Under Mr. Lopriore's leadership, nine LM6000 peaking units were constructed. Fossil also outfitted its two New Jersey coal plants with about $1.5 billion in new pollution control equipment resulting in substantial reductions in emissions. These plants are among the cleanest, most responsible coal stations in the country. In June, 2015, Fossil announced the acquisition of the 775-MW combined-cycle Keys Energy Center in Prince George's County, Maryland, which is expected to be online in 2018. In August, 2015, Fossil announced the construction of a 540-MW, dual-fuel combined-cycle power plant in Woodbridge, New Jersey, to be completed by the summer of 2018.

Mr. Lopriore instituted an in-depth Operational Excellence Model (OEM), one of the first programs in the nation to drive standardization across a Fossil fleet. The program resulted in consistent improvement in operating results, reliability and fleet performance and the achievement of all-time generation records. He also revamped PSEG Fossil's training program. Two industry-first, award-winning mobile training trailers were developed to take training directly to the work sites reducing costs and increasing productivity.

Mr. Lopriore has been a valuable part of the electric generation industry for more than 43 years. Prior to joining PSEG Fossil, he had been senior vice president – mid-Atlantic operations for Exelon Nuclear, responsible for oversight of the Limerick, Peach Bottom, Oyster Creek and Three Mile Island stations. During his tenure, Three Mile Island achieved INPO 1 status (2007).

Mr. Lopriore joined Exelon as plant manager of Byron Stations in 1999 and was promoted to site vice president in 2001. In 2003 he became corporate vice president - operations support at Exelon's nuclear headquarters, responsible for both the Midwest and mid-Atlantic regions. He then became vice president - operations, Midwest boiling water reactors in 2004 responsible for the Dresden, LaSalle County, Quad Cities and Clinton nuclear plants.

Prior to Exelon, Mr. Lopriore held several key management positions at the Brunswick Nuclear Plant in North Carolina, including plant manager. At Vermont Yankee, he achieved an operational SRO certification for Boiling Water Reactors.

Mr. Lopriore received his Bachelor of Science degree from Southern Vermont College and is a member of the American Nuclear Society. He also served in the National Guard.

SI-SSA-0015-13732

Peter P. Sena III

PRESIDENT

PSEG NUCLEAR

Peter P. Sena III was named president of PSEG Nuclear (Nuclear) in February 2016.

Mr. Sena will join PSEG in late March 2016 as president of PSEG Nuclear. Most recently, he was Senior Vice President of Operations, Chief Operating Officer at NextEra Energy.

Mr. Sena was named Chief Nuclear Officer of First Energy in 2012, having held a variety of leadership roles at First Energy nuclear operations spanning 15 years. Mr. Sena joined First Energy in 1996 as a control room supervisor and obtained his first SRO license at Beaver Valley Power Station Unit 2. His second SRO license was obtained in 1999 for Beaver Valley Unit 1. Following a rotational assignment with the Institute of Nuclear Power Operations, Mr. Sena was named the Operations Manager and helped lead the station to the "Most Improved Plant" Award in 2003. In 2005, he was named the Director of Engineering and the station completed the first extended power uprate for a Westinghouse 3 Loop Pressurized Water Reactor. As the Site Vice President of Beaver Valley, Mr. Sena led the station to its first INPO Excellence Award in 2009. The Davis Besse Nuclear Power Plant returned to the Excellence category under Mr. Sena's watch as the Chief Operating Officer in 2011.

Prior to joining FirstEnergy, Mr. Sena was employed by the Nuclear Regulatory Commission as a resident inspector in Region 1. Mr. Sena's nuclear training began as an officer with the US Naval Nuclear Propulsion program and he served on board a ballistic missile submarine during the Cold War.

Mr. Sena earned a Bachelor of Science degree with high honors in Fuel Science from the Pennsylvania State University in 1985. He currently serves on the advisory board for the Penn State Nuclear Engineering Program and is a member of EPRI's research advisory committee. He currently serves on the Auburn University's Advisory Board. In addition, he has recently served on the INPO Executive Advisory Committee and the Nuclear Energy Institute (NEI) Nuclear Strategic Issues Advisory Committee where he was the Industry Executive Sponsor of the NEI post Fukushima flooding response initiative.

SI-SSA-0015-13733

Robert C. Braun

CHIEF NUCLEAR OFFICER

PSEG NUCLEAR

Robert C. Braun was elected president & chief nuclear officer, PSEG Nuclear and assumed the position on April 1, 2015. He currently serves as chief nuclear officer.

Mr. Braun had previously served as the senior vice president and chief operating officer of PSEG Nuclear, a position he had held since September 2012. Prior to that, he had been senior vice president – PSEG Nuclear since 2009. Mr. Braun joined PSEG Nuclear in March 2007 as vice president of Operations Support. Mr. Braun has more than 30 years of experience in commercial nuclear power operations.

Previously, Mr. Braun was site vice president of Exelon Corporation's Peach Bottom Atomic Power Station. Prior to his appointment at Peach Bottom, he was vice president – nuclear oversight of Exelon's nuclear group headquarters and previously served as plant manager of the company's Limerick Generating Station, where he held a senior reactor operator license. Mr. Braun began his career at Limerick in 1982.

Mr. Braun has a Bachelor of Mechanical Engineering degree from Villanova University and earned his Senior Reactor Operator (SRO) license while at Exelon.

SI-SSA-0015-13734

Margaret M. Pego, SPHR

SENIOR VICE PRESIDENT – HUMAN RESOURCES AND
CHIEF HUMAN RESOURCES OFFICER

PSEG SERVICES CORPORATION

Margaret M. Pego was named senior vice president – human resources and chief human resources officer of PSEG Services Corporation in December 2006. Prior, she had been vice president – human resources. Ms. Pego joined PSEG in 1974, and has held a variety of management positions in the human resources department.

Ms. Pego holds a Bachelor of Arts degree in business administration from William Paterson College, and a Master of Business Administration degree with a concentration in management and labor relations from Seton Hall University. In addition, she holds a certificate in EEO studies from Cornell University, and has completed the Human Resources Executive Program at the University of Michigan. She is also certified as a senior professional in human resources.

Ms. Pego was named one of 2013's HR Top 10 Breakaway Leaders by Evanta, a leading organization that fosters leadership development and collaborative exchange among North America's top executives.

Ms. Pego is active in several local and national organizations, including the EEI Chief HR Executive Advisory Committee; the American Gas Association HR Policy Committee; the Conference Board Advisory Council of HR Management – Council of HR Executives; and the Society for Human Resources Management. In addition, she is Chair of the Children's Specialized Hospital Board, a member of the Children's Specialized Hospital Foundation Board and RWJ Health Care Corporation Board. She is the former Chair of the Center for Energy Workforce Development (CEWD) Executive Council and is currently a board member. She is a former member of the Supreme Court of New Jersey Attorney Ethics Committee. Ms. Pego is a 2002 Leadership New Jersey fellow, 1997 TWIN Honoree, 2006 Executive Woman of New Jersey Honoree and 2008 NJ Best 50 Women in Business Honoree.

PRESENTATION

Operator

Ladies and gentlemen, thank you for standing by. My name is Dennis, and I will be your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group First Quarter 2017 Earnings Conference Call and Webcast. (Operator Instructions) As a reminder, this conference is being recorded today, Friday, April 28, 2017. This will be available for telephone replay beginning at 2:00 p.m. Eastern Time today until 11:30 p.m. Eastern Time on May 5, 2017.

It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally - *PSEG Services Corporation - VP of IR*

Thank you, Dennis. Good morning, everyone. Thank you for participating in PSEG's call this morning.

As you are aware, we released our first quarter 2017 earnings statements earlier today. The release and attachments are posted on our website, www.pseg.com, under the Investors section. We also posted a series of slides that detail operating results by company for the quarter.

Our 10-Q for the period ended March 31, 2017 is expected to be filed shortly. The disclaimer statement regarding forward-looking statements details the number of risks and uncertainties that could cause actual results to differ materially for -- from forward-looking statements made therein. And although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so even in light of new information or future events unless required by applicable securities laws.

We also provide you with commentary with regard to the difference between non-GAAP operating earnings and non-GAAP adjusted EBITDA and net income reported in accordance with Generally Accepted Accounting Principles in the United States.

Client Id: 77

I am not going to read the full disclaimer statement or the comments we have on the difference between non-GAAP operating earnings and GAAP results, but I do ask that you read those comments contained in our slides and on our website. PSEG believes that the non-GAAP financial measures providing information on operating earnings and adjusted EBITDA offers a consistent and comparable measure of performance to help shareholders understand operating and financial trends.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service. And joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer.

At the conclusion of their remarks, there will be time for your questions. Thank you.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Thank you, Kathleen, and thank you, everyone, for joining us today. As you saw earlier this morning, we reported non-GAAP operating earnings for the first quarter of 2017 of $0.92 per share versus non-GAAP operating earnings of $0.91 per share in last year's first quarter.

Our GAAP results for the first quarter of $0.22 per share reflect the decisions we made last year to retire the Hudson and Mercer coal fired generating units, which will happen in June of this year. Results also reflect an increase in the reserve for the impairment of our leverage lease investment in the Keystone-Conemaugh generating stations.

Non-GAAP operating earnings for the first quarter benefited from the ongoing successful execution of our investment program. Growth in the regulated utility business and effective cost management offset the impact on power's earnings of a continued decline in energy prices. Our regulated utility business is expected to grow 8.5% in 2017 to represent 2/3 of our full year 2017 non-GAAP operating earnings of $2.80 to $3 per share.

We're off to a good start for the year by maintaining our usual focus on operational excellence, disciplined investment and financial strength. We've also increased our attention on achieving a few key policy objectives. First among these is getting recognition for the value of our nuclear-generating assets. As you know, nuclear generation is facing challenges that are real and serious. We've initiated discussions with key stakeholders at the federal and regional levels and here in New Jersey to improve awareness of the importance of nuclear power. Nuclear is a clean energy resource that provides nearly 97% of the energy that is free of air emissions and is generated in New Jersey. Nuclear supports resiliency of the electric grid by adding to a diverse fuel mix and avoiding the potential reliability problem of putting all of our eggs in one fuel basket. And nuclear provides significant benefits to the regional economy.

We've been working on many fronts to secure the long-term viability of our nuclear generation assets. We have reduced staffing and cut expenses at our nuclear facilities. We've also advocated for change in wholesale market price formation that more accurately recognizes the value that these and other generation resources bring to the customer.

The common sense reality is that these plants are valuable for a variety of reasons. Nuclear-generating facilities have unique characteristics that enhance the resiliency of the system and support public policy objectives that are not recognized or priced in current markets.

While we commend the efforts that FERC is taking on price formation, time is running out for our wholesale market solution. We believe progress in recognizing the value that nuclear brings to the environment, the resiliency of the grid and the economy of the region has been and will take place at the state level.

Enhancing the resiliency of the power system has become an important issue for our company. Super Storm Sandy was the wake-up call that affected our thinking about what is important to our 2.2 million electric customers and 1.8 million gas customers.

PSE&G's $12.3 billion base capital investment program over the next 5 years is focused on ensuring continued reliability and on anticipating, preparing for and recovering from high impact low-frequency events.

THOMSON REUTERS

SI-SSA-0015-13740

Client Id: 77

PSE&G's investment program includes $6 billion dedicated towards transmission system improvements. $3 billion of electric distribution investment is focused on life cycle investments to ensure continued top quartile reliability performance and even better customer service.

Another $3 billion is focused on modernizing and upgrading cast iron and unprotected steel gas mains. And lastly, $250 million is directed to investments in solar and energy efficiency programs that support New Jersey energy policy objectives.

PSE&G's base capital program provides the opportunity for annual growth and rate base of 9% for 2019 and annual growth in rate base of 7% for the 5 years ending 2021.

The expansion and/or extension of existing capital programs could lift PSE&G's 5-year capital program by up to $1.5 billion and raise the growth in rate base from 7% to 9% per year over the 5-year period.

At the beginning of March 2017, PSE&G filed for approval to extend its investments in energy efficiency. This request represents a capital investment of $74 million, and you should expect to see PSE&G request an extension of its existing program to replace gas mains and to modernize its electric distribution system later this year.

PSEG's power construction of 1,800 megawatts of new efficient combined cycle gas-fired cycle capacity within PJM and New England markets is under way to total cost of $2 billion. Earlier this month, the Connecticut Department of Energy and Environmental Protection issued the last set of regulatory permits necessary to begin construction of Bridgeport Harbor 5.

The Keys Energy Center in Maryland and in Sewaren station in New Jersey are scheduled to begin operation in mid-2018. The Bridgeport facility is scheduled to begin operation a year later in mid-2019.

The retirement of Hudson and Mercer and the commercial operation of the new gas-fired combined cycle gas turbine capacity repositions power's portfolio more toward efficient, cleaner assets. Our company-wide investment program is focused on building an infrastructure that improves system reliability. We will update you throughout the year on our efforts to preserve the value of nuclear energy for New Jersey and to secure approval for regulatory mechanisms that provide customers clean, affordable, resilient energy supply.

As mentioned, we are maintaining our non-GAAP operating earnings guidance for the full year of $2.80 to $3 per share. With the support of our dedicated 13,000-plus employees, we expect to be able to successfully deliver on the promise of our investment program that should provide growth for our shareholders and a sustainable energy future for our customers.

With that, I'll turn the call over to Dan who will discuss our financials in greater detail.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Thank you, Ralph, and good morning, everyone. Thanks for joining us this morning. As Ralph said, PSEG reported non-GAAP operating earnings for the first quarter of 2017 of $0.92 per share versus non-GAAP operating earnings of $0.91 per share in the last year's first quarter.

On Slide 4, we've provided you with a reconciliation of non-GAAP operating earnings to net income for the quarter. We've also provided you with information on Slide 8 regarding the contribution to non-GAAP operating earnings by business for the quarter. And in addition, Slide 9 contains a waterfall chart that takes you through the net changes quarter-over-quarter in non-GAAP operating earnings by major business.

I'll now review each company in more detail starting with PSE&G. PSE&G, as shown on Slide 11, reported net income for the first quarter of 2017 of $0.59 per share compared with $0.52 per share for the first quarter of 2016. PSE&G's first quarter results reflect the ongoing successful execution of its growth initiatives and control of operating expenses. Growth in PSE&G's investment in transmission improves quarter-over-quarter net income comparisons by $0.03 per share.

THOMSON REUTERS

SI-SSA-0015-13741

Client Id: 77

Revenue recovery of investments made to replace gas distribution mains under the Energy Strong and Gas System Modernization Programs improved quarter-over-quarter net income comparisons by $0.02 per share, and a reduction in O&M expense also improved quarter-over-quarter net income comparisons by $0.02 per share.

PSE&G implemented a $121 million increase in transmission revenue under the company's FERC-approved formula rate on January 1 of 2017.

Our transmission revenues are adjusted each year to reflect an update of the company's investment program. PSE&G's investment in transmission is expected to grow to represent approximately $7.6 billion of rate base at the end of 2017 or 45% of the company's year end 2017 consolidated rate base.

Gas distribution revenue increased by $16 million, for the completion of gas main replacement work approved under Energy Strong and GSMP.

Under Energy Strong, electric rates are adjusted 2x during the year in March and September and gas rates are adjusted each year in September. And under the Gas System Modernization Program, gas rates are adjusted each year in January to reflect the investment made during the prior year. Annual revenues in 2017, under both of these programs, are forecasted to increase by approximately $55 million.

Actual and weather-normalized electric sales increased about 1.5% in the first quarter compared to the year ago period. The increase is due to a spike in industrial use from one customer that use PSE&G service in 2017, while the dedicated generation plant that normally serves the customer was in an outage. So the improvement in sales to this customer did not lead to an improvement in margin, and actual -- and weather-normalized from gas sales increased about 3% on the quarter and a high volatility of the weather experienced over the last few winters challenges the weather normalization calculations. But over the trailing 12-month period, we view weather-normalized electric and gas sales as essentially flat.

As Ralph mentioned, PSE&G filed with the New Jersey Board of Public Utilities on March of 2017 for approval to increase its investment in existing and new energy efficiency programs. The programs, if approved, would represent a capital investment of $74 million. As part of the petition, PSE&G is also seeking recovery of additional administrative and other costs, including costs associated with the enhancement of the information technology system. The petition has been deemed complete, which starts a 180-day clock to complete a decision on the filing, and this is expected during the third quarter.

PSE&G invested $752 million in capital expenses during the first quarter of 2017 and is on track to invest $3.4 billion in 2017 on transmission and distribution infrastructure. And we are maintaining our forecast of PSE&G's net income for 2017 of $945 million to $985 million.

Moving to Power. PSEG Power reported non-GAAP operating earnings for the first quarter of $0.30 per share and adjusted non-GAAP EBITDA of $359 million. This compares to non-GAAP operating earnings of $0.36 per share and non-GAAP adjusted EBITDA of $409 million for the first quarter of 2016. Non-GAAP adjusted EBITDA excludes the same items as our non-GAAP operating earnings measure as well as income tax expense, interest expense, depreciation and amortization expense.

The earnings release and Slide 17 provide you with detailed analysis of the items having an impact on power's non-GAAP operating earnings, relative to net income quarter-over-quarter. And we have also provided you with more detail on generation for the quarter on Slide 18.

PSEG power's net loss for the quarter reflects the impact of incremental depreciation and other expenses of $564 million, pretax, associated with the decision to retire the Hudson and Mercer coal-fired generating stations on June 1 of this year. Power's results in the second quarter will also be impacted by incremental depreciation expense associated with the early retirement of these units. A decline in the average price received on energy hedges reduced power's quarter-over-quarter non-GAAP operating earnings by $0.09 per share. The non-GAAP quarterly operating earnings comparisons are also lower by $0.01 per share due to a decline in generation output and by $0.01 per share increase in the reserve related to a FERC investigation of power's cost base bids that began in 2014.

THOMSON REUTERS

SI-SSA-0015-13742

Client Id: 77

The impact on non-GAAP operating earnings from these 2 items was offset by a $0.02 per share improvement in off system gas sales. A reduction in O&M, as a result of cost control efforts at the nuclear stations, improved non-GAAP quarter-over-quarter operating earnings comparisons by $0.03 per share.

Power's O&M for the remainder of 2017, particularly the second half of the year, is expected to compare favorably against 2016, given a reduction in pension expense, a decline in major maintenance expense at fossil, the absence of a refueling outage at Power's 100% owned Hope Creek Nuclear Station and of course, the June 1 retirement of Hudson and Mercer as I previously mentioned.

Now let's turn to power's operations. Output from power's generating stations declined 2.8% in the first quarter from year ago levels. Quarterly comparisons were affected by 1 fewer day of operation this year versus last year due to leap year and also reflect the adverse impact on energy pricing and volatility from above-normal temperatures during the first 2 months of the year.

The nuclear fleet operated at an average capacity factor of 100% in the quarter, producing 8.4 terawatt hours of energy. Power's combined cycle fleet experienced a decline in its average capacity factor during the quarter to 41.8% from 51.7%. For the quarter, the combined cycle fleet produced 3 terawatt hours of energy as the coal-fired fleet produced 1.4 terawatt hours of energy.

During the first 2 months of the year, the power markets were characterized by warmer-than-normal weather, reducing overall demand and lowering price volatility. The impact on realized energy pricing from the decline in our average price on energy hedges was notable in the first quarter of '17 versus 2016. As previously disclosed, our average hedge price on energy for 2017 is expected to decline from $51 per megawatt hour in 2016 to $46 per megawatt hour in 2017. The impact on realized energy prices in the first quarter of '17 reflected a larger decline than the average for the year, contributing to the $0.09 per share impact from recontracting I mentioned earlier.

This quarter-over-quarter decline was related to higher seasonal pricing on contracted basis in the eastern PJM region realized in the first quarter of 2016.

For the remainder of 2017, we anticipate a more modest decline year-over-year in energy pricing than what we experienced in the first quarter and a lower decline than what we are forecasting for the full year.

Although power's access to low-cost shale gas continued to provide a benefit to its margins relative to the market, power did experience a compression in spark spreads during the quarter, which had an impact on output from the gas-fired combined cycle fleet. The market has sustained higher prices since the end of February. The improvement can be attributed to higher gas prices and a reduction in congestion with the completion of some transmission work in the area.

Based on the milder weather to date, power's forecasting output for 2017 of 49 to 50 terawatt hours, and the forecast is modified slightly from our prior forecast of output for the year of 49 to 51 terawatt hours. The change in output is primarily the result of a mild winter and the impacts on output on a combined cycle fleet. The nuclear fleet's full year forecasted capacity factor is unchanged at 92%.

Salem 2 is currently in a refueling outage that is forecast seem to be longer than normal, given the decision to proactively address any needs related to the unit's baffle bolts. Approximately 90% of production for the remainder of 2017 is hedged at an average price of $46 per megawatt hour.

Power has hedged approximately 55% to 60% of its forecast production for 2018 of 52 to 54 terawatt hours at an average price of $41 per megawatt hour. And for 2019, power has hedged 20% to 25% of its forecasted production of 58 to 60 terawatt hours at an average price of $42 per megawatt hour.

Power continues to assume BGS volumes will represent approximately 11 terawatt hours in 2017, which is consistent with 2016 volumes. Power's average hedge prices don't include any anticipated future benefit from its retail and marketing efforts. We continue to forecast non-GAAP operating earnings for power in 2017 of $435 million to $510 million. And the forecast of non-GAAP operating earnings represent -- represents an adjusted EBITDA of $1,080,000,000 to $1,210,000,000 for the full year.

THOMSON REUTERS

SI-SSA-0015-13743

Client Id: 77

Now I'll briefly address the operating results from Enterprise and Other. For the first quarter, Enterprise and Other reported a net loss of 15 million or $0.03 per share for the first quarter of 2017 compared to net income of 17 million or $0.03 per share for the first quarter of 2016.

The net loss for the first quarter of 2017 reflects the impact of a pretax charge of $55 million associated with the continuing liquidity issues facing NRG REMA. The charge reflects our current assessment of the ongoing matter.

Non-GAAP operating earnings for the first quarter of 2017 of $17 million or $0.03 per share were unchanged quarter-over-quarter from the first quarter of 2016 and reflect contractual payments associated with the operation of PSEG Long Island and certain tax items at PSEG Energy Holdings. And we continue to forecast full year 2017 non-GAAP operating earnings from Enterprise and Other of $35 million.

With respect to financings, PSE&G closed the quarter with $193 million of cash on the balance sheet. And with debt at the end of March of 2017, representing 47% of our consolidated capital.

Debt at PSEG Power represented 30% of its capital at the end of the quarter. In March 2017, PSEG Power and PSE&G extended the expiration dates on $4 billion of credit facilities to March of 2022. At the end of March, total available credit capacity was $3.6 billion. We remain in a position to finance our 5-year-based capital program of $15 billion without the need for the issuance of equity, and we remain in a position to finance an expansion of our investment program also without the need to issue equity.

Power's cash flow is forecasted to improve following the completion in 2018 and 2019 of construction of the 3 new combined cycle units with the decline in annual capital spending at Power to $200 million a year from 2017's capital budget of $1.2 billion.

PSE&G's internal generation of cash is expected to remain strong throughout the forecast period. We continue to forecast non-GAAP operating earnings for the full year at $2.80 to $3 per share.

That concludes our prepared remarks. And now I'll turn the call back over to the operator for questions.

QUESTIONS AND ANSWERS

Operator

(Operator Instructions) And your first question is from the line of Jonathan Arnold with Deutsche Bank.

Jonathan Philip Arnold- *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

I was curious about the REMA item. When I look back to the Analyst Day, I think you'd said that -- you were talking about guidance. You'd highlighted this as a write down, what you described as the residual value. So is it safe to assume that you have no further exposure?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Jonathan, I think we're in a good place right now. The best information that we have is what we have booked to, really based upon what we know about the liquidity issues at REMA, the issues surrounding the facilities themselves. And basically, the alternative outcomes and -- through our discussions with them. So we think based upon what we know right now, to the best of our information we've recorded to where we think things will be when all's said and done.

Jonathan Philip Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

Can you share sort of how much still on the books?

©2017 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. THOMSON REUTERS

SI-SSA-0015-13744

Client Id: 77

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. Between Keystone and Conemaugh, there's about $55 million of total investment that remains on the books.

Jonathan Philip Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

So you've written off basically half of what was there?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

That's correct, yes.

Jonathan Philip Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

Okay, great. And then just on the penny charge you took for the FERC investigation, not much happened on that recently. And can you just clarify what's going on with that, given the situation at FERC at the moment? And what led to that charge?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. So as you know, this has been an issue that's been around for a while since 2014. It is -- when it began and there was the $25 million charge that was taken in 2014. We are moving forward with it. There's still a fair bit of uncertainty that remains. But based upon where we are right now within the investigation and discussions, the lower end of the range of our exposure, as we've seen it, has raised to $35 million from that $25 million number that we have, and that was the driver behind the reserve that we know.

Jonathan Philip Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

So you were still booking the low end and that's up $10 million

---

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

That's exactly right.

Operator

Your next question is from the line of Julien Dumoulin-Smith with UBS.

Antoine Aurimond - *UBS - Analyst*

This is Antoine Aurimond on for Julian. First, after this quarter, how do you see -- assess your margins trending for the full year? And more generally, how do you see gas basis in PJM evolving in light of the recent pipeline delays?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Your first question was on BGS or BGSS?

©2017 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13745

Client Id: 77

Antoine Aurimond - *UBS - Analyst*

BGSS, the margins for the full year?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. So frankly, as we look at that product in particular, most of what we'll see throughout the year takes place in the first 3 months of the year. So I would say that the BGSS component of our business really is -- will have minimal impact until we get into December. So not a whole lot of variability that we would anticipate until we can adjust it to the fourth quarter there. We have seen some delay in pipelines. I agree on that front, but we have seen some movement within the basis as well. I think that, over time, as we continue to see more takeaway capacity built, we will see some levelization of gas prices over time.

Antoine Aurimond - *UBS - Analyst*

Okay, got it. And lastly, with regards to the ConEd wheel, given that ConEd has been dropped out and that NYPA could possibly follow, do you see any risk of the transmission cost allocated to your utilities customers?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So that's a subject of ongoing dispute at FERC. I think the bottom line for us is that there's no question about recovery of investments that we make. But you're right, Antoine, there will be some healthy debate over who pays that. But at the end of the day, we are getting paid.

Operator

Your next question is from the line of Greg Gordon with Evercore ISI.

Gregory Harmon Gordon - *Evercore ISI, Research Division - Senior MD, Head of Power and Utilities Research and Fundamental Research Analyst*

One in the weeds question and one higher level question. The -- it looks like you have slightly lower, not just slightly lower from output for this year, but also slightly lower projected output in the subsequent years. It doesn't look like it would impact margin much, but I'm just wondering if, is that a function of sort of your dispatch model just being updated for current forwards?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes, that's all it is, Greg. And I'd say the most solid impact is what we've seen year-to-date on winter. So the lower end of that range stayed the same, we just took the top end down by 1 terawatt-hour.

Gregory Harmon Gordon - *Evercore ISI, Research Division - Senior MD, Head of Power and Utilities Research and Fundamental Research Analyst*

Okay. Great. And then I know that you obviously have state-level activity with regard to what you believe to be the right infrastructure agenda for your customers. But at the same time, you've got this federal move with Rick Perry at DOE, opening up a process. And my understanding is that FERC may consider a stakeholder process that ultimately develops into, potentially a 205 proceeding to amend their tariffs to deal with the proliferation of subsidies. Can you comment on all those, on whether you believe that -- and how you think those tensions ultimately get resolved and whether or not that's accurate?

©2017 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13746

Client Id: 77

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So Greg, yes. We're following the DOE study through EEI, which is paying very careful attention to what the future prospects are for baseload generation, primarily in organized markets, but in general, around the country. And the discussions we've had at every level, right, so we've been talking to people at federal levels and talking to people at PJM, we've been talking with people at state, is that regional and national solutions are preferred. But given the time that's required for naming of FERC commissioners, getting your arms around the value of fuel diversity, getting your arms around the value of the environmental impacts of NOx, SO2, carbon, et cetera, that states should be in the lead on those attributes that they value and then those programs should go away as regional and federal programs takeover. So it's not a question of holding off on everything until we get clarity from DOE by any means.

Gregory Harmon Gordon - *Evercore ISI, Research Division - Senior MD, Head of Power and Utilities Research and Fundamental Research Analyst*

Okay. Do you think it's plausible that there could be a stakeholder process that ultimately results in a request for a tariff change at FERC for the PJM auction in 2018?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes, I think It's possible. Sure. We all know what time frames are at PJM and at FERC. But yes, it is possible.

Operator

Your next question is from the line of Praful Mehta with Citigroup.

Praful Mehta - *Citigroup Inc, Research Division - Director*

Just following up on the nuclear discussion. I wanted to understand what kind of timeframe do you have in your mind around getting some resolution on this if there is no support or no exact or any other form of nuclear support? How long are you willing to wait before you take a decision on the nuclear assets?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Well, we haven't picked -- we haven't drawn a line in the sand. I mean, our units are hedged. And as we've said publicly, they are -- because of those hedges generating positive cash flow. However, as one looks at the forward price curve, as those hedges roll off, that cash flow becomes more and more challenged. And in fact, if you believe the forward price curve out for years, those cash flows turned negative. One then has to ask, "Well, what do you think will happen to the price curve beyond that?" So rather than draw a line in the sand, what we've said is we ought to work collectively with people to make sure that the attributes of nuclear are being compensated in the market and that to the extent that those attributes are not being compensated, states should look at providing a needs test for nuclear plants to say, “Okay. If they are in fact not profitable and are at high risk of going away and we will regret losing those attributes, then we ought to make sure that they don't go way." So I think what we've tried to go out of our way to say is the day we announce the date, we are in a mode that is a place that nobody ought to want to be because these assets are too valuable to the state of New Jersey for us to announce a date. So we're doing all we can to avoid having to do that.

Praful Mehta - *Citigroup Inc, Research Division - Director*

Fair enough. And second, just a detailed question. On the hedges, it looks like the percentage hedge obviously came down -- comes down over time, but the price also is down, which you would expect from the forward curve, it's down from $46 to $42. I guess the question is you, generally, when you're hedging in the forward market, are hedging better periods of time, peak periods or peak hours, what do we take away from the hedge

THOMSON REUTERS

SI-SSA-0015-13747

Client Id: 77

price? Does that mean that the average is actually even lower than that? Or, I guess, just trying to get a sense for what the $42 really means in terms of forward achievable prices for 24/7?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes, maybe 2 ways think to think about that, Praful. One is I don't know that I would say that we are necessarily hedging the highest prices earlier and then moving down the scale. There's on peak and off peak hedges that could put on without a particular pattern necessarily. So I would diffuse you of your first thought that it's definitely the higher prices. That said, as we look to the outer years of our disclosed hedge prices and into 2019, given that we've had some BGS auctions that have rolled through, some of that 2019 volume is based upon BGS and we decomposed the BGS price and pull out the capacity components. But there are some other non-energy components that are in there that give a little bit of a lift to that price. So maybe not so much the fact that it's the higher price or the on peak prices that have been hedged, but more so that some of the BGS volume that rolls into '19 shows that price to be what it is. But that's the makeup of it.

Operator

Your next question comes from the line of Angie Storozynski with Macquarie.

Angieszka Anna Storozynski - *Macquarie Research - Head of US Utilities and Alternative Energy*

I just don't know if you are willing to give us the sense what would be the potential construct of that support for nuclear plants in New Jersey. It's my understanding that it wouldn't resemble the one from New York or Illinois. Would it be more like what we're seeing in Connecticut or something completely unrelated?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Angie, I would say right now we are in what I would call an education phase. And the only thing that we know for a fact in New Jersey is that if New Jersey were to agree to the importance of nuclear from an environmental point of view, from a regional economy point of view, from fuel resiliency point of view, is that it would require legislation. And I just have a lot of confidence that New Jersey will give it serious thought. I mean, the issues are pretty clear here. If those assets are not earning their cost of capital over the long term or if they turn cash flow negative, we'll retire them. That will be a very painful decision, given the impact it has on New Jersey. But unfortunately, it's a very clear decision for us from a shareholder point of view. So now the other question is how do policymakers feel about the increased emissions of NOx, SO2, CO2, single fuel dependency. And this is not -- and I thank you for your question. This is not a slam against natural gas. This is not a projection that natural gas won't be abundant for decades to come. It's not a slam against renewables. This is the case for the value of fuel diversity. The value of not putting all your eggs in one basket. The value of something that does not have air emissions. The value of something that has candidly really good jobs. And obviously, the laws of economics, supply and demand. You cannot remove 40% of the supply without having an increase in prices in New Jersey. And that's something New Jersey consumers should not like. So once the plants become “uneconomic”, they still have enormous value to New Jersey. So that's what we're doing right now. We're just educating people about that. To us, right now, they are still positive cash flow generators.

Angieszka Anna Storozynski - *Macquarie Research - Head of US Utilities and Alternative Energy*

So just following this line of thinking, so they -- basically, the plants become free cash flow negative come 2020?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Well, if the forward price curve is realized, the answer is yes.

©2017 Thomson Reuters. All rights reserved. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13748

Client Id: 77

Angieszka Anna Storozynski - *Macquarie Research - Head of US Utilities and Alternative Energy*

Okay. And so...

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

And we do not try to outguess the forward price curve. As you know, we run this company in accordance with the hedging program that feathers in the forward price curve. Now we're working hard to lower our cost at nuclear, to try to fight against that stream, that current.

Angieszka Anna Storozynski - *Macquarie Research - Head of US Utilities and Alternative Energy*

Okay. But in light of that, right, and you said that it's still at the discussion phase in New Jersey. We're going into a capacity auction, which will cover the summer of 2020 and beyond. You'll have a set of assets that, based on observable curves, is free cash flow negative. So what do you do? What do you do going into this auction?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Of course, we discuss that all the time, and you know us well enough, Angie, that we're not going to disclose that. You're really asking how we're going to put the units in RPM and we just never talk about things like that. It's worth trying though.

Operator

Your next question is from the line of Daniel Yu with Goldman Sachs.

Tseng-Kuo Yu - *Goldman Sachs Group Inc., Research Division - Research Analyst*

Two parts in my question on Power and market fundamentals. First, are there major supply changes in New Jersey that we should keep in mind in addition to the retirement of Hudson and Mercer and elimination of the ConEd wheel? And second, in your view, what are the impacts of the supply changes on the energy and capacity markets?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

No. I mean, I think the one that we would point to is we have our Sewaren plant that's coming in, but maybe I would say you have the RPM auction that has happened for the past couple of years. You can see what has come forth from the standpoint of new capacity there. And in the last auction, there was nothing that was in EMAAC, but that's your best indication as to what's going to happen in the near term, near term being 3 years out coming out of the capacity auction-given indication. As you'll be able to see, what supply and demand has committed to the market 3 years out. And then the other thing that we look at that we talked about briefly before is just overall supply of gas and pipeline capacity in the region.

Operator

Your next question is from the line of Chris Turnure with JPMorgan.

©2017 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13749

Client Id: 77

Christopher Turnure - *JP Morgan Chase & Co, Research Division - Analyst*

I know that you had a couple of specific things that you wanted to see changed or things that you thought where, I guess, unjust or unreasonable in regards to the PJM parameters in the transmission capacity in the Eastern region. Given the changes that were announced a couple of weeks back, did they fully reflect those changes or partially reflect those changes? Or can you give us some color there?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes, Chris, partially only. We're still confused and our technical people have a different point of view than what was published by PJM, in particular on the CETL/CETO parameters as it pertains to the PS Zone, and in particular, PS North. So we are going to follow the appropriate communication channels to PJM, and I'm sure that they will post our communications with them on Oasis or whatever other mechanisms they choose. So it was better the second time around, but we still either need to be educated or PJM needs to make some further changes.

Christopher Turnure - *JP Morgan Chase & Co, Research Division - Analyst*

And when you say that, are you referring to changes for future auctions or something that could impact this year?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

I think -- yes, I think it's more than likely for future auctions, Chris. I've lost track of time. I think it says April 28 and the auction starts in 2.5 weeks. So I think we're talking about future auctions.

Christopher Turnure - *JP Morgan Chase & Co, Research Division - Analyst*

Okay. And then I know you don't have that much capacity up there, but the ISO New England proposal from, I think, last week was pretty interesting. Do you have any preliminary thoughts on what the impact of that might be over time and the next steps that would be required to get that in place there?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So as you know, the most important thing we have up in ISO New England is the construction of a new combined cycle gas turbine unit, which has a 7-year lock on prices. So that's how -- we're kind of -- we're good to go for the foreseeable future, so the changes that you're referring to are not of a big consequence to us.

Operator

(Operator Instructions) Your next question is from the line of Paul Patterson with Glenrock Associates.

Paul Patterson - *Glenrock Associates LLC - Analyst*

A few quick ones. First of all, on the DOE examination, et cetera, just in general, are you hearing anything about perhaps something more dramatic coming out of Washington to deal with nuclear or coal plant retirements -- baseload retirements outside of the sort of normal stakeholder process sort of approach? Anything that would lead you to think that there'd be something outside of the stakeholder approach that we've been seeing for so many years now? Have you heard anything perhaps more dramatically happening more quickly to address some of the more imminent closures that might be happening?

©2017 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13750

Client Id: 77

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Paul, we haven't -- I mean, the reality is less congressional stab at tax reform has some phasing out of both the production and investment tax credit. I suppose Congress could revisit that and try to further accelerate those phase outs. The real issue is what happens in organized markets to price the attributes of fuel diversity and/or environmental attributes. And I think that's less about doing away with something and creating something, and that, as the earlier question pointed out, really lends itself more to a stakeholder process or a discussion that would play itself out over the coming months, if not years, which is why we would say that state action is likely going to front run any federal consensus on these issues. But to be blunt, Paul, we're reading the same stuff you are and just getting feedback through EEI on what this all means.

Paul Patterson - *Glenrock Associates LLC - Analyst*

Okay. Great. And then I apologize if you -- I was interrupted just briefly during the call. There was this infrastructure straw proposal at the New Jersey BPU and another one of payments of a [disc] kind of service setup. And I was wondering if you guys -- if you've already talked about it, I apologize, but if you haven't and I was wondering if you could elaborate a little bit more about what you see happening potentially there and how it could impact you?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Sure. Yes. So no, we haven't discussed it. I describe it as a step in the right direction on an issue that we and the board staff and others have been talking about now for well over a year. You may remember, we have filed 15 tracker/clause programs over the past 10 years and had all 15 approved, not exactly as we had filed them, but with modifications. And it's become abundantly clear to us and to board staff that many of these programs that we've initiated have many, many years ahead of them. I mean, we have an aging infrastructure that needs replacement. And to constantly go back in because of an 18-month program's expiration is just suboptimal in terms of how much work you can do efficiently. So things like training programs for long-term employees, permanent hires versus contractors are things that we don't do now because we don't know whether our capital program is going to end in 18 or 36 months. So what the board has come out is that, all right, we'll give things kind of a standard recovery mechanism and a 5-year life, but in exchange, you have to come in for a rate case every 5 years. And given the absence of load growth, that seems to be a very, very reasonable thing to do. Now the devil's in the details, and based upon the straw man that was put out, there's a couple of significant improvements that we think need to be made. I'm sure that there'd be -- maybe some other folks who have a different point of view, but we think it's a good step in terms of realizing that long-term ongoing infrastructure replacement should not be done in 18-month increments, and giving us 5 years of clarity will help us hire the people, train the people, invest in the equipment that can help us replace miles of pipe at more efficiently and reinforce circuits more efficiently and do things that customers are expecting from us. So to be continued but certainly, a constructive first step.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

And Paul, this will all be a public process. So as it progresses over time, you will be able to see the discussions that are going out and how it is going.

Paul Patterson - *Glenrock Associates LLC - Analyst*

Any sense on the timing? I mean, (inaudible) seems kind of -- I don't know, I mean, the consolidated tax seems to take forever. Do you have any idea when this might be resolved?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Not resolved. Next week is the beginning of the process. I believe there's -- you may see some more discussion around it next week that would give more of an indication. But I think as far as when it would end is we don't know right now.

THOMSON REUTERS

SI-SSA-0015-13751

Client Id: 77

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

I'm going to hope that it's done this year, but we don't have a control over that schedule.

Operator

(Operator Instructions) Your next question is from the line of Steve Fleishman with Wolfe Research.

Steven I. Fleishman - *Wolfe Research, LLC - MD and Senior Utilities Analyst*

I'm sorry, it's been answered. Thank you.

Operator

And at this time, there are no further questions. Please continue with any closing or prepared remarks.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Sure. So thank you all again for joining us. As is often the case, we greatly appreciate it. As is always the case, we greatly appreciate you spending your time with us. So hopefully, the main messages you heard is that the utility investment program is on track. We're doing things that are valuable to customers and hopefully, provide a fair, risk-adjusted return to our investors. We certainly view them as being such. We -- Dan briefly mentioned, but it's worth repeating that the power construction program is on schedule and on budget, so looks okay there. We continue to realize the benefits of careful cost control in the utility, in PSEG Power and that commitment is a daily one and you can rest assured that, that will continue out into the future. And lastly, we're engaged in some policy discussions that we believe can be helpful to our customers and our shareholders whether it's energy efficiency, recognizing the value of nuclear or putting in place predictable long-term infrastructure programs, all of which will help us run our system more efficiently and in a way that's safe, reliable and affordable for all involved. I'm sure Kathleen and Dan and I will see you at various venues in weeks and months ahead, and we look forward to chatting with you at that time. Thank you.

Operator

PSEG ANNOUNCES 2017 FIRST QUARTER RESULTS

$0.22 PER SHARE OF NET INCOME

Non-GAAP Operating Earnings of $0.92 Per Share

Re-Affirms Non-GAAP Operating Earnings Guidance $2.80 - $3.00 Per Share

(April 28, 2017 – Newark, NJ) Public Service Enterprise Group (NYSE: PEG) reported today Net Income for the first quarter of 2017 of $114 million, or $0.22 per share as compared to Net Income of $471 million, or $0.93 per share, in the first quarter of 2016. Non-GAAP Operating Earnings for the first quarter of 2017 were $466 million, or $0.92 per share, compared to non-GAAP Operating Earnings for the first quarter of 2016 of $463 million, or $0.91 per share. Net Income for the first quarter of 2017 was affected by accelerated depreciation associated with the early retirement of the Hudson and Mercer coal-gas generating stations and a reserve for the impairment of our leveraged leases.

Ralph Izzo, chairman, president and chief executive officer, commented that “we are off to a good start for the year. Our investment program and control of O&M continue to contribute to the growth in results of our regulated utility business and helps offset the impact of a decline in energy prices on earnings at PSEG Power. Our regulated utility business is expected to grow to represent 66% of non-GAAP Operating Earnings for the full year.”

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG’s financial performance to previous results. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items such as the previously noted Hudson and Mercer retirements and lease impairment.

The tables below provide a reconciliation of PSEG’s Net Income to non-GAAP Operating Earnings for the first quarter. See Attachment 9 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings. The presentation of non-GAAP Operating Earnings is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings as presented in this release may not be comparable to similarly titled measures used by other companies.

*See Attachment 9

Ralph Izzo went on to say, "We are re-affirming our non-GAAP Operating Earnings guidance for 2017 of $2.80 - $3.00 per share. By delivering on our strategic investment program, we are building an energy company that meets the needs of our shareholders and provides a sustainable energy future for our customers."

The following table outlines PSEG's expectations for non-GAAP Operating Earnings by subsidiary for 2017.

2017 Non-GAAP Operating Earnings Guidance
($millions, except EPS)

	2017E
PSE&G	$945 - $985
PSEG Power	$435 - $510
PSEG Enterprise/ Other	$35 - $35
Non-GAAP Operating Earnings	$1,415 - $1,530
Non-GAAP EPS	$2.80 - $3.00

E = Estimate

Due to the forward looking nature of non-GAAP Operating Earnings guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

Non-GAAP Operating Earnings Review and Outlook by Operating Subsidiary

See Attachment 4 for detail regarding the quarter-over-quarter reconciliations for each of PSEG's businesses.

PSE&G

PSE&G reported Net Income of $299 million ($0.59 per share) for the first quarter of 2017 compared with Net Income of $262 million ($0.52 per share) for the first quarter of 2016.

PSE&G's first quarter results reflect the on-going successful execution of its growth initiatives and control of operating expenses.

Growth in PSE&G's investment in transmission improved quarter-over-quarter Net Income comparisons by $0.03 per share. Revenue recovery of investments made to enhance system resiliency under the Energy Strong and Gas System Modernization Programs improved quarter-over-quarter Net Income comparisons by $0.02 per share. A reduction in O&M expense improved quarter-over-quarter Net Income comparisons by $0.02 per share.

PSE&G implemented a $121 million increase in transmission revenue under the company's FERC-approved formula rate on January 1, 2017. Transmission revenues are adjusted each year to reflect an update of the company's investment program. PSE&G's investment in transmission is expected to grow to represent approximately $7.6 billion of rate base at the end of 2017, or 45% of the company's year-end 2017 consolidated rate base. Gas distribution revenue increased by $16 million with the completion of gas main replacement work approved under the Energy Strong and GSMP investment programs.

Actual and weather-normalized electric sales were approximately 1.5% higher than a year ago due to an increase in sales to a large industrial customer whose contracted generation supply was off-line during most of the quarter. Residential sales comparisons were flat, and sales to the commercial sector increased 0.8%. Actual and weather-normalized firm gas sales increased 3.0% in the first quarter. The increase is higher than our forecasted rate of growth, and may be attributable in part to imprecision in weather normalization calculations during extreme weather conditions. The increase is in line with growth trends experienced prior to 2016.

PSE&G filed with the NJ Board of Public Utilities (BPU) in March 2017 for the extension of existing Energy Efficiency programs and the addition of new programs. The programs, if approved, would represent a capital investment of approximately $74 million. As part of the petition, PSE&G is also seeking recovery of additional administrative and information technology system enhancement costs. The petition has been deemed complete, and a decision is pending.

PSE&G invested $752 million of capital expenditures during the first quarter of 2017 and is on-track for its full-year capital investment program of $3.4 billion in its transmission and distribution infrastructure.

The forecast of PSE&G's Net Income for 2017 remains unchanged at $945 - $985 million.

PSEG Power

PSEG Power reported a Net Loss of $170 million ($0.34 per share) for the first quarter of 2017 compared with Net Income of $192 million ($0.38 per share) for the first quarter of 2016. PSEG Power's non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA for the first quarter of 2017 were $150 million ($0.30 per share) and $359 million respectively compared to non-GAAP Operating Earnings of $184 million ($0.36 per share) and non-GAAP Adjusted EBITDA of $409 million for the first quarter of 2016.

Management believes non-GAAP Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization. See Attachment 10 for a complete list of items excluded from Net Income/(Loss) in the determination of non-GAAP Adjusted EBITDA. The presentation of non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to the presentation of Net Income/(Loss), which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

PSEG Power's Net Loss for the first quarter reflects the impact of incremental depreciation and other expenses of $564 million, pre-tax, associated with the decision to retire the Hudson and Mercer coal-fired generating stations on June 1, 2017.

A decline in the average price received on energy hedges reduced Power's quarter-over-quarter non-GAAP Operating Earnings by $0.09 per share. Non-GAAP quarterly Operating Earnings comparisons were also reduced by $0.01 per share as a result of a decline in output and by a $0.01 per share increase in the reserve related to a FERC investigation of Power's cost-based bids begun in 2014. These two items were offset by a $0.02 per share quarter-over-quarter improvement in non-GAAP Operating Earnings on off-system gas sales. A reduction in O&M as a result of cost control at the nuclear stations improved quarter-over-quarter non-GAAP Operating Earnings comparisons by $0.03 per share.

Output from Power's generating facilities was 2.8% lower in the first quarter compared to year-ago levels. Quarterly comparisons were affected by one fewer day of operation in

2017 relative to the year-ago period (due to leap year), and the adverse impact of above normal temperatures during the first two months of the year on energy demand, pricing and volatility. The nuclear fleet operated at an average capacity factor of 100% producing 8.4 TWh of energy. Power's gas-fired CCGT fleet experienced a decline in its average capacity factor during the quarter to 41.8% from 51.7%. For the quarter, the CCGT fleet produced 3.0 TWh of energy and the coal-fired fleet produced 1.4 TWh of energy.

Based on the mild winter, Power is forecasting output for 2017 of 49 – 50 TWh – modified from its prior forecast of output for the year of 49 – 51 TWh. Approximately 90% of production for the remainder of the year is hedged at an average price of $46 per MWh. Power has hedged approximately 55% - 60% of its forecast production for 2018 of 52 – 54 TWh at an average price of $41 per MWh. For 2019, Power has hedged 20% - 25% of its forecast production of 58 – 60 TWh at an average price of $42 per MWh. Power continues to assume BGS volumes will represent approximately 11 TWh in 2017 – consistent with 2016 deliveries.

The forecast increase in output for both 2018 and 2019 reflects the commercial start-up in mid-2018 of 1,300 MWs of new gas-fired combined cycle capacity at the Keys Energy Center in Maryland and Sewaren in New Jersey, and the mid-2019 commercial start-up of the 485 MW gas-fired combined cycle power plant at Bridgeport Harbor, Connecticut.

The forecast of Power's non-GAAP Operating Earnings for 2017 and non-GAAP Adjusted EBITDA remain unchanged at $435 - $510 million and $1,080 million - $1,210 million respectively.

Due to the forward looking nature of non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

PSEG Enterprise/Other

PSEG Enterprise/Other reported a Net Loss of $15 million ($0.03 per share) for the first quarter of 2017 compared to Net Income of $17 million ($0.03 per share) for the first quarter of 2016. Non-GAAP Operating Earnings for the first quarter of 2017 were $17 million ($0.03 per share) compared to $17 million ($0.03 per share) for the first quarter of 2016. The Net Loss for the first quarter of 2017 reflects the impact of a pre-tax charge of $55 million associated with continuing liquidity issues facing NRG REMA, LLC. Non-GAAP Operating Earnings were unchanged quarter-over-quarter and reflect contractual payments associated with the operation of PSEG Long Island and certain tax items at PSEG Energy Holdings.

The forecast of PSEG Enterprise/Other full year non-GAAP Operating Earnings for 2017 remains unchanged at $35 million.

########

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized,

will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-13771

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income/(Loss) to reconcile to non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA with a reference to those slides included on each of the slides where the non-GAAP information appears.

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Management believes non-GAAP Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. The presentation of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

PSEG
2017 Q1 Review

Ralph Izzo

Chairman, President and Chief Executive Officer

SI-SSA-0015-13773

PSEG Q1 Results Summary – Solid Results

Quarter ended March 31

$ millions (except EPS)	2017	2016
Net Income	$ 114	$ 471
Reconciling Items	352	(8)
Operating Earnings (non-GAAP)*	$ 466	$ 463
EPS from Net Income	$ 0.22	$ 0.93
EPS from Operating Earnings (non-GAAP)*	$ 0.92	$ 0.91

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings (non-GAAP).

SI-SSA-0015-13774

PSEG Q1 2017 – Achieved Solid Financial Results

- **First Quarter Highlights**
  - ✓ Net Income of $0.22 vs. Net Income of $0.93 per share in Q1 2016
  - ✓ Non-GAAP Operating Earnings* of $0.92 vs. $0.91 per share in Q1 2016
  - ✓ Net Income reflects decision to retire Hudson-Mercer in June 2017 and REMA lease reserve
  - ✓ PSE&G achieved 13% growth in Q1 Net Income over Q1 2016, supported by increased investment in transmission and distribution
  - ✓ PSEG Power results aided by continued cost containment

- **Operational Excellence**
  - ✓ Nuclear fleet performance achieved 100% capacity factor for Q1

- **Disciplined Capital Investment – Producing Results**
  - ✓ PSEG expected to invest ~$4.7 billion in 2017, consisting primarily of $3.4 billion at PSE&G and $1.2 billion at PSEG Power
  - ✓ Regulatory/Legislative Focus: NJ Needs Nuclear advocacy efforts; Energy Efficiency extension and expansion filing in March
  - ✓ Major capital initiatives on track: Bridgeport Harbor 5 received all needed permits to begin construction phase

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings (non-GAAP).

PSE&G
2017 Q1 Review

PSE&G – Q1 Summary of Results

$ millions (except EPS)	Q1 2017	Q1 2016	Variance
Operating Revenues	$ 1,812	$ 1,712	$ 100
Operating Expenses			
Energy Costs	753	729	24
Operation & Maintenance	367	382	(15)
Depreciation & Amortization	171	139	32
Total Operating Expenses	1,291	1,250	41
Net Income	$ 299	$ 262	$ 37
EPS from Net Income	$ 0.59	$ 0.52	$ 0.07

SI-SSA-0015-13781

PSE&G EPS Reconciliation – Q1 2017 versus Q1 2016

SI-SSA-0015-13782

PSE&G – Monthly Heating Degree Days

1Q 2017 winter weather, as defined by heating degree days, was ~10% warmer than normal; a colder than normal March offset a mild January and the warmest February on record to make 1Q 2017 weather about the same as experienced in 1Q 2016.

PSE&G – Q1 Operating Highlights

Operations

- ✓ Residential electric sales were flat on an actual and weather-normalized basis; industrial and commercial electric sales increased by 2.5% due to a one time event and is not indicative of ongoing C&I demand growth
- ✓ Total firm gas sales rose by 3% on a weather-normalized basis, due to variability versus normal
- ✓ Winter weather was warmer than normal in Q1 due to a warm January and the warmest February on record, offset by colder than normal March weather

Regulatory and Market Environment

- ✓ FERC formula rate revenue increase of $121 million implemented on January 1
- ✓ In March, PSE&G filed an extension and expansion of its award-winning Energy Efficiency programs; the total filing proposes a ~$74 million investment in EE; the filing has been deemed complete and a decision is expected from the NJBPU in Q3 2017
- ✓ PSE&G will file its distribution base rate case with the NJBPU no later than November 1, 2017

Financial

- ✓ PSE&G invested $752 million in capital expenditures in Q1 to upgrade and expand T&D infrastructure and reliability as part of its planned $3.4 billion full-year capital program
- ✓ PSE&G's Q1 2017 earnings increased by $0.07 or ~13% to $0.59 per share
- ✓ PSE&G's 2017 Net Income guidance range remains unchanged at $945 - $985 million

SI-SSA-0015-13784

PSEG Power
2017 Q1 Review

SI-SSA-0015-13785

PSEG Power – Q1 Summary of Results

$ millions (except EPS)	Q1 2017	Q1 2016	Variance
Operating Revenues	$1,284	$ 1,313	$ (29)
Net Income/(Loss)	(170)	192	(362)
Reconciling Items	320	(8)	328
Operating Earnings (non-GAAP)*	$ 150	$ 184	$ (34)
EPS from Net Income/(Loss)	$ (0.34)	$ 0.38	$ (0.72)
EPS from Operating Earnings (non-GAAP)*	$ 0.30	$ 0.36	$ (0.06)
Adjusted EBITDA (non-GAAP)*	$ 359	$ 409	$ (50)

*See Slide B for Items excluded from Net Income/(Loss) to reconcile to Operating Earnings (non-GAAP) and Adjusted EBITDA (non-GAAP) for PSEG Power.

PSEG Power EPS Reconciliation – Q1 2017 versus Q1 2016

SI-SSA-0015-13787

PSEG Power – Q1 Generation Measures

PSEG Power – Generation (GWh)*

PSEG Power – Capacity Factors (%)

	Quarter ended March 31	
	2016	2017
Combined Cycle		
PJM and NY	51.7%	41.8%
Coal**		
NJ (Coal/Gas)	0.4%	0.0%
PA	58.9%	83.5%
CT	6.7%	9.6%
Nuclear	99.7%	100%

PSEG Power – Fuel Costs

	Quarter ended March 31	
($ millions)	2016	2017
Gas	$ 66	$ 78
Coal	$ 27	$ 35
Total Fossil	$ 93	$ 113
Nuclear	58	54
Total Fuel Cost	$ 151	$ 167
Total Generation (GWh)	13,201	12,834
$ / MWh	11.44	13.01

Total Nuclear Total Coal** Natural Gas

* Excludes solar and Kalaeloa. ** Includes figures for Pumped Storage. Includes Hudson and Mercer when run on gas.

SI-SSA-0015-13788

PSEG Power – Gross Margin Performance

- ✓ Lower hedge prices and decline in generation (1 fewer day of operation)
- ✓ Capacity revenues were flat vs. Q1 2016
- ✓ Regional spark spread compressed in the quarter

PSEG Power Gross Margin ($/MWh)

Quarter ended March 31

Regional Performance		
Region	**Q1 Gross Margin ($M)**	**Q1 2017 Performance**
PJM	$440	Recontracting at lower prices and lower volumes
New England	$32	Higher generation offset by lower hedges
New York	$8	Higher prices offset by lower generation

Hedging Update…

Contracted Energy*

		Apr-Dec 2017	2018	2019
Base Load (Nuclear and Base Load Coal)	Volume TWh	25	34	34
	% Hedged	100%	90-95%	35-40%
	Price $/MWh	$46	$41	$42
Intermediate, Combined Cycle, Peaking	Volume TWh	10	19	26
	% Hedged	65-70%	0%	0%
	Price $/MWh	$46	$ -	$ -
Total	Volume TWh	35-37	52-54	58-60
	% Hedged	85-90%	55-60%	20-25%
	Price $/MWh	$46	$41	$42

* HEDGE PERCENTAGES AND PRICES AS OF MARCH 31, 2017. REVENUES OF FULL REQUIREMENT LOAD DEALS BASED ON CONTRACT PRICE, INCLUDING RENEWABLE ENERGY CREDITS, ANCILLARY, AND TRANSMISSION COMPONENTS BUT EXCLUDING CAPACITY. HEDGES INCLUDE POSITIONS WITH MTM ACCOUNTING TREATMENT AND OPTIONS.

PSEG Power – Q1 Operating Highlights

Operations

- ✓ Q1 output down 2.8% as low energy prices and mild weather impacted economic dispatch
- ✓ Nuclear fleet achieved average capacity factor of 100%, producing 8.4 TWhs of energy
- ✓ CCGT fleet had a capacity factor of 42% versus 52% in Q1 2016 as high availability remained strong at >90% and produced 3 TWh of energy; Coal fleet produced 1.4 TWh of energy

Regulatory and Market Environment

- ✓ 2017 expected generation output 49-50 TWh; BGS load projected at 11 TWhs
- ✓ Power has begun construction at Bridgeport Harbor 5, obtained all needed permits in early April; target completion remains mid-2019
- ✓ Construction on schedule and on budget at Keys and Sewaren 7 for targeted 2018 in-service

Financial

- ✓ Power's total debt as a percentage of capitalization at March 31 was 30%
- ✓ Power's 2017 non-GAAP Operating Earnings guidance range remains unchanged at $435 - $510 million; non-GAAP Adjusted EBITDA guidance for 2017 remains unchanged at $1,080 to $1,210 million

SI-SSA-0015-13791

PSEG

PSEG Financial Highlights

- **Reiterating 2017 non-GAAP Operating Earnings guidance of $2.80 - $3.00 per share**
  - ✓ PSE&G earnings forecast to grow 8.5% to comprise 66% of PSEG's 2017 non-GAAP Operating Earnings
  - ✓ Focused on maintaining operating efficiency and customer reliability
- **PSEG's 5-Year capital spending forecast of $15 billion over 2017-2021 to be invested in PSE&G (82%) and Power (18%)**
- **PSE&G infrastructure investment in reliability/resiliency/replacement remains on track**
- **PSEG Power's $2 billion investment in new generation, in PJM and New England, will improve fleet efficiency and geographic diversity**
- **Increased 2017 indicative common dividend by 4.9% to $1.72 per share**
- **Financial position remains strong:**
  - ✓ Positive cash from Power and increasing cash flow from operations at PSE&G supports dividend growth and funds capital spending program without the need to issue equity
  - ✓ Debt as a percentage of capitalization was 47% at March 31

EDITED TRANSCRIPT

PEG - Q2 2017 Public Service Enterprise Group Inc Earnings Call

EVENT DATE/TIME: JULY 28, 2017 / 3:00PM GMT

OVERVIEW:

Co. reported 2Q17 net EPS of $0.22. Expects 2017 non-GAAP operating EPS to be $2.80-3.00.

CORPORATE PARTICIPANTS

Daniel J. Cregg *Public Service Enterprise Group Incorporated - CFO and EVP*

Kathleen A. Lally *PSEG Services Corporation - VP of IR*

Ralph Izzo *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

CONFERENCE CALL PARTICIPANTS

Daniel Frederick Ford *Barclays PLC, Research Division - MD and Head of United States Utilities Equity Research*

Jonathan Philip Arnold *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

Michael Jay Lapides *Goldman Sachs Group Inc., Research Division - VP*

Neel Mitra *Tudor, Pickering, Holt & Co. Securities, Inc., Research Division - Director, Utilities and Power Research*

Paul Patterson *Glenrock Associates LLC - Analyst*

Praful Mehta *Citigroup Inc, Research Division - Director*

Steven Isaac Fleishman *Wolfe Research, LLC - MD & Senior Utilities Analyst*

Travis Miller *Morningstar Inc., Research Division - Director of Utilities Research and Strategist*

PRESENTATION

Operator

Ladies and gentlemen, thank you for standing by. My name is Jamie, and I am your event operator today. I would like to welcome everyone to today's conference. Public Service Enterprise Group Second Quarter 2017 Earnings Conference Call and Webcast. (Operator Instructions) As a reminder, this conference is being recorded, Friday, July 28, 2017, and will be available for telephone replay beginning at 1:00 p.m. Eastern Time today until 11:30 p.m. Eastern on Friday, August 4, 2017.

It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the call -- conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally - *PSEG Services Corporation - VP of IR*

Thank you, Jamie. Good morning. Thank you, everyone, for participating in our earnings call this morning. As mentioned, PSEG released earnings statements for the second quarter 2017 earlier today. And you will find the release and attachments on our website, www.pseg.com, under the Investors section.

We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended June 30, 2017, is expected to be filed shortly.

As you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. And although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so even if our estimate changes, unless required to do so.

We also provide commentary with regard to the difference between non-GAAP operating earnings and non-GAAP adjusted EBITDA and net income reported in accordance with Generally Accepted Accounting Principles in the United States.

Client Id: 77

We won't go through the full disclaimer statements or the comments we have on the difference between non-GAAP financial measures, but I do ask that you read those comments contained in our slides and on our website.

PSEG believes that the non-GAAP financial measures providing information on operating earnings and adjusted EBITDA offers a consistent and comparable measure of performance to help shareholders understand operating and financial results.

Now I'd like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer.

At the conclusion of their remarks, there will be time for your questions. Thank you.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Thank you, Kathleen, and thank you, everyone, for joining us today. PSEG delivered solid results for the second quarter, and has had a good first half, putting us on a solid path to meeting our full year objectives.

Earlier this morning, we reported net income for the quarter of $0.22 per share. PSEG's non-GAAP operating earnings for the second quarter of 2017 increased 9% against the prior year comparable quarter, reflecting strong performance at both PSE&G and PSEG Power. The results for the quarter bring non-GAAP operating earnings for the first half of 2017 to $1.54 per share, which is a 4% increase over non-GAAP operating earnings of $1.48 per share earned in 2016's first half.

Slides 5 and 6 contain the detail on the results for the quarter and the first half. At PSE&G, earnings increased $0.06 per share from the prior year comparable quarter. Continued infrastructure investment was the primary driver of this growth. PSE&G's focus remains on providing customers with what they want in terms of enhanced reliability, resiliency and green energy, while keeping bills affordable.

PSE&G continues to make progress in its 2017 plan to invest approximately $3.4 billion in transmission and distribution upgrades. The investment will allow PSE&G to meet its commitment to provide customers with high quality service.

Yesterday, PSE&G filed for continuation and acceleration of its Gas System Modernization Program. PSE&G is proposing to invest $540 million per year over a 5-year period beginning in 2019. The program would allow PSE&G to shorten to within 20 years the replacement of its aging cast-iron and unprotected steel mains and associated services. The filing is consistent with the draft regulations that the BPU issued in June regarding infrastructure investment programs. We applaud the BPU's efforts in this regards.

While PSE&G has received approval from the BPU for several multi-year investment programs in recent years, they have generally been 2 to 3 years in duration, limiting the opportunity to plan as efficiently as we could with longer term programs. The BPUs infrastructure investment proposal would address this, encouraging needed infrastructure investment through timely recovery of investments and providing increased predictability by expansion of the investment time horizon to 5 years. The longer timeframe provides for better planning with contractors, vendors, municipalities where the work takes place, our own workforce and, of course, helps to promote economic growth in the state of New Jersey.
PSE&G has made progress advancing its investment initiatives. Earlier this week, PSE&G reached an agreement in principle with the BPU staff and the Rate Counsel, which provides for $69 million extension of its investment in energy efficiency equipment for hospitals, multi-family housing and other sectors. The agreement represents more than 90% of PSE&G's original request and will bring PSE&G's cumulative investment in energy efficiency to approximately $400 million. We believe an investment in energy efficiency programs is a cost-effective tool to lower air emissions and control the growth and customer bills.

The work PSE&G has done in promoting solar energy in New Jersey was recently acknowledged by the Smart Electric Power Alliance, also referred to as SEPA, which named PSE&G the 2017 Investor Owned Utility of the Year. The award honors PSE&G for its ongoing commitment to increasing the amount of solar power in New Jersey and specifically for its work to build solar farms on landfills and brownfield sites in the state.

Client Id: 77

PSE&G, as you know, will be filing a distribution base rate case with the New Jersey BPU no later than November 1 of this year. The timing of this filing was agreed to in the settlement of the Energy Strong program. The case will provide PSE&G with the opportunity to reset assumptions on sales and O&M growth as well as provide the opportunity to recover investments not recognized in various clauses since our last base rate proceeding, which was settled in 2010.

It will also give us the opportunity to recover prior approved storm costs. PSE&G, as part of the filing, will request approval for a decoupling of distribution revenue from sales volume to support larger scale energy efficiency investments. We believe strongly that this latter action will incentivize continued investment in energy efficiency and help lower participating customer bills.

We expect PSE&G's initiatives to provide value for the customer and our shareholders. For the 5-year period ending 2021, PSE&G's successful execution of its investment program is expected to result in compound annual growth and rate base of 7% to 9%.

At PSEG Power, non-GAAP operating earnings increased by 6% to $0.19 per share as ongoing programs to reduce operating expenses supported earnings. PSEG Power retired its Hudson and Mercer coal-fired generating stations on June 1 and made good progress on construction activities related to its 3 new natural gas combined cycle generation stations.

The new stations will add 1,800 megawatts of efficient capacity over 2018 and '19, and represents a reconfiguration of Power's merchant generation fleet that will improve its competitiveness in the market. We've seen some improvement in energy pricing in the PS zone relative to the PJM West Hub, a higher gas price with the opening up of more outlets for gas supply and the completion of work on transmission lines has relieved congestion and improved energy prices in the East.

Power's primary market at PJM has also experienced an improvement in capacity prices. In May of this year, PJM announced the results of the RPM capacity auction for the 2020 and 2021 delivery year. Power cleared approximately 7,800 megawatts of its generating capacity at an average price of $174 per megawatt day. The average price received by Power was higher than prior auctions and continues to represent a premium to the price for capacity in the RTO.

However, the number of megawatts, which cleared the auction declined from the amount we have cleared in the past. Our results reflect the higher price resulting from the increased risk in the market associated with PJM's move to 100% capacity performance requirements and the absence of available capacity to meet emergency situations following the retirement of Hudson and Mercer. The results of the latest auction provides stability in Power's capacity revenue through calendar year 2020.

The energy markets, on the other hand, continue to be impacted by flat demand and excess capacity, which has hurt the return on our base load resources as the average price in energy hedges declined. Power continues to advocate for policies at the federal level that would correct flaws in the wholesale market design that suppressed prices and provide adequate recognition of the value that fuel diversity brings to a competitive wholesale market.

We believe that state action is also critical and can be done in a way that both maintains the integrity of the wholesale market and serves as a bridge until a regional or federal solution is in place. A strong legal foundation for state action appears to have been set with recent district court rulings upholding the legislative and regulatory actions in Illinois and New York.

We continue to educate stakeholders at the state level about the need to preserve the diversity and resiliency of our electric generating mix. Successful execution of PSEG's key policy and regulatory initiatives would ensure the company's ability to provide customers with the service, reliability and resiliency they want and need at an affordable price in today's technologically advanced society.

Our non-GAAP operating earnings for the first half of 2017 are solidly within our outlook for the full year. So we are maintaining our guidance for 2017's non-GAAP operating earnings of $2.80 to $3 per share. We expect the growth prospects of PSE&G, the reconfiguration of our merchant generating fleet and successful execution of our policy initiatives will allow PSEG to extend its track record of delivering value for our customers and growth for our shareholders, while we maintain a strong balance sheet and credit metrics.

Client Id: 77

With that, I'll turn the call over to Dan who will discuss our financials in greater detail.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Thank you, Ralph, and thanks, everybody, for joining us today. As Ralph said, PSEG reported non-GAAP operating earnings for the second quarter of 2017 of $0.62 per share versus non-GAAP operating earnings of $0.57 per share in last year's second quarter. And a reconciliation of non-GAAP operating earnings to net income for the quarter can be found on Slide 4.

We've also provided you with a waterfall chart on Slide 11 that takes you through the net changes in quarter-over-quarter non-GAAP operating earnings by major business. And a similar chart on Slide 13, which provides you the changes in non-GAAP operating earnings on a year-to-date basis.

I'll now review each company in more detail starting with PSE&G. PSE&G reported net income for the second quarter of 2017 of $0.41 per share compared with $0.35 per share for the second quarter of 2016. And results for the quarter are shown on Slide 15.

PSE&G's operating results for the second quarter reflect the benefits of revenue growth associated with its expanded investment and the continued control of growth and operating expenses. Growth in PSE&G's investment in transmission improved second quarter net income comparisons by $0.04 per share. And revenue recovery from investments made to enhance system resiliency under the energy's strong and Gas System Modernization Program's, GSMP, drove improved margin and second quarter net income comparisons by $0.02 per share. And an increase in depreciation expenses offset by a reduction in O&M and other expenses.

Recall that transmission revenues are adjusted each year to reflect an update of the company's investment program. PSE&G's investment in transmission is expected to grow to represent approximately $7.6 billion of rate base at the end of 2017, which will be 45% of the company's year-end consolidated rate base.

Under Energy Strong, electric rates are adjusted 2 times during the year in March and September and gas rates are adjusted each year in September. Under the Gas System Modernization Program, gas rates are adjusted each year in January to reflect the investment made during the prior year. The combined annual revenue increase in 2017 from these programs is forecasted to be approximately $56 million.

Economic conditions in New Jersey continue to show steady growth, particularly in the level of employment. On a trailing 12-month basis, weather-normalized electric sales were flat year-over-year, due to the impact of increased efficiency in solar net metering, which offset customer growth. Gas sales on the same basis were slightly higher with growth in demand from the commercial sector.

PSE&G has had significant advances on a number of fronts. As mentioned by Ralph, the company filed earlier this week for an extension of the Gas System Modernization Program. This program, which calls for an average investment of $540 million per year, would accelerate the pace of replacement of aging cast-iron and unprotected steel mains to 250 miles per year from the current GSMP pace of 170 miles per year.

In addition, PSE&G reached an agreement in principle with BPU staff and rate council, which provides for a $69 million increase in the company's investment in energy efficiency equipment for hospitals and multi-family housing as well as for new residential energy efficiency offerings for smart thermostats and data analytics. The agreement calls for a 9.75% allowed ROE and is subject to review by the BPU in the near future.

PSE&G continues to advance its 5-year $12.3 billion program in transmission and distribution and continues to identify incremental investments. We expect to see growth in rate base through 2021 of 7% to 9% per year. Assumed within that $12.3 billion capital program is the extension of our existing GSMP program at the current rate of $300 million per year. Our filing yesterday reflecting investment of $540 million per year would increase our forecast capital program by investments made in excess of that $300 million per year amount. These important service quality-related initiatives builds confidence in PSE&G's ability to expand its growth through its 5-year capital cycle.

Based on results for the first half of the year, the forecast of PSE&G's net income for 2017 remains unchanged at $945 million to $985 million.

Client Id: 77

Now let's turn to power. PSEG Power reported a net loss for the quarter of $97 million or $0.19 per share compared with a net loss of $11 million or $0.02 per share for the year ago quarter. Non-GAAP operating earnings was $0.19 per share and non-GAAP adjusted EBITDA was $261 million in the quarter compared with non-GAAP operating earnings of $0.18 per share and non-GAAP adjusted EBITDA of $250 million for the second quarter of 2016.

Non-GAAP adjusted EBITDA excludes the same items as our nonstop operating earnings measure as well as income tax expense, interest expense and depreciation and amortization. The earnings release on Slide 20 provide you with a detailed analysis of the impact on Power's non-GAAP operating earnings quarter-over-quarter.

We've also provided you with more details on generation for the quarter and the first half of the year on Slides 21 and 22. Power's non-GAAP operating results for the second quarter of 2017 reflect the benefit of ongoing programs to reduce operating expenses and an increase in output, which offset a decline in average energy hedge prices.

PSEG Power's net loss for the second quarter reflects the impact of incremental depreciation and other expenses of $387 million pretax associated with the June 1, 2017, retirement of the Hudson and Mercer coal-fired generating stations. This incremental depreciation expense associated with the retirement of these units is now complete and will not continue into the second half of the year.

An increase in capacity prices in both PJM and New England on June 1 for the 2017-2018 energy year improved quarter-over-quarter non-GAAP operating earnings by $0.01 per share. Growth in output improved second quarter non-GAAP operating earnings comparisons by $0.01 per share.

A reduction in O&M associated with fewer nuclear and fossil unit outage-related days in the quarter, and the June 1 retirement of the Hudson and Mercer coal stations improved non-GAAP operating earnings by $0.02 per share. A decline in the average price received on energy hedges reduced non-GAAP operating earnings by $0.03 per share. And an increase in depreciation expense was offset by a decline in interest expense.

Power's O&M for the remainder of 2017 is expected to compare favorably against 2016, and this reflects the absence of a refueling outage at Power's 100% owned Hope Creek Nuclear Station, a decline in major maintenance expense of the fossil stations and, of course, the retirement of Hudson and Mercer coal-fired generating stations.

Now let's turn to Power's operations. Output of Power's generating facilities increased 4% in the second quarter. The improvement reflects a 30-day reduction in nuclear refueling outage days in 2017 relative to the year-ago quarter, which improved the nuclear fleet's capacity factor to 89.6% from 82.7%.

And you may recall Salem 1 underwent an extended refueling outage in 2016 to inspect and replace that unit's baffle bolts. The outage lasted through the month of July, and the work requiring -- the work required during Salem 2's recent refueling outage to inspect and replace baffle bolts was less extensive and has been completed. And no further work associated with this issue at Salem is currently contemplated.

An increase in the price of gas improved the economic competitiveness of our base load coal fleet during the quarter. And during the quarter, that fleet saw an improvement in its capacity factor to 32.6% from 18.4%. Conversely, the gas-fired CCGT fleet operated at an average capacity factor of 55.3% versus 62.3% last year.

As we indicated earlier this year, we experienced a more modest decline in our hedged energy pricing in the second quarter than in the first quarter, as weather-related risk has not been priced into the market to the same extent as was experienced in prior years.

Gas prices have improved year-over-year, but we have not seen a similar improvement in Power prices, which has led to a compression in Western hub spark spreads. In the PS zone, spark spreads have held up relative to what we experienced a year ago with an improvement in basis.

Power continues to forecast output of 49 to 50 terawatt hours for 2017, and approximately 90% of production for the remainder of the year is hedged at an average price of $46 per megawatt hour. Power has hedged approximately 65% to 70% of 2018's forecast production of 52 to 54 terawatt hours at an average price of $41 per megawatt hour.

©2017 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-13803

Client Id: 77

And for 2019, Power has hedged 25% to 30% of forecast production of 58 to 60 terawatt hours at an average price of $41 per megawatt hour. Power continues to assume deliveries in 2017 under the basic generation service, or BGS contract, will represent approximately 11 terawatt hours of hedged volume.

The forecast increase in output in both '18 and '19 reflects the commercial start-up in mid-'18 of 1,300 megawatts of gas-fired combined cycle capacity at the Keys Energy Center in Maryland and the Sewaren facility in New Jersey and the mid-2019 commercial start-up of the 485-megawatt gas-fired combined cycle generation unit in Bridgeport Harbor, Connecticut.

Our forecast of Power's full year 2017 non-GAAP operating earnings remains unchanged at $435 million to $510 million, and the forecast represents non-GAAP adjusted EBITDA of $1,080,000,000 to $1,210,000,000.

Now turning to PSEG Enterprise and other. We reported a net loss of $2 million for the second quarter of 2017 versus net income of $19 million or $0.04 per share for the second quarter of 2016. Non-GAAP operating earnings for the second quarter of 2017 were $11 million or $0.02 per share compared to $19 million or $0.04 per share for the second quarter of 2016. The net loss for the second quarter includes a pretax charge of $22 million related to ongoing liquidity challenges facing energy arena and deterioration of market conditions affecting the residual value of the leverage leased portfolio. The decrease in non-GAAP operating earnings quarter-over-quarter reflects the absence of certain tax-related items at PSEG Energy Holdings and higher parent interest expense.

Lastly, discussing our financial position, our financial position remains strong. Moody's recent upgrade of PSEG's senior unsecured rating to Baa1 stable from Baa2 positive a test to the strength of the balance sheet and the changing composition of earnings with PSE&G forecast represent 2/3 of 2017's non-GAAP operating earnings.

PSEG closed the quarter ended June 30, 2017, with $430 million of cash on its balance sheet with debt representing 49% of consolidated capital. PSEG Power's debt at the end of the quarter represented 31% of its capitalization providing a debt-to-EBITDA ratio of 2.1x at the midpoint of 2017's powered non-GAAP adjusted EBITDA forecasts.

As Ralph mentioned, we are maintaining our forecast of operating earnings for the full year at $2.80 to $3 per share.

And Jamie, we are now ready to take your questions.

QUESTIONS AND ANSWERS

Operator

(Operator Instructions) First question is with Neel Mitra with Tudor, Pickering.

Neel Mitra - *Tudor, Pickering, Holt & Co. Securities, Inc., Research Division - Director, Utilities and Power Research*

I was wondering if you could comment on the dispute against the Transmission ROE, I believe the 11.68% base level. And then basically, how was it redacted, how that process went? And if you anticipate any complaints in the future, or how we should kind of interpret that?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Neel, I mean, 3 New Jersey towns did file and then they withdrew a couple of weeks later. We're not at liberty to disclose anything other than that, as you know. Large customers always can challenge a lot of ROEs, but at this point, those are the only attempts we've had.

SI-SSA-0015-13804

Client Id: 77

Operator

The next question is from Jonathan Arnold with Deutsche Bank.

Jonathan Philip Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

The -- Ralph, I missed a little bit of this. I think you made some generic comments about support for nuclear-friendly market reforms and legislation. I'm curious whether you could just give us an insight into what you believe the prospects might be for moving something like that in New Jersey this fall. And also, what you're -- from your perspective, what is the most effective format for something like that to take?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes, I don't want to predict any kind of timing stuff, Jonathan. But I did comment that the court decisions, when they came out of Illinois and New York, the federal districts relative -- relevant to the states. Yes, I've solidified the fact that the states have the ability to act in these matters, and that's good news. We have been maintaining, this is both a local and national issue, and it's good to see that it's getting national attention. But the problem, according to the forward price curve, is at New Jersey's doorstep, there's no denying it. So we've continued an education campaign, and I'm pleased that actually in those conversations, we've received just about, not exactly, but just about universal support for the continued operation of those plants. But we're going to work at all levels, primarily at the state, but also at PJM and at FERC to do what we can to just make sure those plants are continuing their operation, that they don't prematurely retire, and they do so with economics that are satisfactory to customers and shareholders. So we don't have specific solutions. We just -- really, right now, are in a kind of education mode. And we're pleased with the kind of feedback we're getting.

Operator

The next question is from the line of Praful Mehta with Citigroup.

Praful Mehta - *Citigroup Inc, Research Division - Director*

So I wanted to follow up little bit on the strategic direction, I guess. And we've talked about this before, but with ZEC and design discussion happening in New Jersey, obviously, something around the nuclear support, how do you think about strategic direction affect power. And also given what IPPs are going through in terms of number of them either merging or going private, how do you see the long-term vision of this business? Do you still see separation as a possibility? Or now you're thinking of it more as an integrated platform?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So , Praful, if you -- I think the best way to look at strategic direction is to look at how we're allocating our investment dollars. And if you look back over the past 10 years, you probably see a 75%, 25% split utility PSEG Power. And if you look ahead 5 years, that's ratio has changed a little bit, now it's 82% PSE&G at the Utility and 18% at Power. So the strength of the company and its growth is clearly at PSE&G, but we are not making VCRs or buggy whips, right? We're producing electricity and power, and people still need that. So we're constantly optimizing that portfolio. We retired 4,000 megawatts of uncompetitive assets. We're now building 1,800 megawatts of competitive assets, and we're warning people about 3,500 megawatts that are at some parallel that actually is a greater parallel to the customer and policymakers than it is to our shareholders, that being nuclear. If there is a strategic opportunity to do something different, we'll entertain it. But right now, we are quite happy with the cash being generated by Power and the Utility's ability to deploy it very, very productively, which gives us a extremely healthy balance sheet, one that the rating agencies are looking more favorably upon, and robust growth of the utility without any need for additional equity and solid support for a dividend that continuously grow at 4% a year. So we're in a good place.

THOMSON REUTERS

SI-SSA-0015-13805

Client Id: 77

Operator

The next question is from Paul Patterson with Glenrock Associates.

Paul Patterson - *Glenrock Associates LLC - Analyst*

On the new rules at the BPU that they've filed with the New Jersey -- or they're going to file with the New Jersey register, I was wondering if you could just -- is there any flavor you can give us in terms of what that means quantitatively in terms of earnings or where your CapEx prospects or what have you?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

So Paul, I don't think of it necessarily as an increase or a decrease in earnings prospects. I think of it as greater predictability of those earnings. So, for example, we talk about GSMP and the extension we're filing, that we filed yesterday. And the reality is that our filing followed those proposed new rules, so that makes life a little bit simpler in terms of discussion. But think about this for a second. GSMP 2 is a bit of a misnomer. We could just have easily have called it GSMP 4 or 5, because it's prior incarnation, it was called Capital Infrastructure Program and then it was called Capital Infrastructure Program 2. And then it was the gas improvement within Energy Strong. And so we've had great dialogue with the board staff, and consistent recognition of the need to replace this aging infrastructure. But it's been going on in 18-month increments and more recently, in 36-month increments. And from an operational point-of-view, it just makes life difficult. And I think the board realized it. Okay, we've got 100 years. And we got down to 30 years and then hopefully, get down to 20 years of this pipe that needs to be replaced. Why are we doing this in such small increments? So as you can see, we filed for a 9.75% on the GSMP program. It's similar to what -- it's exactly the same as what we've been getting in other programs. The mechanism is what's anticipating in the rule, in the proposed rule. So it's not a question of how much or how much more, how much less the earnings will be, but just greater predictability, greater clarity, longer duration.

Operator

The next question is from Michael Lapides with Goldman Sachs.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

An easy one. Just trying to think about PSE&G's capital spending over the next 3 to 4 years, 3 to 5 years, and a little bit what's changed since your March Analyst Conference. If I go back and look at, like, that Slide 13, I think, or one of the other CapEx slides, how should we think about how different the CapEx level is today going forward, for the next few years versus what you discussed 3 or 4, or 4 or 5 months ago?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Michael, this is Dan. I don't think about it as being very dramatically different. I think that one of the things that we sought to address and as we talked about at 7% to 9% rate base growth and identifying things that weren't necessarily in the base plan. But we're on our radar screen to layer into the back end of the plan because of the nature of how we put forth our capital plan based upon what we know. I think what you've seen is very, very consistent with that. As we moved from a 7% rate base CAGR over 5 years and targeted a 9% rate base CAGR, one of the things we identified to be able to fill that gap was energy efficiency. And we talked today about $69 million being approved for energy efficiency. Another is GSMP and embedded within our base plan was $300 million a year on GSMP, which is the consistent run rate, but we thought that we could expand that. And we talked about maybe another $100 million or more that we could put into that plan to be able to get us from 7% to 9%. And what you saw us file is very consistent with that. So I don't think that I would describe the capital plan as being very different. I think I would describe it as executing on the upsides that we saw within it and being able to achieve the higher end of that range. And we will continue to look for opportunities to do exactly that same thing.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Okay. But if I go back and look at the Analyst Day deck, and I think it was actually Slide 15, that's maybe the most appropriate one or so. It kind of showed a role-off or rolldown of CapEx from close to $3.5 billion at E&G this year, going to $2.5 billion or even less in '18 and beyond. Do you still think you're at that $2.5 billion level in '18 and beyond? Or do you think the run rate might look a little bit more something closer to the 2017 level?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Well, I think I would say that directionally, it's not inconsistent with how we have talked about it in the past. And as we step forward into these years, we have been able to find appropriate investments for -- that the system needs to have done. And as we stepped through time, that number has tended to grow. So 2017 is a high year for us with respect to capital. But I do think what we represented then through some historical data and how the years have progressed through time, and what we anticipated on a go-forward basis was an opportunity to grow that capital program. And I think that's what we conveyed then. And I think we still believe that now.

Operator

(Operator Instructions) The next question is from Steven Fleishman with Wolfe Research.

Steven Isaac Fleishman - *Wolfe Research, LLC - MD & Senior Utilities Analyst*

The -- you talked about the different avenues that you're watching with -- for your nuclear generation state, but also PJM and FERC. Could you focus a little bit on the PJM, FERC and DOE side and just kind of how much progress do you think is occurring there? And really, can they do enough, I guess?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So I think if you look at DOE first, it's just good that from a policy point-of-view, DOE recognizes a challenge with base load generation and fuel diversity. As you know, Steve, they don't have day-to-day regulatory authority, they have some emergency powers and various things of that sort. But most of the attention, I think, needs at the -- at our -- from our point-of-view to be at FERC and PJM. And there, we've been talking about price formation for quite some time. The recent PJM proposals on how to deal with inflexible units is potentially quite helpful to the market, overall, in terms of the missing money issue associated with the fixed cost component of energy that's -- that is not recovered as clearly the market design is to drive towards short-run variable cost. I think that could benefit all Power generators from a point-of-view of more accurate pricing. This bifurcated capacity marker or different approaches to the capacity market could also be helpful in terms of mitigated units. At the end of the day, there are some policy objectives that states and others have sought to pursue typically environmental, but it may be resiliency policy objectives that unless they're explicitly targeted by FERC and PJM, states will continue to reserve that right to go forward. So I guess what I'm saying is that, we're encouraged by the reception at DOE and the administration at the importance of these reliability, national security, fuel diversity issues. It's going to be up to FERC to translate that into a price. And there was a recognition that price formation has not delivered on the workshops of 2 years ago all the benefits it can. What is missing in everything I just described at the national levels of price on carbonate. We don't anticipate that being made explicit in the near term, and that's probably going to be the domain that states will continue to probably add incremental value in terms of the environmental benefit. So to me at least, Steve, as I've said, we're not shy from retiring plants. Hopefully, we've proved that. But in the case of nuclear, that's a state, local and national disaster in the making. And we're just working double time everywhere we can to point that out to people that this is something that they don't want to let happen and then say 5 years or 10 years from now, "Oops, what were we thinking."

Client Id: 77

Jonathan Philip Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

At the Analyst Day, in addition to the incremental items you've added, you had the expansion of ESMP or a continuation. Is that still something you see as possible? What should we be thinking around timing there, size wise? Anything you can give us on that?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes. Sure, Jonathan. So that one was more of a fourth quarter event of this year. It will be after the rate case is filed. The rate case won't be over by then. You should think of that in terms of balance of Energy Strong. If you remember, back to Energy Strong, we asked for close to $3 billion. And because we have never done anything like that before, the board staff suggested that we just do the most critical components first and see how it goes. The board then actually hired a third party consultant to oversee our work, and that's gone a very, very well. So I would say it could be an additional $200 million to $300 million per year nominally in terms of electric system modernization that we would be filing in Q4. Well, probably in Q1 of next year, file our large, much, much larger energy efficiency program. So there's no shortage of things that need to be done to continue the aging infrastructure replacement for further enhancement of the grid and now it's by the energy-efficient to help those participating customers control their bill.

Jonathan Philip Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

Would that be a 5-year-type program, Ralph, or $200 million to $300 million...

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

You should expect in all of these cases, we will comply with the infrastructure program rule -- proposed rule. Stumbling on my words there. So yes, it would be a 5-year for the current proposal.

Jonathan Philip Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

Okay. So you would -- we may see more about that in 4Q.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes, you will.

Daniel Frederick Ford - *Barclays PLC, Research Division - MD and Head of United States Utilities Equity Research*

May I just ask one other thing, while I'm on?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Sure.

Jonathan Philip Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

You're up 4% in the first half. Your guidance is still midpoint. It's kind of a flat year. Are there other specific drivers in the second half that you can point us to that would sort of tamper things back down.

THOMSON REUTERS

SI-SSA-0015-13808

Client Id: 77

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

There's 2 things going on. Number one is that I think with only 1 year being the exception that we changed our numbers after Q2, it's also 72 degrees in New Jersey today on July 28. So the third quarter, while not a big pricing event for Power, is still a big volume event for Power. And Dan is waving at me. He may want to add to that.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. I think just -- the last year, there was a little bit of tax help that we saw towards the end of the year that we may not end up seeing for this year. So that and just some of the pricing in what we'll see over the summer. And we talk a little bit within the prepared remarks about how hedged prices are coming down. So I would point to that and some tax help we got at the end of last year.

Operator

The next question is from Travis Miller with Morningstar.

Travis Miller - *Morningstar Inc., Research Division - Director of Utilities Research and Strategist*

I was wondering if we look out a few years, and if you get the nuclear support that you're thinking about wherever that comes from, what would you think about uprates and investments in uprates at your existing plant?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So Travis, good morning. We are actually looking at a very modest uprate at -- Hope Creek. Yes.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

I'm pretty sure it's Hope Creek.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

And it's mostly -- I don't mean to diminish this, a paper exercise, it's the way in which one can measure, monitor and calculate operational risk associated with different operating parameters. So the risk of stating the obvious, you're not going to see any major equipment investments at the same time that I'm talking about the forward price curve coming down and putting tremendous economic pressure on the plants. But to the extent that we have the same staffing levels and the same overhead cost and we can squeeze out a couple more megawatts by doing better probabilistic risk assessment, we're going to do that. We do have a couple of uprates going on in our fossil plants that we've announced in the past, at both our Bergen and our Bethlehem plants, and those are more -- a bit more meaningful in terms of their size. But at the nuclear plants right now, Salem and Hope Creek, We're just looking at Hope Creek, and it's about 18 megawatts, I think, is the exact number.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes, that's right. And so the incremental benefit that you would get versus the incremental cost is very favorable, given the fact that you have the base plant running as Ralph mentioned.

THOMSON REUTERS

SI-SSA-0015-13809

Client Id: 77

Travis Miller - *Morningstar Inc., Research Division - Director of Utilities Research and Strategist*

Sure. Okay. Good uprates and promises to expand nuclear power, could that you think considerably be part of some kind of negotiation at state legislative level?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So from the point-of-view that, as we just tried to suggest that getting a few more megawatt hours without increasing the cost is helpful. Let me be 1,000% clear, we are working our tails off to make sure we don't need any help from anybody, right? I mean, we -- the most important thing is to control what we can control and make sure we run those plants as well as we can, as at lower cost structures as we can so they're -- so that even with the flaws in the market, they can still win. And if that means pay for uprates, then we'll do that. If it means more staff optimization, we'll do that. And so that's job #1, 2 and 3. I -- the comment I made before about near universal desires to see those plants operate is accurate. Obviously, our competitors don't want to see those plants operate, and that's a very rational position on their part. But I don't think that we get the same universal reaction to new nuclear or building additional plants, and not that we would even consider that in the current gas price environment. So I think to the extent that getting more out of the plants is something that helps make them more competitive, the answer is yes. But no one has talked to us about, well build another plant and we'll let you keep these running. I mean that's not part of anybody's calculus right now.

Operator

Mr. Izzo, Mr. Cregg, there are no further questions at this time. Please continue with your presentation or closing remarks.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Thank you, Jamie. So thanks, everyone, for joining us. And hope you -- we genuinely hope you're as pleased as we are with the results we've had year-to-date. And also, hope you are as encouraged as we are with the growth prospects that we have anchored by the Utility with programs, such as GSMP. As Dan said, it was just a few months ago, we thought that was probably going to be a $300 million year program and maybe winding down in '19. And now we have some good hopes that it could be a $500 million-plus program and have 5 years of life after '19. So as always, Kathleen and Carlotta and the rest of the team are available to you for follow-up.

And with that, I'll just wish a very happy and pleasant rest of the summer. And we'll see you, I'm sure, at various different venues. Thanks, everyone. Take care.

- Carlotta Chan, Manager – Investor Relations Phone: 973-430-6596

PSEG ANNOUNCES 2017 SECOND QUARTER RESULTS

NET INCOME OF $0.22 Per Share

Non-GAAP Operating Earnings of $0.62 Per Share

Re-Affirms 2017 Non-GAAP Operating Earnings Guidance of $2.80 - $3.00 Per Share

July 28, 2017 (Newark, NJ) (NYSE:PEG) Public Service Enterprise Group (PSEG) reported second quarter 2017 Net Income of $109 million or $0.22 per share as compared to Net Income of $187 million or $0.37 per share reported for the second quarter of 2016. Non-GAAP Operating Earnings for the second quarter of 2017 were $316 million or $0.62 per share as compared to Non-GAAP Operating Earnings for the second quarter of 2016 of $289 million or $0.57 per share. Net Income for the second quarter of 2017 was affected by accelerated depreciation associated with the June 1, 2017 retirement of the Hudson and Mercer coal/gas generating stations.

Ralph Izzo, Chairman, President and Chief Executive Officer said "PSEG's second quarter earnings demonstrate the benefits of our utility investment program and adherence to operating efficiently. We remain committed to providing customers with affordable and resilient energy in a manner that also provides investors with strong, sustainable returns on capital. That commitment includes improving New Jersey's aging infrastructure, as evidenced by our filing yesterday of a 5-year $2.7 billion extension of our Gas System Modernization Program."

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Non-GAAP Operating Earnings exclude the impact of returns(losses) associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items such as the previously noted Hudson and Mercer retirements.

The table below provides a reconciliation of PSEG's Net Income to non-GAAP Operating Earnings for the second quarter. See Attachment 11 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings. The presentation of non-GAAP Operating Earnings is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings as presented in this release may not be comparable to similarly titled measures used by other companies.

PSEG CONSOLIDATED EARNINGS (unaudited)
Second Quarter Comparative Results
2017 and 2016

	Income ($ millions)		Diluted Earnings Per Share	
	2017	**2016**	**2017**	**2016**
Net Income	$109	$187	$0.22	$0.37
Reconciling Items*	207	102	0.40	0.20
Non-GAAP Operating Earnings	$316	$289	$0.62	$0.57
		Avg. Shares	507M	508M

*See Attachment 11

GUIDANCE

Ralph Izzo went on to say, "We generated strong financial results in the first half of the year, and we are maintaining our non-GAAP Operating Earnings guidance for 2017 of $2.80 - $3.00 per share."

Non-GAAP Operating Earnings guidance by company for the full year remains unchanged:

2017 Non-GAAP Operating Earnings Guidance
($ millions, except EPS)

	2017E
PSE&G	$945 - $985
PSEG Power	$435 - $510
PSEG Enterprise/Other	$35 - $35
Non-GAAP Operating Earnings	$1,415 - $1,530
Non-GAAP EPS	$2.80 - $3.00

E: Estimate

Due to the forward looking nature of non-GAAP Operating Earnings guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

Non-GAAP Operating Earnings Review and Outlook by Operating Subsidiary

See Attachments 5 and 6 for detail regarding earnings reconciliations for 2017's second quarter and year-to-date for each of PSEG's businesses.

PSE&G

PSE&G reported Net Income of $208 million ($0.41 per share) for the second quarter of 2017 compared with Net Income of $179 million ($0.35 per share) for the second quarter of 2016.

PSE&G's results for the second quarter reflect the benefits of its expanded investment program and regulatory mechanisms providing for recovery of costs and continued control of growth in operating expenses.

Growth in PSE&G's investment in transmission improved second quarter Net Income comparisons by $0.04 per share. Investments made to enhance system resiliency under the Energy Strong and Gas System Modernization Program (GSMP) drove improved margin and second quarter Net Income comparisons by $0.02 per share. An increase in depreciation expense was offset by a reduction in O&M and other expenses.

Economic conditions in New Jersey continue to show steady improvement, particularly in the level of employment. The impact on electric revenue in the quarter from weather was favorable given warmer than normal conditions which conversely reduced gas sales early in the quarter. On a weather-normalized basis, electric and gas sales declined modestly. On a trailing twelve month basis, weather-normalized electric sales increased 0.1% year-over-year. Gas sales, on the same basis, increased 0.4% with growth in demand from the commercial sector.

PSE&G has had significant advances on a number of fronts. The company filed for an extension of the Gas System Modernization Program. PSE&G is proposing to invest up to $540 million per year for five years beginning in 2019. This program would accelerate the pace of replacement of its aging cast iron and unprotected steel mains and associated services. The filing is consistent with the draft regulations that the NJ Board of Public Utilities (BPU) issued in June 2017 regarding infrastructure investment programs.

PSE&G reached an agreement in principle with BPU Staff and Rate Counsel related to its proposed extension of its investment in Energy Efficiency. PSE&G would invest $69 million (more than 90% of its original request) in energy efficiency equipment for hospitals, multi-family housing and other sectors as well as provide for new residential energy efficiency offerings for smart thermostats and data analytics. This agreement is subject to review by the BPU.

PSE&G continues to progress towards its 2017 plan to invest $3.4 billion in transmission and distribution infrastructure upgrades.

The forecast of PSE&G's Net Income for 2017 remains unchanged at $945 - $985 million.

PSEG Power

PSEG Power reported a Net Loss of $97 million ($0.19 per share) for the second quarter of 2017 and non-GAAP Adjusted EBITDA of $261 million compared with a Net Loss of $11 million ($0.02 per share) and non-GAAP Adjusted EBITDA of $250 million for the second quarter of 2016. Non-GAAP Operating Earnings for the second quarter of 2017 were $97 million ($0.19 per share) versus $91 million ($0.18 per share) for the second quarter of 2016.

PSEG Power's Net Loss for the second quarter of 2017 reflects the impact of incremental depreciation and other expenses of $387 million, pre-tax, associated with the retirement of the Hudson and Mercer coal-fired generating stations on June 1, 2017.

Power's operating results for the second quarter reflect on-going programs to reduce operating expenses and an increase in output which offset a decline in average hedge prices.

Non-GAAP Operating Earnings in the quarter increased $0.01 per share as the result of a June 1, 2017 increase in capacity prices. Growth in output also improved second quarter non-GAAP Operating Earnings comparisons by $0.01 per share. Lower average prices on energy hedges reduced Power's non-GAAP Operating Earnings in the second quarter by $0.03 per share. A reduction in O&M associated with fewer nuclear and fossil outage related days and the June 1 retirement of Hudson and Mercer improved non-GAAP Operating Earnings by $0.02 per share. A higher level of depreciation was offset by a decline in interest expense.

Output from Power's generating stations increased 4% in the second quarter. The improvement reflects a decline in nuclear refueling outage days to 46 from 76 outage related days in the year-ago quarter. The nuclear fleet's capacity factor improved to 89.6% in the quarter from 82.7% producing 7.6 TWh of energy. Power's gas-fired CCGT fleet operated at an average capacity factor of 55.3% versus 62.3% producing 4.0 TWh of energy. An increase in the price of gas improved the competitive performance of the coal fleet. During the quarter, the coal fleet operated at an average capacity factor of 32.6% versus 18.4% producing 1.4 TWh of energy.

Power continues to forecast output for 2017 of 49 – 50 TWh. Approximately 90% of production for the remainder of the year is hedged at an average price of $46 per MWh. Power has hedged approximately 65% - 70% of its forecast production for 2018 of 52 – 54 TWh at an average price of $41 per MWh. For 2019, Power has hedged 25% - 30% of its forecast production of 58 – 60 TWh at an average price of $41 per MWh. Power continues to assume Basic Generation Service (BGS) volumes will represent approximately 11 TWh of deliveries in 2017.

The forecast increase in output in both 2018 and 2019 reflects the commercial start-up in mid-2018 of 1,300 MWs of new gas-fired combined cycle capacity at the Keys Energy Center in Maryland and Sewaren in New Jersey, and the mid-2019 commercial start-up of the 485 MW gas-fired combined cycle generation unit in Bridgeport Harbor, Connecticut.

Management believes non-GAAP Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization. See Attachment 12 for a complete list of items excluded from Net Income/(Loss) in the determination of non-GAAP Adjusted EBITDA. The presentation of non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to the presentation of Net Income/(Loss), which is an indicator of financial performance in accordance with GAAP. In addition, non-GAAP Adjusted EBITDA

as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains(losses), for future periods due to market volatility.

The forecast range of Power's 2017 non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA are unchanged at $435 million - $510 million and $1,080 - $1,210 million, respectively.

PSEG Enterprise/Other

PSEG Enterprise/Other reported a Net Loss of $2 million for the second quarter of 2017 versus Net Income of $19 million ($0.04 per share) during the second quarter of 2016. Non-GAAP Operating Earnings for the second quarter of 2017 were $11 million ($0.02 per share) compared to $19 million ($0.04 per share) for the second quarter of 2016.

The Net Loss for the second quarter of 2017 includes a pre-tax charge of $22 million related to on-going liquidity challenges facing NRG REMA, LLC (REMA) and deterioration in market conditions affecting the residual value of the leveraged lease portfolio. The decrease in non-GAAP Operating Earnings quarter-over-quarter reflects the absence of certain tax items recorded in 2016 at PSEG Energy Holdings and higher Parent interest expense.

The forecast of PSEG Enterprise/Other non-GAAP Operating Earnings for 2017 remains unchanged at $35 million.

Financing

PSEG closed the quarter ended June 30, 2017 with $430 million of cash on its balance sheet with debt at the end of the quarter representing approximately 49% of consolidated capital.

######

About PSEG:

Public Service Enterprise Group (NYSE: PEG) is a publicly traded diversified energy company with annual revenues of $9.1 billion. Its operating subsidiaries are: Public Service Electric and Gas Company (PSE&G), PSEG Power LLC, and PSEG Long Island.

Public Service Electric and Gas Company (PSE&G) is New Jersey's oldest and largest regulated gas and electric delivery utility, serving nearly three-quarters of the state's population. PSE&G is the winner of the ReliabilityOne Award for superior electric system reliability.

PSEG Power LLC is an independent power producer that generates and sells electricity in the PJM, New York and New England wholesale power markets.

FORWARD-LOOKING STATEMENT

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income/(Loss) to reconcile to non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA with a reference to those slides included on each of the slides where the non-GAAP information appears.

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Management believes non-GAAP Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. The presentation of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

PSEG
2017 Q2 Review

Ralph Izzo

Chairman, President and Chief Executive Officer

SI-SSA-0015-13833

PSEG Q2 2017 – Solid financial results at both businesses

- **Second Quarter Highlights**
  - ✓ Net Income of $0.22 vs. Net Income of $0.37 per share in Q2 2016, reflecting Hudson & Mercer retirements
  - ✓ Non-GAAP Operating Earnings* of $0.62 vs. $0.57 per share in Q2 2016
  - ✓ PSE&G achieved 17% growth in Q2 earnings per share over Q2 2016 – supported by increased investment in transmission and distribution, and cost containment
  - ✓ PSEG Power results aided by continued cost control
- **Operational Excellence**
  - ✓ Nuclear fleet achieved a capacity factor of 89.6% for Q2 and 94.8% for the first-half of 2017
  - ✓ PSE&G named Smart Electric Power Alliance's (SEPA) 2017 Investor Owned Utility of the Year, recognizing PSE&G's Solar 4 All program and its leadership in landfill and brownfield solar development
- **Disciplined Capital Investment – Producing Results**
  - ✓ PSEG to invest ~$4.7 billion in 2017, consisting of ~$3.4 billion at PSE&G and ~$1.2 billion at PSEG Power
  - ✓ Regulatory & Policy Focus: New Jersey Board of Public Utilities (BPU) actions support infrastructure investment; Energy Efficiency agreement in principle reached; $2.7 billion, 5-year Gas System Modernization Program (GSMP) extension and expansion filing
  - ✓ Hudson and Mercer coal/gas generating stations retired on June 1

* See Slides A and B for Items excluded from Net Income to reconcile to Operating Earnings (non-GAAP).

SI-SSA-0015-13836

PSE&G – BPU Proposal to Incentivize Investment

Infrastructure Investment Program (IIP)

The BPU on June 30 proposed changes in regulation that would:

- Encourage and support accelerated utility investment
- Support system safety, reliability, resiliency and sustained economic growth in NJ
- Support accelerated recovery on qualifying investments, and
- Allow utility companies the option to seek approval for investment programs extending up to five years (with a base rate case within five years)

The BPU is receiving comments on the proposal, and a final order is anticipated by year-end

SI-SSA-0015-13837

PSEG - Maintaining 2017 Non-GAAP Earnings Guidance

Growth in utility infrastructure investment drives increased growth in regulated earnings contribution

Non-GAAP Operating Earnings*
Contribution by Subsidiary and 2017 Guidance

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings (non-GAAP).
** Based on the mid-point of 2017 non-GAAP Operating Earnings guidance of $2.80 - $3.00 per share. E = Estimate.

PSEG – First Half Results by Subsidiary

PSEG First Half EPS Summary – Six months ended June 30

GAAP Net Income/(Loss)	2017	2016	Change
PSE&G	$ 1.00	$ 0.87	$ 0.13
PSEG Power	$ (0.53)	$ 0.36	$ (0.89)
PSEG Enterprise/Other	$ (0.03)	$ 0.07	$ (0.10)
Total PSEG	$ 0.44	$ 1.30	$ (0.86)

Non-GAAP Operating Earnings*	2017	2016	Change
PSE&G	$ 1.00	$ 0.87	$ 0.13
PSEG Power	$ 0.49	$ 0.54	$ (0.05)
PSEG Enterprise/Other	$ 0.05	$ 0.07	$ (0.02)
Total PSEG*	$ 1.54	$ 1.48	$ 0.06

*See Slides A and B for Items excluded from Net Income/(Loss) to reconcile to Operating Earnings (non-GAAP) for PSEG, PSEG Power and PSEG Enterprise/Other.

PSEG EPS Reconciliation – First Half 2017 versus First Half 2016

Utility investment and cost control drove year-to-date growth

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings (non-GAAP).

SI-SSA-0015-13843

PSE&G
2017 Q2 Review

SI-SSA-0015-13844

PSE&G EPS Reconciliation – Q2 2017 versus Q2 2016

Earnings per share rose by 17% vs. Q2 2016,
reflecting infrastructure investment

SI-SSA-0015-13845

PSE&G – Q2 2017 weather had minor impact on EPS

PSE&G Monthly Weather Summary
2017 vs. 2016 vs. Normal

Monthly Heating Degree Days (HDD)

Monthly Temperature Humidity Index (THI)

Q2 2017 heating degree days were ~12% lower than Q2 2016 and ~6% lower than normal

Q2 2017 temperature-humidity index was ~15% higher than Q2 2016 and ~8% higher than normal

SI-SSA-0015-13846

PSE&G – Regulatory Agreement/Filing Support Long-term Objectives

PSE&G's recent filing to extend its Gas System Modernization Program (GSMP) and an agreement reached on its proposed Energy Efficiency investment program reinforce PSE&G's commitment to provide clean, reliable energy for its customers

Gas System Modernization Program II

In July, PSE&G filed for a 5-year extension of the GSMP which would accelerate the pace of replacement of its aging cast iron and unprotected steel mains and associated service. PSE&G is proposing to invest approximately $540 million per year, or up to $2.7 billion, over the 5-year program beginning in 2019. The filing is consistent with the draft regulations that the BPU issued in June regarding Infrastructure Investment Programs.

Energy Efficiency

In July, PSE&G reached an agreement in principle with BPU Staff and Rate Counsel related to its proposed request to extend its investment in Energy Efficiency. Under the agreement, PSE&G would invest $69 million in energy efficiency equipment for hospitals, multi-family housing and other sectors and a residential energy efficiency offering for smart thermostats and data analytics. The agreement represents more than 90% of PSE&G's request.

SI-SSA-0015-13847

PSE&G – Q2 Operating Highlights

Operations

- ✓ Total electric sales were flat on a weather normalized basis for the trailing 12 months ended June 30
- ✓ Total firm gas sales were slightly higher at 0.4% for the trailing 12 months ended June 30 due to increased commercial sales
- ✓ The first half of 2017 was the 3rd mildest in New Jersey state records with HDD ~9% below normal and ~2% lower than first-half 2016
- ✓ SEPA named PSE&G its 2017 Investor Owned Utility of the Year, recognizing its leadership in utility-scale solar development on landfill and brownfield sites

Regulatory and Market Environment

- ✓ Filed for a 5-year extension and expansion of our Gas System Modernization Program
- ✓ Agreement in principle reached on PSE&G's Energy Efficiency filing provides a ~$69 million investment
- ✓ PSE&G set to file its distribution base rate case with the BPU no later than November 1, 2017

Financial

- ✓ PSE&G's Q2 2017 earnings increased by $0.06 or 17% to $0.41 per share
- ✓ PSE&G is on-track to meet its 2017 plan to invest approximately ~$3.4 billion to upgrade and expand Transmission & Distribution infrastructure
- ✓ PSE&G's 2017 Net Income guidance range remains unchanged at $945 - $985 million

SI-SSA-0015-13848

PSEG Power
2017 Q2 Review

SI-SSA-0015-13849

PSEG Power EPS Reconciliation – Q2 2017 versus Q2 2016

Fewer outage-related days and cost control offset lower prices

* See Slide B for Items excluded from Net Income/(Loss) to reconcile to non-GAAP Operating Earnings for PSEG Power.

* Excludes solar and Kalaeloa. ** Includes figures for Pumped Storage.

SI-SSA-0015-13852

PSEG Power – Gross Margin Performance

- ✓ PS Zone pricing improved over Q2 2016
- ✓ Baffle bolt replacement outages completed at both Salem units
- ✓ Capacity revenues were up slightly vs. Q2 2016 reflecting step-up in New England capacity pricing to $232 MW/day
- ✓ Regional spark spreads compressed in the quarter
- ✓ Q2 2017 had 46 nuclear refueling outage days vs. 76 outage days in Q2 2016

PSEG Power Gross Margin ($/MWh)

Regional Performance		
Region	**Q2 Gross Margin ($M)**	**Q2 2017 Performance**
PJM	$431	Higher generation offset by recontracting at lower prices
New England	$19	Higher generation and prices
New York	$17	Higher generation and market prices offset by lower hedges

Hedging Update…

* HEDGE PERCENTAGES AND PRICES AS OF JUNE 30, 2017. REVENUES OF FULL REQUIREMENT LOAD DEALS BASED ON CONTRACT PRICE, INCLUDING RENEWABLE ENERGY CREDITS, ANCILLARY, AND TRANSMISSION COMPONENTS BUT EXCLUDING CAPACITY. HEDGES INCLUDE POSITIONS WITH MTM ACCOUNTING TREATMENT AND OPTIONS.

SI-SSA-0015-13854

PSEG Power – Q2 Operating Highlights

Operations

- ✓ Q2 output up 4% with shorter Salem 2 refueling outage versus the extended Salem 1 outage in Q2 2016; baffle bolt inspection and replacement addressed at Salem 2 this Spring
- ✓ Nuclear fleet achieved average capacity factor of 89.6% in Q2, producing 7.6 TWh of energy
- ✓ CCGT fleet capacity factor was 55.3% versus 62.3% in Q2 2016, CCGT availability remained strong at ~90% and produced 4.0 TWh of energy; Coal capacity factor up in PA on higher market demand, coal fleet produced 1.4 TWh of energy

Regulatory and Market Environment

- ✓ The 2020/2021 RPM auction (with 100% Capacity Performance requirement) resulted in a higher average price of $174 MW/day for 7,800 MW that cleared the auction
- ✓ 2017 expected generation output on track for 49-50 TWh; BGS load projected at 11 TWh
- ✓ Recent court actions in New York and Illinois affirm state initiatives supporting Zero Emissions Credits
- ✓ Construction on schedule and on budget at Keys and Sewaren 7 for targeted 2018 in-service; Bridgeport Harbor 5 progressing on schedule for targeted 2019 operations

Financial

- ✓ Power's total debt as a percentage of capitalization at June 30 was 31%
- ✓ Power's 2017 non-GAAP Operating Earnings guidance range remains unchanged at $435 - $510 million; non-GAAP Adjusted EBITDA guidance for 2017 remains unchanged at $1,080 to $1,210 million

SI-SSA-0015-13855

PSEG

PSEG Financial Highlights

- Reiterating 2017 non-GAAP Operating Earnings guidance of $2.80 - $3.00 per share
  - ✓ PSE&G earnings forecast to grow 8.5% to comprise 66% of PSEG's 2017 non-GAAP Operating Earnings
- PSEG's 5-Year capital spending forecast of $15 billion over 2017 – 2021 to be invested in PSE&G (82%) and Power (18%)
- PSE&G successfully executing regulatory/policy initiatives supporting its 5-year, 7 - 9% annual growth in rate base
- PSEG Power's $2 billion investment in new generation, located in PJM and New England, will improve fleet efficiency and geographic diversity
- Moody's upgraded PSEG's senior unsecured credit rating to Baa1, the rating outlook is Stable; subsidiary company ratings were affirmed
- Increased 2017 indicative common dividend by 4.9% to $1.72 per share
- Financial position remains strong:
  - ✓ Cash from Power and increasing cash flow from operations at PSE&G supports dividend growth and funds capital spending program without the need to issue equity
  - ✓ Debt as a percentage of capitalization was 49% at June 30

PSEG ANNOUNCES 2017 THIRD QUARTER RESULTS

Net Income of $0.78 Per Share

Non-GAAP Operating Earnings of $0.82 Per Share

Re-Affirms 2017 Non-GAAP Operating Earnings Guidance of $2.80 - $3.00 Per Share

October 31, 2017 (Newark, NJ) (NYSE – PEG) Public Service Enterprise Group (PSEG) reported third quarter 2017 Net Income of $395 million or $0.78 per share as compared to Net Income of $327 million or $0.64 per share reported for the third quarter of 2016. Non-GAAP Operating Earnings for the third quarter of 2017 were $417 million or $0.82 per share as compared to non-GAAP Operating Earnings for the third quarter of 2016 of $444 million or $0.88 per share.

“We experienced solid results for the quarter, executing well on major initiatives,” said Ralph Izzo, Chairman, President and Chief Executive Officer, “delivering reliable, efficient service, as we continue to upgrade our transmission system, replace cast-iron pipe and construct three new clean gas-fired combined cycle generating stations.”

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG’s financial performance to previous financial results. Non-GAAP Operating Earnings exclude the impact of returns(losses) associated with Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items.

The table below provides a reconciliation of PSEG’s Net Income to non-GAAP Operating Earnings for the third quarter. See Attachment 11 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings. The presentation of non-GAAP Operating Earnings is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings as presented in this release may not be comparable to similarly titled measures used by other companies.

Reconciling Items*	22	117	0.04	0.24
Non-GAAP Operating Earnings	**$417**	**$444**	**$0.82**	**$0.88**
		Avg. Shares	**507M**	**508M**

*See Attachment 11

Ralph Izzo went on to say, "Despite the impact of abnormally cool weather on third quarter sales and earnings, we remain within our non-GAAP Operating Earnings guidance for the full year of $2.80 - $3.00 per share."

Non-GAAP Operating Earnings guidance by company for the full year remains unchanged:

2017 Non-GAAP Operating Earnings Guidance
($ millions, except EPS)

	2017 Estimate
PSE&G	$945 - $985
PSEG Power	$435 - $510
PSEG Enterprise/Other	$35 - $35
Non-GAAP Operating Earnings	$1,415 - $1,530
Non-GAAP EPS	$2.80 - $3.00

Due to the forward looking nature of non-GAAP Operating Earnings guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

Non-GAAP Operating Earnings Review and Outlook by Operating Subsidiary

See Attachment 5 for detail regarding the quarter-over-quarter reconciliations for each of PSEG's businesses.

PSE&G

PSE&G reported Net Income of $246 million ($0.49 per share) for the third quarter of 2017 compared with Net Income of $255 million ($0.50 per share) for the third quarter of 2016.

Net Income growth in the third quarter associated with PSE&G's expanded investment in electric and gas transmission and distribution facilities was offset by the impact on sales of weather conditions which were substantially cooler than experienced in the year-ago quarter and cooler than normal.

Returns on PSE&G's expanded investment in transmission added $0.04 per share to Net Income in the quarter. Incremental revenue associated with recovery of PSE&G's Energy Strong investment infrastructure program of $0.02 per share was offset by a decline in electric demand-related revenues and weather-normalized electric sales. Net Income comparisons were also impacted by a decline in electric sales associated with weather conditions which were approximately 27% cooler than conditions experienced during the 2016 third quarter and 5% cooler than normal. The decline in electric sales reduced third quarter Net Income comparisons by $0.03 per share. An increase in depreciation expense of $0.01 per share associated with PSE&G's expanded capital base was offset by a decline in operating and maintenance expense. An absence of tax credits available in the year-ago third quarter and other items reduced Net Income comparisons by $0.02 per share.

Electric sales, as a result of cooler summer weather, declined 8.3% in the quarter. The decline was led by an approximate 13.9% decline in sales to residential customers and accompanied a decline in sales to commercial and industrial customers of 4.8% and 4.2%, respectively. On a trailing twelve-month basis, weather-normalized electric sales decreased by 0.1% year-over-year. Gas sales, on the same basis, increased 1.5% led by the commercial sector.

Electric sales comparisons for the quarter reflect warmer than normal weather experienced in the second half of September. The warm weather in the second half of September had a more modest impact on margins, as those sales are accrued at the lower non-summer billing rates.

PSE&G filed an update of its Formula Rate for transmission at the Federal Energy Regulatory Commission (FERC) in October 2017. The update, which reflects an increase in the level of PSE&G's investment in transmission and a true-up of prior year results, provides for a $212 million increase in annual transmission revenues effective January 1, 2018. The increase is due to planned capital improvements with a focus on improvements to system reliability.

PSE&G, following discussions with the staff of the NJ Board of Public Utilities (BPU) and Rate Counsel, and as approved by the BPU at its October 20, 2017 meeting, agreed to delay the filing of its base distribution rate case by one month to no later than December 1, 2017. The filing will be based upon three months of actual data and nine months of forecasted data with the test year ending June 2018 remaining unchanged.

PSE&G invested approximately $2.1 billion for the nine months ended September 30 in electric and gas transmission and distribution capital projects designed to provide more reliable, safe and resilient service to its 2.2 million customers. For the year, PSE&G currently expects to invest $3.1 billion of capital in its infrastructure. This is lower than the plan of $3.4 billion due to a delay in timing on certain projects and better than anticipated efficiencies.

The forecast of PSE&G's Net Income for 2017 remains unchanged at $945 - $985 million.

PSEG Power

PSEG Power reported Net Income of $136 million ($0.27 per share) for the third quarter of 2017 and non-GAAP Adjusted EBITDA of $356 million compared with Net Income of $139 million ($0.27 per share) and non-GAAP Adjusted EBITDA of $387 million for the third quarter of 2016. Non-GAAP Operating Earnings for the third quarter of 2017 were $158 million ($0.31 per share) compared with non-GAAP Operating Earnings for the third quarter of 2016 of $170 million ($0.34 per share).

Power's Net Income in the third quarter was impacted by a decline in energy prices and the effect of cooler than normal weather on demand and output, which offset a decline in operating and maintenance expense.

Non-GAAP Operating Earnings in the quarter increased $0.01 per share as the result of higher capacity prices in New England and PJM. Lower average prices on energy hedges and a decline in market prices combined to reduce non-GAAP Operating Earnings comparisons by $0.05 per share. A 6% decline in output associated with the impact of cooler than normal weather conditions on demand reduced non-GAAP Operating Earnings comparisons by $0.02 per share. A reduction in O&M expense associated with the June 1, 2017 retirement of the Hudson and Mercer coal stations and a decline in nuclear plant related costs improved non-GAAP Operating Earnings comparisons by $0.02 per share. A decline in depreciation expense associated with the retirement of Hudson and Mercer combined with a decline in interest expense and taxes to improve non-GAAP Operating Earnings comparisons by $0.01 per share.

Cooler than normal weather limited peak demand requirements and utilization of the gas-fired combined cycle and peaking fleets. The nuclear fleet's output increased 20% quarter-over-quarter to 8.2 TWh as the fleet's capacity factor improved to 96% from 80%. The improvement in performance reflects the absence of lengthy repair-related work at the Salem Station (including repair and replacement of baffle bolts) in the year-ago quarter and strong performance at Hope Creek in the current quarter. Power's gas-fired combined cycle fleet experienced a 29% decline in output to 3.7 TWh. An increase in the price of gas improved the competitive position of the base-load coal fleet as a decline in market demand sharply reduced utilization of the peaking fleet.

Power continues to forecast output for 2017 of 49 – 50 TWh. Approximately 86% of production for the remainder of the year of 11 TWh is hedged at an average price of $45 per MWh. Power has hedged approximately 70% - 75% of 2018's forecast output of 52 – 54 TWh at an average price of $41 per MWh. For 2019, Power has hedged 30% - 35% of forecast output of 58 – 60 TWh at an average price of $39 per MWh. The forecast of output for 2018 and 2019 remains unchanged from prior estimates.

The forecast increase in output in both 2018 and 2019 reflects the commercial start-up in mid-2018 of 1,300 MWs of new gas-fired combined cycle capacity at the Keys Energy Center in Maryland and Sewaren in New Jersey, and the mid-2019 commercial start-up of the 485 MW gas-fired combined cycle generating unit in Bridgeport Harbor, Connecticut.

Management believes non-GAAP Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure, whether assets were constructed or acquired and accounting methods. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization. See Attachment 12 for a complete list of items excluded from Net Income in the determination of non-GAAP Adjusted EBITDA. The presentation of non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

The forecast range of Power's 2017 non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA remain unchanged at $435 – $510 million and $1,080 – $1,210 million, respectively.

PSEG Enterprise/Other

PSEG Enterprise/Other reported Net Income of $13 million ($0.02 per share) for the third quarter of 2017 compared to a Net Loss of $67 million ($0.13 per share) for the third quarter of 2016.

Non-GAAP Operating Earnings for the third quarter of 2017 were $13 million ($0.02 per share) compared with non-GAAP Operating Earnings of $19 million ($0.04 per share) during the third quarter of 2016.

The decrease in non-GAAP Operating Earnings year-over-year reflects the absence of certain tax items at PSEG Energy Holdings and Parent recognized in the third quarter of 2016 as well as higher interest expense at the Parent.

The forecast of PSEG Enterprise/Other full year non-GAAP Operating Earnings remains at $35 million.

Financing

PSEG closed the quarter ended September 30, 2017 with $278 million of cash on its balance sheet with debt at the end of the quarter representing approximately 49% of consolidated capital. PSEG Power had debt at the end of the quarter representing 31% of capital.

###

About PSEG:
Public Service Enterprise Group (NYSE: PEG) is a publicly traded diversified energy company with annual revenues of $9.1 billion. Its operating subsidiaries are: Public Service Electric and Gas Company (PSE&G), PSEG Power LLC, and PSEG Long Island.

PSE&G is New Jersey's oldest and largest regulated gas and electric delivery utility, serving nearly three-quarters of the state's population. PSE&G is the winner of the ReliabilityOne Award for superior electric system reliability.

PSEG Power LLC is an independent power producer that generates and sells electricity in the PJM, New York and New England wholesale power markets.

Forward-Looking Statement

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending rate case proceedings;

- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

PRESENTATION

Operator

Ladies and gentlemen, thank you for standing by. My name is Shelby and I'll be your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group Third Quarter 2017 Earnings Conference Call and Webcast. (Operator Instructions) As a reminder, this conference is being recorded Tuesday, October 31, 2017, and will be available for telephone replay beginning at 1:00 p.m. Eastern Time today until 11:30 p.m. Eastern Time, November 7, 2017. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally - *PSEG Services Corporation - VP of IR*

Thank you, Shelby. Good morning. Thank you for participating in PSEG's call this morning. As you are aware, we released our third quarter 2017 earnings statements earlier today. The release and attachments, as mentioned, are posted on our website at www.pseg.com under the Investors section.

We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended September 30, 2017, is expected to be filed today.

As you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. And although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so unless required to do so.

Our release also contains certain non-GAAP operating information. Please refer to today's 8-K or other filings for a discussion of factors that may cause results to differ from management's projections, forecasts and expectations and for a reconciliation of our non-GAAP operating information to our GAAP results.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group; and joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Thank you, Kathleen, and thank you, everyone, for joining us today. PSEG reported results for the third quarter having executed well on major operational and policy initiatives. Despite the impact of abnormally cool weather on sales and earnings, we remain within our non-GAAP operating earnings guidance for the full year of $2.80 to $3 per share.

Earlier this morning, we reported net income for the quarter of $0.78 per share, non-GAAP operating earnings for the third quarter of 2017 were $0.82 per share compared with net income of $0.64 per share and non-GAAP operating earnings for the third quarter of 2016 of $0.88 per share.

For the 9-month period, non-GAAP operating earnings were $2.36 per share, which is the same as non-GAAP operating earnings for 2016's first 9 months. Slides 5 and 6 contain the detail on the results for the quarter and the 9 months. At PSE&G, earnings per share declined $0.01 per share from the prior year comparable quarter. The results for the third quarter were affected by cooler than normal weather, which reduced demand for electricity from air conditioning. The weather comparisons to last year are stark. For instance, the measure of average temperature and humidity was 27% below the year-ago quarter and the number of hours at temperature equal to or greater than 90 degrees was 69% below the year-ago quarter.

PSE&G's expanded investment in transmission and distribution continue to benefit customers and had a favorable impact on PSE&G's earnings. PSE&G's rate base is forecasted to grow 12% in 2017, reaching $17 billion. The forecast is based on a continuation of PSE&G's investment program to upgrade its transmission and distribution infrastructure. The upgrades will entail full-year capital expenditures of approximately $3.1 billion. This figure is slightly less than our original budget of $3.4 billion and it's the result of some projects being moved to 2018 and improved efficiency related to the cost of other projects.

Based on further development of our various investment programs, we are increasingly comfortable with PSE&G's ability to achieve growth in rate base at the upper end of our forecast of 7% to 9% per year for the 5-year period ending in 2021. Our updated forecast assumes a reasonable reception by the New Jersey Board of Public Utilities to PSE&G's proposal to invest $540 million per year over 5 years to accelerate the pace of replacement of aging cast iron and unprotected steel mains and their associated services. Approval would support expansion and extension of the work currently being performed under the Gas System Modernization Program. This filing was made in July, and we expect the BPU to take action during the first half of 2018.

We also intend to request a multiyear extension of Energy Strong in the near term. PSE&G is in the final stages of work previously approved as part of Energy Strong to strengthen and harden infrastructure damaged during Hurricane Irene and Super Storm Sandy. The extension will address the remaining electric substations that need to be raised or protected in addition to other much needed work that enhances the resiliency of our system and reduces the risk of outages. That request, similar to GSMP 2, will be consistent with the BPU's draft regulation supporting multiyear capital investments under its Infrastructure Investment Program. If the draft regulations are approved, as we expect, before year-end, utilities will be able to proceed with 5-year investment programs that will allow more certainty in staffing and planning of work.

Now I want to bring you up-to-date on PSE&G's Distribution Base Rate Proceeding. As you may be aware, following discussions with BPU staff and Rate Counsel and as approved by the BPU at its October 20 meeting, the deadline for filing our distribution rate case was deferred from November 1 to no later than December 1 of this year. The change in the filing date is simply an administrative procedural matter. We will now be providing the BPU with 3 months of actual data and 9 months of forecast data for the same test year that will end on June 30, 2018.

THOMSON REUTERS

SI-SSA-0015-13883

Client Id: 77

The review of PSE&G's distribution rates, which is expected to result in a modest change in revenue, is primarily driven by the need to recover investments made outside of clause mechanisms since the last rate case to recover storm costs and to allow PSE&G to reset assumptions for growth in sales and O&M. As part of the filing, PSE&G will also be seeking approval to decouple electric and gas distribution revenue from sales volumes and demand, which would support larger scale energy efficiency investments.

We believe that with the right regulatory policies, the state's utilities can provide the energy infrastructure that meets customer requirements and creates a stronger and more efficient New Jersey.

Now let me turn to PSEG Power. At PSEG Power, non-GAAP operating earnings declined by 9% to $0.31 per share from the prior year comparable quarter. A lower average price on energy hedges was partially offset by Power's continued efforts to lower its costs and Power's favorable gas supply position. PSEG Power also made progress on construction activities related to its 3 new natural gas combined-cycle generation stations. The new stations will add 1,800 megawatts of efficient capacity over 2018 and 2019 and represent a reconfiguration of Power's merchant fleet that will improve its efficiency and competitive position in the market.

The design of the wholesale energy market and whether current policies provide adequate recognition of the cost for generation to be available is getting the attention it needs. The Department of Energy issued a notice of proposed rulemaking at the end of September regarding the need to properly value baseload generation with robust on-site fuel characteristics. We hope their interest in this important issue will jump-start efforts by the Federal Energy Regulatory Commission to implement improvements in the market. It is encouraging to see that FERC has acted quickly. To meet the DOE's 60-day requirement for a response, FERC requested comments on the DOE NOPR to be filed by October 23, with reply comments due on November 7. A response by the FERC to the DOE NOPR is anticipated by December 11 of this year.

PSEG filed comments in support of DOE's initiative to immediately address the erosion occurring and the resiliency of our electric grid due to the risk of premature retirements of baseload generation and the subsequent trend towards greatly reduced fuel diversity. We believe that the DOE NOPR is necessary to address the challenges facing distressed yet valuable resources such as nuclear in the absence of a market solution that recognizes the attributes of fuel diversity and resilience. We recommend that measures adopted in response to the DOE NOPR should be viewed as interim until effective mechanisms can be developed that recognize these attributes in the market.

The current market design distorts efficient outcomes due to the disharmony between price signals, public policies and generation dispatch. Implementing the DOE measure as an interim step would stabilize the earnings for qualified units until a comprehensive market-based solution can be integrated into RTO and ISO market designs. It is worth mentioning that a significant amount of generation that competes in the PJM market already falls under cost of service regulation. We believe that DOE NOPR also provides the necessary impetus to push for further action by FERC to address long-standing price formation reforms that would avoid some of the continued distortions of competitive market results that disadvantage baseload resources.

The PJM energy price formation proposal should be evaluated as part of the comprehensive solution to the challenges facing baseload units. As part of our response, we have requested that FERC promptly finalize the fast-start pricing reforms and direct PJM through the commission's Federal Power Act Section 206 authority to submit its energy price formation proposal, especially as it pertains to inflexible units. Getting energy prices right is critical to ensuring that the correct signals are sent to incent efficient investment as well as market exit.

PSEG Power is making every effort to preserve its nuclear asset base, working in concert with the industry to identify means of improving operating efficiency without sacrificing safety. PSEG Power is on track in 2017 to reduce the all-in cost per megawatt hour of its nuclear operations by 10% from the average cost experienced during the prior 3 years. But energy prices, influenced by the availability of natural gas, have declined by a greater degree during this time frame.

State action also remains critical to prevent the loss of these units. We believe state action can be done in a way that both maintains the integrity of the wholesale market and serves as a bridge until a regional or federal solution is in place. A strong legal foundation has been established for state action to preserve generating assets critical to meeting a state's emission-related goals and to maintain the benefits to the state's economy that comes with the safe, reliable operation of nuclear power.

Successful execution of PSEG's key policy and regulatory initiatives would assure the company's ability to provide customers with the service, reliability and resiliency that they have come to expect that is also affordable. Successful execution of our key policy and regulatory initiatives would also provide our shareholders with greater assurance of PSEG's ability to meet our objectives for returns and growth.

With that, I'll turn the call over to Dan to discuss our financials in greater detail.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Thank you, Ralph, and thanks, everyone, for joining us today. As Ralph said, PSEG reported net income for the third quarter of 2017 of $0.78 per share versus net income of $0.64 per share in last year's third quarter.

Non-GAAP operating earnings for the third quarter of 2017 were $0.82 per share versus non-GAAP operating earnings of $0.88 per share in last year's third quarter. The reconciliation of non-GAAP operating earnings to net income for the quarter and 9 months can be found on Slides 5 and 6. We've also provided you with a waterfall chart on Slide 11 that takes you through the net changes in quarter-over-quarter non-GAAP operating earnings by major business and a similar chart on Slide 13 provides you with the changes in non-GAAP operating earnings by major business on a year-to-date basis. I'll now review each company in more detail.

Starting with PSE&G. PSE&G reported net income of $0.49 per share for the third quarter of 2017 compared with $0.50 per share for the third quarter of 2016. Results for the quarter are shown on Slide 15. Net income growth in the third quarter associated with PSE&G's expanded investment in transmission and electric and gas distribution facilities was offset by the impact on sales of weather conditions which were substantially cooler than experienced in the year-ago quarter and cooler than normal. Returns on PSE&G's expanded investment in transmission added $0.04 per share to net income in the quarter.

Incremental revenue associated with the recovery of PSE&G's Energy Strong investment infrastructure program, which added $0.02 per share to net income, was offset by a decline in weather-normalized electric sales and in electric demand-related revenues. Demand-related revenues were impacted by the significantly lower peak temperature hours, which, as Ralph mentioned, were 69% lower than the year-ago quarter and 47% below normal. Net income comparisons were also hurt by weather conditions, which were approximately 27% cooler than conditions experienced during 2016 in the third quarter and 5% cooler than normal.

Electric sales, as a result of the cooler summer weather, declined 8.3% in the quarter. The decline was led by an approximate 14% decline in sales to residential customers. On a trailing 12-month basis, weather-normalized electric sales were flat year-over-year and gas sales on a similar basis increased 1.5%, led by the commercial sector.

The decline in electric residential sales reduced third quarter net income comparisons by $0.03 per share. An increase in depreciation expense of $0.01 per share associated with PSE&G's expanded capital base was offset by a decline in O&M expense. An absence of tax credits available in the year-ago quarter and other items reduced net income comparisons in the third quarter by $0.02 per share.

PSE&G's 5-year capital investment plan includes approximately $6 billion to upgrade and expand transmission-related facilities and investment. PSE&G filed an update of its formula rate for transmission at the Federal Energy Regulatory Commission in October of 2017 and the update, which reflects an increase in the level of PSE&G's investment in transmission and a true-up of prior year results, provides for a $212 million increase in annual transmission revenues effective January 1, 2018.

PSE&G, under Energy Strong and the clause mechanism therein, adjusts electric rates 2 times per year, in March and September, and gas rates are adjusted each year in September. Under the clause mechanism for the Gas System Modernization Program, PSE&G adjusts gas rates in January of each year to reflect the investment made during the prior year. The combined annual revenue increase for the full year in 2017 for these 2 programs is forecasted to be approximately $56 million. As Ralph mentioned, PSE&G has agreed to delay the filing of its distribution rate case by 1 month to no later than December 1, 2017. This filing, as you recall, was agreed to as part of the Energy Strong settlement and provides the opportunity for PSE&G to recover capital investments made outside of existing clause mechanisms and update for other factors such as storm costs and changes in sales growth in O&M. The distribution base rate filing will be based on a test year ending June 2018 and a 10.3% return on equity and provide

Client Id: 77

for a mid-single-digit increase in revenues, still leaving overall rates below the level coming out of our last distribution base rate case in 2010. The 1-month delay in the filing hasn't changed any of the economics associated with the request as the test year is unchanged, but allows 1 incremental month of actual results to be included in the filing.

PSE&G invested approximately $2.1 billion for the 9 months ended September 30 and electric and gas distribution and transmission capital projects designed to provide more reliable, safe and resilient service to its 2.2 million customers. For the year, PSE&G currently expects to invest $3.1 billion on upgrading its infrastructure, and this is slightly lower than the $3.4 billion we originally forecast for 2017. A delay in timing on some projects and greater cost-related efficiencies on others are the primary reasons for the decline in the forecasted spending for the full year. As Ralph mentioned, as a result of identifying incremental investments, we now expect PSE&G's investment program for the 5 years ended 2021 will provide growth in rate base off 2016 year-end amounts at the upper end of our 7% to 9% per year growth rate. This is driven by incremental investments in our GSMP 2 filing relative to what is reflected in our base capital plan and a planned expansion of our Energy Strong filing. These important initiatives build confidence in PSE&G's ability to extend its growth beyond the end of this decade. For 2017, we are maintaining our forecast of PSE&G's net income at $945 million to $985 million.

Now let's turn to Power. PSEG Power reported net income of $136 million or $0.27 per share for the third quarter of 2017 compared with net income of $139 million or $0.27 per share for the year-ago quarter. Non-GAAP operating earnings were $0.31 per share for the third quarter of 2017 compared to non-GAAP operating earnings for the third quarter of 2016 of $0.34 per share. Non-GAAP adjusted EBITDA for the third quarter of 2017 was $356 million versus non-GAAP operating EBITDA for 2016 of $387 million. Our non-GAAP adjusted EBITDA excludes the same items as our non-GAAP operating earnings measure as well as income tax expense, interest expense and depreciation and amortization.

The earnings release and Slide 19 provide you with detailed analysis of the impact on Power's non-GAAP operating earnings quarter-over-quarter. And we've also provided you with more detail on generation for the quarter and the first 9 months of the year on Slide 20 and 21.

Power's net income in the third quarter was impacted by a decline in average energy hedge prices and the effect of cooler-than-normal weather on demand and output, which offset a decline in operating and maintenance expense.

During the quarter, non-GAAP operating earnings comparisons increased $0.01 per share as a result of higher capacity prices in New England and PJM. This increase in capacity prices occurred on June 1, 2017, and will run through May 31, 2018.

Lower average prices on energy hedges and a decline in market prices combined to reduce non-GAAP operating earnings comparisons by $0.05 per share, a 6% decline in output associated with the impact of cooler-than-normal weather on demand, reduced non-GAAP operating earnings comparisons by an additional $0.02 per share. Power's focus on improving operational efficiencies helped mitigate the impact of the decline in energy prices. The June 1, 2017 retirement of the Hudson and Mercer coal stations and a decline in nuclear plant-related O&M improved non-GAAP operating earnings by $0.02 per share and a decline in depreciation expense associated with the retirement of Hudson and Mercer, combined with a decline in interest expense and taxes, improved non-GAAP operating earnings comparisons by $0.01 per share.

Now let's turn to Power's operations. Output of Power's generating stations declined 6% in the quarter. The nuclear fleet's output increased 20% in the third quarter to 8.2 terawatt hours as the fleet's capacity factor improved to 96% from 80%. The quarter-over-quarter improvement was due to strong performance at Hope Creek, which operated at an average capacity factor of 98.4%; and the absence of an extended refueling outage and repairs at the Salem station in the year-ago quarter, which addressed the repair; and replacement of baffle bolts at Salem 1 and repair of a transformer at Salem 2. The nuclear fleet's performance for the third quarter brought the capacity factor for the 9 months ended September 30 to 95%.

As mentioned, cooler-than-normal weather limited energy pricing, peak demand requirements and utilization of the gas-fired combined-cycle and peaking fleet. Power's combined-cycle fleet experienced a 29% decline in output to 3.7 terawatt hours, while an increase in the price of gas improved the competitive position of the base load coal fleet.

THOMSON REUTERS

SI-SSA-0015-13886

Client Id: 77

As we indicated earlier this year, average hedge prices during the second, third and fourth quarters of the year were expected to decline by less than what we experienced in the first quarter and by less than the average decline of $5 per megawatt hour we anticipated for the full year. This reflects the absence of weather-related risk premium during the winter months that was experienced in prior years.

Gas prices improved in the third quarter, but since Power prices didn't move in conjunction with gas, spark spreads declined relative to year-ago levels. Power's realized spark spreads held up better than the market, declining $1 per megawatt hour quarter-over-quarter given its beneficial gas supply position. And Power's beneficial gas supply position also held gross margins in the quarter to a decline of $1.50 per megawatt hour to $40 per megawatt hour. Power continues to forecast output for 2017 of 49 to 50 terawatt hours, approximately 86% of production for the remainder of the year of approximately 11 terawatt hours. It's hedged at an average price for $45 per megawatt hour. Power has hedged approximately 70% to 75% of 2018's forecast output of 52 to 54 terawatt hours at an average price of $41 per megawatt hour. And for 2019, Power has hedged 30% to 35% forecast output of 58 to 60 terawatt hours at an average price of $39 per megawatt hour.

The average price for energy hedge in 2019 is $2 per megawatt hour lower than our prior forecast and the reduction reflects a decline in market prices. The forecast of output for 2018 and 2019 remains unchanged from prior estimates. The forecasted increase in output in both 2018 and '19 reflects the commercial start-up in mid-'18 of 1,300 megawatts of new gas-fired combined-cycle capacity at the Keys Energy Center in Maryland and at Sewaren in New Jersey. And the forecast increase is also supported by the commercial start-up in mid-2019 of the 485-megawatt gas-fired combined-cycle facility in Bridgeport Harbor, Connecticut.

Our forecast of Power's full year 2017 non-GAAP operating earnings remains unchanged at $435 million to $510 million. The forecast represents non-GAAP adjusted EBITDA of $1,080,000,000 to $1,210,000,000.

Now let me turn briefly to PSEG Enterprise and Other, which reported net income of $0.02 per share for the third quarter of 2017 compared with a net loss of $0.13 per share for the third quarter of 2016. Results for the third quarter of 2016 were impacted by the impairment of the REMA leases. Non-GAAP operating earnings for the third quarter of 2017 were $0.02 per share compared with non-GAAP operating earnings of $0.04 per share for the third quarter of 2016.

The decrease in non-GAAP operating earnings quarter-over-quarter reflects the absence of certain tax items recognized in the third quarter of 2016 as well as higher interest expense at the parent. And the forecast for Enterprise and Other for the full year of 2017 non-GAAP operating earnings remains unchanged at $35 million.

PSEG also closed the quarter ended September of 2017 with $287 million of cash on its balance sheet and with debt at the end of the quarter representing approximately 49% of consolidated capital. PSEG Power had debt at the end of the quarter representing 31% of capital. And as Ralph mentioned, we are maintaining our guidance for 2017 non-GAAP operating earnings of $2.80 to $3 per share.

And Shelby, we are now ready to take questions.

QUESTIONS AND ANSWERS

Operator

(Operator Instructions) Your first question comes from Julien Smith from Bank of America Merrill Lynch.

Julien Patrick Dumoulin-Smith - *BofA Merrill Lynch, Research Division - Director and Head of the US Power, Utilities, & Alternative Energy Equity Research*

So perhaps just to kick it off a little bit here on the New Jersey and some of the background of the politics there. I'd be curious, one, do you think there's potential for reform in New Jersey just given what's already going on at the FERC level? And then secondly, in that same vein of thinking, how do you think about the potential for a more comprehensive review of energy in New Jersey next year. You see there's some considerations with

THOMSON REUTERS

SI-SSA-0015-13887

Client Id: 77

respect to solar in addition to the nuclear issues that you've addressed, as well as just your ongoing utility spend and the extension and expansion of those programs. So to the extent to which that legislation might be a fix for all, I'd be curious how that might be shaping up.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Sure, Julian. Yes. I do think that depending on what happens at the federal level, there remains the opportunity for New Jersey to recognize certain attributes that perhaps are not explicitly identified at the federal level. To the extent that the federal level does recognize the same attributes then you would not have redundant programs. So an example of that might be, you could have price formation improvements at the federal level just to make the market more efficient, sort of along the lines of what PJM has talked about with inflexible units. And that doesn't do anything explicitly for fuel diversity or resiliency, and therefore, New Jersey could have an overlay on top of that. Similarly, fuel diversity versus carbon would be mutually exclusive. But if both jurisdictions recognize carbon, then you would not have 2 programs overlapping each other. Those are just the types of examples I would think about in terms of state and federal programs being complementary versus redundant. To your second question, whenever you have a change in administration, and as you implied, Governor Christie is term-limited now, he is finishing his second term, there's a desire on the part of the new incoming administration to establish themselves in various ways. It could be environmental, it could be the economy, it could be education and both candidates have talked about their desire to look at things a little bit differently when it comes to energy policy discussions about RGGI and green energy targets. And we absolutely -- as we've done for 110 years, we absolutely will work with the incoming administration to understand their policy objectives and the implications, both positive and negative, of whatever wants to be done because, as we know, things cost money to do, but if the benefits outweigh the costs, then we're eager to help them pursue it. So yes, we will work closely with whoever the new governor is to help them formulate and execute their energy policy. Lastly, I think you're correct in your, if I could say, implicit remark that an ongoing investment in the infrastructure is something that, no matter who comes into office, we'll probably would be supportive of. And I do think that's correct. There's a widespread recognition on the part of regulators and policymakers that we have an aging infrastructure that's not perfectly suited for the growing dependency that people have on electricity nowadays. And the improvements we're making, we'll certainly continue to propose them and I think we'll be well received.

Julien Patrick Dumoulin-Smith - *BofA Merrill Lynch, Research Division - Director and Head of the US Power, Utilities, & Alternative Energy Equity Research*

Excellent. Just a follow-up, again, congratulations on moving higher within your range here at the top end on the rate base side. Can you talk about reconciling that against earnings and some of the key factors that might be relevant in the current rate case and/or through the current period just in an attempt to reconcile the rate base trajectory against kind of hitting the upper end of that earnings? Perhaps, items might include like an authorized equity ratio or other deferred items in the context of this case that we should be paying attention to once it's filed?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes. So our last base rate case was in 2010 and we've done a very good job of controlling O&M expense, but circumstances have conspired against us by having a complete absence of load growth over that time, so even a very good job of controlling O&M expense loses out to no load growth. We've also, as you know, had some of our clauses anticipate this rate case. So we had some unrecovered CapEx and then we had some modest investment levels above depreciation that served to build the rate case to levels that were not commensurate with what was in the 2010 rate case. That's a really long-winded way of saying we need some rate relief, but we've managed our overall portfolio well enough that we are describing this as a kind of a middle single-digit type of rate increase, which will be far below the compounding of CPI over the last 7 years that one might otherwise have expected. So I think it'll be something that is easily explained. Now the 7% to 9% CAGR in rate base is more a prospective conversation. My last 3 minutes was really looking in the rearview mirror, but now as I look out the windshield, now basically, we have, as you know, in our 7% number, programs that were wholly approved, then the 7% to 9% number anticipated some fairly high degree of confidence in some program extensions and I think what you're hearing in our voices today is that, that confidence has grown as we've been able to put our engineers to work and understand some of the parts of the system, both gas and electric, that needs strengthening. So as you think ahead to earnings, and, as you know, we don't forecast earnings beyond the current year, the 3 levers you have in the regulated utility are earnings grow with load. I think, Kathleen, again, we're seeing 0.4%, 0.5%. Is that forecasted?

THOMSON REUTERS

SI-SSA-0015-13888

Client Id: 77

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Within the last 12, that's about right.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

And then you subtract from that O&M. We've been pretty good at controlling that. And you add to that the clauses that we expect to get recovery of. So it's 2 additions and 1 subtraction and you'll get pretty close to what the utility should look like in the coming 5 years.

Julien Patrick Dumoulin-Smith - *BofA Merrill Lynch, Research Division - Director and Head of the US Power, Utilities, & Alternative Energy Equity Research*

Got it. So let me just make sure what I'm hearing you say is, it shouldn't be all that different notwithstanding any kind of uncertainties with respect to the rate case?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes, I think, that's correct within the limitation of -- as you know, we don't smooth for pensions, so some massive change in pension funding, which we don't expect. We're 92% funded right now. But the equity ratio could be adjusted in the case to -- we're probably going to ask for a skosh more. Is that a word? A bit more than we used to have in the past. And so yes, the case could set a new base from which that upper end of the 7% the 9% can grow.

Operator

Your next question comes from Praful Mehta of Citigroup.

Praful Mehta - *Citigroup Inc, Research Division - Director*

So I got the point on the ZECs and the DOE being mutually exclusive. Just wanted to understand, given, Ralph, your initial comments on the DOE initiative, how do you see it playing out? Like do you see it as a dollar per megawatt? Dollar per megawatt hour? Do you see -- how do you see that actually playing out? And do you see that how much, in terms of benefit, do you expect for your facilities?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes, so Praful, so of course, boy, I wish I could answer that definitively. But let me answer it in the way which we proposed that it be played out, which may or may not have any bearing with what actually happens. In our comments to FERC we basically said, first of all, bringing PJM in under Section 206 to do what PJM says needs to be done is a no-brainer. So the inflexible unit treatment, the fast-start reforms, that is long overdue and needs to be done. And that is the easy part. Others have estimated that could be anywhere from $2 to $4 per megawatt hour. Secondly, as it specifically pertains to the DOE recommendation put forth in a NOPR, we have pointed out that there is a substantial portion of PJM that is competitively positioned in the market, but yet receives cost of service rates from their state regulators. And on an interim basis, that can be replicated at the federal level through a version of RMR type, reliability must-run type contracts for the units that are at risk of premature retirement. And that would be an interim solution until one comes up with a market-based solution that values the diversity associated with these different fuel types. We have proposed one method that relates to tranching of the capacity markets. Others have proposed methods that relate to scarcity pricing in energy markets for different fuels, but that permanent solution will involve a longer discussion with affected stakeholders. So really, it's 3 steps. It's, "Hey, there's plenty of evidence already that fast start and inflexible unit price formation needs to be fixed now and can happen now. An interim solution for at risk premature retirement using a cost to service methodology can be put in place very easily and then the

©2017 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13889

Client Id: 77

longer-term market-based solution, there are known solutions and options that people can pursue, but a more fulsome discussion would not be inappropriate in that regard."

Praful Mehta - *Citigroup Inc, Research Division - Director*

Got you. That's very helpful color, Ralph. And secondly, in terms of long-term views, I know you've talked about, long term, the generation business probably not being a part of the consolidated business over the long term. Now given what's happening with the IPP space and either companies going public or shrinking, given the mergers, how do you see that playing out? Do you see -- has that changed in any way? Do you now see PEG Power being more part of the business going forward? Or has that -- the view on separation still hold at this point?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

No, the view still holds, but I think it's pretty obvious to us, at least, that, right now, in the short term, with all of the conversations taking place at FERC, at DOE, at the state, with new entrants being formed and anticipating the Vistra-Dynegy combination, with old entrants exiting in terms of public markets, anticipating the Calpine going private. I think it's a -- this is a good time to just sort of wait and let something settle out a bit, right? So we're in great shape. Power is a cash generator and earnings producer. In about 15 months, Power will be a healthy free cash flow generator. The utility has an insatiable appetite for that cash. So we're not in any hurry during this period of tremendous change. All healthy, all very healthy given the dialogues taking place at FERC and given the dialogue taking place at the state to let it kind of play out while we enjoy the benefits of the 2 companies being together. That doesn't change the fact that we continually assess our strategic flexibility going forward on whether these 2 businesses belong together or not. And I stand by my prior belief that I think, over the long term, they do diverge.

Praful Mehta - *Citigroup Inc, Research Division - Director*

Got you. And just to be clear, that time of change is what, a 2, 3-year period, while all of this kind of settles down? Do you see...

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

I did make that mistake about 3 or 4 years ago. And I may not be the smartest person in the world but I do learn from those mistakes. I'm not going to give you a time frame. Nice try, though, Praful. Kathleen started like choking me. So my voice broke a little bit, that's the reason.

Operator

Your next question comes from Greg Gordon of Evercore ISI.

Kevin John Prior - *Evercore ISI, Research Division - Associate*

It's Kevin here. I just wanted to see if you could quantify the uplift in PJM price reform as it's currently being contemplated.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So Kevin, what we quoted is what other sources have talked about. If you just take Dan's comments about 55 terawatt hours, every dollar's worth $55 million pretax. So if it's $2 to $4, I've just thrown 3 if statements in there, so please be aware of that, you come up with the impact on us. Dan, did you want to add some color to that?

©2017 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13890

Client Id: 77

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

I think that's right. I think there's been an awful lot of people that have put out some numbers on it and they have actually coalesced around that range pretty tightly. So we'll see, as these different initiatives get done, what it ends up looking like. But I think that seems to be a reasonable place a lot of the pundits are at and we think it's a pretty reasonable as well, Kevin.

Kevin John Prior - *Evercore ISI, Research Division - Associate*

Okay. So now, how would that impact your hedging? Would it -- would you like hedge less or stop hedging '19 if you start to see progress? Or how would you think about that?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So we have constantly disciplined ourselves to staying within a certain range in terms of how much we hedge. We have various parameters, gross margin at risk, standard VAR calculations. We do allow our ER&T folks, our trading organization, to float high and low in that range depending upon what's going on. To the extent that the whole market anticipates price formation, you should start seeing that in the forward price curve and therefore our hedging approach would stay the same. We do challenge ourselves, if we think the market is missing something to make darn sure that we can figure out why the market would be missing it before we would push one boundary or another. But in general, we'll run the place the way we always have, which is to not assume we're smarter than the market and to just stay within those limits. But again, those limits are a range and we do let our folks have some flexibility within that range.

Operator

(Operator Instructions) Your next question comes from Christopher Turnure of JPMorgan.

Christopher James Turnure - *JP Morgan Chase & Co, Research Division - Analyst*

I wanted to get maybe a little bit more detail on the rate case, the test year and, in particular, kind of the true-up and what's included in that. I guess that would kind be a third quarter event after the test year ends on June 30, but I'm just trying to get a sense as to how next year will shape up there and what the rate case will ultimately include in terms of timing coming out of the gate.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes. So, Chris, so we had originally planned to file November 1 per the agreement we made back in May of 2014 coming out of Energy Strong. There was widespread recognition that, that would be a 2 and 10 and there was preference for 3 months of actuals and 9 months of forecast as opposed to 2 months of actuals and 10 months of forecast. And that was the primary driver behind the 1-month delay, if you will. So there's no -- nothing mystical or profound going on there. So the test year still ends in June of '18. As I mentioned before, we're expecting a mid-single-digit requested increase that will still keep rates below where they were in 2010 when we had our last base rate case. And remember, we have $250 million of GSMP stipulated rate base that was not covered by GSMP. We have about $100 million of Energy Strong, above the $1 billion that was in the clause. We have storm recovery costs, that's, I think, $200-something million that was deemed prudent but hasn't been returned to us yet. We have some new business that added to the CapEx. And candidly, we had some additional capital that was above depreciation levels that we've accumulated over the course of the years. So we would anticipate rates going into effect October-November of next year and I don't want to front run the filing. We owe it to the board's staff to let them be the first ones to read the details. But Dan, if you want to add any color?

©2017 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13891

Client Id: 77

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Just one thing, Chris. It sounded like your question was implying there would be a rate case and then there would be a true-up afterwards. And the way that we described the rate case is, basically, it is a trueing up of a host of the things that Ralph's just talked about. So we will come out of the rate case with the rates that are set within that case. And historically, we've seen a settlement in these cases in the state and that may well be where it ends up going, but we'll see. We would look for rates next fall. Usually these have taken about a year, and we would hope to anticipate that we could get rates maybe in like the October range. But it's a little different than our transmission formula rate, which is filed, those rates going into effect for the following year and then there is a separate true-up that happens the year after that. So just, for clarity's sake, there's no true-up after the rate case. The rate case itself will true up our distribution rates and we would anticipate the new rates would be in effect, say, October of next year.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

And just for -- I think most of you know this, but our rate base is roughly half transmission, half distribution right now. So tiny bit more distribution.

Christopher James Turnure - *JP Morgan Chase & Co, Research Division - Analyst*

Okay. That was all very helpful context and everything, but that's kind of what I was driving at there, towards the end, Dan, just that the distribution rate case itself, would have a 9-month forecasted test year, but that, itself, would never be trued up during the rate case process.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. So the 9 months, it will be a 12-year -- 12-month test year and it will start with 3 months of actuals and 9 months of forecasts. And then, as we step through, we'll update those as we go forward.

Christopher James Turnure - *JP Morgan Chase & Co, Research Division - Analyst*

Okay. So you would have some update? On O&M or something during the process?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. Yes.

Christopher James Turnure - *JP Morgan Chase & Co, Research Division - Analyst*

Okay. Got you. And then just on the request for decoupling. Can you help put that into context for me, just kind of understanding your motivation for that and maybe how you think it may or may not be perceived by interveners?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes, Chris. So we've had a series of energy efficiency filings approved over the past 7 or so years. I think the total amount is about $400 million, the most recent one was $69 million this past summer. And we have basically worked around this issue of fixed cost recovery with the stakeholders in these processes. And it's kept us from doing something in a much grander scale and we've simply decided that with the prospect of a new administration coming in and ongoing indication that there are market imperfections that keep customers from investing in energy efficiency, despite the compelling economics of that, that we would like to do this in a much, much more significant way, but we're not going to do it and suffer fixed cost losses, the absence of recovery of fixed costs. So given the tariff-free design involved with decoupling, we thought, well, since

THOMSON REUTERS

SI-SSA-0015-13892

Client Id: 77

we're going in for a rate case, now is a good time to raise the issue. And that's the motivation. The motivation really is not so much of this rate case, but the rate case is an opportunity to pave the way for significant energy efficiency proposals early next year.

Operator

Your next question comes from Travis Miller of Morningstar, Inc.

Travis Miller - *Morningstar Inc., Research Division - Director of Utilities Research and Strategist*

I was wondering if we could boil down all of these power market tissues into 2 buckets, the price formation bucket and the fuel diversity bucket. How do you think about, in the next 2 to 3 years, perhaps even more, of capital investment based on what happens in either of those 2 buckets? So what happens to capital investment depending on the outcome of price formation? What happens to capital investment based on an outcome in fuel diversity?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

I can tell you what it means for us, Travis. We're not deploying additional capital into the power generation business. We have 1,800 megawatts of 6,000 to 6,500 heat rate power plants coming online and we're quite happy with that. At the risk of speaking for others, which is always going to be wrong, you know that PJM, in particular, and many other markets are in an oversupply situation and there's been a reasonable demonstration of capital discipline in the most recent auctions that have taken place. So I think that the supply/demand imbalance that exists is a separate issue that will continue to impart that capital discipline and the price formation issue is just the recognition that if you want a market to be efficient, then price should determine who runs and who doesn't and you can't keep having uplift payments and side bar out of market payments guiding the dispatch of the system, which is what PJM has going on right now. I mean, price is not the sole determinant of how the system is dispatched. Then that's not a market, so that needs to be fixed. So 2 separate issues, I guess, is what I'm saying.

Travis Miller - *Morningstar Inc., Research Division - Director of Utilities Research and Strategist*

Okay. And could I read into that, that you don't think there would much capital investment in general across, certainly, the PJM region however this turns out?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

I think you could, without question, read into it that that's our point of view. Again, I don't want to speak for others, but I know what our capital plans are, and it's to finish these 3 projects and generate some healthy free cash flow for the utility.

Operator

Your next question comes from Paul Patterson of Glenrock Associates.

Paul Patterson - *Glenrock Associates LLC - Analyst*

So just to follow up on Travis' question, what we often see with these market reforms is that others seem to deploy capital and I'm just wondering, when you see this $2 to $4 price increase in -- with price formation or potentially seeing that, how long term do you think that would be? Or is the proposal -- it's hard for me to really completely get my arms around it, is it such that you would still see locational marginal pricing being set by inflexible units even with new entry showing up in the gas-fired area, if you follow me? I mean, how should we think about sort of the sustainability

Client Id: 77

of something like price formation given what we've seen, quite frankly, with the capacity markets and other "market reforms" to change the price, if you follow me?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Sure, Paul. That's fair. I think that one has to realize that there are -- there's cyclicality in these markets that have different periodicity associated with them, right? There's cyclicality in fuel prices, there's cyclicality in boom-bust cycles associated with oversupply and undersupply. There's cyclicality in oversupply and undersupply as determined by power plants being built, as determined by pipelines being built. So to simply say that price formation will drive prices up $3, picking the midpoint in the range that Dan and I have talked about, which we don't attest to but simply quote from others, and then automatically concluding that that's going to lead to people running their numbers and assuming that, that number stays there and, after, they'll build plants, could be a bit risky, right? I mean, what does it mean for the timing of pipelines that may change the basis differential of gas in Western PJM versus Eastern PJM? What does it mean for future carbon constraints that may or may not be part of a subsequent administration in Washington? I think all of us want to go -- some people on this call may want to go see their children in their Halloween parades, otherwise I'd list 1,000 other factors that should be going into people's thought process before making those kind of investment decisions.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Look, no matter how you slice it, having a market that is working better by virtue of some of the changes that need to be made is going to get you to a better answer.

Paul Patterson - *Glenrock Associates LLC - Analyst*

Okay. And then, with respect to the DOE proposal, I know this is kind of -- sort of moonshot question, I guess, maybe. But how much assets should we think about as being potentially -- if it were to be enacted for you guys, how should we think about what the potential impact might be there? How many units -- just how do we sort of quantify that? If that were to -- I know it's kind of a hard question, maybe, to answer, but, I mean, how would you suggest we think about it?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

I think, Paul, the way I would break it down is based upon how they have the DOE describe the eligibility so, and one of the main ones is having 90 days of fuel on site. And if you think about what that means, that means our nuclear facilities, certainly. And it means our small interest in Keystone and Conemaugh.

Paul Patterson - *Glenrock Associates LLC - Analyst*

So all those units would theoretically be able to get a rate-of-return rate base or what you're getting at the utility kind of thing?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

We'll see how where the -- ultimately where the NOPR goes with it. But certainly, from an eligibility standpoint, those are the units that would come to mind.

Paul Patterson - *Glenrock Associates LLC - Analyst*

Okay. And I guess, we don't have -- do we have like a -- what the asset -- what the rate base number would be, kind of, if you follow me, associate with that? Do you follow what I'm saying? I mean...

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes, I mean, but there's a little bit of data related to some of the nuclear facilities in the Q, but it's not on an asset-by-asset basis from a book value perspective.

Paul Patterson - *Glenrock Associates LLC - Analyst*

Okay. Well, I'll follow up afterwards. I mean, I just was wondering -- I was just curious if you had some sort of idea there, but I don't want to hold it up.

Operator

(Operator Instructions) Your next question comes from Michael Lapides of Goldman Sachs.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Easy question. On your 2017 CapEx guidance, the reduction of $300 million, can you give a little more detail about what's moving and does that get put back into a future year's CapEx? And if so, how far out into the future?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes, Michael. So it's always a bit of a split. I think we had referenced there were a couple things that were going on related to the total. Some is, frankly, just doing some work more efficiently, and I think there is a -- the majority of that is on Energy Strong. You heard Ralph talk a little bit earlier about $1 billion going through the clause and about $100 million that will await the rate case, and you'll remember it's about a $1.2 billion program. So frankly, some of that work was done more efficiently and I think that's a great outcome and it's great for customers and we're pleased to be able to do it that way. And we've had a little bit of the same on transmission, not a whole lot. And then, the balance really is timing and the timing is not anything that's going to move dollars out 3, 4, 5 years. It's a just living '17 out into '18. So in the aggregate, if you think of it, maybe about half and half, half being just efficiencies that we've brought to the process and about half being some capital that will move into next year.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

So when you think about efficiencies, if I did half and half, do you think CapEx over the cycle by about $150 million and pushing out $150 million into next year kind of ballpark?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. If you think about the $3.1 billion versus $3.4 billion that we talked about, that's about right. Yes.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

That trend towards the upper end of the rate base growth through 2021 includes all of that [thinking].

THOMSON REUTERS

SI-SSA-0015-13895

Client Id: 77

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Got it. And then one other. Just thinking about transmission rate base growth and transmission capital needs and kind of how you're thinking about whether there's any lumpiness in some of what PJM is trying to plan around, given what's happened with the ConEd wheel. How are you thinking about just whether there are any lumpy or larger scale projects coming down the pike with transmission? Or is it all going to be just lots and lots and lots of kind of small and midsized ones?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes, it's more the latter than the former. I think if you had gone back 3 or 4 years, you would have found more bigger, lumpier projects. A fair bit of what we are spending now is on 69 kV upgrades of 26 kV systems. And that actually moves capital from the distribution area into transmission as it goes up in voltage and those are smaller. Now a lot of them are still sizable projects, but smaller than, for instance, a Susquehanna-Roseland type of project that we talked about in the past. So there are more smaller projects as opposed to fewer larger projects that we've seen in the past that will move us forward. And in fact, as we think about our 2018 revenue number that we talked about, even within our prepared remarks, some of what you see there, it's a step up from what we have seen in some prior years. Even if you look back to last year, there's a pretty sizable step-up in the amount. Some of that is incremental capital year-over-year in both the return on that capital and the depreciation, the return of that capital will contribute to some of that increase. But you may recall last year, part of the number that we had from a revenue increase was inclusive of a true-up and that true-up was related to bonus depreciation. So a couple years back, the bonus depreciation extension took place. I don't think it was December 31, but it was awfully close to that and it was certainly after we had filed our October formula rate filing. So the impact of bonus depreciation in 2015, getting it approved, moved into 2016 after we had set our rates and a true-up in 2017 included the reduction in rate base for those excess deferred taxes for bonus depreciation. So on a year-over-year basis, you'll see a jump and a lot of that had to do with the fact that 2017 had a true-up reducing revenues for transmission related to that late enactment of bonus depreciation back in 2015.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Got it. Much appreciated. Maybe one last one. O&M at the utility has been very strong, meaning you've reduced O&M this year. How much of that is just one-off stuff related to maybe storms in 2016. And how much of that is kind of active O&M management?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

It's the latter. It's active O&M management and we've kept O&M to a very manageable rate over, frankly, the last number of years and would look to continue to do so going forward.

Operator

Your next question comes from Jonathan Arnold of Deutsche Bank.

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

Just one on the hedging data. You mentioned that you'd had a $2 downtick in the average price to $39 for 2019 and the hedge amount only ticked up by 5%. Can you just remind us, does that include an estimate of the pricing on the open position? Or is that just the average price on the hedge piece?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

It's the latter, Jonathan.

©2017 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13896

Client Id: 77

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

Okay. So then, I guess, following from that, then. Between -- over the last 4 quarters, it's ticked down from $43 to $39 and the hedging has gone from [15 to 30], how do we kind of reconcile that math?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Well, I think if you take a look at what the '19 -- 2019 forwards look like over that period, you've been in a $29, $30 rate. And what you're doing is you're pulling down from a BGS price in those out years, which is exclusive of the capacity components, but inclusive of the others. So it's not an unusual trend that we start in the out year of our 3-year cycle with BGS and then we layer on flat-block hedges as well as some other load deals in those flat-block hedges tend to come in at lower prices, in part, because the curve has come down but also because they're energy-only hedges.

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

Okay. So it's sort of those 2 things going on there. And then, but also the curve has sort of traded off in the quarter and then recovered a couple of dollars since. Is it fair to say these were sort of down in the heart of the third quarter or can you give us any sense there?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. During the quarter, since our last update.

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

Okay. And then one other thing. Just on enterprises. Your guidance for '17, the $35 million number, is that still sort of the right ballpark going forward?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. Yes, that's right.

Kathleen A. Lally - *PSEG Services Corporation - VP of IR*

I'm sorry. If you have 1 more question, otherwise, I know we've gone over our allotted hour's time, but I don't want to cut anybody off with a significant question, so we'll allow one more question.

Operator

Okay. Your final question comes from Ashar Khan of Verition.

Ashar Khan

Can I just ask you -- Ralph, can you just talk a little bit about the legislation, if -- when we should kind of expect it or what should we expect in the last 2 months starting tomorrow, I guess, November starts works in? And then, I just had one more question from Cregg, was that, could you remind us how much of the transmission increase went into effect on January 1 of this year? You said you were going to request something like $212 million, right, January 1, 2018. Could you remind us what that amount was for January 1, 2017?

THOMSON REUTERS

SI-SSA-0015-13897

Client Id: 77

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So sure. We are just in a series of conversations with people right now. We're just making sure they understand what our nuclear plants mean to New Jersey. And yes, it is true that if New Jersey were to build a safety net so as to guarantee or assure the continued operation of those plants, it would have required legislation. But anything more than that would be premature to discuss, right? So there's just a lot of conversations that we're having with folks to say, if those plants weren't here, here's what happens. So and then we have 2017, Dan?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. 2017 was $121 million, and that was down off of the last couple of years, which was $146 million and $182 million. And so it's moved around a fair bit and a lot of that is the bonus depreciation item that I talked about earlier.

Ashar Khan

So from $121 million, we are now going to like $212 million, right? Am I correct?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

That's right.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So just to summarize what, hopefully, you heard from me and Dan this morning, our Power plant construction is on budget and on schedule, 3 power plants that we hope to have online in June of next year and the subsequent June. We have a very healthy dialogue that we are active participants and going on underway on wholesale power market design and reform taking place at FERC, at DOE and at the state level. For the utility, we're now pointing toward the upper end of rate base growth, that's 7% to 9% range. We're now thinking we'll be able to hit that upper end of the range between now and 2021. We have a very busy, but a constructive regulatory agenda coming up for PSE&G. We have GSMP in play. We have a rate case, we'll have Energy Strong 2 in the near term and, longer term, some energy efficiency. And we're happy to go over all of that and then some with you at EEI next week. I know we have a full set of meetings set up and if you're not on the meeting schedule, I'm sure you can corner one of us in the hallway. They wouldn't let me say it at the beginning of the script, but I wish everybody a happy Halloween now. And have a great holiday and a safe day. Thank you. We'll see you all next week.

Operator

Ladies and gentlemen, that does conclude your conference call for today. You may disconnect, and thank you for participating.

PSEG Earnings Conference Call

3rd Quarter 2017

October 31, 2017

SI-SSA-0015-13900

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-13901

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income/(Loss) to reconcile to non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA with a reference to those slides included on each of the slides where the non-GAAP information appears.

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Management believes non-GAAP Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. The presentation of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

These materials and other financial releases can be found on the PSEG website at www.pseg.com, under the Investors tab. From time to time, PSEG, PSE&G and PSEG Power release important information via postings on their corporate website at http://investor.pseg.com. Investors and other interested parties are encouraged to visit the corporate website to review new postings. The "email alerts" link at http://investor.pseg.com may be used to enroll to receive automatic email alerts and/or really simple syndication (RSS) feeds regarding new postings at http://investor.pseg.com/rss.

PSEG
2017 Q3 Review

Ralph Izzo

Chairman, President and Chief Executive Officer

SI-SSA-0015-13903

PSEG Q3 2017 – Solid results; executing well on major initiatives

Third Quarter Highlights

- ✓ Net Income of $0.78 vs. Net Income of $0.64 per share in Q3 2016
- ✓ Non-GAAP Operating Earnings* of $0.82 vs. $0.88 per share in Q3 2016
- ✓ PSE&G results benefitted from increased investment in electric and gas transmission and distribution
- ✓ PSEG Power results aided by continued cost control and improved nuclear performance
- ✓ Unseasonably mild weather weighed on results of both businesses

Operational Excellence

- ✓ Nuclear fleet achieved a capacity factor of ~96% for Q3 and ~95% for the year-to-date 2017 period

Disciplined Capital Investment

- ✓ PSE&G investing ~$3.1 billion to upgrade transmission, replace cast-iron pipe and improve the resilience of electric distribution system in 2017 and PSEG Power investing ~$1.2 billion constructing three new, highly efficient gas-fired CCGTs

Regulatory & Policy Focus

- ✓ FERC seeking response to Department of Energy (DOE) proposed rulemaking to preserve the viability of fuel-secure, base load resources; Reply comments due November 7, 2017
- ✓ Per Board of Public Utilities (BPU) agreement, PSE&G will delay filing its Distribution Base Rate Case to no later than December 1, 2017; decision by BPU on Infrastructure Investment Proposal expected by year-end

* See Slides A and B for Items excluded from Net Income to reconcile to Operating Earnings (non-GAAP).

SI-SSA-0015-13904

PSEG Q3 Summary

Quarter ended September 30

$ millions (except EPS)	2017	2016	Change

- Agreed to delay rate review filing by one month to no later than December 1, 2017

Long-Term Infrastructure Investment Platform

- In July, PSE&G filed for a 5-year, $2.7 billion extension of the Gas System Modernization Program (GSMP2)
- In October, the BPU approved $69 million of PSE&G's request to extend its investment in Energy Efficiency (EE)
- A final BPU decision on the Infrastructure Investment Program (IIP) providing for 5-year investment programs expected by year-end
- PSE&G preparing a multi-year extension filing for Energy Strong in coming months
- PSE&G developing a large, multi-year EE investment program to bring benefits to a broader group of customers

Preserve the Value of Nuclear Supply

- Advocating for legislative strategy to recognize the value of nuclear energy under terms and conditions that provide proper incentives for long-term operation

Ensure Federal Regulatory and Policy Framework

- FERC/PJM considering DOE Notice of Proposed Rulemaking (NOPR) issues of Price Formation and fuel-secure resource preservation

PSEG EPS Reconciliation – Q3 2017 versus Q3 2016

Utility investment, cost control and mild weather drive Q3 results

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings (non-GAAP).
**Prior quarter results may not add to year-to-date totals due to rounding.

SI-SSA-0015-13911

PSEG – Year-to-Date Results by Subsidiary

PSEG YTD EPS Summary – Nine months ended September 30

GAAP Net Income/(Loss)	2017	2016	Change
PSE&G	$ 1.49	$ 1.37	$ 0.12
PSEG Power	$ (0.26)	$ 0.63	$ (0.89)
PSEG Enterprise/Other	$ (0.01)	$ (0.06)	$ 0.05
Total PSEG	$ 1.22	$ 1.94	$ (0.72)

Non-GAAP Operating Earnings*	2017	2016	Change
PSE&G	$ 1.49	$ 1.37	$ 0.12
PSEG Power	$ 0.80	$ 0.88	$ (0.08)
PSEG Enterprise/Other	$ 0.07	$ 0.11	$ (0.04)
Total PSEG*	$ 2.36	$ 2.36	$ -

*See Slides A and B for Items excluded from Net Income/(Loss) to reconcile to Operating Earnings (non-GAAP) for PSEG, PSEG Power and PSEG Enterprise/Other.

SI-SSA-0015-13912

PSEG EPS Reconciliation – YTD 2017 versus YTD 2016

Utility investment and cost control drive year-to-date results

* See Slide A for Items excluded from Net Income to reconcile to Operating Earnings (non-GAAP).Year-to-date columns
**Prior quarter results may not add to year-to-date totals due to rounding.

SI-SSA-0015-13913

PSE&G
2017 Q3 Review

PSE&G EPS Reconciliation – Q3 2017 versus Q3 2016

Continued investment and cost containment contributed to margin, offset by mild weather

Prior quarter results may not add to year-to-date totals due to rounding.

SI-SSA-0015-13915

Q3 2017 weather significantly cooler than Q3 2016 and normal

PSE&G Monthly Weather Summary
2017 vs. 2016 vs. Normal

Monthly Temperature Humidity Index (THI)

Q3 2017 temperature-humidity index was ~27% lower than Q3 2016 and ~5% lower than normal

Total Hours at 90°F or Higher

Q3 2017 total hours at or above 90°F were 69% lower than Q3 2016 and 47% lower than normal

SI-SSA-0015-13916

PSE&G – Q3 Highlights

Operations

- ✓ On a weather normalized basis, total electric sales were down slightly (0.6%) for the quarter and flat for the trailing 12 months ended September 30
- ✓ Q3 2017 weather was ~27% cooler than Q3 2016 and ~5% cooler than normal based on the Temperature-Humidity Index; hot weather in late September (billed at lower winter rates) was not enough to offset the mild August

Regulatory and Market Environment

- ✓ PSE&G agreed to delay filing its distribution base rate case by one month to no later than December 1; Filing will now be based on three months actual and nine months forecasted data
- ✓ BPU decision on Infrastructure Investment Program (IIP) proposal expected by year-end
- ✓ Filed for 2018 FERC Formula Rate increase of $212 million to be effective January 1, 2018, reflects increase in transmission investment and a true-up of prior-year results
- ✓ Anticipate filing a multi-year, Energy Strong extension and expansion program (ES2) by year-end

Financial

- ✓ PSE&G expects to invest approximately $3.1 billion of capital on its infrastructure in 2017, lower than the plan of $3.4 billion due to a delay in timing on certain projects and better than anticipated efficiencies
- ✓ PSE&G's 2017 Net Income guidance range remains unchanged at $945 - $985 million

SI-SSA-0015-13917

PSEG Power
2017 Q3 Review

SI-SSA-0015-13918

PSEG Power EPS Reconciliation – Q3 2017 versus Q3 2016

Fewer outage-related days and cost control offset lower prices

* See Slide B for Items excluded from Net Income/(Loss) to reconcile to non-GAAP Operating Earnings for PSEG Power.

SI-SSA-0015-13919

PSEG Power – Q3 Generation down 6% in response to mild weather

PSEG Power – Generation (GWh)*

Total Nuclear Total Coal** Natural Gas

* Excludes solar and Kalaeloa. ** Includes figures for Pumped Storage.

SI-SSA-0015-13921

PSEG Power – Gross Margin Performance

- ✓ Mild Summer weather tempered demand, energy prices and generation output
- ✓ PS Zone basis improved over Q3 2016, despite lower pricing
- ✓ Capacity revenues up slightly vs. Q3 2016 reflecting a step-up in New England capacity pricing to $232 MW/day
- ✓ Regional spark spreads compressed in the quarter

PSEG Power Gross Margin ($/MWh)

Quarter ended September 30

Regional Performance		
Region	**Q3 Gross Margin ($M)**	**Q3 2017 Performance**
PJM	$486	Lower prices and lower generation influenced by mild Summer weather
New England	$24	Higher capacity revenues offset lower generation and lower market prices
New York	$25	Higher generation was offset by decline in average hedge price and market prices

SI-SSA-0015-13922

Hedging Update – Forecast of output unchanged

Contracted Energy*

		Oct-Dec 2017	2018	2019
Base Load (Nuclear and Base Load Coal)	Volume TWh	8	35	35
	% Hedged	100%	100%	50-55%
	Price $/MWh	$45	$41	$39
Intermediate, Combined Cycle, Peaking	Volume TWh	3	18	25

	Price $/MWh	$45	$41	$ -
Total	Volume TWh	10-12	52-54	58-60
	% Hedged	85-90%	70-75%	30-35%
	Price $/MWh	$45	$41	$39

* HEDGE PERCENTAGES AND PRICES AS OF SEPTEMBER 30, 2017. REVENUES OF FULL REQUIREMENT LOAD DEALS BASED ON CONTRACT PRICE, INCLUDING RENEWABLE ENERGY CREDITS, ANCILLARY, AND TRANSMISSION COMPONENTS BUT EXCLUDING CAPACITY. HEDGES INCLUDE POSITIONS WITH MTM ACCOUNTING TREATMENT AND OPTIONS.

SI-SSA-0015-13923

PSEG Power – Q3 Highlights

Operations

- ✓ Q3 output down 6% reflecting mild weather and lower energy prices
- ✓ Nuclear fleet achieved average capacity factor of 96.1% in Q3, producing 8.2 TWh of energy
- ✓ CCGT fleet capacity factor was 51.0% versus 73.6% in Q3 2016, reflecting lower demand; CCGT availability remained strong at ~97% and produced 3.7 TWh of energy
- ✓ Coal capacity factor up 4% in PA on higher market demand, coal fleet produced 1.2 TWh of energy

Regulatory and Market Environment

- ✓ Department of Energy support of fuel secure, base load generation directs the Federal Energy Regulatory Commission to address price formation issues in a timely and constructive manner
- ✓ Court actions in New York and Illinois affirm state initiatives in support of baseload nuclear generation
- ✓ 2017 expected generation output on track for 49-50 TWh; BGS load projected at 11 TWh
- ✓ Construction on schedule and on budget at Keys and Sewaren 7 for targeted 2018 in-service; Bridgeport Harbor 5 progressing on schedule and on budget for targeted 2019 operations

Financial

- ✓ Power's total debt as a percentage of capitalization at September 30 was 31%
- ✓ Power's 2017 non-GAAP Operating Earnings guidance range remains unchanged at $435 - $510 million; non-GAAP Adjusted EBITDA guidance for 2017 remains unchanged at $1,080 to $1,210 million

SI-SSA-0015-13924

PSEG

PSEG Financial Highlights

- Reiterating 2017 non-GAAP Operating Earnings guidance of $2.80 - $3.00 per share
  - ✓ PSE&G earnings forecast to grow 8.5% to comprise 66% of PSEG's 2017 non-GAAP Operating Earnings
- PSEG's 5-Year capital spending forecast of $15 billion over 2017 – 2021 to be invested in PSE&G (82%) and Power (18%)
- PSE&G successfully executing regulatory/policy initiatives: Additional capital spend outlined since the March Investor Conference (GSMP2, upcoming filings for Energy Strong and Energy Efficiency) provides greater support for achieving the high end of its five-year, 7 - 9% annual growth in rate base over the 2017-2021 period
- PSEG Power's $2 billion investment in new generation, located in PJM and New England, will improve fleet efficiency and geographic diversity
- Increased 2017 indicative common dividend by 4.9% to $1.72 per share
- Financial position remains strong:
  - ✓ Cash from Power and increasing cash flow from operations at PSE&G supports dividend growth and funds capital spending program without the need to issue equity
  - ✓ Debt as a percentage of capitalization was 49% at September 30

SI-SSA-0015-13926

PRESENTATION

Operator

Ladies and gentlemen, thank you for standing by. My name is Shelby, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group Fourth Quarter 2017 and Year-End Earnings Conference Call and Webcast. (Operator Instructions) As a reminder, this conference is being recorded today, February 23, 2018, and will be available for telephone replay beginning at 2:00 p.m. Eastern Time today until 11:30 p.m. Eastern Time on Friday, March 2, 2018. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally - *PSEG Services Corporation - VP of IR*

Thank you, Shelby. Good morning, everyone. Thank you for participating in our earnings call. As you are aware, we released our fourth quarter and full year 2017 earnings results earlier today. The release and attachments, as mentioned, are posted on our website at www.pseg.com under the Investor section.

We also posted a series of slides that detail operating results by company for the quarter and year. Our 10-K for the period ended December 31, 2017 is expected to be filed early next week.

I'm not going to read the full disclaimer statement or the comments we have on the difference between operating earnings and GAAP results, but I do ask that you all read those comments contained in our slides and on our website.

The disclaimer statement regarding forward-looking statements details the number of risks and uncertainties that could cause actual results to differ materially from forward-looking statements made therein.

Client Id: 77

And although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so even if our estimates change, unless required by applicable securities laws. We also provide commentary with regard to the difference between operating earnings and adjusted EBITDA and net income reported in accordance with generally accepted accounting principles in the United States.

PSEG believes that the non-GAAP financial measures of operating earnings and adjusted EBITDA provide a consistent and comparable measure of performance to help shareholders understand operating and financial trends, but should not be considered an alternative to our corresponding GAAP measure net income.

I'm now going to turn the call over to Ralph Izzo, Chairman, President, Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer.

At the conclusion of their remarks, there will be time for your questions. (Operator Instructions) Thank you.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Thank you, Kathleen, and thanks, everyone, for joining us today. This morning, we reported non-GAAP operating earnings for the fourth quarter of 2017 of $0.57 per share versus non-GAAP operating earnings of $0.54 per share earned in the fourth quarter of 2016.

Non-GAAP operating earnings for the full year of $2.93 per share versus 2016's non-GAAP operating earnings of $2.90 per share were above the midpoint of our guidance range, which was $2.80 to $3 per share.

Our GAAP results for the full year of $3.10 per share include one-time noncash benefits associated with the revaluation of deferred tax liabilities at Enterprise and PSEG Power associated with the reduction in the federal tax rate and expenses associated with our decision to retire the Hudson and Mercer coal-fired generating stations in June of '17.

Details on the results for the quarter and the full year can be found on Slides 5 and 6.

Successful execution of our capital program at PSE&G and increased output, coupled with strong cost control at PSEG Power, offset earnings weakness experienced earlier in the year from abnormal weather conditions.

Non-GAAP operating earnings from our regulated utility business grew 8.6% in 2017 as PSE&G's investment program expanded rate base by 12.5% to $17 billion at the end of the year.

The utility's earnings have grown at an annual rate of approximately 13% over the past 5 years, which is in line with its growth in rate base over this time frame.

While the growth in earnings occurred with PSE&G maintaining cost discipline and successfully implementing infrastructure programs that upgraded its electric and gas systems to make them both more reliable and resilient.

Importantly, PSE&G has achieved these results as customer bills have declined. This past January, the utility filed its first distribution base rate case since 2010. The filing, which was required by the 2014 Energy Strong settlement, calls for a 1% increase in revenue as it incorporates a reduction in revenue associated with the decline in the federal tax rate.

Also in January, PSE&G updated its 2018 annual transmission formula rate with the Federal Energy Regulatory Commission. The update, reflecting a lower federal corporate tax rate, reduced the transmission revenue requirement by $148 million.

The timing of the reduction in the federal tax rate and the base rate filing places us in a position to pass along tax savings to our customers and keep rates low, allowing us to continue to improve our aging infrastructure.

Client Id: 77

As important, PSE&G's achievements allowed us to maintain our best-in-class reliability. For the 16th year in a row, PSE&G worked to protect and strengthen the system, yielded recognition as the most reliable electric utility in the Mid-Atlantic region.

Also during the year, the New Jersey Board of Public Utilities approved PSE&G's plan to expand its investment in energy efficiency by $69 million. PSE&G also filed with the BPU plans to extend its innovative Gas System Modernization Program. The extension, otherwise known as GSMP II, would accelerate the pace of replacement of aging cast iron and unprotected steel. The program would entail replacing 250 miles of pipe per year over 5 years at a total cost of $2.7 billion. We hope to have a decision on this program in the second quarter.

The GSMP II filing is modeled on the process outlined in the Infrastructure Investment Program -- and as I'll refer to that in the future, I'll just say IIP -- which was approved by the BPU in January. The board's approval of IIP provides for our rate recovery mechanism that encourages and supports the continued safety, reliability and resiliency of utility infrastructure, which is essential for economic growth in New Jersey.

In the coming months, you should expect PSE&G to seek approval, once again, under the IIP process, to extend this Energy Strong-related programs. We also expect to make a filing to broaden our investment in energy efficiency. An expansion of energy efficiency is one of the best means of achieving the state's clean energy goals and simultaneously limiting growth in the customer bill.

Now let me turn my attention to PSEG Power. Power's non-GAAP operating earnings for the full year of $505 million or $1 per share were at the upper end of our guidance range. Cost discipline across the fleet and strong operations from Power's nuclear generating assets supported the better-than-forecast results.

Power's nuclear fleet operated at a 93.9% capacity factor for the year, generating record electric output of 31.8 terawatt hours. PSEG Power has also made progress on construction activities related to its 3 new natural gas combined-cycle generation stations. Two plants, the Keys and Sewaren stations, are expected to be operational during the second quarter of this year. And Bridgeport Harbor 5 is expected to achieve commercial operation during the second quarter of 2019.

Together, these units represent 1,800 megawatts of efficient, clean, gas-fired capacity that will improve Power's competitive position. The cold weather experienced early in 2018 reinforced the importance of Power's diverse fleet and, of course, making sure the assets were available when needed to meet demand. The nuclear plants ran at full power, providing baseload capacity for everyday demand as the shortage of natural gas required some of Power's stations to operate on oil.

Power's management team has continued to drive efficient operations at its fossil stations, which include the early retirement of the Hudson and Mercer coal-fired stations as well as at nuclear. Controlling cost is vital, but we face continued challenges in maintaining operations, particularly at our nuclear plants, as the average price for Power's energy hedges is expected to decline by $5 per megawatt hour in 2018 from $45 per megawatt hour in 2017 with even further erosion foreseen in '19.

On the policy front, as you know, we have been focusing on raising awareness of the financial condition of our nuclear generating assets and communicating to the State of New Jersey the detrimental impact closure would have on the state's cost of electricity, its air quality and overall economy. The loss of the approximately 32 terawatt hours of clean electric energy produced by Power's nuclear generation in 2017 would represent a severe setback to the state's ability to meet its clean energy goals and result in crushing economic impact due to resulting increases in electricity prices and major job losses. We remain involved in discussions with key stakeholders here in New Jersey and with those in charge of the wholesale energy market at FERC and PJM to secure the long-term viability of our nuclear generation assets.

A bill, as proposed in the New Jersey Legislature, would value the attributes of nuclear and create a safety net for our at-risk nuclear capacity. The bill also addresses the state's path toward a clean energy future. We're pleased that the legislature is giving this issue the careful attention it deserves and hope for timely resolution. But the risk of closure remains without a change in the financial condition of nuclear.

To that end, Power recorded a $276 million increase in its asset retirement obligation liabilities at the end of 2017 to take into account a higher assumed probability of early retirement of its nuclear units.

THOMSON REUTERS

SI-SSA-0015-13934

Client Id: 77

Our financial condition is strong given the focus we have placed on maintaining a healthy balance sheet that supports our investment goals. Our balance sheet continues to provide us with a competitive advantage as we adapt to recently enacted changes in the federal tax code.

We ended 2017 with strong credit metrics, which support continued growth in our regulated investment program without the need to issue equity. And this position is unchanged with tax reform. Our capital program for the 5-year period ending in 2022 has expanded to $13 - $15 billion from the $13 billion level outlined a year ago. And it remains focused on investments that improve the reliability and efficiency of our operations, which also advance the state's plans to a clean energy future.

The utility's investment program of roughly $11.5 billion to $13.2 billion, which accounts for 90% of the total PSEG program, addresses customers' desires for reliable, efficient and clean energy and provides for a continuation of our projected 7% to 9% compound annual growth rate for rate base off a higher 2017 base. Also, given the impacts of tax reform, we feel comfortable achieving the midpoint of that range.

PSEG Power's major capital program will be complete in 2019 following the commercial operation of Bridgeport Harbor 5. The startup of that 485-megawatt gas-fired combined-cycle unit will represent the conclusion of Power's $2 billion capital investment in 3 new gas-fired combined-cycle stations, including the previously mentioned Keys Energy Center and Sewaren, which, as I said, are scheduled to start up by the middle of this year. Power's focus will be on efficient operations, improving the returns on generating assets and resolving the fate of its nuclear units.

PSEG's strategy implemented a decade ago has transitioned our business mix to one that is more reliant on regulated earnings. PSE&G, our regulated company, has grown to represent 2/3 of consolidated non-GAAP operating earnings. PSEG Power, focused on improving its operational efficiency and maintaining a strong balance sheet, continues to provide strong cash flow in support of our investment program.

The growth in our investment program and the disciplined approach to O&M have overcome a decline in energy prices over the past 5 years and produced annual growth in consolidated non-GAAP operating earnings of approximately 4% during that time.

Despite the challenges we continue to face in the wholesale markets, especially at our nuclear units, the continued successful investment in regulated programs that provide reliability and quality service to our customers and the benefits of a reduction in the federal tax rate are expected to support continued growth in earnings.

For 2018, we are forecasting consolidated non-GAAP operating earnings of $3 to $3.20 per share, which at the midpoint represents 6% growth in earnings over 2017.

The Board of Directors' recent decision to increase the company's common dividend 4.7% to the indicative annual rate of $1.80 per share is an acknowledgment and expression of confidence in our strategy and outlook. It needs to be said that our success is the result of the outstanding effort of our dedicated workforce, and we are positioned to continue to execute on our strategy to provide long-term value to our shareholders as we meet the needs of our customers and the communities we serve.

I'll now turn the call over to Dan for more details on our operating results and will be available for your questions after his remarks.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Great. Thank you, Ralph, and good morning, everyone. As Ralph said, PSEG reported non-GAAP operating earnings for the fourth quarter of $0.57 per share versus $0.54 per share for the fourth quarter of 2016.

Our earnings in the quarter brought non-GAAP operating earnings for the full year to $2.93 per share, a 1% increase over 2016's non-GAAP operating earnings of $2.90 per share and at the upper end of our non-GAAP operating earnings guidance for 2017 of $2.80 to $3 per share.

And on Slide 5, we have provided you with a reconciliation of non-GAAP operating earnings to net income for the quarter.

Client Id: 77

We've provided you with information on Slide 11 regarding the contribution to non-GAAP operating earnings by business for the quarter. Slides 12 and 14 contain waterfall charts that take you through the quarter-over-quarter and year-over-year net changes in non-GAAP operating earnings by major business. I will review each company in more detail starting with PSE&G.

PSE&G reported net income for the fourth quarter of 2017 of $0.43 per share compared with $0.38 per share for the fourth quarter of 2016. PSE&G's full year 2017 net income was $973 million or $1.92 per share compared with net income of $889 million or $1.75 per share in 2016.

Non-GAAP operating earnings for the full year were $963 million or $1.90 per share, an 8.5% increase over 2016 non-GAAP operating earnings of $1.75 per share.

As shown on Slide 16, PSE&G's net income in the fourth quarter continue to benefit from a return on its expanded investment in transmission and distribution infrastructure, which more than offset an increase in O&M.

Growth in PSE&G's investment in transmission improved quarter-over-quarter net income comparisons by $0.03 per share. Recovery of investment made in gas distribution under PSE&G's Energy Strong and Gas System Modernization Programs increased quarter-over-quarter net income by $0.01 per share.

Colder-than-normal weather, as compared to more normal weather conditions in the year-ago quarter improved net income by $0.01 per share. An increase in O&M expenses associated with preventative and corrective maintenance reduced quarter-over-quarter net income by $0.02 per share.

Electric sales, on a weather-normalized basis, modestly declined 0.4% for the year as energy efficiency and solar net metering offset growth in a number of customers. Weather-normalized gas sales for the year increased 1.2%, led by growth from commercial and industrial customers.

PSE&G's distribution rate base filing provides it with an opportunity to reflect current estimates of electric and gas sales growth and proposes improvements in its rate design, including de-coupling and higher monthly fixed charges offset by lower volumetric rates to minimize the impact of sales variability. This aligns our interest with achieving greater energy efficiency results.

Details of the base rate filing are outlined on Slide 18. The filing is based on a test year ending June 30, 2018, with some adjustments for the following months, including a rate base of $9.6 billion as of December 31, 2018. And as Ralph mentioned, PSE&G filed for a 1% increase in revenue or $95 million. In keeping with maintenance of PSE&G's credit metrics, the request is based on a cap structure consisting of 54% common equity and reflects a 10.3% return on equity.

PSE&G's filing took into account approximately $130 million reduction in its annual revenue requirement as a result of the federal corporate income tax rate reduction from 35% to 21%. And in addition, provides for a one-time credit for estimated excess income tax collected from January 1, 2018 to the time rates go into effect.

PSE&G is also proposing to increase the amount of tax credits flowed back to customers in subsequent years. This would result in rate decreases, which would have the effect of offsetting the impact on the customer bill associated with investments, such as the GSMP II capital program.

Pursuant to a recent BPU order, we expect to make a filing to lower our rates sooner by April 1 to account for the lower federal tax rate, and we'll update our rate case filing accordingly. A decision on the base rate filing is anticipated in the fourth quarter.

PSE&G has separately updated its transmission formula rate filing for 2018 to incorporate the lower federal tax rate. The update reduced its annual revenue requirement by $148 million from the original filing which called for an increase in revenue of $212 million. This adjustment has no impact on earnings expectations.

THOMSON REUTERS

SI-SSA-0015-13936

Client Id: 77

PSE&G's investment of $3.1 billion in its transmission and distribution infrastructure in 2017 provided for approximately 13% growth in rate base to $17 billion. Of this amount, PSE&G's investment in transmission has grown to represent 46% or $7.8 billion of the company's consolidated rate base at the end of 2017.

Supported by the ongoing transmission and distribution investment program, we are forecasting continued growth in PSE&G's net income to a range of $1 billion to $1,030,000,000 in 2018.

Now let's turn to Power. As shown on Slide 21, PSEG Power reported non-GAAP operating earnings of $0.20 per share compared with non-GAAP operating earnings of $0.13 per share a year ago.

The results for the quarter brought Power's full year non-GAAP operating earnings to $505 million or $1 per share compared to 2016's non-GAAP operating earnings of $514 million or $1.01 per share. Power's adjusted EBITDA for the quarter and the year amounted to $196 million and $1,172,000,000, respectively, and this compares with adjusted EBITDA for the fourth quarter of 2016 of $155 million and adjusted EBITDA for the full year 2016 of $1,201,000,000.

We provided you with more detail on generation for the quarter and for the year on Slides 22 and 23. The earnings release as well as the earnings slides on pages 12 and 14 provide you with detailed analysis of Power's operating earnings quarter-over-quarter and year-over-year from changes in revenue and cost.

Power's earnings benefited from an increase in capacity prices in New England and PJM, which improved quarterly net income comparisons by $0.02 per share. A 2% increase in output improved net income comparisons by $0.01 per share, as colder-than-normal weather resulted in higher gas send-out, which increased net income by $0.01 per share.

A decline in the average price received on energy hedges of $4 per megawatt hour was partially offset by an increase in market prices on unhedged output, which combined to reduce quarterly net income by $0.01 per share.

A decline in O&M expense improved net income comparisons by $0.03 per share. A decline in depreciation expense associated with the retirement of Hudson and Mercer as well as the decline in interest and taxes combined to improve fourth quarter net income comparisons by $0.01 per share.

Gross margins in the fourth quarter increased to $38 per megawatt hour from $37 per megawatt hour and power prices held up vis-à-vis gas prices in response to the colder-than-normal weather. For the year, gross margins declined to $38 per megawatt hour from $40 per megawatt hour given a decline in average hedge prices for energy.

Now let's turn to Power's operations. Output from Power's generating facilities decreased 2% in the fourth quarter and quarterly comparisons were influenced by the timing of nuclear plant refueling outages and increased demand in response to colder-than-normal weather during the month of December. Based on results for the fourth quarter, output for the year of 51 terawatt hours was stronger than the forecast we provided you at the end of the third quarter, which called for full year output of 49 to 50 terawatt hours.

The nuclear fleet operated at an average capacity factor of 89.9% in the fourth quarter. And the fleet's performance in the quarter resulted in a full year capacity factor of 93.9%, producing record electric output for the year of 31.8 terawatt hours.

The fleet's output was aided by strong performance from Power's 100%-owned Hope Creek nuclear plant, which operated at 100% capacity factor for the year. And based on our normal 18-month refueling cycle, Hope Creek is scheduled for refueling this spring, in the spring of 2018.

Power's gas-fired combined-cycle fleet operated at an average capacity factor of approximately 40% for the quarter and approximately 47% for the year, producing 13.6 terawatt hours of electric energy for the year.

Output from the coal fleet declined slightly as the quarter -- during the quarter as the result of outage work at Keystone. But for the year, output from the coal fleet increased 12% as the fleet's competitiveness benefited from an increase in gas prices.

THOMSON REUTERS

SI-SSA-0015-13937

Client Id: 77

For 2018, with the addition of Keys and Sewaren combined-cycle units, Power is forecasting an increase in output to 55 to 57 terawatt hours. Following completion of the recent basic generation or BGS auction in New Jersey, approximately 80% to 85% of production for the year is hedged at an average price of $40 per megawatt hour.

Power is forecasting a further increase in output for 2019 to 59 to 61 terawatt hours with the full year of Keys and Sewaren in operation and a partial year from the new combined-cycle unit at Bridgeport Harbor.

And for 2020, Power is forecasting output of 63 to 65 terawatt hours. Approximately 55% to 60% of 2019's expected output has been hedged at an average price of $38 per megawatt hour, and approximately 25% to 30% of 2020's expected output has been hedged at an average price also of $38 per megawatt hour.

An update of Power's hedge position is provided on Slide 26. As you can see, Power has hedged its baseload nuclear and coal output for 2018 and is mostly hedged in 2019. The gas-fired combined-cycle assets remain more open to the market during those years and will be available to take advantage of spark spread opportunities that have improved based upon recent fluctuations in commodity prices.

The outlook for 2018 and 2019 has improved since our last update based on an increase in sparks in the region and power prices have not declined to the same degree as gas.

Power's non-GAAP operating earnings for 2018 are forecast at $485 million to $560 million. And the forecast represents non-GAAP adjusted EBITDA for the full year of 2018 of $1.075 billion to $1,180,000,000.

PSEG Enterprise and Other reported net income for the fourth quarter of 2017 of $126 million or $0.25 per share compared to net income of $11 million or $0.02 per share for the fourth quarter of 2016.

For the full year, PSEG Enterprise and Other reported net income of $122 million or $0.24 per share, which compares to a net loss in 2016 of $20 million or $0.04 per share. And the results for 2017 include a one-time, non-cash earnings benefit of $147 million related to the reduction in the federal corporate tax rate, resulting in a decrease in Energy Holdings' deferred tax liabilities, partially offset by an after-tax charge taken earlier in the year related to on-going challenges facing NRG REMA.

For the fourth quarter of 2017, PSEG Enterprise and Other reported a non-GAAP operating loss of $21 million or $0.04 per share compared to non-GAAP operating earnings of $17 million or $0.03 per share in the year-ago quarter. The results for the fourth quarter brought PSEG Enterprise and Other non-GAAP operating earnings for the full year to $20 million or $0.03 per share versus $72 million or $0.14 per share in 2016.

The decline in non-GAAP operating earnings in the fourth quarter reflects the impact of a $15 million after-tax contribution to the PSEG Foundation as well as certain tax items at the parent and PSEG Energy Holdings and the absence of certain tax items in the fourth quarter of 2016 at PSEG Energy Holdings.

For 2018, non-GAAP operating earnings for PSEG Enterprise and Other, which are driven by PSEG Long Island, and partially offset by parent interest expense, are forecast at $35 million.

I want to spend just a moment on the subject of tax reform. PSEG is a net beneficiary under the Tax Cuts and Jobs Act of 2017 and our financial flexibility remains strong. PSE&G, as mentioned, will be returning 100% of the benefit from the decline in the federal tax rate to its customers. And the recently filed distribution base rate request reflects a $130 million annual reduction in revenue associated with the lower federal tax rate. And as mentioned, we amended our 2018 transmission formula rate to incorporate the decline in revenue of $148 million associated with the lower federal tax rate.

Net income from PSEG Power and Enterprise is expected to benefit from the decline in the federal tax rate. And our estimate of 2018's non-GAAP operating earnings reflects an improvement in earnings of approximately $0.16 per share.

THOMSON REUTERS

SI-SSA-0015-13938

Client Id: 77

PSE&G's cash flow will be negatively impacted by the elimination of bonus depreciation and lower tax rates for ongoing tax depreciation.

PSEG Power's cash flow, on the other hand, is expected to benefit from its ability to expense 100% of its capital expenditures. PSEG Power's cash flow in 2018 will also benefit from the reduction in the federal tax rate as well as the decline in capital spending in 2018 of about$400 million with the mid-2018 completion of construction of both Keys and at Sewaren.

Given our strong balance sheet and low debt balance, we estimate that interest expense at PSEG Power and Enterprise will remain fully deductible for tax purposes.

The reduction in the federal tax rate under the Tax Act also reduced the deferred tax liability of PSEG Power and Enterprise, which was originally recorded based upon the higher 35% rate.

At PSEG Power and Energy Holdings, we recorded onetime, non-cash earnings benefits in the fourth quarter of 2017 of $588 million and $147 million, respectively, resulting from this reduction in deferred tax liabilities.

PSE&G has excess deferred taxes of approximately $2.1 billion as of December 31, 2017, and has recorded the impact of these excess deferred taxes as a regulatory liability. Approximately 70% of PSE&G's excess deferred taxes are deemed protected under the IRS normalization rules, which requires the protected deferred taxes be returned to customers over the remaining life of the assets that generated the taxes in the first place. Given the long-lived nature of utility assets, it will take many, many years for all of these protected taxes to be returned to customers.

The remaining 30% or about $600 million, some of which were included in our distribution base rate filing, will be returned to customers over a time frame that will be determined in discussions with the BPU and with FERC. Of course, as you know, the loss of bonus depreciation and the reduction of PSE&G's deferred tax balance serves to increase its rate base. We estimate that these 2 items combined will increase the annual growth in PSE&G's rate base by approximately 1% through 2022.

The net result of the change in federal tax law on PSEG's consolidated cash flow and credit metrics is manageable given our business mix and the strength of our balance sheet. We do not anticipate the need to issue equity to finance our capital program. And we continue to have excess balance sheet capacity to finance further growth.

As Ralph mentioned, our financial condition remains strong. We closed 2017 with $313 million of cash on hand and debt representing 49.6% of our consolidated capital position, and debt at Power approximating 29% of its capital base.

At year-end, Power's debt position was just over 2.1x the midpoint of our forecasted 2018 adjusted EBITDA. We are guiding to a non-GAAP operating earnings at PSEG for 2018 of $3 to $3.20 per share, which is a 6% increase over 2017. And the common dividend was recently increased 4.7% to the indicative annual level of $1.80 per share. This represents a 58% payout of earnings at the midpoint of our 2018 guidance and builds on the 3.4% annual rate of growth in the dividend over the last 10 years.

Shelby, we are now ready to take questions.

QUESTIONS AND ANSWERS

Operator

(Operator Instructions) And your first question comes from Julien Smith of Bank of America Merrill Lynch.

THOMSON REUTERS

SI-SSA-0015-13939

Client Id: 77

Josephine Moore - *BofA Merrill Lynch, Research Division - Associate*

It's Josephine here. I just was wondering, could you provide a little bit commentary on your outlook of the ongoing PJM price formation reform discussion as well as the potential for comprehensive energy legislation in New Jersey?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Sure, Josephine. So as you know, there's a due date of -- I believe it's sometime in the first week of March, where each RTO is supposed to get back to FERC on -- with respect to the FERC decision to close the DOE NOPR and to ask the question about fuel diversity and resiliency of the grid. There have been very public conversations and statements by PJM that they believe, in particular, their inflexible unit challenges are things that need to be corrected in the market. These showed up in abundance during -- the cold spell.

Josephine Moore - *BofA Merrill Lynch, Research Division - Associate*

Cold snap.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Where Andy testified in front of the Senate Energy and Natural Resources Committee that there had to be $4 million to $5 million in daily uplift payments. So without having control over the pen, I fully expect PJM management to submit comments to FERC as they have some improvements to make in their current tariff if price is, in fact, going to be the way in which the market is reliably dispatched because there continues to be out-of-market payments that are relied upon to achieve that. Switching gears on you and moving over to New Jersey, we've had some very good conversations. We had a good day yesterday with a comprehensive energy bill, which included our nuclear concerns reported out of the Senate Budget Committee and the Assembly Telecommunications and Utilities Committee getting further reference in the assembly through its budget committee, its Appropriations Committee, if you will. And I think the encouraging news there is that everyone who has testified, and we've now have 4 hearings on this, I think. With the exception of our competitors, have said they don't want to see those plants closed. And our competitors obviously want to see those plants closed because that means higher prices. I just have a high degree of confidence that New Jersey policymakers understand the value of those plants and will do the right thing. But of course, one cannot guarantee any outcome.

Josephine Moore - *BofA Merrill Lynch, Research Division - Associate*

Great. And then just one follow-up here. You talked about a roughly $80 million benefit from tax reform at the -- at Power, but increased guidance by only $50 million. Are there any headwinds that limit the ability to fully recognize that tax reform benefit?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. I think if you think about the overall impact year-over-year, we referenced the $0.16 related to tax reform. But of course, there's other impacts as you step from year-to-year. We'll see changes in capacity prices, which will help, but we also have a reduction in the average price that we sold our power. So that's a headwind that we have been fighting, and as you mentioned.

Josephine Moore - *BofA Merrill Lynch, Research Division - Associate*

That's a $5 million reduction -- $5 reduction? Okay.

THOMSON REUTERS

SI-SSA-0015-13940

Client Id: 77

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Per megawatt hour. So you think about that across the fleet and then you compare that to an uplift in capacity and a benefit from tax reform. Those are your biggest pieces.

Operator

Your next question comes from Angie Storozynski of Macquarie Capital.

Angieszka Anna Storozynski - *Macquarie Research - Head of US Utilities and Alternative Energy*

So I understand that you have a pending rate case for your utility, but your guidance for '18 seems to imply a relatively low pickup in earnings power of the utility versus what we have seen in the past. Is this just because you are waiting for your rates to be trued up in the rate case?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes, Angie, if you think about the timing of the rate case, we are essentially saying that we would expect to see rates at the end of the year. I think we referenced fourth quarter in our prepared remarks. So I think a big part of it is just related to the rate increase on the distribution side being --coming at the end of the rate case, which is towards the end of the year.

Angieszka Anna Storozynski - *Macquarie Research - Head of US Utilities and Alternative Energy*

But how about your previous expectations that there would be a rate base growth of around -- I forget -- 8% or 9% and a commensurate increase in earnings. Is that -- does this still hold? I mean, granted that we're still waiting for the outcome of the rate case.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. I think -- if you think about the 2 sides of the business, Angie, on transmission, that's going to move along by virtue of the formula rate, which is always the norm, but when we take a look at the distribution side of the business, I wouldn't expect to see anything different. We have a 6% increase to the midpoint of the range and with a rate case following on later in the year. And as we move into '19, I think that would bridge the gap for you.

Angieszka Anna Storozynski - *Macquarie Research - Head of US Utilities and Alternative Energy*

Great. On the Power side, so it seems like you've marginally reduced your expectations of volumes for the BGS auction. There's been also some news or press coverage of your interest in the retail business. How should we think about it, how you're trying to shape up the merchant power earnings given the weakness in the forward curves?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes. So I think, Angie, we've been pretty consistent that retail business is a defensive play. It's primarily targeted at improving the negativity and basis differentials that we've experienced. We're looking at it as a nice supplement, if you will, to diminution of the BGS load contract that we have seen occur over the years. What did change probably about a year or so ago was our recognition that we would not find an acquisition opportunity to just kind of step into a New Jersey-focused, PJM-centric opportunity. So we're building it organically. And that is -- that's going fine, but when you do something organically, it's a little bit more gradual than just stepping into it. So no change in strategy there at all.

THOMSON REUTERS

SI-SSA-0015-13941

Client Id: 77

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

And Angie, as we step from year to year, we will have a BGS auction roll off, right. So the state goes out to auction 1/3 of the load each year. So over 3 years, they auction everything. And so as we step from year to year to year, there could be some modest differences within volumes of the number of tranches that we would have as we go from auction to auction to auction.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Angie, I just want to supplement something that Dan mentioned before. So the rate base growth, we're still saying 7% to 9% and comfortable with the midpoint. But remember, we had a fair amount of capital that was deployed coming at the back end of GSMP I and Energy Strong that is part of the rate case proceeding we're in now. So the 12% growth in rate base that you saw last year, by necessity, as Dan correctly pointed out, is awaiting rate relief at the end of the year. And when you get it at the end of the year, you just -- and now Dan and I are repeating ourselves, it doesn't give you the full 12 months of impact. So I think we're okay there.

Operator

Your next question comes from Praful Mehta of Citi Investment.

Praful Mehta - *Citigroup Inc, Research Division - Director*

So just, firstly, wanted to just clarify, in terms of tax reform, what is exactly built into the forecast? I know on the power side, it sounds like you've incorporated the lower taxes. On the utility side, it didn't sound like it was. So I just wanted to clarify specifically what is currently built in, in tax reform and what is more left in terms of regulatory outcomes that you're waiting to see?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Praful, I think if you think about the utility side of the ledger, it's much more a cash story, especially right away. So it's about the pass back of taxes because, frankly, you're not going to end up paying taxes. So if you think about what we did, we proactively, in January, went to FERC knowing that there was going to be a rate change. And we knew we were going to pay less tax in 2018. So we proactively went to FERC to get that money back in customers' hands. Revenues come down, taxes come down, ends up being a wash. There will be some modest benefit as we step through time because if you have less deferred taxes on your books and you pass that back to customers, so your rate base will grow as you step through time with that reduction in deferred taxes. But that will grow over time and does not have really much of a P&L impact as you look at 2018, in particular, for the utility.

Praful Mehta - *Citigroup Inc, Research Division - Director*

I got you. Yes, I was, again, more focused on the cash impact specifically like, for example, the DTL refund. Is that currently incorporated within the forecast or no?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes, yes. And further to the prepared remarks as well, Praful, if you think about -- some of those are protected deferred taxes. That's the lion's share of our deferred taxes. And that will get passed back over what's called the average rate assumption method. That's over the remaining life of the asset. And I think it's a true statement to say that we are still passing back some deferred taxes from the 1986 Tax Act when it happened because we got such long-lived property. So that will go on for a period of time as those different lives end up turning. But yes, we've incorporated what we know and estimates of what we don't know into our numbers.

THOMSON REUTERS

SI-SSA-0015-13942

Client Id: 77

Praful Mehta - *Citigroup Inc, Research Division - Director*

Got you. Perfect. And then secondly, in terms of the New Jersey bill, it's helpful. And yes, the conversations clearly were productive from what we heard yesterday. How do you see that playing out from here in terms of timing? And when does it reach the governor's desk and all of that? How do you see that playing out from here?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

My high degree of confidence in the ultimate outcome is matched by my uncertainty over timing. So what I can tell you is the bill is posted for one day in the state Senate. The assembly doesn't have a voting session. I don't think at present scheduling until the end of March. So we're a 115-year-old company, Praful. Salem is 40 years old. Hope Creek is 30 years old. I'm not going to sweat a couple of weeks one direction or another, but I feel pretty good about the nature of the conversation and the clearly earnest desire on the part of all stakeholders to preserve those plants, but timing is not something I can predict.

Operator

Your next question comes from Jonathan Arnold of Deutsche Bank.

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

My question has to do on tax reform and your comments that I think you said, obviously, that you're not planning any equity, but you said you also still have excess balance sheet capacity. And I know you don't normally update that until the Analyst Day. But if I recall, at EEI, you gave us a slide which showed something like a $1.8 billion reduction or roughly halving of what it had been without tax reform. So my -- I guess my question is, is that still a good number? Or as you further refine your inputs and outputs, is that at least somewhere else?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

No. I think you're still very much in that range, Jonathan. I think that what we tried to do at that point is highlight that a number that we have provided was based in large part on FFO to debt and there was a lot of FFO that came from bonus depreciation. So by either the passage of time or by tax reform -- because at EEI, we had not had tax reform at that point in time. Unless bonus was extended, the FFO was going to come down. And so that was kind of a temporal aspect. And what we tried to do, to your good memory, was to give some indication that, that was going to come down. So the order of magnitude numbers was about $3 billion at that point, and we were highlighting that about $1.8 billion or so would go away with bonus depreciation. So that's still in the right ballpark, and I think the right way to think about it. And when I referenced before the strength of the balance sheet and the ability to fund further investments, it's still that order of magnitude.

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

And so that was, if I remember, the math was like a $300 million FFO divided by your 18% target effectively is how you got there.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes.

THOMSON REUTERS

SI-SSA-0015-13943

Client Id: 77

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

So presumably that means -- as you've put all this together, you see FFO degradation roughly in that $300 million range still?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. As you step out into -- I think our numbers were targeted around a 2020 or so time frame, right. So you kind of come off of those bonus years, but that's -- you're thinking about it exactly right, Jon.

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

Okay. Great. And then just on the guidance for Holdings is -- and the increase in '18 over '17, is that all tax-reform related or is this -- and I guess an uptick in the Long Island contract or is there anything else driving that?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

No. It's not a lot. I mean, if you have a little bit lower taxes, you'll have a little bit higher income, and $35 million is kind of a normal range. Last year, we had some tax issues coming through, and we had made a contribution to the foundation. So I think you can look at '18 as being a more normal year.

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

So it's more that '17 was a little skewed low and '18 is more normal?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

That's exactly right.

Operator

Your next question comes from Greg Gordon of Evercore ISI.

Gregory Harmon Gordon - *Evercore ISI, Research Division - Senior MD, Head of Power & Utilities Research and Fundamental Research Analyst*

A lot of my questions have been answered, and this one you may not be able to answer, but I'll try. In terms of your observation from the outside looking in at how PJM gets to the answer on implementing their price reform initiatives, it appears that there's a bit of a cart/horse issue here in that one path is to wait for the FERC to potentially order a 206 proceeding and say that their rates are unjust and unreasonable. So my first question is, are we on a path in the current FERC docket where you believe at the end of the initial filings and the responses that the FERC could look at the evidence that PJM files to show that their rates are not appropriate? Can they actually get to a place at the end of this proceeding where they could legally say, yes, you've proven your rates are unjust and unreasonable and allow them to go ahead and change the rate? Or are we realistically on a path here where they have to make a decision on whether they're going to go through the stakeholder process and then it's whether they go through a truncated process with a board vote or a more elongated process with a stakeholder vote, knowing -- understanding that the former was what they used when they did capacity performance. It's a long question, but hopefully you get the gist.

THOMSON REUTERS

SI-SSA-0015-13944

Client Id: 77

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes, we get the gist. But you were right at the start. Greg, I'm sorry, there's no way to predict that. I would point out to you though that there's multiple things going on at FERC that matter, right, from PJM. There's the capacity market reform. There's fast-start pricing. There's price formation. So there's multiple issues. There's multiple degrees of freedom. Is it a 205? Is it a 206? Is it a truncated process? Is it not? So it's just -- I think we're all visiting with the commissioners and telling them how important it is. And I think we're all seeing the same comments out of PJM. So I don't know what else to say at this point about it.

Operator

Your next question comes from Christopher Turnure of JPMorgan Securities.

Christopher James Turnure - *JP Morgan Chase & Co, Research Division - Analyst*

The only question that I have left is on the New Jersey nuclear support. You've answered a couple of questions on it already, of course. But I'm wondering if there's a couple of potential hurdles to getting across the finish line this session that you're concerned about. It seems like the governor could potentially further his environmental kind of effort and the emission-free power effort long term through this. And there's some other stakeholders that seem to have come in line here, but what might we be missing that could scuttle the entire operation?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Chris, so it's always nice to have quarterly calls where we're trying to explain the past, but now you guys are really pushing us to predict the future. It is so hard. I mean, the good news is, the governor has publicly stated on numerous occasions that those plants have to continue to operate as a bridge to a long-term renewables future. And as I said before, everyone who has testified, other than our competitors, have begun their testimony by saying, "We don't want these plants to close, but" and then they each have a but that they put in there. So are there hurdles? Yes, there are. But I stay grounded on the support, the articulated support of consumer groups, environmental groups and the governor and the legislature itself. And we have made progress in terms of the schedule and in terms of going through the committee process. So we'll just keep making sure people know what it means if they go away. And then, of course, at the risk of stating the obvious, all of our shareholders know that we will do what is right by our fiduciary responsibility in terms of those plants, regardless of New Jersey's actions.

Operator

Your next question comes from Michael Lapides of Goldman Sachs & Co.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

On PSE&G, I just want to make sure I understand the puts and takes in rates or revenue requirements that are happening this year. So on a year-over-year basis, is what you're saying is that transmission is actually down year-over-year and that's just all tax-related?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

From a pure revenue perspective, but completely neutral from an earnings perspective.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Got it. And then the distribution revenue reduction for tax is going to happen in April of this year?

THOMSON REUTERS

SI-SSA-0015-13945

Client Id: 77

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Correct.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Okay. And that's not a full year number, that's an annualized number? So it's as if it were April this year through March of next year?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes, yes, right, right.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Okay. And the rate increase won't happen for -- well, let me rephrase that. Anything tied to rate change is tied -- from the rate case won't happen until the end of the year?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

That's right. Yes.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Are there any other -- what about like tracker or GSMP I or even GSMP II-related revenue changes, are you still getting those in 2018? Or does that get -- or does -- do the things we've talked about kind of supersede that or incorporate that?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

The only thing that ends up superseding that, Michael, is when the rate case is done. And they kind of -- so they roll in as we work our way forward. They'll be done, I think, by the time we get to the rate case and sort of kind of wrap up at about the same time. But until then, we'll have roll ins as we always have.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Hold on, I want to make sure I follow this. So in 2018, you'll have the transmission revenue decline, obviously, offset by tax. You'll have the distribution revenue decline offset by tax. And then whatever you'll have in the rate case, none of the other trackers or anything will flow in, in '18, but they'll kick back in, in '19?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. So you'll have our continuing roll ins as they are from the standpoint of Energy Strong and GSMP. And then we'll have the rate case as it comes in at the end of the year. So I don't think it's any different than the norm. The only thing different than the norm, the way to think about it, really, is the 2 tax return -- tax rate -- the return of the taxes at both the distribution and the transmission side, which has no P&L impact, revenues go down and taxes go down.

THOMSON REUTERS

SI-SSA-0015-13946

Client Id: 77

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Also, I think our solar and energy efficiency filings are not part of rate case proceedings. They'll continue to have their trackers.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Right.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Got it. And then finally, what tax rate are you assuming at both E&G and Power this year, like what's in guidance?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

It's the statutory move to 21% and then we'll have some modest moves like we normally do. So for instance, the update to taxes has eliminated a production deduction, a manufacturing deduction that Power would take to the tune of a couple of pennies. But other than that, it's still modest adjustments off of the statutory rate.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Got it. Okay. And no significant state tax level added on top of that?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes. I mean, we do have, what is it, 9% in New Jersey?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

True, but no different and other than the fact that the federal benefit you get from states is going to change by virtue of the federal tax rate change.

Operator

(Operator Instructions) Your next question comes from Paul Fremont of Mizuho.

Paul Basch Michael Fremont - *Mizuho Securities USA LLC, Research Division - MD of Americas Research*

Does your GRC filing and the rate base numbers that are in there, does that reflect the rate base numbers after tax reform or would there be a further adjustment that we need to make?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

The -- so what we have filed within the rate case assume that we did have the tax rate -- the tax changes come through. We had also, within our base rate case filing, had a pass back of some deferred taxes within that rate case. And we will continue to do so as we make our prospective filings. Now what may end up happening in our prospective filings is some of the pass back of deferred taxes that were embedded within the filing may get swapped out compared to some of the excess taxes that we will ultimately pass back to customers. So part of the -- I guess I would say the --

THOMSON REUTERS

SI-SSA-0015-13947

Client Id: 77

as we step through the next steps of this rate case, we will have overlaid on top of it the BPU order to provide back the tax rate change, which was in our base rate case. So we will adjust the base rate case in our next filing to adjust for the fact that a separate filing will be made by virtue of the BPU order outside of the rate case.

Paul Basch Michael Fremont - *Mizuho Securities USA LLC, Research Division - MD of Americas Research*

Okay. And then can you at all discuss what the retail contribution was in 2017?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

We don't break that out, Paul. It would have been very, very modest at this point.

Paul Basch Michael Fremont - *Mizuho Securities USA LLC, Research Division - MD of Americas Research*

And I mean, can you give us maybe a metric, like how many megawatt hours did you sell?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

It was so small, I don't have the number. I just don't have that number. I don't think -- we've not broken that out. We were really -- what I can tell you is how many people we were hiring to get going, but not in megawatts we sold.

Paul Basch Michael Fremont - *Mizuho Securities USA LLC, Research Division - MD of Americas Research*

So when would be sort of the first year that you would expect any type of material contribution out of that business?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Depends on your definition of material, really. I mean, we don't break out a lot of the sub numbers in Power. We don't do power plant by power plant. We don't give you gas versus electric. So I don't think you should expect us to break out something that is purely an organically grown defensive mechanism -- obviously, changes in revenue recognition portrayals in the SEC documents that may be a little bit more illuminating but...

Operator

And your final question comes from Ashar Khan of Verition Fund Management.

Ashar Khan

Can I just ask one question? Is that -- you kind of referred to it that the utility growth is a little bit muted this year, but then can we expect -- what the inference I got from your comments is that we make it up in '19 because of the back-end loaded nature of the rate case. That's my one question. And the second question I had was that you mentioned the 7% to 9% growth rate in the utility rate base. And that's the same number you mentioned at your Analyst Day, but now you also mention that you have an additional $1 billion of rate base because of the tax reform. Is that $1 billion rate base included in that 7% to 9% or no? Just a clarification on those 2 issues.

©2018 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-13948

Client Id: 77

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. I think the way to think about it is that we jump off as we do every year from a higher base by virtue of the prior year's investment in rate base. So as rate base steps up, the ability to grow at the same rate kind of presupposes a incremental increase to rate base from a pure dollar amount. And if you take a look at the incremental rate base by virtue of the lower deferred taxes, and if you take a look at the bump up in the starting point year-over-year, it's a bit of an offset. So I think that's the -- if you think about us going from 7% to 9% on a lower base to 7% to 9% on a higher base, basically, it's tougher to do, but some of the deferred tax impacts of tax reform provides that offset and leave us at comparably the same place.

Ashar Khan

Okay. And what base are you using? Can you just mention?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

End of '17.

Ashar Khan

End of '17. Do you...

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Right.

Ashar Khan

Okay. And then on the utility earning question?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

I think it's essentially what we referenced before. If we have incremental spend that Ralph referenced from both GSMP and Energy Strong and that was going to roll into the rate case, and we have rates that come in towards the end of the year, you would anticipate seeing maybe a little bit of a modest shave off of rate of growth. What comes in 2019, we'll end up giving you the details on it this time next year from the standpoint of total '19 earnings guidance.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So I guess that was our last question. Thank you, all. Dan and Kathleen will be on the road, hopefully, seeing many of you next week. Three of us will be on the road a couple of weeks after that. Maybe we'll see many of you then. One thing that's a little different this year, you may have noticed that we moved our analyst and investor conference to June. Please read nothing into that other than bad scheduling on my part that required some coordination of family calendars and business calendars. But nonetheless, I think we have some good things to talk to you about. And we'll know a lot more then about the New Jersey nuclear situation. We'll know a lot more about RPM, comments will be in the FERC from PJM and other folks. And so I think we have a lot of opportunities ahead of us in the next few months. With that, thank you for participating in the call, and we look forward to seeing you soon. Take care.

PSEG ANNOUNCES 2017 RESULTS

NET INCOME OF $3.10 PER SHARE

Non-GAAP Operating Earnings of $2.93 Per Share

Common Dividend Increased 4.7%

Non-GAAP 2018 Operating Earnings Guidance $3.00 - $3.20 Per Share

(February 23, 2018 – Newark, NJ) Public Service Enterprise Group (PSEG) reported 2017 Net Income of $1,574 million, or $3.10 per share, as compared to Net Income of $887 million, or $1.75 per share, for 2016. Non-GAAP Operating Earnings for the year 2017 were $1,488 million, or $2.93 per share, compared to $1,475 million, or $2.90 per share for 2016. Compared to 2016, Net Income for 2017 benefited from a revaluation of deferred tax liabilities associated with a reduction in the Federal corporate tax rate, lower reserves for leveraged lease impairments, and gains on Nuclear Decommissioning Trust (NDT) offset by higher expenses associated with the retirement of the Hudson and Mercer generating stations.

PSEG also reported Net Income for the fourth quarter of 2017 of $956 million, or $1.88 per share. This compares to a Net Loss of $98 million, or $0.19 per share, for the 2016 fourth quarter. Non-GAAP Operating Earnings for the fourth quarter of 2017 were $289 million, or $0.57 per share, compared to fourth quarter 2016 non-GAAP Operating Earnings of $279 million, or $0.54 per share. Net Income for the fourth quarter of 2017 reflects a revaluation of deferred tax liabilities associated with a reduction in the Federal corporate tax rate and NDT and Mark-to-Market activity. The Net Loss in the fourth quarter of 2016 reflects incremental depreciation expense and other expenses associated with the early retirement of the Hudson and Mercer generating stations in addition to NDT and Mark-to-Market activity.

“We ended 2017 on a strong note with operating earnings for the year above the mid-point of our guidance” said Ralph Izzo, Chairman, President and Chief Executive Officer. “Successful execution of PSE&G’s capital program and strong operations at PSEG Power contributed to our full year results. The successes of 2017 were the result of the outstanding effort of our dedicated workforce, and position us well as we seek to continue to execute on our strategy to provide long-term value to our shareholders by meeting the needs of our customers and the communities we serve. The recent action by the Board of Directors to increase the common dividend by 4.7% to the indicative annual rate of $1.80 per share is recognition of our financial strength and commitment to growth.”

The tables below provide a reconciliation of PSEG's Net Income to non-GAAP Operating Earnings for the full year and fourth quarter. See Attachment 11 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings.

PSEG CONSOLIDATED RESULTS (unaudited)
Full-Year Comparative Results
2017 and 2016

See Attachment 11

Ralph Izzo went on to say, "We enter 2018 from a position of financial strength aided by a strong balance sheet, continued execution of our strategic growth objectives and tax reform. For 2018, we forecast 6% growth in non-GAAP Operating Earnings at the mid-point of our guidance of $3.00 - $3.20 per share. This is possible, despite the challenges we continue to face in wholesale power markets especially at our nuclear plants, due to continued growth at PSE&G and a $0.16 per share benefit to the bottom line of our unregulated businesses from a reduction in the federal tax rate."

The following table outlines PSEG's 2017 non-GAAP Operating Earnings by subsidiary and expectations for 2018.

2018 Non-GAAP Operating Earnings Guidance and
2017 Non-GAAP Operating Earnings
($ millions, except EPS)

	2018E	2017A
PSE&G	$1,000 - $1,030	$963
PSEG Power	$485 - $560	$505
PSEG Enterprise/Other	$35 - $35	$20
Non-GAAP Operating Earnings	$1,520 - $1,625	$1,488
Non-GAAP EPS	$3.00 - $3.20	$2.93

E = Estimate A= Actual

Non-GAAP Operating Earnings Review and Outlook by Operating Subsidiary

See Attachments 5 and 6 for detail regarding the quarter-over-quarter and year-over-year reconciliations for each of PSEG's businesses.

PSE&G

PSE&G reported Net Income of $220 million ($0.43 per share) for the fourth quarter bringing full year Net Income to $973 million ($1.92 per share). Non-GAAP Operating Earnings for the fourth quarter of 2017 were $210 million ($0.41 per share) bringing non-GAAP Operating Earnings for the full year to $963 million ($1.90 per share). On a comparative basis, PSE&G reported Net Income of $193 million ($0.38 per share) and $889 million ($1.75 per share) for the fourth quarter and full year 2016, respectively.

PSE&G's Net Income in the fourth quarter reflects continued growth in earnings on its increased level of investment in Transmission and Distribution infrastructure.

Growth in PSE&G's investment in transmission improved quarter-over-quarter Net Income comparisons by $0.03 per share. Recovery of investment in gas distribution made under PSE&G's Energy Strong and Gas System Modernization Programs increased quarter-over-quarter Net Income by $0.01 per share. Colder than normal weather as compared to more normal weather conditions in the year-ago quarter improved Net Income by $0.01 per share. An increase in O&M expenses associated with preventative and corrective maintenance reduced quarter over quarter Net Income by $0.02 per share.

Electric sales, on a weather-normalized basis, declined 0.9% in the fourth quarter compared to the year-ago quarter as a decline in Residential and Industrial sales more than offset growth in Commercial sales. For the year, weather-normalized electric sales declined 0.4%. Weather-normalized gas sales for the quarter declined 1.0% as a reduction in sales to Residential customers was partially offset by growth in sales to Commercial and Industrial customers. For the year, growth in weather-normalized gas sales of 1.2% was led by growth from Commercial and Industrial customers.

PSE&G, in January 2018, filed a distribution base rate case as required by the NJ Board of Public Utilities (BPU) as a condition of approval in 2014 of its Energy Strong Program. The filing reflected an approximate one percent increase in revenues ($95 million) primarily to recover investments made to strengthen electric and gas distribution systems. In its filing, PSE&G requested that these rates take into account an approximate $130 million reduction in the revenue requirement as a result of the federal corporate income tax rate reduction from 35% to 21% provided in the Tax Cuts and Jobs Act (the Tax Act), a one-time credit for estimated excess income taxes collected between January 1, 2018 and the time the rates go into effect, and the flow back to customers of certain additional tax benefits. The filing will be updated to incorporate the full impact of the Tax Act including the potential impacts of a recent BPU order requiring utilities to reflect the reduction in the federal tax rate in bills effective April 1, 2018. PSE&G anticipates the new base rates will take effect in the fourth quarter of 2018.

In January 2018, PSE&G filed a revised 2018 Annual Transmission Formula Rate with the Federal Energy Regulatory Commission (FERC) reducing the 2018 transmission annual revenue requirement by $148 million to reflect the lower federal corporate income tax rate. Combined, the lower federal tax requirement reduces PSE&G's annual distribution and transmission revenue requirement by approximately $275 million.

PSE&G's $3.1 billion investment in 2017 to upgrade and expand its transmission and distribution system led to a 12.5% increase in rate base to $17 billion at year-end.

For the 16th year in a row, PSE&G's work to protect and strengthen the system yielded recognition as the most reliable electric utility in the Mid-Atlantic region.

PSE&G's Net Income for 2018 is forecasted at $1,000 million - $1,030 million.

PSEG Power

PSEG Power reported Net Income of $610 million ($1.20 per share) in the fourth quarter of 2017 versus a Net Loss of $302 million ($0.59 per share) for the fourth quarter of 2016. For the full year 2017, PSEG Power reported Net Income of $479 million ($0.94 per share) versus Net Income for the full year 2016 of $18 million ($0.04 per share).

PSEG Power reported non-GAAP Operating Earnings of $100 million ($0.20 per share) for the fourth quarter of 2017 and non-GAAP Adjusted EBITDA of $196 million bringing full year non-

GAAP Operating Earnings to $505 million ($1.00 per share) and non-GAAP Adjusted EBITDA to $1,172 million. On a comparative basis, PSEG Power reported non-GAAP Operating Earnings of $69 million ($0.13 per share) and non-GAAP Adjusted EBITDA of $155 million for the fourth quarter of 2016 and non-GAAP Operating Earnings of $514 million ($1.01 per share) and non-GAAP Adjusted EBITDA of $1,201 million for the full year 2016.

Power's fourth quarter Net Income includes a one-time, non-cash benefit of $588 million associated with a revaluation of deferred tax liabilities stemming from the reduction in the federal income tax rate to 21%. The company's fourth quarter results also reflect an improvement in margins.

An increase in capacity prices in New England and PJM improved quarterly Net Income comparisons by $0.02 per share. A 2% increase in generation output improved Net Income comparisons by $0.01 per share as higher gas send-out due to colder than normal weather improved quarterly Net Income comparisons by $0.01 per share. A decline in the average price received on energy hedges was partially offset by an increase in market prices on unhedged output resulting in a decline in quarter-over-quarter Net Income of $0.01 per share. A decline in O&M expense improved Net Income comparisons by $0.03 per share. A decline in depreciation, interest and taxes combined to improve fourth quarter Net Income comparisons by $0.01 per share.

Output from Power's generating facilities in the fourth quarter was 2% greater than output in the year-ago quarter. Quarterly comparisons were influenced by the timing of nuclear plant refueling outages and increased demand in response to colder than normal weather. For the year, based on results for the fourth quarter, output of 51 TWh was stronger than our forecast provided at the end of the third quarter, which called for full year output of 49 – 50 TWh. The nuclear fleet operated at an average capacity factor of 89.9% in the quarter, resulting in a full year capacity factor of 93.9%, and producing record electric output for the year of 31.8 TWh. Power's gas-fired CCGT fleet operated at an average capacity factor of ~40% in the quarter resulting in a full-year capacity factor of ~47% producing 13.6 TWh of electric energy for the year. For the quarter, output from the coal fleet declined slightly as the result of outage work at the Keystone station. For the full year, output from the coal fleet increased 12% to 5.3 TWh as an increase in gas prices improved its competitiveness.

Power is forecasting an improvement in output for 2018 to 55- 57 TWh. Following completion of the recent Basic Generation Service (BGS) auction in NJ, approximately 80% - 85% of production for the year is hedged at an average price of $40 per MWh. For 2019, Power has hedged 55% - 60% of forecast production of 59 – 61 TWh at an average price of $38 per MWh. Power is forecasting a further increase in output for 2020 to 63 – 65 TWh. Approximately 25% - 30% of Power's output in 2020 is hedged at an average price of $38 per MWh. The forecast of output for 2018 and 2019 has improved since our last forecast with an increase in spark spreads. The forecast for 2018 – 2020 includes generation associated with the mid-2018 commercial start-up of 1300 MWs of new, gas-fired combined cycle capacity at the Keys Energy Center in Maryland and Sewaren in New Jersey, and the mid-2019

commercial operation of the 485 MW gas-fired combined cycle generating unit in Bridgeport Harbor, Connecticut.

For 2018, non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA at PSEG Power are forecast to be $485 million - $560 million and $1,075 million - $1,180 million, respectively.

PSEG Enterprise/Other

PSEG Enterprise/Other reported Net Income for the fourth quarter of 2017 of $126 million ($0.25 per share) compared to Net Income of $11 million ($0.02 per share) for the fourth quarter of 2016. For the full year, PSEG Enterprise/Other reported Net Income of $122 million, ($0.24 per share) compared to a Net Loss in 2016 of $20 million ($0.04 per share). The results for 2017 include a one-time, non-cash earnings benefit of $147 million related to the reduction in the federal corporate income tax rate and a decrease in Energy Holdings' deferred tax liabilities partially offset by an after-tax charge taken earlier in the year related to on-going challenges facing NRG REMA, LLC. The results for 2016 reflect after-tax charges for lease-related impairments.

PSEG Enterprise/Other reported a non-GAAP operating loss in the fourth quarter 2017 of $21 million ($0.04 per share) compared to non-GAAP Operating Earnings of $17 million ($0.03 per share) in the year-ago quarter. The results for the fourth quarter brought PSEG Enterprise/Other non-GAAP Operating Earnings for the full year to $20 million ($0.03 per share) versus $72 million ($0.14 per share) in 2016.

The decline in non-GAAP Operating Earnings year-over-year reflects the impact of a $15 million after-tax contribution to the PSEG Foundation as well as certain tax items at the Parent and PSEG Energy Holdings in fourth quarter of 2017 and the absence of certain tax items that occurred in the fourth quarter of 2016 at Energy Holdings.

For 2018, non-GAAP Operating Earnings for PSEG Enterprise/Other are forecast to be $35 million.

###

About PSEG:

Public Service Enterprise Group (NYSE:PEG) is a publicly traded diversified energy company with annual revenue of $9.1 billion. Its operating subsidiaries are: Public Service Electric and Gas Company (PSE&G), PSEG Power LLC, and PSEG Long Island.

PSE&G is New Jersey's oldest and largest regulated gas and electric delivery utility, serving nearly three-quarters of the state's population. PSE&G is the winner of the ReliabilityOne Award for superior electric system reliability.

PSEG Power LLC is an independent power producer that generates and sells electricity in the PJM, New York and New England wholesale power markets.

Non-GAAP Financial Measures

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items such as the revaluation of deferred tax liabilities and the impact of the retirement of the Hudson and Mercer coal stations on Power.

Management believes the presentation of non-GAAP Adjusted EBITDA for Power is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization.

See Attachment 12 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA. The presentation of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995.

Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to recover the carrying amount of our long-lived assets and leveraged leases;
- an inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to recover the carrying amount of our long-lived assets and leveraged leases;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-13973

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization. The last three slides in this presentation (Slides A, B and C) include a list of items excluded from Net Income/(Loss) to reconcile to non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA with a reference to those slides included on each of the slides where the non-GAAP information appears.

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Management believes non-GAAP Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. The presentation of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

These materials and other financial releases can be found on the PSEG website at www.pseg.com, under the Investors tab. From time to time, PSEG, PSE&G and PSEG Power release important information via postings on their corporate website at http://investor.pseg.com. Investors and other interested parties are encouraged to visit the corporate website to review new postings. The "email alerts" link at http://investor.pseg.com may be used to enroll to receive automatic email alerts and/or really simple syndication (RSS) feeds regarding new postings at http://investor.pseg.com/rss.

SI-SSA-0015-13974

PSEG
2017 Q4 and Full Year Review

Ralph Izzo

Chairman, President and Chief Executive Officer

SI-SSA-0015-13975

PSEG – Exceeded mid-point of guidance in 2017, well positioned for 2018

- **Highlights**
  - ✓ Net Income of $1.88 vs. Net Loss of $(0.19) per share in Q4 2016; Net Income of $3.10 in 2017 vs. $1.75 per share in 2016 – Tax reform and early retirement of Hudson & Mercer influenced results
  - ✓ Non-GAAP Operating Earnings* results of $0.57 vs. $0.54 per share in Q4 2016; Full-year, non-GAAP Operating Earnings* of $2.93 vs. $2.90 per share in 2016 and 2017 guidance of $2.80 to $3.00 per share
  - ✓ PSE&G non-GAAP results up 8.6%, benefiting from increased investment in electric and gas T&D
  - ✓ PSEG Power results were at the top end of 2017 guidance, aided by cost control and improved nuclear performance

- **Operational Excellence**
  - ✓ Nuclear fleet capacity factor improved to 94%; Hope Creek attained 100% capacity factor & record output
  - ✓ PSE&G named most reliable Utility in the Mid-Atlantic region for the 16th year in a row

- **Disciplined Capital Investment**
  - ✓ PSE&G's investment program to upgrade transmission, replace cast-iron pipe and improve the resilience of electric distribution system totaled $3.1 billion in 2017; PSEG Power invested ~$1 billion constructing three new, highly efficient gas-fired CCGTs; Keys and Sewaren expected to be in-service mid-2018

- **Regulatory & Policy Focus**
  - ✓ Filed PSE&G NJ distribution base rate review seeking a modest 1% increase in revenue
  - ✓ PSE&G to return expected benefits of ~$275 million to customers related to lower tax rates plus returning excess deferred taxes
  - ✓ PSEG Power continues to work with key stakeholders in New Jersey on legislation supporting continued operation of nuclear capacity as part of a broader bill that aligns with the state's energy policy goals

* See Slides A, B and C for Items excluded from Net Income (Loss) to reconcile to Operating Earnings (non-GAAP).

PSEG 2017 - Executing on Regulatory and Policy Initiatives

NJ Distribution Base Rate Proceeding

- Filed NJ base rate review January 12, 2018

Long-Term Infrastructure Investment Platform

- In July, PSE&G filed for a 5-year, $2.7 billion extension of the Gas System Modernization Program (GSMP II)
- In October, the BPU approved $69 million of PSE&G's request to extend its investment in Energy Efficiency (EE)
- In December, the BPU finalized its rule on the Infrastructure Investment Program (IIP) providing for 5-year investment programs
- PSE&G preparing a multi-year filing for the extension of Energy Strong
- PSE&G developing a large, multi-year EE investment program to bring benefits to a broader group of customers

Preserving the Value of Nuclear Supply

- Advocating for legislative strategy to recognize the value of nuclear energy under terms and conditions that provide proper incentives for long-term operation

Ensuring Federal Regulatory and Policy Framework

- PJM continuing reform of Price Formation on several issues
- FERC focus on electric system resiliency ongoing through continuing dialogue with RTOs

PSE&G
2017 Q4 Review

PSE&G EPS Reconciliation – Q4 2017 versus Q4 2016

Continued investment in reliability and resiliency offset higher O&M

* See Slide B for Items excluded from Net Income to reconcile to non-GAAP Operating Earnings for PSE&G.

SI-SSA-0015-13988

PSE&G – Q4 & Full Year Weather Summary

Monthly Heating Degree Days (HDD)
Q4 2017 vs. Q4 2016 vs. Q4 Normal

Q4 2017 winter weather, as defined by heating degree days, was ~5% colder than Q4 2016 and on par with a Normal Q4

Winter Weather Summary (HHD)
FY 2017 vs. FY 2016 vs. FY Normal

FY 2017 Winter weather was similar to 2016 and ~6% warmer than Normal.

Summer Weather Summary (THI)
FY 2017 vs. FY 2016 vs. FY Normal

FY 2017 Summer weather was ~14% cooler than 2016 and 3% warmer than Normal

SI-SSA-0015-13989

PSE&G 2018 Distribution Rate Case Filing Summary

- **Dockets** ER 18010029 (Electric) and GR 18010030 (Gas)
- **Filed** January 12, 2018; **Anticipate new rates** Fourth Quarter 2018
- **Test year** – July 1, 2017 through June 30, 2018 (with certain pro forma adjustments)
- **Rate base** of $9.6B ($5.6B E; $4B G) as of December 31, 2018
- **ROE** request of 10.3%; **Capitalization structure** with 54% equity
- **Requested Increase:** ~1% relative to overall revenue
- **O&M and Sales** are roughly flat to last rate case eight years ago
- **Capital recovery** beyond clauses and $125M increase in Depreciation rate
- **Decoupling** of revenues from sales volumes
- **Taxes** – lower tax rate and flow back of deferred taxes to offset storm costs and reduce impact on customer bills
- **Pending updates:**
  - **Taxes** - BPU order to lower rates effective April 1 will accelerate savings planned in rate case; update for other tax impacts such as loss of bonus depreciation
  - **9x3 update** to be filed in May

Overall bill for the typical PSE&G residential customer, even after consideration of the ~1% request, would remain >15% lower than bills after last base rate case

SI-SSA-0015-13990

PSE&G – Q4 Highlights

Operations

- ✓ PSE&G named "Most Reliable Utility" in the Mid-Atlantic region by ReliabilityOne for 16th year in a row
- ✓ On a weather normalized basis, total electric sales were down (0.4%) for the year, as declines in Residential and Industrial sales more than offset growth in the Commercial segment
- ✓ Gas sales, adjusted for weather, were up 1.2%, led by the Commercial and Industrial segments

Regulatory and Market Environment

- ✓ PSE&G filed its distribution base rate case in mid-January
- ✓ BPU finalized rules related to the Infrastructure Investment Program (IIP) in December
- ✓ 2018 FERC transmission formula rates placed into effect January 1 were adjusted lower by $148 million to reflect benefits of tax reform; PSE&G anticipates returning $130 million to distribution customers resulting in a total of ~$275 million to be returned to customers related to tax reform
- ✓ Residential gas customers receiving BGSS bill credits totaling ~$100 million during Winter 2017-18
- ✓ Anticipate filing an Energy Strong extension and a sizable Clean Energy program during 2018

Financial

- ✓ PSE&G 2018 non-GAAP Operating Earnings guidance range is $1,000 - $1,030 million, a 5% increase over 2017 results of $963 million
- ✓ PSE&G invested $3.1 billion in 2017 capital expenditures to upgrade, expand and enhance the reliability and resiliency of the electric and gas T&D system
- ✓ Consolidated rate base grew by 12.5% to $17 billion

Total Nuclear Total Coal** Natural Gas

* Excludes solar and Kalaeloa. ** Includes figures for Pumped Storage.

SI-SSA-0015-13995

PSEG Power – Gross Margin Performance

- ✓ Market prices improved across PJM, NE and NY
- ✓ Capacity revenues step up June 2017 through May 2018

Regional Performance		
Region	**Q4 Gross Margin ($M)**	**Q4 2017 Performance**
PJM	$414	Higher market prices and generation output
New England	$27	Higher prices
New York	$13	Higher prices

SI-SSA-0015-13996

NJ Basic Generation Service (BGS) 2018 Auction Results

Increase in Full Requirements Component Due to:

Growing Renewable Energy/Transmission
Component for Market Risk
Offset by Decline in Energy and Capacity Prices

The BGS auction is a critical component of Power's annual hedging strategy, accounting for ~ 10 TWh

Note: BGS prices are quoted in $/MWh and reflect PSE&G Zone; results from the 2016-2018 auctions will be the new blended prices beginning June 1, 2018.

SI-SSA-0015-13997

Hedging Update – Reflects recent BGS auction

Contracted Energy*

		2018	2019	2020
Base Load (Nuclear and Base Load Coal)	Volume TWh	35	34	35
	% Hedged	100%	95-100%	50-55%
	Price $/MWh	$40	$38	$38
Intermediate, Combined Cycle, Peaking	Volume TWh	20-22	25-27	28-30
	% Hedged	50-60%	10-15%	0%
	Price $/MWh	$40	$38	-
Total	Volume TWh	55-57	59-61	63-65
	% Hedged	80-85%	55-60%	25-30%
	Price $/MWh	$40	$38	$38

* HEDGE PERCENTAGES AND PRICES AS OF FEBRUARY 7, 2018 AND REFLECT REVENUES OF FULL REQUIREMENT LOAD DEALS BASED ON CONTRACT PRICE, INCLUDING RENEWABLE ENERGY CREDITS, ANCILLARY, AND TRANSMISSION COMPONENTS BUT EXCLUDING CAPACITY. HEDGES INCLUDE POSITIONS WITH MTM ACCOUNTING TREATMENT AND OPTIONS.

PSEG Power – Q4 Highlights

Operations

- ✓ Q4 output up 2% on higher nuclear production and higher energy prices; full-year 2017 generation of 51 TWh exceeded projected output of 49-50 TWh
- ✓ Nuclear fleet's average capacity factor was ~90% in Q4, producing 7.7 TWh of energy; Full-year 2017 capacity factor was ~94%, producing an all-time peak output of 31.8 TWh; Hope Creek achieved a 100% capacity factor for 2017
- ✓ CCGT fleet capacity factor was ~47% for the year, reflecting lower NJ market demand
- ✓ Coal production was up 12% for the full year, as competitiveness improved with higher gas prices

Regulatory and Market Environment

- ✓ NJ Legislature continues to evaluate supportive action to preserve nuclear's economic viability
- ✓ PJM price formation reform discussions continue on multiple issues
- ✓ BGS load for 2018 projected at 10 TWh; Recent BGS auction set a $91.77/MWh price for the PS Zone
- ✓ Keys Energy Center and Sewaren 7 targeted for mid-2018 in-service; Bridgeport Harbor 5 targeted for mid-2019 in-service

Financial

- ✓ Power invested $1,040 million in 2017 on construction projects at Keys, Sewaren 7 & Bridgeport Harbor 5
- ✓ Power's total debt as a percentage of capitalization at December 31 was 29%
- ✓ Power increased its ARO liability by $276 million to reflect increased risk of nuclear plant closure
- ✓ Power's 2018 non-GAAP Operating Earnings guidance range is $485 - $560 million; non-GAAP Adjusted EBITDA guidance for 2018 is $1,075 to $1,180 million

PSEG

Tax Cuts and Jobs Act: PSEG well positioned

Positive non-utility contribution to earnings, strong balance sheet maintained and lower customer bills mitigate the impact of T&D investment

Federal Tax Reform	PSE&G	PSEG Power	Enterprise/Other
Reduction of Corporate Tax Rate to 21%	Customer rates lowered with reduction in tax rate Return of excess deferred tax liability – impact on cash and rate base growth dependent on payback period Estimated excess deferred tax balance of $2.1 Billion at YE 2017	After-tax earnings and cash flow increase One-time, non-cash earnings benefit from reduction in deferred tax liability reflected in 2017 GAAP results: $588 Million	After-tax earnings and cash flow increase One-time, non-cash earnings benefit from reduction in deferred tax liability reflected in 2017 GAAP results: $147 Million
Expensing of Capital Expenditures	Bonus depreciation eliminated post 2017 Rate base growth increases by ~1%/year through 2022 relative to prior tax rules	100% expensing -- cash flow increases	
Interest Disallowance Rule 30% Limitation Based on Tax – EBITDA	Not applicable	Well positioned given low debt balance	Well positioned given low debt balance

Our estimates and analysis are preliminary. The SEC has provided companies one year to finalize 2017 accounting requirements. Further adjustments in 2018 may be required.

SI-SSA-0015-14002

PSEG Financial Highlights

- Initiating 2018 non-GAAP Operating Earnings guidance of $3.00 - $3.20 per share
- PSE&G's return of tax benefits reduces the customer bill
- PSEG's 5-Year capital spending forecast of $13 - $15 billion over the 2018 – 2022 period mainly directed at PSE&G capital program
- PSE&G capital spend forecast of $11.5 - $13.2 billion (GSMP II, Transmission, upcoming filings for Energy Strong and Clean Energy, as well as benefits from tax reform) supports its five-year, 7 - 9% annual growth in rate base over 2018 - 2022
- PSEG Power's capital program, including completion of new generation, will improve fleet efficiency and geographic diversity
- Increased 2018 indicative common dividend by 4.7% to $1.80 per share
- Financial position remains strong:
  - ✓PSEG is a net beneficiary from the Tax Act
  - ✓Cash from Power and increasing cash flow from operations at PSE&G supports dividend growth and funds capital spending program without the need to issue equity
  - ✓Debt as a percentage of capitalization was 50% at December 31

PSEG Liquidity as of December 31, 2017

presentation
Kathleen Lally - Good morning. It's nice of you all to be here with us at the New York Stock Exchange on this very cold winter morning.

I'm Kathleen Lally, Vice President of Investor Relations for Public Service Enterprise Group, and I welcome you here with us at the Stock Exchange, or listening to us via webcast. We have, as normal, a very full morning prepared for you.

We intend to start with Ralph Izzo, Chairman, President, and Chief Executive Officer of The Company, who will provide the review of The Company strategy. Ralph would be followed by Tamara Linde, Executive Vice President and General Counsel, who will review our regulatory and policy initiatives that we'll focus on for the next 12-plus months.

And then Tammy will be followed by Ralph LaRossa, President and Chief Operating Officer for Public Service Electric and Gas. Following Ralph LaRossa's presentation, there will be time for you to question he and Tammy on the utility-related matters, both capital and regulatory issues.

After that Q&A, we'll take a short break; and then following the break, Bill Levis, President and Chief Operating Officer of PSEG Power, will present to you the power company where it stands today. There will be Q&A following Bill's presentation. He will be accompanied by Shahid Malik, President of Energy Resources and Trade.

Following that Q&A, Dan Cregg will conclude the conference with a very full review of The Company's financial position and outlook. Following Dan's presentation, there'll be ample time for Q&A with him and Ralph Izzo, and of course, any other subjects that may come to mind throughout the day.

With that, I'm going to turn it over to Ralph Izzo.

Ralph Izzo - Thanks, Kathleen. Thanks everyone for joining us today. If you haven't had a chance, the Stock Exchange has done a wonderful job of putting out some memorabilia and interesting documents from our 100-plus year history, so I encourage you to have a look at that.

Our forward looking statement is as usual; we will be making some projections for you today, about three or five and in some cases on longer daily projections. We will be sharing with you both GAAP numbers as well as some non-GAAP operating earning numbers and few other statistics that we think are quite representative of The Company's future financial prospects.

Kathleen already went through the agenda for you. It is flexible. We're here to answer your questions and to provide you with as much info as we can and feel appropriate.

So the Company's strategy has not changed. For those of you who have been with us before are familiar with these slides. It all begins with PSEG, with operational excellence. It's the foundation of everything we do, without which, we don't think anything else will follow.

Based upon that operational excellence, whether it's at our nuclear plants, our call centers or our accounting department, we pride ourselves on the opportunity to build a financially strong company and we view as good stewards of that financial strength in the way in which we go ahead and invest.

The results hopefully speak for themselves, 10 years of double-digit growth rate at the utility, 15% for the last five years, compound annual growth; a complete shift in power-generating fleet that we'll talk a little bit more about; 13 or at least 14 years growing the common dividend, each year for over 100 years and still in possession of strong credit metrics and the ability to fund the growth of the business without the need for new equity.

Some of the highlights that we'll be sharing with you today, the utility capital program continues to grow. We'll talk about a $12 billion to $14 billion capital program today. And we'll also talk about progress that power is having in terms of its construction

program, which should come to an end in the middle of 2018 and power will then resume its very, very strong free cash flow position and support from the equity needs of the utility.

You'll see that the CapEx ratio between the utility and power is now 5 to 1. Typically, it'd be more of the 3 or 4 to 1 ratio and the five-year program as we look ahead shows a heavy skewing towards the regulated entity and important investments that we're making to serve the needs of customers.

I know you don't want us to dwell on the past, but if you'll just indulge me for a moment, we worked pretty hard so I'd like to give the team credit for some of the outcomes they have achieved.

I won't read every one of these items. But if you look back over the past five years, we've had some enormous successes from major construction programs in our transmission department; projects delivered on budget, on time with the cooperation of the community. The timing of that is perfect. You can even see some of the construction.

Actually, is that picture behind me – no, I'm looking at the screen behind me that's showing a major installation. You'll see a helicopter of our Susquehanna Roseland across Central New Jersey. It's really great that I can see it and you can't. I'm not quite sure why we're doing that, but that's fine.

Then you'll see a range of improvements of power from primarily upgrades to more recent announcements of brand new construction, repowering of existing sites and one greenfield site in the Keys area, and, of course, the never-ending day-to-day victories that results in customer satisfaction scores improving, both in Long Island and in New Jersey.

So rather than dwell too long on the past, let's talk a little bit about the present and the future in terms of those parameters that I laid out in the first slide. We continue to get the accolades for our reliability measures. We're watching PSEG Long Island move up in J.D. Power from the customer SAT scores.

Our operations on our Fossil fleet which have become so critically important just given the gas prices are better than they have ever been before. Hopefully, you will agree that we tell you what we're going to do and then we do it and probably the best example of that is the 10 consecutive years of either realizing within guidance or beating our initial guidance.

The cash flows remain strong on both companies. The credit metrics are robust. We just hit another 4.9% growth on the dividend. You'll see that we'll talk about the utility rate base growth as a baseline that we expect to be 7%, more likely to be closer to 9%, for the next five years and then beyond. We'll talk some more about that.

There's some potential to do even more just given the strength of the balance sheet and some dry powder that remains.

So here on the left side, we are showing you our GAAP earnings; and on the right, our non-GAAP operating earnings.

The difference between the two, in four out of the five years is simply mark-to-market accounting as well as our Nuclear Decommissioning Trust, the fifth year is the one year with us in additional item in the GAAP that is not in the non-GAAP and that's the removal in the non-GAAP of the expenses associated with the early retirement of our two New Jersey coal and gas -- or duel fueled coal and gas, plants that we referred to as Hudson and Mercer.

There's also a component of a writedown for the residual value of the lease that we own with REMA, a subsidiary of GenOn, a subsidiary of NRG.

In general, we do not like to remove items from our GAAP earnings when we put out operating earnings and we've had a pretty consistent track record of only removing the NVP and the mark-to-market accounting. But this time we thought it was not indicative of the future earnings prospects of The Company to keep the Hudson and Mercer retirement and accelerated depreciation in there.

If I then compare our non-GAAP operating earnings to the dividend growth, you'll see that we are -- this is not formulaic. So, the little tilde, the scribbly line in front of the four is intended to demonstrate that we're looking at lockstep that if earnings grow at 4.2%, then the dividend would grow at 4.2%. They are roughly in balance in terms of how these two are moving and we continue to maintain that we have the opportunity for consistent and sustainable growth in that dividend. We're quite confident of that.

While the top line for the Company is showing this 4-percentage growth for the past five years, what's probably equally, if not more important, to the way in which we view the financial stability of the Company is what's going on below the parent.

Here you could see that over the past five years, we've experienced quite a shift between the utility's contribution and power's contribution. In fact, if we were to take this slide back to 2008, I think that ratio would be more like 75/25. If you just do the arithmetic, take 43% of $2.44 and 66% of $2.90, just using the mid-point, you'll see the 15% CAGR that I referred to a moment ago in terms of PSE&G.

And throughout this period, power is just a tremendous cash generator and as I have said, meets the utility equity needs over that period of time.

So a lot of this is familiar stuff to you, I am going to slow down now a bit as we talk about the utility capital program. Ralph will give you far more detail in terms of what we will be doing and where we will be doing it, and Dan will put it all together from a financial point of view.

But I want to spend some time with you talking about it from the point of view of how long can this go on? What is it that we will help everyone in this room feel that the one and only gating function to the needs of the utility are respect for the customer bill. That we are not in a situation where our growth is driven by customer -- new customer demands and new customer growth patterns.

They are driven by new customer needs and those needs are for a level of reliability and resiliency that we haven't seen before. Those needs are reflected in an ageing infrastructure that has really done a great job for 100 years, but can't continue to do that job as we look out the next 10 or 15 years and they are driven by public policy decisions that we choose to be supportive of to help people.

The slide that you see here is one that we have shown, I got to believe, for 10 or 11 years. I'm glanced at Kathleen and that's probably right. I know we've been showing it for quite a bit of time. We started out with the slide here thinking that folks would appreciate seeing the line.

The line reflects what we thought the capital program would be, last year when we were standing in front of you, and how we thought it was going to grow in the five-year period from last year which therefore gives you the four years shown here.

Invariably, we would come back the next year and show you the five-year projection using this stacked bar, and the bars would exceed the line which meant the capital program was growing. I think folks recognize that it is a little tough to predict the future and that future is even tougher when it's five years out versus when it is five months out.

But consistently, we would get the question, the drop-off that you see, will that continue? Is it all going away? That question would usually surface around transmission because it was in the area of new and rapid growth.

So this year, once again, we have baseline spending that exceeds what we saw it would have last year. Baseline spending is stuff that's already approved or we have very, very strong feedback from the Board of Public Utilities that a program has a long way to go and can be extended at its current rate, I don't have approval for it yet, but a high degree of confidence.

So then we try to explain that the reason why we have these drop-off -- so this is the slide we introduced, I think, two years ago, so we're showing it three years in a row we're showing we look out five years, we don't get it right. But what tends to happen is that needs don't go away. We recognize additional needs as we get closer to the five years -- to that five-year point.

So here we are showing you in 2013, we thought the capital program for the utility would be about $1 billion. Now we didn't really think it's going to be $1 billion, but that's what we knew at that time.

Then in 2014 we thought it's going to be about $2 billion. In 2015, I don't know, Ralph LaRossa must be on vacation for a while. We thought it's going to be $2.1 billion. Then in 2017, we thought -- I don't know -- we've got some things that we need to do. It's $2.6 billion. It turned out this year, it's going to be closer to $3.4 billion, Okay, so a tripling of the capital program from the first time we mentioned it to you.

So what we realized needs to be done today, the important thing that needs to be done to meet those customer needs and the public policy needs that we talked about before, so nobody is replacing meters that work just fine. These are investments that are critical for customer satisfaction and reliability.

Now I don't want to suggest that every time we show you a number, that three years from now it's going to triple, but the trend is a very consistent with one in which they increase.

So that's the slide that we have been showing for a couple of years. Then last year, because people kept saying, "Well, is that what you think is likely to happen for the next three years or four years? Is there room for anything else?" So we started showing you things that were in progress, that we have a high degree of confidence in.

As you may recall, last year we talked about 8% to 10% rate base growth. Now, we obviously have a larger base, so we're talking this year about a 7% to 9% rate base growth. Here what we showed last year, what we're repeating now are those programs that we believe have a very high probability of being approved by the Board of Public Utilities as we introduce them.

Why do we believe that? Because they are either extensions of existing programs or expansions of existing programs. What's the difference between extension and expansion? Extension just means doing more of the same, but doing it for longer periods of time. Expansion is doing more of the same, but do 30% more of it.

So a good example of that is on the prior slide, I showed our Gas System Modernization Program, assuming it will continue at $330 million a year run rate. The team has done a fabulous job of managing the work. We now believe we can increase that number. Ralph will talk more about what that increase looks like.

So if you put these grey crosshatch components on the last three bars, because more than likely we would file for some of these late in 2017. It takes six to 12 months for the BPU to work on it because they have other things that they need to work on besides PSEG, and then by the time we get the engineering work done and the construction crew is underway, we figured it will have more of an effect in 2019 and beyond. Then we can achieve this 9% CAGR and we feel once again quite confident that that is an achievable number.

So that's the slide you've seen two years in a row in terms of what do we know and that do we have a high degree of confidence. So in trying to feed your insatiable appetite for never-ending predictions of the future, what we're adding this year is stuff that is not

baseline, not high degree of confidence, but it's on the drawing board. Ralph will go into details to what are some of these items. I'll mention a few of them right now and again later on.

But because we've had to spend so much time doing things like making sure the transmission system can handle a new merchant generation paradigm in PJM, because we've had to spend so much time improving our low-lying areas given the demographics of our service area are an old style, quite candidly industrial geography, we have been more involved in infrastructure replacement.

And the rest of the country has done other things like AMI, modernizing transportation for compressed natural gas, electric vehicles. We haven't participated in that part of kind of Utility of the Future, so we are now beginning to turn our attention to some of those investment opportunities, and that in combination with as you know what is a 30-year run time for our gas system modernization, what we'll cut back 30 years once we are able to engage the regulators to realize that we can do more than that level of work during the year.

That leads us to believe that over the next years, we have the opportunity to continue that growth rate in the utility. A negating function that I mentioned before is the customer bill and we continue, at times, to surprise even ourselves, last October, 7% reduction in the supply portion of the customer bill.

This January and February, we took a $15 a month bill credit. I'm not a 100% sure of that number, I think that was about it. This June, about 2.7% decrease in the customers' electric bill because of BGS results. So you could see over the past few years, I guess that's right around 2009, we lowered customer bills 28%.

Now they are combination customers and we're taking the advantages of the low gas prices and the reduction in the gas bill to primarily fund the construction program in the electric side. But nonetheless, we think that that is something that makes enormous sense to do. Fortunately, our regulators are enlightened to a point where they realize that in a low-interest rate environment with declining bills, if you don't start replacing an aging infrastructure now, you never will.

We have another charge expiring from the bill in April of this year. It's a modest charge. It's a leftover from once again I think is a peripheral charge or a tax charge from when we deregulated, we did at the BGS rate, resulting in a reduction in electric bills in June and we do have these credits that will continue to flow to the customers on the gas bills.

So, we still have additional headroom that we're creating and can allow us to support the construction program and base growth I alluded to a moment ago.

Let's take a minute now to turn our attention to power. It's a different story here, right? So power is probably solidly midway through its construction program. Bill will talk about that. It pretty much winds down in the middle of next year, and once that is

finished, we are going to see a very different supply stack and output that comes from PSEG Power.

At the bottom of this chart, what we're showing here is power today. The left side is power from a nameplate capacity point of view, and the right side is power from the point of view of energy produced and it shouldn't come as any surprise, that power produces a disproportionately large amount of output from its nuclear plants compared to its coal plants or its oil-fired plants. So, you'll see the 32% nuclear from a nameplate point of view grows to 57% nuclear from an energy point of view.

But look at what happens to power as we go from 2016 to 2021 and this is based on current forwards. We've been built on our fundamental model beyond the three-year period where our forwards are not as visible. We don't say the market has got it all along. We simply say we can't outguess the market.

Based upon the efficiency of the commodity cycle units we would be building, you'll see about 15% to 18% growth in the number of megawatts being produced and you'll see a shift from the nuclear output to natural gas. It's not because the nuclear plants which are on 90% capacity factors are expected to cycle, but it's just because we have more combined-cycle gas turbines in the fleet at that point, with an average heat rate of I think, about 7,100 Btu per kWh just for the combined cycles.

Now we had some conversations with the press a week or so on nuclear that has created a little bit of interest in the subject. There's probably nothing more important to me in my presentation today in terms of making sure that we get the facts clear and straight about our nuclear plants.

First of all, at the national level, I doubt that I need to remind yourselves plants have closed, some for economic reasons just in the face of operating conditions, others were combination of capital investment reasons that's in the face of economic conditions that makes sense to go forward, and different responses have occurred in policy circles.

There are a couple of cases in Illinois and New York, the states intervened and said, "No, these plants are too important for a variety of reasons." In the states, there were no interventions, whether that was Vermont, Massachusetts, Wisconsin and other places.

PJM is in the process of a study they called Grid 2020. I believe it's due to be completed late this month, if not early next month for at least the draft. They are looking at some things that are important for those of us who take very seriously the obligation to keep the lights on, but that the market may not recognize things like fuel diversity and reliability of operations and service, not from a point of view of a single power plant, but from the point of view of the system.

Can fuel be supplied in winter in the face of a significant event on the pipeline?

Now in New Jersey, some of the challenges that others have experienced, we do not have to face so we don't have a sustainable wind resource, and the negative dispatch price that occurs sometimes as a result of the production tax credit. We don't have space for huge solar installations. Our solar utility, grid-connected projects are 5 and 7 megawatts, not 200 and 300 megawatts.

We do have Renewable Portfolio Standards and there are subsidy exchanges that virtually guarantees the capital recovery of solar, which does result in solar of being able to bid and be a pure price taker on energy markets. And we do have our number one threat which is the proximity to Marcellus gas.

As we look at our current nuclear plants, even with the benefit of hedges in place, those plants are not earning what we believe to be their cost of capital. They are cash flow positive. So we are not trying to be alarmers, but we will not operate those plants over the long term if they are not earning their cost of capital.

I've told people many times that is a very painful thing to say because I believe the nation should care about nuclear plants and we care about nuclear plants. And equally important, we care about the 1,600 employees and their families down there. While it's a painful thing to say, it's not a difficult thing to say. The numbers are what the numbers are. We understand our responsibility to earn our cost of capital and we will, plain and simple.

As those hedges roll off and we give you our hedge profile. Yes, we do blend nuclear with Keystone and Conemaugh but you can pretty easily back the numbers out. If we have to replace those hedges with what the current forward price predicts, those plants will go cash flow negative. That is a much more serious situation.

We are simply having a discussion with regulators and policymakers at the federal level at PJM and in the state just to tell them that we will not allow ourselves to operate plants from those conditions. So that may not happen; hopefully it doesn't happen.

Bill Levis is leading the national effort to deliver on a nuclear promise to reduce our cost. I have no idea what RPM is going to do in two months that can help the situation, so there are things that can and will change over time to make the situation better or worse.

The only message I want to leave you today is we are not saber-rattling. We are not bluffing. We are not trying to be alarmers. Just believe me when I say that we fully respect the need to be good stewards of your capital. As much as we think these assets are critically important to the nation and to our company, if they are not economically wise to continue to operate, we won't operate them. And right now, the forward price says they should not be operated past the three-year period.

As we look to growth in utility and in power this year, if you look at the midpoint of our non-GAAP operating earnings, utility is two-thirds of the entity and power is one-third. Power is about 32%, Long Island contributes about 1% -- about 2% of the earnings.

You can see on the next five years, we have this $14 billion growth program at the utility which would give us a 9% rate base growth rate. And power's total capital program is $2.6 billion which would yield 18% growth in the number of gigawatt hours that it produces.

You could see the ratio of the utility growth to power growth is now closer to 5 to 1 than the historic 3 to 1 that we've operated over the past five years.

If I look at the utility back in time, that 13% rate base growth that we saw in the past five years is mostly driven by transmission expansion and our energy strong program which was all about storm hardening. You may recall that in Energy Strong, we only were granted one-third of the dollars we believe we needed to simply take care of the damage that had occurred in Hurricane Irene and Super Storm Sandy.

So we weren't even saying, "Gee, let's apply those lessons to the broader infrastructure." We know for a fact we have some low-lying assets here and they need to get our attention and we only received one-third of what we thought we needed to fix that.

In the near term, we'll continue primarily on an aging infrastructure set of investments. But as we look through longer term, there are some lessons we learned from what's going on in other places in the country.

In fact, what is anticipated and is clearly articulated in New Jersey's own Energy Master Plan and in terms of technologies and installations of those technologies, that the marketplace simply is not going to bring to bear. We believe we can make a very strong and credible arguments that the utility has an important role to play on that.

So the awards kept rolling in. I'm going to read every one of these in detail to you so that -- we couldn't fit them all in the page. I asked people to make it a collage. They said, "No, then you can't read it." So I said I'll just stall on this page for a few minutes and let folks realize that we're quite proud of the recognition we receive from others.

So the stability of the platform remains. There is this robust pipeline in terms of the utility growth in particular, we've looked at the power investments that we proposed to make -- and are making. They still look like very smart investments to us based upon the current forward price curve and our fundamental model going forward. That's a function both of the location of the assets and the hardware that already existed on the sites.

I think we have delivered what we promised from the point of view of customer satisfaction and the outcomes from these utility investments.

Power, as I mentioned before, is going from something that was largely nuclear driven to one that now has a significant component coming from a highly efficient combined-cycle suite, where there's tremendous decrease in the amount of power coming from coal with

the retirement of Hudson and Mercer this year, the retirement of Bridgeport Harbor in 2021. We will simply be a partial owner of the Keystone and Conemaugh facilities.

We're going to continue to focus on the sustainability of these returns, strong returns that exceed the cost of capital and a balance sheet that allows us the flexibility to do more of the same or some different things if policy makes us -- gives us the opportunity to do so, supporting the dividend on sustainable basis and not needing any additional equity.

So given the fact that we have some interesting regulatory issues in front of us, in particular, one thing I did not mention but I'm sure you want to know more about it is our base rate case that we have known about for three years now, that we all have to file in November of this year.

We're doing something a little bit different. Rather than stand up here and have several speakers to tell you about the fact that we don't outguess the forward price curve and the market is what the market is. We're going to have Tammy Linde, our general counsel, come up and speak to you a bit about what is happening in the regulatory world both in New Jersey and at FERC and how it pertains to our rate case, some of our infrastructure plans in nuclear considerations. And then I'll be back later on with Dan to answer any questions you might have.

Tamara Linde - Good morning. It's a pleasure to be here this morning. Ralph and Kathleen both invited me to join the discussion today and provide an update on some of our key regulatory and policy matters, and also to share my perspective on where we're heading on some of those matters.

Let me turn to the agenda, as you can see, I'm planning on covering quite a variety of topics. I will, as Ralph indicated, focus on where we are as far as planning for our 2017 base distribution rate case. I'll also talk to you about regulatory reform and the opportunity that brings and has brought to us to invest in our distribution system on the electric and gas side as well as Utility of the Future-type program.

I will talk about where we are on the early stage of the process of having policymakers and regulators understand the importance of nuclear plants and valuing their attributes appropriately. Then I'll also focus on the broader wholesale market and some key initiatives that are underway at FERC and at PJM.

Let me start first with the New Jersey regulatory environment. PSE&G has a long history of good regulatory relationship with the New Jersey of Public Utilities. I have personally worked with the board for most of my 26 years at The Company and the relationship has been and continues to be very strong, and that has translated into very good, reasonable and fair outcomes in rate proceedings.

As you can see here, we highlighted the multi-year rate programs that we've received approval from the New Jersey Board of Public Utilities starting at about the 2008 timeframe, and it has actually been 15 multi-year rate approvals that we have worked

closely with the state, identifying the types of investments and programs that align with state policy goals that are good for our customers.

These programs have received approvals in advance of the investment and have provided for near contemporaneous recovery of these investments. These have covered a variety of important state policy matters, including investment in our electric and gas distribution system as well as programs to help the environment renewables and help customers use energy more efficiently on the Energy Efficiency side.

From a PSE&G perspective, these programs have allowed investments that help our customers, helps us provide good service to our customers. This has allowed Ralph LaRossa and his team to accelerate replacement of older cast iron and bare steel pipes that are throughout our service territory.

It has also allowed us to invest in what we referred as Utility of the Future-type investments, community solar investments, where we have installed, for example, solar, everything from pole tops along our distribution -- in our distribution system to large landfill and ground-fill sites in our service territory; as well as building resiliency into our grid and preparing the system for future storms and preparing our customers to use their energy wisely.

The programs I think are of note because each one of these is almost like a mini rate case, each one involves preparing a proposal with the state and working through whether that type of investment is appropriate, whether the state has an interest in it and agreeing to the terms and conditions that will govern that particular set of investments in that program.

It also involves going back to the BPU periodically after those investments have been made and reviewing the spend and reviewing how we have implemented those programs to allow the recovery of the terms that were agreed to. All of these programs were done outside of a traditional base rate proceeding.

I also want to note that during this timeframe, PSE&G did have a base rate proceeding that was filed in 2009 and settled in 2010, and that was separate and apart from these programs.

Let me turn to our next distribution base rate case. As Ralph indicated, we will be filing our next distribution base rate case with the New Jersey Board of Public Utilities no later than November 1st of this year. That is the result of a commitment we made as part of the settlement of Energy Strong, one of the programs that I referred to on the last slide.

It has been eight years since we filed our last base rate case. But as you noted, we've been -- in the last slide, we have been with BPU working on a variety of rate matters for that entire eight-year period so our team is ready. We have the relationships. We have the skills. I believe that we are well positioned to prepare a rate case and present one that supports all of the terms that are required for PSE&G.

Preparation of that case is well underway. We have -- I've been working on the case for some time period and we have not finalized all of the terms and conditions that we plan to provide and ask the BPU for approval for, but we are well underway in deciding exactly what that case would look like

What will that case look like? Well, I think it's most important to say that a base rate case is very much about updating the data. It is generally a historic-looking-type case, looking at what has already happened since the last rate case and updating a variety of information, everything from the low growth that was predicted in the last rate case, where we are today as far as sales of our product and that goes into creating the volumetric charge, where are we as far as O&M spending since the last base rate case.

It also covers a variety of other topics including in-base rates, the investment in our distribution system that has been made since the last rate case and that's not already been recovered somewhere else. So, for example, the traditional spend that we make on a day-to-day basis that Ralph referred to, since our last base rate case, that spend has been accumulating to and will be included in this case.

This does not include the type of spending that we have, for example, on transmission. This does not include the spending that we have been making on clause recovery mechanism on solar or Energy Efficiency or other things that are already in our base rate case.

We do also plan to attain recovery of the cost that we have incurred for storms, storm damage as well as responding to storms. As you most likely know, the BPU has a mechanism to allow utilities to defer cost incurred during major storms and then to obtain recovery of those storm costs in a future rate case.

We also see opportunity to update and change our rate design, update or capital structure, update our depreciation schedules. Also, we are considering other options, including pursuing to de-coupling that would be incorporated into our rate design to allow our rates to adopt to changes in load going forward.

All of these efforts in our rate case is focused on ensuring that our rates reflect the cost that it takes to serve our customers and it aligns with cost allocation principles.

As far as timing, we anticipate that the rate case outcome will result in new rate going into effect in the end of 2018 or the beginning of 2019. I do anticipate that we our planning will support a modest increase on our base distribution rate.

Let me turn to this rate schedule. This provides a picture of the timeline and activities in a traditional New Jersey distribution rate proceedings. As you note, the rate filing starts and then there is a lot of activities back and forth as far as the regulators and other parties trying to understand our request.

This schedule provides for what a fully-litigated case in the New Jersey regulatory environment would look like, starting, for example, in November of this year and ending at the end of 2018 or the beginning of 2019. It is our experience that many New Jersey rate cases settle. We don't go into a rate case anticipating that it will settle. We plan our rate cases assuming that it will go through the entire length of the case and we just think that's good planning.

We make a decision on whether to settle based upon the facts and the circumstances that we have at that time during the case. I should also note that even if we take the course that is described in this schedule, this takes us all the way to the end of a fully-litigated case. There's always opportunity to settle all the way up until the very end of the case and we will take those into consideration and settle if appropriate or proceed to a fully-litigated outcome if appropriate in our customers and in our best interest.

At the same time, we are preparing for our base distribution case, we are also working on filings to be submitted to the Board of Public Utilities on future investment programs. For examples, this past Friday, we submitted to the BPU a request to extend our Energy Efficiency Program.

There will be other filings that I would anticipate over the 2017 calendar year and during the rate case potentially that will seek approval of additional utility investment programs, much like the multi-year investment program that I referred on the earlier slide.

This theme of those multi-year programs approved, one would certainly be reasonable in concluding that the process has been working well and have continued to allow us to make the investment that helps our customers and help us meet our customer needs. But we do think that there's opportunity for improvement.

Many of these programs have had very limited timeframes. The 15 programs, for the most part, have a limited duration of about three years. There's some exception to that where the BPU allowed us to go beyond the three years. But for the most part, these programs have allowed -- provided for pre-approval as investments to be made over a three-year period with review and tune-up of those investment costs.

But we do believe that through regulatory reform that it would be possible, certainly in our customers' best interest, to allow for longer term approval of investments.

We are in discussions with other key stakeholders and State of New Jersey about lengthening out that time period, that they are comfortable approving those investment programs. That would apply to a variety of investment program types, whether it be replacement of gas pipes or building resiliency into the electric system, or whether it's for programs like community solar or a host of other programs that Ralph LaRossa and his team believe would be helpful to customers and that would fit within the state energy policy.

The important part about these programs is also that they don't need to be part of a base rate proceeding. Here in New Jersey, we have seen that there is a willingness and an ability to work with the regulators and the stakeholders to get approval of the types of programs that are needed and are in customers' best interest. But with that, we understand that there has to be checks and balances. We have worked very successfully with some state and stakeholders -- a variety of stakeholders to ensure that we provide that comfort in the programs to have checks and balances.

What I mean by checks and balances are variety of tools that can be used to provide comfort and demonstrate that we are investing consistent with the program that we have had approved. For example, Energy Strong had agreement to have an independent monitor work with PSE&G and provide visibility into our planning and implementation of the Energy Strong Program.

It was an idea that was introduced in settlement and we welcomed it. It has worked very well to ensure that the regulators and the consumer advocates has an opportunity to see first-hand what we are doing to implement these programs.

There are also a variety of other opportunities to demonstrate that we're meeting our commitment in the forward-looking approvals. They can be reporting. It can various uptake filings. We are comfortable that we can provide the certainty and visibility that once we get these programs approved, that we are implementing them consistent with the state's objectives and consistent with the terms and conditions that we agreed to.

Let me turn to nuclear. We are in the very early stages of discussions with both federal and state regulators and policymakers on the value that nuclear provides. We do believe that preserving existing nuclear plants that are well manned is important to both the nation and to the state because they have become such an integral part of a reliable, clean and resilient energy system.

If you look at the value in New Jersey alone, our nuclear plants in New Jersey contribute about 40% of the energy supply currently relied upon in the State of New Jersey. There's an additional nuclear plant that also operates and that is scheduled to retire, and this is not included in that 40% number.

Preservation of these nuclear plants is something that is not only consistent with the Energy Master Plan which has identified nuclear as critical to New Jersey's clean and reliable energy supply, but it is also very consistent with the objectives of regional and federal policies of maintaining a diverse, reliable and clean energy supply.

We don't believe that preserving nuclear plants through programs, whether state or federal levels, are inconsistent with competitive wholesale markets. In fact, we anticipate that the competitive wholesale markets should ultimately change to value these attributes, the environmental attributes, the fuel diversity attributes, the reliability of attributes of nuclear power. But currently they are not designed to support those attributes.

As a result, there is a gap that is occurring and nuclear plants, as we see, are at risk for not achieving their financial needs.

There is an opportunity to work with both federal and state policymakers to ensure that these attributes are valued. While it's too early to anticipate where the solution for our nuclear plants will come from, I do believe that it is more likely that state outcomes and state legislative and policy matters, programs are more likely to be -- the solutions we will see in the near term.

The initial reaction that we have received from stakeholders that we have had discussions with regarding our nuclear plant has been widespread support for retaining the nuclear plants. In fact, I haven't spoken with anyone who has told us that they want to see the nuclear plant shut down.

The challenge is where do we find the solution. Does it come from the federal markets? Does it come from the state markets? Our conclusion is that in the near term, it's most likely to come from a state initiative.

We are watching closely what is going on in other states. As Ralph indicated, some states have decided to allow their at-risk nuclear plants to shut down, and that was a decision made by those states based upon the factors that existed and they considered.

Other states such as Illinois and New York had taken very strong steps to preserve the nuclear plants in those states and surrounding areas. We are watching also very closely what's happening in some states such as Connecticut, in Ohio and a few others as they start down the path of making the decision whether to take actions.

We are working in parallel with PJM and the wholesale market participants as well as FERC and talking to them about the challenge. There is a long-term path that could be achieved at the wholesale level where these attributes are valued.

As Ralph has indicated, PJM has started to look at through its Grid 2020 Program and conducting a study on the long-term planning needs of the reliability of the system, whether there are some actions it should take.

But in the near term, state regulatory and legislative actions, valuing nuclear plants is something that we are watching closely and we anticipate having more discussion in the State of New Jersey.

If New Jersey does decide to act, it will be required to adopt legislation. The legal framework that exists in New Jersey would not promote a regulatory solution to nuclear support. It would require legislation and it would require that legislation to be implemented by state agency, most likely the Board of Public Utilities.

So it's important that as we start this early dialogue, that we work with all of the key stakeholders, ensure that they understand the challenge, that we understand how they

want to go about if they choose to preserving the nuclear plants through state legislative action.

Let me turn to the broader wholesale market. PSEG is actively involved in working with stakeholders, in RTOs, in ISOs as well as FERC to ensure that we have well-run and well-designed wholesale market.

The FERC is just taking strong action to drive ISOs and RTOs to continue to improve their market design.

On the energy side, we are very encouraged to see FERC issues on rulemaking to look further into improving energy price formation.

As an owner of generation in eastern PJM, we see that price formation continues to need improvement. We don't always see the units that are called to operate and to run when needed. We don't always see them setting price. They are paid, but they are often paid outside of the wholesale market price, not sending a clear market signal through energy prices when these units are called up.

We're very pleased and encouraged, as I said, that FERC has now directed the region to ask -- to take a look at this situation and to dig in further to see what improvements can be made. We'll be participating in those proceedings and continuing to put pressure in the regulatory environment towards improved and transparent energy price formation.

On the capacity side, as you know, this coming October will be the very first that it does not have a base product, but that is purely a capacity performance model. We think that's a big step in the right direction.

Those capacity performance rules were designed -- and it took quite a bit of time to get in place, but they were designed to better value the reliability expectations that exist for generators that are being relied upon by customers and the system to be there when needed. That is a very positive step.

While the wholesale energy markets, from my perspective, are generally working as designed and providing good value to our customers, there are still a lot that can be done to make them better.

If I were to identify the three areas where improvements could be made, in the short term, it would be price formation. This is one of those very detailed technical areas that requires FERC to really dig in, to see how the operators of the RTOs, the ISOs are calling on units and making sure that when they call on units they are really allowed to set the price; and providing visibility to generators and customers on what type of actions and what types of circumstances trigger certain units to be called out there; and when those actions might replicate themselves.

The second category I would say is a little bit longer term and that is trying to work to change the drivers of wholesale market. So they are not just about providing reliability at the lowest cost, but ultimately they also incorporate environmental attributes, fuel diversity attributes and resiliency.

I don't want to suggest those are easy changes or that they will be smooth stakeholder discussions, but it is important. I think the nuclear experience, the fact that we're seeing nuclear plants become at-risk nuclear plants when they have a long future until their license is still remaining, when they are still well-run and providing reliability -- supporting reliability of the grid every day, that is a red flag to market operators and to FERC that longer term, we really do need the market to value and to plan for those diversity of supply, both environmental attributes are becoming more and more important to consumers and to our state policymakers.

Lastly, something that's consistent about middle category, not tremendously long term, not really short term, but we do need to see changes to the market design that allow for improved and have smooth integration of state and federal action.

There is not a bright line in many of the scenarios that we're seeing today between where the federal government role begins and where the state government policy initiatives end; and so we're seeing a lot of state interaction in taking steps by themselves to pursue their policy goals. Some of those state actions are purely legitimate and I would say that support of nuclear plants, in my opinion, falls into that category.

There are other state actions that we've seen that I would say are not legitimate state actions and are intended more to interfere with the market. So it's important that FERC evaluates where is that line and what action do they want to take.

FERC has scheduled a technical conference that was just announced this past Friday that will hopefully start to look into that question about where is this line and what type of integration should we see between state policy and well-functioning wholesale markets. That will be something to anticipate having a lot more involvement at the federal and state levels over the next 12 months.

In summary, I think it's important to remember that all of our regulatory actions are focused on what can we do to provide quality service to our customers, and that involves a variety of different tasks. That involves a variety of different assets. But our customers want reliable, clean and resilient power, and they don't want to know what happened to get that.

But we have to constantly plan and Ralph and his team, and Bill and his team are constantly looking at not just what are we doing today, but are we doing down the road. That also has to be affordable and we want just -- Ralph has just said we watch very closely what is happening with our customer bill to ensure that we can provide these objectives and do it in a way that's affordable to customers.

For now, it means we're focusing on getting ready for our rate case for 2017. It means we're focused on having regulatory reform that improves the already good environment in New Jersey and allows for extensions of programs and longer-term pre-approvals.

It also means that we have to tackle this nuclear challenge and work with policymakers to try to come to a solution that is good, not only for the nuclear plants, but for the grid and for customers.

Lastly, we have to continue to work to improve our wholesale competitive markets, to ensure that they continue to operate, to provide our customers with reliable and affordable power when they need it.

Thank you.

Tamara Linde - I would introduce Ralph LaRossa who doesn't need much of an introduction. You all know who he is.

Ralph LaRossa - Good morning, everybody. Still awake out there? I'm going to go over a few things today, just to kind of put a finer point on some of the comments that Tammy and Ralph made, and I really hope that you take three things away from today's presentation.

One, I would say that we have a team that has delivered over multiple administrations in the state of New Jersey, Republican and Democratic, multiple admissions at the federal level, again, Republican and Democratic.

And we've done so over a timeframe where we've challenged quite a bit with some real severe weather events that have -- that have put us to the test. So, I think we just take that as a background on what we've delivered.

And hopefully, we'll give you a little more insight into what we believe as a true growth plan from the capital side. And I really think that's being driven by, one, the increased reliance on our T&D system that's taking place time and time again.

The fact that we have aging infrastructure, which is something we're blessed with, we didn't create, but there is a real need to go back and replace that infrastructure, and I'll give you some facts and figures about that.

And then the overall changing role of the utilities, that Ralph referenced a little bit in, we're going to get -- continue to get closer and closer to the customer and provide products that we may not have in the past. So, that's the second item.

And then finally, a little bit about what Tammy said just now which is that the time is right for all of these investments. They're right because they're aligned where the policymakers or estimates were and they're also right because of the headroom that we have and the bill has been created through the commodity cost. So, those are the three

big takeaways and I'll try to walk you through that over the next -- a little bit of time here.

So, I'll start out with the old slide which is really just to give everybody a reminder, I do this every year, about our service territory, and I tell you to take a straight line between the George Washington Bridge and the Ben Franklin Bridge, go 30 miles on each side and we pack in all those customers.

The thing that I haven't said in the past, which was kind of interesting, Scott Jennings and I were just sitting in the back and looking at some of the documents. If you go outside during one of the breaks, on the right-hand side of the table, you'll see the 1924 map, which is exactly the same as the map that you see up here of our service territory.

But it's been a service territory that has provided us with great opportunities in the state of New Jersey, and you really see those in the top core things that we have listed there, we are the largest electric and gas distribution utility, we've got a robust transmission system.

It's giving us the ability to invest in things that we had never dreamt about back in 1924, which were renewables and energy efficiency. And we've also built that in applying service business which is really second to none not only in the state, but if you compare it to the utilities across the country.

I will tell you to stop and look at the top right-hand picture because not only does that show you the service territory but the other takeaway there is the transmission system. And I really haven't pointed this out in the past but the blue is the 500,000 vault lines, the 500,000 volt lines, the red being the 230,000 volt lines and the yellow being the 138.

Basically, back in the 20s and 30s, it was all 138 and lower voltages. And we've continued to upgrade and make those highways from two-lane highways to five-lane highways. And so, what you see there that I wanted to point out is really some continued opportunity for us to re-enforce that transmission system.

I'll talk a little bit about a line that's been approved just recently by PJM, which goes from Edison -- I'm sorry, from -- yes, Edison to Metuchen to Trenton and then down to Burlington, which basically takes that yellow line that you see coming down to the middle part of the state and upgrades that to 230,000 volts.

You'll also know we're doing quite a bit up in the far -- the Northeast corner of the state, which is our BLC line, we're also making a lot of upgrades to that part of the system. But what's not on here is the potential impact that we think is going to happen because of all the changes that are happening to the topology of that transmission system.

You've heard Ralph and Tammy and everyone talked about what's happening in nuclear. Well, the biggest things that's happening to our system that we know from a nuclear standpoint is the closure -- the announced closure of the Indian Point.

How is that going to affect us? How is that going to affect that Northeast corner of the state where there still are a number of 138,000 volt lines? Not only how is the closure of the Indian Point going to affect the transmission system but what's going to happen as the wheel to Con Ed, wheel has been referenced quite a bit, rolls off this April, and what re-enforcements will be required to support the city of New York as a result?

All of those are two to be determined and are not in our plans if you look forward to them. How is that -- how is that generation going to be backfilled, will it be through more natural gas that's coming from the West which will need more import capabilities or will it be offshore wind that will be off of Long Island that we're going to continue to build out at very expensive prices?

Each one of those things will come back with a different solution for us from the transmission system, so take a look at that and understand why we think there is a lot of upside in that -- in that part of the -- of our business.

And then on the bottom right, we've talked about it quite a bit over the last 10 years how we morphed the utility, but look at the difference in the regulation that we now have, with the amount of our rate base is going to be regulated by the federal government versus the state of New Jersey.

That's been a change that's happened over time but it also reduces quite a bit as a risk from a single regulatory standpoint, so two good pieces to take away from the chart that I haven't spoken about in the past.

So, our strategy really remains the same as it has in the past. We were out there trying to develop programs that are supported by the great employees that we have and all the pictures that are rolling in the back of the room here today.

We've aligned those skills of the employees that we have with the policies of the state, and as a result of that, we've been able to put these programs in place that we've spoken about, whether it'd be our gas system replacement program, the transmission build that we've had or some of the energy efficiency or renewables that we've done that we never dreamt of doing in the past.

So, put those two pieces together and now, I'm going to try to transition into what we've done and why we should believe in our team to some -- to a big degree. Let's go over -- let's go over in operational excellence.

From my standpoint, this is all about keeping the lights on and the houses warm for our customers, and you need to do that not just on the blue sky day but be able to do that during storms.

And again, I think our history has proven itself out from an operational standpoint but I'll go into some metrics here that could give you a little more confidence in our ability to achieve the good results that are required by our regulators.

I think from a financial standpoint, the results speak for themselves. Our net income over the last five years has gone from $521 million to $889 million. It's been a nice growth plan and we've talked about that quite a bit.

And at the same time, we've grown our rate base from just over $8 billion to just over $15 billion. So, again, a good and nice program that we had in place that's continued to show that growth.

And taking all of that, and Tammy has the timeline up there, but we had five programs approved back in 2008, 2009, and then just about every year since then we've worked with the board to continue to put those programs in place to allow us to recover the capital that we put in work above and beyond our depreciation expenses that are built into our base rate. So, working together, we've come up with those programs and been able to make those disciplined investments that we've spoken about so many times.

So, we'll dive in to our operational metrics just a bit here and I'm going to start with safety. This obviously has its benefits for just the reasons that it has there which is to make -- ensure our employees go home safely and sound as the way as they came in.

But I'd tell you, the other thing you should take away from slides like this from a safety standpoint is this is your good indication of how we engage your employee base is. You cannot have an engaged employee base if they're not working safely.

This is the first thing, if they're not taking care of themselves and they're not returning and watching each other on the job site, than you'll never be able to have a work force that's pulling in the same direction to deliver the results that you're asking them to do from a company standpoint.

So, we've looked at this on a regular basis, and you can see there that we've been in the top quartile for many years but really last year for the first time we've done it to the top decile from a safety standpoint, so something we've very, very proud of.

I'd say no metric in and of itself, means more to our customers than SAIDI numbers. And for those of you that are not familiar with SAIDI, it's basically a multiplication of SAIFI and CAIDI. And for those of you that don't know what SAIFI and CAIDI means, that's all about SAIFI means how many times has the lights gone out and CAIDI means after they gone out, how long does is take to get them back on.

And our metrics there again have produced excellent results over the -- over the long term and we've been in the top quartile, so another really good story that we have from an operational standpoint.

So, you put some of those other pieces together and what is our -- what is it -- what our customers think about us? And these are J.D. Power results, and the J.D. Power results for the utility not only have improved on an absolute basis but they've also improved from the standpoint of how we stack up against the other utilities that are in that panel.

And so, you can see that growth that we've had there obviously increasing their scores or better, and we've been in the top quartile for most of the metrics. The one area that we have a challenge in is our -- is our gas business metric.

And while we actually won that award in 2014 for being number one in the J.D. Power results, we've trailed off in the last few years and it's all been driven by a perception from our gas business customers that prices aren't cheap enough when we look at the data that's been there.

A little bit of that is access to the Marcellus Shale. We haven't -- we've stated New Jersey hasn't been able to really build out the pipelines the way we might have wanted to, so there is an expectation from those business customers which are smaller.

Our industrial load continues to go down a little bit on the -- on the gas side. But their expectation is that they have access to that really, really cheap natural gas that they see in Marcellus Shale just across the border in Pennsylvania. So, it's a little bit of the challenge that we have there and we'll continue to advocate for access to that low-cost commodity.

So, keeping the metrics going, making sure from an operational standpoint we're delivering, and then I'd say, keeping your cost down for your customers is something that's also very important, something we have a very good track record of doing.

Again, going back to 2012 here, you see we've kept our compound annual growth rate under 1%. And it's really driven by three different areas on our -- on our operations team. One is we continue to look for process improvement for Six Sigma efforts, and you've heard that from a number of different folks.

We streamlined our organization and continue to morph that based upon where the workload is. So, as an example, when our FEMA work ticked up on Long Island, we are able to shift some of the people that work on our projects out to support that effort, our gas distribution system that our management team has been changed quite a bit as a result of our gas system modernization program. So, that continues to change in ways that we can move people around and maximize our value.

The one piece of the puzzle that I have to give a little shout out to Dan here and his team that's done a fantastic job of managing the pension and the interest expenses and that's also buried in these numbers here and really has enabled us to keep those costs down, so thanks to Dan and his team for that.

I'm going to go back and I'm going to take the chance here if I dont shut this off, but I do want to point out one thing on the O&M side before we do move on, and I'll tie this in a little bit on the rate case conversation.

You see those costs have been flat, but they started to creep up a little bit in '17, and that's a direct reflection on three different regulatory changes that have taken place in New Jersey.

One, there's a push on cyber, and again, rightfully so, we're starting to look at cyber efforts and more down at the distribution level. That's increased some of the O&M cost for us.

Second, there has been a real push on meter inspections that have taken place and so, we're out inspecting our gas meters in the way that we have been in the past which have increased some of our costs.

And third and most importantly is the tree trimming changes that have taken place from regulations on tree trimming. In fact, when we look at numbers, when we look at 1'7 and out to '18, those numbers are going to have to increase even more dramatically to keep up with the full year program that the state would like us to have from a trimming standpoint.

So, more to come on expenses associated with trees and O&M, but that is part of the driver that you see when it's -- when we talk about why does it make sense in a rate case and some of the challenge -- some of the questions that you may have from an expense standpoint there.

So, just to summarize what we've done and why you should believe in us as a team. This is probably the number -- the two numbers that mean the most to you from an investment standpoint.

We've been able to deliver that rate-based growth and we've been able to deliver that net income. And I would challenge when you look at most utilities across the country that have a story where you deliver the operational excellence that we've had at the same time that we've been able to grow the business the way that we have, and just a lot of thanks to the team that we have in place.

So let me transition now from what we have done in the past to what we are planning to do in the future. And we've got two numbers for you here in two separate charts. One is our base capital plans where we're referring it to, which is a $12.3 billion plan and then a $13.8 billion plan, what we think is reasonable, and I'll go through the differences between each one of those.

First on the left-hand side, those are programs that either have been approved by the board of public utilities or transmission projects that have been approved by PJM or in

the queue to be approved by PJM, replacement of transformers, those types of things at the PJM level, RTEP programs as well.

And then on the -- on the distribution side, all the programs that Tammy mentioned and how they roll out both from a base capital expenditure and from a clause recovery capability, and again, GSMP is probably our best example on that.

The one thing that we have included on the left-hand side in your base capital is an extension of the GSMP program into 19 -- 18, 19 and 20. That program is scheduled to end. If you recall back, it was a three-year program.

We have gotten nothing but positive feedback from the board of public utilities not only since we started the program but when we actually proposed the program that they expected us to come back in, and we do expect later this year to make a filing to continue that program and I'll dive in to a little more detail about that in a few slides.

On the right-hand side, there's really three things that we -- that we're expecting that we could be able to move on. First, not only do we expect to continue the GSMP program but we think we can increase the spend associated with that program on an annual basis.

And we've done that and I'll show you a little bit about that in some of our slides, but we've actually been able to install more piece of main on a regular basis than was previously thought. And again, I think that tells a good story and we've gotten good feedback not only from the regulator but from our customers on that.

Second, we have -- we think, as Ralph mentioned that there's more to do on the electric front, on the Energy Strong type of investments, some more of replacements of our substations and our switching stations in some of the low lying areas but also re-enforcement of resiliency that's needed for the last mile from a T&D standpoint.

And finally, the one that probably we bring the most attention to internal to -- in the building but also so we try to convince regulators about is the movement into energy efficiency and renewables, and again, I'll give you a little more detail on that. So, that's what makes the difference between the left-hand side and the right-hand side about what we expect from a capital standpoint.

So, let me dive into the program just a little bit. Transmission, I think most of the last four or five years I've gotten up here and talked about transmission and given you four or five different slides on a transmission.

The fact that we have one slide on it is not because it's any less important to us but in fact, because it's become more of a normal process for us to go in and have these efforts to go on on the transmission side.

There's no less focus on it from our standpoint. We still have $6 billion of investment coming. And they come in three buckets on our transmission side. First, the large

projects that we have. There are two of them that we have ongoing right now, the BLC line, the Bergen-Linden Corridor, which again, we've talked about quite a bit in prior years.

That's -=- that involved us bringing lines into the North and the Essex load pocket area, coming down from the Northern part of New Jersey. And what we've just accomplished which is kind of the neat little thing and I was trying to convince Kathleen to put some pictures in here but we decided that we'd bore everybody to death.

We actually drilled the line and completed last week two of them underneath the Newark Bay. And so, we're starting that process and really being successful. And Kim Hanemann and her team, Kim is responsible for those helicopters flying, powers and then everything else, really have done a fantastic job and just a "no, never mind" at this point. But from our standpoint, it's a lot more than a "no, never mind" for the work that they complete on a regular basis.

So, that's some of our big project. Then the other large project that we have is that one line and I mentioned going from Edison to Metuchen and then down into the Trenton and Burlington areas, which again, is going to upgrade that 138,000 volt corridor that we have. So, those are two approved launched projects.

In addition to that, we have other RTEP projects, which you will find on the PJM website all the details, the number of those projects and what they are. They are everything from breaker replacements to new capacitor banks that are required.

And then we have our ongoing sub-transmission or transmission system upgrades which accounts for about $1 billion to $2 billion of the number here, and that's where we're taking our system that was 26,000 volts and upgrading to 69,000 volts.

So, for those of you that live in New Jersey, those are the big poles that you see everywhere. Especially in Bergen County, if you go Route 17, you'll see that that's just a good example of what's -- what we're -- what we have on an ongoing basis.

I'm going to move ahead a little bit here to the electric distribution side and some of the opportunities that we continue to have here. This to me is really going to -- is really twofold. And one is this slide which really talks about the core infrastructure.

So, we need to do more with some of the stations that I mentioned that are in the low lying areas, the resiliency, the efforts that we have from an Energy Strong standpoint. But I'd point out to you the aging infrastructure section there.

65 substations that are 60 years of age or older, 30 substations that are older than 80 years, those are assets that need to be replaced on a regular basis. Now is the time to do that, we've talked about the commodity prices and so on and so forth. It is not just because they're old, it's because technology is also passing them by. And I'll show you examples of that on the next slide.

And so, we've got to focus on those substations and those switcher stations, but take it out from the substation and the switcher stations and start to get closer to the homes. For those of you that may be down and may have been down in Florida recently and you've seen all the work that Florida Power & Light has done to build out the resiliency of the their last mile of their infrastructure, there are concrete holes everywhere along their right of ways, along their streets and concrete poles are there, much more reliant than the wood poles that we have.

There are some tradeoffs that require from the traveling public but those are types of things that we're going to be taking a look at to see what we should be doing and have in conversations with our regulators to say, "Hey, are these programs that we should be moving forward with? How do we get that last mile into the customers' home more reliant and more resilient than it ever has been before," because they demand it from us and you see that in all of the conversations that take place over storms.

I happened to be down in Florida during the last hurricane that came through and I think FPL had like 20 customers out and they were having a big press conference about it in the middle of the hurricane.

It was amazing though because they really didn't get hit and it really was due to the fact that they had all of this work that they did ahead of the storms to be prepared for future -- for future efforts. So, kudos for them and hopefully we can copy and see what we can do to upgrade our infrastructure in that same manner.

While you do all of that, you also have to go ahead as Ralph mentioned and upgrade the technology and move forward a little bit from this standpoint, and that's really, to give you a little bit more detail here than we have in the past, it comes in a couple of different ways.

One is you upgrade the way the T&D system speaks to itself. So, you upgrade your relays, you upgrade your different SCADA system so that you can operate the transmission and distribution system.

We have started a lot of that associated with our Energy Strong work. We've got our new SCADA system at the distribution level, that's in the process of being installed and actually is rolled out.

We're continuing to work out some of the -- some of the chinks out of that system. But that allows us to put the lights back on much faster than we would have in the past because we have remote access in just about all of our system now as a result of these upgrades.

So a station breaker trips, we go in and operate that station breaker remotely where in the past, we would have to send someone out for the station to close in the breakers. So, some big upgrades that are happening there.

Not only do you do it there but you have to start to move to the customer. And there was a -- there was pretty robust conversation going on in New Jersey right now about AMI, what do we want to do with automatic metering, do we want to deploy that everywhere, how is it deployed.

I think there was a case that was in front of the Board of Public Utilities and they're still going through whether or not that's going to move forward, but it's something that we're going to tee up again as part of this next rate case because we think from a customer experience standpoint, we can't bring all the value that we know customers are demanding unless we have that ability to touch that customer and be able to communicate to the customer directly.

So, all opportunities are out there. You could go test -- test the meter and actually control a thermostat, and in fact, in our E.E. filing that we just made, we've also proposed that as another way for us to help the customer and to try to actually communicate to see whether or not their lights are on and if they are on, what kind of usage they have and so on.

So, we're thinking about all different ways that we can touch the customer and that's part of this technology upgrade that we're going to have and, again, all conversations that we need to have with our regulator to see how they want to move forward with it.

Now, from my favorite slide, the most boring but my favorite, it's just the replacement of our old cast iron gas system. Just last year, we replaced over 200 miles of the cast iron that we have in the system.

We have the largest cast iron system in the country, no doubt about it, and there is a need to replace it. And in fact, just last -- two weeks ago, a 16-inch, 60-pound pressure gas main [letgo] -- about two blocks from my house and it was quite the event and got everyone up and it just reminded me once again the importance of what we're trying to do to make these -- to make these upgrades. These pipes have served us well, but it's time to replace them.

And again, I think if you talk to our regulator and our policymakers, everyone would say the same thing, it's time to get ahead of this curve and make the replacement. It's an efficient way to do it because we're -- it's programmatic and so we're [hiring] our contractors, and they have a full set of plans to work for years ahead, but it still is only a three-year program, and I'll talk a little more about why we think a longer program makes sense in a few slides.

From a customer standpoint, we were concerned that how many miles could we actually do. We've not only disrupt the traffic flows in towns when we go in to do this work, but we also have to get into every single customer's home to change out the meter, to upgrade the service and to relight all the appliances.

How is that going to go? We have had fantastic results and the team has done a great job of really keeping down, if you look at our complaints, you wouldn't even know that we're ahead of a new program in place. So, great work that's going on. And again, I think it's all important because it proves to the regulator that we can do the work and we can do more of the work that we have out there. So, again, kudos to our team.

The last piece of this which was rather unique was we also worked from an environmental standpoint with the EDF. And the reason we did that was because while you can -- there is a lot of 4-inch cast iron maintenance that's in the system and certain pressures and so you want to upgrade all the 4-inch cast iron and it's all 50 feet away from a building, there's also then a different way to prioritize that work based upon methane leaks and maybe a little different impact on the environment.

So, we work with EDF, they've mapped the system for us, and by doing that, again, we've got more buy-in from a bigger audience than we ever had in the past. Now, the environmental community is using us as an example around the country as to how I guess main replacement program like this should be done. So, again, not the funniest and the sexiest type of project that you might have but it's really, really effective, and again, the team has done a fantastic job.

So, solar and energy efficiency, I'll steal a line from Ralph. This is the most mind-boggling thing to us as you look forward as to why we really haven't been able to do more of this. It just makes sense.

We are the only entity that can provide universal access to these services to all customers. We, being the utility, not just PSE&G but any one of the utilities in the country. If you want to provide universal access to energy efficiency solutions and to renewables, the utilities are the only way that you can do that.

And we talked in the past about the difference in the income of households, who has access to solar and who does it well to same-store from an energy efficiency standpoint because you're going to go in and buy a cheaper light bulb if you can versus a more expensive one, so, how do you provide that universal access that you use the utilities for.

By us doing it, we've proven time and time again, it's the lowest cost. Probably half from a renewable standpoint to put a solar panel on a landfill than it is to put it on top of someone's home.

So, again, from a consumer standpoint and from a society standpoint, we're the right solution for that. And at the end of the day, we are the best channel for the customers because we have access to every one of the customers.

So, I'll talk a little more about it but this is one of the areas that probably frustrates us the most then we're going to continue to take incremental approaches like we did with the $76 million program that we proposed on Friday.

In that one, we're just going to continue what we've done in the past, focus on our hospitals and some of our municipal buildings as well as low income folks and then a little bit more in the thermostat area and some education for customers that we haven't done in the past, again, to show to the regulator that we can add value in this area in a way that most others can.

So, think about the different ways that we've talked and the different places that we've got to invest in. We think the $13.8 billion program is very reasonable although we were only really in our plans talking about the 12.3.

What's the difference in the 1.5? About another 300 million or a 100 million a year on gas main replacements. We think again, that makes sense because of the history and the results that we've achieved.

On the electric distribution side, an expansion of the Energy Strong Program, a continuation of it, again, not built into our base plan but about $800 million that we think makes sense there and then about another $350 million or so on additional energy efficiency renewables to provide that universal access to customers that they so dearly need. So, that's the story from that standpoint to us.

Look pass that initial five-year plan and what is out there that could be done. And we're going to tee up many of these issues in our -- in the timing of the rate case. How we do that, Tammy and her team will come up with the best way to have those conversations with the regulator.

But I want to take you to the right-hand side and really look at the utility of the future and tick down those pieces. From an electric infrastructure standpoint, lifecycle programs, we do not, I talked about those concrete poles, we do not proactively replace any wood poles in the state of New Jersey today.

There is no proactive replacement program. So, what can we do working with the regulators to put a program in place to replace that infrastructure, that's just one example. You could take that to the wires, you could take that to the substations that I talked about that were 80 years old. What are we going to do to have those lifecycle programs put in place?

From a customer standpoint, what do we want to do from an automation, how far do we want to automate the system? I talked a little bit about AMI at the bottom when we get into the energy efficiency side, but what other controls that we want to put in place for some of our industrial and commercial customers, how much access do we want to have for them, how do we want to automate some of our networks that we have and some of our inner cities, there are other opportunities that we have to automate that distribution system.

And then one of the big items that's out there that's really not clear is the recharging stations. Where is that going to be? Is that going to be an asset that's going to be put in

place in rate base by utilities or are we going to continue to see Tesla put out their stations and [Harry] put out his stations and [Larry] put out his station and then the customer is not going to know what he's plugging into.

So, how do we provide, again, universal access, get back to that same message from the utility standpoint and we believe again that it makes sense for us to be involved in that and to get out there from an electric vehicle charging station standpoint.

I'm not even sure how Tesla gives away free electricity right now. I don't know if they are a retail provider. I'll let our lawyers figure that out, but right now, they got that built in somehow and they're giving away electricity, but they're not a retail provider. That will get played out over time and we we'll see how that is once they start charging for it or somebody realizes it's built into their cars already, right, Tammy? So, let's see where that goes.

On the gas infrastructure side, GSMP, I've talked about that a number of times. I wouldn't repeat that. But CNG, compressed natural gas opportunities that we have in the state. New Jersey is perfectly positioned from a port standpoint to become a major transportation provider.

We just raised the Bayonne Bridge. The reason we raised the Bayonne Bridge was we said we could get big tanker trucks, tanks, tanker ships to come underneath. Once they -- those tankers come in, they have to offload. Once they offload, they need to have a way to get out to the -- to the general public some perfect fleet operation opportunity for us.

How do we get the CNG people out there? It could not only be just for the bug trucks but absolutely for the tubs and the other equipment to work around the port and for us to put those types of CNG charging locations in.

We have not done anything really from a CNG standpoint over the years and it's for one simple reason. We had a contract to take our refinery gas from some of the refineries along the New Jersey Turnpike.

That contract expires this year, so we're going to have the ability to start to propose some of the CNG stations because we take refinery gas, it's a different quality gas than most of the engines can take.

So, the Cummings and all those other ones that have the natural gas engines wouldn't allow you to mix that type of fuel, and now, we have that opportunity. So, we're going to move ahead with that, and again, have those conversations as we get into the rate case AMI.

Distributing energy resources, well, we've seen what we've done from a Solar 4 All standpoint. That's going on for many years, and again, the cheapest way to deploy solar in the state of New Jersey that we found so far.

We’re starting to have conversations with the microgrids. We’re working with Hoboken, we’re working with New Jersey Transit right now on two microgrid projects. Those are ongoing conversations.

The state has started a stakeholder process on microgrid to see where they want to go from a policy standpoint, again, we’re going to tee that up universal access to microgrids. We can't be picking winners and losers who has access to the microgrids or how we’re going to provide that service to customers on a regular basis, universal access, same messaging in.

Batteries, what are we going to be doing from a battery standpoint? We’ve actually started to -- some trials with batteries on some of our Solar 4 All sites specifically at some of our schools. So, we’re testing that technology, we’re going to be coming back to proposing some of that, where can we use batteries to offset maybe some T&D investments. Our system doesn’t really lend itself very well for that but there might be specific pockets and specific customers and see some value and we’re going to be pursuing the batteries as well.

And then there’s the holy grail, the fuel cells which are out there, and again, I put that on here more for the long term. There’s really nothing in the near term that we see that’s going to make sense. But that clean gas that we have now, we do not have a refinery gas to provide some additional opportunities for us there.

Energy efficiency, we just continued to bang the drum. This is what you want us to do. And if you really don’t want us to provide retails to all of our customers, we should be doing it for the customers that have provided benefit from -- to all of the -- all of the folks in the state of New Jersey, and that’s really the hospitals, the municipalities, the state universities, and again, some of the low income folks that we have.

We’re going to play around with this a little bit and see where we can go, but I would expect that, again, as we get into the rate case, you’re going to see some large proposals that we’re going to make to move this -- to move these programs forward.

So, that’s the long term, that’s where we see the go, and that should take you well beyond the five years. And again, if you look at those programs and you look at our track history, you could see that we think we’re going to be spending and deploying about the same amount of capital year-over-year in the future.

And that backend to that dip that Ralph talked about and showed you there, you should have some confidence that we’re going to continue to fill that up as a result of what we’ve talked about here.

All right. And that just basically summarizes that, what I just spoke to and some of the -- some of the ability that we have.

Just again, takeaway the fact, we have more dependent on our system than we have been ever in the past, more resiliency and reliability required. We have all the assets that need to be replaced and we're -- and we're moving into a new age for the utilities as far as our interaction with customers.

Okay. Let me talk a little bit about the base rate case and a little finer touch on what Tammy mentioned. We really see this as a moderate increase that we're going to be proposing, very moderate increase when we look at it going forward.

But why is it something that you should have a concern is going to have a negative impact on us? One, the sales have been flat. We showed you that in the past, we really have not outstripped our sales over the last -- outstripped 1% on our sales over the years so that's been flat.

While we've held O&M flat, we have these three major regulatory requirements that are starting to drive up cost from an O&M standpoint and we're starting to roll that in, so you -- and you're starting to see that in our numbers. As we're doing that, that is clearly happening.

And finally, as Tammy mentioned, there are a lot of the capital programs that we had, have additional capital requirements that were not being recovered as part of the contemporaneous return that were required as base expenditures.

And as those are in there, that also drives some of the requirements for base rate increases. So, I think if you'd step back and look at it with those -- with that lens on, you clearly see that there's a need for a rate case but a moderate one that we -- that we project going forward.

One last thing and again, to put a little finer point on some -- Tammy mentioned there are some additional roll-ins that we have and the biggest one being the roll-in that you read about this are costs associated with Sandy.

Not long ago, I will just remind everybody that there was a proceeding that took place where the costs associated with Sandy were found to be prudent.

So, remember, we're just going to be talking about the timing of how we get that money back. I think there were some food that was disallowed in the -- in the preceding but that was it, so we'll have that going forward.

So why does regulatory reform makes sense? And we've talked a little bit about these programs and the fact that we've been very successful with it, all are true. But I'm going to draw an analogy for you.

The state of New Jersey just made a decision to provide certainty for customers, the contractors that work on these assets and the people that use the assets by implementing the TTF, the Transportation Trust Fund.

That is a -- that was something that was decided and pushed for by the users of the roadways because they wanted to have certainty in good roadways as they went forward, so there was advocates for that. The policymakers agreed and they decided to put it for a vote and the customers wanted certainty for long-term projects.

So, if you've used the parallel from our TTF experience that we've just had in the state, this makes a ton of sense. Our customers want it, our policymakers want it and certainly the users of our system want it on a regular basis to know that this system is going to be there for them when then they call on it from a T&D standpoint.

So, we're going to continue to have those conversations. It's good to have three-year programs. It's better to have five-year programs. It's even better as we have just seen for there to be an infinite program based upon certain amount of dollars that are going to be invested above and beyond that are being covered by the customer right now, and that's what the state in New Jersey has done and that's what we're proposing. So, just draw that same parallel and see why it makes sense.

In addition to that, we've got job creation in all the -- in all the points that we put on the slide here. But we feel pretty confident that it's the right time and there's going to be a very, very little impact on the customer bill, and I'll show you that here.

Next, which is why I think no matter how you cut it, Ralph showed the bigger -- the longer term impact on bills, but from our standpoint, if you look at what's going on from a typical residential customer, there is tremendous headroom in the bill.

So, why wouldn't you have some of these long-term programs, why wouldn't you have some of these long-term capital, it's going to be laid out to come back in. I think if we took it out, it would take us 10 to 20 years for us to roll in and all of the programs and actually even get [caught] back up to where we would have been in 2009 from a price standpoint.

And you're not only just looking at it from an absolute standpoint, but one of the things that we're very concerned about is not just, "Hey, are we getting $10," and we used to get $10 in the past, no, we've got to also look at the amount of disposable income that our customers have because that's also part of it because if they have other burdens that they -- that they might have that they're trying to pay for, they'll also be upset about paying the utility bill and how that impacts them.

So, we even take a look at the percentage of disposable income that we might have and we look at that on an ongoing basis and again, try to take them into account as we lay these programs out. So, there's a need for this infrastructure, there's a desire for the customers to have certainty about their bills and there's headroom in the bill. Just it's a perfect storm for us to continue to move ahead with the programs that we've developed.

I think you've seen this before in some of the conversations about the range that we have, so we continue to produce the ongoing positive results from a net income standpoint and, again, it's all based on the story, the positive story that we have that I just walked you through.

So let me take two seconds to talk about something that we're really proud of which is the work that we've done on Long Island. While it is not a large impact as Ralph showed you on the pie chart to our -- to our total EPS, the team has delivered everything and more than we expected.

Dave Daly and his group out there have done a fantastic job of operating the system. Hopefully, some of you that might be customers out there have seen the difference in the way -- in the way we're providing information to customers, the way we're keeping the lights on. I'll show you a couple of metrics on it in a second.

But they've really done a fantastic job, and as a result, they've received over 95% in their incentive payment that was built into our contract in each of the years that we're out there. So, a good testament to the operating experience that Dave and his team have brought and the way they've been able to deploy it.

In addition to that, Shahid and his team have done a fantastic job of trying to keep the cost down for customers from a commodity standpoint, the input to the -- to the tolling generation that exist out on the line.

So, they've done a really nice job and that they've, as a result, been able to have a $20 million contract that's in place. So, it's two pieces of the puzzle, it's Dave and his team, Shahid and his team, and they've really done a nice job of delivering the results. So, a good story all around.

Just looking at the metrics, again, customers, from an employee standpoint, the employees are much more engaged than they were in the past. Customers think more of us from a J.D. Power standpoint, and for some reason on this slide, we didn't multiply SAIFI and CAIDI together, so you cont have the SAIDI number but we have a little bit of a difference in some of the results.

The lights have gone out a little bit more in Long Island but they've been planned to go out because that's all associated with SAIFI initiatives that we've had in place to try to reduce some of the exposure that our -- that our employees have while they're working on some of the live lines, and as a result, if you multiply the SAIFI and the CAIDI together, we still have some positive results out there, which is why Dave has been able to get his incentive compensation returns.

So, with that, I went red on our timer but not by much, only by a few minutes. So I'm going to have Tammy come back up and we'll answer a few questions.

Tamara Linde - Feels like we're going to have a TED talk now.

Ralph LaRossa - Yes.

Tamara Linde - Andy?

Andy Levi - Hey, Ralph, it's Andy Levi at Avon Capital. What's the average cost of substation do you think?

Ralph LaRossa - They're so different and they're -- I don't even try to venture the guess. I mean there is -- some of them are what we call Class A which are they're only servicing 10,000 customers as others, they are servicing 100,000 customers.

As an example, one of the big other transmission projects that's in the queue if you look at some of the TEAC proceedings. And that project in and of itself for one substation is going to be over $100 million. There are others that we're going to do where we'll be upgrading well over $50,000. So, I mean in the $5 million and not even will be close so.

Andy Levi - Okay. But how big do you think you the opportunity is on the substations?

Ralph LaRossa - Well, again, we haven't -- we haven't portrayed any specific number for any one of these substation replacements but if you take the Energy Strong numbers that we've had and understand that we only did 1/3 of what we proposed, I think you can figure out what the -- what the potential CapEx is in some of those areas.

Andy Levi - Okay. And then for the concrete poles, is there any way to kind of quantify the concrete poles?

Ralph LaRossa - I'm just -- I was -- I happened to be in Florida a little more than I like less, a few months, and so I'm taking a look at a few of the concrete poles and that's again a replacement program that would be ongoing, and it just would be one of the opportunities that we have in there.

Andy Levi - There's no way to figure out what the cost is for --

Ralph LaRossa - We wouldn't want to get --

Andy Levi -- how many poles or -- Okay. And then the last question is on, on the $1.5 billion increase in the CapEx, is most of that contemporaneous?

Ralph LaRossa - We would only do it if it was contemporaneous, right? So, we -- just as Ralph mentioned from a power standpoint, we're not going to put capital at work at less than our cost of capital. And the regulators understand that, we had those conversations.

While we are blessed with older systems, the problem that we have is that our depreciation expense in our base rate is very low. So, the only way to do it and still

achieve your allowed ROE, which is what the regulatory compact is, is to put these clause mechanisms in place.

Julien Dumoulin-Smith - Hey, guys, back here, Julien Dumoulin-Smith from UBS. Maybe just to follow on Andy's question just a little bit more to be specific. On the gas main replacement program, what is reflected in the current program versus that $300 million I think we talked about a week or so in the call just kind of apples to apples.

And then also, I think you are alluding to the potential to ramp that up further, so just kind of give us a sense of where we put it at now and then what the potential there?

Ralph LaRossa - Yes. I can't believe -- I don't know if you've got those numbers with Tammy. I want to say that we had 800 in our original -- in our original program.

(Off-Mic)

Julien Dumoulin-Smith - 905 in the original program?

(Off-Mic)

Julien Dumoulin-Smith - -- over 18, 19 and 20 --

(Off-Mic)

Ralph LaRossa - Julien, I have the numbers right there. So, let's just go back with the specifics on those. But it's -- there is -- it continued the 900 programs, so basically calling another 300 million a year but we -- through 21.

Unidentified Audience Member^ Through 21.

Ralph LaRossa - Through 21. And then we're going to -- then we would -- what we're proposing is to increase that to 400 based upon the fact that we've been able to deliver that level and we've been able to do it safely and meeting customer's needs.

Julien Dumoulin-Smith - And then subsequently, same kind of direction CapEx-related, you alluded to AMI here. What's the timing of making that filing specifically? Is it in tandem with the rate case? And obviously, it doesn't seem to be reflected in the case of all.

And then, two, maybe to use Andy's framework, how do you think about the potential cost of an AMI program for a mater, any kind of initial metrics to think about what deployment would look like full year across here?

Ralph LaRossa - So, it'd be premature to say but I think if we just multiply the numbers of meters we have, we'd probably in the -- in the $1 billion or above top roll out a true AMI program.

But again, there's different levels of that dependent upon what meter you buy and how you put the mesh network out, different ways that you're going to -- that you would approach that. But we are not sure yet, we're going to have conversations with the regulator in advance. We're going to see how we want to do that but we want to roll that into one case. Do we want to have multiple cases?

I think -- I think right now based upon what we've seen done, they've separated those types of requests from the base rate preceding. They did that in the Orange and Rockland case and we would expect that same type of thing to happen when we have our conversations.

Tamara Linde - I think the only thing I'll add on the AMI is it is that pre-discussion with the regulators that's important. We're not -- we don't have any plan to go in and install AMI and then come back and look for a recovery.

So, what you've seen is just a history, a successful history of going ahead with investments that are needed to meet our obligations, but where we're doing something on an accelerated basis or whether we're doing something that is not required to meet our obligations but we think is good for the customers, we meet with the policymakers and then only go ahead if they agree that it's something we should do.

Julien Dumoulin-Smith - Right. So, perhaps just to clarify, this would be subsequent to the rate case contemplated, so therefore i.e. 2019 onwards that you'd be making the filing or it could be?

Tamara Linde - No. We haven't decided yet and that's something that we're currently looking at whether that would be part of the rate case or whether it would be filed separate from the rate case.

Julien Dumoulin-Smith - But at the same time, Okay.

Tamara Linde - At the same time, or within a month or so. Those details really depend on a variety of factors and we just haven't gotten to the point where we have finalized the timing of that.

Julien Dumoulin-Smith - But CapEx could start at 98.

Ralph LaRossa - And Julien, I would say, it's not just AMI, right. I talked about a number of other things that we should be doing to upgrade our SCADA systems and our relays, so there's multiple things that we could be doing on a technology front.

Stacy Nemoroff - Hi, this is Stacy Nemoroff from Bloomberg Intelligence. I have a couple of questions about basically these growth opportunities that you've mentioned. One is related to the AMI and the automation.

I would think PSEG is actually from a profit earnings perspective more exposed that a regulated utility to potential cyber attack. And as you automate and increase access to the system, you're exposed -- you're exposing more entry points. So, what is -- how are you working on this, how are you considering it, do you have analog back up plans for the system?

And then also, you mentioned helping to potentially help New York deal with potential supply constraints related to the closure of Indian Point. But how would that work in terms of -- from a regulatory perspective between PJM and New York ISO?

And then finally, is PSE&G uniquely positioned to capture synergies from acquisitions of other New Jersey electric or gas utilities?

Ralph LaRossa - So, the last one is easy, that's -- we usually don't comment on that. So, that's the easiest one to kick.

I'll go back to the cyber security. I think the question that is post quite a bit is AMI provide another entry point. And I think that a lot of it has to do with how those systems were designed, right? So, you can have one-way communication, two-way communication.

And I apologize for those of you that have heard this story before but when we had the Super Bowl here a few years back, we weren't completely manual for that exact reason. So, we had those backup plans to be manual and analog and different ways to operate the system.

The easiest way to eliminate the treat is to disconnect from the Internet and we did that during the Super Bowl where we took all of the stations that fed that area and just disconnect it from the SCADA systems and put individuals out there.

I've said in a number of different places we know the exact number of the cost number that it would be that if I.T. cost get to a certain point, it's a lot cheaper to then go back and put those blue power work within those stations. And so, we've -- we know what it is and if the prices go up, we'll go back that way because there's always that fallback plan.

The other thing that we're blessed with is the compact service territory. If there was an incident, the ability to -- for us to deploy our folks quickly is much better than it is for other utilities. And again, I think you can go back to the 2003 blackout and that was part of the reason that we're able to restore the customers before many of the other utilities because we had folks that we're able to go out there quickly and start to bring the system back remotely rather than -- it depends on the Verizon system which was a challenge I'd say. So, that -- those were all the pieces.

As far as the New York PJM interconnection, that --

(Off-Mic)

Ralph LaRossa -- made identification made through those regional transmission expansion plan in New Jersey and a similar plan that the NYISO has. So, PJM and NYISO will continue to look at that, a lot of it will be driven by what the parameters are and criteria that each one of them had built into their -- into their planning criteria, and we'll see how it plays out.

Right now, what we do know is that Indian Point is closing. We do know there are multiple proposals as to how to backfill for that. I don't know which one will be selected. And each one of those proposals could have a different impact on our -- on our grid up in the Northeast part of the state.

Jonathan Arnold - Ralph, Jonathan Arnold from Deutsche Bank. Just wanted to return to the spending numbers just to make sure I've got this 100% clear. So, this 300 million of extension of the GSMP of the current rate included in the base plan? It wasn't previously in the base plan, is that correct?

Ralph LaRossa - Yes. And then if you move to the right-hand side --

Jonathan Arnold - Yes.

Ralph LaRossa -- there is an additional 300 that we think make sense.

Jonathan Arnold - Which is they've got 19, 20, 21 of the 100 million a year higher rate

Ralph LaRossa - Right.

Jonathan Arnold - So, that is -- that 300 is part of the 1.5 billion of upside over the base.

Ralph LaRossa - Correct.

Jonathan Arnold - So, could you then sort of break down how the rest of the -- well, how does the rest of that, I guess the 1.2 billion split between the electric distribution hardening and then the E.E. and solar?

Ralph LaRossa - Yes, I think I mentioned it already, but just to repeat, it's a little over 800 million on electric, so that's again, a continuation of the E.S. -- the Energy Strong type of work. And then a little over 300 million that we think makes sense on energy efficiency and renewables.

Jonathan Arnold - Great. And then -- and just to be clear, in the transmission base, some of these new RTEP plans that were just announced like a few days ago, are those in the base?

Ralph LaRossa - Those are -- those are in our numbers.

Jonathan Arnold - And then Artificial Island, I think the result they need came out on Friday. Is that an upside or is that --

Ralph LaRossa - It's about $100 million haircut as it's currently proposed.

Jonathan Arnold - Right.

Ralph LaRossa - But there are other things that may not be -- that may be required that are not in the current project scope. So, to get into the weeds a little bit, there was an SVC that was designed in the original program that they have now pulled out but will be required down the road. So, I would expect that there will be another project that we'd come back in to backfill for that and find the solution either with the SVC or with some other transmission solution there.

Jonathan Arnold - Okay. And then, so -- and then all the other things like AMI, but basically about utility of the future, the green box, that's all sort of part of that 2026 rate base that's outside of the base and upside.

Ralph LaRossa - Correct.

Jonathan Arnold - Okay, great, thank you.

Praful Mehta - Hey, Ralph, this is Praful from Citi. Coming back to retail customer rates and all of this CapEx plan with low growth, I wanted to just understand how you're kind of matching the two, right? Low growth looks like it's pretty low this year, going forward as well. I'm assuming your plans would be for low growth to be relatively flat.

With that and with this current CapEx and with the incremented CapEx plan, where do you see rates going and then what do you see customer votes going?

Ralph LaRossa - So, two things, on the low growth, I think we had a 0.5% and seven tenths of a percent on the -- on the gas, and so half on electric, seven tenths of a percent on the gas, so it is low and it's going to -- there is no increase in sight really when you -- when you look in the out years.

But if you -- the last slide that we had, I think we had 2%, is what we expect the annual impact if we got all the programs that we have identified. So, if you layered in 2% into the headroom that exist in the bill, it's going to take us out well pass 10 years before we even get back to where we were in 2009.

Praful Mehta - Okay. So, this 2% is rate or is it bill, just to be clear?

Ralph LaRossa - That's the bill impact.

Praful Mehta - Got you. So, you --

Ralph LaRossa - For more rates.

Praful Mehta - No, got you, but then are you assuming some reduction in usage or are you holding customer usage there?

Ralph LaRossa - Everything was flat.

Praful Mehta - Flat, got you. Thank you.

Anthony Crowdell of Jefferies - Hey, Ralph. The question I guess for Tammy maybe on the -- I guess from the context of the ZEC. Just what -- when would -- do you plan to address this with the New Jersey legislature? How is the session play out this year? I'm not sure when they meet. But I think it's a governor election year. Is that getting the way of them doing stuff, maybe just a little more color on process in New Jersey.

Tamara Linde - Certainly. So, we are in early discussions with all key stakeholders both in New Jersey and at the federal level and exploring on a parallel track like can be done on both runs. And as I indicated, I do think it's more likely that if there is an action taken that it will be state-driven.

As far as timing, I don't want to predict when something will happen. I think it's just fair to say that we are involved in active discussions at this point with all key stakeholders and we don't want to wait until we have a situation where we're saying we're shutting the plant. We think it's appropriate and useful to have these discussions at this stage and explore what options people have and appetite to take on.

Unidentified Audience Member - And just logistically though, when does the legislature meet this year?

Tamara Linde - Sure. So, the -- there is a legislative session that goes into this summer and then there is a lame duck legislative section. As you noted, there is a gubernatorial election in New Jersey in 2017, so there are two periods this year where a legislation could be introduced, and, of course, beyond that.

But there are two this year, one, that goes up through the primary and then after the primary and after when there is a lame duck between the November election and through the end of the year.

Unidentified Audience Member - And then one other question I guess from the rate case, is just, should we -- the one other piece in rate case is obviously what kind of returns are you earning. So, should we assume going in with this additional spend and sales growth and the lack of sales growth and the like that you're under earning your allowed return right now on the jurisdictional piece that's related to the base rates or no?

Tamara Linde - That's a good -- it's fair to say that when we -- when we make this filing, we'll be asking for a moderate rate increase and that we are constantly focused on earning our allowed return. So, it's a balance every day looking at what the investment needs are, what the spending is and managing all of that, so we are close to earning our allowed return as possible, and we do anticipate filing for a moderate rate increase.

Michael Lapides - Hey, Ralph, Michael Lapides of Goldman here. We've seen throughout the country or starting to see more in PJM FERC Section 206 related filings, related the transmission ROEs. Just curious on how you're looking at the potential risk of this for your transmission business.

Ralph LaRossa - I'm going to tee it up for Tammy because Tammy's a little bit closer to some of those than I am. But I think at a high-level you would say that there's enough need as you seen in our plans for ongoing transmission that the regulators at the FERC really are not trying to dis-incent that investment at this point. So, you know, the whole reason that we got to where we are is because there was the desire by the regulators to incent investment.

And as long as we have continued to do that and continued to keep the rates and total bill for the customer down, we have not seen a challenge to our rates, Tammy, from a regulatory.

Tamara Linde - And as you know we have a base ROE at the transmission level of 11.68. And there's a lot of activity still at FERC and in the course looking at when transmission rates are still within that zone of reasonableness, but not at the median or the average of the proxy group. So we're watching those cases closely.

As Ralph said, we don't have any complaint pending. Your rates are good and your ROE is good until the complaint is filed at the FERC and a refund effective date is established. So the ROE that we're earning right now and until that happens, if it were to happen, remains in place. So we don't have any reason to believe anyone is concerned with our ROE at this time. I certainly would expect that at one of our annual customer meetings on transmission, if there was some activity, they would alert us to that.

But it certainly could happen. A complaint could happen, and we would be looking to demonstrate that our ROE is still within the zone of reasonableness.

Michael Lapides - And then one follow-up, totally unrelated.

Ralph, when you think out to that 2025, 2026 rate base opportunity, where does offshore wind fit into this given New Jersey along with a handful of other East Coast states, so probably some of the more viable states when it comes to the potential for offshore wind in the U.S.

Ralph LaRossa - Well, I certainly hope from a customer standpoint it doesn't factor in much at a $160 a megawatt hour, which is what we saw as the information that's out

there right now in the press from the recent Long Island PPAs that were put in place. That's a pretty high number, so I don't have anything in the plan that accounts for that. Obviously, if that took place, you'd have a pretty dramatic impact not only on the customer build from a commodity standpoint, but you'd have a lot from a transmission standpoint because that is just to deliver to the land, and then you have to figure out how you're getting all those electrons in old places.

So our plan is not based upon that, it's based upon the commodity prices staying about what we expect and not being impacted by a much higher price associated with offshore wind.

Kathleen Lally - We have a time for one more question, and then we're going to go into a break.

Greg Orrill - Yes, thank you. Greg Orrill at Barclays. Is there a case on transmission CapEx that you could share with us? I guess, you didn't flex that?

Ralph LaRossa - Yes, we don't really have anything in there to quote an upside or what I was trying to allude to is that there's a lot of things changing, which will impact the transmission system. So again whether it's driven by some other changes that might be happening because of additional generation is being placed in Pennsylvania on top of the Marcellus shale or other things that are going on. That's going to continue to take place, and we really think the wheel is going to have a big impact on the northeast portion of our transmission system. But I don't want to speculate on any of that because I'll let the RTEP process play up.

Kathleen Lally - We're going to have a 10, 15-min break, and we'll be back for Bill Levis to talk about PSEG Power. Thank you.

(BREAK)

presentation

Bill Levis - Well, good morning everybody. Appreciate you coming back for what I think is the most exciting part of the program. I can say that because my boss isn't here right now. But we'll start much like you see the other presentations with our strategy in Power, which frankly is no different than the strategy you heard Ralph Izzo described for the corporation and Ralph LaRossafor the Utility and at the excellence and operating our units safely, reliably in a cost-effective fashion all driven by an engaged workforce.

I do want to take the chance today to let the audience know there's two key members of the Power leadership team here today. Shahid Malik is here. He's president of the Energy Resources & Trading organization. He will join me afterwards for the Q&A session.

And also here today is Pete Sena, president and the chief nuclear officer of our nuclear operations. Pete has been with us for about a year now and doing just a great job of

improving operational performance and mindful of the competitive environment we are in and having the right balance on both of those.

So if you can read the headline here, we're transforming the portfolio to be newer, more efficient and flexible. Flexible is key because it's a matter being able to take what the market dictates.

And if you look over the last decade, what we have done simply is we knew we had good sites. Locations were good, and so it was about making the most of those assets that we had at those sites. And making the most of those assets meant operating them more reliably, increasing the output where we could and extend the life. And extend the life could be with that existing technology or a change in technology.

And so what you see over that span of time is how there were some very modest investments that would do that, something as simple as 2013, adding a second gas pipeline or Bethlehem Energy Center, modest investment. However, what that resulted in is BEC allowing to have a record generation year this past year. And with Indian Point going away, that site becomes more valuable in the future.

Other modest investments are simple things such as adding BlackStart capability and area regulation to our peaking fleet, recognizing that those services will be more valuable in the future given renewable penetration and the like.

And on investments such as peakers in 2012, some of which were done in the competitive environment and others which were done on the rate base, so we took what the market would give us in those cases. And that works its way up to operating our combined-cycle units to make that more efficient to the large project investments in the three combined cycles that we'll talk about a little later today.

Also when the market says it's time to retire plans, we have done that. In 2011, we retired Hudson 1. In 2014, we retired Bridgeport Harbor 2. In 2015, we retired our HEDD units and in 2016 announced the closure of Hudson and Mercer that we plan to retire in 2017. So we'll take what we can get from the market and when that's done, then we're done and we'll move on to the next opportunity.

So our generating assets, as you know, are in three competitive markets and what I like to call the most energy-intensive part of the world. That is that from Boston to Richmond. And so near load pockets, which helps us quite a bit and, in fact, the new combined-cycle we're building now gives us access to a low pocket we didn't have access for in the southwestern access, the D.C. PEPCO area and designed to benefit from volatility when it comes.

We haven't seen much of that with warm weather, but when the winter comes and it does come occasionally and we'll see that again. We also have additional generation assets in solar area. I'll talk a little bit more about that later and a combined-cycle plant at Kalaoloa in Hawaii, an interesting case where this only combined-cycle in the island has

become more and more valuable as its optionality has more value in the marketplace with renewable penetration there.

So we used the word "diversity" and you've heard the fuel diversity piece and, you know, Ralph had a similar picture up before. The other thing I would comment on diversity is different plant types. That plant types are base load, mid-merit and peaking plants, although as the market is telling us those are morphing somewhat, where our mid-merit plants which were typically combined-cycle sometimes operate more like base load plants. In our peaking plants, we're outfitting them so they can operate more like mid-merit plants so, in fact, some of our peaking plants and capacity factors last year in the 20% range.

So the fossil fleet continues to perform well in a challenging environment. So what you see on the left there is availability factor, and that's just when the plants are available, not in any type of outage.

I mentioned before generation record we've set at BEC. We had also set one at Bergen 2, a plant that we had actually installed and operate in the previous year, so that was helpful to us.

Our combined-cycle EFORd rate, that is when you're supposed to be in the market and you're out for forced outage purposes, the lowest in the last five years. And our EFORp, that's the forced outage rate during peak periods, 0.17% last year. So the units are available when they are needed the most. That is more and more important as ISOs place more reliance on reliability moving forward.

You see our start success rate, peaking 99.7%. Our peaking plants were called on to run 4,650 times last year and net that call 99.7% of the time. And even our steam and coal units, which are older units, met about 93% of the time.

So nuclear is vital to New Jersey. As you heard Tammy talk about before, it provides 40% of the state's energy consumption, so critical to the state and to us. So a couple of things I would point out here -- about 3,700 megawatts total capacity that we own and/or operate. And all five of the stations that we have an ownership share have had their licenses renewed.

We refuel our units every spring and every fall. And the Peach Bottom units get refueled one unit each fall.

I will point out for the scheduled 2017 outages that we will be dealing with the Baffle Bolt issue on Salem in the spring of 2017, so we're expecting a similar sort of repair effort that we did on Unit 1 last year, and on Unit 1 in the fall are expected to just to be able to inspect and not to find any additional repairs that we need to do. We're in much better shape obviously for the -- knowing that those repairs are coming in the spring than we were last year when we found the issue when the outage was already underway.

So nuclear has not been standing still in the short-term recognizing the economic challenges that are out there and moving to become more efficient. And if you look at our controllable direct cost from the 2012 period through 2017, you see we've actually reduced cost almost 1.5%.

I would point out 2015 as you see an increase in O&M, that was only about our security force in-house, an important step for us because security has been growing at the fastest rate of any of our expenses in this category. So it was important to bring them in-house so that we can improve their performance and put in place many efficiencies that we thought we could. And, in fact, that process has started and it's as simple as being able to use technology for how we employ our security force.

It was not uncommon that essentially when you determine the security force aging is a three-dimensional chess board, and that's how you would play against your opponent in figuring out what the best strategy was. Obviously, day and age of technology, and computers and simulation and the like, we've been able to take advantage of that and start putting in place efficiencies in our security force and actually reduce the number as well and improving the performance.

We also see the material in cost reductions that have occurred over this period of time. And on the right-hand side, you can what there has been spent from a capital perspective. I would tell you that the 2014, '15 number is driven primarily by the Fukushima efforts that are behind those currently and '16 and '17 by the Baffle Bolt issue I previously discovered or talked about. Going forward, capital needs of the plant are about $100 million a year.

And I call this an umbrella that we have to operate on to help improve the cost structure of the nuclear plants as to delivering the nuclear promise initiative, taking industry-wide.

And what's helpful in this regard is it's an opportunity to learn from one another, leverage from one another and move the industry collectively together to make changes in our power plants along with the appropriate oversight of groups like INPO and our insurers to make sure that everything is still in the best interest of safety.

Not much different, quite frankly, than our industry did in the 90's when we had some economic challenges facing us and we are pulled together to putting in place efficiencies in our processes and the like. And essentially what's happened since that period of time, there was 9/11, some excitement about new nuclear plants and then Fukushima that, frankly, stalled those efforts. So this is going back and really examine what those best practices are, the efficiencies that we can put in place, and then quite frankly using technology that has been absent freely from a lot of what we've done for this point.

So I've also found that it has served as a security or as an opportunity to share best practices and security because there really was not a forum for that before. INPO, which serves as a board for sharing best practices does not have security under its umbrella, so

this opportunity has allowed the various operators to talk about what are the best practices there and start to employ those.

So you can see 46 efficiency bulletins issued to date from an industry perspective, you would hear $600 million of savings advertised. We have implemented 21 of them so far at our station. And in the last year, we reduced headcount by 185 people and in the corresponding reduction in O&M moving forward.

The important part is as we -- as we move out these inefficiencies, we are actually improving safety and its focus on it. And what's fundamental to this and the key learnings with 90's was really understanding why we do what we do and then engaging the workforce to make sure we're doing it in the most efficient fashion possible moving forward.

We would also tell you we have the support of the regulator here, too, as they're under similar mandates from Congress to improve their efficiency. And so I would say it's collaborative on that part, but the folks understand what we're doing and why we're needing to do it.

Despite those efforts in the improvements, as you heard Ralph say before, we're not currently earning our cost of capital in nuclear. So significantly, more needs to be done not only in the cost front but also on the market policy side that Tammy talked about earlier.

So from a Power perspective, we've been able to control our O&M also as much as to the nuclear. And you can see from 2012 to 2017, actually minus 0.3% for O&M growth. And there have been a number of activities that have allowed for this. It was -- some of it was as simple as let's take over the maintenance of our combined-cycle plants, a service that we had contracted out. We took that work in-house.

We then expanded it and we talked to our unions so that our union members from New Jersey could travel to other states and provide maintenance to the other plants that we own outside of the state. We've put in place maintenance in our monitoring and diagnostic center for our combined-cycle plants. So one of the reasons we're able to improve EFORp and the like is we are more closely monitoring key parameters at our operating plants.

This past year, we also put that in place for our nuclear plants, so now we have more [lifetime] monitoring of critical systems and components in our nuclear facilities. These items have saves us numerous plant trips and the like.

And those O&M savings aren't limited to just the [faults] of the nuclear folks, but in the energy resources and training operation, we've been able to take some technology improvements and process improvements and take three systems and replace that with just one, so that improves our cost accounting and bidding practices, and also allows us to be more efficient so that when we can take on with the Long Island work, we don't have

to add or let many more people to there because we have significant process improvement going on at the same time.

Likewise, we're getting help from our service company in the I.T. area, H.R. and the like. And as I heard Ralph talk about the finance coaches helping us with the pension and benefits and the like, so a significant effort. Enterprise-wise, it didn't just start last years and we are doing a good job controlling our expenses here. And you can see in 2017, this assumes that the staffing of the Keys facility, the staffing of the Sewaren facility and staffing of our retail operation.

So we are developing 1,800 megawatts of new efficient combined-cycle capacity, and you see the three states -- Maryland, New Jersey and Connecticut. In the case of Connecticut and New Jersey, it's replacing existing generation. In the case of Maryland, it is going to a new location that gets us closer to a load pocket and help us manage our bases with existing generation.

So a little bit on the Keys site. So if you look at the picture in the bottom right, you can see that construction is well under way there. This is a greenfield site, actually nice to work on in a lot of space and the like, a two by one natural gas plant, 755 megawatts.

So a construction is actually going well for us that one good thing about good weather is people can work in it. It doesn't do much for the other part of the business, but it helps this part quite a bit.

And you can see from a major milestone standpoint, essentially the engineering is complete. Major procurement is complete and all contracts are in place to be able to support the start-up in mid 2018. And so we are staffing the facility now.

And the interesting part about this and may be unique for our company relative to others is we're already a valuable member of the community in that area so our plant manager has knocked on doors, met many neighbors. We're funding a scholarship program for, you know, local folks to be able to work at the plant and that's all working well for us, so we're not seeing permit delays and the like, good cooperation from the people in that area and expect to be a viable member of that community for years to come. We have about 600 people working onsite currently on this project.

Sewaren 7, this is going to replace four of our older units. When I mean older units, about 65 years old in Sewaren area. In a load pocket in New Jersey, engineering is nearly complete here. Major procurements are done here, well out of the [ground]. And you can see the picture there and major components have been set in place. Construction is about 29% complete.

What you don't see here is we're actually doing construction of some of these pieces offsite in New York to help with the schedule and cost, so our HRSGs and air-cooled condensers were actually being built in New York, and we'll take them down the Hudson River to the site when they are needed here. We find that helpful because this site is not

quite as big as the Keys facility and it aided in construction. So we have about 400 plus workers on this plant site and another 100 in New York, putting those major components together for us. And then we put this unit and service in mid-2018, the other four units from Sewaren will retire.

And our last combined-cycle is the Bridgeport 5 plant, very, very similar to the Sewaren plant, in fact, is the contracts we're letting are essentially the same people that are building Sewaren for us. And we will also be doing offsite build of those major components in New York for this plant.

February 28th, we had the last hearing in pursuit of our air permit, non-adjudicatory so that means that essentially the [E.P.] in that area just needs to answer the questions that were provided by the public, which we don't see as an issue at all, and do expect to get the permit by April, and then we'll begin construction.

This has also have been a terrific example of how public outreach and being a member of the community was helpful because the people that were testifying for us for the most part were the local agencies and public officials and the like as they recognize the importance of this plant to the area and our contribution to their community.

So you saw this slide before, and I think you'll see it one more time so in case you don't see all the important facts on here, but our fleet has been transformed with an improvement in efficiency. And efficiency is important and vital as dispatch curves become flatter and flatter. Those that win are the ones that are more efficient and every bit of efficiency helps there.

So you can see the comparison from where we were in 2016 to where we expect to be in 2021. And from a generation standpoint what we actually plan to produce, so we're just about the same capacity, we expect to produce 18% more energy moving forward with the mix being fundamentally nuclear and gas and the coal contribution going down. And then 2021, that's the year where we'll retire Bridgeport Harbor 3, the last coal plan that we will operate, which will leave us just an ownership share in the Keystone and our Conemaugh facilities in the coal area going forward.

So here are the statistics of what this transformation looks like from an operational perspective. So combined-cycle heat rate, 3.5% improvement. O&M on a cents per KW, 10% improvement. Emissions that meet the requirements of the Clean Power Plant, in its current state and whatever might look like in the future, and in the bottom right, what you see is the average age of the fossil fleet.

So we tremendously improved the efficiency and lowered the average age of the fleets, which sets us up very well for the future for whatever that competitive environment may look like.

This is the capital picture as a result of that, and you can see obviously the large spend last year and this year in building these combined-cycle units and some spend in '18 as

we complete the Bridgeport Harbor facility. But in the end, we have $200 million run rate in power in the previous slideshow, 100 of that, and in nuclear operations, so 100 for remainder of fossil and trading and the like moving forward. Obviously, that enhances the cash flow and then provides cash for various investment opportunities in the whole enterprise.

So if I shift a little bit to the market area, we've talked about our location and access to Marcellus Shale and both a benefit and a curse for us -- curse for the lower price of electricity and impact on nuclear plants, but a blessing for the corporation and Power's combined-cycle plant. So you can see in 2010 we essentially [got] none of our gas from the Marcellus Shale to where just last year we got 90% of our gas needs from the Marcellus Shale area.

We have one of the largest procurement and trading gas operations in the country and you can see how much we produced or how much we procured last year of a 400 Bcf. Half of that goes to the utility customers and that reduction in price over the years has helped provide a lot of that headroom for the construction efforts that Ralph and his team talked about before.

So we got about 100 Bcf of that 400 for our own generation, and you can see 80% of that comes from Marcellus so that does give us some price advantage from our gas supply for our combined-cycle plants. And the remainder of that is a combination of our system sales and C&I customer use.

On the right-hand side, you can see what we've been talking about for some time, but which is finally starting to come to fruition. And we don't expect the Marcellus Shale to back off in production at all, but we do expect it to start going other places to kind of equalize the supply and demand mismatch that we have seen.

And so what you see just depicted here is a number of pipelines that are going out of the Marcellus Shale area to other areas where there's a higher priced gas. In all total, by 2018, that's about 20 Bcf a day. And this is where there are either certificates or construction actually happening, and about half of that we expect to occur by the end of 2017.

So what does that mean for prices going forward? So what you see on the left then is essentially the basis converging them between Henry Hub and Leidy prices, a trend that we think will continue into the future. And the result and increase in that has resulted in the change in the electric power prices and an improvement in the basis between P.S. and the Western Hub for PJM.

As you know, we don't leave our generation open and we would do a fair amount of hedging, and one of those big areas we hedge is through BGS. You can see it's about 11 terawatt hours or 20% of our expected generation. This past year we saw a reduction in price. Once again it's more headroom for the customers. As you heard Ralph described

before, the primary areas where the price drop was in capacity and the green charges with some uptick in the transmission charges slight decrease you can see in the energy prices.

We like this product for a number of different reasons, one of the full services requirement that suites the fleet that we have. It's good for liquidity and it matches our generation to load strategies so we can protect our base with this product. That said, if you were here, you know, probably five, six years ago, that was about 20 terawatt hours of generation. So as that load has been lost to others, we expect to get that back to the formation of our retail organization.

We do have licenses now in Pennsylvania and New Jersey for this operation. You can see in years three and five what we're expected to gain back, and we will be in a position actually the second quarter to be able to start our first sale for PSEG Energy Solutions, LLC.

We also hedge in other areas. Typically, we have two-thirds of our generation hedged over a three-year period, you know, 100% of our base load coming into a year and then two-thirds, one-third as we move forward. So what you see on this slide here is total volume for 2017. We have 80 % to 85% of that hedged at a hedge price of $46 a megawatt hour. We will be filling in 2018 and '19 as the year goes on to maintain these ratios. We do have a ratable hedge program. That said, we opportunistically do this and look for periods of volatility where we can lock in prices into the future.

Capacity market is also a good source of revenue for us, so couple of things I would point out here. Obviously, the high watermark that is 2018 and '19 or the capacity performance really hit the marketplace for the first time also incented some new generation, including our own Sewaren 7 plant. But fundamentally, we clear about 9,000 megawatts in each of the capacity auctions.

In the middle I've listed some of the parameters that will impact the upcoming auction. I'm not going to predict the price other than tell you some of those things help us and some of those things hurt us. And there's some big discussions, general things like the ConEd wheel, how that might impact this going forward is important.

The bottom of the slide shows the New England capacity market and just a reminder that for our Bridgeport Harbor 5, the auction price, which is locked in for seven years is the $231 per megawatt-day that you see in years '19 and '20.

So our solar business is essentially doubled in the last year, 17 plants, 13 states, and expect by the end of 2017 to have four more plants in operation. Our next steps there are not all that different in how I described our other operations, and that is how do we get the most out of these assets moving forward. So we are exploring several opportunities of things like doing our own maintenance on these plants like we do our own maintenance on our combined cycles or, you know, looking at the opportunities to pair them up with batteries and the like.

And so obviously it's a business that's growing at a good clip and we'll pursue this where we can. And when we have essentially power purchase agreements with credit-worthy counterparties, that will still be the mode that we operate under so that this contract of energy will provide during our earning stream for years to come.

So there are other sources that we make money. And I mentioned our gas supply business, this is BGSS where we saw wholesale provider to PSEG. You can see the contracts that we have for storage capacity and firm transportation. Essentially, we provide the PSEG customers first, usually our power plant second and off-system sales third. And for off-system sales we share a portion of that profitability with the utility, actually a large portion of that 75/25.

There are other ancillary services that our units provide -- black start, reactive power, area regulation; manage the LIPA fuel contract that you heard before. And I mentioned the Kalaeola investment. All told, these normally add up to about $250 million a year, in summer very plus or minus depending on winter, which has been the big impact. BGSS is important, but these other also provide a steady revenue stream for us for our business.

So going forward, you can see that we are in $514 million in operating earnings last year, and the guidance for 2017 is $435 million to $510 million, coming from the sources that I described on the previous stages.

So our value proposition is as simple as we have good assets in good locations that are highly efficient and are able to take advantage of whatever the market can give us. We have demonstrated this for the very beginning since our company was founded and recognize that we have a tough environment that we operate in. But with this kind of advantages we have, I think, we are well-positioned for the future and face whatever competition to bring us here.

I've mentioned the hedging program we do to protect it and the fact of the capital needs going forward also set us up pretty well for the future with the major investments really behind us at this point.

And with that, I'd like to brings Shahid up and we welcome to take any questions you might have.

Q&A

Praful Mehta - Hi, guys. I'm Praful Mehta from Citigroup. My question was on O&M and O&M expansion. Cutting cost seems to be a theme that many IPPs are going through right now and it sounds like on the generation side you're talking about that as well. But on slide 70 where you talk about O&M expense going down by adding 0.3%, I wanted to understand on a dollar per megawatt-hour or dollar per megawatt basis, how should we think about that? And also as you change your generation profile over time to becoming more natural gas generation at least with the new plants coming online, how do you expect that profile to move?

Bill Levis - When the combined-cycles go in place, there are actually improvement there for two reasons, one is there is increased generation and frankly fewer people needed to operate the plants.

So our Hudson and Mercer facilities employ about 200 people. Our Sewaren 1 through 4 plants employ about 50 people. The Sewaren 7 plant will employ 26 people as well the Keys facility and the Bridgeport Harbor. So those expenses will go down as those plants come into service.

I'd have to think about the math there, the power number. Since we kilowatt hour, I got to figure out my nuclear megawatt-hours and my fossil ones to get those numbers. But you saw the fossil side where there's a 10% reduction in O&M cost on a per kilowatt hour basis. We are a megawatt-hour basis going forward.

Praful Mehta - Got you. That's helpful. I didn't see that on slide 76 that shows the reduction.

Just another quick question follow-up on the CapEx side, on the maintenance CapEx. Run rate maintenance CapEx 2020, 2021, it's about $200 million. This is even after the new plants have come online, so the maintenance CapEx of the new plants is minimal effectively. Is that how I should think about that?

Bill Levis - Yes.

Praful Mehta - Thank you.

Paul Patterson - Paul Patterson, Glenrock Associates. On the nuclear side, you've mentioned in a couple of other people about the cost of capital. I was wondering could you tell us what the cost of capital is for the nuclear plants roughly speaking and how much of a subsidy you guys are perhaps projecting?

Also one of the slides in a previous presentation said that it would lower prices over the long-term or have a lower impact on prices, so I'm wondering whether or not that would be a one-for-one or how we should think about the level of subsidy that you guys are looking at to get your cost of capital and what that impact might be.

Bill Levis - You know, cost of capital is not a number that we would publish. It's something we use as our investment hurdle. But as Tammy described, if you saw the numbers that are being talked about in New York, in Illinois and the like, I think those numbers would be very helpful if we're able to achieve that same level in New Jersey.

Paul Patterson - Oh, Okay, so if you look at -- in that neighborhood. So the other thing is that what we saw in New York and Illinois was basically they waged the fight at the last moment. It does make sense obviously what you guys are saying to have these discussions and to obviously not wait until the last moment. But just seeing how politics sometimes unfolds, it seems that that seems to be something that happens.

When should we think about when the situation would begin to get critical for the new plants?

Bill Levis - We haven't set a timeframe, but we said time and time again as the current pathway is not sustainable so the challenge for Tammy and her team is let's create a crisis without creating a crisis…

Paul Patterson - Okay.

Bill Levis - …so that we can address sooner rather than later because there's a lot of good reasons to do that. One thing we forget is we 1,600 people working there, and I want their heads, minds and hearts working on making sure that plant runs well every day and not worry about that they're going to work tomorrow and not…

Paul Patterson - Okay. And then just plainly, the NEI has projected or made goals -- aspirational or not -- very substantial reductions in cost in operating nuclear plants. Could you address what you think of those goals and how they might apply to PEG?

Bill Levis - Yes, so the number you're referring to is a $3 billion reduction in total operating cost over three years. I would tell you I believe that they are achievable, and that was breaking down the cost into three buckets. That's the O&M cost, fuel cost and capital cost.

And as we meet monthly on this, in fact, our next meeting is on Monday to go where we are from a progress standpoint. Every day we find more opportunities here to save cost. That said, the 30%, I don't know if it's enough or not going forward. But if nothing else, it is a start. And I like to use the words "improve efficiency" instead of "reduce cost" because it helps send the right message to people is by improving efficiency, it will improve safety at the same time.

So one of the big initiatives, for example, this spring is we would -- we hire contractors for an outage, and there's a series of tests and exams and qualifications you have to undergo before you can get a badge. That was taking anywhere from three to five days. Well, the three to five days we're paying for are not getting productive work. That's millions of dollars.

So one of the initiatives here is, Okay, let's get these folks badged in 15 minutes, so they come to our sites and they get the work, millions of dollars of savings with just getting people to work sooner. There are a number of initiatives like that.

The security area, we found a number of different opportunities so that 185 number you saw, about one-third of that is a reduction and security force numbers that we've been able to achieve. And I think we're just seeing the starts of that. So it is important that we do this. Is it going to be enough? That still remains to be seen.

Jonathan Arnold - Jonathan Arnold, Deutsche Bank. In the slides on CapEx, it looks like versus the EEI deck, the $100 million for [Penn East] might not be there anymore. Can you speak about what the status of the project is and if I'm right about that?

Bill Levis - We can't add anything more than you read in the public on [Penn East].

Unidentified Audience Member - Hey, guys. Does potential policy moves in New Jersey impact, how you're going to hedge the nuclear fleet?

Bill Levis - As far -- the potential what?

Unidentified Audience Member - Policy moves as far as nuclear legislation, does it impact how you're going to hedge that fleet post 2019?

Bill Levis - Not currently, no. I mean, it will depend how things [shook out] there, but we're going to continue the hedge program as we have laid it out thus far.

Julien Dumoulin-Smith - It's Julien Dumoulin-Smith, UBS again. Just to follow-up in some of the conversation on nuclear, just to be very clear about it, it looks like the CapEx requirements to the nuclear business are kind of declining over time actually so I just wanted to be very clear about this. Given it may not meet necessarily your cost of capital hurdles, is there a point in time in which you'll need to see that CapEx step-up and make kind of a decision around investments? Is there some kind of generator investment or something like that out in the early 2020's that you are thinking about in making this decision, you know, yay or nay, for instance?

Bill Levis - Actually, there are not any big items out there. Most of those items are behind us, main power transformers, digital feed, voltage regulators if all investments have been made in the last half dozen year or so.

Steam generators replacement, if we recall, was done 2008, '09, so it's not like the steam generators waiting onsite that we're trying to make a decision on. So the capital needs in that $100 million is inclusive what we believe that we'll need in [10 years].

Julien Dumoulin-Smith - And then a further follow-up on the retail side, obviously you just talked about Pennsylvania, New Jersey. Why go the organic route versus the acquisitive route? One. And then secondly, how meaningful of a scaling are we talking about and how meaningful to overall margin composition? And maybe this is…

Bill Levis - I'll give Shahid a chance here.

Julien Dumoulin-Smith - Okay.

Shahid Malik - Yes. So thank you, Julien, for that question. A couple of things. Firstly, it's a defense play for us as opposed to an offensive. So in the grand scheme of things,

scale isn't really what we're looking in full. Typically, the retail companies make a lot of money when they scale up and nationwide. That's not the game we have here.

So, what is important to try and get, you know, good sales in our - in our footprint to these costs, we do expect that the integrated model that we have from generation and the customer will be satisfactory and raise our overall hedges and it would be in a different way of hedging. You know, as Bill showed on his slide, it's complimentary to our existing BGS.

Your second question was about why we're building organically rather than buying. We've looked at buying, and frankly, some of the prices that we've seen and some of the companies that have been available and books that have been available might have been wrong placed, wrong type of customer, wrong type of business for the business which all are built.

So, the way I'm thinking about it is, look, let's go ahead and get started. We will build out a good platform, bring in the systems and folks that we need, have a base. We believe that we can grow that organically ourselves, like we see some nice tuck-in acquisitions as we've talked about publicly. We'll look seriously at them and they'll be able to help increase our penetration in our chosen markets. So, it's not a one or the other. It's one for now and maybe we'll do some additional book tucking in as well.

Unidentified Audience Member - Just a quick clarification on that. It's predominantly C&I effort rather than a mass market?

Shahid Malik - That's correct. It's all C&I.

Unidentified Audience Member - It's all C&I.

Shahid Malik - At the time for now. Yes. And we'll be looking at gas as well.

Unidentified Audience Member - Great. Thank you.

Mike Weinstein - Hi. Mike Weinstein from Credit Suisse. Just a followup on Julien's question. What kind of retail margins do you expect to make on that, I mean, as part of that green bucket.

Shahid Malik - Yes. Great question. That's what my boss keeps asking me as well. Look, the - I think if you look at - and we haven't started selling yet. Plan is to start selling in the second quarter. If you look at what the competition is doing and the numbers that they're reporting. It's anywhere from $2 to $6 is the kind of price range depending on the size of the customer and the risk you take on.

Clearly, the larger the customer, the smaller that margin is, the smaller the customer, the higher that margin is. And as you increase and move into the residential space as plenty

of companies are, those risks for higher but margins are higher too. That's not a place we intend to go right now.

Mike Weinstein - And just to clarify, on the residential side, the rules - for BGS rules today prohibit you from participating in that market or no?

Shahid Malik - No. No, it's personal preference. We've decided for what we think are good reasons for now, change the residential space and start off from the C&I.

Unidentified Audience Member - Steve.

Shahid Malik - Hi, Steve.

Unidentified Audience Member - How are you doing? Just, could you maybe touch on the ConEd Wheel issue for this upcoming auction and just explain what it is, what - will it definitely get updated for the prior to the auction and potential impact on your key zones?

Shahid Malik - Yes. So, I'll talk publicly what's available publicly as opposed to some of the internal discussions that we've been having and you should recognize that PSEG's two entities as the regulated Utility which will have a lot of information that I'm not privy to and then there's a competitive business which we look at and which I managed to so I can talk quite a lot about the latter, not so much the former.

But generally, the ConEd Wheel was a mechanism whereby ConEd was able to bring Power into effectively PJM and then out again to supply the city through different Transmission lines. It's been in the business for many years and last year, ConEd gave notice that they would terminate that agreement for a variety of reasons. Principally related to cost. They felt that they had more cost-effective ways of getting the Power to their customers.

So, PJM and New York ISO and the two utilities, ConEd and PSE&G have engaged in discussions about what are the impacts and the implications of that Wheel. As we've come through the process, ConEd and the New York ISO have had one set of perspectives and we've had PSE&G and PJM have had [another set] of perspectives and they've been ongoing dialogue and that's still continuing between now, between those four entities.

And you probably saw that PJM announced its parameters for this upcoming auction last month. And in those parameters, they said that they expected some additional information to be forthcoming about what the impact of that wheel going away would mean to the import capability or one of the ways they describe it is the [CETO-CTEL] ratio which effectively is a way of defining the ability of a recent import and to export.

In the parameters that they put forward, there was some impact from this ConEd wheel going away. We, in PSEG and on the competitive side, we certainly think that there is

still some more impact to come. I'm not privy to what the Utility is saying, we're doing about it, but we do know that there's actually discussions going on.

And Tammy or Ralph, if you want to comment on that, that's pretty much what - what we're able to share right now.

Kathleen Lally - I'm going to ask that we hold off on any other questions until the end of the morning, after Dan's presentation. Thank you.

presentation
Dan Cregg - All right. Good morning, everybody. I'll close things out today. I'll pull together an overall financial picture for the company and kind of tie together a lot of the things that you've heard this morning and put them all in one place financially. And I think you'll walk away with an understanding that we're well positioned for the continued investments that we've talked about. It will enhance the quality service that we have that our customers deserve and kind of expected at this point and be able to grow business results and provide an opportunity to grow the dividend that we talked an awful lot about with you all.

If I take a look at the first slide, slide 90. So, looking back at 2016, we reported operating earnings with $2.90. It's midpoint of our original guidance, the upper end of our revised guidance and a lot of great work done as we went through the year especially towards the end of the year to get to get to that point. Once again, we increased our regulated contributions to those earnings in 2016 to 60%.

We successfully executed our investment program 2016. It was the highest investment, capital investment that we had made as a company. Over $4 billion in infrastructure to benefit our customers both on the Transmission side and on distribution and in generation. And continue to generate significant cash flow and that's on both sides of the business and I'll show you some sources and uses later in both sides of the business, very strong cash generators which will help fund some of the future opportunities that we have without the need to issue any equity.

And then lastly, the dividend in 2016. We grew the dividend by $0.08, so just over 5%. And earlier this year, with our announcement of another $0.08, we're just under 5% as to what we're doing in 2017, bringing the dividend from a $1.64 to a $1.72 indicative rate.

So, on this next slide, we show a story basically of delivering our commitments. This shows back five years. Ralph Izzo talked a bit earlier about a 10-year story and if the earnings guidance that we provided at the beginning of the year and essentially how we have delivered on that guidance and we've consistently met or exceeded that guidance operating the business well, managing it efficiently, identifying and executing on our investment plans. And frankly, we've done so through some fairly turbulent times.

And 2016, really no exception there if you think about the winter that we had and extremely mild weather. It was the fifth mildest winter on record in New Jersey. We

saw a fairly challenging market environment as well and some unusual events at Salem that we worked our way through, I think, extremely efficiently and we identify the challenges in front of us and ways to overcome them and ultimately found ways to work more efficiently and O&M Power was a big part of how we got through this past yearend and we are very pleased to say that we were able to deliver on our commitments again.

And, so you saw the left side of this slide earlier today when Ralph showed it. It's basically the earnings breakdown by business and the continuing shift in business between PSE&G and Power and it's very consistent with the investment message that we talked about. Ralph showed the - Ralph LaRossa showed our overall service area at the Utility. And, really, the growth we have had is from growth in infrastructure and the increases that you see at the Utility, really, are aided by a contemporaneous recovery mechanism through our formula rate and the cost mechanisms that we have on the distribution side of the business as well.

We get the improvements that we have had in resiliency and the good results that we showed and the five-year 11% CAGR from operating earnings that Ralph LaRossa mentioned earlier today. And as we move from '16 into '17, Utility was showing 8.5% increase to the midpoint of that guidance range that Ralph laid out.

And you also see throughout this period, really, considerable earnings, contributions from Power which contributed $514 million last year in the midst of those challenging market conditions that I've talked about.

So, the aggregate makeup that you can see, the percentages, inside the bar is 43% in 2012 growing to 66% in 2017, all that part of our earnings guidance of $2.80 to $3 in 2017.

From the Utility side, the driving behind those increase in contributions comes from the growth in rate base. And this is a slide that we have shown you in the past, very similar layout, provides a build through time of our rate base from our current levels, $15.2 billion at the end of '16 and it rolls through to where we see ourselves at the end of our 2021 five-year business planning period.

So, if you - if you start by looking at 2016, the split of distribution and Transmission, we're currently about 44% Transmission. So, when Tammy or Ralph LaRossa talked a little bit about our upcoming rate case, really, that's applying to roughly half of the business as the Transmission part of the business, obviously, has a different regulatory regime.

Moving through 2019, the first three years that we talked about where we have a 9% CAGR in our rate base growth both on the Transmission and distribution sides of the business to aggregate as to $19.6 billion in total rate base and Transmission will grow from 44% to 47% of that total rate base. And then extending out to 2021, continued investment brings us to $21.6 billion estimated rate base at that point in time.

And with a little bit less visibility, we've talked a little bit about that and I'll show some numbers as well as to how we grow that overtime. You see a moderate decline so we have the 7% CAGR as you start in 2016 and run through the 2021 time period.

And then we've also captured the additional potential capital spend that both Ralph talked about a little bit earlier, that could bring us up to $22.9 billion. That would have restored us over the five-year period to a 9% per year rate base growth. And again, as we've talked about, that would expand the GSMP program another $100 million a year and also add on the ESM period, the extension of the Energy Strong programs, that's in th e works, but again, not part of our baseline plan.

And then beyond that, we talked a little bit about some of the things that are on the drawing board, a little further out and that's what I referenced on the far right side of the slide, the Utility of the future spend that we've been thinking about. And the way we think about that is the ability to continue to be within that kind of a rate of growth to 7% and 9% out for the foreseeable future for the next five years or so.

So, bottom line, a lot of line of sight into continued growth to enhance reliability and resiliency of the system and the ability to pay for it.

On the Power side of the business, really, it's all about operational excellence and you heard Bill talk a lot about that. It's for being ready when the market calls, it's for delivering when a market calls and putting in place a hedging program to solidify some of those results.

So, we show on the left side of the slide is our energy produced in 2016, a little over 51 terawatt hours. Mostly from nuclear and combined cycle and that will grow overtime, closing to about 60 terawatt hours by the time we get out to 2019.

And then below that on the capacity side, having over 90% of our capacity in PJM and New York - New England, rather, where there is a three-year forward capacity market, it helps solidify the overall margin that we can count on on those periods as well. So, you take those two - the three-year hedging program and the three-year full year capacity market and net-net, if you look at where we are from the gross margin perspective over the next three years is about 55% to 60% of that grows margin that has been secured through those two mechanisms.

So, provides a fairly solid financial base and very strong cash flow coming out of the Power business with good line of sight as to what that amounts are.

And then the rate base growth at the Utility and the improved efficiency at Power really are all supported by the capital program that we have and this is a built, kind of like the rate-base slide that we show but it's capital in the aggregate across enterprise for the $15 billion capital program that we have.

It starts with our baseline capital for the five years and then shows some incremental opportunities as you move from left to right. So, we start with some maintenance capital and if you take a look over the five-year period, Power runs at a moderate run-rate of capital. Bill gave an indication to that number about $200 million a year, basically, just taking care of the existing fleets such as it is.

And then at the Utility, $2.9 billion over those same five years of maintenance capital. Really, the way to think about that is it's spending basically at depreciation levels. So, your rate base is moving along, your rate base goes year-to-year and depreciates to the extent that you're restoring that rate base up to its original balance. You have maintenance capital but you're not actually growing the aggregate rate base. You're just keeping it to where it was.

Following in the center of the page, beyond that, there's $10.9 billion of identified growth capital and the lion share of that as we've been talking about, those come from the Utility, it's about three quarters of the utilities, overall spending during the five-year period and it consist of transmission, about two-thirds of the total but also on the distribution side, some new business spending. So, when we have either somebody new coming into the territory or, frankly, somebody moving within the territory, there's spend to connect them. And that all goes into a new business component which is incremental to the depreciation spend. As is the completing of the Energy Strong program and the extension out of the gas system modernization program.

At Power spending, on the growth base, it's really is Keys, Sewaren and Bridgeport. And beyond that, it drops off and I'll show you another slide on that which gives you an indication as to what that means for availability of free cash flow.

So, total PSE&G is about 82% of total capital spend and 86% of the growth capital and we've identified and are pursuing an extra 1.5 billion of investment at the Utility. Again, really, what that amounts to is the ESMP expansion of Energy Strong, $250 million to $300 million a year that aggregates to $800 million that we talked about.

GSMP for 2019, 2020, 2021, more of it. So, you could bring yourself from $300 million up to $400 million. And then extension of energy efficiency programs and a little bit of renewables that could get you another $400 million.

So, the expansions and extensions, the expansions and extensions Utility of the future that we've talked about, really, that’s indicative by the nature of the system and the nature of our planning process. The age of our system is such that it's got a pretty healthy appetite for capital. We plan what we know and then we identify things overtime and Ralph walked you through, I think, a really good example just looking at 2017.

And what I do here, as we stepped through time, I also just gave that little bit of an example as to what the last three years have looked like from a period three years earlier than the end of that year. So, starting on the left side using 2014 as an example, we have

planned in 2011 that our 2014 spend was going to be $2.1 billion and what we got to the end of 2014, we had spent $2.8 billion.

So, that's based upon the types of things that we've been talking about to, quote-unquote, fill in the back of our capital plan as investments could identify through time. Same in the middle of the page. If you look at 2015, capital $3.9 billion, three years earlier in 2012, we had anticipated that would be a $1.5 billion. So, as we stepped through time, that was the magnitude of the growth.

And then just year, if you look at what 2013's forecast of 2016 was going to be - it was $2 billion and when we finish the year, we were in excess of $4 billion. So, again, it's just an example of how we have planned for what we know, how we have identified investments to make during the intermittent periods between the original forecast and we stepped through time, to a higher balance. And then this really just shows you components of two slides, you had seen earlier in the day.

It's the capital plan and Power on the left and the Utility on the right. But as we look at these, we look at maybe two slightly different situations. And what I mean by that is a Power, if you'd take a look at where we are, the three new combined cycle facilities, really dominates that picture. It's all of the orange section of those bars and it rolls through 2019 where we would complete Bridgeport Harbor.

And beyond that, the growth capital that we see at Power in 2020 and 2021, really are negligible. So, the beneficiary of the reduction of all that capital is free cash flow at enterprise. On the right-hand side, let's take a look at the Utility, $3.4 billion of spend is anticipated in 2017 which together with Power spend will, once again, be the highest amount of capital that we have spend.

And then you see a decline with the reduction in our known projects. But, again, if history is any indication, in that five-year period, we will find opportunities to build that backup either from the shaded area that you see on top for the program extensions and expansions that we've talked about on the last slide or the utilities of the future items such as AMI and some of the other things that we talked about earlier.

So, certainly, opportunity to grow the business and I would say that we would tend to have a higher confidence in the left side of this page, that that's what's it going to look like when all said and done than we would on the right side. So, most of that growth that we showed from '11 to '14, 2011 to 2014, and over to both in the slide that I just showed and in what Ralph showed earlier in 2017 is growth related to the Utility part of the business.

And what that ends up looking like from sources and uses perspective is shown here. We show the five-year sources and uses. Maybe start bottom left. You can see in the green section, you have powers cash from us which has been strong overtime, remain strong. And then the bottom right, you can see Power's overall five-year capital program. So, the

maintenance investment is back on top. You see the growth investment. So, a lot of free cash flow as the growth program declines that will become available to enterprise.

If I go back to the left-hand side and higher up, you can see the utilities cash from ops which, in its own right, is extremely strong and frankly continues to grow as we invest in the business. We've talked about a contemporaneous return mechanism at the transmission and the clause mechanisms on the distribution side. So, that growth investment that you see on the right side has a feedback moved over in to the utilities cash from ops on the left-hand side.

So, again, Utility is where we talked a lot about Power's cash flow generation but the Utility, on its own right, a very strong generator of cash from ops that uses within its own business as well.

And the remainder of what you see here, change in debt at the Utility. We try to keep a regulated cap structure at the Utility a little over 51% equity. So, to the extent that we're investing there, we match those investments and keep that regulated cap structure in place. And at a very modest parent that is removed through the five years. And then on the upper right-hand side, the very important dividend payment.

So, again, the $15 billion capital program worked its way through here and all funded without any incremental equity.

And then the sources and users flows into our credit stats and we show a slide related to that here that gets us to the standpoint of what we have from an investment capacity. We're showing you from 2017 to 2019 based upon the fact that we have FFO here and we have more known results, as I've talked about at Power especially related for the next few years. And across the board, if you take a look at Power, our credit position remains extremely strong. Our average FFO to debt is well above what we consider a minimum threshold of 30% and we keep that threshold based upon what our investment grade rating is.

And it stays fairly steady across those years at a 40% FFO to debt amount. And then if the parent, the threshold minimum, really, is dependent upon the mix of the business but we call it in here, the minimum threshold of high teens, we think about that as 18%, 19% or so.

So, the minimum threshold is shown on the bottom left and then above that, you have the estimate of where we think we're going to be over the next three years. And the excess of where we think we're going to be versus what we have as a minimum threshold really becomes our excess investment capacity and you can see that on the right-hand side of the page. So, it aggregates to around $3 billion and more likely than not, based upon what we have told you about today and the way the direction of the business has gone, more of that would go to the Utility than not.

So, stepping back and thinking about that Utility cap structure and thing about a roughly 50/50, it's a little bit more equity within the regulated cap structure. The funds available here that would go into the Utility would go in as equity and then that would be matched with Utility debt. So, if there's $3 billion here and every dollar of it were to be used at the Utility and it we're to be matched with that at the Utility, that would imply $6 billion available investment capacity at enterprise to be used at the Utility without any incremental equity, to the extent that Power used its own investment capacity on a - on an asset acquisition and basically the remaining two or so billion dollars that you see. If the parent would move over, and it would be matched with debt to get to about $4 billion.

So, considerable drive pattern to be used for the investment opportunities that we talked about earlier today.

I'll shift over briefly related to pension and OPEB and we are in very good shape here. Pension is very well-funded. We ended the year with a funded ratio of about 90% and if you think about what we have done and how we have managed the pension funds over the last five years, our returns have exceeded 10%. So, the upshot of that is that the asset side of the equation is well funded, no cash contributions are needed from - as we look forward into our five-year planning horizon.

And we mentioned on the earnings call a couple weeks back that we had done a merger of our pension plan. So, we had a couple of different plans, somewhere our more senior associates and some where some of it, more recent associates to the company. We merged those plans together into a one plan for simplicity of administration. The benefits are unchanged for any of the participants that are in the plan but by pulling those three plans together, it did streamline the administration.

But it had another effect as well and when you aggregated all the plans together, we have an unamortized gain or loss balance that gets amortized over the remaining service life of the employees. And we had a shift between the average service life in some of the plans versus other and the unamortized balance in one plan versus the other. And when you pull them together, you essentially extended, the active service life remaining which extended the amortization period.

So, our unamortized losses will be amortized over a longer period of time which does provide a benefit to about $48 million this year and that amount is not a one-year event. It will continue through time but we'll start to moderate somewhat because whatever wasn't amortized this year will need to be amortized into the future.

So, benefits into the future from that as well, net-net as we look at this year versus last year, about a $22 million decline in pension and OPEB.

And that pension falls in to our O&M. O&M control is a hugely important part of what we do on a day-to-day basis. You've heard Bill talk about it, you've heard Ralph talk about it. It's not a program, it's really a mindset in how we run the business.

One brief stop in, if you take a look at what we show on the page here on transmission, it shows a 5.6% increase. Really, in addition to some tree trimming that Ralph talked about there as well, some of that is part of the nature of the work that we're doing at transmission and by sometimes removing the old equipment that goes to O&M as opposed to capital and with so much capital going on, that does have a bigger impact on the O&M. It is, by no means, a sign of inefficiency. It's just the nature of the work and it does get recovered through the formula rate.

So, you see a higher percentage there than in some of the areas which should not be alarming. But, really, just what you see here from 2012 being flat all the way through the 2019, I think is a credit to the discipline of the employees that we have and how much importance we put on managing the business sufficiently.

And then, a quick walk through on tax reform, a lot of talk had been had about tax reform and Washington is extremely early within this process, details are really not known but concepts are and I think the concepts are big enough that its drawing the attention that it's gotten.

We do feel like we're well-positioned. I think we feel like we're well-positioned given the contribution that we get to the business from Power as well as strength of balance sheet.

Utility side of the business, we kind of layer out here are some of the key elements that are involved in the discussions thus far. Stepping quickly through the Utility, the reduction and the tax rate, obviously, would pass through to customer and we would also have access to deferred taxes. So, depending upon what they bring the rate to, our existing balance of deferred taxes would no longer be needed in the magnitude that it's there and that would go back to ratepayers over some as unknown today, some period of time. If you think about our balance sheet strength, if you feel like we have a very comfortable ability to pass those back and the access deferred, if you assume a 20% rate, you're on the order of $2 billion. So, we will wait to see what comes of that from the standpoint of timeframe to pass back.

Expensing a capital would reduce customer bills and one way to think about the effects, it would look a lot like the existing 50% bonus depreciation, right? So, if you had 50% of 35%, instead of 100% at 20%, you'd have a number that look pretty much the same although it would be on a more permanent basis.

And then we do have a rate case that we will be going in for on November 1st, we don’t know what we'll know by that time but to the extent that we do know what's going on, these factors, including interest deductibility and the impact on the bills, to the extent that we know something at that point would be layered in to that rate case.

At Power rate reductions, we would retain them. There's no regulatory agency to go back to that helps our after tax earnings in cash flow and that same excess deferred balance

that we talked about would be retained, it would be a one-time noncash benefit to Power, again, at a 20% rate around $700 million or so, noncash. It would become cash as we step through time and those timing differences will roll back to the benefit of the company.

With such low levels of debt, the interest expense impact will be moderate to us versus our peer, both at Power and the parent company. And we also paid fairly low property taxes in New Jersey for those residents of New Jersey, that's a little different for what we see individually and what we see on the Power side of the business. I think, if you think about it from an overall standpoint compared to peers, it's on the lower end. So, to the extent that that's in play, I think, on a relative basis, we're pretty well [served].

And then we are at risk of a Border Adjustment Tax on nuclear fuels about a $200 million a year spend. It's a fairly complicated way that the nuclear fuel comes to us from uranium and conversion enrichment fabrication, so some of that is to be determined as to how it would be implemented.

I think on the earnings call, we said a little more than half would be foreign-based. If I put a finer point on that number, it's probably closer to three-quarter of the aggregate amount in nuclear fuel. But again, a lot to be determined as to how that would be calculated.

And, frankly, another thing that I haven't heard discussion about and it probably will come down the road is transition rules, so how these major changes to the tax code, where they land on them, is going to be important but how they get transition then, I then, I think is going to be equally important and is equally unknown right now.

So, a lot of uncertainty, but I think for some of the macro concepts that we see here, I think we're in pretty good stead.

And then we'll take a look at the dividend here and, you know, we've said that for a long time and we've acted on it for a long time that the opportunity for meaningful and sustained growth in the dividend is here for the company and we have delivered upon that. You see a 3.9% increase in the dividend on a CAGR from 2011 through 2017 and, I mean, we take this commitment to our shareholders, really, as important as reliability in services we do on an everyday basis. We understand the importance of the dividend to our shareholders.

In fact, we were here on Friday afternoon recognizing 110 years of consecutive years of paying a dividend by the company. We are honored with the ability to ring the closing bell on the exchange. The stock exchange was great. The event was extremely well run. We thank the exchange for that. And with just, again, last month, we were pleased to bump up another 5%, another $0.08 on the dividend.

So, as we do go forward, we take a look and what this graph shows you is it compares out dividend at enterprise to the earnings of PSE&G and shows that we can cover the

enterprise dividend with the earnings at PSE&G. That's not a formula, that's not how it is determined. We so all those factors but we do take some comfort from the fact that that part of the business is able to cover the dividend and it gives us a good ability to say that we have the opportunity for meaningful, sustainable growth in the dividend going forward.

And then lastly, just a couple of quick looks at earnings sensitivities and Power on top and the Utility on the Utility on the bottom, you see some of the numbers increase as you step through time that's purely a function of our hedging program.

So, baseload generation, really hedged in 2017, not much of an impact of the change in gas prices, could be some market nuances but we're hedged in 2017 and then as you step through time, wed be more open and more subject to moves in gas prices.

Sparks as well. A little bit of volume locked up in 2017 and then as you step through time, you can see a bigger impact both from more the Sparks being open and having more facilities online as we step into 2018 and 2019. And then moderate impacts on dark spreads and nuclear capacity factor.

Maybe on the PSE&G side, again, similar to what we have shown in the past with one exception. If you take a look at the bottom two rows which shows any kind of a delta in the distribution or transmission ROE numbers, those numbers are a little bit bigger. They were - they kind of cascaded from a $0.01 to $0.02 last year, that's purely a function of growth and rate base.

So, if a change in ROE is going to be what your rate base is times your ROE, you're going to see a bigger effect as you step through time and as you have more rate base. So, we probably had some pennies that are on a heavy side last year. We have some $0.02 that are on the lighter side and as you step through to 2019, you got a good round, $0.02 per share for a 20 BP change in the ROE. So, just a little bit of sensitivities for you to take a look at there.

So, in summary, if you take a look at 2016, we delivered on our original and revised earnings commitments. We have a more regulated profile into 2017. The capital program is going to grow the Utility. It's going to make Power more efficient and in the end of the plan, have Power with a more free cash flow.

We do have our eyes on the opportunity for continued growth in the business that's going to help our customers as well and the prospects for our dividend growth remain strong.

So, with that, I think Ralph is going to come up. We'll be happy to answer some questions.

Q&A

Chris Turner - Good morning. Chris Turner, JPMorgan. Regarding your comment on FFO to debt at Power. I think you said it was going to be consistent at about 40% for the

next couple of years. Could you tell us the exact kind of timeframe underlying that the other assumptions that might be moving around within calculation and if there's anything on the sources and uses slide that we might be missing that's embedded in that as well in terms of flows up or down?

Dan Cregg - Yes. So, I provided the numbers that were there. Maybe the way to think about it is some of the sensitivities that we show, most of those would be purely impactful to cash flow. Our debt balances are fairly steady at Power as you step through the '17, '18, '19 timeframe. So, with a fairly steady 40% FFO to debt, that can give you some indication on that front.

Sources and uses, I think the pieces that we showed there, there was nothing that was missing. You have all the elements across the five years. S,o I don't know that I have a whole lot more to add other than what we've shown.

Praful Mehta - Hi. Prahful Mehta from Citi. So, firstly on ZECS or whatever support you're looking for for the nuclear assets. Given that support, you're still going to look for legislative most like at the state level. I'm assuming it will put the restriction from a strategic perspective if you're looking to do something around what the generation business if you would, let's say, try to spin or something else, it's probably better to keep it at a consolidate business level to try and achieve some of those legislative objectives. Is that a fair way to think about it or no?

Ralph Izzo - I don't think so. I mean, the case we would make at the federal level and at the state level would be that those assets are important to customers and to society in general. We, as a for-profit investor-owned entity are going to keep and operate assets that are returning their cost of capital and retire assets much like we did our FP4 engines and our HEDD units and Hudson and Mercer when they don't achieve their capital.

So, whether one's operating it or somebody else is operating it or some reincarnation of us is operating it, I think the owner is going to make an economic choice. The policy implications are for someone else to make and I don't think they would care as long as they know that they're being well managed, who the owner or operator is. But we haven't gotten to any kind of conversation like that.

Praful Mehta - Got you, but your scale does not, you think, give any benefit that a smaller IPP probably struggles to get the same voice?

Ralph Izzo - No, because it's the same amount of air emissions, it's the same number of jobs, it's the same impact on the market from a supply and demand point of view. I mean, I'd like to think from your question that maybe we have a higher degree of credibility and people will believe us when we say, you know, we're trying our best to keep them operating and when we say Uncle, that they will believe that as opposed to, perhaps, how's some others might behave and if that's the case, that's great. But I think the assets speak for themselves regardless of who has the title to them.

Praful Mehta - And secondly, in terms of the cost of capital point, I just wanted to understand, if the goal is to try and get some subsidy or whatever else, right, that gives the 16.50 cost of carbon calculation, if you get that level, would you be exceeding your cost of capital requirement? And in that case, are you getting subsidized all in above what your cost of capital requirement is?

Ralph Izzo - We're not looking here to get any kind of unfair handout or be greedy. What I'd love to see is just the market pay for the attributes that these plans possess that so many documents that we value, right, whether it's the state energy master plan, whether it's comments made by federal regulators and we've talked to policymakers about, hey, just put a need to test them there and we're not - we're not trying to pull a wool over anybody's eyes, I'm just telling you that it's not a difficult decision for us as a company to retire the assets if they're not achieving their cost of capital.

But if there are broader implications of that, we all ought to make sure we do that with eyes wide open. So, put a needs in there. And that's absolutely fine whatever the mechanism is to continue your support.

Praful Mehta - Thanks so much. Just a quick followup, on the incremental capacity, in terms of financing capacity, is there any intent by the signal of holding company leverage, is there a goal - a target level of holding company debt that you would like to have to kind of support that investment that you put in equity down at the Utility level?

Dan Cregg - No, I mean, we're going to support the business needs and we're going to make the capital opportunity - make the capital investments where we see opportunities to get a good return so there's not a target for saying no.

Andy Levi - Hi. It's Andy Levi from Avon Capital. Just a couple of questions. Maybe just focusing on the balance sheet first. Where do you see the equity ratio at parent growing by '19, '20, as a kind of mid to high mid 50s?

Dan Cregg - Yes. It would be - it would be kind of low to mid 50s. that's right.

Andy Levi - Low to mid 50s at the parent or would it be --

Dan Cregg - Across Enterprise.

Andy Levi - Across Enterprise. So, it'd be like 55 or lower? Is that where you're trying to --

Dan Cregg - Yes.

Andy Levi - Okay. I thought it was maybe a little higher, though. But even at 55%, just wondering kind of to thinking, I guess, just as far as modelling, Ralph, just either we put that capacity to work whether it's at the Utility or a Power or we, at the very least, because the balance sheet is in good shape, if we don't have the investments maybe to

plug in and we buy back stock and then kind of take the buyback out when the capital comes, is that kind of the way to look at it?

Dan Cregg - Yes. So, we've talked for quite some time and it hasn't changed. We have three priorities. Reinvesting the business, providing a little bit of the cushion for that sustain and consistent growth from the dividend, and lastly, and the third priority would be the buyback to the --

Part of the reason why we asked Ralph to show some of the blue sky thinking that we do is just to give you an assurance that we don't run out of ideas for things that are of value to the customer that's been articulated by policymakers so they're important in terms of ways to use their balance sheet.

Andy Levi - And then, just back to kind of the whole legislation possibilities in New Jersey. So, if you kind of look at what's going on at Connecticut, which, obviously, is a much different state, Dominion is actually making money on their plans, maybe not as much as they used to but one of the things that's kind of holding back my opinion, and legislation's (technical difficulty) lack of willingness to open up their books and show kind of what they're making or what they're not making and probably that's maybe one of the main reasons, it doesn't get past, in my opinion.

But in your case, I think you've articulated in the past that basically, the money that you're putting in to the nukes are earning a very low single-digit return which doesn't justify continuing to put hundreds of millions of dollars over a period of time into those plants. But are you also willing to open your books and kind of demonstrate to the --

Ralph Izzo - Yes. So, it depends on the definition of open because we all have different perspectives on that but I personally went through an exercise -- and had Dan check my arithmetic and I almost got it right -- where I took out 10-K and you can very easily, from the information in there, calculate what the current year equity returns are on our nuclear plants in the aggregate right now in a plant by plant basis.

So, I think we would love to walk people through that calculation, explain it better to them if they need that kind of help. But for competitive reasons, we're not going to go through what our day-to-day-ahead bidding strategy is in things of that nature. But it would be sort of annualized numbers of opening the books. That would be absolutely fine.

Julien Dumoulin-Smith - Guys, back here. Julien, UBS, again. Let me take that conversation at cost of capital on individual nukes and bring it out back to the Power level and talk with you about, I supposed, the other - the bigger strategic question of the business congruent, one against the other. Does this greater focus and conversation on cost of capital shift your thinking and when and how?

Ralph Izzo - No, not in the least, Julien. I mean, our thinking on that hasn't changed. You know, the conversation for this is so often, I've actually once gone back to my notes

when I was vice president of strategy and we were asking ourselves in 1998 whether or not to stay integrated or not in the grid.

So, we talked about this at the board level all the time. In fact, you know, the tactical reasons we've talked in the past is staying that the cashflow generation, the ability to move people around, the sharing of expense, the synergy on the bill, the offsetting effect on the customer bill, all those remains front and center in terms of good tactical reasons to stay together.

Right now, what I'd like to do is just make sure we get the portfolio in really good shape, By that, I mean, let's make sure that we treat the 200 people at Hudson and Mercer well, let's make sure the policy makers have open eyes on what the future for nuclear may look like if current forward-prices are realized but no change in our strategic thinking about the longer term value of Power and what it might mean to staying integrated or separate.

Julien Dumoulin-Smith - And perhaps just as a follow-up over that, you know, obviously, you guys have tax capacity in comparison or contrast to your peers, have you thought about scaling up some of the tax absorbing renewable tax credit solar investments that you have?

Ralph Izzo - Yes. So, we have. I'll let Dan talk about the tax appetite because I know it varies from year to year and there are some things we're bumping into.

Dan Cregg - Yes, I mean, I think I've said recently that we're going to be out for a year and then we kind of work our way back to a positive position but it'd be close. I think that the other thing to think about is you got a pretty dynamic situation from an overall tax perspective that's in front of you. So, I think that some of that needs to work its way through before you add any kind of a major strategic shift to understand what the tax landscape was if it was based upon the tax landscape.

Julien Dumoulin-Smith - All right.

Michael Lapides - Ralph, Dan, Michael Lapides of Goldman. On emerging Power markets in general, do the economic signals you're seeing, do they imply new build economics or in a return that's above a cost of capital for new combined cycles? In the market in general and I know your Bridgeport unit is very different because it's got the seven-year lock, that I totally get, we're just - we keep seeing announcements of new builds, we keep seeing new builds happening, whether in Pennsylvania, whether in Ohio, we see assets by private companies, we see assets by public companies who might be cannibalizing themselves, I'm just trying to get your broader view of the economics of new Power generation in the - in the eastern Power markets.

Ralph Izzo - Well, I guess the fact that we said - probably within 24 hours after announcing Bridgeport that we were not going to build any additional supply, might give you some pretty clear understanding of where we think the markets are right now in

terms of the supply. Asia, three projects have some - that where involvement has some unique aspects that we continue to test and they come out positively from that test.

Having said that, we have no plans, as I've said now, for probably a better part of a year and a half to introduce - to introduce additional supply, we think the markets - in Eastern MAC, for example, last RPM auction, no new capacity cleared. I think we've seen some slight compression in Spark spreads. So, if you - if the two components of any investment or energy and capacity and last year's capacity price was insufficient and Sparks have compressed further, if you're going to build new supply that would suggest to me that you think that'd be a significant change in capacity process.

We're not gamblers. So, we won't be - we won't be adding to that mix. So, I guess, my thesis would be if you're a rational investor, new supply, above and beyond certain special situations, it don't make sense, we don't have any more of those special situations but I can't speak for others.

Dan Cregg - We'll find that a little bit more in May.

Leslie Rich - Leslie Rich, JPMorgan Asset Management. I'm sorry if you've already said this but looking ahead to after Hudson and Mercer are closed, what happens to your O&M Power in '18? Like how big a drag are those units?

Dan Cregg - Yes, I think we have said earlier that there was about a $50 million O&M in total now in '17. We're still operating for a chunk of the year so some of that will sustain and as Bill referenced in some of his comments, the increments that will come in in part because of retail, in part for some training and readiness for Keys and Sewaren and then as you step into '19, for Bridgeport, you will see some moderations. So, you don't see a full step change for that amount for a couple of reasons, partial operation, retail and then combined cycle coming in but the combined cycle will come in with some margin that will upset. So, I think those are the pieces that make of that lesson.

Kathleen Lally - Okay. I think that's the last questions. So, Ralph, you have any --

Ralph Izzo - So, you know, hopefully - excuse me, the key takeaway today is that we have some real opportunities looking at us as we move ahead. So, I love working with this group because as soon as we try to give you some insights into a more generic thinking, you immediately want us to fill in some of the cells in the spreadsheet with some precise numbers and that wasn't what we intended to do today with the 10-year outlook that Ralph painted for you.

But that 10-year outlook doesn't include converting the grid and so superconducting cables, it doesn't include taking the overheard system, putting it underground. These are real opportunities, right, these are 80-year-old substations. These are technologies that have been deployed widely in other parts of the country be it AMI or enhanced [data] opportunities.

And really, the opportunity set isn't the limiting factor. The balance sheet isn't the limiting factor. The regulatory relationship isn't the limiting factor. The limiting factor that we will pay attention to is the customer bill. And that was - that was the main reason for giving you the kind of expanded beyond the five-year horizon view.

The other thing I hope that you - that you took away from today is that there had been some talk in times past that there might be a strategic shift with the construction of three Power plants and we've - what we said when we announced the third Power plant was, no, we don't intend to build their supply and now we're showing a capital program that matches that and you see, actually, an even greater emphasis on the Utility than we had seen in the past.

So, I would be remiss if I didn't finish today's meeting by point out just a couple of things. None of these gets down without the work of 13,000 tremendous employees and the leadership team that you saw just a subset of, say, who I can't be thankful enough in terms of all that they do, many of them were in the back of the room but the presenters of that were upfront, all included. I won't go name by name except to just mention two names that I'd ask you to join me in thanking them.

Number one, as we have announced that Bill Levis will be retiring sometime in the third quarter, I can tell if somebody's been with the company for 25 years, I am hard-pressed to think of one person who, on an individual basis, brought more value to the company in terms of what he was able to do for our nuclear operations in the beginning of his tenure with us and then as you took on broader responsibilities, what has been able to do with our fossil operations. So, if you would just please join me and thanking Bill for all he's done for PSEG.

And then also, last but not least, if you join me in thanking our IR department, Carlotta and Kathleen, this is Kathleen's 11th conference and counting and we're going to just - I can't say thank you enough to her and her team for pulling this together. If it were up to me, we would have been in a basement at Newark today, that's a true story, that's where I had slated it because I was so concerned, shall I say, with that - with the bills we have charged by some of the fine New York hotels but Kathleen did a marvelous job of getting us here today and all the presentation and the material she and the team put together, hopefully, provides clarity to you and thank you, Kathleen.

Thank you for joining us today. We'll see you again.

2017 PSEG Investor Conference

NEW YORK – MARCH 6, 2017

PSEG

We make things work for you.

We have the
energy
to make things better
... for you, for our investors
and for our stakeholders.

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income to reconcile to non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA with a reference to those slides included on each of the slides where the non-GAAP information appears.

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Management believes non-GAAP Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. The presentation of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

These materials and other financial releases can be found on the PSEG website at www.pseg.com , under the Investors tab. From time to time, PSEG, PSE&G and PSEG Power release important information via postings on their corporate website at http://investor.pseg.com. Investors and other interested parties are encouraged to visit the corporate website to review new postings. 2017 PSEG Conference Agenda

Presentation	Presenter
Welcome and Introductions	Kathleen Lally
PSEG	Ralph Izzo
Regulatory & Policy Overview	Tamara Linde
PSE&G	Ralph LaRossa
Q&A Session	
Break	
PSEG Power	William Levis
Q&A Session	
Financial Review & Outlook	Dan Cregg
Summary and Q&A	
Conference Conclusion	

SI-SSA-0015-14085

PSEG STRATEGY: GROWING A HIGH-QUALITY, FINANCIALLY SOUND ENERGY INFRASTRUCTURE COMPANY

Ralph Izzo
CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER

PSEG
We make things work for you.

SI-SSA-0015-14086

PSEG Strategy - Delivering Value

Operational Excellence: Improving reliability and customer service as we control costs in a low price environment

Financial Strength: Strong financial position supports investment program

Disciplined Investment:
- Program focused on achieving objectives through infrastructure investment that meets customer and shareholder needs
- Robust pipeline of opportunities

Results:
- Double digit growth in rate base and net income at PSE&G
- Reconfiguration of Power's generating fleet: higher quality, more efficient
- Annual growth in common dividend
- Strong credit metrics

SI-SSA-0015-14087

Two strong businesses

A stable platform, each with growth opportunities

PSEG

PSE&G	PSEG Power LLC
Electric & Gas Delivery and Transmission	**Regional Competitive Generation**
Strategy: Investments aligned with public policy and customer needs **Value Proposition:** A $12 - $14 billion infrastructure program with opportunities to expand, producing high single digit rate base growth through 2021	**Strategy:** Investment program enhances competitive position with addition of efficient, clean, reliable CCGT capacity **Value Proposition:** Provides substantial free cash flow and upside from market rule improvements
2016 — Assets $26B Net Income $889M	2016 — Assets $12B Net Income $18M Non-GAAP Operating Earnings* $514M

SI-SSA-0015-14088

ASSETS AND NET INCOME ARE FOR THE YEAR ENDED 12/31/2016. PSE&G AND POWER DO NOT ADD TO TOTAL DUE TO ENTERPRISE / OTHER ACTIVITY. *SEE SLIDE A FOR A RECONCILIATION OF NET INCOME TO NON-GAAP OPERATING EARNINGS AND SLIDE B FOR RECONCILIATIONS FOR PSEG POWER AND ENTERPRISE/OTHER.

Focus on building a reliable, efficient, clean energy infrastructure

2012	2013	2014	2015	2016

Selected Accomplishments

2012
- Award winning Superstorm Sandy storm response restoring 2.1M customers
- Final federal approval for Susquehanna-Roseland transmission project
- 400 MW of new peaker capacity*

2013
- Expanded Solar investment
- 90% nuclear capacity factor for 9th straight year
- Record output from Linden CCGT and Salem 2 nuclear unit

2014
- Energy Strong program approved
- Advanced Gas Path uprates (through 2018)
- PSEG Long Island management contract effective

2015
- Gas System Modernization Program (GSMP) and Energy Efficiency Extension II approved
- New generation build starts Power fleet transformation

2016
- Solar 4 All Extension Approved
- Continued new generation build and transforming fleet to be more efficient, clean, and higher quality
- Solar Source grew to 396 MW_{DC} **

Cost Control

SI-SSA-0015-14089

PSEG

*KEARNY AND NEW HAVEN. ** AS OF FEBRUARY 2017; INCLUDES 70 MW_{DC} OF PV SOLAR GENERATION IN CONSTRUCTION.

Delivering on commitments and realizing growth

Operational Excellence	• PSE&G: 15 consecutive years of recognition as the most reliable utility in the Mid-Atlantic region • PSEG Power: Lowest CCGT EFORd in last 5 years, while moving the fleet towards improved efficiency and environmental position • PSEG Long Island: Improved customer service and reliability while managing costs • PSEG: Maintaining focus on efficiency, resiliency, and customer satisfaction
Financial Strength	• Non-GAAP Operating Earnings for 2016 at midpoint of original guidance range and upper end of revised guidance range • Cash flows and business mix support strong credit ratings and ability to fully fund robust investment pipeline without issuing new equity • Increased dividend in February 2017 – 13th increase in last 14 years
Disciplined Investment	• PSE&G capital program drives continued rate base growth over the 5-year period (2017-2021) with increased investment in Gas System Modernization Program, Electric and Gas distribution, and Energy Efficiency • Potential for additional investments in Renewables, Expanded Energy Efficiency and integration of Infrastructure with Customer Access • Power capital program focusing on growth investments including Keys Energy Center, Sewaren and Bridgeport Harbor

SI-SSA-0015-14090

PSEG 5 – Year Results

GAAP: Contribution to
PSEG Net Income ($ Millions)
and Net Income per share ($/Share)

Non-GAAP*: Contribution to
PSEG Operating Earnings ($ Millions)
and Operating Earnings per share ($/Share)

SI-SSA-0015-14091

PSEG

*SEE SLIDE A FOR ITEMS EXCLUDED FROM NET INCOME TO RECONCILE TO NON-GAAP OPERATING EARNINGS.

Focus on earning our cost of capital has provided for growth in operating earnings* and dividends

SI-SSA-0015-14092

*SEE SLIDE A FOR ITEMS EXCLUDED FROM NET INCOME TO RECONCILE TO NON-GAAP OPERATING EARNINGS.

Earnings profile with growth at PSE&G has been transformed

Power's locational and fuel cost advantage generate free cash flow in low price environment

PSE&G's earnings contribution has increased with growth in capital program

SI-SSA-0015-14093

PSEG

*SEE SLIDE A FOR ITEMS EXCLUDED FROM NET INCOME TO RECONCILE TO NON-GAAP OPERATING EARNINGS AND SLIDE B FOR A RECONCILIATION OF NET INCOME TO NON-GAAP OPERATING EARNINGS FOR PSEG POWER AND ENTERPRISE/OTHER. E=ESTIMATE.
** 2017 PERCENTS USE MID-POINT OF 2017 NON-GAAP OPERATING EARNINGS GUIDANCE OF $2.80–$3.00 PER SHARE.

Baseline programs yield 7% compound annual growth in rate base

SI-SSA-0015-14094

PSEG

E = ESTIMATE. DATA AS OF MARCH 2017. CAGR = COMPOUND ANNUAL GROWTH RATE. INCLUDES AFUDC.

PSE&G has a track record of identifying opportunities for capital investment

E = ESTIMATE.

SI-SSA-0015-14095

Expansion/Extension of existing baseline programs enhances reliability for our customers

E = ESTIMATE. DATA AS OF MARCH 2017. CAGR = COMPOUND ANNUAL GROWTH RATE. INCLUDES AFUDC.

SI-SSA-0015-14096

PSE&G's investment program provides for 7%–9% growth in rate base

E = ESTIMATE.

SI-SSA-0015-14097

Executing on investment program and continuing to manage the total costs to customers

PSE&G Typical Residential Customer Bills 2009-2017E*

- PSE&G customers' combined electric and gas bills declined 28% over the period
- Low gas prices and elimination of transition charges drove rate decreases
- Continued recent bill reductions include 2017 gas credits and recent BGS auction results
- Tax reform has the potential to reduce rates further

SI-SSA-0015-14098

*FOR ALL YEARS THE BILLING ASSUMES 7,200 KWH FOR ELECTRIC AND 1,010 THERMS FOR GAS ANNUALLY. E = ESTIMATE

Power's fleet to be transformed with new investment and improvement in efficiency

Projected Fleet Comparison 2016 to 2021E

2021E Fuel Diversity[1]
Total MW: 11,900

2021E Energy Produced[1]
Total GWh: 61,000

2016 Fuel Diversity
Total MW: 11,577

- Gas
- Nuclear
- Coal**
- Oil
- Pumped Storage

2016 Energy Produced
Total GWh: 51,510

At conclusion of Power's construction program in 2018, capital to maintain the business declines to ~$200M per year

[1] REFLECTS ANNOUNCED EARLY RETIREMENT OF HUDSON AND MERCER UNITS IN MID-2017
ALL PERIODS EXCLUDE SOLAR (326 MW_{DC}/257MW_{AC}) CAPACITY AND KALAELOA (104MW) CAPACITY / ENERGY PRODUCED
**2016 COAL INCLUDES NEW JERSEY UNITS THAT FUEL SWITCH TO GAS. E= ESTIMATE.

SI-SSA-0015-14099

PSEG

Nuclear outlook is increasingly challenged

National

6 plant closures
2 state interventions
Legislation pending in CT
PJM Grid 2020 study

New Jersey

No sustainable wind resource
Lack of open space for solar fields; RPS Standards; Marcellus gas supply

New Jersey Impacts

Economy/Jobs
Emissions
Cost to replace
Fuel diversity
Reliability

PSEG Nuclear is not currently earning its cost of capital

SI-SSA-0015-14100

Investment programs provide opportunity for growth

2017E Non-GAAP Operating Earnings Guidance Contribution*

2017-2021E Total Capital**

~$13.8B

9% annual growth in rate base with expansion/extension of existing programs

~$2.6B

~18% GWh growth from efficient, low cost capacity

SI-SSA-0015-14101

*BASED ON THE MIDPOINT OF NON-GAAP OPERATING EARININGS GUIDANCE OF $2.80 TO $3.00 PER SHARE.
**INCLUDES ALL PLANNED AND POTENTIAL SPENDING. E = ESTIMATE. INCLUDES AFUDC AND IDC.

Long-term opportunities to invest in the grid supports performance and enables customer access

2012-2016

Transmission Expansion

Storm Hardening

Resiliency

Efficient Generation

13% rate base growth

2017-2021

Upgrade of Aging Infrastructure

7% - 9% rate base growth

Utility of the Future

Integration of Infrastructure with Customer Access

Renewables

Expanded Energy Efficiency

Opportunity for a continuation of PSE&G's rate of growth

SI-SSA-0015-14102

Our commitment to customers, community, employees, the environment, innovation and operational excellence is widely recognized

SI-SSA-0015-14103

PSEG's Value Proposition

- A stable platform with a robust investment pipeline providing opportunity for growth
- PSE&G – Delivering on promise for rate base growth through disciplined investment, customer satisfaction and safety
- PSEG Power – Efficient, low-cost, clean fleet advantaged by asset diversity, fuel mix and location
- Focus on providing strong, sustainable returns of invested capital through operational excellence, regulatory and legislative mechanisms
- Strong balance sheet – Financial strength supported by stable credit rating and investment profile supporting the potential for consistent and sustainable dividend growth

SI-SSA-0015-14104

PSEG REGULATORY & POLICY REVIEW

Tamara Linde

EXECUTIVE VICE PRESIDENT AND GENERAL COUNSEL

SI-SSA-0015-14105

PSEG

We make things work for you.

Regulatory & Policy Review - Agenda

- PSE&G Investment Program Recap
- PSE&G 2017 Base Rate Case Filing
- Regulatory Reform in NJ
- Preserving Nuclear Generation
- Federal Regulatory Framework
- Summary

SI-SSA-0015-14106

PSE&G has received approval for 15 multi-year investment programs that advance state energy goals

2008/ 2009	2011	2013	2014	2015	2016

Selected Accomplishments

- Capital Infrastructure I
- Energy Efficiency
- Solar Loan I
- Carbon Abatement
- Solar Loan II
- Solar 4 All
- Demand Response

- Energy Efficiency Extension
- Capital Infrastructure II

- Solar Loan III
- Solar 4 All Extension

- Energy Strong

- Energy Efficiency Extension II
- Gas System Modernization

- Solar 4 All Extension II

Infrastructure investment programs with near contemporaneous recovery mechanisms

SI-SSA-0015-14107

PSE&G plans to file Distribution Base Rate Case proceeding no later than November 1, 2017

Support

- Requirement of 2014 Energy Strong settlement
- Update for known changes in sales growth forecast, O&M and taxes since 2010 rate case
- Get recovery of distribution investment not covered by clause mechanisms
- Get recovery of approved storm costs

Opportunity

- Establish/update rate design, capital structure and depreciation
- Pursue decoupling
- Pursue interim rates
- Improve alignment with customer
- New E&G rates effective at start of 2019, or earlier

Supports need for moderate base rate increase

SI-SSA-0015-14108

NJ Distribution Base Rate Case Timeline

SI-SSA-0015-14109

New Jersey – Long-term Infrastructure Regulatory Reform with Customer Focus

Support

- Alignment with community and customer needs
- NJ Energy Master Plan
- Support extension of investment program horizon from 3 to 7 years using review process established by the BPU in Energy Strong and Gas System Modernization Program as template

Opportunity

- PSE&G will be seeking approval of multi-year programs that extend existing efforts to improve our system resiliency and broaden investment focus on Energy Efficiency and Utility of the Future services at the lowest cost to our customers

SI-SSA-0015-14110

Preserving Existing Nuclear Power Plants as Part of a Resilient Energy System

Support

- Generation from Power's nuclear units produces ~40% of NJ supply and provides 97% of NJ's carbon free energy
- Preservation of nuclear energy consistent with NJ policy goal: 70% clean resources by 2050
- Competitive wholesale markets not designed to value fuel diversity, resiliency and desirable attributes of nuclear generation

Opportunity

- Preserve highly reliable, clean resources as part of a diverse energy portfolio
- Preserve local jobs and economic base
- Keep prices lower than they otherwise would be, as current replacement options are more expensive
- Maintain system reliability

SI-SSA-0015-14111

What are other states doing to preserve at-risk nuclear generation?

New York April 2016	Illinois November 2016	Connecticut 2017?	Ohio 2017?
Clean Energy Standard approved by NYPSC provides support for at-risk nuclear. Zero Emission Credit standard established. Contract payments available for up to 12 years	Future Energy Jobs Bill enacted establishing a Zero Emission Credit (ZEC) portfolio standard. ZEC contract payments available for 10 years	Connecticut Legislature currently debating clean energy procurement process in recognition of nuclear capacity role as provider of clean energy	Legislative action under consideration to preserve at-risk nuclear generation

State Regulatory/Legislative actions recognize value of nuclear energy in meeting clean energy standards and supporting local economy

SI-SSA-0015-14112

Federal Regulatory Framework – Ensuring market structures recognize the value of reliable, diverse and clean dispatchable generation

Support

- FERC is driving ISOs to improve market constructs and rules on energy pricing
- Higher payments for enhanced reliability (Capacity Performance); first purely CP capacity auction to be held by PJM in May 2017

Opportunity

- Advocate for market solutions that fairly compensate generators for the cost of meeting demand
- Seek recognition of environmental attributes of existing resources
- Seek integration of state public policy objectives for clean energy with grid reliability and efficient market signals

SI-SSA-0015-14113

PSEG Regulatory and Policy focus

on mechanisms that provide customers clean, affordable, resilient energy supply

NJ Distribution Base Rate Proceeding

- True-up data from 2010 base rate case for known changes in customers usage, taxes, O&M and investments

Long-Term Infrastructure Investment Platform

- Seek extension of existing infrastructure programs, e.g., GSMP, and broaden investment platform

Preserve the Value of Nuclear Supply

- Pursuing legislative strategy to recognize the value of nuclear energy under terms and conditions that are affordable for customers and provide the proper incentives for long-term operation

Ensure Federal Regulatory and Policy Framework

- Advocate for rules that preserve benefits of competitive markets while also recognizing the value of clean energy, supply diversity and grid reliability

SI-SSA-0015-14114

PSE&G

Ralph LaRossa

PRESIDENT AND CHIEF OPERATING OFFICER
PUBLIC SERVICE ELECTRIC & GAS

PSEG

We make things work for you.

SI-SSA-0015-14115

Discussion topics

- Overview of PSE&G - Strategy and delivering results
- Operational excellence
- Capital investment program
- 2017 Distribution rate case filing
- Customer rates

SI-SSA-0015-14116

PSE&G –New Jersey's largest:

- Electric and Gas Distribution utility
- Transmission business
- Investor in renewables and energy efficiency
- Appliance service provider

	Electric	Gas
Customers Growth (2012 – 2016)	2.2 Million 0.5%	1.8 Million 0.4%
2016 Electric and Gas Sales	41,580 GWh	2,360M Therms*
Projected Annual Sales Growth (2017 – 2019)**	0.3%	0.7%
Sales Mix (2016)		
Residential	33%	59%
Commercial	58%	37%
Industrial	9%	4%

PSE&G 2016 Rate Base

SI-SSA-0015-14117

PSEG

* GAS FIRM SALES ONLY.
** ESTIMATED ANNUAL GROWTH PER YEAR, ASSUMES NORMAL WEATHER.

PSE&G strategy

Building a sustainable platform that balances reliability, customer rates and public policy to ensure growth at reasonable returns

SI-SSA-0015-14118

Delivering on Our Promises

Operational Excellence	• Strong safety, reliability and customer service record • Cost control efforts have led to flat O&M
Financial Strength	• Achieved 5-year annual growth in net income of 11% • Achieved 5-year annual growth in rate base of 13% • Maintaining solid investment grade credit ratings
Disciplined Investment	• 15 investment programs approved over past eight years ✓ Infrastructure focused ✓ Supportive regulatory mechanisms providing for clause recovery ✓ Policy alignment – across administrations – Solar and Energy Efficiency • Programs creating jobs and providing environmental benefits, in a low-rate environment benefiting from low commodity prices and federal tax benefits from current bonus depreciation rules

SI-SSA-0015-14119

Operational Excellence - Safety

- Management focus and collaboration with unions resulted in top decile safety performance in 2016

SI-SSA-0015-14120

SOURCE: PSE&G

Operational Excellence - Reliability

Consistently recognized for customer reliability

Our system performance, as measured by System Average Interruption Duration Index (SAIDI), has consistently been among the best performers

Named most reliable electric utility in the Mid-Atlantic region for **15th consecutive year**

SI-SSA-0015-14121

SOURCE: PSE&G

Operational Excellence - Customer satisfaction

PSE&G has improved on an absolute and relative basis compared to its peers over the past five years

JD Power Residential and Business Scores

SI-SSA-0015-14122

Operational Excellence – O&M costs

Demonstrated ability to control O&M, preserving earnings and returns in a low sales growth environment

Cost control actions:

- PSE&G is utilizing the Lean Six Sigma discipline to achieve costs savings and process improvements
- Regular organizational refinement to streamline processes
- Continued focus on vendor and inventory practices ensuring maximum value
- Successful management of pension

E = ESTIMATE.

Disciplined Investment – Delivering annual growth

Our rate base is now roughly balanced between federal and state jurisdictions

SI-SSA-0015-14124

Disciplined Investment – Continued growth in robust capital program

2017-2021E PSE&G Capital Spending

Base Capital,
including GSMP extension
$12.3B
Rate Base CAGR 7%

with extension / expansion of current programs
$13.8B
Rate Base CAGR 9%

Transmission | Gas Distribution | Electric Distribution | Solar and Energy Efficiency

With current returns on ~70% of capital investments

. E = ESTIMATE. INCLUDES AFUDC

SI-SSA-0015-14125

Transmission - ~$6 billion, 5-year investment program focusing on reliability and replacing aging infrastructure

- **Formula rate** recovery of capital and expenses
- **PJM's Regional Transmission Expansion Plan** (RTEP) identifies system enhancements needed for reliability
- **Portfolio transitioning –** completing remaining major lines and moving to steady state investments to maintain reliability and stay ahead of asset end of life
  - **69kV system upgrades** improve system reliability and add capacity for future growth
  - **Transmission Lifecycle** to manage asset life and improve system integrity and reliability
  - **Transmission Hardening** projects focus on increasing system resiliency

SLSS-V 5-14126

Electric Distribution – ~$3 billion, 5-year investment program focused on reliability and resiliency

- **Energy Strong** - Completion of currently approved program
- **Future growth efforts**
  - **Hardening** – Extend program for critical system infrastructure
  - **Aging infrastructure** – Life cycle investments to ensure continued top quartile reliability performance
    - Over 65 substations > 60 years old; Over 30 substations > 80 years old
    - ~115 substations 26kV to 4kV
    - Risk assessment model to eliminate/replace
  - **Technology** – Next generation to enhance grid performance

SI-SSA-0015-14127

Electric Distribution - Technology

- **Making the grid smarter**
  - Deployment of hundreds of microprocessor relays
  - A new state of the art distribution SCADA system to facilitate full communication and control
  - Ability to integrate Distributed Energy Resources into the grid while enhancing grid reliability and resiliency

- **Improving customer service - continue to enhance delivery of information and communication**

SI-SSA-0015-14128

Gas Distribution – ~$3 billion, 5-year investment program focused on modernizing and upgrading cast iron and unprotected steel main

- **Cost efficiency** of broad replacement approach
- **Customer service** – conversion from low pressure to high pressure
- **Environmental Collaboration** with EDF and Google to consider methane leaks in work prioritization
- **Replaced** >200 miles in 2016
  - Exceeding run rate of 30 year program, demonstrating ability to accelerate program
  - ~4,800 miles of cast iron and unprotected steel main remaining in the system
  - More cast iron than any other US utility

SI-SSA-0015-14129

Solar and Energy Efficiency – ~$250 million, 5-year investment supports New Jersey policy objectives

- **Solar –**
  - Grid-connected solar on landfills and brownfields provides clean energy for all customers
  - 210 MW installed of the 300 MW total approved programs
- **Energy efficiency** – Continuing programs with a focus on hospitals, multi-family housing and our direct install program which includes municipalities, non-profits and small businesses in Urban Enterprise Zones
- **State Policy** - Programs are aligned with policy goals
- **Opportunity to expand** – Potential for significant opportunity to expand energy efficiency and related customer services in the future

SI-SSA-0015-14130

Developing investment opportunities with near-contemporaneous recovery mechanisms

2017-2021E PSE&G Capital with Program extensions by Recovery Method

Plan to increase current five year, $12.3B capital plan by ~$1.5B through program extensions and expansions:

- GSMP acceleration
- Electric distribution – hardening extension and modernization investment program
- Energy Efficiency and Solar programs – extensions and expansion

With broad opportunity set of additional investment potential driven by customer expectations and public policy

FERC Formula Rates	Traditional Recovery Mechanisms	Clause Recovery Mechanisms
Transmission	Distribution Base Rates	Infrastructure / Solar / Energy Efficiency

SI-SSA-0015-14131

E = ESTIMATE. DATA AS OF MARCH 2017. INCLUDES AFUDC.

PSE&G Investment Evolution: System needs, customer expectations and public policy objectives drive need for continued and increasing Distribution investments

2012 - 2016

Infrastructure Clauses focused on hardening and resiliency

Solar 4 All and Solar loans

Energy Efficiency

2017-2021E

Complete hardening, begin system modernization expand efficiency program

Transition from Energy Strong to Life cycle and automation work

Accelerate GSMP

Solar landfills

Extend and broaden Energy Efficiency

Utility of the Future

Electric Infrastructure

Life cycle programs, distribution automation, EV Charging

Gas Infrastructure

GSMP Acceleration and Resiliency

CNG Charging

Distributed energy resources

Solar 4 All, Microgrids, Batteries, Fuel Cells

Energy Efficiency

Hospitals, Municipalities, Universities, Low Income Programs, EE for All (Residential, Small C&I), AMI, Bill Education

Utility of the Future represents potential investment opportunity to sustain annual rate base growth rate

SI-SSA-0015-14132

Investment program supports strong rate base growth – off a higher base

E = ESTIMATE.

SI-SSA-0015-14133

Distribution – 2017 base rate case filing

- Obligated to file rate case no later than November 1, 2017
- Last rate case – 2009 test year, settled in 2010

Since last rate case

- **Sales growth** – flat, customer growth offset by energy efficiency
- **O&M** – held flat, with increased regulatory requirements
- **Capital Investments** – Growth in rate base beyond clauses, consists of:
  - GSMP annual stipulated base
  - Energy Strong
  - Other Distribution base investments beyond depreciation levels
- **Customer rates** since last rate case
  - Electric decreased 5%; Gas decreased 46%

Supports need for moderate base rate increase

SI-SSA-0015-14134

Optimal time for extension and expansion of investment programs

- 2017 investment program filings
  - **GSMP** - extension and acceleration
  - **Electric infrastructure** - resiliency and modernization
  - **Energy efficiency** – extension, potential future expansion
  - Seeking **long-term** programs to optimize planning and cost
- Programs improve system reliability and meet customer expectations
  - System need as infrastructure reaches end of life
  - Increasing customer and public policy expectations
- Optimal timing

Job creation	Environmental benefits	Federal tax benefits	Low commodity prices
√	√	√	√

- Potential rate impact of program extensions - ~2%/year*

SI-SSA-0015-14135

*ASSUMES TYPICAL COMBINED RESIDENTIAL CUSTOMER WITH 7,200 KWH FOR ELECTRIC AND 1,010 THERMS FOR GAS ANNUALLY.

Customer's bills are materially lower, supporting needed investment in the system

- Combined electric and gas bills declined ~28% over the 2009-2017 period
  - Also provided BGSS bill credits totaling ~$590 per customer since 2012
  - Low gas prices and elimination of transition charges drove rate decreases
- Regional price comparison** Gas is 2nd lowest and Electric is lower than average
- Investing at the Utility of the Future level – would take about a decade to equal the 2009 bill rates (adjusted for growth in CPI/disposable income)

SI-SSA-0015-14136

PSEG

*FOR ALL YEARS THE BILLING ASSUMES 7,200 KWH FOR ELECTRIC AND 1,010 THERMS FOR GAS ANNUALLY. E = ESTIMATE
** COMPARED AGAINST 12 REGIONAL UTILITIES AS OF SEPTEMBER 1, 2016, FOR A CUSTOMER THAT USES 500 KILOWATT-HOURS AND 100 THERMS IN A MONTH.

PSE&G's 2017 net income to benefit from investment programs and cost control

E =ESTIMATE.

SI-SSA-0015-14137

PSEG LONG ISLAND

PSEG

We make things work for you.

SI-SSA-0015-14138

PSEG Long Island - Focused on improving customer service and reliability while managing costs

- 4th year of 12 year contract (with option to extend 8 years)
- 2016 - Earned $0.08 per share*
  - Fixed fee of $65 million / year, escalated for CPI
  - Incentive opportunity of 15%
  - Power has $20 million / year energy management and fuel supply contract

- Focused efforts on safety, reliability, customer satisfaction and stakeholder relationships
- Meeting Operational and Financial expectations
- Realized >95% of incentive payment in 2014, 2015 and 2016

SI-SSA-0015-14139

*OVERALL ENTERPRISE IMPACT.

PSEG Long Island continues to drive improvement in performance metrics

Power is transforming its portfolio to be newer, more efficient and flexible

2012 → 2013 → 2014 → 2015 → 2016

Selected Accomplishments Towards Transformation

Cost Control

2012

- Additional **400** MW of new peaker capacity at Kearny and New Haven

2013

- Bethlehem Energy Center, 2nd gas pipeline connection added

2014

- CCGT Advanced Gas Path (AGP) uprate completed at Linden 1 & 2, **63** MW
- Energy / Fuel management contract for LIPA

2015

- Continued growth with **1,300** MW new CCGT's announced
  - Keys
  - Sewaren 7
- Projects Completed:
  - Peach Bottom EPU, **130** MW
  - Bergen 2 AGP uprate, **31** MW
- Retired HEDD Units
- Solar portfolio reaches **277** MW_{DC}
- Initiated Hope Creek uprate, **18** MW

2016

- Bridgeport Harbor 5 **485** MW CCGT cleared ISO-NE auction
- Hudson & Mercer early retirement announced
- Kearny 13 & 14 uprate, **14.5** MW increased capacity
- Initiated electric & gas retail business in NJ, PA
- Solar reaches ~**326** MW_{DC} in operation

SI-SSA-0015-14144

Power has generating assets in three competitive markets

- Major assets located near key load centers
- Constructing three new, efficient combined-cycle units
- Positioned to benefit from market volatility
- Additional generation assets:
  - Solar (326 MW_{DC}/257 MW_{AC})
  - Kalaeloa, HI (104 MW)

SI-SSA-0015-14145

*POWER ANNOUNCED RETIREMENTS OF HUDSON AND MERCER GENERATING STATIONS AS OF JUNE 1, 2017.

Power has a diverse fleet of generating assets which enables it to respond to market needs

Fuel Diversity 2016*

Total MW: 11,577

Energy Produced 2016*

Total GWh: 51,510

- Nuclear
- Coal**
- Oil
- Pumped Storage

SI-SSA-0015-14146

PSEG

* EXCLUDES SOLAR (326MW$_{DC}$ /257MW$_{AC}$) AND KALAELOA (104MW).
**INCLUDES NEW JERSEY UNITS THAT FUEL SWITCH TO GAS.

Power's Fossil Fleet maintains solid performance in a challenging environment

- Generation records at BEC and Bergen 2 combined-cycle units
- Combined-cycle EFORd* and EFORp lowest in five years
- Start Success Rate:
  - Peaking: 99.7%
  - Coal/Steam: 93%

SI-SSA-0015-14147

*EFORd EXCLUDES EVENTS OUTSIDE OF MANAGEMENT CONTROL.

Nuclear is vital to New Jersey with Salem and Hope Creek providing ~40% of the State's energy consumption

Hope Creek	Salem Units 1 and 2	Peach Bottom Units 2 and 3
• Operated by PSEG Nuclear • PSEG Ownership: 100% • Boiling Water Reactor • Total Capacity: 1,172 MW • Owned Capacity: 1,172 MW • License Expiration: 2046 • 18 MW Uprate Spring 2018 • Next Scheduled Refueling ➢ Spring 2018	• Operated by PSEG Nuclear • PSEG Ownership: 57% • Pressurized Water Reactor • Total Capacity: 2,296 MW • Owned Capacity: 1,318 MW • License Expiration: 2036 and 2040 • Next Scheduled Refueling ➢ Unit 1 – Fall 2017 ➢ Unit 2 – Spring 2017	• Operated by Exelon • PSEG Ownership: 50% • Boiling Water Reactor • Total Capacity: 2,450 MW • Owned Capacity: 1,225 MW • License Expiration: 2033 and 2034 • Next Scheduled Refueling ➢ Unit 2 – Fall 2018 ➢ Unit 3 – Fall 2017

SI-SSA-0015-14148

PSEG Nuclear has been addressing the economic challenges in the current low gas price environment

- 2012 to 2017E CAGR: –1.4%
- The 2015 Labor increase / outside services decrease is due to bringing security force employees in-house
- Material and outside service cost reductions CAGR: – 4%

- Fukushima-related compliance drove $198 M of Regulatory/Environmental spend
- 2016 and 2017E capital driven by Baffle Bolt replacement
- Going forward capital approximately $100M/year to maintain reliability to end of license life

SI-SSA-0015-14149

PSEG

NOTE: LABOR INCLUDES BASE WAGES, OVERTIME AND FRINGE BENEFITS. ALL YEARS EXCLUDE EXPENDITURES FOR NUCLEAR FUEL (APPROXIMATELY $6.50/MWH). E=ESTIMATE

PSEG Nuclear is leading the industry in efforts to ensure economic viability of fleet

Goals

- Industry goal to achieve reductions in O&M, fuel and capital costs by 2018
- The three-year program to examine and implement opportunities to:
  - ✓ Advance safety,
  - ✓ Improve operations, and
  - ✓ Prevent premature reactor closures
- Concurrently, we continue to work with NEI and other industry partners to gain greater compensation for nuclear plants in competitive market policies

PSEG Nuclear progress to date

- 46 Efficiency Bulletins issued, 21 implemented to date
- Cost reductions achieved: 185 FTE reduction; 2017 direct O&M reduction of 5% from plan target while funding equipment reliability improvement
- Implemented changes to focus on eliminating vs. mitigating equipment reliability issues to ensure generation is not negatively impacted

PSEG Nuclear is not currently earning its cost of capital

SI-SSA-0015-14150

Power has demonstrated its ability to control O&M

PSEG Power's Value Proposition

Efficient fleet	Advantaged locations	Investing to grow

- Well-positioned, well-run fleet of merchant generating assets in competitive markets
- Early retirement of Hudson and Mercer coal stations in mid-2017 improves fleet efficiency and returns
- Addition of 1,800 MWs of new, efficient, flexible CCGTs transforms the portfolio
- Low capital requirements post-construction
- Hedging strategy to protect value of assets in declining price environment and provide stable returns and cash flow

2017 Federal Tax Reform – PSEG is well positioned

Given positive non-utility contribution to earnings and a strong balance sheet, PSEG is well positioned for potential tax reform

Assumption	PSE&G	PSEG Power	PSEG Parent
Reduction of Corporate Tax Rate	Customer rates lowered with reduction in tax rate Return of excess deferred tax liability – impact on cash and rate base growth dependent on payback period	After-tax earnings and cash flow increase One-time non-cash earnings benefit from reduction in deferred tax liability	After-tax earnings and cash flow improve
100% Expensing of Capital Expenditures	Impact on rate base growth comparable to existing bonus depreciation rules	Cash flow improves	
Elimination of Deductibility of Interest Expense and Border Adjustment Tax	Change in cost anticipated to be passed through to customers	Well positioned given low debt balance Uncertainty on Border Adjustment Tax	Well positioned given low debt balance

SI-SSA-0015-14181

Opportunity for meaningful and sustainable dividend growth

Payout Ratio	50%	58%	56%	54%	54%	57%	59%(1)

(1) THE 2017 PAYOUT RATIO IS BASED ON THE MIDPOINT OF PSEG'S 2017 NON-GAAP OPERATING EARNINGS GUIDANCE OF $2.80-$3.00 PER SHARE. SEE SLIDE A FOR ITEMS EXCLUDED FROM INCOME FROM CONTINUING OPERATIONS/NET INCOME TO RECONCILE TO OPERATING EARNINGS. E=ESTIMATE

PSEG EXECUTIVE PROFILES

SI-SSA-0015-14185

PSEG

We make things work for you.

Ralph Izzo

CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED

Ralph Izzo was elected chairman and chief executive officer of Public Service Enterprise Group Incorporated (PSEG) in April 2007. He was named as the company's president and chief operating officer and a member of the board of directors of PSEG in October 2006. Previously, Mr. Izzo was president and chief operating officer of Public Service Electric and Gas Company (PSE&G).

Since joining PSE&G in 1992, Mr. Izzo was elected to several executive positions within PSEG's family of companies, including PSE&G senior vice president – utility operations; PSE&G vice president – appliance service; PSEG vice president - corporate planning; and PSE&G vice president - electric ventures. In these capacities he broadened his experience in the areas of general management, strategic planning and finance.

Mr. Izzo is a well-known leader within the utility industry, as well as the public policy arena. He is frequently asked to testify before Congress and speak to organizations on matters pertaining to national energy policy.

Mr. Izzo's career began as a research scientist at the Princeton Plasma Physics Laboratory, performing numerical simulations of fusion energy experiments. He has published or presented over 35 papers on magnetohydrodynamic modeling. Mr. Izzo received his Bachelor of Science and Master of Science degrees in mechanical engineering and his Doctor of Philosophy degree in applied physics from Columbia University.

He also received a Master of Business Administration degree, with a concentration in finance from the Rutgers Graduate School of Management. He is listed in numerous editions of Who's Who and has been the recipient of national fellowships and awards. Mr. Izzo has received honorary degrees from the New Jersey Institute of Technology (Doctor of Science), Thomas Edison State University (Doctor of Humane Letters), Bloomfield College (Doctor of Humane Letters), Rutgers University (Doctor of Humane Letters), and Raritan Valley Community College (Associate of Science).

Mr. Izzo serves as nominating committee chairman of the New Jersey Chamber of Commerce, and is on the board of directors for the New Jersey Utilities Association, the Edison Electric Institute (EEI), and the Nuclear Energy Institute (NEI). He is also a member of the Board of Trustees of Peddie School, Columbia University School of Engineering Board of Visitors and the Princeton University Andlinger Center for Energy and the Environment Advisory Council, as well as a member of the Visiting Committee for the Department of Nuclear Engineering at MIT. Mr. Izzo is a former member of the board of directors of The Williams Companies. In addition, he is a former chair of the Rutgers University Board of Governors and the New Jersey Chamber of Commerce.

SI-SSA-0015-14186

Tamara L. Linde

EXECUTIVE VICE PRESIDENT AND GENERAL COUNSEL

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG POWER, PSEG SERVICES CORPORATION

Tamara Linde was named executive vice president and general counsel for Public Service Enterprise Group Incorporated (PSEG) in July 2014. She is also the executive vice president and general counsel of Public Service Electric and Gas Company (PSE&G), PSEG Power and PSEG Services Corporation.

As PSEG's chief legal officer, Ms. Linde has responsibility for all legal and regulatory functions, and has general supervisory responsibilities for the office of corporate secretary, business assurance and resilience and federal affairs and sustainability. Ms. Linde is a member of PSEG's Executive Officer Group.

Previously Ms. Linde was vice president – regulatory, PSEG. She has led the company's federal and state regulatory functions, as well as managed corporate, environmental and labor/employment practices within the company. Ms. Linde has served as regulatory counsel on many of the company's most important initiatives in recent years.

Ms. Linde joined the law department of Public Service Electric and Gas Company (PSE&G), as an attorney in 1990 handling a variety of natural gas and electric regulatory and transactional matters. After holding several other legal positions at PSE&G she became general solicitor, in 2000. In that position she was responsible for the regulatory affairs of the PSEG companies including electric, gas and nuclear matters.

She has had significant experience working on regulatory matters before various state and federal regulatory agencies on industry issues relating to electric transmission and distribution and energy markets.

Ms. Linde is a member of the New Jersey, New York, District of Columbia and Texas bars. She currently serves on the Board of the PSEG Foundation, the Community Foundation of New Jersey and the Mater Dei Prep High School Board. In addition, Ms. Linde is a member of the General Counsel Steering Committee of the National Association of Corporate Directors (NACD). She is past President of the Northeast Chapter of the Energy Bar Association and served as chair of the Energy Bar Association Electricity Regulation and Compliance Committee. Ms. Linde graduated from Seton Hall University School of Law with a Juris Doctorate and from Seton Hall University with a bachelor's degree.

SI-SSA-0015-14187

Ralph A. LaRossa

PRESIDENT AND CHIEF OPERATING OFFICER

PUBLIC SERVICE ELECTRIC AND GAS COMPANY

Ralph A. LaRossa was named president and chief operating officer of Public Service Electric and Gas Company (PSE&G) in October 2006. PSE&G is New Jersey's oldest and largest regulated gas and electric delivery utility, serving approximately 2.4 million customers, nearly three-quarters of the state's population. Prior to this position he was vice president - electric delivery for PSE&G.

In addition, on January 1, 2014, Mr. LaRossa became Chairman of the Board of PSEG Long Island, a subsidiary of Public Service Enterprise Group (PSEG), which manages the electric transmission and distribution systems on Long Island and in the Rockaways. PSEG Long Island serves 1.1 million customers.

Mr. LaRossa joined PSE&G in 1985 as an associate engineer and advanced through a variety of management positions in the utility's gas and electric operations. In 1998, he received Gas Industry Magazine's Outstanding Manager of the Year Award.

He is a graduate of Stevens Institute of Technology and has completed the Harvard Business School's Program for Management Development.

Mr. LaRossa is Chairman of Choose New Jersey, Inc. and serves on its board of directors. In addition, he is a member of the board of directors for the New Jersey Utilities Association (NJUA), New Jersey Performing Arts Center (NJPAC) and Montclair State University, for which he is past chair of the university. Mr. LaRossa is also the immediate past chair of the American Gas Association (AGA).

SI-SSA-0015-14188

William Levis

PRESIDENT AND CHIEF OPERATING OFFICER

PSEG POWER

William Levis is president and chief operating officer of PSEG Power, a position he's held since June 2007. PSEG Power is a major, unregulated independent power producer in the U.S. with four main subsidiaries: PSEG Nuclear, PSEG Fossil, PSEG Energy Resources and Trade (ER&T) and PSEG Power Ventures.

PSEG Power operates one of the most balanced portfolios in the country, both in terms of fuel mix and market segment (based load units, load following units and peaking units). Its low-cost, load following fleet is geographically well positioned in competitive markets. Its 11,681 MWs represent a diverse fuel mix with different plant types.

Before coming to PSEG, Mr. Levis was Exelon Nuclear's vice-president – Mid-Atlantic operations. Prior to joining Exelon, Mr. Levis worked at Ontario Hydro's Pickering Plant and held several positions over a five-year period with Carolina Power and Light's Brunswick facility.

Mr. Levis has a Bachelor of Science degree in marine engineering from the U.S. Naval Academy and holds an SRO (senior reactor operator) certification. He retired as a commander in the Naval Reserves and attained his professional engineer license in 1985.

Mr. Levis is a member of the Executive Committee of Nuclear Energy Institute's (NEI) Board of Directors, the Nuclear Electric Insurance Limited (NEIL) Board of Directors, and serves as a member of the Institute of Nuclear Power Operations (INPO) National Nuclear Accrediting Board. He is a member of the Philadelphia Archdiocese Catholic Charities Appeals Board and is a member of the CEO Council for Growth based in Philadelphia.

Daniel Cregg

EXECUTIVE VICE PRESIDENT AND CHIEF FINANCIAL OFFICER

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG POWER LLC AND PSEG SERVICES CORPORATION

Daniel J. Cregg was named executive vice president and chief financial officer for Public Service Enterprise Group Incorporated (PSEG) and its subsidiaries in October 2015.

Mr. Cregg is responsible for all financial functions, including Internal Audit Services, Investor Relations and Corporate Development. Given the array of financial instruments which serve as the primary means of selling wholesale energy to customers, Mr. Cregg also has responsibility for the Risk Management function, which provides independent oversight of the PSEG Power trading organization. In addition to finance, Mr. Cregg is responsible for the Strategy and Planning function. He is a member of PSEG's Executive Officer Group.

Prior to his current position, Mr. Cregg was vice president – finance for PSE&G, a role he assumed in June 2013. In 2006, Mr. Cregg was named vice president – finance for PSEG Power. In that capacity and in previous financial roles for Power, Mr. Cregg held leadership positions related to financial reporting and forecasting, investor communications, financings, rating agency interactions, external reporting, cash forecasting, financial valuations, competitive intelligence, and fundamental market modeling, with critical responsibilities in Power's development and strategic planning activities.

Previously, Mr. Cregg was director of PSEG corporate development. He joined PSEG in 1991 with overall responsibility for tax planning, strategy and compliance for PSEG Energy Holdings, including domestic and international tax structuring work for PSEG Global and PSEG Resources.

Before joining PSEG, Mr. Cregg spent five years with the accounting and consulting firm of Deloitte and Touche, providing consulting services to a wide range of clients with an emphasis on the energy industry.

Mr. Cregg holds a Master of Business Administration degree from the Wharton School of the University of Pennsylvania and is a graduate of Lehigh University, where he received a bachelor's degree in accounting.

SI-SSA-0015-14190

Derek M. Di Risio

PRESIDENT

PSEG SERVICES CORPORATION

Derek M. Di Risio was named President, PSEG Services Corporation, in July 2014. He is responsible for the coordination and delivery of several centralized services currently residing within PSEG Services Corporation including corporate communications, corporate citizenship, corporate real estate, information technology, procurement, payroll and other transactional services.

Prior to his current role, Mr. Di Risio was vice president and controller of Public Service Enterprise Group (PSEG), Public Service Electric and Gas Company (PSE&G), PSEG Services Corporation, PSEG Energy Holdings (Holdings) and PSEG Power, a position he assumed in December 2006. He was previously vice president and assistant controller, since July 2004.

Mr. Di Risio had been vice president – planning and analysis of Holdings since March 2004, and vice president – controller for Holdings since July 1998. Prior to that he was director – accounting services and responsible for several accounting and planning functions for Holdings, including overall coordination of the business planning process, accounting research and policy development, financial forecasts and analysis.

Mr. Di Risio was also responsible for the budgeting, analysis and reporting process for PSE&G.

Mr. Di Risio joined PSE&G in September 1991 and has held a variety of positions, including assignments with the internal auditing, electric business, and corporate planning departments. He was instrumental in reengineering the Enterprise business planning process, and advancing the use of performance metrics and balanced scorecard measures to improve business results. Prior to joining PSE&G he worked for several firms, including Chase Manhattan Bank.

Mr. Di Risio graduated from Rutgers University with a degree in accounting/computer science, and received a Master of Business Administration degree from the same university. He is a certified public accountant (inactive). Mr. Di Risio also completed the Program for Management Development at the Graduate School of Business Administration of Harvard University. He serves on the Drumthwacket Foundation Board of Trustees, the Board of the Military Park Partnership and is currently a co-chairman of the Board of Directors of the New Jersey All Stars Project Inc. In addition, Mr. Di Risio previously served on the Drew University Board of Trustees.

SI-SSA-0015-14191

Shahid Malik

PRESIDENT
PSEG ENERGY RESOURCES & TRADE

Shahid Malik was appointed President of PSEG Energy Resources & Trade (ER&T) in 2011. PSEG operates one of the most balanced generation and marketing portfolios in the country, both in terms of fuel mix and market segment (base load units, load following units and peaking units), and Mr. Malik is essentially responsible for managing these assets and taking them to market. He oversees PSEG's generation portfolio and the purchase, sale and risk management of all energy commodities. He is also responsible for Business Development of new power generation projects.

Mr. Malik has an extensive background in the energy industry across the oil, gas, electric and renewable energy sectors in Europe and the United States. Previously, he was with Pittiglio, Rabin, Todd & McGrath (PRTM) in Pittsburgh, PA and was responsible for all aspects of the global energy business, with a primary focus on the North American utility sector. Prior to that he served as President & CEO of Strategic Energy, Great Plains Energy's retail marketing subsidiary and a provider of energy and services to business clients in North America. He was accountable for the company's strategy and operations and led a successful turnaround of the company, achieving significant growth in products and services while reducing costs.

Mr. Malik's career has included Executive Leadership positions with several energy companies in the US and Europe. In addition, he served on the Board of Directors of South Jersey Industries (NYSE: SJI) immediately prior to joining PSEG.

Mr. Malik has been in the energy business for more than 20 years, since receiving his Economics degree from Manchester University in England and an MBA from Rice University, Houston. He sits on the Executive Committee of the Board of Trustees of Newark Museum.

SI-SSA-0015-14192

Margaret M. Pego, SPHR

SENIOR VICE PRESIDENT – HUMAN RESOURCES AND
CHIEF HUMAN RESOURCES OFFICER

PSEG SERVICES CORPORATION

Margaret M. Pego was named senior vice president – human resources and chief human resources officer of PSEG Services Corporation in December 2006. Prior, she had been vice president – human resources. Ms. Pego joined PSEG in 1974, and has held a variety of management positions in the human resources department.

Ms. Pego holds a Bachelor of Arts degree in business administration from William Paterson College, and a Master of Business Administration degree with a concentration in management and labor relations from Seton Hall University. In addition, she holds a certificate in EEO studies from Cornell University, and has completed the Human Resources Executive Program at the University of Michigan. She is also certified as a senior professional in human resources.

Ms. Pego was named one of 2013's HR Top 10 Breakaway Leaders by Evanta, a leading organization that fosters leadership development and collaborative exchange among North America's top executives.

Ms. Pego is active in several local and national organizations, including the EEI Chief HR Executive Advisory Committee; the American Gas Association HR Policy Committee; the Conference Board Advisory Council of HR Management – Council of HR Executives; and the Society for Human Resources Management. In addition, she is immediate past chair of the Children's Specialized Hospital Board, a former member of the Children's Specialized Hospital Foundation Board and RWJ Health Care Corporation Board. She is the former Chair of the Center for Energy Workforce Development (CEWD) Executive Council and is currently a board member. She is a former member of the Supreme Court of New Jersey Attorney Ethics Committee. Ms. Pego is a 2002 Leadership New Jersey fellow, 1997 TWIN Honoree, 2006 Executive Woman of New Jersey Honoree and 2008 NJ Best 50 Women in Business Honoree.

SI-SSA-0015-14193

Peter P. Sena III

PRESIDENT &
CHIEF NUCLEAR
OFFICER

PSEG NUCLEAR

Peter P. Sena III was named president of PSEG Nuclear (Nuclear) in February 2016 and Chief Nuclear Officer in July 2016. Most recently, he was Senior Vice President of Operations, Chief Operating Officer at NextEra Energy.

Mr. Sena was named Chief Nuclear Officer of First Energy in 2012, having held a variety of leadership roles at First Energy nuclear operations spanning 15 years. Mr. Sena joined First Energy in 1996 as a control room supervisor and obtained his first SRO license at Beaver Valley Power Station Unit 2. His second SRO license was obtained in 1999 for Beaver Valley Unit 1. Following a rotational assignment with the Institute of Nuclear Power Operations, Mr. Sena was named the Operations Manager and helped lead the station to the "Most Improved Plant" Award in 2003. In 2005, he was named the Director of Engineering and the station completed the first extended power uprate for a Westinghouse 3 Loop Pressurized Water Reactor. As the Site Vice President of Beaver Valley, Mr. Sena led the station to its first INPO Excellence Award in 2009. The Davis Besse Nuclear Power Plant returned to the Excellence category under Mr. Sena's watch as the Chief Operating Officer in 2011.

Prior to joining FirstEnergy, Mr. Sena was employed by the Nuclear Regulatory Commission as a resident inspector in Region 1. Mr. Sena's nuclear training began as an officer with the US Naval Nuclear Propulsion program and he served on board a ballistic missile submarine during the Cold War.

Mr. Sena earned a Bachelor of Science degree with high honors in Fuel Science from the Pennsylvania State University in 1985. He currently serves on the advisory board for the Penn State Nuclear Engineering Program and is a member of EPRI's research advisory committee. He currently serves on the Auburn University's Advisory Board. In addition, he has recently served on the INPO Executive Advisory Committee and the Nuclear Energy Institute (NEI) Nuclear Strategic Issues Advisory Committee where he was the Industry Executive Sponsor of the NEI post Fukushima flooding response initiative.

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K and available on our website: http://www.pseg.com. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-14198

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization. The last two slides in this presentation (Slides A and B) include a list of items excluded from Net Income to reconcile to non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA with a reference to those slides included on each of the slides where the non-GAAP information appears.

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Management believes non-GAAP Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. The presentation of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

These materials and other financial releases can be found on the PSEG website at www.pseg.com , under the Investors tab. From time to time, PSEG, PSE&G and PSEG Power release important information via postings on their corporate website at http://investor.pseg.com. Investors and other interested parties are encouraged to visit the corporate website to review new postings. The "email alerts" link at http://investor.pseg.com may be used to enroll to receive automatic email alerts and/or really simple syndication (RSS) feeds regarding new postings at http://investor.pseg.com/rss .

PSEG STRATEGY: GROWING A HIGH-QUALITY, FINANCIALLY SOUND ENERGY INFRASTRUCTURE COMPANY

Ralph Izzo
CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER

PSEG
We make things work for you.

SI-SSA-0015-14201

PSEG Strategy - Delivering Value

Operational Excellence: Improving reliability and customer service as we control costs in a low price environment

Financial Strength: Strong financial position supports investment program

Disciplined Investment:
- Program focused on achieving objectives through infrastructure investment that meets customer and shareholder needs
- Robust pipeline of opportunities

Results:
- Double digit growth in rate base and net income at PSE&G
- Reconfiguration of Power's generating fleet: higher quality, more efficient
- Annual growth in common dividend
- Strong credit metrics

SI-SSA-0015-14202

Two strong businesses

A stable platform, each with growth opportunities

PSEG

PSE&G	PSEG Power LLC
Electric & Gas Delivery and Transmission	**Regional Competitive Generation**
Strategy: Investments aligned with public policy and customer needs **Value Proposition:** A $12 - $14 billion infrastructure program with opportunities to expand, producing high single digit rate base growth through 2021	**Strategy:** Investment program enhances competitive position with addition of efficient, clean, reliable CCGT capacity **Value Proposition:** Provides substantial free cash flow and upside from market rule improvements
2016 — Assets $26B Net Income $889M	2016 — Assets $12B Net Income $18M Non-GAAP Operating Earnings* $514M

ASSETS AND NET INCOME ARE FOR THE YEAR ENDED 12/31/2016. PSE&G AND POWER DO NOT ADD TO TOTAL DUE TO ENTERPRISE / OTHER ACTIVITY. *SEE SLIDE A FOR A RECONCILIATION OF NET INCOME TO NON-GAAP OPERATING EARNINGS AND SLIDE B FOR RECONCILIATIONS FOR PSEG POWER AND ENTERPRISE/OTHER.

Focus on building a reliable, efficient, clean energy infrastructure

2012	2013	2014	2015	2016

Selected Accomplishments

2012
- Award winning Superstorm Sandy storm response restoring 2.1M customers
- Final federal approval for Susquehanna-Roseland transmission project
- 400 MW of new peaker capacity*

2013
- Expanded Solar investment
- 90% nuclear capacity factor for 9th straight year
- Record output from Linden CCGT and Salem 2 nuclear unit

2014
- Energy Strong program approved
- Advanced Gas Path uprates (through 2018)
- PSEG Long Island management contract effective

2015
- Gas System Modernization Program (GSMP) and Energy Efficiency Extension II approved
- New generation build starts Power fleet transformation

2016
- Solar 4 All Extension Approved
- Continued new generation build and transforming fleet to be more efficient, clean, and higher quality
- Solar Source grew to 396 MW_{DC} **

Cost Control

PSEG

*KEARNY AND NEW HAVEN. ** AS OF FEBRUARY 2017; INCLUDES 70 MW_{DC} OF PV SOLAR GENERATION IN CONSTRUCTION.

Delivering on commitments and realizing growth

Operational Excellence	• PSE&G: 15 consecutive years of recognition as the most reliable utility in the Mid-Atlantic region • PSEG Power: Lowest CCGT EFORd in last 5 years, while moving the fleet towards improved efficiency and environmental position • PSEG Long Island: Improved customer service and reliability while managing costs • PSEG: Maintaining focus on efficiency, resiliency, and customer satisfaction
Financial Strength	• Non-GAAP Operating Earnings for 2016 at midpoint of original guidance range and upper end of revised guidance range • Cash flows and business mix support strong credit ratings and ability to fully fund robust investment pipeline without issuing new equity • Increased dividend in February 2017 – 13th increase in last 14 years
Disciplined Investment	• PSE&G capital program drives continued rate base growth over the 5-year period (2017-2021) with increased investment in Gas System Modernization Program, Electric and Gas distribution, and Energy Efficiency • Potential for additional investments in Renewables, Expanded Energy Efficiency and integration of Infrastructure with Customer Access • Power capital program focusing on growth investments including Keys Energy Center, Sewaren and Bridgeport Harbor

*FOR ALL YEARS THE BILLING ASSUMES 7,200 KWH FOR ELECTRIC AND 1,010 THERMS FOR GAS ANNUALLY. E = ESTIMATE

Power's fleet to be transformed with new investment and improvement in efficiency

Projected Fleet Comparison 2016 to 2021E

2021E Fuel Diversity[1]
Total MW: 11,900

2021E Energy Produced[1]
Total GWh: 61,000

2016 Fuel Diversity
Total MW: 11,577

- Gas
- Nuclear
- Coal**
- Oil
- Pumped Storage

2016 Energy Produced
Total GWh: 51,510

At conclusion of Power's construction program in 2018, capital to maintain the business declines to ~$200M per year

[1] REFLECTS ANNOUNCED EARLY RETIREMENT OF HUDSON AND MERCER UNITS IN MID-2017
ALL PERIODS EXCLUDE SOLAR (326 MW_{DC}/257MW_{AC}) CAPACITY AND KALAELOA (104MW) CAPACITY / ENERGY PRODUCED
**2016 COAL INCLUDES NEW JERSEY UNITS THAT FUEL SWITCH TO GAS. E= ESTIMATE.

PSEG's Value Proposition

- A stable platform with a robust investment pipeline providing opportunity for growth
- PSE&G – Delivering on promise for rate base growth through disciplined investment, customer satisfaction and safety
- PSEG Power – Efficient, low-cost, clean fleet advantaged by asset diversity, fuel mix and location
- Focus on providing strong, sustainable returns of invested capital through operational excellence, regulatory and legislative mechanisms
- Strong balance sheet – Financial strength supported by stable credit rating and investment profile supporting the potential for consistent and sustainable dividend growth

SI-SSA-0015-14219

PSEG REGULATORY & POLICY REVIEW

Tamara Linde

EXECUTIVE VICE PRESIDENT AND GENERAL COUNSEL

SI-SSA-0015-14220

PSEG

We make things work for you.

Regulatory & Policy Review - Agenda

- PSE&G Investment Program Recap
- PSE&G 2017 Base Rate Case Filing
- Regulatory Reform in NJ
- Preserving Nuclear Generation
- Federal Regulatory Framework
- Summary

SI-SSA-0015-14221

PSE&G has received approval for 15 multi-year investment programs that advance state energy goals

2008/ 2009	2011	2013	2014	2015	2016

Selected Accomplishments

- Capital Infrastructure I
- Energy Efficiency
- Solar Loan I
- Carbon Abatement
- Solar Loan II
- Solar 4 All
- Demand Response

- Energy Efficiency Extension
- Capital Infrastructure II

- Solar Loan III
- Solar 4 All Extension

- Energy Strong

- Energy Efficiency Extension II
- Gas System Modernization

- Solar 4 All Extension II

Infrastructure investment programs with near contemporaneous recovery mechanisms

SI-SSA-0015-14222

PSE&G plans to file Distribution Base Rate Case proceeding no later than November 1, 2017

Support

- Requirement of 2014 Energy Strong settlement
- Update for known changes in sales growth forecast, O&M and taxes since 2010 rate case
- Get recovery of distribution investment not covered by clause mechanisms
- Get recovery of approved storm costs

Opportunity

- Establish/update rate design, capital structure and depreciation
- Pursue decoupling
- Pursue interim rates
- Improve alignment with customer
- New E&G rates effective at start of 2019, or earlier

Supports need for moderate base rate increase

SI-SSA-0015-14223

NJ Distribution Base Rate Case Timeline

SI-SSA-0015-14224

New Jersey – Long-term Infrastructure Regulatory Reform with Customer Focus

Support

- Alignment with community and customer needs
- NJ Energy Master Plan
- Support extension of investment program horizon from 3 to 7 years using review process established by the BPU in Energy Strong and Gas System Modernization Program as template

Opportunity

- PSE&G will be seeking approval of multi-year programs that extend existing efforts to improve our system resiliency and broaden investment focus on Energy Efficiency and Utility of the Future services at the lowest cost to our customers

SI-SSA-0015-14225

Preserving Existing Nuclear Power Plants as Part of a Resilient Energy System

Support

- Generation from Power's nuclear units produces ~40% of NJ supply and provides 97% of NJ's carbon free energy
- Preservation of nuclear energy consistent with NJ policy goal: 70% clean resources by 2050
- Competitive wholesale markets not designed to value fuel diversity, resiliency and desirable attributes of nuclear generation

Opportunity

- Preserve highly reliable, clean resources as part of a diverse energy portfolio
- Preserve local jobs and economic base
- Keep prices lower than they otherwise would be, as current replacement options are more expensive
- Maintain system reliability

SI-SSA-0015-14226

What are other states doing to preserve at-risk nuclear generation?

New York April 2016	Illinois November 2016	Connecticut 2017?	Ohio 2017?
Clean Energy Standard approved by NYPSC provides support for at-risk nuclear. Zero Emission Credit standard established. Contract payments available for up to 12 years	Future Energy Jobs Bill enacted establishing a Zero Emission Credit (ZEC) portfolio standard. ZEC contract payments available for 10 years	Connecticut Legislature currently debating clean energy procurement process in recognition of nuclear capacity role as provider of clean energy	Legislative action under consideration to preserve at-risk nuclear generation

State Regulatory/Legislative actions recognize value of nuclear energy in meeting clean energy standards and supporting local economy

SI-SSA-0015-14227

Federal Regulatory Framework – Ensuring market structures recognize the value of reliable, diverse and clean dispatchable generation

Support

- FERC is driving ISOs to improve market constructs and rules on energy pricing
- Higher payments for enhanced reliability (Capacity Performance); first purely CP capacity auction to be held by PJM in May 2017

Opportunity

- Advocate for market solutions that fairly compensate generators for the cost of meeting demand
- Seek recognition of environmental attributes of existing resources
- Seek integration of state public policy objectives for clean energy with grid reliability and efficient market signals

SI-SSA-0015-14228

PSEG Regulatory and Policy focus

on mechanisms that provide customers clean, affordable, resilient energy supply

NJ Distribution Base Rate Proceeding

- True-up data from 2010 base rate case for known changes in customers usage, taxes, O&M and investments

Long-Term Infrastructure Investment Platform

- Seek extension of existing infrastructure programs, e.g., GSMP, and broaden investment platform

Preserve the Value of Nuclear Supply

- Pursuing legislative strategy to recognize the value of nuclear energy under terms and conditions that are affordable for customers and provide the proper incentives for long-term operation

Ensure Federal Regulatory and Policy Framework

- Advocate for rules that preserve benefits of competitive markets while also recognizing the value of clean energy, supply diversity and grid reliability

SI-SSA-0015-14229

PSE&G

Ralph LaRossa

PUBLIC SERVICE ELECTRIC & GAS

PSEG

We make things work for you.

SI-SSA-0015-14230

Discussion topics

- Overview of PSE&G - Strategy and delivering results
- Operational excellence
- Capital investment program
- 2017 Distribution rate case filing
- Customer rates

SI-SSA-0015-14231

PSE&G –New Jersey's largest:

- Electric and Gas Distribution utility
- Transmission business
- Investor in renewables and energy efficiency
- Appliance service provider

	Electric	Gas
Customers Growth (2012 – 2016)	2.2 Million 0.5%	1.8 Million 0.4%
2016 Electric and Gas Sales	41,580 GWh	2,360M Therms*
Projected Annual Sales Growth (2017 – 2019)**	0.3%	0.7%
Sales Mix (2016)		
Residential	33%	59%
Commercial	58%	37%
Industrial	9%	4%

PSE&G 2016 Rate Base

SI-SSA-0015-14232

PSEG

* GAS FIRM SALES ONLY.
** ESTIMATED ANNUAL GROWTH PER YEAR, ASSUMES NORMAL WEATHER.

PSE&G strategy

Building a sustainable platform that balances reliability, customer rates and public policy to ensure growth at reasonable returns

SI-SSA-0015-14233

Delivering on Our Promises

Operational Excellence	• Strong safety, reliability and customer service record • Cost control efforts have led to flat O&M
Financial Strength	• Achieved 5-year annual growth in net income of 11% • Achieved 5-year annual growth in rate base of 13% • Maintaining solid investment grade credit ratings
Disciplined Investment	• 15 investment programs approved over past eight years ✓ Infrastructure focused ✓ Supportive regulatory mechanisms providing for clause recovery ✓ Policy alignment – across administrations – Solar and Energy Efficiency • Programs creating jobs and providing environmental benefits, in a low-rate environment benefiting from low commodity prices and federal tax benefits from current bonus depreciation rules

SI-SSA-0015-14234

Operational Excellence - Safety

- Management focus and collaboration with unions resulted in top decile safety performance in 2016

SI-SSA-0015-14235

SOURCE: PSE&G

Operational Excellence - Reliability

Consistently recognized for customer reliability

Our system performance, as measured by System Average Interruption Duration Index (SAIDI), has consistently been among the best performers

Named most reliable electric utility in the Mid-Atlantic region for **15th consecutive year**

SI-SSA-0015-14236

SOURCE: PSE&G

Operational Excellence - Customer satisfaction

PSE&G has improved on an absolute and relative basis compared to its peers over the past five years

JD Power Residential and Business Scores

SI-SSA-0015-14237

Operational Excellence – O&M costs

Demonstrated ability to control O&M, preserving earnings and returns in a low sales growth environment

Cost control actions:

- PSE&G is utilizing the Lean Six Sigma discipline to achieve costs savings and process improvements
- Regular organizational refinement to streamline processes
- Continued focus on vendor and inventory practices ensuring maximum value
- Successful management of pension

E = ESTIMATE.

SI-SSA-0015-14238

Disciplined Investment – Delivering annual growth

Our rate base is now roughly balanced between federal and state jurisdictions

SI-SSA-0015-14239

Disciplined Investment – Continued growth in robust capital program

2017-2021E PSE&G Capital Spending

Base Capital,
including GSMP extension
$12.3B
Rate Base CAGR 7%

with extension / expansion of current programs
$13.8B
Rate Base CAGR 9%

Transmission | Gas Distribution | Electric Distribution | Solar and Energy Efficiency

With current returns on ~70% of capital investments

. E = ESTIMATE. INCLUDES AFUDC

SI-SSA-0015-14240

Transmission - ~$6 billion, 5-year investment program focusing on reliability and replacing aging infrastructure

- **Formula rate** recovery of capital and expenses
- **PJM's Regional Transmission Expansion Plan** (RTEP) identifies system enhancements needed for reliability
- **Portfolio transitioning –** completing remaining major lines and moving to steady state investments to maintain reliability and stay ahead of asset end of life
  - **69kV system upgrades** improve system reliability and add capacity for future growth
  - **Transmission Lifecycle** to manage asset life and improve system integrity and reliability
  - **Transmission Hardening** projects focus on increasing system resiliency

SLSS-V 5-14241

Electric Distribution – ~$3 billion, 5-year investment program focused on reliability and resiliency

- **Energy Strong** - Completion of currently approved program
- **Future growth efforts**
  - **Hardening** – Extend program for critical system infrastructure
  - **Aging infrastructure** – Life cycle investments to ensure continued top quartile reliability performance
    - Over 65 substations > 60 years old; Over 30 substations > 80 years old
    - ~115 substations 26kV to 4kV
    - Risk assessment model to eliminate/replace
  - **Technology** – Next generation to enhance grid performance

SI-SSA-0015-14242

Electric Distribution - Technology

- **Making the grid smarter**
  - Deployment of hundreds of microprocessor relays
  - A new state of the art distribution SCADA system to facilitate full communication and control
  - Ability to integrate Distributed Energy Resources into the grid while enhancing grid reliability and resiliency

- **Improving customer service - continue to enhance delivery of information and communication**

SI-SSA-0015-14243

Gas Distribution – ~$3 billion, 5-year investment program focused on modernizing and upgrading cast iron and unprotected steel main

- **Cost efficiency** of broad replacement approach
- **Customer service** – conversion from low pressure to high pressure
- **Environmental Collaboration** with EDF and Google to consider methane leaks in work prioritization
- **Replaced** >200 miles in 2016
  - Exceeding run rate of 30 year program, demonstrating ability to accelerate program
  - ~4,800 miles of cast iron and unprotected steel main remaining in the system
  - More cast iron than any other US utility

SI-SSA-0015-14244

Solar and Energy Efficiency – ~$250 million, 5-year investment supports New Jersey policy objectives

- **Solar –**
  - Grid-connected solar on landfills and brownfields provides clean energy for all customers
  - 210 MW installed of the 300 MW total approved programs
- **Energy efficiency** – Continuing programs with a focus on hospitals, multi-family housing and our direct install program which includes municipalities, non-profits and small businesses in Urban Enterprise Zones
- **State Policy** - Programs are aligned with policy goals
- **Opportunity to expand** – Potential for significant opportunity to expand energy efficiency and related customer services in the future

SI-SSA-0015-14245

Developing investment opportunities with near-contemporaneous recovery mechanisms

2017-2021E PSE&G Capital with Program extensions by Recovery Method

Plan to increase current five year, $12.3B capital plan by ~$1.5B through program extensions and expansions:

- GSMP acceleration
- Electric distribution – hardening extension and modernization investment program
- Energy Efficiency and Solar programs – extensions and expansion

With broad opportunity set of additional investment potential driven by customer expectations and public policy

FERC Formula Rates	Traditional Recovery Mechanisms	Clause Recovery Mechanisms
Transmission	Distribution Base Rates	Infrastructure / Solar / Energy Efficiency

E = ESTIMATE. DATA AS OF MARCH 2017. INCLUDES AFUDC.

SI-SSA-0015-14246

PSE&G Investment Evolution: System needs, customer expectations and public policy objectives drive need for continued and increasing Distribution investments

2012 - 2016

Infrastructure Clauses focused on hardening and resiliency

Solar 4 All and Solar loans

Energy Efficiency

2017-2021E

Complete hardening, begin system modernization expand efficiency program

Transition from Energy Strong to Life cycle and automation work

Accelerate GSMP

Solar landfills

Extend and broaden Energy Efficiency

Utility of the Future

Electric Infrastructure

Life cycle programs, distribution automation, EV Charging

Gas Infrastructure

GSMP Acceleration and Resiliency

CNG Charging

Distributed energy resources

Solar 4 All, Microgrids, Batteries, Fuel Cells

Energy Efficiency

Hospitals, Municipalities, Universities, Low Income Programs, EE for All (Residential, Small C&I), AMI, Bill Education

Utility of the Future represents potential investment opportunity to sustain annual rate base growth rate

SI-SSA-0015-14247

Investment program supports strong rate base growth – off a higher base

E = ESTIMATE.

SI-SSA-0015-14248

Distribution – 2017 base rate case filing

- Obligated to file rate case no later than November 1, 2017
- Last rate case – 2009 test year, settled in 2010

Since last rate case

- **Sales growth** – flat, customer growth offset by energy efficiency
- **O&M** – held flat, with increased regulatory requirements
- **Capital Investments** – Growth in rate base beyond clauses, consists of:
  - GSMP annual stipulated base
  - Energy Strong
  - Other Distribution base investments beyond depreciation levels
- **Customer rates** since last rate case
  - Electric decreased 5%; Gas decreased 46%

Supports need for moderate base rate increase

SI-SSA-0015-14249

Optimal time for extension and expansion of investment programs

- 2017 investment program filings
  - **GSMP** - extension and acceleration
  - **Electric infrastructure** - resiliency and modernization
  - **Energy efficiency** – extension, potential future expansion
  - Seeking **long-term** programs to optimize planning and cost
- Programs improve system reliability and meet customer expectations
  - System need as infrastructure reaches end of life
  - Increasing customer and public policy expectations
- Optimal timing

Job creation	Environmental benefits	Federal tax benefits	Low commodity prices
√	√	√	√

- Potential rate impact of program extensions - ~2%/year*

SI-SSA-0015-14250

*ASSUMES TYPICAL COMBINED RESIDENTIAL CUSTOMER WITH 7,200 KWH FOR ELECTRIC AND 1,010 THERMS FOR GAS ANNUALLY.

Customer's bills are materially lower, supporting needed investment in the system

- Combined electric and gas bills declined ~28% over the 2009-2017 period
  - Also provided BGSS bill credits totaling ~$590 per customer since 2012
  - Low gas prices and elimination of transition charges drove rate decreases
- Regional price comparison** Gas is 2nd lowest and Electric is lower than average
- Investing at the Utility of the Future level – would take about a decade to equal the 2009 bill rates (adjusted for growth in CPI/disposable income)

SI-SSA-0015-14251

PSEG

*FOR ALL YEARS THE BILLING ASSUMES 7,200 KWH FOR ELECTRIC AND 1,010 THERMS FOR GAS ANNUALLY. E = ESTIMATE
** COMPARED AGAINST 12 REGIONAL UTILITIES AS OF SEPTEMBER 1, 2016, FOR A CUSTOMER THAT USES 500 KILOWATT-HOURS AND 100 THERMS IN A MONTH.

PSE&G's 2017 net income to benefit from investment programs and cost control

E =ESTIMATE.

SI-SSA-0015-14258

Power is transforming its portfolio to be newer, more efficient and flexible

2012 → 2013 → 2014 → 2015 → 2016

Selected Accomplishments Towards Transformation

Cost Control

2012

- Additional **400** MW of new peaker capacity at Kearny and New Haven

2013

- Bethlehem Energy Center, 2nd gas pipeline connection added

2014

- CCGT Advanced Gas Path (AGP) uprate completed at Linden 1 & 2, **63** MW
- Energy / Fuel management contract for LIPA

2015

- Continued growth with **1,300** MW new CCGT's announced
  - Keys
  - Sewaren 7
- Projects Completed:
  - Peach Bottom EPU, **130** MW
  - Bergen 2 AGP uprate, **31** MW
- Retired HEDD Units
- Solar portfolio reaches **277** MW_{DC}
- Initiated Hope Creek uprate, **18** MW

2016

- Bridgeport Harbor 5 **485** MW CCGT cleared ISO-NE auction
- Hudson & Mercer early retirement announced
- Kearny 13 & 14 uprate, **14.5** MW increased capacity
- Initiated electric & gas retail business in NJ, PA
- Solar reaches ~**326** MW_{DC} in operation

SI-SSA-0015-14259

Power has generating assets in three competitive markets

- Major assets located near key load centers
- Constructing three new, efficient combined-cycle units
- Positioned to benefit from market volatility
- Additional generation assets:
  - Solar (326 MW_{DC}/257 MW_{AC})
  - Kalaeloa, HI (104 MW)

SI-SSA-0015-14260

*POWER ANNOUNCED RETIREMENTS OF HUDSON AND MERCER GENERATING STATIONS AS OF JUNE 1, 2017.

Power has a diverse fleet of generating assets which enables it to respond to market needs

Fuel Diversity 2016*

Total MW: 11,577

Energy Produced 2016*

Total GWh: 51,510

- Gas
- Nuclear
- Coal**
- Oil
- Pumped Storage

SI-SSA-0015-14261

PSEG

* EXCLUDES SOLAR (326MW$_{DC}$ /257MW$_{AC}$) AND KALAELOA (104MW).
**INCLUDES NEW JERSEY UNITS THAT FUEL SWITCH TO GAS.

Power's Fossil Fleet maintains solid performance in a challenging environment

- Generation records at BEC and Bergen 2 combined-cycle units
- Combined-cycle EFORd* and EFORp lowest in five years
- Start Success Rate:
  - Peaking: 99.7%
  - Coal/Steam: 93%

SI-SSA-0015-14262

*EFORd EXCLUDES EVENTS OUTSIDE OF MANAGEMENT CONTROL.

Nuclear is vital to New Jersey with Salem and Hope Creek providing ~40% of the State's energy consumption

Hope Creek	Salem Units 1 and 2	Peach Bottom Units 2 and 3
• Operated by PSEG Nuclear • PSEG Ownership: 100% • Boiling Water Reactor • Total Capacity: 1,172 MW • Owned Capacity: 1,172 MW • License Expiration: 2046 • 18 MW Uprate Spring 2018 • Next Scheduled Refueling ➢ Spring 2018	• Operated by PSEG Nuclear • PSEG Ownership: 57% • Pressurized Water Reactor • Total Capacity: 2,296 MW • Owned Capacity: 1,318 MW • License Expiration: 2036 and 2040 • Next Scheduled Refueling ➢ Unit 1 – Fall 2017 ➢ Unit 2 – Spring 2017	• Operated by Exelon • PSEG Ownership: 50% • Boiling Water Reactor • Total Capacity: 2,450 MW • Owned Capacity: 1,225 MW • License Expiration: 2033 and 2034 • Next Scheduled Refueling ➢ Unit 2 – Fall 2018 ➢ Unit 3 – Fall 2017

SI-SSA-0015-14263

PSEG Nuclear has been addressing the economic challenges in the current low gas price environment

- 2012 to 2017E CAGR: –1.4%
- The 2015 Labor increase / outside services decrease is due to bringing security force employees in-house
- Material and outside service cost reductions CAGR: – 4%

- Fukushima-related compliance drove $198 M of Regulatory/Environmental spend
- 2016 and 2017E capital driven by Baffle Bolt replacement
- Going forward capital approximately $100M/year to maintain reliability to end of license life

SI-SSA-0015-14264

PSEG

NOTE: LABOR INCLUDES BASE WAGES, OVERTIME AND FRINGE BENEFITS. ALL YEARS EXCLUDE EXPENDITURES FOR NUCLEAR FUEL (APPROXIMATELY $6.50/MWH). E=ESTIMATE

PSEG Nuclear is leading the industry in efforts to ensure economic viability of fleet

Goals

- Industry goal to achieve reductions in O&M, fuel and capital costs by 2018
- The three-year program to examine and implement opportunities to:
  - ✓ Advance safety,
  - ✓ Improve operations, and
  - ✓ Prevent premature reactor closures
- Concurrently, we continue to work with NEI and other industry partners to gain greater compensation for nuclear plants in competitive market policies

PSEG Nuclear progress to date

- 46 Efficiency Bulletins issued, 21 implemented to date
- Cost reductions achieved: 185 FTE reduction; 2017 direct O&M reduction of 5% from plan target while funding equipment reliability improvement
- Implemented changes to focus on eliminating vs. mitigating equipment reliability issues to ensure generation is not negatively impacted

PSEG Nuclear is not currently earning its cost of capital

SI-SSA-0015-14265

Power has demonstrated its ability to control O&M

*EXCLUDES IMPACTS FROM STORM RECOVERY COSTS AND THE HUDSON/MERCER EARLY RETIREMENT.
E=ESTIMATE

SI-SSA-0015-14266

Power is developing ~1,800 MW of new, efficient CCGT capacity in MD, NJ and CT

- **485 MW plant in Bridgeport, Connecticut**
  - 1x1 dual fuel (natural gas & ultra low sulfur diesel) combined cycle
- **Estimated Costs $525 to $575 million**
- **Major Milestones**
  - New Source Review Air Permit is expected to be issued by April 15, 2017
  - Expected to be in-service in mid-2019
- **Outlook**
  - To be constructed on the existing PSEG Bridgeport Harbor site; Bridgeport Harbor 3 will retire in 2021
  - Located in the SW Connecticut load pocket
  - Seven year capacity price lock

Power's fleet is being **transformed** with focus on improvement in efficiency

Projected Fleet Comparison 2016 to 2021E

2021E Fuel Diversity[1]
Total MW: 11,900

2016 Fuel Diversity
Total MW: 11,577

2021E Energy Produced[1]
Total GWh: 61,000

2016 Energy Produced
Total GWh: 51,510

Energy Produced increases by >18%

- Gas
- Nuclear
- Coal**
- Oil
- Pumped Storage

[1] REFLECTS ANNOUNCED EARLY RETIREMENT OF HUDSON AND MERCER UNITS IN MID-2017.
ALL PERIODS EXCLUDE SOLAR (257 MW_{AC}) CAPACITY AND KALAELOA (104 MW) CAPACITY / ENERGY PRODUCED.
**2016 COAL INCLUDES NEW JERSEY UNITS THAT FUEL SWITCH TO GAS. E= ESTIMATE.

SI-SSA-0015-14271

Power's fleet is transitioning to become more efficient, productive and clean

E = ESTIMATE.

Power's capital needs decline following construction of new capacity, enhancing free cash flow

SI-SSA-0015-14273

PSEG

E=ESTIMATE. DATA AS OF FEBRUARY 2017.
EXCLUDES NUCLEAR FUEL. INCLUDES IDC.

Power's fleet is well-located with access to shale gas production

- PSEG Power procured approximately 400 BCF in 2016 with almost 50% going to PSE&G's utility gas customers
- PSEG Power's gas for PJM generation was ~100 BCF in 2016, of which >80% was supplied by Northeast Shale gas

- Significant amount of new pipelines have already been built and more are in construction / development
- Gas production and pipeline takeaway capacity expected to be more balanced in 2018 timeframe

SI-SSA-0015-14274

With additional pipeline capacity, some price convergence is beginning to appear in the gas markets

Electric basis for the PSEG Zone is also showing improvement in the forward markets

PSEG Power's Value Proposition

Efficient fleet	Advantaged locations	Investing to grow

- Well-positioned, well-run fleet of merchant generating assets in competitive markets
- Early retirement of Hudson and Mercer coal stations in mid-2017 improves fleet efficiency and returns
- Addition of 1,800 MWs of new, efficient, flexible CCGTs transforms the portfolio
- Low capital requirements post-construction
- Hedging strategy to protect value of assets in declining price environment and provide stable returns and cash flow

SI-SSA-0015-14295

2017 Federal Tax Reform – PSEG is well positioned

Given positive non-utility contribution to earnings and a strong balance sheet, PSEG is well positioned for potential tax reform

Assumption	PSE&G	PSEG Power	PSEG Parent
Reduction of Corporate Tax Rate	Customer rates lowered with reduction in tax rate Return of excess deferred tax liability – impact on cash and rate base growth dependent on payback period	After-tax earnings and cash flow increase One-time non-cash earnings benefit from reduction in deferred tax liability	After-tax earnings and cash flow improve
100% Expensing of Capital Expenditures	Impact on rate base growth comparable to existing bonus depreciation rules	Cash flow improves	
Elimination of Deductibility of Interest Expense and Border Adjustment Tax	Change in cost anticipated to be passed through to customers	Well positioned given low debt balance Uncertainty on Border Adjustment Tax	Well positioned given low debt balance

SI-SSA-0015-14296

Opportunity for meaningful and sustainable dividend growth

Payout Ratio	50%	58%	56%	54%	54%	57%	59%(1)

SI-SSA-0015-14298

PSEG Summary

- 2016 Operating Earnings (non-GAAP) at upper end of revised guidance of $2.80 - $2.95 per share
- 2017 guidance for Operating Earnings (non-GAAP) of $2.80 to $3.00 per share supported by PSE&G growth
- PSE&G capital spending provides high single-digit rate base growth for foreseeable future balanced between Transmission and Distribution
- Power expected to generate significant free cash flow following CCGT construction program and transformation to a more efficient generation fleet
- Strong balance sheet and cash flow support current capital program and new investment opportunities without the need for equity
- Our indicative $0.08 dividend per share increase for 2017 demonstrates meaningful and sustainable dividend growth given significant contribution from PSE&G earnings and Power's strong financial profile

PSEG EXECUTIVE PROFILES

SI-SSA-0015-14300

PSEG

We make things work for you.

Ralph Izzo

CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED

Ralph Izzo was elected chairman and chief executive officer of Public Service Enterprise Group Incorporated (PSEG) in April 2007. He was named as the company's president and chief operating officer and a member of the board of directors of PSEG in October 2006. Previously, Mr. Izzo was president and chief operating officer of Public Service Electric and Gas Company (PSE&G).

Since joining PSE&G in 1992, Mr. Izzo was elected to several executive positions within PSEG's family of companies, including PSE&G senior vice president – utility operations; PSE&G vice president – appliance service; PSEG vice president - corporate planning; and PSE&G vice president - electric ventures. In these capacities he broadened his experience in the areas of general management, strategic planning and finance.

Mr. Izzo is a well-known leader within the utility industry, as well as the public policy arena. He is frequently asked to testify before Congress and speak to organizations on matters pertaining to national energy policy.

Mr. Izzo's career began as a research scientist at the Princeton Plasma Physics Laboratory, performing numerical simulations of fusion energy experiments. He has published or presented over 35 papers on magnetohydrodynamic modeling. Mr. Izzo received his Bachelor of Science and Master of Science degrees in mechanical engineering and his Doctor of Philosophy degree in applied physics from Columbia University.

He also received a Master of Business Administration degree, with a concentration in finance from the Rutgers Graduate School of Management. He is listed in numerous editions of Who's Who and has been the recipient of national fellowships and awards. Mr. Izzo has received honorary degrees from the New Jersey Institute of Technology (Doctor of Science), Thomas Edison State University (Doctor of Humane Letters), Bloomfield College (Doctor of Humane Letters), Rutgers University (Doctor of Humane Letters), and Raritan Valley Community College (Associate of Science).

Mr. Izzo serves as nominating committee chairman of the New Jersey Chamber of Commerce, and is on the board of directors for the New Jersey Utilities Association, the Edison Electric Institute (EEI), and the Nuclear Energy Institute (NEI). He is also a member of the Board of Trustees of Peddie School, Columbia University School of Engineering Board of Visitors and the Princeton University Andlinger Center for Energy and the Environment Advisory Council, as well as a member of the Visiting Committee for the Department of Nuclear Engineering at MIT. Mr. Izzo is a former member of the board of directors of The Williams Companies. In addition, he is a former chair of the Rutgers University Board of Governors and the New Jersey Chamber of Commerce.

SI-SSA-0015-14301

Tamara L. Linde

EXECUTIVE VICE PRESIDENT AND GENERAL COUNSEL

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG POWER, PSEG SERVICES CORPORATION

Tamara Linde was named executive vice president and general counsel for Public Service Enterprise Group Incorporated (PSEG) in July 2014. She is also the executive vice president and general counsel of Public Service Electric and Gas Company (PSE&G), PSEG Power and PSEG Services Corporation.

As PSEG's chief legal officer, Ms. Linde has responsibility for all legal and regulatory functions, and has general supervisory responsibilities for the office of corporate secretary, business assurance and resilience and federal affairs and sustainability. Ms. Linde is a member of PSEG's Executive Officer Group.

Previously Ms. Linde was vice president – regulatory, PSEG. She has led the company's federal and state regulatory functions, as well as managed corporate, environmental and labor/employment practices within the company. Ms. Linde has served as regulatory counsel on many of the company's most important initiatives in recent years.

Ms. Linde joined the law department of Public Service Electric and Gas Company (PSE&G), as an attorney in 1990 handling a variety of natural gas and electric regulatory and transactional matters. After holding several other legal positions at PSE&G she became general solicitor, in 2000. In that position she was responsible for the regulatory affairs of the PSEG companies including electric, gas and nuclear matters.

She has had significant experience working on regulatory matters before various state and federal regulatory agencies on industry issues relating to electric transmission and distribution and energy markets.

Ms. Linde is a member of the New Jersey, New York, District of Columbia and Texas bars. She currently serves on the Board of the PSEG Foundation, the Community Foundation of New Jersey and the Mater Dei Prep High School Board. In addition, Ms. Linde is a member of the General Counsel Steering Committee of the National Association of Corporate Directors (NACD). She is past President of the Northeast Chapter of the Energy Bar Association and served as chair of the Energy Bar Association Electricity Regulation and Compliance Committee. Ms. Linde graduated from Seton Hall University School of Law with a Juris Doctorate and from Seton Hall University with a bachelor's degree.

SI-SSA-0015-14302

Ralph A. LaRossa

PRESIDENT AND CHIEF OPERATING OFFICER

PUBLIC SERVICE ELECTRIC AND GAS COMPANY

Ralph A. LaRossa was named president and chief operating officer of Public Service Electric and Gas Company (PSE&G) in October 2006. PSE&G is New Jersey's oldest and largest regulated gas and electric delivery utility, serving approximately 2.4 million customers, nearly three-quarters of the state's population. Prior to this position he was vice president - electric delivery for PSE&G.

In addition, on January 1, 2014, Mr. LaRossa became Chairman of the Board of PSEG Long Island, a subsidiary of Public Service Enterprise Group (PSEG), which manages the electric transmission and distribution systems on Long Island and in the Rockaways. PSEG Long Island serves 1.1 million customers.

Mr. LaRossa joined PSE&G in 1985 as an associate engineer and advanced through a variety of management positions in the utility's gas and electric operations. In 1998, he received Gas Industry Magazine's Outstanding Manager of the Year Award.

He is a graduate of Stevens Institute of Technology and has completed the Harvard Business School's Program for Management Development.

Mr. LaRossa is Chairman of Choose New Jersey, Inc. and serves on its board of directors. In addition, he is a member of the board of directors for the New Jersey Utilities Association (NJUA), New Jersey Performing Arts Center (NJPAC) and Montclair State University, for which he is past chair of the university. Mr. LaRossa is also the immediate past chair of the American Gas Association (AGA).

SI-SSA-0015-14303

William Levis

PRESIDENT AND CHIEF OPERATING OFFICER

PSEG POWER

William Levis is president and chief operating officer of PSEG Power, a position he's held since June 2007. PSEG Power is a major, unregulated independent power producer in the U.S. with four main subsidiaries: PSEG Nuclear, PSEG Fossil, PSEG Energy Resources and Trade (ER&T) and PSEG Power Ventures.

PSEG Power operates one of the most balanced portfolios in the country, both in terms of fuel mix and market segment (based load units, load following units and peaking units). Its low-cost, load following fleet is geographically well positioned in competitive markets. Its 11,681 MWs represent a diverse fuel mix with different plant types.

Before coming to PSEG, Mr. Levis was Exelon Nuclear's vice-president – Mid-Atlantic operations. Prior to joining Exelon, Mr. Levis worked at Ontario Hydro's Pickering Plant and held several positions over a five-year period with Carolina Power and Light's Brunswick facility.

Mr. Levis has a Bachelor of Science degree in marine engineering from the U.S. Naval Academy and holds an SRO (senior reactor operator) certification. He retired as a commander in the Naval Reserves and attained his professional engineer license in 1985.

Mr. Levis is a member of the Executive Committee of Nuclear Energy Institute's (NEI) Board of Directors, the Nuclear Electric Insurance Limited (NEIL) Board of Directors, and serves as a member of the Institute of Nuclear Power Operations (INPO) National Nuclear Accrediting Board. He is a member of the Philadelphia Archdiocese Catholic Charities Appeals Board and is a member of the CEO Council for Growth based in Philadelphia.

.

SI-SSA-0015-14304

Daniel Cregg

EXECUTIVE VICE PRESIDENT AND CHIEF FINANCIAL OFFICER

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG POWER LLC AND PSEG SERVICES CORPORATION

Daniel J. Cregg was named executive vice president and chief financial officer for Public Service Enterprise Group Incorporated (PSEG) and its subsidiaries in October 2015.

Mr. Cregg is responsible for all financial functions, including Internal Audit Services, Investor Relations and Corporate Development. Given the array of financial instruments which serve as the primary means of selling wholesale energy to customers, Mr. Cregg also has responsibility for the Risk Management function, which provides independent oversight of the PSEG Power trading organization. In addition to finance, Mr. Cregg is responsible for the Strategy and Planning function. He is a member of PSEG's Executive Officer Group.

Prior to his current position, Mr. Cregg was vice president – finance for PSE&G, a role he assumed in June 2013. In 2006, Mr. Cregg was named vice president – finance for PSEG Power. In that capacity and in previous financial roles for Power, Mr. Cregg held leadership positions related to financial reporting and forecasting, investor communications, financings, rating agency interactions, external reporting, cash forecasting, financial valuations, competitive intelligence, and fundamental market modeling, with critical responsibilities in Power's development and strategic planning activities.

Previously, Mr. Cregg was director of PSEG corporate development. He joined PSEG in 1991 with overall responsibility for tax planning, strategy and compliance for PSEG Energy Holdings, including domestic and international tax structuring work for PSEG Global and PSEG Resources.

Before joining PSEG, Mr. Cregg spent five years with the accounting and consulting firm of Deloitte and Touche, providing consulting services to a wide range of clients with an emphasis on the energy industry.

Mr. Cregg holds a Master of Business Administration degree from the Wharton School of the University of Pennsylvania and is a graduate of Lehigh University, where he received a bachelor's degree in accounting.

SI-SSA-0015-14305

Derek M. Di Risio

PRESIDENT

PSEG SERVICES CORPORATION

Derek M. Di Risio was named President, PSEG Services Corporation, in July 2014. He is responsible for the coordination and delivery of several centralized services currently residing within PSEG Services Corporation including corporate communications, corporate citizenship, corporate real estate, information technology, procurement, payroll and other transactional services.

Prior to his current role, Mr. Di Risio was vice president and controller of Public Service Enterprise Group (PSEG), Public Service Electric and Gas Company (PSE&G), PSEG Services Corporation, PSEG Energy Holdings (Holdings) and PSEG Power, a position he assumed in December 2006. He was previously vice president and assistant controller, since July 2004.

Mr. Di Risio had been vice president – planning and analysis of Holdings since March 2004, and vice president – controller for Holdings since July 1998. Prior to that he was director – accounting services and responsible for several accounting and planning functions for Holdings, including overall coordination of the business planning process, accounting research and policy development, financial forecasts and analysis.

Mr. Di Risio was also responsible for the budgeting, analysis and reporting process for PSE&G.

Mr. Di Risio joined PSE&G in September 1991 and has held a variety of positions, including assignments with the internal auditing, electric business, and corporate planning departments. He was instrumental in reengineering the Enterprise business planning process, and advancing the use of performance metrics and balanced scorecard measures to improve business results. Prior to joining PSE&G he worked for several firms, including Chase Manhattan Bank.

Mr. Di Risio graduated from Rutgers University with a degree in accounting/computer science, and received a Master of Business Administration degree from the same university. He is a certified public accountant (inactive). Mr. Di Risio also completed the Program for Management Development at the Graduate School of Business Administration of Harvard University. He serves on the Drumthwacket Foundation Board of Trustees, the Board of the Military Park Partnership and is currently a co-chairman of the Board of Directors of the New Jersey All Stars Project Inc. In addition, Mr. Di Risio previously served on the Drew University Board of Trustees.

SI-SSA-0015-14306

Shahid Malik

PRESIDENT
PSEG ENERGY RESOURCES & TRADE

Shahid Malik was appointed President of PSEG Energy Resources & Trade (ER&T) in 2011. PSEG operates one of the most balanced generation and marketing portfolios in the country, both in terms of fuel mix and market segment (base load units, load following units and peaking units), and Mr. Malik is essentially responsible for managing these assets and taking them to market. He oversees PSEG's generation portfolio and the purchase, sale and risk management of all energy commodities. He is also responsible for Business Development of new power generation projects.

Mr. Malik has an extensive background in the energy industry across the oil, gas, electric and renewable energy sectors in Europe and the United States. Previously, he was with Pittiglio, Rabin, Todd & McGrath (PRTM) in Pittsburgh, PA and was responsible for all aspects of the global energy business, with a primary focus on the North American utility sector. Prior to that he served as President & CEO of Strategic Energy, Great Plains Energy's retail marketing subsidiary and a provider of energy and services to business clients in North America. He was accountable for the company's strategy and operations and led a successful turnaround of the company, achieving significant growth in products and services while reducing costs.

Mr. Malik's career has included Executive Leadership positions with several energy companies in the US and Europe. In addition, he served on the Board of Directors of South Jersey Industries (NYSE: SJI) immediately prior to joining PSEG.

Mr. Malik has been in the energy business for more than 20 years, since receiving his Economics degree from Manchester University in England and an MBA from Rice University, Houston. He sits on the Executive Committee of the Board of Trustees of Newark Museum.

SI-SSA-0015-14307

Margaret M. Pego, SPHR

SENIOR VICE PRESIDENT – HUMAN RESOURCES AND
CHIEF HUMAN RESOURCES OFFICER

PSEG SERVICES CORPORATION

Margaret M. Pego was named senior vice president – human resources and chief human resources officer of PSEG Services Corporation in December 2006. Prior, she had been vice president – human resources. Ms. Pego joined PSEG in 1974, and has held a variety of management positions in the human resources department.

Ms. Pego holds a Bachelor of Arts degree in business administration from William Paterson College, and a Master of Business Administration degree with a concentration in management and labor relations from Seton Hall University. In addition, she holds a certificate in EEO studies from Cornell University, and has completed the Human Resources Executive Program at the University of Michigan. She is also certified as a senior professional in human resources.

Ms. Pego was named one of 2013's HR Top 10 Breakaway Leaders by Evanta, a leading organization that fosters leadership development and collaborative exchange among North America's top executives.

Ms. Pego is active in several local and national organizations, including the EEI Chief HR Executive Advisory Committee; the American Gas Association HR Policy Committee; the Conference Board Advisory Council of HR Management – Council of HR Executives; and the Society for Human Resources Management. In addition, she is immediate past chair of the Children's Specialized Hospital Board, a former member of the Children's Specialized Hospital Foundation Board and RWJ Health Care Corporation Board. She is the former Chair of the Center for Energy Workforce Development (CEWD) Executive Council and is currently a board member. She is a former member of the Supreme Court of New Jersey Attorney Ethics Committee. Ms. Pego is a 2002 Leadership New Jersey fellow, 1997 TWIN Honoree, 2006 Executive Woman of New Jersey Honoree and 2008 NJ Best 50 Women in Business Honoree.

SI-SSA-0015-14308

Peter P. Sena III

PRESIDENT &
CHIEF NUCLEAR
OFFICER

PSEG NUCLEAR

Peter P. Sena III was named president of PSEG Nuclear (Nuclear) in February 2016 and Chief Nuclear Officer in July 2016. Most recently, he was Senior Vice President of Operations, Chief Operating Officer at NextEra Energy.

Mr. Sena was named Chief Nuclear Officer of First Energy in 2012, having held a variety of leadership roles at First Energy nuclear operations spanning 15 years. Mr. Sena joined First Energy in 1996 as a control room supervisor and obtained his first SRO license at Beaver Valley Power Station Unit 2. His second SRO license was obtained in 1999 for Beaver Valley Unit 1. Following a rotational assignment with the Institute of Nuclear Power Operations, Mr. Sena was named the Operations Manager and helped lead the station to the "Most Improved Plant" Award in 2003. In 2005, he was named the Director of Engineering and the station completed the first extended power uprate for a Westinghouse 3 Loop Pressurized Water Reactor. As the Site Vice President of Beaver Valley, Mr. Sena led the station to its first INPO Excellence Award in 2009. The Davis Besse Nuclear Power Plant returned to the Excellence category under Mr. Sena's watch as the Chief Operating Officer in 2011.

Prior to joining FirstEnergy, Mr. Sena was employed by the Nuclear Regulatory Commission as a resident inspector in Region 1. Mr. Sena's nuclear training began as an officer with the US Naval Nuclear Propulsion program and he served on board a ballistic missile submarine during the Cold War.

Mr. Sena earned a Bachelor of Science degree with high honors in Fuel Science from the Pennsylvania State University in 1985. He currently serves on the advisory board for the Penn State Nuclear Engineering Program and is a member of EPRI's research advisory committee. He currently serves on the Auburn University's Advisory Board. In addition, he has recently served on the INPO Executive Advisory Committee and the Nuclear Energy Institute (NEI) Nuclear Strategic Issues Advisory Committee where he was the Industry Executive Sponsor of the NEI post Fukushima flooding response initiative.

Public Service Enterprise Group Inc.

Moderator: Kathleen Lally
April 30, 2018

OPERATOR: This is Conference #9399818

Operator: Ladies and gentlemen, thank you for standing by. My name is Nicole and I will be your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group First Quarter Earnings 2018 Earnings Conference Call and Webcast.

At this time, all participants are in a listen-only mode. Later, we will conduct a question and answer session for members of the finance community. At that time, if you have a question, you may press the star and the number one on your touchtone phone. To withdraw your question, please press the pound key. As a reminder, this conference is being recorded, Monday, April 30th, 2018, and will be available for telephone replay beginning at 1:00 p.m. Eastern today until 11:30 p.m. Eastern on Tuesday, May 8th, 2018.

It will also be available for audio webcast on PSEG's corporate website at www.pseg.com. I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen Lally: Thank you, Nicole. Good morning, everyone. Thank you for participating in our earnings call. As you are aware, we released first quarter 2018 earning statements earlier this morning.

The release and attachments are posted on our website at www.pseg.com under the investor section. We also posted a series of slides that detail operating results by company for the quarter, a 10-Q for the period ended March 31st, 2018 is expected to be filed shortly.

I'm not going to read the full disclaimer statement or the comments we have on the difference between operating earnings and adjusted EBITDA and GAAP results, but I do ask that you all read those comments contained in our slides and on our website. The disclaimer statement regarding forward-looking statements details a number of risks and uncertainties that could cause actual results to differ materially from forward-looking statements made therein. And although we may elect to update forward-looking statements from time to time, we specifically disclaimed any obligation to do so even in light of new information or future events, unless required by applicable security's loss.

We also provide commentary with regard to the difference between non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA. And net income reported in accordance with generally accepted accounting principles in the United States.

PSEG believes that the non-GAAP financial measures of operating earnings and adjusted EBITDA provided consistent and comparable measure of performance to help shareholders understand operating and financial trends, but should not be considered an alternative to our correspondent GAAP measure net income.

I would now like to turn the call over to Ralph Izzo, chairman, president and chief executive officer at Public Service Enterprise Group. And joining Ralph on the call is Dan Cregg, executive vice president and chief financial officer.

At the conclusion of their remarks, there will be time for your questions. We ask that you limit yourself to one question and one follow up to provide enough time for everyone. Thank you. Ralph.

Ralph Izzo: Thank you, Kathleen. And thank you everyone for joining us today. Earlier this morning, we reported non-GAAP Operating Earnings for the first quarter of 2018 of $0.97 per share versus non-GAAP Operating Earnings of $0.92 per share in the last year's first quarter.

Our GAAP results for the first quarter of $1.10 per share reflect solid operating and financial contributions from both businesses. This compares to

GAAP results of $0.22 per share in last year's first quarter, which included expenses associated with our decision to retire the Hudson and Mercer generating stations.

Details on the results for the quarter can be found on slide five. Non-GAAP Operating Earnings for the first quarter benefited from an increase in earnings at both PSE&G and Power. On the operating front, our service area experienced four consecutive nor'easters in March that wreaked havoc on the trees and power lines.

The repeated battering of freezing rain, heavy snow and high winds caused widespread service outages to over 500,000 customers during two of the back-to-back storms. PSEG employees, once again, rose to the challenge.

Beginning with comprehensive storm preparation and then efficiently and safely completing PSE&G and PSEG Long Island customer restorations, the utility then offered assistance to neighboring utilities.

The diversity of PSEG Power's generating fleet was also responsive to the extremes in weather, that range from the near zero temperatures experienced in January to the very mild weather in February.

Eight days of severe weather in January, however, demonstrated again the importance of fuel diversity. Power's high nuclear availability and greater use of oil was able to meet weather-related demand.

(For) the quarter, PSEG's nuclear plants achieved the near perfect capacity factor of 99.5 percent, anchored by a record setting, 517 consecutive day run at the Hope Creek generating station.

We have successfully advanced many policy and regulatory initiatives during the quarter. Last week, PSE&G reached a settlement to expand and extend its Gas System Modernization Program.

The settlement, which is awaiting approval by the Board of Public Utilities, would allow PSE&G to invest approximately $1.9 billion over five years beginning in 2019.

This next phase of GSMP will replace approximately 875 miles of gas (mains) and make other improvements that will reduce methane emissions and ensure we have the critical infrastructure needed to grow New Jersey's economy.

PSE&G has also implemented transmission and distribution rate reductions to pass through the benefits of recently enacted lower federal corporate tax rate to our customers.

In addition, PSE&G filed with the BPU this past January its first base rate case since 2010. PSEG Power made significant progress in its continuing efforts to ensure the economic viability of its nuclear plants.

With broad bipartisan support, the New Jersey legislature passed the zero emissions certificate bill in early April. Key provisions of the ZEC bill as we referred to it are outlined on slide six.

We are hopeful that this safety net mechanism to be implemented by the BPU upon Governor Murphy's signature will secure Power's nuclear fleet as a major source of New Jersey's carbon-free energy supply and acts as a bridge to a cleaner energy future as the state implements companion legislation to further promote renewable energy.

The major energy policy goals of the new clean energy bill are outlined on slide seven. PSEG has been incorporating climate change considerations into its business planning and investment decisions for many years.

We look forward to working with the Murphy administration as New Jersey pursues energy policies which recognize the value of existing carbon-free energy resources and promotes new opportunities to advance New Jersey's clean energy goals.

Also in the category of good news, we have reached the full and final resolution of the longstanding FERC investigation into Power's cost-based bidding matter. PSEG continues to focus on its strategic investment program of $13 to $15 billion over the 2018 to 2022 period.

Earnings for PSE&G are expected to grow by 5 percent in 2018 to represent 65 percent of our full year 2018 non-GAAP Operating Earnings.

The previously mentioned $1.9 billion settlement providing for the second phase of PSE&G's Gas System Modernization Program is aligned with our investment goals and supports annual growth in PSE&G's rate base at the upper end of our forecasted rate of growth of 7 percent to 9 percent for 2022.

PSEG Power continues to operate its assets safely and efficiently and remains focused on the cost discipline essential in today's power market.

Construction of two of Power's three combined cycle gas turbines under construction is expected to conclude around midyear and will add 1,300 megawatts of clean, highly efficient gas fire generating capacity in favorable locations.

This significant list of accomplishments could not have been achieved without the tireless effort of many talented teams across PSEG. From the utility's line (crews) and Power's plant operations to state government affairs, communications, regulatory, legal and finance, I'd like to recognize their exceptional contributions to our progress.

Today, we are reaffirming our non-GAAP Operating Earnings for the full year of $3 to $3.20 per share. At the midpoint, this represents a 6 percent increase over 2017's full year non-GAAP results of $2.93 per share.

With the support of our 13,000 dedicated employees, we expect to be able to successfully deliver on the promise of our investment programs that should provide growth for our shareholders and a sustainable energy future for our customers. With that, I'll turn the call over to Dan who will discuss our financials in greater detail.

Dan Cregg: Thank you, Ralph. And good morning, everyone. As Ralph said, PSEG reported non-GAAP Operating Earnings for the first quarter of 2018 of $0.97 per share versus non-GAAP Operating Earnings of $0.92 per share in last year's first quarter.

On slide five, we provided you the reconciliation of non-GAAP Operating Earnings to net income for the quarter. And we provided you with information on slide 10 regarding the contribution to non-GAAP Operating Earnings by business for the quarter.

Slide 11 contains a waterfall chart that takes you through the net changes quarter over quarter in non-GAAP Operating Earnings by major business. I will now review each company in more detail starting with PSE&G.

PSE&G, as shown on slide 13, reported net income for the first quarter of 2018 of $0.63 per share compared to $0.59 per share for the first quarter of 2017. PSE&G's first quarter results reflect continued successful execution of our infrastructure investment programs.

Growth in PSE&G's investment and transmission added $0.03 per share for the first quarter. And recovery of investments made under the Gas System Modernization Program improved net income by $0.02 per share.

And favorable weather comparisons added $0.01 per share versus the year ago quarter. PSE&G experienced higher cost associated with restoring service to customers following four storms that occurred over a 30-day period.

The increase in storm costs, when combined with the change in pension accounting standards for non-service costs increased O&M by $0.01. In addition, the higher depreciation expense reflecting the utilities expanded asset base, reduced net income by $0.01 per share versus the first quarter of 2017.

Weather-normalized electric sales to residential and commercial customers rose by four tenths of a percent compared to the first quarter of 2017. Weather-normalized gas sales were higher by 1.6 percent in the quarter led by increased residential and commercial usage. Residential customer growth continues to trend higher at eight tenths of a percent per year.

PSE&G implemented a revised $64 million annual increase in transmission revenue under the company's, FERC-approved formula rate effective January

1st after factoring in the $148 million decrease in its revenue requirement associated with the lower federal tax rate.

PSE&G also reduced its distribution revenue by $114 million, in response to the BPU's order to accelerate returning the benefits of federal tax reform to customers effective April 1st. Combined that's $262 million of benefit to customers.

As Ralph mentioned, PSE&G settled the GSMP II filling with the staff of the New Jersey BPU, Rate Counsel and other parties, which remains subject to BPU approval. The details of the agreement are summarized on slide 16.

Modeled after the BPU's recently enacted Infrastructure Investment Program or IIP initiative, the agreement will allow PSE&G to invest $1.9 billion over five years beginning in 2019 to continue and accelerate the replacement of cast iron and unprotected steel main in addition to other improvements to the gas system.

The settlement provides five-year project visibility to efficiently plan labor, materials, vendors and permitting. Approximately $1.6 billion of the total program will be eligible for semi-annual rate roll-in, with the remaining $300 million to be addressed in a future base rate case.

The return on equity for the GSMP II investment will be determined in PSE&G's pending base rate case. And as part of the settlement, PSE&G agreed to file a base rate case no later than five years from the commencement of GSMP II.

We are maintaining our forecast of PSE&G's net income for 2018 of $1 billion to $1,030 million. Moving on the Power. PSEG Power reported non-GAAP Operating Earnings for the first quarter of $0.33 per share and non-GAAP Adjusted EBITDA of $313 million.

This compares to non-GAAP Operating Earnings of $0.30 per share and non-GAAP Adjusted EBITDA of $359 million for the first quarter of 2017. Non-GAAP Adjusted EBITADA includes the same items as our non-GAAP

Operating Earnings measure as well as income tax expense, interest expense, depreciation and amortization expense.

The earnings release and slide 21 provide you a detailed analysis of the (earnings) having an impact on Power's non-GAAP Operating Earnings relative to net income quarter over quarter. And we've also provided you with more detail on generation for the quarter in slide 22.

Power's net income comparison for the first quarter reflection increased in capacity prices of $0.01 per share. Re-contracting and lower market demand reduced results by $0.06 per share versus the first quarter of 2017.

Planned maintenance increased O&M expense and reduced net income comparisons by (one penny) per share. And lowered depreciation associated with the early retirement of Hudson and Mercer generating stations in June of '17 along with lower interest expense added $0.02 per share versus the year ago quarter.

A reduction in the corporate tax rate from recently enacted federal tax reform and other tax items improved first quarter net income comparisons by $0.07 per share. Gross margin in the first quarter declined to $35 per megawatt hour from $37 per megawatt hour in the year ago quarter.

Although power prices were higher on average driven by extreme temperatures in early January, lower market demand experienced in February lowered dispatch of Power's intermediate fleet.

Compared to last year's first quarter, Power experienced a $4 per megawatt hour decline in the average hedge price. This decline is lower than the anticipated annual reduction of $6 per megawatt hour forecasted for the full year as results in the first quarter benefited from the cold weather experience in January.

We forecast average hedge prices for the remainder of the year to decline by more than $6 per megawatt hour resulting in an average decline for the full year of $6 per megawatt hour.

Capacity revenues, by comparison, are expected to increase throughout the remainder of the year with the average price received scheduled to increase on June 1st, 2018 to $205 per megawatt hour in PJM and to $314 per megawatt day in ISO New England, that's 205 per megawatt day in PJM.

Now, let's turn to Power's operations. Generation output declined modestly compared to the first quarter of 2017. Output was affected by severe winter weather at the start of the year.

And in conjunction with an unseasonably warm February and higher planned outage hours at the Bergen and Linden combined cycle units, Power's gas-fired CCGT fleet operated at an average capacity factor of 37 percent and produced 2.7 terawatt hours of output. A higher price for gas in the quarter favored a shift to more production from coal, which generated 1.5 terawatt hours, and a doubling of peaking output.

Power's nuclear fleet operated on an average capacity factor of 99.5 percent for the quarter, producing 8.4 terawatt hours, representing 66 percent of total generation for the fleet.

And of note, Hope Creek's strong performance was evident by a breaker-to-breaker run of 517 consecutive days of production before entering its planned refueling and maintenance outage on April 13.

Power continues to forecast an improvement in output for 2018 to 55 to 57 terawatt hours. For the remainder of 2018, Power has hedged 80 percent to 85 percent of total forecast production at an average price of $38 per megawatt hour.

For 2019, Power has hedged 60 percent to 65 percent of forecast production of 59 to 61 terawatt hours at an average price of $37 per megawatt hour. And for 2020, output is forecast to be 63 to 65 terawatt hours with 35 percent to 40 percent of forecast output hedge in an average price of $36 per megawatt hour.

The forecasted increase in output for 2018 to 2020 includes generation associated with the mid-2018 commercial startup of 1,300 megawatts of

combined cycle capacity at the Keys Energy Center in Maryland and at Sewaren in New Jersey, and the mid-2019 commercial startup of the 485 megawatt combined cycle unit at Bridgeport Harbor, Connecticut that will also mark the conclusion of Power's construction program.

I'd also like to update you on the conclusion of the FERC investigation for Power's cost-based bidding matter that has been pending since 2014. Last week, FERC issued an order fully resolving this issue.

Financially, Power has recorded an incremental $5 million pretax charge to income in accordance with the order, which included an $8 million non-tax deductible penalty. So a $0.02 impact from that item.

And operationally, we do not believe that the order will have any material impact on Power's ongoing business operations. We continue to forecast Powers non-GAAP Operating Earnings for 2018 and non-GAAP Adjusted EBITDA at $485 million to $560 million and $1, 075 billion to a $1,180 billion respectively.

Now, let me briefly address the operating results from Enterprise and Other. And for the first quarter, Enterprise and Other reported Net Income of $5 million or a penny per share versus a Net Loss of $15 million or $0.03 cents per share in the first quarter of 2017.

Net Income for the first quarter of 2018 reflects the absence of tax benefits in the year-ago quarter at PSEG Energy Holdings and higher interest expense at the Parent.

The Net Loss in the first quarter of 2017 included the $55 million pre-tax charge related to the continuing liquidity issues facing NRG REMA, partially offset by tax benefits at PSEG Energy Holdings. And the forecast for PSEG Enterprise and Other Net Income remains unchanged at $35 million.

PSEG close the quarter with $118 million of cash on the balance sheet with debt at the end of March representing 49 percent of our consolidated capital, and debt at Power representing 28 percent of its capital at the end of the quarter.

Based on our strong balance sheet and credit metrics, we are able to fund our five year capital investment program without the need to issue equity. We continue to forecast on non-GAAP Operating Earnings for the full year of $3 to $3.20 per share. That concludes my remarks. I'll now turn the call back to (Nicole) for our question and answer session.

Operator: And ladies and gentlemen, we will now begin the question and answer session for members of the financial community. If you have questions, please press the star and the number one on your telephone keypad.

If your question has been answered and you wish to withdraw your polling request, you may do so by pressing the pound key. If you're on a speaker phone, please pickup your handset before entering your quest.

One moment please for the first question. And the first question is from Julien Dumoulin-Smith from Bank of America, Merrill Lynch. Please proceed with your question.

Julien Dumoulin-Smith: Hey, good morning.

Ralph Izzo: Good morning Julien.

Julien Dumoulin-Smith: Hey, I wanted to follow up on the latest clean energy bill at the Legislature. Can you define a little bit more specifically the energy efficiency opportunity at the utility? And just how think about the Net Income impacts at the end of the day?

And then separately related, Power's ability of pursuing offshore wind giving its risk profile and giving your current position, I mean, how do you think about approaching or tackling that opportunity? Or at is at all?

Ralph Izzo: Yes, no – so, Julien, thanks for the question. We're genuinely excited by the Murphy Administration's stated energy policies. As I think, you know, we've been strong advocates of energy efficiency.

We've done it in kind of small bytes. So, I think total over the past 10 years or maybe a little bit more for $400 million worth of energy efficiency programs.

And the clean energy bill anticipates a 1.5 or two percent reduction and, you know, where there's a lots for gas. I think it's two percent on electric and that 0.75 percent on gas.

And the BPU is going to come up with rules, but suffice to say we've been thinking about this for a good long time, the legislation also talks about recovering that utilities have the right to file annually to recover that cost including return on and of capital and lost revenues as well.

So, this is great news. And we will jump into this feet first and deliver a universal access to energy efficiency for all New Jerseyans.

On the offshore wind piece, we don't have a track record on offshore wind but we do have a lease offshore and we do have a partner and that's part of the (J.V.) that we have in place.

So, I would say that whether it's a participant in the transmission aspects or in the offshore wind aspects of the farm itself, that's probably not quite as mature in our own thinking as the energy efficiency, but overall this notion of a sustainable energy future as one we've been talking about for a decade or more and we're excited by the prospects that are created.

Julien Dumoulin-Smith: But just to clarify the EE for this, I mean how do you think about that in the context of decoupling specifically? And maybe that's more of a rate case question.

And then separately, if I can recharacterize a little bit how you described that you talked about sort of initial $400 million of accumulative spending. I mean, how do that compare versus what prospects of what you're talking about even order magnitude?

Ralph Izzo: Yes. No, I'd say that's right, in order magnitude different. We – I don't think we've released our planned number for filing. But we have said that we anticipate filing before the middle of the year and we still are on track to do that.

I'd rather not give a specific number because there's a pre-filing meeting we need to go through with the Board of Public Utilities and they deserve to hear that before we start blurting it out in the quarterly earnings call. But it is an order of magnitude difference in terms of the opportunity.

Den Cregg: And then to your point, Julien, related to the rate case we did file a decoupling mechanism as part of the rate case.

Julien Dumoulin-Smith: OK. Exactly, thank you.

Operator: Our next question comes from line of Praful Mehta from Citigroup. Please proceed with your question.

Praful Mehta: Great. Thanks so much. Hi, guys.

Male: Hi, Praful.

Praful Mehta: Hi. So, on the GSMP and the settlement and the distribution rate case, I just want to understand were you saying that if you achieve both you would be at the upper end of the seven percent to nine percent? I just want to confirm that.

Ralph Izzo: So, it's a combination multiple factors Praful. There's the rate case which includes various tax givebacks that have to do with both the change and federal tax policy and deferred tax balances. There's GSMP II which takes up $300 million per year prior GSMP program up to about a $375 million per year program.

There's still the number one investment area that we will be focused on which is transmission and our expectations there. And then there's some expectation for a continuation of energy strong and energy efficiency, but not at numbers that we have completely disclosed yet.

But when you add all of that together, at least just to think that we're bias towards the higher end of the seven percent to nine percent range, but then you may want to tell the real story.

Dan Cregg: Yes. We said we're on the higher end of that and we anticipate being there. And, Praful, I guess if you think about the rate case, the rate base element of that is a couple of things. One, it's the end of some remaining portion of some prior clauses, but it's also rolling in the giveback on some of the tax effects.

So, but the way we characterize that earlier in the year was that we always talk about our growth rate, and as we continue the capital program that we have the existing rate base goes up.

So, you're jumping off of a higher base. And last year we were at about seven percent to nine percent growth rate, this year we at about seven percent to nine percent growth. But that higher base was really offset by some of the tax flow back that we would anticipate.

So, that is what, basically, the rate case and that flow back (we told) you about, and then with the existing GSMP settlement plus energy strong too which we've talked a little bit about and plus the clean energy filing we would anticipate moving higher up within that range.

Praful Mehta: Right. And so just to clarify, I think you had said 600 million was the unprotected deferred tax balance on I think previous calls. Is that refund expected to happen pretty soon and is that part of like the growth for this kind of flowing in to the rate (base)?

Dan Cregg: That'll ultimately be determined in the rate case. So, I think that the (bulk) of the excess deferred are going to be through the average rate assumption method which will be a longer term period.

But some of that, in addition to some of the excess deferred is going to be worked through the rate case related to some other items. So, we'll know more about that as we move towards the end of the year.

Praful Mehta: Fair enough. And then, just quickly on ZEC, congratulations to where it's kind of come out so far. I just want to understand in terms of the three year extension, it sounds like it is that price change -- don't change meaningfully.

But I just wanted to understand from your perspective, how do you see that extension discussion going? Because if you do get the three year, what does it take to kind of have that next three-year extension?

Ralph Izzo: So, first of all, it's important to realize that the ZEC price is not tied to a market price. So, the ZEC price is an attribute payment for the carbon and fuel diversity dimensions of nuclear power.

There is a consumer protection putting the bill that goes to simply the affordability of ZEC when viewing the context of overall energy prices that customers have to pay. As well as provision in the bill that anticipates a review by the BPU as to whether or not the plans are in any kind of economic duress.

So, that's what the three-year review is for, right. Can New Jersey continue to afford to pay for a zero emissions energy? And that's sort of a question that make sure you will have to answer on behalf of customers.

We will always be mindful. Both on behalf of customers, but on behalf of our shareholders leads as to whether or not the plants are making it cost to capital on a risk adjusted basis. And if they are not, then we will close the plants.

So it's not saber rattling, that's not threatening, that's just our fiduciary responsibility and we will always work extra hard to make sure New Jersey is aware of those situations and what that means.

So, I just think it's a – and as you know in nuclear space, nothing happens in less than a year anyway. And in RPM and PJM world, things tend to happen in three year increment. So, just checking in every three years as to affordability, economic viability seem like a very natural rhythm to put in to public policy.

Praful Mehta: Fair enough. Thanks so much guys.

Dan Cregg: (Nicole), do we have any other questions?

Operator: Your next question comes from the line of Jonathan Arnold from Deutsche Bank. Please proceed with your question.

Jonathan Arnold: Good morning guys.

Ralph Izzo: Hey, Jonathan.

Dan Cregg: Hi Jonathan.

Jonathan Arnold: Just – so on the energy efficiency and I hear you comment about filing by the middle - you know, middle of the year and then needing to go through pre-file with the BPU. Is it a reasonable expectation that you'd be through that and able to give us a little more flavor by the time of the analyst day?

Ralph Izzo: Yes. So, we should definitely have the pre-file done before the analyst day, Jonathan. And then, we'll tell you everything that we plan to file at that point, correct.

Jonathan Arnold: So, the filing itself might not have been made, but you'll have a better sense of the scope of it.

Ralph Izzo: It (won't) be because the pre-file meeting is – there's a 30 clock that starts from then. And as you know, the analyst day is on the 31st and we haven't had the pre-file meeting yet, (although) we're going close.

Jonathan Arnold: Right. I'm hearing you would tell us a bit more than you've told us today.

Ralph Izzo: Yes, yes. We'll tell you a lots, but we're just too excited not tell you a lot more. So, this is a favorite, so

Jonathan Arnold: Switching to something a little different, slide 22 on power generation measures. And I just wanted to understand a little better the coal cost up to 9 million, it's about 20 – over 25 percent and the generation was up more like, you know, mid-single digits.

So, is that just the fact that you're (left) hedge than you'd been in the past and, you know, buying some spot to cover the extreme weather? Or is it a contract

rolling off or how should we think about that as we're trying to calibrate coal cost, you know, for the rest of the year?

Dan Cregg: I don't think I would put too much weight into that, Jonathan. I think that – especially if I think about it from an overall component of the generation. I think what we saw really was a little bit more reliance on coal because of the weather. And I think on an ongoing basis, I don't anticipate it to be much of an impact as we go through to the rest of the year.

Ralph Izzo: Yes. I didn't do the number, Jonathan. But if you look at that slide, you'll see that Pennsylvania's down a little bit and Connecticut's up quite a bit, and Connecticut's has got more expensive coals.

Jonathan Arnold: OK. That's helpful, thank you. But then on the oil piece, presumably the denominator for those fuel – that 25 million of cost is in the gas segment.

Ralph Izzo: That's correct.

Dan Cregg: Yes.

Jonathan Arnold: And again, I mean, is that – I mean is there any – I'm trying – well, I guess what I'm trying to get a feel for is to what extent the weather may have actually, you know, hurt you in Power this quarter?

Dan Cregg: Well, I think it had a lot to do with what you're seeing on the delta quarter versus quarter from the standpoint of oil. That number under normal situation would be much, much lower.

And what you saw was prices moving up and gaps getting a little bit tighter and gas prices going to extreme level sort of quarter. So, I think what you saw was much more an anomaly with respect to oil burn for the quarter. And that…

Jonathan Arnold: But did you make that up in price? So, is that – was that really just, you know, loss margin?

Dan Cregg: If it – we were economic when we were running on oil. So, the – if we weren't economic we wouldn't have been running.

But if you take a look where a gas prices were, I mean gas prices during that part of the year, the very early part of the year, we're dressing up looking like a very healthy age old power prices as oppose to gas prices while up into the double digits.

Jonathan Arnold: So, those – you don't feel that there was a net-net. This was of drag on the quarter. It's just the moving pieces within the revenue and cost lines?

Dan Cregg: Yes. I think that's right. And I think, you know, some anticipated spark for earlier. January wasn't quite where we would've wanted to be because gas prices basically puts into oil which our lower margin.

But it was a fairly short term phenomenon in January and anomaly. But it really does drive all the oil burn that you see there for the quarter.

Jonathan Arnold: Right. Thank you.

Operator: Your next question comes from the line of the Greg Gordon from Evercore ISI. Please proceed with your question.

Greg Gordon: Thanks. Good morning. Well, we're on a subject of PSEG Power, there's several initiatives that PJM that are certain independency, whether it's a capacity market design updates, ORDC pricing, Fast-Start pricing.

I believe Andy Ott put out a letter recently indicating that he hope those three things would get done this year. Can you review what your expectation is for the timing on those and the potential impacts on Power?

And then there's one thing extant which is while the management PJM still seems to support of overall price reform, there hasn't been much progress there so you can give us an update on your expectations on that front.

Ralph Izzo: Sure Greg. So, on capacity market reform we've been public that we prefer the two phase approach which is the PJM preferred approach even though they've submitted the IMM's MOPR based approach as well.

I think we have a reason to believe that we're going to effect by May of 19, obviously that won't have impact on the current RPM. So, I think that's the timing there.

I would view Fast-Start as yet another piece of the transformation puzzle. I know that many people including ourselves talk about the inflexible unit dimension of transformation.

But Fast-Start thus have a now propose zero threshold element to it which is a characteristic of inflexible units, right, that they can't move over the timeframes of PJM to see things.

We've been never one to "whether or not the four price curve has these numbers in it", nor have we (do one), to "what these changes will mean to the four price curve". We just say the market is the best determinant of that and our own internal views will influence whether we hedge a little bit to the high side or to low side of our own internal disciplined approach.

I think, (Andy) himself has said that this should go into – should be able – the energy price fixes should be able to be put in place by a little bit more than a year from now. But some time in this summer of nineteen.

So, that is the delay I think that once upon a time there was talk of fall of '18 for some of these reforms, but I think the combination effect does introduce that bit of delay.

I think the good news if I might is that, you know, the PJM board appears to be willing to undertake what's called a liaison process as oppose to a full pledge stakeholder process which can put a little bit more of a limitation on the amount of time.

I should, by the way, point out that in terms of RPM we prefer the status quo, but the (submittals) that PJM has made we think that that two phase approach is better than one phase approach.

I don't think PJM has given up on the full inflexible unit pricing. They see that as part of their resiliency discussion which continuous with comments

due back from, I think, the rest of us. The (RTS) had already made their comments, ours do back I think in the middle of June or in the middle May. Middle May (so to speak).

So, it's still working process not over by any stretch and some things that have a bit more of a date certain. And (here's) the capacity of market reforms and energy market reforms we think will still creep into the market.

Greg Gordon: Thank you for the update.

Operator: Your next question comes from the line of Travis Miller from Morningstar. Please proceed with your question.

Travis Miller: Thank you.

Male: Hi Travis.

Travis Miller: Bring to the ZEC, It sounds like there could be out of state plants that would be eligible and I'm most interested in your thoughts on Peach Bottom Plant if that is true, if I'm in fact reading that ZEC correctly.

Ralph Izzo: Yes. So, Travis, you absolutely are reading it correctly. The bill simply says that New Jersey wants 40 percent of its power supplied by nuclear energy, and it does not limit geographically.

In terms of (they're) being more than 40 percent of New Jersey's electricity being deliverable by a nuclear power plants whether it's Salem, Hope Creek, Peach Bottom or a variety of others, then there's a ranking system that the BPU is encouraged to say that is really driven off of the greatest impact on New Jersey from an air quality point of view and various other parameters that are detailed in the legislation.

But to short answer your question is, yes, out of state plants would be eligible, but New Jersey would not support according to legislation more than 40 percent of its energy being supplied by nuclear power.

Travis Miller: OK, with the thought that Peach Bottom would rank at the bottom, just given us not New Jersey.

Ralph Izzo: No, no, no and I don't want to – I don't want to predetermine what the BPU will do, you know, Peach Bottom will compete with Salem and Hope Creek and Susquehanna and Limerick.

Travis Miller: Yes, sure. So, and second question on the clean energy bill, what component specifically could generate rate base growth if any, just clarifying a couple in previous?

Ralph Izzo: Oh my guess is there's multiple, right. So, the utility has done grid-connected solar where utility has done rooftop solar. The utility has done energy efficiency. It has done pilot programs and battery storage technology.

So, there is no shortage of opportunities that are expanded in the clean energy we're all – throughout, you know, there's a transmission components to offshore wind, there's offshore wind itself.

So, I think you just have to really – remember, what the governor said is he sees nuclear powers an important bridge to renewable future. And the renewable future he has in that bill which he has not signed yet is a 50 percent renewable target in 2035 and we (expected to the) participants in every aspect of that sustainable energy agenda.

Travis Miller: OK. And then those investments you foresee could go on the rate base, not just the kind of earnings in neutral type collection. OK.

Ralph Izzo: That's correct. Yes, well I mean, yes, the – look, the reality is in New Jersey just given our geographic and natural resource profile, you're not going to be able to do merchant solar or merchant offshore wind.

Those will have to be supported through some type of regulatory revenue stream. That’s either in a form of a renewable credit and / or some other mechanism. And, again, on the offshore wind piece I just want to emphasize that what we have at least we – you know, we've never done that before.

So, we would be interested in the transmission component probably as much as not more than the actual wind farms and we are – as I said a moment ago, we are all in on the energy efficiency piece.

Travis Miller: OK, great.

Dan Cregg: And I think some elements of the legislation, Travis, (talk) specifically about utilities investing and having recovery on and of like the energy efficiency.

Offshore wind, very different situation, not specifically laid out as to how that will work out. And in fact the legislation really calls for a study for that to be determined, things like that to be determined.

Travis Miller: OK, great yes, that's helpful. Thank you very much.

Operator: Your next question comes from the line of Paul Patterson from Glenrock Associates. Please proceed with your question.

Paul Patterson: Hey, good morning.

Ralph Izzo: Hi Paul.

Paul Patterson: Just a – sorry if I missed this, but when is the governor expected to sign the nuclear legislation?

Ralph Izzo: Paul, so he's – so a New Jersey the governor has 45 days to act on legislation, and that action could be either a veto which would require two-thirds majority of the legislation's override.

Something called a conditional veto, which is, hey, like this except for, and then he sends it back to a legislature to change the piece that he liked except for, or to sign into law. In addition, if he doesn't act for 45 days it then automatically goes into law. So, those are the options for the governor.

Paul Patterson: OK, and – OK. So let me ask you this, if we don't get him signing it by the RPM auction which isn't that far from now, how should we think about how that might affect how you guys would be bidding into the capacity auction?

Ralph Izzo: Well, you know, we never comment about bidding plants prior to the auction. But – what I'd say is (just) that we would view things differently if he were to veto the legislation versus simply not getting around to signing it yet. And so those are two …

Paul Patterson: I see. OK, I got you. So, OK, absolutely, you know, you guys are sort of are expecting that this bill would be enacted.

Ralph Izzo: You know, I think he's – the governor – you never ever want to pretend to be constraining your governor, right?

Paul Patterson: Sure, I got you.

Ralph Izzo: He's a very important person and he is a talented person and one that we admire. So, I'm not going to try to tell him what to do on an earnings cal.

But having said that, I mean, he has been outspoken and supportive of nuclear as a bridge to a renewable energy in the future and he is – he's also been outspoken in support of the importance of those jobs to South Jersey. So, you know, I feel pretty good about those public statements on his part.

Paul Patterson: OK, awesome. And then the energy efficiency program, just how should we think about how that impacts the demand forecast longer term and just in general, how we should think about how you see energy demand or electricity demand working in the state.

Ralph Izzo: You know, Paul, we've been working hard to try to remind investors that the utility growth story is really independent of demand growth. Demand growth or the actions of it has significant implications for how regulation needs to be rethought to avoid the compounding of inevitable (O&M) growth and regulatory lag on investment returns.

But PSE&G's growth over the past 10 years and its continued future growth really is about an aging infrastructure that needs replacement and a higher degree of customer service and customer demands for a clean energy future.

And I am absolutely convinced that we can continue to invest in a resilient grid, cleaner energy and more efficient use of energy which would help – that their piece would help lower customers bills and put better smiles on our shareholders.

So – you know, I think that energy efficiency is an important part of controlling the bill from the point of view of the extra class associated with renewable energy and making the grid more resilient.

Paul Patterson: And you got to demonstrate that too. So, you guys have been ahead of a curve on that, but I guess I'm sort of wondering though it does have an impact perhaps on non-regulated generation, not just in your state but all over.

So, what you guys might be doing could have an impact? And I'm just sort of curious as to what you guys think, you know, just roughly speaking all these – what do you see the demand forecast kind of being?

Ralph Izzo: I see. You know, well, I mean, you know, I think RPM is a good example demand forecast is down yet again. I don't know that's nth consecutive year where N is some large single digit number, but that's been the case.

We've obviously made that decision in our own service territory that Power has a much bigger market in which you can play and therefore to the extent that our own efforts is accountable on Power. We've been willing and continue to be willing to do that.

I do think that the primary supply demand economics in the wholesale market are going to be determined as much by the shrinkage of supply as it's going to be determined by any changes in demand.

Paul Patterson: Okay. Thank you very much.

Operator: Your next question comes from the line of Michael Lapides of Goldman Sachs. Please proceed with your question.

Michael Lapides: Hey, guys, thank you for taking my question. One easy one, you have talked about this prior earnings calls or analyst day haven't circle back on this in a

bit. Can you just talk about how much extra balance sheet capacity that you think the company has right now?

Meaning, either to fund incremental rate base growth or incremental renewable growth at (P.S.) Power, just kind of when you think about your credit metrics in a post-catch reform world and the balance sheet strength. How big is that balance sheet strength?

Dan Cregg: Yes, Michael and I think you'd want to think about it really in two steps, right. We've talked about the ability to fund the capital plan such as we have without the need for any additional equity.

And then as you mentioned consistent with that, we've talked about it in the past. If you take a look at our existing credit statistics and you take a look at where some of the threshold points are, you've got somewhere in the order of a billion dollars of excess at PSEG Power, which then can be utilized at the utility and within the existing regulatory capital structures.

So that can be matched with that and so you'd come up within that double at if you think about it from a utility overall investment incremental spend standpoint without having any impact on the existing ratings.

Michael Lapides: Got it. And increment for potential holding – incremental holding company leverage, or do you just think about it as, if opportunities came up for incremental investment at Power or at E&G, you would simply make the leverage down at Power.

Dan Cregg: Well, I think that the leverage could happen at Power or at the parent company. I think we've had some parent company (debt) ugly and we tend to take a look at what makes the most sense from an economic standpoint when looking to source of that.

So, I think that it could be at either location, but I think you're in the same ballpark when I talk about the numbers that I just referenced.

Michael Lapides: Got it. Thank you Dan, much appreciate it.

Dan Cregg: Yes.

Operator: Your next question comes from the line of Paul Fremont from the Mizuho. Please proceed with your question.

Paul Fremont: Thanks. I guess first question would be on the clean energy bill. When I think of the seven percent to nine percent rate base growth target and the fact that you guys are seeing yourselves sort of at the upper end, does – do the investment opportunities under the clean energy bill keep you within that seven percent to nine percent band or would that potentially put you outside of that band?

Ralph Izzo: So, I'd rather give more detail on the band at the upcoming investor conference call right now, because I think we'll have more information coming out at our pre-filing meeting with the board staff. And so, hopefully I have resolution but we'll definitely have resolution of the nuclear bill by that point in time.

Paul Fremont: OK. And then sort of a quick question on Hope Creek, the 60 megawatt upgrade that was approved, when would that take effect?

Ralph Izzo: It was a 60 megawatt or 16 megawatt?

Kathleen Lally: Sixteenth.

Ralph Izzo: Sixteenth. It was much more and I, you know, I have to get back to you on that. I don't know the answer. We – a nuclear had been jammed with broader issues than 16 out of the 1100.

It wasn't equipment, I mean, this is a – this was a change I believe in our probabilistic risk assessment that allow us to run the plant at different numbers. But I am tempted to say it will be available when it comes back from refueling

Dan Cregg: I think coming out of this outrage is the right answer, but we can confirm that for you.

Paul Fremont: OK.

Ralph Izzo: Any questions we can answer for you Paul?

Paul Fremont: No, that's good. Thank you and congratulations.

Operator: You next question comes from the line of Angie Storozynski from Macquarie, your line is open.

Angie Storozynski: Thank you. So, my only question is it is in the past you mentioned that you might try to pursue electric retail in the mid-Atlantic, we haven't actually had much – we haven't heard much about it.

And, you know, do you think that this is still something you would be interested in? And if so, do you think that this would be done organically or would you need to (acquire) a retail book? Thank you.

Ralph Izzo: Yes, Angie. So thanks for the question. We're still at work. It is exclusively an organic effort. We did look at the potential for acquisitions, but given the purely defensive nature of this effort and our desire for it to basically help us improve our margins based on our own assets, you know, there's been no book that kind of fit that to a high enough degree of accuracy that the transaction cost would've have swamped the benefits of – because whatever book we bought we have to sell off a piece of it and that would be suboptimals. So, we're continuing to pursue an organic road strategy there.

Angie Storozynski: Cool. And my other question on the regulated side. So, even if your rate base were to grow at nine percent, would you consider acquisitions of other regulated under invested systems in your – around your services territory or in the same state?

Ralph Izzo: So, we always – there aren't too many left in our state, I don't know if any that are available in our state that are part of a bigger entity. So, we always look at those, right. But we've been very public that we are quite enamored with our organic growth strategy.

And without any disrespect to our colleagues in the industry, sometimes are puzzled by the premiums that others are willing to pay and we've not been

able to pencil those in a way that it works. But we always look at those possibilities.

Angie Storozynski: OK, thank you.

Operator: And your next question comes from the line of Steve Fleishman from Wolfe Research. Please proceed with your question.

Steve Fleishman: Yes, hi, good morning. Sorry to bug you with some clarifications. But just on the rate base growth comment, could you clarify if the – what the base of your growth forecast is? Has that changed due to some of the tax reform adjustments, or is it the same kind of base level period 2007 to 2009?

Ralph Izzo: Hi Steve, I think I'll let Dan dive into that.

Dan Cregg: Yes. If it's just the year-end 2016 number, so the 2017 number which is $17 billion.

(Steve Watson): OK. So, the base is still the same base?

Dan Cregg: Yes.

Steve Fleishman: And then, in the same way, you might be toward the high-end that is including the GSMP agreement, but nothing else different?

Dan Cregg: It would include as we look forward the opportunity – some opportunity related to future filings, right. So, I would say that if we had nothing beyond the GSMP filing, we'd be more middle of the road within that range. And with the opportunity for future filings, we could see the opportunity if we go higher than the middle of the range.

Steve Fleishman: OK. So, it may include some of these clean energy investments or?

Dan Cregg: Yes. And any other adjustments as we step forward through time, yes, yes.

Steve Fleishman: OK. And then – Yes, I'm good, thank you.

Operator: Your next question comes from the line of Michael Weinstein from Credit Suisse. Please proceed with your question.

Michael Weinstein: Hi Ralph. Hey, it's Mike Weinstein. Hey, a quick question, you said before that you prefer the status quo for current capacity market reforms, I believe.

I'm just wondering what is it about the status quo that's better than any of the proposals that's to put out there?

Ralph Izzo: It's just that the status quo has new plants for being MOPR'd as suppose to existing plants being MOPR'd, and it doesn't interfere with the state's ability to price attributes that the market isn't currently pricing. So, we just don't see a need for this kind of modification at the current time.

Michael Weinstein: I mean, do you think it need, you know…

Ralph Izzo: OK.

(Michael Weinstein): You know, do you think the modifications won't have an effect at all or?

Ralph Izzo: No, no, no. I mean, they'll have different effects. I think that the two phase approach at least continues to allow states to recognize the value of renewables and carbon free energy sources.

You know, the market monitors approach is this protracted administrative battle over what constitutes the appropriate minimal offer price which as you know can be moved quite a bit depending upon whether you believe something has a 30-year life or 40-year depreciable life across the capital was x or 1.1 x or 0.9 x.

And so it's – if you characterize that as a correction to ensure the market is working properly, I think is inaccurate. I think it's just a correction to ensure administrative power reverts to people who want to have an administrative power and that's not necessarily consistent with markets.

I mean, look, we're all dancing around here is we need a price on (carbon) and then let the market pick the technology. And then I think you'd see every participant in the market signup for that. Well, except for me to a (carbon) and how many participants, I guess.

Michael Weinstein: Is that more handled better on the energy side basically …

Ralph Izzo: Yes, absolutely.

Michael Weinstein: Do you think – yes. So, the capacity market reforms are kind of destruction of some sort maybe?

Ralph Izzo: Yes, you've got to collapse in intramarginal revenues because there's no carbon price in energy markets. And because of that collapse in intramarginal revenues, high fixed clause participants are getting crushed. And that's – and yet, people are saying they want the attributes of this high fixed cost participants up.

You know, you have the decoder, right? The high fixed cost participant is the nuclear plant. And yet people are paying record prices of anywhere from $5 to $200 per ton of carbon. And so the market just got these inherent inconsistencies built into it.

So, if we could get a single price on carbon and energy markets, then the intramarginal revenues will increase and the fixed cost recovery would be mitigated and then capacity markets could do what they were supposed to do in reliability mechanisms and nothing more.

Michael Weinstein: Got it. OK, thank you.

Ralph Izzo: Sure. So, (Nicole) I think we have time for one more question and then we'll – I think let folks have their day back.

Operator: Mr. Izzo and Mr. Cregg, there are no further questions at this time. Please continue with your presentation or closing remarks.

Ralph Izzo: It's always magic, no matter where you are, whether it's a teleconference or public speaking, if you say one more question, there's no more questions. But that's great.

So, anyway, so thank you folks for joining us today and I hope you heard from Dan and I that there's a lot of good things happening at PSEG.

And they range from the continuation of our $13 billion to $15 billion investment program which 90 percent of which is going to utility and leaves us to be biased towards the upper end of that seven percent to nine percent rate base growth looking out to 2022 off of the higher base in, at the end of 2017.

Again, we've got to give kudos to the great work done by our utility crews and power plant operations doing what was a very, very, difficult circumstances certainly in January.

And kudos to our regulatory team and all of our support functions for the strive they've made on some of the policy of fronts with the settlement of GSMP II and the legislation that recognizes the value of Power's nuclear generation.

I mean, getting 60 out of 80 votes in the Assembly and 30 out of 40 votes in the Senate from a bipartisan basis. I think it validates what we have been saying all along that New Jersey will recognize the importance of these plants to our environment, to our cost of energy, to our economic well-being and that they are much cheaper to keep than they are to let shutdown.

And then of course our ongoing commitment to maintain our financial strength which gives us flexibility to support the growth in the dividend, fund this rate base growth investments. No need to issue equity and still some balance sheet capacity leftover.

So, hopefully we'll see all of you on May 31st. I know that's the weekend after. That's Memorial Day. So, you know, come in your two piece or whatever other beachwear you have.

That's – and we'll host you and we'll have a great conversation about the rate base growth in detail and where we are with RPM. And I think that's a brand of clothing is with this – that's all we have. And we'll see you soon. Thanks a lot everyone. Take care.

Kathleen Lally: Very good.

Operator: Ladies and gentlemen, this does conclude your conference call for today. You may disconnect and thank you for your participation.

END

PSEG ANNOUNCES 2018 FIRST QUARTER RESULTS

$1.10 PER SHARE OF NET INCOME

Non-GAAP Operating Earnings of $0.97 Per Share

Re-Affirms Non-GAAP Operating Earnings Guidance $3.00 - $3.20 Per Share

PSE&G $1.9 Billion Settlement of GSMP II Program Aligned with Forecast Growth

(April 30, 2018 – Newark, NJ) Public Service Enterprise Group (NYSE: PEG) reported today Net Income for the first quarter of 2018 of $558 million, or $1.10 per share as compared to Net Income of $114 million, or $0.22 per share, in the first quarter of 2017. Non-GAAP Operating Earnings for the first quarter of 2018 were $492 million, or $0.97 per share, compared to non-GAAP Operating Earnings for the first quarter of 2017 of $466 million, or $0.92 per share. Prior year results included costs related to the early retirement of the Hudson and Mercer generating stations and a reserve for the impairment of leveraged leases.

Ralph Izzo, chairman, president and chief executive officer, commented that "we have begun 2018 with solid results. Our service area experienced four consecutive Nor'easters in March that wreaked havoc on trees and power lines. PSEG employees, once again, rose to the challenge, efficiently and safely completing PSE&G and PSEG-Long Island customer restorations and then assisted neighboring utilities with their restoration efforts. The diversity of PSEG's generating fleet was also responsive to the extremes in weather that ranged from the near-zero temperatures experienced in January to the very mild weather in February."

The table below provides a reconciliation of PSEG's Net Income to non-GAAP Operating Earnings for the first quarter. See Attachment 8 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings.

PSEG CONSOLIDATED RESULTS (unaudited)
First Quarter Comparative Results
2018 and 2017

	Income ($ millions)		Diluted Earnings Per Share	
	2018	**2017**	**2018**	**2017**
Net Income	$558	$114	$1.10	$0.22
Reconciling Items*	(66)	352	(0.13)	0.70
Non-GAAP Operating Earnings	**$492**	**$466**	**$0.97**	**$0.92**
		Avg. Shares	**507M**	**508M**

*See Attachment 8

Ralph Izzo went on to say, “We are re-affirming our non-GAAP Operating Earnings guidance for 2018 of $3.00 - $3.20 per share. PSEG continues to focus on its strategic investment program of $13 billion to $15 billion over the 2018 to 2022 period. The recent settlement of the second phase of PSE&G’s Gas System Modernization Program (GSMP II) is aligned with our investment goals. PSEG’s financial flexibility will enable it to fund its capital program over the 5-year period without the need for equity issuance.”

The following table outlines PSEG’s expectations for non-GAAP Operating Earnings by subsidiary for 2018.

2018 Non-GAAP Operating Earnings Guidance
($ millions, except EPS)

	2018E
PSE&G	$1,000 - $1,030
PSEG Power	$485 - $560
PSEG Enterprise/Other	$35 - $35
Non-GAAP Operating Earnings	$1,520 - $1,625
Non-GAAP EPS	$3.00 - $3.20

E = Estimate

Non-GAAP Operating Earnings Review and Outlook by Operating Subsidiary

See Attachment 4 for detail regarding the quarter-over-quarter reconciliations for each of PSEG’s businesses.

PSE&G

PSE&G reported Net Income of $319 million ($0.63 per share) for the first quarter of 2018 compared with Net Income of $299 million ($0.59 per share) for the first quarter of 2017.

PSE&G’s first quarter results reflect continued successful execution of its infrastructure investment programs and costs related to winter storm activity and higher depreciable plant. Growth in PSE&G’s investment in Transmission added $0.03 per share to quarter- over-quarter Net Income comparisons. Recovery of investments made under the Gas System Modernization Program (GSMP) improved quarter-over-quarter Net Income comparisons by $0.02 and weather added $0.01 per share. PSE&G experienced higher costs associated with restoring service to customers following four separate storms that occurred over a 30-day period. The increase in storm costs, when combined with a change in pension accounting standards for non-service costs, increased O&M by $0.01 per share. In addition, higher depreciation expense reflecting the utility’s expanded asset base, reduced Net Income by $0.01 per share versus the first quarter of 2017.

Weather-normalized electric sales to Residential and Commercial customers rose by 0.4% compared with Q1 2017. Weather normalized gas sales were higher by 1.6% in the quarter,

led by increased Residential and Commercial usage. Residential customer growth continues to trend higher at 0.8% per year.

PSE&G implemented a revised $64 million annual increase in transmission revenue under the company's FERC-approved formula rate effective January 1, 2018 after incorporating a $148 million decrease in its revenue requirement associated with the reduction in the Federal corporate tax rate. Transmission revenues are adjusted each year to reflect an update of the company's investment program for the coming year.

PSE&G has reached a settlement of its GSMP II filing with the Staff of the New Jersey Board of Public Utilities (BPU), Rate Counsel and other parties, which remains subject to BPU approval. Modeled after the BPU's recently enacted Infrastructure Investment Program (IIP) initiative, the agreement will allow PSE&G to invest $1.9 billion over five years beginning in 2019 to continue and accelerate the replacement of cast iron and unprotected steel mains in addition to other improvements to the gas system. The settlement provides five-year project visibility to efficiently plan labor, materials, vendors and permitting. Approximately $1.6 billion of the total program will be eligible for semi-annual rate roll-ins, with the remaining $300 million to be addressed in a future base rate case. The return on equity for GSMP II investment will be determined in PSE&G's pending base rate case. As part of the settlement, PSE&G agreed to file a base rate case no later than five years from commencement of GSMP II, as well as maintain a base level of gas distribution capital spending of $155 million and achieve certain leak reduction targets.

PSE&G's pending electric and gas distribution base rate case filed in January 2018 is progressing. The company is scheduled to provide a routine update to its filing with the BPU in May. In response to the BPU's recent order regarding the Tax Cut and Jobs Act of 2017, PSE&G filed to lower its electric and gas revenue requirement by $114 million annually effective April 1 to reflect the reduction in the federal corporate tax rate from 35% to 21%. Overall, tax reform has reduced PSE&G's transmission and distribution revenue requirements by approximately $262 million per year, providing customers with rate savings as the utility continues to invest in improving the reliability and resiliency of its T&D system and advancing the state's clean energy goals.

Earlier in April, the New Jersey Legislature passed a Clean Energy bill requiring the state's utilities to implement energy efficiency programs that would achieve annual savings of 2% and 0.75% for electric and gas usage, respectively. Once the Clean Energy bill is signed by Governor Murphy, PSE&G expects it will make a filing with the BPU to outline a broader range of planned investments and proposed programs to achieve the state's targeted energy savings goals in a cost efficient manner to benefit the most customers.

PSE&G's forecast of Net Income for 2018 is unchanged at $1,000 million - $1,030 million.

PSEG Power

PSEG Power reported Net Income of $234 million ($0.46 per share) for the first quarter of 2018 compared with a Net Loss of $170 million ($0.34 per share) for the first quarter of 2017. PSEG Power's non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA for the first quarter of 2018 were $168 million ($0.33 per share) and $313 million, respectively, compared to non-GAAP Operating Earnings of $150 million ($0.30 per share) and non-GAAP Adjusted EBITDA of $359 million for the first quarter of 2017.

PSEG Power's Net Income comparison for the first quarter reflects an increase in capacity prices of $0.01 per share. Re-contracting and lower market demand reduced results by $0.06 per share versus first quarter 2017. Planned maintenance increased O&M expense and reduced Net Income comparisons by $0.01 per share. Lower depreciation from cost savings associated with the early retirement of Hudson and Mercer generating stations last June along with lower interest added $0.02 per share versus the year-ago quarter. A reduction in the corporate tax rate from the recently enacted Tax Cut and Jobs Act and other tax items improved first quarter Net Income comparisons by $0.07 per share.

Generation output declined modestly compared with Q1 2017. Output was affected by severe winter weather at the start of the year. In conjunction with an unseasonably warm February and higher planned outage hours at the Bergen and Linden CCGTs, Power's gas-fired CCGT fleet operated at an average capacity factor of 37% and produced 2.7 TWh of output. A higher price for gas in the quarter favored a shift to more production from coal, which generated 1.5 TWh, and a doubling of peaking output. Power's nuclear fleet operated at an average capacity factor of 99.5% for the quarter, producing 8.4 TWh representing 66% of total generation. Of note, Hope Creek achieved a breaker-to-breaker run of 517 continuous days of production before entering its planned refueling and maintenance outage on April 13.

Power continues to forecast an improvement in output for 2018 to 55 – 57 TWh. For the remainder of 2018, Power has hedged 80% - 85% of total forecast production at an average price of $38 per MWh. For 2019, Power has hedged 60% - 65% of forecast production of 59 – 61 TWh at an average price of $37 per MWh. For 2020, output is forecast to be 63 – 65 TWh at an average price of $36 per MWh. The forecasted increase in output for 2018 – 2020 includes generation associated with the mid-2018 commercial start–up of 1,300 MWs of gas-fired combined cycle capacity at the Keys Energy Center in Maryland and Sewaren in New Jersey, and the mid-2019 commercial start-up of the 485 MW gas-fired CCGT at Bridgeport Harbor, Connecticut.

The Federal Energy Regulatory Commission (FERC) has issued an order resolving the Power cost based bidding matter that has been pending at FERC since 2014. In accordance with the order, Power has recorded an incremental $5 million pretax charge to income in the first quarter that will conclude the issue.

The forecast of Power's non-GAAP Operating Earnings for 2018 and non-GAAP Adjusted EBITDA remain unchanged at $485 million - $560 million and $1,075 million - $1,180 million, respectively.

PSEG Enterprise/Other

PSEG Enterprise/Other reported Net Income of $5 million ($0.01 per share) for the first quarter of 2018 compared to a Net Loss of $15 million ($0.03 per share) for the first quarter of 2017.

Net Income for the first quarter of 2018 reflects the absence of tax benefits in the year-ago quarter at PSEG Energy Holdings and higher interest expense at the Parent. The Net Loss in the first quarter of 2017 included a $55 million pre-tax charge related to continuing liquidity issues facing NRG REMA, LLC, partially offset by tax benefits at PSEG Energy Holdings.

For 2018, the forecast of PSEG Enterprise/Other Net Income remains unchanged at $35 million.

#######

About PSEG:

Public Service Enterprise Group (NYSE:PEG) is a publicly traded diversified energy company with annual revenue of $9.1 billion. Its operating subsidiaries are: Public Service Electric and Gas Company (PSE&G), PSEG Power LLC, and PSEG Long Island.

PSE&G is New Jersey's oldest and largest regulated gas and electric delivery utility, serving nearly three-quarters of the state's population. PSE&G is the winner of the ReliabilityOne Award for superior electric system reliability.

PSEG Power LLC is an independent power producer that generates and sells electricity in the PJM, New York and New England wholesale power markets.

Non-GAAP Financial Measures

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items such as the revaluation of deferred tax liabilities and the impact of the retirement of the Hudson and Mercer coal stations on Power.

Management believes the presentation of non-GAAP Adjusted EBITDA for Power is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization.

See Attachments 8 and 9 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA. The presentation of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;

- changes in state and federal legislation and regulations;
- the impact of pending and any future rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to recover the carrying amount of our long-lived assets and leveraged leases;
- an inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

Presentation

Operator

Ladies and gentlemen, thank you for standing by. My name is Leeway, I'm your event operator today. I would like to welcome everyone to today's conference Public Service Enterprise Group Second Quarter 2018 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later we will conduct a question-and-answer session for members of the financial community. (Operator Instructions)

As a reminder, this conference is being recorded Wednesday, August 1st, 2018 and will be available for a telephone replay beginning at 1 o'clock PM Eastern Time today until 11:30 PM Eastern Time on Thursday, August 9th, 2018. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to the Carlotta Chan. Please go ahead.

Carlotta Chan, Senior Director of Investor Relations

Thank you, Leeway. Good morning everyone and thank you for participating in our earnings call. Earlier today PSEG released earning statements for the second quarter of 2018. These materials including the release, financial attachments and accompanying slides, detailing operating results by company are posted on the IR website at investor.pseg.com. Our 10-Q for the period ended June 30 has been filed with the SEC.

The earnings release and other matters we will discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. We also discuss non-GAAP operating earnings and non-GAAP adjusted EBITDA, which differ from net income as reported in accordance with Generally Accepted Accounting Principles in the United States. Reconciliations of our non-GAAP financial measures and a disclaimer regarding forward-looking statements are posted on our IR website and are included in today's slides and in our earnings release.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group. Joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer. At the

conclusion of their remarks, there will be time for your questions.

Ralph Izzo, Chairman, President and Chief Executive Officer

Thank you, Carlotta and thank you everyone for joining us today. PSEG reported net income for the quarter of $0.53 per share versus $0.22 in the second quarter of 2017. We also reported non-GAAP operating earnings of $0.64 per share, versus $0.63 in last year's second quarter. Non-GAAP operating earnings for the second quarter rose 3%, compared with the year ago period reflecting continued strong performance at PSE&G and effective cost control and the lower corporate tax rate at PSEG Power.

Solid results for the quarter bringing non-GAAP operating earnings for the first half of 2018 to $1.61 per share, a 4.5% increase over operating earnings of a $1.54 per share earned in 2017's first half. For the first half of 2018, we have made substantial progress in meeting our objectives for the full year. On slide six and seven, we summarize the results for the quarter and the first half of 2018.

At PSE&G, earnings increased by $0.05 per share, up 12% over second quarter 2017 results. Continued investment in PSE&G's transmission and distribution programs was the primary driver of earnings growth for the quarter and year-to-date periods. PSE&G has made over $3 billion in electric and gas infrastructure investments in the past 12 months, including increased distribution spending as we continuously strive to upgrade New Jersey's aging infrastructure and to maintain high levels of customer reliability and achieve high customer satisfaction scores.

PSE&G reach many significant milestones during the second quarter, successfully executing on its capital programs. PSE&G recently finished construction of the third and final phase of the $1.2 billion 345 kV Bergen-Linden Corridor or BLC as we refer to it. This project improve reliability was one of the larger and more complex projects we've built and was finished safely, on time, and on budget. After completion of the BLC line, our transmission project portfolio will focus on our 69 kV upgrade program, enhance storm hardening, as well as life cycle replacement to maintain reliability, increase grid resilience and modernize aging plant.

Turning to our ongoing distribution programs, PSE&G is completing the first phase of its gas system modernization program or what we refer to is GSMP. And this has replaced approximately 500 miles of gas mains in the last three years. We will begin work on GSMP 2 in 2019. This next phase, a five-year $1.9 billion program was recently approved by the New Jersey Board of Public Utilities and will enable us to replace an additional 875 miles of aging gas mains.

In early June PSE&G filed for an extension of its energy strong infrastructure program or ES2 with the BPU. The key components of the $2.5 billion five-year program are outlined for you on Slide 17. The request this progressing at the BPU and will enable us to continue investments to harden our system against storms, replacing aging or end of life infrastructure and incorporate advanced technology to improve grid management. PSE&G's pending distribution base rate case is proceeding according to the schedule, including early stage settlement meetings with the parties held in July, which will continue into August. Three public hearings across the state were recently completed in early July and the next week we will file a scheduled update with financial data for the full test year ended June 30th. We also expect the BPU staff and others to file their initial testimony in the coming weeks.

As a reminder, in the absence of the settlement, we have the ability to self-implement interim rates this November consistent with regulations issued by the BPU last December. The BPU recently released their investigative report conducted in response to the multiple March 2018 nor'easters that left many customers throughout the state without power. PSE&G is reviewing the BPUs report and its recommendations for improving storm response protocols to ensure that our procedures are continually aligned with industry best practices.

Among the BPUs recommendations, each utility is to submit within 180 days a plan with an accompanying cost benefit analysis for the implementation of Advanced Metering Infrastructure or AMI. Focusing on the use and benefits of AMI, for the purpose of reducing the number of customer outages, as well as outage durations during major storm events.

SI-SSA-0015-14362

Also, as we discussed during our recent investor conference this past May, New Jersey Governor Murphy signed into law clean energy legislation, which adopted significant new standards for energy efficiency, and the use of renewable energy. PSE&G plans to submit our clean energy future or CES filing, a $2.9 billion six-year proposal aligned with New Jersey's energy policy goals that details a broad range of planned investments in energy efficiency, electric vehicle infrastructure and battery storage. The CEF program sets targets for energy efficiency savings for electric and gas usage in a cost efficient manner to broadly benefit customers by helping to lower bills and better manage energy use. PSEG's focus remains on providing customers enhanced reliability, a resilient system supported by green energy and bills that are affordable. We look forward to making this filing in the near-term, supporting the state's energy policy goals and bringing value to our customers.

New Jersey's legislation enabling zero emission certificates or ZECs was also signed into law by Governor Murphy in May. The legislation calls for the BPU within 330 days to establish a process for ZECs including determining eligibility and certification of need and ultimately selecting nuclear plants to receive ZECs starting in April 2019. The BPU will rank nuclear plant applicants based on considerations that include fuel diversity, air quality and other environmental attributes. PSEG Power estimates that if all three of its nuclear -- of its New Jersey nuclear units are selected, it could be eligible to receive ZEC revenues of approximately $200 million per year.

PSEG Power placed into service the Keys Energy Center and Sewaren 7 combined cycle units, adding 1,300 megawatts of clean efficient gas-fired generating capacity. Construction activities are ongoing at Bridgeport Harbor 5, which we expect to bring online in mid of 2019. Once Bridgeport Harbor is in service, it will complete a reconfiguration of Power's merchant generation fleet that will improve its competitiveness in the marketplace.

In June of 2018, the Federal Energy Regulatory Commission issued an order finding that PJMs current capacity market is unjust and unreasonable, because it allows resources supported by out of market payments to suppress capacity prices. FERC established a new proceeding to address an alternative approach, in which PJM would; one, modified its minimum offer price rule, so that it would apply to new and existing resources that receive out of market payments, regardless of resource type. And two, establish an option that would allow on a resource specific basis, resources receiving out of market support to be removed from the PJM capacity market along with a commensurate amount of load for some period of time. We are participating in this proceeding and we'll continue advocating for policies at the federal levels to correct flaws in wholesale market design that suppressed prices, while striving to obtain adequate recognition of the value that fuel diversity brings to the secure, resilient and well-functioning electric grid.

We expect that the growth prospects for PSE&G, the reconfiguration of our merchant generating fleet and successful execution of our policy initiatives will allow PSEG to extend its track record of delivering value for our customers and growth for our shareholders. We intend to maintain our strong balance sheet and credit metrics that enable us to fund PSEG's projected capital investment program of $14 billion to $17 billion over the 2018 to 2022 period without the need to issue equity and continue providing shareholders with the opportunity for consistent and sustainable dividend growth.

Our non-GAAP operating earnings for the first half of 2018 are supportive of our outlook for the full year and we are maintaining our full year guidance for 2018s non-GAAP operating earnings of $3 to $3.20 per share.

With that, I'll turn the call over to Dan, who will discuss our financials in greater detail and then will join Dan at the end of the call for your questions.

Daniel Cregg, Executive Vice President and Chief Financial Officer

Thank you, Ralph and thanks everybody for joining us today. As Ralph said, PSEG reported non-GAAP operating earnings for the second quarter of 2018 of $0.64 per share versus non-GAAP operating earnings of $0.62 per share in last year's second quarter. And a reconciliation of non-GAAP operating earnings to net income for the quarter can be found on slide six.

Bloomberg
SI-SSA-0015-14363

We've also provided you with the waterfall chart on slide 11, that takes you through the net changes in quarter-over-quarter non-GAAP operating earnings by major business and a similar chart on slide 13, that provides you with the changes in non-GAAP operating earnings by each business for the first half of 2018.

I will now review each company in more detail, starting with PSE&G. PSE&G reported net income of 231 million or $0.46 per share for the second quarter of 2018, compared with net income of $208 million or $0.41 per share for the second quarter of 2017. Results for the quarter is shown on slide 15. PSE&G second quarter results reflect continued successful execution of our infrastructure investment programs and ongoing control of operating expenses. Growth in PSE&G is investment in transmission improved second quarter net income comparisons by $0.03 per share. Revenue recovery of investments made to enhance system resiliency under the energy strong and gas system modernization programs, drove improved margin in second quarter net income comparisons by $0.02 per share.

Distribution OEM savings added a $0.01 per share over the second quarter of 2017 results. Changes to the accounting treatment of the non-service component of pension and OPEB expenses resulted in a favorable $0.02 per share comparison over 2017 second quarter. Partially offsetting the favorable margin items were higher expenses related to depreciation, interest and taxes that had a combined impact of $0.03, compared to 2017s teens second quarter.

As a reminder, transmission revenues are adjusted each year based on the Company's investment program. PSE&Gs investment and transmission is expected to grow to approximately 8.6 billion of rate base at the end of 2018 or 45% of the Company's year-end consolidated rate base. Under Energy Strong, electric rates were adjusted twice during the year in March and September and gas rates were adjusted each year in September.

Under the gas system modernization program, gas rates which are now adjusted each year in January to reflect the investment made during the prior year will move to a semi-annual recovery schedule when we began the GSMP 2 program in 2019. The combined annual revenue increase in 2018 over 2017 from both the Energy Strong and GSMP programs as forecast to be approximately $53 million.

Economic indicators for New Jersey continues to be generally positive, supported by gains in employment and housing data. Quarterly gas sales were higher influenced by cold April temperatures. On a trailing 12-month basis, which provides longer term trending data, weather normalized electric sales were relatively flat, while gas sales were 2.7% higher led by demand from the commercial sector.

Residential, electric and gas customer growth continues to trend higher at approximately 1% per year. And our forecast of PSE&Gs net income for 2018 is unchanged at $1 billion to $1.30 million.

Now let's start to Power. PSEG Power reported net income for the quarter of $41 million or $0.08 per share, compared with a net loss of $97 million or $0.19 per share for the second quarter of 2017. 2017 include an incremental depreciation and other expenses related to last June's retirement of the Hudson and Mercer coal-fired generating stations.

Non-GAAP operating earnings for the second quarter of 2018 were $0.16 per share, compared to $0.19 per share in 2017, and Non-GAAP adjusted EBITDA for the second quarter of 2018 was 210 million, compared to 261 million in 2017. And non-GAAP adjusted EBITDA excludes the same items as our non-GAAP operating earnings measure, as well as income tax expense, interest expense and depreciation, amortization.

The earnings release in slide 21 provide you with a detailed analysis for the impact on Power's non-GAAP operating earnings quarter-over-quarter. And we've also provided you the generation statistics for the quarter and for the first half of the year on slides 22 and 23. Power's non-GAAP results for the second quarter of 2018 reflect the impact of lower market prices on re-contracting of our hedges, which reduced operating earnings by $0.08 per share. Power experienced a $6 per megawatt hour decline in its average hedged energy prices during the second quarter and this is consistent with our expectations for the full year. Lower volumes of $0.01 per share and higher O&M of $0.02 per share reflect the impact of Power's Hope Creek nuclear refueling outage, compared to the year-ago outage of our 57% owned Salem unit.

final

In increasing capacity prices in both PJM and New England, starting on June 1st, improved quarter-over-quarter results by $0.03 per share and higher gas send out as a result of cold April temperatures added a $0.01 per share. The decline in depreciation expense related to the Hudson and Mercer coal requirements, together with lower interest expense and a lower corporate income tax rate combined to improve quarterly comparisons by $0.04 for the quarter.

Now, let's turn to Power's operations. Generation output declined by 5%, compared with the second quarter of 2017, reflecting the planned refueling outage at Hope Creek and other scheduled maintenance. Power's gas-fired combined cycle fleet operated at an average capacity factor of 46% and produce 3.5 terawatt hours of output during the second quarter of 2018, down by a 11% over the year ago quarter, reflecting outages and lower market demand. PJM coal generation output remained constant at 1.4 terawatt hours and operated at an 81% capacity factor in the quarter.

And for the year-to-date period Power's nuclear fleet operated at an average capacity factor of 92.9% producing 15.8 terawatt hours and representing 63% of Power's total generation. Gas prices were flat year-over-year and an improvement in power prices was offset by lower market demand. Power has adjusted its forecast for expected 2018 through 2020 output to reflect current market conditions and now expects 2018 output of 53 terawatt to 55 terawatt hours, 2019 output of 57 terawatt to 59 terawatt hours and 2020 output of 62 terawatt to 64 terawatt hours, down slightly from our earlier forecast volumes of 55 terawatt to 57 terawatt hours for 2018, 59 terawatt to 61 terawatt hours for 2019 and 63 terawatt to 65 terawatt hours for 2020.

An update to Power’s hedge position is provided on slide 25. For the remainder of 2018 Power has hedged 90% to 95% of total forecasted production of 28 terawatt to 30 terawatt hours at an average price of $38 per megawatt hour. For 2019, Power is hedged at 65% to 70% of forecast of production of 57 terawatt to 59 terawatt hours at an average price of $37 per megawatt hour, and for 2020 Power has hedged 35% to 40% of output forecasted to be at 62 terawatt to 64 terawatt hours at an average price of $36 a megawatt hour.

Earlier this year in July the State of New Jersey made changes to its income tax laws, including imposing a temporary surtax on corporate taxable income of 2.5% effective January 1st, 2018 through 2019, and declining to 1.5% in 2020 and 2021. The surcharge provides an exemption for public utilities and as such PSE&G will not be impacted by this change. But for the full year 2018, the tax surcharge is expected to have a modest negative impact our results of Power and to a lesser extent on enterprise and other as each begins to accrue the surcharge starting July 1st 2018.

Our forecast of Power’s full-year 2018 non-GAAP operating earnings and non-GAAP adjusted EBITDA remains unchanged at $485 million to $560 million and a $1.75 billion to $1.180 billion respectively.

Now let me turn to PSEG Enterprise and Other, which reported a net loss of $3 million or $0.01 per share for the second quarter of 2018, compared to a net loss of $2 million for the second quarter of 2017. Non-GAAP operating earnings for the second quarter 2018 were $11 million or $0.02 per share, representing no change versus the second quarter of 2017. The net loss for the second quarter of 2018 includes a pre-tax charge of $20 million related to the ongoing liquidity challenges facing NRG REMA, compared to a similar pre-tax charge of $22 million in the year ago quarter.

Results this quarter also reflect higher parent interest expense offset by the lower federal tax rate at PSEG and ongoing contributions from our PSEG Long Island contract. For 2018, the forecast the PSEG enterprise and other non-GAAP operating earnings remains unchanged at 35 million.

Now I'd like to take a moment just to recap our 2018 to 2022 capital spending plan of $14 billion to $17 billion, with approximately 90% directed to regulated growth initiatives at PSE&G. As we detailed in our Investor Day presentation in May, PSE&Gs five year $12 billion to $15.5 billion capital spending program supports our expected compound annual growth in rate base of 8% to 10% over the 2018 to 2022 period. The recent five-year expansion of GSMP 2 and approximately $1.9 billion is incorporated into the lower end of the spending and growth range, at an average annual spend of approximately $350 million to $400 million, which is an increase over GSMP 1 of approximately $75 million per year beginning in 2019.

The upper end of the range adds the full investment positions contained in our pending $2.5 billion Energy Strong 2 program and our anticipated $2.9 billion Clean Energy Future program that when combined totaled approximately $3.5 billion through 2022. The timeframes for both Energy Strong 2 and our Clean Energy Future program extend beyond

Bloomberg Transcript
Bloomberg

SI-SSA-0015-14365

the 2022 horizons. So the tail end of both programs is beyond PSE&Gs 2018 to 2022 capital spending window.

PSEGs financial position remains strong. Power's free cash flow is expected to improve in 2018 with the decline in capital spending following the completion of construction of Keys and Sewaren and overall we expect an improvement in PSEG's cash flow in 2018 versus 2017. PSEG close the quarter ended June 30th, 2018 with $95 million of cash on its balance sheet and debt representing 50% of consolidated capital.

Power's debt at the end of the quarter represented 34% of its capitalization providing a debt to equity -- debt to EBITDA ratio of 2.7x at the midpoint of Power's 2018 non-GAAP adjusted EBITDA forecast. And well within Power solid investment grade credit metrics. And I would note that in May Standard & Poor's affirmed the credit ratings of PSEG, PSE&G and PSEG Power retaining each rating outlook at stable.

We continue to expect that Powers improving cash flow beginning in the second half of 2018, will be directed to supporting regulated growth investments. PSEG continues to expect no new equity to fund our current capital spending program over the 2018 to 2020 timeframe. And we stand firm in our commitment to providing our shareholders with the opportunity for consistent and sustainable dividend growth, it has averaged nearly 5% annually over the last few years. As Ralph mentioned, we are maintaining our forecast of non-GAAP operating earnings for the full year of $3 to $3.20 per share.

And Leeway, we are now ready to take some questions.

Questions And Answers

Operator

Thank you so much. Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. Your first question comes from the line of Julien Dumoulin-Smith from Bank of America. Please proceed with your question.

Claire Zeng, Analyst

Hey, good morning. This is actually Claire Zeng.

Ralph Izzo, Chairman, President and Chief Executive Officer

Hi, Claire.

Claire Zeng, Analyst

Hi, thank you for taking my questions. So I appreciate the update on the rate case settlement negotiations, just if you could provide a little more color on. Maybe progress on some of the critical issues and just any more color you can give there?

Ralph Izzo, Chairman, President and Chief Executive Officer

Clarie, it's really difficult to reveal the details of the negotiation publicly it doesn't seem fair to the other parties, but there's a bunch of issues that we had resolved even prior to this discussion in terms of storm cost and recovery of that, but we are under confidentiality agreement with the other parties to not discuss the negotiations at this point. I think we just stick with what we've said in the script that we're engaged in the dialog has been constructive, summer vacations are now interfering a little bit and at the end of the day, everything is on schedule and we always have recourse to

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14366

interim rates nine months after the filing date of January. So as much as I'd like to share with you, we do have these confidentiality limitation.

Daniel Cregg, Executive Vice President and Chief Financial Officer

Yeah, from a scheduled standpoint we will provide the latest update as we step through time, so the 12+0 will be submitted on the 8th of August and things are moving according to schedule.

Claire Zeng, Analyst

Got it.

Ralph Izzo, Chairman, President and Chief Executive Officer

Just a reminder that our ask is net of the tax give back of 1% rate increase and we'll still be 20% below where rates were in our last rate case, even if we got 100% of our ask.

Claire Zeng, Analyst

Got it. I appreciate the confidentiality aspect. Well, in that case my second question here is broadly, could you give a little more color on how you see New Jersey, the BPUs complaints on transmission cost allocation and cost inflation and how you might address that?

Ralph Izzo, Chairman, President and Chief Executive Officer

Sure. Well, first of all, let's make sure everybody understands that the issue is who pays, not whether we get paid, right. So, PSE&G will get fully compensated for it's transmission investments as per our FERC transmission rates. And there has been some back and forth between who the beneficiaries are of things like the artificial islands stability improvements, the Bergen-Linden Corridor and its impact on New York ISO teams and we have been working with the BPU to obviously advocate for a fair treatment of New Jersey customers. So we are completely aligned and what we want to see happen there. So we obviously had a couple of -- not the best of outcomes from a New Jersey perspective, it's FERC recently, but there is no gap between what we want and what the New Jersey BPU wants. And again, I'll end where I started, which is there's no issue in terms of shareholder recovery of what's been invested.

Claire Zeng, Analyst

Got it. Could you give -- possibly one more color on some of the discussions at PJM to lower transmission cost or if there's anything you can reveal at this time there?

Ralph Izzo, Chairman, President and Chief Executive Officer

Yeah. I mean, I think that there are two types of transmission projects the PJM has presented to with us, stuff that comes out of the RTEP Regional Transmission Expansion Program and that is generated by PJM. And then, there are additional non-RTEP projects that have more of a local reliability component to it, that the company's generate. And there's been a movement at PJM, which we've been supportive of to make the visibility of the justification for those projects more consistent with each other. That hasn't been the case always in the past, primarily because the RTEP projects are bigger.

So, if you have one $750 million project like Susquehanna-Roseland, you kind of understand why you want to treat that different, then 10 $75 million projects like a 69 kV upgrade. But, recognizing that customers and load-serving entities and suppliers and all of the stakeholders at PJM have the right information, PJM has been moving towards a passive greater and greater upfront disclosure. We just have to make sure that we don't get to the point where diminishing returns with literally the eight-figure project is or seven-figure project is getting the same amount of upfront time and disclosure that the 9 and 10 figure projects demanded, because that will just paralyze the whole process.

Claire Zeng, Analyst

Thank you.

Operator

Thank you so much. And your next question comes from the line of Praful Mehta from Citigroup. Please proceed with your question.

Praful Mehta, Analyst

Thanks very much. Hi guys.

Ralph Izzo, Chairman, President and Chief Executive Officer

Hi, Praful.

Praful Mehta, Analyst

Hi, so Ralph, wanted to get your view on this whole capacity reform and the FERC proposal. It sounds like if you're going to remove both demand and supply from the capacity market, it probably has a negative impact or at least not a positive impact on capacity prices. So, first you wanted to get your view on that. And secondly, what does that mean for resources that are getting support like zero emission credits. Does that mean they have to go to the state to kind of get that refund for the capacity that they lost? Just some color on that I would really appreciate it.

Ralph Izzo, Chairman, President and Chief Executive Officer

Sure, Praful. So, I don't think, I'm being pollyannaish, when I say that I'm quite optimistic about what could come out of this, although we don't know, what will come out of this. Let me explain why. It's first of all, let's level set the calendar right now. Barring an unusual action by FERC to call back prior RPM auctions. For the next three years, we know what our financial situation is, right. We have three auctions that took place and those capacity prices are set and it's by no means coincidental that the first phase of the ZEC program in New Jersey will coincide with that, right. We deliberately talked about three year horizons for the ZEC program, because of the visibility of capacity prices and the fairly high visibility of energy prices, although not deterministic the way capacity prices are. So for three years, I think we understand our financial situation pretty well provided our New Jersey units, are selected for the ZEC payments, which I don't want to presume to be the case.

Now, let's take a look at what FERC has said is the reason for doing what they're doing. Number one, they said that they want to allow state flexibility in choosing their own resources. Well, when you get 60 out of 80 votes in the assembly and 28 out of 40 votes in the senate and a Governor who signs the bill, you got to feel pretty good about this

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14368

state wanting to support its nuclear plants. And whether that's through an FRR or some other mechanism, I have a very high degree of confidence that the state recognizes the energy, capacity and environmental attributes of our nuclear plants.

Now, the devil is in the details as to how that will be actually designed and recovered, but again from a policy point of view, that feels pretty good to me. And then when you think about who brought the complaint and why they brought the complaint, the claim is that out of market payments which by the way is not limited to ZECs, it's ZECs, it's RECs it's regulated generation in the market today, that these out of market payments were serving to suppress capacity prices.

So, if the goal is to correct for that, I feel pretty good about what that means for our fossil units. So, somewhere between the goals and Ralph is also feeling good about the goals and getting the details right, is a fair amount of wood to chop obstensibly over the next four months by January 4th, which has all sorts of other probations that are associated with in terms of how many FERC commissions are there, who's filing for rehearing, it wasn't filing for rehearing, et cetera, et cetera.

So, I don't want to suggest that there isn't uncertainty, but there is clearly. But I think, if you hold onto the stated goals to eliminate price oppression for the things that are receiving out of market payments, check that box for our fossil units; and number two, allow states to support those resources if they want to support, check that box for our nuclear units. There's no other boxes for us to check, so that's where I come out of Praful right now. And again, we are actively engaged in the details of how one achieves that and that's the part that no one is able to predict at this point. Dan, I don't know if you want to add anything?

Daniel Cregg, Executive Vice President and Chief Financial Officer

The only other thing I would add, if you think about the mechanics of it as well, Praful, you talked about taking out the load and taking out generation there's a reserve aspect that would come with the load and how that gets worked through would also have an effect. But, that would serve if it was megawatt for megawatt load in generation you absolutely would have the effect you're talking about to the extent, the reserves are going to turn any kind of an FRR alternative into a smaller version of what you're seeing in the market, meaning it would be with reserves you would have a lesser impact or maybe no impact based upon and how that math would work.

Ralph Izzo, Chairman, President and Chief Executive Officer

And not to solve the problem here, but if they remove supply and it’s a small subset and presumably the reserve margin needed for that smaller market would have to be comparable, if not higher than what you have for a 168,000 megawatt 13 state region so --

Praful Mehta, Analyst

Yeah, that's super helpful color. I mean almost the depth of your answer also suggests the complex job here and as you've said, do you really think that it can get done in that January time frame or do you think this is kind of going to take more time?

Ralph Izzo, Chairman, President and Chief Executive Officer

Instinctively, I'd say probably will take more time, but I don't want to second-guess the FERC and the stated schedule, but yeah, I mean we'd be kidding ourselves, if history wasn't some sort of teacher about how long these things take and something is -- complicated is this.

Praful Mehta, Analyst

Got you. Thanks so much guys.

Ralph Izzo, Chairman, President and Chief Executive Officer

You're welcome.

Operator

Thank you so much. And your next question comes from the line of Jonathan Arnold from Deutsche Bank. Please proceed with your question.

Jonathan Arnold, Analyst

Good morning guys.

Ralph Izzo, Chairman, President and Chief Executive Officer

Hey, Jonathan.

Jonathan Arnold, Analyst

A question on -- I was just curious what's -- the Analyst Day, Ralph, you had said that on the CEF filing you'd already held the 30-day pre-filing and that was kind of ready to go and your slides today say later in the year, I think you said in the near-term, but either way, it seems to have been held off a little bit. Can you give us any color of why that is?

Ralph Izzo, Chairman, President and Chief Executive Officer

Sure, Jonathan. It's very simple, we've got a wonderful opportunity here with Governor Murphy's passion for the types of things that are in that filing and we just want to work very closely with the front office in terms of policy alignment and you may or may not be aware of this, but June 30th is the end of the fiscal year for New Jersey. So until June 30th arrive, it's just impossible to think of anything, but State budget conversations, right. So, even though energy is important, it doesn't step in front of the state budget. So, then you run into vacations, it's really just a question of being completely in sync with the policy of the administration and having a couple other things step in front of us for that. But nothing more than that. I would be surprised if it's much delayed at this point. Once we get some people back from vacation to look.

Jonathan Arnold, Analyst

Well, you're saying seems to imply it might evolve a little bit versus what you showed us, is that a fair?

Ralph Izzo, Chairman, President and Chief Executive Officer

Yeah, the program elements, but I wouldn't expect -- I mean we are determined to go in with this dollar amount, if anything, you know, this interesting BPU comment on the importance of AMI for outage restoration could affect what

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14370

we submit, and that obviously would have the effect too, if anything increase it, somewhat as opposed to decrease it.

Jonathan Arnold, Analyst

So that's what I was going to ask as you. So do you have an early sort of feel of what a full deployment would cost and -- yeah, and it sounds like you're saying that would be incremental rather than displacing something else the wonderful words from you.

Ralph Izzo, Chairman, President and Chief Executive Officer

You are correct, it would be incremental, I'd rather I not give that number Jonathan, because we're just starting that conversation with BPU staff and I'd rather not have them hear it for the first time in one of your reports, even though they're well written and wonderful reports, yeah.

Jonathan Arnold, Analyst

Okay. But you would -- but to the point of being incremental or sort of -- instead of what's the --

Ralph Izzo, Chairman, President and Chief Executive Officer

I would think it will be more incremental, rather then we don't want to take away from the other side.

Jonathan Arnold, Analyst

Okay.

Daniel Cregg, Executive Vice President and Chief Financial Officer

From dollar amount standpoint as well, Jonathan. If you look at the spend that's been identified and then what have been talking about that does aligned with the EE savings objectives that are laid out within the legislation. So that should hold fairly steady to get the savings that we need and having the spend that we've talked about.

Jonathan Arnold, Analyst

Okay, thanks. Just one other topic if I may. Dan, you mentioned the lower forecast for output power. Just curious, if you could give us a little more color behind why the change is in '19 and '20?

Daniel Cregg, Executive Vice President and Chief Financial Officer

Yeah, and I think Jonathan, it's a little bit of what we're seeing from a market demand perspective right now and also a little bit related to whether or not the units are running through the night and whether there is some dubfire and that's going on. So just they moved from time-to-time and they remain estimates, and as we step through 2019 and 2020, we'll continue to keep an eye on it, but the early indications now is that there's a little bit more downward pressure than up, so we're just providing that from the standpoint of our forecasted output.

Jonathan Arnold, Analyst

Okay, thank you.

Operator

Thank you so much. And your next question comes from the line of Greg Gordon from Evercore. Please proceed with your question.

Greg Gordon, Analyst

Hey, good morning.

Ralph Izzo, Chairman, President and Chief Executive Officer

Good morning, Greg.

Greg Gordon, Analyst

Not to layer uncertainty upon uncertainty, but in addition to the 206 related to the capacity market ahead, your Power markets are -- was sort of articulated in the last answer to last question, you know, pretty low and more about pricing wise, but we've got this has our pricing decision pending there also seems to be a continued desire around the part of PJM leadership to address the overall pricing model from an energy perspective. So would seem to me that, you know, the revenue model for Power does have a lot of uncertainty on both sides of the equation, capacity and energy. But it would seem to me that they're both bias to the upside, but I don't want -- I'd rather than bias or answer, I'd like to hear what you think about the momentum for energy price reform as well both fast-start and if the momentum can be reestablished on low power price reform?

Daniel Cregg, Executive Vice President and Chief Financial Officer

Yes, I think what we're hearing is a fast-start can and should be implemented beginning of '19 and then the broader inflexible unit aspects of price formation PJM has committed to filing something at the end of this year. So I would agree with you, Greg my sense and this is not -- is just that is, that there has been enough delays and false starts that it's hard to believe that either or both of those are fully baked into the forward price curve at this point. So that would suggest that there is more upside, I mean if a fast-start unit is allowed to set price, that's a good thing, right. And if an inflexible unit allowed to surprise that's a good thing. But I would be less than wholly accurate, if I didn't say that when we last met at EEI, I thought that it would happen around this time, because that's what PJM was saying, yet we are not there yet.

So there's got to be some degree of discounting going on -- in the forward price curve, but we don't outguess the forward price curve view, we do have a range of hedging that we allow ourselves to gravitate up or down within some boundaries, but so short answer, yes, I would agree there is some upside, but the delays of the past fully account for I think some of the skepticism that might not have fully priced this into the forward curve.

Greg Gordon, Analyst

Okay. Thank you, Ralph. Have a good day.

Operator

Thank you so much. And your next question comes from the line of Steven Fleishman from Wolfe Research. Your line is now open.

Steven Fleishman, Analyst

Hi, Ralph good morning. So just to kind of get a better understanding of scenarios from the FERC structure, I get where you say that you kind of have a protection for non-subsidized generation and a path forward on subsidized generation. I guess the only issue would be you would -- I assume need to get a new legislative structure then, if this now, it can be done within the current one?

Ralph Izzo, Chairman, President and Chief Executive Officer

Yeah, well, I mean, of course it depends on what FERC says, but we have every reason to believe that the state could designate resource requirements that it -- that, you know, for example, it got legislation right now that's been signed by the Governor saying about 40% of its energy to come from nuclear plants, so that legislation exists. There is renewable energy legislation that exists in terms of our renewable portfolio standards. So the approach we would think could work is that the BPU would simply say that based upon that statutory authority using a couple of mechanisms that we've already started talking about, but I'd rather not go into detail here, it could be purely done through regulation without any need for additional legislation fully supportive of the 3,500 megawatts of nuclear, 1,400 megawatts of solar and whatever else is running out there right now, which I'm not counting.

Steven Fleishman, Analyst

Okay. So the fact that there was a $300 million cap on the ZECs is not relevant for that aspect?

Ralph Izzo, Chairman, President and Chief Executive Officer

No it is, right, because the ZEC was not a payment for energy or capacity, the ZEC was the payment for fuel diversity and environmental attributes, so to supply the load in New Jersey there has to be an energy and a capacity payment and that's wholly separate from the ZEC payment that's -- that was abundantly clear in the legislation and --

Steven Fleishman, Analyst

Okay, okay. And then just -- I'm just curious if, you know, in trying to figure out this full picture. If you've heard any updates on potential DOE, fuel stability plan and just where that might be and how that might fit into this?

Ralph Izzo, Chairman, President and Chief Executive Officer

I have not -- we one could conclude that if price suppression has been eliminated that could solve DOE's concern about the units that are suffering from that price suppression becoming viable again, but that's really an extrapolation that you'd have to judge for yourself. The DOE issues been out there for a while now, there is a resiliency technical workshop going on at FERC, I think there was a meeting yesterday, if I'm not mistaken or two days ago, but I don't have any other information then what you probably have already surmised or read it in the press.

Steven Fleishman, Analyst

And then just on the AMI potential program you mentioned when are we going to -- what is the date from one will get an update on that?

Ralph Izzo, Chairman, President and Chief Executive Officer

So, if we file it with the clean energy filing it would literally be within a couple of weeks, if not -- the outset maybe a month or two. If it's done separately that could be a little longer date, if that could spill into the end of this year.

Steven Fleishman, Analyst

Okay. Thank you.

Ralph Izzo, Chairman, President and Chief Executive Officer

You're welcome.

Operator

Thank you so much. And your next question comes from the line of Paul Patterson from Glenrock. Your line is now open.

Paul Patterson, Analyst

Good morning, guys.

Ralph Izzo, Chairman, President and Chief Executive Officer

Hi, Paul.

Daniel Cregg, Executive Vice President and Chief Financial Officer

Hi, Paul.

Paul Patterson, Analyst

So just to sort of follow-up on this capacity, just make sure I understand Praful and Greg's and other questions. The -- and your answers I guess, it seems to me that if I understand you correctly, you expect to see some additional form of mitigation measures to address the impact of essentially through the self supply FRR specific resource alternative. Is that correct and am I understanding that correctly?

Ralph Izzo, Chairman, President and Chief Executive Officer

Yeah, that's right Paul, I show what we understand FERC has said and it's second step of the process was that, okay states, if you want to assure your own resource adequacy consisting of various components then you can do that and

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14374

we'll let you remove them from the market, as well as the load associated with that. And I think we're profitable and we were talking about was in the second half of that sentence, what is the load associated with that, right. So if resource adequacy and a 168,000 megawatt market is 16% or 15.8%. What's an adequate reserve margin, when the market is 3,000 megawatts, is it higher, is it lower, I would argue it's much higher, because if you lose one nuclear unit out of 3,000 you've got a big problem, so may be resource adequacy then says the you've got to have -- you are only taking, your reserve margin needs to be 35%. I'm making stuff up here with you. So the state wants that nuclear unit it's paying for the environmental attributes, it's going to collect an energy price in the PJM market, it's then going to set a capacity price presumably through a market proxy that RPM would be a great duplicate for, and then it's going to leave behind a lot more load and it took out and a lot less supply, then it took out, well that works nicely for the residual market, we just have to make sure that, that everyone else sees it that way.

Daniel Cregg, Executive Vice President and Chief Financial Officer

At a minimum if you think about, if you do have that hypothetical situation, that Ralph just talks about and there's a shortfall with respect to the load and the resources that we're taking out, what's going to happen is that, that load is going to rely upon the balance of the market and the reserve that sits within the balance of that market. So, a very strong reserve within the balance of that market is going to, inures to the benefit of the load that was taken out for an FRR. So absent some kind of ability to ensure that, that's compensated for there's a bit of a free rider issue. So logic would tell you that there should be a reserve that's going to be appropriate for the smaller amount of load that's come out.

Paul Patterson, Analyst

I hear you, but that really hasn't been done with regulated assets, right. I mean, we don't see that, I mean PJMs, IRM has been done sort of on a footprint or regional specific area, it doesn't seem like they've said, okay, this muni and this co-op if they have right, I mean that's why it seems a little bit, seems little novel to me. I mean, I understand the logic and, but I appreciate that, that will be interesting to see how it all works out. Just on NRG REMA, how much more do we have left there, what's the net investment after all this?

Daniel Cregg, Executive Vice President and Chief Financial Officer

There's an aggregate total of $20 million that's there. So, and those are the more acute area, so there's very little that remains in that regard.

Paul Patterson, Analyst

Okay. So we're pretty much finished with all, I think?

Daniel Cregg, Executive Vice President and Chief Financial Officer

I mean we'll see what happens. Ultimately, there could be some timing aspects to the extent that there is a process that goes forward within a bankruptcy scenario there could be a write-down in the aggregate, to be followed at a later date by a recovery in the aggregate. So from the accounting conservative standpoint, you could see more down before there is a recovery and they could be separated as opposed to net it. That would be the other element that I would point out here.

Paul Patterson, Analyst

PSEG ANNOUNCES 2018 SECOND QUARTER RESULTS

$0.53 PER SHARE OF NET INCOME

Non-GAAP Operating Earnings of $0.64 Per Share

Reaffirms Non-GAAP Operating Earnings Guidance $3.00 - $3.20 Per Share

PSEG Power Places Keys Energy Center and Sewaren 7 in Service

Progress Continues on PSEG's $14 Billion to $17 Billion Capital Spending Program; Supports PSE&G's Rate Base Growth Projection of 8%-10% per year over 2018-2022

(August 1, 2018 – Newark, NJ) Public Service Enterprise Group (NYSE: PEG) reported today Net Income for the second quarter of 2018 of $269 million, or $0.53 per share as compared to Net Income of $109 million, or $0.22 per share, in the second quarter of 2017. Non-GAAP Operating Earnings for the second quarter of 2018 were $325 million, or $0.64 per share, compared to non-GAAP Operating Earnings for the second quarter of 2017 of $316 million, or $0.62 per share. Prior-year results included costs related to the early retirement of the Hudson and Mercer generating stations.

Ralph Izzo, chairman, president and chief executive officer, said "PSEG's second quarter earnings benefited once again from expanded investment at PSE&G and ongoing focus on cost containment across PSEG. We recently reached several significant milestones, including obtaining final New Jersey Board of Public Utilities (BPU) approval of PSE&G's $1.9 billion, 5-year Gas System Modernization Program II (GSMP II); filing the utility's Energy Strong II infrastructure program; and completing construction of Power's newest generating stations at Keys and Sewaren. PSEG was also an active participant as New Jersey shaped its energy policy with the enactment of a wide ranging clean energy law that sets ambitious targets on energy efficiency, off-shore wind, battery storage and renewable portfolio standards that would require use of 50% of renewable energy by 2030. Governor Murphy also signed zero emission certificate (ZEC) legislation that will help preserve the benefits nuclear generation provides to New Jersey."

The table below provides a reconciliation of PSEG's Net Income to non-GAAP Operating Earnings for the second quarter. See Attachment 10 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings.

PSEG CONSOLIDATED RESULTS (unaudited)
Second Quarter Comparative Results
2018 and 2017

	Income ($ millions)		Diluted Earnings Per Share	
	2018	**2017**	**2018**	**2017**
Net Income	$269	$109	$0.53	$0.22
Reconciling Items*	56	207	0.11	0.40
Non-GAAP Operating Earnings	**$325**	**$316**	**$0.64**	**$0.62**
		Avg. Shares	**507M**	**507M**

*See Attachment 10

Ralph Izzo went on to say, "With solid financial results in the first half of 2018, we are re-affirming our non-GAAP Operating Earnings guidance for the year of $3.00 - $3.20 per share. The approval of PSE&G's GSMP II combined with two recently outlined investment programs (Energy Strong II filed in June, and Clean Energy Future (CEF) expected to be filed later in 2018) support PSEG's projected capital investment program of $14 billion to $17 billion over the 2018 to 2022 period. PSEG's strong balance sheet and financial flexibility will enable funding of this expanded capital program over the 5-year period without the need to issue equity."

The following table outlines PSEG's expectations for non-GAAP Operating Earnings by subsidiary for 2018.

2018 Non-GAAP Operating Earnings Guidance
($ millions, except EPS)

	2018E
PSE&G	$1,000 - $1,030
PSEG Power	$485 - $560
PSEG Enterprise/Other	$35 - $35
Non-GAAP Operating Earnings	$1,520 - $1,625
Non-GAAP EPS	$3.00 - $3.20

E = Estimate

Non-GAAP Operating Earnings Review and Outlook by Operating Subsidiary

See Attachments 5 and 6 for detail regarding the second quarter and year-to-date reconciliations for each of PSEG's businesses.

PSE&G

PSE&G reported Net Income of $231 million ($0.46 per share) for the second quarter of 2018 compared with Net Income of $208 million ($0.41 per share) for the second quarter of 2017.

PSE&G's second quarter results reflect continued, successful execution of its infrastructure investment programs and ongoing control of operating expenses. PSE&G's growth in Transmission investment added $0.03 per share to quarter-over-quarter Net Income comparisons. Recovery of investments made to enhance system resiliency under Energy Strong and GSMP drove improved

SI-SSA-0015-14378

margin comparisons of $0.02 per share. Distribution O&M savings added $0.01 per share over second quarter 2017 results. Changes to the accounting treatment of the non-service component of pension and other post-retirement benefit (OPEB) expenses resulted in a favorable $0.02 per share comparison over 2017's second quarter. These favorable items were offset by an increase in depreciation expense of $0.01 per share, higher interest expense of $0.01 per share, and an increase in taxes and other items of $0.01 versus the second quarter of 2017.

Economic indicators for New Jersey continued to be generally positive, supported by gains in employment and housing data. Quarterly gas sales were higher, influenced by cold April temperatures. On a trailing 12-month basis, which provides longer-term trending data, weather normalized electric sales were relatively flat while gas sales were 2.7% higher, led by demand from the commercial sector. Residential electric and gas customer growth continues to trend higher at approximately 1% per year.

PSE&G received approval of its GSMP II from the BPU in May, and expects to begin this infrastructure replacement program in 2019 to invest $1.9 billion over five years. In early June, PSE&G filed with the BPU the second stage of its Energy Strong Program that proposed a $2.5 billion investment in New Jersey's infrastructure to further strengthen the utility's distribution systems to withstand storms, improve reliability, and significantly enhance grid resiliency and modernize an aging infrastructure.

PSE&G's pending electric and gas distribution base rate case filed in January 2018 is progressing. PSE&G expects to provide another routine update to its filing with the BPU in August. In addition, three public hearings were recently completed, and initial testimony from the BPU staff and intervenors is expected in early August.

In support of New Jersey's clean energy legislation enacted in late May, PSE&G continues to develop its CEF program, a $2.9 billion, six-year proposal aligned with NJ's energy policy goals. The CEF details PSE&G's broad range of planned investments in energy efficiency, electric vehicle infrastructure, and battery storage focused on achieving required savings in electric and gas usage in a cost efficient manner to broadly benefit our customer base.

PSE&G's forecast of Net Income for 2018 is unchanged at $1,000 million - $1,030 million.

PSEG Power

PSEG Power reported Net Income of $41 million ($0.08 per share) for the second quarter of 2018 compared with a Net Loss of $97 million ($0.19 per share) for the second quarter of 2017. PSEG Power's non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA for the second quarter of 2018 were $83 million ($0.16 per share) and $210 million, respectively, compared to non-GAAP Operating Earnings of $97 million ($0.19 per share) and non-GAAP Adjusted EBITDA of $261 million for the second quarter of 2017.

PSEG Power's Net Income comparison for the second quarter reflects an increase in capacity prices of $0.03 per share. Re-contracting and lower market demand reduced results by $0.08 per share compared with the second quarter of 2017. Higher gas send out in response to cold April weather added $0.01, but was offset by $0.01 per share of lower generation volume. Higher O&M expense of $0.02 per share reflects Power's full ownership share of the Hope Creek nuclear refueling outage in

SI-SSA-0015-14379

Q2 2018 compared with its co-ownership share of the Salem nuclear refueling outage in Q2 2017, along with other planned fossil maintenance. Lower depreciation from cost savings associated with the early retirement of Hudson and Mercer generating stations along with lower interest added $0.01 per share versus the year-ago quarter. A reduction in the corporate tax rate from the Tax Cut and Jobs Act and other tax items improved Net Income comparisons by $0.03 per share in the second quarter.

Generation output declined by 5% compared with Q2 2017 reflecting the planned refueling at Hope Creek and other scheduled maintenance outages. Power's gas-fired CCGT fleet operated at an average capacity factor of 46% and produced 3.5 TWh of output during the second quarter of 2018, down by 11% over the year-ago quarter, reflecting the outages and lower market demand. Coal generation output remained constant at 1.4 TWh and operated at an 81% capacity factor in the quarter. For the year-to-date period, Power's nuclear fleet operated at an average capacity factor of 92.9%, producing 15.8 TWh representing 63% of total generation.

Power's forecast of total output for 2018 is now slightly lower at 53 – 55 TWh from its prior estimate of 55 – 57 TWh. For the remainder of 2018, Power has hedged 90% - 95% of total forecasted production of 28 – 30 TWh at an average price of $38 per MWh. For 2019, Power has hedged 65% - 70% of forecasted production of 57 – 59 TWh at an average price of $37 per MWh. For 2020, Power has hedged 35% - 40% of output forecasted to be 62 – 64 TWh at an average price of $36 per MWh. The forecasted output for 2018 – 2020 includes generation associated with 1,300 MW of new, gas-fired combined cycle capacity at the Keys Energy Center in Maryland and Sewaren 7 in New Jersey, as well as the mid-2019 commercial start-up of the 485 MW gas-fired CCGT at Bridgeport Harbor, Connecticut.

In May, New Jersey legislation enabling zero emission certificates was signed into law by Governor Murphy in an effort to preserve the economic viability of nuclear power resources that produce over 90% of the state's carbon free generation. The legislation calls for the BPU (within a 330-day period from enactment) to establish a collection process for a customer charge, determine eligibility and certification of need, and ultimately select nuclear plants to potentially receive ZECs starting in April 2019. The BPU will rank nuclear plant applicants based on considerations that impact fuel diversity, air quality, and other environmental attributes. Power estimates that if all of its New Jersey nuclear units are selected, it could be eligible to receive ZEC revenues of approximately $200 million per year during each 3-year cycle.

In June 2018, the Federal Energy Regulatory Commission (FERC) issued an order finding that PJM's current capacity market is unjust and unreasonable because it allows resources supported by out-of-market payments to suppress capacity prices. FERC established a new proceeding to address an alternative approach in which PJM would: (1) modify PJM's minimum offer price rule (MOPR) so that it would apply to new and existing resources that receive out-of-market payments, regardless of resource type; and (2) establish an option that would allow, on a resource-specific basis, resources receiving out-of-market support to be removed from the PJM capacity market, along with a commensurate amount of load, for some period of time. We intend to continue to participate in this proceeding.

In July 2018, the State of New Jersey made significant changes to its income tax laws, including imposing a temporary surtax on corporate taxable income of 2.5% effective January 1, 2018 and 2019, and 1.5% in 2020 and 2021. The surcharge provides an exemption for public utilities; as such PSE&G is not expected to be impacted by this change. For the full-year 2018, the tax surcharge is

SI-SSA-0015-14380

expected to have a modest negative impact on results at Power, and to a lesser extent on Enterprise/Other, as each begins to accrue the surcharge starting July 1, 2018.

The forecast of Power's non-GAAP Operating Earnings for 2018 and non-GAAP Adjusted EBITDA remain unchanged at $485 million - $560 million and $1,075 million - $1,180 million, respectively.

PSEG Enterprise/Other

PSEG Enterprise/Other reported Net Loss of $3 million ($0.01 per share) for the second quarter of 2018 compared to a Net Loss of $2 million for the second quarter of 2017.

Non-GAAP Operating Earnings for the second quarter of 2018 were $11 million ($0.02 per share) compared to non-GAAP Operating Earnings of $11 million ($0.02 per share) in the second quarter of 2017.

The net loss for the second quarter of 2018 includes a pre-tax charge of $20 million related to ongoing liquidity challenges facing NRG REMA compared to a similar pre-tax charge of $22 million in the year-ago quarter. Results this quarter also reflect higher parent interest expense, offset by tax benefits at PSEG.

For 2018, the forecast of PSEG Enterprise/Other non-GAAP Operating Earnings remains unchanged at $35 million.

#######

About PSEG:

Public Service Enterprise Group (NYSE:PEG) is a publicly traded diversified energy company with annual revenue of $9.1 billion in 2017. Its operating subsidiaries are: Public Service Electric and Gas Company (PSE&G), PSEG Power LLC, and PSEG Long Island.

PSE&G is New Jersey's oldest and largest regulated gas and electric delivery utility, serving nearly three-quarters of the state's population. PSE&G is the winner of the ReliabilityOne Award for superior electric system reliability.

PSEG Power LLC is an independent power producer that generates and sells electricity in the PJM, New York and New England wholesale power markets.

Non-GAAP Financial Measures

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items such as the revaluation of deferred tax liabilities and the impact of the retirement of the Hudson and Mercer coal stations on Power.

SI-SSA-0015-14381

Management believes the presentation of non-GAAP Adjusted EBITDA for Power is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization.

See Attachments 10 and 11 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA. The presentation of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third-party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations, and PSE&G's ability to recover costs and earn returns on authorized investments;
- the impact of pending and any future rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;

SI-SSA-0015-14382

- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to recover the carrying amount of our long-lived assets and leveraged leases;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

Presentation

Operator

Ladies and gentlemen, thank you for standing by. My name is Natalia, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group Third Quarter 2018 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. (Operator Instructions) As a reminder, this conference is being recorded, Tuesday, October 30, 2018, and will be available for telephone replay beginning at 1:00 p.m. Eastern today until 11: 30 p.m. Eastern on Thursday, November 8, 2018. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Carlotta Chan. Please go ahead.

Carlotta Chan, Head of Investor Relations

Thank you, Natalia. Good morning and thank you for participating in our earnings call. Earlier today PSEG released earnings statements for the third quarter of 2018. These materials including the release attachments and accompanying slides detailing operating results by company are posted on the IR website at investor.pseg.com. Our 10-Q for the period ended September 30, 2018, will be filed shortly.

The earnings release and other matters we will discuss during today's call contains forward-looking statements and estimates that are subject to various risks and uncertainties. We will also discuss non-GAAP operating earnings and non-GAAP adjusted EBITDA, which differ from net income as reported in accordance with generally accepted accounting principles in the United States. Reconciliations of our non-GAAP financial measures and a disclaimer regarding forward-looking statements are posted on our IR website, and are included in today's slides and in our

Bloomberg Transcript

earnings release.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group. Joining Ralph on the call is Dan Cregg, Executive Vice President & Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions. Ralph?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Thank you Carlotta, and thank you all for joining us today.

PSEG reported solid results for the third quarter and through nine months. We are updating full year non-GAAP operating earnings guidance by narrowing the range to $3.05 to $3.15 per share, with an increased contribution from PSE&G, balancing lower expected results at PSEG Power and the Parent. The midpoint of our guidance remains unchanged and continues to represent a 6% increase above 2017 full year results.

This morning we reported net income for the third quarter of $0.81 per share, and non-GAAP operating earnings of $0.95 per share versus net income of $0.78 per share, and non-GAAP operating earnings of $0.82 per share in the year-ago period. Third quarter net income and non-GAAP operating earnings improved by 4% and 16% respectively over 2017's third quarter comparables. Our results for the quarter bring non-GAAP operating earnings for the nine months to $2.56 per share, an 8% increase over the $2.36 per share earned in the nine months ended September 30, 2017.

Slides 6 and 7 summarize the results for the quarter and the year-to-date periods. Throughout a very hot summer, both PSE&G and Power performed well. Therefore our financial results reflect solid contributions from both businesses. PSE&G's earnings increased by $0.05 per share, up 10% over third quarter 2017 results, driven primarily by continued investment in transmission and distribution programs, focused on increasing system resiliency and reliability. Warmer than normal weather increased electric demand for air conditions throughout an extended summer that was the second hottest in nearly half a century. Expanded investment in transmission and distribution infrastructure continues to benefit customers and have a favorable impact on PSE&G's rate base and earnings.

We are on pace to spend $2.8 billion for the year and the utility's rate base is forecasted to grow to almost $19 billion at year-end. Based on our various investment programs, we remain comfortable with PSE&G's ability to achieve growth in rate base within our forecasted 8% to 10% per year for the 5-year period ending in 2022. We have made significant progress to date in our regulatory and policy partnerships. PSE&G recently filed several Clean Energy Future investment programs totaling $3.6 billion over six years. These filings continue the alignment of PSE&G's capital investment plans with New Jersey's energy policy goals by advancing a broad range of programs in Energy Efficiency, Electric Vehicle Infrastructure and Energy Storage. The inclusion of what we are calling Energy Cloud or AMI is consistent with the BPU's recommendations for improving storm response following the March 2018 nor'easters in which they directed each utility to submit a plan and cost benefit analysis for the implementation of AMI, focusing on reducing customer outages and outage duration.

PSE&G's filing is designed to create an advanced technology network and upgrade 2.2 million electric meters to smart meters by the year 2024. In addition, Energy Strong II, the proposed $2.5 billion 5-year extension of our infrastructure reliability and resiliency investment program is pending at the BPU. Inclusive of the AMI initiative, PSE&G's 2018 to 2022 capital spending forecast range is $12 billion to $16 billion.

I now want to bring you up-to-date on PSE&G's distribution base rate case proceeding. As you may be aware at its regular meeting yesterday, the New Jersey Board of Public Utilities approved the settlement agreement between PSE&G, BPU staff and Rate Counsel. This concludes the utility's first distribution rate review since 2010, and is expected to provide PSE&G's customers with rate stability while allowing us to achieve three important outcomes: First, to recover investments made outside of clause mechanisms since 2010; second, to recover deferred storm costs; and third, to set revenues which reflect our current sales and O&M levels.

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-14396

The terms of the agreement provides for an additional $212 million in annual revenue, and a flow back to customers of $225 million in tax savings largely due to tax reform, resulting in a net $13 million revenue reduction. When new distribution rates go into effect on November 1, a typical combined residential customer build will be at levels that are 30% lower than they paid in 2008 in nominal terms and 40% lower in real terms.

The updated revenue requirements based upon the distribution rate base of $9.5 billion, a return on equity of 9.6% and a 54% equity ratio, all of PSE&G's distribution investment programs will adopt the new ROE of 9.6% and equity percentage of 54% going forward. PSE&G's decoupling proposal was not adopted in the settlement. Decoupling of electric and gas distribution revenue from sales volumes and demands remains an essential element of larger scale energy efficiency investments. New Jersey's energy efficiency savings goals outlined in legislation passed last May require utilities to reduce customers annual electric and gas consumption by 2% and 0.75% respectively, and also provides for lost revenue recovery. We refiled our decoupling proposal as part of our Clean Energy Future filings, but we are open to other forms of timely lost revenue recovery.

Now let me turn my attention to PSEG Power. The Power's non-GAAP operating earnings increased 23% to $0.39 per share over 2017's third quarter comparable results, largely reflecting its lower corporate income tax rate and other tax benefits as well as a step up in capacity pricing this past June that will extend through May of 2019.

Despite favorable weather, higher natural gas prices rose more than electric prices, which negatively impacted Power's results. These changes in market conditions have contributed to a reduction in Power's expected 2018 non-GAAP operating earnings. Power continues to anticipate completion of its combined cycle gas turbine construction program with Bridgeport Harbor 5 expected online in 2019. Moreover, the addition of 1,300 megawatts of highly efficient capacity at Keys and Sewaren 7 earlier this year, leads the reconfiguration of Power's merchant suite as demonstrated by this quarter's CCGT production. The design of wholesale energy and capacity markets and with the current policies and mechanisms provide adequate recognition of the cost per generation to be available, continues to attract needed attention. We are proactively engaged with the Federal Energy Regulatory Commission and PJM on several fronts. PJM energy price formation proposals continue to be evaluated as part of a comprehensive solution to the challenges facing baseload units. FERC is expected to issue an order by year end on its pending fast start proceeding and PJM anticipates implementation in 2019. We await other price reform filings at PJM such as the operating reserve demand curve enhancements and the spending reserves. But we don't expect PJM will reprioritize those efforts until after it implements fast start. Getting energy prices right is critical to ensuring efficient investment and market exit for generation assets.

Power continues advancing efforts to preserve its nuclear asset base. The BPU has begun implementation of New Jersey's Zero Emissions credits law signed by Governor Murphy this past May. We recently filed comments and responses to the BPU on the application and selection process for the New Jersey's ZEC as we refer to them. The BPU held three public hearings early in October, and an order establishing the ZEC application process is expected in November. In December, Power anticipates submitting applications for all three of its New Jersey nuclear plants, and we'll make the certification that the units will shut down within three years in the absence of a material financial change.

In June 2018 FERC issued an order of finding that PJM's current capacity market is unjust and unreasonable and establish the proceeding to evaluate potential reforms. PSEG submitted comments in early October recommending the status quo remain in place. Within the alternatives, we support PJM's capacity redesign proposals of a minimum offer price rule with few or no exemptions, which is consistent with FERC's direction and the resource carve-out option for supported resources subject to the MOPR.

The ZEC law recognized that energy and capacity payments -- again I'm referring to the New Jersey's ZEC law, were not sufficient to compensate nuclear units for the carbon attributes they provide, and that ZEC were additive to energy and capacity payments. We have initiated discussions on how the state can put in place a structure under existing laws to support nuclear resources in a redesigned PJM capacity market using the existing BGS mechanism. We continue to believe that this option requires no new legislation, and equally importantly places no additional burdens on customers. We will continue to advocate our views to establish a market design that satisfies FERC and that

final

accommodates state interest in resource procurement with key attributes, while ensuring that price suppression is addressed.

A strong legal foundation has been established for state action to preserve generating assets critical to meeting a state's initial and related goals. New York and Illinois have recently received appellate court affirmations from the Second and Seventh Circuit Court of Appeals, respectively, concluding that those states have the authority to implement their ZEC program setting a positive legal precedent for New Jersey. We remain focused on the successful execution of our key policy and regulatory initiatives to provide our shareholders with greater assurance of PSEG's ability to meet our financial objectives for returns and growth. PSEG continues to perform at high levels, safely operating the system throughout a very hot summer, which is a testament to the dedication of our 13,000 associates in New Jersey, New York, Maryland and Connecticut.

With that, I will turn the call over to Dan to discuss our financial results in greater detail, and I'll rejoin for your questions after he is finished.

Daniel Cregg, Executive Vice President & Chief Financial Officer

Great. Thank you, Ralph and thank you everyone for joining us on the call today.

As Ralph said, PSEG reported net income for the third quarter of 2018 of $0.81 per share, and that's versus net income of $0.78 per share in the last year's third quarter. Non-GAAP operating earnings for the third quarter of 2018 were $0.95 per share versus non-GAAP operating earnings of $0.82 per share in last year's third quarter. And reconciliation of non-GAAP operating earnings to net income for the quarter and nine months can be found on slides 6 and 7.

We've also provided you with a waterfall chart on slide 11 that takes you through the net changes in quarter-over-quarter non-GAAP operating earnings by each business, and a similar chart on slide 13 provides you with the changes in non-GAAP operating earnings by each business on a year-to-date basis. And I'll now review each company in more detail, starting with PSE&G.

PSE&G reported net income of $0.54 per share for the third quarter of 2018, that's compared with $0.49 per share for the third quarter of 2017. Results for the quarter are shown on slide 15. Net income growth in the third quarter was driven by continued investment in transmission and electric and gas distribution facilities, as well as the impact on sales of weather conditions which were substantially warmer than both the year-ago quarter as well as normal conditions.

Returns on PSE&G's expanded investment in transmission added $0.02 per share to net income in the quarter. Incremental revenue associated with recovery of PSE&G's Energy Strong and the Gas System Modernization Program added $0.02 per share. Favorable weather comparisons year-over-year added $0.03 per share, and higher volume and demand added $0.01 per share. Changes to the accounting treatment of the non-service component of pension and other post-retirement benefits or OPEB expenses, resulting in a favorable $0.02. And these positive items were partially offset by an increase in operating and maintenance expense of $0.02 per share, driven by higher corrective maintenance work, higher depreciation expense of $0.02 per share reflecting higher plant balances and higher interest taxes and other of $0.01 per share.

As Ralph mentioned, electric sales reacted favorably to hot summer weather, and actual sales increased by 6% over 2017's mild third quarter. The THI or temperature-humidity index was 35% greater than in the year-ago quarter, and 25% warmer than normal. PSE&G reached the 2018 system peak of 9,978 megawatts compared to 2017 system peak of 9,567 megawatts. On a trailing 12-month basis, weather normalized electric sales were flat year-over-year. And gas sales on a similar basis increased 1.9%, led by the commercial sector and strong second quarter results.

The conclusion of PSE&G's distribution rate review achieved several regulatory priorities, mainly the recovery of non-investments made since 2010 outside of the programs with cost base recovery. In addition to the recovery of deferred storm cost dating back to 2011 and a true-up of sales end cost estimates. New rates are based upon the distribution rate base of $9.5 billion, a return on equity of 9.6% and a 54% equity ratio. We are pleased that the settlement recognized the need to maintain solid utility credit metrics, following the negative cash impacts that resulted

final

Bloomberg
SI-SSA-0015-14398

from tax reform in 2017 as PSE&G's financial flexibility is essential to providing reliable service at the lowest cost. Going forward, PSE&G's distribution investment programs will adopt a new ROE rate and equity percentage established in the settlement agreement. As Ralph mentioned, the net $13 million revenue reduction takes into account an additional $212 million in annual revenues, including storm cost recovery and an increase in depreciation expense, as well as a flow back to customers of $225 million in tax savings, largely due to tax reform. PSE&G customers will benefit from $262 million in annualized rate reductions to reflect savings from federal tax reform enacted in 2017.

PSE&G filed two updates earlier this month to its Formula Rate for transmission at the Federal Energy Regulatory Commission. The first was an annual update reflecting our planned capital improvements with a focus on system reliability, and that provides for a $100 million increase in annual transmission revenues. The second filing adjusts our Formula Rate to provide a refund of our excess deferred income taxes due to federal tax reform, resulting in a refund of over $150 million. Both of these changes are expected to be effective January 1, 2019.

Our distribution infrastructure programs, Energy Strong and GSMP continue to perform as expected. The combined annual revenue increase for the full year 2018 from these two programs is forecasted to be approximately $53 million as we near completion of the first GSMP in Energy Strong programs. Once GSMP II begins, gas rates will adjust in December and June of each year. PSE&G has invested approximately $2.3 billion for the nine months ended September 30 in electric and gas distribution and transmission capital projects. For the full year, PSE&G expects to invest approximately $2.8 billion on increasing system reliability and resiliency, upgrading critical infrastructure, and supporting New Jersey's energy policy goals. We continue to expect rate base growth at a CAGR of 8% to 10% over the 2018 to 2022 period. For the full year we've increased PSE&G's forecast of net income for 2018 to reflect the impact of higher sales margins largely due to weather with the range now forecast to be $1,055 million to $1,070 million, up from a $1 billion to $1,030 million.

Now let's turn to Power. PSEG Power reported net income of $125 million or $0.25 per share for the third quarter of 2018 compared with net income of $136 million or $0.27 per share in the year-ago quarter. Non-GAAP operating earnings were $0.39 per share for the third quarter of 2018 compared to non-GAAP operating earnings for the third quarter of 2017 of $0.31 per share. Non-GAAP adjusted EBITDA for the third quarter of 2018 was $360 million versus non-GAAP adjusted EBITDA for 2017 of $356 million. Non-GAAP adjusted EBITDA excludes the same items as on non-GAAP operating earnings measure as well as income tax expense, interest expense and depreciation and amortization.

The earnings release and slide 21 provide you with detailed analysis of the impact of Power's non-GAAP operating earnings quarter-over-quarter. We've also provided you with more detail on generation for the quarter and the first nine months of the year on slides 22 and 23. Power's net income in the third quarter was impacted by a decline in average energy hedged prices and lower realized margins despite the effect of warmer-than-normal weather on demand and output. During the quarter, non-GAAP operating earnings comparisons increased $0.05 per share as a result of the higher capacity prices in New England and PJM. The increase in capacity prices occurred on June 1, 2018, and will run through May 31st of next year.

Recontracting of hedges at lower prices and the market impact of lower spark spreads in PJM East reduced results by $0.10 per share compared with the third quarter of 2017. Power experienced a $7 per megawatt hour decline in its average hedged energy price during the third quarter, which is consistent with our expectations for the full year. The impact of placing the Keys and Sewaren combined cycle stations and service along with higher demand boosted generation volumes by $0.06 per share. Higher O&M expense of $0.01 per share reflects new units start up expenses at Keys and Sewaren, and higher depreciation of $0.02 per share and a higher interest expense of $0.02 per share, both relate to the new combined cycle units placed in service versus a year-ago quarter. And these impacts will continue to affect year-over-year comparisons in coming quarters given the in-service of Keys, Sewaren and ultimately Bridgeport Harbor 5 next year.

A reduction in the corporate tax rate from federal tax reform combined with the impact of less taxes due year-over-year from lower pretax income, improved net income comparisons by $0.07 per share. The anticipated benefit from the re-measurement of tax reserves associated with the nuclear carryback claim and the closure of IRS

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-14399

audits for the year 2011 and 2012 added $0.06 per share compared to year earlier results. These tax benefits were slightly offset by a $0.01 per share impact related to a newly enacted New Jersey surtax.

Now let's turn to Power's operations. Output of Power's generating stations increased 24% in the quarter, reflecting the higher output of the combined cycle fleet with Keys and Sewaren in commercial operation. Power's gas-fired combined cycle fleet operated at an average capacity factor of 68% and produced 7 terawatt hours of output during the third quarter of 2018, up by 88% over the year-ago quarter, primarily reflecting the production of the two new units. Pennsylvania coal generation output also improved to 1.3 terawatt hours and operated at 79% capacity factor in the quarter. For the year-to-date period, Power's nuclear fleet operated at an average capacity factor of 93%, producing 23.7 terawatt hours and representing 57% of Power's total generation.

Gas prices improved in the third quarter on low storage levels and weather-driven demand, but Power prices didn't move up in conjunction with gas putting pressure on Power's spark spreads. Power's forecast of total output for 2018 has been raised modestly to 54 terawatt hours to 56 terawatt hours from last quarter's reduced estimate of 53 terawatt hours to 55 terawatt hours. For the remainder of 2018, Power has hedged 80% to 85% of total forecasted production of 13 terawatt hours to 15 terawatt hours at an average price of $37 per megawatt hour. For 2019, Power has hedged 70% to 75% of forecasted production of 58 terawatt hours to 60 terawatt hours at an average price of $36 per megawatt hour. For 2020, Power has hedged 40% to 45% of output forecasted to be 62 terawatt hours to 64 terawatt hours at an average price of $36 per megawatt hour. The forecasted output for 2018 to 2020 includes generation associated with Keys and Sewaren, as well as the mid-'19 commercial startup of the 485 megawatt gas powered combined cycle units at Bridgeport Harbor.

In addition, Power has decided to exit the retail electric marketing business after determining it would not provide a material enhancement to its hedging activity. Power has therefore ceased taking on new customers but will continue to meet all obligations to existing customers through the end of their contracts. Our forecast of Power's non-GAAP operating earnings for 2018 and non-GAAP adjusted EBITDA has been updated to $465 million to $500 million, and $1,045 million to $1,100 million respectively, from $485 million to $560 million, and $1,075 million to $1,180

million, respectively.

Now turning to PSEG Enterprise and other. Reported net income of $9 million or $0.02 per share for the third quarter of 2018 compared to net income of $13 million or $0.02 per share for the third quarter of 2017. The decrease in net income year-over-year reflects higher interest expense at the Parent, partially offset by lower taxes and other items. The forecast of PSEG Enterprise and other's full year 2018 non-GAAP operating earnings has been reduced to $25 million from $35 million reflecting those higher interest costs.

PSEG closed the quarter ended September 30th with $88 million of cash on its balance sheet with debt at the end of the quarter representing approximately 51% of consolidated capital. And Power's debt at the end of the quarter represented 34% of capital. In September, PSE&G issued $325 million of five-year 3.25% medium term notes and $325 million of 10-year 3.65% medium term notes. And PSE&G also retired $315 million of 2.3% medium term notes at maturity. And as Ralph mentioned, we narrowed our guidance for full year 2018 non-GAAP operating earnings to $3.05 to $3.15 per share, while maintaining the midpoint of guidance at $3.10 per share.

And with that, Natalia, we are now ready to take questions.

Questions & Answers

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. (Operator Instructions) And your first question is from the line of Praful Mehta from Citigroup.

Praful Mehta, Analyst

Hi guys.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Hi, Praful.

Praful Mehta, Analyst

Hi. So may be a specific question on the quarter for us and then we'll get to all the market reforms that taking place. But starting with slide 24 where you highlight gas prices went up and that's what pushed up your fuel costs. I wanted to understand why that didn't drive up Power prices as well? I mean, really that implies some reduction in the spark spread and wanted to understand why heat rates have been coming down? So some color on that that would be helpful.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Right. So there is a strong correlation, obviously, Praful, between gas and electric prices, but it's not perfect. One can only assume that there was some dispatching of coal that took place that keep a little bit of lid on those power prices from moving perfectly in tandem. Dan, I don't know if you want to add to that?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yeah. I also think that the sourcing of gas matters as well and Leidy has been a very low cost source of gas for us and we saw a little bit of an uptick in Leidy prices, and Leidy doesn't necessarily drive all of the electric prices that we end up seeing. So depending upon what units are running, where the source of the gas is, you can see some different gas prices coming through. And I think the magnitude of gas that was used during the summer for gas generation as well as coming out of a winter where storage levels were low, it pushed gas up a little bit more for some of our units compared to what we saw from an electric pricing standpoint.

Praful Mehta, Analyst

Got you. That's helpful. And so do you see this as a permanent kind of issue or is this something that happened more this quarter but it's not more of a permanent issue?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

We never try to out guess the price curve, Praful, but we are seeing that with the opening of some pipelines that are taking Marcellus gas to regions other than the Eastern region that the basis differential between Leidy and Henry Hub is changing with prices coming up in the region. Stronger pricing in M3, and if you believe historic correlations that should ultimately be reflected in Power prices, but -- and forward curve is predicting -- whatever it's predicting right now.

Praful Mehta, Analyst

Got you. Understood. And then quickly just going onto the market reform side, especially around capacity prices and capacity reforms, given all the different proposals out there, Ralph, where do you see capacity -- this whole capacity

final
Bloomberg Transcript

reform process going? Do you see any downside risk to capacity prices through all this? And how do you see the BGS auction kind of fitting in from a legal perspective?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

So again, what we keep anchoring ourselves to is what FERC has filed in terms of their policy objectives, which is, A, to remove price suppression; and B, to allow states to do what they want to from a point of view of resource designation. As I think I mentioned, our preference is the status quo but not withstanding an ability to preserve that status quo we think that PJM's offered an intelligent alternative. There are some things we would quarrel with perhaps their cutoff at the 20 megawatt level versus FERC's guidance that any at all subsidized units should be subject to reform. But if you look at the approach PJM has suggested, it does point to higher capacity prices for unsubsidized units, all other things being equal. And as you know, Praful, there are many other factors to consider. There's transmission transfer capability, there's demand management, there is how different local delivery areas breakout, but nonetheless when you remove supply, which is what PJM is proposing to do, from the setting of price, that should -- that without changing demand, as I said, all the things being equal, that should remove the price suppression for unsubsidized units. And that will set a different market price. It’s hard for me to see how that will be a lower market price.

And as we pointed out, the ZEC legislation in New Jersey has recognized that the zero emission credit payment was for the carbon attributes of nuclear and was additive to the energy and capacity price, and the BGS auction clearly states that energy -- electricity will be secured at prevailing market rates for both energy and capacity. So we think -- and certainly the output from 30 terawatt hours of nuclear, which is what the New Jersey ZEC law targets, is well within the capacity of the overall need of BGS. I use the word capacity in the generic sense not in the industry sense of the word.

So I do think BGS can use up or consume or call for the 30 terawatt hours of nuclear at prevailing market prices for energy and capacity without any need for legislation, which would just be a win all around, right? And FERC get its way, New Jersey get its way, and nobody -- the customers are not burdened any more than was originally envisioned in the legislation, and in fact will achieve the savings that were envisioned in the legislation if the plants were tonot operate.

Daniel Cregg, Executive Vice President & Chief Financial Officer

And just one reminder as well, Praful, as you think about, it's the next three capacity auctions have -- the next three years I should say, the capacity auctions have happened already. And what we will anticipate this coming April will be determination related to ZEC for those same three years. So this all that we're talking about is an important effort that's got to go on, and the next thing to look forward, reply comments are due on the 6th of November, but this will all impact the period after those three years.

Praful Mehta, Analyst

Got you. Very helpful color guys. Thanks so much.

Your next question is from the line of Julien Dumoulin-Smith with Bank of America.

Julien Dumoulin-Smith, Analyst

Hey, good morning.

final
Bloomberg Transcript
Bloomberg

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Good morning, Julien.

Daniel Cregg, Executive Vice President & Chief Financial Officer

Good morning, Julien.

Julien Dumoulin-Smith, Analyst

Hey, so Ralph to follow-up on Praful's question. Just going back to the forward hedges that you all disclosed in your slides, I mean obviously you had some impacts on sparks here in the latest quarter. Can you elaborate? Is that reflected in your expectations of realized energy prices in the hedges at this point? Or is it too much of noise?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Yeah. I mean, to the extent that hedges were put on during that period, you would see it in the hedges. And as you know, we have kind of a mix within the intermediate combined cycle section of the overall fleet of some elements that are open and some that are hedges. But to the extent that those hedges are put on, I'd say, the only difference really is that, you're going to see the effect coming through the forward markets as opposed to just in the real-time and day ahead markets, but it's been a consistent phenomenon across both.

Julien Dumoulin-Smith, Analyst

Got it. But may be to be clear about it, your expectations going forward with respect to what you saw transpire and spark spread in the latest quarter, I mean is this more of an acute issue that you saw during the quarter or how do you think about that from an ongoing impact?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Well, I think they are both shorter term and longer-term impacts, right? So if you think about a couple of things that Ralph and I already talked about, I've talked about having some more extreme weather in the summer, having some lower inventory levels that need to be bought in, which is going to have upward pressure on pricing. And Ralph talked about on the longer term that you see some takeaway capacity coming into the market that's going to have a longer-term effect. So I think you will continue to see both shorter term and longer term impacts -- impacting market prices.

Julien Dumoulin-Smith, Analyst

Got it. And did that have any bearing on the decision on the retail side at this point?

Daniel Cregg, Executive Vice President & Chief Financial Officer

No. The retail side was -- as you know Julien, always defensive on our part primarily targeted and trying to reverse some of the losses we've been realizing on -- from the point of view of wholesale market basis differentials.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14403

With the start of the Keys plant, with the strengthening of gas prices in the M3 zone, we've seen some decreased harm from basis to our fleet. And the margins were so thin on the retail business, as you know, I've never been a huge fan of it and we just decided that was not in our best interest to continue to pursue it.

Julien Dumoulin-Smith, Analyst

Got it. And then if could clarify the comments on capacity, it seems that you're thinking there is no need for legislation. Can you talk about timing for any potential, I suppose it would be a BPU-led effort to change BGS procurement relative to the implementation of MOPR. It would seem as if and you tell me if this is correct that there would not be application of MOPR for New Jersey next year and that would give you some runway to be able to implement for a 2020 auction?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

So remember, BGS typically follows the RPM auction in terms of the energy applicability. So the RPM auction that would have taken place in April but is now going to take place in August is input to the BGS auction that will take place in 2020. So we have plenty of time. And as Dan pointed out, for the next three years capacity prices are known, BGS has been layered in to the tune of 100% next year, two-third the year after, one-third the year after that, so the timing of all this is that the PJM proposal would only apply if we did get the ZEC. We will find out if you get the ZEC in April. And at that point in time, assuming we get the ZEC and assuming that the PJM proposal goes in as accepted, we have a full 10 months to get the BGS auction right. Of course we would do it much in advance, so that typically the LDCs put that comments in the fall for what BGS rule changes should take place if any in the following winter. So the way to think of this is, January FERC rules on the PJM proposal, we make comments shortly thereafter, FERC finalizes the RPM auction in the April time frame, we find out whether or not we get a ZEC in the same time frame, the auction takes place in August. In the fall. We -- if we are a ZEC recipient and if the auction has taken place, the MOPR approach we would file with other LDCs for BGS to be the entity that secures the nuclear energy and capacity for the following February. So that was a long-winded way of saying, I think the timing will work just fine.

Julien Dumoulin-Smith, Analyst

Excellent. Thank you all.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Hi, Greg.

Greg Gordon, Analyst

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14404

I'm sorry to circle back to Power. But I just wanted to see if maybe we could get a clarification on why we saw you lower the guidance range now, because to the extent that you knew you were hedged at lower prices, right, that was a known factor that impacted the guidance range, and there was only a small portion of your combined cycle and peaking generation that was open to the market. And even though we know spark spreads were lower, it doesn't seem like there's enough volume there on an open basis to swing your numbers by the magnitude that the guidance range was reduced. So can you just -- is it possible for you to be a little bit more granular on just how much of this was known and how much of this was unknown? Because going into the second quarter -- going into the third quarter from the second quarter, realized spark spreads were not very different from what the forward curve was telling us.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Yeah Greg, and you're right. So if you think about it as just a pure open volume and the delta on the open volume, you can have some impact, but it's not going to be as much as what you saw. I think that there's a couple other factors that are coming into play. One is that, just our volume amounts are down a little bit. So if you think about where we have them pegged at the beginning of the year and where they ended up, they are down about 1 terawatt hour. So we're down a little bit on volume.

And then the other factor is, some of the basis differentials that we end up seeing. And we have seen some lower eastern basis, we've talked about that a fair bit of late, and that comes through an awful lot of our hedges or not perfect hedges at the exact generator buzz where the generator is generating. To the extent that our hedges are at the West Hub, there is a little bit of an openness on that basis and we've seen some deterioration of the basis as well within the hedges. So I would point to those other factors as well to think about in addition to just the pure open position times at delta spark and the accumulation of those factors would get you to the delta that we're talking about.

Greg Gordon, Analyst

Okay. So that basis exactly what it caused you to move the Power to the Hub where you are hedged?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Right. So for instance if you think about our nuclear facilities, you got a lot of volume coming out of there but you don't have a lot of ways to transact at the nuclear location. So if you're going to put a forward sale on, for example, you might put in on at the Western Hub. And to the extent that you saw basis differential move between the Western Hub where your hedge was put on and where the actual generation is at nuclear, you're going to have some openness within a hedged amount of volume.

Greg Gordon, Analyst

Great. One last follow-up. The $0.06 that you booked on the mark-to-market associated with -- well I forgot exactly what it was, it was a pension or associated with the Nuclear Trust, was that an expected item or was that something that was an unexpected benefit in the quarter, the tax reserves?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yes. So what that is, that's not on the NDT, because you mentioned Trust, really what that is, is just a more generic tax issue, generic meaning that it's on the company's taxes as opposed to the NDT. And it's a carry back of losses back to an earlier year with higher tax rates. But the direct answer to your question was, yes that was expected.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14405

Greg Gordon, Analyst

Okay. So that was an unexpected gift that was in the guidance already?

Daniel Cregg, Executive Vice President & Chief Financial Officer

That's right.

Greg Gordon, Analyst

Thank you guys. Take care.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

And Greg, just to go back to your question about the quarter versus -- and Dan's accurate answer about some of the cumulative impacts. I mean at the risk of stating the obvious that when we initially give guidance at the beginning of the year, we give a range and we expect to be somewhere in the middle, otherwise we would bias them one way or another. And typically, within the second quarter we try not to change that, because it's still early, it's a half year to go. It's not unreasonable to assume that we saw some creep of Power, as Dan mentioned, in terms of the volume reduction towards the lower end of that range but still within the range and utility towards the upper end of that range but still in the range, and then the third quarter just resulting in the need to re-designate the ranges. So long-winded way of saying, I wouldn't assume that all of the movement in Power or for that matter utility occurred in the third quarter. That's not the case.

Greg Gordon, Analyst

Okay. Yeah, that was my intuition. I just wanted to make sure I understood it. I appreciate you clarifying. Thank you.

Operator

Your next question is from the line of Jonathan Arnold with Deutsche Bank.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Hi, Jonathan.

Hi, good morning guys.

Daniel Cregg, Executive Vice President & Chief Financial Officer

Good morning, Jonathan.

Jonathan Arnold, Analyst

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14406

Great. So just, I wanted -- along the lines of just where Greg was going. When we look at the fourth quarter guidance now for Power and where you were through the nine months, the low end suggest that you might have as low a quarter as a $20 million quarter in Q4. It just seems that that would be unusually low for you. So I'm just curious, is that some of the same issues that are working into Q4 as well or is there something else back Q4 that's kind of in the plan that we may be need to remember?

Daniel Cregg, Executive Vice President & Chief Financial Officer

No, I think you can just kind of do the math over where we are now and what the range would imply. And I think you'd be north of the number that you gave. But maybe one thing to keep in mind, there was some tax benefits that came through more of a onetime in the last year's fourth quarter. So if you just go against that as a comparison, you would have to carve out some of the one-time items as you look at the two quarters compared to one another. So it's something to keep in mind in that regard. But you do have a couple of shorter months in the fourth quarter and you also have a lot of the outages that are going during some of those shorter months. So you can some variability as you go year-to-year.

Jonathan Arnold, Analyst

Okay. And then on just -- could I ask on investment capacity? That slide was in the Analyst Day deck at somewhere sort of between I guess in the sort of high single hundreds of millions. And it was also in the September deck. And I guess with the rate case settlement and the transmission rate adjustments now in hand, is that still a good number or is there some -- is there an update there?

Daniel Cregg, Executive Vice President & Chief Financial Officer

So we'll update that at EEI in a week or so, Jonathan rather than trying to give that piece here today.

Jonathan Arnold, Analyst

Okay. Well I guess we'll see you then. Thank you guys.

Operator

The next question is from the line of Christopher Turner with JP Morgan.

Christopher Turner, Analyst

Good morning. I think Ralph in your prepared remarks you mentioned the importance of decoupling to your long-term plan and New Jersey customers. Can you give us a sense as to what kind of might have been missing from the negotiations with intervenors, and if there's any kind of partial agreement heading into your energy future filing?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Yeah, Chris. First of all, I can't give you the details, there's a settlement discussion, because those are all confidential. We can give you details on the outcome of that. However, it's not -- it won't come as a surprise to you to know that the principles in a base rate case are different than the principles, and I'm referring to participants here than in a strictly energy-efficiency conversation. So the Clean Energy Future filings will have a greater percentage of people who are

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14407

interested in seeing that the green energy agenda of Governor Murphy being advocated and pushed forward, and that will therefore have the kind of center stage that's appropriate to it which may not have been more expected in the base rate filing.

Christopher Turner, Analyst

Okay. That's helpful. And could you give us a sense as to what some of the other mechanisms might be there if it's not an outright decoupling that mechanism?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

I'd rather not go into that now since we haven't even sat down and gotten discovery questions from the other parties. But there's all sort of stuff that one can do to get contemporaneous type recovery of both investments being made as well as trueing up for what might have been anticipated to the revenues versus what's realized in revenues either in six months or annual filings or things of that nature.

Christopher Turner, Analyst

My second question was on weather versus normal on the utilities side. Can you quantify that for the quarter or the year-to-date? And then just related on the corporate side, anything changed versus your original plan there other than just the interest rate on new debt?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yeah. So I can point you to the slides. If you take a look, you've got a breakout both of weather in particular as well as on volume, and demand sometimes can come into play there. So on the weather for the year-to-date for the utility, you can see we had about $0.04 delta, three of that in the quarter, and volumes and demand about $0.02 year-to-date and about $0.01 in the quarter. So you can see it broken out pretty cleanly within the slides that we provided.

And then your question on interest, basically what we're seeing mainly at the Parent is just the increase in some of the shorter term debt that exists up there as we've stepped through the year, which has put a little bit of pressure on the aggregate numbers at the Parent.

Christopher Turner, Analyst

Okay. And then just on those weather numbers, where those year-over-year or where those versus normal?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Those were year-over-year.

Christopher Turner, Analyst

Okay. Any sense as to versus normal or is that something we could take offline?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14408

Daniel Cregg, Executive Vice President & Chief Financial Officer

It's pretty close. I think you might have seen just a little bit of an uptick because 2017 summer was a little bit milder, but they are almost the same if you take a look at versus last year versus looking at normal.

Christopher Turner, Analyst

Okay. Thank you.

Operator

Your next question is from the line of Michael Lapides with Goldman Sachs.

Michael Lapides, Analyst

Hey guys, thanks for taking my question. Real quick, if I go back to the Analyst Day and look at the PSE&G forecast capital spend, and then I think a little bit about some of the filings that you made in the last few months, how should we think about where you're tracking and whether you think you're likely above? What do you kind of highlighted back at the Analyst Day? I mean, the filings you've made are pretty large scale capital projects. Are you above where that would be if all of those come through? Are you kind of somewhere in that range? Just kind of walk us through how you're thinking about that right now.

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yeah. I mean, Mike I think that we have GSMP II approved in April and we had our conference in May, so that was a account for. And I think if you really look at the major areas that we were talking about, one was Energy Strong -- Energy Strong II I should say. In Energy Strong II, we talked about putting forth a $2.5 billion filing, and in June we put forth a $2.5 billion filing. And we said in May that we were going to put forth the Clean Energy filing of $2.9 billion, and those programs and the magnitude of those programs is -- were filed as we talked about with one exception, and Ralph talked about a little bit earlier today is the inclusion of AMI which was not in the filing at the time. So the programs that we filed aggregate to a capital investment of $3.6 billion versus the $2.9 billion, and you can attribute the full amount of that delta to the AMI component of that filing.

Now it's a 6-year program. So if you're trying to look at it within a 5-year horizon that we normally talked about -- that we talked about, you're going to have two issues, one six years is more than five, but number two, you're going to have some of that capital spill over the back end because it would not have been started at the beginning of 2018. And then similarly for Energy Strong II, it's a 5-year program. And since it was filed in 2018, then we won't see an approval of that until the process runs. You're going to have some more spill over there. But I think that's how you would think about the magnitude of the capital programs. And as we talked about at the time, the 8% to 10% CAGR on rate base growth really is simply with and without those two programs.

Michael Lapides, Analyst

Meaning the 10% assumes you get full approval of both of those of Energy Strong II and the Clean Energy filing? Or does that assume some -- something in the middle of what you asked for versus often where you see intervenor request come in at a slightly lower number?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14409

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yeah. It assumes approved as filed for the periods within that five-year period. And it also assumes that there is no other incremental programs for the balance of the five years. So if nothing else were to happen, but -- and we were to get every dollar as filed, we'd be at the 10%. Any reduction from as filed would lower that amount, and then anything else between now and then that is identified as incremental capital would be additive.

Michael Lapides, Analyst

Got it. And then one last one. How are you looking at the potential changes to transmission spend over the next three to five years versus what you laid out? I mean, if I go back over time, what you laid out in the Analyst Day for years three and years four and beyond, the number is actually usually as you rolled for a year or two came in higher as PJM recognized incremental needs or as you recognize an incremental needs as you kind of got closer to those years occurring. How are you thinking about it now relative to what you put out back in at the Analyst Day?

Daniel Cregg, Executive Vice President & Chief Financial Officer

So is the question how does our forecast differ from our forecast?

Michael Lapides, Analyst

Well, little bit of -- are you seeing incremental opportunities that may not have been embedded in the forecast?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yeah. I think we're a few months away from when we put that forward and it's still how we are characterizing the five-year capital plan at this time.

Michael Lapides, Analyst

Okay. Last item, a little bit housekeeping. O&M at the utility year-over-year and sequentially it was up a double-digit percentage. How much of that drops to the bottom line, meaning I'm just looking at the quarter.

Daniel Cregg, Executive Vice President & Chief Financial Officer

So you're talking about for the quarter for PSE&G, the $0. 02 incremental O&M?

Michael Lapides, Analyst

Yes.

Daniel Cregg, Executive Vice President & Chief Financial Officer

All of that $0.02 drops to the bottom line, if that's your question.

final
Bloomberg Transcript

Daniel Cregg, Executive Vice President & Chief Financial Officer

Thanks.

Operator

Your next question is from the line of Paul Fremont with Mizuho.

Paul Fremont, Analyst

Thanks. Looking at fast start, I guess Exelon I think has put out estimates that would imply may be less than $2 per megawatt hour. And at your Analyst Day I think you were in the $1 to $3 range. Are you still at the same level in terms of where your -- what you're expecting in terms -- if fast start is adopted?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

So there's two schools of thought on this, right? Paul, one is that, in the aggregate fast start reserve margins in flexible units could be $3 to $5 with fast start being a significant down payment on that -- possibly in that $1 to $3 range. But the question is, what is the degree of at which the forward price curve already has incorporated that, if we believe that FERC is going to be issuing that decision fairly soon and PJM will be incorporating it in Q1. I don't know the answer to that, but that's the two considerations you have to make, right? So should fast start result to an increase? Absolutely. Is it already in the forward price curve? Depends on your confidence in the timing of the FERC decision.

Paul Fremont, Analyst

Great. Thank you very much.

Operator

Your next question is from the line of Shar Pourreza with Guggenheim Partners.

Shahriar Pourreza, Analyst

Hey, good morning guys.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Good morning, Shar.

Shahriar Pourreza, Analyst

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14411

You guys touched on most of the questions. Just real quick on the Clean Energy legislation versus what you proposed on slide 17. The storage mandate versus what you're proposing, correct me if I'm wrong, has incremental upside versus what your plan is?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Yes. I think the storage goal is like 600 megawatts by 2025 or something like that. And it's a big number. And we proposed 35 megawatts. So yes, there is upside there.

Shahriar Pourreza, Analyst

Would that be within -- is that a backend loaded or when do you think you will figure that out as far as how we should

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

One of the conversations we've been having with the policy leaders is that, most of these technologies and battery storage is a great example, is something that we do believe has a healthy trajectory in terms of prices coming down in the future. So you want to both stimulate the market price, same token, you don't want to pay for that market in its entirety upfront. So there's a little bit of a delicate timing of how much you do and when you do it, that is in iterative conversation that we do have with policy leaders both in the BPU and within the Governor's office on the legislation.

Shahriar Pourreza, Analyst

And then Ralph just on -- one of your peers is out talking about $5 to $10 per megawatt hour of incremental cost when you layered in with wind or sort of solar on two to four hours of sort of storage. Are you seeing figures like that or seeing higher figure? Because if you use two to four, it seems like you could probably get something that's economically viable, right?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Yeah. On the -- I'm used to coating it in terms of capacity. And the number we use is $2 million to $3 million per megawatt. I'd have to work it backwards to see if I get to that $3 to $5 per megawatt hour, and I'd rather not do that in real time, which is, Shar, but I will take that as a homework assignment.

Shahriar Pourreza, Analyst

Okay. Great. I'll bother again later. And then just lastly, what's your -- no problem. What drove the lower capacity factors on your new gas assets for the third quarter?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Was it a Hope Creek outage? Was it the 100% ownership of Hope Creek?

Daniel Cregg, Executive Vice President & Chief Financial Officer

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14412

Nuclear capacity factor was at 93%, it was nothing more than a Peach outage that's all.

Shahriar Pourreza, Analyst

Okay, got it. Okay. Thanks guys. Sure I think Dan I'll follow-up with you after the call.

Daniel Cregg, Executive Vice President & Chief Financial Officer

Thank you.

Operator

Your next question is from the line of Angie Storozynski with Macquarie.

Angie Storozynski, Analyst

Thanks. So two questions. One, FERC has just updated its ROE -- its transmission ROE methodology now, but there also seems to be some discussion about may be changes to transmission ROE adders. What they should be actually related to? And I mean, what are your expectations about how those ROEs will be trending and if your existing projects will be impacted?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

So Angie, we're following the discussion -- as we understand it ROE adders and incentives have not been ruled on yet. We do have a rising interest rate environment, and the three methodologies that FERC are using, all due then lead to a discussion about how does each specific company and its risk profile sit within the range predicted by those three methodologies. So I'd say that, the ingredients to the stew are getting a little bit better known, but what the stew comes out tasting like still remains to be understood going forward.

Angie Storozynski, Analyst

Okay. And then for the equity layer at the utility under the rate case settlement or decision is now going to be 54%. I think you mentioned at the end of the quarter, it was 51%. So I mean, should I expect that there's going to be additional equity injection into the utility? And is it going to come from basically corporate level debt?

Daniel Cregg, Executive Vice President & Chief Financial Officer

No Angie, our 51.2 percent was the stated rate from the last rate case, and our existing equity percentage was somewhere between 53%, 53.5%. So that delta is not as big as you might otherwise think, and just general corporate funds would fund that delta.

Angie Storozynski, Analyst

That's great. Thank you.

Your next question is from the line of Andrew Weisel with Scotia Howard Weil.

Andrew Weisel, Analyst

Hey, thanks for squeezing me in. And I guess, good morning or past the hour here. Quick first one, on the PSE&G guidance for the year, the midpoint essentially went up by $0.10 on an EPS basis. When I look at the year-to-date weather benefit versus normal, that was only about $0.03. So what else is taking you ahead of the plan? And would any of that be sustainable to benefit future years?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yeah. I think in addition to the area that just labeled whether you've also got some volumes and demands which will give you probably another $0.02 or $0.03 or so. And then there's a couple of other modest items that would end up moving it north of that. So I think two things for you. One is, layer in the volume and demands incrementally to the weather amounts, which also tend to be fairly weather-related. And then you think about a couple of other smaller adjustments and you can get to that range.

Andrew Weisel, Analyst

Okay. The smaller adjustments should we think of that a sort of one-time or would that carry through?

Daniel Cregg, Executive Vice President & Chief Financial Officer

I think more of one-time than not.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

I think one of the most -- I was just, there is maybe a little bit conservative on the timing of the rate case.

Andrew Weisel, Analyst

Oh, I see. Okay. Good. Then the other question I had on the AMI. You mentioned there is a reaction to the March storms and improving reliability. My question is, can you remind us the history in the state? I believe the BPU chose not to continue a pilot program at one of your neighbors and they instead asked you to the utility to file for cost benefit analysis. I guess my question is, is it a little premature to file for the $700 million program now? And how comfortable are you that it will be approved as part of the CEF filing?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

final
Bloomberg Transcript

Bloomberg
SI-SSA-0015-14414

We definitely do not think it's premature. There is a moratorium as you correctly pointed out Andrew, and -- but we think that there's a couple of factors that are materially different. One is the BPU announcement seeking the cost-benefit analysis and the concern over outages. You are right. But the second is this huge initiative that the Governor has embarked upon to really push forward on a Clean Energy agenda. And the value of information that one can extract from Advanced Metering Infrastructure to help customers use their energy more intelligently, translation, reduce their energy consumption is I think an important consideration for policymakers in achieving what the Governor has outlined as his priorities.

Andrew Weisel, Analyst

Okay. And just to clarify, I believe this is the case, but it's certainly possible that the CEF could be approved without that. In other words it's not a package deal. The pieces could be treated individually, so it might end up looking like what you had talked about at the Analyst Day. Is that right? Is that a possibility?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yes. That's correct. We didn't go into details, but we did -- the CEF is really three separate filings that were all put in at the same time. But that's correct.

Andrew Weisel, Analyst

Okay. Thanks everyone.

Operator

We have reached the allotted time for questions. Mr. Izzo or Mr. Cregg, please continue with any closing remarks.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Okay. Well thank you there. So hopefully the take away from this call was that the Utility and Power both have had some solid operating performance in terms of our traditional hallmark attributes, our reliability, our availability. The financial performance is on track albeit with a much stronger performance at the Utility and weaker performance at Power than had been anticipated at the start of the year. And I would say that we look forward to seeing you in San Francisco in 10 days where we can discuss these and other issues more fully and enjoy Halloween. New Jersey has a famous Mischief Night coming up, hopefully none of you are victims of that. But with that, we'll see you in about 12 days. Thanks all.

Operator

Ladies and gentlemen, that does concludes your conference call for today. You may disconnect, and thank you for participating.

PSEG ANNOUNCES 2018 THIRD QUARTER RESULTS

$0.81 PER SHARE OF NET INCOME

Non-GAAP Operating Earnings of $0.95 Per Share

Updating Full-Year Non-GAAP Operating Earnings Guidance to $3.05 - $3.15 Per Share and Adjusting Subsidiary Contribution Ranges

NJBPU Approves PSE&G's Distribution Rate Case Settlement Agreement

(October 30, 2018 – Newark, NJ) Public Service Enterprise Group (NYSE: PEG) reported today Net Income for the third quarter of 2018 of $412 million, or $0.81 per share as compared to Net Income of $395 million, or $0.78 per share, in the third quarter of 2017. Non-GAAP Operating Earnings for the third quarter of 2018 were $481 million, or $0.95 per share, compared to non-GAAP Operating Earnings for the third quarter of 2017 of $417 million, or $0.82 per share.

Ralph Izzo, chairman, president and chief executive officer, said "PSEG's third quarter earnings benefited from continued investment in PSE&G capital programs and from lower corporate income taxes at PSEG Power. We have made significant progress to date in our regulatory and policy partnerships. PSE&G achieved several milestones including the recent Board of Public Utility Commission (BPU) approval of our distribution rate case settlement agreement. The BPU's approval of the rate case settlement concludes the utility's first distribution rate review since 2010, and is expected to provide PSE&G's customers with long-term rate stability. In addition, PSE&G filed three Clean Energy Future investment programs totaling $3.6 billion over six years -- Energy Efficiency, Electric Vehicle Infrastructure and Energy Storage, and Energy Cloud initiatives including Advanced Metering Infrastructure (AMI), all continuing the alignment of PSEG's capital investment plans with New Jersey's energy policy goals. Power placed the Keys Energy Center and Sewaren 7 power plants into service mid-year, and continues to target completion of the CCGT construction program with Bridgeport Harbor 5 in mid-2019. In addition, the BPU process to implement the Zero Emission Certificate (ZEC) program legislated in May is underway, with three public hearings concluded earlier this month."

The table below provides a reconciliation of PSEG's Net Income to non-GAAP Operating Earnings for the third quarter. See Attachment 10 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings.

PSEG CONSOLIDATED RESULTS (unaudited)
Third Quarter Comparative Results
2018 and 2017

	Income ($ millions)		Diluted Earnings Per Share

Net Income	$412	$395	$0.81	$0.78
Reconciling Items*	69	22	0.14	0.04
Non-GAAP Operating Earnings	**$481**	**$417**	**$0.95**	**$0.82**
		Avg. Shares	**507M**	**507M**

*See Attachment 10

Ralph Izzo went on to say, "throughout a very hot summer, both PSE&G and Power performed well and our results reflect solid contributions from both businesses. We are updating our non-GAAP Operating Earnings guidance for the year to $3.05 - $3.15 per share and adjusting the contributions from each of the businesses. Stronger sales mostly due to warmer than normal summer weather have lifted the utility's results above PSE&G's original guidance range to $1,055 million - $1,070 million, while power pricing has negatively impacted our forecast for Power's results, which are now expected to be in the range of $465 million - $500 million.

The following table outlines PSEG's updated expectations for non-GAAP Operating Earnings by subsidiary for 2018.

2018 Non-GAAP Operating Earnings Guidance
($ millions, except EPS)

	Original 2018E	**Updated 2018E**
PSE&G	$1,000 - $1,030	$1,055 - $1,070
PSEG Power	$485 - $560	$465 - $500
PSEG Enterprise/Other	$35 - $35	$25 - $25
Non-GAAP Operating Earnings	$1,520 - $1,625	$1,545 - $1,595
Non-GAAP EPS	$3.00 - $3.20	$3.05 - $3.15

E = Estimate

Non-GAAP Operating Earnings Review and Outlook by Operating Subsidiary

See Attachments 5 and 6 for detail regarding the third quarter and year-to-date reconciliations for each of PSEG's businesses.

PSE&G

PSE&G reported Net Income of $278 million ($0.54 per share) for the third quarter of 2018 compared with Net Income of $246 million ($0.49 per share) for the third quarter of 2017.

The improvement in PSE&G's net income for the third quarter reflects increased revenue from the ongoing transmission and distribution infrastructure investment programs and warmer summer weather that increased sales volumes over last year's mild third quarter. PSE&G's growth in Transmission investment added $0.02 per share to quarter-over-quarter comparisons. Recovery of

SI-SSA-0015-14418

investments made to enhance system resiliency under Energy Strong and Gas System Modernization Program I improved comparisons by $0.02 per share. Favorable weather comparisons year over year added $0.03. Changes to the accounting treatment of the non-service component of pension and other post-retirement benefit (OPEB) expenses resulted in a favorable $0.02 per share comparison over 2017's third quarter. These positive items were offset by an increase in operating and maintenance expense of $0.02 driven by higher corrective maintenance work, and higher depreciation expense of $0.02 per share reflecting higher plant balances.

The New Jersey economy continues to be positive, supported by improved employment and housing data. Electric demand benefited from warmer than normal temperatures and actual sales rose by 6.4% over last year's mild third-quarter results. PSE&G reached a 2018 system peak of 9,978 MW compared to 2017's system peak of 9,567 MW. The temperature-humidity index (THI) was 35% greater than in the year-ago quarter. Weather normalized electric sales for the trailing 12 months, which provides longer-term trending data, remained relatively flat while gas sales were 1.9% higher, led by demand from the commercial sector and strong second quarter results. Residential electric and gas customer growth continues to trend higher at approximately 1% per year.

PSE&G filed two updates to its Formula Rate for transmission at the Federal Energy Regulatory Commission (FERC) this past month. The annual update filing reflects our planned capital improvements with a focus on increasing system reliability, which results in a $100 million increase in annual transmission revenues. The second filing is to adjust our formula rate to provide a refund of our excess deferred income taxes due to federal tax reform, resulting in a refund of over $150 million in 2019. Both of these changes are expected to be effective January 1, 2019.

The BPU recently approved a settlement agreement between PSE&G and key participants in its distribution rate case, concluding the company's first base rate review in eight years. New rates go into effect on November 1. The terms of the agreement provide for an additional $212 million in annual revenues, including recovery of deferred storm costs, and a flow back to customers of $225 million in tax savings largely due to tax reform, resulting in a net $13 million revenue reduction. The updated revenue requirement is based upon a distribution rate base of $9.5 billion, a return on equity (ROE) of 9.6 percent and a 54 percent equity ratio. All of PSE&G's distribution investment programs will adopt the new ROE rate established in the settlement agreement. Thus far in 2018, PSE&G customers have benefited from $262 million in annualized rate reductions to reflect savings from federal tax reform enacted in 2017. As part of this settlement, PSE&G will provide a $28 million credit to customers covering the period prior to the April 1 BPU directive to flow through the benefits of a lower corporate tax rate. PSE&G's decoupling proposal was not adopted in the settlement, and has been refiled as part of the Clean Energy Future filings.

PSE&G also filed its Clean Energy Future programs (CEF) with the NJBPU. These filings will advance a broad range of investments in energy efficiency, electric vehicle infrastructure, energy storage, and the energy cloud, designed to create an advanced technology network and upgrade 2.2 million electric meters to smart meters. These proposed CEF investments total $3.6 billion over a six-year period. The filings are aligned with New Jersey's progressive energy policy goals. The centerpiece of CEF is the $2.5 billion energy efficiency program that would provide customers with access to savings opportunities from 22 energy efficiency programs, and supports the goals of Clean Energy legislation signed into law in May of this year, which requires utilities to reduce customers' annual electric and gas consumption by 2 percent and 0.75 percent, respectively.

SI-SSA-0015-14419

PSE&G invested approximately $2.3 billion for the nine months ended September 30 in electric and gas transmission and distribution capital projects. For the year, PSE&G currently expects to invest $2.8 billion of capital in its infrastructure.

PSE&G's forecast of Net Income for 2018 has been updated to reflect the impact of weather, with the range now forecast to be $1,055 million - $1,070 million.

PSEG Power

PSEG Power reported Net Income of $125 million ($0.25 per share) for the third quarter of 2018 compared with Net Income of $136 million ($0.27 per share) for the third quarter of 2017. Power's non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA for the third quarter of 2018 were $194 million ($0.39 per share) and $360 million, respectively, compared to non-GAAP Operating Earnings of $158 million ($0.31 per share) and non-GAAP Adjusted EBITDA of $356 million for the third quarter of 2017.

Power's Net Income comparison for the third quarter reflects a reduction in income tax expense as a result of tax reform and a step up in capacity prices in PJM and ISO-New England that was largely offset by increases in fuel costs, higher depreciation and interest expense.

The increase in the average capacity price realized by the PJM and New England fleet added $0.05 per share. The impact of placing the Keys and Sewaren CCGT stations in service, and higher demand boosted generation volumes by $0.06 per share. Re-contracting and market impact of lower spark spreads in PJM East reduced results by $0.10 per share compared with the third quarter of 2017. Higher O&M expense of $0.01 per share reflects new unit start-up expenses at Keys and Sewaren. Higher depreciation of $0.02 per share and higher interest expense of $0.02 per share both relate to the new CCGTs placed in-service versus the year-ago quarter. A reduction in the corporate tax rate from federal tax reform improved Net Income comparisons by $0.07 per share and the anticipated benefit from the re-measurement of tax reserves associated with a nuclear carryback claim and an IRS audit of 2011 and 2012 added $0.06 per share compared to year-earlier results. These tax benefits were slightly offset by the $0.01 per share impact related to a newly enacted New Jersey surtax.

As anticipated, total generation output improved as compared to the third quarter of 2017, reflecting the higher output of the combined cycle fleet with Keys and Sewaren in commercial operation. Power's gas-fired CCGT fleet operated at an average capacity factor of 68% and produced 7.0 TWh of output during the third quarter of 2018, up by 88% over the year-ago quarter primarily reflecting the production of the two new units. Pennsylvania coal generation output also improved to 1.3 TWh and operated at a 79% capacity factor in the quarter. For the year-to-date period, Power's nuclear fleet operated at an average capacity factor of 93%, producing 23.7 TWh and representing 57% of Power's total generation.

Power's forecast of total output for 2018 has been raised to 54 – 56 TWh from last quarter's reduced estimate of 53 – 55 TWh. For the remainder of 2018, Power has hedged 80% - 85% of total forecasted production of 13 – 15 TWh at an average price of $37 per MWh. For 2019, Power has hedged 70% - 75% of forecasted production of 58 – 60 TWh at an average price of $36 per MWh. For 2020, Power has hedged 40% - 45% of output forecasted to be 62 – 64 TWh at an average price of $36 per MWh. The forecasted output for 2018 – 2020 includes generation associated with Keys

SI-SSA-0015-14420

and Sewaren, as well as the mid-2019 commercial start-up of the 485 MW gas-fired CCGT at Bridgeport Harbor.

Power recently decided to exit the retail electric marketing business, having entered the business two years ago to complement its wholesale trading business and provide additional hedges for its generation. Power has concluded that retail electric marketing will not provide a material enhancement to its hedging activity. Energy Solutions has therefore ceased taking on new customers but will continue to meet all obligations to existing customers through the end of their current contracts.

The BPU has begun implementation of New Jersey's ZEC law. An order establishing the ZEC application process is expected to be issued in November. In December, Power anticipates filing its ZEC application for its three New Jersey nuclear units. Power estimates that if all three of its New Jersey nuclear units are selected, it could be eligible to receive ZEC revenues of approximately $200 million per year during each 3-year cycle.

In June 2018, the Federal Energy Regulatory Commission (FERC) issued an order finding that PJM's current capacity market is unjust and unreasonable and established a proceeding to evaluate potential reforms. Power submitted comments in early October largely supporting the PJM capacity redesign proposals, and will continue to participate in this proceeding.

The forecast of Power's non-GAAP Operating Earnings for 2018 and non-GAAP Adjusted EBITDA has been updated to $465 million - $500 million and $1,045 million - $1,100 million, respectively, reflecting lower realized margins from Power's portfolio.

PSEG Enterprise/Other

PSEG Enterprise/Other reported Net Income of $9 million ($0.02 per share) for the third quarter of 2018 compared to Net Income of $13 million ($0.02 per share) for the third quarter of 2017. The decrease in Net Income year over year reflects higher interest expense at the Parent partially offset by lower taxes and other items.

For 2018, the forecast of PSEG Enterprise/Other Net Income has been updated to $25 million, reflecting higher interest expense at the Parent.

#######

About PSEG:

Public Service Enterprise Group (NYSE:PEG) is a publicly traded diversified energy company with annual revenue of $9.1 billion in 2017. Its operating subsidiaries are: Public Service Electric and Gas Company (PSE&G), PSEG Power LLC, and PSEG Long Island.

SI-SSA-0015-14421

PSE&G is New Jersey's oldest and largest regulated gas and electric delivery utility, serving nearly three-quarters of the state's population. PSE&G is the winner of the ReliabilityOne Award for superior electric system reliability.

PSEG Power LLC is an independent power producer that generates and sells electricity in the PJM, New York and New England wholesale power markets.

Non-GAAP Financial Measures

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items such as the revaluation of deferred tax liabilities and the impact of the retirement of the Hudson and Mercer coal stations on Power.

Management believes the presentation of non-GAAP Adjusted EBITDA for Power is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization.

See Attachments 10 and 11 for a complete list of items excluded from Net Income in the determination of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA. The presentation of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe,"

SI-SSA-0015-14422

“expect,” “plan,” “should,” “hypothetical,” “potential,” “forecast,” “project,” variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third-party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations, and PSE&G’s ability to recover costs and earn returns on authorized investments;
- the impact of pending and any future rate case proceedings;
- risks associated with our ownership and operation of nuclear facilities, including regulatory risks, such as compliance with the Atomic Energy Act and trade control, environmental and other regulations, as well as financial, environmental and health and safety risks;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to recover the carrying amount of our long-lived assets and leveraged leases;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC) including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations;
- the impact of pending and any future rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to recover the carrying amount of our long-lived assets and leveraged leases;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

SI-SSA-0015-14437

GAAP Disclaimer

PSEG presents Operating Earnings and Adjusted Earnings Before Interest, Taxes, Depreciation and Amortization (EBITDA) in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Operating Earnings and Adjusted EBITDA are non-GAAP financial measures that differ from Net Income. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items. Non-GAAP Adjusted EBITDA excludes the same items as our non-GAAP Operating Earnings measure as well as income tax expense, interest expense and depreciation and amortization. The last three slides in this presentation (Slides A, B and C) include a list of items excluded from Net Income/(Loss) to reconcile to non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA with a reference to those slides included on each of the slides where the non-GAAP information appears.

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Management believes non-GAAP Adjusted EBITDA is useful to investors and other users of our financial statements in evaluating operating performance because it provides them with an additional tool to compare business performance across companies and across periods. Management also believes that non-GAAP Adjusted EBITDA is widely used by investors to measure operating performance without regard to items such as income tax expense, interest expense and depreciation and amortization, which can vary substantially from company to company depending upon, among other things, the book value of assets, capital structure and whether assets were constructed or acquired. Non-GAAP Adjusted EBITDA also allows investors and other users to assess the underlying financial performance of our fleet before management's decision to deploy capital. The presentation of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings and non-GAAP Adjusted EBITDA guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

These materials and other financial releases can be found on the PSEG website at www.pseg.com, under the Investors tab. From time to time, PSEG, PSE&G and PSEG Power release important information via postings on their corporate website at http://investor.pseg.com. Investors and other interested parties are encouraged to visit the corporate website to review new postings. PSEG STRATEGY: BUILDING A SUSTAINABLE, FINANCIALLY SOUND ENERGY INFRASTRUCTURE COMPANY

Ralph Izzo
CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER

PSEG
We make things work for you.

SI-SSA-0015-14440

PSE&G Represents **65%** of Non-GAAP Operating Earnings

4.7% Increase in 2018 Common Dividend

Promoting Sound Energy Policy

115 Years Investing in NJ's Critical Infrastructure

5–Year Investment Program Provides Opportunity for **8%-10%** CAGR in PSE&G Rate Base

PSEG

SI-SSA-0015-14441

Two strong businesses with a track record of success

Electric & Gas Distribution and Transmission

Strategy: Investments aligned with public policy and customer needs

Value Proposition: A $12 Billion - $15.5 Billion infrastructure program expected to produce **8%-10%** annual rate base growth through 2022

2017	Assets $29B Net Income $973M Non-GAAP Operating Earnings* $963M

Regional Competitive Generation

Strategy: Investment program enhances competitive position with addition of efficient, clean, reliable CCGT capacity

Value Proposition: Provides substantial free cash flow and upside from market rule improvements

2017	Assets $12B Net Income $479M Non-GAAP Operating Earnings* $505M

SI-SSA-0015-14442

ASSETS AND NET INCOME ARE FOR THE YEAR ENDED 12/31/2017. PSE&G AND POWER DO NOT ADD TO TOTAL DUE TO ENTERPRISE / OTHER ACTIVITY. *SEE SLIDE A FOR A RECONCILIATION OF NET INCOME TO NON-GAAP OPERATING EARNINGS, SLIDE B FOR RECONCILIATIONS FOR PSE&G AND PSEG POWER, AND SLIDE C FOR ENTERPRISE/OTHER.

Delivering on commitments, realizing growth

Operational Excellence

- PSE&G: 16 consecutive years of recognition as the most reliable utility in the Mid-Atlantic region
- PSEG Power: Improved nuclear capacity factors to ~94% in 2017; Fleet moving towards improved efficiency and environmental position
- PSEG Long Island: Improved customer service and reliability while managing costs
- PSEG: Maintaining focus on efficiency, resiliency, and ESG (environmental, social and governance)

Financial Strength

- 2018 non-GAAP Operating Earnings guidance of $3.00-$3.20 per share, +6% from $2.93 in 2017*
- Cash flows and business mix support credit ratings and ability to fully fund robust investment pipeline without the need to issue new equity
- PSEG is a net beneficiary of recent tax legislation
- Increased indicated common dividend by 4.7% to $1.80 per share in February 2018 – the 14th increase in the last 15 years

Disciplined Investment

- PSE&G capital program drives continued rate base growth over 2018-2022 with investments in Transmission, Electric & Gas Distribution, and Clean Energy
- Plans for additional investment in Energy Efficiency and increased use of technology to improve communication between Distribution Infrastructure and customers
- Power capital program, focused on completing construction at Keys, Sewaren and Bridgeport Harbor, improves fleet efficiency and geographic diversity

SI-SSA-0015-14443

PSEG

* BASED ON THE MID-POINT OF 2018 NON-GAAP OPERATING EARNINGS GUIDANCE OF $3.00 TO $3.20 PER SHARE. SEE SLIDE A FOR A RECONCILIATION OF NET INCOME TO NON-GAAP OPERATING EARNINGS, SLIDE B FOR RECONCILIATIONS FOR PSE&G AND PSEG POWER, AND SLIDE C FOR ENTERPRISE/OTHER.

Strategic focus produced growth in non-GAAP Operating Earnings as regulated business contribution grew to ~65%

2012	PSEG 5-Year Capital Investment Program of $18 Billion*	2017

- ✓ Regulated annual Rate Base growth of 13% to $17 Billion
- ✓ Transmission has grown to 46% of Rate Base
- ✓ Efficient growth: O&M held flat
- ✓ Overall customer bill is down

$2.44	Non-GAAP Operating Earnings +4% per year	$2.93
43%	Regulated Net Income Contribution Increased	65%
$1.42	Common Dividend Per Share +4% per year	$1.72

*CAPITAL INCLUDES YEARS 2013-2017.

Next Steps: Building on a successful and sustainable platform that meets the needs of customers and shareholders

2018	PSEG 5-Year Capital Investment Program $14B - $17B

- ✓ Investing $12 Billion-$15.5 Billion to upgrade New Jersey infrastructure and meet NJ's Clean Energy goals
- ✓ Minimizing risk/volatility of merchant generation
- ✓ Continued cost discipline in operations
- ✓ Maintaining high customer satisfaction levels
- ✓ Tax reform benefits customers and shareholders
- ✓ Financial strength remains a core operating principle

Rate Base	Expected 8%-10% Compound Annual Growth in Rate Base through 2022
$1.80	Opportunity for Consistent and Sustainable Growth in Common Dividend

SI-SSA-0015-14445

Expanded utility investment program of $12B - $15.5B provides opportunity for rate base growth of 8% - 10%

SI-SSA-0015-14446

E = ESTIMATE.
HASHED PORTION OF THE CHART REPRESENTS PLANS FOR EXTENSION OF ENERGY STRONG (ES2) AND A CLEAN ENERGY FUTURE (CEF) PROGRAM.

Power's fleet transformed with focus on improvement in efficiency

Projected Fleet Comparison 2017 to 2022E

[1] REFLECTS RETIREMENT OF HUDSON AND MERCER UNITS IN JUNE 2017
E=ESTIMATE

SI-SSA-0015-14447

NJ Zero Emission Certificates (ZEC) support carbon free nuclear generation

- ✓ Legislation signed by New Jersey Governor Murphy on May 23
- ✓ Starts a 330-Day process – NJ Board of Public Utilities to determine eligibility and selection of nuclear plants eligible for ZECs
- ✓ Hope Creek and Salem produce >90% of NJ's carbon free generation, support ~6,000 jobs, and benefit fuel diversity and grid reliability

SI-SSA-0015-14448

PSEG's future direction aligned with customer needs and NJ's Clean Energy agenda

2012-2017	2018 – 2022	Utility of the Future
Transmission expansion Storm hardening and resiliency New peaking generation and generation uprates Regulated & Unregulated Renewables	Upgrade aging infrastructure and Transmission Storm hardening and resiliency New, efficient CCGTs Clean Energy Legislation • Expanded Energy Efficiency • EV infrastructure • Battery storage Regulated & Unregulated Renewables	Clean Energy Legislation • Expanded Energy Efficiency • EV infrastructure • Battery storage Greater use of technology to enhance 2-way customer communication; AMI Regulated Renewables

SI-SSA-0015-14449

Customer's bills are materially lower, supporting needed investment in the system

- Combined electric and gas bills declined ~20% since our last rate case, 30% adjusted for inflation
- Also provided BGSS bill credits totaling ~$680 per customer since 2012

- Regional price comparison** - Gas is 2nd lowest and Electric is lower than average
- Distribution revenue component is the lowest in the state for Gas and second lowest for Electric
- Investing at the filing levels of the infrastructure extension and clean energy future programs will keep rates under 2010 levels for over a decade (adjusted for growth in CPI)

SI-SSA-0015-14450

PSEG

*FOR ALL YEARS THE BILLING ASSUMES 7,200 KWH FOR ELECTRIC AND 1,010 THERMS FOR GAS ANNUALLY. E = ESTIMATE
** COMPARED AGAINST 12 REGIONAL UTILITIES AS OF DECEMBER 1, 2017, FOR A CUSTOMER THAT USES 500 KILOWATT-HOURS AND 100 THERMS IN A MONTH.

Strategic focus generating growth in earnings with increased contribution from regulated business

We make things work for you.

SI-SSA-0015-14457

Pursuing Critically Needed Market Reforms

Supporting NJ's Energy Agenda

Preserving NJ's Nuclear Energy

Infrastructure Investment Program Supports PSE&G Reliability & Resiliency

NJ Base Rate Case First Since 2010 has Modest 3% Request

PSEG

SI-SSA-0015-14458

Pursuing regulatory policies supporting investment and delivery of clean, affordable and resilient energy supply

What We Discussed in 2017		Results to Date 2018
NJ Distribution Base Rate Case	→	Progressing on filing schedule
Long-Term Infrastructure Regulatory Reform	→	Adopted January 2018; Model for GSMP II and future filings
Properly Value Nuclear Supply	→	Governor Murphy signed bill on May 23; Regulatory process now begins
Pursuit of Price Reform in Wholesale Energy Market	→	Underway at FERC and PJM

SI-SSA-0015-14459

PSE&G Base Rate Filing: A path to long-term rate stability

Base rate case filed January 2018 and updated in May 2018, calls for an overall increase in electric and gas revenue of 3%

Requested Amounts	Electric	Gas
Revenue Increase	$134 Million	$108 Million
Rate Base	$5.7 Billion	$4.2 Billion

- First base rate request since 2010
- Filing updated to reflect the April 1, 2018 rate reduction associated with decline in the federal corporate tax rate; Net of tax benefits, request is 1%
- Seeks return on and of increased levels of investment in rate base
- Incorporates an electric revenue de-coupling mechanism to support investments in energy efficiency
- Requests a change in depreciation
- Effect of Tax Reform on cash flow further supports capital structure request
- Schedule calls for Rate Counsel and other intervenors to file testimony July 2018; Hearings are scheduled for September - October 2018; Expect a decision in Q4 2018

SI-SSA-0015-14460

NJ addresses investment in energy infrastructure; Streamlined process reduces regulatory lag

Infrastructure Investment Program (IIP) Recovery Mechanism

- Adopted by NJBPU January 2018, streamlines regulatory planning process for long-term infrastructure programs related to safety, reliability and/or resiliency
- Endorses accelerated recovery of investment over and above baseline spend levels, reducing regulatory lag
- Program term not to exceed 5 years with nexus to base rate case at the end of the term

Gas System Modernization Program II

- NJBPU approved agreement May 22
- Provides $1.9 Billion to be invested over five years beginning 2019
- Clause mechanism provides semi-annual recovery of 84% ($315M) of annual spend
- ROE to be set in pending base rate review
- PSE&G will file a base rate case within five years of starting GSMP II

Energy Strong II Filing

- Expect to file with NJBPU shortly
- Extension and expansion of $1.2 Billion Energy Strong program
- Upgrading/hardening of substations
- Strengthen Gas system resiliency
- Grid modernization

SI-SSA-0015-14461

Broad based benefits from properly valuing nuclear…

- Seeks fair compensation for the environmental attributes of at-risk nuclear generating plants
- Bill approved by NJ Legislature on April 12, and signed by NJ Governor on May 23; NJBPU has 330 days to determine eligibility and select which nuclear power plants have been chosen to receive Zero Emission Certificates (ZEC)
- Would require NJ utilities to purchase ZECs from eligible nuclear plants at $0.004 per KWh on retail distribution customers (approximately $300 Million/year)
- NJBPU will rank nuclear plants based on assessment of financial need in addition to its impact on fuel diversity, air quality, and other environmental attributes to determine ZEC eligibility
- Eligible nuclear plants must be licensed to operate beyond 2030 and be located in PJM
- Opportunity to preserve a highly reliable, zero carbon generation resource as part of a diverse energy grid

SI-SSA-0015-14462

...As NJ advances a new Clean Energy agenda

Energy Policy	Description	Investment Opportunity for PSEG
Energy Efficiency (EE)	• Requires electric utilities to reduce energy consumption by 2% and gas utilities to reduce energy consumption by 0.75% from average annual usage over prior 3-year period within 5 years • Allows utilities to recover "reasonable and prudent costs" including return of and on capital and revenue impact of lost sales	☑
Renewable Portfolio Standard (RPS)	• Increases percentage of energy to be supplied from renewable energy resources to 50% by 2030	☑
Solar	• Annual solar requirement increases to 4.8% in 2025 before declining to 4.5% in 2026 and 1.1% in 2033 as net metering cap increased to 5.8% from 2.9% • BPU must complete a study on how to modify/replace SREC program by 24 months after enactment	☑
Community Solar	• BPU must develop rules and regulations establishing a "Community Solar Energy Pilot Program"	☑
Offshore Wind (OSW)	• BPU to establish Offshore Renewable Energy Certificate (OREC) to support 3,500 MW by 2030 • Allows OSW projects to receive tax credits from the Energy Development Agency (EDA) • NJ Dept. of Labor directed to develop job training programs to support OSW development	☑
Energy Storage	• BPU to provide Governor and Legislature with analysis of "energy storage needs and opportunities" • BPU to initiate process within six months of delivering report that establishes a process and mechanism for achieving 600 MW of energy storage by 2021 and 2,000 MW by 2030	☑
EV Infrastructure	• Charging stations and related infrastructure for workplace, multi-family and travel corridors	☑

SI-SSA-0015-14463

PSEG Engaged in Wholesale Energy Market Reform … process moving slowly

Federal Energy Regulatory Commission (FERC)

- PSEG Power is an active participant in dialogue at FERC to expand the definition of resiliency to incorporate the impact on the bulk electric system from a loss of fuel diversity associated with the potential retirement of nuclear generation
- FERC is examining ISO efforts to ensure resilience of the bulk electric system

PJM Independent System Operator

- PSEG Power is an active participant in PJM discussions to improve price recognition of the cost of meeting demand and PJM stakeholder process on resiliency/ valuing fuel security
- FERC is pushing ISOs to improve market constructs and rules on energy pricing

  → Fast start pricing reform expected in 2018
- PSEG Power is an active participant in capacity market proceedings at PJM/FERC that integrate state public policy objectives for clean energy with grid reliability and efficient market signals

SI-SSA-0015-14464

Regulatory/legislative policy initiatives strengthen foundation for providing clean, affordable and resilient energy supply

Base Rate Case Provides Opportunity for Long-Term Rate Stability

- Decision expected in Q4 2018

NJ regulators endorse streamlined process supporting long-term investment

- GSMP II Approved; ES II Filing Shortly

NJ Advances Clean Energy Future

- PSEG Power will request NJBPU determination of eligibility for our NJ nuclear plants to receive Zero Emission Certificates
- PSE&G plans to accelerate investment in Energy Efficiency, Energy Storage and EVs

FERC/PJM Wholesale Market Reforms Underway

- Fast start pricing reform expected in 2018

SI-SSA-0015-14465

PSEG Value Proposition

- PSE&G – Delivering on promise for rate base growth through disciplined investment, customer satisfaction and safety
- PSEG Power – Efficient, low-cost, clean fleet advantaged by asset diversity, fuel mix and location
- Focus on providing strong, sustainable returns of invested capital through operational excellence, regulatory and legislative mechanisms
- 111-year record of paying common dividend with opportunity for consistent, sustainable growth

Discussion Topics

- Capital investment program
- Operational excellence
- Customer rates

SI-SSA-0015-14469

~$14B investment program delivered benefits to New Jersey and delivered 13% annual compound growth of rate base and earnings

Our rate base is roughly balanced between federal and state jurisdictions

SI-SSA-0015-14470

* SEE SLIDE B FOR A RECONCILIATION OF NET INCOME TO NON-GAAP OPERATING EARNINGS FOR PSE&G

$12B-$15.5B investment program focused on grid modernization, reliability and clean energy

E = ESTIMATE.
HASHED PORTION OF THE CHART REPRESENTS PLANS FOR EXTENSION OF ENERGY STRONG (ES2) AND A CLEAN ENERGY FUTURE (CEF) PROGRAM.

SI-SSA-0015-14471

Transmission: ~$6 Billion investment program focused on enhancing reliability and resiliency, and replacing aging infrastructure

Forward-looking Formula Rate recovery of capital and expenses

PJM's Regional Transmission Expansion Plan (RTEP) identifies system enhancements needed for reliability

- **Reliability Criteria Violations:** upgrades to relieve network overloads
- **Transmission Hardening:** enhancements to system resiliency
- **Transmission Lifecycle:** asset end-of-life replacements to maintain system integrity
- **69kV System:** upgrades for system reliability and capacity for future load growth

SI-SSA-0015-14472

Gas Distribution: ~$3 Billion investment program focused on modernizing and replacing cast iron and unprotected steel main

GSMP I Program Delivered

- **Customer service**
  - Conversion from low to high pressure
  - Relocate inside meter sets outside
- **Environmental Collaboration** to consider methane leaks in work prioritization
- **Replaced >200 miles** in both 2016 and 2017

GSMP II program provides for replacement of 875 miles over five years

- $1.9 Billion investment beginning in 2019
- $1.6 Billion recovered through clause
- Improved terms, includes semi-annual recovery

Base capital and new business >$1 Billion over five years

SI-SSA-0015-14473

Electric Distribution and Energy Strong:

$3–$4 Billion of investments focused on reliability and resiliency

Energy Strong Program delivered reliability improvements through remote automation, communication and control; elevated sub-stations

- $1 Billion program will be completed in 2018

Energy Strong II program will request to invest ~$2.5 Billion

- **$1.5 Billion Electric:** Continuation of infrastructure programs
  - **Hardening** – raise 16 stations in flood zones, pole and circuit upgrades, and smart grid reclosers
  - **Aging Infrastructure** – lifecycle projects at 84 substations with an average age of 73 years
  - **Technology** – advanced distribution management system (ADMS) and fiber/mesh communication network
- **$1 Billion Gas:** Resiliency and lifecycle projects

Base capital and new business ~$2 Billion over five years

Before

After

SI-SSA-0015-14474

Partnership for a Clean Energy Future:

~$2.9 Billion investment program to provide cost-effective and innovative solutions supporting NJ's clean energy goals

- **Energy Efficiency**: Residential and C&I programs to lower energy bills and combat climate change
  - Savings targeting 2% electric and 0.75% gas savings consistent with NJ Clean Energy Legislation
- **Electric Vehicles**: "Smart" electric vehicle infrastructure: residential, workplace, multi-family, travel corridors
- **Battery Storage**: Utility-scale systems to defer traditional distribution investment, enable additional solar, and enhance critical infrastructure resiliency

Program Investment	$ Billion
Energy Efficiency	$2.5
Electric Vehicles	$0.3
Battery Storage	$0.1
Investment Total	$2.9

- 6-year investment program starting in 2019
- Seeking contemporaneous recovery
- Contingent on approval of decoupling
- Expect to file in the near-term

SI-SSA-0015-14475

Investment programs provide opportunity for rate base growth

E = ESTIMATE.
HASHED PORTION OF THE CHART REPRESENTS PLANS FOR EXTENSION OF ENERGY STRONG (ES2) AND A CLEAN ENERGY FUTURE (CEF) PROGRAM.

Cleaner, More Efficient Fleet of Flexible Assets

Free Cash Flow Improves with Completion of Construction Program

414 MW of Solar Under Long-Term Contracts

Preserving Nuclear Generation as a Zero-Carbon Resource

12,022 MW
2022E Generating Capacity

PSEG

SI-SSA-0015-14487

Power's portfolio is efficient and flexible

Asset Profile

- Focused on safe and reliable operations
- Completing construction of 1,800 MW of efficient, Combined Cycle Gas Turbine (CCGT) generation
- From 2012 through 2017, retired 3,197 MW of un-economic capacity

O&M

- History of controlling growth in O&M
- More efficient operations with new capacity

Free Cash Flow

- Seeking fair compensation for zero-carbon and fuel diversity attributes of nuclear capacity
- Capital spending declines after CCGT construction projects conclude in mid-2019
- Optimizing value with focus on efficiency, earnings and free cash flow

SI-SSA-0015-14488

Power's generating assets mainly located in three competitive markets

- Power Ventures assets:
  - Solar (414 MW_{DC}/325 MW_{AC})
  - Kalaeloa, HI (104 MW)

- Major assets located near key load centers
- Constructing three new, highly efficient combined-cycle units
- Positioned to benefit from market volatility

SI-SSA-0015-14489

Power nearing completion of ~1,300 MW of new, highly efficient CCGT capacity in PJM

- **755 MW plant in Prince George's County, MD**
  - 2x1 natural gas combined cycle
- **Outlook**
  - Expands geographic footprint to the SWMAAC* load pocket
  - Pricing proximity to PJM West
  - Heat rate: 6,930 Btu/KWh

Keys Energy Center

2017 Average Spark Spread SWMAAC: ~$15/MWh

- **540 MW plant in Sewaren, New Jersey**
  - 1x1 dual fuel (natural gas & ultra-low sulfur diesel) combined cycle
- **Outlook**
  - Leverages existing infrastructure
  - Located in the PS Zone load pocket
  - Existing Sewaren units to retire upon completion
  - Heat rate: 6,510 Btu/KWh

Sewaren 7

2017 Average Spark Spread PS Zone: ~$17/MWh

*SWMAAC – SOUTHWEST MID-ATLANTIC AREA COUNCIL

SI-SSA-0015-14490

Bridgeport Harbor 5 CCGT under construction, on schedule for mid-2019 addition to ISO-NE

- **485 MW plant in Bridgeport, Connecticut**
  - 1x1 dual fuel (natural gas & ultra-low sulfur diesel) combined cycle
- **Outlook**
  - Under construction on the existing PSEG Bridgeport Harbor site
  - Leveraging existing infrastructure
  - Bridgeport Harbor 3 (383 MW Coal) will retire in 2021
  - Located in SW Connecticut load pocket
  - Seven year capacity price lock
  - Heat rate: 6,530 Btu/KWh

Bridgeport Harbor Unit 5

2017 Average Spark Spread ISONE: ~$14/MWh

SI-SSA-0015-14491

Solar Source has developed 414 MW_{DC} in the US

Solar capacity located in 14 States

SI-SSA-0015-14492

Power's fleet is transitioning to be more efficient, productive and clean

E = ESTIMATE.

Power's fleet transformed with focus on improvement in efficiency

SI-SSA-0015-14494

Power's PJM gas fleet is well-located with access to shale gas production

PSEG's Total PJM Gas Procurement

Additional Pipeline Takeaway Capacity (2018-2019)

Transco Z6 vs. Leidy Gas Prices

- PSEG Power's PJM gas fleet consumed ~65 BCF in 2017, of which >85% was supplied by Northeast shale gas
- Addition of new pipeline takeaway capacity over 2018-2019 expected to bring market closer to balance
- Spark spreads of New Jersey-based combined cycle generating fleet benefit from access to Leidy gas

F = FORWARDS AS OF 5-1-2018. 2018 IS AN AVERAGE OF FOUR MONTHS ACTUAL AND FORWARDS AS OF 5-1-18.

SI-SSA-0015-14495

PSEG Nuclear is vital to New Jersey; Salem and Hope Creek represent >90% of the State's zero carbon energy

Plant	Operator	PSEG Ownership	Total Capacity / PSEG Owned (MW)	License Expiration Year	Next Scheduled Refueling	Historical Average Capacity Factor (2014 - 2017)
Hope Creek	PSEG Nuclear	100%	1,180	2046	Fall 2019	94.1%
Salem 1	PSEG Nuclear	57%	2,282 / 1,310	2036	Spring 2019	83.9%
Salem 2	PSEG Nuclear	57%		2040	Fall 2018	82.0%
Peach Bottom 2	Exelon	50%	2,450 / 1,225	2033	Fall 2018	92.9%
Peach Bottom 3	Exelon	50%		2034	Spring 2019	95.1%

SI-SSA-0015-14496

Market response to severe winter weather in Q1 2018 demonstrates the importance of fuel diversity and the preservation of nuclear generation to New Jersey

- As temperatures plummeted, gas prices rose faster than power prices
- This made even the most efficient combined cycle units uneconomic on gas
- Oil displaced gas

SI-SSA-0015-14497

DISPATCH COST SHOWN BASED ON GAS PRICES.

Had nuclear units not been available or had combined cycle units run out of their secondary fuel…

- Power prices would likely have skyrocketed
- Meeting demand would have been dependent on availability of gas
- Uncertain if sufficient gas for generation would have been available

SI-SSA-0015-14498

Available oil volumes were being depleted rapidly at the largest PSEG oil burning units despite ongoing oil deliveries at maximum capacity

- Cold snap in early January quickly depleted oil supply
- Delivery could not keep up with demand
- Reliable, low cost nuclear generation provided the bulk of the supply
- A change in the weather pattern averted a potential crisis

Solid credit metrics support additional investment capacity

Average Funds From Operations/Debt* 2018E – 2020E

	Power	PSEG
Estimate	Low - Forties	~20%
Minimum Threshold	30%	High - Teens

* Does not consider potential ZEC impact on estimated FFO/Debt

Total Incremental Investment Capacity 2018E – 2020E (PSEG and Power)

Incremental capacity invested in PSE&G would be matched with utility debt

SI-SSA-0015-14519

Zero Emission Certificate (ZEC) Process

2018	2019	2020

Enacted May 23 (Day One)

November 2018 (Day 180), BPU issues Order establishing ZEC program

April 2019 (Day 330), BPU ranks applicants and selects plants to receive ZECs. Utilities begin purchasing ZECs for 'stub' period. Cash payment follows

During 'stub' period (end of energy year), ZECs earned through May 31

Within 90 days of May 31, cash payment occurs for ZECs earned during 'stub' period

June 2019, utilities purchase ZECs for new energy year, with cash payment within 90 days of the energy year ending May 31, 2020

Subsequent years work the same

Annual revenues estimated at ~$200 million, or ~$0.28 per share if all three NJ units are selected

SI-SSA-0015-14520

Tax Reform benefits customers and PSEG

- ✓ Benefiting PSE&G customers with $262 million of annual rate reductions in 2018, expected to grow with return of excess deferred taxes
- ✓ Estimated to provide PSEG with uplift to earnings, including $0.16 per share in 2018

PSE&G Tax Impacts

- Lowers customer bill
- Increases 5-year rate base growth for same capital spend by ~1% per year
- Average earnings increase by $20M/year growing to $30M/year over 2019-2022
- Cadence of future rate reductions related to return of excess deferred taxes to be determined in base rate case

PSEG Power Tax Impacts

- After-tax earnings improve through lower federal corporate tax rate
- Cash flow increases with 100% expensing of capital
- Retains full interest expense deductibility based upon low debt balance

- ✓ After tax reform, PSEG retains investment capacity, has ability to grow the common dividend, with no need to issue equity to fund its investment program
- ✓ Lower customer bills extend opportunity to invest in system while minimizing rate impact

SI-SSA-0015-14521

PSEG has controlled O&M

Cost Control Actions

- Continued focus on vendors to ensure maximum value
- Regular organizational refinement to streamline processes
- Managed Pension & OPEB Expense
- Retirement of un-economic generating plants
- 'Best practices' teams focused on improving performance while managing costs

1) EXCLUDES REGULATORY BALANCING ACCOUNT ITEMS AND NUCLEAR ARO ACCRETION EXPENSE ; INCLUDES THE IMPACT OF THE CHANGE IN PENSION ACCOUNTING STANDARDS. E = ESTIMATE.

SI-SSA-0015-14524

PSEG Value Proposition

- PSE&G – Delivering on promise for rate base growth through disciplined investment, customer satisfaction and safety
- PSEG Power – Efficient, low-cost, clean fleet advantaged by asset diversity, fuel mix and location
- Focus on providing strong, sustainable returns of invested capital through operational excellence, regulatory and legislative mechanisms
- 111-year record of paying common dividends with opportunity for consistent, sustainable growth

SI-SSA-0015-14525

PSEG APPENDIX

SI-SSA-0015-14526

PSEG

We make things work for you.

PSE&G Distribution Base Rate Case Filing

- **Dockets** ER 18010029 (Electric) and GR 18010030 (Gas)
- **Filed** January 12, 2018; **Anticipate new rates** Fourth Quarter 2018
- **Test year** – July 1, 2017 through June 30, 2018 (with certain pro forma adjustments)
- **Rate base** of $9.9B ($5.7 Billion Electric; $4.2 Billion Gas) as of December 31, 2018
- **ROE** request of 10.3%; **Capitalization structure** with 54% equity
- **Requested Increase:** ~3% relative to overall revenue, 1% net of tax benefits
- **O&M and Sales** are roughly flat to last rate case eight years ago
- **Capital recovery** beyond clauses and $125M increase in Depreciation rate
- **Decoupling** of revenues from sales volumes
- **Taxes** – lower federal tax rate and flow back of deferred taxes to offset storm costs and reduce impact on customer bills
- **Filing Updates:**
  - ✓ **Taxes:** Lowered rates effective April 1 to accelerate savings planned in rate case; update for other tax impacts such as loss of bonus depreciation
  - ✓ **9x3 update** filed May 14

Overall bill for the typical PSE&G residential customer, would remain ~20% lower than bills after last base rate case

2018 PSEG EXECUTIVE PROFILES

PSEG

We make things work for you.

SI-SSA-0015-14529

Ralph Izzo

CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED

Ralph Izzo was elected chairman and chief executive officer of Public Service Enterprise Group Incorporated (PSEG) in April 2007. He was named as the company's president and chief operating officer and a member of the board of directors of PSEG in October 2006. Previously, Mr. Izzo was president and chief operating officer of Public Service Electric and Gas Company (PSE&G).

Since joining PSE&G in 1992 Mr. Izzo was elected to several executive positions within PSEG's family of companies, including PSE&G senior vice president – utility operations; PSE&G vice president – appliance service; PSEG vice president - corporate planning; and PSE&G vice president - electric ventures. In these capacities he broadened his experience in the areas of general management, strategic planning and finance.

Mr. Izzo is a well-known leader within the utility industry, as well as the public policy arena. He is frequently asked to testify before Congress and speak to organizations on matters pertaining to national energy policy.

Mr. Izzo's career began as a research scientist at the Princeton Plasma Physics Laboratory, performing numerical simulations of fusion energy experiments. He has published or presented over 35 papers on magnetohydrodynamic modeling. Mr. Izzo received his Bachelor of Science and Master of Science degrees in mechanical engineering and his Doctor of Philosophy degree in applied physics from Columbia University.

He also received a Master of Business Administration degree, with a concentration in finance from the Rutgers Graduate School of Management. He is listed in numerous editions of Who's Who and has been the recipient of national fellowships and awards. Mr. Izzo has received honorary degrees from the New Jersey Institute of Technology (Doctor of Science), Thomas Edison State University (Doctor of Humane Letters), Bloomfield College (Doctor of Humane Letters), Rutgers University (Doctor of Humane Letters), and Raritan Valley Community College (Associate of Science).

Mr. Izzo is on the board of directors for the New Jersey Chamber of Commerce, the Edison Electric Institute (EEI), the Nuclear Energy Institute (NEI) and the New Jersey Performing Arts Center. He is also a member of the Board of Trustees of Peddie School and the Princeton University Andlinger Center for Energy and the Environment Advisory Council, as well as a member of the Visiting Committee for the Department of Nuclear Engineering at MIT. Mr. Izzo is a former member of the Columbia University School of Engineering Board of Visitors. In addition, he is a former chair of the Rutgers University Board of Governors and the New Jersey Chamber of Commerce.

SI-SSA-0015-14530

John Paul Cowan

SENIOR VICE PRESIDENT - OPERATIONS

PSEG FOSSIL, LLC

John Paul Cowan was named Senior Vice President Operations in February 2011. Mr. Cowan joined PSEG in January 2009 as Director-Fossil Programs and Efficiency. In August 2009 he assumed the position of Vice President Operations. Prior to joining PSEG as an employee, Mr. Cowan provided Consultant Services to PSEG Fossil, LLC and PSEG Power, LLC. In these roles, Mr. Cowan served as the Executive Director for PSEG's New Nuclear Plant Development reporting to Bill Levis. Mr. Cowan also consulted to the President, PSEG Fossil, LLC for initial implementation of the Fossil Operational Excellence Model (OEM).

Prior to joining PSEG, Mr. Cowan held several executive positions including Executive Vice President and Chief Nuclear Officer-Nuclear Management Company, Vice President and Chief Nuclear Officer-Florida Power Corporation, Vice President Environmental Services-Carolina Power and Light, and Vice President-Operation Services for Carolina Power and Light. Mr. Cowan has worked for the Institute of Nuclear Power Operations (INPO) as a department head, assistant to the Chief Executive Officer and Secretary to the Board of Directors. He also spent 10 years with General Electric in technical, operational, and management positions.

Mr. Cowan is a graduate of the University of Wisconsin- Madison with a Bachelor's Degree in Nuclear Engineering. He has a Master's Degree in Business Management from Rensselaer Polytechnic Institute, and a Juris Doctor's Degree from Georgia State University. He is currently an active member of the Georgia State Bar Association and the American Bar Association. He is a recipient of the University of Wisconsin's Distinguished Service Award and has been a member of several electric industry groups including the Institute of Nuclear Power Operations, Nuclear Electric Institute, and Electric Power Research Institute.

SI-SSA-0015-14531

Daniel J. Cregg

EXECUTIVE VICE PRESIDENT AND CHIEF FINANCIAL OFFICER

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG POWER LLC AND PSEG SERVICES CORPORATION

Daniel J. Cregg was named executive vice president and chief financial officer for Public Service Enterprise Group Incorporated (PSEG) and its subsidiaries in October 2015.

Mr. Cregg is responsible for all financial functions, including Internal Audit Services, Investor Relations and Corporate Development. Given the array of financial instruments which serve as the primary means of selling wholesale energy to customers, Mr. Cregg also has responsibility for the Risk Management function, which provides independent oversight of the PSEG Power trading organization. In addition to finance, Mr. Cregg is responsible for the Strategy and Planning function. He is a member of PSEG's Executive Officer Group.

Prior to his current position, Mr. Cregg was vice president – finance for PSE&G, a role he assumed in June 2013. In 2006, Mr. Cregg was named vice president – finance for PSEG Power. In that capacity and in previous financial roles for Power, Mr. Cregg held leadership positions related to financial reporting and forecasting, investor communications, financings, rating agency interactions, external reporting, cash forecasting, financial valuations, competitive intelligence, and fundamental market modeling, with critical responsibilities in Power's development and strategic planning activities.

Previously, Mr. Cregg was director of PSEG corporate development. He joined PSEG in 1991 with overall responsibility for tax planning, strategy and compliance for PSEG Energy Holdings, including domestic and international tax structuring work for PSEG Global and PSEG Resources.

Before joining PSEG, Mr. Cregg spent five years with the accounting and consulting firm of Deloitte and Touche, providing consulting services to a wide range of clients with an emphasis on the energy industry.

Mr. Cregg holds a Master of Business Administration degree from the Wharton School of the University of Pennsylvania and is a graduate of Lehigh University, where he received a bachelor's degree in accounting.

SI-SSA-0015-14532

David M. Daly

PRESIDENT AND CHIEF OPERATING OFFICER

PUBLIC SERVICE ELECTRIC AND GAS COMPANY (PSE&G)

David M. Daly was elected president and chief operating officer of Public Service Electric and Gas Company (PSE&G) effective October 2017. PSE&G is New Jersey's oldest and largest regulated gas and electric delivery utility, serving approximately 2.4 million customers, nearly three-quarters of the state's population. In addition, Mr. Daly will assume the role of Chairman of the Board of PSEG Long Island, a subsidiary of Public Service Enterprise Group (PSEG), which has been managing the electric transmission and distribution systems on Long Island and in the Rockaways since January 2014. PSEG Long Island serves 1.1 million customers.

Prior to his current position, Mr. Daly served as president and chief operating officer of PSEG Long Island. Previously he served as vice president and lead of the transition to PSEG Long Island.

Prior to his appointment to PSEG Long Island, Mr. Daly served as vice president - asset management and centralized services at PSE&G. Since joining PSE&G in 1983, Mr. Daly has held a variety of positions in utility operations and support services, including vice president of energy acquisition and technology, division manager - merger integration, director of utility operations services, director of corporate strategy, and general manager of transmission planning.

Earlier in his career, Mr. Daly held various first and second line supervisory positions in fossil generation plant operations, and was a senior consultant at Metzler & Associates and UMS Group. He has an electrical engineering degree from the State University of New York Maritime College, and a Master of Business Administration from Rutgers University.

SI-SSA-0015-14533

Derek M. Di Risio

PRESIDENT

PSEG SERVICES CORPORATION

Derek M. Di Risio was named President, PSEG Services Corporation, in July 2014. He is responsible for the coordination and delivery of several centralized services currently residing within PSEG Services Corporation including corporate communications, corporate citizenship, corporate real estate, information technology, procurement, payroll and other transactional services.

Prior to his current role, Mr. Di Risio was vice president and controller of Public Service Enterprise Group (PSEG), Public Service Electric and Gas Company (PSE&G), PSEG Services Corporation, PSEG Energy Holdings (Holdings) and PSEG Power, a position he assumed in December 2006. He was previously vice president and assistant controller, since July 2004.

Mr. Di Risio had been vice president – planning and analysis of Holdings since March 2004, and vice president – controller for Holdings since July 1998. Prior to that he was director – accounting services and responsible for several accounting and planning functions for Holdings, including overall coordination of the business planning process, accounting research and policy development, financial forecasts and analysis.

Mr. Di Risio was also responsible for the budgeting, analysis and reporting process for PSE&G.

Mr. Di Risio joined PSE&G in September 1991 and has held a variety of positions, including assignments with the internal auditing, electric business, and corporate planning departments. He was instrumental in reengineering the Enterprise business planning process, and advancing the use of performance metrics and balanced scorecard measures to improve business results. Prior to joining PSE&G he worked for several firms, including Chase Manhattan Bank.

Mr. Di Risio graduated from Rutgers University with a degree in accounting/computer science, and received a Master of Business Administration degree from the same university. He is a certified public accountant (inactive). Mr. Di Risio also completed the Program for Management Development at the Graduate School of Business Administration of Harvard University. He serves on the Drumthwacket Foundation Board of Trustees, The Board of the Military Park Partnership, the All Stars Project National Board, and is currently chairman of the Board of Directors of the New Jersey All Stars Project Inc. In addition, Mr. Di Risio previously served on the Drew University Board of Trustees.

SI-SSA-0015-14534

Kim C. Hanemann

SENIOR VICE PRESIDENT – DELIVERY PROJECTS AND CONSTRUCTION

PUBLIC SERVICE ELECTRIC AND GAS COMPANY (PSE&G)

Kim C. Hanemann is Senior Vice President, Delivery Projects and Construction (DP&C), at Public Service Electric and Gas Company (PSE&G). Headquartered in Newark, New Jersey, PSE&G is one of the largest combined electric and gas companies in the United States and is also New Jersey's oldest and largest publicly owned utility. PSE&G is the largest subsidiary of Public Service Enterprise Group Incorporated (PSEG).

At PSE&G, Ms. Hanemann is responsible for ensuring the on time, on scope and on budget execution of the company's large transmission construction projects, which includes overseeing project management, project controls, licensing and permitting, and commissioning. Her organization also includes a mobile construction workforce. During the period 2017 through 2021, the portfolio under Ms. Hanemann's management will command a budget of approximately $6.0 billion.

Ms. Hanemann is also responsible for managing key components of PSE&G's Energy Strong program to increase the resiliency of 29 switching and substations, and to protect gas metering and regulating stations affected by Superstorm Sandy or located in flood zones. She also oversees a $630 million FEMA grant for hardening projects on facilities operated by PSEG Long Island.

Ms. Hanemann joined PSE&G as an engineer in 1986 and has held numerous leadership positions in both electric and gas field operations and in utility support operations. She was named a director in 2007, promoted to vice president in 2010, and to senior vice president in 2014. Under her leadership, DP&C has grown from a startup team of 40 in 2007 to a still growing team of over 800 today.

Ms. Hanemann is a member of the board of directors of Middlesex Water Company and Children's Specialized Hospital.

Ms. Hanemann is a graduate of Lehigh University, where she earned a bachelor's in mechanical engineering, and the Rutgers Graduate School of Management, where she earned a Masters of Business Administration.

SI-SSA-0015-14535

Ralph A. LaRossa

PRESIDENT AND CHIEF OPERATING OFFICER

PSEG POWER

Ralph A. LaRossa was elected president and chief operating officer (COO) of PSEG's merchant generation business, PSEG Power, effective October 2017.

PSEG Power is a major, unregulated independent power producer in the U.S. with four main subsidiaries: PSEG Nuclear, PSEG Fossil, PSEG Energy Resources and Trade (ER&T) and PSEG Power Ventures.

PSEG Power operates one of the most balanced portfolios in the country, both in terms of fuel mix and market segment (base load units, load following units and peaking units). Its low-cost, load-following fleet is geographically well-positioned in competitive markets. Its approximately 12,000 megawatts represent a diverse fuel mix with different plant types.

Before being elected to his current position, Mr. LaRossa served as president and chief operating officer of Public Service Electric and Gas Company (PSE&G). In addition, Mr. LaRossa served as Chairman of the Board of PSEG Long Island. Previously he was vice president - electric delivery for PSE&G.

Mr. LaRossa joined PSE&G in 1985 as an associate engineer and advanced through a variety of management positions in the utility's gas and electric operations. In 1998, he received Gas Industry Magazine's Outstanding Manager of the Year Award.

He is a graduate of Stevens Institute of Technology and has completed the Harvard Business School's Program for Management Development.

Mr. LaRossa is Chairman of Choose New Jersey, Inc. and serves on its board of directors. In addition, he is a member of the board of directors for Montclair State University and is also the immediate past chair of the American Gas Association (AGA).

SI-SSA-0015-14536

John R. Latka

SENIOR VICE PRESIDENT – ELECTRIC AND GAS OPERATIONS

PUBLIC SERVICE ELECTRIC AND GAS COMPANY (PSE&G)

John R. Latka was named Senior Vice President – Electric & Gas Operations in July 2014. He is a member of PSEG's Executive Officer Group. John is responsible for Transmission & Distribution of all electric and gas operations, safety and emergency preparedness initiatives. He is also responsible for implementing the natural gas pipe replacements in the GSMP Program and the electric system resiliency upgrades included in PSE&G's Energy Strong program.

Under his leadership, PSE&G has been named the most reliable utility in the nation five times, and the most reliable in the Mid-Atlantic region for the past 16 years.

In 2015, J.D. Power ranked PSE&G highest in business customer satisfaction for both electric and gas service. This is the first time in PSE&G's history to rank highest in business customer satisfaction for both electric and gas service.

Prior to his current role, Mr. Latka was Vice President-Electric Operations for PSE&G. Since joining PSE&G in 1982, Mr. Latka has held a variety of management positions in the utility.

Mr. Latka is a graduate of Tennessee Technological University. He is currently a board member for the Commerce and Industry Association of New Jersey. He is a Board of Trustee of the Partnership for a Drug-Free New Jersey and a member of the National Response Executive Committee. In 2014, he was appointed to the NJ Infrastructure Advisory Committee (IAC) as co-chair of the Energy Sector.

SI-SSA-0015-14537

Tamara L. Linde

EXECUTIVE VICE PRESIDENT AND GENERAL COUNSEL

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG POWER, PSEG SERVICES CORPORATION

Tamara Linde was named executive vice president and general counsel for Public Service Enterprise Group Incorporated (PSEG) in July 2014. She is also the executive vice president and general counsel of Public Service Electric and Gas Company (PSE&G), PSEG Power and PSEG Services Corporation.

As PSEG's chief legal officer, Ms. Linde has responsibility for all legal and regulatory functions, and has general supervisory responsibilities for the office of corporate secretary, business assurance and resilience and federal affairs and sustainability. Ms. Linde is a member of PSEG's Executive Officer Group.

Previously Ms. Linde was vice president – regulatory, PSEG. She has led the company's federal and state regulatory functions, as well as managed corporate, environmental and labor/employment practices within the company. Ms. Linde has served as regulatory counsel on many of the company's most important initiatives in recent years.

Ms. Linde joined the law department of Public Service Electric and Gas Company (PSE&G), as an attorney in 1990 handling a variety of natural gas and electric regulatory and transactional matters. After holding several other legal positions at PSE&G she became general solicitor, in 2000. In that position she was responsible for the regulatory affairs of the PSEG companies including electric, gas and nuclear matters.

She has had significant experience working on regulatory matters before various state and federal regulatory agencies on industry issues relating to electric transmission and distribution and energy markets.

Ms. Linde is a member of the New Jersey, New York, District of Columbia and Texas bars. She currently serves on the Board of the PSEG Foundation, the Community Foundation of New Jersey and the Mater Dei Prep High School Board. In addition, Ms. Linde is a member of the General Counsel Steering Committee of the National Association of Corporate Directors (NACD). She is past President of the Northeast Chapter of the Energy Bar Association and served as chair of the Energy Bar Association Electricity Regulation and Compliance Committee. Ms. Linde graduated from Seton Hall University School of Law with a Juris Doctorate and from Seton Hall University with a bachelor's degree.

SI-SSA-0015-14538

Shahid Malik

PRESIDENT

PSEG ENERGY RESOURCES & TRADE

Shahid Malik was appointed president of PSEG Energy Resources & Trade (ER&T) in 2011. PSEG operates one of the most balanced generation and marketing portfolios in the country, both in terms of fuel mix and market segment (base load units, load following units and peaking units), and Mr. Malik is essentially responsible for managing these assets and taking them to market. He oversees PSEG's generation portfolio and the purchase, sale and risk management of all energy commodities. He is also responsible for business development of new power generation projects.

Mr. Malik has an extensive background in the energy industry across the oil, gas, electric and renewable energy sectors in Europe and the United States. Previously, he was with Pittiglio, Rabin, Todd & McGrath (PRTM) in Pittsburgh, PA and was responsible for all aspects of the global energy business, with a primary focus on the North American utility sector. Prior to that he served as president & CEO of Strategic Energy, Great Plains Energy's retail marketing subsidiary and a provider of energy and services to business clients in North America. He was accountable for the company's strategy and operations and led a successful turnaround of the company, achieving significant growth in products and services while reducing costs.

Mr. Malik's career has included executive leadership positions with several energy companies in the U.S. and Europe. In addition, he served on the board of directors of South Jersey Industries (NYSE: SJI) immediately prior to joining PSEG.

Mr. Malik has been in the energy business for more than 20 years, since receiving his Economics degree from Manchester University in England and an MBA from Rice University, Houston. He sits on the Executive Committee of the Board of Trustees of Newark Museum .

SI-SSA-0015-14539

Margaret M. Pego, SPHR

SENIOR VICE PRESIDENT – HUMAN RESOURCES AND
CHIEF HUMAN RESOURCES OFFICER

PSEG SERVICES CORPORATION

Margaret M. Pego was named senior vice president – human resources and chief human resources officer of PSEG Services Corporation in December 2006. Prior, she had been vice president – human resources. Ms. Pego joined PSEG in 1974, and has held a variety of management positions in the human resources department.

Ms. Pego holds a Bachelor of Arts degree in business administration from William Paterson College, and a Master of Business Administration degree with a concentration in management and labor relations from Seton Hall University. In addition, she holds a certificate in EEO studies from Cornell University, and has completed the Human Resources Executive Program at the University of Michigan. She is also certified as a senior professional in human resources.

Ms. Pego was named one of 2013's HR Top 10 Breakaway Leaders by Evanta, a leading organization that fosters leadership development and collaborative exchange among North America's top executives.

Ms. Pego is active in several local and national organizations, including the EEI Chief HR Executive Advisory Committee; the American Gas Association HR Policy Committee; the Conference Board Advisory Council of HR Management – Council of HR Executives; and the Society for Human Resources Management. In addition, she is Immediate Past Chair of the Children's Specialized Hospital Board, a former member of the Children's Specialized Hospital Foundation Board and RWJ Health Care Corporation Board. She is the former Chair of the Center for Energy Workforce Development (CEWD) Executive Council and is currently a board member. She is a former member of the Supreme Court of New Jersey Attorney Ethics Committee. Ms. Pego is a 2002 Leadership New Jersey fellow, 1997 TWIN Honoree, 2006 Executive Woman of New Jersey Honoree and 2008 NJ Best 50 Women in Business Honoree.

SI-SSA-0015-14540

Peter P. Sena III

PRESIDENT &
CHIEF NUCLEAR
OFFICER

PSEG NUCLEAR

Peter P. Sena III was named president of PSEG Nuclear (Nuclear) in February 2016 and Chief Nuclear Officer in July 2016. Most recently, he was Senior Vice President of Operations, Chief Operating Officer at NextEra Energy.

Mr. Sena was named Chief Nuclear Officer of First Energy in 2012, having held a variety of leadership roles at First Energy nuclear operations spanning 15 years. Mr. Sena joined First Energy in 1996 as a control room supervisor and obtained his first SRO license at Beaver Valley Power Station Unit 2. His second SRO license was obtained in 1999 for Beaver Valley Unit 1. Following a rotational assignment with the Institute of Nuclear Power Operations, Mr. Sena was named the Operations Manager and helped lead the station to the "Most Improved Plant" Award in 2003. In 2005, he was named the Director of Engineering and the station completed the first extended power uprate for a Westinghouse 3 Loop Pressurized Water Reactor. As the Site Vice President of Beaver Valley, Mr. Sena led the station to its first INPO Excellence Award in 2009. The Davis Besse Nuclear Power Plant returned to the Excellence category under Mr. Sena's watch as the Chief Operating Officer in 2011.

Prior to joining FirstEnergy, Mr. Sena was employed by the Nuclear Regulatory Commission as a resident inspector in Region 1. Mr. Sena's nuclear training began as an officer with the US Naval Nuclear Propulsion program and he served on board a ballistic missile submarine during the Cold War.

Mr. Sena earned a Bachelor of Science degree with high honors in Fuel Science from the Pennsylvania State University in 1985. He currently serves on the advisory board for the Penn State Nuclear Engineering Program and is a member of EPRI's research advisory committee. He currently serves on the Auburn University's Advisory Board. In addition, he has recently served on the INPO Executive Advisory Committee and the Nuclear Energy Institute (NEI) Nuclear Strategic Issues Advisory Committee where he was the Industry Executive Sponsor of the NEI post Fukushima flooding response initiative.

PSEG

PLEASE SEE PAGE 3 FOR AN EXPLANATION OF PSEG'S USE OF OPERATING EARNINGS AS A NON-GAAP FINANCIAL MEASURE AND HOW IT DIFFERS FROM NET INCOME.

Investor Conference

Thursday, May 31st, 2018

Welcome and Introductions

Kathleen Lally

Vice President, Investor Relations, PSEG

Welcome

Good morning. I am Kathleen Lally, Vice President of Investor Relations for Public Service. Thank you all for attending our annual financial conference with the executive management of Public Service Enterprise Group.

Agenda

We have a full morning prepared for you today. We are going to start, as usual, as is our norm, with Ralph Izzo, Chairman, President and CEO of Public Service, who will outline the company's strategic plans and goals for growth. Ralph will be followed by Tammy Linde, Executive Vice President and General Counsel for the company, who is going to outline the regulatory and legislative policy issues that help inform our strategic goals.

Following Tammy, there will be time for questions. Then, after that Q&A session, Dave Daly, President and Chief Operating Officer of Public Service Electric and Gas will outline the utility company's outlook and programs and basically, its major capital program which we are announcing today. Following Dave, there will be an opportunity for questions.

We will take a break right after that Q&A session. Following that, Ralph LaRossa, President and Chief Operating Officer of PSEG Power will outline the initiatives underway at Power. Then, there will be time for questions of Ralph following his presentation. That will be followed by Dan Cregg, who is going to wrap up the financial picture for the company. Following Dan, there will be time for Q&A of he and Ralph Izzo.

So, it is a very full morning, as we have normally provided to you over the past 12 years. I hope you get the information that you need to properly value our securities. With that, I will turn it over to Ralph.

PSEG Strategy: Building a Sustainable, Financially Sound Energy Infrastructure Company

Ralph Izzo

Ralph Izzo, Chairman, President and Chief Executive Officer

Opening Remarks

Thank you, Kathleen, and thank you to the New York Stock Exchange for once again hosting us at this terrific facility. I noticed Kathleen did not advance the slides, so she is expecting me to read the forward-looking statements and to read the GAAP disclaimer. So, if you want to come back in ten minutes, I will be done reading those.

Here is the agenda she already laid out. Let me just offer a few highlights. As was mentioned, Dave and Dan and Tammy and Ralph will fill you in on the details of each of these. But as has so often been the case, we are focused on making sure that we are partners with public policymakers and our customers in achieving the objectives that they

SI-SSA-0015-14546

have articulated both explicitly in terms of legislation and energy master plans and implicitly in terms of the voice of the customer that we hear as we speak to them.

Overall Highlights

With that in mind, we have continued to grow the utility. It has now achieved 65% of the operating earnings of the overall parent. It is a bigger piece of an increasing pie, which we like to talk about. We again raised the dividend almost 5% in 2018. That is 14 out of the last 15 years, and 111 years in a row. Most importantly, though, today we are informing you that the 7-9% growth in rate base looks like an 8-10% growth in rate base over the next five years. We will give you a little bit more detail. To the extent that maybe some of the numbers have changed a little bit, the themes have not changed. In fact, they have not changed for 115 years.

Two Strong Businesses

Let us talk about what I consider to be two very healthy companies.

Utility

At the utility, we are looking at anywhere from a $12-$15.5 billion capital program that will produce that 8-10% growth in rate base.

Power

At Power, I think we have an underappreciated business here. I am extremely proud of the way in which we have repositioned this business. I will show you one or two slides as to what I mean about that, but Ralph will go into much greater detail in terms both the operational performance of the fleet and the financial performance of the fleet in terms of its cash flow generation and its competitive position.

Delivering on Commitments, Realizing Growth

For those of you who have been here before, I am going to once again emphasize the three-part simple model that we adhere to on a daily basis.

It all begins with the operations, making sure we are best-in-class in everything we do. We summarize that as operational excellence. We have been convinced, and I think our track record has demonstrated, that as long as we achieve those levels of operational excellence that we set for ourselves, our financial condition is strong. We are rewarded by our regulators. We are rewarded by our customers. Also, we are rewarded by the market.

With that financial strength, I think you will agree that we have been disciplined in our pursuit of investments, making sure that the return on every dollar of invested capital is above and beyond our cost of capital and that we are creating value in every one of our decisions.

I am not going to read every one of the items underneath each of those three categories, but I think there is an abundance of evidence that we have adhered to that model, whether it is the 16 consecutive years of being the most reliable utility, the 94% capacity factor in nuclear, the improvement in JD Power scores, the track record in terms of increasing the dividend, hitting our earnings targets, and so forth. So, the model remains the same in terms of start with operational excellence. That will produce financial strength, and then use that financial strength to invest wisely.

SI-SSA-0015-14547

Last Five Years

If I look back at the prior five years, before stepping ahead and looking into the next five years, a lot has taken place.

Capital investment

We did invest $18 billion across the enterprise. That was inclusive of three combined-cycle gas turbines plants that will yield about 2,000 new megawatts. That program is almost over. It will be completed with the Bridgeport facility next June. Two facilities are going in to service this year – one at Sewaren, one at Keys.

Rate base

Over the prior five years, the rate base growth was 13%. Yes, 13% is bigger than 8-10%. However, the denominator is a lot bigger now. So, keeping pace with the low double-digit is just a very challenging thing to do.

Transmission & O&M

Transmission – FERC regulated, not New Jersey regulated – is nearly half of the rate base. Throughout this period, despite doing all this work on the capital side, we have been able to hold O&M flat. Dan, Ralph and David will have some statistics on that.

Customer bill

The key here has been, and we will talk a little bit more about it, that there are no limits essentially in terms of the needs of the infrastructure for either expansion or replacement or enhancement. We can define each of those terms in turn. However, our limitation is the customer bill. Because we want to make sure that the customer who is demanding cleaner, more reliable energy, but also wants it at a reasonable price, is not aggrieved in this expansion process.

In fact, overall, that bill is down 20% since 2010, and even more since 2008. Now, that is not the result of our actions. That is obviously the result of low gas prices. But we have had a great partnership with policymakers and recognition of the fact that in the face of low gas prices and low interest rates, now is the time to make these critical infrastructure investments.

Other measures

We have watched the operating earnings grow by 4% every year. We have watched the utility, as I said before, grow to be an ever-increasing part of this increasing pie, going from about 40% to two-thirds. Also, we have watched the dividend grow over 4% per year. Last year it was at $1.72. This year it is at an indicative rate of $1.80.

Looking Ahead

Capital investment

Looking ahead to the next five years, the capital program is $14-17 billion. The range there is due to some filings that are just going into the BPU now that we do not have decisions on. 90% of that capital program will be at the utility, with over 90% of that getting contemporaneous returns. So, all of this is focused on publicly-stated goals of New Jersey policymakers.

SI-SSA-0015-14548

Minimizing risk/volatility of merchant generation

The repositioning of the fleet by eliminating the HEDD units years ago, by eliminating the coal units that had become basically peakers and investing more in highly efficient natural gas and getting the market imperfections corrected for our nuclear plants, has really reduced the risk in our generation fleet to a very low-cost, environmentally-friendly set of assets.

Other measures

The cost discipline in the operations just continues. We are not announcing any new cost reduction program. It is something we pay attention to every day, just as we do customer satisfaction. Dan will talk to you a little bit about the benefits of tax reform, because it was a good news story for both our customers and our shareholders. Of course, keeping that healthy balance sheet, which has served us so well, remains a priority for us.

We will look forward to that 8-10% growth in rate base. We will look forward to the fact that we believe we have the opportunity for consistent and sustainable growth in the dividend, and a line that I will never tire of saying, 'All of this without the need for additional equity.' So, no new equity in the plan for the next five years.

Expanded utility investment

How is the rate base growing?

Transmission

The bottom part of the slide in red from my point of view is the transmission growth. That moves more from a transmission expansion program, which had to take place both in terms of PJM's RTEP and debottlenecking some of the east/west flows to more of an aging infrastructure replacement. We have some switching stations that are 80 years old. These things have done their time and then some.

Distribution

The green is the expansion of both the electric and gas distribution system, which includes GSMP-II, that $1.9 billion program that was recently approved by the BPU.

Combined

That gives us the 8%. So, all those programs have been approved. You may recall in the past we have then added to those bars two types of possibilities. This year, we have only added one type of possibility, which are filings that we are about to make, some of them days away and some of them a couple weeks away. So, if we were to achieve the filed positions in terms of energy efficiency, which we are calling 'The Clean Energy Future' and 'Energy Strong II,' the 8% becomes 10%.

It is safe to assume, just as in the past, that there are things that we are talking about and discussing that are not on those stack bars at this point and time. It is also safe to assume that we will not get 100% of our ask. So, the 8-10% is what we are comfortable guiding towards in terms of rate base growth now for those additional reasons.

Power's Fleet Transformed

Power's repositioning. If I direct your attention to the left part of this slide, I would suggest that the two graphics do not look all that different. Yes. There is a little bit more blue, and there is a little bit less orange. There is about a 9-10% increase in terms of nameplate

SI-SSA-0015-14549

capacity as you go from 2017 to 2022, and that is what the left side is showing you – the nameplate capacity of our fleet. If we were to show 2014 instead of 2017, you would see probably a 15% reduction in the nameplate capacity, because many of our retirements preceded 2017.

But let me suggest that the right side of the slide is quite a bit different, notwithstanding the fact that the colors may not be that different. First of all, you do see an appreciable increase in the amount of gas output, and you see what looks like a decrease in the amount of nuclear output. But that is not the case. The nuclear fleet is expected to produce at the low 90% capacity factor as in the past. What you see is a 24% jump in the net output of the fleet, as we take our average heat rate down from its current level to about 7,700 Btu/KWh, with three new plants, all of which are below 7,000 Btu/KWh, therefore highly dispatchable and highly efficient.

Therefore, it is a really clean fleet. In fact, I think we have a lower carbon footprint than 80% of the generators in the United States today.

NJ Zero Emission Certificates (ZEC)

Let's talk a little bit about our zero-emission credit legislation that was passed in New Jersey. The bill was passed early in April. The governor signed it into law last week. This then is a critical safety net. It basically empowers the BPU to do something it could not do before, which is to issue these zero-emission credits, if it believes that in the absence of these credits, nuclear plants would be retired, and if it values the attributes, and particularly the attributes being zero emissions – thus the name of the bill – and to a certain extent the fuel diversity of the nuclear fleet. It would be incumbent upon the applicant for these zero-emission credits to certify that the plants will be retired in the absence of these zero-emission credits. That is a 330-day process. I think Tammy walks you through a little bit of it in her presentation.

So, the value as we have communicated to you in the past of these fleets cannot be overstated in terms of what they mean to New Jersey. Even at these price points, several analyses that were done both by us and by folks independent of us, have clearly demonstrated that it is cheaper from a New Jersey consumer point of view to keep these plants than it is to retire them. I mean that just in terms of what shows up on the customer bill. If you start layering on top of that the environmental benefits – pick any price you want on carbon, pick market prices for mercury, SO_2, NOx, and fine particulate matter – you layer on top of that the economic multiplier associated with the 1,800 direct jobs, 6,000 indirect jobs and the tax receipts that would be lost, you literally get a six-times multiplier in terms of the wisdom of implementing this particular piece of legislation.

Notwithstanding – quite candidly – some of the questionable reporting on the contents of the legislation, this one was a no-brainer and reflected in the votes of the legislature in terms of 60 out of 80 and 29 out of 40 in the Assembly and the Senate respectively.

Future Aligned with NJ's Clean Energy Agenda

2012-2017

If I look back again, repeating some of the concepts I mentioned a moment ago, the prior five years was expanding the transmission system, debottlenecking, enhancing reliability, responding to Superstorm Sandy by performing some storm hardening and improving the

SI-SSA-0015-14550

resiliency, building some gas peakers at Kearny and up in New Haven, Connecticut, doing some advanced gas retrofits on some of our older combined-cycle units, some modest expansion of our nuclear units, and then some modest efforts in terms of unregulated renewables and about $1 billion.

2018 - 2022

As I look ahead five years, there is a modest modification to that. The single biggest area of expansion will look at the $400 million that we have done over the last ten years in energy efficiency – you will see when David presents some numbers – that is going to turn into a $2.5 billion program as we look ahead in terms of expanded energy efficiency. Also, our first foray into electric vehicle infrastructure and battery storage in a meaningful way to the tune of about $300 million on EV infrastructure and $100 million battery storage.

As I said a moment ago, the transmission program is less about expansion and more about replacing an aging infrastructure. We still have lots of storm hardening to do. You may recall our original Energy Strong proposal was a $3.9 billion number and we got $1.2 billion. So, there is much more to do in storm hardening as we look ahead.

2022 - future

As we look beyond the five-year – this is in the category of stuff that we have not quantified, and we are not guiding about today – there is a lot that we have not done in terms of the catch phrase that you hear so often, 'the digitalization of the operations', both in terms of at the customer premise and in terms of our upstream assets. That could be an advanced metering platform. It could be a variety of other things that can help the customer make choices and help us manage a more distributed set of supply options.

Customer Bills Materially Lower

Let us talk about that customer bill, because it is something that we pay attention to on a daily basis. Here, we are showing what customers were paying in 2010. The footnotes show what we define as a typical customer.

You can see largely as a result of the reduction in gas bills – we are a combination utility at the risk of stating the obvious – that the customer bill is down about 20% from 2010. I forget what the number is exactly, but, if I look at this back from 2008, it is shy of 30% but greater than the 20% number. What that means is if I look at our current predictions of rate base growth, that in a decade the customer will be paying in the year 2028 what they were paying in 2010, in real terms.

That candidly is not something that the customer will remember, and it is not something that the customer will applaud as they see their bill inch up, basically keeping pace with CPI. But it is a rational conversation one can have with the regulator when they see 100-year old gas pipes that are made out of cast iron and leaking and need to be replaced and when they see 80-year old transmission switching stations that need to be replaced, that now is the time in terms of the consumer dividend that was afforded to us as a result of reduced gas prices to make these investments. So, we are absolutely paying attention to making sure that our customers remain satisfied, both in terms of the quality of service that they receive and the cost of the service that we deliver to them.

SI-SSA-0015-14551

Growth in Earnings

If I look at the non-GAAP operating earnings of the company over the past five years, you can see the 4% growth rate that I spoke to earlier. The mid-point this year would take us at $3.10, which is about a 6% increase over where we were last year. You can see the utility going from 47% to 65% of the increased earnings of the company.

Consistent and Sustainable Dividend Growth

Regarding the dividend, we have gone from a point where the dividend represented 120% of the utility earnings, to now, it represents approximately 90% at the mid-point of the utility earnings guidance. I am not suggesting that Power is not a cash generator and not a contributor to the dividend. It is. But to the extent that there obviously is volatility in the commodity markets in which Power participates, and the utility represents a much more stable earnings picture, we grow in confidence in the security of the dividend as a result of this reversal of the pattern where the utility did not cover the dividend to now where it comfortably does cover the dividend. You can see the 4.0% growth rate that took place over the prior five years.

Sustainability is the Hallmark of 115 Years of Public Service

One of the questions we are getting with increased frequency as we meet with our investors is, 'What are our efforts in terms of sustainability?' Without question, sustainability at large has been something we have paid attention to for many years: the sustainability of our dividend; the sustainability of our customer satisfaction; the sustainability of our service; the sustainability of our financial health. I think increasingly, this has come to mean the sustainability from the point of view of social issues, diversity and inclusion and environmental issues.

While we have not trumpeted this in the past, we do pay a lot of attention to these issues. That is why we have been on the Dow Jones North American Sustainability Index for over a decade. That is why Forbes named us one of the 150 Best Corporate Citizens in America in 2016. That is why we continue to invest in things like solar energy and energy efficiency, as well as sustainability programs at our local universities and science, technology, engineering and math programs at those local universities.

In addition to having a lower carbon footprint than 80% of the generators in America today, we have made an additional commitment to eliminate 13 million tons of carbon from our current emissions profile by 2030.

PSEG's Commitment to Stakeholders is Widely Recognized

So, the accolades keep coming in from a variety of sources. I mentioned just a couple of them a moment ago. I will not read this to you. You have it in your notes.

An equally important set of accolades is how the market has voted. You can see here over the one, three and five-year period, we have kept pace with the Standard & Poor's 500, and we have outperformed both the Dow Jones utility average and the S&P utility average. That is obviously important to you, as it is to us in addition to all that we do for our customers, and policymakers and employees. I think we have – hopefully you will agree – delivered in terms of our commitments to you as our owners of the company.

SI-SSA-0015-14552

PSEG Value Proposition

I will summarize here, ending up where I started. The model remains the same. Start with operational excellence, produced financial health and be good stewards of that financial strength in terms of how one goes ahead and makes investment. That operational excellence is simply safe, reliable operations, keeping that balance sheet strong, deploying that capital to the tune of $14-17 billion at the parent, 90% of which will be at the utility. So, strong rate base growth at the utility, a highly-competitive, well-positioned, environmentally-friendly, PSEG power fleet and strong sustainable returns on capital and every one of those investments, which gives us confidence to be able to say to you that we believe we have the opportunity to sustain that dividend growth.

I am going to end with my favorite tagline once again: all of that without the need for new equity at this point. I will be back later for questions. Right now, I am going to turn it over to Tammy, who is going to walk you through all of the exciting stuff we have going on at the BPU and all the fun stuff we just finished in the legislative process.

PSEG Strategy: Review of Regulatory and Policy Initiatives

Tammy Linde

Executive Vice President and General Counsel

Opening Remarks

Good morning. I have the pleasure to speak with you today about the good progress that we have made and continue to make on achieving PSEG's regulatory and policy agenda. I am going to be discussing today five topics. Number one, I am going to give you an update on our distribution rate case that is pending before the BPU, our first rate case on the distribution level since 2010. I am going to update you on some really important new regulations that went into effect in New Jersey earlier this year and how those regulations work and how we have seen good progress under those regulations with our GSMP filing.

I am going to talk to you about the very exciting nuclear bill in New Jersey that became law last week and what is up next under that law and what we expect to happen. As you know, at the same time that New Jersey passed the zero-emission credit bill, they also signed a comprehensive clean energy bill that will significantly change the clean energy agenda in New Jersey. I am going to talk to you about that bill and the opportunities that we believe exist as a result of that agenda for our customers and our investors. Lastly, I am going to update you on the ongoing efforts to improve the much-needed improvements in the market design at PJM and to improve price formation.

Pursuing Regulatory Policies

Let me first remind you of what I talked to you about as far as our policy and regulatory agendas when I spoke here at the conference last year. I covered four topics, and I am pleased to say that we have made significant progress on delivering on those topics.

SI-SSA-0015-14553

NJ distribution base rate case

Number one, I told you that we were going to be filling PSE&G's distribution rate case. We have done that. It is moving on schedule. Later on in the presentation, I will provide you more details about where we are in that schedule, and what is expected to happen next.

Long-term infrastructure regulatory reform

I also talked to you about the need for more certainty on the infrastructure programs in New Jersey. We have had great success in the past on getting approval for much-needed infrastructure programs in New Jersey for distribution pipes and wires. However, there was always a lack of clarity about how long those programs could be, what type of rate recovery we could obtain, and it took a lot of time in those proceedings to fight over those issues. So, we were very pleased when earlier this New Jersey put into effect two new regulations that I will talk about in detail. But, those regulations provide significant improvements in predictability and clarity on what the State's policies are on investments that are for safety, reliability and resilience on the distribution side of the business.

Properly value nuclear supply

Last year, I talked to you about our ongoing efforts to get value appreciation for the under-appreciated nuclear generation assets that day-in and day-out provide significant benefits to customers and to the environment. Last year, we were on a parallel track to focus both to try to convince the federal government and the state government to appreciate the value that nuclear generation has in the current fleet. I am very pleased to stand here today that the conference was scheduled after the governor signed the zero-emission credit bill. So, that is great news for New Jersey, great news for the environment and the customers. We believe that our assets will have a reasonable chance of being selected in that process. I am going to talk to you about that.

Price reform in wholesale energy market

Lastly, I talked to you about our ongoing efforts to improve price formation to have the energy market prices truly reflect the cost of serving load. We are continuing on that effort. I do not have great news to report. It is a slow and very contentious process. I will talk to you about some of the proceedings that are ongoing in that front.

Base Rate Filing

Let me start with some details on PSE&G's base rate case. Just to remind you, this is distribution only. This rate case does not cover transmission. That is a separate rate filing.

In January of this year, we submitted this gas and electric distribution rate case. The rate case is a very modest request. Currently at the BPU, the request is for about a 3% increase. We just recently updated the information and data in that case in May to reflect a few more months of actual data. As you know, New Jersey has a historic test year. So, when we make our filing, we start with quite a bit of forecasted data. Then, as the case proceeds, we update that forecasted data with actual data. Dave Daly will talk to you during his presentation about some of the really significant cost containment efforts that have occurred at PSE&G since our last rate case that have allowed us to make sure this filing has as small an impact on our customers as possible. The change in the tax laws also helped us keep these costs down and have a very modest increase.

SI-SSA-0015-14554

Key components

The key components of our rate case that is currently pending are – if you recall, we had storms since our last rate case, including Superstorm Sandy and several storms since then. The majority of the expenses and the investments that we had to make during or as a result of those storms have already been reviewed by the BPU from a prudency standpoint, but this will be the time where we actually get the recovery of those dollars in our rates. We also have included in this rate case the additional capital investments that we have made that were not covered by clause mechanisms, and that is included in this case.

Depreciation changes

We have updated our depreciation schedules and extended some of the lives of the assets, but also made some adjustments to what we include in those depreciation and make sure that we have the cost of removal for the end of the life of those assets properly spread out into the costs that customers are paying today.

We have included the benefits of tax reform and flowed those back to our customers. We also have proposed a slight increase in our equity level, up to 54% in line with what we are seeing in other utilities and what we believe is a reasonable level in today's environment and regulatory context.

Decoupling mechanism

And, like you have seen with many utilities across the country, we have proposed a decoupling mechanism, something we called a 'Green Enabling Mechanism.' That decoupling mechanism is important from the perspective of enabling future investment in energy efficiency. So, all of the energy efficiency programs that we have invested in in the past, we have been able to work out something in the proceeding to ensure that there is not a loss of revenues on the distribution side of the assets.

As you know, when utilities come out of base rate cases, their rates are set and there is a natural incentive to try to increase the volume of usage, because the per unit charge that we collect for those rates increases as people use more of the units of our product. This mechanism is really aimed at trying to better de-link that disincentive and better align the incentive that our rates provide with the State's goals of reducing consumption, reducing emissions and keeping customers' bills as low as possible. So, we are very excited about hat green enabling mechanism. Again, it is not something that is the first time that it is being proposed either in the State of New Jersey or elsewhere in the country.

Process forward

On the process going forward, we are about half-way done with the rate case. We have submitted, as I said, updated data. Now the parties have a very good feel for the actual test year data. We have been handling a lot of discovery back and forth – nothing out of the ordinary. The next steps are that we will have public hearings where parties and non-parties get an opportunity to come into these public hearings later in June and the beginning July to talk about service and any questions they have.

After those public hearings, we will be receiving testimony of the State of New Jersey BPU staff and rate counsel, as well as other intervenors. That is when you will see other parties

SI-SSA-0015-14555

put forward their litigation positions, what they think the ROE should be, what they think we should get recovery on. That is just part of the process.

After that testimony is filed, there will be more discovery and hopefully some settlement meetings, because as you know, it is very common in rate cases in New Jersey for the cases to be resolved in settlement. It is part of the traditional process for parties to try to work things out. We never enter these cases expecting that we are going to settle. We prepare to go through the entire process, and we are always prepared to do that. But of course, if there is an opportunity to settle on reasonable terms, we will be looking for that opportunity.

Whether we end up in a settlement or a fully-litigated outcome, we do expect this case to be coming to a close in the fourth quarter of this year.

NJ Addresses Investment in Energy Infrastructure

Let me move to these new regulations that I referred to earlier. These two new regulations became effective in January of this year, and they are very significant as far as streamlining and providing clarity on what goes on once a filing is made and what the utility can expect. Essentially, the regulations fall into two categories.

Infrastructure investment program

The first set of regulations provide for more certainty about certain non-revenue producing investments. Non-revenue producing investments are essentially investments that you make in order to provide safe and reliable service. So, it is not something that you are putting in and that you are going to be charging the customer for directly. It is the pipes and the wires and all of the things that are required in order to provide the service that we need to provide to our customers.

These types of investments – these traditional utility distribution investments – now have this special regulation in New Jersey that never existed before that make it clear that they are entitled to accelerated rate recovery, including semi-annual roll-ins into our rates, which is a very significant improvement to reduce regulatory lag when we put in these investments. The regulation spells out the exact type of investments that we can make. It spells out how we go about proceeding with the regulatory process. It talks about the type of rate recovery we are allowed and the type of base investment that you have to make in these types of infrastructure.

Then, it also provides clarity on something that has been unclear in New Jersey for many, many years and that is how long should the BPU approve these programs. As I noted before, we have had great success over the years in working with the State in obtaining approval for these infrastructure programs, whether it was Energy Strong or GSMP-I or the many, many infrastructure clause mechanisms before that. We always spent a lot of time talking in these proceedings and a lot of inefficiencies about could we have a longer-term program, rather than coming back every couple of years and convincing the parties again that it is a good idea to replace aging steel, bare steel and cast-iron pipes. Come up with a program that makes it more efficient, that we can get a longer-term trajectory for those approvals.

This regulation, for the first time, says, that the BPU can approve up to five-year programs, which is very important. It also says that the nexus with the rate case only has to be at that

SI-SSA-0015-14556

five-year increment. That is, again, a very significant improvement. From a regulatory perspective, it really does provide a lot of clarity.

Interim rates

The other set of regulations deal with a slightly different topic. That is interim rates. So, there is now a regulation in New Jersey that went into effect that provides clarity for utility companies that are in base rate cases for how they can put those filed rates, or a lower level if they choose to, in effect, before the rate case is over. Of course, it would be subject to refund and if you end up settling or litigating the results of the case in a way that you put in effect rates that were higher, you have to refund the difference, plus interest back to the customers. So, it provides a consumer protection. However, it provides a great benefit to utilities to not have to wait the entire length of a rate case, because sometimes rate cases can be contentious and sometimes the pressure of wanting to put in effect your rates, can cause utilities to settle sooner than they otherwise would.

We are really excited about these two new regulations, and we think they represent a balance of protecting customer interests, but also providing great efficiency and certainty to the regulatory process and probably most importantly, reducing regulatory lag on these utility infrastructure programs.

Gas system modernization program II

We have already seen the benefits of these regulations. Our Gas System Modernization Program II (GSMP-II) filing was the first infrastructure program to work through this new regulation. We filed it before the regulation became effective, but we knew that these regulations were being worked on. So, in our application, we modeled the petition based upon the pending regulations. The BPU on 22nd May approved our settlement of this GSMP-II with all the benefits of this reduced regulatory lag.

Now, we have semi-annual roll-ins of the rates for this program. We have a five-year program that will start in 2019. We asked for it to start in 2019, because we are still finishing up the GSMP-I program that had been approved before with a three-year period. Now, that GSMP-I was a very good program, but it had annual roll-ins. But this is even better, because it has semi-annual roll-ins. So, reduced regulatory lag and improved efficiency, and it provides for that continuity of the investment in the replacement of these bare steel and cast-iron pipes.

Energy strong II filing

The other thing I want to talk to you about under these new regulations is what is next. Dave Daly will go into some of the specifics of what we plan on investing in. I will focus only on the regulatory context and how we get approval for those. But, I can tell you that we are very close to filing an Energy Strong II program under these new regulations. We have been working on that program for a while closely with PSE&G to make sure that it is consistent with the State's goals and consistent with these new regulations. It will be an extension as well as an expansion of the Energy Strong Program that we had approved back in 2014. I will leave it to Dave to talk about some of the details of what we are going to be investing in if we get approval of that program.

SI-SSA-0015-14557

Nuclear

Let me turn to nuclear, a topic that I have been spending a lot of time over the last year on and something that we are very excited that finally the State of New Jersey has taken a very important step to value the attributes that come from these nuclear power plants.

New bill

As Ralph said, the bill is focused on zero-emission credits, but the bill also talks about the benefits to New Jersey from other environmental attributes from these plants, as well as having a diverse fuel generation mix out there to rely upon, as well as the resilience that comes from having that diverse fuel system. So, it is a comprehensive recognition that nuclear is important to New Jersey, important to the environment and will be important going forward.

Safety net

The bill provides a safety net. What does that mean? It provides a lot of detail on what the State's policy is. The State's policy, as I read it in this new law, is essentially that they want nuclear to continue to be an important part of their energy mix into the future. It does not provide a check right over to nuclear plants, but instead it provides a very, very detailed process for how the Board of Public Utilities will ensure that nuclear continues to be at least 40% of the supply in New Jersey.

BPU actions

So there is a lot for the BPU to do. In 330 days, they have to – and all of the details of these subtasks are spelled out. They have to determine the process that they are going to use. They have to have the utilities in New Jersey update all of their tariffs to start collecting this $0.004 on every kilowatt hour in New Jersey. They have to review the applications that will be filed by nuclear plant owners for these ZECs. Once they review all these applications, they have to rank them, because under the bill, the BPU can choose up to three nuclear plants to give zero emission credits to. They do not have to choose any if they feel that the nuclear plants are not going to retire without the ZECs. But they can choose zero, one, two or three. They cannot choose more than three, and because there is a chance that more than three nuclear plants will apply and that will meet the basic eligibility requirements of being a licensed nuclear power plant in PJM with a license that goes out to 2030.

The new law specifies that this ranking will be very important and that the top ranked plants will receive the zero emission credits. These zero emission credits will then be authorized to these selected plants for three years. The first cycle is a little bit longer than three years, just because of the timing of the bill and the alignment with the PJM energy market time period. But the law essentially approves these ZECs once the BPU selects the nuclear plants for three-year periods.

In that first three-year period, the price that the selected generator will receive is fixed. It cannot change. There is one provision in the law that provides that if the State decides they are not going to select any new generators for the second three-year period, then they can reduce that last-year period, but they would have already had to have made the decision that they are not going to continue selecting generators because they have determined that the generators are not going to be shutting down. So, the bill does provide that opportunity in that last year of the three-year period, but only in a very limited circumstance.

SI-SSA-0015-14558

As Ralph said, there has also been a lot of press that we read on the nuclear bill about what it does and what it does not do. Now that it is signed, I am very glad to be able to clear up some of that confusion. I have been doing that since the bill was signed with many, many stakeholders to make sure they understand what it really means.

Consumer protections

The bill does provide a tremendous amount of consumer protection. As part of this application process, from the very beginning, we expected there to be a thorough review of the financials of the nuclear plants that apply. Of course, the BPU has to have the ability to do that, and not only do they have that opportunity, but each of the applicants have to submit a $250,000 application fee. So, we will be submitting applications for three nuclear plants – the two Salem plants and Hope Creek. With each of those, we will pay a $250,000 application fee. Why is that important? Well, it is important that the BPU who will be doing a lot of things during this time period have the resources to hire and have on their side to help them review and do a thorough job of executing on this important legislation.

The consumer protections do not end there with a thorough review. They also provide for annual certifications by the nuclear plant owners. The purpose of these annual certifications is that the nuclear plant owners have to describe whether they are receiving from any other source, whether federal, regional or state, a payment for these same attributes that the nuclear plants are being paid for in New Jersey. So, if there is a carbon tax that is passed – which we do not think is likely – then this mechanism would take a look at that carbon tax and determine if that was an overlapping payment for the ZEC. If it was, there is a mechanism to address that.

The other thing that the bill does to protect consumers is that it has a repayment obligation. There are many carve-outs for this in the bill where the nuclear plant shuts down because it had no other choice, during the three-year period, but if it had a choice and it shuts down anyway after it is receiving the zero-emission credit, the law spells out exactly what happens as far as repaying the collection during that three-year period. It is a very fair and reasonable mechanism.

A lot to happen in the next 330 days, and we are hard at work back at PSEG preparing our applications. We are very hopeful that at the end of this process, our nuclear plants are selected. We think we will present very strong applications. Hopefully, this time next year I will be up here updating you on our great success under that law.

NJ Advances New Clean Energy Agenda

I want to switch to the other legislation that was passed by the governor last week, because it is very much tied to nuclear. The State has embarked on a very aggressive, forward-leaning, clean energy agenda. We are really excited about that, because it creates opportunities. It created an opportunity for nuclear, because nuclear is part of that future.

It also provides opportunities in many of these other categories, which I will touch on. The Clean Energy agenda is just at its infancy. The governor indicated he would be issuing a new Energy Master Plan, and each one of these topics that is covered under the Clean Energy law has a proceeding or a review by the State that has to occur. So, there is going to be a lot of activity on this front in New Jersey over the next six months and a year. As we have been

SI-SSA-0015-14559

doing for the last 115 years, we will be working very closely with the State of New Jersey, with the stakeholders, and with the policymakers to work with them and support their efforts.

Great opportunities

We do think all of these initiatives are great opportunities for the State. We think they are great opportunities for utilities. I will give you a couple of examples.

On the energy efficiency front, we have been looking to do more energy efficiency investment for many, many years. There just really has not been a strong appetite for it. Now, we have an administration in New Jersey who sees the value of energy efficiency, and right in the law it recognizes that utilities have a role to play. Exactly what that role is will be spelled out in great detail over the next year, but the law specifically talks about utility investment and the recovery of and on that investment to achieve these specific targets that the utilities will have to meet in reducing electric and gas consumption in the State.

We are really looking forward to the benefits that will come from that, coupled with our decoupling mechanism and the opportunity for energy efficiency investment. As Ralph said earlier, it really ties back to making the customer bill as low as possible, while still providing the great service and investment opportunity.

Solar

On the solar front, there will be some major changes in the New Jersey solar regulatory environment. We have continued to be very successful in investing in solar, both at the utility as well as on our merchant side. We think that there are opportunities there.

Offshore wind

On offshore wind, the BPU in New Jersey has already started a proceeding on offshore wind a couple of weeks ago, or maybe even months ago, in anticipation of this law. We have been actively participating in that proceeding, supporting the State, looking for opportunities to move forward with this offshore wind agenda in the most cost-effective and efficient way. We are engaged in that proceeding. We look forward to investment opportunities as a result of that proceeding, whether it is in the offshore wind itself, or in the transmission that will have to be built as a result of the offshore wind.

Energy storage

There is also quite a bit in the new law on energy storage. Up to 2,000 MW of energy storage that the State will study and look at the ability to move forward with that and the cost. We will be participating in that effort and that study.

EV infrastructure

On electric vehicle infrastructure, this is perhaps one of the most mature areas of the new bill. It is really quite mainstream now. I am sure many of you in this room actually probably drive electric vehicles, or someone in your family has electric vehicles. The mainstream nature of electric vehicles has just changed dramatically, and there is a need for investment. We believe that PSE&G – Dave will talk about a little bit of this later – is in a great position to help further those goals and help our customers and help our investors.

SI-SSA-0015-14560

Wholesale Energy Market Reform

I am going to turn to wholesale market design. Switching topics a little bit to an area that we have not made as much progress, but we are not giving up. So, the process at FERC and at PJM is very litigious and very contentious. But there are some proceedings still going on that could potentially lead to progress. It is fairly uncertain at this point.

FERC

At FERC, as you know, there was an effort to do something on a very expedited basis. That has turned into kind of a slower, more methodical look at resilience. We are actively involved in that proceeding. We do not know exactly where it is going to go. I think it could take quite a long time for the government at the federal level to really make significant movements. But we are engaged, and we are pursuing that avenue as much as we can. It is hard to predict what might happen at the federal government on that topic.

PJM

Price formation is another topic that continues to be a struggle. Price formation covers many, many different topics, but I think about it really as the objective of trying to have the energy prices reflect what it really costs to serve load. Unfortunately, on a lot of days, energy prices do not reflect that, because of the mechanism at PJM that certain units are not allowed to set the price and some detailed rules at PJM that prevent true, accurate, price formation. However, there is ongoing effort to look at that. It would be faster. It could be successful as far as regulatory outcomes, but again, we are continuing to engage.

Also, PJM has just started to kick off – I think they had one meeting so far – on their efforts to look at resilience. Their definition of fuel diversity and resilience really has morphed into something called fuel security. It is a little bit too early to determine what that will look like. Right now, it sounds like it is a physical constraint evaluation. More to come. We are actively involved in that stakeholder process, and we will continue to push for a broader view of resilience that ensures that we have fuel diversity and a resilient system to rely upon.

I am sure many of you are watching very closely the capacity market debates at PJM and whether there will be a MOPR – the often, I think, mistitled topic of reform to address state clean energy efforts really is very contentious. It is pending at FERC right now. Our view at PSEG is that there is no need for a Minimum Officer Price Rule (MOPR) to apply to existing generation. There never has been one, and we do not believe that there is a need for one. Whether it is an RPS that is providing support to a solar project or a ZEC that is providing support to a nuclear project, we do not think there is a difference from the market perspective, and we think that the status quo should be maintained.

We told FERC that. And FERC may not choose the status quo. So, we also made it very clear to FERC that under no circumstances should they adopt the MOPR-EX. The MOPR-EX, unfortunately, is aimed at making it more difficult for states to proceed with its clean energy objectives. That would be fine if the federal government was taking action, but with the lack of action to support clean energy and the lack of action to support nuclear at the federal government, it is important that the federal government respect the rights of the states and allow them to proceed with their efforts, as long as they are not aimed at suppressing wholesale market prices, which we do not believe the New Jersey ZEC is aimed at, at all.

SI-SSA-0015-14561

Regulatory/Legislative Policy Initiatives Strengthen Foundation

We have a busy agenda, and we have made I think truly strong progress over the last year on many of these really important initiatives. We have a lot ahead. We will continue to work through our base rate case. We do not expect anything very unusual to come from that rate case, but we are treating with the seriousness it deserves and will continue to work towards a good resolution. We will continue to pursue new programs under the new regulations that I have talked about in New Jersey which reduce regulatory lag, and which provide more clarity.

We will continue our nuclear journey in New Jersey, submitting our applications and working through that process at the BPU, hopefully at the end receiving ZECs for our three plants. Also, we will continue to work with the State as it forms its Clean Energy policy and its agenda, and we think there will be significant opportunities for us and for our customers in those programs. We will not give up on FERC or PJM. We will continue to work with those important parties, hopefully at the end to have much needed market reform put in place and improved price formation in the future.

PSEG Value Proposition

Just to close things out, our regulatory and policy agenda is very important to our value proposition. As Ralph indicated at the beginning, in the end, it is really all about how we operate and how we perform. We understand that the regulatory success that we have had is greatly influenced by our good customer performance, our customer satisfaction, our reliability and our ability and willingness to work very closely with stakeholders and policymakers as we have done over the last 115 years and as we will continue to do in the future. Thank you.

Q&A

Chris Turner (JP Morgan): Hi. Chris Turner, JP Morgan. You guys mentioned that you are going to be filing the Energy Strong program pretty soon. You just got done with GSMP-II. Can you give us more detail about the upcoming filings that are required, whether for those or energy efficiency, what the BPU has to do in terms of getting back to you, timing, spending dollars, etc.?

Tammy Linde: Sure. Dave Daly, during his presentation, will talk about the actual investments and programs that we are going to be seeking approval on. Let me talk about the process of the BPU. It depends on the type of investment and if we proceed with an investment that is behind the meter, whether it is energy efficiency or whether it is solar, that falls into a separate category in the BPU regulations and we have a mandatory prefiling meeting that is 30 days before we submit the filing.

Once we make that filing, there is a clock that ticks 180 days for the BPU once they have a completed application to review it and act on it. That has been in the law for quite a long time. I forget the actual year. It might have been 2000-and-something. We have successfully proceeded under that regulatory program with various solar filings and energy efficiency filings. It is very restrictive on their time.

When we look at the more traditional utility investments, the energy strong type programs, the GSMP type programs, they have never had a specified process at all. This new regulation

SI-SSA-0015-14562

does cover those investments. It does not do it exactly as the process is set forth for the solar and energy efficiency and it, for example, does not require a 30-day prefiling meeting. It does not put that 180-day clock on the review.

But instead what it spells out is that the state's policy is to accelerate these investments and to provide for accelerated up to semiannual late recovery and that the programs can be approved up to five years with a nexus to a rate case every five years. A lot of those more contentious issues in those proceedings now have been addressed by this new regulation. Those were the issues that we mostly got caught up on in the other filings. These proceedings will now focus on, are these utility infrastructure investments needed and appropriate for safety, reliability or resilience? I hope that answers your question.

Chris Turner: Yes, it does. It sounds like the BPU has some leeway there in terms of that they actually approve this as long as you are achieving those goals.

Tammy Linde: That is correct. It does. It is up to us to make our case as we always have as to what the right level investment is, what the impact on customers will be and why this is the right time to make those investments. I think we have been very successful in that regard in the past at the BPU. I do not see any reason why that would change going forward, but we have to take every case, every filing based upon the facts and what is going on at the time.

Speaker: This is super helpful so thanks for that. In terms of price formation, clearly it is going very slow and it is valued down maybe to fast-start. Where do you see the shape or form it takes right now and what kind of timing are you expecting?

Tammy Linde: On the fast-start pricing, we are very hopeful that FERC will act this year. They do not have to act on any particular schedule on that, but we do think that the case is far enough along that it is reasonable to expect FERC to issue a fast-start pricing decision this year. There are people who do not agree with the fast-start pricing mechanism that is before FERC so people could challenge that in court. Typically, those proceedings, once the FERC acts, the mechanism goes into effect and any challenge does not slow things down. That is just typically the way things are done at FERC.

As far as all of the other price formation efforts, unfortunately, they are a little bogged down in the stakeholder processes. There are just so many different opinions in the PJM stakeholder process on what they should look like, what the benefits are. As I said, we are not giving up; we are going to continue to pursue what we think are important price formation changes and we are not alone. There are many companies like us making those same arguments. But I do not have specific dates on when PJM will move forward or when they will be successful on that front.

Speaker: Is there a view in terms of pricing impact of the fast-start, if it gets done, of when you think that impact would be?

Tammy Linde: There is. I do not know that off the top of my head. Certainly, we have evaluated what we think – I do not know if we have talked about that yet. So, we can follow-up with you after. I do not know if we have made that public yet either. Why don't we talk afterwards? If we have, we can certainly point you to where we described that in the past.

SI-SSA-0015-14563

Speaker: Thank you. First of all, just on the bills. So, I know the bills have come down dramatically, but if you look forward from here with all the different rate mechanisms or the clean energy mechanisms with the ZECs capacity went up. Just if you took from these levels, are bills still kind of inflationary type growth?

Tammy Linde: As Ralph indicated, it is something we focus on every day. And Dave, president of PSEG, will be talking to you about our ongoing efforts to keep our costs down and that is one of many levers that could impact customer bills. One is how we run the utility and how we run it in a way that minimizes the O&M increases. And we have done a great job. I think we are going to continue to keep those costs down and keep the utility as lean as possible. We do not like to sacrifice needed investments. We always want to make the investments that keep the system strong and resilient, so when storms come or when customers want their electricity to come on, everything works as planned. We try to put those at the top of the hierarchy of what costs should be passed along to customers.

I think a significant benefit though in this clean energy agenda for customers will be energy efficiency. That is one area where we are really excited that the state is not just looking at adding more renewables or adding things to the system that cost customers money, but looking at ways that we can invest in a way that brings down the customer bill. So, that is a really important piece of how this all fits together and we will continue to be diligent about keeping our customers' costs at a reasonable level. We think that is important. How much that energy efficiency will keep customers' costs down depends on the programs and how it is moving forward. We will figure that out over the next year what the state's appetite is, but there is great opportunity there.

Steve Fleishman: One other quick question. If you look at the clean energy initiatives, a lot of them from our standpoint arguably are long-term pressurers; offshore wind, adding a lot of renewables and lowering demands for energy efficiency. I do not know if maybe Ralph wants to answer this. So, how should we think about what these things might mean for the other side of the business?

Ralph Izzo: We made a conscious decision that the PSEG sandbox is much smaller than the big power sandbox. The big power is looking at 168,000 megawatt sandbox and PSEG is looking at a 10,000 megawatt sandbox. So, they do put pressure on PEG Power. We are willing to do that. In terms of what it means for the customer, as Tommy said, we think that the combination of infrastructure placement, cleaner energy puts upward pressure on prices, energy efficiency puts downward pressure on prices. All of that, except for the transmission investment, reduces load opportunity for Power just given the size of the pool that it can play in.

The issue for Power, as you know, if you look over the last ten years has not been volume of output. It has been price per unit. We are going from 50 terawatt hours to 64 terawatt hours. The question is, are we going from 30 dollars a megawatt hour to 25 or to 35? So, we do not worry about the volumes that power faces as much as the price it faces.

Leslie Rich: Hi. I wondered if you could shed some light on how the BPU might go about doing the selection of nuclear plants for ZECs. Clearly, you three are going to apply, but there are some other ones in Pennsylvania, for example, that could also apply. So, just

SI-SSA-0015-14564

wondering what your understanding is of the lens through which they will judge the determination of need.

Tammy Linde: That is a very important question and one that is addressed by the law itself. We are pleased that it is directly addressed in the law. The BPU, based upon the law, is to identify and rank those units. So, once it identifies which units meet the binary, are they a risk of retirement and if they retire would they have an impact on New Jersey from an environmental, fuel diversity or resilience perspective. So, it is a yes or no on that and then if they have more than 40% of the energy in New Jersey then they rank them based upon the impact that the retirement would have on the state of New Jersey in those three categories.

So, they will be ranked on the environmental, fuel diversity and resilience perspectives looking at which one's retirement would have a bigger impact on the state.

Leslie Rich: Given that, do you sense that there could be some of the Peach Bottom or Susquehanna that are very closely tied into your zone that could potentially qualify?

Tammy Linde: I think that there are many plants that could qualify for that first screen; the yes or no lens. On the ranking, I believe that our plants have an advantage in the ranking. I do not know exactly how the analysis will end up that the BPU will conduct on determining which ones have a bigger impact on New Jersey if they retire, but I think there is a reasonable chance, based upon our analysis and our experts internally, that our plants have an advantage at the end of the day. Again, that will be determined and there are two step process. The first two is eligible and then the separate ranking of those eligible plants.

Abe Azar (Deutsche Bank): What role do you see for the utility to play in some of the other elements of the clean energy agenda? Mainly, the renewables and the solar and offshore wind, if any.

Tammy Linde: Sure. I think there are numerous opportunities yet to be spelled out in great detail; this law was just passed and the law spells out numerous steps that have to take place. Storage, for example, the law spells out that there needs to be a stakeholder process and study conducted of the benefits and opportunities for bringing up to 2,000 megawatts of storage. If the state decides to go ahead with storage, there is a reasonable chance that they could do so in a way that the utility has an investment opportunity. That detail is yet to be seen. On some of the others such as energy efficiency and electric vehicles, I think it is more obvious and more clear at this stage what role the utilities could play.

Energy efficiency, the law speaks directly about utilities in New Jersey being required to reduce consumption both on the electric side and the gas side and then specifically talks about the investments that the utilities make in order to achieve those reductions will be recoverable. Not only the recovery of the investments, but an earnings opportunity on top of that investment. I think energy efficiency is really clear. Some details still to be worked out on the proceeding about what type of energy efficiency and where and how quickly and important items like that, but I think there is a clear path for utility involvement. It is important for the utilities who are the ones responsible for achieving these reductions to have an active role in meeting those objectives.

On electric vehicles, I think there is an opportunity and Dave will be talking about those opportunities in his presentation about our proposed clean energy filing that will interest you.

SI-SSA-0015-14565

We do think there are some things that utilities can do, particularly as far as enabling some infrastructure for electric vehicles, and making electric vehicles easier to access for those who have a difficult time getting access to it.

On solar, we have had a long history of successful investments in solar, both on landfills in New Jersey as well as in other locations that are challenging to install. We believe it is important to continue utility scale solar. We think that is the most cost effective solar investment and we are very optimistic that the state will see an important role for utilities on all of these different initiatives.

PSE&G

David Daly

President and COO, PSE&G

Opening Remarks

Good morning, everybody. If you have been here for many years, you are probably used to Ralph LaRossa being up at this point, and he reminded me last night that he has been doing this for the utility for ten years. So, I am very honored to be here. I moved into Ralph's role this past October having been with the company over 30 years and having worked for Ralph for many years. Ralph has been a great leader of the utility teams and has been a mentor to me and really enjoying continuing to work with him in his new role.

Key Takeaways

Tremendous team

If there was three things that I would want you to take away from my presentation today it would be these. Number one, it would be kind of looking back at what I just said: that the utility has a tremendous team. It is a team of people that Ralph built, that I was honored to be a part of. We have two leaders here today; Kim Hanneman is sitting in the third row here on the right and John Latka. They are both senior VPs, members of our executive officer group part of that team. The utility team is one that delivers on its commitments. It is a group that delivers day-to-day. As the slide says, on reliability, 16 years in a row. It is a team that gets investment programs approved at the BPU. It is a team that delivers on those investment programs on time and on budget.

Tremendous opportunities

The second is that we have tremendous opportunities that I am going to describe on the following pages. Opportunities in investments in infrastructure on the gas and electric side and our transmission infrastructure. Those opportunities are not three or five-year opportunities. These are opportunities that have 20+ year runways on them: needed investments in the basic infrastructure that helps to grow the economy and over the long-term produces strong jobs. Winners all the way around. And opportunities on clean energy. Tammy just described, based on the question that Abe asked, about where our opportunities are. I am going to describe a very specific one we are moving forward with on energy efficiency, electric vehicles and energy storage for $2.9 billion. But every one of those other items that Tammy just went through are other opportunities that are before us and that we will be pursuing very aggressively.

SI-SSA-0015-14566

Policy alignment in NJ

Then, the third piece is the alignment that we have from a policy perspective in New Jersey. What we are proposing here in this business plan fits like a glove with New Jersey policy, coming from all branches of government, coming from the BPU. It is very, very consistent. On the infrastructure side, the infrastructure rules updates that Tammy described on the how infrastructure programs are implemented. The energy efficiency program that I am going to describe, a 2.9billion filing, is tailor-made for that legislation. We really do not have to do much work to implement that legislation. We have done it already.

So, as I said, a very strong team, tremendous opportunities over a long period of time and very, very strong alignment with New Jersey policymakers.

PSE&G Strategy

We put that all together. The business model that we use is in the bottom right, that Ralph described, and our strategy is to create a sustainable platform that balances reliability rates policy and produces strong financial returns over the long-term.

~$14 billion Investment Program Delivered

This slide gets into a little bit of that team. This is a little bit of history and this goes back five years. This is 2013 to 2017 and it is depicting rate base growth and earnings growth. $14 billion was invested. Earnings and rate base grew at around 13%. One of the things that is important on this slide is the fact that there is a very narrow bandwidth between the growth rate of rate base and the growth rate of earnings.

Earnings are slightly less, but not much. They are both right around that 13% rate and that is because of the contemporaneous or near contemporaneous of these returns that we have on well over 90% of these investments and some strong cost control by that team. The growth from 2013 on rate base was from about $10.5 billion to about $17 billion and earnings from about $600 up to just about $1 billion dollars.

Transmission business

The only other point I would make on this slide is the bottom section in the red, which is our transmission business, is the growth of that business. Growing from about a third of our business and about 3.8 billion in rate base to almost double that over that time period. By the time we get to the end of 2017 then, transmission is close to half of our business. That is important from the point of view of the regulatory diversity. Transmission of course regulated by FERC with the forward-looking FERC formula rate and the other half regulated by the BPU. So, over this time period, we have also developed a good diversity in terms of our regulatory structure. As I said, this gets back to the team that has been delivering over the last five years.

$12-15.5 billion Investment Program

Then, moving to the exciting part of this presentation, is the program going forward from 2018 on the far left to 2022. I just want to explain a few of the moving parts in this slide because I think there is a lot of fantastic information in this slide.

What you see in the header that it talks about $12 billion to $15.5 billion and what that is referring to there is if you look at the slide on the bars there is solid bars in the bottom and then there is hatched bars on the top. The solid bars are the programs that we have in place,

SI-SSA-0015-14567

approved or very, very high confidence for approved and we are not really focused on needing to get them in place. They are already in place. If you look at the aggregate amount of the capital spend of the solid section on the bottom, that is the $12 billion number over that five-year period. The abstractions are the two programs that we described we are going to be filing very soon. The first, the energy strong program, with a $2.5 billion program over five years, and the clean energy program, with a $2.9 billion program. If you take the bars and include both the solid on the bottom and the halves, that refers then back to the $15.5 billion. So, somewhere between those two.

Transmission business

If you just then look at the far-right bar and just to describe then what is in there, the bottom bar is the red. That is our transmission business, the one that you know about very well. The aggregate value of those bars going left to right is about $6 billion that will go into that business under the FERC formula rate. The green bar–again, programs that are already in place, includes about $3 billion in the aggregate in those green sections. About half of that is our base depreciation level spending on the base structure and new business. So, that is spending that is within our depreciation levels and therefore, are recovered in rate. That is about half of it.

GSMP-II

The other half of what is in that green section is the recently settled GSMP-II which, as Ralph had mentioned as well, is about $1.9 billion. Now, that program is a five-year program that starts in 2019. This is only showing four years of that.

So, GSMP-II component, depicted in the green section of this bar, is four of the five years. It is about $1.5 billion of the $1.9 billion. If we were showing 2023, there would be another 400 million or so of GSMP-II out there. The only other piece of the green is that all the way on the left, that green sliver in 2018 includes the last year of GSMP-I. GSMP-I was a $900 million program, about $300 a year, and we are spending $300 million on GSMP-I on 2018. Then, GSMP-II starts in 2019. So, the green is all about the gas and the GSMP-II program, having been approved by the BPU a week ago, is baked into the solid.

Base electric distribution

Then, the blue on top of that is our base electric distribution work. Base work within depreciation do business. That is going left to right about a $2 billion cost.

ES2 & Clean Energy

Then, the two programs. The Energy Strong 2. Energy Strong 2 is an electric and gas program. I will talk a little bit more about in a few moments. In total, it is $2.5 billion and once again, this is only showing four of the five years because the fifth year would be 2023. Now, think about that program at about $500 a year or so, that is showing about $2 billion. Four years of 500 and there would be another $500 million in 2023 if we were showing that far.

Then, the clean energy. The clean energy is a $2.9billion program. It is a six-year program. So, there is two more years of this program not depicted on this chart. The value of the abstraction here in the first four years is about $1.5 billion of the $2.9 billion, and if we showed the extra two years, it would be about $700 in each year. That is a program that

SI-SSA-0015-14568

ramps up and we assume we get approval, as you see, in 2019. So, that is just the way that the chart is constructed. If we got zero out of Energy Strong 2 and zero out of clean energy, we have a $12 billion investment program. If we got everything on those, we would have $15.5 billion.

Prior capital plans

The other point on this slide is what the two lines are talking about. The bottom line, going from left to right that goes from 2018 to 2020, was our 2016 to 2020 two years ago when we were here talking. That is what we thought the level of investments was going to be in those years. Then, the line just above that is last year's capital plan that shows what we thought last year. Of course, my job and the job of our team is to draw the third line which will be this year's and make sure that is intersecting through that hatched area. You do see we have this track record of improving on each year's plan on the capital and I am confident we will be able to do that. It is going to be about getting approval for those half areas.

Transmission

Then, just a little bit about some of the programs. First, is the transmission program. As you saw in the previous slide, that was in the solid section at the bottom. $6 billion. Ralph mentioned that this program in days past had more to do with solving reliability criteria violations. They still come up. PJM's goes through an annual process where they will identify where there are violations on the system and then local owners come up with projects. As more renewables get integrated into the grid, there may be more of them coming up, but right now the bigger driver of the $6 billion program over the five years is the transmission hardening, the lifecycle and the 69kV work.

Hardening

The hardening, for example, we have three projects going on now. The McCutcheon, Burlington, Trenton project is a $750 million lifecycle project that is replacing aged equipment, very old transmissions equipment. We have a substation, for example, in Newark. $350 million was just approved to change out old life-cycle, end of life equipment. Just very, very recently we had a $550 million program approved; the Roseland/Pleasant Valley upgrades. A 230kV upgrade. Those are the types of the projects that are in the lifecycle.

69kV program

Then, the 69kV system is a very robust program. We are one of the few utilities that has a sub transmission network at 26kV and we are upgrading that network at 26kV sub transmission up to transmission level. These are very, very valuable investments. They bring tremendous reliability. They bring tremendous flexibility in the grid and that is a big piece of what the transmission program is all about over the next five years.

Offshore wind

It is not shown here because it is not there yet, as Tammy said, but offshore wind is a potential opportunity for the future. The governor's platform calls for up 3,500 megawatts of offshore wind. At any level above 1,000 megawatts, but certainly at 3,500 megawatts, there would be a tremendous investment in transmission first to bring the power ashore and then once it landed, depending on where it landed, there would likely be significant upgrades particularly at 3,500 to upgrade the on-land system to get the power where we need to go.

SI-SSA-0015-14569

There are other things out in the future that we are looking forward to as well that are not yet mature enough to bake into the plan.

Gas Distribution

Then, the next is the gas distribution. That was the green section back on the previous slide. About $3 billion over the next couple of years. Just a couple of things that are depicted on this slide. One, the GSMP-I program. That was 2016, 2017 and 2018 so we are just finishing that program. There is about $300 million left to go in that program this year. That was a very successful program; was $900 million total over the three years. It did some of the same types of things. On the replacement of gas mains, it was replacing cast-iron, unprotected steel and so forth. That is really not playing into the next five-year picture very significantly.

GSMP-II

What comes next is the GSMP-II, approved last week, $1.875. Two components each year over the five years. The base amount of $315 million a year and stipulated base of 60 million so a total of $375 a year. One of the improvements in the infrastructure regulations that were approved was more flexibility to shape that step. So, we have $300 million over the life of that GSMP-II program. Out of the $1.9 billion, about $300 is flowing through step, but we can shape it and time it later in the period to better align it with rate recovery in our next rate case. That was a very significant improvement that allows us to minimize lag on that program.

Base capital

Then, there is the base capital on the new business that we talked about. Depreciation level capital spending in our gas business is about $150-160 million and we have new business that is probably in the range of $80-100 million a year. So, the gas business is in very good shape. Clause program for GSMP, depreciation spending and new business for the balance.

Electric Distribution & Energy Strong

Moving on to electric distribution, about $3-4 billion depicted here. Energy strong one is a program you may recall was a $1.2-billion- program and the arrangement in that program was the first billion dollars flowed through a clause with near contemporaneous return and the last $200 million was to be recovered in the next rate case. As that program has come to an end now this year, we spent just about one billion dollars. Just a little bit over.

So, all of that did flow through the clause and there is really not that much, maybe $30 or $40 million dollars above the billion-dollar amount, that would not be recovered in the rate case. We did not spend the additional $200. We did all the work. What we did was got better pricing; back to the team executing very, very well. So, we did all the work, but we were able to get it done for about $1 billion and that savings flowed right back to customers.

Energy Strong II

That program is coming to an end so that also does not really factor into the capital program going forward, but what it does is Energy Strong 2, it has two components and a lesser component in gas. The lesser component is about $1.5 billion and the gas component is about one billion. The $1.5 billion on the electric is the core infrastructure upgrades. Hardening, we are raising substations. We have 16 substations to raise in this program. We

SI-SSA-0015-14570

look at the FEMA 100-year flood maps and then we take that amount, we go one foot higher. There is aging infrastructure components to this. We have 85 stations we are going to be looking at that have an average age of 73 years. Within that subset of those 84 stations there is a group of 20 or 25 that have an average age of over 90 years. So, there is a lot of work to do in these substations and then there is some technology. So, that is what that program is about. $2.5 billion, five years, starting in 2019. We plan to file that very, very soon in the next week or so and we will get going on that very shortly.

Gas resiliency and life cycle

Then, on the gas side, about $1 billion of that $2.5 billion is really focused on resiliency. Our service territory in New Jersey is not about our gas system. It is fed by five major pipelines that come from the west, from the southeast and then from the southwest. What we have been doing, again, aligned it with the BPU policy, is looking at the impact on our system if one of those major pipelines was to fail.

What the $1 billion dollars is doing in this program is essentially as these pipelines come in, they come into what we call metering and regulating stations and their pressure is dropped and then they are fed into our distribution system. So, the transmission coming in through these stations and then into our distribution system. The biggest part of this gas program is taking the downstream side of our meter read stations and better interconnecting it so that if we have a problem with one of the major pipes coming in, up north for example, we can better move gas on the downstream side of the stations up to the north.

So, it is kind of like creating a gas sub-transmission system to better move gas on our side if we have a problem on the other side with the pipelines. It is something that has the attention of the BPU and is the vulnerability that we have to the reliability of those pipelines. There was an incident in 2015 involving one of the pipelines that really raised attention to this matter and so this work will allow us to better move gas around in the event we have any of those types of problems.

Then, on electric we have about $2 billion in over five years on base capital and new business.

Partnership for a Clean Energy Future

Then, I would say the most exciting part for me is the clean energy future. It is a tremendous opportunity. It says partnership there because, as I have said, this is a hand in glove alignment with New Jersey's policies. $2.9 billion investment. The biggest part of that is energy efficiency at $2.5 billion, $300 million on electric vehicles and $100 million on energy storage for a total of $2.9 billion.

Energy efficiency

The energy efficiency component is submitted as a filing. As Tammy described, we have a 30-day meeting. We have held that 30-day meeting. You cannot file any sooner than 30 days, but we did hold that meeting. This thing is ready to go. On these types of filings, they have cost benefit tests. Tammy had mentioned the fact that these actually help lower bills. It is exactly what they do. These tests basically look at you making these investments and you are doing an investment which is going to allow you to eliminate generating a kilowatt hour or sending through a thermogas and the question is, what is it costing you to save that therm versus if you had generated or flowed it through.

SI-SSA-0015-14571

These tests pass very, very strongly. The benefits of these programs outweigh the cost of these programs and they save customers money. The energy efficiency is precisely aligned, as it turns out. We were working on this before the legislation was finished, but the legislation calls for 2% electric savings, 0.5% gas savings. Our program, at the 2.5 billion energy efficiency, achieves basically that amount. So, it is very much aligned. We do not have to do much work to comply with the new regulation.

It involves residential and commercial/industrial energy efficiency options. Electric and gas, virtually everything that uses a kilowatt hour of electricity or uses a thermogas in a house, in a commercial environment, in a hospital, school or university. Whether it is an appliance, a refrigerator, gas water heater; in the industrial settings, motors, pumps, lighting; you name it, it is in there. In low income, new construction and a tremendous program. We are very, very excited about it.

Electric vehicles

The electric vehicles is $300 million and basically has a couple of components. A residential component to help get the level two chargers that need to be in place for electric vehicles to be viable into the residential area. Workplace, multifamily charging station, travel corridors; and there is a couple pilots associated with this program. One of the ones that we are very excited about is an electric school bus pilot that brings the benefits of clean energy particularly into areas that are underserved and in the summer time when those buses are not being used, they are basically sending power back, so it is kind of a pilot looking at how you can use batteries to flow power both ways. Everything we are doing on the electric vehicles infrastructure component is smart and we are learning. These programs involve understanding how people will behave. How we can best utilize and manage charging.

Battery storage

Then, battery storage is 35-megawatt battery, $100 million. Solar smoothing, distribution deferral, microgrid, applications, peak production. It is a six-year program, as I mentioned earlier, for all three. As Tammy mentioned, their legislation describes contemporaneous returns for the utilities that make these investments. The legislation mentions and supports decoupling for the folks that make these investments and we expect to file this very, very soon. A very exciting step into this arena. It makes economic sense, provides an offset to the bill pressure that the infrastructure has put on because it literally saves money. We show that with hard dollars and cents and support customers.

Opportunity for Rate Base Growth

So, we put that all together and we are back looking at rate base for the next five years and the construction of this chart is very similar to the one at the beginning with what we mean by the solid section versus what we mean by the hatched. The solid sections are the things that are in place that we know are approved and ready to go; the transmission business. The green is the electric and gas combined this time together in one section that includes the GSMP-II because that is improved. And the hatched section are the two programs that we are about to file.

Similarly, like the structure of the previous slide, if we have nothing from Energy Strong 2 and from clean energy, the rate base growth over this period would be 8%. If we got 100% of those two filings, the rate base growth would be 10%. 10% would be rate base at about

SI-SSA-0015-14572

$27 billion; $24.7 billion for the eight percent. As I have said, what our job is right now is to get those filings in and get them approved. We have a good track record for doing that and that is what we plan to do.

Operational Excellence:

Operational excellence, just a few thoughts here because our credibility, when we go in for these filings, it all hinges on the fact that we are running the business and we have shown we can get these things done on time, on budget.

Safety

The two top slides talk about safety which, in my opinion, safety is a leading indicator of how well a business is run. What that stock is showing there is depicting on the top left how many injuries we have and on the top right how severe those injuries are. We perform in the top 10%; the top decile of the industry. And there is no way, in my opinion, a company cannot perform at that level with safety without a tremendously strong culture, without engaged employees and without a discipline around process. So, when you look at safety, if you are not able to work safely you are never going to get there in the rest of your business. This is a very, very strong leading indicator. We saw this a little bit on Long Island. I am going to talk about it in a minute.

When we first started on Long Island there was a lot of problems with safety and what goes along with that is poor business processes. They go hand in glove. So, very, very strong performance on safety and very proud of that. It speaks to the discipline we have around process and procedure and employee engagement.

Reliability

On the bottom, SAIDI, the measure of reliability. I think it is the best measure. It basically says how often we route our power. How many outages you had and how long they lasted. You put the two together, it is your total outages. Once again, lower is better on that chart. The line on all of these charts is our performance and you see on the far right on the bottom chart, we are almost off the chart. Meaning very, very strong reliability. A good track record is there as well.

Customer satisfaction

Then, on customer satisfaction. We look at customer satisfaction and use JD Power. They were compared against a panel of about 20 companies, all in the northeast. We look at electric, residential and commercial. Gas, residential and commercial. Now, on this, the higher score is better. The color coding in the bars are the quartiles and you will see we are basically sitting in the top quartile in every one of those quadrants. Strong safety, strong reliability and strong customer satisfaction.

The other thing about this slide that I would like to point out is just take a look at the upper left chart and look at 2016, which is the second bar from the right. If you were in the top quartile in 2016, like we were, in the green, but you did not improve. One year later, just draw a straight line to the right and look where you are. You go from the top quartile to the third quartile if you do not improve. Look there on the far upper right, same thing. In fact, there, you could be in the top quartile in 2016; if your score did not go up, you are at the very bottom. That phenomena, of this improving trend, that to stay in the top quartile you

SI-SSA-0015-14573

need to continuously improve, is very evident here and that is what we have done. The team has improved and will continue to improve.

Demonstrated ability to contain growth in O&M

O&M, this is a very strong track record here of cost control over the last five years or so. Our job is and our intention is to keep it going at that rate. This allows us to keep rates down and allows us to earn our ROE. We have a lot of things going that are depicted on the bottom of the page and that is my job and our team's job is to control these costs so we can continue that trend.

Materially Lower Customer Bills

This slide was also in Ralph's presentation. A little bit about rates. So, the upper left-hand side is an electric customer and the right-hand side is a gas customer. If you take a combined customer, which most of our customers are combined customers, the rates are down, as Ralph had mentioned, 20%. Adjusted for inflation, they are down 30%. By the way, without changing the rate, we also gave back bill credits along the way as well of 680 dollars. It positions us very well. The point of this slide is that this is the time to make the investments: when we have this head room.

To make the investments in the critical infrastructure. To make the investments in energy efficiency which will help mitigate some of those costs and leverage this head room that we have in this situation over the last many, many years. That is what we are doing and I think, again, we have alignment in that thinking around leveraging this head room and making investments now, evidenced by the infrastructure upgrades, infrastructure regulation that came out and the support from the clean energy.

Non-GAAP Operating Earnings

Our operating guidance for 2018 is unchanged. We are on track to meet that performance for this year.

Value Proposition

So, to wrap up, PSE&G it is all about operational influence. It is about financial strength, recovery programs and it is about that capital program that is somewhere between $12 and $15.5 dependent on our success with Energy Strong 2 and clean energy. It is a very, very strong program driven by a strong team and the other things we talked about.

Long Island

Just real quick on Long Island. I led Long Island for the past four years prior to the opportunity to come back here to be a part of the New Jersey operation. Long Island is a management services contract. It is completely performance based. If we do a good job, we get paid. If we do a really good job, we get paid 15% extra on incentives. If we do a lousy job, we get thrown out and you will get a check on the way out the door. That is basically the model and that is what we have done. We have improved.

For the most part, when we started this operation four years ago, we were taking practices with New Jersey, lifted them up and bringing them over and replicating them. What has happened is the team out there has become more and more engaged and there has been very significant improvements. We have got to the point now where a lot of the practices are now flowing back and forth because we have a very strong team. The improvements have

SI-SSA-0015-14574

been made. We have hit 95% or better of all of those incentive targets and we are meeting all of our financial commitments.

Improvement in performance metrics

On this last page on Long Island, I had mentioned on the upper left hand the safety performance. I mentioned how if you do not have safety right, you are never going to get your processes right. So, we are improving that safety performance. To be in the top decile, we need to be below 1.0. So, you see on that chart in the upper left, we started at 2.8, down to 2.3 and then to last year at 1.1. We are almost getting there and that is really coincident with getting engaged culture, getting our processes in place and getting that discipline in place. We are on the right path. Satisfaction is up. Reliabilities are in good shape and improving and so it all speaks to the piece around the performance-based contract and we are doing what we need to do out there by leveraging the best practice between our companies.

So, with that, I will take any questions.

Q&A

Paul Fremont: Hi. Could you give some examples of the energy efficiency investments? $2.5 billion is a lot to spend so I am not sure if you are doing that inside the home or outside the home.

David Daly: So, I will give you a couple of examples. Inside the home, smart thermostats. Anything down in the basement on heater, water heaters, furnaces, electric and gas. Any appliance in the home, refrigerators and those types of things. Any of those types of lighting in the homes as well. Anything that is using gas or kilowatt hour where we would go in and put in a much more efficient appliance, light, so on and capture those savings. So, that would be an example in the home.

On the commercial/industrial end, you have bigger types of equipment. Motors and controllers, air compressors, food refrigeration. So, when you think about large commercial/industrial, any of those types of pumps, motors, fans, lighting as well inside that home there.

The program in the low-income area does the same type of thing more in multifamily type settings. Some weatherization type things. There is another aspect of it involving analytics. So, we put the smart thermostat in, but some of the other offerings are then to help customers analyze the data that is coming from smart devices in there and help them manage their bill. It is kind of like management services analytics type aspects to this as well. Those would be a couple of examples in the energy efficiency area.

Paul: I was just hoping to put some actual numbers on your slide 41. The total rate base in 2018, what would that be?

David Daly: At the end of 2017 it was $17 billion, so I can get you the number.

Paul: Then, is the 8-10 CAGR off a 2018 base or is it off the 2017 base?

David Daly: It is off end of year 2017. So, it is off that $17 billion number.

Paul: Great. Then, I know in the past you have provided sort of a detailed breakout of capital spend by category which normally would have appeared in 10-K. Are you going to

SI-SSA-0015-14575

provide sort of annual numbers/breakouts for your CAPEX or are you going to wait until the next 10-K.

David Daly: The breakout of the CAPEX for example on the slide in front it breaks out between transmission versus gas. You mean within those categories?

Paul: I think on an annual basis in your 10-K you have given the five years of spend for each of the buckets in numbers. Are we going to need to wait until the next year K to put these numbers to get the actual numbers, or are you going to put something in potentially before that?

Kathleen Lally: We have them Paul. We will get them for you. They are further back in Dan's presentation and so on, but we have them for you.

David Daly: Okay. I will ask Dan to think about that and maybe address that when he comes up.

Speaker: You said that part of the storm hardening was when you showed a picture of taking an old substation and raising it up. You said that you looked at the flood maps and are going a foot higher than what they say is the sort of expected maximum level of potential flooding. How do you get comfortable that that is actually adequate? The only reason I ask is because I remember during Sandy, [inaudible] said we did 15 different storm models and we thought that the East River was not going to go above x number of feet and we were wrong and one of their plants got flooded and the city got blacked out.

So, what does it cost to go an extra foot above the foot you are already going? How do you get comfortable that you are actually spending this money to the level of protection?

David Daly: First thing was, after Sandy, based on that experience, FEMA redid all of their flood maps and they made them much more, I'll say, conservative. So, the approach we use, if a station has been flooded particularly during Sandy, we compare the new FEMA standard plus one to what we actually observed. We saw a very good cushion. Now, we are doing stations now that were not flooded and so we are basically saying that, with the revisions that were done and the observations we made, that we have confidence in that formula which is the 100-year plus one.

Speaker: Understood. And that design configuration, if it performs as planned, even if there is flooding, there will still be power? As long as the lines are up?

David Daly: That is right. There is a lot of other factors of course. That if there is flooding at that level there probably was very high wind. Our electric system is 90% overhead outside plant running down streets with a lot of tress on them. When the winds blow at 130 miles per hour, the lines are coming down. So, you may have other issues going on, but the stations themselves without getting particularly the electronics flooded. We have estimated that, for example, in the first program, that 500,000 customers would not have seen an outage if we had done that work prior to Sandy, as an example.

Speaker: Great. Last question, you put a number up there on the age of some of your substations which was astounding to me; 70+ years. Are they really that old or are you making substantial – are you replacing components? How do they actually still work at that age and why are they actually still that old? Why have they not been replaced before?

SI-SSA-0015-14576

David Daly: Right and it is kind of funny to call it 'end of life' replacement, which we sometime call it. Do you ever travel around New Jersey?

Speaker: Yes, I am from New Jersey.

David Daly: Right. So, if you travel around New Jersey, we have over 300 of these stations, you will see some of our stations have a brick enclosure on them. Those are the older, they call them class A substations. That is the stuff that has the 90- to 100-year-old stuff and it is 4kV equipment. It was installed back in 1920 and it works fine. It has been inside all of this time, but it worked. This stuff that is 70 years old, it is outside and it has been outside in the weather for 70 or 80 years and it still works.

But it is time to replace it and it is good to get it replaced because we have reached that point. It absolutely is that old. Incredible. Then, the project I mentioned, for example the Roseland/Pleasant Valley which is $550 million we just had approved at PJM, that is an outside transmission line on the towers. A lot of these towers were put up in the 1920s and 1930s. That conductor, somebody 80 years ago climbed that tower and put that wire up there and it has been running. The foundations are becoming unstable and the hardware is becoming unstable, so it is time.

Speaker: Thank you for all of the detail. I was hoping you could clarify a little bit about the distribution or rate case filings strategy in the future? I know you are in the middle of one now, but a lot of these programs are five-year, six-year; and should we expect rate case filings on that sort of five-year schedule or is it going to depend on how the programs go? What gets approved with Energy Strong 2, and some of the clean energy stuff; high level thoughts on that please?

David Daly: So, the rate case we are filing now is required based on a settlement back two or three years ago. When we settled GSMP-II recently, we agreed to file a rate case in five years, and that was part of what the improvements were in the infrastructure regulation. First thing is we have a requirement that we cannot go any more than five years. The plan that we have in place, when we talk about well over 90% of these investments being contemporaneous or very near contemporaneous combined with cost control, is to file in five years. That is my goal and over time we need to be very, very aggressive in controlling costs. We need to implement that to hold the line on O&M particularly and we need to have discipline around the investments we make that we are not creating regulatory lag in those investments.

The piece I mentioned where, under the new regulation, we can shape the stipulation closer to year four. For example, in GSMP, the $300 million. We can spend as little as $20 or $30 million dollars in two years. So, if you do a lot of that stip work in year four and you have a case in year five, that almost looks like near contemporaneous return. It is a combination of managing the stip, that we have the ability to do now, having the discipline to not overspend depreciation level, maintain the system's reliability at depreciation level depending on the base program and control O&M. That is the plan and we would then have to be in for new rates that would be effective in 2024.

Speaker: Earlier in the presentation, you mentioned that if you do not get 100% of the clean energy or the energy strong asks there would be potential for some other spend. Could you just elaborate a little bit more on what some of the other programs potentially could be?

SI-SSA-0015-14577

David Daly: I was just simply doing math by saying that clean energy piece, which is $2.9 billion, was not in the capital of the lower end. It was not in the rate base. So, I was just kind of showing it is in or it is out. I do fully expect to get approval of both Energy Strong 2 and clean energy. We will work through that detail, but I think what I was referring to was there was a slide up when Tammy was here that said there is offshore wind. Under the new legislation, for example, the renewable portfolio standard has been raised from where it is today where it has to get to about 20% in the next year or two. It has been raised to get to 35% by 2025 to 50% by 2030. So, the renewable portfolio has been significantly raised. That presents opportunities to help achieve that that could be done in the utility. Depends on how it works.

So, those are opportunities that are associated with that increased portfolio standard that are not under my plant, number one. The energy storage is in our filing, but it is well short of the governor's goals. I had mentioned that $100 million filing is but 35 megawatts. The energy platform in place in New Jersey today is to get 600 megawatts. We are doing 35. To get 600 megawatts by 2020 and 2,000 megawatts by 2030.

So there is tremendous upside if that is where we are going there. The offshore wind transmission is not in any of this plan. I was just mentioning that under the policy, which is that much. It is these types of things that could have us investing more in solar to meet that RPS, for example, in offshore wind, in more energy storage. They are not in there yet, but they are opportunities. Thanks.

Praful: [Inaudible]. Hi, I wanted to just catch up on electric vehicles and storage.

Dave Daly: Yeah.

Praful: In the $300 million that you have here, what kind of assumption is there on the number of electric vehicles that this kind of investment can support? Is there a correlation that you build out and if that growth is further than what you expect, what kind of investment would that kind of…

Dave Daly: One example is residential charging. I drive a Chevrolet Volt; I have had it about 1.5 years now. When I got it, I loved the thing. I do not know how many people here drive electric vehicles. However, I had to put a level two charger on the side of my house because, although they advertise you can plug it in like a cellphone, it takes about 18 hours to charge. That cost me about $1,200. So, for example, the residential charging piece of this $300 million would put about 50,000 of those in. That is what that would enable: the charging at the workplaces, at the corridors, is seeding the market.

We do have projections. For example, our view of where electric penetration is going. Today it is, in New Jersey, about 16,000 vehicles. We are projecting it to get up between 275,000-300,000 vehicles by 2025. We do therefore have an idea of where we think it is going. However, the question is kind of like the cart and the horse. This is a program where we are stepping forward; this will have a significant impact on getting it seeded but then we have to see where it goes and what opportunities come from it.

Praful: Right, that is superb. Then, on storage a similar question. Firstly, what kind of pricing is assumed in terms of the cost of storage at this point in your $100 million investment and where do you see that going?

SI-SSA-0015-14578

Dave Daly: The storage batteries that are the most economic today and typically have the application when you are talking about grid scale are 4MWh batteries. They are about the size of an 18-wheeler tractor and they generate a megawatt for four hours. That is the most economic size. That size battery costs anywhere from about $2.7–3 million, for that 4MWh battery. That is the pricing today.

The pricing of these batteries has come down 60% in the last five years and the battery technology that we are talking about here is the same technology that is employed in the vehicles. There is tremendous investment being made today in battery technology. It is primarily driven overseas in electric vehicle facilities to support overseas demand for electric vehicles. But that technology R&D is directly impacting the cost curves on grid-scale batteries.

There is tremendous build of these factories and this R&D capability. So the question is going to be how fast that cost curve continues to come down. It has come down a lot but at $2.5-2.7 million for a 4MWh battery you can make certain projects work; if the stars align, if you have a site that could use a microgrid and could use a peak reduction, there is a circuit nearby that is overloaded that could be relieved for a couple of years. There are a few things but to do things on large scale the cost would have to continue to come down to make it economic.

Speaker: When you look at your cars rate base[?] per customer, it is actually pretty significantly higher than the vast majority of utilities in the country. I understand that there is some space on the bill to fund additional investment but how would you defend, for instance, against the skeptics that say that you are already gold-plating your systems, especially on the electric side, and that there are imported requirements but the level of investment is already pretty high?

Dave Daly: We are continuously looking, as we said, at the balance. We look at our metrics and our strategy is to be in the top quartile on reliability, for example. We measure reliability a couple of ways, I mentioned the SAIDI[?]. We target to have top-quartile customer satisfaction. Customer satisfaction is driven primarily by our customers' view of value, which is a combination of price and reliability, typically.

So we look at it, we balance it, we consider the headroom, we consider the need on the system and where reliability might go when you are not investing in a system that has aged 70 to 90 years. When we look at that whole balance and we look at it continuously we think we have a good balance between them. That may change over time; we have to see but right now, when I look at the plan, when I look at how we are delivering value to customers and what they are telling us, what our policy makers are telling us, there seems to be general alignment that we are doing the right thing right now for long-term growth. We do not want to end up like the New York City subway system, where you had significant underinvestment in needed, aged infrastructure. This is the time to do it within the context of that balance.

Speaker: Can you just quickly elaborate a little bit on potential rewards or penalties we could see as far as the clean energy mandates for PSE&G as the mandates start to form? Secondly, as we think about transmission opportunities for offshore wind, how should we think about the socialization of that cost and how the recovery could work, especially for part of the line that is offshore?

SI-SSA-0015-14579

Dave Daly: Right.

Speaker: Would that be something that New Jersey would bear or something that you could socialize among PJM?

Dave Daly: On your first one, if I heard you right, in the structure of the energy efficiency programs' penalties, we are not achieving the 2%, or 0.75%.

Speaker: Correct.

Dave Daly: These are going to be requirements and so it is one of the reasons why we feel very strongly we should be the ones implementing these programs. I think we recognize that, if we have this obligation, it comes with a duty to perform. I think the details on that are going to be worked out. That is what is going to happen. BPU has been charged with taking the broad outline of that legislation and putting some of those details in place. In discussions we have had so far, they are talking about, first of all, how you even measure the savings. There is a lot of flexibility in there in how you do it. There is analysis that has to be done to make sure that we are understanding what the true opportunities are.

But to your point, I do not mean to side step your question but that is a detail that is going to be worked out. It is expected, it is a requirement and if you are not meeting a requirement there is going to be some kind of consequence. That does not concern me at all. Our team is on time, on budget to get things done.

Speaker: Transmission.

Dave Daly: The offshore wind. I think Tammy mentioned they have started the proceeding; the BPU, again, is moving very aggressively and there are a lot of details that need to be worked out. I mentioned the fact that if you have all this wind power there is going to be a tremendous amount of transmission needed to bring it onshore. One of the questions would be: is that part of the investment that is included with the developer and that developer is responsible? Or do you separate that out and make that available? If you do it separately do you do it in the context of PJM or do you do it with some kind of state [inaudible]?

All these details need to be worked out. The fact is there is going to be a lot of it, if you put in that much. We are very engaged in that stakeholder process and we think we are uniquely qualified to build transmission, to do it right and do it well so that is what we are going to be keeping an eye on. It is very, very early but they are moving very, very quickly.

PSEG Power

Ralph LaRossa

President and Chief Operating Officer, PSEG Power

Welcome and Overview

Good morning everybody. My name is Ralph LaRossa. As Dave mentioned, in the last few years I have been up here I have been speaking mostly about the utility activities so today is a little bit different to me. As I explained to my family, the only real difference is I now go to work and try to figure out different ways to boil water, so it is not that much more complicated.

SI-SSA-0015-14580

It really has been a good opportunity to change businesses but still stay within the same company and I thank Ralph and the whole board for that. However, it was also very easy to make the adjustment because, as you saw, Dave and the entire team will continue the good work that we have put in place over the past ten years and I am really excited to see that continue.

I am going to focus on a few things here today and try to answer a couple of questions that have been raised, specifically how are we going to continue to feed the beast that is the utility from a cash standpoint and not have to issue equity? That is where this business really comes in. We are going to be focused on free cash flow and how we continue to improve that.

I guess the other question Steve Fleishman asked Ralph earlier: what is going to differentiate us when we continue to have the downward pressure on the volumes? That is really about transforming our fleet, making sure that the assets that we have are really the best assets and are ones that really can operate within the marketplace in a very efficient way.

Power's Portfolio is Efficient and Flexible

I will start off my presentation really just focused on the assets themselves. Everything starts with a focus on safe and reliable operations. That is not going to change in any way, shape or form. I will update you a little bit on the three plants that we are in the process of building, combined cycle plants and give you a quick run through of that. I will remind you a little bit about that transformation, the plants that we have retired and how that has worked out for us.

We continue to focus on O&M. We will talk a little bit about where we have been and where we expect to be on an O&M basis, not just from a fleet standpoint but from an overall Power standpoint and then what results from that from a free cash flow standpoint, leading right into Dan's presentation and what he will talk to, about some of the finances.

Power's Generating Assets Mainly Located in Three Competitive Markets

Let me start with our assets themselves and where they are. Again, for ten years I talked about a straight line up from the George Washington Bridge down to the Ben Franklin Bridge on the utility side. The scope is a little bit bigger and the footprint is a little bit bigger, but it is still focused in the North East, while we have a number of assets on the Power Venture side that are across the US. Those are specifically our solar plants, a little over 400MW of solar. We also have a 100MW plant in Hawaii, not anywhere near the lava or any of the risks that might be out there right now from the volcano but a very small plant that is under a PPA out there with HECO.

Most of our assets, as you know, are focused in the PJM region. In fact, I would say over 9,500MW of our generation capacity is focused in PJM, about 800MW up in New York ISO associated with our Bethlehem plant and then about 1,000MW in New England. It is focused in the North East and really in spots that are close to our load and really positioned well to handle anything that comes up from a market volatility standpoint.

Nearing Completion of New, Highly Efficient CCGT Capacity in PJM

Let me give you a little bit about what is going on with our three new plants. We are just in the final throws of completing construction this year on 1,300MW of combined cycle plants.

SI-SSA-0015-14581

Keys Energy plant

The top one is Keys Energy plant, which as you recall we purchased back in 2015. It was a developed project, a greenfield project, from Genesis developers. We are in the process of working through the last kinks on that.

I would say we are probably 4 to 8 weeks away from commercial operation on that plant. It is a plant that is being built by SNC-Lavalin; they are the constructors and really hold most of the construction risk on that project. Our risk really comes from just making sure the plant gets online on time. It is well positioned, as you know, South West MAAC has been a robust marketplace, especially around the PEPCO region; prices have been pretty high in that area and we really think this plant is going to perform well, with the high-efficiency heat rate that you see there as well as the positioning that it has within the load center.

Sewaren plant

The second plant is our Sewaren plant. This is a 540MW plant that is being built on our old site in Sewaren, New Jersey. Specifically, we have four units that were down at that site in the past and now we are upgrading that. Again, it is a much more efficient unit is in that spot than has been in there in the past. The good news about that plant is we are really in the final testing stages. Actually the plant is running right now at about 200MW. As of this morning, we have been up to 345MW on that plant and the gas unit itself has been running at its maximum output during that timeframe. We see that moving along pretty well. That asset has access to what we really like to see, which is our best fuel supply on the gas side of the house. I will go into a little bit of that in the future; we have access to low-priced Leidy gas at that location.

Bridgeport Harbor 5 CCGT under construction

The last unit is our Bridgeport Harbor plant. That plant will be completed in 2019. It is another combined cycle plant, one by one, that is being built on our existing Bridgeport site, which is home to our coal unit that will be retired in 2021. That plant again has a good heat rate, of about 6,500 and is one that has access to natural gas through the Connecticut Natural Gas Company. We have a contract there and again that has good pricing and access to a market that tends to be volatile over time. Therefore, between spot spreads[?] and its location, we think it will provide us with good efficiency as we move forward.

Solar Source Has Developed 414MW in the US

I will say a little bit about our Solar Source business. I mentioned that is across the country. You can see the growth that we have had in our Solar Source business from about 148MW back in 2015 to over 400MW in 2017. We do not expect any new solar farms to be brought online in 2018; there are none in our current business plan. However, we continue to have a small group of people who actually look for mostly acquisitions. We do not develop them from the ground up; they are mostly acquiring projects that have had some level of development that has been completed so far. We continue to look for that but, again, in 2018 we do not see any new plants coming online for us in that area.

Power's Fleet Transformed with Focus on Improvement in Efficiency

This summarizes what Ralph mentioned in the first part of his presentation and really talks about how this fleet has transformed over the years. If you look at the top bit, these are all

SI-SSA-0015-14582

the additions that we have had, including uprates that we have done at our nuclear facilities, some that we have done in our combined cycles, as well as the new assets that we are putting in place that I have been talking about, both at Bridgeport, Sewaren and down at Keys. We have added about 2,900MW that will be completed by 2021.

At the same time, we are eliminating some of the less economic and environmentally challenged units that have been in the fleet. This includes, again, the HEDD units were retired back in 2015, the two large coal units that we had in New Jersey in Hudson and Mercer and again, fast-forwarding to 2021, we will be eliminating that Bridgeport Harbor unit. That will just leave us with the 23% ownership that we have out of Keystone-Conemaugh on our coal assets out there.

This really is the summary of the answer to Steve's question which is: why do we think that we are going to be okay as the load continues to be challenged by energy efficiency programs? This is the short story of how we are going to be able to outrun the others in the forest if the bear is coming. We are just going to have better units and units that we believe will stay in the market.

Power's Fleet is Transitioning to be More Efficient, Productive and Clean

How do we get some of that competitive advantage that is so important to us? Let me go back one slide; this is where we get some of that advantage from. If you look over that transformation that is going to take place, look at what happens to our heat rate. We are currently around just over 7,400 on our heat rate. With the addition of Bridgeport Harbor it is 6,500; with Keys it is 6,800; Sewaren again at 6,500. When we fast-forward out to 2022 our heat rate gets into the 7,100 range, which is much more efficient from a heat rate standpoint.

At the same time we are cleaning up the fleet. You can see what happens to our emissions from a SOX, NOX and CO_2 standpoint. Again, we have probably short-changed ourselves a little bit because we have taken out some of the coal units in the prior years. If you looked at that profile, we have actually come down at a greater pace than what is shown there. However, we continue to move to a cleaner fleet.

At the same time, we are reducing the age. That is going to help us on the O&M side as we continue reduce expenses. You can see that up in the top-right-hand corner, where the average age of our fleet out in 2022 will be down to almost 21 years.

Put it all together, it is a much more efficient fleet, a newer fleet and we are going to operate that fleet at a lower cost on a per-megawatt-hour basis. I can give you a little bit more about the history there but you can see how we are dropping down into a range that is going to be very competitive in the marketplace.

Power's PJM Gas Fleet is Well-Located

Let’s fast-forward to a little bit about the combined cycle plant specifically and how we have access to low-cost fuels. You can see up on the top-left-hand corner our procurement group, which is really led through our ER&T department. Shahid Malik, who you have seen and heard from here in the past at these meetings, goes out and has done a great job of procuring fuel for us, specifically on the natural gas side. Our access to that low-cost shale shows up in a number of different ways and has given us that competitive advantage for those combined cycle units.

SI-SSA-0015-14583

Additional capacity

On the right-hand-side we have taken a look out and see what we think is going to happen with additional capacity take-aways from that region. We think that the overall story here is we will be in balance. We will continue to have additional use of natural gas, additional production that will be taking place. However, overall we think the natural gas prices will stay flat as you continue to take a look at what is going on in the marketplace there. With a pretty flat price curve that you see in the bottom left but an advantage by having access to the shale in the Leidy region, we think our units will, as I have been saying, be advantaged by access to that fuel.

Forward markets

You can see if you go out, those are just the forward markets there, the Leidy price will have about a 20–60% benefit to us over the Z6 price in the out years.

That all put together gives us why we have some comfort in our combined cycle plants and why they will be more advantaged than some of the others that we compete with on a day-in and day-out basis.

PSEG Nuclear is Vital to New Jersey

On the Nuclear side, I would say the biggest advantage that we are going to have here is twofold. One is the work that has been done. We heard a lot about that on the decks from Tammy and her team. Specifically, I just wanted to point out a couple of people in the back of the room, Rick Thigpen and Josie DiRienzo, who were really instrumental in getting us across the finish line on that standpoint. They did a great job for us on the governmental affairs side. Dan in his team and Tim Pellegrin spent a ton of time getting all the numbers together for us to get through the process as well. Tammy was up here before, but we will still give her credit for the work that was done on the legal front and there were a couple of people in her shop that were just fantastic.

That is who enable us to continue to compete. While we are able to compete, it is still about the operational performance that Ralph spoke about earlier. That really has improved dramatically over the last year and a half. Pete Sena is here, who is our Chief Nuclear Officer and I would encourage you to grab him at some point. They have just really done a nice job of working to improve the capacity factors down at the plant. Nowhere is that better seen than at Hope Creek, where we just completed our first ever, in the history of our company, breaker to breaker run between outages. As a result, if you look at the 2017 numbers, our capacity factor was 100% at Hope Creek.

We did that there; we also were better than the four-year average at Salem 1 and also better than the four-year average at Salem 2. We have seen good operational improvements down there. We have a long way to go, we still want to continue to improve but I feel very confident that that strong base has been enabled by the ZEC combined with the operational performance from Pete and his team will really enable us to move forward on the Nuclear side of our business for a long time to come.

Market Response to Severe Winter Weather

Why is it so important for Nuclear? We talked a little bit about the value that we have gotten from the environmental side. However, I thought I would take a second to show you

SI-SSA-0015-14584

three slides just to highlight why fuel diversity is so important and a little bit about what happened this past winter and what really could have happened in a marketplace without these plants, or other nuclear plants, being available.

I will take you back to the first week in January. If you remember, it got pretty cold in this region. As a result, you can see what happened to the market prices around the clock in PJM. They were spiked up to over $800/MWh. At that point, the gas units did not become economical any further because the price of natural gas had gone up so much, well over the place where oil would have been more economic. As a result, many of our units switched over to oil at that point. We therefore not only had a high usage of natural gas but we had a high price that showed up in the marketplace with natural gas.

What Would Have Happened Without Nuclear and Secondary Fuel?

What does mean? If we took a look at how the dispatch curve for our units looked for that day on January 7th, as you can see, our nuclear plants continued to run, producing about 3,500MW of power. Look at the steepness of that dispatch curve on the right-hand side and what would have happened but for those nuclear plants being there and our ability to access the oil reserves that we had at our combined cycle facilities.

Think about this very simply by just taking that 3,500MW. If, on the day that we had about $800 cost per megawatt hour and we needed about 8,000MW, if you drew a straight line there. If you move that over to the right, the price would have been well over $1,800. That is the value when you think about what nuclear plants bring to the table on days like we saw here, where those natural gas prices were spiked as much as they were.

Available Oil Volumes Were Being Depleted Rapidly

You cannot just say, 'Well that is a one-time and we could have run on oil,' because what also happened at the same time was we were running out of oil. You can take a look here at the tank levels there. Linden is one of our units that has dual-fuel capabilities. You can see where the tank level went down to; it was just over the limit of about 9ft where we could have continued to run that unit and we saw the same thing at our Bergen facilities. Our tanks were being depleted, we literally were just having round-the-clock deliveries from oil trucks at that point.

The take-away from this is really twofold. One, the value of nuclear really does exist from a fuel diversity standpoint. I know we are talking a lot about it from an environmental standpoint and that is what a lot of the ZEC is based upon. However, there is a tremendous value from a fuel diversity standpoint. It also points out a little bit about why we need some of that market, the price formation that takes place in PJM. This is one microcosm of what happened in PJM during that snap, but it is one that you can take away and extrapolate across the region on why PJM needs to do something to help us on the price formation standpoint.

There are some things going on with quick start we talked about; Dan and I were talking in the break. I think we have been seeing it the same way the rest of the marketplace has been: it is probably worth about $1–3; we do not see it any differently than that. However, that is a long way off and we really, again, are focused on getting this safety net in place from a state standpoint. If you want to look just at that fast start, there is maybe $1–3 that might take place there.

SI-SSA-0015-14585

Power Has Successfully Controlled O&M

That talks a little bit about what has happened and how our assets are a little bit advantaged over some of the others. Let me talk a little bit about O&M. If you look at this CAGR that has existed since 2013, the organization has done a really nice job of controlling costs: about a 2.6% reduction from 2013 back to 2018 up to where we are. You will see a little bit of an uptick in 2018 over 2017; that is not just because I loosened the reins a little bit, that is really based upon the fact that we have a Hope Creek outage in 2018. Any year that we have a Hope Creek outage the expenses for us, since we are 100% owner at that site versus a Salem outage, where we are not 100% owner, the price will tick up a little bit. However, over the overarching time you can see that the dollars continue to come down and we expect that to continue going forward.

Cost Efficiencies to Optimize Free Cash Flow

I showed you before the fleet costs for Power and how we have come down. This is the overall costs of Power, all in, including all the white collar and everything else that is involved in running the business. You can see that price has gone down just as well on an O&M per megawatt hour basis. We are controlling costs not only at the fleet level but also in the management ranks over time. We will continue to see that going forward in the out years.

This is driven by two factors. One is O&M itself, the actual expenditure but the other one is what Ralph alluded to earlier, which is we are just producing additional terawatt hours. That is going to go up from 53TWh to 62TWh over time. Again, we think that is going to happen because of the value of the plants that we have versus what we had in the past.

Power's Capital Needs Decline

This is probably the most important slide for today and that is how some of this cash flow gets created. This is as we are coming out of the back end of the construction programs. You should have some confidence that those programs are coming to an end. We are, as I mentioned, in those final throws of testing at Sewaren and getting into that at Keys.

You can see what is going to happen to the capital expenditure profile for Power in the out years. No large expenditures planned, small upgrades at a few plants and then the ongoing end-of-life expenditures that we need to take for any one of these assets going forward.

Hedging Strategy

Let me switch a little bit from that; I will talk a little bit about the top line and talk about two things. One is from the energy prices and two is the capacity price and the recent results.

First, on the energy side, we have talked about this a lot and Shahid has given you a ton of details in the past on it. We are not changing anything from a hedging standpoint in the strategy. We continue to focus on our base load, both nuclear and a little bit of coal that we have our in Pennsylvania. You can see again that we are 100% hedged for the rest of 2018; 100% hedged on those assets for 2019; then we are in the 65–70% range for 2020.

That price you see there is an all-in price; it is an average price. It is not just the energy price because we are also supplying full-requirements contracts for BGS and some of the other, I guess, tranches that we have at other locations, such as PECO and other utilities. That is an all-in price per megawatt hour, that is not just our energy price. But you can see

SI-SSA-0015-14586

from just a trending standpoint those prices are pretty flat and we see that continuing in those years.

Intermediate peaking

On the intermediate peaking in combined cycle plants that you see there again our hedging practice has been consistent. We stay a little bit open on those and for the rest of this year we are about 30–35% open and the same thing in 2019, where you can see where that number comes out to be for us.

Total generation

Total generation and our total hedging practice has not changed. We continue to be focused on that. Most of this is taking place at the West Hub.

New Jersey BGS Accounts for Around 10TWh of Our Hedging

When we focus on the West Hub that creates two risks for us. One is obviously the basis risk, the other being the operational risk. We take a big piece of that away when we have our actual hedging that we do in our BGS auction. About 10TW of that hedging that I just spoke about on the prior page is covered in that BGS auction. Again, you can see here, as we have shown you many years in the past, a consistent way of showing the price from the forward markets at the West Hub and then all of the ancillary services and other pieces that get built into that pricing to build up to the $90–100 price that we have had over the past few years.

That price has come down in 2017 and 2018. It ties right back into what Dave has talked about, from creating headroom on the bill. This is exactly for New Jersey and so again a good opportunity for the investments to continue from a utilities standpoint.

Retail electric/gas marketing

On the right-hand side I just wanted to touch a little bit on what we are also doing to try to eliminate some of that potential basis risk that we have. This is to get closer to our customers due through our retail position that we have taken and get it more into sales on the commercial and industrial side directly to customers. That has been a slow go. We have been at it for about, I would say, 12 to 18 months now. It has not really progressed as well as we expected it to do from an organic standpoint. However, we are going to continue on that path and see if we cannot make some additional progress over the next six to 12 months and then reassess where we are from a retail standpoint. The biggest challenge there is really getting directly to the customers. There are a lot of brokers in that process and we continue to look for other ways to gain access directly to those large customers.

Capacity Markets

Switching from the energy side to the capacity piece of the equation, from a revenue standpoint, you saw the results from the last auction at PJM. I think this is the first time we are letting you know exactly how much we have cleared in that capacity auction: 7,700MW. The revenues up on the top right-hand side are at the PJM level. Then you can see, on the bottom-right side exactly how we compared to the rest of the RTO. With that competitive advantage, that geographical location that we have for those assets, not only are we benefiting from the gas pipelines on the fuel side but also from the actual price that get on the capacity payments. You can see that we have continued to maintain that geographic advantage that we have had from prior years.

SI-SSA-0015-14587

Looking forward, obviously there are a few areas that we continue to be concerned about as we look to the prices in the out years. Obviously net CONE and how that plays out is going to be a challenge for us and the load forecast that you picked up on earlier and you continue to ask about. However, we continue to believe that the positioning and the repositioning of this fleet is going to have us in a better spot for that.

Solid and Continuing Revenue Stream in ISO NE

There is a similar story in New England. We can see the prices have come down. However, what we have enjoyed the benefit of is the fact that we have the Bridgeport Harbor unit, which has been cleared for seven years at a $231 price. That unit is well-positioned and has a nice advantage for us. You can see the revenues on the top-right side but the differential has been created by that bid that we made and the fact that we are now going to be outperforming the rest of the pool in New England as well on a capacity standpoint when you get out to 2021.

So a good story for us on both sides of the equation, both in New England and in PJM and obviously with the PJM market being much more important to us than the New England side based upon the amount of megawatts we have in each one of those locations.

Stable Return and Free Cash Flow

I put the pieces together and I thought a little bit about how we are in this more competitive environment, how concerned you have to be about the volatility. Working in the utility for 30 years it was a little bit different to try to figure out. This pie put things together for me in a context that I thought really made a ton of sense, which is that we are not as open as I may have thought and maybe we have left, sometimes, folks with the impression.

If you take a look at the energy margin that we have had there, a large portion of that has been hedged, a large portion being the capacity being hedged as well. Then we have a little bit of our margin on the energy side that is left open. It is therefore a portfolio that has really been well-managed over time. It provides a great opportunity for that cash flow to come back to feed the utility without having to issue the equity, as Ralph mentioned earlier and it is very stable over the next two to three years from a time horizon standpoint.

I think, as I looked at the business and saw where we are, it is something that is a much more stable business than people may actually think is in place.

2018 non-GAAP Operating Earnings Expected to Benefit From Tax Reform

The earnings that we have talked about are not new news; this is guidance we have given out before. However, I just wanted to reinforce we are still in that range there: $485–560 million for 2018.

Value Proposition

I will leave you with really just the major take-aways. The fleet itself is very well-positioned. We have upgraded that fleet, we have transformed it over the years. These new builds are coming in and will put us in a great position from a heat rate standpoint and from an efficiency standpoint. We have eliminated a lot of the old units that were driving higher O&M, as well as challenging us from an environmental standpoint.

We have continued to work towards improving the energy policy. Tammy walked through all of that again, but I cannot reinforce with you enough the great work that was done to get us

SI-SSA-0015-14588

that stability on the Nuclear side. A little bit of a thank you to my boss as well for taking some of the beatings that he took in the press. However, that was an effort that was a true team effort from a lot of folks and really has put us in a great spot going forward.

Take away the fact that there is low capital requirements going ahead, which should really leave you with an impression and the security that we have some positive free cash flow as we go forward.

So, it is an overall good story. It has been a great opportunity for me to transition to something new and I just want it to open up for any questions that you might have.

Q&A

Speaker: Assuming that you do get the support from the state for Nuclear, how, if at all, does that change your overall approach to the BGS auction?

Ralph LaRossa: I do not think it will change one bit our approach to the BGS auction. I think about that as just almost like a capacity payment, right, just making sure we keep the doors open. It will not change one bit our approach to the BGS auction. I would like to have more BGS auctions and take away that basis risk but no change.

Speaker: Looking at the slides that you put with regard to the weather event in January, it struck me to ask the question is battery storage actually a viable option for the fleet in circumstances like that? A lithium-ion battery today is, what, $400/MWh and it looks like you were in a situation where you could have theoretically been out of oil and having to buy at a lot higher prices than that. However, is that going to be dealt with in the context of the deployment of batteries on the utility side in a way that actually is going to clip those peaks prospectively?

Ralph LaRossa: I am not sure whether the battery piece is going to wind up playing in the wholesale market or not and how PJM thinks it through. The observation is not incorrect, that there is an opportunity for that there. But if you compare it to using nuclear plants at the prices that we have there, it is not even close in my mind. Yeah, there may be pockets of it where it might make sense for us but the point that we are trying to make there is if you are going to value at such a high price the batteries, it should be providing that same value to the other plants, such as nuclear, that are providing that same benefit.

Speaker: Understood, thank you.

Speaker: Ralph, on your comments on retail and it not going as quickly as you would have liked and then that you will reassess, are the options to buy something or partner with one of these brokers you are talking about? That came to mind. Is it possible that you will just strategically decide you do not really need to be there?

Ralph LaRossa: I think all of those things are being looked at, right? We just take it day by day. I think the first opportunity will be to continue to grow it organically. Then, if not, we look for an REP-type of arrangement with a broker. That is an opportunity that exists for us. Then, if all else fails, you just have to reassess where you are. However, I think over time we just wanted to be clear that it has not grown as much as we expected it to grow.

SI-SSA-0015-14589

Speaker: Hi. Your cleared capacity in the last auction was still fairly below your E4[?] capacity. Can you discuss why that is and maybe give us some color on the bidding strategies this time around?

Ralph LaRossa: I do not think we discuss the bidding strategies in too much detail. But we have discussed in the past that we basically have some sort of a layered approach to each one of our units. Based upon that is where we wound up with the clearing price, very similar to what we had last year, which you can see. We were 7,800MW last year and 7,700MW this year. We basically tier each one of the units and we bid it into the auction in that manner.

Speaker: Do you see any upside from the incremental auctions?

Ralph LaRossa: There is an opportunity in the incremental auctions. I am just not sure what is going to take place from a pricing standpoint. A lot of it will depend upon the excess capacity that exists at the FE[?] fleet and also at ZECs[?] fleet. Our units are in a different geographic area, so there will be some opportunities for us, maybe, that do not exist for others but that is to be determined.

Speaker: I just wanted to talk about the cold weather events and that combined with the hedging strategy that you guys have. If you guys had not been able to have the oil, or if it had extended longer and the oil had run out, do you have enough unhedged capacity that you would have been okay? Would the hedges have caused issues for you so that you would have ended up losing money, because you sold for much less then you had this high-cost gas to generate?

Ralph LaRossa: There were a lot of possibilities there in what you said. I was mostly discussing it from a customer standpoint, though, when I was presenting it here and the value that the nuclear units actually bring to the overall fleet when you look at it from a PJM standpoint. That is why some of these market reforms are required and the support for the ZECs is so important for the state, because the prices would have spiked way up from a customer standpoint.

From our hedging standpoint, the team does a great job and they always have a small position for that so, again, I will not get into a lot of details about the work that they do on a day-in and day-out basis. However, there is always a risk in some of the scenarios you laid out there.

Speaker: So you are not saying that you would have been having to generate something that you sold for $50, or something and you are having to generate for $900?

Ralph LaRossa: No.

Speaker: That is not going to be a situation that happens.

Ralph LaRossa: No, that was mostly from a customer perspective.

Speaker: Hi. I think in the past senior management has described PSEG Power[?] as maybe not being well-matched with the utility over the long term under, maybe, the same parent company. I was wondering, with the passage of the ZECs, if the management's stated view on that has changed at all?

Ralph LaRossa: I will certainly pass the buck on that at some point here. However, I would say to you, just from a newbie on the street standpoint, I think it makes a whole ton of sense

SI-SSA-0015-14590

for these businesses to be together. Maybe long-term things change but the value that we are bringing and the free cash flow that we are bringing to the table adds a lot of value for the utility.

I do not know if the boss wants to say anything else now or later. He will hit that one later. Do not leave; that is how you get to stay.

Speaker: I want to just touch back on the price formation point.

Ralph LaRossa: Yeah.

Speaker: You said up $3 in terms of the impact.

Ralph LaRossa: That is what the market is saying for the fast start, maybe $1-3, and we do not feel any differently than what you have been hearing from others.

Speaker: Gotcha. Then, secondly, in terms of capacity auctions, some of the impact, or the benefit, of capacity auctions this year was because energy prices have come down, so everybody's bidding strategy has reflected it and the demand curve has reflected it as well. How do you see that playing out? If energy prices stay at these levels, or go down further, where do you see the capacity auction playing out and how big a piece does that play in your view of the world, of how you look at PSEG Power?

Ralph LaRossa: We do not take a position on energy prices anything different than what the market has, right? If you just look at the forwards, that is the way we think about it and that will not change. From a capacity standpoint, I pointed out a few of the risks that exist on the slide there, specifically the load itself, what is going to happen there and then it was about four or five other items that could potentially create concerns from a capacity standpoint.

The bottom line, for any generator, is we need to have enough to cover the risks and to keep the doors open. Whether it is coming from the energy market, the capacity market or the ancillary markets, to throw another piece in there, black start and other things, you have to put the puzzle together to keep the plants open. We have seen that because so many plants have retired all the time.

Speaker: Sorry, one final thing about slide 72, where you laid out the pieces of the puzzle, or at least the hedged portion of your business being quite high over the next three years. That obviously then changes after the three years because the capacity auctions kind of roll off, your hedges roll off, so the volatility is really post the three-year period. How do you see that volatility post the three-year period?

Ralph LaRossa: We have feathered into this every year. If you look at what has happened, in the out years obviously we have less hedged but then as we get closer to that year we hedge more, right? This pie does not, therefore, change. The point that I was really trying to make here is that it is a very stable business. There is obviously some unhedged positions but it is not a completely open business for the marketplace. The policies and procedures that have been put in place have led us here so we are going to continue that.

Steve: Hey Ralph. What would be your interest in acquiring additional plants in your market? So, for example, Dominion has plants that they kind of saying they may put on in both PJM and New England; any thoughts on that?

SI-SSA-0015-14591

Ralph LaRossa: I do not have any plans to be diving into anything at this point, Steve. I think we are focused right now on getting those three plants up and running. We always look for opportunities; that is in Dan's wheelhouse and we continue to see if there is anything out there that we can get. If something popped up that made a ton of sense, you would look at it. However, that has not been our history and I do not think that is going to change.

I am focused really on getting these three plants up and running, making sure they are economical and they win in the marketplace.

Speaker: Given that you are so heavily hedged over the next three years, what is your projection for free cash flow for PSEG Power over the next three years, cumulative?

Ralph LaRossa: We do not go into that level of detail. You can try one more time with Dan when he gets up here but that is not something we get into the details on.

Speaker: Okay, thank you Ralph.

Ralph LaRossa: Alright, thanks.

Financial Review and Outlook

Daniel J. Cregg

Executive Vice President and Chief Financial Officer

Overview

Good morning everybody. No questions on our new artistic logo, really, which shows our headquarters in Newark and some of the key points that we will talk about.

I will pass through here, we will end up talking about a lot of the things that are on there and frankly a lot of the things I am going to talk about you have heard already. I will give you a sense as to the overall financial picture, pull together some of the pieces that you saw in Dave's presentation, some of the pieces that you saw in Ralph's presentation. I will pull them together, let you see them all together. I think what you are going to see is good opportunities for growth, strong financial position, good work done for the infrastructure and efficiency of the grid in New Jersey and an enhanced ability, frankly, for us to continue to provide returns to shareholders, including increasing the dividend.

Strong Financial Position

This first slide, does give you an indication of that strong financial position. It does create opportunities for growth. Some of that growth you can see even in what we have shown you for 2018's earnings guidance forecast versus 2017.

So, at the midpoint of that 2018 guidance of $3–3.20 were up 6% compared to 2017. Really that is driven by the continued investment that you have heard about at PSE&G and from some benefits from tax reform that we see at Power.

The investment opportunity is fairly evenly split between transmission and distribution. For transmission we do have the formula rate treatment, contemporaneous returns and on the distribution side, near-contemporaneous returns. I think we have made some improvements, which Tammy talked about, from the standpoint of the infrastructure investment programs that New Jersey has put in place and that template that has been put in place. We used it

SI-SSA-0015-14592

with GSMP really before it was in place but knowing it was coming and I think it has worked well there; the first one in the state to have the IIP work through the process and I think more to follow as we talk about Energy Strong going forward.

In Power the end of the combined cycle construction program is going to reduce the capital needs of power and provide that incremental cash flow. Ralph talked about it before, he kicked off the presentation with it, he closed off his presentation with the fact that we have no need for additional equity for the cash flow and credit metrics section. That is obviously a positive that we like a lot and goes to some degree to what Ralph LaRossa just answered on the one question about the value of having the companies together. This all works, again, for the benefit of New Jersey. There are a lot of advantages that we see. Dave made a reference before to some infrastructure challenges in other areas. We do not want to be in that place. Maybe 70 is the new 50 but we still do have work to do to ensure that our infrastructure is going to be where it needs to be on a go-forward basis. Those investments are going to create the opportunity for us to continue to provide returns to shareholders.

As we take a look, for 2018 the indicative rate was up 4.7% from a dividend perspective for shareholders. As we have said for a long time and continue to say, the opportunity to continue to provide growth in that dividend on a sustainable basis is what we are looking to do.

Growth in Utility Infrastructure Investment and Tax reform

This is a quick look just at 2017 versus 2018. What we have tried to do here is put together a slide that shows you a bridge as we have gone from 2017's results for each of the utility, Power, Enterprise and other into 2018. The obvious movement at PSE&G that we have talked a lot about is the results of the investments that we have been making. The return on that incremental investment gives a boost to PSE&G.

Energy Strong

However, one of the other things, as we look just year over year, 2017–2018, as we have led into this rate case there has been some capital that we have incurred over the last few years that has not yet gotten a recovery. The first of those that comes to mind is Energy Strong. You may recall $1.2 billion was approved across that five-year program. The last $200 million of that did not get a roll-in, yet we had agreed to a rate case, so that rate case essentially became the roll-in for that tail end of capital. The good news is that a lot of that capital is not going to be spent because we were able to do the work that we did as efficiently as we did. However, there is a little bit of that that awaits recovery on the revenue side, yet we will have some of the burden of the cost.

GSMP

Dave talked before about GSMP. The first GSMP program of about $300 million a year and about $85 million each year awaited recovery. That is another bucket of capital that was awaiting recovery in a rate case and then some other incremental spending that we had on a capital basis leading up to the rate case. That is a cost that is borne by the business right now still awaiting recovery in the rate case. As you go from 2017 to 2018, some of that brings down the bridge, the jump as you go from year to year, if you look at it on a capital versus a net income basis, as opposed to when we talked earlier about a 13% increase in net income, a 13% net increase in our rate base. One other item is we did have a small tax

SI-SSA-0015-14593

advantage last year that will not repeat, also just a year-over-year dip, that is a one-time item.

Power

In Power, the moving parts are the ones we have seen a lot of, right? Capacity price is up and Ralph showed year-by-year capacity numbers. We will see a benefit from capacity as we roll through from 2017 to 2018, the re-contracting impact, as I think we said on the first quarter call, will be down about $6/MWh. That will be a drag as we go from year to year. We will get the units running that we have, both Sewaren and Keys, in 2018. That will give a boost to 2018 and we will see about $0.16 benefit from tax reform. Those are the moving pieces as you go from 2017 to 2018.

Then, really, on the enterprise another biggish piece of that is the Long Island business that Dave talked about briefly. We also had a tax item in 2017 that we do not anticipate seeing repeating. All of this is consistent with the guidance that we provided earlier. There is no change to that guidance and it just gives you a little bit of an understanding, year over year, as we walk through the next three quarters of this year's results.

Capital Spending Focused on Regulated Growth

This is a more detailed look at the capital program. You have heard a little bit about each of it. This all just puts everything in one place. If you start at the bottom, Dave talked about $6 billion of transmission spend, a little bit of a change in the nature of it but still a consistent spend across the overall five-year period. The formula rate treatment: [Inaudible] jurisdictional at an 1,168 ROE. It is the resiliency, it is the replacing of some of that ageing infrastructure, lifecycle-type investments, as well as the replacing of the 69kV system. We have talked about that for a number of years as well: restringing the state to a higher voltage to enable the resiliency of the system that we need.

Distribution growth

As you move up the page, we show you the distribution spend. We show it in two buckets: in the green and in the blue, distribution maintenance and distribution growth. Very simply, distribution maintenance is the spending amount that we will incur that will offset the depreciation that we will see in the rate base. You have a rate base of X, you are going to drop down that amount from depreciation. It is the capital that restores that rate base back up to what you had come out of the late rate case on, considering maintenance distribution capital spend.

Hold your rate base steady; everything above that that you see is growth. The biggest component that you see within that distribution growth is the last year of GSMP I and the first four of the five years for GSMP II that will be put in place.

Clean Energy & Energy Strong

Above that we have separated out the two filings that will be pending and will come shortly: the Clean Energy filing that we have heard a lot about, as well as Energy Strong 2. Then we have talked a lot about the capital program at Power coming down over time. I will show you some more details as we go forward but you can see small slivers of Power capital at the very top.

SI-SSA-0015-14594

That gets you to your $14–17 billion. The orange-hatched area in the middle is the difference between the $14–17 billion of capital and about 90% of that being focused on the regulated side of the business. It is very consistent with what we have heard about in the past and with what you have heard today.

Increased Capital Investment is Growing Consolidated Results

This is a quick slide just to look back in time. If I were to come back to this podium each of the last three years, you would have seen the three bars on the left-hand side of this slide. That would be for PSE&G's capital. Ralph initially and now Dave has come forth and said that we anticipate spending at the utility $10.8 billion, $11.9 billion, $12.5–13.8 billion and this year, as we have talked about, $12–15.5 billion. So a growing profile of investments and as we have come every year we have also shown you the trajectory across the five years which dips down a little bit in the back. We always say that we are going to look to identify investments that will build up the back of that five-year trajectory. This is no different from our known investments. However, with Energy Strong 2 and the Clean Energy filing we seek to fill in the top.

What this tells you is, frankly, that there has been some success in doing that by virtue of the blue lines getting bigger as we step through time. I would also note that there is a notation on top of each bar which gives you the percentage of our overall capital plan attributable to PSE&G. And you can see we have grown from order magnitude 80% on up to the 90% that I just mentioned. So, incremental investment opportunities, incrementally on the regulated side of the business, especially as the CCGT program comes down. Overall, I think a good story and the right story for PSEG.

Five-Year Annual Growth Expected in PSE&G's Rate Base

So, for PSE&G, ultimately what this means is growth and rate base; so again, maybe just reiterating a little bit, the question was asked about where do we start when we think about the rate base, for 2017 year-end rate base of $17 billion, split between jurisdictions. Always an important thing to remember: as a single state utility, we are not concentrated with one regulator, we have two, right, because the fourth component of our overall rate base is a pretty sizeable component. So, that $17 billion grows to about $22 billion by the time we get to 2020 and as you move out to 2022, you are at $24.5 to $27.5 billion, depending on size, timing and approval of those two programs as we move through.

One other thing to talk about as well, so the 8% to 10% CAGR in our rate base over these five years is a new number, and so maybe just a minor and quick history of us, and if we go back in time and just think about last year, what did we say? Last year we said we had a 7% to 9% CAGR in our rate base, but we also caveated: we are spending a lot of capital that grows our rate base, that increases the base and the ability to sustain that 7% to 9%, may be challenged.

I think at first blush we did think that was the case, and if you just took the same numbers, you just jumped up from 2016's year end to 2017's year end, we would have come down to a 6% to 8% five year CAGR on rate base. Then tax reform happened, so the absence of those deferred taxes reducing rate base, work to right about a 1% delta in our rate base CAGR. So, that really brought our 7% to 9% which had moved to 6% to 8% because of the higher base, back up to 7% to 9%.

SI-SSA-0015-14595

Since then, I think you put two other building blocks on and you get up to the 8% to 10%, one is the $1.9 billion of GSMP, that was just approved. That steps us up as we have talked about being more to the higher end. That moves us to around 8% without any of Energy Strong 2 or GSMP II. You layer those on as filed and you will get up to that 10%. So, if it does not come in exactly as filed, it will be somewhere between that 8% and 10%, but that also presumes that nothing else transpires and Dave got a question before and answered about some other potential opportunities. So, that is the basis upon which and the history upon which we get to our 8% to 10% rate base growth.

Power's Free Cash Flow Improves as Construction Ends

Then this next slide, the rate base basically is funded without equity and this slide was shown in the past and this updates the slide, and somebody had asked the question earlier about capital over the five-year period by bucket, and there is some disclosure within the 10,000 that is really a capital commitment as opposed to anticipated spend, so there could be some spend that is not absolutely committed. This gives you, certainly an updated view, and gives an indication on the left-hand side as to what Power's capital spend looks like over the next five years, with just a split where you can take a look at the two major pieces, what the growth capital is far and away the biggest piece being the [inaudible] cycle program; you see that rolling off.

Then the baseline capital we expect to see at power for the next five years, under $200 million a year. So, the absence of that capital at power frees up incremental cash flow. You move to the right-hand side, you can see again by bucket within PSE&G from a transmission standpoint, from electric and gas distribution standpoint, and then energy efficiency and renewables.

The top area is the hatched area that we have already talked about; we have talked about it from a rate base perspective; this gives you a snapshot of what it looks like from a capital perspective. If you add up all those hatched areas, you will not get to the aggregate amount of the filings, again as Dave mentioned 2023, and I think even into 2024 for the six-year clean energy program is going to have a little bit more capital as you go out beyond that tail end.

We continue to plan really what we know within the solid areas, but we also identify ongoing areas to improve the system and the investments that we can make, and that is what you see within the hatched area.

Cash Sources

The funding of the capital program, you take a quick look at the five-year cash sources and uses and maybe in some way if you are thinking about Power's free cash flow, you can draw a little bit from this slide. If you start on the bottom side on the left-hand side, you see power's strong cash from us, in the green area on the bottom left. Moving over to the right, you see power's investments, so the excess of the left over the right obviously provides some free cash flow generation and that will grow as we go through the five-year component of the plan, so that will increase towards the out years.

Stepping up to the blue areas, we talk so much about Power's cash from operations and how strong that is, utility also has very strong cash from operations as well, they just have a big appetite to redeploy that capital, so you can see how both sides of the page in the blue

SI-SSA-0015-14596

shaded areas on the left side, PSE&G's cash from operations, we redeploy that into the maintenance and growth investments on the right-hand side. We get the positive mechanisms to be able to get cash back out of those investments, either from the formula rate at that transmission as well as from some of the favorable clause recoveries that help to be able to bring some of that cash flow back into the organization, and those ultimately are the bigger pieces of cash from operations as well as investments.

In between, on the left hand side, the cash from operations, from Power and the utility, we have PSE&G net debt, so the utilities regulated cap structure, Tammy talked about a 54%, it is a little bit higher than it has been in the past, but somewhere within that range, you are going to see an equity component coming into the business from Power's cash flow getting matched up with debt issuances for PSE&G. Those debt issuances are what is shown in that orange section on the left-hand side.

I think of note, apparent net debt on the left, Power net debt on the right, not a lot of activity, so basically holding steady from that perspective. All going as well to fuel on the upper right hand side, the shareholder dividend. So, I think this gives a picture as to the cash flows coming and going at Enterprise over the next five years.

Solid Credit Metrics

All that flows into the credit stats, this page, page 84, it gives an indication as to what they look like and what it means from the standpoint of incremental capacity. Left hand side of the page, we have shown this in the past as well, as it steps through time, we have updated the numbers obviously. On the Power side, from an FFO to debt perspective, we are currently in the low 40%, as you look at 2018, 2019, 2020.

With a minimum threshold of 30% that provides some excess capacity. We take the same look at Enterprise, based upon a mix of the two businesses that Enterprise is made up of, and as we have more regulated investments, have more regulated profitability, that part of the business ends up growing and improves the overall risk profile of the business. The minimum threshold we think about, call it high teens, maybe 18%, 19% FFO to debt.

So, to the extent those statistics are in excess of that, we have some excess debt capacity that is reflected on the right-hand side, less than $1 billion, to the extent that that is deployed in the utility, if you are harking back to that orange section of the sources and uses, it will be matched up with utility debt to be able to fund incremental investments.

This snapshot is based – we talked about a 14% to 17% capital program on about a 15 billion or so capital spend, so if you think about this excess capacity being deployed, matched up with debt, we do anticipate being able to get to the high end of our $17 billion program without any external equity.

Zero Emmission Certificate Process

So, a quick walk through as well; those numbers did not reflect any cash flow coming into the business for zero emissions credits, so it's obviously to the extent that they were to come forth, those would increase the numbers as you can see on the bottom left hand side, a dark blue box, annual revenue is estimated at about $200 million at $0.28 per share. If all three New Jersey units were chosen. So, Tammy showed a slide earlier, which correctly said that the ZECs could be about 300 million, recall that the three New Jersey units include two units

SI-SSA-0015-14597

of Salem which we co-own with Exelon. So the Exelon component, roughly 100 million, our component of Salem as well as all of Hope Creek, which we own 100% of. Which is why when Ralph referred to the Hope Creek outage cost being higher, because we have a bigger ownership, we pay the full [inaudible], that would get you to the $300 million number, so that is the difference between the $200 and the $300.

We have seen some of the numbers published back and forth, so those numbers for $200 million for our share, $300 million total for ZECs. But the process that got kicked off when the governor signed the bill on May 23rd is laid out here in some detail. We talked before about day 330, so signed in May, this would bring us to April of next year. Tammy mentioned that the eligible units that have come forth, seeking to get ZECs would be rank ordered and chosen.

But before that, there is a 180-day process, whereby the BPU is going to go off and determine how the process is going to work. They have not had a ZEC process in place in the past, so they have that timeframe to basically determine how the applications will be put forth and how the overall process will work. There will be hearings that will go on with that, so that whole proceeding will go out for 180 days at which point applications will come in and the ultimate determination made within 330 days.

In parallel, the BPU will ask the utilities to come forth with tariff updates, because I think an important part of this as well is that utilities are not going to be underwater cash flies as they are the purchaser of the ZECs, so they will be putting in place tariff increases overtime to get ahead of that payment for the ZECs. They will aggregate the cash, within 150 days they will go to the BPU, they will provide an update of their tariff within 210 days, both of those [inaudible]. The BPU will approve that tariff update, and cash will start to be collected so that when the ZEC payment is made, the cash is [inaudible]. That cash payment will be made, 90 days after the close of the energy – this is not a calendar year program, this is an energy year program.

In New Jersey, the energy year runs from June 1st to May 31st, so our first ZEC period in New Jersey will be from April to the end May of 2019, a sub period, and then 90 days after, a cash payment will be made to the nuclear generators. Then each year after that, the same will happen; it will be the full 12 months ending May 31st with a cash payment to follow 90 days thereafter.

So, that's the mechanism that will be put in place. Tammy also mentioned that it's $0.004/kWh charge, that is on all retail sales when you take that full bucket at 100% of retail sales and then those payments just go to the nuclear component of the energy mix in New Jersey that $0.004 or $4/MWh turns into $10/MWh and that is what each megawatt hour will see, as generated by a chosen nuclear unit.

Tax Reform Benefits Customers & PSEG

A very quick look at tax reform, this basically a good news story for customers and I think for us as well. Customers have already seen reductions in their bills and they have seen it in two different ways. Right away we had $148 million reduction on the transmission side of the business that we filed, and then we filed in April, an execution, I guess I should say, of $114 million on the distribution side. So $262 million went back to customers; we talked about the customer bill before, so that is helpful from that perspective, and as we step

SI-SSA-0015-14598

through time we will continue to see some excess deferred taxes going back to customers. So, more to follow.

And then for us, a $0.16 per share benefit that we saw just 2018 alone, and that will continue on as Power and the non-utility components of enterprise get to retain that benefit. At PSE&G, lower bills, that rate base change that I talked about before, about a 1% differential, and as time goes on and those deferred taxes get passed back, less deferred taxes, more rate base; more rate base, more earnings. To the tune of about $20 to $30 million for PSE&G, and then we have protected excess deferred taxes and unprotected excess deferred taxes will flow back based upon a mechanism that exists; it is what it is, and they will go back over a fairly long period of time, but the unprotected really will be determined how quickly they will go back within the upcoming rate case. So, more to follow as we finish up that rate case.

At Power we keep the benefit of the lower taxes; we do retain full expenses of capital. Mind you, we do not have as much capital of power, so I just went through the magnitudes from a cash flow basis. The loss of the bonus depreciation at PSE&G is more than the gains that we would get on the Power side of the business. One other element of some of the tax reform is some companies may well be limited on how much they can deduct their interest expense based upon where we are from a balance sheet perspective, we do not have that anticipation. We will not be limited from the standpoint of our interest deductibility for tax purposes.

That is a quick run through on tax reform.

PSEG Has Controlled O&M

O&M, Dave showed you the utility O&M, Ralph showed you Power's O&M; this really just puts everything together and a host of examples of the things that we have been doing on the right side to be able to get to this place, so whether it is working with our vendors to bring costs down, whether it is organizational changes, whether it is reduction in our overall pension expense which has come down quite a bit, and whether it is frankly retiring some uneconomic units, that O&M burdened from some of the units that Ralph showed you on that one slide, with all the units that we have retired over the years, in addition to benefiting us on a bottom line basis, also pulls out some higher O&M units like Hudson and [inaudible].

And also, we have best practices teams throughout the organization who, as we usually do, are looking for ways to provide a very, very disciplined approach to our O&M management. It is not a programmatic thing, it is something that we really do, on an ongoing basis, and even utilization of this fine facility for this event actually does not cost us anything, as being a member of the NYSE, so just one little example, we thank the NYSE for that.

Strategic Focus Delivers Solid Results

So, overall if you take a look at what the earnings have looked like, this goes back from 2012 out to 2018, maybe just one thing to talk about on the slide, in addition to the growth that you do see here, and Ralph gave you the components by PSE&G and Power. What I would say is, if you look back over these six years, the guidance that we provided at the beginning of the year, for one of these years we were at the midpoint of that guidance, for three of the years, we were at the upper end of that guidance and for two of those years we exceeded that guidance. I think an example of the commitments made, and then ultimately delivered on is as important as the growth that we do show within the overall earnings of enterprise.

SI-SSA-0015-14599

Consistent and Sustainable Dividend Growth

And by no means least, but lastly, the dividend, you can see here the trajectory that we have, again a very consistent story with what we have said in the past; consistent and sustainable increases in the dividend is our objective.

Last year's 4.7% increase from $1.72, to $1.82 indicative number is an indication of that. Ralph showed before, the ability for that to be covered by PSE&G's earnings, but by no means funded entirely from E&G given the cash flow of the overall business. An extremely important aspect of our business to our shareholders, which we completely understand and have that commitment to the dividend, I would say no less than we do to our employees, to our customers and to the environment. With that, the value proposition is frankly the same, as Ralph showed in the beginning, so maybe in that vein, I will ask Ralph to come up and we would be happy to take some Q&A.

Q&A

Speaker: Morning, a question on the financial headroom slide: Dan, you are obviously showing 65% regulated mix in 2018, but all the investments going into the utility, what is the level at which your earnings mix might sort of change the threshold and create some more headroom? and then how shall we think about the addition of the ZEC which would obviously add to power within that, but would not be typical power revenue?

Dan Cregg: Yes, and I think you are exactly right, so the business mix to the extent that 90% of the capital that we are deploying is going into the utility side of the business, is going to increase the overall favorability of the business mix from a rating agency perspective and from a debt capacity standpoint, so it will increment over time, I would say, no differently than we have thought about it in the past.

As more of that happens it will be more favorable. There is actually an interesting parallel between your second question and the first question, so how will ZECs impact it? Well they would help, right. It is obviously going to be some more free cash flow, but it is an interesting question. That is free cash flow, it is known free cash flow to the extent we operate it is going to be there, and Tammy talked about some of the timeframes earlier, so that is clearly a positive.

I think it is not subject to volatility other than being able to operate and run those megawatt hours to the extent that we ultimately are selected. But, if you think about the business mix and the results between the two companies it would lift up the power contribution, but it would do so with a fairly steady known stream. Ultimately the rating agencies will take a look at that and make a determination of it, but I think it will be a positive and I think that it will be looked at as a more positive component of Power's overall free cash flow.

Speaker: As you look at the plan, where do you see that percentage getting to, over the sort of – through 2022 timeframe, and do you think that is going to be enough to take you through a trigger on changing the 2018 and 2019 for example?

SI-SSA-0015-14600

Dan Cregg: We have not provided a number on percentage of earnings, to kind of back into the guidance by companies as you go out through time. But, I think it will help and it will either change the mix or it will strengthen the ability to meet the mix.

Speaker: Ralph, you got the question earlier which you tabled, and you are going to get it anyway, and no matter what you say, three different people are going to interpret it differently, but I have to ask, what are your short, medium and long term strategic ideas about the company, you know, every year someone walks out of here thinking, oh he is definitely going to spin off peg power and someone says, 'No, he did not say that.' give you an opportunity to be clear and concise in the way you are thinking about the strategic vision for the company as opposed to together or separate and then secondarily, there has been a tremendous amount of consolidation in the industry and is that on the table, off the table? You clearly have a tremendous amount of organic growth keeping you busy.

Ralph Izzo: Let me break that into two pieces, let me go specifically to the Power question, I think we have had a bunch of good news with power right, the ZEC program gives some comfort that the attributes of nuclear are so important that policy makers will figure out a way to keep those plants running, certainly for the rest of the license life.

We have had some improvements in the fleet in terms of the heat rates, and we have great access to shale gas, that puts us in a competitively fairly strong position. We have the end of the capital program that generates some nice free cash flow opportunities for us, so in many respects, I feel like we have much more flexibility in terms of what we can do with power, whereas in the past, I will be honest with you, as I have said, I felt like we were in this inexorable march down a certain path that said, 'I don't know when, but eventually these things are going to have to split.'

But now I feel like, 'Wow, we have a really healthy fleet, healthy from the point of view of its competitive position, its financial position, its environmental position and it's not a burden. The plants are running great; Pete [inaudible] has got those things running at 94% capacity factor. Ralph has done a great job of heading over there and managing the capital construction program to get these plants online.

I think we have a lot more flexibility than we had just two weeks ago, and certainly a lot more flexibility than we had a year ago. So, as I look at the company overall, there are some near-term, mid-term and long-term priorities. The near-term priorities are very clear, we have to get the two plants up and running that we are building, and we have to get the regulatory process well in hand in terms of nuclear ZEC payment, in terms of the rate case, in terms of the energy [inaudible], in terms of the clean energy filing.

In addition to I think longer term, I want to strongly position us to have the same potential rate base growth, on the customer side of the meter as we have had on our side of the meter. I think there is a lot of work that can be done in digitalizing the utility, in terms of managing distributed resources in terms of helping the customer control their bill. I think the combination of our traditional investments, the 90-year-old switching stations, the 70-year-old switching stations, and the opportunities on the other side of the customer bill, we have no AOI at PSEG, we have drive-by meter reading; that is the most sophisticated meter reading we have. We have no data analytics in terms of our customer usage pattern.

SI-SSA-0015-14601

We are great at restoring them, when they call us up and tell us they are out, but we do not know that before they do. So, I do think that longer term you are going to see a lot more of this utility of the future stuff, dominating the picture and what we will continue to pay attention to, is whether or not our investors are comfortable with these two entities being together. Right now, the signals are, they are; the signals are that our investors are comfortable with them being together. If we see a portfolio discount, if we see some valuation discount, then that will be motivational to rethink the integrated entity.

The question was, what about M&A? I love the organic growth store; we pay a dollar for a dollar of rate base. We do not pay $2 for a dollar of rate base. The premiums that other people are willing to pay, we just cannot pencil them in. If people want to pay us that premium, it is ralph.izzo@PSEG.com, but other than that, it has to be value-creating for the investor.

Speaker: I want to get a sense of the variability in the growth of the rate base going forward, I realize you have a track record of coming in here and upping up the capital budget every year, but it is rather remarkable that you have been able to grow the rate base when your customer base is growing 0.8% per year. Now you have the energy efficiency headwind where you are going to try to reduce that.

I realize the transmission is kind of a different dynamic and that gets you out from maybe a little bit of the traditional customer base that you have within the utility, but it also seems to me that commodity prices have played a role here and another remarkable thing that you have been able to accomplish this while customer bills have been going down. But, what would cause the growth rate and the rate base to change on the negative side, and how fast would that happen?

Ralph Izzo: Excellent question, so I think the specific answer to your question is you have a spike in commodity prices. I am not wishing this, but heaven forbid, seismic activity increases in western Pennsylvania and Ohio and people say we need to figure this out and gas prices blow out, so if you have a tremendous amount of pressure on the supply component of the bill and that puts a tremendous amount of pressure on the G part of our PSE&G then you would have to have a pause in the infrastructure development.

One of the things we have not talked about as yet, we have tremendous amount of benefits that we have made use of that we did not control; lower gas prices, lower taxes, expiration of charges on the bill. All that stuff we did not influence, we just said, 'Now is the time to replace this old stuff.' But, the one thing that we do not talk enough about, that I think is important for folks to recognize is we had three nor'easters in New Jersey in March; that was not particularly strange, it was not normal but it was not something that you would have to look 100 years to see what happened. BP launched an investigation on customer restoration times: the tolerance for outages is gone.

We happen to be a great performer, so we are not in the cross hairs or in the bullseye of that, but as you continue to see further electrification of transportation of the household, of the workplace, the demands and the value that people put in electricity are just going to continue to climb and you cannot do that with 90-year-old switching stations, with wires on wooden poles that are leaning a lot. So, I think that as long as people recognize the value of the service they are getting, the appetite for it will be enormous. In a side bar conversation

SI-SSA-0015-14602

before, somebody correctly pointed out, Ralph your customers are not going to remember that in 2008 they were paying the same in real terms that they are paying in 2028. Of course that is true, they will not remember that, but as they see the kind of statistics that Dave Dally put up there in terms of safety, CAIDI, SAIDI, and the kind of statistics that Ralph LaRossa put up there in terms of carbon per megawatt hour and overall traditional pollutant statistics, I think we will have policy support.

If we continue to do this on a gradual basis, another benefit of clause recovery, you do not wait five years to then say, oh the 3% compounded over each of those five years, we need an 18% rate increase, but you feather it in, all that works towards managing the customer bill rationally, and it is the customer that matters. Do they see the value? Are we managing our O&M? Are we investing in assets that matter to them? And then I think we have a nice long runway.

Speaker: So my question was first on capital allocation: clearly you have headroom coming in in terms of the 2018, 2022 timeframe and capital that you have excess, and you have ZECs incrementally that will come in. Is the signal right now that the key thrust in terms of allocation of all that excess capital is primarily to the regulated side or are there deleveraging or any other goals or renewables, anything else that we should be looking at on the horizon as things that you are focused on?

Ralph Izzo: That has not changed either. We have said many times, number one is organic growth investments, the utility has been averaging 80% to 82% of the capital program, now it has gone to 90%. I think that is going to be probably the new normal for us. We do have lots of ambitious things that we want to do in support of governor Murphy's clean energy agenda, we are 110% behind him on that and we want to help do that as economically as possible because doing it at scale is more economic than doing it in onesies and twosies.

Then what we have always said is that we like the strength of the utility growth to even further cover the dividend, so the dividend has to be tied to earnings growth over time but having a health balance sheet helps you on those years where things go flat and we boast about a nice 4% plus growth in earnings but we had a couple of years where it was zero. Lastly would be share repurchase but we seem to keep finding opportunities to grow the company organically.

Speaker: Thank you, and the second question, the deferred tax liabilities, you mentioned that almost giving you a 1% boost in rate base; I am assuming that is the unprotected because the protected is so slow it is probably not going to have benefit, but you also mentioned that the unprotected piece is going to be an outcome from the rate base proceedings itself. So, what is the assumption that is basically built in right now that is driving the 1% increase in unprotected?

Ralph LaRossa: Really, if you think about it, it is a couple of different things, so you have your excess that are going to go back, but even as you are taking your tax deductions year over year over the next five years, the deferred tax build-up from that is going to be at 21%, not 35%. So there is a piece that comes into play there, so if you look at the absence of bonus, if you take a look at what I just described to you and if you take a look at what gets flowed back, which I think is maybe two things to think about there, one is that there is some

SI-SSA-0015-14603

excess deferreds that are not protected that are going to go back and it is going to be determined within the rate case.

There is also, in between rate cases there was a change in one particular deduction we take around repairs, and that gave us a much faster write off, which built up some deferred, which some of which turned out to be excess because every deferred tax became somewhat excess when the rate went from 35 to 21, but also some of that is there to be flowed back as well and is not protected. So, those two components, plus the bonus, plus the 21% gets you about that billion-dollar delta in rate base over the next five years and so we will work our way through in the rate case and we will see how much of that will go back and how fast. So it is still to be determined, but if you take all those things in the bucket and you think of them over five years being about $1 billion, you have got it about right.

Speaker: Just finally, cash taxes, can you just remind us where your position is now with the deferred taxes kind of impact built in?

Ralph LaRossa: Cash taxes not currently but in the near term and the other thing I would say is if you think about ZECs, that could accelerate the near term, so maybe a year or two is kind of ball park.

Speaker: Any other questions? If not, I think we are…

Ralph Izzo: I think we have one more slide Dan do we not, that we want to just…

Dan Cregg: We talk all the time about operational excellence, we talk about finance strength, discipline investment and all that and everything everybody does in the business, that is all nice, that all works pretty well but there is another secret source in enterprise that we have had for the last 11 or 12 years and her name is Kathleen Lally, so during the Lally era, you can make your own determination as to how much of the upward slope of this line had to do with everything we talked about today and how much it had to do with Kathleen, but I would put a lot of it on Kathleen personally. Everything she has done for the organization, for us, for insights, absolutely her value is more than I can speak to, so from the bottom of my heart I would like to thank Kathleen for everything and wish her all the best going forward.

Ralph Izzo: As a matter of fact, we did some analysis, evidently every one of the dips were your vacations. Thank you so much Kathleen, thank you all for being here, there really is no finer way to end the meeting than just to recognize you for all the great work. Thank you all.

Forward-Looking Statements

Certain of the matters discussed in this presentation about our and our subsidiaries' future performance, including, without limitation, future revenues, earnings, strategies, prospects, consequences and all other statements that are not purely historical constitute "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995. Such forward-looking statements are subject to risks and uncertainties, which could cause actual results to differ materially from those anticipated. Such statements are based on management's beliefs as well as assumptions made by and information currently available to management. When used herein, the words "anticipate," "intend," "estimate," "believe," "expect," "plan," "should," "hypothetical," "potential," "forecast," "project," variations of such words and similar expressions are intended to identify forward-looking statements. Factors that may cause actual results to differ are often presented with the forward-looking statements themselves. Other factors that could cause actual results to differ materially from those contemplated in any forward-looking statements made by us herein are discussed in filings we make with the United States Securities and Exchange Commission (SEC), including our Annual Report on Form 10-K and subsequent reports on Form 10-Q and Form 8-K. These factors include, but are not limited to:

- fluctuations in wholesale power and natural gas markets, including the potential impacts on the economic viability of our generation units;
- our ability to obtain adequate fuel supply;
- any inability to manage our energy obligations with available supply;
- increases in competition in wholesale energy and capacity markets;
- changes in technology related to energy generation, distribution and consumption and customer usage patterns;
- economic downturns;
- third-party credit risk relating to our sale of generation output and purchase of fuel;
- adverse performance of our decommissioning and defined benefit plan trust fund investments and changes in funding requirements;
- changes in state and federal legislation and regulations, and PSE&G's ability to recover costs and earn returns on authorized investments;
- the impact of pending and any future rate case proceedings;
- regulatory, financial, environmental, health and safety risks associated with our ownership and operation of nuclear facilities;
- adverse changes in energy industry laws, policies and regulations, including market structures and transmission planning;
- changes in federal and state environmental regulations and enforcement;
- delays in receipt of, or an inability to receive, necessary licenses and permits;
- adverse outcomes of any legal, regulatory or other proceeding, settlement, investigation or claim applicable to us and/or the energy industry;
- changes in tax laws and regulations;
- the impact of our holding company structure on our ability to meet our corporate funding needs, service debt and pay dividends;
- lack of growth or slower growth in the number of customers or changes in customer demand;
- any inability of Power to meet its commitments under forward sale obligations;
- reliance on transmission facilities that we do not own or control and the impact on our ability to maintain adequate transmission capacity;
- any inability to successfully develop or construct generation, transmission and distribution projects;
- any equipment failures, accidents, severe weather events or other incidents that impact our ability to provide safe and reliable service to our customers;
- our inability to exercise control over the operations of generation facilities in which we do not maintain a controlling interest;
- any inability to recover the carrying amount of our long-lived assets and leveraged leases;
- any inability to maintain sufficient liquidity;
- any inability to realize anticipated tax benefits or retain tax credits;
- challenges associated with recruitment and/or retention of key executives and a qualified workforce;
- the impact of our covenants in our debt instruments on our operations; and
- the impact of acts of terrorism, cybersecurity attacks or intrusions.

All of the forward-looking statements made in this presentation are qualified by these cautionary statements and we cannot assure you that the results or developments anticipated by management will be realized or even if realized, will have the expected consequences to, or effects on, us or our business, prospects, financial condition, results of operations or cash flows. Readers are cautioned not to place undue reliance on these forward-looking statements in making any investment decision. Forward-looking statements made in this presentation apply only as of the date of this presentation. While we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even in light of new information or future events, unless otherwise required by applicable securities laws.

The forward-looking statements contained in this presentation are intended to qualify for the safe harbor provisions of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended.

GAAP Disclaimer

PSEG presents Operating Earnings in addition to its Net Income reported in accordance with accounting principles generally accepted in the United States (GAAP). Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results.

Operating Earnings is a non-GAAP financial measures that differ from Net Income. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items. The last two slides in this presentation (Slides A and B) include lists of items excluded from Net Income/(Loss) to reconcile to non-GAAP Operating Earnings with a reference to those slides included on each of the slides where the non-GAAP information appears.

Due to the forward looking nature of non-GAAP Operating Earnings guidance, PSEG is unable to reconcile these non-GAAP financial measures to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility.

These materials and other financial releases can be found on the PSEG website at https://investor.pseg.com. From time to time, PSEG, PSE&G and PSEG Power release important information via postings on their corporate website at https://investor.pseg.com. Investors and other interested parties are encouraged to visit the corporate website to review new postings. The "email alerts" link at https://investor.pseg.com may be used to enroll to receive automatic email alerts and/or really simple syndication (RSS) feeds regarding new postings at https://investor.pseg.com/rss.

PSEG STRATEGY: BUILDING A SUSTAINABLE, FINANCIALLY SOUND ENERGY INFRASTRUCTURE COMPANY

Ralph Izzo

CHAIRMAN, PRESIDENT AND
CHIEF EXECUTIVE OFFICER

Dan Cregg

EXECUTIVE VICE PRESIDENT AND
CHIEF FINANCIAL OFFICER

SI-SSA-0015-14608

PSEG

We make things work for you.

PSE&G Represents **65%** of Non-GAAP Operating Earnings

4.7% Increase in 2018 Common Dividend

Promoting Sound Energy Policy

115 Years Investing in NJ's Critical Infrastructure

5–Year Investment Program Provides Opportunity for **8%-10%** CAGR in PSE&G Rate Base

PSEG

Two strong businesses with a track record of success

Electric & Gas Distribution and Transmission

Strategy: Investments aligned with public policy and customer needs

Value Proposition: A $12 Billion - $16 Billion infrastructure program expected to produce 8%-10% annual rate base growth through 2022

2017	Assets $29B Net Income $973M Non-GAAP Operating Earnings* $963M

Regional Competitive Generation

Strategy: Investment program enhances competitive position with addition of efficient, clean, reliable CCGT capacity

Value Proposition: Provides substantial free cash flow and upside from market rule improvements

2017	Assets $12B Net Income $479M Non-GAAP Operating Earnings* $505M

SI-SSA-0015-14610

ASSETS AND NET INCOME ARE FOR THE YEAR ENDED 12/31/2017. PSE&G AND POWER DO NOT ADD TO TOTAL DUE TO ENTERPRISE / OTHER ACTIVITY. PSE&G 5 YEAR CAPITAL SPEND FORECAST UPDATED FOR CLEAN ENERGY FUTURE PROGRAM FILED SEPTEMBER 26, 2018

*SEE SLIDE A FOR A RECONCILIATION OF NET INCOME TO NON-GAAP OPERATING EARNINGS AND SLIDE B FOR RECONCILIATIONS FOR PSE&G AND PSEG POWER.

Strategic focus produced growth in non-GAAP Operating Earnings as regulated business contribution grew to ~65%

2012	PSEG 5-Year Capital Investment Program of $18 Billion*	2017

- ✓ Regulated annual Rate Base growth of 13% to $17 Billion
- ✓ Transmission has grown to 46% of Rate Base
- ✓ Efficient growth: O&M held flat
- ✓ Overall customer bill is down

$2.44	Non-GAAP Operating Earnings +4% per year	$2.93
43%	Regulated Net Income Contribution Increased	65%
$1.42	Common Dividend Per Share +4% per year	$1.72

*CAPITAL INCLUDES YEARS 2013-2017.

Next Steps: Building on a successful and sustainable platform that meets the needs of customers and shareholders

2018	PSEG 5-Year Capital Investment Program $14B - $17.5B

- ✓ Investing $12 Billion-$16 Billion to upgrade New Jersey infrastructure and meet NJ's Clean Energy goals
- ✓ Minimizing risk/volatility of merchant generation
- ✓ Continued cost discipline in operations
- ✓ Maintaining high customer satisfaction levels
- ✓ Tax reform benefits customers and shareholders
- ✓ Financial strength remains a core operating principle

Rate Base	Expected 8%-10% Compound Annual Growth in Rate Base through 2022
$1.80	Opportunity for Consistent and Sustainable Growth in Common Dividend

SI-SSA-0015-14612

HASHED PORTION OF THE CHART REPRESENTS EXTENSION OF ENERGY STRONG (ES2) AND CLEAN ENERGY FUTURE (CEF) FILINGS.
5 YEAR CAPITAL SPEND FORECAST UPDATED FOR CLEAN ENERGY FUTURE PROGRAM FILED SEPTEMBER 26, 2018 E = ESTIMATE.

Power's generating assets mainly located in three competitive markets

Power Ventures assets:

- Solar (414 MW_{DC}/325 MW_{AC})
- Kalaeloa, HI (104 MW)

- Major assets located near key load centers
- Completing construction program of three new, highly efficient combined-cycle units
- Positioned to benefit from market volatility

SI-SSA-0015-14615

Power's fleet transformed with focus on improvement in efficiency

Projected Fleet Comparison 2017 to 2022E

[1] REFLECTS RETIREMENT OF HUDSON AND MERCER UNITS IN JUNE 2017
E=ESTIMATE

SI-SSA-0015-14616

Regulatory/legislative policy initiatives strengthen foundation for providing clean, affordable and resilient energy supply

Base Rate Case Provides Opportunity for Long-Term Rate Stability

- Decision expected in Q4 2018

NJ regulators endorse streamlined process supporting long-term investment

- GSMP II Approved; ES II Filed in June 2018

NJ Advances Clean Energy Future

- PSEG Power will request NJBPU determination of eligibility for our NJ nuclear plants to receive Zero Emission Certificates
- PSE&G plans to accelerate investment in Energy Efficiency, Energy Storage, EVs and Energy Cloud - AMI

FERC/PJM Wholesale Market Reforms Underway

- Fast start pricing reform at PJM expected in 2019

SI-SSA-0015-14617

AMI = ADVANCED METERING INFRASTRUCTURE.

NJ Zero Emission Certificates (ZEC) support carbon free nuclear generation

- ✓ Legislation signed by New Jersey Governor Murphy on May 23
- ✓ 330-Day process underway – NJ Board of Public Utilities expected to determine eligibility and select nuclear plants to receive ZECs by mid-April 2019
- ✓ Hope Creek and Salem produce >90% of NJ's carbon free generation, support ~6,000 jobs, and benefit fuel diversity and grid reliability

SI-SSA-0015-14618

Zero Emission Certificate (ZEC) Process

2018	2019	2020

Enacted May 23 (Day One)

November 2018 (Day 180), BPU issues Order establishing ZEC program

April 19, 2019 (Day 330), BPU ranks applicants and selects plants to receive ZECs. Utilities begin purchasing ZECs for 'stub' period. Cash payment follows

During 'stub' period (end of energy year), ZECs earned through May 31

Within 90 days of May 31, cash payment occurs for ZECs earned during 'stub' period

June 2019, utilities purchase ZECs for new energy year, with cash payment within 90 days of the energy year ending May 31, 2020

Subsequent years work the same

Annual revenues estimated at ~$200 million, or ~$0.28 per share if all three NJ units are selected

SI-SSA-0015-14619

PSEG's future direction aligned with customer needs and NJ's Clean Energy agenda

2012-2017	2018 – 2022	Utility of the Future
Transmission expansion Storm hardening and resiliency New peaking generation and generation uprates Regulated & Unregulated Renewables	Upgrade aging infrastructure and Transmission Storm hardening and resiliency New, efficient CCGTs Clean Energy Legislation • Expanded Energy Efficiency • EV Infrastructure • Energy Storage • Energy Cloud – AMI Regulated & Unregulated Renewables	Clean Energy Legislation • Expanded Energy Efficiency • EV infrastructure • Battery storage Greater use of technology to enhance 2-way customer communication Regulated Renewables

AMI = ADVANCED METERING INFRASTRUCTURE.

NJ has advanced a new Clean Energy agenda

Energy Policy	Description	Investment Opportunity for PSEG
Energy Efficiency (EE)	• Requires electric utilities to reduce energy consumption by 2% and gas utilities to reduce energy consumption by 0.75% from average annual usage over prior 3-year period within 5 years • Allows utilities to recover "reasonable and prudent costs" including return of and on capital and revenue impact of lost sales	☑
Renewable Portfolio Standard (RPS)	• Increases percentage of energy to be supplied from renewable energy resources to 50% by 2030	☑
Solar	• Annual solar requirement increases to 4.8% in 2025 before declining to 4.5% in 2026 and 1.1% in 2033 as net metering cap increased to 5.8% from 2.9% • BPU must complete a study on how to modify/replace SREC program by 24 months after enactment	☑
Community Solar	• BPU must develop rules and regulations establishing a "Community Solar Energy Pilot Program"	☑
Offshore Wind (OSW)	• BPU to establish Offshore Renewable Energy Certificate (OREC) to support 3,500 MW by 2030 • Allows OSW projects to receive tax credits from the Energy Development Agency (EDA) • NJ Dept. of Labor directed to develop job training programs to support OSW development	☑
Energy Storage	• BPU to provide Governor and Legislature with analysis of "energy storage needs and opportunities" • BPU to initiate process within six months of delivering report that establishes a process and mechanism for achieving 600 MW of energy storage by 2021 and 2,000 MW by 2030	☑
EV Infrastructure	• Charging stations and related infrastructure for workplace, multi-family and travel corridors	☑

SI-SSA-0015-14621

Partnership for a Clean Energy Future:

~$3.6 Billion investment program to provide cost-effective and innovative solutions supporting NJ's clean energy goals

- **Energy Efficiency:** Residential and C&I programs to lower energy bills and combat climate change
  - Savings targeting 2% electric and 0.75% gas savings consistent with NJ Clean Energy Legislation
  - Customer benefits exceed costs
- **Electric Vehicles:** "Smart" electric vehicle infrastructure: residential, workplace, multi-family, travel corridors
- **Energy Storage:** Utility-scale systems to defer traditional distribution investment, enable additional solar, and enhance critical infrastructure resiliency
- **Energy Cloud: Advanced Metering Infrastructure (AMI):** Accelerated roll-out of 2.2 million electric meters and supporting infrastructure. Compelling customer benefits

Program Investment	$ Billion
Energy Efficiency	$2.5
Electric Vehicles	$0.3
Energy Storage	$0.1
Energy Cloud – AMI	$0.7
Investment Total	$3.6

- 6-year investment program starting in 2019
- Seeking contemporaneous recovery
- Contingent on approval of lost revenue recovery mechanism

SI-SSA-0015-14622

Customer's bills are materially lower, supporting needed investment in the system

PSE&G Combined Typical Annual Residential Customer Bills*

- Combined, typical residential electric and gas customer bills are ~30% lower since the highpoint in 2008 and >40% lower when adjusted for inflation
- Also provided BGSS bill credits totaling ~$680 per customer since 2012

- Regional price comparison** - Gas is 2nd lowest and Electric is lower than average
- Delivery revenue component is the lowest in the state for Gas and second lowest for Electric
- PSE&G's infrastructure and clean energy investment programs would increase rates by approximately 2% - 3% annually, aligned with inflation

SI-SSA-0015-14623

PSEG

*FOR ALL YEARS THE BILLING ASSUMES 7,200 KWH FOR ELECTRIC AND 1,010 THERMS FOR GAS ANNUALLY.
** COMPARED AGAINST 12 REGIONAL UTILITIES AS OF DECEMBER 1, 2017, FOR A CUSTOMER THAT USES 500 KILOWATT-HOURS AND 100 THERMS IN A MONTH.

Capital spending focused on regulated growth

PSEG
2018E – 2022E Capital Spending

$14B to $17.5B

Investment in regulated business represents ~90% of capital program

.HASHED PORTION OF THE CHART REPRESENTS EXTENSION OF ENERGY STRONG (ES2) AND CLEAN ENERGY FUTURE (CEF) FILING.

PSEG Value Proposition

- PSE&G – Delivering on promise for rate base growth through disciplined investment, customer satisfaction and safety
- PSEG Power – Efficient, low-cost, clean fleet advantaged by asset diversity, fuel mix and location
- Focus on providing strong, sustainable returns of invested capital through operational excellence, regulatory and legislative mechanisms
- 111-year record of paying common dividends with opportunity for consistent, sustainable growth

SI-SSA-0015-14630

NOTE: PSEG 5 YEAR CAPITAL SPEND FORECAST UPDATED FOR CLEAN ENERGY FUTURE PROGRAM FILED SEPTEMBER 26, 2018

Sustainability is the hallmark of our 115 years of Public Service

- ✓ PSEG's climate goal is to eliminate 13 million tons of CO_2 equivalent emissions by 2030 from 2005 levels
- ✓ Named to the Dow Jones North America Sustainability Index for the 11th year in 2018
- ✓ Working to secure the economic viability of PSEG Power's nuclear fleet, which generates >90% of New Jersey's carbon free energy
- ✓ Invested approximately $1.7 Billion in the development of solar energy
- ✓ Proud sponsor of several sustainability and STEM programs including Montclair State's Institute for Sustainability Studies; the Andlinger Center for Energy & the Environment at Princeton; and the Stevens Institute of Technology's SURE House

SI-SSA-0015-14631

PSEG EXECUTIVE PROFILES

PSEG

We make things work for you.

SI-SSA-0015-14632

Ralph Izzo

CHAIRMAN, PRESIDENT AND CHIEF EXECUTIVE OFFICER

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED

Ralph Izzo was elected chairman and chief executive officer of Public Service Enterprise Group Incorporated (PSEG) in April 2007. He was named as the company's president and chief operating officer and a member of the board of directors of PSEG in October 2006. Previously, Mr. Izzo was president and chief operating officer of Public Service Electric and Gas Company (PSE&G).

Since joining PSE&G in 1992 Mr. Izzo was elected to several executive positions within PSEG's family of companies, including PSE&G senior vice president – utility operations; PSE&G vice president – appliance service; PSEG vice president - corporate planning; and PSE&G vice president - electric ventures. In these capacities he broadened his experience in the areas of general management, strategic planning and finance.

Mr. Izzo is a well-known leader within the utility industry, as well as the public policy arena. He is frequently asked to testify before Congress and speak to organizations on matters pertaining to national energy policy.

Mr. Izzo's career began as a research scientist at the Princeton Plasma Physics Laboratory, performing numerical simulations of fusion energy experiments. He has published or presented over 35 papers on magnetohydrodynamic modeling. Mr. Izzo received his Bachelor of Science and Master of Science degrees in mechanical engineering and his Doctor of Philosophy degree in applied physics from Columbia University.

He also received a Master of Business Administration degree, with a concentration in finance from the Rutgers Graduate School of Management. He is listed in numerous editions of Who's Who and has been the recipient of national fellowships and awards. Mr. Izzo has received honorary degrees from the New Jersey Institute of Technology (Doctor of Science), Thomas Edison State University (Doctor of Humane Letters), Bloomfield College (Doctor of Humane Letters), Rutgers University (Doctor of Humane Letters), and Raritan Valley Community College (Associate of Science).

Mr. Izzo is on the board of directors for the New Jersey Chamber of Commerce, the Edison Electric Institute (EEI), the Nuclear Energy Institute (NEI) and the New Jersey Performing Arts Center. He is also a member of the Board of Trustees of Peddie School and the Princeton University Andlinger Center for Energy and the Environment Advisory Council, as well as a member of the Visiting Committee for the Department of Nuclear Engineering at MIT. Mr. Izzo is a former member of the Columbia University School of Engineering Board of Visitors. In addition, he is a former chair of the Rutgers University Board of Governors and the New Jersey Chamber of Commerce.

SI-SSA-0015-14633

Daniel J. Cregg

EXECUTIVE VICE PRESIDENT AND CHIEF FINANCIAL OFFICER

PUBLIC SERVICE ENTERPRISE GROUP INCORPORATED, PUBLIC SERVICE ELECTRIC AND GAS COMPANY, PSEG POWER LLC AND PSEG SERVICES CORPORATION

Daniel J. Cregg was named executive vice president and chief financial officer for Public Service Enterprise Group Incorporated (PSEG) and its subsidiaries in October 2015.

Mr. Cregg is responsible for all financial functions, including Internal Audit Services, Investor Relations and Corporate Development. Given the array of financial instruments which serve as the primary means of selling wholesale energy to customers, Mr. Cregg also has responsibility for the Risk Management function, which provides independent oversight of the PSEG Power trading organization. In addition to finance, Mr. Cregg is responsible for the Strategy and Planning function. He is a member of PSEG's Executive Officer Group.

Prior to his current position, Mr. Cregg was vice president – finance for PSE&G, a role he assumed in June 2013. In 2006, Mr. Cregg was named vice president – finance for PSEG Power. In that capacity and in previous financial roles for Power, Mr. Cregg held leadership positions related to financial reporting and forecasting, investor communications, financings, rating agency interactions, external reporting, cash forecasting, financial valuations, competitive intelligence, and fundamental market modeling, with critical responsibilities in Power's development and strategic planning activities.

Previously, Mr. Cregg was director of PSEG corporate development. He joined PSEG in 1991 with overall responsibility for tax planning, strategy and compliance for PSEG Energy Holdings, including domestic and international tax structuring work for PSEG Global and PSEG Resources.

Before joining PSEG, Mr. Cregg spent five years with the accounting and consulting firm of Deloitte and Touche, providing consulting services to a wide range of clients with an emphasis on the energy industry.

Mr. Cregg holds a Master of Business Administration degree from the Wharton School of the University of Pennsylvania and is a graduate of Lehigh University, where he received a bachelor's degree in accounting.

MANAGEMENT DISCUSSION SECTION

Ralph Izzo

So you're at the Public Service Enterprise Group presentation, just to make sure you're in the place you want to be. I refer you to our forward-looking statements as well as our GAAP disclaimer. We will be making some projections and we will use the methodology that we think better reflects the ongoing financial condition of the company.

I am Ralph Izzo, the Chairman, President and CEO of PSEG. I'm joined today with three of my colleagues Dan Cregg, our Executive Vice President and Chief Financial Officer; Carlotta Chan, who's in-charge of our Investor Relations; and Brian Reighn also from our Investor Relations Group. And each of us will be available to answer your questions as they arise.

So some highlights that we'll spend a little more time on during the course of the presentation, but the major theme here is a long history of success and a long-term view of how to manage the company going forward. Each of these particular items will come up during the course of the conversation, so I won't dwell on them here, but it is an over 100 year – over a century of success in various operational as well as financial measures.

So those of you who are less familiar with Public Service Enterprise Group, we have two principal operating subsidiaries. About two-thirds of the company's earnings comes from our regulated utility, it's an electric and gas utility in New Jersey. Its primary area of focus is an aging infrastructure investment program that has allowed us to grow the rate base over the past decade by low double-digits and over the next five years expects to invest between $12 billion and $16 billion to continue an 8% to 10% growth rate in that rate base, down from the prior 12% to 13% as the rate base has expanded.

PSEG Power, making up the bulk of the remaining one-third of the earnings of the company, characterized by a highly efficient natural gas fleet of approximately 7,200 average heat rate, producing a little bit under half of the electricity of power and then a low cost nuclear fleet of about 3,500 megawatts, producing a little bit over half of the remaining output from power. So we're well-positioned fleet from the point of view of economic efficiency, of environmental footprint as well as geographic location being primarily in Eastern PJM.

Another minute or two on the utility, we basically serve the north, south, central corridor of the State of New Jersey. A little bit over 2 million electric customers, a little bit under 2 million gas customers, essentially zero load growth over the past few years, modestly up in gas, modestly down in electric. So, load growth is not the correlating factor to the utility's growth. At the risk of repeating myself, it's all about an aging infrastructure replacement that is the primary impetus behind the past decade and future five years of growth, with the additional caveat now of an interest and an excitement around the Clean Energy Future being resurrected in New Jersey with the incoming new Governor Murphy administration.

Also worthy of note is the pie chart in the lower right hand corner. As you can see, we are approximately one-half transmission rate base and, therefore, FERC formula rate regulated, with the other half the distribution component being New Jersey Board of Public Utilities regulated.

A fairly busy year and a somewhat successful year from the point of view of 2018, our first base rate case in eight years having been successfully concluded just this past month successfully from the point of view of we didn't get everything

Bloomberg Transcript

Bloomberg

SI-SSA-0015-14637

we wanted and our regulators didn't get everything that perhaps they may have wanted. A 9.6% allowed return on equity and a 54% equity ratio being the highlights of that rate case outcome. We also received approval for a Gas System Modernization Plan. We have the dubious distinction of owning the largest cast-iron gas main system in America. It is fortunately a low pressure, low utilization pressure system and just sort of represents both an O&M and public nuisance from the point of view of occasional breaks and cracks that require correction.

At our current pace of expenditure, under the GSMP II, forgive me for using the acronym, but it just makes it easier, it will take us anywhere from 20 to 25 years to fully replace that program. That's a $400 million a year spend. In addition, legislation was enacted that preserves the life of our nuclear fleet by recognizing both their environmental benefits through a zero-emission credit as well as the fuel diversity they provide the state in terms of minimizing our exclusive dependence on natural gas. Also this year, the passage of Clean Energy legislation, which creates a framework for the utility to participate in a whole range of beyond-the-meter services, which we had been participating in, in the past, but now gives an explicit mandate, things like energy storage, energy efficiency and the like and we'll talk a little bit more about that Clean Energy Future program as we continue.

To be sure, some activity underway at FERC as it pertains to PJM capacity markets. There too, while there's no question that there's some uncertainty associated with that. We do believe that given the stated objectives of FERC in redesigning the capacity market that we are extremely well-positioned: number one, through the elimination of, to the extent that exists, price suppression on unsubsidized units that could potentially – should potentially support and help our fossil fleet; and number two, through FERC's stated desire to not interfere with state's abilities to designate various technologies in particular as it pertains to carbon limitations and continue to support the operation of those technologies, which should benefit our nuclear fleet.

Let's spend a little bit of time talking about that 8% to 10% growth rate in the rate base of the utility. What do you see here is the rate base for transmission at the bottom half of the bar and the rate base for distribution the green part of the bar. Those are approved and existing programs. The projects are in engineering, they're in design, they're in construction and that produces the 8% growth rate. The additional potential for 2% is if the two filings that we have made this year, one for something called Energy Strong II, which brilliantly follows on the heels of Energy Strong I, which was completed just this past year, which is an attempt to harden and make more resilient our electric grid. We have filed for $2.5 billion over the next five years. Here we show the first three years of that five-year program. And on top of that, our Clean Energy programs that I referred to briefly a moment ago, which is $3.6 billion filing for the next six years. Here we show the first three years of that.

If the as-filed programs are approved in the as-filed condition, the first three years of them would produce the 10% growth rate. That 10% growth rate could be achievable in other ways by either additional transmission projects, additional distribution projects, or even if the programs are not fully approved, if the first three years of the as-filed programs are approved, that 10% would be real. So somewhere between 8% and 10%.

My favorite slide of the whole deck, one that I'll spend a few minutes on, the stacked solid colored bars reflect known and approved capital programs that contribute – that provides the 8% growth in rate base. So here we break that out in terms of transmission, electric and gas distribution and Clean Energy. So that would be the solid bars. And if you look at the tops of the solid bars, you see a roughly $12-plus billion program that is declining over the five years.

We have shown this graph every year for the past 11 to 12 years. We don't have to change it at all except for the numbers on the Y axis and the years on the X axis. To emphasize that point, if you look at that dark line that's on the bottom, that's somewhat short, that shows years three, four and five of what would have been the solid bars that I showed two years ago in 2016. So you see the same declining pattern.

The equally dark line, but I think it's black if you look close to it, our years two, three, four and five of what the tops of the solid bars would have been in 2017, same declining pattern, but about $0.5 billion higher in each year. If we were not to show stacked bars but instead were to simply show you a solid line, for the current solid bars you could see that it is the same declining pattern but about $300 million higher in each year.

So every year we talk about the declining capital program and every year we come back and show you the increased capital program. And it suffices to say that the crosshatched region on top are the two current filings Energy Strong II and Clean Energy Future. We will not get 100% of what we request, even though we think every penny of it is worth doing. To the extent that we get some of it, it is very likely that I will repeat the last three minutes of this presentation when I speak to you next year.

So notwithstanding the growth in the rate base, the emphasis has shifted. So some of the transmission projects we did five years ago were all about decongesting and making more reliable the East-West Interchange and PJM East. Now we are spending more money not so much on big transmission projects, but on hardening the transmission system, replacing literally 70-year-old assets, 60-year-old assets to make sure they're more reliable. Prior five years, we spent a fair amount of money in building some small peakers in our generation fleet one in Connecticut, one in New Jersey and in the last year and then into the next year, we've built a few combined cycles. That program will wind down and we will deemphasize our construction in the generation fleet.

We have spent a fair amount of money the prior five years on distribution resiliency. That will continue in the current five years and we are just beginning to ramp up our Clean Energy spending. We had spent about $700 million in solar over the past 10 years, $400 million on energy efficiency over the past 10 years. But if you just look at that Clean Energy filing, $3.6 billion over the next six years, you can see an order of magnitude shift in that emphasis.

Let me spend a little bit of time again on the base rate case settlement. So, the $17.5 billion rate base, about half of that, as I mentioned a moment ago, a little bit more than half of that, $9.5 billion is in distribution. The last five settled cases in New Jersey have yielded a 9.6% allowed ROE. That was the ROE we settled for. We were given a 54% equity layer, which also applies to our transmission system as a result of that being the capital structure of the single legal entity known as PSE&G. But through the miracles of tax reform, we are actually able to improve our earnings while lowering the customer bill by $13 million. And Dan during the Q&A can walk you through the deferred tax impacts of tax reform as well as some of the flow-back issues that allowed us to both increase the earnings of the company and lower customer bills.

At the conclusion of this case, our customers' bills, not their rates, but the bill for the average residential customer is 30% lower than what it was 10 years ago in nominal dollars and 40% lower if you were to escalate for the Consumer Price Index. I have to remind customers of that every so often because they don't seem to recall what their bill was back in 2008.

Energy Strong program, by way of reminder, back in the 2011, 2012 timeframe, we had some very strange events. We had a snowstorm in New Jersey around Halloween then the subsequent August we had Hurricane Irene, not such an unusual event. But then October 28, 2012, we had Superstorm Sandy and that resulted in literally a resetting of the Federal Emergency Management Agency maps for where the flood plains reside. New Jersey being an old industrial state where electrification followed the industrialization of the state, primarily in transportation corridor, in the old days transportation corridors were rivers and rail lines. Those happened to be coincidental with low-lying areas and flood-prone areas. We have a lot of assets that were susceptible to floods not just from rain, but from tidal surges.

At that time, we went to the Board of Public Utilities and said to fix those assets that were affected by each of those three events. I'm not predicting any future climate change calamities, but just to fix what was affected will cost us $3.9 billion and we need to spend that over the next 10 years. The Board of Public Utilities said here – we then asked for $2.6 billion over five years. The Board of Public Utilities said you're right, something needs to be done. Here's $1.2 billion and get it done in the next three or four years. And by the way, we're going to assign somebody to monitor your activity. I think with complete pride on behalf of our employees, I can say that that monitor gave us an A-plus on our report card. We did the work that we thought would take $1.2 billion and used only $1 billion and now we've gone back and said $3.9 billion minus $1.2 billion is not $2.7 billion, it's $2.5 billion. And by the way, we think we can do a few more things here and a few less things there, but [ph] give us the second-half of energy shown (00:14:20) given how well we did.

You can see a before and after picture here of a particular switching station that was modified as a result of Energy Strong. And if you can't see the detail, I'd encourage you to pick up one of the slides in the back. It's pretty impressive

how different the facility is both in terms of just being lifted off the ground and being protected from inclement weather.

The partnership for Clean Energy Future, as I mentioned a moment ago, really comes on the heels of Clean Energy legislation that was enacted and signed into law by Governor Murphy in May of this past year. The primary component of that is an energy efficiency program that seeks to reduce electricity demand by 2% per year and gas demand by 0.75% per year. The legislation clearly articulates that those ought to be the targets for the electric and gas utilities in the state and the BPU should enact rules that allow us to recover the costs for running the program, to recover the investment of the equipment we put in, to earn a return on the investments we put in as well as to recover the loss revenues from the foregone sales as a result of the energy efficiency.

So the legislative language we are very supportive of. The actual rules to implement that is something that will be discussed during the course of the Clean Energy Future filing. Theoretically, the laws are written in a way where the Board of Public Utilities has 180 days to act on that after they've deemed the application complete. This is webcast, but nonetheless [ph] I will guard on a limb (00:15:50) and remind the Board of Public Utilities that today is the 30-day expiration of the clock for completeness. It's a three-hour time zone, I wish I was speaking at 1:00 PM instead of 9:00 AM, but nonetheless hopefully that application will be deemed complete. Even if it's not, we will work with the staff to get them the information they need. So, that's the [indiscernible] (00:16:10) of the $2.5 billion.

If you look at New Jersey from the point of view of conditions that blend it to be a place for electric vehicle penetration, third highest per capita income in the nation, among the worst air quality, densely populated state, short travel distance, high traffic congestion. Nonetheless, we lag – I think we're 48th in the state in electric vehicle charging stations. So all we've said here is we recognize it's not a natural monopoly service, but there is a strong mismatch between how much electric vehicle penetration should exist in New Jersey and how much does exist in New Jersey. Let us help you get the market started. Similarly, if one were to look at the Governor's articulated and then legislated goals for energy storage, a target of 600 megawatts of energy storage by the year 2021, which is about 26 months away. And we are proposing to do 35 megawatts of that once again to get the market underway.

And last but by no means least, in the latter years of the six-year filing to install about 2 million smart meters and to move forward where New Jersey has lagged the rest of the nation. I believe I've seen estimates of 50% to 60% of the nation now has smart meters and we do not have any appreciable number of those in New Jersey and to provide the data analytics to really improve the customer experience from a point of view of affordability, from a point of view of energy efficiency and a whole variety of basic daily operational services – outage detection, remote reconnect and disconnect and things of the sort.

Moving over to Power, we show here the location of our assets on the left hand side in terms of our fossil and nuclear fleet. On the right hand side, we also have about 400 megawatts DC of solar farms, sprinkled around I think 15 or 16 states. The largest installation is somewhere in the low 50 megawatt range, the smallest installation being a couple of megawatts. So we don't do rooftop, we don't do large scale installations, all of them are supported by long-term power purchase agreements, which creditworthy counterparties usually [ph] end up at (00:18:22) utility. As you can see, our fossil and nuclear fleet is in PJM East with one power plant in New York ISO and then one power plant in [ph] NEPOOL (00:18:32) in the Bridgeport area.

The fleet is undergoing quite a transformation. The charts on the left are the nameplate capacity of our assets. So, as you can see that we are primarily a gas fleet in terms of the blue being slightly larger than the orange, which is the nuclear component in terms of nameplate capacity. But as we step forward in time, the completion of three combined cycle gas turbines, one in Maryland, one in Connecticut, one in New Jersey will further expand the gas nameplate capacity of that fleet.

But more importantly, in terms of the output of the fleet, the lower right shows you that we are predominantly a nuclear generator, nowadays close to 60% of the output. However, given any efficiency of the new combined cycle fleet that we are just finishing the construction of, two of them actually finished, one will be complete in June, you see quite a bit of an increase in the amount of output from natural gas. The small piece of coal that remains is our partial ownership of a mine mouth coal facility in Western Pennsylvania known as Keystone Conemaugh. I think we own about 25%, 27%

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14640

of that, something like that.

If we look at Power's capital construction program, as I mentioned a moment ago, we just finished the construction of two combined cycle units this past year, one in New Jersey, one in Maryland. We will finish the third and final piece of that construction program in Bridgeport, Connecticut by June of next year. That will take Power's capital construction program down to a maintenance level of about $200 million a year, freeing up $800 million of funds from operation to be available as free cash flow over to the insatiable appetite of the utility to improve the aging infrastructure that we talked about a few minutes ago.

So that capital program in the utility can be performed without the need for additional equity. It is internally self-funded plus the debt capacity of the utility. So the equity needs of the utility is provided by the internal cash flow generation, the debt capacity of Power and then the 46% debt component of the utility capital structure as its own debt capacity.

O&M has been something that we pay attention to every day, every week, every month, every year. We can never come to EEI, I am almost sad, but – I can't actually cross that line to actually being said and announce a major cost reduction program. We obsessed over this all the time. Dan got to fly out here in economy plus seating next to a service dog that evidently [ph] shed (00:21:07) all over, his eyes are still red from doing that. I had one analyst scold me over the fact that we put Dan in that seat. I said I don't feel sorry for him. He builds character. I had the same seat coming up, but without the service dog. I have nothing against service dogs. I know I'm going to get in trouble for joking about that, but that's a true story. I've completely forgotten what I wanted to tell you about that. That wasn't part [indiscernible] (00:21:31) the fact that O&M over these five years at the parent level has decreased by about a little less than 0.5% per year. Yet we did manage to give people on average a 3% wage increases, we did manage on average to invest a tremendous amount of money in capital construction at the utility.

That's significant because when you're doing that amount of work at the utility, there is a fair amount of O&M that goes along with it, right. You can't start working on the system and take substations at a service without being dispatching people to other substations to make sure the system is in a stable configuration. So the capital program does incur a fair amount of [ph] volume (00:22:07). So that just means that we found ways to save money in other areas.

If I take a look at the current condition of the balance sheet, our cash metrics, what we find is that we tend to pick minimum thresholds that would keep the company at a solid investment-grade credit rating. For us, that's typically BBB+. So with the capital program, as I've described, with our expectations for dividend growth, which I'll speak to in a moment, without the need for additional equity, we still have about $1.4 billion in unutilized debt capacity. And what that means if we were to do something in the unregulated business, that debt capacity equals the investment capacity. However, that capital program that I described to you a moment ago, 90% is targeted towards the utility. That ratio has gone anywhere from 80% to 90% over the next five years whenever you look back in time, right. So if you look back in time and then look forward five years, we spent between 80% and 90% on the utility and that will continue to be the overwhelmingly majority part of our capital program.

With that in mind, that $1.4 billion in debt capacity could yield an additional $2.8 billion in utility investment – that being the equity component and then the utility being able to access the debt markets on its own. So we have a pretty strong 8% to 10% rate base growth, we have some fairly solid credit metrics and we have additional capability for further investment, never with the need to issue additional equity.

We just recently narrowed our guidance without changing the midpoint, so I believe we're now at $3.05 to $3.10 a share. Over the last five years, we've been growing earnings at 4%. The utility's double-digit growth being offset by the recontracting of Power and therefore the decline in profitability in merchant generation business.

We have paid a dividend every year for 111 years and that – we didn't do that by occasionally cutting it down to $0.01 a year and no cheap shots intended there. But nonetheless, you do see that the utility more than covers the dividend and the utility growth rate more than covers the growth rate in the dividend, therefore, further increasing the security of that dividend. We don't give a formulaic guidance in terms of dividend policy. We do offer these qualitative words that you can fairly easily translate into what you've seen recently is what you should expect to continue to see certainly over the predictable near term. So that's that opportunity for consistent and sustainable dividend growth.

SI-SSA-0015-14641

The value proposition hasn't changed. We run the business by obsessing over operational excellence. Being named to the Dow Jones Sustainability Index for 11 years in a row, being the most reliable electric utility in the Mid-Atlantic region 17 years in a row, a series of accolades that range from diversity and inclusion to being in the Forbes' Most Trustworthy Lister, some such crazy designation I don't even know what to call it. But that operational excellence is what leads to very strong regulatory relations and therefore solid financial performance and then we invest that money wisely in things that are consistent with public policy or meet the needs of our customers, even if it's not yet quite reflected in public policy, all the while making sure that that financial strength is intact.

If there is a takeaway from this EEI Meeting that we're sharing with investors, and I'd like to share with you today, it's summarized here, it talks about the recent regulatory derisking that's undertaken. It talks about the fleet in terms of the merchant generation de-risking that's taken place both in terms of the expanded geographic footprint by putting an actual asset at the PJM West Hub in Maryland and in terms of improving the overall heat rate of the fleet while all the time looking at what is possible for the future in terms of now moving down to the smaller projects in transmission, accelerating the gas pipe replacement, finishing the distribution hardening, moving into a Cleaner Energy Future and all the while protecting the strength of that balance sheet.

So, with that, I do believe I've left more than enough time for some questions. I'm not getting the nasty card from the back that says your time is up. So Dan and I are here to answer any questions you might have. Thank you.

Q&A

<A - Ralph Izzo>: We have a question here.

<Q>: I don't need the mic. I'm loud. I loved your comments. Great story. [ph] We can see (00:26:41) growth nationwide in renewables [indiscernible] (00:26:45)

<A - Ralph Izzo>: Yeah. Yeah, I do. I mean, most states are following some sort of renewable portfolio standard. I think it's a sub-optimal approach. We're a company that explicitly has said climate change is real and the preferred approach would be a national price on carbon, preferably economy-wide, but certainly industry-wide and then let the market pick and choose the best approach for achieving those outcomes. The way in which you get the price on carbon are many and varied. You can do a carbon tax, you can do cap and trade, you can do a variety of things. But there are some regions of the country that will survive the decrease in the ITC and the elimination of the PTC. There are some areas of the country that will not and you'll have to rely on the renewable portfolio standard to achieve continued investment.

New Jersey has opted to do most of its in-state renewables through rooftop solar. It's been a very expensive way to do renewables. The Solar Renewable Energy Credit, which is the regulated subsidy [ph] stream (00:27:53) that is on top of the investment tax credit and on top of net metering, nowadays trades [ph] for $220 (00:27:59) a megawatt-hour in New Jersey. That's a pretty steep price for an SREC.

So I do see it continuing. The technology is getting better. There are some parts of the nation where it's already competitive – wind in the Greater Plains, solar in the Southwest, but there are other parts that I think will slow down in the absence of any kind of robust renewable portfolio [indiscernible] (00:28:19). It's funny how a question that simply merits a yes or no can be stretched out for five minutes.

<Q>: Thanks. I know in the last rate cases, the decoupling didn't go through, so you're going to apply to get that.

<A - Ralph Izzo>: Yeah.

<Q>: What's the importance there? Are you conservation or efficiency or is it rooftop solar or why is it so important to you guys?

<A - Ralph Izzo>: Yeah. So decoupling is important to us as a foundation for the energy efficiency filing. So energy efficiency, as you know – we're not trying to do signal processing of refrigeration consumption of electricity, right. We're trying to get people to replace their light bulbs, their thermostats, their HVAC systems. So there is a significant

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14642

component. It varies by customer class and you can think of it as 30% to 50% of what a customer pay us [ph] then is (00:29:10) a fixed cost. So to the extent that we can help customers by helping them avoid consumption, we can eliminate our variable costs, that could be customer savings, but we don't want to lose the fixed cost recovery. So decoupling would help us avoid that fixed cost recovery. One could go in for frequent rate cases, but for a short-lived asset, the regulatory lag associated with a frequent rate case would be such that you would really underachieve the allowed return on that light bulb investment.

So what we said to the regulators back when we filed the rate case is we are going to file a Clean Energy program in the not too distant future and we won't be able to do it without a recovery of that fixed cost component. 28 other states do it by decoupling, why don't we be number 29. We essentially have it in natural gas in New Jersey. So we put it as part of the base rate case knowing full well that that was not the optimal forum for discussion of decoupling, but hoping that we could do something proactively. Therefore, we were willing to settle and concede that we would not decouple in the base rate case knowing that the Clean Energy filing would bring a whole different set of parties into the discussion who had much deeper experience, knowledge and candidly support for decoupling. And that's where it more naturally resides. So that will be the policy debate that will take place.

To us, energy efficiency is a quadruple when you can literally improve the environment, you can allow the shareholder to earn some money, you can lower the customer bill and candidly these are low skill jobs that you can now employ people that perhaps have long-term unemployment challenges. If everyone is willing to accept a quarter of the pie, everyone can win. But if somebody wants a half of the pie and the other people have to have a third each, I think I did my fractions right, then there are some losers and we're just trying to set the stage for that.

<Q>: [indiscernible] (00:31:18)

<A - Ralph Izzo>: Yeah, [ph] Frank (00:31:21). So the Long Island business I believe is doing fabulously well. So we are the operators of the Long Island Power Authority's electric distribution and transmission system. We have a12-year contract. We're just about to begin year five. Our J.D. Power scores are greatly improving. But more important than that, my sister-in-law who lives on Long Island who's legally insane, who I adore and otherwise I wouldn't say that, is telling me that her service is better. So that seems to be going fabulously well. We have a great team out there that's doing a good job in storm response. Now candidly, in all fairness to our predecessor operator, we've not been challenged by Superstorm Sandy, we've not been challenged by Hurricane Irene. So it's easier to perform well under less dire circumstances.

We have something called an operating services agreement, which fixes the fee that we get paid for operating that system. And then it's varied over time, but typically about 30 operating statistics that we have to achieve and we get bonuses if we achieve a certain percentage and we get penalized if we achieve a smaller percentage. And every year of the first four years of the contract, we've achieved bonuses. I think this year we're literally on track to hit 20 out of the 30 metrics. So I think that's going quite well. Anyone here who live on Long Island? How is it going, [ph] Helen (00:32:43), don't tell me you have an outage last week.

<Q>: [ph] We had a fewer hours (00:32:47).

<A - Ralph Izzo>: That's good. Thank you. I literally used to get Newsday clippings from my sister-in-law like the first month that we were out there. I was like I begged my brother tell her to stop please, I'm not coming out there to fix this.

Okay. Well, I don't see other hands. Oh, I see one hand there.

<Q>: [indiscernible] (00:33:10-00:33:17)

<A - Ralph Izzo>: Yeah. No, so New Jersey has one of the most diverse populations in the nation. And I fundamentally don't understand why any business would say to itself, I really want to recruit from only half this population. We're 85% male. Or I'd only want to recruit from 45% of the population. We're 80% Caucasian. So, to me, whether it's suppliers, whether it's labor, one needs to make available to oneself 100% of what is out there. So we are actively going to schools that have a highly diverse population to try to attract a diverse set of engineers. We have a

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14643

Chief Diversity Officer who's got me as part of the CEO network. I think Thursday I'm going to a meeting to learn better what others are doing.

If you look at our Board of Directors, it's fairly diverse. Our officer core is not diverse. I've not penetrated that level. The tension is I believe that employees want to get promotional opportunities. And so that's right. I have a bias towards promoting from within, oh, that pipeline is not diverse. So that means to improve your diversity, you have to recruit from these schools, you have to change the look of the leadership on the top that then takes away opportunities from people from within. So that's the constant balance that we undergo.

We have created an innumerable amount of employee business resource groups to create forums where people, whether it's alternate lifestyle, whether it's LBGT, whether it's disability, whether it's [indiscernible] (00:34:59) can meet together and work together and provide a shared support network for each other. So, not only do I think it's a business imperative, I also think it's the right thing to do. So, to the extent that we can allow our diverse population who are there today they feel good about the place. That enhances our prospect to attract and recruit people into the future. But we really have no choice. One-third of our employees are related to each other. So that's both a blessing and a curse, right, I mean, it's a blessing when I go to union meetings and they start swearing at me and saying, hey, what I do wrong and I say, well, then why is it that you have your nephew working here [indiscernible] (00:35:41). So it's a multifaceted challenge, but one that is front and center for us.

I'm getting the yellow card. Yes, [ph] Helen (00:35:48).

<Q>: [indiscernible] (00:35:50-00:35:59)

<A - Ralph Izzo>: No. I love all my children. We pruned assets in many different places over many years. We had big assets in South America, we had some sociopolitical challenges that we weren't the best at managing. We had some assets in Texas that seemed to be subject to low barriers to entry and short commodity cycle. So, no, I think we've done the pruning that we want to do. I would say that there are some parts of the business that have more uncertainty and difficulty in terms of explaining than other parts of the business. I mean, try to have a conversation about the reliability, pricing model and capacity reform for subsidized plants and not have people their hair catch fire and then [indiscernible] (00:36:53) But, no, I mean, I think what we do is we just make sure that we retire inefficient units and we build efficient units and we put them in places where we think the demand will grow strong. So I think we've done the pruning that we wanted to do.

What do you think?

<Q>: [indiscernible] (00:37:14)

<A - Ralph Izzo>: Are you business class going back? Are you?

<Q>: [indiscernible] (00:37:18)

Ralph Izzo

Thank you for joining us, everyone.

MANAGEMENT DISCUSSION SECTION

Kathleen A. Lally

Just ask that you all take your seat, so we can get started on close to time, close to schedule.

[audio gap] (00:00:19-00:01:35)

So good morning. I'm Kathleen Lally, Vice President of Investor Relations for Public Service. And thank you all for attending our Annual Financial Conference with the Executive Management of Public Service Enterprise Group. We have a full morning prepared for you today. We want to start as usual as is our norm with

Ralph Izzo, Chairman, President and CEO of Public Service who will outline the company's strategic plans and goals for growth. Ralph will be followed by Tammy Linde, Executive Vice President and General Counsel for the company, who's going to outline the regulatory and policy, legislative policy issues that help inform our strategic goals.

Following Tammy, there'll be time for questions. And then after that Q&A session, Dave Daly; President and Chief Operating Officer of Public Service Electric and Gas will outline utility companies' outlook and programs. Basically it's a major capital program which we're announcing today. And following Dave, there will be an opportunity for questions. And we'll take a break shortly after the, right after that Q&A session.

Following that Ralph LaRossa, President and Chief Operating Officer of PSEG Power will outline the initiatives underway at Power. And then there'll be time for questions of Ralph following his presentation. And then that will be followed by Dan Cregg, who's going to wrap up the financial picture for the company. And following Dan, there will be time for Q&A if he and Ralph Izzo. So it's a very full morning as we've normally provided to you over the past 12 years and I hope you get the information that you need to properly value our security.

So with that, I'll turn it over to Ralph.

Ralph Izzo

Thank you.

Thank you, Kathleen and thank you to the New York Stock Exchange for once again hosting us at this terrific facility. I noticed Kathleen did not advance the slide. So she is expecting me to read the forward-looking statements here and to read the GAAP disclaimer. So if you want to come back in 10 minutes, I'll be done reading those.

Now, so here is the agenda she already laid out and let me just offer a few highlights. As was mentioned, Dave and Dan and Tammy and Ralph will fill you in on the details of each of these, but as so often been the case, we are focused on making sure that we are partners with public policy makers and our customers and achieving the objectives that they

Bloomberg Transcript

have articulated both explicitly in terms of legislation and energy master plans and implicitly in terms of the voice of the customer that we hear as we speak to them. With that in mind, we continue to grow the utility. It is now achieved 65% of the operating earnings of the overall panel. It's a bigger piece of an increasing pie which we like to talk about. We again raised the dividend almost 5% in 2018. It's 14% over the last 15 years and 111 years in a row. But most importantly, I think today we're informing you that the 7% to 9% growth in rate base looks like an 8% to 10% growth in rate base over the next five years and we'll give you a little bit more detail.

To the extent there maybe some of the numbers have changed a little bit, the themes haven't changed. And in fact, they haven't changed for 115 years. So let's talk about what I consider to be two very healthy companies. At the Utility, we're looking at anywhere from a $12 billion to $15.5 billion capital program that will produce that 8% to 10% growth in a rate base. And at Power, I think we have an underappreciated business here. I'm extremely proud of the way in which we repositioned this business. I'll show you one slide or two slides as to what I mean about that, but Ralph will go into much greater detail in terms of the – both the operational performance of the fleet and the financial performance of the fleet

and the financial performance of the fleet in terms of its cash flow generation and its competitive position.

So, for those of you who've been here before. I'm going to once again emphasize the three part simple model that we issue to on a daily basis. So, it all begins with the operations making sure we are best-in-class in everything we do. We summarize that as operational excellence. We have been convinced and I think our track record has demonstrated that as long as we achieve those levels of operational excellence that we set for ourselves, our financial condition is strong. We are rewarded by our regulators, we're rewarded by our customers and we are rewarded by the market. With that financial strength, I think you'll agree that we've been disciplined in our pursuit of investments making sure that the return on every dollar of invested capital is above and beyond our cost of capital and we are creating value in every one of our decisions.

I'm not going to read every one of the items underneath each of those three categories, but I think there's an abundance of evidence that we've adhered to that model whether it's the 16 consecutive years of being the most reliable utility with 94% capacity factor in nuclear or the improvement in JD Power scores, the track record in terms of increasing the dividend, hitting our earnings targets and so forth. So, the model remains the same in terms of start with operational excellence that will produce financial strength and then use that financial strength to invest wisely. So, if I look back at the prior five years before stepping ahead and looking into the next five years, a lot is taking place. We did invest $18 billion across the enterprise that was inclusive of three combined cycle gas turbine plants that will yield about 2,000 new megawatts that program is almost over. It will be completed with the Bridgeport facility next June. Two facilities are going into service this year one at C-1, one at Keys that over the prior five years, the rate base growth was 13%. Yes, 13% is bigger than 8% to 10%

but the denominator is a lot bigger now, so keeping pace with that low double-digit is just a very challenging thing to do. Transmission, FERC regulated, not New Jersey regulated is nearly half of the rate base. And throughout this period despite doing all this work on the capital side, we've been able to hold O&Ms flat. And both Dan, Ralph, and David will have some statistics on that.

The key here has been and we'll talk a little bit more about it is that there are no limits essentially in terms of the needs of the infrastructure for either expansion or replacement or enhancement. And we can define each of those terms in turn. The limitation is the customer bill, right because we want to make sure that the customer who is demanding cleaner, more reliable energy, but also wants at a reasonable price is not aggrieved in this expansion process. And in fact, overall that bill is down 20% since 2010 and even more since 2008.

Now, that's not the result of our actions. That's obviously the result of low gas prices. But we've had a great partnership with policymakers in recognition of the fact that in the face of low gas prices and low interest rates, now is the time to make these critical infrastructure investments. We've watched operating earnings grow by 4% a year. We've watched the utility, as I said before, grow to be an ever increasing part of this increasing pie going from about 40% to two-thirds, and we've watched the dividend grow over 4% per year. And it's – last year, it was at a $1.72. This year, it had an indicative rate of a $1.80.

SI-SSA-0015-14647

So looking ahead to the next five years, the capital program is $14 billion to $17 billion and the range there is due to some filings that are just going into the BPU now that we don't have decisions on, but 90% of that capital program will be at the utility with over 90% of that getting contemporaneous returns. So, all of this is focused on publicly stated goals of New Jersey policy makers. The repositioning of – in the fleet by eliminating the HEDG units years ago by eliminating the coal units that have become basically peakers and investing more in a highly efficient natural gas and getting the market imperfections corrected for our nuclear plants has really reduced the risk in our generation fleet to a very low cost environmentally friendly set of assets. The cost discipline in the operations just continues we're not announcing any new cost reduction program, it's something we pay attention to every day just as we do customer satisfaction.

Now I'll talk to you a little bit about the benefits of tax reform, because it was a good news story for both our customers and our shareholders. And of course keeping that healthy balance sheet which has served them so well remains a priority for us. So, we'll look forward said 8% to 10% growth and in rate base. We look forward to the fact that we hit, we believe we have the opportunity for consistent and sustainable growth and in a dividend and a line that I never tire of saying all of this without the need for additional equity. So, no new equity in the plan for the next five years.

So, how is the rate base growing? So, that the bottom part of the slide is red – read from my point of view is the transmission growth that moves is more from a transmission expansion program, which was involved in terms of which has to take place both in terms of PEGM's our tap and the bottlenecking some of the east, west flows, so to more of an aging infrastructure replacement. We have some switching stations that are 80 years old. I mean these things have done their time and then some. The green is the expansion of both the electric and gas distribution system which includes GSMP II – 2 that's a $0.9 billion program that was recently approved by the BPU – BP – I'm sorry $1.9 billion, I get that right four times, five times is close to $1 billion, $2.9 billion. We'll get it right eventually $1.5 billion of program

that was approved by the BPU. Now so that gives us the 8%. So all those programs have been approved. Now you may recall in the past we've then added to those bars two types of possibilities. This year we've only added one type of possibility which are filings that we are about to make. Some of them days away, some of them are a couple of weeks away. So if we were to achieve the final positions in terms of energy efficiency, which we're calling the clean energy feature and in terms of energy strong too, the 8% becomes 10%. It is safe to assume just as in the past, that there are things that we are talking about and discussing that are not on those stacked bars at this point in time. It is also safe to assume that we won't get our 100% of our ask right. So the 8% to 10% is what we're comfortable guiding towards in terms of rate-based growth now for those additional reasons.

Now power is repositioning. If I direct your attention to the left part of the slide, I would suggest that the two graphics don't look all that different. Yes, there is a little bit more blue, there is a little bit less orange. There is about a 9% to 10% increase in terms of nameplate capacity as you go from 2017 to 2022 and that's what the left side is showing is a nameplate capacity of our fleet. If we were to show 2014 instead of 2017, you'd see probably a 15% reduction in the nameplate capacity because many of our retirements precede at 2017. But let me suggest that the right side of the slide is quite a bit different. Notwithstanding the fact that the colors may not be that different, first of all you do see an appreciable increase in amount of gas output. And you see what looks like a decrease in the amount of nuclear output, but that's not the case. The fleet is expected to produce at the low 90% capacity factor as in the past. But what you see is a 24% jump in the net output of the fleet as we take our average heat rate down from its current level to about 70 to 100 BTU used for kWh with three new plants all of which are below

with three new plants all of which are below 7,000 BTUs per kWh, therefore, highly dispatchable and highly efficient. So, a real clean fleet in fact, I think we have a lower carbon footprint in 80% of the generators in the United States today. Yeah.

Let's talk a little bit about our zero emissions credit legislation that was passed in New Jersey, so the bill was passed early in April, the governor signed into law last week. This then is a critical safety net. It basically empowers the BPU to do something it could not do before, which is to issue the zero emission credits, if it believes that in the absence of these credits, plants, nuclear plants would be retired. And if it values the attributes and particularly attributes being the zero emissions, that's the name of the bill, and to a certain extent, the fuel diversity of the nuclear fleet. It would be

Bloomberg Transcript
initial
Bloomberg
SI-SSA-0015-14648

incumbent upon the applicant for these zero emission credits to certify that the plants will be retired in the absence of the zero emission credits. And that's a 330-day processing. Tammy walks you through a little bit of it in her presentation. So, the value as we have communicated to you in the past of these fleets cannot be overstated in terms of what they mean to New Jersey, even at these price points, several analyses that were done both by us and by folks independent of us, have clearly demonstrated that it is cheaper from a New Jersey consumer point of view to keep these plants than it is to retire them. And I mean that just in terms of what shows up on the customer bill, if you start layering on top of that the environmental benefits pick any price you want on carbon, pick market prices for mercury, So2, NOX and fine particulate matter you layer on top of that the economic multiplier associated with the 1,800 direct jobs, 6,000 indirect jobs, the tax receipts that would be lost and you literally get a six times multiplier in terms of the wisdom

you literally get a 6 times multiplier in terms of the wisdom of implementing this particular piece selection. So notwithstanding some of that quite candidly questionable rewarding on the contents of the legislation this one was a no brainer and reflected in the votes in the legislature in terms of 60 out of 80 and 29 out of 40 in the Assembly and the Senate respectively.

So if I look back again using some of the – repeating some of the concepts I mentioned a moment ago, the prior five years was expanding the transmission system, debottlenecking, enhancing reliability, responding to Superstorm Sandy by performing some storm hardening and improving the resiliency, building some guest speakers at Kearny and at up in Connecticut and New Haven, doing some advanced gas retrofits on some of our older combined cycle units, some modest expansion of our nuclear units and then some modest efforts in terms of unregulated renewables and about $1 billion in terms of regulated renewables.

As I look ahead five years, there's some modest modification to single biggest area of expansion, we'll look at that $400 million that we've done over the last 10 years in clean – in energy efficiency and you'll see David will present some numbers that's going to turn into a $2.5 billion program as we look ahead in terms of expanded energy efficiency and our first foray into electric vehicle infrastructure and battery storage in a meaningful way to the tune of about $300 million is the infrastructure and $100 million on battery storage.

As I said a moment ago the transmission program is less about expansion and more about replacing an aging infrastructure. We still have lots of storm hardening to do, you may recall our original energy strong proposal was a $2.9 billion number and we got $1.2 billion of that $2.9 billion and was at $3.9 billion, it was a $3.9 billion number and we got $1.2 billion. So there's much more to do in a storm hardening as we look ahead. And as we look to

as we look ahead and as we look to beyond the five year and so, this is in the category of stuff that we haven't quantified and we're not guiding about today. There is a lot that we haven't done in terms of the catch phrase that you hear so often, the digitalization of the operations, both in terms of – at the customer premise and in terms of our upstream assets and that that could be an advanced metering platform. It could be a variety of other things that can help the customer make choices and help us manage a more distributed set of supply options.

So let's talk about that customer bill because it is something that we pay attention to on a daily basis. So here we're showing what customers were paying in 2010 and the footnote show what we define as a typical customer. And you could see largely as a result of the reduction in gas bills and we are a combination utility at the risk of stating the obvious, that the customer bill is down about 20% from 2010. If I did look at this back from 2008, I forget what the number is, but it's shy of 30. But it's greater than 20% number. What that means is, if I look at our current predictions of rate based growth that in a decade, the customer will be paying in a year, 2028 what they were paying in 2010 in real terms.

Okay, so that candidly is not something that the customer will remember and it's not something that the customer will applaud as they see their bill inch up basically keeping pace with CPI. But, it is a rational conversation one can have with the regulated 100 year old gas pipes that are made of cast iron and leaking and need to be replaced when they see 80-year old transmission switching stations that need to be replaced. That now, is the time in terms of the consumer dividend that was afforded to us so as a result of reduced gas prices to make these investments.

initial
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14649

So we are absolutely paying attention to making sure that our customers remain attention to making sure that our customers remain satisfied both in terms of the quality of service that they receive, and the cost of the service that we deliver to them.

So, if I look at the earnings of the – again this is a non-GAAP operating earnings of the company over the past five years. You could see the 4% growth rate that I spoke to earlier, the midpoint this year will take us at 310, which is about a, I think, a 5% or so percent increase of where we were last year. And you can see the utility going from 47% to 65% of the increased earnings of the company. But then, we've gone from a point where the dividend would represent a 120% of the utility earnings. So now, it represents approximately 90% at the midpoint of the utility earnings guidance. I am not suggesting that Power is not a cash generator and not a contributor to the dividend, it is, but to the extent that there is some volatility and there obviously is volatility in the commodity markets in which Power participates and the utility represents a much more stable earnings picture. We grow in confidence in the security of the dividend as a result of this reversal of the pattern where the utility did not cover the dividend to now where it comfortably does cover the dividend. And you could see the 4.6% growth rate that took place over the prior five years.

One of the questions we're getting with increased frequency as we meet with our investors is what are our efforts in terms of sustainability? And without question, sustainability writ large has been something that we paid attention to for many years, the sustainability of our dividend, the sustainability of our customer satisfaction, the sustainability of our service, the sustainability of our financial health, but I think increasingly this has come to mean the sustainability from the point of view of social issues, diversity and inclusion, and environmental issues. And while we haven't trumpeted this in the past, we do pay a lot of attention to these issues. That's why we've been on the Dow Jones North America Sustainability Index for over a decade. That's why Forbes named us

one of 150 best corporate citizens in America in 2016. And that's why we continue to invest in things like solar energy and energy efficiency as well as sustainability programs in our local universities and science technology engineering and math programs at those local universities. So, in addition to being – to having a lower carbon footprint than 80% of the generators in America today, we've made an additional commitment to eliminate 13 million tons of carbon from our current emissions profile by 2030.

So, the accolades keep coming in from a variety of sources, I've mentioned just a moment ago I won't read this to you, you have it in your notes, but an equally important set of accolades how the market has voted and you could see here over the one, three and five year period we've kept pace with the Standard & Poor's 500 and we've outperformed both the Dow Jones Utility Average and the S&P Utility Average. And that's obviously important to you and as it is to us in addition to all that we do for our customers and policymakers and employees. Hopefully, you'll agree delivered in terms of our commitments to use our owners of the company.

<A>: So, I'll summarize here, end up – ending up where I started. The model remains the same start with operational excellence produces financial health and be good stewards of that financial strength in terms of how one goes ahead and makes investment. That operational excellence is simply safe reliable operations, keeping that balance sheet strong, deploying that capital to the tune of $14 billion to $17 billion as the parent, 90% of which will be at the utility.

So, as with the utility are highly competitive well-positioned environmentally friendly PSEG Power fleet and strong sustainable returns on capital and every one of those investments which gives us confidence to be able to say to you that we believe we have the opportunity to sustain sustained that dividend growth and I'm going to end with my favourite tag line once again. All of that without the need for new equity

at this point.

So, I will be back later for questions. But right now, I'm going to turn over to Tammy, who is going to walk you through all of the exciting stuff we have going on at the BPU and all the fun stuff we just finished in the legislative process. Tammy?

Tamara Louise Linde

Good morning. I have the pleasure to speak with you today about the good progress that we've made and continue to make on achieving PSEG's regulatory and policy agenda. I'm going to be discussing today five topics. Number one, I'm going to give you an update on our distribution rate case that is pending before the BPU, you are first rate case on the distribution level since 2010. I'm going to update you on some really important new regulations that went into effect in New Jersey earlier this year and how those regulations work and how we've seen good progress under those regulations already with our GSMP filing.

I'm going to talk to you about the very exciting nuclear bill in New Jersey that became law last week and what's up next under that law and what we expect to happen. And as you know at the same time that New Jersey passed the Zero Emission Credit Bill, they also signed a comprehensive Clean Energy Bill that will significantly change the Clean Energy agenda in New Jersey. I'm going to talk to you about that – that bill and the opportunities that we believe that exist as a result of that agenda for our customers and our investors.

And lastly, I'm going to update you on the ongoing efforts to improve the much needed improvements in the market design at PJM and to improve price formation. But let me first remind you

of what I talked to you about as far as our policy and regulatory agendas when I spoke here at the conference last year. I covered four topics, and I'm pleased to say that we've made significant progress on delivering on those topics.

Number one, I told you that we are going to be filing PSE&G's distribution rate case. We've done that, it's moving on schedule. And later on in the presentation I'll provide you more details about where we are in that schedule and what is expected to happen next. I also talked to you about the need for more certainty on the infrastructure programs in New Jersey. We had great success in the past on getting approval for a much needed infrastructure programs in New Jersey for distribution pipes and wires but there was always a lack of clarity about how long those programs could be, what type of rate recovery we could obtain, and if a lot of time in those proceedings to fight over those issues.

So we were very pleased when – earlier this year New Jersey put into effect two new regulations, that I will talk about in detail, but those regulations provide significant improvements in predictability and clarity on what the states policies are on investments that are for safety, reliability and resilience on the distribution side of the business.

And last year I talked to you about our ongoing effort to get value or value appreciation for the underappreciated nuclear generation assets that day in and day out provide significant benefits to customers and to the environment. And last year we were on a parallel track to focus both to try to convince the federal government and the state government to appreciate the value that nuclear generation has

appreciate the value that nuclear generation has in the current fleet. And I'm very pleased to be able to stand here today that the conference was scheduled after the Governor signs a Zero-Emission Credit bill. So that is great news for New Jersey, great news for the environment and the customers. And we believe that our assets will have a reasonable chance of being selected in that process. I'm going to talk to you about that.

And then lastly I talked to you about our ongoing efforts to improve price formation to have the energy market prices truly reflect the cost of serving load. We are continuing on that effort. I don't have great news to report. It's a slow process, a very contentious process and I'll talk to you about some of the proceedings that are ongoing in that front.

So, let me start with some details on PSE&G's base rate case. Just remind you that this distribution only. This rate case does not cover transmission. That is a separate rate filings. And in January of this year, we submitted this gas and electric distribution rate case. The rate case is a very modest request, currently at the BPU, the request is for about a 3% increase. And we just recently updated the information, the data in that case in May to reflect a few more months of actual data. As you probably know, New Jersey has a historic test year. So, when we make our filing we start with quite a bit of forecasted data. And then as the case proceeds, we update that forecasted data with actual data. So, Dave Daly will talk to you during his presentation about some of the really significant cost containment efforts that have occurred at PSE&G since our last rate case that have allowed us to make sure this filing has a small and impact on our customers as possible on our customers as possible. The change in the thought also helped us keep these costs down and have a very modest increase.

Bloomberg Transcript

So the key components of our rate case that's currently pending are if you recall we had storms, since our last rate case including super storm Sandy and several storms since then. The majority of the expenses and the investments that we had to make during or as a result of those storms have already been reviewed by the BPU from a prudency standpoint. But this will be the time where we actually get the recovery of those dollars in our rates. We also have included in this rate case the additional capital investments that we've made that were not covered by clause – clause mechanism and that is included in this case. We have updated our depreciation schedule and extended some of the lives of the assets, but also made some adjustments to how – what we include in those depreciation and make sure that we have the cost of removal for the end of the life of those assets properly spread out into the cost that customers are paying today.

We have included the benefits of tax reform and flow those back to our customers. We also have proposed a slight increase in our equity level, up to 54% in line with what we're seeing in other utilities and what we believe is a reasonable level in this – in today's environment and regulatory context. And like you've seen with many utilities across the country, we have proposed a decoupling mechanism something we called a green enabling mechanism. And that decoupling mechanism is important from the perspective of

enabling future investments in energy efficiency. So, all of the energy efficiency programs that we've invested in in the past, we've been able to work out something in the proceeding to ensure that there's not a loss of revenues on the distribution side of the assets. And as you know when utilities come out of base rate cases their rates are set and there is a natural incentive to try to increase the volume of usage, because the that the per unit charge we collect for those rates increases as people use more of the units of our product. And this mechanism is really aimed at trying to de-link and better de-link that disincentive and better align the incentives that are raised to provide with the states goals of reducing consumption, reducing emissions and keeping customers' bills as low as possible. So we're very excited about that green enabling mechanism. And again, it is not something that is the first time that it's being proposed either in the State of New Jersey or elsewhere in the country.

And on the process going forward, we are about halfway done with the rate case. We have submitted as I said updated data, so now the parties have a very good feel for the actual test year data. We've been handling a lot of discovery back and nothing out of the ordinary. And the next steps are we will have public hearings where parties and non-parties get an opportunity to come into these public hearings later in June and the beginning of July to talk about service and any questions they have. After those public hearings, we will be receiving testimony of the State of New Jersey

testimony the state of New Jersey the BPU rates – BPU staff and rate council, as well as other interveners. So that's when you'll see other parties put forward their litigation position. What they think the ROA should be, what they think we should recovery on and that's just part of the process.

After that testimony is filed, there'll be more discovery and hopefully, some settlement meetings because as you know, it's very common in rate cases in New Jersey for the cases to be resolved in settlement. And it's part of the whole process for parties to try to work things out. We never enter these cases expecting that we're going to settle. We prepare to go through the entire process. And we're always prepared to do that, but of course if there is an opportunity to settle on reasonable terms, we'll be looking for that opportunity. And whether we end up in a settlement or a fully litigated outcome, we do expect this case to be coming to a close in the fourth quarter of this year.

So, let me move to these new regulations that I referenced earlier. They're – these two new regulations became effective in January of this year and they are very significant, as far as streamlining and providing clarity on what goes on once a filing is made and what the utility can expect, essentially the regulation categories. The first set of regulations provide for more certainty about certain non-revenue producing investments and revenue – non-revenue producing investments are essentially investments that you make in order to provide safe and reliable service. SO, it's not something that you are putting in and that you're going to be charging the customer for directly.

that you're going to be charging the customer for directly. It is the pipes and the wires and all of things that take that are required in order to provide the service that, that we need to provide to our customers. So these types of investments, these traditional utility distribution investments now have the special regulation in New Jersey that never existed before that make it clear that they are entitled to accelerated rate recovery, including semi-annual roll-ins into our rates, which is a very significant improvement to reduce regulatory lag when we put in these investments.

initial
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14652

The regulation spells out the exact type of investments that we can make. It spells out how we go about proceeding with the regulatory process. It talks about the type of rate recovery we're allowed the type of base investments that you have to make in these types of – in these types of infrastructure. And then it also provides clarity on something that has been here in New Jersey for many, many years and that is how long should the BPU approve these programs for us. As I noted before we've had great success over the years in working with the state in obtaining approval for these infrastructure programs, whether it was energy strong or GSMP I or the many, many infrastructure clause mechanisms before that. But we always spent a lot of time talking in these proceedings and a lot of inefficiencies about could we have a longer term program rather than coming back every couple of years and convincing the parties again that it's a good idea to replace aging steel and bare steel pipes and cast iron pipes. Come up with a program that makes it more efficient that we can get a longer term trajectory for those

approvals. And this regulation for the first time says that the BTU can approve up to five-year programs, which is very important. And that it also says that the nexus with the rate case only has to be at that five-year increment. And that is again very significant improvement from a regulatory perspective, it really does provide a lot of clarity.

The other set of regulations deal with a slightly different topic and that is interim rate. So there is now a regulation in New Jersey that went into effect, that provides clarity for utility companies that are in base rate cases, for how they can put those rates, those filed rates or a lower level if they choose to raise in effect before the rate case is over. And of course, it would be subject to refund. And if you end up settling or litigating the result of the case in a way that you put in effect rates that were higher, you have to refund the different fund trust back to the customers. And it also – so it provides a consumer protection. But it provides a great benefit to utilities to not have to wait the entire length of a rate case, because sometimes rate cases can be contentious and sometimes the pressure of wanting to put in affect to your race can cause utilities to settle sooner than they otherwise would.

So we're really excited about these two new regulations. And we think they represent a balance of protecting customer interests, but also providing great efficiency and certainty to the regulatory process and probably most importantly, reducing regulatory lag on these utility infrastructure programs. And we've already seen the benefits of these regulations. Our GSMP II Gas System Modernization II filing was the first infrastructure program to work through this new regulation. We filed it before the regulation became effective, but we knew that these regulations were being worked on. So in our application we've modeled it, modeled the petition based upon the pending regulations and the BPU on May 22 approved our settlement of this GSMP II with all the benefits of this reduced regulatory lag. So now we have semiannual roll-ins of the rates for this program.

We have a five-year program that will start in 2019 and we asked for it to start in 2019, because we're still finishing up the GSMP I program that had been approved before with the three-year period. Now that GSMP I was a very good program, but it had annual roll-ins, and this is even better because they're semiannual roll-ins, so reduce regulatory lag and improve efficiency and it provides with that continuity of the investment in these replacement of these bare steel and cast iron pipes.

The other thing I want to talk to you about under these new regulations is what's next. So, Dave Daly will go into some of the specifics of what we plan on investing in. I will focus only on the regulatory context and how we get approval for those, but I can tell you that we are very close to filing an Energy Strong II program under these new regulations and we've been working on that program for a while closely with PSE&G to make sure that it is consistent with the states goals and consistent with these new regulations and it will be an extension as well as an expansion of the Energy Strong program that we

had approved back into 2014 and I'll leave to Dave to talk about some of the details of what we're investing in, if we get approval of that of that program.

So let me turn to nuclear, a topic that I've been spending a lot of time over the last year on and something that we are just very excited that finally the State of New Jersey has taken a very important step to value the nuclear – the attributes that comes from these nuclear power plants. As Ralph said bill is focused on zero emission credits, but the bill also talks about the benefits to New Jersey from other environmental attributes from these plants, as well as having a diverse

Bloomberg Transcript
initial
Bloomberg
SI-SSA-0015-14653

fuel, generation fuel mix out there to relax as well as the when it comes from having that diverse reverse fuel system.

So with a comprehensive recognition that nuclear is important to New Jersey and important to the environment and will be important going forward. So the bill provides a safety net and so what it [audio gap] it's provide a lot of detail on what the state's policy is and the states policy as I read it in this new law is essentially that they want nuclear to continue to be an important part of their energy mix into the future. It doesn't provide a check right over to nuclear plants, but instead it provides a very, very detailed process for how the Board of Public Utilities will ensure that nuclear can use to be at least 40% of the supply in New Jersey. And so there's a lot for the BPU to do and

And so, there is a lots of the BPU to do. In 330 days, they have to and all the details of these sub-tasks are spelled out but they have to determine the process that they're going to use. They have to have the utilities in New Jersey, update all of their tariffs to start collecting this $0.004 on every kilowatt hour in New Jersey. They have to review the applications that will be filed by nuclear plant owners for these Zacks. And then once they review all of these applications they have to rank them because under the bill, the BPU can choose up to three nuclear plants to give zero emission credits to. They don't have to change if they feel that the nuclear plants are not going to retire without the zacks. But they can choose one or they can choose zero, one, two or three. They can't choose more than three. And because there is a chance that more than three nuclear plants will apply and that will meet the basic eligibility requirements of being a licensed nuclear power plant in PJM with a license that goes out to 2030.

This regulation and for the new law specifies that this ranking will be very important and the top ranked plants will be eligible for what will receive I shouldn't say just eligible they will receive the zero emission credits and the zero emission credits then will be authorized to these selected plants for three years. The first cycle is a little bit longer than three years just because of the timing of the bill and the alignment with the PJM energy market time period. But the bill – the law essentially approves these zacks once if you select the nuclear plants

for a three year period and that first three year period, the price that the generator -- the selected generator will receive is fixed. It cannot change.

There is one provision in the law that provides that if the state decides they are not going to select any new generators for the second period, the second three year period then they can reduce that last year period but they would have already had to have made the decision that they are not going to continue selecting generators because they have determined that the generators are not going to be shutting down.

And so the bill does provide that opportunity in that last year of the three year period but only in a very limited circumstance. As Ralph said there's also been a lot of press that we read on the nuclear bill about what it does and what it doesn't do and now that it's signed I'm very glad to be able to clear up some of that confusion and I've been doing that since the bill has signed with many, many stakeholders to make sure they understand what it really means.

So the bill does provide a tremendous amount of consumer protection as part of this application process from the very beginning we expected there to be a thorough review of the financials of the nuclear plants that apply. Of course that if you have to have the ability to do that and not only do they have that opportunity but each of the applicants have to submit a $250,000 application fee. So we will be submitting applications for three nuclear plants, the two Salem plants and Hope Creek and with each of those we will pay a $250,000 application fee. And why is that important? Well, it's important that the BPU who will be doing a lot of things during this time period have the resources to hire and have on their side to help them

review and do a thorough job of executing on this important legislation.

The consumer protections don't end there with a thorough review. They also look for annual certifications by the nuclear plant owners and the purpose of these annual certification is that the nuclear plant owners have to describe whether they are receiving from any other source whether federal, regional, or state, a payment for the same attributes that the nuclear plants are being paid for in New Jersey. So if there is a carbon tax that is passed, which we don't think is likely. But, if it were to be passed, then this mechanism would take a look at that carbon tax, and determine if that was a overlapping payment for the ZEC. And if it was, there's a mechanism to address that.

SI-SSA-0015-14654

The other thing that the bill does to protect consumers is that, it has a repayment obligation. If during those – that three-year period, the nuclear plant just goes ahead and shuts down, and there are many carve outs for this in the bill where the nuclear plant shuts down because it has no other choice. But, if it had a choice and it shuts down anyway after it is receiving the zero emission credits, the law spells out exactly what happens as far as repaying the collection during that three-year period. And it's a very fair and reasonable mechanism.

So a lot to happen in the next 330 days and we are hard at work back at PSEG, prepare applications and we are very hopeful that at the end of this process, our nuclear plants are selected. We think, we will present very strong applications and hopefully, this time next year I'll be up here updating you on our great success under that law.

updating you on our great success under that law. The – I want to switch to the other legislation that was passed by the governor last week because it is very much tied to nuclear and the state has embarked on a very aggressive forward leaning clean energy agenda and we're really excited about that because it creates opportunities – it create an opportunity for nuclear because nuclear is part of that future. It also provides opportunities in many of these other categories which I will touch on. The clean energy agenda is just at its infancy. The governor indicated he would be issuing a clean – a new energy master plan and each one of these topics that is covered under the Clean Energy Law has a proceeding or a review by the state that has to occur.

So there is going to be a lot of activity on this front in New Jersey over the next six months and a year. And as we have been doing for the last 115 years, we will be working very closely with the New Jersey, with the stakeholders, with the policymakers to work with them and support their efforts. We do think all of these initiatives are great opportunities for the states. We think they are great opportunities for utilities. And I'll give you a couple of examples. So on the energy efficiency front we have been looking to do more energy and efficiency investment for many, many years. So there just really hasn't been a strong appetite for it, and now we have an administration in New Jersey who sees the value of energy efficiency and right in the law recognizes this that utilities have a role to play and exactly what that role is will be spelled out in great detail over the next

year, but the loss specifically talked about utility investment and the recovery of in and on that investment to achieve these specific targets that the utilities will have to meet in reducing electric and gas consumption in the state. So we're really looking forward to the benefits that will come from that coupled with our decoupling mechanism and the opportunity for energy efficiency investments.

As Ralph said earlier it really ties back to making the bill as our customer bill as low as possible while still providing the great service and investment opportunity.

On the solar front, there will be some major changes in the New Jersey solar regulatory environment. We have continued to be very successful in investing in solar both at the utility as well as on the on our merchant side. And we think that there are opportunities there.

On offshore wind, the BPU in New Jersey has already started a proceeding on offshore wind a couple of weeks ago and maybe even months ago in anticipation of this law. And we have been actively participating in that proceeding, supporting the state, looking for opportunities to move forward with this offshore wind agenda in the most cost effective and efficient way. And so we're engaged in that proceeding, we look forward to investment opportunities as a result of that proceeding whether it's in the offshore wind itself or in the transmission that will have to be built as a result of the offshore wind.

There's also quite a bit in the new law on energy storage, up to 2,000 megawatts of energy storage that the state will study and look at the ability to move forward with that. And,

that and the cost and we will be participating in that effort and that study.

And then, on energy or electric vehicle infrastructure. This is perhaps, one of the most mature areas of the new bill. It's really quite mainstream now. I'm sure many of you in this room actually probably drive electric vehicles or someone in your family has electric vehicles and the mainstream nature of electric vehicles has just changed dramatically and there is a need for investment and we believe that PSE&G and Dave will talk about a little bit of this later, is in a great

SI-SSA-0015-14655

position to help further those goals and help our customers and help our investors.

So I'm going to turn to wholesale market design. Switching topics a little bit to an area that we have not made as much progress, but we're not giving up. So the process at FERC and at PJM is very litigious, very contentious, but there are some proceedings still going on that could potentially lead to progress. It's really uncertain at this point. So at FERC, as you know there is – there was an effort to do something on a very expedited basis and that has turned into kind of a slower more methodical look at resilience and we are actively involved in that proceedings. We don't know exactly where it's going to go. I think, it could take quite a long time for the government at the federal level to really make significant movements, but we're engaged and we are pursuing that avenue as much as we can. And it's hard to predict what might happen at the federal government on that topic.

Price formation is another topic that continues to be a struggle. Price formation covers many, many different topics. But I think, about it really as the objective

of trying to have the energy prices reflect what it really cost to serve load and unfortunately on a lot of days energy prices don't reflect that because of the mechanisms at PJM that certain units are not allowed to accept the price and some detailed rules at PJM that prevent true accurate price formation. But there is ongoing effort to look at that. It could be faster, it could be more successful as far as regulatory outcomes but again we are continuing to engage. Also at PJM, PJM has just started to kick off I think they had one meeting so far on first to look at resilience and their definition of fuel security – of fuel diversity and resilience really has morphed into something called fuel security.

It's a little bit too early to determine what that will look like. Right now it sounds a lot like it's a physical constraint evaluation, but more to come. We're actively involved in that stakeholder process and we'll continue to push for a broader view of resilience that ensures that we have fuel diversity and a resilient system to rely upon.

And I'm sure many of you are watching very closely the capacity market the base that PJM and whether there will be a moper. The Often I think mistitled topic of reform to address state's clean energy effort really is very contentious and it is pending right now. Our view at PSEG is that there is no need for a minimum offer price rule to apply to existing generation. There never has been one

and we don't believe that there is a need for one. Whether it's an RPS that is providing support to a solar project or a Zech that's providing support to a nuclear project, we don't think there is a difference from the market perspective and we think that the status quo should be maintained and we told FERC that.

Now, FERC may not choose the status quo. So we also made it very clear to FERC that under no circumstances should they adopt the MOPR Act. The MOPR Act's unfortunately is aimed at making it more difficult for states to proceed with its clean energy objective and that would be fine if the federal government was taking action. But with the lack of action [Technical Difficulty] 00:57:54 strategy and the lack of action to support nuclear after federal government, it's important that the federal government respect the rights of the state and allow them to proceed with their efforts as long as they are not aimed at suppressing wholesale market prices which we do not believe the New Jersey's Act is aimed at, at all.

So we have a busy agenda and we have made I think truly strong progress over the last year are many of these really important initiatives. We have a lot ahead. We will continue to work through our base rate case. We don't expect anything very unusual to come from that rate case but we are treating it as though it is treating it with the seriousness it deserves and we'll continue to work towards a good resolution. We will continue to pursue new programs under the new regulations that I talked about in New Jersey which reduced regulatory lag and which provide more clarity We will continue our nuclear journey in New Jersey submitting our applications and working through that process at the BPU, hopefully at the end receiving regs for our three plants. And we will continue to work with the state as it forms its energy – clean energy agenda, we think there will be significant opportunities for us and for our customers in those programs. And we won't give up on FERC and PJM, we'll continue to work with those important parties hopefully at the end to have much needed market reform put in place, and improve price formation in the future. So just to close things out, our regulatory and policy agenda is very important to our value proposition. And as Ralph indicated at the beginning and in the end, it's really all about how we operate, and how we perform. And we understand that the

SI-SSA-0015-14656

regulatory success that we have had is greatly influenced by our good customer performance, our customer satisfaction, our reliability and our ability and willingness to work very closely with stakeholders and policymakers as we have done over the last 115 years, and as we will continue to do in the future. Thank you.

Q&A

<A>: We have time for a question.

<Q>: Okay. Hi, Chris Turner, J.P. Morgan. And you guys mentioned that you're going to be filing the energy strong program pretty soon. You just got done with GSMP-2. Can you give

you're going to be filing the energy strong program, pretty soon. You just got done with GSMP II. Can you give us more detail about the upcoming followings that are required whether for those or energy efficiency? What BPU has to do in terms of getting back to you, timing, spending dollars et cetera.

<A>: Sure. So, Dave Daly during his presentation will talk about the actual investments and programs that we're going to be seeking approval on. But let me talk about the process at the BPU, so it depends on the type of investment. And if – if we proceed with a an investment that is behind the meter, so whether its energy efficiency or whether it's solar that falls into a separate category in the BPU regulations. And we have a mandatory pre-filing meeting, that's 30 days before we submit the filings.

And once, we make that filings, there is a clock that tics 180 days for the BPU, once they have a completed application to review it and act on it. So that has been in the law for quite a long time, I forgot something, successfully proceeded under that – program that regulatory program with variable filings and energy efficiency filings, it's very risk upon their time.

When we look at the more traditional utility investments and strong type programs – type programs, so they have never had a specified process at all. This new regulation does cover those investments. It doesn't do it as the process, the solar and the energy efficiency. And it's for example does not require a 30-day pre-filing meeting. And it does input that 180 day clock on the review, but instead what it spells out is, that the state's policy is to accelerate these

[ph] investments and to provide for accelerated up to semi-annual rate recovery and that the programs can be approved up to five years with a in excess to a rate case every five years. So a lot of those more contentious issues in those proceedings now have been addressed by this new regulation. And those were the issues that we mostly got caught up on in the other filings. So these proceedings will now focus on, are these investments these utility infrastructure investments needed appropriate for safety, reliability or resilience. So I hope that answers your question.

<Q>: Yeah, it doesn't, it sounds like BPU has some lever there and that they actually able to achieving those goals.

<A>: That's correct, it does. So it's up to us to make our case as we always have as to what the right level investment is, what the impact on customers will be and why it's the right time to make those investments? And I think we've been very successful in that regard in the past at the BPU any reason whatever change going forward, but we have to take every case, every filings on -- based upon the facts and what's going on at the time.

<Q>: Okay.

<Q>: Hi, this is super helpful, thanks for that. In terms of price formation clearly it's going very financially diluted down maybe Fast. What do you see the shape when it takes right now and what kind of timing are you expecting?

<A>: So on the Fast start pricing we are very hopeful that FERC will act this year. They don't have to act on any particular schedule on that, but we as far as along that it is reasonable to expect FERC to issue a Fast start pricing decision this year. There are people who don't agree with the Fast start pricing mechanism that is before FERC. So people could challenge that in court, but typically those points once the FERC acts

the mechanism goes into effect, and any challenge doesn't slow things down. And that shows typically the way things are done at FERC. As far as all of the other price formation efforts, unfortunately they're a little bogged down in the

stakeholder processes. There are just so many different opinions in the PJM stakeholder process, on what they should look like, what the benefits are?

As I said, we're not going to [Technical Difficulty] – we're going to continue to pursue, what we think are important price formation changes and we're not alone. There are many companies like us making those same arguments, but I don't have specific dates on when PJM will move forward or when they will be successful on that front?

<Q>: Got you. And is there a view in terms of pricing impact of the fast start, if it gets done, what do you think that impact would be?

<A>: There is, I don't know that off the top of my head, so certainly we have evaluated what – what we think the – I don't know if we've talked about that yet. So I can follow up with you after, I don't know if we've made that public yet either. So why don't we talk afterwards if we have, we can certainly point you to where we've described that in the past.

<Q>: Thank you. First of all just on the bills, so you know, it doesn't come down dramatically. But if you look forward from here with all the different rate merging mechanisms with the [ph] Zacks capacity went up, just if you took these levels, are bills still kind of inflationary type growth?

<A>: As Ralph indicated, it's something we focus on every day. And Dave, President of PSE&G will be talking to you about our ongoing efforts to keep our costs down and that's there were many levers that could impact customer bills. One is, how we run the utility and how we run it in a way that

minimizes the O&M increases and we've done a great job and I think we're going to continue to keep those costs down and keep the utility as lean as possible. We don't like to sacrifice needed investment, so we always want to make the investments that keep the system strong and resilient so when storms come or when customers want their electricity to come on they – that everything works as planned. So we try to put those at the top of the hierarchy of what cost should be passed along to customers.

I think a significant benefit though in this clean energy agenda for customers will be energy efficiency. So that's one area where we are really excited that the state is not just looking at adding more renewables or adding things that to the system that cost customers money, but looking at ways is that we can invest in a way that brings down the customer bill. So that's a really important piece of how this all fits together and we will continue to be diligent about keeping our customers cost at a reasonable level, we think that's important. And so, how much that [Technical Difficulty] (01:08:08) will keep customer cost down, it depend on the programs and how it's moving forward. I'll figure that out of over next year, appetite is but there is great opportunity there.

<Q>: One other quick question. Just maybe this is on, if you look at the clean energy initiatives, a lot of them from a PEG power standpoint, arguably are long-term pressure as you know offshore wind and...

<A>: Yes.

<Q>: ...adding a lot of renewables, lowering demand through energy efficiency, so just, maybe I don't know if Ralph wants to answer this. Just how should we think about what these things right mean for the other side of the business?

So we made a -- so we made a conscious decision that the PSE&G sandbox is much smaller than the PEG Power sandbox. So PEG Power is looking at 168,000 megawatt sandbox and PSEG is looking at a 10,000 megawatt sandbox. So they do put pressure on PEG power, we're willing to do that in terms of what it means for the company.

As Tami said we think that the combination of infrastructure replacement, cleaner energy puts upward pressure on prices, energy efficiency puts pressure on prices. All of that except for the transmission investment reduces load opportunity for power. But just given the size of the pool that it can plan the issue for power as you know if you look over the last 10 years has not been volume of output [Technical Difficulty] per unit. So we're going from 50,000 from 50 terawatt hours to 64 terawatt hours. The question is are we going from $30 a megawatt hour to $25 megawatt hour or to $35 megawatt hour. So I'm not worried about the volumes that power faces I am as much as I'm worried about the price of face.

<Q>: Thanks.

<Q>: Hi. I wondered if you could shed some light on how the BPU might go about doing the selection of nuclear plants for Zacks. So clearly your three year going to apply but there are some other ones in Pennsylvania for example that could also apply. So just wondering what your understanding is of the lens through which they will just judge the determination of need.

<A>: So it's a very important question and one that is addressed that we're pleased that it is directly addressed in the law. [Technical Difficulty] based upon identify and rank those units once it select -- identifies which unit meets the threshold a binary threshold are they at risk of retirement and they retire would they have an impact on New Jersey from an environmental

field diversity or resilience perspective. So it's a yes or no on that. And then if they have more than 40% of the energy needed or energy in New Jersey that so they select more – that they more than three plants are eligible, then they rank them based upon the impact that the retirement would have on this in those three categories. So they will be ranked on the environmental, fuel diversity, and resilience perspective. Looking at which one's retirement would have a bigger impact on the state.

<Q>: So given that do you sense that there be of the like Peach Bottom or Susquehanna that are very closely tied into your zone that could potentially qualify?

<A>: So I think that there are many plans that could qualify for that first screen, the yes or no lens. On the ranking, I believe that our plants have an advantage in the ranking. I don't know if the analysis that EPU will conduct on determining which have a bigger impact on New Jersey if they retire. I don't know exactly how that will end up but I think there is a reasonable chance based upon our analysis and our experts internally that our plants have an advantage at the end of the day. But again that will be determined and there are two-step process, first who is eligible and then the separate ranking of those eligible plants.

<A>: We have time for one more question.

<Q>: Thanks. It is with FERC, do you see for the utility to play in some of the other elements of the clean energy agenda, mainly the renewables and the solar

the renewables and the solar and offshore wind if any.

<A>: Sure. I think there are numerous opportunities, yet to be spelled out in great detail. This law was just passed and the law spells out numerous steps that have to take place. Storage for example, the law spells out that there needs to be a stakeholder process and study conducted of the benefits and opportunity for bringing up to 2,000 megawatts of storage. If the states decides to go ahead with storage there is a reasonable chance that they could do so in a way that the utility has an investment opportunity that detail is yet to be seen.

And some of the others such as energy efficiency and electric vehicles I think it's more obvious and more clear at this stage what role the utilities could play. Energy efficiency as the law speaks directly about utilities in New Jersey being required to reduce consumption both on the electric side and the gas side and then specifically talks about the investments that the utilities make in order to achieve those reductions will be recoverable. And not only the recovery of the investment, but are earnings opportunity on top of that investment. So I think energy efficiency really clear, some details still to be worked out on the preceding about what type of energy efficiency and where and how quickly and important items like that. But I think there is a clear path for utility involvement. And it's important for the utilities who are the ones responsible for achieving these reductions to have an active role in meeting those objectives.

On electric vehicles I think there is an opportunity and Dave will be talking about those opportunities in our – in his presentation about our

proposed clean energy filing that will interest you. We do think there are some things that utilities can do, particularly as far as enabling some infrastructure for electric vehicles and making electric vehicles easier to access for those who have a difficult time getting access to it.

On solar, we have had a long history of successful investments in solar both on landfills in New Jersey as well as in other locations that are challenging to install. We believe it's important to continue utility scale solar. We think that is the most cost effective solar investment and we are very optimistic that the state will see an important role for utilities on all of these different initiatives.

So, thank you very much.

Unverified Participant

Thanks. We'll move to Dave Daly, President and COO of PSE&G.

Dave Daly

Good morning, everybody. And if you've been here for many years probably used to have Ralph LaRossa being up at this point. He told me – reminded me last night that he's been doing this for the Utility for 10 years, and so I'm very honored to be here. Moved into Ralph's role this past October of having building the company over 30 years and having worked for Ralph for many years. Ralph's been a

having worked for us for many years. Ralph has been a great leader of the utility team and had been a mentor to me and looking and really enjoying continuing to work with him in his new role. If there was three things that I would want you to take away from my presentation today, it would be these. Number one, it would be, kind of linking back to what I just said is that the utility has a tremendous team. It's a team of people that I was honored to be a part of.

We have two leaders here today, Kim Hanemann. He is sitting in the third row here in the right. And John Latka, they're both senior VPs, Members of our Executive Officer group, part of that team. And the utility team is one that delivers on its commitments. It's a group that delivers day to day, as the slide says on reliability 16 years in a row, the team that gets investment programs approved at the BPU, it's a team that delivers on those investment programs on time and on budget.

Second is that, we have tremendous opportunities that I'm going to describe on the following pages. Opportunities in investments in infrastructure on the gas and electric side in our transmission infrastructure and those intra opportunities are not three-year or five-year opportunities. These are opportunities that have 20 plus here runways on them. Needed investments in the basic infrastructure that helps to grow the economy over the long term produces strong jobs.

Winter is all the way around. And opportunities on clean energy, Tammy just described based on the question that Abe asked about where our opportunities are? I'm going to describe a very specific one we're moving forward with on energy efficiency, electric vehicles and energy storage for $2.9 billion but every one of those other items that Tammy just went through are other opportunities that are before us, and that will be pursuing very aggressively. And then the third piece is the alignment that we have from a policy perspective in New Jersey We're proposing here in this business plan fits like a glove with New Jersey policy coming from all branches of government, coming from the BPU. It's very, very consistent.

On the infrastructure side, the infrastructure rules, updates that Tami described on the how the infrastructure programs are implemented, the energy efficiency program that I'm going to describe a $2.9 billion filing is tailor-made for that legislation. We really don't have to do much work to implement that legislation, we've done it already. So as I said a very strong team, tremendous opportunities over a long period of team and very, very strong alignment with New Jersey policymakers.

So we put that altogether, the business model that we use is in the bottom right that Rob described and our strategies platform balances reliability rate policy and produce strong financial returns over the long-term.

So this slide gets into a little bit of that teams, that's a little bit of history, it's going back five years it's since 2013 to 2017 and it is depicting rate base growth and earnings growth. $14 billion was invested, earnings and rate base grew at

Bloomberg Transcript
initial
Bloomberg
SI-SSA-0015-14660

around 13%. One of the things that is important on this slide is the fact that there is a very narrow width between the growth rate of rate base and the growth rate of earnings. Earnings are slightly less, but not much, they are both running around that 13% rate. And that's because of the contemporaneous or near contemporaneous returns that we've on well over 90% of this investment and some strong cost control by the team. The growth from 2013 on rate base about $10.5 billion to about $17 billion and earnings from about $600 million up to just about a $1 billion

And only the other point I would make on this slide is the bottom section in the red which is our Transmission business is the growth of that business growing from about a third of our business and about $3.8 billion in rate base to almost double of that over that time period. And by the time we get to the end of 2017 then transmission is close to half of our business and that's important from the point of view of the regulatory diversity. Transmission of course regulated by FERC in the – with the forward looking for the FERC formula rate and the other half regulated by the BPU. So over this time period, we've also developed a good diversity in terms of our regulatory structure.

And as I said, this gets back to the team that's been delivering over the last five years. So let's move to the exciting part of the presentation, exciting for me anyway is the program going forward from 2018 on the far left to 2022. And I just want to explain a few of the moving parts in the this slide. I think there's a lot of fantastic information in this slide. What did you see in the header is that it talks about $12 billion to $15.5 million. And what that's referring to there is if you look at the slide or the bars there are solid bars in the bottom and then there's 01:22:03 [indiscernible] spots on the top. And the solid bars are the programs that we have in place approved are very, very high competence were approved and we're not really focused on needing to get them in place, they're are already in place. And if you look at the aggregate amount of the capital spend of the solid section on the bottom, that's the $12 billion number over that five year period. The hatch sections are the two programs that we describe we're going to be filing very soon. The first the energy strong program which is a $2.5 billion program over five years and the clean energy program which is a $2.9 billion program

And if you take the bars and include both the solid on the bottom and the hatched that refers then tied back to the $15.5 billion, so somewhere between those two. And if you just then look at the far right bar and just to describe then what's in there, the bottom bar is the red, that's our transmission business. The one that you know about very well.

The aggregate value of those bars going left to right is about $6 billion, that will go into that business under the first formula rate. The green bar again programs that are already in place includes about $3 billion in the aggregate in those green sections. About half of that is our base depreciation level spending on the base structure and new business. So that spending that's within our depreciation levels and therefore already covered in rate, that's about half of it. And the other half of what's in that green section is the recently settled GSMP2 which as Ralph had mentioned is well is about $1.9 billion.

Now that program is a five year program starts in 2019. So this is only showing four 4 years of that. And so the GSMP2 component depicted in the green section of this bar is four of the five years. It's about $1.5 billion of the $1.9 billion. If we were showing $23 million there would be another $400 million or so of GSMP2 out there. And the only other piece green all the way on the left, that green sliver in 2018 includes the last year of GSMP1. GSMP1 was a $900 million program about $300 million a year. And we're spending $300 million on GSMP1 in 2018 and then GSMP2 starts in 2019. So the green is all about the gas and the GSMP1 program having been approved by BP a week ago, it's baked into the solid. And then the blue on top of that is our base electric distribution

then the blue on top of that is our base electric distribution work, base work within depreciation new business. That's about going left or right about $2 billion cost.

And then you have the two programs. The Energy Strong 2, Energy Strong 2 is an electric and gas program. I'll talk a little bit more about it in a few moments. In total, it's $2.5 billion. And once again, this is only showing four of the five years because the fifth year would be 2023. I think about that program about five years at about $500 a year or so. That's showing about $2 billion for year as a $500 and there would be another $500 million in 2023 if we were showing that bar.

Bloomberg
SI-SSA-0015-14661
initial
Bloomberg Transcript

And then the Clean Energy. The Clean Energy is a $2.9 billion program. It's a six-year program. So, there's two more years of this program not depicted on this chart. The value of the hatched section here in the first four years is about $1.5 billion of the $2.9 billion. And if we show the extra years, it'd be about $700 billion, and ramps up. And we assume we get approval as you see in 2019.

That's just the way that the chart is constructed. If we got zero out of Energy Strong 2 and zero out of Clean Energy, we have a $12 billion investment program. And if we got everything on those, we'll have $15.5 billion.

The other point I will just make in the slide is what the two lines are talking about. The bottom line going from left to right that goes from 18 to 20 was our 2016 to 2020, two years ago when we were here talking. That's what we thought the level of investment was going to be in those years. And then the line that's above that is last year's capital plan that shows what we thought last year.

And of course, my job and the job of our team is to draw the third line, which would be this year's and make sure that's intersecting through that hatched area and – but you do see we have this track record of improving on each year's plan on the capital. I'm confident we'll be able to do that but it's going to be about getting approval

confident we'll be able to do that but it's going to be about getting approval for those hatched areas.

So then, just a little bit about some of the programs that I just went through. First is the transmission program. As you saw on the previous slide that was in the solid section of the bottom, $6 billion. Ralph mentioned that this program in days past had to do with solving reliability criteria violations. They still come up. PJM goes through an annual process where they'll identify where there are violations on the system and the local owners come up with projects. As more renewables get integrated into the grid, there may be more of them coming up, but right now, the bigger driver of that $6 billion program over the five years is the transmission hardening the life cycle and the 69 kV work. The hardening, for example, we have three projects going on now, the Metuchen, Burlington, printing project is a $750 million lifecycle project that is replacing aged equipment's, very, very old transmissions equipment. We have a sub-station for example in New York. $350 million was just approved to change out all lifecycle, end of life equipment.

And just, very, very recently, we had a $550 million program approved, the Roseland Pleasant Valley, upgraded to 230 kV upgrade. So those are the types of the projects that are in the lifecycle and then, the 69 kV system is a very robust program. We're one of the few utilities that has a sub-transmission program network at 26 kV and we are upgrading that network at 26 kV sub-transmission up to transmission level. These are very, very valuable investments. They bring tremendous reliability. They bring tremendous flexibility in the grid and that's a big piece of what the transmission program is all about over the next five years.

And then, it's not shown here because it's there yet as Tammy said, but there yet as Tammy said, but offshore wind is a potential opportunity for the future. The governor's platform calls for up to 3,500 megawatts of offshore wind. At that level in fact, at any level above 1,000 megawatts but certainly at 3,500 megawatts there would be a tremendous investment in transmission first to bring the power shore, and then once it landed depending on where it landed there would likely be significant upgrades particularly at 3,500 megawatt to upgrade the on land system to get the power where it would need to go.

So there's other things out in the future that we're looking forward to do well there are not yet mature enough to bake into the plan.

So, then the next is the gas distribution, green section back on that previous slide, about $3 billion over the next couple of years and just couple of things that are depicted on this slide, one is the GSMP I program, that was 2016, 2017 and 2018. So we're just finished on this year, that was a very successful program. It was $900 million in total over the three years. It did some of the same types of things, it – on the replacement of gas mains that was replacing cast iron unprotected steel, that's very, very successful at the end of the year.

So that's really not playing into the next five year picture, very, very significantly. What's playing, what is coming next this is the GSMP II approve last week 1.875, two components each year over the five years but based on the $315 million a year and stipulated base of $60 million. So a total of $375 million a year. One of the improvements though in

Bloomberg Transcript
initial
Bloomberg
SI-SSA-0015-14662

the infrastructure regulations that were approved was more flexibility to shape that step. So, we have $300 million over the life for that GSMP II program, $0.9 billion about $360 million is flowing through step, but we can shape it and time it later

through step, but we can shape it and time it later in the period to better align it with rate recovery in our next rate case. So that was a very, very significant improvement that allows us to minimize lag on that program. And then there's the base capital on the new business that we talked about. Depreciation level capital spending in our gas business is about $150 million, $160 million and we have new business that's probably in the range of $80 million to $100 million a year. So, the gas business is in very good shape. Clause program for GSMP, depreciation level spending and new business for the balance.

Then we move on to electric distribution. About $3 billion to $4 billion depicted here, Energy Strong I is a program you may recall was a $1.2 billion program and the arrangement in that program was the first $1 billion flowed through a Clause with near contemporaneous return and the last $200 million was to be recovered in the next rate case. As that program has come to an end now this year, we've spent just about $1 billion, just a little bit over. And so all of that did flow through the Clause and there is really not that much, maybe $30 million or $40 million above the billion dollar amount that will be recovered in the rate case. But we didn't spend the additional $200 million. We did all the work. What we did was it got better pricing, back to the team executing very, very well. So, we did all the work, but we were able to get it done for about $1 billion, about $1.30 billion and that savings flowed right back to customer. So that program is coming to an end.

So, that also doesn't really factor into the capital program going forward, but what does to Energy Strong II, it has two components, an electric component and a gas. The electric component is about a $1.5 billion and the gas component is about $1 billion. The $1.5 billion on the electric is the core infrastructure upgrades hardening, we're raising substation. We have 16 substations to raise in this program.

We have 16 substations to raise in this program. We look at the FEMA 100-year flood maps and then we take that amount. We go one foot higher. There's aging infrastructure components to this. We have 84 stations. We're going to be looking at that have an average age of 73 years. And within that subset of those 84 stations, there's a group of 20 or 25 that have an average age of over 90. So, there's a lot of work to do in the substations.

And then there's some technology. So that's what that program is about, $2.5 billion, five years starting in 2019. We plan to file that very, very soon in the next week or so. And we'll be get going on that very shortly.

And then on the gas side, about $1 billion of that $2.5 billion is really focused on resiliency, our service territory in New Jersey, I think about our gas system, it's set by five major pipelines that come from the west from the shale up to the Western Pennsylvania, from the southeast and the from the southwest.

And what we've been doing a lot is that very, very again alignment with the BPU, policy is looking at the impact on our system, if one of those major pipelines was to fail. And what the $1 billion is doing in this program is essentially same, as these pipelines come in, they come in to what we call metering and regulating station.

And their pressures drop and then they're fed into our distribution system, so transmission coming in through these stations and then into our distribution system. And the biggest part of this gas program is taking the downstream side of our metering station and better interconnecting it. So that if we have a problem with one of the major pipes coming in, up north for example, we can better move gas on the downstream side of the stations up to the north. So, it's kind of like creating a gas sub-transmission system, the better move gas our side, if we have a problem on the other side with the pipelines.

And it's something that has the attention to BPU, the vulnerability that we have to the reliability of

attention of the BPU, the vulnerability that we have to the reliability of those pipelines, there was an incident in 2015 involving one of the pipelines that really raised attention to this matter. And so, this work will allow us to better move gas around in the event we have those types of problems. And then on electric, we have about $2 billion over five years on base capital and new business.

Bloomberg
SI-SSA-0015-14663
initial
Bloomberg Transcript

And then I would say the most exciting part for me, I've been spending at great deal time on this over the last eight months is the clean energy future. It's a tremendous opportunity. It says partnership there, because as I said, this is a hand in glove alignment with New Jersey's policy. A $2.9 billion investment, the biggest part of that's energy efficiency $2.5 billion, $300 million on vehicles, electric vehicles and $100 million on energy storage totaled $2.9 billion.

The energy efficiency component is submitted as a filing as Tammy described, where we have a 30-day meeting, we've held that 30-day meeting. You can't file any sooner than 30 days so we did hold that meeting. This thing is ready to go. It – on these types of filings, they have cost benefit tests. Tammy had mentioned the fact that these actually help lower bills, which is exactly what they do. These tests basically look at you're making these investments and you're asking – you're doing an investment which is going to allow you to eliminate generating a kilowatt hour or sending through a therm of gas and the cost – question is what's it costing you to save that therm versus if you have generated or floated through and these pass very, very strongly these tests. The benefits of these programs outweigh the cost of these programs and they save customers money.

The energy efficiency is precisely aligned, as it turns out. We were working on this before the legislation is finished, but the legislation calls for 2%, electric savings 0.5%, gas savings

our program at the $2.5 billion energy efficiency achieves basically that amount. So it's very much aligned. We don't have to do much work to comply with the new regulation. It involves residential and commercial industrial energy efficiency options, electric and gas. Virtually everything that uses a kilowatt hour of electricity or uses a therm of gas in a house, in a commercial environment, in a hospital, school, university, whether there is an appliance, refrigerator, gas water heater in industrial settings, motors, pumps, lighting, you name it, it's in there, in low income, new construction and tremendous program, and we're very, very excited about it.

The electric vehicles is $300 million, basically has couple of components or residential component to help get there's the Level 2 chargers that need to be in place for electric vehicles to be viable into the residential area. Workplace, multifamily charging station, travel corridors, and there's a couple of pilots associated with this program. One of the ones that, we are very excited about is a school, electric school bus pilot that's used brings the benefits of clean energy, particularly into areas that are under-served. And in the summertime, when those buses aren't being used, they are basically sending power back. So it's kind of a pilot looking at, how you can use batteries to flow power both ways, everything we're doing on the electric vehicles, infrastructure component is smart.

And we're learning, and these programs involve understanding, how people will behave, how we can best utilize and manage charging. And then battery storage, there's 35-megawatts of battery, $100 million volt solar smoothing, distribution deferral, micro-grid, applications peak reduction. The – it's a six year program as I mentioned earlier for all three. As Tammy mentioned the legislation described contemporaneous returns for the utilities to make these investments. The legislation I forget if you mentioned this with Tammy, but it mentions and supports decoupling for the folks that make these investments and we expect to file this very, very soon. So a very exciting step into this arena, makes economic sense [Technical Difficulty] that provides an offset to the bill pressure that the infrastructure is put on because it literally saves money. We show that with hard dollars and cents for customers.

So we put that all together. Now we're back looking at rate base for the next five years and the construction of this chart is very similar to the one at the beginning with what we mean by the solid section versus what we mean by the hatched. So the solid sections are the things that are in place that we know are approved and ready to go the transmission business, the greenness, the electric and gas combined this time together into one section that includes the GSMP II because that's improved. And the hatched section of the two programs that we are about to file.

And similarly, if like the construction of the previous slide if we got nothing from Energy Strong to and from clean energy, the rate base growth over this period would be 8%. If we got 100% of those [Technical Difficulty] rate base growth would be 10% – 10% would be rate base and at about $27 million 24x7 for the aid. And as I said what our job is right now is to get those filings in and get them approved. And we have a good track record for doing that and that's what we plan to do.

initial
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14664

So operational excellence just a few thoughts here, because our credibility when we go in for these filings, it all hinges on the fact that we're running the business and we've shown we can get these things done on time

on budget.

The two top slides talk about safety which in my opinion safety is a leading indicator of how well a business is run. What that's not is showing there is depicting the top left, how many injuries we have and on top right how severe those injuries are. And we perform in the top 10% the top 10 – top decile of the industry. And there's no way in my opinion a company can perform at that level with safety, without a tremendously strong culture, without engaged employees and without a disciplined around process. And so when you look at safety, if you're not able to work safely, you're never going to get there in the rest of your business. So this is a very, very strong leading indicator. We saw this a little bit on Long Island. I'm going to talk about in a minute where, when we first started on Long Island, there's a lot of problem with safety and what goes along with that is, and so very, performance we're very proud of that and it's really – it's speaks to the disciplined we have around process and procedure and employee engagement.

On the bottom, is 01:41:28[indiscernible] it's a measure of reliability, I think it's the best measure, it basically says how many – how often we were out of power, it's a function of how many outages you had and how long they lasted and you puts two together it's your total outages. Once again lower is better on that chart the line – the line on all of these charts is our performance and you see on the far right on the bottom chart, we're almost off the chart low, meaning very, very strong reliability. So, good track record is there as well.

And then one customer set. We look at customer set, we used J.D. Power. We were compared against a panel of about 20 companies all in the Northeast. We look at electric, resident, residential and commercial and this a higher scores better than the color coding the bar is the

and the color coding in the bar is the other quartiles, and you see we're basically sitting in the top quartile in every one of those quadrants, strong safety, strong reliability, strong customer satisfaction. The other thing about this slide that I'd like to point out is just take a look at the upper left chart and look at 2016, which is the second bar from the right. If you were in the top quartile in 2016 like we were, we were in the green, but you didn't improve.

One year later, just draw a straight line to the right and look where you are. You go from the top quartile to the third quartile, if you don't improve. Look at on the far upper right, same thing in fact there you can be in the top quartile in 2016, if your score didn't go up you're at the very bottom. And that phenomena of this improving trend that to stay in the top quartile you need to continuously improve is very, very evident here, and that's all we've done. The team has improved and we'll continue to improve.

O&M, this is a very strong track record here of cost control over the last five years or so. Our job is and our intention is to keep it going at that rate. This allows to keep us allows us to keep rates down and allows us to earn our ROEs. We've got a lot of things got depicted on the bottom the page. And that's my job and our team's job is to control these costs, so we can continue that trend.

This slide was also in Ralph's presentation, a little bit about rates. So the upper – the left hand side is an electric customer, right hand side is the gas customer. If you take a combined customer which most of our customers our combined customer, the rates are down as Ralph had mentioned 20% adjusted for inflation they're down 30%, along that way by the way we also gave back without changing the rate you payback Bill credits along the way as well of $618. And so

along the way as well to $680. And so it positions us very well, the point of this slide is that this is the time to make the investments when we have this headroom to make the investments in the critical infrastructure, to make the investments in energy efficiency, which will help mitigate some of those costs and leverage this headroom that we have on this – in this situation over the last many, many years.

And that's what we're doing and I think again, we have alignment in that thinking around leveraging this headroom and making the investments, now it's evidenced by the infrastructure upgrade, it's tougher regulation that came out and the support for the Clean Energy. Our operating guidance for 2018 is unchanged, to the pattern there we're on track to meet

Bloomberg
SI-SSA-0015-14665
initial
Bloomberg Transcript

that performance for this year.

Sort to wrap up, PSE&G is about operational excellence, it's about financial strength, clause-based recovery programs and it's about that capital program that is somewhere between 12% and 15.5% depending on our success with Energy Strong II and Clean Energy and it's a very, very strong program driven by a strong team and the other things we talked about.

Just for a quick on Long Island, I was led Long Island for about four years prior to getting the opportunity to come back here to our New Jersey operation. Long Island is a services contract, it's a management services contract, it's completely performance based. If we do a good job, we get paid. If we do a really good job we get paid 15% extra on incentives. If we do a lousy job, we get thrown out and we don't get a check on the way out the door. And that's basically the model and that's what we've done.

We've improved for the most part when we started this operation four years ago. We were taking this from New Jersey, lifting them up and bringing them over and replicating them. And what's happened is the team out there has become

more and more engaged and there's been very significant improvements and we got to the point now where a lot of the practices are now flowing back and forth because we've got a very strong team. The improvements have been made. We've hit 95% or better of all of those incentive targets and we're meeting all of our financial commitments.

I'm sorry – I didn't – that page turned at the time. Last page on [ph] Long Island (01:46:39) I mentioned on the upper left the safety performance and I mentioned how – if you don't have safety right you're never going to get your proxies right. So we're improving that safety performance. To be in the top decile, we need to be below 1.0. So you see in that chart in the upper left, you started 2.8 down to 2.3. We ended last year at 1.1 we're almost getting there. And that's really coincident with getting engaged – calls are getting our processes in place, getting that discipline in place. So we're on the right path. Satisfaction is up, reliabilities are in good shape and improving itself. It all speaks to the piece around it's the a performance based contract and we're doing what we need to do out there by leveraging the best practices between our company.

So with that I'll take any questions.

Q&A

<Q>: Hi. Could you give some examples of the energy efficiency investments $2.5 billion is a lot to spend, so I'm not sure if you're doing that inside the home or outside the home or sort of...

<A>: Yeah.

<Q>: ...categories.

<A>: So I'll will give u couple of examples. So inside the home, smart thermostats, anything down in the basement on heat or water heaters, furnaces, electric gas, any appliance in the home, refrigerators, those types of things. Anything – any of those – lighting in the homes as well, anything is using gas per kilowatt hour, where we would go in and put in a much more efficient appliance light so on and capture those, those savings. So that would be an example for example in the home. On the commercial and industrial end you have bigger types of equipment motors and controllers, air compressors, food refrigeration much, much bigger refrigeration types of units. So when you think about large commercial and industrial any of those types of pumps motors, fans, I think as well inside that home there. The program in the low income area does the same type of thing in more in like multi-family type of settings, some weatherization type things when you particularly in that particular program. Another [indiscernible] 01:49:08 analytics, so we put the smart thermostat in, but some of the other offerings are then to help customers analyze the data that's coming from smart devices in there and help them manage their bills, so like management services, analytics types aspect to this as well. So those would be a couple of example in the energy efficiency area.

<Q>: I'm just hoping to put some actual numbers on I guess it's your slide 41, so the rate base in 2018 – the total rate base in 2018 what would that be?

Bloomberg
SI-SSA-0015-14666
initial
Bloomberg Transcript

<A>: What slide did you refer to?

<Q>: Slide – I think it's slide 41, it's just the rate base for 2018.

<A>: The rate base in 2018, about [Technical Difficulty] I can get you the numbers.

<A>: He will get you those numbers.

<Q>: And then is the half of an 2018 base or is that half of 2017 base?

<A>: It's half of end of year 2017, so half of that $17 billion.

<A>: Okay. Great. And asked you have provided sort of a detailed break out of capital spend by category, normally that would have appeared in your 10-K. Are you going to provide sort of annual numbers, breakouts for your CapEx or are you going to wait until the next year 10-K?

<A>: So the breakdown on the CapEx in the [Technical Difficulty] (01:50:39) breaks it out between T versus gas D, ED you mean within those categories? Yeah.

<Q>: Well, I think on an annual basis in your K, you've given like the five years of spend for each of the buckets in numbers. Are we going to need to wait until the next year K to just sort of put these numbers to get the actual numbers or are you going to put something out potentially before that?

<A>: Right. Yeah. We have them, Paul. We'll get them for you. They further back in the invitation and so on. But we read them [indiscernible] 01:51:11

<A>: Okay. I'll ask Dan to think about that and maybe address that one when it comes up.

<Q>: Thank you. Any other...

<Q>: Thanks. Thanks, Kathleen. So, yeah, you said that the part of the storm was when you showed a picture of taking it all substation and raising it up and you said that you looked at the those flood maps and it got higher than what they say is the sort of the expected maximum level of potential flooding.

<A>: Right.

<Q>: How do you get comfortable that, that's the adequate, and the only reason I ask as I remember during Sandy, you kind of Ed said we did 15 different storm models and we hope that East River wasn't going to above and we were wrong and one of their plans got flooded and the city got blocked out. So, as you – I mean what the cost to go an extra foot above the foot you already

So as you – I mean what is the cost to go an extra foot above the foot you're already going? I mean, how do you get comfortable which you're actually spending this money to the right level...

<A>: Yeah. There is – first thing was after Sandy, based on that experience, FEMA redid all their flood maps, and they made them much more, I'll say, conservative. And so the approach we use – if a station has been flooded, particularly during Sandy compare the new FEMA standard plus one to what we actually observed and we saw a very good cushion. And so now we're doing stations now that weren't flooded, and so we're basically saying that with the revisions that were done and the observations we made that we have confidence in those – in that formula which is the 100 year plus one.

[indiscernible] (01:52:56) judgment that's being [ph] burden in and some analysis what we saw.

<Q>: Understood. And that design configuration if it performs as planned if – when if there's flooding but still be power as long as the lines are up because that's...

<A>: That's right. Right. There is a lot of other factors of course that there is flooding, at that level there probably was very high wind. And our electric system is 90% overhead outside plant running down streets with a lot of trees on them. And when the winds blow at 130 miles an hour [indiscernible] may have other issues going on but the stations

initial
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14667

themselves without getting the particularly the electronics flooded we've estimated that, for example, in the first program that 500,000 customers would not have seen an outage if we had done that work prior to Sandy as an example.

<Q>: Great. And last question, you put a number out there on the age of some of your substations which was...

<A>: Yeah.

<Q>: ... astounding to me, 70 plus years -

<A>: Actually 90 also [indiscernible] we got that. Yeah.

<Q>: Yeah. I mean, are they really...

<A>: And they're that. Yes.

I mean are they really...

<A>: They are that, yes.

<Q>: Yes, you know you've been replacing components as they, I mean how do they actually work and why are they actually still that old. Why and they've been report?

<A>: And it's kind of funny all the 01:54:15[indiscernible], which some call. We usually call lifecycle. Do you ever travel around New Jersey?

<Q>: Yeah, I'm from New Jersey.

<A>: Right so. If you travel around New Jersey we have over 300 these stations, you'll see sometimes even the station, some of them brick building on them. Those are the old class A substations. That's the stuff that's got the 90 to 100 year and it's 01:54:34[indiscernible]. It was installed in 1920 and it worked, it worked first time. But work this stuff that's 70 years old, it's outside. And it's been outside in the weather for 70 years or 80 years and it still works. But it is time to replace it. And it's good, good to get it replaced, because we've reached that point. But yeah, it is absolutely so incredible. And then the – the projects I mentioned for example the [ph] roseline, Pleasant Value, which is $550 we just had approved the PJM. That's an outside transmission line on the towers. And you know a lot of these towers they were put up in the ninth year ago, climb that tower, put that wire. It's been becoming cable and the hardware is becoming on [indiscernible].

<Q>: Thank you.

<Q>: Thank you for all the detail. I was hoping if you can to clarify distribution rate case filing strategy in the future, and I know you're in the middle of one now, but a lot of these programs are five years, six years. Should we expect rate case filings on that sort of five years sched, It depend on how the programs go, what gets approved with energy strong too and some of the clean energy stuff. High-level thoughts on that please?

<A>: Yeah. So, the rate case we're filling now is required based on settling back two years to three years ago, when we settled GSM case in five years and that was part of what the paperwork and the infrastructure regulation. So I think we have a requirement that we can't go any more

than five years. The plan that we have in place, what percent of these investments being contemporaneous or very near contemporaneous combined with cost control is to file in five years. That's my goal. And over time, we need to be very, very aggressive in controlling costs. We need to implement best practice to hold the line on O&M particularly, and we need to have discipline around the investments we made [Technical Difficulty] (01:56:32) we're not going to be regulatory eminent.

The key function where regulation we can shape the stipulation [Technical Difficulty] (01:56:40) closer to [Technical Difficulty] (01:56:42) in that, for example in GSMP, we can spend $1 million in the initial year. So that, if you do a lot of that step work in year four, and you have a case in year five, that almost looks like your contemporaries return. So the combination of managing the step that we have the ability to do now, having the discipline to not overspend

SI-SSA-0015-14668

depreciation level, get -- maintain the system's reliability at depreciation level spending on the BAIT program and control O&M. And that's the plan. And we would then have to be in – for new rates that would be effective in 2024.

<Q>: Hi. Earlier in the presentation, you mentioned that if you don't get a 100% of the Clean Energy or the Energy Strong asks, there'd be potential for some other spend. Could you just elaborate a little bit more on some -- what some of these other programs potentially could be?

<A>: Yeah, and I certainly didn't mean -- I was simply doing math by saying that Clean Energy with this [ph] $2 billion wasn't in the capital of the lower end, it wasn't in the right base. So I was just kind of like showing it in or it's out. So I do fully expect to get approval of both Energy Strong and Clean Energy. We'll work through that detail. But I think what I was referring to was, there was a slight up when Tammy was here that says, there's offshore wind, there's -- under the new legislation for example the renewable portfolio stay from where it is today. We're out to get to about 20% in the next year or two. It's been a raise to get to 35% by 2025, to 50% by 2030. So, the renewable portfolio standard has been significantly raised. That presents opportunities to help achieve that. That could be done in the utility, spent how it works. So, those are opportunities that are associated with that increased portfolio standard, that are on my plan number 1.

The energy storage is in our filing, but it's well short of governor's goals. I mentioned that $100 million filing is for 35 megawatt. The platform, the energy platform in place in New Jersey today is to get 600 megawatts. We're doing 35 to get 600 megawatts by 2020 and 2,000 megawatts by 2030. So, a tremendous upside if that's where we're going there. The orphaned transition is not in any of the [indiscernible] (01:59:07), which is that much. So, it's these types of things that could have us investing more in solar to meet that RPS. For example, in offshore wind, more energy have been stored. They're not in there yet, but there are opportunities.

<Q>: Thanks.

<A>: Thank you.

<Q>: Hi. I wanted to just catch up on electric vehicles and storage.

<A>: Yeah.

<Q>: The $300 million that you have here, what kind of presumption is there on the number of electric vehicles that this kind of investment can support? Is there like a correlation that you build out. And if that growth is further than what you expect, what kind of investment would that kind of...

<A>: For example, the residential charging, I have a, I drive a Chevrolet Volt for about a year and a half now, and when I got it, I loved the thing. I don't know that many people here drive electric vehicle. But I did put a level to charge

drive electric vehicles but I put a level 2 charge. Although, [indiscernible] you can plug it in like a cell phone. It's about an hours to charge. It cost – that cost me about $1,200. And so for example, the residential charging piece of this $300 million would put about 50,000 of those in. And so that's what that would enable, the charging at the workplaces at the corridors is seeding the market. We do have projections for example, our view of where electric vehicle penetration is going, today it's about in New Jersey about 16,000 vehicles, we're projecting it to get up between 275,000 and 300,000 vehicles by 2025. So we do have an idea of where we think it's going but the question is, it's kind of like the cart and the horse. This is a program where we're stepping forward, this will have a significant impact on getting it seeded, but then we got to see where it goes and what opportunities come from it.

<Q>: Got you. That's super helpful. And then on storage...

<A>: Yeah.

<Q>: A similar question firstly, what pricing is assumed in terms of the cost of storage at this point in your $100 million investment and where do you see that going?

<A>: Yeah. The batteries, the storage batteries that are the most economic today and typically have the application you're talking about grid scale, our 4 megawatt hour batteries, there are battery. They are about the size of an 18

initial
Bloomberg Transcript

wheelers tractor, and they generate a megawatt for four hours. That's the most economics, and that size battery cost anywhere from about $2.7 million to about $3 million for that 4 megawatt hour battery, that the pricing today. The pricing of these batteries has come down 60% in the last five years. And the battery technology is the same that we're talking about here, it's the same technology that's employed in the vehicles. And so, there is tremendous investment being made today in battery technology. It's primarily driven overseas in electric vehicle facilities to support

overseas demand for electric vehicles, but that technology R&D is directly impacting the cost curve on grid scale battery. So – and there's a tremendous build of these factories and this R&D capability. So, the question is going to be how fast that cost curve continues to come down, it's come down a lot, but at $2.5 million to $2.7 million for a 4 megawatt-hour battery, you can make certain projects [Technical Difficulty] (02:02:27) site that you got a site that could use a micro-grid and could use a peak reduction, there is a circuit nearby that's overloaded that could be relieved for a couple of years. There's a few things, but to do things on large scale the cost would have to come down, they continue to come down to make it economic.

<Q>: Any other questions? Okay.

<Q>: Yeah. So, thank you. So when you look at your current rate base per customer, it's actually pretty significantly higher than the vast majority of utilities in the country. And I understand that there is some space on the bill to fund the additional investment, but how would you defend for instance, the skeptics that say that you're already gold plating your systems especially on the electric side and that there is positive requirements but the level of investment is already pretty high?

<A>: Right. So, we're continuously looking at it as we've said as a balance and metrics, and our strategy is to be in the top cortile on reliability for example and we measure reliability a couple of ways I mentioned in this [ph] steady. We target to have top cortile customer satisfaction, customer satisfaction is driven primarily by a customer's view which is a combination of price and

and reliability typically. And so we look at it and we balance it and we consider the headroom, we consider the need on the system and where reliability might go when you're not investing in the systems that's aged, 70 years to 90 years and so when we look at that whole balance and we look at it continuously. We think we've got a good balance between them and that may change over time, we have to see, but right now when I look at the plan, I look at how we're delivering value to customers and what they're telling us what our policy makers are telling us. There seems to be general alignment that we're doing the right thing, right now for long-term growth. We don't want to end up. Like the New York City Subway System, where you had significant under-investment in needed aged infrastructure and this is the time to do it within the context of that balance.

<Q>: Hi. Can you just quickly elaborate a little bit on potential rewards or penalties we could see as far as the clean energy mandates for PSCNG as the mandates start to form? And then secondly, as we think about transmission opportunities for offshore wind, how we should think about sort of the socialization of that costs? And how the recovery could work especially for part of the line that is offshore?

<A>: Right.

<A>: Right.

<Q>: So would that be something that New Jersey would bear or something that he could socialize among PJM?

<A>: So, on your first one, if I heard you right, it was in the structure of the energy efficiency programs. Penalties we're not achieving the 2% or 0.75%.

<A>: Correct.

<A>: Yeah, and so that's you know the BPU is, these are going to be requirements. And so it's one of the reasons why we feel very strongly we should be the ones implementing these programs. And I think we recognize that if we have this obligation it comes with

initial
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14670

it comes with a duty to perform. I think the details on that are going to be worked out, and that is what's going to happen to you. BPU has been charged with taking the broad outline of that legislation and putting some of those details in place and in discussions we've had so far, they are talking about how do we think about – first of all, how you can measure the savings? There's a lot of flexibility in there, and how you do it? There's an analysis that has to be done to make sure that we're understanding what the true opportunities are, but to your point, I don't mean to sidestep the question, but that's a detail it's going to be worked out, but it's expected, it's a requirement, and if you're not meeting your requirement there's going to be some kind of consequence, that doesn't concern me though. You know like, I said our team is on time, on budget to get things done.

Your second piece, I'm sorry was on ...

<Q>: Transmission ...

<A>: ... of the offshore wind.

<Q>: Yeah.

<A>: I think they're Tammy mentioned they've started, the proceedings the BPU again is moving very aggressively and just a lot of details that need to be worked out. I mentioned the fact that if you have all this wind power, there's going to be a tremendous amount of transmission needed to bring it onshore. One of the questions will be is that part of the investment that is included with the developer or and that developers are responsible? Or do you separate that out and make that available? If you do it separately, if do you do it in the context of PJM or do you do it with some kind of state, so all of these details need to be worked out. The fact is there's going to be a lot of it. If you put in that much we're very engaged in that stakeholder process and we think we are uniquely qualified to build transmission and to do it right, do it well. And so that's what we're going to be keeping an eye on, but it is very, very early, but they are moving very, very quickly.

<A>: So we're at that time for a break. We're going to take a 15 minute break, and come back [indiscernible] at 10:30. Thank you. [Music]

[Break]

[Music]

Hello. I'm going to ask that you take your seats and we'll resume the program. Thank you.

Seats, we'll resume the program. Thank you.

[audio gap] (02:25:36-02:25:55)

Ralph A. LaRossa

Well, we're at the beginning; I got to go through all these slides.

[audio gap] (02:26:00-02:26:17)

All right. I'll get started, and good morning everybody. My name is Ralph LaRossa and as Dave mentioned in the last two years I've been up here, I've been speaking mostly about the utility activities. So today is a little bit different for

SI-SSA-0015-14671

me. As I explained to my family, the only real differences I now go to work and try to figure out different ways to boil water. So it's not that more, it's not that much more complicated.

But it is a – it's really has been a good opportunity to change businesses, but still stay within the same company and I think Ralph and the whole board for that but it was also very easy to make that adjustment because as you saw Dave and the entire team will continue the good work that we've put in place over the past 10 years and I'm really, really excited to see that continue.

So I'm going to focus on a few things here today and try to answer a couple of questions that have been raised, typically how are we going to continue to feed that is the utility from a cash standpoint and not have to issue equity. And that's where this business really comes in, we're going to be focused on free cash flow and how do we continue to improve that.

And I guess the other question that Steve asked earlier, Steve Fleishman asked Ralph earlier which was what's going to differentiate us when we continue to have the downward pressure on the volumes and that's really about transforming our fleet making sure that the assets that we have are really the best assets and are ones that really can operate within the marketplace in a very efficient way.

And so, I'll start off my presentation really just focused on the assets themselves. Everything starts with that when I'm focused on safe and reliable operations that's not going to change in one -- anyway shape or form. I'll update you a little bit on the three plants that we are in the process of building combined cycle plants give you a quick run through of that. Remind you a little bit about that transformation on how the plants that we've retired in and how that's worked out for us. Continue to focus on O&M, we'll talk a little bit about where we've been and where we expect to be on an O&M basis not just from a fleet standpoint but from an overall power standpoint. And then what results from that from a free cash flow standpoint and kind of lead right into Dennis presentation and what he'll talk to about some of the finances.

So, let me start with our assets themselves and where they are, again for 10 years I talked about a straight line up from the George Washington Bridge[indiscernible] Ben Franklin Bridge on the utility side. Well, the scope is a little bit bigger and the footprints a little bit bigger, but still focused in the northeast while we have a number of assets on the power venture side that are across the U.S. and those are specifically our solar plants about a little over 400 megawatts of solar. We also have 100 megawatt plant in Hawaii not in the area of – anywhere near to [indiscernible] or any of the risk that might be out there right now from the volcano but a very small plant that's under a PPA out there with Hiko. Most of our assets as you know are focused in the PJM region. In fact I'd say over

9,500 megawatts of our generation capacity is focused in PJM, about 800 megawatts up in New York ISO, associated with Bethlehem plant and then about a 1,000 megawatts in New England. So its focused in the northeast and you know really in spots that are close to our load centers and really positioned well to handle anything that comes up from a market volatility standpoint.

So let me give you a little bit about what's going on with our three new plants. We're just in the final throes of completing construction in this year on 1,300 megawatts of combined cycle plants and the top one is our – is Keys Energy plant, which as you recall we purchased back in 2015 which was a developed project, greenfield project from Genesis developers. And so we're in a process of working through the last kings on that I'd say we're probably four to eight weeks away from commercial operation on that plant. It's a plant that has been built on a by SNC-Lavalin. They are the constructors and really hold most of the construction risk on that project. Risk really comes from just making sure the plant gets online, on time and on budget – on time not on the budget side. And it's well-positioned as you know Southwest MAC has been a robust marketplace especially around the Pepco region, prices have been pretty high in that area. And we really think this plants going to perform well with the high efficiency heat rate that you see there as well as the positioning that it has within the load center.

The second plant is our Sewaren plant, 540 megawatt plant, that's being built on our old site in Sewaren, New Jersey and specifically we had a four units that were down at that site in the past and now we're upgrading that and again much more efficient unit that

Bloomberg Transcript
initial
Bloomberg
SI-SSA-0015-14672

was in that spot business has been in there in the past. The good news about that plant is we are really in final testing stages, actually the plans running right now at about 200 megawatts as of this morning. We've been up to 345 megawatts on that plant and the combined cycle the guests, the guests unit itself has been running at its maximum output during that timeframe. So, we see that moving along pretty well. That asset has access to what we really like to see, which is our best fuel supply on the guest side of the house, and I'll go into a little bit of that in which we have access to low price light gas at that location.

The last unit is our Bridgeport Harbor plant, that plan will be completed in 2019. It is another combined cycle plant one by one that's being built on our existing Bridgeport site which is home to our coal unit that will be retired in 2021. That plant again good heat rate about 6,500 on that and is one that has access to guess through Connecticut Natural Gas Company, we have a contract there and again has good pricing and has access to some market that is – that tends to be volatile over time. So, one is between the sport spreads and its location we think will provide us with good efficiency as we move forward.

A little bit of our Solar Source business, again I mentioned that's across the country, you can see the growth that we've had in our Solar Source business from about 148 megawatts back in 15 to 20 to over 400 in 2017. That business we do not expect any new power plant, any new solar farms to be brought online

in 2018. There's none in our current business plan. But we continue to have a small group of people there, who actually look for mostly acquisitions, we don't develop them from the ground up. They're mostly acquiring projects that had some level of development that's been completed so far. So, we continue to look for that. But again in 2018, we don't see any new plants coming on line for us in that area.

We're going to skip ahead one slide and then come back. This kind of summarizes what Ralph had mentioned in the first part of his presentation, and really talks about how this fleet has transformed over the years. If you look at the top bit, these are the all the additions that we've had, both freights that we've done at our nuclear [Technical Difficulty] (02:34:15) cycle as well as new assets that we're putting in place that I've been talking about both at Bridgeport, Seawater and [Technical Difficulty] 2,900 megawatts that will be complete. At the same time, we're eliminating the less economic and really those that have been environmentally challenged unit. Again, the [indiscernible] retired back in 2015 with large coal units that we had in New Jersey, [indiscernible] fast forwarding to 2021 will be eliminating number of units. That will just leave us with the 23% ownership that we have out of Keystone Canada on our coal that's out there.

So, this really is the summary of the answer to Steve's question, which is why do we think that we're going to be okay as the load continues to be challenged by energy efficiency programs. This is the short story of how we're able to outrun the others in the forest that the bear is coming. So, we just [Technical Difficulty] better units and the units that we believe will stay in the market.

So, how do we get some of that competitive advantage

that's so important to us? Well, a big piece [indiscernible] And that's – and that's, this is where we get some of that advantage from. If we look over that transformation that's going to take place, look at what happens to our heat rate. We're currently around just over 7,400 and with the addition of [indiscernible] 68 Sewaren again at 65. We fast forward out to 2022, our heat rate is going up to the 7,100 range so a much more efficient from a heat rate standpoint.

Same time, we're cleaning up the fleet. You could see what happens to our missions from SOx and NOx and CO2 stamp. Again that we've probably shortchange ourselves a little bit because we've taken out some of the coal units in the prior years. And if you look at that profile we've actually come down at a greater pace than what's shown there. But we continue to move to a cleaner fleet.

At the same time, we're reducing the age that's going to help us on the O&M side as we continue to reduce expenses. And you can see that up in the top right hand corner where the average age of our fleet out in 2022 will be down to almost 21 years.

initial

SI-SSA-0015-14673

Put it all together, much more efficient fleet, a newer fleet, and we're going to be able to operate that fleet at a lower cost on a [audio gap] a little bit more about the history there. But you can see how we're dropping down into a range that's going to be very competitive marketplace.

So let's fast forward to a little bit about combined-cycle plant specifically and how we have access to low cost fuels. You can see up on the top left hand corner, our procurement group which has really led to our ER&T department Shahid Malik who you have seen and heard from here in the past at these meetings. Those guys has done a great job of procuring fuel force or access to that low coast shale has been, shows up in a number of different ways, but given us that competitive advantage for those combined cycle units.

On the right hand side, we'll take a look out and see what we think is going to happen with additional capacity take ways from that region and we think that it's at the -- we'll continue to have with the use of that of natural gas additional production that will be taken place. But in overall we think that natural gas prices will stay flat as you continue to take a look at what's going [indiscernible] play there.

So combined with a flat price curve as you see in the bottom left, but in advantage by [indiscernible] natural to the shale and the [ph] lighty region we've [indiscernible] as well as I've been saying the advantage by access to that fuel. If you see, if you go out, and those are just the foreign markets there, the [ph] lighty price will have about a $0.20 to $0.60 benefit to us over the Z6 price in the out years. So that all put together gives us why we have some comfort in our combined cycle plants and why there'll be – there'll be more advantage than some of the others that we compete with on a day-in and day-out basis.

[indiscernible] I say the biggest advantage that we're going to have here is twofold. One is the work that's been done and we've heard a lot about that on the [indiscernible] from Tammy and her team, specifically I wanted to point out a couple of people in the back room Rick Thigpen and Josie DiRienzo, who were really instrumental in getting us across the finish line on that standpoint and did a great job for us on the governmental affairs side. Dan and his team and Tim Pellegrin has spent a ton of time getting us all than all the numbers together for us to get through the process as well.

And then Tammy was up here before, but we'll still give her credit for the work that she has done on the legal front. And there are a couple of people in her shop that were just fantastic. That – that will enable us to continue to compete. While we are able to compete, it's still about the operational performance that Ralph spoke about earlier and that really has

improved dramatically over the last year year-and-a-half, [Technical Difficulty] (02:39:24) year was our Chief Nuclear Officer and encourage you to grab him at some. They have just really done a nice job of working to improve the capacity factors down at the plant. And nowhere is that better seen than in Hope Creek where we just completed our first ever in the history of our company breaker-to-breaker run between outages and as a result you know if you look at the 2017 numbers our capacity factor was a 100% in Hope Creek.

We did that there. We've also were better than the four year average at Salem 1 and also better than the four your average at Salem 2. So good operational improvements, [Technical Difficulty] (02:40:02) long way to go. We still like continue to improve, but I feel very confident that that strong base has been enabled by the ZEC combined with the operational performance from Pete and his team will really enable us to move forward on the nuclear side of our business for a long time to come.

Why is it so important for nuclear? A little bit about the value the environmental side. But I thought I'd take a second to show you three slides just to highlight why fuel diversity is so important, and a little bit about what happened this past winter, and what really could have happened in the marketplace without these plants available. I'll take you back to the first week in January if you remember it got pretty cold in this region, and as a result you can see what happened to the [indiscernible] to the market prices around the clock in PJM, they were spiked up to over $800 a megawatt hour. So we've – the candidates did not become economical any further, because the price of natural gas has gone up so much somewhere well over the place where oil would have been more economic and as a result many of our units switched over through oil at that point. So we not only had a high usage of natural gas but we had a high price

Bloomberg
SI-SSA-0015-14674
initial
Bloomberg Transcript

that showed up in the marketplace for natural gas. So what does that mean if we took a look at how the dispatch curve for our units. I looked and you can see our nuclear plants continue to run producing about 3,500 megawatt hour and look at the steepness of that dispatch curve on the right hand side. And what would have happened, what four of those nuclear plants being there and our ability to access the oil reserves that we had in the – in our combined cycle facilities.

I think about this very simply by just taking at 3,500 megawatts and if on the data we had about $800 plus per megawatt hour. We had a capacity we needed about 80 – I'd say about 8,000 if you draw a straight line there. Move that over to the right the price would have been well over $1,800 value when you think about what brings – what nuclear plans bring to the table on day like [Technical Difficulty] 02:42:18 one-time and we could have because also happens at the same time was we were running out of oil.

So you can take a look here and see, I guess I can't use a pointer here but I'll just point out to you. The tank levels there Lynden is one of our 02:42:33 and you can see where the tank level went down to is just over the limit of about 9 feet where we could have continued to run that unit and the same thing at our Bergen facilities. So our tanks were being depleted. Clearly we're just having round the clock deliveries from world. So the takeaway from this is really two-fold. One the value of nuclear really does exist from a fuel diversity standpoint and we're talking a lot about it from an environmental standpoint and that's what a lot of the ZEC is on there's a tremendous value from a fuel diversity standpoint. It also points out a little bit about what needs to take place [Technical Difficulty] 02:43:10. There's one microcosm of what happens in PJM during that snap, but it's one that you could takeaway

and extrapolate across the region and why PJM needs to do something to help us on the price formation standpoint. There's something [indiscernible] (02:43:24) talked about, Dan and I were talking in the break. Since we've been seeing it the same way the rest of the marketplace has been it's probably worth about a $1 dollar and or $3 three dollars. We don't see it any differently than that, but that's a long way really again are focused on get a safety net in place from a state standpoint. But if you were to – if you were to look just that fast start maybe a $1 dollar or $3 that might take place there.

So that kind of talks a little bit about what's happened and how our assets are a little bit advantaged over some of the others, little about O&M. If you look at this CAGR that's existed since 2013. The organization has done a really nice job of controlling costs, about a 2.6% reduction from 2013 back to 2018 to where we are. You'll see a little bit of an uptick in 2018 over 2017, that's not just because I loosen the reins a little bit. That's really based upon the fact that we don't – we have a Hope Creek outage in 2018. Any time – any year do we have a Hope Creek outage, the expenses for us, since we're 100% owner at that site versus a Salem outage where we're not 100% owner the price will tick take up a little bit. But over the overarching time you can see that the dollars continue to come down and we expect that to continue going forward.

I showed you before the fleet costs for power and how we've come down. This is the overall cost of power all in, including all the white collar and everything else that's involved in running the business. Those you can see that – that price has gone down just as well on a O&M per megawatt hour basis. So controlling costs not only at the fleet level, but also in the management ranks over time and we'll continue to see that going forward in the out years. This is driven by two factors. One is O&M itself the actual expenditure but the other one is

what Ralph alluded to earlier, which is, we're just producing additional terawatt hours. And so that's going to go up from 53 to 62 over time, and again we think that's going to happen because of the value of the plants we have now versus what we had in the past.

This is probably the most important slide for today, and that's how some of this cash flow gets created. This is as we're coming out at the backend of the construction programs, we should have some confidence that those programs are coming to an end. We are as I mentioned in those final close of testing at C. Warren and getting into that keys, you can see what's going to happen to the capital expenditure profile for power in the out years, no large expenditure plans, small upgrades at a few plants and then the ongoing end of the life expenditures that we need to take for any one of these assets going forward.

So let me switch a little bit from that to talk a little bit about the top line and talk about two things. One is from the energy prices, and then two, being the capacity in the recent results. First on the energy side, we've talked about this a lot and Shiv given you a ton of details in the past on it. We are not changing anything from a hedging standpoint from a strategy. We continue to focus on our baseload both nuclear and a little bit of coal that we have out of Pennsylvania. And you can see again that we are 100% hedged for the rest of 2018, 2019, a 100% hedged on those assets and then we're in the 65% to 70% range, that price that you see there is in all the prices, it's an average prices, not just the energy price because we're also supplying full requirements contracts for BGS and some of the other I guess trenches that we have in other locations such as [indiscernible] and other utilities.

locations such as [indiscernible] another utilities. So that's an all in price per megawatt hour, that's not just our energy price, but you can see from a just the trending standpoint those prices are pretty flat and we see that continuing in those years.

The intermediate peaking and combined cycle plants that you see there those price again our hedging practice has been consistent, we say a little bit open on those in for the rest of this year for about 30% to 35% open and the same thing in 2019 where you can see that where that number comes out to be for us. So total generation in our total hedging practice hasn't changed, we continue to be focused on that and most of this is taking place at the West Hub.

Now when we when we focus on the West Hub that creates two risk force, one is obviously the basis risk and the other being the operational risk and we take a big piece of that away. When we have our actual hedging that we do in our BGS auction. So about 10 terawatts of that hedging that I just spoke about on the prior page is covered in that BGS auction. And again you can see here as we've shown you many years in the past the consistent way of showing the price from the forward markets, the West Hub and then all of the ancillary services and other pieces that get built into that pricing to build up to the $90 to $100 price that we've had over the past few years. That price has come down in 2017 and 2018, ties right back into days talked about from creating headroom on the bill. This is exactly for New Jersey and so again a good opportunity for the investments to continue from a utility standpoint.

The right hand side I just wanted to touch a little bit on what we're also doing to try to eliminate some of that potential basis risk that we have and that's to get closer to our customers due to retail, a retail position that we've taken and get it more into sales on the commercial and industrial side directly to customers that has been a slow go.

We have been at for about I'd say 12 months to 18 months now, hasn't really progressed as well as we expected it to do from an organic standpoint, but we continue on that – on that path and see if we can't make some additional progress over the next six months to 12 months, and then we assess where we are from a retail standpoint. The biggest challenge here is really getting directly to the customers there's a lot of brokers in that process and we continue to look for other ways to – to gain access directly to those – to those large customers.

Switching from the energy efficiency, piece of the equation from a revenue standpoint, you saw the results from the last auction at PJM, and I think this is the first time that we'll let you know exactly how much we've cleared in that capacity auction 7,700 megawatts. The revenues up on the top right hand side. Our – but at the PJM level and then you can see on the bottom right side exactly how we compared – compared to the rest of the RTL. So that competitive advantage, the geographic location that we have for those assets not only are benefiting from the gas pipelines on fuel side, but also from the natural price that we get the capacity payments. So you can see we've – we've continued to maintain that that geographic advantage that we've had for prior years.

Looking forward obviously there's a few – few areas that we continue to be concerned about as we look to the prices in the out years, obviously net cone and how that plays out and that would be challenge for us, and the load forecast that that you picked up on earlier and you continue to ask about, but we continue to believe that the positioning and reposition it is fleets going to have us in a better spot for that.

Similar story in New England

if you see the prices have come down, what we've enjoyed the benefit of is the fact that we've got the Bridgeport Harbor unit which has been cleared for seven years at a $231 price. So that unit is well-positioned and has a nice advantage for us. You can see the revenues on the top right side but the differential has been created by that bid that we

Bloomberg Transcript
initial
Bloomberg
SI-SSA-0015-14676

made and the fact that we're now going to be outperforming the rest of the pool in New England as well on a capacity standpoint when you get out to 21.

So a good story for us on both sides of the equation, both in New England and in PJM, and obviously with the PJM market being much more important to us than based upon the amount of – [Technical Difficulty] (02:51:52) each one of those locations.

So I'll put the pieces together and I thought a little bit about well, you're in this more competitive environment and how concerned you have to be about the volatility and working in the utility for 30 years, it was a little bit different to try to figure out, while this pie put things together for me in a context that I thought really made a ton of sense which is that we're not as open as – as I may have thought and maybe we've left sometimes folks with the impression. If you take a look at the energy margin that we've had there it's hedged, a large portion of that has been hedged, a large portion being the capacity of being hedged as well. And then we have a little bit of our margin on the entry side that's left open, so it's a portfolio that is really been well-managed over time. It provides a great opportunity for that cash flow to come back to the [Technical Difficulty] (02:52:49) without having to issue of the equity as Ralph mentioned earlier, and it's very stable over the next two years to three years from the time horizon standpoint.

So I think, as I looked at the business and saw where we are that's something that is much more stable business than people may actually

think it is in place. The earnings that we've talked about, this is not new news, this is guidance that we've given out before, but I just want to reinforce, we're still in that range thereof 45 to 560 for 2018. And then I'll leave you with really just the – the major takeaways which is that the fleet itself is very well positioned. We've upgraded our fleet, we've transformed it over the years. These new builds are coming in and will put us in a great position from a from a heat rate standpoint and from an efficiency standpoint. We've eliminated a lot of the old units that with an higher OEM as well as challenges from the environmental standpoint. And we've continued to work towards improving the energy policy. Tamie will walk through all of that again, but I can't reinforce with the enough the great work that was done to get us that stability on the nuclear side.

A little bit of a thank you to my boss as well for taking some of the beatings that he took in the press, but that was – it was an effort that was a true team effort from a lot of folks and really has put us in a great spot going forward. Take away the fact that there's low capital requirements going ahead, that should really leave you with an impression and security that we have some positive free cash flow as we go forward. So it's an overall good story. It's a very great opportunity for me to transition to something new. And I just wanted to open up for any new questions. Any questions you might have.

Q&A

Operator

Harris and the first.

<Q>: Well, no, no, no, no. I was just.

<Q>: Assuming that you do get the support from the state in nuclear

how if at all does that change your overall approach to the BGS auction?

<A>: I don't think it will change one bit. Our approach to BGS auction, I mean that just I think about that it's just almost like a capacity payment, we're just making sure we keep the doors open. So it won't change one bit our approach to the BGS auction. We like to have more BGS auctions, and then take away our basis risk but no change.

<Q>: Looking at the slides that you put up with regard to the weather event in January. It struck me that to ask the question is – is the battery storage actually a viable option for the fleet in circumstances like that? A lithium ion battery today is worth $400 a megawatt hour and it looks like you're in a situation where you could have theoretically been out

Bloomberg
SI-SSA-0015-14677
initial
Bloomberg Transcript

of oil and having to buy it a lot higher prices than that? Or is that going to be dealt within the context of the deployment of batteries on the utility side in a way that actually is going to clip those peaks prospectively and...

<A>: Yeah, I think the battery piece really is going to turn up -- I'm not sure where that's going to [indiscernible] in a wholesale market or not and how PJM thinks it through. But the observation is not incorrect that there's an opportunity for that there but if you compare it to losing nuclear plants at the prices that we have there it's not even close to my mind. So yeah, there may be pockets of it where it might make sense for us. But the point that we're trying to make there is if you're going to value at such a high price the batteries should be providing that same value to the other plants that are providing that same benefit.

<Q>: Understood. Thank you.

<Q>: Ralph on your comments on retail and it not growing as quickly as you would have liked. And then you'll reassess I mean, are the options to buy something or partner with one of these brokers you're talking about came to mind or is it possible that you're just strategically decide, you don't really need to be there?

<A>: No, I think there is, all of those things would been looked at, right, so we just take it day by day, I think the – with the first opportunity will be to continue to grow it organically and then if we [indiscernible] we look for REP, type of an arrangement with a broker, that's an opportunity that exist for us, and then the follow-ups fails and you just have to reassess where you are, but I think over time we just wanted to be clear that we hasn't grown as much as we expected it to grow.

<Q>: Hi, your clear capacity in the last auction was still fairly below the – your E4 capacity.

<A>: Yeah, it was.

<Q>: Yeah, probably saying the clear capacity in the last auction was still fairly below to your E4 capacity. Can you discuss the reason why that is and maybe give us some color on the bidding strategies this time around?

<A>: Well I don't think we discussed the bidding strategies in too much detail, but we do we have discussed in the past that we basically have some sort of a layered approach to each one of our units and based upon that is where we round up with the clearing price very similar to what we had last year which you can say, we're 7,800 megawatt last year and 7,700 megawatts this year. So we basically tier each one of the units and we put it into the auction in that manner.

<Q>: Do you see any upside from the incremental auctions?

<A>: There is not really an incremental auctions, I'm just not sure what's going to – what's going to take place from a pricing standpoint. A lot of it will depend upon the excess capacity exist with the FD Fleet and also at Exelon's fleet. Our units are in a different geographic area. So there will be some opportunities for us

maybe that don't exist for others, but that's to be determined.

<Q>: Okay. Just wanted to talk about, you know the cold weather event and that kind of combined with the hedging strategy that you guys have. If you guys hadn't been able to have the oil or if it expanded longer and the oil ran out, would do you have sort of enough un-hedged capacity that you're doing okay, or with the hedges have caused issues for you that you would have ended up losing money because you you know, sold for a much less and then you'd had this, you know, high cost gas to generate?

<A>: A lot of possibilities there in what you said, I was mostly discussing it from a customer standpoint though when I was presenting it here and the value that the nuclear units actually bring to the overall fleet, right. When you look at it from a PJM standpoint and why that some of these market reforms are required in the support for this [indiscernible] so important for the state, because the prices would have spiked way up from a customer standpoint. From our hedging standpoint, the team does a great job and they've always got us well-positioned for that. So I kind of walking into lot of details about [indiscernible] day in and day out basis, but there's, there's always a risk in some of the scenarios you laid out there.

initial
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14678

<Q>: Yeah. So, you're not seeing that, you wouldn't have been having to generate something that you sold for you know 50 bucks or something and you're having to generate for 900, you wouldn't though...?

<A>: No.

<Q>: ...That's not going to situation happening on.

<A>: That was mostly from a customer perspective.

<Q>: Hi. I think in the past, senior management has described PEG has maybe not being well matched with the utility over the long-term [indiscernible] same parent company and I was wondering what the passage of the Zacks if the managements that be one that has changed all?

<A>: Well, I'm certainly pass the book and that at some point

Well. I'll certainly pass the buck on that at some point to you. But you know I would see it just with a newbie on the street standpoint. I think they make all stands for these businesses to be together right, maybe long-term things change, but the value that we're being and the free cash flow that we're bringing to the table adds a lot of value for, for the utility. And I don't know if boss wants to say anything else now or later but, yeah he'll, he'll hit that one later. So don't leave, that's how you get the stake.

<Q>: So I wanted to just touch back on the price formation point. You said [indiscernible] three bucks of the impact.

<A>: I guess it was the market saying for, for a fast start maybe a $1, $3 and we are not differently than their others.

<Q>: Gotcha. And then secondly in terms of capacity auctions, some of the impact of the benefit of capacity auctions this year was because energy prices have come down, so you've, everybody's bidding strategy is kind of reflected in you know the demand goes reflected to it as well. How do you see that playing out, do you see energy prices if they stay at these levels or go down further. Where do you see the capacity auction playing out and how big a piece does that play in your view of the world of how you look at big power?

<A>: So we don't take a position on energy prices, anything given the market as right, so we just look at the forwards that's the one kind I think that won't change. From a capacity standpoint, I've pointed out a few of the risks that exist on, on the slide there, specifically the load itself, what's going to happen there and then and then it was about four or five other items that that you know could potentially create concerns from a capacity standpoint. The bottom line for any generator is we need to have enough to cover the risks and to keep doors open. So whether it's coming from the big basket market or the ancillary markets for also in the, in the piece in their Blackstar and all the things, you have to puzzle together to keep the plants open and I know you've seen that because so many plants have retired over time.

<Q>: Sorry, and one final thing the slide 72 where you laid out you know that the piece of the puzzle or at least the hedged portion of your business being quite in the next three years,

But that obviously then changes after the three years because your capacity auctions kind of roll off, your hedges roll off. So the volatility is really post the three-year period. How do you see that volatility post the three-year period?

<A>: Well I think what this really tells you we have feathered into this every year. So if you look at what's happened in the out years, obviously, we have less hedged, but then as we get closer to that year we hedge more, right. So this pie doesn't change. And the point that I was really trying to make here is that is a very stable business. There's obviously some on edge positions here, but it's not completely open to the marketplace. And the policies and procedures have been put in place up until this point that lead us here. So we're going to continue that.

<Q>: Yeah. Hey, Ralph. Just a question on that what would be your interest in acquiring additional plants in your market, so for example Dominion has plants that there is kind of and may put on in both PJM and New England. So any thoughts on that?

<A>: I don't have any plans to be diving into anything at this point, Steve. I mean I think we're focused right now on getting those three plants up and running. There was look for opportunities and then Dan [indiscernible] (03:04:12) and

initial
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14679

we continue to see if there's anything out there that we can get on something popped up that made a ton of sense you look at it but that's not been our history and I don't think that's going to change. So I'm focused really on getting these three plants up and running and making sure that they're economical and they win in the marketplace.

<Q>: We have time for one more question, Ralph.

<Q>: Given that you were so heavily hedged though the next three years, what is your projection for free cash flow for PSE&G Power for the next two years cumulative?

<A>: Yeah, we don't – we just don't -- we don't go into that level of detail and you can try one more time with Dan when he gets up here. But that's something

we get into the details.

<Q>: Great. Thank you, Ralph.

<A>: All right. Thanks.

Unverified Participant

All right, good morning, everybody. No questions on our new artistic logo, really which shows our headquarters in New York and some of the key points that we'll talk about. So I'll pass through here, we'll end up talking about a lot of the things that are on there and frankly a lot of things I'm going to talk about you've heard already.

I'll give you a sense as to the overall financial picture pulled together some of the pieces that you saw in Dave's presentation, some of the pieces that you saw in Ralph's presentation, pulling together let you see them all together and I think what you're going to see is good opportunities for growth, strong financial position, good work done for the infrastructure and efficiency of the grid in New Jersey and an enhanced ability frankly for us to continue to provide returns to shareholders, including increasing the dividend.

This first slide, slide 77 does give an indication of that strong financial position. It does create opportunities for growth and some of that growth you can see even in what we've shown you for 2018's earnings guidance forecast versus 2017. So at the midpoint of that 2018 guidance of $3 to $3.20 we're up 6% compared to 2017. And really that's driven by the continued investment that you've heard about at PSENG and some – from some benefits from tax reform that we see at power.

The investment opportunities fairly evenly split between transmission and distribution.

Transmission, we do have the formula rate treatment, contemporaneous returns. And on the distribution side, near contemporaneous returns. I think, we've made some improvements and Tammy talked about those from the standpoint of the infrastructure investment programs that – that New Jersey has put in place in that template that's been put in place. We used it with GSMP really before it was in place, but knowing it was coming and I think it's worthwhile. They're the first one in the state to have the – the IIP work through the process and I think more to follow, as we talk about energy strong going forward.

And in power, the end of the combined cycle construction program is going to reduce the capital needs of power and provide an incremental cash flow. Ralph talked about it before. He kicked off the presentation, although he closed off his presentation with the fact that no need for additional equity for the cash flow and credit metrics section. That's obviously a positive that we like a lot and goes to some degree to what Ralph and Rich have just answered on the one question about the value of having the companies together. And this all works again for the benefit of New Jersey, a lot of advantages that we see.

Dave made a reference before to the some infrastructure challenges in other areas. We don't want to be in that place. And maybe 70 is the new 50, but we still do have work to do to ensure that our infrastructure is going to be where it needs to be on a go forward basis. Those investments are going to create the opportunity for us to continue to provide

Bloomberg Transcript
initial
Bloomberg
SI-SSA-0015-14680

returns to shareholders. So, as we take a look at for 2018, the indicative rate was up 4.7% from a dividend perspective for shareholders. And as we have said for a long time and continue to say the opportunity to continue to provide growth in that dividend on a sustainable basis is well to do.

So, a quick look just at 2017 versus 2018. What we try to do here is put together a slide that shows you a bridge, as we've gone from 2017 results for each of the utility and power and enterprise and other into 2018.

the obvious movement at PSEG that we've talked a lot about is the result of the investments that we've been making. So the return on that incremental investment gives a boost to PSE&G over one of the other things that as we look just year-over-year 2017 to 2018, as we have led into this rate case, there's been some capital that we've incurred over the last few years, that has not yet gotten the recovery. The first of those that comes to mind is energy strong. You may recall $1.2 billion was approved across that five year program. The last $200 million of that did not get a role in. Yet, we had agreed to a rate case. So that rate case essentially became the rolling for that tail end of capital.

And the good news is that a lot of that capital isn't going to be spent, because we were able to do the work that we did as efficiently as we did, but there's a little bit of that that awaits recovery, on the revenue side yet we'll have some of the burden of the cost. Dave talked before about GSMP. And so the first GSMP program of about $300 million a year and about $85 million each year, a weighted recovery, so that's another bucket of capital that was awaiting recovery in a rate case. And then some other incremental spending that we had on a capital basis leading up to the rate case. So, that's a cost that is borne by the business right now, still awaiting recovery in the rate case. As you go from 2017 to 2018, some of that brings down the bridge to jump as you go from year-to-year if you look at our capital versus the net income basis; as opposed to when we talked earlier about 13% increase in net income, 13% net increase in our rate base.

One other item we did have a small tax benefit last year that won't repeat also just a year-over-year dip, that's a onetime item. In power, the moving parts are the ones that we've seen a lot of, right, so capacity prices up and Ralph showed year-by-year capacity numbers. So, we'll see a benefit from capacity as we roll through from 2017 to 2018. The recontracting impact, I think we said on the first quarter call down about $6 a megawatt hour. So that will be a drag as we go from year-to-year.

year-to-year, we'll get the units running that we have those sea warning keys in 2018 that will give a boost to 2018, and we'll see about $0.16 benefit from tax reform. So those are the moving pieces as you go from 2017 to 2018. And then really the enterprise another biggest piece of that is the Long Island business that Dave talked about briefly and we had a tax item in 2017 that we don't anticipate seeing repeating. So all this consistent with the guidance that we provided earlier. No change to that guidance and just gives you a little bit of an understanding year-over-year as we walk through the next three quarters of this year's results. So more detailed look at the capital program and you've heard a little bit about each of it. This all just puts everything in one place and as Dave talked about $6 billion of transmission spend, a little bit of a change in the nature of it, but still consistent spend across the overall five-year period, formula rate treatments FERC jurisdictional at an 11.68% ROE and it's the resiliency, it's the replacing of some of that aging infrastructure lifecycle type investments as well as the replacing of the 69 KV system and we've talked about that for a number of years as well restringing the state to a higher voltage to enable the resiliency of the system that we need.

As you move up the page, we show you the distribution spend and we showed in two buckets in the green and in the blue, distribution – maintenance and distribution growth. Very simply distribution and maintenance is the spending amount that we will incur that will offset the depreciation that we'll see in the rate base. So you got rate base of X, you're going to drop down that amount from depreciation, the capital that restores that rate base back up to what you've come out of the last rate case on, we're considering maintenance distribution capital spend, holds your rate base steady, everything above that that you see is growth. So the biggest component that you see within that distribution growth is

the last year of the GSMP1 and four of – the first four of the five years for GSMP2 that will be put in place. Above that we separated out the two filings that [Technical Difficulty] 03:12:57 and will come shortly. The clean energy filing that we've heard a lot about as well as energy strong too. And then we've talked a lot about the capital program that power coming down over time, I'll show you some more details as we go forward. But you can see small slivers of power capital at the very top, that gets you to your $14 billion to $17 billion.

SI-SSA-0015-14681

The orange hatched area in the middle is the difference between the $14 billion and the $17 billion of capital, and about 90% of that being focused on the regulated side of the business, very consistent with what we've talked about in the past and with what you've heard today. So quick slide just to look back in time, and if I were to come back to this podium each of the last three years, you would have seen the three bars on the left hand side of the slide. And that would be for PSE&G's capital.

So Ralph initially and now Dave have come forth and said that we anticipate spending at the utility $10.8 billion, or $11.9 billion, $12.5 billion to $13.8 billion and this year as we talked about $12 billion to $15.5 billion, so – and a growing profile of investments, and as we have come every year we've also shown you the trajectory across the five years, which dips down a little bit in the back, and we always say that we're going to look to identify investments that will build up the back of that five-year trajectory.

This is no different from our known investments, but with energy strong too and the clean energy filing we seek to fill in the top. What this tells you is frankly that there's been some success in doing that by virtue of the blue lines getting bigger as we step through time. And I would also note that there's a notation on top of each bar, which gives you the percentage of our overall capital plan attributable to PSE&G. And you can see

we've grown from order of magnitude of 80% on up to the 90% that I just mentioned.

So incremental investment opportunities incrementally on the regulated side of the business especially as the CCGT program comes down overall I think a good story and the right story for PSEG. So if it is ENG ultimately what this means is growth in rate base, so again maybe just reiterating a little bit the question was asked about where do we start, when we think about the rate base for 2017 year-end rate base of $17 billion. Split between jurisdictions, always an important thing to remember as a single state utility we're not with one regulator, we have two, right, it is the component of a pretty sizable component.

So that $17 billion grows to about $22 billion by the time we get to 2020 and as you move out to 2022 you're at $24.5 billion to $27.5 billion depending upon size, timing and approval of those two programs as we move through.

One other thing to talk about is well, so the 8% to 10% CAGR in our rate base over these five years is a new number. And so maybe just a minor and quick history lesson if we go back in time just think about last year what do we say last year we said we had a 7% to 9% CAGR in our rate base, but we also caveated, we're spending a lot of capital that grows our rate base that increases the base and the ability to sustain that 7 to 9 maybe challenge. And I think at first blush we did think that was the case and if you just took the same numbers you just jumped up from 2016's year end to 2017's year-end we will come down to a 6% to 8% CAGR on rate base. Then tax reform happen, so the absence of those deferred taxes reducing rate base works to write about a 1% delta in our rate base CAGR, so that really brought our 7% to 9% So, that really brought our 7% to 9%, which had moved to 60 because the higher base back up to 7% to 9%. Since, then I think you put two other things, two of the building blocks on and you get up to the $10.1 billion is the $1.9 billion of GSMP, that was just approved that steps us up as we've talked about being more to the higher end, that moves us to around 8% without any of Energy Strong II or GSMP II. You layer those on as filed, and you'll get up to that 10%. So, if it doesn't commit exactly as filed, it will be somewhere between that 8% and 10%, but that also presumes that nothing else transpires, and Dave got a question before an answered about some other potential opportunities.

So, that's the basis upon which we get to our 8% to 10% rate-based growth. Then this next slide rate base basically is funded without equity. And this slide we shown in the past and this updates the slide, and somebody had asked the question earlier about capital over the five year period by bucket. And there is some disclosure within the 10-K that's really a capital commitment as opposed to an anticipated spend, so there could be some spend, that's not absolutely committed. This gives you certainly an updated view and gives an indication on the left hand side as to what powers capital spend looks like over the next five years with just a split where you can take a look at the two major pieces what the growth capital is, far and away the biggest piece being the combined cycle program, you see that rolling off. And then the baseline capital that we expect to see at Power for the next five years under $200 million a year. So the absence of that capital at Power frees up incremental cash flow. If you move to the right hand side, where you can see

Bloomberg Transcript
initial
Bloomberg
SI-SSA-0015-14682

again by bucket within PSE&G from a transmission standpoint, from an electric and gas distribution standpoint and then energy efficiency and renewables. The top area is the

hatched area that we've already talked about, we've talked about it from a rate based perspective this just gives you a snapshot of what it looks like from a capital perspective. If you add up all those hatched areas you will not get to the aggregate amount of the filings. Again as Dave mentioned 2023 and I think even if it's a 2024 for the six-year clean energy program is going to have a little bit more capital as you go out beyond that tail end. So we continue to plan really what we know within the solid areas, but we also identify our ongoing areas to improve the system and the investments that we can make. And that's what you see within the hatched area.

So the funding in the capital program, you take a quick look at the five year cash sources and uses. As you can – in some way if you're thinking about capitals retail you can power free cash flow rather you can draw a little bit from this slide if you start on the bottom side on the left hand side you see power strong cash from ops in the green area on the bottom left. Moving over to the right, you see powers' investments. So the excess of the left over the right obviously provides some free cash flow generation and that will grow as we go through the five-year components of the plan so that will increase towards the out years.

Stepping up to the blue areas we talked so much about Powers cash from operations and how strong that is. Utility also has very strong cash from ops as well. We just have a big appetite to redeploy that capital. So you can see on both sides of the page in the blue shaded areas on the left side PSE&G's cash from ops we redeploy that into the maintenance and growth investments on the right hand side with the positive mechanisms to be able to get cash back out of those investments either from the formula rate that transmission as well as from some of the favorable clause recoveries that help to be able to bring some of that cash flow back into the organization

and that ultimately are the bigger pieces of cash from ops as well as investments.

In between on the left hand side, the cash from ops from power and the utility [indiscernible] PSE&G net debt. So, the utilities regulated capture, Tami talked about a 54%, it's a little bit higher than it's been in the past but somewhere within that range, you're going to see an equity component coming into the business from Power's cash flow, getting matched up with debt issues or PSE&G [audio gap] (03:21:08) the issuances what's shown in that orange section on the left hand side.

I think of note, parent net debt on the left, power net debt on the [indiscernible] 03:21:17 activity. So basically holds from that perspective. All going is on the upper right hand side the shareholder dividend. So, I think this gives a picture as to the cash flows coming and going for the next five years.

All that flows into the credit stats, that's page, page 84 indication as to what they look and what it means from the standpoint of incremental capacity. Left hand side of the page we've shown this in the past as well as it steps through time we evaluated the numbers obviously. On the power side from an FFO to debt perspective, we're currently in the low 40%, as you look at 2018, 2019, 2020 with a minimum threshold of 30% that provides some excess capacity.

We take the same look at enterprise. Based upon mix of the two business that enterprises and as we have more regulated investments, have more regulated profitability that part of the business ends up growing and improves the overall growth of the business. Now we think about call it high teens maybe 18%, 19% FFO to debt. So we have the statistics also that we have some excess debt that's reflected on the right hand side, a little less than a billion dollars to the extent that's deployed in the utility if you hearken back to that orange [audio gap] sources and uses it will be matched up with utility debt to be able to fund incremental investments.

This snapshot is basically we talked about 14% to 17% capital program on about $15 billion or so capital spend. So if you think about this excess capacity being deployed matched up with that, we do anticipate being able to get to the high end of our $17 billion program without any external equity.

So a quick walk through as well those numbers did not reflect any cash flow coming into the business for zero emissions credits. So it's obviously to the extent that they [indiscernible] those would increase the number, you can see on the bottom left-hand side a dark blue box, annual revenues estimated at about $200 million or $0.28 per share, three

initial

Bloomberg
SI-SSA-0015-14683

New Jersey units were chosen. So Tammy showed a slide early, which correctly said that this x could be about $300 million, recall that the three New Jersey units include two units at Salem, which we call in with Exelon. So the Exelon component roughly $100 million our component of Salem as well as all of Hope Creek, which we own a 100% of, which is why Ralph – when Ralph referenced the Hope Creek outage cost being higher because we have a bigger ownership we paid for freight that would get you to the $300 million number.

So that's the difference between the $200 million and $300 million and some of the numbers published back and forth. So those numbers [audio gap] $200 million or $300 million in total for ZEC. But the process that got kicked off when the Governor signed the bill on May 23 is laid out here in some detail. We talked $330 million. So signed in May this would bring us to April here. Tammy mentioned the unit – that the all units that have come forth seeking yet ZEC's would be rank order and [audio gap] But before that there's a 180-day process, whereby the DPU is – going to process is going to work. They have not had a ZEC process in place in the past. So they've got timeframe to basically determine how these will be put forth [audio gap] 03:24:29 how the overall process will work, there will be hearings that will go on with that. So that whole proceeding 180 days at which point

applications will come in and the ultimate determination made within 330 days. In parallel, the utility will ask the – the BPU will ask the utilities to come forth with tariff updates. Because I think an important part of this as well is that utilities are not going to be underlies as they are the purchaser of the ZECs. So they will be putting in place, tariff increases over time to get ahead of that payment for the ZECs. We'll aggregate the cash within 150 days, they'll go to the BPU, they will provide an update of their tariff within 210 days both of those of [indiscernible], the BPU will approve that tariff update and cash will start to be collected when the ZEC payment is made the cash tariff [indiscernible]

And that cash payment will be made 90 days after the close of the energy, this is not a calendar year program, this is an energy year program. In New Jersey, the energy runs from June 1 to May 31, so our first ZEC period in New Jersey will be from April to the end of May of 2019 a stub period and then 90 days after a cash payment will be made to the nuclear generators and then each year after that the same will happen but it won't – it'll be the full 12 months ending May 31 with a cash payment that fall in 90 days thereof.

So that's the mechan that will be put in-place Tammy also mentioned that it's a 4% per kilowatt hour charge, that's all retail sales. When you take that full bucket at a 100% of retail sales and then those payments just go to the nuclear component of the energy mix in New Jersey that $0.04 or $4 a megawatt hour to $10, and that's what each megawatt hour will see as generated by a chosen nuclear unit. So a very quick look at tax reform. This basically a good news story for customers and I think for us as well Customers have already seen reductions in their bills and they've seen it in two different ways. So right away we had a $148 million reduction on the transmission side of the business that we filed and then we filed in March, in April enactment or execution, I guess, I should say of a $114 million on the distribution side. So $262 million went back to customers. We talked about the customer ability for us, so that's helpful from that perspective. And as we step through time, we'll continue to see some excess deferred taxes going back to customers. So more to follow and then first a $0.16 per share benefit that we saw just 2018 alone and that will continue on as non-utility components of enterprise get to retain that benefit.

So at E&G lower bills, that rate base change that I talked about before about 1% differential. And as time goes on and those deferred tax get passed back, less deferred taxes, more rate base, more rate based earnings to the tune of about $20 million to $30 million a year for PSE&G. And then we have protected excess deferred taxes and unprotected excess deferred taxes, the protected excess deferred taxes will flow back based upon a mechanism that exists. It is what it is and they will go back over a fairly long period of time but the unprotected really will be determined how quickly they will go back within the upcoming rate case. So more to follow as we finish up that rate case. A power benefit of the lower taxes, we do retain full expensing of capital.

Now, mind you, we don't have as much capital at power, so I just went through the magnitudes from a cash flow basis. The loss of the bonus depreciation at PSE&G is more than the gains that we would get on the power side of the business. The one other element of some of the tax reform is some companies may well be limited on how much they can deduct their interest expense

Bloomberg
SI-SSA-0015-14684
initial
Bloomberg Transcript

based upon our balance sheet perspective, we do not have that anticipation. So we will not be limited from the standpoint of our interest deductibility for tax purposes.

So that's a quick run through on tax reform. O&M, Dave showed you the utility O&M, Ralph showed you the Power's O&M, this really just puts everything together and a host of examples of the things that we have been doing on the right hand side to be able to get to this place. So whether it's working with our vendors cost down or the organizational changes whether it's a reduction in our overall pension expense, which has come down quite a bit and whether it's frankly retiring some uneconomic units that O&M burden from some of the units that Ralph showed you on that one – with all the units that we retire the year, in addition to benefiting us on a bottom line basis also pull out some higher O&M units like Hudson and Mercer

And also we are – we have best practice teams throughout the organization, who as we usually do are looking for ways to very, very disciplined to provide a very, very disciplined approach to our O&M management. It's not a programmatic thing it is something that we really do on an ongoing basis, even utilization of this fine facility for this event actually does not cost us anything, it's being a member of the NYSE, so just one little example we think the NYSE for that.

So overall, if you take a look at what the earnings have look like, this goes back from 2012 after 2018 maybe just one thing to talk about on this slide, in addition to the growth that you do see here and Ralph gave you the guidance by PSE&G and power. What I would say is if you look back over these six years, the guidance that we provided at the beginning of the year for one of these years we were at the midpoint of that guidance. For three of the years, we're at the upper end of that guidance and for two of those years we exceeded that guidance. So I think an example of the commitments made and then ultimately delivered on

is as important as the growth that we do show within the overall earnings of enterprise.

By no means of last, by no means least, but lastly the dividend. You can see here the trajectory that we have, again a very consistent story with what we said in the past, consistent and sustainable increases in the dividend is our objective. Last year's 4.7% increase from a $1.72 to $1.80 Indicative number is an indication of that. Ralph showed before the ability that to be covered by PSE&G's earnings but by no means funded entirely from E&G given the cash flow the overall business.

So an extremely important aspect of our business to our shareholders which we completely understand and have that commitment to the dividend, I would say no less than we do to our employees, to our customers, and to the environment.

And with the value proposition is frankly the same as Ralph showed in the beginning. So, maybe myself and Ralph would be happy to take some Q&A.

Q&A

<A>: Dan has a lovely hair, so he'll be able to stand off, I do not.

<Q>: Good morning. Question on the financial headroom slide, Dan you've obviously showing 65% regulated mix in 2018, but all the investments going into the utility. What was the level at which your earnings mix might sort of changed the threshold and create some more headroom and then how should we think about the addition of the Zack which would obviously add to power within that, but kind of not the typical power revenue.

<A>: Yeah. And I think you're exactly right, so the business makes sense that 90% of the capital that we're deploying is going to the utility side of the business, is going to increase the overall favorability of the business mix from a rating agency perspective and from a debt capacity standpoint. So it will increment over time, I would say no differently than we thought about it in the past. And so as more of that happens it will be more favorable. It is actually an interesting parallel between your second question and the first question.

So how will ZECs impact, will they would help, right. It's obviously going to be some more free cash flow, but it's an interesting question that's free cash flow is known free cash flow to the extent we operate. It's going to be there and

Bloomberg
SI-SSA-0015-14685
initial
Bloomberg Transcript

Tammy talked about some of the timeframes earlier. So that's clearly a positive. I think it's not subject to volatility other than being able to operate and run those megawatt hours to the extent that we ultimately are selected.

But if you think about the business mix and the results between the two companies, it would lift up the power contribution, but it would do so with a steady known dream. So ultimately the rating agencies will take a look at that and make a determination of it, but I think it will be a positive and I think that it will be looked at as a more positive component of powers overall for cash flow.

<Q>: As you look at the plan where do you see that percentage getting to over the sort of 2022 timeframe and do you think that's going to be enough to take you through the trigger on changing the 2018 to 2019 for example?

<A>: We haven't provided a number on percentage of earnings, that's kind of back into the guidance by companies as you go out through time, but I think it will help and it will either change the mix or it will strengthen the ability to meet the mix.

<Q>: Ralph, you're going to get it, you got the question earlier which you tabled and you're going to get that anyway. And no matter what you say three different people are going to interpret it differently, but I have to ask.

[indiscernible]

<Q>: What are your short, medium and long term strategic ideas about the company? You know every year someone walks out of here thinking, oh! he's definitely going to spin off PEG Power and someone says no he didn't say that, give you an opportunity to be clear and concise in the way you're thinking about the strategic vision for the company as opposed to together or separate. And then, secondarily there's been a tremendous amount of consolidation in the industry and is that on the table, off the table you've clearly got a tremendous amount of organic growth keeping you busy?

<A>: Right. Yes, so let me break that into two pieces. Let me go specifically to the power question. Kerry did leave or she [indiscernible] – she did leave?

<A>: Yeah.

<A>: That's all what I said.

[indiscernible]

<A>: So I'll teach him. So I think we've got a bunch of good news at Power right, the ZEC program gives some comfort that the attributes of nuclear are so important that policymakers will figure out a way to keep those plants running certainly for the rest of the license life. We've had some improvements in the fleet in terms of this and we've got great shale gas – fairly strong position. We have the end of the capital program that generates some nice free cash flow opportunities for us. So in many respects I feel like we have much more flexibility in terms of what we can do with Power. Whereas in the past, I'll be honest with you, I've said, I felt we were in a – in kind of this inexhaustible march down a certain path. That said I don't know when, but eventually these things are going to have to split, but now I feel like wow we've got a really healthy fleet, healthy from a point of view of its competitive position, its financial position, its environmental position and we don't – it's not a burden. I mean the plants are running great feeds I know we've got those things running at 94% capacity factor. Ralph done a great job of heading over there and managing the capital construction program to get these plants online.

So I think we have a lot of more flexibility than we had just two weeks ago and certainly a lot more flexibility than we had a year ago.

So as I look at the company overall, there are some near-term, mid-term and long-term priorities. The near-term priorities are very clear, right. We got to get the two plants up and running that we're building and we've got to get the regulatory process well in hand in terms of the nuclear ZEC payment, in terms of the rate case, in terms of Energy Strong, in terms of the Clean Energy filing. In addition to that, I think longer term, I want to strongly position us to have the same potential rate base growth on the customer side of the meter as we've had on our side of the meter. I

initial
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14686

think there's a lot of work that can be done and digitalizing the utility in terms of managing distributed resources in terms of helping the customer control their bill.

And I think that the combination of our traditional investments, the 90-year old switching stations, the 70-year old switching stations and the opportunities on the other side of the customer bill. We have no AOI at PSEG, no – we have drive-by metering, the most sophisticated metering we have. We have no data analytics in terms of our customer usage pattern. We're great at restoring them when they call us up and tell us they're out but we don't know that before they do. So I do think that longer term you're going to see a lot more of this utility at the future stuff dominating the picture and what we will continue to pay attention to Greg is whether or not our investors are comfortable with these two entities being together.

And right now the signals are they are, that our investors are comfortable with and being together. If we see portfolio discount, if we see some valuation discount then that will be motivational to rethink the integrated entity.

The premium, the question was what about M&A. I love the organic growth story, we pay a $1 for $1 rate base, we don't pay $2 for a $1 rate base

pay a $1 for a $1 rate base, we don't pay $2 for a $1 rate base. The premiums that the other people are willing to pay, we just can't [ph] pencil them in people want to pay us that premium, Ralph that is www.pseg.com. But other than that just it's got to be value creating for the investor.

<Q>: I want to get the sense of the variability in the growth of the rate base going forward. I realize you have a track record of coming in here and upping up the capital budget every year, but it's rather remarkable that you've been able to grow the rate base when your customer base is growing 0.8% per year. Now you've got the energy efficiency headwind where you're in try to reduce that. I realize that transmission is kind of a different dynamic and that gets you out from maybe a little bit of the traditional customer base that you have within the utility, but it also seems to me that commodity prices have played a role here and another remarkable thing that you've been able to accomplish this while customer bills have been going down. But what would cause the growth rate and the rate base to change on the negative side and how fast would that happen?

<A>: Yeah. Excellent question. So I think the specific answer to your question is if you had a spike in commodity prices. If I'm not wishing this, but haven't forbid seismic activity increases in western Pennsylvania and Ohio and people say we need to figure this out and guess this blowout. And I mean so if you have a tremendous pressure on the supply component of the bill and that puts a tremendous amount of pressure on our GE part of our PSE&G then you have to have a pause in the infrastructure development. But one of the things we haven't talked about yeah we've had tremendous amount of benefits that we have made use of that we didn't control lower gas prices, lower taxes

expiration of charges on the bill. All that stuff we didn't influence, we just said, now is the time to replace this old stuff, but the one thing that we don't talk enough about, I think it is important for folks to recognize is, we had three Nor'easters in New Jersey in March. It wasn't particularly strange. It was not normal, but it wasn't something that you'd have to look 100 years to see what happened.

The BP launched an investigation on customer restoration times. The tolerance for outages is gone. We happen to be a great performer, so we're not in the crosshairs or in the bull's eye of that. But as you continue to see further electrification of transportation, of the household, of the workplace, the demand and the value that people put in electricity are just going to continue to climb, and you can't do that with 90-year-old switching stations with wires on wooden poles that are leaning more than, moves away from the mic, but you get the idea, we're leaning a lot. So I think that as long as people recognize the value of service they're getting, the appetite for will be enormous. You know a sidebar conversation before somebody correctly pointed out, Ralph your customers are not going to remember that in 2008 they were paying the same in real terms they're paying in 2028.

<A - Ralph Izzo>: Of course that's true. They won't remember that. But if they see the kind of statistics that Dave Daly put up there in terms of saifi, caidi, saidi and the kind of statistics that Ralph LaRossa put up there in terms of carbon per megawatt hour, and the overall traditional pollutant statistics, I think will have policy support. So if we if we continue to do this on a gradual basis, another benefit of cost recovery. You don't wait five years to then say, oh! The

3% compounded over each of five years, we need an 18% rate increase, but you feather it in, all that works

rate increase but you feather it in all that works towards managing the customer bill rationally and it is the customer that matters. Do they see the value are we managing our O&M, are we investing in assets that matter to them and then I think we've got a nice long runway.

<Q>: So my question was first on capital allocation. Clearly, you have headroom coming in terms of the 2018/2022 timeframe and capital that you have excess and you ZECs incrementally that will come in. Is the signal right now that the key trust in terms of allocation of all that excess capital is primarily to the regulated side or are there deleveraging or any other goals or renewables anything else that we should be looking at in the horizon as things that you're focused on?

<A>: Yeah. That hasn't changed either, as you know, we have said in many times number one is organic growth investments. The utility has been averaging 80%, 82% of the capital program now it's gone to 90%. I think that that's going to be probably the new normal for us and we do have lots of ambitious things that we want to do in support of Governor Murphy's Clean Energy agenda, we're 110% behind them on that and we want to help do that as economically as possible because doing it at scale is more economic than doing it in 1Zs and 2Zs. Then what we've always said is that we like the strength of the utility growth to even further cover the dividend right. So the dividend has to be tied to earnings growth over time but having a healthy balance sheet helps you on those years when things go flat and we boast about a nice 4-plus-percent growth in earnings but we had a couple of years where it was zero. Lastly, it would be a share repurchase but we seem to keep finding opportunities to grow the company organically.

<Q>: Okay. Got you. Thanks. And then the second part or second question. The deferred tax liabilities you mentioned that almost giving your 1% boost in rate base. I'm assuming that is the

unprotected, because the protected is so slow it's probably not going to have a benefit. But you also mentioned that the unprotected piece is going to be an outcome from the rate case procedure itself. So what's the assumption that's basically built in right now that's driving the 1% increase in unprotected?

<A>: Yeah. And it's really if you think about it, it's a couple of different things. You have your access that are going to go back. But even as you're taking your tax deduction year-over-year over the next five years deferred tax build up from that is going to be a 21%, not 35%, right. So there is a piece that comes into play there. So if you look at the absence of bonus, if you take a look at what I have just described to you and if you take a look at what gets flowed back, which I think is maybe two things to think about there.

One is that there is some excess defers and unprotected they're going to go back and it's going to be determined within the rate case. There is also in between rate cases, there was a change in one particular deduction we take around repairs. And that gave us a much faster write-off, which built up some defers which some of which turned out to be excess, because every deferred tax became somewhat access when the rate went from 35% to 21%. But also some of that is there to be flowed back as well and it's not protected. So those two components plus the bonus plus the 21% gets you about that $1 billion delta in rate base over the next five years. And so we'll work our way through in the rate case and we'll see how much of that will go back and how fast. So it's still to be determined, but if you take all those things in the bucket you think of them over five years being about a $1 billion you've got it about right.

<Q>: And just maybe the cash taxes can you just remind us where your [indiscernible] position is now with the deferred taxes kind of impact build in?

<A>: Cash tax is not currently but in the near-term and the other thing I would say is if you think about ZECs that could accelerate the near-term. So maybe year or two years is just kind of a ballpark.

Any other questions? No? If not I think we're...

<A>: Okay. We're seeing none. I think we have one more slide Dan, do we not that we want to just deal with these folks?

<A>: So..

<A>: Oops! That's not yet.

Unverified Participant

Oops! Yeah. Yeah, so – we talk all the time about operational excellence, financial strategy, right, disciplined investment and all that. And with – everything, everybody does in the business, that's all nice. It's works pretty well. But there's another secret sauce in enterprise we've had for the last 11 years or 12 years, and [indiscernible] Kathleen Lally. So during the Lally era, you can make your own determination to hedge of the upward slope of this line had to do with everything we talk today and how much had to do with Kathleen. But I would put a lot of it on Kathleen, personally. So everything she has done for the organization for us, for the industry [indiscernible] is so vital. So from bottom of my heart, I'd like to thank Kathleen for things and wish her all the best going forward.

Unverified Participant

Thanks Kathleen. I'd say all the best.

Unverified Participant

As a matter of fact, we did some analysis and evidently ever [ph] did predictions. Thank you so much, Kathleen. Thank you all for being here. So there is no final way to end them and we need to recognize you for all of the work. Thanks all.

MANAGEMENT DISCUSSION SECTION

Ralph Izzo

So I'm Ralph Izzo – Brandenburg gets away with all the time -- so I'm Ralph Izzo, President and CEO of PSEG. I'm joined today by Dan Cregg, our CFO; Kathleen Lally and Carlotta Chan – who is here somewhere, she's gone to get some handouts I think – of our Investor Relations department.

In front of presentation material are both our forward-looking Safe Harbor statements, as well as our GAAP disclaimer. We'll obviously be talking about some projections looking out into the future, which we believe to be correct, but can't guarantee, and we will describe some of our financial statements in terms of parameters that we think are more indicative of ongoing operations, but do not comport with GAAP.

And for those of you who are less familiar with PSEG, we have two principal operating subsidiaries, a regulated electric and gas distribution and transmission business in New Jersey – I'll give you little more details in a moment – as well as a PJM-centric merchant power generation business.

The primary characteristics of the two companies are; for PSE&G, a substantial aging infrastructure replacement program that allows us to grow the rate base in the past at low double digits, in the future at high single digits, just given the size of the overall rate base increase; and for PSEG Power, a fuel diverse fleet that is well-positioned in many dimensions, is well-positioned from an environmental point of view, well-positioned from a geographic point of view, and well-positioned from a technology and efficiency point of view.

Now for a little more detail on the utility. We run north-south corridor of Central New Jersey. That is the primary industrial corridor of the state. Having said that, as you can see, the load both through electric and gas businesses are characterized by the commercial and residential sector; the electric side having the commercial sector dominate, on the gas side having the residential sector dominate. Little more than 2 million customers on the electric business and a little less than 2 million customers in the gas business. De minimis load growth, the growth of the business is completely decoupled from the growth in number of customers or the growth in sales. At the risk of repetition, it is driven by an aging infrastructure that is in desperate need of replacement. Even though it's a single state utility, it's important to recognize that it is by jurisdictional, nearly half of the rate base is FERC regulated through a formulaic transmission approach.

As we step into power, you could see here pictorially that the vast majority of the assets are located in Eastern PJM. We have a piece of some base load coal plants in Western PJM, as well as a new construction going on in Maryland, which qualifies, believe it or not, as Western PJM. Some isolated assets in Southwestern Connecticut as part of New England ISO and just outside of Albany, New York as part of the New York ISO.

Lots of activity on the regulatory and policy front that merits your attention. First of all, we will be going in for a base rate case proceeding in New Jersey. The filing deadline is December 1 of this year. That will be our first base rate proceeding in seven years. Our last base rate case was 2010. In the intervening years, however, we've had a substantial amount of construction in our transmission business, which as I said is subject to FERC formula rates on an annual true-up basis.

Bloomberg Transcript

And we've had a significant amount of investment in our distribution business subject to trackers and various clause mechanisms, which you see highlighted here in the middle of the page and something that we will continue to do going forward. We have proposed and filed with the Board of Public Utilities an expansion of a gas pipe replacement program. We are in possession of the largest cast iron gas pipe maintenance system in the United States. It is at a low utilization pressure, so it's not a safety issue. However, cast iron and bare steel pipe does tend to be more vulnerable to cracks and fissures, which then incur – which results in a release of methane, which is a 30x to 35x contributor to greenhouse gas effect, as well as a problem from a point of view of O&M and nuisance odors that need attention.

The current spending level in our gas program is about $300 million to $400 million per year, which would take us about 30 years to replace all the cast iron main that is in our system. So we've proposed to the Board of Public Utilities that we accelerate that program to a 20-year timeframe by investing a little over $500 million a year over the next five years.

We recently were granted approval by the BPU to continue some incremental expansion of some energy efficiency work we've undertaken in the state targeted at lower income and public good. Public good we typically define as hospitals, schools, government buildings. And we will also expand some efforts that we began about three years ago to reinforce and harden our electrical system and distribution system to make it a bit more resilient in the wake of some significant storm events that we experienced five and six years ago in the form of Superstorm Sandy, Hurricane Irene, and something that we call the Halloween snowstorm that occurred between Hurricane Irene and Superstorm Sandy.

At the time we had proposed a $3.9 billion program to take the affected assets and physically elevate them or protect them from water infiltration. We proposed that for a 10-year period, but then actually filed only for $2.6 billion program for a five-year period and were granted $1.2 billion for three years, so we're just going back to finish up that program. We'll drop a few items that we thought were necessary when we originally filed and add a few items that we've learned since then would be money better spent.

On an ongoing basis, given the fact that we have had repeated success working with the Board of Public Utility staff on these various trackers and clauses, and I think to the tune of 14 over the past seven or eight years, we've both sort of fatigued each other and the board staff has recognized that perhaps it would be much better to come up with a template that would be used regardless of whether it's a gas or an electric infrastructure enhancement program to institutionalize the recovery mechanism, as well as the duration of the programs and the method by which the allowed ROEs would be determined.

That rule was proposed this past summer. We modeled our Gas System Modernization Program and the expansion of prior efforts on that proposed rule. We expect it to be made final – it being the proposed rule – to be made final in December and we will follow quickly on the heels of that with our Energy Strong too modeled after the final rule, which we don't expect to be materially different than the proposed rule.

Outside of the utility, there's a lot going on in regulatory and policy space as it pertains to the imperfections in the market, imperfections in the market that are resulting in uplift payments, out of market payments to preserve the reliability of the system. PJM, in particular, has had to dispatch the system, first and foremost, with an eye towards reliability, but that does result in some occasional payments that are referred to as uplift payments that are out of market – others have called this price formation and price transparency – that we hope to see put into effect in the near-term, certainly within calendar year 2018, that are fuel indifferent, that will make the market more efficient, and a more accurate reflection of the way in which the system is operated and will benefit all generators, ourselves, who have a blend of fuels, as well as any other participant in the PJM market.

Separate, and apart from that, specific to nuclear and base load power, we are engaged in conversations both with DOE and New Jersey to recognize the market imperfections that fail to compensate for various externalities. The externalities in particular that are the subject of conversation nowadays are the externalities associated with long-term fuel diversity, that the current market design [ph] will not (08:17) point towards in terms of ongoing new investment in assets and premature retirement of existing assets.

So going back to the utility, a slide that we often show people once a year, slide that we show once a year and have done so for many years in the past is what we expect our capital program to be in the next five years. And the capital program always looks like it's going to decline and it tends to lead folks to ask the question, well, when will it end. And despite our best efforts to try to remind people that, the only limiting function on the replacement of an aging infrastructure base is what the customer can afford to pay, and the aging infrastructures constantly need a replacement.

So what we show in these five bars that anticipate what our spend will be going out to the future and we try to point out that the reason why the front year is higher, is because that's where we have the greatest visibility toward, right, so the out years we just know less about, and therefore it tends to drop off.

The line you see is what we thought the five bars look like in the prior year, and this is a slide that we've been able show for 10 years now, but the years on the bottom just change, right, so the pattern is always the same. We learn more as the year – as the calendar rolls forward. And as a result, based on what we know, we had predicted in March that we would have about a 7% percent CAGR growth in our rate base. And then we indicated at that time that there were things that we were working on that could take those blue and orange bars and add some additional necessary investments in the form of this great crosshatch. That had to do with a continuation of the gas program, as I've pointed out before, the current run rate would take 30 years to replace the gas and the incomplete efforts that related to Energy Strong, and in fact move that from a 7% growth rate to a 9% growth rate.

Well, in the ensuing eight months from March to today, we have, as I've mentioned, both filed a Gas System Modernization Program and intend to file an electric system enhancement. That give us a greater degree of confidence when coupled to the Board of Public Utility proposed rule for clause recovery mechanisms that will be much closer to the 9% than the rule to the 7% and fill in these crosshatch regions going forward.

So as I think back five years and I think to the current look ahead of five years, the lion's share of our efforts have been in core infrastructure, enhancing the transmission system for reliability, strengthening the electric distribution system from the point of view of storm hardening, strengthening the gas system from the point of view of old technology that – it was in need of replacement.

What that's left available to us, which we have not really spent much time on and are not in the current five year plan, are significant investments in what you often hear described as utility of the future. What is that more specifically? Advanced metering infrastructure, electric vehicle charging station support, micro-grids, battery storage and things that like, right? Important stuff. I'm not denigrating it in any way, shape, or form, but not an area of emphasis for us, and one that we will begin to engage in at some minimal level in the coming few years to begin to prepare ourselves to when we have the bulk of the aging infrastructure work behind us to position the asset base and the infrastructure more for that utility of the future.

Taken in sum, what that means is that the capital program has a robust future going out for many, many years to come, with again a limiting function being making sure that we don't unduly burden the customer. We are the beneficiary of having a PSE&G, and E&G, of course, stands for electric and gas. And the reduction in gas prices over the past 10 years are such that our total bill for a customer is 28% below where it was 10 years ago.

And, in fact, even with this 9% growth rate in the rate base for the next five years and some high-single-digit estimate of that continuation, we could find ourselves in a position where over a 20-year period, customers rates would be flat in nominal terms, having of course gone down, and then back up. So in a low interest rate environment, with a declining total bill, this is a critical time and opportunity to seize for necessary infrastructure improvements and we've had a great partnership with our regulators in doing so.

Moving from the utility over to PSEG Power. We are in the middle of a construction program, whereby we will be completing 1,800 megawatts of highly efficient natural gas combined cycles, one in Connecticut, one in New Jersey, one in Maryland. The Maryland and New Jersey facilities are due to come online this June, as in June of 2018. The Connecticut facility in June of 2019. All projects are on schedule, on budget.

And what it will do is substantially shift the makeup of the fleet. Coupled to some retirements you'll see on the left side, that the overall number of megawatts we will have in play and during this transition won't change much. But as you

final
Bloomberg Transcript

look to the right side, you will see a significant increase in the amount of energy that we put out, because the three units that we're building will be fairly low on the dispatch curve. And therefore, we do believe will be dispatched quite frequently, thereby increasing our expected energy output by well over 10%. And you'll see, as a result of them being primarily – exclusively natural gas, that they will eat into some of that nuclear output. That's not to say that the nuclear plants will run less often. It just means that as the denominator grows, most of that growth in the denominator will come from growth in the gas component of the numerator, and therefore increase the overall gas component of our output.

We have great access to Marcellus shale gas, and therefore enjoy some regional spark spreads that are more robust than one might calculate if one were to look at the Henry Hub price for natural gas. So highly a clean fleet and a well-positioned fleet, and one that we expect to be a significant contributor to the energy market and a significant recipient of energy margins.

Now that expansion program for power, that capital program for power – I shouldn't describe it as an expansion, because as I just said a moment ago, we have been retiring units that are not high in the dispatch queue and not meaningful contributors to the bottom line. That capital program will come to an end in 2019 and we will be more in a maintenance capital mode, which is a run rate of closer to $200 million a year. And what that will mean is that power will resume the position it had prior to this initiation of this capital program, which has been going on for a couple of years now, as a significant generator of cash for the utility's insatiable appetite for cash.

So power shown here on the left in terms of its capital program, you could see that coming down by $1 billion per year. And on the right – we're just repeating the slide I showed a moment ago, which is the utility's capital program going forward. So internally generated cash will be a significant part of the equity requirements of the utility.

As I take a look now at how well we've managed our O&M expense, we try to separate each of the major functions of the company here. And you could see that at the distribution level and at the power level, we've done, I think, a good job of maintaining fairly flat O&M expense. The large number at the transmission level is driven by the fact that inevitably when you have a massive capital program – and if you recall the slides I showed you just a moment ago, transmission was the single biggest component of the utility capital program. But whenever you have that kind of a large capital program in transmission, there is a lot of associated O&M work that goes along with that. It's always – reliability is always foremost in our thinking. We need to make sure that the system configuration is such that it can tolerate various perturbations, requires active field work on the part of our transmission team to make sure that we're switching lines in and out to support that capital work.

We pay careful attention to that transmission O&M, but the good news from a shareholder perspective is it is fully incorporated into our annual formula rate and all other parts of components of O&M we do an aggressive job of keeping a lid on them, both in terms of meeting the needs of our customers and our shareholders.

If I take a look at the strength of the balance sheet and our credit metrics, they remain strong. So you have an ambitious utility infrastructure replacement program and you have a fair amount of internal cash generation. The balance of the equity needs of the utility are achieved through the debt capacity of the parent and the power business. In addition to the 9% growth rate in the rate base that we have a high degree of confidence in, we have an additional incremental debt capacity that's shown here of about $3.5 billion to $4 billion, closer to the $3.5 billion than to the $4 billion, both at power and at the parent. That debt capacity becomes the equity that the utility needs – the utility has some separate debt capacity and it's roughly regulated at 50/50 debt/equity split. So therefore the standalone utility capability for additional financing would be double this amount.

Now, it's important that we point out something here that is common to the industry about – and we've talked about it for a few years, but we want to make it really explicit. We always give a three-year look ahead, and the three-year look ahead is 2017, 2018, and 2019. Now, what's significant about those three years, that is different from 2020 is that all other things being equal, so no comment on the possibility of tax reform and the various provisions that may or may not survive the current versions that have been put forth, is the expiration of bonus depreciation. And currently that bonus depreciation has been generating about $300 million a year in FFO for us.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14693

If you just take at the parent level an 18% or a high-teens ratio of FFO to debt that that could support, that would result in a diminution of about $1.5 billion to $2 billion of debt capacity after 2019. So, just given that our stub year happens to coincide with the end of that bonus depreciation, we didn't think it was fair to leave you with the absence of information about what happens in 2020, which is probably a cut in half of the excess debt capacity available to the company, right? So we are still in an excess capacity situation, but it will be one that goes from 3.5-plus billion to something less than $2 billion with the expiration of bonus depreciation, all else being equal, assuming no change in the tax bill or current situation.

So still a strong balance sheet, still 2 times that amount available for utility investment, above and beyond the 9% growth rate in the rate base. And during the Q&A, since I just exhausted my knowledge of what all that means, Dan will be [ph] happy to answer (19:31). Did I do that okay, Dan?

Daniel J. Cregg

Perfect.

Ralph Izzo

Okay. But did he look like he was in pain while I was speaking?

[indiscernible] (19:38)

<<[0052TC-E Ralph Izzo]??

Thank you. I've been CEO long enough [ph] where (19:41) I can admit these things.

We are reaffirming our guidance for the year, right, somewhere between $2.80 and $3 a share. Here we just show you a little bit of our recent history. You see a combination of factors; one, some modest growth in the parent company earnings, flattening over the past two years as a result of declines in power prices. But equally important, you could see that even as the parent company earnings grew, the disproportionate growth in the utility earnings becoming an increasingly significant part of the overall mix of earnings that we put forth. And this year, just taking the midpoint of the guidance for both companies, the utility will be fully two-thirds of the overall earnings of PSEG.

That has a couple of ramifications, obviously, in terms of the predictability and stability of those earnings and the potential for future growth driven by this 9% CAGR. Here what we show you in the green line is the utility earnings growth, and in the blue bar the growth in the dividend, which isn't growing in recent years at about 5% a year. And you can see that, given the visibility to the utility rate base growth, we had confidence in growing the dividend, and now, in fact, the utility growth continues to outstrip the growth rate of the dividend and more than covers the dividend for us, which leads us to a dividend policy which is illustrative of the fact that there are multiple factors that we consider when thinking about the dividend, where are our earnings coming from, what are the cash needs of the business, where are we in the power cycle, what are our competitors doing. But it allows us to basically signal to you that we do think we have the opportunity for consistency and sustainability of this ongoing dividend growth that you've seen in the past few years.

So in sum, we have a stable platform. There's plenty of opportunities for investment and growth in the business. Most of that – about 80% of it is targeted at the utility. As the capital growth program in power comes down, that number will be even bigger than 80% in terms of the utility, where power begins to go into a maintenance capital mode. I think we've had a great partnership with our regulators in New Jersey. We do things that matter to them and they are a good proxy for things that matter to our customers. We're doing well. At our last quarterly call we talked about the fact that a $3.4 billion capital program in the utility this year has become a $3.1 billion capital program, largely because some of the work we plan to do, we've done better than we even thought we could do it. That doesn't mean that $300 million of work evaporated. It just means $300 million of work will be shifted into other things that need to be done.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14694

Power has a great fleet. It has the largest, I believe, combined cycle fleet in PJM. Its aggregate heat rate will be close to 7,000 Btus per kWh. It's a highly efficient fleet, a very strong nuclear program that we think is going to get some recognition for some attributes that the market does not recognize today, and therefore we'll sustain that fleet into the future. We have, I think, one of three companies that can boast about 110-year record of paying the dividend each year for over a century. That balance sheet carries us into the future with the current program without the need for additional equity and the opportunity for further expansion.

So I think I'll stop there. I've tried to leave about 15 minutes for questions and, hopefully, answers, and we're ready for you. Yeah.

Q&A

<Q>: I came in late, so I apologize [indiscernible] (23:09). But could you just help me with [indiscernible] (23:12)?

<A - Ralph Izzo>: Yeah, sure. So we've been talking to people about kind of a range of four possible outcomes as it pertains to the DOE NOPR, and the FERC reaction to it. At the book-end, one is that FERC simply says, oh boy, you're right, we will take that. And the other book-end is FERC says, you're imagining things, there is no problem here. We think both are unlikely. And, in fact, probably zero chance.

Now, that's significant, because while most people are predicting the former, that FERC won't take the NOPR as is. I think in large measure, even though FERC has not said that there's no problem, they've been acting as if it's not a big deal, right? I mean, the [indiscernible] (23:57) rule, price formation, those have been going on for years now, depending upon how you define the start three or four years. And even though FERC was being deliberate, I do think that DOE's action has created a sense of urgency that something needs to be done. So more than likely, our belief, with no more information than you possess, is that one of two things will happen, and I'll take them in order of increasing likelihood.

We proposed that FERC take what DOE has proposed and implement it on an interim basis. And we point to the fact that fully – close to a third of the assets in PJM right now are on cost of service regulation, and they do not create havoc in the marketplace at all. That putting at risk premature [indiscernible] (24:47) in cost of service regulation would also not put the market at risk. And then FERC should enter into a parallel process, take hold the process to design mechanisms, whereby fuel diversity is explicitly recognized as an externality that has a value. And we've also put forward proposals to how to do that. It could be either an energy price, scarcity payment for fuels that are not dominating the supply stack, or it could be traunching of the capacity market to explicitly require different clearing prices in [ph] capacity (25:19) markets for fuel diversity.

So interim cost of service regulations [ph] take hold of (25:24) process for market mechanisms that recognize fuel diversity. Another possibility is simply to recognize that PJM has said, hey, there are some things that we do right now that are inconsistent with price being the determinant of what runs, namely these uplift payments for inflexible units that I mentioned a moment ago. And FERC can declare victory by simply saying, yeah, we know about that, we've been working on that for a few years. So, therefore, every RTO tell us what you've done to improve price formation, and what else you need to do, and therefore call the RTOs in. That can allow RTOs to say we don't have an issue, and it can allow PJM to confirm that they do have an issue. Get that fixed. Various folks have modeled that and have come up with their estimates of what that would mean in terms of around the clock energy prices. And then in parallel to correcting for those out of market uplift payments, initiate a stakeholder process to explicitly recognize fuel diversity, because price formation is independent of fuel. And so either of those two scenarios, we think, are possibilities and we'll know a little better on December 11 when FERC is due to respond. Yes?

<Q>: [indiscernible] (26:38-26:49)

<A - Ralph Izzo>: Yeah. So, when you're 110-year old company, you don't wear a party stripe, right, you wear a yellow stripe, and you go right down the middle of the road. And I think every governor I've worked with, and my predecessors told me the same thing, understands that we can't move out wires. So, as New Jersey goes, so goes our T&D expenses business, right? So we are a great partner.

final

I mean, that does tend to mean that you're never in the inner circle, because you're not there in the early days when primary battles are going on, but you're there for them once they achieve office. So we have fully briefed both candidates for governor about what we think is smart and maybe not the brightest thing to do in terms of energy policy, and what matters and what doesn't matter, and both have been great supporters throughout the campaign – energy has not been a dominant issue – about the importance of an aging infrastructure and replacing that, the importance of job creation that results from that, both are very careful to talk about the affordability of the state of New Jersey. One is a little bit more green emphasis than the other. One is little bit more emphasis on affordability than the other. So at the end of today, we'll see who we're going to work with for the next four to eight years, and we'll work with them just fine. Our relationship with the governor has been terrific. He's been a big champion of infrastructure replacement, has been a big champion of clean air, hasn't been a major proponent of concerns over carbon. And that's okay. I mean, nuclear power doesn't emit NOx, doesn't emit SO2, doesn't emit mercury, and so therefore he's been a big supporter of nuclear even in the absence of concern over carbon.

<Q>: [indiscernible] (28:25-28:32)

<A - Ralph Izzo>: Yeah. So nuclear will benefit, as will oil generation, from fixing the flaws associated with price formation, Fast Track, things of that nature. In PJM East, it's important to realize that nuclear challenges that relate to inflexible units have nothing to do with wind. They have more to do with the fact that they are all – that there's a behavior at PJM that requires dispatch of some slow to ramp units that often results in uplift payments that are not reflected in the locational marginal price because of the way in which the tariff is designed in PJM. There's a white paper in the PJM published that's like six or seven pages long, very readable, very understandable that I did not just give great justice to. But that has nothing to do with the attributes of nuclear.

In New Jersey, our plants constitute 40% of the energy used in New Jersey, about 45% of the energy generated in New Jersey. The absence of those plants, we believe, does several things. First of all, just the way in which PJM dispatches, you don't have to be an economist to know that when you remove 40% of supply and you dispatch on a least cost basis, and you don't change demand, prices go up. Our estimates are about $400 million a year.

Number two, if you replace those plants with the current PJM dispatch, which is a blend of gas and coal, and you simply say, what does a pound of NOx cost, what does a pound of SO2 cost, what does a pound of mercury cost, you result in about $150 million a year of environmental impact.

Number three, you emit 15 million more tons of carbon if you do not replace the units with the current dispatch, but you're replacing with the most efficient natural gas combined-cycle units you can, so we're being very generous there. Now if you think carbon's worth zero, then that's not a big deal. If you think carbon is worth $30, that's $450 million a year, and you pick your number and do the arithmetic and it's pretty straightforward.

Number three, we employ 1,500 people at those plants. It's the second poorest county in the state of New Jersey. That's full time people. When you include refueling outages, it's closer to 3,000. If you make some estimates about what it costs to provide the food to the plants, the dry cask storage to the plants, various other things, you can get a number closer to 5,000. So pick your assumptions, it's definitely 1,500, it could be as much as 5,000. That results in sales tax, payroll taxes of anywhere from $150 million to $180 million, because of the range of number of people.

And last, but by no means least, if you replace those plants with natural gas, you would have 97% of your electricity coming from natural gas. You should worry about that, not because there's a meteor that's going to hit the natural gas plants or it's going to disrupt anything in Ohio that has to do with shale, but we as a combination of electric and gas utility during the polar vortex had to curtail gas to customers. That was with 40% of the electricity in state being generated by nuclear power.

If you don't have nuclear power, we will be doing a lot more than curtailing interruptible customers. You will basically be choosing between heating a home or illuminating a home. That's because you don't want to build an interstate pipeline capability for a polar vortex. It's not necessary, it's expensive, there's no need to do that. And candidly, I would say this right now, it's socially unacceptable to do that.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14696

Similarly, a very well run, well managed – I'm not going to name them – interstate pipeline company had an issue with an East-West pipeline last year. Fortunately that issue occurred between the months of April and November. If it had gone past November, and we run into a cold spell, we would have been faced with the same issue. So those are two episodes of operational limitations that occurred in the past three years, and again at the risk of being flip, have nothing to do with some bizarre set of circumstances that will never ever happen again that would lead you to be concerned about 97% asset concentration in terms of natural gas powered electricity.

So with all of that in mind, we have simply begun a conversation in the state to say, did you know, if these plants aren't earning the cost of capital, we have a fiduciary responsibility to shut them down. That's a problem for New Jersey, and we've been real clear. We've retired 4,000 megawatts of power plants in the past few years. It wasn't a headline, it wasn't winding, it just needed to be done. Nobody noticed, nobody cared. This one people will notice, people will care. So we're trying to avoid that situation. And we've gotten great response in terms of the concerns about seeing those plants go away. [ph] Yes, Nick (32:54).

<Q>: Hi. Ralph, I guess you've made a very convincing argument about why you need [indiscernible] (33:01), so I appreciate that.

<A - Ralph Izzo>: Correction of the flaws in the market. We have to get the terminology right.

<Q>: Thanks. The future of the [indiscernible] (33:15) seems to be somewhat out of fashion these days [indiscernible] (33:23-33:29) given it's running by itself, but there is not so much growth opportunity there, [indiscernible] (33:37), how do you see that could be separated out or that could be sold to somebody or keep it intact?

<A - Ralph Izzo>: Yeah. So I remember when I took this job 10 years ago, people used to tell me about the fact that you've got these two businesses and they don't belong together. You've got this wonderful power business and this hideous slow-growing utility, why don't you get rid of it? And now people say, you've got these two companies that don't belong together, you've got this wonderful growing utility and this hideous power business.

Okay. Now having said that, I do think that given the amount of uncertainty in the regulatory world and in the marketplace, now is not a good time to be thinking about separating the companies, right? You can't have a conversation as a corporate citizen say, hey, these nuclear plants matter to you and expect people to wonder, well, who is it that I'm going to be speaking to the day after tomorrow. That's just – that's not fair to policymakers and we wouldn't do that.

Similarly, with price formation discussions with DOE NOPR, I don't know what the right valuation of these plants are. And while we're more than willing to earn our compensation by managing risk, I don't think we get paid to gamble. So to simply say, well, who knows what these things are worth, let me just sell them now and see what I can get on what basis.

Now over the long-term, as I've been quoted and as I still believe, the opportunity to grow the power business is inconsistent with keeping it inside an integrated company and we're not making buggy whips in power, we're making electricity, and as far as I can tell people like that and want more of that. But people seem to worry about it, where is capital going to be deployed, and is it in the slow steady grower called the utility. If you consider high single-digit slow, maybe not. Or is it in this more cyclical business called power that has a different investment profile. And I think over time that those are different investors and we will have to recognize that, but over the near-term I don't think that makes any sense. 5 minutes, thank you. Yes.

<Q>: [indiscernible] (35:40)

<A - Ralph Izzo>: About 6,500 Btus per kWh.

<Q>: Pardon?

<A - Ralph Izzo>: 6,500 Btus per kWh. Wow, I can actually give an answer in one sentence. I didn't think I could do that. [ph] Carl (35:59)?

<Q>: Ralph, [indiscernible] (36:01) your ability to work with regulators, which you have done very well over the last 10 years, I guess, [indiscernible] (36:11) is it too early to say is there any names being floated for anybody [indiscernible] (36:17) or any of the critical positions like environmental or whatever.

<A - Ralph Izzo>: Oh, yeah, it is definitely too early to say.

<Q>: Okay. Do you think the campaigns are focusing [ph] on it at all (36:31)?

<A - Ralph Izzo>: Again, as I said, because we go down that yellow stripe in the middle of the road, we're not on the inside of any campaign to know that. We have in the past been asked to put forward a list of candidates. I've often wondered whether or not they ask us to do that so as they avoid those names. I almost had two questions in a row where I gave a one sentence answer, [ph] Carl (36:57), then you followed up. Yes.

<Q>: [indiscernible] (37:04-37:09)

<A - Ralph Izzo>: Absolutely. I'll tell you, knowing where we are today in LIPA and what we've achieved, if you had asked me four years ago when we began that to sort of set my aspirations for what the team could do and someone had [ph] touched (37:21) me, would you like to do this, I would say, sure, of course, I'd like to do that, I'd also like to pitch for the New York Yankees, but that's not likely to happen at this point in my life.

So the team has just done fabulous work there. I think we have an operating services agreement that has – it varies between 22 and 24 measures that we have to hit. We hit all but one or two of them every year. We've gone from literally dead last in J.D. Power to now being just, I think, one position out of the median company in terms of customer satisfaction. The team has done a fabulous job and the employees have responded well to us. It's been a very rewarding experience. I wish there were more of those opportunities out there, but they're not obvious to us.

Ralph Izzo

I'm going to just take one more question which – of course, whenever you say that there's never another question. But I'll say it anyway. We have time for one more question. Works like a charm every time. Thank you for joining us.

All right. So, next up we have Public Service Enterprise Group. Dan Cregg who is the Chief Financial Officer is going to take us through the PEG story. Dan?

Daniel J. Cregg

Thank you, Dan. Good afternoon, everybody. We'll walk through the forward-looking statements and GAAP disclaimer to get to the beginning of the proper presentation.

So, now I'll walking through our story. Really it is surrounded by and driven by a $15 billion infrastructure investment program and that is far and away the largest opportunity that we have for growth. And it spans both companies that we have within the group, PSE&G which is our regulated utility company in New Jersey. And I'll show a slide a little bit more about what that entity looks like geographically, which represents a fair bit of rate base growth. We'll go through some of those details in applying disciplined investment that really in conjunction with policy drivers in the State of New Jersey.

And PSEG Power, efficient, low-cost, clean fleet and getting more so from some changes that we've been making. We've seen a couple of retirements of coal facilities recently and build-out of combined cycle units, which is going to bring the overall fleet [ph] gate (01:22) rate down considerably as we step through time.

All hinging ultimately on operational excellence. So, in both entities, we really target the issues of running the business well, benchmarking considerably throughout both sides of the business and whether it's operating a nuclear facility, running the grid, or even in the accounting and payables areas making sure that everything is operated as efficiently as possible. And the third lever that we utilize is financial strength.

So, operational excellence, disciplined investment and financial strength. 110-year record of dividends, recently acknowledged at the New York Stock Exchange where we rang the closing bell to mark our 110th consecutive year of dividend payments and all supported by a very strong balance sheet and good credit statistics.

So, quick look at the two businesses that we do have. On the left hand side, PSE&G, if you take a look at the midpoint of our 2017 guidance, it would represent about two thirds of the overall contribution of the company with Power making up the balance. Again that first bullet that you see on in PSE&G, strategy, investments are line with public policy and customer needs. That has really been behind most of the investments that we have made on that part of the business, aligning our business with what the State wants to get accomplished, as opposed to fighting things that we think may or may not make more sense working in unison with the State to advance the capital program that we do have.

That results in a $12 billion to $14 billion capital plan at PSE&G, focused mostly on infrastructure and opportunities to expand our rate base. And I'll go through in some slides where you can see the overall compounded annual growth rate of that rate base somewhere between 7% to 9% over the next five years.

Bloomberg Transcript

On the Power side of the business, increased our competitive position through the build-out of our combined cycle program. So, we have a construction program in place. Three new combined cycles being built. They will be completed and in service in 2019, which will bring the efficiency of the fleet up considerably and enhance the overall competitive position.

In addition to that business, when you look at the value proposition, very strong cash flow is coming from that business. Those cash flows are used as a source of value and investment to meet the $14 billion program, that I talked about on the capital side at PSE&G. So, a good relationship between those two entities. And if you take a look at the capital program in the aggregate, a little over 80% of the capital that we will put to work goes to PSE&G, the regulated side of the business. So, as we step through time, more and more focused on the regulated side of the business and a higher contribution to the overall enterprise's growth.

So, a couple of slides to define each of the individual components. So on the utility side first. If you take a look at PSE&G, territory runs down the center of New Jersey, really from the George Washington Bridge to the Ben Franklin Bridge, expanded on both sides. 2.2 million electric customers, 1.8 million gas customers in place.

One thing to think about for a number of the transactions that have happened in this space off late, they were convergence, mergers, where electric and gas ended up coming together. PSE&G has electric and gas that are together and have been together for quite some time. So, the benefits of having those two companies together have been part of what we have been for many, many decades.

Also a sizeable transmission business, and I will show you some slides later on where we look at the total investment, as well as the total rate base. And a little less than half of the aggregate rate base at PSE&G, is on the transmission side. So we have a transmission formula rate in place with contemporaneous returns. And it is a considerable piece of the overall pie that you see for PSE&G and you can see it in the form of a pie-chart on the bottom right-hand corner of the slide with 52% distribution, 44% transmission and about 4% of rate base coming through solar and energy efficiency.

On the Power side of the business, very well-located assets. Again, in the same territory that I laid out largely. The investment program, adding those efficiencies, but also, I would point to the nature of the assets themselves and the ability to follow load. So, a good mix of base load, as well as load following units within the fleet as a whole.

If you also think about how we hedge that. We hedge over the three-year forward program and a big part of our hedging program is our BGS, or Basic Generation Service product that we have in New Jersey. It's the default supplier in New Jersey. It's about 11 terawatt hours of the roughly 50 terawatt hours that we do produce, and we're in the process of supplementing that with a retail business to supplement the BGS retail product. It's on the smaller side and growing, but will be growing organically as we continue to step through time.

Also a very modest solar business, you can see on the slide, 326 megawatts of solar assets as well as one asset that resides in Hawaii. So, we've been pursuing a number of policy and regulatory issues this year, and a number of them are listed on the slide. First and foremost, the first one listed there is a New Jersey distribution based rate proceeding.

So, on November 1st, we will file our first rate case since 2009. It will be a rate case that will deal with just the distribution side, but within the distribution space both the electric and the gas side of the business. So it'd be rate case dealing with both of those. As we think about, basically we're going to step forward and true up some of the numbers that we have in place. We don't see this as being a hugely dramatic rate case, but one of the things that we do anticipate that will be addressed in this rate case is decoupling.

Our two businesses, on the gas side, we have a weather-normalization cost for the gas side of the business, which does a pretty good job at mitigating some of the ups and down that we see as we step through time, due to weather events. But on the electric side of the business, we do not have decoupling and that's one of the things that we will be pursuing in this rate case. New Jersey has a fairly strong interest in energy efficiency and certainly decoupling would also be a hand and glove process to work through and move forward within this rate case to enable some incremental energy efficiency investments coming through that's been coming from PSE&G.

final
Bloomberg Transcript
Bloomberg

Another avenue that we look to do a fair number of our investments have been through clauses with the State of New Jersey. And we have been to the BPU in New Jersey for a number of clauses over the last decade or so, somewhere in the order of 15 clauses that we've worked through, mainly infrastructure-oriented, but also on the energy efficiency and on the solar side.

And we've worked with some other utilities in the state during this past year with the BPU to try to simplify the process that we have gone through to enable some of those clauses to get, put in place. And it's been described by some as a Straw proposal in the State of New Jersey. And in August, it moved through the BPU and moved into a 60-day comment period. And that 60-day comment period will come and go and we would anticipate by the end of the year, that this infrastructure proposal would be in place. Now what it essentially will do is provide the template by which these types of clauses and incremental investments can be pursued.

And so, I think incremental transparency is an outcome that we would anticipate by virtue of having longer programs, and also a known ability to go through with a mechanism by which these investment programs would be recovered. So, we see this as simplifying the process, making it more transparent, and I think a good outcome for the capital needs that the State of New Jersey has across all the different utilities.

Next item on the list is preserving the value of nuclear supply. So we have been talking about this for the vast majority of this year, and taking a look at where the market is, and taking a look at where our nuclear facilities stand within that market. What we have said to folks is that we are not earning our cost of capital on our nuclear facilities.

And as we look forward into time and if some of those three-year hedges end up rolling off, and we step into forward prices, we would anticipate that this situation is more likely to get worse than better. So, we have been in conversations at the federal level, at the regional level, and at the state level to acknowledge and make sure that people can understand the value that comes from these facilities.

And we see that value in the form of environmental benefits, not only from a carbon perspective, but from other emissions standpoint. We see it from the standpoint of fuel diversity and resiliency of the grid. If you think about our nuclear facilities, they're about 40% of New Jersey's use and over 90% of New Jersey's emissions free energy. So from those perspectives, they are a very, very, important part of New Jersey's energy mix.

They also have the benefit of keeping energy prices lower given their low cost of dispatch, and also they're very important locally. If you think about where they are in the State, the jobs that they provide, and what they do for the local economy, we think for all those reasons, there's an awful lot of value of having them continue to be around.

But as we look at the economic situation of those facilities, there's no guarantee that they will be. So, those conversations have taken place as I said, at the federal, regional, and state level to ensure that the value that these plants provide can be identified, captured, and ultimately paid to the units.

And then lastly, we talk about ensuring federal regulatory and policy framework. There if we think about some of the rules that we have in place and some of the pricing elements that we have in place largely in PJM, there are improvements that have been identified by PJM and others that we feel do need to be made. And you can think about this largely in the form of the price formation efforts that are going on at PJM.

So, things like inflexible units, not being able to set a marginal price, can result in uplift payments to particular units, but no increase in the overall price points that all units see. And so, efforts that PJM is pursuing, which I would argue are fairly consistent with what we've seen from the recent DOE report and other efforts in other areas to try to get the markets to work better, I think, will serve all generators well and that's another effort that we are working towards as we move through the year.

And the results of these efforts and prior efforts have allowed us to grow earnings by 4%. If we take a look back at this slide, back through the last five years or so, back through 2012 to current. And also, if we take a look on the dividend side, vitally important to our shareholders and we acknowledge that importance with the 4% growth that we have seen on our dividends over the last five years.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14701

As we've talked about dividends, we've talked about our desire to have consistent and sustainable growth in those dividends, and I'll show you slide later on, which will give you an indication as to what the dividend policy overall looks like.

So, move back to the utility for just a couple of minutes, and if you take a look at PSE&G's investment program and what it does for our overall rate base growth, what we are planning now for the next five years, and if we look at from 2016 and running through to 2021, over that five-year period, we've identified 7% to 9% compounded annual growth in rate base. If we think about the first three years of our plan, we've got a 9% CAGR. And running out through five years, that declines down to 7%. And I'll give you a little indication as to what drives that.

The slide here also shows the split between transmission and distribution. So you can see there's a fairly good balance between the two. And if we think about a single state utility with a single state regulator, having FERC regulation on that rate base gives us a little bit of diverse regulatory risk as well.

And then you can see that there's – as we move into 2021, there's also a bar in the far right-hand side, which goes beyond 2021. And I'll talk in another couple slides about some of the growth opportunities that we think we have as we step beyond the planned years more generally. But on balance, the system that we have is an older system, New Jersey is in an older area and there is no shortage of infrastructure needs that we have, both on the gas, on the electric side. And I'll touch on those as we move forward.

So, moving from that slide of a rate base to this slide of capital expenditures, we say that our baseline programs yield 7% compounded annual growth rate. So, this represents $12.3 billion capital plan over the next five years. And if you take a look at the bars that are on the slide, that represents this year's plan. There's also a black line that runs through, that represents last year's plan.

So, we step forward a year, we've identified incremental investments in each of the four years that are in common to those plans for incremental investment across the utility. And I talked earlier about the way that we plan. We think about what is in our plan, largely it is what we know, as opposed to what we know, plus a host of different investments that might come to pass.

So, the trajectory of capital that you see in our five-year plan does decline over time. And what we have done, if you look at history, is identified more investments as we step into the out-years of that plan to lift the back-end of that plan. And as I move in from this slide into the following slide, it shows what is I would say most known within the out-years of the plan as to what additional investments are out there for us to make.

Those additional investments take the form of extensions and expansions of existing plans that are in place. So, for instance, we have the largest cast iron system of any gas utility in the U.S. We have 4,800 miles of cast iron pipe, that's in the ground. And we move forward with the plan – with the program last year called GSMP, it's a Gas System Modernization Program to replace that cast iron. That was at a rate of about $300 million a year and at that rate, we'd have about 30 years of investment to replace all of that cast iron.

So, as we step from our base plan, which includes $300 million to replace all that cast iron throughout the five years of a plan, we have proven through the work that we've been doing that we can do more than. So, part of what we get us from our $12.3 billion base plan up to what you see here is $13.8 billion incremental plan, which would serve to move us to 9% CAGR from 7% CAGR would be to upsize that Gas System Modernization Program or replacement of those pipes from a rate of $300 million a year to $400 million a year.

And the filing that we just made in July with our state regulator is for $2.7 billion over five years, so that rate is $540 million. So, there's the potential for incremental spend above this $13.8 million that you see to the extent that that would be approved in full.

A second component that would look to raise the overall capital spend that you see in this – in our base plan up to the $13.8 billion would be related to energy efficiency and solar. So, we are targeting to invest an incremental $400 million in energy efficiency and in solar over the last three years of the plan, that would also contribute to getting us up to the $13.8 billion target.

final
Bloomberg Transcript

And then, there's a third leg of that still which would increment further the plan up to the $13.8 billion and that would be the next phase of our Energy Strong program. So, prior to Harvey, prior to Irma, we had superstorm Sandy here in New Jersey and we came forth with $2.6 billion of $3.7 billion aggregate amount of spend that we thought was necessary to make improvements to add to the resiliency of our own grid. $1.2 billion was approved.

So, embedded within this back-end of our plan is three years and $800 million of spend that we would anticipate from a filing that would probably take place later this year to do the next stage of the resiliency of the grid in New Jersey. So, a couple of existing types of work that are being done to be extended out and/or expanded upon is what will drive us to a continuation of 9% growth in our rate base as we step forward over the next five years.

And then, this next slide gives a little bit of an indication as to what I talked about on an earlier slide when I look beyond 2021. And the way that I think about this says is, it lays out in the first two boxes the kind of work that has been done on the system over the last five years and what we see in front of us for the next five. And I will tell you that most of that work is very infrastructure-oriented, it is basically – basic blocking and tackling that's in front of us, things like replacing cast iron mains that are in the ground in New Jersey, which is going to go on for some period of time.

Above and beyond that different types of investments that we are calling Utility of the Future still await us. Items like AMI which we really have not moved into at all, like electric vehicle charging stations, like microgrids and anything that really is more expansive of the way the things are done really are not in the existing base plan as we look at it right now.

So, with that spend awaiting us, we see the ability to continue to invest at a similar rate as we have in the past as we go beyond the next five years. I'll move over to the Power side of the business. We gave a little bit of indication as to what the business looks like now on the bottom of the page and what it will look like on a go-forward basis on the top of the page.

So, on the bottom left-hand side, we give an indication of the aggregate capacity of the fleet right now at 11,600 megawatts. And as we step forward through time, we don't see an awful lot of megawatt growth based upon some retirements in place to Hudson and Mercer facility being replaced by new efficient gas combined-cycle units at our key facility in Maryland, at Sewaren in New Jersey and Bridgeport in New England.

But on the right-hand side, if you take a look at what those units will produce, we anticipate about an 18% increase in the aggregate output of the fleet. So, having the more efficient fleet, the more flexible fleet will enable us to increase our output and increase the amount of the output which is coming from natural gas.

And if we also take a look at what we've seen from the capacity market standpoint, very important for our fleet, in particular, especially with PJM in New England having a forward capacity auction, you can see the pricing that we are receiving in these markets which is north of what you see for the rest of pool. And basically, that transparency and the value that this has brought to our assets as a result of those payments is a big part of what Power relies upon as they step forward over the next three years.

There has also been a modest change that PJM has announced related to some of the measures that they use as they go into the next auction. And we talked a little about this last year about the Con Ed Wheel going away. So, Con Edison would wheel power down into New Jersey and then across the Hudson River into New York City as a way to make sure that there is sufficient power for New York City. That arrangement ended earlier this year, and as a result, the parameters that are put forth in advance of the capacity auction that were updated prior to this past year's capacity auction.

And we talked recently about the fact that that made up for some of what happened with the wheel, but there was likely to be some incremental changes that would happen to those parameters and to the CETO/CETL transfer limitations as you move from area to area within PJM.

And recently, PJM has put forth that in large part because of the non-firm nature of some of the flows of electrons between the different areas, there have been some changes that will look to tighten up the transfer limitations between some of the LDAs within MAAC, EMAAC, PS Zone and PS North. So, we'll see what those look like when they end

final

Bloomberg
SI-SSA-0015-14703

up putting the parameters out for next year's auction, but we will see some changes as we step forward into the next auction.

And then, on the bottom of the page, you can see in New England, the Bridgeport Harbor station that I referenced earlier. When that cleared the auction, that was the beneficiary of a seven-year lock-on capacity prices. So, the bottom of the page lays out that $231 of megawatt day for seven years, that's what that unit will see, from a capacity standpoint. So, a healthy capacity stream that Bridgeport will see in its first seven years.

And if we look at Power as a whole and if we look in particular at the free cash flow that's coming from Power as a whole, you can see that it is dominated in the first couple of years by the construction program of the three combined-cycle units. So, the left-hand side of this page shows Power's five-year capital program, the orange bars represent the combined-cycle construction program.

As that comes to an end in 2019, we'll move to more of a steady state capital amount of about $200 million a year at Power. So, a sizeable decline in the overall capital spend, which will free up considerable cash flow for PSE&G. And if you take a look on the right-hand side, basically that lays out the $13.8 billion higher capital program, which will be funded by debt at PSE&G, but also from capital contribution which will be sourced from the free cash flow from Power.

And moving on to O&M, if you take a look in the aggregate at the enterprise level, a lot of focus on O&M at PSEG. We work extremely hard on an ongoing basis I would say less programmatically and more every day, every month, every year, as we step through our normal business operations to manage costs. And basically, the proof in the pudding is what you see here on this slide, as you look at 2012 to 2017's O&M, our O&M CAGR has been flat at 0.0% increase.

And the one item that you do see on the page, this is a higher O&M growth is within our transmission business. Frankly given the magnitude of construction that's gone on at transmission, some of the removal of the old transmission units ends up falling into O&M. So I'd say, by no means, it has had the result of any inefficiency related to how the transmission business is run. What I would say is much more about the removal of existing assets that end up working their way into O&M. So, O&M has been a focus, will continue to be a focus for the business as we step forward.

And then if you take a look right here what this next slide shows is the trajectory of our earnings over the last number of years, and maybe as importantly, the overall contribution to the earnings that we have seen over the last number of years. So, if you go back to 2012, PSE&G contributed 43% of our total earnings contribution and as you step in to the midpoint of 2017's guidance, as I mentioned earlier, 66% of the company's earnings contributions will come from the regulated side of the business. And as we step forward beyond that and take a look at the overall capital mix of the companies, you would expect to see that trajectory to continue to go in that direction.

And then one final slide on dividend. This also is a look back at the dividend that we have paid over the last number of years. That shown in the bars is also a line that is superimposed on top of those bars. What that line represents is the earnings of PSE&G-only, placed on top of the bars which is the dividend that is paid at Enterprise. So, what this serves to show is that the entire dividend of PSEG can be covered by the earnings of solely PSE&G, so the baseline of earnings that sits behind the dividends are very strong, very steady and growing from the standpoint of PSE&G's earnings contribution.

And our last slide is our first slide repeated. So, that kind of wraps up the story for PSEG. I'll be thrilled to take any questions anybody may have.

Q&A

<Q>: Terrific. So, there's a microphones in the room that will be going around and I'll start it off. So, couple of things on the policy front-end. There has been talk about New Jersey reengaging in RGGI and then also some talk legislatively about whether or not a zero emission credit program might be in order. Can you talk us through some of the – what are the steps to get those things done and what is the calendar look like the balance of this year and into next?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14704

<A - Daniel J. Cregg>: Yeah. Sure. So, maybe first on RGGI. And you may recall that RGGI is Regional Greenhouse Gas Initiative. It involves New England, New York and then a very little bit of PJM and our existing governor took us out of the RGGI program a number of years ago. The overall RGGI pricing was fairly low and the impact that it was having, it was kind of put in place initially as a bridge to a national carbon program.

There is interest in the state by both gubernatorial candidates or in a gubernatorial election year to come back into RGGI. And if we think about it, maybe if I think about it coupled with the other questions that's there from a standpoint of nuclear, nuclear is obviously not a carbon emitter, so RGGI would be on balance helpful for nuclear.

But if you take a look at where overall pricing is coupled with the fact that there is a leakage issue, what I mean by a leakage issues is if you take a look at PJM as a market and New Jersey being in RGGI or maybe being back in RGGI and as neighboring states not being there, then some of the impact on ultimate pricing will be watered down by virtue of the fact that you're going to have units that are burdened by a carbon price and instead are not burdened by a carbon price on the same market.

So, I think it will take the next governor for us to come back into RGGI, I think that the likelihood is probably high because both have expressed an interest in it. But if I think about the overall impact, given the fairly low prices and the existing leakage issue, which PGM has some plans to seek to correct, but nothing is in place right now. I would consider that probably a modest impact overall on nuclear and on the market as a whole.

More broadly, with respect to nuclear, we've talked a fair bit about the existing economic situation within nuclear. And I've worked at the federal level, I've worked at the regional level, and I've worked at the state level, really to get people to understand the nature of the problem and ultimately to work through some kind of a fix to provide the economic payment for the value that nuclear provides.

I think that there has been progress in all of those venues. But I think from a timing perspective, much as we have seen in Illinois and in New York, the most likely quick response, would be, or the fastest of the three jurisdictions, would be at the State much like in Illinois and in New York.

So in New Jersey, the fix would end-up being a legislative fix rather than a regulatory fix. And we don't have an existing legislative session. Our next legislative session would be [indiscernible] (30:52) session after the gubernatorial election. So, basically the months of November and December. So, that would be the next opportunity for legislation. Beyond that, you would be into 2018 and the first legislative session starts in January of 2018 after that.

<Q>: Thank you. Other questions for Dan? You have one there.

<Q>: Yeah. Hi. Can you talk a little more about the decoupling proposal that you're going to make in the case? And kind of how that's coming together, kind of the evolution of it?

<A - Daniel J. Cregg>: Yeah. So, I think the – maybe one way to think about it is that that there is some interest in the State, and I think about New Jersey's desire to have more of a green element within the overall power structure. It's limited somewhat by virtue of our renewable resources. So, we're not Arizona with deserts and as much sun profile. Our wind profile is not durably strong certainly on land, and the offshore wind has some economic challenges to it. So, I think that our best mechanism to ensure that we are as managing our environment as much as we can, can come from energy efficiency.

In energy efficiency, obviously, to the extent that you have the utilities involved in that, there's a disincentive to reduce load to the extent that that you were involved in the business. So, I think there's an acknowledgement that the decoupling aspect is more enabling of the energy efficiency. And if you take a look at aggregate load growth which is basically pretty flattish, it's a sensible approach for us to make. The details of that are not out, but they'll be part of the rate case filing that we'll do on November 1st.

<Q>: All right. The company has talked historically about potentially separating PSE&G and PEG Power (sic) [PSEG Power]. Can you update us on those talks?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14705

<A - Daniel J. Cregg>: Yeah. And I don't think that there really is much of an update on that front. We've basically talked about the fact that there are benefits of the company being together and frankly, the one slide that I showed really punctuated that. If you take a look at the overall cash flow availability from Power and the capital appetite of PSE&G, and Power being a source of value for investing the equity piece of our capital program at PSE&G.

I think the ability to share costs across both sides of the business is also there as well. And also, little bit of symbiotic bill relationship, right? So, as you have Power prices come off a little bit, it may be a time for you to be able to, for the build to absorb some of the capital that the system really does end up needing. And to the extent that those dynamics were to change and drift, you could see a little bit more of an interest in some separation. But, right now, I think what we see is it still supports us being together. It's something that we look at like a lot of different strategic aspects of what goes on with the business. But we see those advantages stand together as well.

Unverified Participant

All right. I don't see any other questions. So, we do have a breakout session in Liberty Five, that Dan will be at. But with that, thank you very much, Dan, for sharing your story with us.

Daniel J. Cregg

Thanks, Dan.

Presentation

Kit Konolige, Senior Utility Analyst

Good afternoon. This is Kit Konolige, I'm the Senior Utility Analyst at Bloomberg Intelligence and I have the pleasure of hosting a webinar today on the PJM Capacity Auction Results for '20/21.

With us today will be Stu Bresler, who's Senior Vice President of Operations and Markets at PJM, which as many of you know, is the largest competitive grid in the US and Adam Keech; Executive Director at -- with Stu at PJM and myself. And of course, anybody who wants to ask questions along the way, I can just mention to you will be able to type in a question on the side of your screen.

So here is some housekeeping notes before I turn it over to Stu. Today's presentation will be recorded. It will be available for playback. It will be available for potentially for reporters and (Technical Difficulty), so just be aware that this is a live event in every sense. And as it says here, you can adjust the volume and size of the screen. And the right of the slide is where you type-in the questions, you can type them at any time, and then I will compile them and present them to Stu as we move along, he will give a presentation and then we'll move to Q&A. And the copy of the slides and often I'll have to re-confirm this, a transcript will be available after the event.

Just briefly a commercial for BI. This is the part of Bloomberg, rapidly growing part of basically investment focused research. I'm focused on equities, we have fixed income people, we have people doing commodities, we have people doing litigation and legislation. So we have all kinds of analysts many from the sell-side, many developed internally, who cover a lot of industries, a lot of regions and the goal is to develop a really reliable source of insightful investment insight that you can work with many of you on the sell-side and buy-side.

And with that, I will turn things over to Stu Bresler. Stu, take it away.

Stu Bresler, Senior Vice President of Operations and Markets

Thank you, Kit, and hello to everyone on the phone. It is as always good to be with you today to talk about the results from our RPM Base Residual Auction for the 2020/21 Delivery Year. As I mentioned to Kit, before we started, it's been a sometime anyway since the results of the auction were posted I guess, it's going on two weeks here. So my assumption is that a lot of folks have had some time to at least partially digest the results maybe skim through our auction report. And so as a result, I'm not going to spend a whole lot of time on the high-level overview because I don't want this to be too redundant and it probably makes the most sense to get into a Q&A with your folks sooner rather than later to kind of hit the things that they'd like to hear about. But certainly, I will start out with just a few minutes of overview and kind of hit the highlights from our perspective, and then, like I said, we can go right into the Q&A.

Bloomberg Transcript

So if you take a look at sort of the graphical representation of the PJM footprint and you overlay the clearing prices from the Base Residual Auction, you can see what it looks like. That blue area in the center is what we refer to as sort of the rest of RTO in the parlance of our auction and the base clearing price in this auction was $76.53 per megawatt day.

I think that is safe to say was somewhat lower than most of the probably participants and analysts expectations going into the auction. And we'll go through some of the reasons as to why or what contributed to that supply and demand dynamic that resulted in that clearing price. But you can also see that we had a fair amount of constrained results as well moving out from that sort of center portion of the footprint. On the left side, ComEd bound again in the auction with their price of $188.12 per megawatt day. Duke Ohio/Kentucky had a somewhat lower price of $130 per megawatt day. And then to the East, MAAC bound by about $10 at a [ph] less than $10 at $86.04. And Eastern MAAC was up closer to where ComEd cleared at $187.87 per megawatt day.

So part of the contributing factor to the somewhat lower RTO clearing price was the fact that we did have binding constraints on both sides of the system. And as a result of clearing higher cost resources in those constrained areas, the price in the rest of the RTO does drop somewhat. This is the first year that the Duke Ohio/Kentucky LDA was binding in the RPM auction. It's the first year; we actually posted the potentially constrained LDA. And we posted both Duke Ohio/Kentucky, as well as Dayton, as a result of both -- a couple of announced retirements namely the Stuart and Killen generators on the Ohio River, as well as some at-risk generation as well that we thought might impact the auction. And as you can see, Dayton actually did not bind in the auction, but the Duke Ohio/Kentucky LDA did. So it's just a sort of a map again of sort of where the binding constraints were and the various clearing prices that we saw.

The next slide really just shows these in tabular form together with the offered and cleared megawatts. Start -- we are starting with the top-line with the whole RTO and then moving down to all the constrained LDAs basically in order of their size from the standpoint of offered and cleared resources. And you can see clearly that those LDAs that actually bound in the auction were tighter from a supply and demand viewpoint, namely Eastern MAAC and ComEd were sort of the tightest as far as offered versus cleared capacity, followed by Duke and then MAAC and then obviously the RTO had the most uncleared capacity given its lower clearing price.

The one nice thing, if you will about this auction, we are 100% now a homogeneous product just the capacity performance definition of capacity resources. So we don't have really for the first time in a long-time separation of prices by various product types like limited and extended summer, DR and base capacity like we had last year. It's one product defined the same way really across the entire footprint. And the only reason for price separation in this auction, which is a departure from many prior auctions; it's the locational aspect of capacity.

The next slide then sort of goes through the one sort of additional aspect of this auction that we have not had in the past and that is since we went to a single product definition, the capacity performance defined products were capacity. We did facilitate aggregation of resources to make up that annual capacity performance products in the auction. So in other words, we did allow resources to offer in as summer-only or winter-only and we would to the extent that we could offset summer and winter. In other words, clear and equal amount of summer and winter in the locations, where it was necessary, we did sell through the auction.

And you can see here that we cleared just under 400 megawatts of those aggregated resources in both the summer and the winter. And then you can see the breakdown as to what made those resources up. So the summer-only resources, very, very few, were generation, the majority were demand response and then some energy efficiency as well. And then the entirety of the winter resources that made up the aggregated, the facilitated aggregated products were generation. And I believe that was actually all wind generation that has additional capability in the winter, just given the way, the wind blows more steadily in the winter than it does over the peak in the summer.

So you can see that the annual generation -- I'm sorry, annual resources cleared were about 164,711 on the bottom left of this table. And then you add the 400 megawatts of aggregated resources together and you get the 165,109 on the bottom right for total cleared annual capacity.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14708

And then really just sort of the final slide as far as the high-level overview is concerned, just shows the intermittent and renewable participation in this auction. And you can see that, we had about 890 megawatt, 887.7 megawatts of wind, 504.3 of that was cleared as annual capacity and 383.4 was that winter -- winter-only resources. You can see, I was wrong a second ago that was actually 14.5 megawatts of winter resources that were hydro; it wasn't completely all wind units. And then, we had a 119.1 megawatts of solar that was willing to commit on an annual basis 6.2 of summer; and then, we had over 6,200 megawatts of hydro. So you can see just how the intermittent resources sort of broke down.

I'm going to back one slide, just to hit one other highlight here that we have on the slides. And that is the really strong continued participation of demand response and energy efficiency even in the face of the 100% annual capacity performance product in this auction. I know there was some feeling among stakeholders in general, market participants, regulators and so forth that we would see a precipitous drop in the participation of demand response in particular given the requirement of 100% annual resources.

And you can see that where we typically have somewhere on the order of 8,000 to 9,000 megawatts of demand response resources that wind up being committed and actually register and participate during a delivery year, we had over 7,500 megawatts of demand response that cleared as an annual resource in this auction. So yes, there was a decline, but I don't think it was of the magnitude that was anticipated or that caused some fairly significant concern going into this auction. So I think that's a -- at least from the standpoint of those that we are concerned about that a sort of a positive story out of this auction. And then obviously, if you add the summer-only resources, their participation gets even stronger. So I would point that out as a significant result from this particular auction.

I think the last thing I'll highlight as far as just introductory comments or concerns somebody always asks? Yes, we did have about 2,350 megawatts of new generation clear in this auction and it was in the form of three new natural gas-fired combined cycle generators that had not previously cleared in an RPM auction. So that's something that that folks always ask with respect to these auctions and so, we still -- we still continue to see brand-new generation clear in these auctions.

And as a result of kind of a combination of all of that, the relatively strong response from DR resources, the new generation that we are [ph] clearing, the aggregated resources, we did see a -- an effective reserve margin of just over 23% as a result of this auction, where our required installed reserve margin is about 16.7% or so some like that. So again, strong response by resources, really a great new story for load given the prices resulting from the auction and the significant reliability provided by that additional reserves.

So Kit, I think -- I think that's -- that's where I'll stop at least for now with respect to the overview and I'll turn it back over to you to start the Q&A.

Questions And Answers

Kit Konolige, Senior Utility Analyst

Very good. Thanks a lot, Stu. Very helpful introduction and insight into how the auction turned out. Let -- first, let me mention to people, please type in your questions and we'll be happy to pass them along. It's straightforward to do that and type them at any time during the upcoming discussion.

Stu let me just follow-up a little bit on your last point of discussion, the new generation that cleared, the 2,300 or so megawatts, the three new plants is about half or a little less than has cleared in the last two, three, four auctions, may be. Is -- in your view is the lower amount of new build clearing, obviously it has A) relationship to lower prices. Can you maybe give us some insight into which comes first, the lower price or the new generation and how the separation of the Eastern and the ComEd zones plays into that calculation? I assume that that's -- that was a part of the feedback loop that the new builders were looking at as they were bidding?

Stu Bresler, Senior Vice President of Operations and Markets

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14709

Yeah, I mean it's tough for folks to really pinpoint what areas of the system are going to be constrained in a given auction. Now, I did see analyst reports indicating an expectation that ComEd was going to bind again, that Eastern MAAC was likely to bind, I think I saw some expecting that MAAC would bind. So I think from a transparency standpoint, it's actually good, if analysts can take all the information that's available out there and build a reasonable expectation as to what's likely to happen in the auction. So there is a sort of interplay between those expectations, I think, and then how various offers come into the auction.

As far as sort of what comes first, the lower prices or the new build. There's a lot of folks, I think out there that were surprised that we still have new build clearing given the relatively low prices for a lot of the PJM region. If you take the RTO and the MAAC region outside of Eastern MAAC, $76 and $86 per megawatt day, I think folks see that as a price they wouldn't maybe not expect to drive new entry, if you will.

So I think there is some rational to the interpretation that some of this new build had a lot of investment already accomplished. And at this point they're moving forward and so they're offering into an auction at the -- at a level, where they think they're going to clear because like I said they're pretty well along the development track.

Well, you know, to the extent that any of these resources are on the constrained areas, then I think there is the possibility that the higher prices in those areas would drive a decision to build. So I think it's probably a combination of those factors, Kit, and it's obviously difficult to put your finger on something specific because I'm not in the -- the conference room is where the analytics are being done by these folks to determine how they offer.

Kit Konolige, Senior Utility Analyst

Exactly. And I'm sure they wouldn't want to invite any outsiders in there because obviously bidding strategy is a pretty closely held secret for -- if you want to optimize your results. There is an interesting question that's been submitted here, Stu. I'll just read it the way it is and see what you think. Why do you think units that claim to be unprofitable are clearing the auction. Is there anything PJM can do about that?

Stu Bresler, Senior Vice President of Operations and Markets

I think the short answer to that question is, no. I think -- I think there is probably a phenomena out there that I will acknowledge with respect to these auctions that is what's been I think characterized as kind of a race to the bottom, if you will. And I think if you're on the demand side of the equation, you would say, well that's the benefit of a competitive approach to resource procurement. But some of these -- some resources I think out there are saying, look, I'm not ready to retire my generator and so I'm going to offer into these auctions at a price, I know, we will clear because it's better than offering at something higher and taking a chance on not getting anything.

So I think maybe some of these resources that are out there that were saying they're not profitable, well their owners are not ready to retire them at this point. And so they are offering into these auctions at something that will clear because like I said, they need some revenue out of the auction and offering at a price that takes a risk of not clearing the risks, not getting anything out of the auction. So that is really the only basis of explanation that I have. And like I said, I mean, this is intended to be a competitive approach.

So well, I think PJM certainly has expressed along with others concern about the efforts to subsidize resources that have indicated they are economically challenged because of the suppressive impacts they would have on market prices and the negative impacts, they would have on the ability for markets to continue to perform their intended function, outside of resources that are being subsidized in areas that are relying on the competitive markets, no, I don't -- I don't think there is anything PJM can do about a given resource, it decides to offer in a certain way given its own particular situation.

Kit Konolige, Senior Utility Analyst

Fair enough. To follow-up a little bit on something you mentioned there, you said, aside from situations, where a subsidized unit is fitting into the auction or clearing the auction that actually occurred this time right that Quad Cities cleared in ComEd Zone. Did that have an impact on the clearing price by your analysis?

Stu Bresler, Senior Vice President of Operations and Markets

Well, I think actually and PJM never reveals this information, but I think Exelon has already announced that Quad Cities did not clear in this auction. So I guess my answer to you, Kit, is no.

Kit Konolige, Senior Utility Analyst

Okay.

Stu Bresler, Senior Vice President of Operations and Markets

The action in Illinois would not have appeared to have any impact on this auction.

Kit Konolige, Senior Utility Analyst

Right. That's right.

Stu Bresler, Senior Vice President of Operations and Markets

(Multiple Speakers) I think the resources that would assume is not definitive as far as I know, but would have -- would assume to be have benefited from that legislation did not clearing the auction.

Kit Konolige, Senior Utility Analyst

Right. My mistake. That is -- of course, you're right about that and not sure what I was thinking was subsidized, maybe I thought it was going to clear or should have cleared. Fair enough. So we don't really have, I guess it's fair to say, then we don't really have an example at this point of a -- an asset that's been subsidized participating or having an apparent impact on the auction as of now anyway although --

Stu Bresler, Senior Vice President of Operations and Markets

Well, I don't want to be argumentative with you, Kit. So please don't take it that way. But I think the point has been made by many in a lot of the discussions that are going on for -- probably the most obvious example that for technical conference that occurred back on May 1st and 2nd that there are myriad of subsidies out there both at the state and federal level and there have been for some time and I think probably some would make the argument that there were a lot of subsidized resources that cleared in this auction.

So that's part of the challenge that we have with respect to the issue that's in front of us and resource subsidization is, if something is going to be done to try to protect these markets from the impacts of resource subsidization in areas that are relying on the competitive markets to ensure resource adequacy at the lowest reasonable cost then what subsidies do we address and where do we draw that line.

final
Bloomberg Transcript
Bloomberg

Kit Konolige, Senior Utility Analyst

Absolutely. And again to that point, one of the other questions we have here asks about the Department of Energy study that's going on and of course, as you said, FERC had those hearings, what do you anticipate might develop from those processes that are underway to examine how PJM deals with some subsidies or all subsidies, et cetera. How do you see that working out? What might a reasonable timeline be on that?

Stu Bresler, Senior Vice President of Operations and Markets

Well, I think from PJM's perspective, there is the Illinois legislations, everybody knows about that, of course it's been challenged by others in court. So want to see how that plays out. There are sort of discussions in other states as well that I'm sure folks are aware of. So while PJM do not see this as an issue that was burning so desperately that we needed to make hasty rule changes prior to this auction in May.

And frankly, I think the wisdom of that kind of was born and I'm not trying to toot our own horn, but given the way the auction played out, I think it was the right approach to take. However, like I said, given that there are discussions ongoing elsewhere and the potential for subsidies to become contagious, as was said by our Market Monitor in -- in the State of the Market Report for last year. We do think that it -- you -- that some action likely needs to be taken prior to our next auction, next May.

And so we have a stakeholder process in PJM that is -- that's working very hard to analyze this subsidy issues, specific to the capacity market and come up with where our stakeholders think that some changes might be beneficial in order to protect markets from those impacts. And from PJM standpoint, we really need to find a way to get something out of that stakeholder process by the end of the year to get it in front of FERC if anything is going to be enhanced by that May 2018 auction for '21/22.

So did that answer your question on timeframe? Because you started out with DOE study, and then I think you went into timeframe of any potential changes for PJM, I just want to make sure, I answered the question.

Kit Konolige, Senior Utility Analyst

Right. Is there a both, I mean obviously, I think folks are interested in any of these processes that might eventually work their way into how you operate the auction?

Stu Bresler, Senior Vice President of Operations and Markets

Yeah, I see that -- I see that question there about the DOE study. And to be perfectly frank, while I know there are opinions that go from soup to nuts on the validity of that study given the timeframe it was allotted and lot sort of stuff, I also know that there are opinions to the effect of the outcome of that study could be influential on any changes that are made in the organized market.

So it's hard to say sort of what impact the outcome of that study will have or how that impact will be effectuated. But certainly, I will tell you that the DOE has reached out to PJM for our input like I'm sure, they have reached out to many others and we are trying to be as helpful as we possibly can with respect to data and information and we will be as anxiously as anyone else awaiting for the outcome, you know that, so that we can make sure that we're monitoring any impact that that study has and hopefully having a hand in sort of the way it shapes any impacts on the wholesale markets given our goal to make sure these markets function as effectively as possible again, to ensure resource adequacy at the lowest reasonable cost.

Kit Konolige, Senior Utility Analyst

final
Bloomberg Transcript
Bloomberg

Right. Let's move along to a question here about the reserve margin, as you mentioned 23%, well above what you and most folks would normally think as an adequate reserve margin. How does it get to 23%? I guess, is the point of this question. In other words, why didn't the price just go lower with that much being bid in, not that it wasn't and RTO price obviously was already down a fair amount, but with the 23% reserve margin, how did that sort of physically workout that you had that higher reserve margin?

Stu Bresler, Senior Vice President of Operations and Markets

Right. And it's a -- it's really just a function of that slope demand curve that we used in the auction. So the price did go down by virtue of the fact that we had more supply than was required to meet the minimum required reserve margin. And it goes -- the price goes down at the slope of the VRR curve, that demand curve that we used in the auction. So thinking about it very simply on a conceptual level, you take the supply curve that's offered into the auction, you bounce it up against the VRR curve, that demand curve and where the two cross is your price and your quantity.

And so that's how the price came about and that's how the committed quantity came about, and then obviously it gets a bit more complex when you throw in the fact that we have constrained areas of the system as well. But that is -- that's exactly what happens and as the increase in supply hits further out on that VRR curve, the total cost of load goes down. And so that's the result of that lower price at 70, whatever, $76 that we saw for the RTO.

Kit Konolige, Senior Utility Analyst

Very good. Here is a kind of similar high level question. Last year, PJM mentioned that they saw a change in bidding behavior from the prior year as one driver in the auction. Did you see anything similar in bidding behavior this year?

Stu Bresler, Senior Vice President of Operations and Markets

Trying to remember from a year ago what I meant by that. You know and exactly, in other words, exactly what I was -- what I was referencing in a change in bidding behavior. The only thing I can think of is last year we had both the base and CP products available. And so resources that offered as capacity performance were not required to submit a base offer necessarily. And so we had a relatively small discount between the CP price and the base price was when I think about $20 a megawatt day. So that might have been what I was referring to last year. This year, if I was to point to any change in bidding behavior, I guess what I would say is, we had on the demand response side more that was willing to commit as an annual product than we have ever had in the past. I think when we look back at last year, just to try to get some handle on what the impact on demand responses likely to be, once we went to a 100% capacity performance.

If we looked at demand response that was offered as either base or CP, in other words, had indicated through its offer that for a given price, it was willing to be annual. I think we only had about 5,500 megawatts or some like that. So we got 2,000 more than that that cleared this year as an annual resource. So -- so that I think is what I would point you probably from my own perspective as probably the biggest change in, if you want to call that bidding behavior that I saw in this auction compared to history.

Kit Konolige, Senior Utility Analyst

And on the DR portion, do you have any sense of what was going on there? Is it just a matter of folks have had several years to plan for the full CP auction and so, if you were in the DR space, you were working on it and came up with some answers or are there other even any color that you've heard for example, about why it was such a large participation by the DR folks?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14713

Stu Bresler, Senior Vice President of Operations and Markets

Yeah, I really think demand response has matured as a resource. It's been a decade since we introduced demand response, as an equal supply side participant that could compete directly against generation. And for a couple of years, it didn't really take off because we had another product and without going through all the history, it took off exponentially after a few years.

And like I said over time here, I think it's really matured as a product. And I think the curtailment service providers that represent end use customers and actually provide this service are very savvy from a technical perspective. They know their customers. They know the markets and I think there is enough money. And if want that they can apply all that technology and that expertise to provide an annual product when that's what's required.

So I have to rely on the fact that they're committing to provide a physical demand response reduction products and that result come forward with when the delivery year rolls around. So I think this is really a reflection of how mature the demand response product has become.

Kit Konolige, Senior Utility Analyst

Right. Stu, do you break down the fuel used by the winning participants since specifically our -- client wants to know if he can find out how much nuclear cleared in total in the capacity -- in the auction -- capacity auction?

Stu Bresler, Senior Vice President of Operations and Markets

Yes. I don't have the number off the top my head, Kit. I saw that question here and I apologize, I don't have those numbers in a spreadsheet in front of me. But we do post a spreadsheet after the auction and Adam is dutifully checking to see if it's up there yet. He said it is up there. We do -- he is just -- he's looking for exactly where it's out, but there is a spreadsheet out there that has offered and cleared by fuel types on the website. So interested folks can go and see that in relatively excruciating detail on the website.

Kit Konolige, Senior Utility Analyst

It is detailed and that's what it should be, obviously. Okay. And here is maybe as a wind up, a question that's very broad. What kind of changes are you expecting between this year's auction and next year's auction? As you say it's full CP now, so that part, I guess won't change, but maybe there are tweaks to that and/or other issues and so on that that might have to be addressed?

Stu Bresler, Senior Vice President of Operations and Markets

As always Kit, stability of these rules is very important to the market, it's very important to us, so I would love it if I could tell you that nothing is going to change between now and the next auction. I just don't think that that's practical at this point. Although, I certainly don't see anything from the standpoint of significant structural changes to the market. However, just hitting a few things that I think we do need to continue to evaluate this year that could present potentially result in changes what I would considered to be sort of around the edges for next year.

We do have this public policy, the subsidy issue that we need to work through. So there could be something that we propose like I said that's stakeholder process, we are working as hard as we can to get concluded by the end of the year. So that's one issue we need to address. The aggregation that I mentioned, there are some issues that are actually still outstanding in front of FERC, as a result of some protests that came in, when we filed those rules. FERC accepted the rules and suspended them for one day, so they allowed the auction to proceed under those rules even though there was no quorum. So there's a couple of details around that that I think need to be addressed that are down in the weeds like

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-14714

make whole payments and how they're allocated and that sort of thing. So that needs to be addressed.

The third one, I would hit and this is not a Base Residual Auction issue as much as it is an Incremental Auction issue, but we have another stakeholder group that's looking at the structure of our incremental auctions. And our Market Monitor and PJM shares is concerned, but the Market Monitor has continued to and expressed it a concern, that like I said we share about the volume of megawatts that are sold forward in the Base Residual Auction; and then for which replacement capacity is purchased in the incremental auctions and essentially those positions are bought out.

And we think that that speaks to the potential intent to arbitrage the Base Residual Auction price versus the Incremental Auction prices, which would have the suppressive effect on the BRA price. So we are actively discussing with our stakeholders potential structural changes to the incremental auctions, in order to, if there is a sort of a better way to form price in the incremental auction and decrease any incentive there is for that behavior.

So I think those are the -- the three things, it feels like I'm missing a fourth, but those are the three things that I would point to, as things that are undergoing discussion now for -- that could result in changes for next year.

Kit Konolige, Senior Utility Analyst

Sounds good. I don't -- if you would, can you just take a quick look through the questions. We have a good number of questions, some overlap a little bit and just take a look and see if there's anything in here that you think would be worthwhile addressing before we wrap things up?

Adam Keech, Executive Director of Operations and Markets

Yeah. This is Adam Keech. In response to the question about the capacity cleared by fuel type, I think the question was specific to nuclear.

Kit Konolige, Senior Utility Analyst

Right.

Adam Keech, Executive Director of Operations and Markets

So in the posting we have on pjm.com, if you navigate to the capacity market page, under the links that go for each delivery year, you'll see a link that says commitments by fuel type and delivery year 2017, 2018, 2019, 2020. The file that's linked to that actually contains the most recent auction results, so we can get the title of that change. But you'll see every auction year and every fuel type and how much has cleared and offered in terms of UCAP. And so for nuclear, in 2020/2021, if you calculate it out, it's 16.5%.

Kit Konolige, Senior Utility Analyst

Okay. Excellent.

Stu Bresler, Senior Vice President of Operations and Markets

Yeah. Kit, let me just -- let me just scroll through some of these questions, so I think some of them are ones that we can answer pretty, pretty quickly. So there's one here about the impact of fixed resource requirement load in that 23.3% reserve margin. If we look at just the RPM cleared resource that was higher than that, it was like 23.7% or some like that, but the FRR load only has to submit resources in its plan up to the required installed reserve margin and then there

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14715

are some like buffer quantities and that sort of stuff. But the bottom line is when you include the FRR load because it's required reserve, which is why we call it a fixed reserve -- fixed resource requirement. It actually sort of reduces the overall reserve quantity, so that's how we end up with a sort of a weighted value of that 23.3%. We hit the changes for next year.

Unidentified Participant

We -- there is one here about can we see the offers from market participants.

Stu Bresler, Senior Vice President of Operations and Markets

The answer to that question is, no. We do not post all the offers. However, in a few months, we will post scenario analysis. So we will change quantities of supply and demand in both the RTO as well as various locations and then post the varying results of the auction so that people can get an idea of the supply and demand dynamics, if you will, but we can't post the unit specific offers.

Unidentified Participant

There's a question as well as to whether there is any kind of power plant that cannot participate in the auction?

Stu Bresler, Senior Vice President of Operations and Markets

Again, the basic answer to that question is, no. Hypothetically really any resource can participate as long as it can commit to the capacity performance requirements. But for example, a combustion turbine that is natural gas-fired that can't put in dual fuel, but is behind a local distribution company for its natural gas service and therefore can't get firm delivery may not be able to participate in the auction because it can't meet the delivery requirements in the winter time because it's likely to get curtailed as far as its fuel source. So there are some specific generators that just physically are unable to participate. But there is no class of resources that is prohibited, if you will.

Unidentified Participant

Do you have to physically be in PJM?

Stu Bresler, Senior Vice President of Operations and Markets

No, you can physically be outside of PJM, but we do have very stringent requirements for how you must be modeled. In other words, you have to be, what we call, pseudo-tied into PJM, which means we have to actually be able to dispatch you; we have to really sort of electrically move a resource into PJM for it to participate if it's physically located outside of PJM.

Unidentified Participant

I think we may wonder [ph] why so much demand response cleared.

Stu Bresler, Senior Vice President of Operations and Markets

final
Bloomberg Transcript
Bloomberg

CETL changes for next year are difficult. I know there's transmission upgrades in the plant, so we are likely to see some increases in CETL and that sort of thing. So that that it's hard to predict exactly how they will change, already this early in the process.

Kit Konolige, Senior Utility Analyst

On that, specifically in the New York intertie that was changed in, I think in the updated parameters this year. And my sense was, you were suggesting that that is on -- the analysis is ongoing as the status of Indian point changes and what New York's do in response to that and so on. So should we just expect that CETO and CETL and -- will keep changing and EMAAC in that region?

Stu Bresler, Senior Vice President of Operations and Markets

Yeah. There's a -- there's a couple things that are the subject of ongoing evaluation, if you will. The state of the external system could potentially be an ongoing input. But we're also looking at whether or not we should even consider non-firm assistance from an external area in the capacity emergency transfer limit for a given LDA. And there is only two that we do right now, I think it's Eastern MAAC and MAAC.

And so the question is, if we count on non-firm imports to an LDA from an external area in the transfer limit for the -- that LDA, then how does that comport with the fact that from the standpoint of what's required to actually deliver during an emergency that we require the actual physical capacity resources that are committed. So we're -- like I said, it's a subject of ongoing discussion and we will be taking that to our stakeholder process well ahead of next year.

Kit Konolige, Senior Utility Analyst

There -- there is kind of a similar --

Stu Bresler, Senior Vice President of Operations and Markets

(Multiple Speakers) I guess it's down to the weeds pretty quickly.

Kit Konolige, Senior Utility Analyst

Well, speaking of -- there is some -- there is a somewhat similar question about Com -- the effect that you might be able to see for next year, or at least might be weighing new transmission into ComEd. And I guess, PSE&G and we discussed the wheeling in New York, but at ComEd, I guess since that's the other separated LDA is I'm sure reviewed consistently for transmission upgrades there?

Stu Bresler, Senior Vice President of Operations and Markets

Yeah, exactly. There is -- there is a transmission upgrade in the RTO [ph] that I think is scheduled to go in service sometime in '20, I think it's like the early part of '20/21, yeah, some like that. So -- so that could have an impact from the CETL for ComEd and since -- and when I say a transmission upgrade, it's a transmission upgrade to relieve the binding constraint that limited the CETL into ComEd in this auction. So all else being equal, one side upgrade is in the plan, which it would then be for next delivery year if things stay on schedule, I would expect an increase in the CETL for ComEd for the '21/22 auction that we execute next year. But again that depends on that -- although this remaining true.

final

SI-SSA-0015-14717

Kit Konolige, Senior Utility Analyst

Right. And here is -- here is a couple of big picture questions, I see. How do you like the three-year outlook versus the long-term. I think I've heard you discuss that issue in the past certainly and what about the two-part auction process that ISO New England is using now?

Stu Bresler, Senior Vice President of Operations and Markets

Well, they're not using it now, they proposed it given the same sort of public policy, yeah, same public policy concerns they have up there. They -- their concerns are stemming from a bit of a different angle because the subsidies that have been proposed in the PJM region are all two existing units. When I say that -- when I say all, the new ones, the new subsidies that have been proposed are two existing units.

In New England, the states are considering subsidizing the penetration of new resources from the standpoint of those that have not yet been committed as capacity in New England. For example, new offshore wind or hydro out of Canada that has not previously been committed and that sort of things. So they have a bit of a different problem, but the net impact is the same.

And so their proposal, the way I understand it from talking about it with -- talking about it with them is, what it would amount to sort of is a phase-in of those new resources, as other resources in New England that maybe on the edge, anyway are sort of incentivized to retire. And so it's a way to not allow the subsidized resources to have a material impact on the supply and demand balance and therefore not have a price suppressive effect.

In PJM like I said, we have a bit of a different issue because we're talking about subsidies to existing resources. So you may know, PJM has thrown out a concept for our own sort of two-tiered pricing structure. I would imagine, in the next few days here we're going to post an update to that sort of thought piece of that work paper, if you will, for the purposes of kind of injecting that idea into the stakeholder process I mentioned before. So certainly more discussion here in PJM and that's one idea that we're advancing for at least for a consideration.

On the short-term outlook, I don't think it's really any secret that I think PJM feels that a longer, somewhat longer outlook might actually be better. And the reason I say that is because that's what we originally posed -- proposed back in 2007. I think we've started out was like five years and then I think through stakeholder discussion came down to four and then through the first settlement process round up with three.

So there is a balance to be struck for sure. Obviously, the longer out you go, the less, I should say the more uncertainty there is with respect to some of your input parameters, primarily the load forecast probably have a credit and collateral implications as well. But on the other hand, the benefits of the longer outlook would be greater certainty for certain types of resources, as well as more ability to offer earlier in the development process for resources that are unsure whether they're going to be economic or not.

So there are certainly are pluses and minuses, certainly from PJM standpoint that's not one of the items that's currently on the table for discussion. Like I said, because we -- I think feel that there is some real value to the stability and these rules and even if they're not perfect, changing something that is -- that fundamental to the structure might be more disruptive to the function of these markets than maybe getting to the perfect.

Kit Konolige, Senior Utility Analyst

Fair enough. I think -- I think we have gone through a lot of the questions and you have certainly addressed many of the main issues clearly that are on peoples' minds. So with that, I'd like to thank Stu Bresler and his team and thank everyone on the phone. I can just remind people that, you should be getting an email that will enable you to get, I think copies of slides and potentially a transcript in the future. If you have any issues with that, give me a call or be in touch with one of our folks at Bloomberg. Stu, thanks again, we look forward to incremental auctions and more to come.

MANAGEMENT DISCUSSION SECTION

Daniel J. Cregg

Okay. Good morning, everybody. I appreciate the opportunity to talk to you this morning a little bit about Public Service Enterprise Group. We have our forward-looking statements and GAAP disclaimer, which will bring us to our first slide. Really the company is made up of two strong businesses. On the left hand side you can see description of Public Service Electric & Gas Company, our regulated utility, it's electric and gas delivery, as well as transmission, New Jersey's largest utility.

And our growth really is fairly considerable at this point through infrastructure spend. We have the next five years a $12 billion to $14 billion infrastructure program. And as you take a look and roll that through from a rate base perspective, we anticipate that that will bring us high single-digit rate-base growth in the range of 7% to 9% over the next five years. And really our objective there is aligning with public policy goals, identifying especially in New Jersey what the state is looking to accomplish and working hand in glove with them to put capital to work to be able to address the customer needs that we have in New Jersey.

On the right hand side of the slide, PSEG Power. It's a regional competitive generation company, undergoing some changes really to improve our efficiency and competitive position. We're in the midst of a construction power to build out three combined cycle units, one in Maryland, one in New Jersey and one in Connecticut. In aggregate, over the next five years, about a $2.6 billion capital program at PSEG Power and that will roll off as we get to 2019, and I'll show you a little bit of color as to what that means from the standpoint of overall cash flow for the business. And whether it's that $12 billion to $14 billion growth plan and capital spend plan at the utility and about $2.6 billion at PSEG Power, about a 5:1 ratio of capital on the utility versus what we see on the Power side of the business.

Take a closer look at the two businesses, and we'll start with the utility. PSE&G really running down the center part of the state from the George Washington Bridge to the Ben Franklin Bridge if you will, electric and gas utility, so we are converged already, and have been for quite some time with a sizeable transmission business as well. For a single state utility, there is a fair bit of regulatory diversity because of magnitude of transmission spend that we have as regulated by the Federal Energy Regulatory Commission.

We also have some investments in renewables and energy efficiency, again working hand in glove with what the state is looking to accomplish from a policy perspective. You take a look at the bottom right hand side of this slide, slide 6, it gives you a pie chart as to what at the end of the last year, our overall rate base was made up of. About $15.2 billion in the aggregate. And on the distribution side, about 52% and 44% coming from transmission with the balance coming from solar and energy efficiency.

Let's step over to Power for a moment or two. We have generation in three competitive markets in New York, in New England, and the largest of our markets with the assets that we have is in PJM. We are close to load. We think we have generation in very good locations. And as I said, really positioned to improve our efficiency and competitive position with some newbuild that we're working on right now. The portfolio is rounded out as well, with some other interest – we have the solar business on the Power side as well, about 326 megawatts DC in that business and in other facility in Hawaii that rounds out the portfolio.

Bloomberg Transcript

We've been paying a fair bit of attention of late to a number of policy and regulatory issues, really all with a focus to improve quality service to customers. And really there're different assets and different means as part of some of these different elements that I'll speak to, but the same purpose really, which is to drive reliable, clean and affordable power for our customers. There is four listed on the page and I'll step through a little bit of details for each of them.

First being a rate case. So on our distribution business in New Jersey, we fought our last rate case in 2009 and came out of that case in 2010. So, it's been about seven years since we've been in a rate case in New Jersey on the distribution part of the business. As we think about the rate case, it'll be on the distribution side, and really will be all about updating the data that we have. So, it's been a while since we've been in. One of the elements that will come about within this rate case is there are some capital roll-ins that are scheduled to transpire within the rate case.

And in particular, if you think about some of the spend that we did for Superstorm Sandy back in 2012, the state had a generic proceeding to go through the prudency of that spend shortly after the spend was incurred, but that spend still awaits regulatory treatment. So that will be one component that will go into the rate case. In addition, two of our more recent clauses, one also related to Superstorm Sandy, but what came out of that was an energy strong program. So, that was a $1.22 billion program to enhance the resiliency of the grid in New Jersey, both on the electric and on the gas side. So, a good example of that was raising substations to avoid the impact of any flood conditions. That $1.22 billion program in the aggregate had about a $1 billion of clause roll-ins as that money was spent, but anything beyond that $1 billion awaits rate recovery until this next rate case. So, we'll see that come into the rate case.

And similarly the following program that we did which is a Gas System Modernization Program, which was replacing cast iron and bare steel pipes in the ground. There was a component of that spend as well, about $85 million a year that awaits rate treatment. So, knowing we have this rate case coming up, it was timely for us to take on that kind of capital spend and put some of that capital spend into rate treatment during this rate case. So, all spend that's been acknowledged and understood that was to be done and in the case of Superstorm Sandy, spend that has already been deemed prudent through a generic proceeding, but spend that will roll into this rate case.

And we'll also look to explore some rate design treatment during this rate case and the one example of that is decoupling. If you think about our business on the gas side of the business, we have a weather normalization clause on the gas side of the business, which works to moderate some of the weather impacts that we have on the gas side. On the electric side, we do not have a decoupling mechanism in place and we anticipate as we step into this rate case having discussions about decoupling, which has been a topic of discussion in the state especially related to some energy efficiency objectives that the state is looking to pursue. So, we'll file that rate case in November of 2017 and if history has any indication, it may take about a year's time until we come to a final determination on that case.

Separate and apart from that, in New Jersey, there is some activity that's going on to enhance the programs that we have for long-term infrastructure. So, if you go back to the 2008-2009 timeframe until where we are today, it's been about 15 programs that we have put in place related to infrastructure, related to solar development, related to energy efficiency that we have worked through on a clause-by-clause mechanism with the state. Those mechanisms have worked well to enable us to do some of the things that the state is trying to accomplish and that we need to accomplish for our own infrastructure within the system, but they've ended up being, I would say maybe more effort and work that has needed to be done to get to the point where the work can actually be done.

So instead of going through a series of shorter term clauses, we think it makes sense to try to put something in term of the longer term – put something in place for the longer term, so that we can have more line of sight on what needs to be done, avoid any demobilization and remobilization of the work, be able to take on full-time employees and acquire equipment as opposed to do some of this work through contractors and have better line of sight on the work.

So, there has been a strong proposal that's been put forth just within the last month or so by the BPU in New Jersey, looking to extend the length of time by which we can do some of these infrastructure programs and we think that makes a whole lot more sense. So, instead of going into two or three-year bites, we could go into more of a five-year horizon to do some of the work that we all agree needs to be done. So, that effort is progressing along, comments are continuing to be worked through that process, and I think within the next couple of months, we'll have a little bit more certainty there.

final

Bloomberg Transcript

In addition, preserving the value of nuclear supply is an item that's on the list. And I think folks are pretty well aware of the economic challenges that are being faced by nuclear facilities, we've had nuclear facilities that have closed in various places around the country. And we think that there are a lot of very important attributes that nuclear brings to the overall grid, from fuel diversity and resiliency as a result of that from the standpoint of being an emissions-free resource, also from being a low-cost unit within the overall dispatch. And then finally on a more localized basis, the economic engine that a nuclear plant brings to the area that's it's in brings some very considerable benefits. And in New Jersey in particular if you think about the amount of energy that is produced in New Jersey, nuclear is about 40% of it and it's about 97% of the emissions-free energy in New Jersey.

So, a lot of very important attributes that come from the facilities and we've had a number of discussions at the federal level, at the regional level and at the state level to make sure that folks understand, A, the economic challenges that these units are facing, and B, the attributes that they actually do bring to the grid.

In addition, separate and apart from that, we are working with the industry to try to do everything we can to ensure that these facilities are as efficient as they can be. And Bill Levis who runs our Power company is headed up within the industry something called Delivering the Nuclear Promise to ensure that everything we are doing within the facilities are being done as efficiently as we can and the rules that are imposed upon us allow us to do that.

So, as much effort as we can do to make the plants as efficient as they can be, while at the same time working with stakeholders to make sure they understand the importance of the attributes that are brought to bear by these facilities has been ongoing. Increasingly, if we take a look at where traction may happen in the nearer term, we think it's more likely on the state level, but over the longer term, the recognition of these attributes at the regional level, at the PJM level and at the federal level is something that we're also working towards.

And then finally from a market perspective, we're very actively involved in advocating for some market reforms, and maybe a good example of that in PJM are the efforts going on around price formation. And if you take a look at the way those markets are working, there is a host of different improvements that we think can be made and that are underway in discussions throughout a stakeholder process within PJM to try to enhance how those markets are working, how they are pricing electricity and how as a result the different participants in the markets are viewing those prices and moving forward.

So, we think in the near term, some improvements can be made from the standpoint of price formation. In the longer term, there is the potential for some of the attributes that I referenced before, and really in the interim trying to work through what could be the impact of some of the state actions that we have seen in Illinois, in New York, and how they can interplay within the markets.

So, moving on to look at PSE&G's rate base growth. This is a slide we've shown before that projects our rate base growth out into the future. I referenced earlier in 2016 the $15.2 billion aggregate rate base that we have at the utility. As we step through time, you can see how we anticipate that how much that will grow. And by 2019, within our base plan, we anticipate a 9% compounded annual growth rate in our rate base growing to $19.6 billion. Our base plan then steps into 2021, which would enable a 7% growth over that five-year period in total, growing to $21.6 billion. And you can see, as we step through time, there is a moderate increase in the amount of transmission that makes up the overall components of rate base for us.

You also see a fourth bar on this page, which shows what the rate base growth could look like with some expansion and extension of some programs that we have in place. And I'll spend just a minute to talk about what that entails. One element that entails is an expansion of our Gas System Modernization Program. So, I mentioned before what's in place, is for three years from 2016 to 2018 about a $300 million per year investment in replacing those cast iron and bare steel pipes. As we have been doing this work, we've identified that we can do an amount more than $300 million, and we will go in for an extension of this program later in the year to continue the work that would leave us on a pace to replace all those pipes over about a 30-year horizon, so that we have the largest cast iron and bare steel system in the country.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14722

As we have been doing that work and seeing that we can do more, taking that number from $300 million a year to $400 million a year would provide an increase over what's in that base plan that takes us to a seven-year – 7% CAGR as we move through 2021. So that's one component of that increase.

Another component of that increase would be the extension of our Energy Strong program. So again that was a $1.22 billion program that we put in place that is starting to come to an end of that existing program. But you may recall when we put that filing in initially it was for a $2.6 billion program, and we have about half of that, $1.22 billion approved. So there is incremental work that we see that gets us to that $2.6 billion amount, and that's compared to a backdrop of an aggregate amount of about $3.7 billion that were identified on the heels of Superstorm Sandy. So we think more work is available there to be done and we will go back and have that discussion with the BPU as we step forward later into the end of this year. That could be an amount of about $800 million, call that, $200 million to $300 million a year for the tail end of the plan. Not approved, but identified as incremental work that can be done.

And then lastly within the energy efficiency and solar area, there is call it $300 million or so that if we continue to do the nature of the work that we have been doing on the solar and on the energy efficiency front, that could be additive as well as we step into 2021. Those three areas combined would lift that 7% five year compounded annual growth rate up to about a 9% compounded annual growth rate. So, if the past is any indication as we have stepped forward into our plan and moved into the five year period that we talk about, we plan what we know and then we identify incremental capital spend as we step into that plan. These are the kind of things that would tend to lift that number up to what we anticipate being about a 9% compounded annual growth rate over the five year period.

A quick look at Power, this slide provides a look at really how the transformation of Power's fleet will take place over time. And what you see here on the left hand side is a megawatt snapshot of the Power fleet. On the bottom left looking at 2016 and on top of that looking at 2021. So, you don't see a very large growth in the number of megawatts between those two pies. And if you think about the nature of it, we've got about 2,000 megawatts that we're building in new combined cycle units, but we also have two of those locations at Sewaren as well as Bridgeport units that will be retiring as those units go in. So, that's replacement capacity at two of the three locations where we're building combined cycles. And in addition to earlier last year, we announced the closure of our Hudson and Mercer coal plants. So, really a change out of capacity as we go from 2016 and look out into the future.

On the right side of the page, those megawatts will be more efficient and will be more productive. So, we anticipate on a megawatt hour of output basis on the right side, an increase of about 18% of total production as we step through time and you can see from the blue component of that pie chart, we end up growing on a gas component from about 34% of our output up to about 43% of our output. So, increasingly a efficient and clean fleet as we step into the future and look at what our total output will be growing by in an amount of 18% as we step through to 2021.

And then a quick snapshot in looking at what the overall capital plan looks like for the two sides of the business and we can start on the left-hand side and take a look at Power's overall capital plan for the next five years. So, the left-hand side is really dominated by that orange sections – those orange parts of the bars that you see, that is the combined cycle, construction program that is currently in place. So, with two units going into service in 2018, that would be Keys and Sewaren and one unit going into service in 2019 that would be Bridgeport. That component of our capital plan declines as we step through 2019 and leaves us with a run rate of about $200 million of capital for the balance of Power across the five-year period. So, going from the high point of 2017 at $1.2 billion of capital spend down to a run rate of $200 million of capital spend, considerable cash flow comes off of the Power business. And I would say on that left side of the page, we're highly confident that that is what our capital plan will look like.

The right side of the page shows PSE&G. And if past is any indication, maybe we have a little less confidence in those numbers. And what I mean by that is as we have stepped into the out years of our plan, we have always identified incremental capital spend much like what I just described to you that fills in, if you will, the back part of our capital plan. And you can see that depicted here by the last three years have a hatched grey area and those are the programs that I referenced before that could bring us from that five-year rate base CAGR of 7% up to 9%.

So, PSE&G has considerable appetite for capital. The system has been around a very long-time and needs for replacement of existing older infrastructure. And so in taking a look at how the cash will flow as Power's program

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14723

comes down and the cash needs decline there, the opportunity for Power to fuel growth through the equity component of [audio gap] (20:25) plant to be matched from the overall standpoint about one-to-one, if you think about a regulatory cap structure being roughly 50-50, the balance of that capital program will be funded by debt at PSE&G. So, good cash flow coming of the Power and good utilization at PSE&G for infrastructure growth.

And on the O&M side, we continue to focus on the efficiency of our operations. It is something that we do on a daily basis. It is a mantra, it is not a program oriented thing for us. It is something that we focus on every single day. And I think it – ultimately it shows in the results. If you take a look at our overall PSEG O&M, as you go back to 2012 and you look at where we are in 2017, the compounded annual growth rate in O&M across all those years is 0.0%.

And you can take a look in all areas. On the right-hand side we show what the CAGRs are for the different components of the business. Frankly, the only area that has a more sizeable growth is the transmission part of the business [audio gap] (21:35) comes from the fact that as we are doing some of this capital work, there are O&M components or components of those cost that fall into O&M, so it is by no means coming from any kind of an inefficiency of operation on the transmission part of the business, really it's a function of the nature of the capital work that we are doing.

So if you take a look at the overall earnings profile of the company, this shows a breakdown on the left-hand side of the page. And as we've moved through time, you will notice that we have an increasing regulatory contribution to our earnings mix. So we show in 2012, we had a 43% contribution coming from the regulated part of the business. As we look at the midpoint of 2017's guidance we're up to 66% of [audio gap] (22:25) regulated part of our business. And if you think about what we have been discussing and how we have been investing that really should be no surprise, it is very consistent with the capital mix we have been talking about as we move through 2017 and similarly as we talk about the 5:1 ratio that I referenced earlier as we step through the next five years on our capital plan, very consistent with the investment focus and also consistent with those investments having good regulatory recovery. So a little less than half of our overall rate base being on the transmission part of our business, our FERC formula rate has a contemporaneous return component to it. And as we have gone through a host of the different clauses that we have gone through since our last rate case, that has had [audio gap] (23:10) through time, all helping contribute to the earnings picture that you see there.

So the utility in particular has grown at a 11% earnings CAGR as we've moved through this period of time through 2016 and an 8.5% growth as we move from 2016 into 2017, and Power as well does continue to provide a considerable earnings contribution to the business, $514 million was Power's earnings in 2016. So a good cash flow generator, an important part of the overall earnings mix.

And then on the right side, we provide the components of guidance that we have for 2017, those are consistent with when we issued guidance earlier this year at $2.80 to $2.90 per share in the aggregate. [audio gap] (24:00) dividend that we have provided to our shareholders for years. If you go back and take a look through 2011 through today, a 3.9% CAGR on that dividend and in the last two years, a 5% increase at $0.08 per share for each of the last two years.

One of the things that we also have talked about of late, if you take a look at [audio gap] (24:25) that is PSE&G's earnings per share. So [audio gap] (24:30) dividend and our PSE&G earnings per share being north of that, the dividend can be thought of as being fully covered by PSE&G's earnings in 2016. And we see the increase into 2017 [audio gap] (24:48) increase in our earnings, and a 5% indicative dividend increase that should continue into the future. [audio gap] (24:58) dividend, it is not a formulaic approach but absolutely understand the importance of that dividend to shareholders and do anticipate continuing to have meaningful and sustainable dividend growth.

So in summary, if you take a look at our value proposition as a whole, I think our platform remains very stable, including a $15 billion infrastructure investment pipeline, which does enhance the ability for us to grow the business. At PSE&G, where most of that capital is going to take place it will provide for a rate base growth, and all again targeted towards state objectives, and ultimately customer satisfaction, safety and affordability.

At PSEG Power, we continue to advance the efficiency and competitive position of that business and having a low-cost and clean fleet. And again, the intense focus on our operational excellence, both from an O&M perspective, as well as delivering on this capital plan. 2017 will be the highest capital amount at $4.7 billion that we have spent as a company.

So, delivering on that is vitally important, and is a part of what we're doing on a day-to-day basis as we at the same time, work through some of our regulatory issues that I mentioned earlier.

And for 110 years, we have been paying that [audio gap] (26:24) keep that dividend secure and growing, all while keeping a very strong balance sheet. So, that $12 billion to $14 billion at the utility and $2.6 billion at Power is all funded without the need for external equity, and balance sheet strength is an extremely important part of what we are all about and is an important part of the business.

So, with that, I'll be happy to take any questions everybody has.

Q&A

<Q>: Hi. Could you just comment a little bit on the prospects for revenue decoupling in the state and how open do you think commission will be in that regard? And you characterized it as discussions, I am just wondering what the process would be if you have success?

<A - Daniel J. Cregg>: Yeah. And I guess I would maybe start the answer by saying that we'll file the rate case on November 1 of 2017. So, in that regard their discussions as opposed to a formal process that's going on, and it'll be part of that rate case as we have those discussions.

I guess the other thing I would say is that, New Jersey has had an interest in energy efficiency and will continue to have an interest in energy efficiency. And I think from some of the legislators' actions as well, there is an understanding that as a good vessel to bring some energy efficiency spend to the state there is an understanding that energy efficiency obviously has an impact on aggregate volumes. So, it more incentivizes utilities to move forward on energy efficiency to the extent that you have decoupling.

So, I think we have not had a formal decoupling in New Jersey as yet. But I do think that given the interest in energy efficiency, there is a symbiotic relationship between moving forward with energy efficiency and moving forward with decoupling.

Daniel J. Cregg

All right, if there's no further questions, thank you very much.

Presentation

Kit Konolige, Senior Utilities Analyst

Good afternoon, everyone, and thank you for joining us today. We have a very interesting and hopefully useful webinar with several folks from PJM, the major unregulated marketplace in the US in power. I'm Kit Konolige; I'm the Senior Utility Analyst at Bloomberg Intelligence. And my guest is Stu Bresler, who is the Senior Vice President for markets at PJM, and he has several folks assisting him as well. We'll turn to Stu in a minute.

Let me first just mention a couple of housekeeping notes. The presentation will be recorded. It will be available immediately after we finished talking live. You can adjust the volume, maximize your screen. To ask a question, you can submit one on the right side of the slides. And then, what I propose to do is, we will go through the questions and ask them after the full presentation. And a copy of these slides will be available for download in the post-event email. In addition to the questions that I'm turning to in a minute, we will -- we have a number of charts and graphs that explore some of the aspects of the PJM structure and the PJM auction coming up.

Just one brief commercial; Bloomberg Intelligence, which I'm a member of now is approaching about 300 members, workers and -- hard workers, and it's -- we're obviously part of a much larger Bloomberg organization, but in some ways, we're quite separate. We are focused on investment considerations, so we're not news. On the other hand, we are not strictly a sell side operation, but we do a lot of the same things that the sell side does.

Basically, we publish research on equity, debt. We have people who are specialized in law of various kinds, litigation, policy, et cetera. So we think it's a very interesting, and ideally it's a very helpful platform to be able to communicate with a lot of our clients.

And with that I will move along to a list of the key topics that I jotted down and I shared with Stu prior to this call and we went through them a little bit and I think these are to my mind questions that clients ask, the questions that I ask and the questions that Stu has heard about. So I know from the past that Stu is very straightforward and thorough in discussing issues that come up such as these and obviously wants to be communicative and transparent about the PJM situation, the PJM auction, capacity auction in particular.

So, with that, let me turn over to Stu Bresler and as I say, if as he is speaking, if you have questions, you can type-in in real time on the right hand side type in a question, and then we'll get to those questions when he's finished his discussion. With that, Stu?

Frederick S. Stu Bresler III, Senior Vice President

Well, thank you, Kit, and good afternoon, everyone. As always it is a pleasure to have the opportunity to speak with you and exchange information regarding the upcoming May RPM Base Residual Auction. We certainly recognize that for our market participants the investor community it's certainly is a significant event during the year with respect to for procurement of capacity in the PJM market, so again, it's our pleasure to be able to have the opportunity to speak to you.

Bloomberg Transcript

With me today, Kit mentioned that I had some -- some of my colleagues with me, I have Adam Keech, who is our Executive Director of Market Operations and Jeff Bastian, who manages our Capacity Market Operations Group, his folks actually have the awesome responsibility of clearing the capacity auctions in PJM. So, you may hear their voices as well during the conversation this afternoon to the extent that they have detailed information that they can supplement and that sort of thing.

So, as Kit indicated, when he had sent me what his thoughts were on what we could cover today, I thought it was a pretty comprehensive list of the kinds of things I would talk about with respect to the factors impacting the upcoming May auction. So, I thought I would hit those topics, because it's -- like I said what I would have talked about anyway and certainly we should have plenty of time for Q&A either as we go along or once I finish with these topics.

So, as you all know the sort of the first step and preparing for the auction in May, at least the first major step that it involves publicly posting information is posting the auction parameters, the planning parameters for the May auction. And we published an initial set of planning parameters by February 1st, leading up to the May auction and then it just about every year -- based on every year so far prior to RPM auctions. We have posted an updated set of planning parameters about a month out and that update occurred last Thursday, April 13th. So you can find if you haven't already, the most up-to-date set of planning parameters for the upcoming auction on our website on the RPM page. I do not expect at this point another update to be necessary before the May auction. Those parameters you see should be the final ones that are posted up there on our website.

But looking at sort of what changed from last auction to this one with respect to those planning parameters, is the major factor that really basically drive the results. We have seen yet another reduction in the forecast peak load for PJM. The forecast peak for 2020-2021, which is the delivery year fullish [ph] well on the basis we do auction in May, decreased about 3,273 megawatts, or about 2.1% from the forecast peak load that was used for the 2019-2020 delivery year.

And again this is a -- surely the result of increased penetration of behind-the-meter solar installations as well as the continued incorporation of energy efficiency efforts. I think the major factors behind the peak load forecast change from one year to the next, and then obviously the underlying econometrics effected as well.

There was a bit of a change in the system-wide forced outage rate. So the reduction in the reliability requirement that we need to meet was slightly less, it was about 2% reduction from last year to this year, about 3,400 megawatts or so from last year to this year.

From the standpoint of the locational deliverability areas, the LDAs, those potentially constrained areas of the PJM system that we will model in this auction, we posted two additional LDAs this year. So all of the LDAs for which we posted a separate VRR curve last year, we did so again this year, but we also added the Dayton and the Duke, Ohio, Kentucky LDAs. And the primary reason for doing so was the potential for at risk generation in those LDA's given some of the public statements we had seen made by market sellers in those areas about the potential to retire certain resources, namely Stuart and Killen in that -- in those areas. I think they're actually in the Dayton zone.

And so with that publicly announced information and then we actually have since received an official retirement request for those resources. We felt it prudent to model those additional LDAs. The updated planning parameters that I mentioned that were posted on April 13th, include adjustments to the transfer limits for really any LDA, but I think those primarily affected were those two based on the removal of those Stuart and Killen units from the network model.

So, again, there is no necessarily requirement or expectation that those LDAs will actually bind and be constrained in the auction does not automatically mean that when we post them, but we felt that again prudent that we model them and they have the potential to do so given the fact that that we saw that potential for that generation retiring before the 2020-2021 delivery year.

We are for the first time this year have had some registration price responsive demand for the upcoming auction, again, we posted that with this latest for the most up-to-date value with its latest set of planning parameters. It is on the order about 600 megawatts that has registered, that does not guarantee necessarily that again it will clear in the auction depends on what the prices were indicated or for that price responsive demand, but again that's a first for this auction compared to prior auctions.

Bloomberg
SI-SSA-0015-14727

Let me cover with respect to the transfer limits the CETL value, that stands for Capacity Emergency Transfer Limits for the LDAs, because there were some fairly significant changes, both in what was posted initially and then the updates we posted on April 13th, and I thought it might be beneficial to provide some rationale there. Primarily that we're talking about, here are the some of the Eastern LDAs, there is the PS and PS-North LDAs as well as Eastern MAAC.

Those two LDAs and the CETL values, the transfer limit values, which really are in expectation of how much energy could be transferred into an area during a capacity emergency are impacted somewhat by the assumptions on the emergency assistance we could receive from New York ISO. And we have a transmission service contract affectionately [ph] known as the PS-Con Ed Wheel that is ending actually at the end of this month. And between last year and this year we got that final notification that that transmission contract is being canceled, and that change the way we sort of model things up with the Northeastern interface between PJM and New York ISO. And so to make a very long story short, we were a bit optimistic in the emergency assistance that we assumed, we could receive from New York during a capacity emergency when we posted the initial values for PS, PS-North and Eastern MAAC. And as we continue to refine the modeling assumptions -- I'm sorry, because we were optimistic the CETL values we posted for those three LDAs, PS, PS-North and Eastern MAAC were significantly higher than they were for the last RPM auction, last (technical difficulty).

As we refine those assumptions and really model something much more realistic for the amount of energy that would likely be available from the Eastern part of New York ISO in a capacity emergency. We significantly reduced that, again, previously optimistic assumption. And the final values we posted last week on the 13th for Eastern MAAC was much closer to what we actually had for the 2019-2020 auction. I think it's within 15 megawatts or some like that.

The PS, PS-North values came down a lot as well from an initial posting, but they are still a few hundred megawatts higher than what we use last year, because there are some transmission upgrades in the Eastern part and Northeastern part of New Jersey that help the CETL values for PS and PS-North. But again, not nearly the increase we had initially posted with those optimistic assumptions about emergency assistance from New York.

The last one I'll hit is -- actually there is two more. The MAAC LDA, we posted a value for this auction that actually is fairly significantly reduced from last auction, and that is due to a constraint towards the Southwest portion of the MAAC LDA that is affected by a change in really the sort of system configuration in that area. We have seen a change in retirement notifications where resources that were previously retiring, now intend to repower and so therefore back in the model and as a result of the -- sort of the flow changes from that reconfiguration we had a limit down there in the Southwestern portion of MAAC, that reduced that MAAC import capability, that emergency transfer limit.

And then finally there was a reduction in the transfer limit into ComEd of about 900 megawatts or so, and that was due to some increased flows on our transmission constraint AEP feeding into ComEd that caused that that lower transfer capability into the ComEd LDA. So from the standpoint the transmission system modeling, I think that's -- the changes that I would highlight from -- again from last auction to this one.

From the standpoint of potential for new capacity in this auction, what we post out there on the website, which you can go have a look at is the generation that has requested an exception from the minimum offer price rule, which is a pretty good indication of the quality of megawatts that may decide to offer into the auction and that value it's about 12,200 megawatts or so, something like that, is roughly the same as what we've seen in the aggregate for the last several auctions. There is not much of a change to that number. The split is little different between the competitive entry, exception and the self-supply exception, but the aggregate number is about the same.

I would say just from a back of the envelope standpoint, we typically see maybe about half or so of that value that actually request exceptions offer into the auction and then something less than that typically clear. So again, no guarantees whatsoever as to what would happen with this auction, just trying to give you a feel for what we have seen in the past.

As far as generation retirements, what we -- if you go to the retirement page on the PJM website, and you take a look at the next several delivery years, I think we have maybe 3,000 plus megawatts or so, that is already scheduled to retire

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14728

between now and the end of the 1920 delivery year. We don't have anything else out really past that timeframe, as far as already requested future de-activations, but obviously that can change given the results of an RPM auction sometimes. And so it's possible some markets always out there waiting to see the results from 2021 in this instance. But, again, it gives you a decent guidance to what we're seeing between now and then.

This is, as Kit indicated in his PowerPoint, this is the first year where we will require the procurement of 100% capacity performance resources. Last year we cleared to somewhere on the order of 27,000 megawatts or so of base capacity, which has the requirement to perform only during that summer peak period. A lot of that was or some of that anyway was demand response, energy efficiency, others was generation. It remains to be seen obviously what the impact of the 100% CP requirement is. A lot of the generation, not all going to -- lot of the generation that cleared as base capacity last year, submitted offers for both base and capacity performance. And the base capacity offer was simply the more economic one to take, given the fact that we could accept up to a certain cap of base capacity. So, my message I guess is that, a lot of the generation that previously cleared as base has probably CP capability, but didn't clear based on a CP offer last year. So, what CL -- the unavailability if you will of an offer as base capacity affects offer behavior this year to see what impact that 100% CP requirement has.

I probably should hit this before, so I apologize for not doing that. I did mention already the new transmission, I think the major upgrades I would point to that affected this year are those in New Jersey. There's a couple of 345-kV lines that were added in New Jersey that I think affected the PS and PS-North CTEL.

But the impact of the Indian Point closing really had no impact on our transmission modeling for this year's auction, because New York ISO has not yet actually received an official retirement notification from Indian Point and PJM's practice would be not to remove an -- a unit from our transmission model until we receive that official retirement notification. And so we applied our same methodologies to Indian Point from the standpoint of calculating again CTEL values for any LDA that might impact.

Again, we did consider that potential when we look at the potential availability of emergency assistance from New York given the fact that we would likely peak around the same time.

So that was considered, I don't really think it affected it much because we probably would have been able to get much assistance even without Indian Point's closing. But, I guess that from a transmission modeling standpoint, there was no effect.

I already hit the ComEd import capacity, and the next bullet was the -- again the increase in Eastern MAAC and PS-North, those were really reset back to about last year's levels with the exception of the (technical difficulty) PS-North because of the transmission upgrades. So Eastern MAAC again is about the same as it was last year.

The only thing I'll hit as far as the last bullet on, I believe, come back to the second last bullet. The only thing I'll hit on the last bullet; solar, wind, demand response and energy efficiency is we do have the new rules for aggregation of resources where FERC approved PJM's filing of its aggregation proposal, so that resources could offer on a summer only, or winter only basis and we could aggregate them through the auction to make 100% annual CP across the board. And we did post the total value of winter capability that has applied for the ability to submit a winter only offer. They were -- with all wind resources.

And the total winter capacity and connection rates that we essentially awarded for this upcoming auction was about 1,700 megawatts and that 1,700 megawatts was the winter CIR capability already had an annual capacity and connection rates of about 500 megawatt. So the net change, I would say that between what was -- what could already be annual versus what could be winter only was about 1,200 megawatts or so.

So that means that, that would be, I think the amount that would be likely to be able to aggregate winter only resources to make summer only resources, primarily I would think demand response capable of clearing in this auction. But we will only clear those resources to the extent that we can match up equivalent quantities of summer only and winter only, and also dependent on their offer prices compared to obviously where the market clears given their locations. So just to give you again some aggregate indication as to the numbers we're looking at there.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14729

I think that's about it on solar, wind, DR and EE, but again we can go into the Q&A in just a minute here and see if there's anything else you'd like to know there.

That second-last bullet, I know it's a bit of an elf in the room these days, it's the nuclear subsidies and really kind of the issue of subsidies in general. It's very difficult to judge what if any impact that will have on this auction. And I say that for several reasons; number one, the subsidies aren't even in effect yet, we're talking about the Illinois subsidies to the Exelon nuclear units at this point. They actually go into effect on June 1st. And obviously [ph] that's a long time before the 2021 delivery year, but I make that point because they are the subject of a court challenge at this point similar to the -- this AAC [ph] program in New York as well.

So it's -- like I said, it's difficult for me to guesstimate if you will, how that might affect offer behavior we're just going to have to see how things turn out. If you want doing a Q&A, we can get into to the larger discussion on the impact of subsidies to the markets in general, but keeping it to sort of the expectation for this upcoming auction, I like -- don't have anything definitive, I can say there simply because the status of those subsidies, I think still remains a bit up in the air, given the fact that not even effective yet. So. again, from the standpoint of this is auction specifically I just -- I think I just this far as we can go.

So, Kit, I think with that, I'll wrap up hopefully within here is less than 30 minutes from our start time, which leaves us plenty of time for Q&A. I'll turn it back over to you to moderate that.

Questions And Answers

Kit Konolige, Senior Utilities Analyst

Excellent. Okay, that's great. Thank you. As I mentioned before, folks, if you have a question, type it in on the right hand side and it pops up here and we can review those with Stu, you know, the ones that are most interest and we have about half a dozen now.

First, there is one that -- it's a question about the load forecast and basically questions how come it goes down every year. In other words the curve gets redrawn each year that a lower level, is it reasonable to expect that that's going to stabilize at some point or what either particular factors there that we're missing that create that that difference every year or is the modeling biased upwards and has to be adjusted?

Frederick S. Stu Bresler III, Senior Vice President

Yeah, it's a great question, Kit. And I would say that unbeknownst to us at PJM. I would say that several years ago, yes, the forecast was -- was too high, and I think there's several reasons behind that. And remember, now this is a 15-year forward-looking load forecast and several years ago we saw that for several years in a row, we had forecast that were percentage points -- multiple percentage points higher than what we actually saw come in and will be back as it based on our models.

And so we undertook a significant effort a few years ago to make significant enhancements to our load forecasting models. And we started with the relationship between the econometrics and the load and a lot of work on sort of better correlating those with a lot of back-casting to get that relationship closer. And then we also worked to incorporate things like energy efficiency, behind-the-meter, resource integration and I think it's primarily lower voltage solar installations, smaller solar installations. And beyond that, I just think there is a lot going on out there in the retail space that is resulting in less load in aggregate for the same other types of system conditions like weather. And I guess I think there's a lot of energy efficiency efforts that are going on and conservation efforts and all sorts of things.

So, we think based on our most recent back-casting that we have squeezed out a significant amount of the area that we had in the past to the extent that our back-casting now actually floats around either over or under forecasting, because I think we've got an handle on some of these dynamics that we have been changing in the industry. Now where it goes in

final
Bloomberg Transcript
Bloomberg

the future, it remains to be seen sort of how the industry dynamics continue to change.

We could -- we can see continued energy efficiency efforts in those types of things, which would continue to result in lighter loads for the same like I said, other types of suited conditions. We could see via all of a sudden a revolution with respect to the technology behind electrification of transportation and see huge increases in load again based on the load requirements to support that particular industry.

So I think it could go either way and even more difficult is predicting what that timing of that would be. In other words, even if we did see a significant increase in electric vehicles would that be necessarily an increase to peak load consumption as opposed to off peak consumptions, but more energy consumption.

So, it really depends on how things continue to evolve. Kit, I think the best I can say is that I think we've gotten a pretty good handle now on the new interplay of the various things that go into the long-term load forecast.

Kit Konolige, Senior Utilities Analyst

Okay, great, Stu, thanks. Question pretty specific to one of your discussions about exceptions to MoPar [ph]. Does a generator need to apply for an exception each year, so that the 12,200 is kind of current year starting from zero kind of number or once you get an exception, can you really look forward to the next year, so there going to be a backlog of plants that didn't bid previously who are still able to bid.

Jeffrey Bastian, Manager, Capacity Market Operations

Yeah, once a resource clears, it no longer need a MoPar exception. So, to answer your question directly, I think resources that in the past have applied for a MoPar exception and either didn't offer or offered but didn't clear would need to apply again the next year, if they wanted to get an exception in the next year. The only ones that don't need to re-apply are the ones that clear in a particular year.

Kit Konolige, Senior Utilities Analyst

Right. Okay, fair enough. On the decline in the CETL [ph] tip from Intren ComED, I think you mentioned it was AEP to ComEd primarily, but in any case, can you discuss a little further what was leading to that and I know you can't predict pricing outcomes and so on, but is it fair to say that that is a significant tightening that in the past as indicated some pretty serious potential for different outcomes?

Frederick S. Stu Bresler III, Senior Vice President

Well, I mean it's about an 18% reduction in the transfer limit into ComEd, and yes, I did say, it was based on the -- an increase loading in the AEP area on a 345-kV transmission facility, that was the actual reliability violation. Now we do have an RTEP upgrade in the works to relieve that that transmission constraint. But for now, it did -- I guess it did result in a reduction in the CETL, it's 926 megawatts for the upcoming BRA. So, yeah, I mean all other things being equal, which is I think is the key, all other things being equal, you might expect ComEd to create a little bit higher than it had in the past. But again, that depends heavily on the offer behavior that we see from resources inside and outside of ComEd as well.

Kit Konolige, Senior Utilities Analyst

Right. Fair enough. Different arena, there has been a proposal in ISO New England, that addresses subsidized generation. Have you guys looked at that proposal with any kind of thought towards what PJM might do. And maybe

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14731

this is a good time because I think as you mentioned, the question of what and "open market does with generation that subsidized" and so presumably changes its behavior because of that is obviously has to be a very significant issue if that's going to be the direction things go and maybe you can just discuss broadly if the New England proposal is relevant that you mentioned that if there are other thoughts that you and the team have -- you know, are considering on where PJM goes if everybody starts subsidizing a significant part of the generating fleet, a very useful outlook kind of discussion.

Frederick S. Stu Bresler III, Senior Vice President

Sure. And I fully expected this topic to come up. I agree, it's an important one. So important that FERC is holding a two-day Technical Conference on May 1st and 2nd in which we'll be obviously an active participant. But I think PJM has heard sort of the complete gamut of opinions on the impacts of subsidies to the wholesale markets.

We hear from some market participants that there is threat of state subsidies is in existential concern with respect to their business model and the markets as a whole because as Dr. Bowering [ph] put it in his latest data, the market report subsidies are contagious and one subsidy suppresses prices and leads to more subsidies, which further surprises prices, which leads to more subsidies and pretty soon you have nothing but state sponsored RMRs and no market left.

Then you hear the complete opposite opinion which is there our subsidies all over the place, this is just one more, it's not even that many megawatts, you're already along and so why would you want to do anything that would counter those subsidies and prop up the price and incentivize additional new entry when you're already clearing at a reserve margin of over 20%. So those are your two south poles.

I think from PJM standpoint, yeah, I think, while it may be the case that yes, we have had subsidies in the past, certainly there are the federal production tax credits for renewables, there are state renewable portfolio standards, which can act similarly to subsidy. There is a local tax abatements and the list goes on and on.

These state actions to preserve resources that may otherwise be economic, maybe significant enough to warrant a serious look at whether or not the markets need to adjust in order to handle the impact of those subsidies and the potential action stands and equally large range as the opinions on the impacts, because those who are in that camp are the real threat to the markets would say the only rationale response here is a minimum offer price rule that applies to any subsidized resource thereby protecting the markets and the price formation in the markets for long-term price formation. The other end of that spectrum by the way is, this is already in the markets, you don't need to do anything and really all the market should procure the residual that is necessary once all these subsidies cause the entry those resources that extremely low offers.

Those again are the two poles. From PJM standpoint, well, we are searching for is a way to recognize that states have legitimate public policy initiatives and objectives that they're looking to achieve, but harmonize the markets, so that they still perform the function that I think everybody agrees, they have been successful in performing which is long-term reliability at lowest reasonable cost to the consumer.

And for PJM's perspective, in the long term, we understand the concerns around efficient price formation, because so much of what the RPM capacity construct is built around is considering the long-term impacts of the year-by-year execution of the market. So that's why we think it is our serious consideration.

Getting to your question finally about the ISO New England proposal -- from just to state at the outset, New England is coming from a very different starting points. New England is really concerned mostly about new entry and subsidized new entry, subsidized -- sorry, suppressing the prices in the four capacity market.

PJM's concern at least what has been presented most recently with respect to state actions has to do more with subsidization of existing resources. New England already has a new unit minimum offer price rule, a new resource minimum offer price rule, there are some renewable exceptions for that rule, but they already have an existing rule. PJM does not have an existing unit minimum offer price rule.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14732

So, again, they're coming out from a different starting point, but having said that, I find their proposal very intriguing, I think it's worth a lot of discussion. I think it's very innovative and I think is a real effort to for lack of a better characterization sort of phase in. The new resources has other resources are willing to exit the market and retire, thereby, sort of, again, the intent being to maintain the supply and demand balance, even as subsidized resources come in and I think it's a fairly elegant way to go about it. I don't pretend to have thought through every potential implication. In fact, I know there are some opinions around this very table as to what those implications might be that frankly we did have to wrestle to the ground. So, like I said, more to discuss, but I think it's a innovative proposal that is very worthwhile that discussion.

PJM put out a sort of a capacity repricing proposal last August at a stakeholder form that we had. We've continued to kind of refine that. We will probably post a revision to it fairly soon here. That I think, again, there is additional discussion again, the idea being that we recognize the quantity of resources that are coming into the market are staying in the market by virtue of state actions, but at the same time try to insulate the price signal that comes out of the capacity market from the suppressive effects of that -- that state action.

So that's it, so what I'd think from a capacity market standpoint, it's looking at various ways to sort of get the right quantity, but maintain the right competitive price at the same time. I think maybe it's possible that the bigger impact here of these state actions are actually in the energy market and the suppressive effect that megawatts that would not otherwise be there are still there around the clock due to state action, and that's a much tougher enough to crack, but we're trying to kick around potential ways we might be able to facilitate things like a sub region of PJM states that wish to recognize carbon price, if you will, and their portion of the region and how we could actually make that fit within to the PJM market construct.

Those kinds of ideas, again, certainly nothing that I would consider a well-formed fully yet but those are the kinds of things we've been working on. So it's a pretty long-winded answer to your question Kit, but it's a big topic right now. We're spending a lot of time on it.

Kit Konolige, Senior Utilities Analyst

Well, no question, I was aware of that meeting and impact there was a kind of lunch panel in DC earlier this week, you may have been familiar with where the -- one of the two FERC members was there and other folks as well. And somebody were saying something to the effect of, well, you're just kind of what you said in describing one view of what could evolve namely everything, it's the potential is therefore a slow motion re-regulation that and, you know, one state gives what's in effect the PPA or a subsidy et cetera to one type of assets and then the next state does the same thing and pretty soon everybody is paying for all their capacity and energy through bilateral contracts or whatever. So it's obviously, if that -- even if we move in that direction at all obviously that can affect the outcome of the remaining merchant plants, so interesting, very interesting topic. Well, you guys have the complex models, so you can just punch it in and do it right?

So, okay, I just want to -- here is a specific question which I personally have wondered about this a little bit, but can you briefly describe determining NetCONE, what's the technology that's modeled there? Is that just a new gas plant for NetCONE?

Jeffrey Bastian, Manager, Capacity Market Operations

Hi, Kit. It's Jeff Bastian. Yeah the NetCONE is the combustion turbine cost that's the reference resource that we use -- I'm sorry, combustion turbine, yes.

Frederick S. Stu Bresler III, Senior Vice President

Yes. Not combined-cycle, combustion turbine.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14733

Kit Konolige, Senior Utilities Analyst

Combustion turbine. Fair enough. Okay. And then I think you described how that's done, right?

Frederick S. Stu Bresler III, Senior Vice President

Yes. What we do there, Kit, is every four years we go back and do sort of a bottoms-up, if you will, reconstruction of the gross cost of new entry for various locations on the PJM system. And then, we do an annual evaluation of the net energy and ancillary service revenues for that reference unit for those various locations on the system. And then that gives us a net cost of new entry for each of those reference units in each of those areas. And the gross CONE is adjusted by WEGF and CPIs, remember. It's some sort of inflationary index.

Jeffrey Bastian, Manager, Capacity Market Operations

Yeah. It's a combination of --

Frederick S. Stu Bresler III, Senior Vice President

Right, so lot of the -- if I should have mentioned this in my overview, a lot of the -- I mean, since a lot -- a few of the NetCONE values were reduced somewhat substantially, 12%, 17% in a couple of cases. That was not a result of the -- any change in the gross cost of new entry because those went up slightly, but there was a fairly significant increase in the energy and ancillary service offset in a couple of locations in PJM, for example in Southwest MAAC that caused a reduction in the NetCONE value.

Kit Konolige, Senior Utilities Analyst

Right. Right. How that -- you obviously have a projected reserve margin for this next auction, the upcoming auction, do you project it out for the years ahead as well?

Frederick S. Stu Bresler III, Senior Vice President

No. We do that on an annual basis. So and it's not a projection, really it's a requirement. We have an installed (technical difficulty) this is a requirement. And if we were to calculate that every year on the basis of updated input parameters like forced outage rates and load forecast there and those types of things and then once a year we reset it.

Kit Konolige, Senior Utilities Analyst

Great. Requested, just reviewing once more the demand response, bidding rule changes, I think this probably addresses the potential for, well, DR has to address the 100%. It has to be a CP and I guess it has to be or may have to be associated with other types of supply, right?

Frederick S. Stu Bresler III, Senior Vice President

Yeah. Demand response as a standalone resource must be annual in order to offer in next auction. In order to offer as a seasonal resource like summer only [ph], for example, it can do that in this auction, but it won't clear unless it can be

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14734

final

married up with a winter only resource on the basis of location megawatts and offer prices.

Kit Konolige, Senior Utilities Analyst

And do you expect any, well, there is always some impact, but what do you expect the impact to be on demand response and on renewables of the 100% CP requirement. I know -- you know, when you first started talking about it a lot of parties had objections on the ground that it would disadvantage these types of generation, what are you expecting as an actual outcome at this point. Is there going to be any kind of drop off, do you think in those sources or are suppliers adapting to it?

Frederick S. Stu Bresler III, Senior Vice President

Yeah. I mean, like anything else, we'll have to wait and see but I'm happy just to tell you what my thoughts would be or what a reasonable expectation might look like for -- for demand response, it's hard to see how we would get an increase and clear demand response last year to this year, where last year the base capacity category was available. This year it's not everything has to be annual except what can be aggregated or I think can be fairly certain that there is not going to be enough winter only to marry up with what might want to be summer only from a demand response perspective. So again, all things being equal, I would expect to see some level of reduction in clear demand response this year. It's very difficult to estimate by how much until we see how things come in.

With respect to renewables, I don't know that I would expect necessarily a reduction in wind, because of the 100% CP requirement. The requirement for wind to be 100% annual, the hardest -- harder period of the year for winter performance is summer. They actually perform better during the winter peak than they do during the summer peak. So as far as what can qualify as annual versus what can qualify as summer only base, I don't see there -- I don't see necessarily a reason to expect a drop-off there. We may actually see an increase in wind if there is some that actually does aggregate with summer only demand response by being the winter only, but again we want to see how that turns out.

And then, energy efficiency, the majority of the energy efficiency that I cleared before was already CP, because, again energy efficiency is largely a permanent reduction in consumption. So I'm not sure I see much of a reason for a drop-off there either.

Solar; right, solar might be a different story, because, again, it's very difficult for solar to be 100% annual, because it's actually more difficult for solar to perform during a winter peak before the sun comes up than during a summer peak, where it's in the heat of the afternoon.

(Multiple Speakers) So at least directionally those of you, my expectations --

Kit Konolige, Senior Utilities Analyst

Right.

Frederick S. Stu Bresler III, Senior Vice President

-- can be difficult to predict.

Kit Konolige, Senior Utilities Analyst

And to stick with the CP requirement for a second, my impression was in the last auction that there was some general, I don't know if I'd call it surprise, but some folks took note that many generators seem to not have to spend the whole lot

Bloomberg Transcript

of money to harden themselves, if you will, to approach -- to be comfortable with CP requirements. In other words, the backup systems whether it was a committed supply of gas or tanks on on-site et cetera were able to be put into place at a reasonable enough cost that that many generators see and seem to able to bid, you know, not at massively higher prices to recover their costs in that situation. Is that a correct characterization as -- are the fossil generators doing okay as far as complying with CP at a relatively small percent of their prior costs?

Frederick S. Stu Bresler III, Senior Vice President

Yeah. Again, it's difficult for us to really get a whole lot of visibility into what generators might be spending in order to achieve the CP requirements. And we asked the question, we've asked it multiple times and certainly we collectively get back and I think we've actually published in various forms. We've gone back and it's -- certainly it's in the hundreds of millions of dollars of investment that has taken place.

Again, just from what we're able to get back, but I certainly would not claim that is the full story or the full spend, because like I said there is no requirement for us -- for them to tell us what they're spending necessarily.

Having said that, it's going to be very interesting to see what the offer behavior looks like this year. I mean, I mentioned that there were some probably 20,000 plus megawatts of generation that classified [ph] not quite that much, but, you know 1,000 certainly make a -- thousands of megawatts of generation that cleared as base last year.

And a lot of that offered as either CP or base, but the base offer was the more economic one for us to take. Now that has to be 100% capacity performance, it will be interesting to see whether or not they still offer at a higher price for CP or whether -- the raise to the bottom that some of the generators have, I think offered experience with before where they just want to offer some that make sure that they clear kind of takes over.

So it's very difficult, Kit, to get a really good handle on whether the offers we get are really reflective of what costs might be experienced in order to manage CP risks because there is the competitiveness of the market, right, which is they are submitting an offer that they think is going to be competitive with other resources because in some cases, we just want to make sure they get a commitment.

Kit Konolige, Senior Utilities Analyst

Okay. I think that brings us to the end of the questions that I see here, so, and you've certainly answered all my questions. So Stu and team from PJM, really like to thank you on behalf of myself and all the clients we've had on the phone. I think this has been a great, really great (inaudible) position of what's coming up in the ever exciting RPM auctions. So, thanks again and look forward to talking to you soon.

Frederick S. Stu Bresler III, Senior Vice President

Okay. Thank you. And thank you everybody who was on the phone. It's, like I said, always a pleasure to have this opportunity.

Kit Konolige, Senior Utilities Analyst

Take care.

Frederick S. Stu Bresler III, Senior Vice President

All right. Bye-bye.

MANAGEMENT DISCUSSION SECTION

Kathleen A. Lally

Good morning, everyone. Please take your seats. We're going to start momentarily. Good morning. It's nice of you all to be here with us at the New York Stock Exchange on this very cold winter morning. I'm Kathleen Lally, Vice President of Investor Relations for Public Service Enterprise Group, and I welcome you here with us at the stock exchange or listening to us via webcast.

We have, as normal, a very full morning prepared for you. Intend to start Ralph Izzo, Chairman, President and Chief Executive Officer of the company, who will provide an overview of the company's strategy. Ralph would be followed by Tammy Linde, Executive Vice President and General Counsel, who will review our regulatory and policy initiatives that we're focused on for the next 12-plus months.

And then, Tammy will be followed by Ralph LaRossa, President and Chief Operating Officer for Public Service Electric and Gas. And following Ralph LaRossa's presentation, there will be time for you to question he and Tammy on utility-related matters, both capital and regulatory issues.

And then after that Q&A, we'll take a short break. And then following the break, Bill Levis, President and Chief Operating Officer of PSEG Power, will present his view of the power company where it stands today. And there will be a Q&A following Bill's presentation. He'll be accompanied by Shahid Malik, President of Energy Resources & Trade.

Following that Q&A, Dan Cregg will conclude the conference with a very full overview of the company's financial position and outlook. And then following Dan's presentation, there'll be time for – ample time for Q&A with he and Ralph Izzo and, of course, any other subjects that may come to mind throughout the day. But with that, I'm going to turn it over to Ralph Izzo.

Ralph Izzo

Thanks, Kathleen, and thanks, everyone, for joining us. If you haven't had a chance, the stock exchange has just done a wonderful job of putting out some memorabilia and interesting documents from our 100-plus year history out in the area where the food is being served. So, I encourage you to have a look at that.

So, our forward-looking statement is as usual, we will be making some projections for you today both three, five and, in some cases, a longer dated projections. And we will be sharing with you both some GAAP numbers as well as some non-GAAP operating earning numbers and a few other statistics that we think are quite representative of the company's future financial prospects. Kathleen already went through the agenda for you, it is flexible. We're here to answer your questions and to provide you with as much information as we can and feel appropriate.

So, the company strategy has not changed. Those of you who've been with us before are familiar with this slide. It all begins at PSEG with operational excellence, the foundation of everything we do without which we don't think anything else will follow. So, based upon that operational excellence whether it's at our nuclear plants, our call centers, or in our accounting department, we provide ourselves the opportunity to build a financially strong company.

And then we view ourselves as good stewards of that financial strength in the way in which we go ahead and invest. And the results hopefully speak for themselves: 10 years of double-digit growth rate at the utility, 15% for the last five years, compound annual growth; a complete shift in power's generating fleet that we'll talk a little bit more about; 13 of the last 14 years growing the common dividend, paying it for well over 100 years, each year for over 100 years; and still in possession of strong credit metrics and the ability to fund the growth in the business without the need for new equity.

So, some of the highlights that we'll be sharing with you today, the utility capital program continues to grow. We'll talk about a $12 billion to $14 billion capital program today. And we'll also talk about progress that power is having in terms of its construction program, which should come to an end in the middle of 2018 and power will then resume its very, very strong free cash flow position and support for the equity needs of the utility.

You'll see that the CapEx ratio between the utility and power is now 5:1, typically have been more of a 3:1 or 4:1 ratio. And the five-year program, as we look ahead, shows heavy skewing towards the regulated entity and important investments that we're making to serve the needs of customers.

I know you don't want us to dwell on the past, but if you'll just indulge me for a moment. We work pretty hard so I'd like to give the team credit for some of the outcomes they've achieved. I won't read every one of these items. But if you look back over the past five years, we've had some enormous successes from major construction programs in our transmission department, projects delivered on budget, on time with the cooperation of the community, and the timing of that is perfect, you can even see some of the construction got – actually is that picture behind me? No.

Okay. I'm looking at a screen behind me that's showing a major installation using helicopters at our Susquehanna-Roseland [ph] across Township Boonton (5:44) . It's really great that I can see it and you can't. I'm not quite sure why we're doing that, but that's fine. And you'll see a range of improvements at power from primarily [ph] upgrades (5:54) to more recently announcements of brand new construction, repowering of existing sites, and one greenfield site in the Keys area and, of course, the never ending day-to-day victories that result in customer satisfaction scores improving both in Long Island and in New Jersey.

So, rather than dwell too long on the past, let's talk a little bit about the present and the future in terms of those parameters that I laid out in the first slide. We continue to get the accolades for our reliability measures. We're watching PSEG Long Island move up the J.D. Power from the customer sat scores.

Our operations on our Fossil fleet, which have become so critically important just given gas prices are better than they've ever been before. Hopefully, you will agree that we tell you what we're going to do and then we do it and probably the best example of that is 10 consecutive years of either arriving within guidance or beating our initial guidance.

The cash flows remain strong at both companies. The credit metrics are robust. We just did another 4.8%, 4.9% growth in the dividend. You'll see that we'll talk about a utility rate base growth that is, as a baseline, that we expect to be 7% more likely be closer to 9% for the next five years and then beyond. We'll talk some more about that. And then there's some potential we'll do even more just given the strength of the balance sheet and some dry powder that remains.

So, here on the left side we are showing you our GAAP earnings and, on the right, our non-GAAP operating earnings. The difference between the two in four out of the five years is simply mark-to-market accounting as well as our Nuclear Decommissioning Trust. The fifth year is the one year where there's an additional item in the GAAP that is not in the non-GAAP, and that's the removal in the non-GAAP of the expenses associated with the early retirement of our two New Jersey coal, gas – both dual-fuel coal and gas plants that we refer to as Hudson and Mercer. There's also a component of a write-down for the residual value of a lease that we own with REMA a subsidiary of GenOn, a subsidiary of NRG.

In general, we do not like to remove items from our GAAP earnings when we quote for you our operating earnings and we've had a pretty consistent track record of only removing the NDT and the mark-to-market accounting. But this time, we thought it was not indicative of the future earnings prospects of the company to keep the Hudson and Mercer retirement and accelerate the depreciation in there.

So, if I then compare our non-GAAP operating earnings to the dividend growth, you see that we are – this is not formulaic, so the little tilde, the squiggly line in front of the 4% is intended to demonstrate that we're not looking in lockstep. That if earnings grow at 4.2% then the dividend would grow at 4.2% But they are roughly in balance in terms of how these two are moving. And we continue to maintain that we have the opportunity for consistent and sustainable growth in that dividend. We are quite confident of that.

So, while the top line for the company is showing this 4%-ish growth over the past five years, what's probably equally, if not more important, to the way in which we view the financial stability of the company is what's going on below the parent. And here you could see that over the past five years, we've experienced quite a shift between the utilities contribution and power's contribution. In fact, if we were to take this slide back to 2008, I think that ratio would be more at 75-25. And if you just do the arithmetic here and take 43% of $2.44 and 66% of $2.90, just using the midpoint, you'll see the 15% CAGR that I referred to a moment ago in terms of PSE&G. And throughout this period, power has just been a tremendous cash generator and, as I said already, has said the utility equity needs over that period of time.

So, a lot of this is familiar stuff too. I am going to slow down now a bit as we talk about the utility capital program. Ralph will give you far more detail in terms of what we'll be doing and where we'll be doing it and Dan will make a – will put it all together from a financial point of view.

But I want to spend some time with you talking about it from the point of view of how long can this go on? What is it that will help everyone in this room feel that the one and only gating function to the needs of the utility are respect for the customer bill? That we are not in a situation where our growth is driven by customer – new customer demands, and new customer growth patterns. They are driven by new customer needs and those needs are for a level of reliability and resiliency that we haven't seen before. Those needs are reflected in an aging infrastructure that has really done a great job for 100 years, but can't continue to do that job as we look out the next 10 or 15 years. And they're driven by public policy decisions that we choose to be supportive of to help people.

So, the slide that you see here is one that we've shown, I've got to believe for 10 or 11 years. I glanced at Kathleen and see if that's probably right. I know we've been showing it for quite a bit of time. And we started out with this [ph] slide view here (11:30) thinking that folks would appreciate seeing the line. The line reflects what we thought the capital program would be last year when we were standing in front of you and how we thought it was going to grow in the five-year period from last year which, therefore, gives you the four years shown here. And invariably, we would come

back the next year and show you the five-year projection using a stack bar and the bars would exceed the line, which meant the capital program was growing. And I think folks recognize that it's a little tough to predict the future and that future is even tougher when it's five years out versus when it's five months out. But consistently, we would get the question, well, that drop-off that you see, will that continue and is it all going away? And that question would usually surface around transmission because there was an area of new and rapid growth.

So, this year once again, we have baseline spending that exceeds what we thought we would have last year. Baseline spending is stuff that's already approved or we have very, very strong feedback from the Board of Public Utilities that a program can be basically our Gas System Modernization Program has a long way to go and can be extended at its current rate. Don't have approvals for it yet but a high degree of confidence.

So, then we try to explain that the reason why we have this drop-off – so this is a slide we introduced I think two years ago, so now we're showing it three years in a row. So, when we look out five years, we don't get it right. But what tends to happen is that needs don't go away. We recognize additional needs as we get closer to the five years – to that five-year point. So, here we're showing you in 2013 we thought the capital program for the utility would be about $1 billion. Now, we didn't really think it was going to be $1 billion but that's what we knew at the time. And then in 2014, we thought it's going to be about $2 billion. In 2015, I don't know, Ralph LaRossa must have been on a vacation for a while. We thought it was going to be maybe $2.1 billion. And then in 2017, we thought, no, no, no, we've got some things that we need to do. it's $2.6 billion. And it turns out, this year it's going to be closer to $3.4 billion. So, a tripling of the capital program from the first time we mentioned it to you, so what we realized needs to be done today. And all this stuff is important things that needs to be done to meet those customer needs and public policy needs that we talked about before, right. So, nobody is replacing meters that work just fine, these are investments that are critical for customer satisfaction and reliability.

Now, I don't want to suggest that every time we show you a number that three years from now, it's going to triple, but the trend is a very consistent one, one in which they increase. So, that's a slide that we have been showing for a couple of years. Then last year, because people kept saying, well, is that what you think is likely to happen for the next three or four years? Is there room for anything else?
