. Levis worked at Ontario Hydro's Pickering Plant and held several positions over a five-year period with Carolina Power and Light's Brunswick facility.

Mr. Levis has a Bachelor of Science degree in marine engineering from the U.S. Naval Academy and holds an SRO (senior reactor operator) certification. He retired as a commander in the Naval Reserves and attained his professional engineer license in 1985.

Mr. Levis is a member of the Executive Committee of Nuclear Energy Institute's (NEI) Board of Directors, the Nuclear Electric Insurance Limited (NEIL) Board of Directors, and serves as a member of the Institute of Nuclear Power Operations (INPO) National Nuclear Accrediting Board. Mr. Levis is a member of the Philadelphia Archdiocese Catholic Charities Appeals Board and is a member of the CEO Council for Growth based in Philadelphia.

.

SI-SSA-0015-13729

Shahid Malik

PRESIDENT
PSEG ENERGY RESOURCES & TRADE

Shahid Malik was appointed President of PSEG Energy Resources & Trade (ER&T) in 2011. PSEG operates one of the most balanced generation and marketing portfolios in the country, both in terms of fuel mix and market segment (base load units, load following units and peaking units), and Mr. Malik is essentially responsible for managing these assets and taking them to market. He oversees PSEG's generation portfolio and the purchase, sale and risk management of all energy commodities. He is also responsible for Business Development of new power generation projects.

Mr. Malik has an extensive background in the energy industry across the oil, gas, electric and renewable energy sectors in Europe and the United States. Previously, he was with Pittiglio, Rabin, Todd & McGrath (PRTM) in Pittsburgh, PA and was responsible for all aspects of the global energy business, with a primary focus on the North American utility sector. Prior to that he served as President & CEO of Strategic Energy, Great Plains Energy's retail marketing subsidiary and a provider of energy and services to business clients in North America. He was accountable for the company's strategy and operations and led a successful turnaround of the company, achieving significant growth in products and services while reducing costs.

Mr. Malik's career has included Executive Leadership positions with several energy companies in the US and Europe. In addition, he served on the Board of Directors of South Jersey Industries (NYSE: SJI) immediately prior to joining PSEG.

Mr. Malik has been in the energy business for more than 20 years, since receiving his Economics degree from Manchester University in England and an MBA from Rice University, Houston. He sits on the Executive Committee of the Board of Trustees of Newark Museum as well as the Board of the Electric Power Suppliers Association in Washington DC.

SI-SSA-0015-13730

Derek M. Di Risio

PRESIDENT

PSEG SERVICES CORPORATION

Derek M. Di Risio was named President, PSEG Services Corporation, in July 2014. He is responsible for the coordination and delivery of several centralized services currently residing within PSEG Services Corporation including corporate communications, corporate citizenship, corporate real estate, information technology, procurement, payroll and other transactional services.

Prior to his current role, Mr. Di Risio was vice president and controller of Public Service Enterprise Group (PSEG), Public Service Electric and Gas Company (PSE&G), PSEG Services Corporation, PSEG Energy Holdings (Holdings) and PSEG Power, a position he assumed in December 2006. He was previously vice president and assistant controller, since July 2004.

Mr. Di Risio had been vice president – planning and analysis of Holdings since March 2004, and vice president – controller for Holdings since July 1998. Prior to that he was director – accounting services and responsible for several accounting and planning functions for Holdings, including overall coordination of the business planning process, accounting research and policy development, financial forecasts and analysis. Mr. Di Risio was also responsible for the budgeting, analysis and reporting process for PSE&G.

Mr. Di Risio joined PSE&G in September 1991 and has held a variety of positions, including assignments with the internal auditing, electric business, and corporate planning departments. He was instrumental in reengineering the Enterprise business planning process, and advancing the use of performance metrics and balanced scorecard measures to improve business results. Prior to joining PSE&G he worked for several firms, including Chase Manhattan Bank.

Mr. Di Risio graduated from Rutgers University with a degree in accounting/computer science, and received a Master of Business Administration degree from the same university. He is a certified public accountant (inactive). Mr. Di Risio also completed the Program for Management Development at the Graduate School of Business Administration of Harvard University. He serves on the Drumthwacket Foundation Board of Trustees, the Board of the Military Park Partnership and is currently a co-chairman of the Board of Directors of the New Jersey All Stars Project Inc. In addition, Mr. Di Risio previously served on the Drew University Board of Trustees.

SI-SSA-0015-13731

Richard P. Lopriore

PRESIDENT

PSEG FOSSIL

Richard P. Lopriore was elected president of PSEG Fossil in May 2007. He oversees operations for 13 generation facilities spanning four states. He is also responsible for the oversight of two service groups: Laboratory & Testing Services, and Maintenance & Repair Services, as well as Construction, Capital Projects and Engineering.

The PSEG Fossil fleet is comprised of natural gas, coal and oil-fired electric generating units that contribute about 7,900 megawatts of electricity to PSEG Power's generation portfolio. This includes an ownership interest of 1,000 megawatts in three jointly-owned facilities.
