So, we started showing you things that were in progress, that we had a high degree of confidence in. So, you may recall last year we talked about 8% to 10% rate-based growth. Now, we obviously have a larger base. So, we're talking this year about a 7% to 9% rate-based growth. And here, what we showed last year and what we're repeating now are those programs that we believe have a very high probability of being approved by the Board of Public Utilities as we introduce them. Why do we believe that? Because they are either extensions of existing programs or expansions of existing programs.

What's the definition of extension and expansion? Extension just means to do more of the same, but do it for a longer period of time. Expansion is do more of the same, but do 30% more of it. So, a good example of that is on the prior slide. I showed you our Gas System Modernization program assuming a continued $300 million a year run rate. The team has done a fabulous job in managing the work. We now believe we can increase that number, and Ralph will talk more about what that increase looks like.

So, if you put these gray cross-hatched components on the last three bars, because more than likely we would file for some of these late in 2017, it takes 6 to 12 months for the BPU to work on it, because they have other things that they need to work on besides PSEG. And then, by the time we get the engineering work done and the construction crew is underway, we figure it will have more of an effect in 2019 and beyond. Then we can achieve this 9% CAGR, and feel once again quite confident that that is an achievable number. So, that's the slide you've seen two years in a row in terms of what do we know, and what do we have a high degree of confidence.

So, in trying to feed your insatiable appetite for a never-ending predications of the future, what we're adding this year is stuff that is not baseline, not high degree of confidence, but is on the drawing board. And Ralph will go into details to what some of these items are. I'll mention a few of them right now, and then again later on. But because we've had to spend so much time doing things like making sure the transmission system can handle a new merchant generation paradigm in PJM, because we've had to spend so much time improving our low-lying areas given the demographics of

our service territory being an old style quite candidly industrial geography.

We have been more involved in infrastructure replacement and the rest of the country has done other things like AMI, modernizing transportation through compressed natural gas, electric vehicles. So, we haven't participated in that part of kind of the Utility of the Future. So, we are now beginning to turn our attention to some of those investment opportunities. And that in combination with as you know what is a 30-year run-time for our Gas System Monetization, will cut back that 30 years once we are able to engage the regulators to realize that we can do more than [ph] $300 million a year (17:38).

That leads us to believe that really over the next 10 years, we have the opportunity to continue that growth rate in the utility. And the gating function that I mentioned before is the customer bill and we continue at times to surprise even ourselves. Last October, 7% reduction in the supply portion of the customer bill. This January and February, like a $15 a month bill credit, I'm not 100% sure of that number, I think that was about it. This June, a 2.7% decrease in the customers' electric bill because of the BGS results.

So, you could see, over the past few years, since – I guess that's right around 2009, we've lowered customer bills 28%. Now, they are combination customers and we're taking the advantages of low gas prices and the reduction in the gas bill to primarily fund the construction program in the electric side. But nonetheless, we think that that is something that makes enormous sense to do. And fortunately, our regulators are enlightened to the point where they realize that in a low interest rate environment with declining bills, if you don't start replacing an aging infrastructure now, you never ever will.

So, we have another charge expiring from the bill in April of this year. It's a modest charge. It's a leftover from once again, I think this is either a corporate charge or a tax charge from when we deregulated. We do have the BGS rate resulting in a reduction in electric bill in June and we do have these credits that will continue to flow to customers on their gas bill. So, we still have additional headroom that we're creating and can allow us to support the construction program and the rate-based growth I alluded to a moment ago.

Let's take a minute now and turn our attention to power. A different story here, right. So, power is probably solidly midway through its construction program, Bill will talk about that. It pretty much winds down in the middle of next year. And once that is finished, we are going to see a very different supply stack and output that comes from PSEG Power. So, at the bottom of this chart, what we're showing is power today. And the left side is power from a nameplate capacity point of view, and on the right side is power from the point of view of energy produced, and this shouldn't come as any surprise that power produces a disproportionately large amount of our performance nuclear plants compared to its coal plants or its oil-fired plants. So, you see the 32% nuclear from a nameplate point of view, grows to 57% nuclear from a energy point of view.

But look at what happens to power as we go from 2016 to 2021. And again this is based on current forwards. We then bolt-on our fundamental model beyond the three-year period where the forwards are not as visible. We don't take a view, we don't say that the market has got it all wrong. We simply say we can't out-guess the markets. And then based upon the efficiency of the combined cycle units we will be building, you see about a 15% to 18% growth in the number of megawatts being produced and you see a shift from the nuclear output to natural gas. It's not because the nuclear plants which are running at 90% capacity factors are expected to cycle, but it's just because we have more combined cycle gas turbines in the fleet at that point with an average sheet rate of I think about 7,100 BTUs per KWH just for the combined cycles.

Now, we had some conversations with the press a week or so ago on nuclear that's created a little bit of interest in the subject and there's probably nothing more important to me in my presentation today in terms of making sure that we get the facts clear and straight about our nuclear plants. So first of all, at the national level, I doubt that I need to remind you several plants have closed, some for economic reasons, just in the face of operating conditions. Others were a combination of capital investment reasons that – in the face of the economic conditions that makes sense to go forward. And different responses have occurred in policy circles in a couple of cases in Illinois and New York. The states intervene and said no, these plants are too important for a variety of reasons. And other states there were no interventions whether that was Vermont, Massachusetts, Wisconsin, and other places.

PJM is in the process of a study they call Grid 2020. I believe it's due to be completed late this month if not early next month or at least a draft. And they are looking at some things that are important for those of us who take very seriously the obligation to keep the lights on, but that the market may not be recognized, so the things like fuel diversity, reliability of operations and service, not from the point of view of a single power plant, but from the point of view of the system. Can fuel be supplied in the winter in the face of a significant event on the pipeline?

Now, in New Jersey, some of the challenges that others have experienced, we do not face. So, we don't have a sustainable wind resource and the negative dispatch price that occur sometimes as a result of the – of the production tax credit. We don't have space for huge solar installations. Our solar – utility grid connected projects are 5 and 7 megawatts, not 200 and 300 megawatts.

We do have renewable portfolio standards and there are subsidy streams that have virtually guarantee the capital recovery of solar, which does result in solar being able to bid and be a pure price taker in energy markets. And we do have our number one threat which is proximity to Marcellus gas.

So, as we look at our current nuclear plants, even with the benefit of hedges in place, those plants are not earning what we believe it to be their cost of capital. They are cash flow positive. So, we are not trying to be alarmist, but we will not operate those plants over the long-term if they are not earning their cost of capital. I've told people many times, that is a very painful thing to say, because I believe the nation should care about nuclear plants, and we care about nuclear plants and, equally important, we care about the 1,600 employees and their families down there. So, while that's a painful thing to say, it's not a difficult thing to say. The numbers are what the numbers are. And we understand our responsibility to earn our cost of capital and we will, plain and simple.

As those hedges roll off and we give you our hedge profile, yes, we do blend nuclear with Keystone and Conemaugh, but you can pretty easily back the numbers out. If we were to replace those hedges with what the current forward price curve predicts, those plants will go cash flow negative. That is a much more serious situation. And we are simply having a discussion with regulators and policymakers at the federal level, at PJM, and in the state, just to tell them that we will not allow ourselves to operate plants in those conditions. That may not happen, hopefully it doesn't happen. Bill Levis is leading the national effort to deliver on the nuclear promise to reduce our costs. I have no idea what RPM is going to do in two months that could help the situation. So, there are things that can and will change over the time to make the situation better or worse.

The only message I want to leave you today is we are not saber-rattling. We're not bluffing. We're not trying to be alarmist. Just believe me when I say that we fully respect the need to be good stewards of your capital, and as much as we think these assets are critically important to the nation and to our company, if they are not economically wise to continue to operate, we won't operate them. And right now, the forward price curve says, they should not be operated pass the three-year period.

So, as we look to growth in utility and in power, this year, if you look at the midpoint of our non-GAAP operating earnings, the utility is two-thirds of the entity, and power is one-third – power is about 32%, Long Island contributes about 1% of the – about 2% of the earnings. And you could see that the next five years we have this $14 billion growth program at the utility which would give us a 9% rate base growth rate. And power's total capital program is $2.6 billion, which would yield 18% growth in the number of gigawatt hours that it produces.

So, you could see the ratio of utility growth to power growth is now closer to 5:1, than the historic 3:1 that we've operated over the past five years. If I look at the utility back in time, that 13% rate base growth that we saw the past five years is mostly driven by a transmission expansion and our Energy Strong Program which was all about storm hardening, you may recall that in Energy Strong, we only were granted one-third of the dollars we believe we needed to simply take care of the damage that had occurred in Hurricane Irene, and Superstorm Sandy. So, we weren't even saying, let's apply those lessons to the broader infrastructure which we know for a fact, we have some low lying assets here and they need to get our attention and we only received one-third of what we thought we needed to fix that.

In the near-term, we'll continue primarily on an aging infrastructure set of investments, but as we look to longer term, there are some lessons to be learned from what has gone on in other places in the country and in fact, what is

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14743

anticipated and is clearly articulated in New Jersey's own Energy Master Plan and in terms of technologies and installations of those technologies that the marketplace simply is not going to bring to bear and we believe we can make a very strong and credible argument that the utility has an important role to play in that.

So, the awards keep rolling in. I'm going to read every one of these in detail to you so that – we couldn't fit them all on the page. I asked people to make it a collage, they said, no, then you can't read it. So, I said I'll just scroll on this page for a few minutes and let folks realize that we're quite proud of the recognition we received from others.

So, the stability of the platform remains. There is this robust pipeline in terms of the utility growth in particular. We've looked at the power investments that we proposed to make and are marking. They still look like very smart investments to us based upon the current forward price curve, and our fundamental model going forward. That's a function both of the location of the assets and the hardware that already existed on the sites. I think we've delivered on what we promised from the point of view of customer satisfaction and the outcomes from these utility investments.

Power's fleet, as I mentioned before, is going from something that was largely nuclear-driven to one that now has a significant component coming from a highly efficient combined cycle fleet with a tremendous decrease in the amount of power coming from coal with the retirement of Hudson and Mercer this year, the retirement of Bridgeport Harbor in 2021. We will simply be a partial owner of the Keystone, Conemaugh facility. And we're going to continue to focus on the sustainability of these returns, strong returns that exceed the cost of capital and the balance sheet that allows us the flexibility to do more of the same or some different things if policymakers give us the opportunity to do so, supporting the dividend on a sustainable basis and not needing any additional equity.

So, given the fact that we have some interesting regulatory issues in front of us, in particular one thing I did not mention that I'm sure you'll want to know more about is our base rate case that we've know about for three years now, that we will have to file in November of this year. We're doing something a little bit different, rather than stand up here and have several speakers tell you about the fact that we don't out-guess the forward price curve, and that the market is what the market is, we're going to have Tammy Linde, our General Counsel, come up and speak to you a bit about what is happening in the regulatory world, both in New Jersey and at FERC and how it pertains to our rate case, some of our infrastructure plans and nuclear considerations. And then I'll be back later on with Dan to answer any questions you might have.

Tamara Louise Linde

Good morning. It's a pleasure to be here this morning. Ralph and Kathleen both invited me to join the discussion today and provide an update on some of our key regulatory and policy matters, and also to share my perspective on where we're heading on some of those matters. I'll turn to the agenda. As you can see, I'm planning on covering a quite a variety of topics. I will, as Ralph indicated, focus on where we are as far as planning for our 2017 base distribution rate case. I'll also talk to you about regulatory reform and the opportunity that brings and has brought to us, to invest in our distribution system on the electric and gas side, as well as Utility of the Future type programs, and I will talk about where we are on the early stage of the process of having policy makers and regulators, understand the importance of nuclear plants, and valuing their attributes appropriately. And then I'll also focus on the broader wholesale market and some key initiatives that are underway at FERC and at PJM.

So let me start first with the New Jersey regulatory environment. PSE&G has a long history of good regulatory relationships with the New Jersey Board of Public Utilities. I have personally worked with the board for most of my 26 years at the company. And the relationship has been and continues to be very strong. And that has translated into very good, reasonable and fair outcomes in rate proceedings.

As you can see here, we highlighted the multiyear rate programs that we've received approval from the New Jersey Board of Public Utilities starting in about the 2008 timeframe. And it's actually been 15 multiyear rate approvals that we have worked closely with the state, identifying the types of investments and programs that align with state policy goals, and that are good for our customers. These programs have received approval in advance of the investment and have provided for near contemporaneous recovery of these investments.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14744

These have covered a variety of important state policy matters, including investment in our electric and gas distribution system as well as programs to help the environment through renewables and help customers use energy more efficiently on the energy efficiency side. And from a PSE&G perspective, these programs have allowed investment, investment that helps our customers, helps us provide good service to our customers.

It has allowed Ralph LaRossa and his team to accelerate replacement of older cast iron and bare steel pipes that are under our streets, throughout our service territory, and has also allowed us to invest in what we refer to as Utility of the Future type investments, community solar investments where we have installed, for example, solar on everything from pole-tops along our distribution – in our distribution system to large landfill and brownfield sites in our service territory, as well as building resiliency into our grids and preparing the system for future storms and preparing our customers to use their energy wisely.

The programs, I think, are of note, because each one of these is almost like a mini rate case. Each one involves preparing a proposal with the state and working through whether that type of investment is appropriate, whether the state has an interest in it, and agreeing to the terms and conditions that will govern that particular set of investments in that program. And it also involves going back to the BPU periodically, after those investments have been made and reviewing the spend and reviewing how we have implemented those programs to allow the recovery on the terms that were agreed to. And all of these programs were done outside of a traditional base rate proceeding.

I also want to note that during this timeframe, PSE&G did have a base rate proceeding, that was filed in 2009 and settled in 2010. And that was separate and apart from these programs.

So, let me turn to our next distribution base rate case. As Ralph indicated, we will be filing our next distribution base rate case with the New Jersey Board of Public Utilities no later than November 1 of this year. That is the result of a commitment we made as part of the settlement of Energy Strong, one of the programs that I referred to on the last slide, and it has been eight years since we filed our last base rate case. But as you noted, we've been – in the last slide, we have been in with the BPU working on a variety of rate matters for that entire eight-year period. So, our team is ready. We have the relationships, we have the skills, and I believe that we are well positioned to prepare a rate case and present one that supports all of the terms that are required for PSE&G.

And preparation of that case is well underway. We have been working on the case for some time period, and we are not finalized with all of the terms and conditions that we plan to provide and ask the BPU for approval for, but we are well underway in deciding exactly what that case would look like.

So, what will that case look like? Well, I think it's most important to say that a base rate case is very much about updating data. It is generally a historic-looking type case, looking at what has already happened since the last rate case, and updating a variety of information, everything from the load growths that was predicted in the last rate case. Where are we? Where are we today as far as sales of our product? That goes into creating the volumetric charge. Where are we as far as the O&M spending since the last base rate case? And it also covers a variety of other topics including, in base rates, the investment in our distribution system that has been made since the last rate case and that's not already being recovered somewhere else.

So, for example, the traditional spend that we make on a day-to-day basis, that Ralph referred to, since our last base rate case, that spend has been accumulating to – and will be included in this case. It does not include the type of spending that we have, for example, on transmission. It does not include the spending that we've been making on clause recovery mechanisms, on solar energy efficiency or other things that are already in our base rate case.

We do also plan to obtain recovery of the costs that we have incurred for storm, storm damage as well as responding to storms. As you most likely know, the BPU has a mechanism to allow utilities to defer costs incurred during major storms and then to obtain recovery of those storm costs in a future rate case.

We also see opportunity to update and change our rate design, update our capital structure, update our depreciation schedules. And also, we are considering other options, including pursuing decoupling that would be incorporated into our rate design, to allow our rates to adapt to changes in load going forward. All of these efforts in a rate case are

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14745

focused on ensuring that our rates reflect the cost that it takes to serve our customers and are aligned with cost causation principles.

And as far as timing, we anticipate that the rate case outcome will result in new rates going into effect in the end of 2018 or the beginning of 2019. And I do anticipate that our filing will support a modest rate increase on our base distribution rates.

So, let me turn to this rate schedule. This provides a picture of the timeline and activities in the traditional New Jersey distribution rate proceedings. And as you note, the rate filing starts and then there is a lot of activity back-and-forth as far as the regulators and other parties trying to understand our request. This schedule provides for what a fully litigated case in the New Jersey regulatory environment would look like, starting for example in November of this year, and ending at the end of 2018 or the beginning of 2019.

It is our experience that many New Jersey rate cases settle. We don't go into a rate case anticipating that it will settle, we plan our rate cases assuming that it will go for the entire length of a case, and we just think that's good planning. We make a decision on whether to settle based upon the facts and the circumstances that we have at the time during the case.

And I should also note that even if we take the course that is described in this schedule, that takes us all the way to the end of a fully litigated case, there's always opportunities to settle all the way up until the very end of the case. And we will take that into consideration and settle, if appropriate, or proceed to a fully litigated outcome, if appropriate, and in the customer and in our best interest.

At the same time that we are preparing for our base distribution case, we are also working on filings to be submitted to the Board of Public Utilities on future investment programs. For example, this past Friday, we submitted to the BPU a request to extend our energy efficiency program. There will be other filings that I would anticipate over the 2017 calendar year and during the rate case, potentially, that will seek approval of additional utility investment programs, much like the multiyear investment programs that I referred to on the earlier slide.

And with 15 of those multiyear programs approved, one would certainly be reasonable in concluding that the process has been working well, and has continued to allow us to make the investments that help our customers and help us meet our customer needs. But we do think that there's an opportunity for improvement. Many of these programs have had very limited timeframes. The 15 programs, for the most part, had a limited duration of about three years. There's some exceptions to that, where the BPU allowed us to go out beyond the three years, but for the most part, these programs have provided for pre-approval of investments to be made over a three-year period with review and true-up of those investment costs.

So we do believe that, through regulatory reform, that it would be possible and certainly in our customers' best interest to allow for longer term approval of investments. And we are in discussions with other key stakeholders and the State of New Jersey about lengthening out that time period that they are comfortable approving those investment programs. And that would apply to a variety of investment program types, whether it be replacement of gas pipes or building resiliency into the electric system, or whether it's for programs like community solar or the host of other programs that Ralph LaRossa and his team believe would be helpful to customers and that would fit within the state's energy policy.

The important part about these programs is also that they don't need to be part of a base rate proceeding. In New Jersey, we have seen that there is a willingness and an ability to work with the regulators and the stakeholders to get approval of the types of programs that are needed and are in customers' best interest. But with that, we understand that there have to be checks and balances, and we have worked very successfully with the state and the stakeholders – a variety of stakeholders to ensure that we provide that comfort in the programs to have checks and balances.

And what I mean by checks and balances are a variety of tools that can be used to provide comfort and to demonstrate that we are investing consistent with the program that we have had approved. For example, Energy Strong had a agreement to have an independent [ph] monitor (44:53) work with PSE&G and provide visibility into our planning and implementation of the Energy Strong program.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14746

That was an idea that was introduced in settlement and we welcomed it. And it has worked very well to ensure that the regulators and the consumer advocate has an opportunity to see, firsthand, what we are doing to implement these programs. There's also a variety of other opportunities to demonstrate that we're meeting our commitment in these forward-looking approvals. It can be reporting, it can be various update filings, and we are comfortable that we can provide the certainty and the visibility that once we get these programs approved, that we are implementing them consistent with the state's objective, and consistent with the terms and conditions that we agreed to.

So, let me turn to nuclear. We are in the very early stages of discussions with both federal and state regulators and policymakers on the value that nuclear provides. We do believe that preserving existing nuclear plants that are well run is important to both the nation and to the states, because they have become such an integral part of a reliable, clean and resilient energy system.

If you look at the value in New Jersey alone, our nuclear plants in New Jersey contribute about 40% of the energy supply currently relied upon in the State of New Jersey. There's an additional nuclear plant that also operates and that is scheduled to retire, and this is not included in that 40% number.

So, preservation of these nuclear plants is something that not only is consistent with the energy master plan, which has identified nuclear as critical to New Jersey's clean and reliable energy supply, but it is also very consistent with the objective of regional and federal policies of maintaining a diverse and reliable and clean energy supply.

We don't believe that preserving nuclear plants through programs, whether it's states or at the federal level are inconsistent with competitive wholesale markets. In fact, we anticipate that the competitive wholesale markets should ultimately change to value these attributes, the environmental attributes, the fuel diversity attributes and reliability attributes of nuclear power. But currently, they're not designed to support those attributes. And as a result, there is a gap that is occurring and nuclear plants are, as we see, at risk for not achieving their financial needs.

There is an opportunity to work with both federal and state policymakers to ensure that these attributes are valued. And while it's too early to anticipate where the solution for our nuclear plants will come from, I do believe that it is more likely that state outcomes and state legislative and policy matters programs are more likely to be the solutions we will see in the near term.

Then initial reaction that we have received from stakeholders that we have had discussions with regarding our nuclear plants has been widespread support for retaining the nuclear plants. In fact, I haven't spoken with anyone who has told us that they want to see the nuclear plant shut down. And the challenge is where do we find the solution? Does it come from the federal markets? Does it come from the state markets? And our conclusion is that in the near term, it's most likely to come from a state initiative.

And we are watching closely what is going on in other states. As Ralph indicated, some states have decided to allow their at-risk nuclear plants to shut down. And that was a decision made by those states, based upon the factors that existed and they considered.

Other states such as Illinois and New York have taken very strong steps to preserve the nuclear plants in those states and surrounding areas. And we're watching also very closely what's happening in some states, such as Connecticut and Ohio, and a few others as they start down the path of making the decision whether to take action.

We are working in parallel with PJM and the wholesale market participants, as well as making visits to FERC and talking to them about the challenge. There is a long-term path that could be achieved at the wholesale level where these attributes are valued. And as Ralph indicated, PJM has started to look at, through its Grid 20/20 program, and conducting a study on the long-term planning needs of the liability of the system, whether there is some action it should take. But in the near term, state regulatory and legislative action valuing nuclear plants is something that we are watching closely and we anticipate having more discussions in the State of New Jersey.

If New Jersey does decide to act, it will be required to adopt legislation. The legal framework that exists in New Jersey would not promote a regulatory solution to nuclear support, it would require legislation and it would require that legislation to be implemented by a state agency, most likely the Board of Public Utilities. So it's important that as we

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14747

start this early dialogue that we work with all of the key stakeholders, ensure that they understand the challenge, that we understand how they want to go about, if they choose to, preserving the nuclear plants through state legislative action.

Let me turn to the broader wholesale market. PSEG is actively involved in working with stakeholders and RTOs and ISOs as well as FERC to ensure that we have well run and well designed wholesale markets. The FERC is taking strong action to drive ISOs and RTOs to continue to improve their market design.

On the energy side, we are very encouraged to see FERC issue some rulemaking to look further into improving energy price formation. As a owner of generation in Eastern PJM, we see that price formation continues to need improvement. We don't always see the units that are called to operate and to run when needed, we don't always see them setting price. They are paid but they're often paid outside of the wholesale market price, not sending a clear market signal through energy prices when these units are called on.

We're very pleased and encouraged, as I said, that FERC has now directed the region to take a look at these situations and to dig in further to see what improvements can be made. And, we'll be participating in those proceedings and continuing to put pressure in the regulatory environment towards improved and transparent energy price formation.

On the capacity side, as you know, this coming auction will be the very first that does not have a [ph] base (53:31) product, but that is purely a capacity performance model, and we think that is a big step in the right direction. Those capacity performance rules were designed and took quite a bit of time to get in place, but they were designed to better value the reliability expectations that exist for generators that are being relied upon by customers and the system to be there when needed. And that is a very positive step.

And while the wholesale energy markets, from my perspective, are generally working as designed and providing good value to our customers, there's still a lot that can be done to make them better. And if I were to identify the three areas where improvements could be made in the short term, it would be price formation. This is one of those very detailed technical areas that requires FERC to really dig in to see how the operators of the RTOs and the ISOs are calling on units and making sure that when they call on units, they really are allowed to set the price; and providing visibility to generators and customers on what type of actions and what types of circumstances trigger certain units to be called out of merit and when those actions might replicate themselves.

The second category, I would say, is a little bit longer-term, and that is trying to work to change the drivers of wholesale markets. So they're not just about providing reliability at the lowest cost. But ultimately, that they also incorporate environmental attributes, fuel diversity attributes and resiliency. And I don't want to suggest those are easy changes or that they will be smooth stakeholder discussion, but it is important. And I think the nuclear experience, the fact that we're seeing nuclear plants become at-risk nuclear plants, when they have a long future under their license still remaining. And when they're still well run and providing reliability – supporting reliability of the grid every day that, that is a red flag to market operators and to FERC that, longer term, we really do need the markets to value and to plan for both diversity of supply, both environmental attributes, which are becoming more and more important to consumers and to our state policymakers.

And then lastly, something that fits into that middle category, not tremendously long term, not really short term, but we do need to see changes to the market design that allow for – and have smooth integration of state and federal action. There is not a bright line in many of the scenarios that we're seeing today between where the federal government's role begins and where the state government's policy initiatives end. And so, we're seeing a lot of state interaction and taking steps by themselves to pursue their policy goals.

Some of those state actions are purely legitimate. And I would say that support of nuclear plants, in my opinion, falls into that category. There are other state actions that we've seen that, I would say, are not legitimate state actions, and that are intended more to interfere with the market. So it's important that FERC evaluate where is that line and what action do they want to take. FERC has scheduled a technical conference that was just announced this past Friday. That will hopefully start to look into that question about where is this line and what type of integration should we see between state policy and well-functioning wholesale markets. And that will be something I anticipate having a lot more

final

SI-SSA-0015-14748

involvement at the federal and state level over the next 12 months.

So in summary, I think it's important to remember that all of our regulatory actions are focused on what can we do to provide quality service to our customers? And that involves a variety of different tasks, it involves a variety of different assets, but our customers want reliable, clean and resilient power, and they don't want to know what happens to get that. But we have to constantly plan and Ralph and his team, and Bill and his team are constantly looking at not just what are we doing today, but what are we doing down the road.

And that also has to be affordable. As Ralph Izzo said, we watch very closely what is happening with our customer bill to ensure that we can provide these objectives and do it in a way that's affordable to customers. For now, it means we're focusing on getting ready for our rate case for 2017. It means we're focused on having regulatory reform that improves the already good environment in New Jersey, and allows for extensions of programs and longer term of pre-approvals. It also means that we have to tackle this nuclear challenge and work with policymakers to try to come to a solution that is good, not only for the nuclear plants, but for the grid and for customers.

And then lastly, we have to continue to work to improve our wholesale competitive markets to ensure that they continue to operate to provide our customers with reliable and affordable power when they need it. So thank you.

I want to introduce Ralph LaRossa, who is up, and he doesn't need much of an introduction, you all know who he is.

Ralph A. LaRossa

Good morning, everybody. Still awake out there? I'm going to go over a few things today, just kind of put a finer point on some of the comments that Tammy made and Ralph made and I really hope that you take three things away from today's presentation. One, I would say that we have a team that has delivered over multiple administrations in the State of New Jersey, Republican and Democratic, multiple administrations at the federal level, again Republican and Democratic, and we've done so over a timeframe where we've been challenged quite a bit with some real severe weather events that have put us to the test.

So I think if you just take that as a background of what we've delivered and hopefully we'll give you a little more insight into what we believe is a true growth plan from the capital side, and I really think that's being driven by, one, the increased reliance on our T&D system that's taken place time-and-time again. The fact that we have aging infrastructure, which is something we're blessed with, we didn't create, but there's a real need to go back and replace that infrastructure, and I'll give you some facts and figures about that. And then the overall changing role of the utilities Ralph referenced a little bit, and how we're going to get – continue to get closer and closer to the customer, provide products that we may not have in the past. So that's the second item.

And then, finally a little bit about what Tammy said, just now which is that the time is right for these investments. They're right because they're aligned with what policymakers are asking us for, and are also right because of the headroom that we have and the bill that's been created through the commodity cost. So those are the three big takeaways, and I'll try to walk you through that over the next little bit of time here.

So I'll start out with the old slide, which is really just to give everybody a reminder, I do this every year, about our service territory. And I tell you to take a straight line between the George Washington Bridge and the Ben Franklin Bridge, go 30 miles on each side, and we pack in all those customers.

The thing that I haven't said in the past, which was kind of interesting. Scott Jennings and I were just sitting in the back and looking at some of the documents. If you go outside during one of the breaks on the right-hand side of the table, you'll see the 1924 map, which is exactly the same as the map that you see up here of our service territory.

But it's been a service territory that has provided us some great opportunities in the State of New Jersey, and you really see those on the top four things that we have listed there. We are the largest electric and gas distribution utility. We've got a robust transmission system. It's given us the ability to invest in things that we had never dreamed about back in 1924, [ph] which are (01:02:52) renewables and energy efficiency. And we've also built out an appliance service

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14749

business, which is really second to none, not only in the state, but if you compare us to the utilities across the country.

I will tell you to stop and look at the top right-hand picture. Because not only does that show you the service territory, but the other takeaway there is the transmission system. And I really haven't pointed this out in the past, but the blue is the 500,000 volt lines, the red being the 230,000 volt lines and the yellow being the 138,000. Basically, back in the 1920s and 1930s, it was all 138,000 and lower voltages, and we've continued to upgrade and make those highways from two lane highways to five lane highways.

And so, what you see there that I wanted to point out to you is really some continued opportunity for us to reinforce that transmission system. I'll talk a little bit about a line that's been approved just recently by PJM, which goes from Edison – I'm sorry – yeah, Edison to Metuchen to Trenton and then down to Burlington, which basically takes that yellow line that you see coming down the middle part of the state and upgrades that, 230,000 volts. You also note what we're doing quite a bit up in the Northeast corner of the state, which is our BLC line, we're also making a lot of upgrades to that part of the system. But what's not on here is the potential impact that we think is going to happen, because of all the changes that are happening in the topology of that transmission system.

You've heard Ralph and Tammy and everyone talk about what's happening with nuclear. Well, the biggest thing that's happening to our system that we know from a nuclear standpoint is the announced closure of Indian Point. How is that going to affect us? How is that going to affect that Northeast corner of the state where there still are a number of 138,000 volt lines. Not only how is the closure of Indian Point going to affect the transmission system, but what's going to happen as the wheel, the ConEd Wheel, that's been referenced quite a bit rolls off this April, and what reinforcements will be required to support the city of New York as a result. All of those are to be determined and are not in our plans, if you look forward to them.

How is that generation going to be backfilled? Will it be through more natural gas that's going to come in from the West, which will need more import capabilities or will it be offshore wind that will be off of Long Island that we're going to continue to build out at very expensive prices. Each one of those things will come back with a different solution for us on the transmission system. So take a good look at that and understand why we think there is a lot of upside in that part of our business.

And then on the bottom right, we talk about quite a bit over the last 10 years, how we've morphed the utility, but look at the difference in the regulation that we now have with the amount of – our rate base is going to be regulated by the federal government versus state of New Jersey. That's been the change that's happened over time, but it also reduces quite a bit of the risk from a single regulatory standpoint. So two good pieces of takeaway from the chart that I haven't spoken about in the past.

So our strategy, it really remains the same as it has in the past. We were out there trying to develop programs that are supported by the great employees that we have and all the pictures that are rolling in the back of the room here today. We've aligned those skills of the employees that we have with the policies of the state and as a result of that, we've been able to put these programs in place that we've spoken about, whether it be our gas system replacement program, the transmission build that we've had, or some of the energy efficiency and renewables that we've done, that we never dreamed of doing in the past.

So put those two pieces together, and now I'm going to trying to transition into what we've done, and why you should believe in our team to a big degree.

Let's start with operational excellence. From my standpoint, this is all about keeping the lights on and the houses warm for our customers. And you need to do that not just on a blue sky day, but be able to do that during storms. And again, I think our history has proven itself out from an operational standpoint, but I'm going through some metrics here that could give you a little more confidence in our ability to achieve the good results that are required by our regulators.

I think from a financial standpoint, the results speak for themselves. Our net income over the last five years has gone from $521 million to $889 million. It's been a nice growth plan and we've talked about that quite a bit. And at the same time, we've grown our rate base from just over $8 billion to just over $15 billion. So again, a good, nice program that we've had in place that's continued to show that growth.

final
Bloomberg Transcript

And [ph] take and put all of that (01:07:25) and Tammy has the timeline up there, but we had five programs approved back in 2008 – 2009 and then just about every year since then, we've worked with the board to continue to put those programs in place to allow us to recover the capital that we're putting to work above and beyond our depreciation expenses that are built into our base rate. So, working together, we've come up with those programs and been able to make those disciplined investments that we've spoken about so many times.

So, I'm going to dive into our operational metrics just a bit here, and I'm going to start with safety. This obviously has its benefits for just the reasons that it has there, which is to make sure our employees go home safely and sound the way that they came in. But I'll tell you, the other thing you should take away from slides like this from a safety standpoint, this gives you a good indication of how engaged your employee base is. You cannot have an engaged employee base if they're not working safely. This is the first thing, if they're not taking care of themselves and they're not [ph] returning (01:08:28) and watching each other on a job site, that you'll never be able to have a workforce that's pulling in the same direction to deliver the results that you're asking them to do from a company standpoint.

So, we look at this on a regular basis. And you can see there that we've been in the top quartile for many years, but really last year, for the first time, we've gone into the top decile from a safety standpoint, so it's something we're very, very proud of.

I'd say no metric, in and of itself, means more to our customers then SAIDI numbers. And for those of you that are not familiar with SAIDI, it's basically a multiplication of SAIFI and CAIDI. And for those of you that don't know what SAIFI and CAIDI means, that's all about SAIFI means how many times have the lights gone out and CAIDI means after they've gone out, how long does it take you to get them back on. And our metrics there again have produced excellent results over the long term, and we've been in the top quartile and have been recognized for 15 years as most reliable utility in the Mid-Atlantic region by PA Consulting. So another really good story that we have from an operational standpoint.

So you put some of those other pieces together and what is our – what do our customers think about us? And these are J.D. Power results. And the J.D. Power results for the utility not only have improved on an absolute basis but they've also improved from the standpoint of how we stacked up against the other utilities that are in that panel. And so you can see that growth that we've had there, obviously, increasing your scores are better, and we've been in the top quartile for most of the metrics.

But one area that we have a challenge in is our gas business metric. And while we actually won that award in 2014 for being number one in the J.D. Power results, we've trailed off in the last few years. And it's all been driven by a perception from our gas business customers that prices aren't cheap enough, when we look at the data that's in there. A little bit of that is the access to the Marcellus Shale, we, the state of New Jersey, haven't been able to really build out the pipelines the way we might have wanted to, so there's an expectation from those business customers which are smaller and smaller, by the way.

Our industrial load continues to go down a little bit on the gas side, but their expectation is that they have access to that really, really cheap natural gas that they see in Marcellus Shale just across the border in Pennsylvania. So it's a little bit of the challenge that we have there and we continue to advocate for access to that low cost commodity.

So, keeping the metrics going, making sure from an operational standpoint we're delivering. And then I'd say, keeping your costs down for your customers is something that's also very important, something that we have a very good track record of doing. Again, going back to 2012, here you see we've kept our compound annual growth rate under 1%, and it's a really driven by three different areas on our operations team. One is we continue to look for process improvements through Six Sigma efforts, and you've heard that from a number of different folks.

We streamline our organization and continue to morph that based upon where the workload is. So as an example, when our FEMA work picked up on Long Island, we were able to shift some of the people working on projects out to support that effort. Our gas distribution system management team has been changed quite a bit as a result of our Gas System Modernization Program. So that continues to change in ways that we can move people around to maximize their value.

The one piece of the puzzle – and I have to give a little shout out – Dan here and his team, they've done a fantastic job of managing the pension and the interest expenses and that's also buried in these numbers here and really has enabled us to keep those costs down. So thanks to Dan and his team for that.

I'm going to go back – I'm going to take a chance here if I don't shut this off – but I do want to point out one thing on O&M side before we do move on, and I'll tie this in a little bit on a rate case conversation. You see those costs have been flat, but they started to creep up a little bit in 2017, and that's a direct reflection on three different regulatory changes that have taken place in New Jersey.

One, there's a push on cyber. And again rightfully so, we're starting to look at cyber efforts that are more down at the distribution level, that's increased some of the O&M costs for us. Second, there's been a real push on meter inspections that have taken place and so we're out inspecting our gas meters in a way that we haven't in the past, which have increased some of our costs. And third, and most importantly, is the tree trimming changes that have taken place in regulations on tree trimming. In fact, when we look at numbers – when we look at 2017 and out to 2018, those numbers are going to have to increase even more dramatically to keep up with the full year program and that the state would like us to have from a trimming standpoint. So more to come on expenses associated with trees and O&M, but that is part of the driver that you'll see when we talk about why does it make sense in the rate case and some of the questions that you may have from an expense standpoint there.

So just to summarize what we've done and why you should believe [ph] in this sort of team (01:13:27), this is probably the number the two numbers that mean the most to you from an investment standpoint. We've been able to deliver that rate base growth, and we've been able to deliver that net income. And I would challenge, when you look at most utilities across the country, to have a story where you've delivered the operational excellence that we've had at the same time that we've been able to grow the business the way that we have. And just a lot of thanks to the team that we have in place.

So let me transition now from what we've done in the past to what we are planning to do in the future. And we've got two numbers for you here in two separate charts. One is our base capital plan is what we're referring it to, which is the $12.3 billion plan and then the $13.8 billion plan, what we think is reasonable, and I'll go through the differences between each one of those.

First on the left hand side, those are programs that are either been approved by the Board of Public Utilities or transmission projects that have been approved by PJM or are in the queue to be approved by PJM, replacement of transformers, those types of things at the PJM level, RTEP programs as well. And then on the distribution side, all the programs that Tammy mentioned and how they roll out, both from a base capital expenditure and from a clause recovery capability. And again GSMP is probably our best example of that.

But one thing that we have included, on the left hand side, in your base capital is an extension of the GSMP program into 2018, 2019 and 2020. That program is scheduled to end. If you recall, back it was a three-year program. We have got nothing but positive feedback from the Board of Public Utilities, not only since we started the program, but when we actually proposed the program that they expected us to come back in. And we do expect later this year to make a filing to continue that program, and I'll dive into a little more detail about that in a few slides.

On the right hand side, there's really three things that we're expecting that we could be able to move on. First, not only do we expect to continue the GSMP program, but we think we can increase the spend associated with that program on an annual basis. And we've done that, and I'll show you a little bit about that in some of our slides, but we've actually been able to install more feet of main on a regular basis than was previously thought. And again, I think that tells a good story and we've gotten good feedback not only from the regulator but from our customers on that.

Second, we think, as Ralph mentioned, that there's more to do on the electric front, on the Energy Strong pipe of investments. So more of replacements of our substations and our switching stations in some of the low lying areas, but also the reinforcement and resiliency that's needed for the last mile, and I'll talk a little bit about that on that last mile from a T&D standpoint.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14752

And finally, the one that probably we bring the most attention to internal – in the building but also as we try to convince regulators about is the movement into energy efficiency and renewables, and again, I'll give you a little more detail on that. So, that's what makes the difference between the left hand side and the right hand side about what we expect from a capital standpoint.

So let me dive into the programs just a little bit. Transmission. I think most of the last four or five years I've gotten up here and talked about transmission and giving you four or five different slides on transmission. The fact that we have one slide on it is not because it's any less important to us, but in fact because it's become more of a normal process for us to go in and have these efforts to go on, on the transmission side.

There's no less focus on it from our standpoint, we still have $6 billion of investment coming. And they come in three buckets on our transmission side. First, the large projects that we have, there's two of them that we have ongoing right now, the BLC line, the Bergen-Linden Corridor, which again, we talked about quite a bit in prior years. That involves us bringing lines into the Newark and the Essex load pocket area, coming down from the northern part of New Jersey.

And what we've just accomplished, which is kind of a neat little thing, and I was trying to convince Kathleen to put some pictures in here, but we decided we'd bore everybody to death, we actually drilled the line, and completed last week two of them, underneath the Newark Bay. And so we're starting that process and really being successful, and Kim Hanemann and her team [ph] Kim's here, who's (01:17:54) responsible for those helicopters flying towers in and everything else, really have done a fantastic job. And just a no never mind at this point, but from our standpoint, it's a lot more than a no never mind for the work that they complete on a regular basis.

So that's some of our big projects. And the other large project that we have is that one line that I mentioned going from Edison to Metuchen, and then down into the Trenton and Burlington areas, which again is going to upgrade that 138,000 volt corridor that we have. So those are two approved launch projects.

In addition to that, we have other RTEP projects, which you can all find on the PJM website. All the details are there, the number of those projects, what they are. They're everything from breaker replacements to new capacitor banks that are required. And then we have our ongoing subtransmission to transmission system upgrades, which accounts for about $1 billion to $2 billion of the number here, and that's where we're taking our system that was 26,000 volts and upgrading it to 69,000 volts. So for those of you that live in New Jersey, those are the big poles that you see everywhere. Especially in Bergen County, if you go up Route 17, you'll see that that's just a good example of what we have on an ongoing basis.

I'm going to move ahead a little bit here to the electric distribution side and some of the opportunities that we continue to have here. This to me is really two-fold. And one is this slide, which really talks about the core infrastructure. So, we need to do more with some of the stations that I mentioned that are in the low lying areas, the resiliency, the efforts that we've had from an Energy Strong standpoint. But I point out to you the aging infrastructure section there, 65 substations that are 60 years of age or older, 30 substations that are older than 80 years, those are assets that need to be replaced on a regular basis.

Now is the time to do that. We've talked about the commodity prices so on and so forth. And it's not just because they're old, it's because technology is also passing them by. And I'll show you a little bit about the examples on that on the next slide. So we've got to focus on those substations and those switching stations, but take it out from the substation and the switching stations and start to get closer to the homes.

For those of you that may be down – may have been down in Florida recently, you've seen all the work that Florida Power & Light has done to build out the resiliency of their last mile, their infrastructure. There are concrete poles everywhere, along their right-of-ways, along their streets, the concrete poles are there, much more reliant than the wood poles that we have. There are some tradeoffs that are required from the traveling public, but those are types of things that we're going to be taking a look at to see what we should be doing and having conversations with our regulators and say, hey, are these programs that we should be moving forward with. How do we get that last mile into the customers' home more reliant and more resilient than it ever has been before, because they demand it from us, and you see that in all of the conversations that take place over storms.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14753

I happened to be down in Florida during the last hurricane that came through. And I think FPL had like 20 customers out and they were having a big press conference about it in the middle of a hurricane. It was amazing though, because they really didn't get hit and it really was due to the fact that they had all of this work that they did ahead of the storms to be prepared for future effort. So kudos to them and hopefully we can copy and see what we can do to upgrade our infrastructure in that same manner.

While you do all of that, you also have to go ahead, as Ralph mentioned, and upgrade the technology and move forward a little bit from this standpoint. And that's really – to give you a little bit more detail here than we have in the past, that comes in a couple of different ways. One is you upgrade the way the T&D system speaks to itself. So you upgrade your relays, you upgrade your different SCADA system, so that you can operate the transmission and distribution system.

We have started a lot of that associated with our Energy Strong work. We've got our new SCADA system at the distribution level that's in the process of being installed and actually has rolled out. We're continuing to work out some of the kinks out of that system. But that allows us to put the lights back on much faster than we would have in the past, because we have remote access to just about all of our system now as a result of these upgrades. So a station breaker trips, we go in and operate that station breaker remotely, where in the past, we would have to send someone out to the station of closing the breakers. So some big upgrades that are happening there.

Not only do you do it there though, but you have to start to move to the customer. And there's a pretty robust conversation going on in New Jersey right now about AMI. What do we want to do with automatic metering? Do we want to deploy that everywhere? How is it deployed? I think Orange & Rockland just had a case that was in front of the Board of Public Utilities, and they're still going through whether or not that's going to move forward. But it's something that we're going to tee up again as part of this next rate case. Because we think, from a customer experience standpoint, we can't bring all the value that we know customers are demanding unless we have that ability to touch that customer and be able to communicate to the customer directly.

So, all opportunities are out there. You could go past the meter and actually control the thermostats. And in fact, in our EE filing that we just made, we've also proposed that as another way for us to help the customer and to try to actually communicate to see whether or not their lights are on. And if they are on, what kind of usage they have and so on. So, we think about all different ways that we can touch the customer and that's part of this technology upgrade that we're going to have and again, all conversations that we need to have with our regulator to see how they want to move forward with it.

Now for my favorite slide, the most boring, but my favorite. Just the replacement of our old cast iron gas system. Just last year, we replaced over 200 miles of the cast iron that we have in the system. We have the largest cast iron system in the country, no doubt about it, and there's a need to replace it. And in fact, just last – two weeks ago, a 16 inch, 60 pounds pressure gas main [ph] let go (01:24:06) on my – about two blocks from my house, and was quite the event and got everyone stirred up, and it just reminded me once again, the importance of what we're trying to do to make these upgrades. These pipes have served us well, but it's time to replace them.

And again, I think if you talk to our regulator and our policymakers, everyone would say the same thing, it's time to get ahead of this curve and make the replacement. It's an efficient way to do it because we're – it's programmatic. And so we're hiring our contractors and they have a full set of plans, work for years ahead, but it still is only a five-year program, and I'll talk a little more about why we think a longer program makes sense in a few slides.

From a customer standpoint, we were concerned that how many miles could we actually do. We'd not only disrupt the traffic flows in towns, when we go in to do this work, but we also have to get into every single customers' home to change out the meter, to upgrade the service and to relight all the appliances. How is that going to go? We have had fantastic results and the team has done a great job of really keeping down – if you look at our complaints, you won't even know that we had a new program in place. So great work is going on. And again, I think it's all important because it proves to the regulator that we can do the work and we can do more of the work that we have out there. So again, kudos to our team.

final
Bloomberg Transcript
Bloomberg

The last piece of this, which was rather unique, was we also worked, from an environmental standpoint, where we're the EDF. And the reason we did that was because while you can – there's a lot of 4-inch cast iron maintenance that's in the system, and it's certain pressures, and so you want to upgrade all the 4-inch cast iron, and it's all 50 feet away from a building, there's also then a different way to prioritize that work based upon methane leaks and maybe a little different impact on the environment.

So we worked with EDF, they've mapped the system for us. And by doing that, again, we've got more [ph] buying (01:25:55) from a bigger audience than we ever had in the past. Now the environmental community is using us as an example around the country, as to how I a gas main replacement program like this should be done. So again, that's the funnest and the sexiest type of project that you might have, but it's really, really effective and again, the team has done a fantastic job.

So solar and energy efficiency, I'll steel a line from Ralph, this is the most mind boggling thing to us, as you look forward, is to why we really haven't been able to do more of this. It just make sense. We are the only entity that can provide universal access to these services to all customers. We being the utility, not just PSE&G but anyone of the utilities in the country. If you want to provide universal access to energy efficiency solutions and to renewables, the utilities are the only way that you can do that. And we've talked in the past about the difference in the income of households who has access to solar and who doesn't, well it's the same story from an energy efficiency standpoint, because you're going to go in and buy a cheaper light bulb if you can versus a more expensive one. So how do you provide that universal access? You use utilities for it.

By us doing it, we've proven time and time again, it's the lowest cost, probably half, from a renewable standpoint, to put a solar panel on a landfill then it is to put it on top of someone's home. So again, from a consumer standpoint or from a society standpoint, we're the right solution for that. And at the end of the day, we are the best channel for the customers, because we have access to every one of the customer.

So I'll talk a little more about it, but this is one of the areas that probably frustrates us the most, and we're going to continue to take incremental approaches like we did with the $76 million program that we proposed on Friday. In that one, we're just going to continue what we've done in the past, focused on our hospitals and some of our municipal buildings, as well as low income folks, and then a little bit more in the thermostat area and some education for customers that we haven't done in the past, again, to show the regulator that we can add value in this area in a way that most others can't.

So think about the different ways that we've talked and the different places that we've got to invest in, we think the $13.8 billion program is very reasonable. Although we're only really in our plans talking about the $12.3 billion. What's the difference in the $1.5 billion? About another $300 million or $100 million a year on gas main replacements, we think again, that makes sense because of the history and the results that we've achieved.

On the electric distribution side, an expansion of the Energy Strong program and continuation of it. Again, that built into our base plan, but about $800 million that we think makes sense there, and about another $350 million or so on additional energy efficiency/renewables provide that universal access to customers that they so dearly need. So that's the story from that standpoint [ph] to us (01:28:56).

Look past that initial five-year plan, and what is out there that could be done? And we're going to tee up many of these issues in the timing of the rate case. How we do that, Tammy and her team will come up with the best way to have those conversations with the regulator. But I want to take you to the right hand side and really look at Utility of the Future and tick down those pieces.

From an electric infrastructure standpoint, lifecycle programs. We do not – I talked about those concrete poles – we do not proactively replace any wood poles in the state of New Jersey today. There is no proactive replacement program. So what can we do working with the regulators to put a program in place, to replace that infrastructure, that's just one example. You could take that to the wires, you could take that to the substations that I talked about that were 80 years old. What are we going to do to have those lifecycle programs put in place?

From a customer standpoint, what do we want to do from an automation? How far do we want to automate the system? I'll talk a little bit about AMI at the bottom, when we get into the energy efficiency side, but what other controls do we want to put in place for some of our industrial and commercial customers? How much access do we want to have for them? How do we want to automate some of our networks that we have in some of our inner cities? There's other opportunities that we have to automate that distribution system.

And then, one of the big items that's out that's really not clear is EV charging stations. Now where is that going to be? Is that going to be an asset that's going to be put in place and rate based by utilities, or are we going to continue to see Tesla put out their stations and [ph] Harry (01:30:31) put out his stations and [ph] Larry (01:30:33) put out his stations, and then the customer's not going to know what he's plugging into. So how do we provide, again, universal access? Get back to that same message from a utility standpoint. And we believe, again, it makes sense for us to be involved in that and to get out there from an electric vehicle charging station standpoint.

Now I'm not even sure how Tesla gives away free electricity right now, I don't know if they're a retail provider, I'll let our lawyers figure that out. But right now, they've got that built in somehow and they're giving away electricity, but they're not retail provider. That will get played out over time and we'll see how it is once they start charging for it, or somebody realizes it's built into the cars already. Right, Tammy? So let's see where that goes.

On a gas infrastructure side, GSMP, I've talked about that a number of times, I won't repeat that, but CNG, compressed natural gas opportunities that we have in the state. New Jersey is perfectly positioned from a port standpoint to become a major transportation provider. We just raised the Bayonne Bridge. The reason we raised the Bayonne Bridge was so that we could get big tanker trucks – tanker ships to come underneath. Once those tankers come in, they have to offload; once they offload, they need to have a way to get out to the general public, perfect fleet operation opportunity for us. How do we get CNG vehicles out there? It could not only be just for the big trucks, but absolutely for the tugs and the other equipment that work around the port and for us to put those types of CNG charging locations in.

We have not done anything, really, from a CNG standpoint, over the years, and it's for one simple reason. We had a contract to take refinery gas from some of the refineries along the New Jersey Turnpike, that contract expires this year. So we're going to have the ability to start to propose some of these CNG stations. Because if you take refinery gas, it's a different quality gas than most of the engines can take. So the [ph] Cummins (01:32:28) and all those other ones that have the natural gas engines wouldn't allow you to mix that type of fuel and now we have that opportunity. So, we're going to move ahead with that and again have those conversations as we get into the rate case timing.

Distributed energy resources. Well, you've seen what we've done from a Solar 4 All standpoint, that's gone on for many years, and again, the cheapest way to deploy solar in the state of New Jersey that we found so far. We're starting to have conversations about microgrids, we're working with Hoboken, we're working with New Jersey Transit right now on two microgrid projects. Those are ongoing conversations, the state has started a stakeholder process on microgrids to see where they want to go from a policy standpoint. Again, we're going to tee that up, universal access to microgrids. We can't be picking winners and losers. Who has access to the microgrids or how are we going to provide that service to customers on a regular basis? Universal access, same message again.

Batteries. What are we going to be doing from a battery standpoint? We've actually started some trials with batteries on some of our Solar 4 All sites, specifically at some of our schools, so we're testing that technology. We're going to be coming back and proposing some of that, where we can use batteries to offset maybe some T&D investments. Our system doesn't really lend itself very well for that, but there might be specific pockets and specific customers that see some value, and we're going to be pursuing the batteries as well.

And then there's the Holy Grail of fuel cells, which are out there. And again, I put that on your more for the long term, there's really nothing in the near term that we see that's going to make sense. But that clean gas that we have now, and not having refinery gas, provides some additional opportunities for us there.

Energy efficiency. We just continue to bang the drum. This is what you want us to do. And if you really don't want us to provide retail to all of our customers, we should be doing it for the customers that have provided benefit to all of the folks in the state of New Jersey. And that's really the hospitals, the municipalities, the state universities, and again,

final

SI-SSA-0015-14756

some of the low income folks that we have. We're going to play around with this a little bit and see where we can go, but I would expect that again, as we get into the right case, you're going to see some large proposals that we're going to make to move these programs forward.

So that's the long term, that's where we see to go, and that should take you out well beyond the five years. And, again, if you look at those programs and you look at our track history, you could see that we think we're going to be spending and deploying about the same amount of capital year-over-year in the future, and that [ph] back end of that dip (01:35:02) that Ralph talked about and showed you there, you should have some confidence that we're going to continue to fill that up as a result of what we've talked about here.

All right. That just basically summarizes what I just spoke to and some of the ability that we have. Just again, take away the facts we have – more dependent on our system than we have ever been in the past, more resiliency and reliability required. We have old assets that need to be replaced and we're moving it to a new age for the utility as far as our interaction with customers.

Okay. Let me talk a little bit about the base rate case and a little finer touch, what Tammy mentioned. We really see this as a moderate increase that we're going to be proposing, very moderate increase when we look at it going forward. But why is it something that you [ph] shouldn't (01:35:56) have a concern is going to have a negative impact on us? One, the sales have been flat. We showed you that in the past, we really have not outstripped ourselves over the last – outstripped 1% on our sales over the years, so that's been flat. While we've held O&M flat, we have these three major regulatory requirements that are starting to drive up costs from an O&M standpoint and we're starting to roll that in and you're starting to see that in our numbers, as we're doing that, that's clearly happening.

And finally, as Tammy mentioned, there are a lot of the capital programs that we had, have additional capital requirements that were not being recovered as part of the contemporaneous return that were required as base expenditures. And as those are in there, they'll also drive some of the requirements for base rate increases. So I think if you'd step back and look at it with that lens on, you clearly see that there's a need for a rate case, but a moderate one that we project going forward.

One last thing, and again to put a little finer point on something Tammy mentioned, there are some additional roll-ins that we have, and the biggest one being the roll-in – and you'll read about this – of our costs associated with Sandy. That long ago, we have deferred all those costs, but I would just remind everybody that there was a proceeding that took place, where the costs associated with Sandy were found to be prudent. So now we're just going to be talking about the timing of how we get that money back. I think there was some [ph] food (01:37:17) that was disallowed in the proceeding, but that was it. So we'll have that going forward.

So why does regulatory reform make sense? And we've talked a little bit about these programs and the fact that we've been very successful with it, [ph] all are true (01:37:36). But I want to draw an analogy for you. The state of New Jersey just made a decision to provide certainty for customers, the contractors that work on these assets, and the people that use the assets by implementing the TTF, the Transportation Trust Fund. That was something that was decided and pushed for by the users of the roadways, because they wanted to have certainty in good roadways as they went forward, so there was advocates for that. The policymakers agreed and they decided to put it for a vote. And the customers wanted certainty for long term projects.

So, if you used the parallel from our TTF experience that we just had in the state, this makes a ton of sense. Our customers want it, our policymakers want it and certainly the users of our system want it on a regular basis, and know that this system is going to be there for them when they call on it, from a T&D standpoint.

So, we're going to continue to have those conversations. It's good to have three-year programs, it's better to have five-year programs, it's even better, as we've just seen, for there to be an infinite program, based upon certain amount of dollars that are going to be invested above and beyond the costs that are being covered by the customer right now. And that's what the state of New Jersey has done, and that's what we're proposing. So, just draw that same parallel and see why it makes sense.

SI-SSA-0015-14757

In addition to that, we've got the job creation and all the points that we put on the slide here. But we feel pretty confident that it's the right time, and it is going to be very, very little impact on a customer bill, and I'll show you that here next, which is why I think no matter how you cut it, Ralph showed the bigger – the longer term impact on bills, but from our standpoint, if you look at what's gone on for a typical residential customer, there is tremendous headroom in the bill.

So, why wouldn't you have some of these long-term programs? Why wouldn't you have some of this long-term capital that's going to be laid out [ph] to come back in? (01:39:47). I think if we took it out, it would take us 10 to 20 years for us to roll in all of the programs and actually even get [ph] caught back up (01:39:55) to where we would have been in 2009 from a price standpoint.

And you're not only just looking from an absolute standpoint, but one of the things that we're very concerned about is not just, hey, are we getting $10? And we used to get $10 in the past. No, we got to also look at the amount of disposable income that our customers have, because that's also a part of it. Because if they have other burdens that they might have, that they're trying to pay for, they'll also be upset about paying the utility bill and how that impacts them. And so, we even take a look at the percentage of disposable income that we might have, and we look at that on an ongoing basis, and again, try to take that into account as we lay these programs out.

So there's a need for this infrastructure, there's a desire for the customers to have certainty about their bills, and there's headroom in the bill, It's the perfect storm for us to continue to move ahead with the programs that we've developed.

I think you've seen this before in some of the conversation and about the range that we have. So we continue to produce the ongoing positive results from a net income standpoint and again, it's all based on the positive story that we have, that I just walked you through. So let's take two seconds to talk about something that we're really proud of, which is the work that we've done on Long Island. While it is not a large impact, as Ralph showed you on the pie chart, to our total EPS, the team has delivered everything and more than we expected.

Dave Daly and his group out there have done a fantastic job of operating the system, hopefully somebody that might be customers out there have seen the difference in the way we're providing information to customers, the way we're keeping the lights on, I'll show you a couple metrics on that in a second, but they've really done a fantastic job. And as a result, they've received over 95% in their incentive payment that was built into our contract in each of the years [ph] that we're (01:41:43) out there. So a good testament to the operating experience that Dave and his team have brought and the way they've been able to deploy it.

In addition to that, Shahid and his team have done a fantastic job of trying to keep the costs down for customers from a commodity standpoint, the input to the tolling generation that exists on Long Island, so they've done a really nice job. And that they've, as a result, been able to have a $20 million contract that's in place. So it's two pieces in a puzzle, it's Dave and his team, and Shahid and his team, and they've really done a nice job of delivering the results. So a good story all around.

Just looking at the metrics again, customers – from an employee standpoint, the employees are much more engaged than they were in the past. Customers think more of us from a J.D. Power standpoint and for some reason on this slide, we didn't multiply SAIFI and CAIDI together, so you don't have the SAIDI number, but we have a little bit of a difference in some of the results, the lights have gone out a little bit more in Long Island, but they've been planned to go out. Because that's all associated with safety initiatives that we've had in place to try to reduce some of the exposure that our employees have while they're working on some of the live lines. And as a result, if you multiplied the SAIFI and CAIDI together, we still have some positive results out there, which is why Dave's been able to get his incentive compensation returns.

So with that, I went red on our timer, but not by much, only by a few minutes. So I'm going to have Tammy come back up and we'll answer a few questions.

Tamara Louise Linde

Feels like we're going to have a TED Talks now.

Ralph A. LaRossa

Yeah.

Q&A

<Q - Andrew Stuart Levi>: Hey, Ralph, it's Andy Levi at Avon Capital. What's the average cost of a substation, do you think?

<A - Ralph A. LaRossa>: Oh, they're so different, Andy. I wouldn't even try to venture to guess. I mean, there's – some of them are what we call Class A, which are only servicing 10,000 customers, there's others that are servicing 100,000 customers. And as an example, Newark Switch [Newark Switching Station] is one of the big other transmission projects that's in the queue if you look at some of the TEAC proceedings. And that project, in and of itself, for one substation is going to be over $100 million. There's others that we're going to do where we'll be upgrading and will be $50,000. So I mean, $5 million [ph] that even will be close (01:44:09).

<Q - Andrew Stuart Levi>: Okay. But how big do you think the opportunity is on the substations?

<A - Ralph A. LaRossa>: Well, again, we haven't portrayed any specific number for any one of these substation replacements. But, if you take the Energy Strong numbers that we've had and understand that we only did one-third of what we proposed, I think you can figure out what the potential CapEx is in some of those areas.

<Q - Andrew Stuart Levi>: Okay. And then for the concrete poles, is there any way to kind of quantify cost for concrete poles?

<A - Ralph A. LaRossa>: I was – I happen to be in Florida a little more than I like the last few months, and so I'm taking a look at a few of the concrete poles, and that's again a replacement program that would be ongoing, and it just would be one of the opportunities that we have in there.

<Q - Andrew Stuart Levi>: [ph] But wait, (01:44:52) there's no way to figure out what the cost is for...

<A - Ralph A. LaRossa>: I wouldn't even want to guess what that is.

<Q - Andrew Stuart Levi>: ...how many poles or – okay. And then, the last question is on the $1.5 billion increase in the CapEx, is most of that contemporaneous?

<A - Ralph A. LaRossa>: We would only do it if it was contemporaneous, right. So, we've, just as Ralph mentioned, from a power standpoint, we're not going to put capital work at less than our cost of capital. And the regulators understand that, we've had those conversations. While we are blessed with older systems, the problem that we have is that our depreciation expense in our base rates is very low. So, the only way to do it and still achieve your allowed ROE, which is what the regulatory compact is, is to put these clause mechanisms in place.

<Q - Julien Dumoulin-Smith>: Hey guys, back here. Julien Dumoulin-Smith, UBS. Maybe to just follow on Andy's question just a little bit more to be specific, on the gas main replacement program, what is reflected in the current program versus that $300 million, I think we talked about a week or so in the call, just kind of apples-to-apples? And then, also I think you're alluding to the potential to ramp that up further. So, just kind of give us a sense of where we put it at now, and then what the potential is there.

<A - Ralph A. LaRossa>: Yeah. Kathleen, I don't know if you've got those numbers of Tammy. I want to say that we had $800 million in our original program.

<A>: It was $905 million in the original program.

<A - Ralph A. LaRossa>: $905 million in the original program.

Bloomberg
SI-SSA-0015-14759

<A>: [ph] It just went through (01:46:14) this year. And then what Ralph indicated, [indiscernible] (01:46:19) additional $100 million over 2018, 2019 and 2020 [indiscernible] (01:46:29)

<A - Ralph A. LaRossa>: Julien, I have the numbers right there. So let us go back here with the specifics on those. But there's – [ph] it continued at $900 million (01:46:37) program, so basically call it another $300 million a year, but we...

<A - Ralph Izzo>: [indiscernible] (01:46:42)

<A - Ralph A. LaRossa>: [ph] 321? (01:46:41)

<A - Ralph Izzo>: [ph] Through 2021. (01:46:41)

<A - Ralph A. LaRossa>: [ph] Through 2021 (01:46:43) and then we're going to – then what we're proposing is to increase that to $400 million based upon the fact that we've been able to deliver that level, and we've been able to do it safely and meeting the customer's needs.

<Q - Julien Dumoulin-Smith>: And then subsequently same kind of direction, CapEx-related. You allude to AMI here, what's the timing of making that filing? Specifically, is it in tandem with the rate case? And obviously, it doesn't seem to be reflected in the case at all. And [ph] there too (01:47:07), maybe to use Andy's framework, how do you think about the potential cost of an AMI program per meter, any kind of initial metrics to think about what deployment would look like [ph] fully (01:47:17) across your [ph] capital costs (01:47:18)?

<A - Ralph A. LaRossa>: So it'd be premature to say, but I think if you just multiply the number of meters we have, we'd probably be in $1 billion or above to roll out a true AMI program. But again, there's different levels of that, depends upon what meter you buy, how you put the mesh network out, different ways that that you would approach that. But we are not sure yet, we're going to have conversations with the regulator in advance. We're going to see how we want to do that. Do we want to roll that into one case? Do we want to have multiple cases? I think right now, based upon what we've seen done, they've separated those types of requests from the base rate proceeding. They did that in the Orange & Rockland case and we would expect that same type of thing to happen when we have our conversations.

<A - Tamara Louise Linde>: The only thing I'll add on the AMI is it is that pre-discussion with the regulators that's important. We're not – we don't have any plan to go and install AMI and then come back and look for recovery. So, what you've seen is it's just a history – a successful history of going ahead with investments that are needed to meet our obligations, but where we're going doing something on an accelerated basis or whether we're doing something that is not required to meet our obligation but we think is good for the customers, we meet with the policymakers and then only go ahead if they agree that it's something we should do.

<Q - Julien Dumoulin-Smith>: Right. So, perhaps just to clarify, this would be subsequent to the rate case contemplated. So therefore, i.e., 2019 onwards that you'd be making the filing?

<A - Ralph A. LaRossa>: No.

<A - Tamara Louise Linde>: We haven't decided yet, and that's something that we're currently looking at whether that would be part of the rate case or whether it would be filed separate from the rate case.

<A - Ralph A. LaRossa>: But at the same time.

<Q - Julien Dumoulin-Smith>: Okay.

<A - Tamara Louise Linde>: At the same time, or within a month or so. Those details really depend on a variety of factors and we just haven't gotten to the point where we have finalized the timing of that.

<Q - Julien Dumoulin-Smith>: But CapEx could start in 2019 [indiscernible] (01:49:13)?

<A - Ralph A. LaRossa>: Again, and Julien, I would say it's not just AMI, right? I talked about a number of other things that we should be doing to upgrade our SCADA systems and our relays. So, there's multiple things that we could be doing on a technology front.

SI-SSA-0015-14760

<Q - Stacy Nemeroff>: Hi. This is Stacy Nemeroff from Bloomberg Intelligence. I have a couple questions about basically these growth opportunities that you've mentioned. One is related to the AMI and the automation. I would think PSEG is actually, from a profit earnings perspective, more exposed than a regulated utility to a potential cyber attack. And as you automate and increase access to the system, you're exposing more entry points. So, what is – how are you working on this? How are you considering it? Do you have analog backup plans for the system?

And then also, you mentioned helping to potentially help New York deal with potential supply constraints related to the closure of Indian Point, but how would that work in terms of – from a regulatory perspective, between PJM and New York ISO? And then finally, is PSE&G uniquely positioned to capture synergies from acquisitions of other New Jersey electric or gas utilities?

<A - Ralph A. LaRossa>: So the last one's easy, we usually don't comment on that. So that's the easiest one to kick. I'll go back to the cyber security. I think – the question is posed quite a bit as does AMI provide another entry point? And I think that a lot of it has to do with how those systems are designed, right. So you can have one-way communication, two-way communication. And I apologize for those of you that have heard this story before, but when we had the Super Bowl here a few years back, we went completely manual for that exact reason. So we had those backup plans to be manual and analog and different ways to operate the system.

The easiest way to eliminate the threat is to disconnect from the Internet, and we did that during the Super Bowl where we took all of the stations that fed that area and just disconnected them from the SCADA systems and put individuals out there. I've said in a number of different place places, we know the exact number of – the cost number that it would be, that if IT costs get to a certain point, it's a lot cheaper to then go back and put those blue collar workers in those stations. And so we know what it is, and if the prices go up, we'll go back that way, because there's always that fallback plan.

The other thing that we're blessed with is the compact service territory. If there was an incident, the ability for us to deploy our folks quickly is much better than it is for other utilities. And again, I think you can go back to the 2003 blackout, and that was part of the reason that we were able to restore [ph] to (01:52:24) customers before many of the other utilities, because we had folks that were able to go out there quickly and start to bring the system back remotely rather than depend on the [ph] Verizon (01:52:34) system, which was a challenge that day. So those are all the pieces.

As far as the New York-PJM Interconnection that [indiscernible] (01:52:44) made and identification made through those Regional Transmission Expansion Plan in New Jersey and a similar plan that the NYISO has. So PJM and NYISO will continue to look at that, a lot of it will be driven by what the parameters are and criteria that each one of them have built into their planning criteria, and we'll see how it plays out. Right now, what we do know is that Indian Point is closing. We do know there are multiple proposals as to how to backfill for that, I don't know which one will be selected. And each one of those proposals could have a different impact on our grid up in the Northeast part of the state.

<Q - Jonathan Philip Arnold>: Ralph, Jonathan Arnold from Deutsche Bank. Just wanted to just return to the spending numbers just to make sure I've got this 100% clear. So this $300 million of extension of the GSMP at the current rate included in the base plan, that wasn't previously in the base plan. Is that correct?

<A - Ralph A. LaRossa>: Yes. And then if you move to the right hand side, there's an additional $300 million that we think makes sense.

<Q - Jonathan Philip Arnold>: Which is [indiscernible] (01:53:55) 2019, 2020, 2021 of $100 million a year higher rate.

<A - Ralph A. LaRossa>: Right.

<Q - Jonathan Philip Arnold>: So that piece – that $300 million is part of the $1.5 billion of upside over the base.

<A - Ralph A. LaRossa>: Correct.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14761

<Q - Jonathan Philip Arnold>: So, could you then sort of break down how the rest of the – how does the rest of that, I guess, the $1.2 billion split between the electric distribution hardening and then the EE and solar?

<A - Ralph A. LaRossa>: Yeah, I think I mentioned it all, but just to repeat, it's a little over $800 million on electric. So that's again a continuation of the ES – the Energy Strong type of work, and then a little over $300 million that we think makes sense on energy efficiency and renewables.

<Q - Jonathan Philip Arnold>: Great. And then – and just to be clear, in the transmission base, some of these new RTEP plans that were just announced like a few days ago, are those in the [ph] base? (01:54:41)

<A - Ralph A. LaRossa>: Those are in our numbers.

<Q - Jonathan Philip Arnold>: And then, [ph] artificial item. I think there was something new that (01:54:44) came out on Friday, is that an upside or is that...

<A - Ralph A. LaRossa>: It's about $100 million haircut as it's currently proposed...

<Q - Jonathan Philip Arnold>: Right.

<A - Ralph A. LaRossa>: But there are other things that may be required that are not in the current project scope. So to get into the weeds a little bit, there was an SVC that was designed on the original program, that they have now pulled out, but will be required down the road. So I would expect that there would be another project that would come back in to backfill for that and find the solution, either with the SVC or with some other transmission solution there.

<Q - Jonathan Philip Arnold>: Okay. And then all the other things like AMI, [ph] basically about (01:55:24) Utility of the Future, the green box, that's all sort of part of that 2026 rate base that's outside of both base and upside.

<A - Ralph A. LaRossa>: Correct.

<Q - Jonathan Philip Arnold>: Okay. Great. Thank you.

<Q - Praful Mehta>: Hey, Ralph. This is Praful from Citi. Coming back to retail customer rates and all of this CapEx plan [ph] with (01:55:46) load growth, wanted to just understand how you're kind of matching the two, right. Load growth looks like it's pretty low this year, going forward as well, I'm assuming your plans would be for load growth to be relatively flat. With that and with this current CapEx and with the incremental CapEx plan, where do you see rates going, and then where do you see customer bills going?

<A - Ralph A. LaRossa>: So, two things. On the load growth, I think we had 0.5% and 0.7% on the gas. So it's 0.5% on electric, 0.7% on the gas. So, it is low. And it's going to – there's no increase in sight really when you look in the outyears. But if you – that last slide that we had, I think we had 2% is what we expect, the annual impact if we got all the programs that we had identified. So, if you layered in 2% into the headroom that exists in the bill, it's going to take us out well past 10 years before we even get back to where we were in 2009.

<Q - Praful Mehta>: Got you. So, this 2% is rates or is it bills, just to be clear?

<A - Ralph A. LaRossa>: That's the bill impact.

<Q - Praful Mehta>: Got you. So...

<A - Ralph A. LaRossa>: [ph] From our (01:56:49) rates.

<Q - Praful Mehta>: No. Got you. But then, are you assuming some reduction in usage or are you holding customer [indiscernible] (01:56:55)

<A - Ralph A. LaRossa>: Usage is flat – everything was flat.

<Q - Praful Mehta>: Flat. Got you. Thank you.

Bloomberg

<Q>: Hey Ralph. Question I guess for Tammy maybe on the – I guess, this is in the context of the [indiscernible] (01:57:09) Just when would you plan to address this with the New Jersey Legislature? How does the session play out this year? I'm not sure when they meet. I think it's a governor election year. Does that get in the way of them doing stuff? Maybe just a little more color on process in New Jersey?

<A - Tamara Louise Linde>: Certainly. So, we are in early discussions with all key stakeholders, both in New Jersey and at the federal level, and exploring on a parallel track what can be done on both fronts. And as I indicated, I do think it's more likely that if there is an action taken that it will be state-driven. As far as timing, I don't want to predict when something will happen. I think it's just fair to say that we are involved in active discussions at this point with all key stakeholders. And we don't want to wait until we have a situation where we're saying we're shutting down the plant. We think it's appropriate and useful to have these discussions at this stage and explore what options people have an appetite to take on.

<Q>: And just logistically though, when does the legislature meet this year?

<A - Tamara Louise Linde>: Sure. There is a legislative session that goes into this summer. And then there is a lame-duck legislative session. As you noted, there is a gubernatorial election in New Jersey in 2017. So, there are two periods this year where legislation could be introduced and of course beyond that. But there are two this year; one that goes up through the primary and then after the primary and after when there's a lame-duck between the November election and through the end of the year.

<Q>: Okay. And then one other question I guess on the rate case is just, should we – the one other piece in a rate case is obviously what kind of returns are you earning. So, should we assume going in with this additional spend in sales growth and the lack of sales growth and the like, that you're underearning your allowed return right now on the jurisdictional piece that's related to the base rates or no?

<A - Tamara Louise Linde>: I think it's fair to say that when we make this filing, we'll be asking for a moderate rate increase, and that we are constantly focused on earning our allowed return. So, it's a balance every day looking at what the investment needs are, what the spending is and managing all of that so we are as close to earning our allowed return as possible. And we do anticipate filing for a moderate rate increase.

<Q - Michael Lapides>: Hey, Ralph. Michael Lapides of Goldman here. We've seen throughout the country and are starting to see more in PJM FERC Section 206-related filings, related to transmission ROEs. Just curious how you're looking at the potential risk of this for your transmission business.

<A - Ralph A. LaRossa>: I'll tee it up for Tammy, because Tammy's a little bit closer to some of those than I am. But I think at a high level, you would say that there's enough need, as you see in our plans, for ongoing transmission that the regulators at the FERC really are not trying to disincent that investment at this point. So, the whole reason that we got to where we are is because there was a desire by the regulators to incent investment. And as long as we have continued to do that and continued to keep the rate [ph] spend (02:01:02), the total bill for the customer down, we have not seen a challenge to our rates. [ph] Giving to (02:01:10) Tammy from a regulatory...

<A - Tamara Louise Linde>: And as you know, we have a base ROE at the transmission level of 11.68% and there's a lot of activity still at FERC and in the courts looking at when transmission rates are still within that zone of reasonableness, but not at the median or the average of the proxy group. So, we're watching those cases closely.

As Ralph said, we don't have any complaint pending. Your rates are good and your ROE is good until a rate is – or a complaint is filed at the FERC and a refund effective date is established. So, the ROE that we're earning right now and until that happens, if it were to happen, remains in place. And we don't have any reason to believe anyone is concerned with our ROE at this time. I certainly would expect that at one of our annual customer meetings on transmission, if there was some activity, they would alert us to that. But it certainly could happen, a complaint could happen and we would be looking to demonstrate that our ROE is still within the zone of reasonableness.

<Q - Michael Lapides>: And then one follow-up, totally unrelated. Ralph, how are you – when you think out to that 2025, 2026 rate base opportunity, where does offshore wind fit into this, given New Jersey, along with a handful of

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14763

other East Coast states or probably some of the more viable states when it comes to the potential for offshore wind in the U.S.?

<A - Ralph A. LaRossa>: Well, I certainly hope from a customer standpoint, it doesn't factor in much. At $160 a megawatt hour, which is what we saw – that's the information that's out there right now in the press from the recent Long Island PPAs that were put in place – that's a pretty high number. So I don't have anything in the plan that accounts for that. Obviously, if that took place, you'd have a pretty dramatic impact not only on the customer bill from a commodity standpoint, but you'd have a lot from a transmission standpoint, because that is just to deliver to the land and then you have to figure out how you're getting all those electrons in all the places. So, our plan is not based upon that, it's based upon the commodity price staying about what we expect in the forward prices, and not being impacted by a much higher price associated with offshore wind.

<A - Kathleen A. Lally>: We have time for one more question and then we're going to go into a break.

<Q - Gregg Orrill>: Yeah. Thank you. Gregg Orrill at Barclays. Is there a up case on transmission CapEx that you could share with us? I guess, you didn't flex that.

<A - Ralph A. LaRossa>: Yeah. We don't really have anything in there that's an "upside" but what I was trying to allude to is that there's a lot of things changing which will impact the transmission system. So, again, whether it's driven by Indian Point, some other changes that might be happening because of additional generation that's being placed in Pennsylvania on top of Marcellus Shale or other things that are going on, that's going to continue to take place. And we really think the Wheel is going to have a big impact on the Northeast portion of our transmission system. But I don't want to speculate on any of that because I'll let the RTEP process play out.

Kathleen A. Lally

We're going to have a 10, 15-minute break and we'll be back for Bill Levis to talk about PSEG Power. Thank you.

MANAGEMENT DISCUSSION SECTION

William Levis

Well, good morning, everybody. Appreciate you coming back for what I think is the most exciting part of the program. I can say that because my boss isn't here right now. But we'll start much like you see the other presentations with our strategy in Power, which frankly is no different than the strategy you heard Ralph Izzo describe for the corporation and Ralph Izzo (sic) [LaRossa] (02:20:40) for the utility and it's excellence in operating our units safely, reliably in a cost effective fashion, all driven by an engaged workforce.

I did want to take the chance today to let the audience know there's two key members of the Power leadership team here today. Shahid Malik, who's here, the President of the Energy Resources and Trading organization. He will join me afterwards for the Q&A session. And also here today is Pete Sena, President and Chief Nuclear Officer of our Nuclear operations. Pete has been with us for about a year now and doing just a great job of improving operational performance and mindful of the competitive environment we are in, and having the right balance on both of those.

So you can read the headline here, we're transforming the portfolio to be newer, more efficient and flexible. Flexible is key because it's a matter of being able to take what the market dictates. And if you looked over the last decade what we have done simply is we knew we had good sites, locations were good, and so it was about making the most of those assets that we had at those sites. And making the most of those assets meant operating them more reliably, increasing the output where we could and extend the life. And extend the life could be with that existing technology or a change in technology.

And so what you see over that span of time is there were some very modest investments that would do that. Something as simple as 2013, adding a second gas pipeline to our Bethlehem Energy Center, modest investment. However, what

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14764

that had resulted in is BEC allowing to have a record generation year this past year. And with Indian Point going away, that site becomes more valuable in the future.

Other modest investments were simple things such as adding black start capability and area regulation to our peaking fleet, recognizing that those services will be more valuable in the future [ph] as a (02:22:46) renewable penetration and the like. And investments such as peakers in 2012, some of which were done in a competitive environment and others which were done under rate base. So we took what the market would give us in those cases. And that works its way up to operating our combined-cycle units to make them more efficient to the large project investments [ph] in (02:23:07) three combined-cycles that we'll talk about a little later today.

Also when the market says it's time to retire plants, we have done that. In 2011, we retired Hudson 1. In 2014, we retired Bridgeport Harbor 2. In 2015, we retired our HEDD units, and in 2016 announced the closure of Hudson and Mercer that we planned to retire in 2017. So we'll take what we can get from the market and when that's done, then we're done and we'll move on to the next opportunity.

So our generating assets as you know are in three competitive markets and what I like to call the most energy-intensive part of the world, that's from Boston to Richmond. And so, they're load pockets, which helps us quite a bit. And in fact, the new combined-cycle we're building now gives us access to a load pocket we didn't have access before in the Southwestern MAC, that's a D.C. Pepco area, and designed to benefit from volatility when it comes. We haven't seen much of that with warm weather, but when the winter comes, and it does come occasionally, we'll see that again.

We also have additional generation assets in the solar area, I'll talk a little bit more about that later. And our combined-cycle plant at Kalaeloa in Hawaii, an interesting case where this only combined-cycle in the island has become more and more valuable, [ph] as (02:24:33) its optionality has more value in the marketplace with renewable penetration there.

So we use the word diversity and you've heard the fuel diversity piece and you know Ralph had a similar picture up before. The other thing I would comment on, diversity is different plant types, and that plant types are base load, mid-merit and peaking plants, although the market is telling us those are morphing somewhat, where our mid-merit plants were typically combined cycle, sometimes operate more or like base load plants. And our peaking plants, we're outfitting them, so they can operate more like mid-merit plants. So, in fact, some of our peaking plants had capacity factors last year in the 20% range.

Well, the Fossil fleet continues to perform well in a challenging environment. So, what you see on the left here is availability factor and that's just one. The plants are available and not in any type of outage. I mentioned before generation record we had set at BECAUSE. We had also set one at Bergen 2, a plant that we had actually installed or operated in the previous year, so that was helpful to us.

Our combined-cycle EFORd rate that is when you were supposed to be in the market and you're out for forced outage purposes, the lowest in the last five years. And our EFORp, that's the forced outage rate during peak periods, 0.17% last year. So, the units are available when they are needed the most. That is more and important as ISOs are placed more reliance on, or reliability moving forward.

You see our start success rate in peaking, 99.7%. Our peaking plants were called on to run 4,650 times last year and met that call 99.7% of the time. And even our steam and coal units, which are older units met the bell 93% of the time.

So, Nuclear is vital to New Jersey, as you heard Tammy talked about before. It provides 40% of the State's energy consumption, so critical to the state and to us. So, a couple of things I would point out here. About 3,700 megawatts total capacity that we own and/or operate. And all five of the stations that we have an ownership share have had their licenses renewed. We refuel our units every spring and every fall. And the Peach Bottom units get refueled one unit each fall.

And we'll point out for the scheduled 2017 outages that we will be dealing with the baffle bolt issue on Salem in the spring of 2017. So, we're expecting a similar sort of repair effort that we did on Unit 1 last year. And on Unit 1 in the fall are expected to just to be able inspect in order to find any additional repairs that we need to do. We're in much

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14765

better shape, obviously, knowing that those repairs are coming in the spring than we were last year when we found the issue when the outage was already underway.

So, Nuclear has nothing standing still, and in the short-term recognizing the economic challenges that are out there and moving become more efficient. And if you look at our controllable direct cost from the 2012 period through 2017, you see we've actually reduced costs almost 1.5%. I would point out 2015 is you see in increase in O&M. That was when we brought our security force in-house, an important step for us, because security had been growing at the fastest rate of any of our expenses in this category, so it was important to bring them in-house, so that we can improve their performance and also put in place many efficiencies that we thought we could. And in fact, that process has started.

And it's as simple as being able to use technology for how we deploy our security force. It was not uncommon that essentially when you determine the security force need, you use a three-dimensional chess board, and tell you would play against your opponent in figuring out what the best strategy was. Obviously, in day and age of technology in computers and simulations and the like, we've been able to take advantage of that and putting in place efficiencies in our security force and actually reduced the numbers while improving the performance.

You also see the material and cost reductions have occurred over this period of time. And on the right hand side, you can see what have been spent from a capital perspective. I would tell you that the 2014, 2015 numbers driven primarily by the Fukushima efforts that are behind us currently, and the 2016 and 2017 by the baffle bolt issue I previously talked about. Going forward, capital needs of the plant are about $100 million a year.

So, and I call this is an umbrella that we have to operate on to help improve the cost structure of nuclear plants as to delivering the nuclear promise initiative, taken industry-wide. And what's helpful in this regard is it's an opportunity to learn from one another, leverage from one another, and move the industry collectively together to make changes at our power plants, along with the appropriate oversight of groups like INPO and our insurers to make sure that everything is still in the best interest of safety.

Not much different quite frankly than what our industry did in the 1990s, when we had some economic challenging facing us and we pulled together, putting in place of efficiencies in our processes and the like. And essentially, what's happened since that period of time, there was 9/11, there's some excitement about new nuclear plants in Fukushima that frankly stalled those efforts. So, this is going back and really examine what those best practices are, the efficiencies that we can put in place. And then quite frankly, using technology that has been absent fairly from a lot of what we've done to this point.

So, I've also found that it is served as a security or as an opportunity to share best practices in security, because there really was not a forum for that before. INPO, which serves as the sounding board for sharing best practices does not have security under its umbrella. So, this opportunity has allowed the various operators to talk about what are the best practices there and just start to employed those.

So, you can see 46 efficiency bulletins issued to-date from an industry perspective. You would hear $600 million of savings advertized. We've implemented 21 of them so far at our station. And in the last year, we reduced head count by 185 people and the corresponding reduction in O&M moving forward. The important part is that as we move out these inefficiencies, we are actually improving safety and its focus on it. And what's fundamental for this and the key learnings from the 1990s was really understanding why we do, what we do, and then engaging the workforce to make sure we're doing it in the most efficient fashion possible moving forward.

We will also have the support of the regulator here, too, as they're under some similar mandates from Congress to improve their efficiency. And so, I would say, it's collaborative on that part. But folks understand what we're doing and why we're needing to do it. Despite those efforts and the improvements, as you heard Ralph say before, we're not currently earning that cost of capital in Nuclear. So, significantly, more needs to be done, not only on the cost front, but also on the market and policy side that Tammy had talked about it earlier.

So, from a Power perspective, we've been unable to control our O&M also not just in the Nuclear. And you can see from 2012 to 2017, actually, minus 0.3% for O&M growth. And there have been a number of activities that have allowed for this. Some of it was as simple as, let's take over the maintenance of our combined cycle plant service that

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14766

we had contracted out. We took that work in-house, we then expanded it, and we talked to our union, so that our union members from New Jersey could travel to other states and provide maintenance to the other plants that we owned outside of the state.

We put in place some maintenance in our monitoring and diagnostic center for our combined cycle plant. So, one of the reasons we're able to improve EFORp and the like is we're more closely monitoring key parameters at our operating plants. This past year, we also put that in place for our nuclear plants. So, now, we have more lifetime monitoring of critical systems and components in our nuclear facilities. These items have saved us numerous plant trips and the like.

And those O&M savings aren't limited to the faults of the nuclear folks, but in our energy resources and training operation, we've been able to take some technology improvements and process improvements, and take three systems and replace that with just one. So, I think it improves our cost accounting and bidding practices and also allows us to be more efficient, so that when we can take on the Long Island work, we don't have to add on that many more people through, because we've got a significant process improvement going on at the same time.

And likewise, getting help from our service company in the IT area, HR, and the like. And as you heard Ralph talk about the finance [indiscernible] (02:34:26) helping us with the pension and benefits and the like. So, significant effort enterprise-wise. It didn't just start last year. And we are doing a good job, controlling our expenses there. And you can see it in 2017, this assumes that the staffing of the Keys facility, the staffing with Sewaren facility, and the staffing of our retail operation.

So, we are developing 1,800 megawatts of new, efficient combined cycle capacity. And you see the three states in Maryland, New Jersey and Connecticut. In the case of Connecticut and New Jersey, it's replacing existing generation. And in the case of Maryland, it is going to a new location, because it's closer to a load pocket and helped as you know manage our bases with existing generation.

So, a little bit on the Keys site. So, if you look at the picture in the bottom right, you can see that construction is well underway there. This is a greenfield site, actually nice to work on, a lot of space and the like, a 2x1 natural-gas plant, with 755 megawatts. So, construction is actually going well for us. That's one good thing about good weather, people can work in it. Doesn't do much for the other part of business, but it helps this part quite a bit. And you can see from a major milestone standpoint, essentially the engineering is complete. Major procurement is complete, and all contracts are in place to be able to support a startup in mid-2018. So, we are staffing the facility now.

And the interesting part about this and maybe unique for our company relative to others is we're already a valuable member of the community in that area. So, our plant manager has knocked on doors, many neighbors. We're funding a scholarship program for local folks to be able to work at the plant. And that's all working well for us. So, we're not seeing permit delays and the like. Good cooperation from the people in that area and expect to be a viable member to that community for years to come. We have about 600 people working on site currently on this project.

Sewaren 7. This is going to replace four of our older units. One of the older units, about 65 years old in Sewaren area and a load pocket in New Jersey. Engineering is nearly complete here. Major procurements are done here, well out of the ground. And you can see the picture there, and major components have been set in place.

Construction's about 29% complete. What you don't see here is we're actually doing construction of some of these pieces offside in New York to help with the schedule and costs. So, our HRSGs and air-cool condensers are actually being built in New York, and we'll take them down the Hudson River to the site when they are needed here. We find that helpful, because this site is not quite as big as the Keys facility that aided in construction. So, we've about 400-plus workers on this plant site and another 100-plus in New York, putting those major components together for us. And then, when we put this unit in service in mid-2018, the other four units from Sewaren will retire.

And our last combined cycle is the Bridgeport 5 plant, very, very similar to the Sewaren, in fact, the contracts we're letting essentially the same people that are building the Sewaren for us. And we will also be doing off-site build of those major components in New York for this plant.

final
Bloomberg Transcript
Bloomberg

February 28, we had the last hearing of in pursuit of our air permit, non-adjudicatory, so that means that essentially, the DEP in that area just needs to answer the questions that were provided by the public, which we don't see as an issue at all and do expect to get the permit by April, and then we'll begin construction. This is also been a terrific example of how public outreach and being a member of the community was helpful, because the people that were testifying for us, for the most part, were the local agencies and public officials and the like, because they recognize the importance of this plant to the area and our contribution to their community.

So, you saw this slide before. And I think you'll see it one more time. So, in case you don't see all the important facts on here, but our fleet has been transformed with an improvement in efficiency. And efficiency is important and vital as dispatch curves become flatter and flatter, those that win are the ones that are more efficient. And every bit of efficiency helps there.

So, you can see the comparison from where we were in 2016 to where we expect to be in 2021, and from a generation standpoint where we actually plan to produce. So, with just about the same capacity numbers, we expect to produce 18% more energy moving forward, with the mix being fundamentally nuclear and gas, and the coal contribution going down. And then 2021 is critical that's the year, where we'll retire Bridgeport Harbor 3, the last coal plant that we will operate which will leave us just an ownership share and the keystone on our [indiscernible] (02:40:14) facilities in the coal area going forward.

So, here's the statistics of what this transformation looks like from an operational perspective. So, combined cycle heat rate 3.5% improvement; O&M and the cent per KW, 10% improvement; emissions that meet the requirements of the clean power plant, in its current state whether it might look like in the future. And in the bottom right, what you see is the average age of the Fossil Fleet. So, we tremendously improved the efficiency and lowered the average age of the fleets, which sets us up very well for the future for whatever that competitive environment may look like.

This is a capital picture as a result of that. And you can see obviously the large spend last year and this year, in building these combined cycle units and some spend in 2018 as we complete the Bridgeport Harbor facility. But in the end, we have $200 million run rate in Power. And the previous slide showed $100 million of that in the Nuclear operations, so $100 million for the remainder of fossil and trading and the like moving forward. Obviously, that enhances the cash flow and then provides cash for various investment opportunities in the whole enterprise.

So, if I shift a little bit to the market area, we've talked about our location and access to Marcellus Shale. That has been both a benefit and a curse for us, curse for the lower price of electricity and impact to nuclear plants, but a blessing for the corporation and Power's combined cycle plants.

As you can see in 2010, none of our gas from the Marcellus Shale to where just last year where we got 90% of our gas needs from Marcellus Shale area. We have one of the largest procurement and trading gas operations in the country. And you can see how much we procured last year, over 400 BCF. Half of that goes to the utility customers. And that reduction in price over the years has helped provide a lot of that headroom for the construction efforts that Ralph and his team talked about before.

So, we get about 100 BCF of that 400 BCF for our own generation. And you can see 80% of that comes from Marcellus, so that does give us some price advantage from our gas supply for our combined cycle plants. And the remainder of that is a combination of all system sales and C&I customer use.

On the right-hand side, you can see what we've been talking about for some time, but what is finally starting to come to fruition. And we don't expect the Marcellus Shale to back off at production at all, but we do expect it to start going other places to kind of equalize the supply and demand mismatch that we have seen. And so, what you see just depicted here is a number of pipelines that are going out of the Marcellus Shale area to other areas, where there's a higher priced gas. In all total by 2018, that's about 20 bcf a day. And this is where there are either certificates or construction actually happening. And about half of that we expect to occur by the end of 2017.

So, what does that mean for prices going forward? So, what you see on the left hand is essentially the basis converging them between Henry Hub prices and Leidy prices, a trend that we think will continue into the future. And the resultant increase in that has resulted in the change in the electric power prices and an improvement in the basis between PS and

final

Bloomberg
SI-SSA-0015-14768

the Western Hub for PJM.

As you know, we don't leave our generation open, and we do a fair amount of hedging. And one of those big areas we hedge is through BGS. We can see it's about 11 terawatts hours or 20% of our expected generation. This past year, we saw a reduction in price. Once again, it's more headroom from the customers as you heard Ralph describe before. The primary areas were this price drop was in capacity and the green chart merges with some uptick in the transmission charges. Slight decrease you can see in the energy prices. We like this product for a number of different reasons.

One is the full services requirement. It suits the fleet that we have. It's good for liquidity, and matches our generation to load strategy. So, we can now protect our basis with this product. That said, if you were here, probably five, six years ago, that was about 20 terawatt hours of generation. So, as that load has been lost to others, we expect to get that back with the formation of our retail organization. We do have licenses now in Pennsylvania and New Jersey for this operation. You could see in years three and five what we're expected to gain back, and we will be in a position actually [audio gap] (02:45:33) the second quarter to be able to be able to start our first sale for PSEG Energy Solutions LLC.

We also hedge in other areas, and so typically, we have two-thirds of our generation hedged over three-year period. 100% of our base load coming into the year, and then two-thirds, one-third as we move forward. So, what you see on this slide here is total volume for 2017. We have a 80% to 85% of that hedged that are hedge price of $46 a megawatt hour. We will be filling in 2018 and 2019, as the year goes on to maintain these ratios. So, we do have a ratable hedge program. That said, we opportunistically do this and look for our periods of volatility, where we can lock in prices into the future.

Capacity market is also a good source of revenue for us. So, a couple of things, I would point out here. Obviously, the high watermark there is 2018 and 2019 or the capacity performance really hit the marketplace for the first time, also incented some new generation, including our own Sewaren 7 plant. But fundamentally, we clear about 9,000 megawatts in each of the capacity auctions.

In the middle, we've listed some of the parameters that will impact the upcoming auction. I'm not going to predict the price, other than tell you some of those things help us and some of those things hurt us in the middle, and with some big discussions here on things like the [indiscernible] (02:47:09) and how that might impact us going forward is important. The bottom of the slide shows, the New England capacity market. And just a reminder that for our Bridgeport Harbor 5, the auction price which is locked in for seven years at the $231 per megawatt there that you see in years 2019 and 2020.

So, our Solar business has essentially doubled in the last year, 17 plants, 13 states and expect by the end of 2017 to have four more plants in operation. Our next steps there are not all that different in how I described our other operations and that is how do we get the most out of these assets moving forward. So, we are exploring several opportunities of things like doing our own maintenance on these plants like we do our maintenance on our combined cycles or looking at the opportunities in order to pair them up with batteries and the like.

And so, obviously, it's a business that's growing at a good clip. And we will pursue this, where we can. And when we have, essentially, power purchase agreements with credit-worthy counterparties that'll still be the AMO that we operate under. So, that this contract of energy will provide in our earnings stream for years to come.

So, there are other sources that we make money. And I mentioned our gas supply business. This is BGSS, where we saw wholesale provider the PSEG. You can see the contracts that we have for storage capacity and firm transportation. Essentially, we provide to the PSEG customers first, usually our power plant second, and off-system sales third. And for off-system sales we share a portion of that profitability with the utility – actually a large portion of that, 75%, 25%.

There are other ancillary services that are units provide, black start, reactive power, area regulation. We manage the LIPA fuel contract that you heard before. And I mentioned the Kalaeloa investment. All pooled, these normally add up to about $250 million a year in the summer, vary plus or minus, depending on the winter or no winter, which has been the big impact on our BGSS business, but these other also provide a steady revenue stream for us for our business.

Bloomberg
SI-SSA-0015-14769

So, going forward you can see that we are in $514 million in operating earnings last year. And our guidance for 2017 is $435 million to $510 million coming from the sources that I described on the previous pages. So, our value proposition is as simple as we have good assets in good locations that are highly efficient and are able to take advantage of whatever the market can give us. We've demonstrated this for the very beginning since our company was founded and recognize that we have a tough environment that we operate in. But with these kind of advantages we have, I think we're well positioned for the future and face whatever competition can bring us here.

I'd mentioned the hedging program we do it to protect it and the fact the capital needs going forward also set us up pretty well for the future with the major investments really behind us at this point.

And with that, I'd like to bring Shahid up. And we welcome to take any questions you might have.

Q&A

<A - Kathleen A. Lally>: State your name and the company.

<Q - Praful Mehta>: Hi, guys. I'm Praful Mehta from Citigroup. My question was on O&M, and O&M expense. And cutting costs seems to be a theme that many IPPs are going through right now, and sounds like on the generation side, you're talking about that as well. But on slide 70, where you talk about O&M expense going down by I think 0.3%, wanted to understand, on a dollar per megawatt basis, how should we think about that? And also, as you change your generation profile over time to becoming more natural gas generation at least with the new plants coming online, how do you expect that profile to move?

<A - William Levis>: When combined cycles don't place their actually improvement there for two reasons. One is there is increased generation and frankly fewer people need to operate the plants. So, our Hudson and Mercer facilities employ about 200 people. Our Sewaren 1 through Sewaren 4 plants employ about 50 people. The Sewaren 7 plant will employ 26 people, as well the Keys facility and the Bridgeport Harbor. So, those expenses will go down as those plants come into service. I'd have to think about the math there. The Power number [indiscernible] (02:52:30) I get to figure of my Nuclear megawatt hours and my Fossil ones to get those numbers. But you saw the Fossil side was a 10% reduction in O&M costs on a megawatt hour basis going-forward.

<Q - Praful Mehta>: Got you. And that's helpful. And I see that on slide 76 that shows the reduction. Just another quick question follow-up on the CapEx side, on the maintenance CapEx. Run rate maintenance CapEx, 2019, 2020, 2021, it's about $200 million. This is even after the new plants have come online. So, the maintenance CapEx of the plants is minimal effectively with – is that how now I should think about that?

<A - William Levis>: Yes.

<Q - Praful Mehta>: Thank you.

<Q - Paul Patterson>: Paul Patterson, Glenrock Associates. On the Nuclear side, you've mentioned and a couple of other people about the cost of capital. I was just wondering, could you tell us what the cost of capital is for the nuclear plants, roughly speaking, and how much of the subsidy you guys are perhaps projecting? Also, one of the slides in the previous presentation said that, it would lower prices over the long-term, or have a lower impact on prices. So, I'm wondering whether or not that will be a one-for-one, or how we should think about level of subsidy that you guys are looking at to get to your cost of capital, and what that impact might be?

<A - William Levis>: Yeah. Cost of capital is not a number that we publish. It's something we use as our investment hurdle. But as Tammy described, if you saw the numbers that are being talked about in New York and Illinois and the like, I think those numbers would be very helpful for you to be able to achieve that same level in New Jersey.

<Q - Paul Patterson>: Okay. So, in that neighborhood. So, the other thing is that what we saw in New York and Illinois was basically wait to like at the last moment. It does make sense obviously, what you guys are saying to have these discussions into obviously not wait till the last moment. But just seeing how politics sometimes unfolds, it seems that, that seems to be something that happened. When should we think about when the situation would begin to get

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14770

critical for the nuke plants?

<A - William Levis>: We haven't set a timeframe. What we've said time and time again is the current pathway is not sustainable. So, the challenge for Tammy and her team is let's create a crisis without creating a crisis.

<Q - Paul Patterson>: Okay.

<A - William Levis>: And so that we can address this sooner rather than later, because there's a lot of good reasons to do that. The one thing we forget is, we got 1,600 people working there. And I want their heads, minds, and hearts working on making sure that plant runs well every day and worried about if they're going to come to work tomorrow or not.

<Q - Paul Patterson>: Okay. And then just finally, the NEI made goals, aspirational or not, very substantial reductions in cost in operating nuclear plants. Could you address what you think of those goals, and how they might apply to PEG?

<A - William Levis>: Yeah. So the number I was referring to is a $3 billion reduction in total operating costs over three years. I would tell you, I believe that they are achievable. And that was breaking down the cost into three buckets. So, that's the the O&M cost, fuel cost, and capital cost.

And as we meet monthly on this effect, our next meeting is on Monday to go where we are from a progress standpoint. Every day, we find more opportunities here to save cost. That said, the 30%, I don't know if it's enough or not going forward, but if nothing else, it is a start. And more importantly, and you will find that as we – and I'd like to use the words, improve efficiency instead of reduced cost, because it helps send the right message to people is by improving efficiency will improve safety at the same time.

So, one of the big initiatives for example, this spring is, we hire contractors for an outage. And there's a series of test and exams and qualifications you have to undergo before you can get a badge. That was taking anywhere from three days to five days. Well, the three days to five days, we're paying for and not getting productive work. That's millions of dollars. So, one of the initiatives here is, okay, let's get this folks badged in 15 minutes. So, they come to our sites, and they get to work, millions of dollars of savings with just getting people to work sooner.

There are number of initiatives like that. The security area, we found a number of different opportunities. So, that 185 member you saw, about one-third of that is reduction in security force numbers, that we've been able to achieve. And I think we're just seeing the starts of that. So, it is important that we do this. Is it going to be enough? That still remains to be seen.

<Q - Jonathan Philip Arnold>: Jonathan Arnold, Deutsche Bank. In the slides on CapEx, it looks like versus the [indiscernible] (02:57:6) the $100-odd million for PennEast, might not be there anymore. Can you speak about what the status of the project is, and if I'm right about that?

<A - William Levis>: I can't add anything more that you read in the public on PennEast.

<Q>: Hey, guys. Is potential policy moves in New Jersey impact how you're going to hedge the nuclear fleet?

<A - William Levis>: I'm sorry, the potential what?

<Q>: Policy moves as far as nuclear legislation? Does it impact how you're going to hedge that fleet post-2019?

<A - William Levis>: Not currently. No, I mean, it would depend how things will got there, but we're going to continue to hedge program as we have laid it out thus far.

<Q - Julien Dumoulin-Smith>: It's Julien Dumoulin-Smith, UBS again. Just a follow-up in terms of the conversation on Nuclear, just to be very clear about it. It looks like the CapEx requirements for the Nuclear business are kind of declining over time actually, so I just wanted to be very clear about this. Given it may not meet necessary your cost of capital hurdles, is there a point in time, which you'll need to see that CapEx step-up and make kind of a decision around investments. Is there some kind of generator investment or something like that out in the early 2020s that you are

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14771

thinking about in making this decision, yay or nay, for instance?

<A - William Levis>: Actually, there are not any big items out there. Most items are behind us. I mean power transformers, digital feeds, voltage regulators, if all investments have been made in the last half a dozen years so. Steam generator replacement if you recall was done 2008, 2009. So, it's not like 15 generators waiting outside. We're trying to make a decision on. So, the capital needs in that $100 million is inclusive of what we believe will be made in...

<Q - Julien Dumoulin-Smith>: And then a further follow-up on the retail side, obviously you just talked about Pennsylvania, New Jersey. Why go the organic route versus the acquisitive route? One. And then secondly, how meaningful of a scaling are we talking about and how meaningful to overall margin composition and maybe this is...

<A - William Levis>: I'll give Shahid a chance here.

<Q - Julien Dumoulin-Smith>: Yeah.

<A - Shahid Malik>: Yeah. So, thank you, Julien for that question. A couple of things, firstly, it's a defensive play for us as opposed an offensive. So, in the grand scheme of things, scale isn't really what we're looking for. Typically, the retail companies make a lot of money when they scale up and nationwide. That's not the game we have here. So, while it's important to try and get good sales in our footprint to reduce costs, we do expect that the integrated margin that we have from generation as the customer will be satisfactory and raise our overall hedges. And we view it as a different way of hedging. And as Bill showed on his slide, it's complementary to our existing BGS.

Your second question was about why we're building organically rather than buying. We've looked at buying. And frankly, some of the prices that we've seen, some of the companies that have been available and books that have been available might have been wrong place, wrong type of customer, wrong type of business for the business we're trying to build. So, the way I'm thinking about it is, look, let's go ahead and get started.

We will build out a good platform, bringing the systems and the folks that we meet to have a base. We believe that we can grow that organically ourselves. But if we see some nice tuck-in acquisitions as we've talked about publicly, we'll look seriously at them. And maybe that will help increase our penetration in our chosen markets. No, it's not a one or the other. It's certainly one for now and maybe we'll do some additional book tucking-in as well.

<Q - Julien Dumoulin-Smith>: Just a quick clarification on that. Is it predominantly C&I effort, rather than a mass market?

<A - Shahid Malik>: That's correct, it's all C&I.

<Q - Julien Dumoulin-Smith>: It's all C&I.

<A - Shahid Malik>: It's the plan for now. Yes. And we'll be looking at gas as well.

<Q - Julien Dumoulin-Smith>: Great. Thank you.

<Q - Michael Weinstein>: Hi. Mike Weinstein from Credit Suisse. Just a follow up on Julien's question. What kind of retail margins do you expect to make on that, I mean, as part of that the green bucket?

<A - Shahid Malik>: Yeah. It's a great question. This is what my boss keeps asking me as well. And we haven't started selling yet, planning to start selling in the second quarter. If you look at what the competition is doing and the numbers that they're reporting, it's anywhere from $2 to $6 is the kind of price range, what will depend on the size of the customer and the risk you take on. Clearly, the larger the customer, the smaller that margin is; the smaller the customer is, the higher that margin is. And as you increasingly move into the residential space, as plenty of companies are, those risks are higher but the margins are higher, too. That's not a place we intend to go right now and tends to have in C&I.

<Q - Michael Weinstein>: Just to clarify on the residential side, the rules, for BGS rules, do they prohibit you from participating in that market or no?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14772

<A - Shahid Malik>: No. It's personal preference. We have decided for what we think are good reasons for now, not turn to the residential space and the start off from the CNI.

<Q - Michael Weinstein>: Okay.

<Q>: Yeah. Hey, Shahid, question over here, [ph] Steve(03:02:47).

<A - Shahid Malik>: Yes. Hey, [ph] Steve (03:02:48).

<Q>: How are you doing? Just could you maybe touch on the ConEd Wheel issue for this upcoming auction, and just explain what it is. Will it definitely get updated prior to the auction and potential impact on your key zones?

<A - Shahid Malik>: Yeah. So I'll talk what's available publicly, as opposed to some of the internal discussions that we've been having. And you should recognize that, PSEG is two entities, as the regular utility, which will have lot of information that I'm not privy to; and then there's a competitive business, which we look at, and we're trying to manage too. So, I can talk quite a lot about the latter, not so much the former.

But generally, the ConEd Wheel was a mechanism, whereby ConEd was able to bring power into, effectively, PJM and then out again, supply this will be through different transmission lines. It's been in business for many years. And last year, ConEd gave notice that they would terminate that agreement for a variety of reasons, principally, related to cost. They felt that they had most cost-effective ways of getting the power to their customers.

So, PJM and the New York ISO and the two utilities, ConEd and PSE&G have engaged in discussions about what are the impacts and the implications of that will. As we've come through the process, ConEd and the New York ISO have had one set of perspectives, and we've had PSE&G and PJM have had another set of perspectives. And there's been ongoing dialog, and that's still continuing between now, between these four entities.

And you've already saw that PJM announced its parameters for this upcoming auction last month. And in this parameters, they said that, they expected some additional information to be forthcoming about what the impact of that will go in a way would mean to the import capability or one of the ways they describe it is the [indiscernible] (03:04:48) ratio, which effectively is a way of defining the ability of reaching to import and to export.

In the parameters that they put forward, there was some impact from this ConEd Wheel going away. We and PSEG, on the competitive side, we certainly think that there is still some more impact to come. I'm not privy to what the utility is saying or doing about it, but I do know there's active discussions going on.

And Tammie or Ralph, if you want to comment on that, but that's pretty much what we're able to share right now.

Kathleen A. Lally

I'm going to ask that we hold off on any other questions until the end of the morning after Dan's presentation. Thank you.

MANAGEMENT DISCUSSION SECTION

Daniel J. Cregg

All right. Good morning everybody. I'll close things out today. I'll pull together an overall financial picture for the company, and kind of tie together a lot of the things that you've heard this morning and put them all in one place financially. And I think you'll walk away with an understanding that we're well-positioned for the continued investments that we've talked about. It will enhance the quality service that we have, that our customers deserve and kind of expected at this point, and be able to grow business results, and provide an opportunity to grow the dividend that we talk an awful lot about with you all.

final
Bloomberg Transcript
Bloomberg

If I take a look at the first slide, slide 90. So, looking back at 2016, we reported operating earnings of $2.90. It's the midpoint of our original guidance, the upper end of our revised guidance, and a lot of great work done as we went through the year especially towards the end of the year to get to that point. Once again, we increased our regulated contributions to those earnings in 2016 to 60%.

We successfully executed our investment program in 2016. It was the highest capital investment that we had made as a company. Over $4 billion in infrastructure to benefit our customers, both on the transmission side and on distribution and in generation. And continue to generate significant cash flow, and that's on both sides of the business. And I'll show you some sources and uses later on. In both sides of the business, very strong cash generators, which will help fund some of the future opportunities that we have without the need to issue any equity.

And then lastly, the dividend in 2016, we grew the dividend by $0.08 or just over 5% and earlier this year with our announcement of another $0.08. We're just under 5% as to what we're doing in 2017, bringing the dividend from $1.64 to $1.72 indicatively.

So, on this next slide, we show a story basically of delivering our commitments. This shows back five years. Ralph Izzo talked a bit earlier about a 10-year history. And it's the earnings guidance that we provided at the beginning of the year and essentially how we have delivered on that guidance. And we've consistently met or exceeded that guidance, operating the business well, managing it efficiently, identifying and executing on our investment plans. And frankly, we've done so through some fairly turbulent times.

And 2016, really no exception there. If you think about the winter that we had, an extremely mild weather. It was the fifth mildest winter on record in New Jersey. We saw a fairly challenging market environment as well. And some unusual events at Salem that we worked our way through, I think, extremely efficiently. And we identified the challenges in front of us and ways to overcome them, and ultimately found ways to working more efficiently. And O&M at Power was a big part of how we got through this past year. And we are very pleased to say that we were able to deliver on our commitments again.

And so you saw the left side of this slide earlier today, when Ralph showed it. It's basically the earnings breakdown by business and the continuing shift in business between PSE&G and Power. And it's very consistent with the investment message that we talked about. Ralph also showed our overall service area at the utility, and really the growth we have had is from growth in infrastructure. And the increases that you see at the utility really are aided by a contemporaneous recovery mechanism through our formula rate and the clause mechanisms that we have on the distribution side of the business as well. We get the improvements that we've had in resiliency and the good results that we showed, and the 5 year 11% CAGR from operating earnings that Ralph have also mentioned earlier today. And as we move from 2016 into 2017, utility will show an 8.5% increase to the midpoint of that guidance range that Ralph laid out.

And you also see, throughout this period really considerable earnings contributions from Power, which contributed $514 million last year, in the midst of those challenging market conditions I talked about. So, the aggregate makeup that you can see that percentages inside the bar is 43% and 2012, growing to 66% in 2017, all that part of our earnings guidance of $2.80 to $3 in 2017.

So, on the utility side, the driver behind those increased contributions comes from the growth in rate base. And this is a slide that we have shown you in the past, very similar layout, provides a build through time of our rate base from our current levels, $15.2 billion at the end of 2016. And it rolls through to where we see ourselves at the end of our 2021, five-year business planning period.

So, if you start by looking at 2016, the split of distribution and transmission. We're currently about 44% transmission. So, when Tammy and Ralph LaRossa talk a little bit about our upcoming rate case, really that's applying to roughly half of the business as the transmission part of the business obviously has a different regulatory regime.

Moving through 2019, the first three years that we talked about where we have a 9% CAGR in our rate base, growth both on the transmission and distribution sides of the business to aggregate us to $19.6 billion in total rate base. And transmission will grow from 44% to 47% of that total rate base. And then extending out to 2021, continued investment brings us to a $21.6 billion estimated rate base at that point in time. And there's little bit less visibility, and we've talked

final
Bloomberg Transcript

a little bit about that, and I'll show some numbers as well as to how we grow that over time. You see a moderate decline, so we have a 7% CAGR as you start in 2016 and run through the 2021 time period.

And then, we've also captured the additional potential capital spend that both Ralph talked about a little bit earlier that could bring us up to $22.9 billion. That would restore us over the five-year period to a 9% rate base. And again as we've talked about that would expand the GSMP program another $100 million a year, and also add-on the ESMP or the extension of the Energy Strong Program that's in the works, but again, not part of our base line plan.

And then beyond that, we've talked a little bit about some of the things that are on the drawing board, a little further out, and that's what I referenced on the far right side of the slide, the Utility of the Future spend that we've been thinking about. And the way we think about that is the ability to continue to be within that kind of a rate of growth to 7% to 9% out for the foreseeable future for the next five years or so. So bottom line, a lot of line of sight into continued growth to enhance reliability and resiliency of the system, and the ability to pay for it.

On the Power side of the business, really it's all about operational excellence. And you heard Bill talk a lot about that. It's for being ready when the market calls. It's for delivering when the market calls and putting in place a hedging program to solidify some of those results.

So, we show on the left side of this slide is our energy produced in 2016, little over 51 terawatt hours, mostly from Nuclear and combined cycle. And that will grow over time closer to about 60-terawatt hours by we get out to 2019. And then below that on the capacity side, having over 90% of our capacity in PJM and New England, where there is a three or four-year capacity market. It helps to solidify the overall margin that we can count on in those periods as well. So, you take those two, the three-year hedging program and the three or four-year capacity market, and net-net, if we look at where we are from the gross margin perspective over the next three years is about 55% to 60% of that gross margin that has been secured through those two mechanisms. So, provides a fairly solid financial base and very strong cash flow coming out of the Power business, with good line of sight as to what that amounts are.

And then, the rate base growth at the utility and the improved efficiency of Power really are all supported by the capital program that we have. And this is a build kind of like the rate base slide that we show, but it's capital and the aggregate across enterprise for the $15 billion capital program that we have. It starts with our baseline capital for the five years and then shows some incremental opportunities as you move from left to right.

So, we start with some maintenance capital. And if you take a look over the five-year period, Power runs at a moderate run rate of capital. Bill gave an indication of that number, about $200 million a year, basically just taking care of the existing fleet such as it is.

And then at the utility, $2.9 billion over those same five years of maintenance capital. Really, the way to think about that is it's spending basically at depreciation levels. So, your rate base is moving along, your rate base goes year to year and depreciates to the extent that you're restoring that rate base up to its original balance. You have maintenance capital, but you're not actually growing the aggregate rate base, you're just keeping it to where it was.

Following in the center of the page, beyond that, there's $10.9 billion of indentified growth capital. And the lion's share of that is we've been talking about those come from the utility. It's about three quarters of the utility's overall spending during the five-year period. And it consists of transmission about two-thirds of the total, but also on the distribution side some new business spending. So, when we have either somebody new coming into the territory or frankly somebody moving within the territory, their spend to connect them. And that all goes into a new business component, which is incremental to the depreciation spend, as is the completion of the Energy Strong program and the expansion out of the gas system monetization program.

At Power, the spending on the growth basis really is Keys, Sewaren and Bridgeport. And beyond that it drops off. And I'll show you another slide on that which gives you an indication as to what that means from an availability of free cash flow.

So in total, PSE&G is about 82% of total capital spend, and 86% of the growth capital. We've identified and are pursuing an extra $1.5 billion of investment at the utility. Again, really what that amounts to is the ESMP expansion of

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14775

Energy Strong $250 million to $300 million a year, that aggregates to $800 million that we talked about. GSMP for 2019, 2020, 2021, more of it, so you could bring yourself from $300 million up to $400 million. And then extension of energy efficiency programs and a little bit of renewables, that could get you another $400 million.

So, the expansions and extensions Utility of the Future that we've talked about, really, that's indicative of the nature of the system and the nature of our planning process. The age of our system is such that it's got a pretty healthy appetite for capital. We plan what we know, and then we identify things over time. And Ralph walked you through, I think a real good example of just looking at 2017. And what I do hear as we step through time, I also just gave a little bit of an example as to what the last three years have looked like, from a period three years earlier than the end of that year.

So, starting on the left side using 2014 as an example. We had planned in 2011 that our 2014 spend was going to be $2.1 billion. And when we got to the end of 2014, we had spent $2.8 billion so that's based up on the types of things, that we've been talking about to "fill in the back of our capital plan as investments get identified through time".

Same in the middle of the page, if you look at 2015's capital $3.9 billion. Three years earlier in 2012 we had anticipated that would be a $1.5 billion. So, as we step through time and that was the magnitude of the growth. And then just last year, if you look at what 2013 forecast of 2016 was going to be, it was $2 billion. And when we finish the year we were in excess of $4 billion. So again it's just an example of how we have planned for what we know, how we have identified investments to make during the intermittent periods between the original forecast, and as we step through time to a higher balance.

And then this really just shows you components of two slides you have seen earlier in the day. It's a capital plan at Power on the left, and the utility on the right. But as we look at these, we look at maybe two slightly different situations. And what I mean by that is at Power, if you take a look at where we are, the three new combined cycle facilities, really dominates that picture. It's all of the [indiscernible] (03:18:50) section of those bars. And it rolled through 2019, where we would complete Bridgeport Harbor. And beyond that, the growth capital that we see at power in 2020 and 2021 really are negligible. So, the beneficiary of the reduction of all that capital is free cash flow at enterprise.

On the right-hand side, if you take a look at the utility, $3.4 billion spend is anticipated in 2017, which together with Power spend will once again be the highest amount of capital that we have spent. And then you see a decline with the reduction in our known projects. But again, if history is of any indication, in that five-year period, we will find opportunities to build that backup, either from the shaded area that you see on top for the program extensions and expansions that we talked about on the last slide, for the utilities of the future items such as AMI and some of the other things that we talked about earlier.

So, certainly opportunity to grow the business. And I would say, that we would tend to have a higher confidence in the left side of this page that, that's what it's going to look like when all said and done than we would on the right side. So, most of that growth that we showed from 2011 to 2014 and on over in the slide I just showed and then what Ralph showed earlier in 2017 is growth related to the utility part of the business.

And what that ends up looking like from a sources and uses perspective is shown here. We show the five year sources and uses. Maybe start bottom left, you can see in the green section, you have Power's cash from us, which has been strong over time, remain strong. And then the bottom right you can see Power's overall five-year capital program. So, the maintenance investment stacked on top, you see the growth investments, so a lot of free cash flow as the growth program declines that will become available to enterprise.

If I go back to the left-hand side and higher up, you can see the utilities cash from ops, which in its own right, is extremely strong, and frankly, continues to grow, as we invest in the business. We talked about a contemporaneous return mechanism at transmission and the clause mechanisms on the distribution side. So, that growth investment that you see on the right side has a feedback loop over into the utilities cash from ops on the left-hand side.

So, again, utility. Though we talked a lot about Power's cash flow generation, but the utility on its own right have very strong generator of cash from ops that it uses within its own business as well. And then the remainder of what you see here, change in debt at the utility, we try to keep a regulated cap structure at the utility, a little over 51% equity. So, to

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14776

the extent that we're investing there, we match those investments and keep that regulated cap structure in place and then a very modest amount of parent that is removed through the five years. And then on the upper right-hand side, the very important dividend payment. So, again, the $15 billion capital program worked its way through here and all funded without any incremental equity.

And then the sources and uses flows into our credit stats, and we show a slide related to that here that gets us to this standpoint of what we have from an investment capacity. We're showing you from 2017 to 2019, based upon the fact that we have FFO here and we have more known results as I talked about at Power especially, related for the next few years. And then across the board, if you take a look at Power, our credit position remains extremely strong. Our average FFO to debt is well above what we consider a minimum threshold of 30%. And we keep that threshold based upon what our investment grade rating is. And it stays fairly steady across those years at a 40% FFO to debt amount.

And then at the parent, the threshold minimum really is dependent upon the mix of the business. But we call it in here the minimum threshold of high teens, to think about that as 18%, 19% or so. So, the minimum threshold that's shown on the bottom left, and then above that you have the estimate of where we think we're going to be over the next three years. And the excess of where we think, we're going to be versus what we have as a minimum threshold really becomes our excess investment capacity. And you can see that on the right hand side of the page.

So, it aggregates to around $3 billion and more likely than not, based upon what we've told you about today and the way the direction of the business has gone, more of that would go to the utility than not. Just stepping back and thinking about that utility cap structure, and thinking about it roughly 50-50, it's a little bit more equity within the regulated cap structure. The funds available here that would go into the utility would go in as equity, and then that would be matched with utility debt. So, if there is $3 billion here and every dollar of it were to be used at the utility, and it were to be matched with that at the utility, that would imply $6 billion available investment capacity at enterprise to be used at the utility without any incremental equity.

To the extent that Power used its own investment capacity on an asset acquisition and basically the remaining $2-or-so billion that you see, the parent would move over and it would be matched with debt to get to about $4 billion. So, considerable dry powder to be used for the investment opportunities that we talked about earlier today.

I'll shift over briefly related to pension and OPEB. And we are in very good shape here. Pension is very well funded. We ended the year with a funded ratio of about 90%. And if you think about what we have done and how we have managed the pensions funds over the last five years, our returns have exceeded 10%. So, the upside of that is that the asset side of the equation is well funded, no cash contributions are needed as we look forward into our five-year planning horizon.

And we mentioned on the earnings call, a couple of weeks back that we had done a merger of our pension plan. So, we had a couple of different plans, some were our more senior associates, and some were more recent associates to the company. We merged those plans together into one plan for simplicity of administration. The benefits are unchanged for any of the participants that are in the plan, but by pulling those three plans together did streamline the administration, but it had another effect as well. And when you aggregated all the plans together, we have an unamortized gain or loss balance that gets amortized over the remaining service life of the employees. And we had a shift between the average service life in some of the plants versus other and the unamortized balance in one plant versus the other. When you pull them together, we essentially extended the active service life remaining, which extended the amortization period.

So, unamortized losses will be amortized over a longer period of time, which does provide a benefit. It's about $48 million this year. And that amount is not a one year event, it will continue through time, but will start to moderate somewhat because whatever wasn't amortized this year will need to be amortized into the future. So, benefits into the future from that as well. Net-net as we look at this year versus last year, about a $22 million decline in pension and OPEB.

And that pension falls into our O&M. O&M control is a hugely important part of what we do on a day to day basis. You've heard Bill talk about, you've heard Ralph talk about it. It's not a program, it's really a mindset in how we run the

final

SI-SSA-0015-14777

business.

One brief stop, and if you take a look at what we show on the page here, on transmission, it shows a 5.6% increase, really in addition to some [indiscernible] (03:26:42) Ralph talked about there as well, some of that is part of the nature of the work that we are doing in transmission and by sometimes removing the old equipment that goes to O&M as opposed to capital. And it was so much capital going on that does have a bigger impact on the O&M. It is by no means a sign of inefficiency, it's just the nature of the work and it does get recovered through the formula rate. So, you see higher percentage there than in some of the areas, which should not be alarming. But really just what you see here from 2012 being flat all the way through to 2019, I think is a credit to the discipline of the employees that we have and how much importance we put on managing the business efficiently.

And then quick walk through on tax reform, lot of talk been had about tax reform. And Washington is extremely early within this process, details are really not known, but concepts are, and I think the concepts are big enough that it's drawing the attention that it's gotten. And on balance, we do feel that like we're well-positioned, I think we feel like we're well-positioned given the contribution that we get to the business from Power, as well as strength of balance sheet.

Utility side of the business, we kind of layer out here some of the key elements that are involved in the discussions thus far. Stepping quickly through the utility, the reduction in the tax rate, obviously, would pass through to customers and we would also have excess deferred taxes. So, depending upon what they bring the rate to, our existing balance of deferred taxes would no longer be needed in the magnitude that it's there and that would go back to rate payers over some as unknown today, some period of time. If you think about our balance sheet strength, we feel like we have a very comfortable ability to pass those back. And the excess deferreds, if you assume a 20% rate on the order of $2 billion. So we will wait to see what comes up that from the standpoint of timeframe to pass back.

Expensing a capital would reduce customer bills. And one way to think about the effects, it would look a lot like the existing 50% bonus depreciation, right. So if you got 50% and 35% instead of 100% and 20%, you'd have a number that look pretty much the same, although, it would be on a more permanent basis. And then we do have a rate case that we will be going in for on November 1. We don't know what we'll know by that time, but to the extent that we do know what's going on. These factors including interest deductibility and the impact on the bills to the extent that we know something at that point would be layered into that rate case.

At Power, rate reductions, we will retain them, as there is no regulatory agency to go back to that helps our after tax earnings and cash flow. And that same excess deferred balance that we talked about would be retained. It would be a one-time, non-cash benefit to Power again at a 20% rate around $700 million or so, non-cash. It would become cash as we step through time and those timing difference were to roll back to the benefit of the company.

With such low levels of debt, the interest expense impact would be moderate to us versus our peer both at Power and the parent company. And we also take fairly low property taxes in New Jersey. For those residents of New Jersey that's a little different for what we see individually and what we see on the Power side of the business, but Power's property taxes, I think – if you think about it from an overall standpoint compared to peers is on the lower end. So, to the extent of that's in play, I think on a relative basis, we're pretty well served.

And then we do build a risk of a boarder adjustment tax on nuclear fuels about $200 million a year spend. It's a fairly complicated way that the Nuclear field comes to us from uranium and conversion, enrichment and fabrication. So, some of that is to be determined as to how it would be implemented. I think on the earnings call, we said a little more than half would be foreign based, but a finer point on that number, it's probably closer to three quarters of the aggregate amount on Nuclear fuel. But again, a lot to be determined as to how that would be calculated.

And frankly, another thing that I haven't heard much discussion about and probably will come down the road, is transition rules. So, how these major changes to the tax code, where they land on them is going to be important, but how they get transitioned in, I think is going to be equally important, and is equally unknown right now. So a lot of uncertainty, but I think for some of the macro concepts that we see here, I think we're in pretty good step.

And then we'll take a look at the dividend here. And we've said for a long time, and we've acted on it for a long time that the opportunity for meaningful and sustainable growth in the dividend is here for the company, and we have delivered upon that. You see a 3.9% increase in the dividend on a CAGR from 2011 through 2017. And I mean, we take this commitment to our shareholders really as important as reliability services we do on an everyday basis. We understand the importance of the dividend to our shareholders.

In fact, we were here on Friday afternoon, recognizing 110 years of consecutive years of paying a dividend by the company. We were honored with the ability during the closing bell on the exchange. The stock exchange was great. The event was extremely lower on it. We think the exchange for that. And we just again, last month, we were pleased to bump up another 5%, another 0.8 on the dividend.

So as we do go forward, we take a look and what this graph shows you is, it compares our dividend at enterprise to the earnings of PSE&G and shows that we can cover the enterprise dividend with the earnings of PSE&G. That's not a formula, that's not how it is determined, we use a whole host of factors, but we do take some comfort from the fact that that part of the business is able to cover the dividend, and it gives us a good ability to say that we have the opportunity for meaningful sustainable growth and the dividend going forward.

And then lastly, just a couple quick looks at earning sensitivities and Power on top and utility on the bottom. You see some of the numbers increase as you step through time, that's purely a function of our hedging program. So, with base load, generation really hedged in 2017, not much of an impact of a change in gas prices, could be some market nuances, but we're hedged in 2017. And then as you step through time, we'd be more open and more subject to moves and gas prices.

SPARKs as well, a little bit of volume locked up in 2017. And then as you step through time you can see a bigger impact both from more of the SPARKs being open and having more facilities online as we step into 2018 and 2019. And then moderate impacts on dark spreads and nuclear capacity factor.

Maybe on the PSE&G side, again, similar to what we have shown in the past with one exception, if you take a look at the bottom two rows, which shows any kind of a delta in the distribution or transmission ROE number, those numbers are a little bit bigger. They kind of cascaded from the $0.01 to $0.02 last year. That's purely a function of growth in rate base. So, the change in ROE is going to be what your rate base is times your ROE. You're going to see a bigger effect as you step through time, and as you have more rate base. So, we probably had some pennies that were on the heavy side last year. We had some $0.02 that are on the lighter side. And as you step through the 2019, you got a good round $0.02 per share for 20 bps change in the ROE, so just a little bit of sensitivities for you to take a look at there.

So, in summary, if you take a look at 2016, we delivered on our original and revised earnings commitments. We have a more regulated profile into 2017. The capital program is going to grow, the utility's going to make Power more efficient, and in the end of the plan have Power throw up more free cash flow. We do have our eyes on the opportunity for continued growth in the business that's going to help our customers as well and the prospects for our dividend growth remain strong.

So, with that, I think Ralph's going to come up. We're going to answer some questions.

Q&A

<A - Kathleen A. Lally>: Chris.

<Q - Christopher J. Turnure>: Good morning. Chris Turnure, JPMorgan. Regarding your comment on FFO to debt at Power, I think you said it was going to be consistent at about 40% for the next couple of years. Could you tell us the exact kind of timeframe underlying that, the other assumptions that might be moving around within that calculation, and if there's anything on the sources and uses slide that we might be missing that's embedded in that as well in terms of flows up or down?

<A - Daniel J. Cregg>: Yeah. So I provided the numbers that were there. Maybe the way to think about it is some of the sensitivities that we show. Most of those would be purely impactful to cash flow. Our debt balances are fairly

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14779

steady at Power, as you step through to 2017, 2018, 2019 timeframe. So, with a fairly steady 40% FFO to debt, that can give you some indication on that front. Sources and uses, I think the pieces that we've showed there, there was nothing that was missing. You have all the elements across the five years. So, I don't know that I would have a whole lot more to add other than what was shown.

<Q - Praful Mehta>: Hi, Praful Mehta from Citi. So, firstly, on the ZEX or whatever support you're looking for, for the nuclear assets, given that support, you still going to look for legislative most likely at the state level. I'm assuming it will put a restriction from a strategic perspective, if you're looking to do something around what the generation business. If you were to, let's say, try to spin or something else. It's probably better to keep it at a consolidated business level to try and achieve some of those legislative objectives. Is that a fair way to think about it or no?

<A - Ralph Izzo>: I don't think so. I mean, the case we could make at the federal level and at the state level would be that those assets are important to customers and to society in general. We as a more profit investor owned entity are going to keep and operate assets that are returning the cost of capital and retire assets much like we did our FT4 engines and our HEDD units and Hudson and Mercer, when they don't achieved their cost of capital. So whether we're the ones operating it or somebody else is operating it or some reincarnation of us is operating it, I think the owner is going to make an economic choice that the policy implications for someone else make and I don't think they would care as long as they know they're being well managed who the owner or operator has been. But we haven't gotten any kind of conversation like that.

<Q - Praful Mehta>: Got you. But your scale does not you think give any benefit that a smaller IPP probably struggles to get the same voice?

<A - Ralph Izzo>: No, because it's the same amount air machines, it's the same numbers of jobs, it's the same impact on the market from a supply and demand point of view. I mean, I'd like to think from your question that maybe we have a higher degree of creditability and people will believe us when we say it, you know we're trying our best to keep them operating, and when we say that they will believe that as opposed to perhaps how some others might behave, and if that's the case, that's great. But I think the assets speak from themselves regardless of who has the title to them.

<Q - Praful Mehta>: Got you. And secondly in terms of the cost to capital point, just wanted to understand if the goal is to try and get some subsidy or whatever, right, the 1650 cost of carbon calculation, that if you get that level, would you be exceeding your cost of capital requirement, and in that case are you getting subsidized over and above or what your cost of capital requirement is?

<A - Ralph Izzo>: We're not looking here to get any kind of unfair handout or be greedy, what I'd love to see is just the market pay for the attributes, that these plants posses that some many documents that we value, right. Whether it's the state energy master plan, whether it's comments made by federal regulators, we've talked to policy makers but, hey, just put a needs test in there. We're not trying to pull the wool over anybody's eyes, we're just telling you that it's not a difficult decision for us as a company to retire the assets if they're not achieving their cost of capital. But if there are broader implications that, then we all ought to make sure we do that with eyes wide open. So, put a needs test in there, and that's absolutely fine, whatever the mechanism is to continue to support them.

<Q - Praful Mehta>: Got you. Thanks so much. Just a quick follow-up on the incremental capacity in terms of financing capacity, is there any intent by this signal of like holding company leverage, is there a goal to a target level of holding company debt that you would like to have to kind of support that investment that you put an equity down at the utility level?

<A - Daniel J. Cregg>: No, we're going to support the business needs and we're going to make the capital investments where we see opportunities to get a good return. So there is not a target per se, no.

<Q - Andrew Stuart Levi>: Andy Levi from Avon Capital. Just a couple of questions. Maybe just focusing on the balance sheet first, where do you see the equity ratio at parent growing by 2019, 2020s that kind of in the mid to high-mid 50s?

<A - Daniel J. Cregg>: Yeah. It would be kind of low-to-mid 50s, that's right.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14780

<Q - Andrew Stuart Levi>: And low-to-mid 50%s at the parent, or would it be...

<A - Daniel J. Cregg>: Across the enterprise.

<Q - Andrew Stuart Levi>: Across the enterprise, so it'd be like 55% or lower, is that what you're...

<A - Daniel J. Cregg>: Yeah.

<Q - Andrew Stuart Levi>: Okay. I thought it was maybe a little higher though. But even at 55% just wondering kind of the thinking, I guess, just as far as modeling, Ralph, just either we put that capacity to work, whether it's at the utility or power or we at the very least because balance sheet is in such a good shape, if we don't have the investments maybe to plug-in we buy back stock and then kind of take the buyback out when the capital comes is that kind of the way to look at it?

<A - Ralph Izzo>: Yeah. So we've talk for quite some time, and it hasn't changed repriorities or reinvesting in the business, providing a little bit of a cushion for that sustained and consisting growth from the dividend. And lastly, third priority would be to buy back stock. Part of the reason why, yes, Ralph, to show some of the kind of the blue sky thinking that we do, there is just to give you an assurance that we don't run out of ideas for things that are value to the customer and then articulate by policy makers, but the important, in terms of ways to use their balance sheet.

<Q - Andrew Stuart Levi>: And then just back to kind of the whole legislation possibilities in New Jersey, so, if you kind of look at what's going on in Connecticut, it's obviously a much different state, I mean it's actually making money on their plans, maybe not as much as they used to. But one of the things that's kind of holding back my opinion is the legislation, I mean there's a lack of willingness to open up their books and show kind of what they're making, or what they're not making, and probably that's maybe one of the main reasons it doesn't get past in my opinion.

But in your case, I think you've articulated in the past that basically you're – the money that you're putting into the nukes are earning a very low-single digit return, which doesn't justify continuing to put hundreds of millions of dollars over a period of time into those plans. But are you also willing to open your books and kind of demonstrate to the, say kind of where you're at?

<A - Ralph Izzo>: So it depends on the definition of open, because we all have different perspectives on our book, I personally went through an exercise. And I had Dan check my reference, and I almost got it right, where I took our 10-K. And you can very easily from the information in there calculate what the current year equity returns are on our nuclear plants in the aggregate right now on a plant-by-plant basis. So, I think we would love to walk people through that calculation, explain it better to them if they need that kind of help. But for competitive reasons, we're not going to go through what our day ahead bidding strategy is and things of that nature, but it would be sort of annualized numbers of opening the books, that would be absolutely fine.

<Q - Julien Dumoulin-Smith>: Hey, guys. Back here, Julien, UBS again. Let me take that conversation of cost of capital on the individual nukes, and bring it up back to the Power level, and talk with you about, I spoke the bigger strategic question of the business congruent one against the other. Does this greater focus in conversation on cost of capital shift your thinking in when and how?

<A - Ralph Izzo>: No, not in the least, Julien, I mean our thinking on that hasn't changed, the conversation comes up so often, I have actually once more gone back to my notes when I was Vice President of Strategy and we were asking ourselves in 1998 was not just integrated or not integrated.

So we talk about this at the board level all the time. In fact, the tactical reasons we've talked on the past are the same. The cash flow generation, the ability to move people around, the sharing of O&M expense, the synergy on the bill, the offsetting effect on the customer bill, all those remain front and center in terms of good tactful reasons to stay together.

Right now what I'd like to do just make sure we get the portfolio in really good shape, but that I mean let's make sure that we treat the 200 people at Hudson and Mercer well, let's make sure the policymakers have opened eyes on what the future for nuclear may look like if current forward prices are realized, but no change in our strategic thinking about the longer term value of power and what it might mean to staying integrated or separate.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14781

<Q - Julien Dumoulin-Smith>: And perhaps just as a follow-up real quickly, I mean, obviously you guys have tax capacity in comparison or contrast to your peers. Have you thought about scaling up some of the tax absorbing renewable tax credit, solar investments that you have?

<A - Ralph Izzo>: Yeah. So, I'll let Dan talk about the tax effort, Chuck, I know it varies from year-to-year and there are some ceilings we'll bumping into it.

<A - Daniel J. Cregg>: Yeah. I think I said recently that we're going to be out for a year and then we kind of work our way back to a positive position, but it'd be closed. I think that the other thing to think about is, you got a pretty dynamic situation from an overall tax perspective that's in front of you. So I think that's some of that needs to work its way through before you had any kind of a major strategic shift to understand what the tax landscape was if it was based upon the tax landscape.

<Q - Julien Dumoulin-Smith>: All right.

<A - Michael Weinstein>: Ralph, Dan, Michael Lapides of Goldman.

<A - Ralph Izzo>: Hi, Mike.

<Q - Michael Lapides>: On the merchant power markets in general, do the economic signals you're seeing, do they imply new build economics earn a return that's above the cost of capital for new combined cycles in the market in general and I know your Bridgeport unit is very different because it's got the seven-year lock, that I totally get. We keep seeing announcements of new builds, we keep seeing new builds happening whether in Pennsylvania, whether in Ohio, we see assets by private companies, we see assets by public companies who might be cannibalizing themselves. I'm just trying to get your broader view of the economics of new power generation in the Eastern power markets?

<A - Ralph Izzo>: Well, I guess the fact that we said, probably within 24 hours if they're announcing Bridgeport that we were not going to build any additional supply might give you some pretty clear understanding of where we think the markets are right now in terms of new supply. Each of the three projects have some – that we're involved in have some unique aspects that we continue to test and they come out positively from that test. Having said that, we have no plans as I've said now for probably a better part of the year-and-a-half to introduce additional supply. We think the markets in Eastern Mac, for example, less RPM option, no new capacity cleared.

I think we're seeing some slight compression in spark spreads, so if the two components of any investment are energy and capacity and last year's capacity prices are in position and sparks have to press further. If you're going to build new supply that would suggest the need which you think that to be a significant change in capacity prices. We're not gamblers. So, we won't be adding to that mix. So I guess, my thesis would be if you are rational investor new supply above and beyond certain special situations that will make sense, we don't have any more of those special situations, but I can't speak for others.

<A - Daniel J. Cregg>: We'll find out a little bit more in May?

<Q - Michael Lapides>: All right.

<Q - Leslie Best Rich>: Leslie Rich, JPMorgan Asset Management. I'm sorry, if you've already said this, but looking ahead to after Hudson and Mercer are closed, what happens to your O&M at Power in 2018, like how big a drag are those units?

<A - Daniel J. Cregg>: Yeah. I think we've said earlier that there was about a $50 million O&M in total, now in 2017 we're still operating for a chunk of the year. So some of that will sustain. And as Bill referenced in some of his comments, the increments that will come in, in part because of retail, in part for some training and readiness for keys in sea-worn and then as you step into 2019 for Bridgeport, you will see some moderation. So you don't see a full step change for that amount for a couple of reasons, partial operation, retail, and then combined cycle coming in, but the combined cycle will come in with some margin that will offset. So I think those are the pieces to think about it.

Kathleen A. Lally

Okay. I think, that's it for questions. So, Ralph you have any...

Ralph Izzo

Sure. So, hopefully, the key takeaway today is that we have some real opportunities looking at us, as we move ahead. So, I love working with this group because as soon as we try to give you some insights into our more generic thinking, you immediately want us to fill in some of the cells in the spread sheet with some précised numbers and that wasn't what we intended to do today with the 10-year outlook that Ralph painted for you, but that 10-year outlook doesn't include converting the grid into super conducting cables, it doesn't include taking the overheads just and putting them on the ground. These are real opportunities, right, these are 80-year old substations. These are technologies that have been deployed widely in other parts of the country be it AMI or enhanced data opportunities and really the opportunity set isn't the limiting factor. The balance sheet isn't the limiting factor, the regulatory relationship isn't the limiting factor, the limiting factor that we will pay attention to is the customer build and that was the main reason for giving you the kind of expanded beyond the five-year horizon view.

The other thing I hope that you took away from today is that there had been some talk in times past that there might be a strategic shift with the construction of three power plants and what we said when we announced the third power plant was, no, we don't intend to build new supply and now we're showing a capital program that matches that and you see actually an even greater emphasis on the utilities than we had seen in the past. So, I would be remiss if I didn't finish today's meeting by pointing out just a couple of things. None of this gets done without the work of 13,000 tremendous employees and the leadership team that you saw just a subset of them who I can't be thankful enough in terms of all that they do, many of them were in the back of the room, but the presenters that were up front, all including – I won't go name by name except to just mentioned two names and I would ask you to join me in thanking them.

Number one is we have announced that Bill Levis will be retiring sometime in the third quarter. I can tell you if somebody has been with the company for 25 years, I'm hard pressed to think of one person who on an individual basis brought more value to the company in terms of what he was able to do for our nuclear operations in the beginning of his tenure with us and then as he took on broader responsibilities, what he's been able to do with our Fossil operations, so if you would just please join me in thanking Bill for all he's done for PSEG.

And then also, last but not least, if you join me in thanking our IR Department, [ph] Carlota (03:52:24) and Kathleen. This is Kathleen's 11th conference and counting. And we're going to just, I can't say thank you enough to her and her team for pulling this together. If it were up to me, we would've been in a basement in New York today, that's a true story. That's where I'd slated it because I was so concerned I shall say with the bills we had been charged by some of the fine New York hotels. But Kathleen did a marvelous job of getting us here today and all the presentation and the material she and the team put together hopefully provides clarity to you, and thank you, Kathleen for all.

Thank you for joining us today. We'll see you again.

MANAGEMENT DISCUSSION SECTION

Ralph Izzo

Good morning, everyone. Hopefully, you're here to listen to presentation by Public Service Enterprise Group. I'll begin with our forward-looking statement, which I won't read here in detail but it obviously has the usual guidance around some of the cautionary statements regarding some of the information we'll be displaying as predictive in nature nor will I read here our GAAP disclaimer. Some of the data we'll be presenting does not conform to GAAP, but we do believe is helpful and complementary in illustrating the financial performance of the company.

I am Ralph Izzo, the Chairman, President and CEO of Public Service Enterprise Group. I'm joined on the stage by Dan Cregg, our Chief Financial Officer and Executive Vice President. In the audience with me are Kathleen Lally and Carlotta Chan of our Investor Relations Department. And again, thank you for being with us this morning.

For those of you who are less familiar with PSEG, we operate with two primary subsidiaries. On your left, you will see a little dialogue box describing Public Service Electric and Gas. It's a regulated combination electric and gas utility thus the name at the risk of being a bit trivial. Operating in New Jersey with over 2 million electric customers, a little under 2 million gas customers. The financial data you see recorded there is accurate for 2015.

The hallmark of PSE&G is a very robust capital program, which I'll describe in a little further detail in a moment that seeks to replace an aging infrastructure with a quality of service consistent with the high regard in which we've been held by our customers for over 100 years.

To the right, we have brief description of PSEG Power, a regional independent power business – merchant power business with primary operations in New Jersey and Pennsylvania. Once again, I will describe in a moment with some plant operations in Connecticut and New York State as well. Power is over 50% nuclear in its operations. So, we do consider ourselves to be a nuclear power company.

Our operating strategy has been the same for as long as one can remember. It all begins with an engaged workforce. We fully realize that the equipment which we operate is common throughout the industry. We think that the unique aspect of our company is all related to the quality of our employees, their training, their commitment to our customers, our shareholders, and other stakeholders. So, no one can be in front of me for more than 30 seconds without them hearing me mutter the two words, operational excellence. It's our fervent belief that if we provide safe, reliable, economic and environmentally-friendly energy services, that yields an outcome of – a desirable outcome for our investors. Good husbanding of those resources yields a financially strong entity. And by financial strength, our definition is the ability to not only produce the results that our shareholders expect today, but produce an outcome that allows us to invest wisely in the future.

And some of those wise investments, we'll go through in a moment but we have had successive years of growth in operating earnings, which is one of the non-GAAP measures I alluded to a moment ago. And over 100-year history of paying dividends every year, a recent history of dividend growth of 5% for the past couple of years, close to 4% for the last 10 years. And candidly, some improvements in our power production fleet that will give us a fleet that has enviable environmental profile and enviable efficiency profile.

Bloomberg Transcript

If I take a look at the capital program that we expect and compare it to the capital program that we've just finished, you can see here an illustration of a $14 billion capital program in the prior five years heavily, heavily weighted towards the utility. In fact, about 78% of the capital program were utility investments; 70% of that, which received contemporaneous return treatments either at the FERC or at the New Jersey Board of Public Utilities.

That $14 billion program is now morphing into a $16 billion capital program for the next five years, and a 78% spending at the utility is now 74% spending of utility. So, a strategy that has been pretty consistent for the prior five years and remains consistent for the next five years of heavy organic growth at our regulated entity. The 70% contemporaneous return expectations persists out into the future as well, largely driven by the single-biggest component of the program being transmission investment.

Let's break down some of these components in a little more detail now going forward. You can see this large portfolio of projects in transmission are primarily born out of a process at PJM known as the Regional Transmission Expansion Program (sic) [Regional Transmission Expansion Plan) (05:12), most often referred to as RTEP, by people familiar with PJM governance.

The RTEP process is PJM's annual look over the next 10 to 15 years at the reliability requirements of the bulk power system across the PJM region given the competitive nature of generation in the PJM region and the absence of the traditional integrated planning for transmission and generation in that region.

Every year, there are new requirements that come forward to account for unexpected retirements, unexpected new build that may come out of the various PJM wholesale power market mechanisms that encourage either retirement or new build. So transmission has been and continues to be the single largest component of the utility capital program going forward.

Second to that would be our investments in electric distribution. New Jersey, like many other states, has an increasingly electrified customer base, which is to say that despite the absence of load growth, our load growth numbers have typically been on the weather-adjusted basis low-single digit tenth of a percent, so 0.1 percentage. Given the vagaries of weather normalization, one could say that's pretty close to zero obviously.

Nonetheless, the reliance on electricity is spiraling upward, thus the need for ever increasing reliability and in fact bridging over from reliability to resiliency, where resiliency to us simply means having blue sky reliability on stormy occasions.

This was never more apparent coming out of Superstorm Sandy which is, hard to believe, four years ago just last week. And that has resulted in infrastructure improvements, storm hardening throughout our electric system. The program that we launched two-and-a-half years ago to do this was known as Energy Strong. We will see a continuation of that that we will refer to us Electric System Modernization Program.

So, these are a combination of Board of Public Utility approved capital improvement programs that receive tracker treatment in addition to our base spending in maintenance capital. We just recently filed with the New Jersey Board of Public Utilities a special project for $270 million substation improvement to serve one particular customer, the New Jersey Transit, which is the public transportation system in the State of New Jersey.

So, in addition to the transmission build-out for bulk system reliability, the electric distribution build-out for storm hardening and electric resiliency, we have some increased investment opportunities in our gas distribution business in addition to the normal base spending that's associated with service connection and new load.

We have a major undertaking in the area of cast iron main replacement. PSE&G has the largest cast iron main and bare steel system in the nation that comes along with being one of the oldest and largest gas utilities in the nation.

At our current investment rate in our Gas System Modernization Program of $300 million a year, our needs would last for the next 30 years before we would be able to fully replace the cast iron and bare steel system.

And we recently, last year, received approval for a three-year contemporaneous return clause recovery mechanism in that program. And our expectations are that since we've asked permission for special trackers on this type of program

final

four times and received approvals four times, that this program will continue out into the future.

Lastly, New Jersey's Energy Master Plan, a policy document that guides energy policy in the State of New Jersey is ambitious in its aspirations for solar energy, as well as energy efficiency. We have been an active participant in that. We have invested over $700 million in regulated solar projects, and we're recently able to achieve an agreement with third parties and interveners in a filing we had made for an additional 33 megawatts or $80 million of solar investment dedicated to sites that are characterized as brownfields. Brownfields would be inclusive of landfills or old industrial sites that are underutilized.

Last year, we received an additional approval for $95 million in energy efficiency projects geared primarily towards hospitals, multi-family dwellings, low-income housing opportunities. So, the utility capital program as you can see is rather comprehensive, in dollars is primarily driven by the top part of this slide, the transmission, electric and gas distribution components. But in terms of policy implications and non-traditional services, there's a small complementary piece as well that we would expect to continue.

The growth rate in the utility rate base is known to be 8% per year for the next five years, with the potential for close to 10%. To go from that 8% to 10% would require $2 billion in additional investment over the forecasted numbers that you saw earlier. And over the last few weeks, we announced $650 million of opportunities that are fairly visible to us and are in front of the BPU today for approval, making up fully one-third of the additional $2 billion in opportunity set that we anticipate realizing over this period.

The story is somewhat different at PSEG Power. Over the near term, we are seizing on some investment opportunities in the construction of some combined-cycle units that I'll describe more fully in a moment, but Power's opportunity set is one that we would view looking forward as more in the potential of acquisition. However, we are historically conservative in our offerings for asset acquisitions and have, I like to boast, about a 96% failure rate in our ability to consummate transactions. But that's a good thing. That just means that we're not the victim of the winner's curse. It's probably not a bad thing, given the slow growth in demand and equally slow growth – slow decline in supply stack that many of us have anticipating would occur at a faster pace.

So we typically show a slide like this for the utility where the headline is: don't believe it, because the out-years, which show a decline in capital spending, are always gets filled in. This slide, however, for Power should have as a headline: you should believe this. Because what it illustrates clearly is that 2018, we begin a restoration of Power's role as a free cash flow generator, able to feed the equity needs of the utility, and in 2019 that it becomes a very robust free cash flow generator feeding the equity needs of the utility.

The slide is just ever so slightly out-of-date because we just recently announced the closing – that we will be closing two coal units that we operate in New Jersey. They are referred to as the Mercer and Hudson units. So, in the out-years of this chart, in 2019 and 2020, there's about $100 million each year of capital that was intended for those units that will now not be spent. So you can see Power's capital needs in 2019 and 2020 look to be just south of $300 million per year and a business that's generating in the neighborhood of a $1 billion plus in funds from operations. So, a tremendous free cash flow generator to meet the equity needs of the utility.

In the short term, however, Power is in a construction mode, replacing some aging assets in Bridgeport, Connecticut and in Sewaren, New Jersey. Sewaren is a subzone of the Township of Woodbridge, New Jersey with highly efficient combined-cycle gas turbines. And a wholly new construction program in Maryland at the Keys Energy Center, which has some attractiveness to us, not so much for its replacement value, because it's not replacing anything here, but this part of PJM is a load pocket with some fairly strong growth and also allows us to do a better job of managing our portfolio, given the fact that the PJM West zone is the liquid hub and we are lacking in assets around that liquid hub. Most of our assets are in PJM East, but Keys will give us an ability to better manage the portfolio and hedge profile of our system of plants.

Most importantly, however, the combination of the construction of these three units and the closing of the Hudson and Mercer units really continues the transformation of the PSEG Power fleet. What we're trying to illustrate here is if you take a snapshot of our fleet in 2015 and what we expect it to look like in 2020, on the left side of this chart, the pies are

final
Bloomberg Transcript
Bloomberg

a little bit misleading. The change in nameplate capacity is a little less than 2%. So the vagaries of PowerPoint here, yielding a bigger pie, one should not take literally.

You can see, however, the shift in the fuel of choice that's being used, going from one pie to the next. So the slight increase in capacity of 2% is very different when one moves to the right of the slide and takes a look at the energy output that's expected from the fleet, which is nearly 20%, and this just reflects the fact that we will have 5,000 megawatts of combined-cycle gas turbines with an average heat rate of 7,200 Btus per kWh. That will be complemented by an existing nuclear fleet that for 10 of the last 11 years has run at a capacity factor north of 90%. That's 3,500 megawatts of nuclear, spread across the Salem, Hope Creek, and Peach Bottom units, four of which are co-owned by us and Exelon, complemented by about 3,000 megawatts of peaking capacity at an average heat rate of a little north of 9,000 Btus per kWh, anchored by some pretty efficient units that we've newly built in New Haven, Connecticut and Kearny, New Jersey.

So we're positioning Power not as a larger fleet – once again, the reason for that is because demand is not growing – but as a far more efficient, cleaner, and flexible fleet, which we are convinced will meet the demands of a very competitive, challenging marketplace going on into the future.

Beyond the capital program, the ability to control O&M is something we obsess about every day. It's a byproduct and an offshoot of having that engaged workforce I spoke about before. You can see here that Power's O&Ms had some years of slightly up and slightly down. But over the last six years, the compound annual growth rate has been zero.

The puts and takes are a function of whether or not our 100% owned Hope Creek unit is in a refueling outage that might lead to a slightly up year in O&M, whether or not there's an absence of major maintenance at some of our fossil fleets that would result in a down year in O&M. But overall, very good cost control at the Power business.

You can see similar strong cost control at the Electric and Gas distribution business, an annual CAGR of 1.5%. There's a misleading 10% CAGR on the transmission business. It's misleading for two reasons. Number one, when you start at zero, it doesn't take much to have a high percentage growth rate. But also, given the very strong capital program in the transmission business, obviously, for system stability, when one is doing work at one transmission location, there is related work that has to take place at another transmission switching station. That related work is not capital work. That becomes O&M work, and that drives the O&M expense. However, given the FERC formula rate treatment that we receive, we are able to earn our allowed return across the transmission business in each of these years.

So the robust capital program at Power and at the Utility coupled with the strong O&M cost control yields a set of financial credit metrics that we are quite proud of. Our emphasis is on maintaining strong investment grade credit ratings across all three entities: the parent, the merchant business, and the utility. Our minimum thresholds in our key measures are FFO to debt.

As you can see here, we set that target at PSEG Power at 30%. Over the next three years, the average will be somewhere in the mid-40%s. At the parent, given our current mix of about two-thirds, 60% to 66% regulated earnings and the balance unregulated earnings, we think our parent FFO to debt ratio can remain anywhere from the high teens and above and it currently is in the low 20%s.

What that implies is that we have additional investment capacity just through the debt markets that Power are somewhere in the neighborhood north of $1 billion and at the parent north of $1.5 billion. Given the regulated capital structure of the utility and given the predominance of utility type investments, the utility itself has access to the debt markets. Our allowed equity ratio is, just think of it as 50% debt, 50% equity. So, this $2.5-ish billion additional investment capacity in terms of debt yields a $5 billion unutilized investment capacity at the utility on top of the numbers I've already spoken about.

The strength in the balance sheet, the growth in the utility, the efficiency of the Power fleet gives us confidence to continue speaking about our growth that we've not only experienced but expect to experience. You can see here the transition that we've undergone over the past five years, not only have we grown our operating earnings, but the utility has grown as a percentage of that operating earnings. So the utility is the primary earnings driver of the business today, as I mentioned a moment ago. If one is just to look at the midpoint of our guidance, the utility would be slightly more

final
Bloomberg Transcript
Bloomberg

final

than 60% of the earnings of the company.

This combination of factors, the increasing importance of the utility, the expectation of future growth of the utility, the continued O&M control, the efficiency of the Power fleet allows us to continue to embrace a dividend guidance that is qualitative and not formulaic, that speaks about the opportunity for meaningful and sustainable growth in that dividend. Here, you see the utility earnings now north of the dividend payout ratio this year of $1.64 on an indicative basis. Of course, our Board of Directors determines this on a quarterly basis and it's solely at their discretion.

So, hopefully, in summation, what you've heard me say is that we have a truly stable platform in terms of the combination of a regulated utility making up the majority of our earnings, a PSEG Power business, and an efficient, highly liquid power market at PJM, one which through the combination of our hedging of energy contracts and our combination of participation in PJM capacity auctions gives clear visibility to the next three years of top line revenue streams at Power business.

We are of the opinion that PSE&G certainly through its service history and its customer satisfaction scores and growth profile would be ranked certainly among top-tiered growth and performing utilities throughout the nation. Power's fleet, the combination of nuclear, and combined-cycle natural gas turbines make it not only efficient and clean from today's standpoint, but well-positioned for a future of carbon constraints. And the balance sheet continues to support growth across these businesses, sustains the dividend, and gives us the opportunity for further investments that we fully expect to identify in the months and years to come.

So, with that, I'll stop. I think we have plenty of time for questions if I'm not mistaken. That was certainly our intent. And I'll join Dan at the table and be open to your questions. Thank you.

Q&A

<Q>: [ph] It's working, Dan (22:39). Ralph, given your excellent outline of where things are and what you're looking for, bring to mind the fact that the earlier presentation that I went through this morning was by FirstEnergy, they're going to have some nuclear plants that will be available that they'd like to dispose them. Will you have a look at those? Do you believe that there's a price for everything? And at the right price, yes, you could look?

<A - Ralph Izzo>: Thanks, [ph] Karl (23:12). So, I guess, there's kind of two answers to that. One is you're absolutely right. At the right price, things can be of interest. But second is I've got a lot of respect for FirstEnergy. They have a long history of successfully operating nuclear plants and if they think economically they're not supportable, it sort of – it stretches my imagination to wonder how we could do anything different to make them economically viable. So, I would think that's a low probability event that we would be able to do something different than they could.

On the broader topic of nuclear, separate and apart from FirstEnergy, as you know, this is a challenge across competitive markets, and my only hope is that the nation realizes this is extraordinarily shortsighted to sacrifice what is, without question, one of our cleanest sources of energy from not only a carbon point of view but from traditional pollutant point of view and the short-term dislocation being caused by natural gas, compounded by the subsidization of renewables is something we're going to greatly regret if we don't start pricing some of the externalities associated with nuclear into those plants.

We are not in the same position with some of these challenged plants just because of the location, the size of our plants. The location has a twofold benefit for us. Number one, we have better pricing. And number two, we don't have the same pressure from renewables. But nonetheless we are out there shoulder-to-shoulder with people like Exelon and FirstEnergy saying: policymakers better figure this out because it doesn't make sense to have negative dispatch prices caused by wind, shutting down nuclear plants only to be replaced by natural gas. It's just policy insanity.

So I thank you for the question. But, no, my guess would be that we would have limited interest in those assets only because I think FirstEnergy is a good company. And if they can't make them work, I don't how somebody else could.

<Q>: Given the strength of the balance sheet, could you comment on the types of investments that might be attractive opportunities going forward?

Bloomberg Transcript

<A - Ralph Izzo>: Yes. So, I mean, our primary emphasis is going to be continuing to grow the regulated utility. If you just think about the Gas System Modernization Program, which we have just about universal acceptance in New Jersey needs to be done, we're pushing the run rate from $300 million a year up to $400 million a year. We think that's probably going to be the natural limit for the foreseeable future. That will take us from a 30-year program to maybe a 25-year program, 20-year program. By the time we're done with that, the pipe that we laid 40 years ago will need some replacing, right?

So, our growth story in utilities is not about load growth. It's about an aging infrastructure that people rely on every day that just constantly needs refreshment. The value of being a combination utility is that even while we're doing this major overhaul of the infrastructure, we're lowering bills. Now, this is water, it's not vodka. The reason why I'm able to say that is because as gas prices have come down as a combination utility, we're able to lower the bill while making these investments in the utility.

So, my prediction is that we'll continue to have the vast majority of our investment in the utility. But as I said a moment ago, we'll keep poking at existing power plants to see whether or not they fit into our portfolio. I don't want to overstate the likelihood of being successful there, thus the 96% failure rate. But I don't want to have one land in our lap and then have people say, well, you never mention that, so.

<Q>: With regard to your plans for growth in transmission investment, is there a limit to future needs in PJM? And we noticed in the RTEP process, things keep getting pulled out of the RTEP, pull – are pushed further out because of declining power demand or changing directions of flows or whatever?

<A - Ralph Izzo>: Yes. And we are seeing a decline in the big projects, right? So we had a period of time in the past decades where some major, major projects needed to be built to debottleneck the East/West flows of the powers and that worked. I mean, it helped free up some congestion. It was done for reliability. But obviously, electrons don't follow paths because of reliability or economic conditions. They follow path because of Dr. Kirchhoff of years ago. So most of the big projects have decreased. We have one that remains. It's corrective seam issue between PJM East and New York ISO.

However, I will remind you that long gone are the days when utility engineers looked at load distribution, transmission and generation in one fell swoop. And given the slow-moving nature of load changes and given their ability to control where generation was built and where it was it was retired, you can have a fairly stagnant transmission system that would meet the reliability needs.

PJM did not know we were going to retire Mercer and Hudson until literally two weeks ago. Nobody knew that developer A, B, and C was going to build a combined-cycle gas turbine in RTO, six months ago. So as PJM addresses these changes, these major perturbations in the bulk power system, there's an ongoing need for projects. They're just not as big as they were before. So, I don't see the need for transmission going away, but I do see it as sort of more isolated programs than I do see kind of the mega projects that are going to decongest major systems.

A big part of that program also, if I might go on just for another moment or two is in an effort to enhance reliability, which I think we've been successful at. We're upgrading our 26kV loop system, which is a distribution level system to a 69kV system. So, we're still anticipating a very robust transmission program.

<Q>: Yes, [ph] Barry (29:03).

<Q>: Well, about one year from now, there'll be an election in New Jersey for Governor, and what would you like to see in terms of policy changes that would come in with the new administration that might create the opportunities for investment in energy beyond what is now allowed by the current policies?

<A - Ralph Izzo>: I can't think of any changes that I'd like to see, [ph] Barry (29:32), in terms of the areas in which we've been allowed to invest. We've been upgrading our traditional infrastructure and we've been allowed to participate at very active level in some non-traditional areas, in solar and in energy efficiency.

final

The one policy change – so in terms of areas of investment, no change. I think we've been welcomed into all areas that we've asked to be allowed to participate in. The policy change I'd like to see is, the duration of the programs that receive approval. So, I'll refer to the gas system program as hopefully with a little bit of humor.

It's a 30-year program. We'd like a 30-year approval. The regulatory [indiscernible] (30:15), stop whining, you've come in four times and we've said year four times. And I turn back and say yeah, but the first two times you said yes, for 18 months, the last two times you said yes for 36 months. And they say, well, you should be very confident that we'll say yes the next time. And I say yeah, there's a difference between confidence and certainty. So, unfortunately, they win. So, what I'd like to see is changes in the duration of the program, but I don't think we've been denied any opportunities in terms of where we can invest.

The banter is not quite that pleasant when it actually takes place.

<Q>: What are the prospects for PSEG Long Island.

<A - Ralph Izzo>: Yes. So, there's really two dimensions for PSEG Long Island. We thought there could be a third, but I'll get to that in a moment. Number one is, we operate their transmission and electric system. And that's under a contract. It's a 12-year contract. It has, I think, another nine years to run. And secondly, we dispatch the generation fleet, as well as contract with other generation.

In my opinion, both are going exceedingly well. They've gone far beyond my expectations in terms of how well we've performed. In the former case, we had 21 performance metrics we needed to meet as part of the contract. We've consistently met 18 and 19 of them, which resulting in slight bonus payments. It's a modest bonus payment. And in the case of managing the generation and their fuel supply, we've been able to pass on strong savings to them as a result of that.

So, I think we've done well. We're the student. The teacher would be the Long Island Power Authority. They give us the grade and I think they've been happy. That's contributing about $0.07 a share. It's indexed to inflation, so it will creep up over the course of next nine years.

The part that's been a disappointment, quite candidly, there was a vague reference in the contract to our ability to participate in something called Utility 2.0. It was not defined in terms of what it would be. We had hoped it would be a very ambitious program of kind of distributed generation energy efficiency that we could deploy our own capital.

But we've not been able to come to an agreement with life about what that really means. They would like to see us sort of manage other people's efforts in that area and our response is no, that's not what the core contract was. If you want us to do it as opposed to manage others, then here's what we'd like to do. So, it's unfortunate I think, but it doesn't keep me awake at night.

That's what I like. We're a very clear company, no confusing questions. Everyone's good. So we'll give back the balance of our time. Thank you all very much for joining us today.

MANAGEMENT DISCUSSION SECTION

Unverified Participant

All right. Our next presentation is Public Service Enterprise Group. We've got Dan Cregg, who is Executive Vice President and Chief Financial Officer, who's going to take us through the [ph] page. So, Dan? (0:12)

Daniel J. Cregg

Thank you, [ph] Dan, (0:14) good afternoon, everybody. I'll work swiftly through our forward-looking statements and GAAP disclaimer to get to – me to the presentation. And I think in summary, if you think about PSEG, I think you really think about two strong businesses. I think we have PSE&G, a New Jersey-based electric and gas regulated utility, both distribution and transmission. It's got about a $12 billion infrastructure program over the next five years, which will generate high single-digit rate base growth through 2020. I'll give you a little bit of color on that as we move forward.

And then on the other side of the ledger, PSEG Power. We're changing a few things at PSEG Power with respect to the fleet. We've seen some change out of some older units in the last few years, what we call our HEDD units, some older peaking units, and have an investment program to replace that with some combined cycle units, I'll also talk about in a little bit. Very strong cash flow generator at PSEG Power, which help support the business in the aggregate.

But think about the overall operating philosophy of the company, it's a philosophy that we have used for many years, three parts, and it all starts with operational excellence and that all starts with our employees. And the thought process frankly is very simple, to the extent that we can operate what we operate with excellence that will earn us financial strength. So, operating units that we know how to operate and operating them well will generate financial strength. And with that strong financial position, we will deploy that on a disciplined basis back into the business. And in doing so, we have seen positive results over the years.

The last three years we've seen increases in our operating earnings on an EPS basis. Our dividend growth, extremely important to our shareholder base, has continued to grow over the years, and I'll touch on that a little bit in a couple of slides, and really, best-in-class utility rate base growth, and like I talked about the increase in the efficiency of the fleet as a whole with our construction program around a couple of combined cycle units that we are currently building.

So, this gives you a snapshot of the overall capital spending of the business through two pie charts. On the left-hand side we look backwards, and over the last five years, we invested $14.3 billion in the business. And on the right-hand side, looking forward, $16 billion prospectively over the next five years. A couple of things jump out as you look at the pie charts, both the past and the future, same – relative proportion of spend between the two businesses. So, roughly a 3:1 basis utility versus Power spend both looking backwards and forwards. And within the utility side of the business, you can see that light blue area, transmission, $7 billion over the last five and a forecasted $7.1 billion over the next five. That equates to about 60% of our utility investment in both of those time frames. So fairly consistent investment profile.

Bloomberg Transcript

As you look forward in the next five years, investments in some clauses or trackers that we have ongoing both related to GSMP, or Gas System Modernization Program. What that program does is replace a host of cast iron pipe that's in the ground and we – the magnitude of cast iron pipe that we have in the ground that equates through about a 30 year run to replace all that pipe. So, it's one of the largest cast iron systems that's in the country that has a need of an overhaul. And on the Power side of the business, you can see there is a $3.9 billion investment over the next five years. A little over half of that relates to the new combined cycle units that we're building; one in Maryland, one in New Jersey, and one in Connecticut.

So, if you take a look first at the utility side of the business and you look at the rate base growth, strong rate base growth looking back over the last five years. The compounded annual growth rate of our rate base growth has been about 11%, and the depiction that you see also plays out pretty clearly where most of that growth has come from over the last five years is investment in transmission. You can see that from the dark blue component of the bar charts that you have.

Also, you see an orange line that moves through that, that is a PSE&G EPS number over the last five years, tracking closely to rate base growth. And the way we think about that is from the standpoint of the moderate load growth that we have seen, there needs to be a very strong control on the O&M side of the business. So, those two have offset one another pretty closely to let us grow by our utility earnings at a rate that's very close to what we've seen from the rate base growth as well.

Thinking more on a forward look with the same type of information. Looking at 2011 rolling out to 2016, again, this is rate base growth and our forecasted rate base growth on a compounded annual growth rate is 8%. So, those are the numbers we have put forth. We have also talked about the potential for incremental investments that could move that 8% rate base growth up to 10%. Those items in particular would include the continuation of that Gas System Modernization Program that I talked about. So, continuing to replace the cast iron that's in the ground.

Also, we have a program that we have implemented in response to Superstorm Sandy and that was a $1.2 billion program that was put in place based upon a $2.6 billion initial ask. So, additional work that follows on from that initial request is another area where we could see some potential upside to that rate base growth. And then, in addition, we have a renewable filing that's in right now with the BPU earlier in the year. We filed for a $275 million filing with the BPU for solar, and also opportunities within energy efficiency.

So, this gives you a little bit of an indication as to the overall make-up of our rate base, and the components that are there as well as the overall net income picture that has come from it. And by 2020, incremental growth anticipated beyond what we have shown in our baseline numbers.

Moving to Power. We have seen incremental growth on the Power side of the business through three particular opportunities that we are investing in over the next couple of years. In particular, to walk through each of them, we are constructing a 755 megawatt combined cycle facility in Maryland, the Keys Energy Center. It is in Southwest MAAC, and at an estimated cost of $825 million to $875 million.

That facility is in an area where we feel that there is the potential for stronger load growth than most areas within PJM. Also brings to us the value of having the output of that plant very close to PJM West. So, the correlation between that liquid hub at PJM West and the output of the facility gives us a good place to hedge the output of the Keys Energy Center. And that facility will go into service in 2018.

In addition in New Jersey, at Sewaren, we've had a facility there that's been in place for 70 years and really has run its course, and last year, we bid into the capacity auction to clear a new unit at Sewaren. So, that would be replacement capacity at the Sewaren site in EMAAC, a 540 megawatt unit. That unit would also go into service in 2018.

And then lastly, at Bridgeport, in Connecticut, a 485 megawatt combined cycle unit that cleared in the most recent New England capacity auction. That auction – the way that the New England capacity market works is that new capacity into that auction would see a seven-year lock on capacity prices. So, with that stable capacity price rolling out for the first seven years of operation gives a good stable base to work off of. That unit would go in service in 2019 and there are conditions in place that as that unit goes forward and gets its permits, it would anticipate that a coal unit on that same

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14792

site would shut down in 2021. So, also replacement capacity in the Connecticut market for that unit.

What that means from the standpoint of overall capital spend at Power, you can see on this next graph. And what it shows you really in two pieces is a fairly steady run rate of capital across the Power business of about $200 million to $300 million a year to run the business. And on top of that, over the next couple of years, that light blue area that you see is the spend that we have for the construction of these three units.

This unit – this capital spend would be covered by operating cash flow. So during this construction period, we are free cash flow positive with no need for any equity issuance throughout the entire five years of our business planning period. And then, this next slide gives a little bit of an indication as to what the new fleet would look like on the other side of this capacity build. So, two parts to this slide, on the left-hand side, gives you the megawatts that we have in our fleet.

And if you look on the bottom, there's a small pie chart, shows you the 2015 pie chart of the fuel diversity that we have within our existing capacity. And as you move northeast on that left-hand side of the graph, you see what it will look like in 2020. So, an increase in the blue part of that graph which really represents the combined cycle capacity within the total Power fleet; a moderate decrease on the nuclear side, not from any decrease in nuclear, but from an overall increase in the size of the fleet as a whole; and then a small contribution from the coal part of the fleet.

And on the right side, we go more to 1 gigawatt hour energy produced snapshot. So, same concept, looking at 2015 moving into 2020, how the output from the fleet will change over time, and we'll see an increase from about 35% to an estimated 42% of the output coming from the combined cycle units. And our nuclear units will stay at about 50%, the forecast is 49% there. And a fairly small contribution coming from the coal part of our fleet, really only 8% of the output.

Touching on that coal part of the fleet, we announced today through an 8-K that last week we had submitted to both PJM and the PJM Market Monitor a request for an exception to the must-bid requirements into the upcoming May of 2017 reliability pricing model auction that will take place. Those two stations have not cleared in each of the last two capacity auctions within PJM and what will happen is that the Market Monitor will take a look at that submission and make a determination where they will get back to us by December 1 for an exception to the must-bid requirement within PJM. And in parallel, during that timeframe, we will be making an evaluation of the path forward for those two units.

Again, they have not cleared the last two auctions and you can see here a fairly low capacity factor over the last couple of years. So, the thought process is that as PJM tries to make a determination as to what capacity will come to market in the upcoming auction, this kind of indication will give them a sense as to those units who are looking to have a choice with respect to what they do with the units. So, we will know more by December 1 or before about what the path forward is as we move into next year's capacity auction.

And then, one final slide looking at Power. If you take a look at the total energy produced in 2015 of 55 gigawatt hours and try to think about how much of what that output is in addition to capacity has been secured on a go forward basis, really there are two functions that help to get us to what it shows on the right-hand side of the page. And the right-hand side of the page basically reflects in the green that the three-year forward capacity market in PJM, plus what we see from the standpoint in New England and New York, would secure about 32% of our revenue for the 2016 to 2018 timeframe. And in addition, our three-year ratable hedging program would secure about 40% of the energy margin that we have.

So, if we take a look at that as a whole, about two-thirds of the revenue for Power is secured for the next three years, and as we step forward and continue to hedge and continue to enter into capacity auctions, that number will continue to move as we forward. So, a fairly stable base to move off of prospectively for Power.

A quick look at the balance sheet and really looking at sources and uses for 2016 to 2018, this is for PSEG as a whole. Taking a look for 2016 to 2018, the biggest source of cash for the business really is cash from operations and you see that on the left side, far and away the biggest magnitude of the sources of cash, but also supplemented this year and during 2016, 2017, and 2018 by the extension of bonus depreciation. So, we saw about $1.2 billion at the utility come

final
Bloomberg Transcript

to us from bonus depreciation in our forecast, as well as about a $0.5 billion on the Power side of the business from the spend we have there. All contributing to sources of cash for the business.

PSE&G's net debt, you can get a sense as to what we're going to see incrementally on the debt side. If you think about the capital program that we have at PSEG (sic) [PSE&G] (14:27) for over five years, $12 billion, for 2016 through 2018 we will match that roughly dollar for dollar, we have about a 51% equity percentage on the regulatory basis at PSE&G. So, we will match our debt with our equity at PSE&G. And then a fairly small component of Power and parent debt, which round out the overall cash from the business in the next three years.

On the right side, the uses of that cash. Most of the investment that we're making is growth investment. If you think back to those two pie charts that we showed you it's the combined cycle units that we are building, it is also the transmission spend that we have, and most of the spend on the distribution side of the business.

And then finally the shareholder dividend. So, none of this reflecting any equity issuances and no equity issuances in the five years of the business plan. That gives you a little bit of a sense as sort of sources and uses of cash. What that translates into from an operating earnings perspective, you see an increasing contribution to the overall operating earnings from the utility part of the business. So, regulated moves from a 43% contribution to a 62% contribution as we move from 2012 into 2016. Continuing contributions come from those clauses that I talk about from the transmission business that we have and the contemporaneous nature of the formula rate on the transmission business helping to grow the overall earnings of the business from a regulated perspective.

Those earnings translate themselves into dividends. If you take a look at the growth in the dividend, we've been over 3% growth since 2012 and last year we saw a 5.1% increase in our dividend from 2015's indicative dividend into 2016. That represents a 57% payout ratio if you look at it from an enterprise perspective and that dividend can be covered in its entirety from the utility earnings. And what we said on a go-forward basis with respect to the dividend is that we do expect to have the potential for consistent and sustainable growth in the dividend going forward. We don't do it on a formulaic basis; we don't provide exactly how we get to that number. We have the two businesses that we put together and look at what makes sense from the overall standpoint of the business mix for a dividend policy and we look at that every year.

So, looking forward, continuing to operate well is critical to both sides of the business as you can see on this slide. Executing on the capital program at both businesses. So, $16 billion in the aggregate over the five years related to the clauses in transmission and the combined cycle units on the Power side of the business. We look for continued improvements in the regulatory framework and I would say that on the regulated side of the business, on the distribution side, we've continuously moved forward with clauses and trackers with the regulated business.

And as we look forward to the extent that that can be simplified and moved into more of a longer-term infrastructure program, we think that that works better from the standpoint of the continuity of the work that needs to be done from the employment capability of the folks that we are hiring to have a better long-term view as to what we're doing from the business perspective. So, the regulatory framework that we talk about really referencing the potential to have more long-term infrastructure programs is an objective that we have.

And then continuing to look for growth opportunities. One thing that we always note is that our capital program as we go through our five years reflects what we know, and we know more about the next few years than we do about the tail-end of our plan. So, we tend to forecast a capital program that looks like it dips down over time. And as we step in to the next couple of years, we have historically tended to find ways to fill the back as opportunities have come up. And that will be a component that we will continue to look for from the standpoint of reliability for our customers.

And obviously, running the units well and touching on advocacy of constructive market rules. And maybe there, the most important element is the new price formation rules that PJM is looking at and trying to make sure that the elements of how the market is priced, how start-up costs, how load is forecasted, the periodicity with which payments are made compared to how units are bid becomes a fairly important component to make sure that units are getting the right price signals that they should.

final
Bloomberg Transcript
Bloomberg

And then lastly just to touch on Long Island, we do have the operating agreement for the Long Island Power Authority that has been in place for a few years, and I will say that folks have done a great job to execute on that. And that transition has been well executed, and I think the results that we're seeing in that business are exactly what we had hoped that they would be.

So, in summary, a stable platform between the two companies with predictable earnings and a robust investment pipeline. PSE&G, I think easily called a best-in-class utility with a very strong growth profile; and Power increasingly an efficient fleet. If you take a look at some of the units that have done their time and moved on, and with some of the new units that are coming on, we will be a very clean fleet and a very efficient fleet. And lastly, a very strong balance sheet, strong credit ratings, and the ability to execute on a $16 billion capital program without the need for any equity.

So with that, I'll be happy to take your questions.

Q&A

<Q>: And there is a microphone. There is a question in the back there.

<Q>: I missed your comment about those three new units, three newbuilds. Are those contracted power or they will be sold in the market on a competitive basis?

<A - Daniel J. Cregg>: They're merchant facilities and they are not contracted on a long-term basis but for the fact that there is a seven-year capacity lock in New England. So, those will work their way into our normal hedging program as we step forward.

<Q>: So, to follow-up, what kind of returns can you get from that investment of $1.8 billion or so on those units?

<A - Daniel J. Cregg>: So, we don't provide what our hurdle rate or anything would be, but I will say that, that as we've gone through those analysis, they met our requirements.

<Q>: Are they more in line with the existing assets, or are they better or they're worse?

<A - Daniel J. Cregg>: I would say that they met our requirements as we went through our analysis.

<Q>: [indiscernible] (21:25)

<Q>: When you look at price formation rules and thoughts on PJM, what are your thoughts on price formation rules around assets with environmental qualities like nuclear?

<A - Daniel J. Cregg>: I think that's a secondary aspect of what I've seen from some of the price formation elements within PJM. I think part of the disjoint between the nature of the duration of the bids, be they hour long or five-minute settlement, it's more of those kind of elements for units that are on and off, for units that are ramping up and ramping down, that's more where the focus has been I think with respect to trying to tighten up those rules, and make sure that the right signals are out there, so that the market can work more efficiently.

<Q>: Two follow-up questions. Sort of [ph] process ahead (22:33) on getting approval for the $275 million renewable spending, and then, any outstanding approvals you need for moving ahead with the new CCGT plants?

<A - Daniel J. Cregg>: Yeah. So on the – with respect to the solar filing, there are requirements in New Jersey for those types of filings, for once a filing is deemed complete, that they would be completed within – a decision would be made within 180 days. So, I think that's a reasonable timeframe to expect and they were deemed complete around mid-year. So, I would say around the turn of the year is the right time for when we would hear back on the solar projects.

And then with respect to the combined cycles, various plants in various stages of the permitting, so I think we will continue to step our way forward in that process over the next year or so, and then the rest will just be the construction side of things. So, more permitting going on in Connecticut, and the other two plants which are a year ahead from the standpoint of a service date are a little bit ahead on the permitting as well.

MANAGEMENT DISCUSSION SECTION

[Abrupt Start]

Daniel J. Cregg

...PSEG presentation gave just a high level overview of the company. My name is Dan Cregg. I am EVP and CFO of the company. Of course, we start with the forward looking statements and the GAAP disclaimer. And there is a page – the last page of your document will go through the differences between the GAAP results and the operating earnings results.

So, at the highest level, if you think about PSEG, two main subsidiaries of the company. On the left-hand side, you see a depiction of PSE&G that is our regulated company, Electric and Gas. So we are converged already, and by virtue of the name, Public Service Electric & Gas, have been so for a very, very long time.

Single-state regulation from the distribution part of our business and FERC-regulated on transmission. Is about a $12 billion infrastructure program over the next five years that will continue our strong rate base growth, and I'll show you a little picture of what that looks like.

And then complementing that business, PSEG Power, a merchant generation company. Some changes going on with that company to make us more efficient, and I'll go into a little bit of that detail as we go forward.

So some improvements there. And you can see the relative size of the business. Our regulated side from an operating earnings perspective exceeds our generation side. We'll also show you a slide where that dynamic has changed over time. We've gotten a little bit more regulated as time has gone on.

And when we think about the companies, one of the basic tenets that we live by is seen by this depiction on the right-hand side of this slide here. It all starts with operational excellence. Absolutely key to what we do. I'll go through a couple of instances where you can see some indications of that. But the thought process is that if we can operate our assets excellently, it will build financial strength. That financial strength in turn can lead to disciplined investments that we will make and those investments are in assets that we will be able to operate excellently. And that circle can go on forever. And all backed up by a workforce that is engaged and we think one of the best in the industry.

From a results perspective, it's resulted in earnings growth over the last three years. Our EPS has grown. Dividend growth over time. And I'll give you a picture what that has looked like and a little bit about what that will look like on a go-forward basis. And strong rate base growth and a new combined cycle gas turbine fleet that will be coming online in the next couple of years as well.

So continuing on the same theme, we've delivered. And on the operational excellence side, PSE&G this year, for the 14th consecutive year has been named the Mid-Atlantic's Most Reliable Electric Utility, Electric Light & Power's Utility of the Year, just real strong response to Superstorm Sandy. I mean, that was a enormous impact to the business and to the customer to this day, and I think our results that we had against that backdrop, very, very strong and has changed the company. We are making some changes to our infrastructure as a result of that event.

Bloomberg Transcript

We continue to see increased output on the Power side of the business, both at nuclear and also on our combined cycle fleet. More and more of our output comes from there. And with the changeover and the incremental construction program that you see in the next couple of years, we'll continue to see that move forward.

And then a smaller part of our business, PSEG Long Island. So we have a contract to run LIPA's operations. And we have seen in that operation, improved customer service, which has been a big focus for that operation, and improved reliability. So that's an area where we step into a situation that needed some help and have really worked with the team at LIPA to improve that business, improve results and make things better in our neighboring state.

From a financial strength perspective, last year's earnings of $291 were at the upper end of our guidance. Both of our businesses throw up very strong cash flows, which enables the dividend policy that you see and we'll talk a little bit about that. And maybe more importantly, over the next five years we have a $16 billion capital program and we will move through that capital program without the need to issue equity. So that's a credit to the strength of the cash flows from both of the businesses that we have.

And then lastly from an investment perspective, capital programs both at PSE&G and at Power. At PSE&G, driving rate base growth 8% to 10% over the next five years and investments really across the board in Transmission. Energy Strong that you see referenced on the bottom of the page, that was the response to Superstorm Sandy. And also the Gas System Modernization Program; that's a more recent program, was approved last year and started at the beginning of this year. $300 million a year to replace one of the largest cast iron and bare steel gas systems in the country. That program at its current pace will continue for about 30 years or has a need for about 30 years' worth in investment to replace all that cast iron and bare steel that we have in our system. So that's an area where we expect to see continued investments for a long time to come.

And then on the Power side, we have in the past few years moved mainly with respect to the growth of the business at Nuclear with some uprates and Fossil also with some incremental uprates around the edges to improve the fleet as well as a single pipeline investment of PennEast and a Solar Source business which is a solar business on the Power side of our business responding to PPAs. And that capital program will change over time and be more focused on new build programs.

And that's what you see here in the following slide. So on the left-hand side of this next slide, it shows you the last five years from 2011 to 2015, and it shows the capital spending across PSEG. And it gives an indication of the mix of our spend and where our investments have gone between our two businesses. So the blue – the different shades of blue represent PSE&G and the orange represents Power. So you can see, there was roughly a 3:1 ratio of spend at the utility versus spend on the Power side of the business.

Moving to the right-hand side, from 2016 to 2020, a comparable business mix if you think about the investments that we are putting into the business. So about $12 billion going into PSE&G and about $4 billion going into Power. So while we are investing in a little bit of a different mix across the business, the general investments between the two companies has remained fairly constant across the last five years and as we look forward to the next five years. And, again that $16 billion investment program will be funded without any need for equity.

And just a quick look back at the last five years. And keeping with those same timeframes, we really simplified the business from 2011 to 2015. There was a third company that if we went back five years or so, we would have talked a little bit more about, PSEG Energy Holdings. Those investments have been largely monetized. It's thrown off incremental cash flow. And we've simplified the business really to just the two businesses that we are talking about now with PSE&G and Power.

The balance sheet strength also helps us to fund the dividend. And if you see on a go-forward basis, in 2016, we've continued the dividend growth. The dividend growth between 2015 and 2016 is up 5%. And the investments really are focused on reliability, resiliency and efficiency on both sides of the business.

So PSE&G, if we look at the utility, what you see here is the rate base growth that we have seen over the last five years. It's a stacked bar visual. And on the bottom, you see the distribution rate base; on top, you see the transmission rate base. So the growth in our business has been on both sides, but more pronounced on the transmission side of the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14798

business, a FERC-regulated business. So, again, while we are a one-state utility, two regulators have jurisdiction over the investments that we are making.

And as we move out to 2015, you can see that that balance between FERC regulation and New Jersey regulation has come closer in balance and is almost half and half. And again, these investments will move us to the – or these investments in the past will continue. And again, the rate base growth on a compounded annual growth rate is expected to be 8% to 10% as we move through the next three to five years.

The impact that that has on the customer bill is something that we always take into mind as well and being cognizant of what that's going to look like. What you see here is going back from 2008 to the current state of what the customer bill looks like on the electric side of the business on the left and the gas side of the business on the right. And largely due to the commodity price declines that we've seen in gas, but also due to some transition charges that have come off of the bill, you see that a combined customer has a 28% reduction in their bill from 2008 to 2016, and that's on a nominal basis. So that's not cost-adjusted for the years that are involved.

So as we move forward and pursue this rate base growth that we have, the impacts on the bill are manageable. And if we were to see a 2% increase on the bill over the next 14 years, we would get back to where we were 8 years ago. So that's just an indication of, 14 years from now somebody is going to know that they've had an increase of 2% every year as opposed to what happened in 2008. That's understood. But I think we have – we work off of the base of a declining bill, which gives us some headroom to do the investments that we do need for an aging infrastructure in New Jersey.

Then on the Power side of the business, three recent announcements for growing the business, all three combined cycle gas turbine investments that we are making, two in PJM and one in New England. So the first that you see here is a 755 megawatt combined cycle unit at the Keys Energy Center in Maryland. The second is a 540 megawatt combined cycle unit at Sewaren, New Jersey. Both of those units will be online in June of 2018.

And then complementing that in 2019, in New England we have our Bridgeport Harbor 5 unit, which would be just under 500 megawatts which will come online in 2019, and that Bridgeport unit just recently cleared last year's capacity auction in New England. By clearing that auction has a 7-year lock on its capacity revenue. And all three of these units will benefit from bonus depreciation as well.

And all in all, these new units will come on, will be very efficient new technology there. They are not repowerings of old units; they are new construction. And in two of the instances, both at Sewaren and at Bridgeport, we will be taking out older capacity to replace it with newer capacity. So from a supply-demand perspective, there's a netting of the two as we go forward.

What that looks like as a fleet overall is, on the left-hand side you see megawatts and on the right-hand side you see gigawatt hours. And you see what the fleet mix will look like as we go from 2015 on the bottom of the page to 2020 on the top of the page.

So, incremental megawatts, and as we look at the right-hand side from a gigawatt hour perspective, the gas contribution to the fleet will go from 35% to 42%, so a 20% increase in the efficient gas part of our fleet, balanced of course by a large nuclear output from the balance of the portfolio. And we'll go from roughly 55-terawatt hours to 65-terawatt hours as a fleet as a whole, so incremental production from those units coming online.

So, if you had looked back five years, we had a bunch of units which were nearing the end of their life; we often refer to those as the HEDD, High Electric Demand Day units. Those are some older peaking units that were still around. They would run on those days when absolutely needed, but generally not more than that. And they had served their time, and it was time for them to drift off into the sunset as may have seen outside yesterday. But as we move forward, we will have a more efficient fleet and a construction program that's underway that's going to serve us well for years to come.

So I talked a little bit earlier about the earnings contribution from each of the businesses, and this gives a depiction of exactly that. So if you go back to 2012, you can see on the bottom of the page, there's the PSE&G contribution to earnings per share and sitting on top of that is Power's contribution. So from 2012 to 2016, you'll see an increase in the

final
Bloomberg Transcript
Bloomberg

regulated contribution to our business from 43%, growing based upon the earnings guidance that we've given by company to 61% as we move into 2016, providing a stable base for the business and representing the rate base growth that we talked about.

And again, both sides of the business generating very strong operating cash flows. That helps support the dividend that we have paid over the last few years. And just briefly here on page 15, you can see the growth in the dividend over that same timeframe as we've gone from 2012 at a $1.42 and grown by 2016 the indicative dividend of $1.64. That $1.64 is less than PSE&G's standalone guidance midpoint for 2016. So that dividend can – you can think about it as being covered solely by the regulated earnings of PSE&G. And what we said on a go-forward basis is that we feel very comfortable that we have the potential for consistent and sustainable growth in the dividend on a go-forward basis.

So, on both sides, again, operational excellence. Execution of the investment plans will be vital over the next few years as we go forward. And maybe just one other thing to touch on on this slide for each of the businesses. At PSE&G, we are looking to optimize the business environment by advocating for a regulatory framework that provides support for long-term infrastructure programs.

This is consistent with some of the other companies in our state as well. And as we have gone through the years, looking back maybe the past six, seven, eight years, there has been a host of infrastructure programs that we have put in place in working with the state and trying to align with state policy. And we have been successful in doing that.

But as we go forward, the ability to do that on a longer term basis as opposed to a series of shorter term programs, it seems like it's in the best interest of everybody. It helps the company plan a little better. It helps the workforce be developed a little better. It stops a demobilization, remobilization of the business. So one of the things that we think would be an advantage to the business is to enable a longer-term infrastructure program. And so, there's some discussions going on to pursue that on the Jersey side.

And then, at PSEG Power, continuing to advocate for constructive market rules. And there certainly have been some challenges there in the recent past. We've seen them years ago with the [ph] LCAP (16:06) rule in New Jersey. And then more recently further west from us there's been some activity that have challenged the market rules as well. So one of the things that we are trying to do is work in that direction to enhance the market rules and to maintain competitive markets as we step forward.

And then lastly, again, in Long Island, continued execution of a small but very good business where I think we've proven our ability to run another operation extremely well and make some much needed improvements in that business.

So in summary, a great platform, strong earnings and a very strong investment profile. I think clearly easy to say a best-in-class utility, and I would say a best-in-class power generation business as well. And a very strong balance sheet with very strong credit stats and the ability to finance a $16 billion, five-year investment program without equity.

So that in brief is our story. And I'd be happy to take any questions.

Q&A

<A - Daniel J. Cregg>: [ph] Frank (17:19).

<Q>: [Question Inaudible] (17:21 – 17:50).

<A - Daniel J. Cregg>: Yeah, the question is about the growth of Power and where it may come from on a go forward basis. And I would say that from what we have in front of us, it's a fairly ambitious program over the next couple years. So three major construction projects that we will work our way forward. My sense is that you will not see three more construction projects or really anything significant beyond what's there.

And I would say on the growth front, it would lead us more to an acquisition-based growth, but probably not big fleets. I think your areas that you mentioned of New England and New York and PJM, provided it's not very close to where our assets are right now, because sometimes we can have some [ph] worker (18:36) concentration issues there. Would be where we would go. I mean, we've always been a PJM-and-up focused company. So that's the geographic area. And

final

Bloomberg
SI-SSA-0015-14800

as we look to asset acquisitions, probably on the smaller side, but we continue to look and pursue that. Yes.

<Q>: [Question Inaudible] (18:56 – 19:07).

<A - Daniel J. Cregg>: Yeah. And that's more of a state-oriented comment. And right now, I think for the immediate term, we will be watching as much as talking. There are others in our state who are in for regulatory re-ups. And as part of those filings, they are seeking the ability to go a little bit longer with some of their infrastructure builds. And again, I think it makes sense from the standpoint of being able to plan your work. I mean, just a simple example is that rather than hiring folks from the outside for short-term durations, we can hire employees, train them, and give people careers instead of giving folks jobs. That's just one simple example of why it seems to make sense. And maybe another example of the type of program where it fits so well is that Gas System Modernization Program I talked about earlier.

So we know we have over 4,000 miles of cast iron and bare steel in the ground. We know that they all need to come out of the ground and be replaced. And we know that at the current pace, it's going to take us about 30 years to do that.

So why are we planning for it in shorter bites rather than trying to put something in place on a longer-term basis? – So, to acquire the right equipment and the right people and it just – it seems to make sense to let that have a little bit of a longer view as to where we're going, and it would enable us to plan it and be more efficient with it. And I think everybody wins in that regard.

[ph] Frank (20:38).

<Q>: [Question Inaudible] (20:39 – 20:53).

<A - Daniel J. Cregg>: Yes. So the solar program has been a – the question is the solar program in New Jersey. And it's been a focus of the state for quite some time. We are not Arizona, right, so it is not nearly as – it doesn't naturally fit as well. But from an environmental perspective, it's an interest of the state and it's something that's been pursued by us in the past and by others. In fact, just recently, a couple days ago, we filed for a $275 million program called Solar 4 All. So it's a solar program where our utility-scale solar will be built on landfills and brownfields. So we are a little bit of a compressed state. So to take farmland and turn it into a solar farm doesn't work quite as well as to take a landfill and turn it into a solar farm.

So that's been the focus of that program. And we also think that utility-scale [indiscernible] (21:50) is the best cost-efficient manner to get solar in the state as well. So there definitely is an interest in the state. And like I said before, we've been trying to align with state policy and work with what they want to get done with respect to some of our filings. And what you saw the other day is a perfect example of that.

Any other questions? [ph] Frank (22:23).

<Q>: [Question Inaudible] (22:25 – 22:40).

<A - Daniel J. Cregg>: Yeah. So with respect to financing of the capital plan that we have, so you heard a couple times that there's no equity that's involved in it. On the PSE&G side, a pretty simple way to think about it; our regulated cap structure is [ph] 51 and change and 48 and change (22:58). So we'll kind of step forward that way, leveraging the cash flows of the business for the equity side of things and then going outside for the debt piece.

Power's program also has a element of debt that we anticipate going out for. We haven't given any specifics about it. But I would say that if you would look back historically to the way that we have financed the business, it's been fairly traditional. And I would expect that we would probably be in that same vein as we step forward.

So we will have some financing needs – some debt financing needs as we go forward with the program that we have. And it would be more along the traditional means that you've seen us do in the past. Yes.

<Q>: [Question Inaudible] (23:39 – 23:46).

<A - Daniel J. Cregg>: Yeah.

<Q>: [Question Inaudible] (23:47 – 23:59).

final

Bloomberg Transcript

<A - Daniel J. Cregg>: Yeah. So the question is really about net metering and what's going in the state in that front. I would say there are discussions around net metering more than there are advanced discussions about major changes to it right now. Our – the overall solar penetration in the state is fairly moderate from a net metering perspective. I think certainly, those customers that are net metered, it does create a little bit of an imbalance and it can be a little bit regressive.

So if you have those that have solar panels on their house, if they tend to be on the higher income side and they are going to benefit from an ITC and from a Solar REC which is upwards of $300 a megawatt hour and net metering takes their whole bill down on a full retail basis until they eclipse their own usage. So as a result, the balance of the grid is being funded by everybody else. And I think in time that will continue to be discussed and developed. But I would say, again, we are not as acute with respect to the magnitude of the effects in New Jersey. But I think as time moves on, that conversation probably rises a little [ph] bit (25:21).

You're welcome. Yes.

<Q>: [Question Inaudible] (25:29 – 25:41).

<A - Daniel J. Cregg>: Yeah. Great question. So it's a question about our Gas System Modernization Program. What's in the plan right now is $300 million a year for each of 2016, 2017, 2018. And the original ask with respect to that program was the same run rate, but five years. So I think it was $1.6 billion, so pretty close to that same run rate.

And when we talked before, I mentioned that over the next three to five years we would see 8% to 10% rate base growth. That five-year plan from identified investments is 8%, but we've identified some other investments that are not yet approved that we would anticipate could bring us up to 10%. And as a perfect example, those – a part that gets you there is years four and five at $300 million a year.

So, this is – we have done replacement of these pipes through a series of other infrastructure clauses that we've had in place. A piece of the Energy Strong program was really about targeting those pipes that needed to be more water-resistant. And in earlier programs, our capital infrastructure one, capital infrastructure two also had some elements to it.

But in those five years, you see about $300 million a year. That's probably the run rate that we would expect to have on an ongoing basis as well, just from the standpoint of labor sufficiency and infrastructure disruption. So you are digging up roads, there's a certain magnitude that you can do there. So it could be a little bit larger, but it's a good ballpark number to think about for that program.

Daniel J. Cregg

All right. Well, thank you very much for your time and attention and enjoy the rest of the conference.

MANAGEMENT DISCUSSION SECTION

Ralph Izzo

Morning, everyone. Thanks for joining us. I'm Ralph Izzo, Chairman, President and CEO of PSEG. I'm joined today by – seated up front with me here is Dan Cregg, our Executive Vice President and Chief Financial Officer. Also in the audience are Kathleen Lally and Carlotta Chan, our Vice President and Director of Investor Relations, who will also be available to answer any questions you might have.

So, as is usually the case, I'll begin with our forward-looking statements, just of course cautioning you that some of what I'll be talking about are predictions. I won't read it for you in detail. And also, we'll be talking a little bit about operating earnings, which are not GAAP numbers. And we do have a reconciliation for you in the back of the presentation.

So I'll start with an overview of the company. For those of you who are little less familiar with Public Service Enterprise Group, we consist primarily of two operating companies, Public Service Electric and Gas, which is a regulated electric and gas transmission and distribution system, serving New Jersey. It's the largest regulated utility in New Jersey.

Primary characteristics that I'll feature and describe for you today is a pretty ambitious $12 billion capital program in the next five years that will result in a compound annual growth rate of its regulated rate base of approximately 11%. Posted here for you some numbers in terms of how we ended the year 2014, which are available for your reading.

Operating alongside PSE&G is PSEG Power, our unregulated competitive generation business. Its hallmark and value proposition is its advantaged environmental and geographic location as well as an asset mix, a portfolio of assets that are characterized by fuel diversity and technological diversity. By that I mean a combination of peaking load following and highly reliable base load generation.

As I look at the strategy we've deployed over the past few years, it really does begin with our employees by setting clear expectations, making sure they have the ability to succeed and explain why we do the things that we do. We produce a very engaged workforce, focused purely on two words, operational excellence. And that excellence is demanded, whether it's in our nuclear plants, our fossil plants, our field operations in the utility; or our support functions, IT, accounting, and a whole myriad of others.

We absolutely believe and we've demonstrated that with that operational excellence comes solid financial performance, and with that solid financial performance comes the opportunity to redeploy capital in a disciplined manner. The result of that strategy has been three years of earnings per share growth, an increased rate of growth of our dividend, and what we believe is a best-in-class utility growth story, as well as increased competitiveness of our fossil fleet through the expansion of some of our combined-cycle gas turbines and, more recently, plans to build new combined-cycle gas turbines.

As I take a look at the capital program, both past, present and future, you'll see that over the past five years, we deployed a little over $12 billion in capital, approximately 78% of that at the utility, with the lion's share of the utility investment in transmission. The significance of that is that the transmission investment is FERC-regulated and

Bloomberg Transcript

Bloomberg

SI-SSA-0015-14803

final

recovered through a formula rate proceeding, which minimizes the degree of regulatory lag. We basically file for our rates in October. And three months later, in January, those rates are made actual for us, subject to prudency review of course, but not subject to ROE review.

As we look ahead for the next five years, we've expanded that capital program by about 20% for both the Utility and PSEG Power. And you can see the utility capital program now approaching $12 billion, still with the lion's share being in transmission at about 60% and Power now having some growth opportunities as well, that I'll go into in a few moments, mostly in the form of new gas-fired power capability.

Approximately 70% of the utility's capital program receive some form of contemporaneous return. So the 60% due to transmission and an additional 10% through various clauses that have been negotiated with the state of New Jersey through regulatory proceedings. The remaining 30% of the utility capital program is modestly in excess of depreciation, and the result of which means that we have very little capital that's deployed that's subject to regulatory lag.

And the most recent approval that we received in the form of a contemporaneous return mechanism in New Jersey, I need to qualify that, the most recent program that we have come through an agreement with the staff on and we expect to have approved in six days next Monday, it is on the Board of Public Utility docket, is a Gas System Modernization Program, which has been approved for $900 million in expenditures over the next three years.

PSE&G has what we believe is the largest cast iron main system in the nation. It is a low pressure system, so safety is not the issue. However, chronic leaks, methane emissions, contribution to greenhouse gases and simply excess of O&M expense associated with needing to repair those leaks warrant the replacement of the system. At a $300 million per year run rate, it'll take 30 years to replace this system. So it's an ongoing program, it's one which we've had three prior approvals for a special clause/tracker recovery, this being the most recent one.

And as is listed here, the return mechanism is identical to what we had in an Energy Strong filing that we received approval for in May of 2014. And in this particular case, we're being allowed a return on equity of 9.75%. A little over $600 million of the $900 million will be subject to that clause and tracker return, and a little bit over $250 million is expected to be recovered through a standard base rate case that we must file no later than November of 2017, and that has been planned for the prior year-and-a-half.

If I look at the utility's overall capital program, this is the $12.6 billion that I referred to two slides ago. You could see at the bottom of each bar chart is a significant amount of transmission investment. Just above that is a combination of some special clause mechanisms, but mostly maintenance capital on the gas and electric distribution system, inclusive of some modest amount of new business.

Above that is our Energy Strong tracker mechanism, which for those of you who don't recall, Energy Strong was born out of the consequences of Superstorm Sandy, and the recognition that many of our legacy assets were built in industrial areas, which were low-lying areas with respect to possible flood and storm surge consequences and needed to be either elevated or protected from such future events.

The piece above the lighter shade of blue is our new Gas System Modernization Program, which you see is scheduled to start January 1 of 2016, and then run for three years. And we've been quite active at PSE&G in some non-traditional programs, which are largely a combination of rooftop solar, grid connected solar and energy efficiency.

And just prior to the approval of the $900 million for the gas program, we received approval for a $95 million energy efficiency program, inclusive of the opportunity to recover fixed costs associated with the distribution system and the lack of throughput resulting from an energy efficiency program.

I will point out that, as often been the case in the past, this six-year profile, current year plus five future years, has been pretty consistent over the last eight years. It just keeps shifting out in terms of the expectations for future growth. That's not a guarantee that we'll continue to add 20% to the capital program with each annual revision of the five-year plan.

However, I do think that one should expect that the out years, where there's a forecasted decline, is really more reflective of the fact that it is difficult to predict what the needs will be out there. But suffice to say, in a fairly mature infrastructure such as ours, infrastructure replacement for preservation of reliability is something that is likely to

Bloomberg Transcript
Bloomberg

SI-SSA-0015-14804

final

continue.

If I switch over now to PSEG Power, you can see that we've had some good news in terms of market design and market rules. The best example of that has been the most recent capacity auction run by PJM, otherwise known as the RPM BRA for reliability pricing model, base residual auction, in which PJM has modified the rules, whereby the penalties for a asset that is the recipient of capacity revenues are great, much increased if the capacity asset does not perform at critical points in times. The rich premium associated with that greater penalty was reflected in the fairly robust price realized by market participants, inclusive of PSEG Power.

We're also encouraged by the fact that FERC is now giving much needed attention to the issue, not so much prevalent in capacity markets, but in energy markets around price formation. And this is merely the fact that there have been a substantial number of cases where, for reliability sake, units have been dispatched with specific uplift payments that have not been available to all market participants, and we believe this is part of the well discussed and well-known hidden money problem that FERC is stepping up to address.

And I'm sure you're all aware of the ongoing interest at the Supreme Court of the United States revolving the proper location for the regulation of demand response, where most recent court decisions have, we believe, correctly suggested that these are retail services and not the purview of FERC, and therefore, more than likely not eligible for wholesale power capacity or energy pricing opportunities.

In addition to just those kind of progressive or positive outcomes in terms of market design, we've had some good news specific to PSEG Power. We have been adding capacity at our Hope Creek and Peach Bottom nuclear units. We have been adding capacity at our existing combined-cycle units, notably Linden, Bergen, and we'll do Bethlehem Energy Center I believe in the coming year-and-a-half.

And most recently, we've announced the acquisition of a to-be-built plant in Prince George County, Maryland known as the Keys Energy Center, as well as having cleared in the most recent PJM auction a new combined-cycle unit known as the Sewaren unit in Woodbridge, New Jersey.

So, some combination of recent brownfield site newbuilds, primarily in the form of simple-cycle gas turbines at carbon and Carney. These upgrades at our nuclear plants and these planned construction at Keys and at Sewaren have taken an already competitive fleet and truly enhanced its competitive position, particularly with access to low-cost Marcellus Shale gas.

A little bit more color on the 1,300 megawatts of combined-cycle gas turbine plants for Maryland and New Jersey. The Keys facility is 755 megawatts, but expected to be in operation in 2018. The Sewaren facility are 540 megawatts that will replace an existing 550 megawatts of an old steam unit in the Sewaren at the Sewaren site, which quite candidly was not a candidate for bidding into a CP-type market, just given the age and reliability of the unit. So these two plants will both be quite efficient units with heat rates in the 6,500 Btu per kWh to 6,700 Btu per kWh and therefore jump pretty much to the front of the dispatch queue.

As we look at earnings for this year, we recently adjusted the lower-end of our guidance and took it up $0.05. We're now forecasting earnings in 2015 of $2.85 to $2.95. If one were simply to look at the midpoint of that earnings range, you would see a third year of consecutive growth in earnings per share.

In addition to the earnings growth that we've realized, you see a continued growth in the proportion of the earnings coming from the regulated utility. And with the capital program designed, as I've tried to describe to you, you should continue to expect an increasingly regulated component of the total earnings of the company.

In addition to being a solid earnings producer at PSEG Power, it enjoys a very healthy free cash flow component, which is used to provide the equity needs of the utility in its $12 billion-plus capital program over the next five years.

With that, I'm going to turn the podium over to Dan Cregg, and then I'll rejoin Dan later on for any questions you might have.

Bloomberg

SI-SSA-0015-14805

Daniel J. Cregg

Thank you, Ralph, and good morning. I'll touch a little bit on some of the financial aspects of the business in my remarks, and I'll start with our operating earnings. So our recent earnings call we reported earnings year-to-date of $2.41 versus $2.27 in the year-ago period. So, about a 6% increase.

And I'll touch more on the individual company contributions to that in a slide in a minute, but what that means from a year-end operating earnings forecast is the following.

For PSE&G, we see an increase. So we were previously at $760 million to $775 million of operating earnings, and that number has been increased to $785 million to $805 million of operating earnings at year-end. And Power has slid down to the lower end of its prior range, and their current year-end guidance is $620 million to $650 million of operating earnings for the year.

And as Ralph mentioned, we're at $2.85 to $2.95 of operating earnings for PSEG, the parent company, and that's an increase from where we were earlier in the year, as Ralph mentioned.

Related to the capital program, it's been a pretty busy year for identifying opportunities. And Ralph talked about the major elements that we see on both sides of the business, both on our Gas System as well as the Power. So I won't go further into those.

But, further down the slide, other elements worth mentioning and repeating here are PJM's capacity performance market. So, first time, we've had that change in the market at PJM. It's been a longstanding capacity market. But more rigorous expectations, and I think that it was a well done auction. It completed in August of this year, and I think there is both discipline on the market generator side as well as a good structure that was put in place.

And also the FERC NOPR on price formation, more to come there, but I think really good focus on the energy side of the business. So, good to see both the capacity side and the energy side being addressed and improved as we walk forward.

And last point here is the Reliability One Award for PSE&G. So this is the fourteenth straight year that PSE&G has been named the most reliable utility in the mid-Atlantic region. So, something we're very proud of and the result of a lot of good hard work from the people at the utility side of the business.

So, a little more color on the results year-to-date, and I'll start on the left-hand side at the utility. $0.13 increase year-over-year, and the first piece that you see there is transmission. You previously saw from Ralph's slide all the CapEx that has gone into that business, and the continued investment there worked its way into our earnings stream through that $0.10 of earnings that we saw through the first three quarters of the year. A big important part of our growth program, and it has served this one, has been a pretty consistent provider of earnings increases over the year.

Next, both on the electric and gas side, we have seen increases in volumes and demand adding $0.07 throughout the year. Some of that weather and some of it the programs that Ralph talked about as well coming through from an earnings perspective.

On the O&M side, we see about $0.03 of downdraft, about $0.01 a quarter for pension. So, that is almost entirely the pension expense going through the utility side of the business. We'll see something similar on the Power side. And then, finally, that last item, $0.01 down, that's just the absence of an uptick from last year related to taxes.

Moving over to the Power side, $0.01 to the good. $0.22 of re-contracting and lower cost to serve. So, gas prices coming down, some of our hedges coming into play have increased our results by $0.22, largely offset, if you go down that column a little bit, by a 21% reduction in capacity.

Now recall, in PJM, where most of our assets are, that capacity market is a three-year forward market. So we know three years in advance what those prices are going to be. So this impact that you see here is the effect of prices that have come through, as we've gone year-over-year in the auction and then, frankly, an uplift that we had seen in the prior period coming back to more regular capacity prices.

Beyond that, some help from gas send out in the winter and some higher volumes in the summer helped us to the tune of $0.06. And then the O&M, I mentioned a little bit about the pension earlier, some of that is pension coming through, roughly half, and then the other is mainly outage timing. So some of our nuclear outages can bridge different quarters depending upon the timing of that outage. So we would expect to see that reverse out as we go to the fourth quarter, and that is not a uptick in a run rate O&M spend. And then, finally, just $0.01 on D&A.

So, moving on to the balance sheet. I think, if you look at this slide, it tries to lay out two different timeframes. And during the 2010 to 2014 timeframe, we talk about transforming our business mix, and I might say even simplifying our business mix. So we had some non-core assets at our Energy Holdings portfolio. Those had been monetized. And we put $12.6 billion to work towards investments. At the same time, we were able to improve our credit ratings, and during a low price environment, increased the dividend.

So, a little bit of a simplification of the business over that timeframe, which sets us up for the bottom of the slide where we talk about the following five years. So, continued dividend growth. If you look at 2015, I'll talk a little bit more about the dividend that we saw there. And Ralph showed in those pie charts, there's a $15.6 billion investment program that we are embarking on through 2019.

So, good growth opportunities for the business, and the financial capacity to support further expansion. And I'll touch on that on the next couple of slides.

The slide here is a five-year look at sources and uses. So, if I start on the left-hand side of this page, the cash from ops at the Utility has eclipsed Power's cash from ops, as you take a look at where we've been. And that's not because of Power's cash from ops going down. That's because Utility's cash from ops coming up. So, a good answer in that regard.

And Ralph talked about the contemporaneous return we have on the utility side of the business. So 70% of that capital that we're putting to work is providing a return on a contemporaneous or near-contemporaneous basis, either from transmission or from the clause recovery mechanisms that are in place. So, real important for the Utility from that perspective when you look at cash from ops that it's getting a return on its investments on a fairly quick basis.

On the debt side, you see on the bottom of the left-hand side PSE&G's net debt. So, that just supports the growth that we're seeing at PSE&G, and again, think about that regulatory cap structure, 51.2% equity on the PSE&G side of the business. So we will match the 48.8% debt with that 51.2% and we'll have the debt issuances that you see there.

And then last, at Power, you see a slice in the middle of parent long-term debt. So we currently do not have parent long-term debt, but would intend to move in that direction in the future. Power, seeing incremental investment opportunities, we'll have more of a use for its cash. So the opportunity to invest at the parent level and the investment capacity that I'll talk about again in just a second is there to help the business as a whole.

And on the right-hand side, you can see the strong investment opportunities that we have in place for both companies. And at the top, very, very important is our dividend obligation that we will make to our shareholders.

So I'll talk a little bit about the source of funding, and we'll start on the Power side of the business and take a look at Power's credit metrics. So we seek to maintain a floor of FFO to debt of 30% at the Power business. That's consistent with the ratings that we have. And as you can see from the bars on the left-hand side here, we have comfortably exceeded that in each of the last couple of years.

And the last bar shows that, from 2015 to 2017, we would intend to be at roughly 50% FFO to debt. So, still comfortable margin there and that's derived from a $1.6 billion funds from operation at the Power part of the business. So, Power, very good cash generator and very strong credit metrics.

Now what that means from an investment capacity standpoint is that there is incremental headroom above our credit stats that we can utilize at the Power level. And so, looking at the blue bar on the left-hand side of the sheet, you can see that with a 50% current FFO to debt forecasted for the next three years and with a 30% floor, we have incremental headroom and that headroom shows up on the right side of this graph in the green bar. So, room to invest on the Power side and debt capacity to do so.

Also at the Power side, on the parent side of the business, a similar phenomenon happens as well. So our FFO to debt at 27% at the parent, as compared to a minimum threshold given the regulatory mix that we have as well as the credit ratings that we have. So, more room at the parent to borrow as well to create investment capacity, and that manifests itself on the right-hand side in the gray bar.

So, all in all, if you look on the right-hand side, about $2 billion of investment capacity that we see coming out of the excess headroom that we have. Layering that in, it could be spent on the Power side of the business and that's really on a dollar-for-dollar basis.

But recall, at utility, I talked about a roughly 50-50 cap structure. So, that funding can be used at the utility as equity in the utility, and that equity can and will be matched by borrowing at the utility to maintain that cap structure. So, to the extent that the funding is used at the utility, it's a 2:1 ratio that would increase that investment capacity further.

So, in summary, what we see is another year of growth in 2015. Operating earnings guidance, as you can see on the bottom of the slide, began the year $2.75 to $2.95. And we've pulled $0.05 off the bottom of that range twice. So we stand today at $2.85 to $2.95, which will be the third year of operating earnings growth for the company.

Another slide that we wanted to talk about as we look forward into 2016 is the sensitivity of different elements that can impact the business. And as you go across the top of this slide, these are a lot of sensitivities that we have shown in the past. There's not a lot of new information here. Just trying to give an indication as to what different elements would mean from either a market change or from incremental investment at the utility.

But I'll call your attention just to the bottom for a second, as we get to this time of year, when we think about the pension expense moving from year-to-year, and different companies have different exposures in that regard. With us, we did a calculation in the third quarter and we looked at our year-over-year pension expense, and we estimated somewhere in the range based upon that third quarter timeframe of about a $0.02 to $0.03 increase on the pension expense.

You can see three elements of building blocks, if you will, that will impact that expense; one is a return that we will see from the pension funds, the second is the discount rate that we would use in discounting the liability that we have, and the third is a series of actuarial assumptions that come into play as well.

So, that actuarial assumption, looks like it will add about $0.02 to the good year-over-year. But, again, thinking about the third quarter and where the financial markets are, we saw a downturn in our returns. So, for every 1% of a change in our return on our investment base, there's about $0.01 down. And the discount rate is $0.01 up for about every 15 basis point change.

So the sum of those at the third quarter resulted in about a $0.02 to $0.03 downdraft. We've seen some improvement as we've gone through the year since then. But, obviously, that discount rate and those returns will all be finalized at year-end. And we'll manage all of that against the backdrop of a larger O&M program.

And last but by no means least, the dividend. So you can see, we've had a growing dividend over the last number of years and we're currently at $1.56. It's a very, very important part of our value proposition to our shareholders. And I think what we've said here is exactly what we need to say. It's a consistent, sustainable dividend growth, given contributions from both sides of the business.

We've overlaid here for you the utility EPS, just to give a frame of reference. It is by no means the only thing we look at in determining what the dividend is going to be for next year. But taking a look at what the green line shows, we are about at a payout ratio that's equivalent to our utility earnings and about a 54% payout ratio across all of enterprise.

So, a host of factors goes into that look every year. As we move into February of this year with our board of directors, we will discuss what our dividend will be on a go-forward basis. But we anticipate consistent and sustainable dividend growth.

And with that, I think we'll open up to questions.

Q&A

<A - Ralph Izzo>: I think we have another few minutes available to us. If there are any questions, Dan and I'd be happy to try to answer them. I believe, we also have some – we have the slideshow available for folks in terms of booklets that can be handed out and we do have some thicker books if folks want more detail in the rear. Yes, there's a question here. Hi, [ph] Frank (27:12)

<Q>: Yeah, Ralph. How do you think about the investment decision to buy new assets in Power? And will you look to buy additional assets in Power, and what type of geographic focus will you have?

<A - Ralph Izzo>: Yes. Thanks, [ph] Frank (27:27). So we have consistently looked for purchasing existing or newbuild opportunities. We deploy the same valuation technique. We don't have a price curve for new build and a price curve for existing assets. There are some differences obviously. Typically, the new assets have a better heat rate. Therefore, a lower operating cost, and they have a longer life. So there's a few years of value creation when you do the discounted cash flow calculation.

But I think what was unique in terms of our ability to succeed in making the Keys acquisition versus our consistent inability to succeed in making other acquisitions is there was probably a smaller pool of competitors, given that there was construction risk associated with this. And whether it's our transmission program or our upgrades at the nuclear units or our simple-cycle gas turbine builds, we have a lot of confidence in our team's ability to manage the construction.

The interest in the Keys facility was a longstanding interest that we've had in having an asset in the PJM West region to give us a little bit more flexibility in managing basis risk differentials between the PS Zone and PJM West. That has been a evolving relationship over the past five years from the heady days of the 2008 year where PS enjoyed a $20 to $25 basis differential to now, on an annualized basis, it looks kind of flat. But that's a very misleading characterization because, as you know, in the winter, it tends to blow out positive. And then, in the other nine months of the year, gets somewhat negative.

So Keys will give us an opportunity to have a physical presence in PJM West, which is actually geographically located in Maryland, but somehow that gets scooped into PJM West. And we like that portfolio management aspect of it. And we've been looking to purchase assets down there. I think, we hit on this one because of the construction risk did not intimidate us the way it may have intimated others.

Sewaren, it's quite a different story, and that's a case where there isn't enough duct tape in the world that could have kept the old unit viable for the new CP market. So we were faced with the retirement there. You're familiar with the PS Zone, which is where Sewaren is. It's a fairly tight zone. Extracting 550 megawatts would have tightened that zone further. When we ran the numbers, we said, wow, attractive regional spark spreads due to Marcellus gas, nice capacity prices, somebody is going to build here. That'll cannibalize some of our older combined-cycle units. It's one of those pills that you have to just say, okay, who's going to do the cannibalizing, somebody else or us, and we said, it's going to be us.

So, in general though, we're not fans of introducing new supply, given paltry demand growth that we see, but these were two special situations that made sense. We have been public about the fact that we bid, and did not succeed at building a new unit in Bridgeport, and we will bid that new unit again in February. That's really borne out of the fact that you have some supply retirements in the New England region.

Yes, [ph] Carl (30:35).

<Q>: Ralph, in talking about the Power during your presentation, you talked about potential rule changes that you would like. And I've put that in the category of devinely to be wished for. And I assume that there are some things in the same category, as far as the DPU is concerned and the rate case that you won't file for another two years. And I wonder if you could elaborate overall, because predicting ahead is something that you all are known for and have done very successfully? Thank you.

<A - Ralph Izzo>: Thank you, [ph] Carl (31:12). Yes. So, in Power's case, as you correctly pointed out with capacity markets and price formation, feel pretty good about capacity markets, price formation yet to be determined. In the case of the utility, there is a very clear direction we'd like to encourage regulators to head.

As I think about the three things that have huge financial and operational implications at the utility, it's capital deployment, load growth and O&M. The reality is, load growth is going to be less than 0.5%. We're a very service economy-oriented part of the nation, a highly matured service territory. There's only so many additions you can put on the house. So, load growth combined with appliance efficiencies and various other things is going to be modest.

I am so proud of our team's O&M cost control, but their ability to keep that O&M cost control to 1% to 2% is probably a best-in-class type of thing we can do on a compound annual rate, which means your load growth is not going to make up for your O&M growth, which means you have to go in for rate cases, depending upon what you do with your capital. We're not a believer in shrinking the rate base. We have an ageing infrastructure that needs reinvestment in order to preserve the reliability people are accustomed to.

So I'd like to get to a future where we simply agree in advance. We will come in for a rate case every seven years, every five years. That will make up for the disconnect between load growth and O&M. But in the intervening years, we're not going to deploy capital and let it be subject to a seven-year lag. What we'd like to do is have programmatic approval of where we would deploy capital and then have trackers applied to it, so that everybody has predictability.

And there's so many benefits to that, not only from an investor point of view, but from a workforce point of view. We have a 30-year gas pipe replacement challenge ahead of us, getting approved 18 months at a time. It's been approved four times. But even though it's been approved four times, we use contractors. We're not training people to be permanent employees. We're not training kids in community colleges. Even though they could have a 30-year career doing this, when you're getting yes every 18 months, we're just not willing to make that kind of long-term commitment to people.

So I think if you have trackers that say, okay, during these five years here are the things we want you to do, raise your substations, replace your gas pipe, improve your scale, all those things are reliability-focused. Every five years you're coming in here, so we're going to take a closer look, maybe every year we'll take a light look through some sort of performance standards. And I just think you enhance the predictability, you enhanced our ability to invest in people, and everyone is better off. So, that's the kind of discussion we want to have with the regulators.

We'll come back to you in a second, [ph] Carl (33:54). Is there a question right behind?

<Q>: Yeah. It's always good to hear a little bit about regulation. I'm the Former Chair of the Pennsylvania Commission. I want to make sure I understood the good news that you just say that you want to come in about every five years, which is good. And second, to also understand you to say that returns on equity are somewhere in the 9.7%, 9.8% range in New Jersey?

<A - Ralph Izzo>: Yeah. So our most recent rate case was 2010. So our base allowed return is 10.3%. But, as interest rates had come down from that time, as we went in for separate clauses, the allowed return we agreed to for those clauses varied from the 10.3%. So we have a couple of clauses that are at 10%, and the most recent one was at 9.75%.

Yeah, [ph] Carl (34:46).

<Q>: I think you more or less answered what my next question was going to be. Just as a follow-up on what you devoutly hope for in the next few years. 9.75%, as the interest rates climb, will probably climb or should probably climb. Do you think that the board is likely to recognize that or is there something you can do to have them recognize that?

<A - Ralph Izzo>: I think the answer to that is yes. Of course, we know that there's not a 1 basis point correlation between rising rates and rising allowed ROEs. And that's a good thing, right, because if there had been – as the rates come down, I don't want to conjecture what the ROEs might have done either. So, historically, we've looked at anywhere from 600 basis point to 800 basis point differential between the 10-year Treasury and allowed ROEs.

So we have to file no later than November 17 between now and – if we did file, the last allowable data rates would be effective January 1 of 2019. I can't predict what's going to happen next week, let alone what's going to happen over the next three years. So I do think that they would recognize and increase any interest environment. I just wouldn't want people to think that the 10-year Treasury just moved 25 basis points, so we're guaranteed at 10% ROE right now. I don't think that's the case.

<Q>: Thank you.

Ralph Izzo

And our hostess is very efficient at flashing all sorts of threatening signs at me in terms of how much time we have. And knowing how long-winded I am with answers, we were under five minutes. So I'll simply thank you for your participation today and hope to see you soon.

Presentation

Shahid Malik, President

Good morning, everyone. Thank you, Steve for inviting us to your conference again. Appreciate the opportunity to just come across the Hudson rather than fly all the way down to Texas. This is good for us. Before I start, I just like to remind you of the forward-looking statements, let's see. Okay. Here we go.

And then, so I'm here today really to talk about our de-regulated business that we call PSEG Power. Our strategy is very simple; actually is to operate regionally focused highly efficient generation fleet in -- hopefully the nation's premium power markets. We have approximately $12 billion worth of assets, consisting primarily of 12,000 megawatts of power generation in the northeastern part of the US. And we're in the process right now upgrading our generation fleet. We have investment schedule of approximately $3.5 billion over the next five years, investing in those existing as well as in the new generation.

And like others in the industry, we've retired all the units to comply with some of the environmental regulations out there. But we're also investing to grow our existing nuclear and our existing and new gasified generation. And in addition, we own about 6 utility -- sorry 12 utility scale solar facilities in six states, that's totally about 150 megawatts.

So I mentioned that we're originally focused and really we think that's the one distinguishing factor that we have -- one of the distinguishing factors that we have; the primary one of those is location, and we said next to -- its really big electric demand region in North America with New York City and Philadelphia in one side; and on the other side, as you mentioned -- as you heard, the previous panelist talk about the largest natural gas supply region in North America, the Marcellus. So benefit from that cheap gas and we also have that consistent load and volatility as a result of being close to New York and Philadelphia, and those other Northern New Jersey Power markets.

It's very important these days to have a well performing and flexible gas fired assets, especially with the SEP product that Joe just talked about. We've a solid base of high performance nuclear units too, and that allows us to cover our base load sales with those nuclear assets, while having our gas assets really take advantage of the volatility, that's inherent in being the constrains that ends up in the Northeast.

So with respect to additional investments, what we plan to do is, upgrade our existing fleet with more efficient combined cycles, and I'll talk about that in just a second. And you'll see that our mix will be changing a little bit over the next few years. And principally, however, you'll note that our megawatt output despite the slightly lower owned capacity, megawatt generated will still be a little bit -- or little bit higher than we are currently between the 54 to the 58, 59 terawatt hour range. That's principally because we are replacing some of our older, less efficient megawatts with new efficient combined cycles, which will run on one of the base-load basis.

Bloomberg Transcript

I mentioned gas earlier on and our fuel costs, among the lowest in the US. We have also fortunately one of the largest gas trading and procurement operations in this region. And last year we bought over 400 bcf of gas, but the largest leverage to those prices further down and benefit our utility customers. The orange and the blue slices show that we've bought over 60% of our gas directly from the Marcellus and from the Utica, and the green slice, which is what we bought at delivered basis -- from other customers and producers, that would -- a lot of that comes from the Marcellus as well.

So we are getting lot of gas at cheap prices, and because of our extensive network of gas contracts on the pipelines, we're able to get the gas delivered to our assets at a pretty good price, certainly better than we think a lot of our competitors.

On the development side, we've been naturally seeking ways to grow our portfolio and to improve our efficiencies, as I mentioned earlier. So we're very happy than to be building two new combined cycle power plants, both of which are targeted to come online in the 2018 timeframe. As the Keys Energy Center is close to Washington DC and it's located in the constrained PEPCO itself, we believe that strong load growth in the region and also easy access to Marcellus gas, that really is a nice growth story for us we believe.

The Sewaren plant in New Jersey that we've also announced is the redevelopment of an existing site. So essentially we're trading old and inefficient megawatts for new efficient megawatts. And since it's a brown field site, we have the ability to lower our cost by using existing infrastructure, as well as benefiting from the strong local natural gas position that we have. Importantly, these new plants will improve our overall heat rate or our efficiency, and in a competitive market, as you heard the panelists talked about earlier, pennies matter. And if we can share lot of few cents from cost of production by having those most efficient power plants in the marketplace, then we'll get dispatched first.

We've additional growth investments going on right now. I mentioned the combined cycles and some uprights that we have on the gas side, that will cost us about 1.6 billion over the next five years. And as you can see from this profile, our capital spend for new investments in blue will peak next year, and then we'll see the earnings impact from 2018 onwards. We've a small amount of spend that's required for environmental reasons, which is the orange segment there, and the gray segments reflect capital for maintenance and for improvement. But even after these investments, our intention is to have a very strong balance sheet until the strong credit rating and we will retain that strong balance sheet and that will allow us to keep looking for additional high value opportunities as this market goes through a period of consolidation.

And our capital investments are being made to increase our OPEB, but also to reduce -- to increase the efficiency and as you can see, the average heat rate of the fleet is going down. We believe that leading technology these days is between 6,500 [ph] to a 7,000 heat rate, and we are investing that fleet to get down to those levels as well, so we can be the cheapest unit on the block.

Just briefly, Joe also talked about capacity markets, so we have two additional advantages by virtue of being where we are. The first is the capacity market, that's present in each of the three Northeastern markets that we operate in. This chart shows you how the last full capacity cycles stretching through May of 2019. Our assets have generally enjoyed a significant premium over the rest of the RTO in PJM. And I guarantee capacity revenue of $540 million to $630 million each year, really allows us to invest in existing and new units to improve the reliability, and to improve their effectiveness.

And the second advantage is our ability to sell long term electricity to New Jersey's customers. This forward sales construct is available for pretty much all of our generation in that part of the world, and it's very helpful at a time when forward liquidity is lower than in prior years, and also provides us a visible stream of earnings for the next three years. So you compare -- you add the energy visibility we have with the capacity market visibility, we've a pretty good benefit from our locations in the northeast.

Just quickly then on the regulatory side. Although we can't control our influence energy prices, which by the way, Steve, a latter [ph] than we would like, as you pointed out, we do have the ability to influence the regulatory environment, which we're actively doing. And I might add that the industry is such in considerable success actually the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14813

last couple of years, in improving both capacity and energy markets from a regulatory standpoint and a market development standpoint. And we've already seen significant uplift from improved capacity markets, and we also expect improvements in capacity -- in energy market price signals as well.

And you may have heard that last week, FERC signed off on -- and issued a NOPR, Notice of Proposed Rulemaking, and they challenge the RTOs to address the two issues that I have on this slide here, and they indicated the other items such as operated transparency are also in the works. And that's very encouraging for those of us in this industry, because it will help the industry obtain fair and more accurate pricing we believe for our assets.

So to wrap up, in summary, we've been very active in helping shape and improve goals in the markets that we operate in -- whether it's in new capacity market, construct in New England or in PJM, a stricter rules on how demand response, participate, as well as those recent moves I mentioned to improve price signals in the market by FERC. We think we've been a leading player together with Exelon and others in this marketplace. And this regulatory backdrop for PSEG coupled with our stronger balance sheet has really allowed us to start growing our footprints again, but we're doing in a highly selective manner. We're doing with where we anticipate strong projected financial returns in a very disciplined way. So we believe we have a good story, that gives us the ability to be successful now and in the future.

So with that, I'll wrap up, and I'll be happy to take any questions with Joe in a bit.

Steve Fleishman, Analyst

Great, thanks guys. We're solidly back on schedule. So, maybe just to kickoff the questioning, I guess, first for Joe on -- you mentioned very much that NiHUB is very cheap, you don't really mention PJM West. So maybe kind of view the differences there. And if -- I guess if the issue is a kind of -- lack of forward liquidity, why is that, okay, PJM West and NiHUB I guess that's a bigger hub, but maybe just some views there?

Unidentified Speaker

I think, Steve, there's a couple of things. First is, PJM West Hub is, we think, is more favorably priced than NiHUB. I would add though there is tremendous amount of seasonality associated with that. And what I mean by that is, we believe the winter periods are probably, favorably priced there and carry the right premiums, and some periods in the off peak hours in the non-winter months of West Hub actually -- still, we still see upside relative to market, relative to our fundamental view.

I think the big thing now is, you do have more market liquidity at West Hub, but as you go beyond the year, two years, let's say 2017, now the liquidity falls off quite substantially. I think the other thing to notice, most of the new generation that's being built is more impactful to West Hub than it would be, for example, the NiHUB.

And I think, what we see is more of the coal retirements have happened to our -- are happening in the western part of PJM. So when you overlay the new generation on the eastern side with the retirements on the western side, we actually see the basis between those two locations becoming closer together and the market currently is reflecting that, that's part of the region we see the increased value at NiHUB.

And then we just have less liquidity on the forward curve at NiHUB, compared to West Hub. So I think all of those things factor together drives what we're saying, it's not just one variable.

Steve Fleishman, Analyst

Okay. And Shahid just maybe a question on the new build question. So in the panel before which you weren't listening to, but one of the comments was just that don't see the economics for a new build, but then you just bought a new build plant, and so do you see that differently or was that just a kind of a special situation in terms of opportunity, and that generally you don't see that the new build economic.

final
Bloomberg Transcript

Shahid Malik, President

That's always preferable if you can buy a combined cycle or unit that's been operating for a while, you have less construction risk, and we're able to earn earnings from day one. Those assets are pretty competitive. So then you prepare that with building new, and you look for specific opportunities. For us, we felt -- we've been looking for some time frankly to grow our portfolio and we haven't found the right assets to do that.

This one came along, we're very excited about it because actually we think there is a good load growth in that area, it's a constrained zone. We believe it will have a strong spot spread because of the cheaper Marcellus gas and the load growth that we expect in that region. And so actually, we do think it's a good asset. We think we'll be successful in constructing it, and we think it's going well located. Plus, it also helps in how we manage our portfolio with respect to the other parts of our business. So we feel pretty good about that Steve.

Steve Fleishman, Analyst

Let me ask that question just another way, which is just that kind of at a high level, would you be interested in doing more of those, let's say, the same rough valuation?

Shahid Malik, President

So when we look at our investments, we clearly look at what are the alternatives for those dollars do we spend on the regulated side, the deregulated side, do we give money back to our shareholders. So we have a very stringent internal hurdle metrics that we look at, you know, just to make the investments. As you can tell, for the last couple of years we haven't made a lot of investments in the power side.

We've had a lot of upgrades, we've had some improvements in our base rate, but having stepped out to build new generation, these circumstances look very favorable to us. They passed on our internal hurdles and our internal metrics and so, yeah, if the right opportunity come along, Steve, we certainly look at it.

As I mentioned, we are now in the process of building two new combined cycles; Sewaren power plant in New Jersey is a slightly different animal for us and it's replacing old megawatts with new efficient megawatts; it's replacing megawatts on an existing Brownfield site, which makes it cheaper from an infrastructure standpoint. And so that's a different animal.

So yes, I would say that we would look at them, but generally, our preference right now, would be to look at those assets that have been that are being currently running, probably offer another discount in new build.

Steve Fleishman, Analyst

Okay. I will ask one more question and then I'll kind of -- I'll open up to the audience. So I think as you guys know, we put out a report last week that talked about kind of supply/demand work that we do. And in PJM, I guess, one of the more controversial conclusions we came to was that supply/demand is loosening. And I'm just curious -- I'm not sure how much you've had a chance to look at what we did. But just overall, would you agree that's true, or not? And if you had views that were different than ours, what would they -- what would they be?

Unidentified Speaker

Yeah, I did look at it briefly, Steve, and I think like I said, I think in general, when you look at it, we expect a fair amount of new generation to be built as well. We saw, I think, in the previous three capacity auctions about 5 gigawatts

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14815

of new combined cycle point is clear each year, I think, this year will -- little less than that. So call it close to 20 gigawatts in total that we expect, we've retired about 25 gigawatts of coal, we're re-powering some assets. There's continued -- I would say continued development of renewables and load growth is probably somewhere, it's less than 1% clearly when you look at it.

So I think when we put all that together, I think the big driver is, you are getting -- you have a change in composition of the dispatch stack. I think this summer, quite frankly was a little bit of an anomaly. We had obviously very, very low M3 gas prices, and if gas prices were sustained to the $1.15 in perpetuity, we are going to be having a very different conversation obviously. I think also we didn't see, let's call it the peak loads that we would have expected, and the coincident peaks across the power pool that we've seen in years past. So I think some of the volatility got masked.

I think it's fair to say that when you put all that together, as we said, we think the West Hub is generally, fairly priced with the seasonality I mentioned, and there is upside in NiHUB. But I think the other relevant point is, with that, you're going to get an increased volatility, and we serve a pretty big book of load in PJM, as you saw in the slide represented, and we're comfortable with that given our generation backstop, and our ability to do that. And I think you're going to see that, and I think there is opportunity to capture value both when the market is volatile for the high side, like it was in the winter of '14, but also to the downside like we saw this past summer.

Shahid Malik, President

And I would just add a little to what Joe said. And I wouldn't dream of contradicting my friend here; but Steve we did look at your report yesterday, and the one previously, and I think you fairly accurately represent potential new builds and then spot splits are very strong, particularly, if you have access to that cheap gas, which I think is very helpful.

Perhaps, there might be some more retirements, not necessarily because of environmental, but also because of economics. And they got the previous plan that talk about some of the pressure on some of the base load units, the old nuclear, the small single side nuclear units that are out there, as well as some of the disadvantage coal that frankly we don't expect to be around that much longer. So, maybe on the retirement side, you might see some more of those primarily for economic reasons.

Steve Fleishman, Analyst

Any questions from the audience? Making it very easy on me. Maybe just on capacity. Obviously the auctions overall, I think, were a success. And whatever has gone on with supply/demand, the capacity side obviously gives you a lot of cash visibility. What do you see beyond this? It seems like next year we go to more full CP, and demand response still a question. Do you think this is just beginning -- continue of higher auction pricing?

Shahid Malik, President

I think one thing, you know is, expect the unexpected. We've seen a lot of volatility in capacity results. But I think the point you made is a relevant one. As we transition from -- into the 80% procurement for the recently completed '18-'19 auction, by the time we get out to (inaudible) 2021.

I think there is a lot of puts and takes that will be associated with that. There's talk of how PJM is going to forecast load in the future, it's changes to the DRR curve. I think the jury is out on how demand response is going to be able to participate with the capacity performance product, I'm not sure that it will be quite the quantity we've seen in years past.

But I think at the end of the day, there's two elements that are really important. I think the first is, recognizing to ensure reliability, the penalty structures needed to change. And I think folks recognized that, and we saw that new prices that cleared in '18-'19. And then, the second element is the bidding behavior of the participants really matters. And I think

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14816

they recognize that with the increased volatility or the risk of higher penalties, and associated with non-performance, you have to prepare your plans to perform in those hours when they are most needed, and I think the prices need to reflect that, and we would expect that to continue.

So So, I was a little surprised in the 2018-2019 auction frankly, that there was such a small discount between the base products and the premium products, the CP products. And I would attribute that to being a relatively the new market construct, and I believe, I think others in the company believe that, some folks in the industry that did bid underpriced risk relative to the base, and we could see some continued widening of that spread over the next few years.

I'm not sure what it means price for the absolute price of capacity, and I wouldn't want to predict that. But I would say that's one element that we should keep an eye on. The other element, in addition to the puts and takes that Joe mentioned is that if energy prices -- electric prices stay low, then, the way the formula in PJM works, is that capacity prices have to rise. Because the net of the two adds up to a number of that provides incentives for generators to maintain that power plants and to build new power plants. So there is a constant dynamics between energy price and capacity price, strictly in these northeastern markets. So one is weak, then the other one should be strong.

Generally I feel pretty good about the construct. I think it took some more learning that participants will have to go through to get comfortable with it, maybe some refinements of people's bidding tactics. But I think its -- PJM made a good start, and I think the industry responded.

Steve Fleishman, Analyst

Okay. Questions in the audience?

Questions And Answers

Unidentified Participant

(inaudible)

Shahid Malik, President

Yeah, it was a pretty good side move for us. And as you know, over the last two years, it took a lot of our attention and development dollars on our utility business, which has performed pretty well. But we still have a pretty strong balance sheet, good opportunities on the power side. It's not that we haven't wanted to spend on the power side; we haven't found the opportunities that really worked for us.

So to answer your question and to follow up on Steve said, unlikely that we want to build a whole bunch more right now, we're assuming lot more selective assets that we could pick up to add to our portfolio, either to improve our diversity, to improve the efficiency, or to increase the amount of base capacity that we have.

With respect to consolidation, the reason I mentioned that is, because I believe that the economics of industries today are closing some companies with financial problems, strictly those companies that have high debt, and highly leveraged, and the cash flow which is coming in, as we might have expected since tar prices are relatively low. So I think some companies are going to be forced to make decisions, do want to continue funding the leverage that I put on with the lower cash flows? Or do I exit? And I think we're seeing signs of folks, particularly smaller portfolios, smaller power plants, looking to exit.

And Paul Farr mentioned that in the previous panel, that they're seeing every opportunity that's out there, and so are we; and there does seem to be quite lot out in the market right now.

final
Bloomberg Transcript
Bloomberg

Whether we'd be interested in buying another portfolio our size or not, I guess probably not, but we'd certainly look for selective assets rather than a big portfolio. Does that answer your question?

Unidentified Speaker

I would just echo similar comments. I mean, we have seen consolidation on the power generation side, and I would expect that we continue to see consolidation. I think another important element for Exelon is, in 2014, we acquired two retail companies, and I think you're going to see continued consolidation on that side of the business as well. And I think that would be an area where we would have interest in acquiring assets on the retail side, given the nice match with our generation output.

Steve Fleishman, Analyst

On that topic, I know, Shahid, that Ralph almost gave a little bit of a hint to potentially having interest in the retail business. So be curious kind of where your thoughts are there right now, because that was definitely new for PEG.

Shahid Malik, President

Right. So I have run a retail company, I'm comfortable with the retail business and operational risks, I believe, and there are operational risks around retail businesses -- and I am sure Joe will be happy to describe -- principally for companies in our space, it's critical risk, and getting your bills out on time and getting paid. So generally, PSEG has always considered different vehicles for getting its output to market. And one that's what best for us in the past has been the wholesale market.

As you -- as the market and the industry develops, you're seeing less liquidity in the out years, and you are definitely seeing more and less liquidity out there. And as a result of that, whatever vehicles working in order to get your megawatts out would be a good potential option.

So we considered in the past, we are considering it right now, and we'll see whether it makes sense for us in the future.

If we do it, it would be defense strategy, something that basically helps us sell megawatts in our territory. I don't expect it to be significant in anyway, what moves the needle from a learning standpoint. It's more about vehicle for us to move megawatts from our power plants.

Steve Fleishman, Analyst

Okay. Want to make sure we had a chance, since Jack is here, to maybe talk a little bit about Exelon's news last night with PEPCO. So maybe, Jack, if you could just address that and --

Unidentified Speaker

Certainly. So, as many of you saw, we have had, we (inaudible) based on the new merits of (inaudible) comment on that and the commission will make a move on whether we have to reclear the merchant filing, we also note that we had a communication from the mayor of the district, will ask a few things that (inaudible) force settlement and that profit. So with that regard, that is the first indication from the mayor of support for the transaction and (inaudible)

Steve Fleishman, Analyst

final
Bloomberg Transcript
Bloomberg

Well, maybe just to use on -- the chances that a settlement can get done; are there other important parties involved, like the Public Council, which is in opposition? And how long would you let this -- if there's not something happening -- how long would you let this go before you'd kind of say it's over?

Unidentified Speaker

So, maybe I will start with the last question, that has the (inaudible) which we are trying to admit it to pursue (inaudible). Obviously, it's a transaction we like as long as we believe (inaudible) company, (inaudible) to a more regulated footprint (inaudible) rating agencies.

To the extent that we were able to secure settlements (inaudible) parties, we will seek an (inaudible). That said, again, we believe this transaction (inaudible) for our shareholders. We will need substantial support as part of the settlement from the (inaudible) stakeholders, but (inaudible) stakeholders are, but fairly (inaudible) is a major driving force, that will work for (inaudible).

To the extent that we are able to get a settlement and we see a pathway on a (inaudible) basis, (inaudible) transaction (inaudible).

Steve Fleishman, Analyst

Okay. Anybody else have questions for Jack on this, before we go back? You guys are being easy. Okay, maybe just one more question for the panel on just -- Joe, you touched on this a little bit on natural gas prices, because obviously those are very important, that you expect it to get better. And it sounds like you expect gas basis to moderate as well. Could maybe each of you give your views there, and a little more define why you expect it to get better? And how do you know the LNG is actually going to leave the country, for example, in your view?

Unidentified Speaker

Yeah, I think, I'll start with what the I think the easier one is. First, I think from a gas basis perspective, and I'm talking about M3, we see the market improving already. When you look at like 2016, you had a slight discount to Henry Hub, and by the time you get out to '18-'19, you are at a premium, and I think that's really predicated on -- the build out of takeaway capacity from that area to other parts of the country. I don't think we differ from that in anyway, I think, we think the market structure the way it's priced is right.

When I talk about our upside fundamentally, on the power side at NiHUB, we're using market fuel prices. So we're now adding to that anything that overlays a view. I do -- we do believe though, on the Henry Hub side of it, there is some upside to natural gas prices, and I don't think anyone can debate we continue to get more and more efficient on the supply side. The technology is getting better and better, increasing the efficiency.

I think the cost of drilling, given all the capital cuts both on the oil and gas side come down. But I do think when you look at the prices, you see that there will be a supply -- a small supply response to that, and I think if you dial back to clock, call 12 to 24 months, you would have expected to continue to grow production. And I know, I think just given where prices are, we think that that may flatten some.

But more importantly, I think it's on the demand side. I think the LNG, the 7.5 to 8 bcf that is being contracted will get exported. We've seen a pickup of power generation as a consumption of natural gas with the turnover, the more of gas stack. You're seeing increased exports to Mexico and we think that will continue. And when you look at it over the four or five-year horizon, there's probably an additional somewhere between 16, 20 bcf of additional demand in all these different buckets. And we think that will be a driver, and we're not talking about material upside here in the near term, but as you go out through time I don't think it's unreasonable, I think we could see some upside to price. And that would be an addition to what we're saying on the power side.

final

Shahid Malik, President

I would echo a lot of what Joe said, I think, the wild card, frankly, though, is what are producers going to do? And you probably have a good handle on that. Other panelists are going on tomorrow, Steve. As I was preparing for this presentation and the conference today, I looked back at, last time I did this, a year and a bit ago, in Houston, and at the time, the predictions for -- Marcellus production for 2015 were about 16 bcf a day, well, today we're 20 bcf, and so the production guide really gone on binge in the last couple of years.

And the question we have is, when the hedges roll off, what will they do with production and will they reduce production, not just because gas prices are low, but because oil prices are low, and certainly we've seen signs of that. And Joe alluded to the supply side being important as well. So I think that's bit of wild card. But I think the trends, both domestically and internationally, are for less drilling, less production at these low prices. So on the demand side, though -- which I think is, something that we have a reasonably handle on, as a utility, we're seeing a lot more are used by our customers for natural gas as a result of low prices, so they are switching from oil, they're switching from electricity, they are using more gas. So customers are using -- or power companies are using a lot more gas to generate than they were previously. So there is demand growth there as well.

We're seeing industry come back in a significant way, particularly in the South, but also increasingly here in Mid-Continent and the Northeast. And chemicals industry in particular are big consumers of natural gas. We expect that to happen. The other wild card of course is exports and contracts have indeed been signed to export gas, LNG, and then the question is, will those physically leave these shores, or will they be replaced by purchases elsewhere to cover those short sales? And I think the jury is out on that. It depends a lot on what the world crude oil prices do. If OPEC has its way, and is able to take some producers out of business and then rise the price and I think you could see LNG prices and gas prices rise as well.

And we're at this -- this business is cyclical and I remember 10 years ago, when gas prices were 2 bucks? Guess what, we're at 2 bucks again and the power industry hasn't gone out of the business. In fact, the power industry in many ways has gotten better and better. And so I think that you will see these cycles and the challenge for companies like ours is, how do you manage through these cycles and how do you have the most efficient machines, how do you have the lowest cost, and how do you invest that you can be successful in the markets that its used to be in.

Steve Fleishman, Analyst

I'm going to ask one more question to close it up. So, in our panel before, I guess Bob Flexon talked about -- with a 20% free cash flow yield, I'd rather buy my stock than necessarily buy other companies right now. Both of your stocks, at least relative to the pure independent generators, have held up relatively well. So, given that there's a lot of assets and portfolios out on the markets, do you have interest in growing the generation side of your businesses, still? Do you have room to do it? You are both pretty big in PJM, at least and do you see maybe more of a competitive advantage to actually win these days?

Shahid Malik, President

Steve, I think we are investing in two new state-of-the-art efficient combined cycle plants in Texas. And they are being built on -- both being built on existing sites. We think that provides a competitive advantage, match very well to our load business. I think from our perspective though, we would have to think long and hard about adding additional merchant generation.

I think you mentioned in PJM, lot of the instances, it's going to be difficult for us to do that. To the extent, we can keep our book of business balanced between our load and power generation business, we may have some interest. But, I think right now where we are, we're very comfortable with the portfolio we have, and we will continue to look to consolidate retail entities and acquire retail entities, and to the extent, then, we need it to backstop that with generation

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-14820

we would look that as necessary.

Unidentified Speaker

I think that from PSEG standpoint, we would like to grow the company. We would like to grow it on the regulated side as well as the deregulated side. The alternative of course is to give money back to our shareholders in the form of dividends or share buybacks, or whatever companies like that, do with that their cash.

Firstly, we intend to maintain a strong balance sheet, intend to maintain a very strong credit rating, because we think it helps us. And actually I think we're able to take advantage of that. In periods like this, we see -- start seeing some assets coming to market, that a good strong asset that you previously wanted to own, but didn't want to pay the price for.

So we think that there will be opportunities, Steve. We will certainly look at them all, whether we execute on them, really depends on the situation at the time and the particular asset. But we have room to grow. As I said, I think we prefer existing generation, unless there is a unique situation, such as in New England, where there's a seven-year capacity lock [ph], we might think differently. But we did evaluate each asset, for each portfolio of assets likely not big, probably very small -- in the context of, how does that fit our portfolio and it can add value or return for our shareholders.

But we're in this business for the long haul. It's not like we intend to come out of it in the next two to three years. So we have to figure out how we deploy our capital. Letting our fleets to run down and be inefficient and ineffective is not an option for us. We're going to figure out how we invest smartly to improve our efficiency, so we can be effective in the marketplace.

Steve Fleishman, Analyst

Great. Well. Joe, Shahid, thank you very much. Great panel. Appreciate it.

Presentation

Ralph Izzo, Chairman, Chief Executive Officer and President

Good morning all. This is the PSEG presentation and thank you for joining us today. We've set things up, so that should [ph] we shift ample time for question-and-answer at the end of presentation. I will refer you to our forward-looking statements and not read it, but suffice to say we will be looking into some prospects for future factors that are influential in our business and similarly I will refer you to our GAAP disclaimer as we will be reporting some financial performance that we think is reflective of the ongoing earnings capability of the company, but that do not concile with GAAP.

I am Ralph Izzo, the Chairman, CEO and President of PSEG. I am joined here at the front with Ms. Carolina Dorsa, our Chief Financial Officer. Also with me today is Kathleen Lally, our Vice President of Investor Relations; Carlotta Chan also of Investor Relations; and John Scarlata, our Vice President of Gas Supply. All will be available for questions at the end of the presentation.

So for those of you who are not familiar with PSEG, on an extremely higher level, it all begins for us with operational excellence. We take enormous pride in being outstanding stewards of an asset base that include both regulated gas and electric distribution and transmission as well as unregulated merchant generation.

It's only by operating those assets with excellence, whether it's our nuclear plants or our customer call center that we believe we have a chance of creating a financially strong company and then we look to deploy that capital in a way that we describe as disciplined. And for us, discipline means those areas those products and services in those markets that are core to our region that will provide value to customers and are consistent with the policy objectives of our primary regulators. And at the center of all of that of course is an engaged workforce who make it all happen.

The two primary subsidiaries of the company are Public Service Electric and Gas, PSENG, regulated electric and gas distribution and transmission company in New Jersey. Its primary thesis today is a very robust $11 billion plus capital program where we are looking at the years 2014 to 2018 as has been our habit, we will update that number for an additional year in March of the coming year at our normal investor conference.

Side-by-side with that, producing roughly half of the earnings of the company equal to the PSENG earnings is our unregulated competitive generation business with assets primarily in the PJM region and to a lesser extent in NYISO and (inaudible) region and the key aspect of characterization of this particular part of our operation is the robust diversity and competitive advantages associated with our fleet, which I'll describe in little further detail in subsequent slides.

So just a minute on some of the primary characteristics of PSE&G; a little bit more than 2 million electric customers, a little bit less than 2 million gas customers, load growth of about 0.5% to 1%, primarily a residential and commercial customer base. As you can see here the electric sales were primarily driven by the commercial sector, secondarily by

Bloomberg Transcript

the residential sector. And when we look at the gas business, the story is exactly the opposite. But in both cases, a minor contribution from the industrial sector.

A lot of returns in New Jersey for the regulated distribution business are approximately 10.3%. I'd say approximately only because there is a small component in a recent capital construction rider [ph] program that we have approved that was -- the allowed return is 9.75%. However, our single biggest construction program is our transmission program and they are because we are part of the PJM ISO, our allowed return is 11.68%, which includes a 50 basis points adder on our base return of 11.18%.

I'll talk a little bit more about this later on, but in addition to our traditional services i.e. gas pipes, electric distribution system, electric transmission system, we've been very active over the past six years in developing some non-traditional products and services primarily in the area of renewable grid connected energy supply and energy efficiency, totaling a little over $1 billion in construction.

So PSEG Power, the primary characteristics are reflected here in terms of the asset base. Starting from the left just from the nameplate capacity point of view, as you can see, we have a very rich diversity in terms of available fuels, nuclear, natural gas, coal, and oil. I'll point out for you that all of the non-nuclear, all of the fossil fuel as such dual fuel, our gas units can run on oil, our coal units can run on gas, in fact our coal units most often run on natural gas. And just recently we've crossed the 1% mark in solar capacity.

However, if you look at how the capacity factors of these assets result in the energy produced, the pie chart in the left looks quite different when one looks to the center of the slide and not surprisingly, you can see nuclear is the workforce of the fleet, producing over 50% of our electricity while natural gas in second at 30% and coal at 13%. That coal of 13% doesn't include the times of the coal units run on natural gas.

And lastly as you look to the far right on the slide, you can see once again a fairly diverse blend of the types of assets from peaking to load following to base load. It is interesting to us at least that if I were to show you the slide from five years ago, the left slide -- the left pie chart and the right pie chart would look essentially identical. The solar having been a new entrant to the pie chart on the far left. And the center slide would look identical in terms of the colors. What would be different is the fact that that 30% that is now showing for gas would have been 30% for coal and the 13% for coal would have be 30% for gas, and that's just reflecting the change in price associated with natural gas coming from the Marcellus and Utica regions, which are accessible to us.

In terms of what we've been doing in the recent past, it's -- our primary emphasis has been on growing the regulated rate base. Our investment programs in PSE&G are not driven by load growth, but they're driven by an aging infrastructure that is in need of replacement. We are proud of our reliability track record by one organization, the ReliabilityOne organization, we've been named the most reliable electric utility in the Mid-Atlantic region for I think 13 or 14 years in a row and the most reliable in nation's five out of the last nine years. And that doesn't come without significant investment in the capital infrastructure of the utility.

We've been able to do this while maintaining flat to declining bills for customers, really driven by the fact that gas prices have come down as hard as they have over the same timeframe. So here you see six years of 23% compounded annual growth rate in the capital program of the utility. The green line is an annual number, the blue bar seeks to smooth out some of the years of higher growth and lower growth by just taking a three-year average with the third year being the base year shown on the slide. But program of $600 million or so a year growing to one that's nearly $2 billion a year in just six years.

If we take a look at what things look like from 2009 to 2013, there was about $11 billion in spent at the overall company that was inclusive of PSE&G as well as PSEG Power. As we look to the future between 2014 and 2018 that number goes up by about 20%. That increase while seemingly modest, has matched [ph] a little bit by the fact that in the 2009 to 2013 era, there were sizeable investments, nearly $1 billion that were dedicated to environmental permits of PSEG Power. This is in preparation of expected regulations on acid rain, gases and mercury, SO2, NOX, mercury acid gases in the like and that environmental CapEx of Power is now behind us.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14823

We are fully compliant with our units and that nearly $1 billion is on the right chart has been diminished to little under $200 million and you could see that most of the capital being deployed at PSEG is in the area of transmission, making up nearly $7 billion over the next five years.

So speaking about transmission, you can see that from 2009 to 2013, essentially, very strong growth, growing from a little bit over $200 million program to last year being $1.6 billion. A lot of that in large projects that are listed at the bottom of the slide. I won't read all them to you, however, not to be missed is the fact that there is a significant portion of upgrades to existing transmission lines, reconductoring, taking 26 KV distribution systems and turning them into 69 KV transmission systems providing network protection for critical customers, that makes up about half of the transmission program and that too has been increasing over the years.

Equally interesting and that we tried to point in this slide is, if we were having this conversation in March of 2013, our expectations for the next four years would be that dark blue line that you see on the right side of the slide, which shows a significant drop-off in transmission, we only present to investors our known and approved projects.

So these projects will be projects that would be designated in the PJM Regional Transmission Expansion Plan, often refer to as RTEP for short. And given the dynamic nature of the deregulated power generation market and PJM's mandate to ensure reliability, the fact that power plants do not necessarily forecast foreign events when they're going to be retired or when they're going to be built and given the major changes in the generation mix expected as a result of the 2015 deadlines associated with the Clean Air Act rules pertained to acid gases and mercury, we had a major change in our transmission plant spend when we went from March of 2013 to March of 2014.

And that dark line, which shows some leveling, some decline and then leveling off became the blue bars, and that's the $6.8 billion in transmission projects that we now are planning and fully expect to implement over coming now four years. And these projects remain on schedule and on budget, terrific bit of work by our construction team.

Here is a little bit more detail on the issue that I hinted out earlier on where we started to move into areas that are little bit non-traditional. We've received approval for $700 million of solar projects that are all in rate base. They tend to fall into two categories. You'll see words here like Solar Loan and Solar 4 All. We sell little loan program as our roof-top solar program in which customer petitions us for a loan, we provide up to 50% of the project funding in the form of cash and that customer then pays us back in the form of a solar renewable energy credit. That renewable energy credit is valued at a level that allows us our 10.3% return on the investment that we've made i.e. the loan. We monetize that solar REC. If the monetization of that solar REC provides a revenue stream that's in excess of that 10.3% allowed return, then we would fund the access to the rest of the customer base. If it falls short of that, then we collect and make up the difference from the rest of the customer base. So it's basically a roof-top program with an allowed return of 10.3%.

The Solar 4 All program is great connected program. We own the land, we own the assets, we construct them, we operate and we maintain them, largely dedicated towards brownfield sites in New Jersey, that might be an old industrial site, that might be a landfill site, just for calibration purposes reconnected solar in New Jersey typically is 3 to 7 megawatts, we're not talking 10s nor 100s of megawatts, we are talking single digits, and the roof-top systems are exactly what you'd expect several kilowatts.

In addition to the 700 million solar, we have received approval and have deployed about $300 million in energy efficiency projects. And these are largely projects that go to either multi-family dwellings, typically lower income hospitals, municipal build schools, and things of that sort. This is not rocket science, it's is not sophisticated sensors, and complicated to a customer communication devices, these are lighting systems, upgraded chiller systems, upgraded heating systems.

On top of that we've had the opportunity to get riders, clauses, trackers, whatever terminology you want to use that you're comfortable with for some major capital infrastructure improvement in the States, starting in 2009 and then refreshed in 2011, mostly directed at our gas infrastructure, we have the largest cast iron and bare steel systems in the nation. And we've been trying to accelerate the replacement of them, however, there have been some electric distribution programs associated with this.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14824

And most recently, we've had a $1.2 billion approval for program that we call Energy Strong, which is less about the need to replace aging infrastructure and more about the need to adjust for the redrawing of flood claims and strong threatened assets coming on the heels of super storm Sandy. So that Energy Strong program is just underway. The first part of it that we've been deploying is $350 million worth of gas pipeline replacement and then the other $850 million are geared more towards the electric system and that's more in engineering and design stage right now.

So all total well over a couple billion dollars and riders and clauses that allow us to achieve contemporaneous returns as we deploy the capital in the interest of our customers. So in fact when you look at PSE&G's $11 billion program between 2014 and 2018, so much of the solar and much of the energy efficiency was earlier and there is some residual underway now, but as we look forward we have quite a fair and reasonable regulatory system that allows us to recover about 70% of that on a reasonably contemporaneous basis. It's not real time, I don't want to suggest that. Certainly the formula rate treatment at FERC is as real-time as one gets, it's an annual formula rate with true-up for the assumptions that are made going into the year, assumptions that are made regarding how much of the asset base will go into service, what the throughput will be and therefore what the rate structure needs to be to compensate us for that as are allowed 11.68% return.

Then we do have a maintenance capital program in our distribution system that is slightly above our depreciation rate. And then we have these additional programs that I've mentioned just a moment ago, showing up here at 12% in terms of Energy Strong and the Residual of the solar in the energy efficiency programs. So that 60 plus 12, we round to 70%, all receive is free if the regulatory lag, that horns [ph] the distribution base rates and the typical capital programs that we are subject to as utilities.

Okay. And so we take a look at the financial strength at PSEG Power, PSEG Power is solid BBB plus that's where we like to operate it. Given the amount of regulated, unregulated mix within the family, we've said as a floor, not as a target, but as a floor, 30% FFO to debt coverage ratio at PSEG Power. You can see for the past two years that number has actually been 70%. Our forecast for this year, next year and 2016 on average is a number that's close to 50% and that will be driven by a little over $1 billion per year and FFO coming out of PSEG Power, all the combination of O&M control, hedging of our energy sales, locking in the capacity markets.

I believe in 2013, cash, what I'm [ph] seeking, the free cash flow is about $700 million at PSEG Power and that being because most of the environmental permits, as I said before, behind us there, so that's not a consumer of cash. To great extent, we are just incrementally building out PSEG Power. So things like operating our nuclear plants, improving some of the technologies are combined cycles to get a little bit more output from them.

We've tucked in some peaking units here and there, some in Kearny, New Jersey, some in New Haven, Connecticut. And we're proposing to do build a combined cycle gas turbine unit at our Bridgeport site in Connecticut, a contingent upon successfully bidding and clearing the New England capacity auction this coming February. But the capital needs of Power have not been large and they have generated a fair amount of free cash flow available to the rest of the business to use in ways that you see describes here on this slide. Just summarizing for you, three-year period of sources and uses of capital and you can see that based upon the fact that we do have this reasonable treatment from a regulatory perspective about transmission investments and some of the expanded distribution investments, but the cash from operations at PSE&G now actually exceed the cash from operations at Power.

Having said that, the capital requirements of PSE&G dwarf the capital requirements of PSEG Power. We issued debt at PSE&G consistent with this regulated capital structure, which is 51.2% equity and 48.8% debt. And then I used the leverage capability of Power to fund the equity needs of the utility. We currently have no debt at the parent company. So we have investment capacity both in terms of the free cash flow of Power as well as the debt capacity at the parent, but we like to think of the debt capacity of the parent as available for regulated uses.

So here are some of the investment opportunities. I argued with Kathleen about putting nearly 1.5 billion, but she insisted upon putting exceeding $1 billion, so we don't give you a single digit precision on these numbers. But since we announced our $13 billion capital for the next five years, people have been asking us what else is in the pipeline, and here is a bunch of projects that we're working on. None of these are approved as yet, they are opportunities that we think are very real and are quite possible. So I mentioned a moment ago, our Bridgeport Harbor combined cycle. Yes,

final

Bloomberg
SI-SSA-0015-14825

turbine, I won't dwell on that.

We are also the operators of the Long Island Power Authority assets on Long Island. In that regard, as part of kind of being the petri dish, so the New York State REV project, which I won't go into detail, but more than happy to expand upon in the Q&A.

We've been asking to propose something that's called the Utility 2.0 project, it's part of our contractual obligations, it's a 10-year contract that we have to operate those assets and then I think it was July 1 or early in July was our obligation to submit a program. We submitted a $200 million program. It consisted of the types of things I spoke about a moment ago in terms of distributed generation, energy efficiency and then went through a series of public hearings, a little bit of mix bit of testimony given, but by in large the prevailing voice was that we weren't ambitious enough.

So when we re-filed our proposal early in the fall, we put in a program that said we would be willing doing up to $345 million worth of Utility 2.0 type of work. And right now, that's with the Long Island Power Authority for their decision as to: A, how much?; B, where to spend it? and C, how that compensates us? In fact there is every reason to believe that we have the potential and again these projects are not approved to R&D equivalent of regulated ROE on these investments, even though we don't deploy our own capital. The logic behind that being that tax refinancing is available to the Long Island Power Authority and that would really reduce the cost of debt associated with any investment programs, but we would still -- we allowed our equity type returns albeit on a performance basis. So lots of discussion is going on. We're hopeful to get a decision by the end of December, but there's no hard and fast rule that that decision would be forthcoming in the December. That would not be a one-year program, whatever the number turns out to be would be a multi-year program.

We are a participant in the FERC Order 1000 project coming out of Artificial Island. Artificial Island is the name that's used to describe the location. We have three of our nuclear power plants are selling, more than selling two unit as well as our Little Creek unit, some voltage and stability issues coming out of there that PJM seeks to resolve and opened up this project to FERC Order 1000. We are one of the four named finalists in that solicitation and outcome will be known sometime in the first quarter of 2015.

We recently announced that we signed up for 10% interest in a 1 Bcf per day pipeline running from the Marcellus region into the New York-New Jersey region actually ending in New Jersey, that's another $100 million contribution. The target date for being in service is November of 2017, however, it is a greenfield site. And today we are in front of Board of Public Utilities seeking an expansion of our energy efficiency programs by about 100 million. So I noticed we wrote 100 million to 100 million on this one exactly [ph].

So what is here is the fact that as a result of having lowered our customer gas bills by an additional 9% on October 1 and in anticipation of crediting our gas customers another $160 million over the next three months, because of declining cost of natural gas, if you look back to, I think the 2009 timeframe, we've lowered customer gas bills over 45%.

We are probably going to once again try to accelerate the gas infrastructure improvement program in the range of $50 million that was approved in Energy Strong, we'll probably run its course by the end of 2015. So just given the time it takes to file an application and get approval from the Board of Public Utilities, we will probably go in sometime in the early part of the second quarter for an expansion of our gas pipeline replacement program.

We can manage about $250 million a year in work. So depending on what we file for one-year extension or two-year extension that could be $250 million to $500 million to be determined. So $1.5 billion worth of opportunities are in front of us now, it [ph] assume to be additional $250 million to $500 million of capital infrastructure improvement.

So 2014 has been an eventful year. Our earnings are up 9% from where they were at this time in 2013. The utility is on track to get double-digit earnings growth again as a result of its capital improvement program. I think over the last five years or six years I forget we've grown the earnings per share of utility by 18% per year that was actually declining load growth over that timeframe now reversing, it's often slightly growing.

final

Bloomberg
SI-SSA-0015-14826

We've guided in our third quarter call that we expect PSEG Power to earn at the upper level of its expectations for the full year and we did take $0.05 off the bottom of our consolidated earnings expectations and now we're guiding to 260 to 275 with expectations being towards the upper-end as well.

As I mentioned a moment ago, the transmission capital program is on schedule and on budget. We've started the cast on in main replacement that is $315 [ph] million component of the $1.2 billion Energy Strong, and we are eagerly awaiting resolution of some of the proposals in PJM to modify the capacity markets where there are multiple considerations that worked at we think will provide a solution to the missing money problem that exists for those of us who are incumbents with assets very essential in terms of their operational capabilities during times of high demand, but for which the capacity markets have not provided inadequate incentive to ensure the maintenance practices that on rare occasions.

But nonetheless on occasions are needed to make sure they operate with an acceptable degree of liability.

And we are referring here to the change in what's called the demand curve variable response resource. The removal of 2.5% holdback in the RPM auctions. The court's actions and decisions on demand response not being a wholesale power products, and of course the capacity of performance product that PJM is describing.

On that last item, I think we are especially well positioned to perform well in that regard for three reasons. Number one, we have a set of units, namely our nuclear units, which are highly reliable and their value really comes through in times when other units may have difficulty getting access to fuel. Which leads me to the second reason why I think we're well positioned as I mentioned a moment ago, all of our fossil units are dual-fuel, we can run the coal units on gas, we can run the gas units on oil.

And last but not least, we have a fleet and that fleet allows us to backstop and manage the risks associated with any of the assets that does get capacity payments in the inevitable cases they don't perform and is subject to penalties being able to backfill that asset with an asset that perhaps did include the auction, but it's nonetheless available to provide supply at that point in time.

So the past three years, we've seen some earnings growth from 244 in 2012 to this year guiding towards the upper-end of the 260 to 275 range. I can't show three years without candidly contrasting to the prior three years where we had peaked out in 2010 at $3.12 a share, but (inaudible) of commodity prices curved down as gas and power prices were reduced.

However, what is important to note here is the way in which the company has really shifted in terms of the earnings generation and you could see that we went from a factor of 3 to 1 power to the utility as recently as 2009 and this year, at the midpoint of our guidance, we would expect utility contribute a little bit more than half of the earnings of the company. And here you see my quoting the 5-year, 18% growth compounded annually at the utility. All driven by the aggressive investment program targeted towards either reliability or public policy objectives in the State of New Jersey to see solar grow and to see energy efficiency expand.

Having said that, as we look at the dividend, we are one of the few companies in America, we use to say one of the three, but we're not quite sure if that number is accurate, maybe two or maybe four, I'm not 100% sure, who have paid the dividend every year for over a 100 year. So we take great pride in that. We've grown at about 3% a year over the last 10 years.

And you can see here what I'm showing is that the utilities earnings per share of the green line, this year given the guidance that we put forth would just about cover the annual dividend. And that's not to suggest that that's the only thing we think about when deciding dividend policy. We are forecasting double-digit growth in utility earnings between 2014 and 2016. We look at where the earnings are coming from, we look at what the cash needs of the businesses are and we also look at where we are in power cycle and what the expectations are for the allowed returns in the regulated business and then decide our dividend policy.

What we've told people is that given our five-year outlook, we believe we have the opportunity for modest and sustainable growth in that dividend and we specifically stick with a very qualitative description and formally revisit

final

Bloomberg

what the number is, which I know is what matters the most folks in the February timeframe at our February Board meeting. You could see our payout ratio is at very, very comfortable level when compared to the overall payment earnings.

Oops, I went the wrong way. Sorry about that. So I think I'll stop there and open up to questions for either Carol and myself or other team members are here. This slide, I've already spoken few moment ago, but it's just a summary of the two main subsidiaries that exist for PSEG.

So I believe that Kim has a microphone if there are questions, and we'll take them now.

Questions And Answers

Ralph Izzo, Chairman, Chief Executive Officer and President

I was perfectly clear somebody has to break the ice.

Unidentified Participant

The roof-top solar program sounds like a real win-win. Congratulations on that. Just curious that since the loan, are they buying the panels in the roof-top system from you guys or they have choice to go?

Ralph Izzo, Chairman, Chief Executive Officer and President

They have a choice, they can purchase where ever they like.

Unidentified Participant

Okay.

Ralph Izzo, Chairman, Chief Executive Officer and President

In case of the Solar 4 All, we determine (inaudible).

Unidentified Participant

Of course, okay. Thank you.

Ralph Izzo, Chairman, Chief Executive Officer and President

Do you live in New Jersey? Are you going to apply for loan? Okay. Other questions? Okay. Well, we thank you for joining us today. Have a great day.

MANAGEMENT DISCUSSION SECTION

Unverified Participant

Okay. Our next presentation is going to be from Public Service Enterprise Group. We have Caroline Dorsa, who is Executive Vice President and Chief Financial Officer to present the company's story. Caroline?

Caroline D. Dorsa

Thank you, [ph] Dan. (0:00:18) Good afternoon everyone, happy to be here with you this afternoon. As we've done in prior presentations, I want to give you a little bit of an overview about the PSEG story, some of the key things that we're focusing on for this year. I will do a little bit of a quick top-side overview, then talk a little bit about the utility, a bit about power and some of our financial key metrics and hopefully leave some time to answer any questions that you might have.

So, hit the clicker, here we go. As normal we always start with the forward-looking statement derived from our 10-K as you would expect and also our GAAP disclaimer, keep in mind that some of the numbers that I'll be discussing with you today are non-GAAP metrics like operating earnings that we believe are a good way to think about our business on a long-term basis and keep in mind the reconciliations to GAAP, which always appear at the end of our presentation.

So strategy, just to start at the very top in terms of our strategy, our strategy has been consistent for the last few years, and it focuses on those three key parameters that you see in the circles; operational excellence, disciplined investment and financial strength. We really do look to see our business reliably deliver cash flow from each of our businesses, and from those businesses we look for incremental growth-oriented investments, and on the power side with an environmentally friendly fleet; and on the utility side, investments that enhance the reliability and service delivery from our customers.

We do so by working with a balance sheet that we believe continues to give us the strength to pursue new opportunities, the opportunity to raise capital in the capital markets. Because of the strength of our balance sheet, raising debt has been easy for us in the capital markets. All of our ongoing investment opportunities that we see in the long-term and they are significant, and we'll talk about those, none of those require the issuance of equity. We don't see any investment opportunity scenarios that we can handle that would require us to issue equity because of the strength of the balance sheet.

So let me talk a little bit more then about our businesses. Let's just do the top side overview of PSE&G and PSEG Power, our two primary subsidiaries that comprise our holding company PSEG. So PSE&G, Public Service Electric and Gas, is our delivery and transmission company. You can see the 2013 data at the bottom of the slide, assets of about $20 billion and operating earnings in excess of $600 million last year. As I said, our strategy is to position this company to deliver good reliability to our customers both from an electric and a gas perspective, and support the state's energy policy goals and, of course, economic growth objectives for the state as well.

We have an $11.3 billion infrastructure program over the next five years that I'll talk about in a little more detail as we go forward, but that is where most of the investment is going at PSEG because there is a great opportunity to both

Bloomberg Transcript

Bloomberg

SI-SSA-0015-14830

return for our shareholders and provide value and service and reliability to our customers.

For PSEG Power, that's our competitive generation business. You can see assets in that business of about $12 billion, and operating earnings last year of slightly in excess of $700 million. You'll note that the power company was a little bit more than half of the earnings last year versus the utility. And this year, you will see from our guidance, you'll see that start to flip as we talk about guidance for our company for 2014.

In terms of the guidance overall for the company, here you can see our progression from 2012, 2013, and 2014. Our 2013 results $2.58 per share on an op earnings basis and our guidance this year of $2.55 to $2.75. At the end of the second quarter, we announced that our anticipation was to be at the upper end of the current guidance range. We did not change the range, but we did guide to be at the upper end of the range assuming normal weather and normal unit operation.

So if you look at the progression of where we have been to the upper end of the guidance range that we're talking about now, you would see potential for two consecutive years of growth in our operation earnings. And as you will see those have been driven significantly by growth in our regulated utility.

So in terms of the capital program for the company overall, you can see if you take a comparison and I think, this is an interesting comparison to look at for the business. When you compare the capital program of the company in the aggregate over the last five years, 2009 to 2013, you can see an $11.3 billion capital program of which $8.4 billion was the regulated utility. And you can also see the capital pieces for power and then you can see the piece that relates to transmission was over $4 billion. You can also see that maintenance CapEx in the shading, but the environmental CapEx in that blue shading, about $800 million over that period.

Now, if you look over to the right pie, these are the five years upcoming, including this year. And you see some interesting things in the overall investment program for the company in the next five years. First of all, you can see that the total program is $13.1 billion. The piece that is PSE&G is actually now over the next five years the same size as the entire company capital program over the past five years.

So ramped up the utility capital investment program very significantly. And when you look at the piece that is transmission, which is the blue shaded portion, you can see that over the next five years that is $6.8 billion out of the total utility $11.3 billion. So transmission continues to be a very important part of our capital program and a significant portion of our capital program going forward.

In addition to that, you can see solar and energy efficiency at the utility in orange and you can see the newly approved Energy Strong at $1.2 billion for the utility over the next five years as well. When you look down on the power side, you can see that for power, the investments are smaller, power does not need remediation for an environmental reason, so you see the environmental piece of power investment over the five-year period is about $200 million, so not that much is needed environmentally.

So most of what you see we're spending on is growth, and most of what you see we're spending on is at the regulated utility, where we have nice regulatory returns without a lot of regulatory lag, in fact very little has lagged at all on – or on the transmission side for formula rate returns. So a robust capital program that we look forward to delivering, and I think you can see from our history of delivering over $4 billion in transmission over the last five years, this is clearly a capability we have built and one that we really do know how to execute.

One of the questions that we've often gotten about our regulated utility profile is how we think about the future in terms of capital expenditures for the utility as the current things that we are planning start to become executed and go in service. One of the things that we've always done in our capital forecast, all the time, including the prior slide that I just showed you on the five-year, is we never forecast things on our utility capital program that are speculative. We only put things in our capital program, our capital forecast here that have been identified and assigned to us, so you can look at that five-year projection as what you should expect us to do.

This slide is actually a very interesting slide, I think, because what it is looking at is the picture of as we've stood in each year and we've looked at what our forecast has been from three years prior, two years prior and a year prior of

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14831

what the capital spend will be in the relevant year that you see in each column. What we've shown here is actually what's happened for PSE&G is every year we've identified new things as we get closer to the year that we're thinking about for capital spend, such that, as we get to that year, it typically turns out to be higher than even our projections of the prior two years and three years.

And so that's really a discussion about the fact that we don't speculate in our capital program forecast. We've put in what we know and what's been assigned to us, but that we're always continuing to look for new opportunities to make those kinds of contemporaneous return or formula rate return regulated investments. And we've had some pretty significant success in driving up that utility capital program over the past years even from what our near-term forecasts have turned out to be.

So one of the things that we're quite proud of, in addition to all the work that we have done in growing transmission is that we have really enhanced our regulatory diversity both by having state regulated investment opportunities complemented by FERC transmission, formula rate investment opportunities. But although, we spend a lot of time talking about the size of the pie that relates to our transmission opportunities, I don't want you to lose sight of the fact that we have done a significant amount of investment and gotten a significant number of clauses over the past few years from the BPU at the state level.

And these have really been things that help support some of the state's goals, particularly around things like energy efficiency and renewables and also support economic growth and development in our state by things like gas main replacement or incremental infrastructure accelerator replacement.

And so when you look at the three categories here, we've had the opportunity to get incremental clause recovery, in addition to base rate for, if you add up the three pieces, about $2 billion worth of incremental clause recovery. So we think a very good track record of success in identifying, identifying those things that are valuable for our customers and valuable for our regulators; getting approval for those and doing so with good reasonable contemporaneous return approaches; and then of course executing, because if you don't execute well on the programs you previously have approved, you're a lot less likely to get new programs approved.

And all of these things we do think assist what we're trying to do as good citizens in the state, whether it's incremental solar to help the state meet its renewable goal, whether it's energy efficiency or demand response to help the state managing its overall energy footprint or whether it's things that have enhanced job growth like our capital infrastructure programs, the SIP 1 and SIP 2 or Energy Strong, which is the $1.22 billion program we recently had approved that responds to some of the challenges that we saw as a result of Superstorm Sandy and things that can give even enhanced reliability over our base reliability. And we're just in the process of getting started in spending that Energy Strong $1.22 billion.

In addition to that, we recently filed, just in August of this year, an additional $100 million in energy efficiency extension with the BPU to provide some additional energy efficiency opportunities for investments in our service territory as well. So one of the things we always said post Energy Strong is that we would still continue to look at more opportunities to make investments. And we certainly were not precluded from coming back to the BPU to propose other programs that could provide benefits to our bottom line, but also to our customers. And I think the evidence of that is the fact that we stepped up in August and made this incremental energy efficiency filing.

So a lot to do, I think a lot of success that we're very happy about in terms of our ability to deliver on many of these programs, and the opportunity to spend a lot more with this most recent Energy Strong filing, which really should give our customers enhanced reliability for the sort of challenges that we all – many of us experienced in this region with Superstorm Sandy.

If you look at our transmission spend, just one other view of it that I think is valuable, so as you think about this regulatory diversity and think about the federal aspects of our regulation, that $6.8 billion in transmission spend is what you see rolling out in the light blue. The historical bars from 2009 through 2013, we've broken them out by project in the various colors, you can see the amount spent on the various projects.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14832

But I think the interesting thing about this picture is you can see that we are well in excess of the $1 billion a year in transmission spend for each of the next few years. And importantly is the line. The line that cuts through the bars, as you go out from 2013 through 2017, that line represented – represents the height of the bars, if I had drawn this chart for you, when I was – we were here last year.

And so I think the interesting thing about it is another way to reinforce even on the transmission side as you see those bar heights start to come down at the backend, that line represented where the bars were last year and since then everything above the line is new things that we have identified that we're adding in transmission since last year. So PJM open windows, RTEP processes, identified reliability needs, things that have been assigned to us. We continue to find them. And I think if we took this back two years and drew the same line, the shape would be somewhat similar but again with the transmission kinds of needs in our area there seem to always be new things that we can capitalize on that we can execute and our track record of putting things in service, I think, has served us well, and the ability to step up for these incremental investments. So a lot to do. And I think the opportunities to continue to identify more things as we go forward.

Let me turn now for a few minutes to the power side of the business. I think many of you are aware that we have a very diverse fleet of assets at PSEG Power, about 13,000 megawatts, 13,400 megawatts. And you can see how those break out by capacity relative to gas being the largest from a capacity perspective and then nuclear a little bit more than a quarter. And you can see coal and the rest. Of course, by energy produced, the nuclear units run as base load as to the share we have in our KeyCon units, the Keystone and Conemaugh units in Pennsylvania.

And so you can see, of course, that nuclear has continued over the last few years to be over half of the generation that we've actually produced from the 54 terawatt hours that we generally have produced over the last few years.

And then in terms of the markets served, the way we describe it, we have a full suite of assets and I'll show you how that works up the dispatch curve. But we do have base load as well as load following and peaking across this suite of assets in our fleet. And we really do like having that full suite of assets. We think it gives us opportunities to bid on low contracts and things like that. And we spend a lot of time making sure that we run these assets very well.

So here is the diversity in terms of heat rate and dispatch diversity. You can see for PJM so this would not include our New York combined cycle nor our New England combined cycle or coal plants. But just in PJM you can see how our assets array across the dispatch curve all the way up through peaking assets with the nuclear as base load, the load following units, and then the peakers. So, we've always retained this full suite of assets. And as I said, we think that provides us a lot of opportunity and advantage and we see that advantage as something that is quite sustainable.

One of the other things that we also have is a gas asset portfolio – and I think this should click, there it is – which we think gives us a nice advantage. This is something we've had for quite a long time, but it's become a bit of focus in the last few years, because these capacity rights that we own, which are the bright green lines that you can see going both south and west, these are contracts for evergreen capacity right that Power owns, and it provides us with just a little less than half of our access for capacity from the Marcellus Shale, slightly more than half from the Henry Hub direction. And that has provided incremental reliability for our customers because one of the things that Power also is, is the supplier for the gas business for PSE&G, and the priority of this gas, both the pipeline and the storage, is for the residential customers. But after serving the residential customers and off system sales, which are shared between the customers and Power, then Power has access to use this gas for its units.

So we have seen benefits come as the differential, obviously as we all know, between the Leidy Hub and the prices in the East has widened and that started about a year-ago June, that having this access from both sources has both provided reliability and economics. We actually have given our customers gas price reductions for many years and actually we did as well give them a credit this winter when many people were having challenges providing fuel, we were actually giving our customers credit. So it's worked out very well for our residential customers, but it has also provided the opportunity for benefits for Power, because Power gets a portion, about 25%, over the entire year, but it's not a smooth distribution, it's bit of a lumpy distribution, again with residential customers first in the winter, but Power uses about 25% of its gas from the Leidy Hub. And last year that was worth about $0.05 a share to us. We've not disclosed our results obviously for the third quarter, but having access to both sources of gas is both reliability and

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14833

economic benefit for Power.

And these contracts are evergreen rights that we have for Power, and so we look forward to seeing this continue in terms of Power's access. How long that basis differential will continue, nothing is permanent, but if you look at the forwards that are out on Bloomberg, you know that there is an anticipation for the next few years to continue to see some benefit from having this kind of Leidy pipeline access as well as Henry Hub.

So in terms of how we think about putting those assets into the market, one of the things that Power has always had is a very consistent, not always, but for the past few years, a very consistent hedging approach. And we look at this by taking our fleet, the dispatch curve that I just showed, breaking it out between the base load and the intermediate combined cycle and peaking. And we hedge the base load on a ratable basis over a three-year period, such that in the current year you would anticipate that we would be at a 100% of the base load hedge before we come into the current year and then we start to hedge a little bit of the intermediate.

We'd never be 100% hedged. We typically are about 75% to 80% hedged total for the year when we come into a new year. And then as the winter and the shoulder quarter drop off and you've got a bigger representation of the summer, which is what you see here in the current year. You'd see that percentage go down because the summer is the period with the peakers that would naturally be most open on a weighted average basis.

So you can see our numbers now for 2014, 2015, and 2016 and you can see the hedged percentages here. We are about 70% to 75% because this is starting from July through the rest of the year, so again, a heavier representation of the summer month. And then for 2015, we're about 65% to 70% hedged, a little bit more than the mid-point of our target, a little bit more to the upper end of the ranges that we allow our traders to put on for hedges, took advantage a little bit in the second quarter of incremental opportunities to hedge just a little bit more, again within the parameters of our targets. And then about 30% to 35% hedge for 2016. You'd generally see the picture look like this on a consistent basis.

Again, we're a little more to the top end of our bands for 2015 and pretty much on target for 2016. For 2016 and certainly if you look out for three years, the markets are less liquid. So as we – if we moved up in our bands a little bit, it wouldn't always be for the current year or the prompt year. It would never be for few years out because the markets are less liquid. But we like to approach because we think it takes some risk off the table.

So we're not speculating on trying to guess the top and the bottom particularly in a multiyear basis. And then in the intermediate, the combined cycle of the peaking, that's where our traders really have incremental knowledge as they look at what's happening in the market either because of the weather or transmission outages and can position the portfolio most optimally to take advantage of opportunities in the near term.

The other piece, obviously, of Power's margin that is very important that we often talk about is what's going on with capacity prices. What I show you here, in the top line, is Power's average prices for the entirety of our fleet, and our fleet, of course, has no assets in the rest of pool, as you're probably well aware. And, so you can see the prices for our fleet. We came off the highest capacity price that we had for Power's fleet of $242 per megawatt per day, that ended on May 30 of this year, and we now come into the $166, which you can see $166, $165, we have very consistent capacity prices for the next four years based on the clears that are already known, which of course is distinct from the kind of prices you see in rest of pool, which have moved around quite a bit.

So, we had a lot of conversations about capacity prices over the past few years and where are they going. I think the thing that I want to emphasize for you as you look at this slide is, they're pretty steady, in fact they're very steady. We probably have the steadiest capacity prices of anyone because of the heavy representation in Eastern Mac, PSE&G Zone and PS North and that has worked out to mean really, really stable capacity prices.

You see some movements around relative to the size of our cleared capacity. The biggest delta you see there in our cleared capacity numbers between 2014-2015 and 2015-2016 are the HEDD units that we said we would be retiring the very older peakers in New Jersey. So, those pieces have moved around a bit. And then with some incremental auctions sometimes those numbers might move up as we come into closer to the current year.

final

Bloomberg
SI-SSA-0015-14834

So in terms of the numbers then for each our businesses, just to give you some sense of where we are and what our forecast looks like, not just for the entire company, but also by business, you can see the $2.55 to $2.75, that I just mentioned earlier is the current guidance for 2014 with the expectation of being at the upper end of the guidance range, assuming the normal weather and unit ops. But I think it's also useful to take a look at the two businesses comprising the primary sources of our earnings.

And you can see that switch now happening with PSE&G relative to PSEG Power, you can see that the numbers for PSE&G and the numbers for power now start to switch that power being more than 50% to having utility being more than 50% of our earnings as we come into this year. And that's really driven by the double-digit earnings that the utility had delivered last year, and we forecasted out for the next two years. You're really seeing that come to fruition as those transmission spend gets put into service, as we earn on that, as we implement those cost programs, the utility has become a bigger and bigger piece of the total earnings of the company. And of course, while power has come down from what it was a number of years ago, and you can see that last year actually power ended up having more earnings than it did in the prior year. And of course enterprise/other really kind of captures all else that's going on in the business to get us to that picture of the $2.55 to $2.75 with regulated being somewhere from 53% to 55% of earnings.

So, we've really changed the picture around from what it was a few years ago. While power has come down, the utility has absolutely grown, so it's been not just a relative piece with power, it's definitely been an absolute because of the growth that we had in the regulated utility.

In terms of what the balance sheet looks like, in terms of our cash generation and where the monies are going, I like this slide because I think it's a really good way to see two really important things. First of all, on the cash sources, we used to always talk about power as the source of incremental cash flow and the source of free cash flow, because of this low capital needs. But I think, if you just look at cash from operations, you now see something that we started to see last year and has become more stark this year. And that is that the regulated utility is now the biggest piece of the cash from operations. So again the things that we've put into service, the contemporaneous return, the regulated utility is a significant cash flow generator, power still continues to generate cash flow. And then, we've raised debt consistent with PSE&G's capital structure, which is 51.2% equity and that's to support where the investments are going, which are so significantly into PSE&G.

So when you look at this picture, you can see that after the investment opportunities for PSE&G, power's capital investment, which is generally small and in this view, which is more aligned with our cash flow statement. power's capital investment here includes purchase of nuclear fuel. That's really to line up with the normal conventions, it's really not a capital investment. But you can see that power's cash is well in excess of what its capital needs are, which provides significant extra room and therefore room to support the dividend and support incremental investment without the need to issue equity. You see we have power's net debt going up slightly over the period from very strong perspective and power's debt-to-cap ratio ended last quarter about 32%. So we have a lot of room in power.

And that's really to support all the incremental investment we have in the regulated utility and of course, supports the shareholder dividend with absolutely no pressure on the balance sheet of the overall company or either of the subsidiaries.

Here's power's credit metrics. We showed earlier this year, you can see the key credit metric we look at consistent with power's credit rating is FFO to debt, and you can see we ended last year with FFO to debt in excess of 60% and our estimates over the 2014 through 2016 period still put us well in excess of the floor that we set consistent with our rating, which is 30% FFO to debt. So, what that means that means lots of room to consider incremental investment opportunities. That means we can continue to look long and hard as we have, and I think you've seen with some success for new investment opportunities that can drive good things for our customers, as well as results for our bottom line.

Operating earnings mix, as I mentioned earlier, you can really see that progression. And this is scaled to the size of the bar being 100%, so you're seeing that mix change. And you can PSE&G being such a significantly higher portion of the mix from 20% in 2009, and that's come from PSE&G's growth of over 18% – about 18% over that five-year period, Power has come down, but the utility has, on an absolute basis, gone up, which has been a great change in the mix of our business, given the current opportunities we have on the regulated side.

final
Bloomberg Transcript

final

And then, I can't end any presentation without some discussion about where we are on the dividend. You can see our dividend progression in terms of our 10-year progression of dividend growth of about 3.8%. And we did just about that in this year's $0.04 increase from $1.44 to $1.48. Payout ratio in terms of where we are this year, just taking the midpoint of our guidance is about 56%, so we're in great shape relative to payout ratio, no pressure there. You can see from the cash flow and the credit metrics, obviously no challenges to the current dividend.

We also put in PSE&G EPS again to midpoint of guidance, and you can see the guidance range in the shaded. We show that because a lot of investors have interest in understanding kind of on a theoretical basis how much of your dividend is actually supported by your regulated utility earnings. And you can see for us it's almost all of it this year, given the strength of the growth of PSE&G's earnings per share. And of course, while we don't have a particular target for our payout ratio, our dividend policy is noted on the top, not changed. We have the opportunity for consistent and sustainable dividend growth. Take a look at our long-term history, our current-year history and obviously the strength of the dividend and where we're going in terms of our investment opportunities providing the ability to continue to look to that as an important source of our shareholder return.

So that completes my prepared remarks. And with that, I'll be happy to open it up to any questions from the audience or from [ph] Dan (0:31:27) and thank you all very much for your attention.

Q&A

<Q>: Great. Thanks very much Caroline. Questions from the room we have a microphone coming around. But I guess first I'd like to start it off just by asking about some of the debate that's going on at PJM around capacity changes for next year, the new product, and what your thoughts are around both the motivation and what the outcome of those changes might be?

<A - Caroline D. Dorsa>: Sure. Great question. Thanks [ph] Dan. (0:31:54) It's something we've been talking about a lot today in the one-on-ones and the breakout. So we think that the motivation and the goal which is to provide that incremental reliability given that near but not issues but the near to issues that we saw with the polar vortex and also with the impending retirements of some of the coal units which appear to be real that many folks are looking to retire that there is value in considering how we address incremental reliability needs for PJM so that they can continue to deliver for the customers. So we think that makes a lot of sense and those units that provide that kind of base load reliability and can step up for incremental performance parameters, getting incremental value with penalties that go along with not performing that, it's fair, is the right kind of conversation to have.

In terms of where we are, of course, these are comment period in September. We are part of a stakeholder process. There will be a management board meeting in November, don't know how this will progress or what speed it will progress with. I think the right issues that we're all talking about, I'm sure, others among the generators are talking about as well, relate to what are the performance standards, how firm is firm fuel supply, how will that be addressed, what will count, what kinds of outages like transmission-related outages won't count toward the penalty, what about other outages, the ability to have capacity generation that isn't collecting capacity payments substitute, if you have an outage on an incremental reliability unit. And then that balance between what you might need to do to qualify versus what the penalties are, and what you would get as the incremental payment to make sure that that balance is fair, so that you're incented to make whatever investments you might need to enhance your reliability and be able to count on that stream of value for a number of years, so that that investment is worth making.

So all of those parameters, I think PJM was trying to address in its – in what they put out in draft. And there will, I'm sure, be lots of comments and lots of discussions. So we like the theory, we like the approach, it's now all about the balance among those very many factors to get the balance right, so that the units that really can provide more are incented to do it, are measured to do it, get pay to do it, with, of course, the offset on penalties if they don't.

<Q>: All right. Thank you.

Bloomberg Transcript

<Q>: As the growth rate of the PSEG is outperforming the Power's, what do you expect the mix will be, say, two years, three years from now? Will that continue to change from what the current ratio?

<A - Caroline D. Dorsa>: Yeah. So it's a good question. We don't forecast Power other than the current year, because of the issues of, obviously the changes in the forward curve and not being a 100% hedged as we go out.

We're pleased to see the utility grow to be more than half this year. You may remember, last year, we were actually forecasting the utility and Power to be closer to 50%-50%, but then Power did really well, that we raised the guidance last year, because of Power and that was really resulting of the things that we were able to do in Power and the prices.

So can't really forecast it, I think, you should consider that you'll still see the utility be this robust portion of our earnings and still has lots of growth opportunity ahead of it with its capital program. So I don't want to give a particular number, but I think you should think about just continuing to see the regulated being not more than half [ph] the units. (0:35:37)

Unverified Participant

And with that, I think we'll have to move to our breakout session, which will be in Liberty 5 where we will have time for more questions. Thank you very much, Caroline.

Caroline D. Dorsa

Thank you, [ph] Dan. (0:35:46)

Presentation

Operator

Ladies and gentlemen, thank you for standing by. My name is Natalia, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group Third Quarter 2018 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. (Operator Instructions) As a reminder, this conference is being recorded, Tuesday, October 30, 2018, and will be available for telephone replay beginning at 1:00 p.m. Eastern today until 11: 30 p.m. Eastern on Thursday, November 8, 2018. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Carlotta Chan. Please go ahead.

Carlotta Chan, Head of Investor Relations

Thank you, Natalia. Good morning and thank you for participating in our earnings call. Earlier today PSEG released earnings statements for the third quarter of 2018. These materials including the release attachments and accompanying slides detailing operating results by company are posted on the IR website at investor.pseg.com. Our 10-Q for the period ended September 30, 2018, will be filed shortly.

The earnings release and other matters we will discuss during today's call contains forward-looking statements and estimates that are subject to various risks and uncertainties. We will also discuss non-GAAP operating earnings and non-GAAP adjusted EBITDA, which differ from net income as reported in accordance with generally accepted accounting principles in the United States. Reconciliations of our non-GAAP financial measures and a disclaimer regarding forward-looking statements are posted on our IR website, and are included in today's slides and in our

Bloomberg Transcript

earnings release.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group. Joining Ralph on the call is Dan Cregg, Executive Vice President & Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions. Ralph?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Thank you Carlotta, and thank you all for joining us today.

PSEG reported solid results for the third quarter and through nine months. We are updating full year non-GAAP operating earnings guidance by narrowing the range to $3.05 to $3.15 per share, with an increased contribution from PSE&G, balancing lower expected results at PSEG Power and the Parent. The midpoint of our guidance remains unchanged and continues to represent a 6% increase above 2017 full year results.

This morning we reported net income for the third quarter of $0.81 per share, and non-GAAP operating earnings of $0.95 per share versus net income of $0.78 per share, and non-GAAP operating earnings of $0.82 per share in the year-ago period. Third quarter net income and non-GAAP operating earnings improved by 4% and 16% respectively over 2017's third quarter comparables. Our results for the quarter bring non-GAAP operating earnings for the nine months to $2.56 per share, an 8% increase over the $2.36 per share earned in the nine months ended September 30, 2017.

Slides 6 and 7 summarize the results for the quarter and the year-to-date periods. Throughout a very hot summer, both PSE&G and Power performed well. Therefore our financial results reflect solid contributions from both businesses. PSE&G's earnings increased by $0.05 per share, up 10% over third quarter 2017 results, driven primarily by continued investment in transmission and distribution programs, focused on increasing system resiliency and reliability. Warmer than normal weather increased electric demand for air conditions throughout an extended summer that was the second hottest in nearly half a century. Expanded investment in transmission and distribution infrastructure continues to benefit customers and have a favorable impact on PSE&G's rate base and earnings.

We are on pace to spend $2.8 billion for the year and the utility's rate base is forecasted to grow to almost $19 billion at year-end. Based on our various investment programs, we remain comfortable with PSE&G's ability to achieve growth in rate base within our forecasted 8% to 10% per year for the 5-year period ending in 2022. We have made significant progress to date in our regulatory and policy partnerships. PSE&G recently filed several Clean Energy Future investment programs totaling $3.6 billion over six years. These filings continue the alignment of PSE&G's capital investment plans with New Jersey's energy policy goals by advancing a broad range of programs in Energy Efficiency, Electric Vehicle Infrastructure and Energy Storage. The inclusion of what we are calling Energy Cloud or AMI is consistent with the BPU's recommendations for improving storm response following the March 2018 nor'easters in which they directed each utility to submit a plan and cost benefit analysis for the implementation of AMI, focusing on reducing customer outages and outage duration.

PSE&G's filing is designed to create an advanced technology network and upgrade 2.2 million electric meters to smart meters by the year 2024. In addition, Energy Strong II, the proposed $2.5 billion 5-year extension of our infrastructure reliability and resiliency investment program is pending at the BPU. Inclusive of the AMI initiative, PSE&G's 2018 to 2022 capital spending forecast range is $12 billion to $16 billion.

I now want to bring you up-to-date on PSE&G's distribution base rate case proceeding. As you may be aware at its regular meeting yesterday, the New Jersey Board of Public Utilities approved the settlement agreement between PSE&G, BPU staff and Rate Counsel. This concludes the utility's first distribution rate review since 2010, and is expected to provide PSE&G's customers with rate stability while allowing us to achieve three important outcomes: First, to recover investments made outside of clause mechanisms since 2010; second, to recover deferred storm costs; and third, to set revenues which reflect our current sales and O&M levels.

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-14839

The terms of the agreement provides for an additional $212 million in annual revenue, and a flow back to customers of $225 million in tax savings largely due to tax reform, resulting in a net $13 million revenue reduction. When new distribution rates go into effect on November 1, a typical combined residential customer build will be at levels that are 30% lower than they paid in 2008 in nominal terms and 40% lower in real terms.

The updated revenue requirements based upon the distribution rate base of $9.5 billion, a return on equity of 9.6% and a 54% equity ratio, all of PSE&G's distribution investment programs will adopt the new ROE of 9.6% and equity percentage of 54% going forward. PSE&G's decoupling proposal was not adopted in the settlement. Decoupling of electric and gas distribution revenue from sales volumes and demands remains an essential element of larger scale energy efficiency investments. New Jersey's energy efficiency savings goals outlined in legislation passed last May require utilities to reduce customers annual electric and gas consumption by 2% and 0.75% respectively, and also provides for lost revenue recovery. We refiled our decoupling proposal as part of our Clean Energy Future filings, but we are open to other forms of timely lost revenue recovery.

Now let me turn my attention to PSEG Power. The Power's non-GAAP operating earnings increased 23% to $0.39 per share over 2017's third quarter comparable results, largely reflecting its lower corporate income tax rate and other tax benefits as well as a step up in capacity pricing this past June that will extend through May of 2019.

Despite favorable weather, higher natural gas prices rose more than electric prices, which negatively impacted Power's results. These changes in market conditions have contributed to a reduction in Power's expected 2018 non-GAAP operating earnings. Power continues to anticipate completion of its combined cycle gas turbine construction program with Bridgeport Harbor 5 expected online in 2019. Moreover, the addition of 1,300 megawatts of highly efficient capacity at Keys and Sewaren 7 earlier this year, leads the reconfiguration of Power's merchant suite as demonstrated by this quarter's CCGT production. The design of wholesale energy and capacity markets and with the current policies and mechanisms provide adequate recognition of the cost per generation to be available, continues to attract needed attention. We are proactively engaged with the Federal Energy Regulatory Commission and PJM on several fronts. PJM energy price formation proposals continue to be evaluated as part of a comprehensive solution to the challenges facing baseload units. FERC is expected to issue an order by year end on its pending fast start proceeding and PJM anticipates implementation in 2019. We await other price reform filings at PJM such as the operating reserve demand curve enhancements and the spending reserves. But we don't expect PJM will reprioritize those efforts until after it implements fast start. Getting energy prices right is critical to ensuring efficient investment and market exit for generation assets.

Power continues advancing efforts to preserve its nuclear asset base. The BPU has begun implementation of New Jersey's Zero Emissions credits law signed by Governor Murphy this past May. We recently filed comments and responses to the BPU on the application and selection process for the New Jersey's ZEC as we refer to them. The BPU held three public hearings early in October, and an order establishing the ZEC application process is expected in November. In December, Power anticipates submitting applications for all three of its New Jersey nuclear plants, and we'll make the certification that the units will shut down within three years in the absence of a material financial change.

In June 2018 FERC issued an order of finding that PJM's current capacity market is unjust and unreasonable and establish the proceeding to evaluate potential reforms. PSEG submitted comments in early October recommending the status quo remain in place. Within the alternatives, we support PJM's capacity redesign proposals of a minimum offer price rule with few or no exemptions, which is consistent with FERC's direction and the resource carve-out option for supported resources subject to the MOPR.

The ZEC law recognized that energy and capacity payments -- again I'm referring to the New Jersey's ZEC law, were not sufficient to compensate nuclear units for the carbon attributes they provide, and that ZEC were additive to energy and capacity payments. We have initiated discussions on how the state can put in place a structure under existing laws to support nuclear resources in a redesigned PJM capacity market using the existing BGS mechanism. We continue to believe that this option requires no new legislation, and equally importantly places no additional burdens on customers. We will continue to advocate our views to establish a market design that satisfies FERC and that

accommodates state interest in resource procurement with key attributes, while ensuring that price suppression is addressed.

A strong legal foundation has been established for state action to preserve generating assets critical to meeting a state's initial and related goals. New York and Illinois have recently received appellate court affirmations from the Second and Seventh Circuit Court of Appeals, respectively, concluding that those states have the authority to implement their ZEC program setting a positive legal precedent for New Jersey. We remain focused on the successful execution of our key policy and regulatory initiatives to provide our shareholders with greater assurance of PSEG's ability to meet our financial objectives for returns and growth. PSEG continues to perform at high levels, safely operating the system throughout a very hot summer, which is a testament to the dedication of our 13,000 associates in New Jersey, New York, Maryland and Connecticut.

With that, I will turn the call over to Dan to discuss our financial results in greater detail, and I'll rejoin for your questions after he is finished.

Daniel Cregg, Executive Vice President & Chief Financial Officer

Great. Thank you, Ralph and thank you everyone for joining us on the call today.

As Ralph said, PSEG reported net income for the third quarter of 2018 of $0.81 per share, and that's versus net income of $0.78 per share in the last year's third quarter. Non-GAAP operating earnings for the third quarter of 2018 were $0.95 per share versus non-GAAP operating earnings of $0.82 per share in last year's third quarter. And reconciliation of non-GAAP operating earnings to net income for the quarter and nine months can be found on slides 6 and 7.

We've also provided you with a waterfall chart on slide 11 that takes you through the net changes in quarter-over-quarter non-GAAP operating earnings by each business, and a similar chart on slide 13 provides you with the changes in non-GAAP operating earnings by each business on a year-to-date basis. And I'll now review each company in more detail, starting with PSE&G.

PSE&G reported net income of $0.54 per share for the third quarter of 2018, that's compared with $0.49 per share for the third quarter of 2017. Results for the quarter are shown on slide 15. Net income growth in the third quarter was driven by continued investment in transmission and electric and gas distribution facilities, as well as the impact on sales of weather conditions which were substantially warmer than both the year-ago quarter as well as normal conditions.

Returns on PSE&G's expanded investment in transmission added $0.02 per share to net income in the quarter. Incremental revenue associated with recovery of PSE&G's Energy Strong and the Gas System Modernization Program added $0.02 per share. Favorable weather comparisons year-over-year added $0.03 per share, and higher volume and demand added $0.01 per share. Changes to the accounting treatment of the non-service component of pension and other post-retirement benefits or OPEB expenses, resulting in a favorable $0.02. And these positive items were partially offset by an increase in operating and maintenance expense of $0.02 per share, driven by higher corrective maintenance work, higher depreciation expense of $0.02 per share reflecting higher plant balances and higher interest taxes and other of $0.01 per share.

As Ralph mentioned, electric sales reacted favorably to hot summer weather, and actual sales increased by 6% over 2017's mild third quarter. The THI or temperature-humidity index was 35% greater than in the year-ago quarter, and 25% warmer than normal. PSE&G reached the 2018 system peak of 9,978 megawatts compared to 2017 system peak of 9,567 megawatts. On a trailing 12-month basis, weather normalized electric sales were flat year-over-year. And gas sales on a similar basis increased 1.9%, led by the commercial sector and strong second quarter results.

The conclusion of PSE&G's distribution rate review achieved several regulatory priorities, mainly the recovery of non-investments made since 2010 outside of the programs with cost base recovery. In addition to the recovery of deferred storm cost dating back to 2011 and a true-up of sales end cost estimates. New rates are based upon the distribution rate base of $9.5 billion, a return on equity of 9.6% and a 54% equity ratio. We are pleased that the settlement recognized the need to maintain solid utility credit metrics, following the negative cash impacts that resulted

final

Bloomberg
SI-SSA-0015-14841

from tax reform in 2017 as PSE&G's financial flexibility is essential to providing reliable service at the lowest cost. Going forward, PSE&G's distribution investment programs will adopt a new ROE rate and equity percentage established in the settlement agreement. As Ralph mentioned, the net $13 million revenue reduction takes into account an additional $212 million in annual revenues, including storm cost recovery and an increase in depreciation expense, as well as a flow back to customers of $225 million in tax savings, largely due to tax reform. PSE&G customers will benefit from $262 million in annualized rate reductions to reflect savings from federal tax reform enacted in 2017.

PSE&G filed two updates earlier this month to its Formula Rate for transmission at the Federal Energy Regulatory Commission. The first was an annual update reflecting our planned capital improvements with a focus on system reliability, and that provides for a $100 million increase in annual transmission revenues. The second filing adjusts our Formula Rate to provide a refund of our excess deferred income taxes due to federal tax reform, resulting in a refund of over $150 million. Both of these changes are expected to be effective January 1, 2019.

Our distribution infrastructure programs, Energy Strong and GSMP continue to perform as expected. The combined annual revenue increase for the full year 2018 from these two programs is forecasted to be approximately $53 million as we near completion of the first GSMP in Energy Strong programs. Once GSMP II begins, gas rates will adjust in December and June of each year. PSE&G has invested approximately $2.3 billion for the nine months ended September 30 in electric and gas distribution and transmission capital projects. For the full year, PSE&G expects to invest approximately $2.8 billion on increasing system reliability and resiliency, upgrading critical infrastructure, and supporting New Jersey's energy policy goals. We continue to expect rate base growth at a CAGR of 8% to 10% over the 2018 to 2022 period. For the full year we've increased PSE&G's forecast of net income for 2018 to reflect the impact of higher sales margins largely due to weather with the range now forecast to be $1,055 million to $1,070 million, up from a $1 billion to $1,030 million.

Now let's turn to Power. PSEG Power reported net income of $125 million or $0.25 per share for the third quarter of 2018 compared with net income of $136 million or $0.27 per share in the year-ago quarter. Non-GAAP operating earnings were $0.39 per share for the third quarter of 2018 compared to non-GAAP operating earnings for the third quarter of 2017 of $0.31 per share. Non-GAAP adjusted EBITDA for the third quarter of 2018 was $360 million versus non-GAAP adjusted EBITDA for 2017 of $356 million. Non-GAAP adjusted EBITDA excludes the same items as on non-GAAP operating earnings measure as well as income tax expense, interest expense and depreciation and amortization.

The earnings release and slide 21 provide you with detailed analysis of the impact of Power's non-GAAP operating earnings quarter-over-quarter. We've also provided you with more detail on generation for the quarter and the first nine months of the year on slides 22 and 23. Power's net income in the third quarter was impacted by a decline in average energy hedged prices and lower realized margins despite the effect of warmer-than-normal weather on demand and output. During the quarter, non-GAAP operating earnings comparisons increased $0.05 per share as a result of the higher capacity prices in New England and PJM. The increase in capacity prices occurred on June 1, 2018, and will run through May 31st of next year.

Recontracting of hedges at lower prices and the market impact of lower spark spreads in PJM East reduced results by $0.10 per share compared with the third quarter of 2017. Power experienced a $7 per megawatt hour decline in its average hedged energy price during the third quarter, which is consistent with our expectations for the full year. The impact of placing the Keys and Sewaren combined cycle stations and service along with higher demand boosted generation volumes by $0.06 per share. Higher O&M expense of $0.01 per share reflects new units start up expenses at Keys and Sewaren, and higher depreciation of $0.02 per share and a higher interest expense of $0.02 per share, both relate to the new combined cycle units placed in service versus a year-ago quarter. And these impacts will continue to affect year-over-year comparisons in coming quarters given the in-service of Keys, Sewaren and ultimately Bridgeport Harbor 5 next year.

A reduction in the corporate tax rate from federal tax reform combined with the impact of less taxes due year-over-year from lower pretax income, improved net income comparisons by $0.07 per share. The anticipated benefit from the re-measurement of tax reserves associated with the nuclear carryback claim and the closure of IRS

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14842

audits for the year 2011 and 2012 added $0.06 per share compared to year earlier results. These tax benefits were slightly offset by a $0.01 per share impact related to a newly enacted New Jersey surtax.

Now let's turn to Power's operations. Output of Power's generating stations increased 24% in the quarter, reflecting the higher output of the combined cycle fleet with Keys and Sewaren in commercial operation. Power's gas-fired combined cycle fleet operated at an average capacity factor of 68% and produced 7 terawatt hours of output during the third quarter of 2018, up by 88% over the year-ago quarter, primarily reflecting the production of the two new units. Pennsylvania coal generation output also improved to 1.3 terawatt hours and operated at 79% capacity factor in the quarter. For the year-to-date period, Power's nuclear fleet operated at an average capacity factor of 93%, producing 23.7 terawatt hours and representing 57% of Power's total generation.

Gas prices improved in the third quarter on low storage levels and weather-driven demand, but Power prices didn't move up in conjunction with gas putting pressure on Power's spark spreads. Power's forecast of total output for 2018 has been raised modestly to 54 terawatt hours to 56 terawatt hours from last quarter's reduced estimate of 53 terawatt hours to 55 terawatt hours. For the remainder of 2018, Power has hedged 80% to 85% of total forecasted production of 13 terawatt hours to 15 terawatt hours at an average price of $37 per megawatt hour. For 2019, Power has hedged 70% to 75% of forecasted production of 58 terawatt hours to 60 terawatt hours at an average price of $36 per megawatt hour. For 2020, Power has hedged 40% to 45% of output forecasted to be 62 terawatt hours to 64 terawatt hours at an average price of $36 per megawatt hour. The forecasted output for 2018 to 2020 includes generation associated with Keys and Sewaren, as well as the mid-'19 commercial startup of the 485 megawatt gas powered combined cycle units at Bridgeport Harbor.

In addition, Power has decided to exit the retail electric marketing business after determining it would not provide a material enhancement to its hedging activity. Power has therefore ceased taking on new customers but will continue to meet all obligations to existing customers through the end of their contracts. Our forecast of Power's non-GAAP operating earnings for 2018 and non-GAAP adjusted EBITDA has been updated to $465 million to $500 million, and $1,045 million to $1,100 million respectively, from $485 million to $560 million, and $1,075 million to $1,180

million, respectively.

Now turning to PSEG Enterprise and other. Reported net income of $9 million or $0.02 per share for the third quarter of 2018 compared to net income of $13 million or $0.02 per share for the third quarter of 2017. The decrease in net income year-over-year reflects higher interest expense at the Parent, partially offset by lower taxes and other items. The forecast of PSEG Enterprise and other's full year 2018 non-GAAP operating earnings has been reduced to $25 million from $35 million reflecting those higher interest costs.

PSEG closed the quarter ended September 30th with $88 million of cash on its balance sheet with debt at the end of the quarter representing approximately 51% of consolidated capital. And Power's debt at the end of the quarter represented 34% of capital. In September, PSE&G issued $325 million of five-year 3.25% medium term notes and $325 million of 10-year 3.65% medium term notes. And PSE&G also retired $315 million of 2.3% medium term notes at maturity. And as Ralph mentioned, we narrowed our guidance for full year 2018 non-GAAP operating earnings to $3.05 to $3.15 per share, while maintaining the midpoint of guidance at $3.10 per share.

And with that, Natalia, we are now ready to take questions.

Questions & Answers

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. (Operator Instructions) And your first question is from the line of Praful Mehta from Citigroup.

Praful Mehta, Analyst

Hi guys.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Hi, Praful.

Praful Mehta, Analyst

Hi. So may be a specific question on the quarter for us and then we'll get to all the market reforms that taking place. But starting with slide 24 where you highlight gas prices went up and that's what pushed up your fuel costs. I wanted to understand why that didn't drive up Power prices as well? I mean, really that implies some reduction in the spark spread and wanted to understand why heat rates have been coming down? So some color on that that would be helpful.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Right. So there is a strong correlation, obviously, Praful, between gas and electric prices, but it's not perfect. One can only assume that there was some dispatching of coal that took place that keep a little bit of lid on those power prices from moving perfectly in tandem. Dan, I don't know if you want to add to that?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yeah. I also think that the sourcing of gas matters as well and Leidy has been a very low cost source of gas for us and we saw a little bit of an uptick in Leidy prices, and Leidy doesn't necessarily drive all of the electric prices that we end up seeing. So depending upon what units are running, where the source of the gas is, you can see some different gas prices coming through. And I think the magnitude of gas that was used during the summer for gas generation as well as coming out of a winter where storage levels were low, it pushed gas up a little bit more for some of our units compared to what we saw from an electric pricing standpoint.

Praful Mehta, Analyst

Got you. That's helpful. And so do you see this as a permanent kind of issue or is this something that happened more this quarter but it's not more of a permanent issue?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

We never try to out guess the price curve, Praful, but we are seeing that with the opening of some pipelines that are taking Marcellus gas to regions other than the Eastern region that the basis differential between Leidy and Henry Hub is changing with prices coming up in the region. Stronger pricing in M3, and if you believe historic correlations that should ultimately be reflected in Power prices, but -- and forward curve is predicting -- whatever it's predicting right now.

Praful Mehta, Analyst

Got you. Understood. And then quickly just going onto the market reform side, especially around capacity prices and capacity reforms, given all the different proposals out there, Ralph, where do you see capacity -- this whole capacity

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14844

reform process going? Do you see any downside risk to capacity prices through all this? And how do you see the BGS auction kind of fitting in from a legal perspective?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

So again, what we keep anchoring ourselves to is what FERC has filed in terms of their policy objectives, which is, A, to remove price suppression; and B, to allow states to do what they want to from a point of view of resource designation. As I think I mentioned, our preference is the status quo but not withstanding an ability to preserve that status quo we think that PJM's offered an intelligent alternative. There are some things we would quarrel with perhaps their cutoff at the 20 megawatt level versus FERC's guidance that any at all subsidized units should be subject to reform. But if you look at the approach PJM has suggested, it does point to higher capacity prices for unsubsidized units, all other things being equal. And as you know, Praful, there are many other factors to consider. There's transmission transfer capability, there's demand management, there is how different local delivery areas breakout, but nonetheless when you remove supply, which is what PJM is proposing to do, from the setting of price, that should -- that without changing demand, as I said, all the things being equal, that should remove the price suppression for unsubsidized units. And that will set a different market price. It’s hard for me to see how that will be a lower market price.

And as we pointed out, the ZEC legislation in New Jersey has recognized that the zero emission credit payment was for the carbon attributes of nuclear and was additive to the energy and capacity price, and the BGS auction clearly states that energy -- electricity will be secured at prevailing market rates for both energy and capacity. So we think -- and certainly the output from 30 terawatt hours of nuclear, which is what the New Jersey ZEC law targets, is well within the capacity of the overall need of BGS. I use the word capacity in the generic sense not in the industry sense of the word.

So I do think BGS can use up or consume or call for the 30 terawatt hours of nuclear at prevailing market prices for energy and capacity without any need for legislation, which would just be a win all around, right? And FERC get its way, New Jersey get its way, and nobody -- the customers are not burdened any more than was originally envisioned in the legislation, and in fact will achieve the savings that were envisioned in the legislation if the plants were tonot operate.

Daniel Cregg, Executive Vice President & Chief Financial Officer

And just one reminder as well, Praful, as you think about, it's the next three capacity auctions have -- the next three years I should say, the capacity auctions have happened already. And what we will anticipate this coming April will be determination related to ZEC for those same three years. So this all that we're talking about is an important effort that's got to go on, and the next thing to look forward, reply comments are due on the 6th of November, but this will all impact the period after those three years.

Praful Mehta, Analyst

Got you. Very helpful color guys. Thanks so much.

Bloomberg Transcript
Bloomberg

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Good morning, Julien.

Daniel Cregg, Executive Vice President & Chief Financial Officer

Good morning, Julien.

Julien Dumoulin-Smith, Analyst

Hey, so Ralph to follow-up on Praful's question. Just going back to the forward hedges that you all disclosed in your slides, I mean obviously you had some impacts on sparks here in the latest quarter. Can you elaborate? Is that reflected in your expectations of realized energy prices in the hedges at this point? Or is it too much of noise?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Yeah. I mean, to the extent that hedges were put on during that period, you would see it in the hedges. And as you know, we have kind of a mix within the intermediate combined cycle section of the overall fleet of some elements that are open and some that are hedges. But to the extent that those hedges are put on, I'd say, the only difference really is that, you're going to see the effect coming through the forward markets as opposed to just in the real-time and day ahead markets, but it's been a consistent phenomenon across both.

Julien Dumoulin-Smith, Analyst

Got it. But may be to be clear about it, your expectations going forward with respect to what you saw transpire and spark spread in the latest quarter, I mean is this more of an acute issue that you saw during the quarter or how do you think about that from an ongoing impact?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Well, I think they are both shorter term and longer-term impacts, right? So if you think about a couple of things that Ralph and I already talked about, I've talked about having some more extreme weather in the summer, having some lower inventory levels that need to be bought in, which is going to have upward pressure on pricing. And Ralph talked about on the longer term that you see some takeaway capacity coming into the market that's going to have a longer-term effect. So I think you will continue to see both shorter term and longer term impacts -- impacting market prices.

Julien Dumoulin-Smith, Analyst

Got it. And did that have any bearing on the decision on the retail side at this point?

Daniel Cregg, Executive Vice President & Chief Financial Officer

No. The retail side was -- as you know Julien, always defensive on our part primarily targeted and trying to reverse some of the losses we've been realizing on -- from the point of view of wholesale market basis differentials.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14846

With the start of the Keys plant, with the strengthening of gas prices in the M3 zone, we've seen some decreased harm from basis to our fleet. And the margins were so thin on the retail business, as you know, I've never been a huge fan of it and we just decided that was not in our best interest to continue to pursue it.

Julien Dumoulin-Smith, Analyst

Got it. And then if could clarify the comments on capacity, it seems that you're thinking there is no need for legislation. Can you talk about timing for any potential, I suppose it would be a BPU-led effort to change BGS procurement relative to the implementation of MOPR. It would seem as if and you tell me if this is correct that there would not be application of MOPR for New Jersey next year and that would give you some runway to be able to implement for a 2020 auction?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

So remember, BGS typically follows the RPM auction in terms of the energy applicability. So the RPM auction that would have taken place in April but is now going to take place in August is input to the BGS auction that will take place in 2020. So we have plenty of time. And as Dan pointed out, for the next three years capacity prices are known, BGS has been layered in to the tune of 100% next year, two-third the year after, one-third the year after that, so the timing of all this is that the PJM proposal would only apply if we did get the ZEC. We will find out if you get the ZEC in April. And at that point in time, assuming we get the ZEC and assuming that the PJM proposal goes in as accepted, we have a full 10 months to get the BGS auction right. Of course we would do it much in advance, so that typically the LDCs put that comments in the fall for what BGS rule changes should take place if any in the following winter. So the way to think of this is, January FERC rules on the PJM proposal, we make comments shortly thereafter, FERC finalizes the RPM auction in the April time frame, we find out whether or not we get a ZEC in the same time frame, the auction takes place in August. In the fall. We -- if we are a ZEC recipient and if the auction has taken place, the MOPR approach we would file with other LDCs for BGS to be the entity that secures the nuclear energy and capacity for the following February. So that was a long-winded way of saying, I think the timing will work just fine.

Julien Dumoulin-Smith, Analyst

Excellent. Thank you all.

Your next question is from the line of Greg Gordon with Evercore ISI.

Greg Gordon, Analyst

Thanks. Good morning all.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Hi, Greg.

Greg Gordon, Analyst

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14847

I'm sorry to circle back to Power. But I just wanted to see if maybe we could get a clarification on why we saw you lower the guidance range now, because to the extent that you knew you were hedged at lower prices, right, that was a known factor that impacted the guidance range, and there was only a small portion of your combined cycle and peaking generation that was open to the market. And even though we know spark spreads were lower, it doesn't seem like there's enough volume there on an open basis to swing your numbers by the magnitude that the guidance range was reduced. So can you just -- is it possible for you to be a little bit more granular on just how much of this was known and how much of this was unknown? Because going into the second quarter -- going into the third quarter from the second quarter, realized spark spreads were not very different from what the forward curve was telling us.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Yeah Greg, and you're right. So if you think about it as just a pure open volume and the delta on the open volume, you can have some impact, but it's not going to be as much as what you saw. I think that there's a couple other factors that are coming into play. One is that, just our volume amounts are down a little bit. So if you think about where we have them pegged at the beginning of the year and where they ended up, they are down about 1 terawatt hour. So we're down a little bit on volume.

And then the other factor is, some of the basis differentials that we end up seeing. And we have seen some lower eastern basis, we've talked about that a fair bit of late, and that comes through an awful lot of our hedges or not perfect hedges at the exact generator buzz where the generator is generating. To the extent that our hedges are at the West Hub, there is a little bit of an openness on that basis and we've seen some deterioration of the basis as well within the hedges. So I would point to those other factors as well to think about in addition to just the pure open position times at delta spark and the accumulation of those factors would get you to the delta that we're talking about.

Greg Gordon, Analyst

Okay. So that basis exactly what it caused you to move the Power to the Hub where you are hedged?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Right. So for instance if you think about our nuclear facilities, you got a lot of volume coming out of there but you don't have a lot of ways to transact at the nuclear location. So if you're going to put a forward sale on, for example, you might put in on at the Western Hub. And to the extent that you saw basis differential move between the Western Hub where your hedge was put on and where the actual generation is at nuclear, you're going to have some openness within a hedged amount of volume.

Greg Gordon, Analyst

Great. One last follow-up. The $0.06 that you booked on the mark-to-market associated with -- well I forgot exactly what it was, it was a pension or associated with the Nuclear Trust, was that an expected item or was that something that was an unexpected benefit in the quarter, the tax reserves?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yes. So what that is, that's not on the NDT, because you mentioned Trust, really what that is, is just a more generic tax issue, generic meaning that it's on the company's taxes as opposed to the NDT. And it's a carry back of losses back to an earlier year with higher tax rates. But the direct answer to your question was, yes that was expected.

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-14848

Greg Gordon, Analyst

Okay. So that was an unexpected gift that was in the guidance already?

Daniel Cregg, Executive Vice President & Chief Financial Officer

That's right.

Greg Gordon, Analyst

Thank you guys. Take care.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

And Greg, just to go back to your question about the quarter versus -- and Dan's accurate answer about some of the cumulative impacts. I mean at the risk of stating the obvious that when we initially give guidance at the beginning of the year, we give a range and we expect to be somewhere in the middle, otherwise we would bias them one way or another. And typically, within the second quarter we try not to change that, because it's still early, it's a half year to go. It's not unreasonable to assume that we saw some creep of Power, as Dan mentioned, in terms of the volume reduction towards the lower end of that range but still within the range and utility towards the upper end of that range but still in the range, and then the third quarter just resulting in the need to re-designate the ranges. So long-winded way of saying, I wouldn't assume that all of the movement in Power or for that matter utility occurred in the third quarter. That's not the case.

Greg Gordon, Analyst

Okay. Yeah, that was my intuition. I just wanted to make sure I understood it. I appreciate you clarifying. Thank you.

Operator

Your next question is from the line of Jonathan Arnold with Deutsche Bank.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Hi, Jonathan.

Jonathan Arnold, Analyst

Hi, good morning guys.

Daniel Cregg, Executive Vice President & Chief Financial Officer

Good morning, Jonathan.

Jonathan Arnold, Analyst

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14849

Great. So just, I wanted -- along the lines of just where Greg was going. When we look at the fourth quarter guidance now for Power and where you were through the nine months, the low end suggest that you might have as low a quarter as a $20 million quarter in Q4. It just seems that that would be unusually low for you. So I'm just curious, is that some of the same issues that are working into Q4 as well or is there something else back Q4 that's kind of in the plan that we may be need to remember?

Daniel Cregg, Executive Vice President & Chief Financial Officer

No, I think you can just kind of do the math over where we are now and what the range would imply. And I think you'd be north of the number that you gave. But maybe one thing to keep in mind, there was some tax benefits that came through more of a onetime in the last year's fourth quarter. So if you just go against that as a comparison, you would have to carve out some of the one-time items as you look at the two quarters compared to one another. So it's something to keep in mind in that regard. But you do have a couple of shorter months in the fourth quarter and you also have a lot of the outages that are going during some of those shorter months. So you can some variability as you go year-to-year.

Jonathan Arnold, Analyst

Okay. And then on just -- could I ask on investment capacity? That slide was in the Analyst Day deck at somewhere sort of between I guess in the sort of high single hundreds of millions. And it was also in the September deck. And I guess with the rate case settlement and the transmission rate adjustments now in hand, is that still a good number or is there some -- is there an update there?

Daniel Cregg, Executive Vice President & Chief Financial Officer

So we'll update that at EEI in a week or so, Jonathan rather than trying to give that piece here today.

Jonathan Arnold, Analyst

Okay. Well I guess we'll see you then. Thank you guys.

Operator

The next question is from the line of Christopher Turner with JP Morgan.

Christopher Turner, Analyst

Good morning. I think Ralph in your prepared remarks you mentioned the importance of decoupling to your long-term plan and New Jersey customers. Can you give us a sense as to what kind of might have been missing from the negotiations with intervenors, and if there's any kind of partial agreement heading into your energy future filing?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Yeah, Chris. First of all, I can't give you the details, there's a settlement discussion, because those are all confidential. We can give you details on the outcome of that. However, it's not -- it won't come as a surprise to you to know that the principles in a base rate case are different than the principles, and I'm referring to participants here than in a strictly energy-efficiency conversation. So the Clean Energy Future filings will have a greater percentage of people who are

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14850

interested in seeing that the green energy agenda of Governor Murphy being advocated and pushed forward, and that will therefore have the kind of center stage that's appropriate to it which may not have been more expected in the base rate filing.

Christopher Turner, Analyst

Okay. That's helpful. And could you give us a sense as to what some of the other mechanisms might be there if it's not an outright decoupling that mechanism?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

I'd rather not go into that now since we haven't even sat down and gotten discovery questions from the other parties. But there's all sort of stuff that one can do to get contemporaneous type recovery of both investments being made as well as trueing up for what might have been anticipated to the revenues versus what's realized in revenues either in six months or annual filings or things of that nature.

Christopher Turner, Analyst

My second question was on weather versus normal on the utilities side. Can you quantify that for the quarter or the year-to-date? And then just related on the corporate side, anything changed versus your original plan there other than just the interest rate on new debt?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yeah. So I can point you to the slides. If you take a look, you've got a breakout both of weather in particular as well as on volume, and demand sometimes can come into play there. So on the weather for the year-to-date for the utility, you can see we had about $0.04 delta, three of that in the quarter, and volumes and demand about $0.02 year-to-date and about $0.01 in the quarter. So you can see it broken out pretty cleanly within the slides that we provided.

And then your question on interest, basically what we're seeing mainly at the Parent is just the increase in some of the shorter term debt that exists up there as we've stepped through the year, which has put a little bit of pressure on the aggregate numbers at the Parent.

Christopher Turner, Analyst

Okay. And then just on those weather numbers, where those year-over-year or where those versus normal?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Those were year-over-year.

Christopher Turner, Analyst

Okay. Any sense as to versus normal or is that something we could take offline?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14851

Daniel Cregg, Executive Vice President & Chief Financial Officer

It's pretty close. I think you might have seen just a little bit of an uptick because 2017 summer was a little bit milder, but they are almost the same if you take a look at versus last year versus looking at normal.

Christopher Turner, Analyst

Okay. Thank you.

Operator

Your next question is from the line of Michael Lapides with Goldman Sachs.

Michael Lapides, Analyst

Hey guys, thanks for taking my question. Real quick, if I go back to the Analyst Day and look at the PSE&G forecast capital spend, and then I think a little bit about some of the filings that you made in the last few months, how should we think about where you're tracking and whether you think you're likely above? What do you kind of highlighted back at the Analyst Day? I mean, the filings you've made are pretty large scale capital projects. Are you above where that would be if all of those come through? Are you kind of somewhere in that range? Just kind of walk us through how you're thinking about that right now.

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yeah. I mean, Mike I think that we have GSMP II approved in April and we had our conference in May, so that was a account for. And I think if you really look at the major areas that we were talking about, one was Energy Strong -- Energy Strong II I should say. In Energy Strong II, we talked about putting forth a $2.5 billion filing, and in June we put forth a $2.5 billion filing. And we said in May that we were going to put forth the Clean Energy filing of $2.9 billion, and those programs and the magnitude of those programs is -- were filed as we talked about with one exception, and Ralph talked about a little bit earlier today is the inclusion of AMI which was not in the filing at the time. So the programs that we filed aggregate to a capital investment of $3.6 billion versus the $2.9 billion, and you can attribute the full amount of that delta to the AMI component of that filing.

Now it's a 6-year program. So if you're trying to look at it within a 5-year horizon that we normally talked about -- that we talked about, you're going to have two issues, one six years is more than five, but number two, you're going to have some of that capital spill over the back end because it would not have been started at the beginning of 2018. And then similarly for Energy Strong II, it's a 5-year program. And since it was filed in 2018, then we won't see an approval of that until the process runs. You're going to have some more spill over there. But I think that's how you would think about the magnitude of the capital programs. And as we talked about at the time, the 8% to 10% CAGR on rate base growth really is simply with and without those two programs.

Michael Lapides, Analyst

Meaning the 10% assumes you get full approval of both of those of Energy Strong II and the Clean Energy filing? Or does that assume some -- something in the middle of what you asked for versus often where you see intervenor request come in at a slightly lower number?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14852

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yeah. It assumes approved as filed for the periods within that five-year period. And it also assumes that there is no other incremental programs for the balance of the five years. So if nothing else were to happen, but -- and we were to get every dollar as filed, we'd be at the 10%. Any reduction from as filed would lower that amount, and then anything else between now and then that is identified as incremental capital would be additive.

Michael Lapides, Analyst

Got it. And then one last one. How are you looking at the potential changes to transmission spend over the next three to five years versus what you laid out? I mean, if I go back over time, what you laid out in the Analyst Day for years three and years four and beyond, the number is actually usually as you rolled for a year or two came in higher as PJM recognized incremental needs or as you recognize an incremental needs as you kind of got closer to those years occurring. How are you thinking about it now relative to what you put out back in at the Analyst Day?

Daniel Cregg, Executive Vice President & Chief Financial Officer

So is the question how does our forecast differ from our forecast?

Michael Lapides, Analyst

Well, little bit of -- are you seeing incremental opportunities that may not have been embedded in the forecast?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yeah. I think we're a few months away from when we put that forward and it's still how we are characterizing the five-year capital plan at this time.

Michael Lapides, Analyst

Okay. Last item, a little bit housekeeping. O&M at the utility year-over-year and sequentially it was up a double-digit percentage. How much of that drops to the bottom line, meaning I'm just looking at the quarter.

Daniel Cregg, Executive Vice President & Chief Financial Officer

So you're talking about for the quarter for PSE&G, the $0. 02 incremental O&M?

Michael Lapides, Analyst

Yes.

Daniel Cregg, Executive Vice President & Chief Financial Officer

All of that $0.02 drops to the bottom line, if that's your question.

final

Michael Lapides, Analyst

Okay. Got it. Thanks guys.

Daniel Cregg, Executive Vice President & Chief Financial Officer

Thanks.

Operator

Your next question is from the line of Paul Fremont with Mizuho.

Paul Fremont, Analyst

Thanks. Looking at fast start, I guess Exelon I think has put out estimates that would imply may be less than $2 per megawatt hour. And at your Analyst Day I think you were in the $1 to $3 range. Are you still at the same level in terms of where your -- what you're expecting in terms -- if fast start is adopted?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

So there's two schools of thought on this, right? Paul, one is that, in the aggregate fast start reserve margins in flexible units could be $3 to $5 with fast start being a significant down payment on that -- possibly in that $1 to $3 range. But the question is, what is the degree of at which the forward price curve already has incorporated that, if we believe that FERC is going to be issuing that decision fairly soon and PJM will be incorporating it in Q1. I don't know the answer to that, but that's the two considerations you have to make, right? So should fast start result to an increase? Absolutely. Is it already in the forward price curve? Depends on your confidence in the timing of the FERC decision.

Paul Fremont, Analyst

Great. Thank you very much.

Operator

Your next question is from the line of Shar Pourreza with Guggenheim Partners.

Shahriar Pourreza, Analyst

Hey, good morning guys.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Good morning, Shar.

Shahriar Pourreza, Analyst

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-14854

You guys touched on most of the questions. Just real quick on the Clean Energy legislation versus what you proposed on slide 17. The storage mandate versus what you're proposing, correct me if I'm wrong, has incremental upside versus what your plan is?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Yes. I think the storage goal is like 600 megawatts by 2025 or something like that. And it's a big number. And we proposed 35 megawatts. So yes, there is upside there.

Shahriar Pourreza, Analyst

Would that be within -- is that a backend loaded or when do you think you will figure that out as far as how we should

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

One of the conversations we've been having with the policy leaders is that, most of these technologies and battery storage is a great example, is something that we do believe has a healthy trajectory in terms of prices coming down in the future. So you want to both stimulate the market price, same token, you don't want to pay for that market in its entirety upfront. So there's a little bit of a delicate timing of how much you do and when you do it, that is in iterative conversation that we do have with policy leaders both in the BPU and within the Governor's office on the legislation.

Shahriar Pourreza, Analyst

And then Ralph just on -- one of your peers is out talking about $5 to $10 per megawatt hour of incremental cost when you layered in with wind or sort of solar on two to four hours of sort of storage. Are you seeing figures like that or seeing higher figure? Because if you use two to four, it seems like you could probably get something that's economically viable, right?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Yeah. On the -- I'm used to coating it in terms of capacity. And the number we use is $2 million to $3 million per megawatt. I'd have to work it backwards to see if I get to that $3 to $5 per megawatt hour, and I'd rather not do that in real time, which is, Shar, but I will take that as a homework assignment.

Shahriar Pourreza, Analyst

Okay. Great. I'll bother again later. And then just lastly, what's your -- no problem. What drove the lower capacity factors on your new gas assets for the third quarter?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Was it a Hope Creek outage? Was it the 100% ownership of Hope Creek?

Daniel Cregg, Executive Vice President & Chief Financial Officer

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14855

Nuclear capacity factor was at 93%, it was nothing more than a Peach outage that's all.

Shahriar Pourreza, Analyst

Okay, got it. Okay. Thanks guys. Sure I think Dan I'll follow-up with you after the call.

Daniel Cregg, Executive Vice President & Chief Financial Officer

Thank you.

Operator

Your next question is from the line of Angie Storozynski with Macquarie.

Angie Storozynski, Analyst

Thanks. So two questions. One, FERC has just updated its ROE -- its transmission ROE methodology now, but there also seems to be some discussion about may be changes to transmission ROE adders. What they should be actually related to? And I mean, what are your expectations about how those ROEs will be trending and if your existing projects will be impacted?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

So Angie, we're following the discussion -- as we understand it ROE adders and incentives have not been ruled on yet. We do have a rising interest rate environment, and the three methodologies that FERC are using, all due then lead to a discussion about how does each specific company and its risk profile sit within the range predicted by those three methodologies. So I'd say that, the ingredients to the stew are getting a little bit better known, but what the stew comes out tasting like still remains to be understood going forward.

Angie Storozynski, Analyst

Okay. And then for the equity layer at the utility under the rate case settlement or decision is now going to be 54%. I think you mentioned at the end of the quarter, it was 51%. So I mean, should I expect that there's going to be additional equity injection into the utility? And is it going to come from basically corporate level debt?

Daniel Cregg, Executive Vice President & Chief Financial Officer

No Angie, our 51.2 percent was the stated rate from the last rate case, and our existing equity percentage was somewhere between 53%, 53.5%. So that delta is not as big as you might otherwise think, and just general corporate funds would fund that delta.

Angie Storozynski, Analyst

That's great. Thank you.

Daniel Cregg, Executive Vice President & Chief Financial Officer

You're welcome, Angie.

Operator

Your next question is from the line of Andrew Weisel with Scotia Howard Weil.

Andrew Weisel, Analyst

Hey, thanks for squeezing me in. And I guess, good morning or past the hour here. Quick first one, on the PSE&G guidance for the year, the midpoint essentially went up by $0.10 on an EPS basis. When I look at the year-to-date weather benefit versus normal, that was only about $0.03. So what else is taking you ahead of the plan? And would any of that be sustainable to benefit future years?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yeah. I think in addition to the area that just labeled whether you've also got some volumes and demands which will give you probably another $0.02 or $0.03 or so. And then there's a couple of other modest items that would end up moving it north of that. So I think two things for you. One is, layer in the volume and demands incrementally to the weather amounts, which also tend to be fairly weather-related. And then you think about a couple of other smaller adjustments and you can get to that range.

Andrew Weisel, Analyst

Okay. The smaller adjustments should we think of that a sort of one-time or would that carry through?

Daniel Cregg, Executive Vice President & Chief Financial Officer

I think more of one-time than not.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

I think one of the most -- I was just, there is maybe a little bit conservative on the timing of the rate case.

Andrew Weisel, Analyst

Oh, I see. Okay. Good. Then the other question I had on the AMI. You mentioned there is a reaction to the March storms and improving reliability. My question is, can you remind us the history in the state? I believe the BPU chose not to continue a pilot program at one of your neighbors and they instead asked you to the utility to file for cost benefit analysis. I guess my question is, is it a little premature to file for the $700 million program now? And how comfortable are you that it will be approved as part of the CEF filing?

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

final
Bloomberg Transcript

Bloomberg
SI-SSA-0015-14857

We definitely do not think it's premature. There is a moratorium as you correctly pointed out Andrew, and -- but we think that there's a couple of factors that are materially different. One is the BPU announcement seeking the cost-benefit analysis and the concern over outages. You are right. But the second is this huge initiative that the Governor has embarked upon to really push forward on a Clean Energy agenda. And the value of information that one can extract from Advanced Metering Infrastructure to help customers use their energy more intelligently, translation, reduce their energy consumption is I think an important consideration for policymakers in achieving what the Governor has outlined as his priorities.

Andrew Weisel, Analyst

Okay. And just to clarify, I believe this is the case, but it's certainly possible that the CEF could be approved without that. In other words it's not a package deal. The pieces could be treated individually, so it might end up looking like what you had talked about at the Analyst Day. Is that right? Is that a possibility?

Daniel Cregg, Executive Vice President & Chief Financial Officer

Yes. That's correct. We didn't go into details, but we did -- the CEF is really three separate filings that were all put in at the same time. But that's correct.

Andrew Weisel, Analyst

Okay. Thanks everyone.

Operator

We have reached the allotted time for questions. Mr. Izzo or Mr. Cregg, please continue with any closing remarks.

Ralph Izzo, Chairman of the Board, President & Chief Executive Officer

Okay. Well thank you there. So hopefully the take away from this call was that the Utility and Power both have had some solid operating performance in terms of our traditional hallmark attributes, our reliability, our availability. The financial performance is on track albeit with a much stronger performance at the Utility and weaker performance at Power than had been anticipated at the start of the year. And I would say that we look forward to seeing you in San Francisco in 10 days where we can discuss these and other issues more fully and enjoy Halloween. New Jersey has a famous Mischief Night coming up, hopefully none of you are victims of that. But with that, we'll see you in about 12 days. Thanks all.

Operator

Ladies and gentlemen, that does concludes your conference call for today. You may disconnect, and thank you for participating.

Operator

Ladies and gentlemen, thank you for standing by. My name is Leeway, I'm your event operator today. I would like to welcome everyone to today's conference Public Service Enterprise Group Second Quarter 2018 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later we will conduct a question-and-answer session for members of the financial community. (Operator Instructions)

As a reminder, this conference is being recorded Wednesday, August 1st, 2018 and will be available for a telephone replay beginning at 1 o'clock PM Eastern Time today until 11:30 PM Eastern Time on Thursday, August 9th, 2018. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to the Carlotta Chan. Please go ahead.

Carlotta Chan, Senior Director of Investor Relations

Thank you, Leeway. Good morning everyone and thank you for participating in our earnings call. Earlier today PSEG released earning statements for the second quarter of 2018. These materials including the release, financial attachments and accompanying slides, detailing operating results by company are posted on the IR website at investor.pseg.com. Our 10-Q for the period ended June 30 has been filed with the SEC.

The earnings release and other matters we will discuss during today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. We also discuss non-GAAP operating earnings and non-GAAP adjusted EBITDA, which differ from net income as reported in accordance with Generally Accepted Accounting Principles in the United States. Reconciliations of our non-GAAP financial measures and a disclaimer regarding forward-looking statements are posted on our IR website and are included in today's slides and in our earnings release.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group. Joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer. At the

Bloomberg Transcript

conclusion of their remarks, there will be time for your questions. Ralph?

Ralph Izzo, Chairman, President and Chief Executive Officer

Thank you, Carlotta and thank you everyone for joining us today. PSEG reported net income for the quarter of $0.53 per share versus $0.22 in the second quarter of 2017. We also reported non-GAAP operating earnings of $0.64 per share, versus $0.63 in last year's second quarter. Non-GAAP operating earnings for the second quarter rose 3%, compared with the year ago period reflecting continued strong performance at PSE&G and effective cost control and the lower corporate tax rate at PSEG Power.

Solid results for the quarter bringing non-GAAP operating earnings for the first half of 2018 to $1.61 per share, a 4.5% increase over non-GAAP operating earnings of a $1.54 per share earned in 2017's first half. For the first half of 2018, we have made substantial progress in meeting our objectives for the full year. On slide six and seven, we summarize the results for the quarter and the first half of 2018.

At PSE&G earnings increased by $0.05 per share, up 12% over second quarter 2017 results. Continued investment in PSE&G's transmission and distribution programs was the primary driver of earnings growth for the quarter and year-to-date periods. PSE&G has made over $3 billion in electric and gas infrastructure investments in the past 12 months, including increased distribution spending as we continuously strive to upgrade New Jersey's aging infrastructure and to maintain high levels of customer reliability and achieve high customer satisfaction scores.

PSE&G reach many significant milestones during the second quarter. Successfully executing on its capital programs. PSE&G recently finished construction of the third and final phase of the $1.2 billion 345 kV Bergen-Linden Corridor or BLC as we refer to it. This project improve reliability was one of the larger and more complex projects we've built and was finished safely on time and on budget. After completion of the BLC line, our transmission project portfolio will focus on our 69 kV upgrade program, enhance the storm of hardening, as well as life cycle replacement to maintain reliability, increase grid resilience and modernize aging plant.

Turning to our ongoing distribution programs, PSE&G is completing the first phase of its gas system modernization program or what we refer to is GSMP. And this has replaced approximately 500 miles of gas mains in the last three years. We will begin work on GSMP 2 in 2019. This next phase, a five-year $1.9 billion program was recently approved by the New Jersey Board of Public Utilities and will enable us to replace an additional 875 miles of aging gas mains.

In early June PSE&G filed for an extension of its energy strong infrastructure program or ES2 with the BPU. The key components of the 2.5 billion five-year program are outlined for you on slide 17. The request this progressing at the BPU and will enable us to continue investments to harden our system against storms, replacing aging or end of life infrastructure and incorporate advanced technology to improve grid management. PSE&G's pending distribution base rate case is proceeding according to the schedule, including early stage settlement meetings with the parties held in July, which will continue into August. Three public hearings across the state were recently completed in early July and the next week we will file a scheduled update with financial data for the full test year ended June 30th. We also expect the BPU staff and others to file their initial testimony in the coming weeks.

As a reminder, in the absence of the settlement, we have the ability to self-implement interim rates this November consistent with regulations issued by the BPU last December. The BPU recently released their investigative report conducted in response to the multiple March 2018 nor'easters that left many customers throughout the state without power. PSE&G is reviewing the BPUs report and its recommendations for improving storm response protocols to ensure that our procedures are continually aligned with industry best practices.

Among the BPUs recommendations each utilities to submit within 180 days a plan with an accompanying cost benefit analysis for the implementation of Advanced Metering Infrastructure or AMI. Focusing on the use and benefits of AMI, for the purpose of reducing the number of customer outages, as well as outage durations during a major storm of that.

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-14861

Also, as we discussed during our recent investor conference this past May, New Jersey Governor Murphy signed into law clean energy legislation, which adopt significant new standards for energy efficiency, and the use of renewable energy. PSE&G planned to submit our clean energy future or CES filing. A $2.9 billion six-year proposal aligned with New Jersey's energy policy goals that details a broad range of planned investments in energy efficiency, electric vehicle infrastructure and battery storage. The CEF program sets targets for energy efficiency savings for electric and gas usage in a cost efficient manner to broadly benefit customers by helping to lower bills and better manage energy use. PSEG's focus remains on providing customers enhanced reliability, a resilient system supported by green energy and bills that are affordable. We look forward to making this filing in the near-term, supporting the state's energy policy goals and bringing value to our customers.

New Jersey's legislation enabling zero emission certificates or ZECs was also signed into law by Governor Murphy in May. The legislation calls for the BPU within 330 days to establish a process for ZECs including determining eligibility and certification of need and ultimately selecting nuclear plants to receive ZECs starting in April 2019. The BPU will rank nuclear plant applicants based on considerations that include fuel diversity, air quality and other environmental attributes.

PSEG Power estimates that have all three of its nuclear -- of its New Jersey nuclear units are selected, it could be eligible to receive ZEC revenues of approximately $200 million per year. PSEG Power placed into service the Keys Energy Center and Sewaren 7 combined cycle units, adding 1,300 megawatts of clean efficient gas-fired generating capacity. Construction activities are ongoing at Bridgeport Harbor 5, which we expect to bring online in mid of 2019. Once Bridgeport Harbor is in service, it will complete a reconfiguration of Power's merchant generation fleet that will improve its competitiveness in the marketplace.

In June of 2018, the Federal Energy Regulatory Commission issued an order finding that PJMs current capacity market is unjust and unreasonable, because it allows resources supported by out of market payments to suppress capacity prices. FERC established a new proceeding to address an alternative approach, in which PJM would; one, modified its minimum offer price rule, so that it would apply to new and existing resources that receive out of market payments, regardless of resource type. And two, establish an option that would allow on a resource specific basis, resources receiving out of market support to be removed from the PJM capacity market along with a commensurate amount of load for some period of time. We are participating in this proceeding and we'll continue advocating for policies at the federal levels to correct flaws in wholesale market design that suppressed prices, while striving to obtain adequate recognition of the value that fuel diversity brings to the secure, resilient and well-functioning electric grid.

We expect that the growth prospects for PSE&G, the reconfiguration of our merchant generating fleet and successful execution of our policy initiatives will allow PSEG to extend its track record of delivering value for our customers and growth for our shareholders. We intend to maintain our strong balance sheet and credit metrics that enable us to fund PSEG's projected capital investment program of $14 billion to $17 billion over the 2018 to 2022 period without the need to issue equity and continue providing shareholders with the opportunity for consistent and sustainable dividend growth.

Our non-GAAP operating earnings for the first half of 2018 are supportive of our outlook for the full year and we are maintaining our full year guidance for 2018s non-GAAP operating earnings of $3 to $3.20 per share.

With that, I'll turn the call over to Dan, who will discuss our financials in greater detail and then will join Dan at the end of the call for your questions.

Daniel Cregg, Executive Vice President and Chief Financial Officer

Thank you, Ralph and thanks everybody for joining us today. As Ralph said, PSEG reported non-GAAP operating earnings for the second quarter of 2018 of $0.64 per share versus non-GAAP operating earnings of $0.62 per share in last year's second quarter. And a reconciliation of non-GAAP operating earnings to net income for the quarter can be found on slide six.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14862

We've also provided you with the waterfall chart on slide 11, that takes you through the net changes in quarter-over-quarter non-GAAP operating earnings by major business and a similar chart on slide 13, that provides you with the changes in non-GAAP operating earnings by each business for the first half of 2018.

I will now review each company in more detail, starting with PSE&G. PSE&G reported net income of 231 million or $0.46 per share for the second quarter of 2018, compared with net income of $208 million or $0.41 per share for the second quarter of 2017. Results for the quarter is shown on slide 15. PSE&G second quarter results reflect continued successful execution of our infrastructure investment programs and ongoing control of operating expenses. Growth in PSE&G is investment in transmission improved second quarter net income comparisons by $0.03 per share. Revenue recovery of investments made to enhance system resiliency under the energy strong and gas system modernization programs, drove improved margin in second quarter net income comparisons by $0.02 per share.

Distribution OEM savings added a $0.01 per share over the second quarter of 2017 results. Changes to the accounting treatment of the non-service component of pension and OPEB expenses resulted in a favorable $0.02 per share comparison over 2017 second quarter. Partially offsetting the favorable margin items were higher expenses related to depreciation, interest and taxes that had a combined impact of $0.03, compared to 2017s teens second quarter.

As a reminder, transmission revenues are adjusted each year based on the Company's investment program. PSE&Gs investment and transmission is expected to grow to approximately 8.6 billion of rate base at the end of 2018 or 45% of the Company's year-end consolidated rate base. Under Energy Strong, electric rates were adjusted twice during the year in March and September and gas rates were adjusted each year in September.

Under the gas system modernization program, gas rates which are now adjusted each year in January to reflect the investment made during the prior year will move to a semi-annual recovery schedule when we began the GSMP 2 program in 2019. The combined annual revenue increase in 2018 over 2017 from both the Energy Strong and GSMP programs as forecast to be approximately $53 million.

Economic indicators for New Jersey continues to be generally positive, supported by gains in employment and housing data. Quarterly gas sales were higher influenced by cold April temperatures. On a trailing 12-month basis, which provides longer term trending data, weather normalized electric sales were relatively flat, while gas sales were 2.7% higher led by demand from the commercial sector.

Residential, electric and gas customer growth continues to trend higher at approximately 1% per year. And our forecast of PSE&Gs net income for 2018 is unchanged at $1 billion to $1.30 million.

Now let's start to Power. PSEG Power reported net income for the quarter of $41 million or $0.08 per share, compared with a net loss of $97 million or $0.19 per share for the second quarter of 2017. 2017 include an incremental depreciation and other expenses related to last June's retirement of the Hudson and Mercer coal-fired generating stations.

Non-GAAP operating earnings for the second quarter of 2018 were $0.16 per share, compared to $0.19 per share in 2017, and Non-GAAP adjusted EBITDA for the second quarter of 2018 was 210 million, compared to 261 million in 2017. And non-GAAP adjusted EBITDA excludes the same items as our non-GAAP operating earnings measure, as well as income tax expense, interest expense and depreciation, amortization.

The earnings release in slide 21 provide you with a detailed analysis for the impact on Power's non-GAAP operating earnings quarter-over-quarter. And we've also provided you the generation statistics for the quarter and for the first half of the year on slides 22 and 23. Power's non-GAAP results for the second quarter of 2018 reflect the impact of lower market prices on re-contracting of our hedges, which reduced operating earnings by $0.08 per share. Power experienced a $6 per megawatt hour decline in its average hedged energy prices during the second quarter and this is consistent with our expectations for the full year. Lower volumes of $0.01 per share and higher O&M of $0.02 per share reflect the impact of Power's Hope Creek nuclear refueling outage, compared to the year-ago outage of our 57% owned Salem unit.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14863

In increasing capacity prices in both PJM and New England, starting on June 1st, improved quarter-over-quarter results by $0.03 per share and higher gas send out as a result of cold April temperatures added a $0.01 per share. The decline in depreciation expense related to the Hudson and Mercer coal requirements, together with lower interest expense and a lower corporate income tax rate combined to improve quarterly comparisons by $0.04 for the quarter.

Now, let's turn to Power's operations. Generation output declined by 5%, compared with the second quarter of 2017, reflecting the planned refueling outage at Hope Creek and other scheduled maintenance. Power's gas-fired combined cycle fleet operated at an average capacity factor of 46% and produce 3.5 terawatt hours of output during the second quarter of 2018, down by a 11% over the year ago quarter, reflecting outages and lower market demand. PJM coal generation output remained constant at 1.4 terawatt hours and operated at an 81% capacity factor in the quarter.

And for the year-to-date period Power's nuclear fleet operated at an average capacity factor of 92.9% producing 15.8 terawatt hours and representing 63% of Power's total generation. Gas prices were flat year-over-year and an improvement in power prices was offset by lower market demand. Power has adjusted its forecast for expected 2018 through 2020 output to reflect current market conditions and now expects 2018 output of 53 terawatt to 55 terawatt hours, 2019 output of 57 terawatt to 59 terawatt hours and 2020 output of 62 terawatt to 64 terawatt hours, down slightly from our earlier forecast volumes of 55 terawatt to 57 terawatt hours for 2018, 59 terawatt to 61 terawatt hours for 2019 and 63 terawatt to 65 terawatt hours for 2020.

An update to Powers hedge position is provided on slide 25. For the remainder of 2018 Power has hedged 90% to 95% of total forecasted production of 28 terawatt to 30 terawatt hours at an average price of $38 per megawatt hour. For 2019, Power is hedged at 65% to 70% of forecast of production of 57 terawatt to 59 terawatt hours at an average price of $37 per megawatt hour, and for 2020 Power has hedged 35% to 40% of output forecasted to be at 62 terawatt to 64 terawatt hours at an average price of $36 a megawatt hour.

Earlier this year on July the State of New Jersey made changes to its income tax laws, including imposing a temporary surtax on corporate taxable income of 2.5% effective January 1st, 2018 through 2019, and declining to 1.5% in 2020 and 2021. The surcharge provides an exemption for public utilities and as such PSE&G will not be impacted by this change. But for the full year 2018, the tax surcharge is expected to have a modest negative impact our results of Power and to a lesser extent on enterprise and other as each begins to accrue the surcharge starting July 1st 2018.

Our forecast of powers full-year 2018 non-GAAP operating earnings and non-GAAP adjusted EBITDA remains unchanged at 485 million to 560 million and a 1.75 billion to 1.180 billion respectively.

Now let me turn to PSEG Enterprise and other, which reported a net loss of $3 million or $0.01 per share for the second quarter of 2018, compared to a net loss of 2 million for the second quarter of 2017. Non-GAAP operating earnings for the second quarter 2018 were 11 million or $0.02 per share, representing no change versus the second quarter of 2017. The net loss for the second quarter of 2018 includes a pre-tax charge of $20 million related to the ongoing liquidity challenges facing NRG REMA, compared to a similar pre-tax charge of 22 million in the year ago quarter.

Results this quarter also reflect higher parent interest expense offset by the lower federal tax rate at PSEG and ongoing contributions from our PSEG Long Island contract. For 2018, the forecast the PSEG enterprise and other non-GAAP operating earnings remains unchanged at 35 million.

Now I'd like to take a moment just to recap our 2018 to 2022 capital spending plan of 14 billion to 18 billion, with approximately 90% directed to regulated growth initiatives at PSE&G. As we detailed in our Investor Day presentation in May, PSE&Gs five year $12 billion to $15.5 billion capital spending program supports our expected compound annual growth in rate base of 8% to 10% over the 2018 to 2022 period. The recent five-year expansion of GSMP 2 and approximately $1.9 billion is incorporated into the lower end of the spending and growth range, at an average annual spend of approximately $350 million to $400 million, which is an increase over GSMP 1 of approximately $75 million per year beginning in 2019.

The upper end of the range adds the full investment positions contained in our pending $2.5 billion Energy Strong 2 program and our anticipated $2.9 billion Clean Energy Future program that when combined totaled approximately $3.5 billion through 2022. The timeframes for both Energy Strong 2 and our Clean Energy Future program extend beyond

final
Bloomberg Transcript

the 2022 horizons. So the tail end of both programs is beyond PSE&Gs 2018 to 2022 capital spending window.

PSEGs financial position remains strong. Power's free cash flow is expected to improve in 2018 with the decline in capital spending following the completion of construction of Keys and Sewaren and overall we expect an improvement in PSEG's cash flow in 2018 versus 2017. PSEG close the quarter ended June 30th, 2018 with $95 million of cash on its balance sheet and debt representing 50% of consolidated capital.

Power's debt at the end of the quarter represented 34% of its capitalization providing a debt to equity -- debt to EBITDA ratio of 2.7x at the midpoint of Power's 2018 non-GAAP adjusted EBITDA forecast. And well within Power solid investment grade credit metrics. And I would note that in May Standard & Poor's affirmed the credit ratings of PSEG, PSE&G and PSEG Power retaining each rating outlook at stable.

We continue to expect that Powers improving cash flow beginning in the second half of 2018, will be directed to supporting regulated growth investments. PSEG continues to expect no new equity to fund our current capital spending program over the 2018 to 2020 timeframe. And we stand firm in our commitment to providing our shareholders with the opportunity for consistent and sustainable dividend growth, it has averaged nearly 5% annually over the last few years. As Ralph mentioned, we are maintaining our forecast of non-GAAP operating earnings for the full year of $3 to $3.20 per share.

And Leeway, we are now ready to take some questions.

Questions And Answers

Operator

Thank you so much. Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. (Operator Instructions) Your first question comes from the line of Julien Dumoulin-Smith from Bank of America. Please proceed with your question.

Claire Zeng, Analyst

Hey, good morning. This is actually Claire Zeng [ph] sitting in for Julien here.

Ralph Izzo, Chairman, President and Chief Executive Officer

Hi, Claire.

Claire Zeng, Analyst

Hi, thank you for taking my questions here. So I appreciate the update on the rate case settlement negotiations, just if you could provide a little more color on. Maybe progress on some of the critical issues and just any more color you can give there?

Ralph Izzo, Chairman, President and Chief Executive Officer

Clarie, it's really difficult to reveal the details of the negotiation publicly it doesn't seem fair to the other parties, but there's a bunch of issues that we had resolved even prior to this discussion in terms of storm cost and recovery of that, but we are under confidentiality agreement with the other parties to not discuss the negotiations at this point. I think we just stick with what we've said in the script that we're engaged in the dialog has been constructive, summer vacations are now interfering a little bit and at the end of the day, everything is on schedule and we always have recourse to

final
Bloomberg Transcript

interim rates nine months after the filing date of January. So as much as I'd like to share with you, we do have these confidentiality limitation.

Daniel Cregg, Executive Vice President and Chief Financial Officer

Yeah, from a scheduled standpoint we will provide the latest update as we step through time, so the 12+0 will be submitted on the 8th of August and things are moving according to schedule.

Claire Zeng, Analyst

Got it.

Ralph Izzo, Chairman, President and Chief Executive Officer

Just a reminder that our ask is net of the tax give back of 1% rate increase and we'll still be 20% below where rates were in our last rate case, even if we got 100% of our ask.

Claire Zeng, Analyst

Got it. I appreciate the confidentiality aspect. Well, in that case my second question here is broadly, could you give a little more color on how you see New Jersey, the BPUs complaints on transmission cost allocation and cost inflation and how you might address that?

Ralph Izzo, Chairman, President and Chief Executive Officer

Sure. Well, first of all, let's make sure everybody understands that the issue is who pays, not whether we get paid, right. So, PSE&G will get fully compensated for it's transmission investments as per our FERC transmission rates. And there has been some back and forth between who the beneficiaries are of things like the artificial islands stability improvements, the Bergen-Linden Corridor and its impact on New York ISO teams and we have been working with the BPU to obviously advocate for a fair treatment of New Jersey customers. So we are completely aligned and what we want to see happen there. So we obviously had a couple of -- not the best of outcomes from a New Jersey perspective, it's FERC recently, but there is no gap between what we want and what the New Jersey BPU wants. And again, I'll end where I started, which is there's no issue in terms of shareholder recovery of what's been invested.

Claire Zeng, Analyst

Got it. Could you give -- possibly one more color on some of the discussions at PJM to lower transmission cost or if there's anything you can reveal at this time there?

Ralph Izzo, Chairman, President and Chief Executive Officer

Yeah, no, I mean, I think that there is two types of transmission projects the PJM has presented to with us, stuff that comes out of the RTEP Regional Transmission Expansion Program and that is generated by PJM. And then, there are additional non-RTEP projects that have more of a local reliability component to it, that the company's generate. And there's been a movement at PJM, which we've been supportive of to make the visibility of the justification for those projects more consistent with each other. That hasn't been the case always in the past, primarily because the RTEP projects are bigger.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14866

So, if you have one $750 million project like Susquehanna-Roseland, you kind of understand why you want to treat that different, then 10 $75 million projects like a 69 kV upgrade. But, recognizing that customers and load-serving entities and suppliers and all of the stakeholders at PJM have the right information, PJM has been moving towards a passive greater and greater upfront disclosure. We just have to make sure that we don't get to the point where diminishing returns with literally the eight-figure project is or seven-figure project is getting the same amount of upfront time and disclosure that the 9 and 10 figure projects demanded, because that will just paralyze the whole process.

Claire Zeng, Analyst

Thank you.

Operator

Thank you so much. And your next question comes from the line of Praful Mehta from Citigroup. Please proceed with your question.

Praful Mehta, Analyst

Thanks very much. Hi guys.

Ralph Izzo, Chairman, President and Chief Executive Officer

Hi, Praful.

Praful Mehta, Analyst

Hi, so Ralph, wanted to get your view on this whole capacity reform and the FERC proposal. It sounds like if you're going to remove both demand and supply from the capacity market, it probably has a negative impact or at least not a positive impact on capacity prices. So, first you wanted to get your view on that. And secondly, what does that mean for resources that are getting support like zero emission credits. Does that mean they have to go to the state to kind of get that refund for the capacity that they lost? Just some color on that would be really appreciate it.

Ralph Izzo, Chairman, President and Chief Executive Officer

Sure, Praful. So, I don't think, I'm being pollyannaish, when I say that I'm quite optimistic about what could come out of this, although we don't know, what will come out of this. Let me explain why. It's first of all, let's level set the calendar right now. Barring an unusual action by FERC to call back prior RPM auctions. For the next three years, we know what our financial situation is, right. We have three auctions that took place and those capacity prices are set and it's by no means coincidental that the first phase of the ZEC program in New Jersey will coincide with that, right. We deliberately talked about three year horizons for the ZEC program, because of the visibility of capacity prices and the fairly high visibility of energy prices, although not deterministic the way capacity prices are. So for three years, I think we understand our financial situation pretty well provided our New Jersey units, R&D selected for the ZEC payments, which I don't want to presume to be the case.

Now, let's take a look at what FERC has said, is the reason for doing what they're doing. Number one, they said that they want to allow state flexibility in choosing their own resources. Well, when you get 60 out of 80 votes in this assembly and 28 out of 40 votes in the senate and a Governor who signs the bill, you got to feel pretty good about this

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14867

state wanting to support its nuclear plants. And whether that's through an FRR or some other mechanism, I have a very high degree of confidence that the state recognizes the energy, capacity and environmental attributes of our nuclear plants.

Now, the devil is in the details is to how that will be actually designed and recovered, but again from a policy point of view, that feels pretty good to me. And then when you think about who brought the complaint and why they brought the complaint, the claim is that out of market payments which by the way is not limited to ZECs, it's ZECs, it's RECs it's regulated generation in the market today, that these out of market payments were serving to suppress capacity prices.

So, if the goal is to correct for that, I feel pretty good about what that means for our fossil units. So, somewhere between the goals and Ralph is also feeling good about the goals and getting the details right, is a fair amount of wood to chop are sensibly over the next four months by January 9th, which has all sorts of other probations that are associated with in terms of how many FERC commissions are there, who's filing for rehearing, it wasn't filing for rehearing, et cetera, et cetera.

So, I don't want to suggest that there isn't uncertainty, but there is clearly. But I think, if you hold onto the stated goals to eliminate price oppression for the things that are receiving out of market payments, check that box for our fossil units; and number two, allow states to support those resources if they want to support, check that box for our nuclear units. There's no other boxes for us to check, so that's where I come out of Praful right now again for the third time, we are actively engaged in the details of how one achieves that and that's the part that no one is able to predict at this point. Dan, I don't know if you want to add anything?

Daniel Cregg, Executive Vice President and Chief Financial Officer

No, I mean, just the only other thing I would add, if you think about the mechanics of it as well, Praful, you talked about taking out the load and taking out generation there's a reserve aspect that would come with the load and how that gets worked through would also have an effect. But, that would serve if it was megawatt for megawatt load in generation you absolutely would have the effect you're talking about to the extent, the reserves are going to turn any kind of an FRR alternative into a smaller version of what you're seeing in the market, meaning it would be with reserves you would have a lesser impact or maybe no impact based upon and how that math would work.

Ralph Izzo, Chairman, President and Chief Executive Officer

And not to solve the problem here, but if they remove supply is a small subset and presumably the reserve margin needed for that smaller market would have to be comparable, if not higher than what you have for a 168,000 megawatt 13 state region so --

Praful Mehta, Analyst

Yeah, that's super helpful color. I mean it almost the depth of your answer is also suggest to vote the job here and as you've said, do you really think that it can get done in that January time frame or do you think this is kind of going to take more time?

Ralph Izzo, Chairman, President and Chief Executive Officer

Instinctively, I'd say probably will take more time, but I don't want to second-guess the FERC and the stated schedule, but yeah, I mean we'd be kidding ourselves, if history wasn't some sort of feature about how long these things take and something is -- complicated is this.

Praful Mehta, Analyst

Got you. Thanks so much guys.

Ralph Izzo, Chairman, President and Chief Executive Officer

You're welcome.

Operator

Thank you so much. And your next question comes from the line of Jonathan Arnold from Deutsche Bank. Please proceed with your question.

Jonathan Arnold, Analyst

Good morning guys.

Ralph Izzo, Chairman, President and Chief Executive Officer

Hey, Jonathan.

Jonathan Arnold, Analyst

A question on -- I was just curious what's -- the Analyst Day, Ralph, you had said that on the CEF filing you'd already held the 30-day pre-filing and that was kind of ready to go and your slides today say later in the year, I think you said in the near-term, but either way, it seems to have been held off a little bit. Can you give us any color of why that is?

Ralph Izzo, Chairman, President and Chief Executive Officer

Sure, Jonathan. It's very simple, we've got a wonderful opportunity here with Governor Murphy's passion for the types of things that are in that filing and we just want to work very closely with the front office in terms of policy alignment and you may or may not be aware of this, but June 30th is the end of the fiscal year for New Jersey. So until June 30th arrive, it's just impossible to think of anything, but State budget conversations, right. So, even though energy is important, it doesn't step in front of the state budget. So, then you run into vacations, it's really just a question of being completely in sync with the policy of the administration and having a couple other things step in front of us for that. But nothing more than that. I would be surprised if it's much delayed at this point. Once we get some people back from vacation to look (Multiple Speakers)

Jonathan Arnold, Analyst

Well, you're saying seems to imply it might evolve a little bit versus what you showed us, is that a fair?

Ralph Izzo, Chairman, President and Chief Executive Officer

Yeah, the program elements, but I wouldn't expect -- I mean we are determined to go in with this dollar amount, if anything, you know, this interesting BPU comment on the importance of AMI for outage restoration could affect what

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14869

we submit, and that obviously would have the effect too, if anything increase it, somewhat as opposed to decrease it.

Jonathan Arnold, Analyst

So that's what I was going to ask as you. So do you have an early sort of feel of what a full deployment would cost and -- yeah, and it sounds like you're saying that would be incremental rather than displacing something else the wonderful words from you.

Ralph Izzo, Chairman, President and Chief Executive Officer

You are correct, it would be incremental, I'd rather I give that number Jonathan, because we're just starting that conversation with BPU staff and rather not have them here for the first time in one of your reports, even though they're well written and wonderful reports, yeah.

Jonathan Arnold, Analyst

Okay. But you would -- but to the point of being incremental or sort of -- instead of what's the --

Ralph Izzo, Chairman, President and Chief Executive Officer

I would think it will be more incremental, rather then we don't want to take away from the other side.

Jonathan Arnold, Analyst

Okay.

Daniel Cregg, Executive Vice President and Chief Financial Officer

From dollar amount standpoint as well, Jonathan. If you look at the spend that's been identified and then what have been talking about that does aligned with the e-savings objectives that are laid out within the legislation. So that should hold fairly steady to get the savings that we need and having the spend that we've talked about.

Jonathan Arnold, Analyst

Okay, thanks. Just one other topic if I may. Dan, you mentioned the lower forecast for output power. Just curious, if you could give us a little more color behind why the change is in '19 and '20?

Daniel Cregg, Executive Vice President and Chief Financial Officer

Yeah, and I think Jonathan, it's a little bit of what we're seeing from a market demand perspective right now and also a little bit related to whether or not the units are running through the night and whether there is some dubfire and that's going on. So just they moved from time-to-time and they remain estimates, and as we step through 2019 and 2020, we'll continue to keep an eye on it, but the early indications now is that there's a little bit more downward pressure than up, so we're just providing that from the standpoint of our forecasted output.

SI-SSA-0015-14870

Jonathan Arnold, Analyst

Okay, thank you.

Operator

Thank you so much. And your next question comes from the line of Greg Gordon from Evercore. Please proceed with your question.

Greg Gordon, Analyst

Hey, good morning.

Ralph Izzo, Chairman, President and Chief Executive Officer

Good morning, Greg.

Greg Gordon, Analyst

Not to layer uncertainty upon uncertainty, but in addition to the 206 related to the capacity market head your Power markets are -- was sort of articulated in the last answer to glass question, you know, pretty low and more about pricing wise, but we've got this has our pricing decision pending there also seems to be a continued desire around the part of PJM leadership to address the overall pricing model from an energy perspective. So would seem to me that, you know, the revenue model for Power does have a lot of uncertainty on both sides of the equation, capacity and energy. But it would seem to me that they're both bias to the upside, but I don't want -- I'd rather than bias or answer, I'd like to hear what you think about the momentum for energy price reform as well both fast-start and if the momentum can be reestablished on low power price reform?

Daniel Cregg, Executive Vice President and Chief Financial Officer

Yes, I think what we're hearing is a fast-start can and should be implemented beginning of '19 and then the broader inflexible unit aspects of price formation PJM has committed to filing something at the end of this year. So I would agree with you, Greg my sense and this is not -- is just that is, that there has been enough delays and false starts that it's hard to believe that either or both of those are fully baked into the forward price curve at this point. So that would suggest that there is more upside, I mean if a fast-start unit is allowed to set price, that's a good thing, right. And if an inflexible unit allowed to surprise that's a good thing. But I would be less than wholly accurate, if I didn't say that when we last met at EEI, I thought that it would happen around this time, because that's what PJM was saying, yet we are not there yet.

So there's got to be some degree of discounting going on -- in the forward price curve, but we don't outguess the forward price curve view, we do have a range of hedging that we allow ourselves to gravitate up or down within some boundaries, but so short answer, yes, I would agree there is some upside, but the delays of the past fully account for I think some of the skepticism that might not have fully priced this into the forward curve.

Greg Gordon, Analyst

Okay. Thank you, Ralph. Have a good day.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14871

Operator

Thank you so much. And your next question comes from the line of Steven Fleishman from Wolfe Research. Your line is now open.

Steven Fleishman, Analyst

Yeah, hi. Hi, Ralph good morning. So just on the -- just to kind of get a better understand of scenarios from the FERC structure, I get where you say that you kind of have a protection for non-subsidized generation and a path for per subsidized generation. I guess the only issue would be you would -- I assume need to get a new legislative structure then, if this now, it can be done within the current one?

Ralph Izzo, Chairman, President and Chief Executive Officer

Yeah, well, I mean, of course it depends on FERC says, but we have every reason to believe that the state could designate resource requirements that it -- that, you know, for example, it got legislation right now that's been signed by the Governor saying about 40% of its energy to come from nuclear plants, so that legislation exist there is renewable energy legislation that exists in terms of our renewable portfolio standards. So the approach we would think could work is that the BPU would simply say that based upon that statutory authority using a couple of mechanisms that we've already start talking about, but I'd rather not go into detail here, it could be purely done through regulation without any need for additional legislation fully supportive of the 3,500 megawatts of nuclear, 1,400 megawatts of solar and whatever that helps, we are running around out there right now, which I'm not counting.

Steven Fleishman, Analyst

Okay. So the fact that there was a $300 million cap on the ZECs is not relevant for that aspect?

Ralph Izzo, Chairman, President and Chief Executive Officer

No it is, right, because the ZEC was not a payment for energy or capacity, the ZEC was the payment for fuel diversity and environmental attributes, so to supply the load in New Jersey there has to be an energy and a capacity payment and that's wholly separate from the ZEC payment that's -- that was abundantly clear in the legislation and --

Steven Fleishman, Analyst

Okay, okay. And then just -- I'm just curious if, you know, in trying to figure out this full picture. If you've heard any updates on potential DOE, fuel stability plan and just where that might be and how that might fit into this?

Ralph Izzo, Chairman, President and Chief Executive Officer

I have not -- we one could conclude that if price suppression has eliminated that could solve DOE's concern about the units that are suffering from that price suppression becoming viable again, but that's really an extrapolation that you'd have to judge for yourself. The DOE issues been out there for a while now, there is a resiliency technical workshop going on at FERC, I think there was a meeting yesterday, if I'm not mistaken or two days ago, but I don't have any other information then what you probably have already surmised or read it in the press.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14872

Steven Fleishman, Analyst

And then just on the AMI potential program you mentioned when are we going to -- what is the date from one will get an update on that?

Ralph Izzo, Chairman, President and Chief Executive Officer

So, if we file it with the clean energy filing it would literally be within a couple of weeks, if not -- the outset maybe a month or two. If it's done separately that could be a little longer date, if that could spill into the end of this year.

Steven Fleishman, Analyst

Okay. Thank you.

Ralph Izzo, Chairman, President and Chief Executive Officer

You're welcome.

Operator

Thank you so much. And your next question comes from the line of Paul Patterson from Glenrock. Your line is now open.

Paul Patterson, Analyst

Good morning, guys.

Ralph Izzo, Chairman, President and Chief Executive Officer

Hi, Paul.

Daniel Cregg, Executive Vice President and Chief Financial Officer

Hi, Paul.

Paul Patterson, Analyst

So just to sort of follow-up on this capacity, just make sure I understand Praful and Greg's and other questions. The -- and your answers I guess, it seems to me that if I understand you correctly, you expect to see some additional form of mitigation measures to address the impact of essentially through the self supply FRR specific resource alternative. Is that correct and am I understanding that correctly?

Ralph Izzo, Chairman, President and Chief Executive Officer

Yeah, that's right Paul, I show what we understand FERC has said and it's second step of the process was that, okay states, if you want to assure your own resource adequacy consisting of various components then you can do that and

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14873

we'll let you remove them from the market, as well as the load associated with that. And I think we're profitable and we were talking about was that second half of that sense is, what is the load associated with that, right. So if resource adequacy and a 168,000 megawatt market is 16% or 15.8%. What's an adequate reserve margin, when the market is 3,000 megawatts, is it higher, is it lower, I would argue it's much higher, because if you lose one nuclear unit out of 3,000 you got a big problem, so may be resource adequacy then says the you've got to have -- you are only taking, your reserve margin needs to be 35%. I'm making stuff up here with you. So the state wants that nuclear unit it's paying for the environmental attributes, it's going to collect an energy price in the PJM market, it's then going to set a capacity price presumably through a market proxy that RPM would be a great duplicate for, and then it's going to leave behind a lot more load and it took out and a lot less supply, then it took out, well that works nicely for the residual market, we just have to make sure that, that everyone else sees it that way.

Daniel Cregg, Executive Vice President and Chief Financial Officer

At a minimum if you think about, if you do have that hypothetical situation, that Ralph just talks about and there's a shortfall with respect to the load and the resources that we're taking out, what's going to happen is that, that load is going to rely upon the balance of the market and the reserve that sits within the balance of that market. So, a very strong reserve within the balance of that market is going to, in order to the benefit of the load that was taken out for an FRR. So absent some kind of ability to ensure that, that's compensated for there's a bit of a free rider issue. So logic would tell you that there should be a reserve that's going to be appropriate for the smaller amount of load that's come out.

Paul Patterson, Analyst

I hear you, but that really hasn't been done with regulated assets, right. I mean, we don't see that, I mean PJMs, IRM has been done sort of on a footprint or regional specific area, it doesn't seem like they've said, okay, this muni and this co-op if they have right, I mean that's why it seems a little bit, seems little novel to me. I mean, I understand the logic and, but I appreciate that, that will be interesting to see how it all works out. Just on NRG REMA, how much more do we have left there, what's the net investment after all this?

Daniel Cregg, Executive Vice President and Chief Financial Officer

For Q Starcom, there's been aggregate total of $20 million that's there. So, and those are the more acute area, so there's very little that remains in that regard.

Paul Patterson, Analyst

Okay. So we're pretty much finished with all, I think?

Daniel Cregg, Executive Vice President and Chief Financial Officer

We do, I mean we'll see what happens. Ultimately, there could be some timing aspects to the extent that there is a process that goes forward within a bankruptcy scenario there could be a write-down in the aggregate, to be followed at a later date by a recovery in the aggregate. So from the accounting conservative standpoint, you could see more down before there is a recovery and they could be separated as opposed to net it. That would be the other element that I would point out here.

Paul Patterson, Analyst

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Nichole, and I will be your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group First Quarter Earnings 2018 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. [Operator Instructions]

As a reminder, this conference is being recorded Monday, April 30, 2018, and will be available for telephone replay beginning at 1 PM Eastern today until 11:30 PM Eastern on Tuesday, May 8, 2018. It will also be available for audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Nichole. Good morning, everyone. Thank you for participating in our earnings call. As you are aware, we released first quarter 2018 earnings statements earlier this morning. The release and attachments are posted on our website at www.pseg.com under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended March 31, 2018, is expected to be filed shortly.

I'm not going to read the full disclaimer statement or the comments we have on the difference between operating earnings and adjusted EBITDA and GAAP results. But I do ask that you all read those comments contained in our slides and on our website. The disclaimer statement regarding forward-looking statements details a number of risks and uncertainties that could cause actual results to differ materially from forward-looking statements made therein. And

Bloomberg Transcript

final

although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so even in light of new information or future events unless required by applicable securities laws.

We also provide commentary with regard to difference between non-GAAP operating earnings and non-GAAP adjusted EBITDA and net income reported in accordance with generally accepted accounting principles in the United States. PSEG believes that the non-GAAP financial measures of operating earnings and adjusted EBITDA provide a consistent and comparable measure of performance to help shareholders understand operating and financial trends, but should not be considered an alternative to our corresponding GAAP measure net income.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group; and joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions. We ask that you limit yourself to one question and one follow-up to provide enough time for everyone. Thank you. Ralph?

Ralph Izzo

Thank you, Kathleen, and thank you, everyone, for joining us today. Earlier this morning, we reported non-GAAP operating earnings for the first quarter of 2018 of $0.97 per share versus non-GAAP operating earnings of $0.92 per share in the last year's first quarter. Our GAAP results for the first quarter of $1.10 per share reflect solid operating and financial contributions from both businesses. This compares to GAAP results of $0.22 per share in last year's first quarter, which included expenses associated with our decision to retire the Hudson and Mercer coal-fired generating stations.

Details on the results for the quarter can be found on slide 5. Non-GAAP operating earnings for the first quarter benefited from an increase in earnings at both PSE&G and Power. On the operating front our service area experienced four consecutive Nor'easters in March that wreaked havoc on trees and power lines. The repeated battering of freezing rain, heavy snow and high winds caused widespread service outages to over 500,000 customers during two of the back to back storms. PSEG employees once again rose to the challenge. Beginning with comprehensive storm preparation and then efficiently and safely completing PSE&G and PSEG-Long Island customer restorations, the utility then actually offered assistance to neighboring utilities.

The diversity of PSEG Power's generating fleet was also responsive to the extremes in weather that ranged from the near-zero temperatures experienced in January to the very mild weather in February. Eight days of severe weather in January, however, demonstrated again the importance of fuel diversity. Power's high nuclear availability and greater use of oil was able to meet weather-related demand. For the quarter, PSEG's nuclear plants achieved a near-perfect capacity factor of 99.5%, anchored by a record setting 517 consecutive day run at the Hope Creek generating station.

We have successfully advanced many policy and regulatory initiatives during the quarter. Last week PSE&G reached a settlement to expand and extend its Gas System Modernization Program. The settlement, which is awaiting approval by the Board of Public Utilities would allow PSE&G to invest approximately $1.9 billion over five years beginning in 2019. This next phase of GSMP will replace approximately 875 miles of gas mains and make other improvements that will reduce methane emissions and ensure we have the critical infrastructure needed to grow New Jersey's economy.

PSE&G has also implemented transmission and distribution rate reductions to pass-through the benefits of recently enacted lower federal corporate tax rates to our customers. In addition, PSE&G filed with the BPU this past January, its first base rate case since 2010. PSEG Power made significant progress in its continuing efforts to ensure the economic viability of its nuclear plants, with broad bipartisan support the New Jersey legislature passed the Zero Emissions Certificate Bill in early April. Key provisions of the ZEC Bill as we refer to it are outlined on slide 6.

We are hopeful that this safety net mechanism to be implemented by the BPU upon Governor Murphy's signature will secure Power's nuclear fleet as a major source of New Jersey's carbon-free energy supply and acts as a bridge to a cleaner energy future as the state implements companion legislation to further promote renewable energy. The major energy policy goals of the new Clean Energy bill are outlined on slide 7.

Bloomberg Transcript

PSEG has been incorporating climate change considerations into its business planning and investment decisions for many years. We look forward to working with the Murphy administration as New Jersey pursues energy policies which recognize the value of existing carbon-free energy resources and promotes new opportunities to advance New Jersey's clean energy goals. Also in the category of good news, we have reached the full and final resolution of the longstanding FERC investigation into Power's cost-based bidding matter. PSEG continues to focus on a strategic investment program of $13 billion to $15 billion over the 2018 to 2022 period.

Earnings for PSE&G are expected to grow by 5% in 2018 to represent 65% of our full year 2018 non-GAAP operating earnings. The previously mentioned $1.9 billion settlement providing for the second phase of PSE&G's Gas System Modernization Program is aligned with our investment goals and supports annual growth in PSE&G's rate base at the upper end of our forecasted rate of growth of 7% to 9% through 2022.

PSEG Power continues to operate its assets safely and efficiently and remains focused on the cost discipline essential in today's power market. Construction of two of Power's three combined cycle gas turbines under construction is expected to conclude around mid-year and will add 1,300 megawatts of clean, highly-efficient gas-fired generating capacity in favorable locations. This significant list of accomplishments could not have been achieved without the tireless effort of many talented teams across PSEG, from the utilities line crews and Power's plant operations to state government affairs, communications, regulatory, legal and finance. I'd like to recognize their exceptional contributions to our progress.

Today, we are re-affirming our non-GAAP operating earnings guidance for the full year of $3.00 to $3.20 per share. At the midpoint, this represents a 6% increase over 2017's full year non-GAAP results of $2.93 per share. With the support of our 13,000 dedicated employees, we expect to be able to successfully deliver on the promise of our investment programs that should provide growth for our shareholders and a sustainable energy future for our customers.

With that, I'll turn the call over to Dan, who will discuss our financials in greater detail.

Daniel J. Cregg

Thank you, Ralph, and good morning everyone. As Ralph said, PSEG reported non-GAAP operating earnings for the first quarter of 2018 of $0.97 per share versus non-GAAP operating earnings of $0.92 per share in last year's first quarter.

On slide 5, we've provided you with a reconciliation of non-GAAP operating earnings to net income for the quarter. And we've provided you with information on slide 10 regarding the contribution to non-GAAP operating earnings by business for the quarter. Slide 11 contains a waterfall chart that takes you through the net changes quarter-over-quarter in non-GAAP operating earnings by major business.

I will now review each company in more detail starting with PSE&G. PSE&G, as shown on slide 13, reported net income for the first quarter of 2018 of $0.63 per share compared to $0.59 per share for the first quarter of 2017. PSE&G's first quarter results reflected continued successful execution of our infrastructure investment programs, growth in PSE&G's investment in transmission added $0.03 per share for the first quarter. And recovery of investments made under the Gas System Modernization Program improved net income by $0.02 per share and favorable weather comparisons added $0.01 per share versus the year-ago quarter.

PSE&G experienced higher costs associated with restoring service to customers, following four storms that occurred over a 30-day period. The increase in storm costs when combined with a change in pension accounting standards for non-service costs, increased O&M by $0.01. In addition, higher depreciation expense reflecting the utility's expanded asset base, reduced net income by $0.01 per share versus the first quarter of 2017.

Weather-normalized electric sales to Residential and Commercial customers rose by 0.4% compared to the first quarter of 2017. Weather-normalized gas sales were higher by 1.6% in the quarter, led by increased Residential and Commercial usage. Residential Commercial (sic) [Residential customer] (00:12:33) growth continues to trend higher at 0.8% per year. PSE&G implemented a revised $64 million annual increase in transmission revenue under the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14878

company's FERC-approved formula rate effective January 1 after factoring in the $148 million decrease in its revenue requirement associated with a lower federal tax rate.

PSE&G also reduced its distribution revenue by $114 million in response to the BPU's order to accelerate returning the benefits of federal tax reform to customers effective April 1. Combined that's $262 million of benefit to customers. As Ralph mentioned, PSE&G settled the GSMP II filing with the Staff of the New Jersey, BPU, Rate Counsel and other parties, which remains subject to BPU approval. The details of the agreement are summarized on slide 16. Modeled after the BPU's recently enacted Infrastructure Investment Program or IIP initiative, the agreement will allow PSE&G to invest $1.9 billion over five years beginning in 2019 to continue and accelerate the replacement of cast iron and unprotected steel mains in addition to other improvements to the gas system. The settlement provides five-year project visibility to efficiently plan labor, materials, vendors and permitting.

Approximately $1.6 billion of the total program will be eligible for semi-annual rate roll-ins, with the remaining $300 million to be addressed in a future base rate case. The return on equity for the GSMP II investment will be determined in PSE&G's pending base rate case. And as part of the settlement, PSE&G agreed to file a base rate case no later than five years from the commencement of GSMP II. We are maintaining our forecast of PSE&G's net income for 2018 of $1 billion to $1.30 billion.

Moving on to Power. PSEG Power reported non-GAAP operating earnings for the first quarter of $0.33 per share and non-GAAP adjusted EBITDA of $313 million. This compares to non-GAAP operating earnings of $0.30 per share and non-GAAP adjusted EBITDA of $359 million for the first quarter of 2017. Non-GAAP adjusted EBITDA includes the same items as our non-GAAP operating earnings measure, as well as income tax expense, interest expense, depreciation and amortization expense.

The earnings release and slide 21 provide you with detailed analysis of the earnings having an impact on Power's non-GAAP operating earnings relative to net income quarter-over-quarter. And we've also provided you with more detail on generation for the quarter in slide 22.

Power's net income comparison for the first quarter reflects an increase in capacity prices of $0.01 per share. Re-contracting and lower market demand reduced results by $0.06 per share versus the first quarter of 2017. Planned maintenance increased O&M expense and reduced net income comparisons by $0.01 per share. And lower depreciation associated with the early retirement of Hudson and Mercer generating stations in June of 2017 along with lower interest expense added $0.02 per share versus the year-ago quarter. A reduction in the corporate tax rate from recently enacted federal tax reform and other tax items improved first quarter net income comparisons by $0.07 per share.

Gross margin in the first quarter declined to $35 per megawatt-hour from $37 per megawatt-hour in the year-ago quarter. Although, Power prices were higher on average, driven by extreme temperatures in early January, lower market demand experienced in February, lower dispatch of Power's intermediate fleet. Compared to last year's first quarter, Power experienced a $4 per megawatt-hour decline in the average hedge price. This decline is lower than the anticipated annual reduction of $6 per megawatt-hour forecasted for the full year as results in the first quarter benefited from the cold weather experienced in January. We forecast average hedge prices for the remainder of the year to decline by more than $6 per megawatt-hour resulting in an average decline for the full year of $6 per megawatt-hour.

Capacity revenues by comparison are expected to increase throughout the remainder of the year with the average price received scheduled to increase on June 1, 2018, to $205 per megawatt-day in PJM and to $314 per megawatt-day in ISO New England.

Now, let's turn to Power's operations. Generation output declined modestly compared to the first quarter of 2017. Output was affected by severe winter weather at the start of the year and in conjunction with an unseasonably warm February and a higher planned outage hours at the Bergen and Linden combined cycle units. Power's gas-fired CCGT fleet operated at an average capacity factor of 37% and produced 2.7 terawatt hours of output. A higher price for gas in the quarter favored a shift to more production from coal, which generated 1.5 terawatt hours, and a doubling of peaking output. Power's nuclear fleet operated at an average capacity factor of 99.5% for the quarter, producing 8.4 terawatt hours representing 66% of total generation for the fleet. And of note, Hope Creek's strong performance was evidenced

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14879

by a breaker-to-breaker run of 517 consecutive days of production, before entering its planned refueling and maintenance outage on April 13.

Power continues to forecast an improvement in output for 2018 to 55 terawatt hours to 57 terawatt hours. For the remainder of 2018, Power has hedged 80% to 85% of total forecast production at an average price of $38 per megawatt hour. For 2019, Power has hedged 60% to 65% of forecast production of 59 terawatt hours to 61 terawatt hours at an average price of $37 per megawatt hour. And for 2020, output is – output is forecasted to be 63 terawatt hours to 65 terawatt hours with 35% to 40% of forecast output hedged at an average price of $36 per megawatt hour.

The forecasted increase in output for 2018 to 2020 includes generation associated with the mid-2018 commercial start-up of 1,300 megawatts of combined cycle capacity at the Keys Energy Center in Maryland and at Sewaren in New Jersey, and the mid-2019 commercial start-up of the 485 megawatt combined cycle unit at Bridgeport Harbor, Connecticut that will also mark the conclusion of Power's construction program.

I'd also like to update you on the conclusion of the FERC investigation for Power's cost-based bidding matter that has been pending since 2014. Last week, FERC issued an order fully resolving this issue.

Financially, Power has recorded an incremental $5 million pre-tax charge to income in accordance with the order, which included an $8 million non-tax deductible penalty saw a $0.02 impact from that item. And operationally, we do not believe that the order will have any material impact on Power's ongoing business operation.

We continue to forecast Power's non-GAAP operating earnings for 2018 and non-GAAP adjusted EBITDA at $485 million to $560 million and $1.75 billion to $1.80 billion, respectively.

Now let me briefly address the operating results from Enterprise and Other. And for the first quarter Enterprise and Other reported net income of $5 million or $0.01 per share versus a net loss of $15 million or $0.03 cents per share in the first quarter of 2017.

Net income for the first quarter of 2018 reflects the absence of tax benefits in the year-ago quarter at PSEG Energy Holdings and higher interest expense at the parent. The net loss in the first quarter of 2017 included a $55 million pre-tax charge related to the continuing liquidity issues facing NRG REMA, partially offset by tax benefits at PSEG Energy Holdings. And the forecast for PSEG Enterprise and Other net income remains unchanged at $35 million.

PSEG closed the quarter with $118 million of cash on the balance sheet with debt at the end of March representing 49% of our consolidated capital and debt at Power representing 28% of its capital at the end of the quarter. Based on our strong balance sheet and credit metrics, we are able to fund our five-year capital investment program without the need to issue equity. We continue to forecast our non-GAAP operating earnings for the full year of $3 per share to $3.20 per share.

That concludes by remarks. And I'll now turn the call back to Nicole for a question-and-answer session.

Q&A

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. [Operator Instructions] And the first question is from Julien Dumoulin-Smith from Bank of America Merrill Lynch. Please proceed with your question.

<Q - Julien Dumoulin-Smith>: Hey, good morning.

<A - Ralph Izzo>: Good morning, Julien.

<A - Daniel J. Cregg>: Good morning.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14880

<Q - Julien Dumoulin-Smith>: Hey, I wanted to follow up on the latest Clean Energy bill cited the legislation that passed. Can you define a little bit more specifically the Energy Efficiency opportunity at the utility, and just how to think about the net income impacts at the end of the day? And then separately related just the palatability of pursuing offshore wind given its risk profile and given your current position. I mean, how do you think about approaching or tackling that opportunity here, or if at all?

<A - Ralph Izzo>: Yeah. No. So, Julien, thanks for the question. I mean, we're genuinely excited by the Murphy administration's stated energy policies. As I think you know, we've been strong advocates of Energy Efficiency. We've done it in kind of small bites though, I think total over the past 10 years maybe a little bit North of $400 million worth of Energy Efficiency Programs, and the Clean Energy bill anticipates a 1.5% or 2% reduction depending on whether it's electric or gas. I think it's 2% on electric and about 0.75% on gas, and the BPU is going to come up with rules, but suffice to say we've been thinking about this for a good long time, the legislation also talks about recovering, that utilities have the right to file annually to recover their costs, including return on and of their capital and loss revenues as well. So, this is great news and we will jump into this feet first and deliver universal access to Energy Efficiency for all New Jerseyans.

On the offshore wind piece, we don't have a track record in offshore wind, but we do have a leased offshore and we do have a partner, and that's part of a JV that we have in place. So, I would say that whether it's a participant in the transmission aspects or in the offshore wind aspects of the farm itself that's probably not quite as mature in our own thinking as the energy efficiency, but overall this notion of a sustainable energy future is one we've been talking about for a decade or more, and we're excited by the prospects that are created.

<Q - Julien Dumoulin-Smith>: But just to clarify on the EEP for this, I mean, how do you think about that in the context of decoupling specifically, and maybe that's more of a rate case question? And then separately, if I can re-characterize a little bit how you describe that you talked about sort of initial $400 million of cumulative spending. I mean, how does that compare versus what prospectively you're talking about even order of magnitude?

<A - Ralph Izzo>: Yeah, I'd say that's right, an order of magnitude different. We – I don't think we've released our planned number for filing, but we have said that we anticipate putting a filing in before the middle of the year. And we still are on track to do that. I'd rather not give a specific number because there's a pre-filing meeting we need to go through with the Board of Public Utilities, and they deserve to hear that candidly before we start blurting it out in a quarterly earnings call. But it is an order of magnitude different in terms of the opportunity.

<A - Daniel J. Cregg>: And to your point Julien, related to the rate case we did file a decoupling mechanism as part of the rate case, and that really fits hand in glove with what's going on from an Energy Efficiency standpoint.

<Q - Julien Dumoulin-Smith>: Right. Exactly. Thank you.

Operator

Our next question comes from the line of Praful Mehta from Citigroup. Please proceed with your question.

<Q - Praful Mehta>: Great. Thanks so much. Hi, guys.

<A - Ralph Izzo>: Hi, Praful.

<A - Daniel J. Cregg>: Hey, Praful.

<Q - Praful Mehta>: Hi. So, on the GSMP and the settlement and the distribution rate case, just want to understand were you saying that if you achieve both, you would be at the upper end of the 7% to 9% just wanted to confirm that?

<A - Ralph Izzo>: So, it's a combination of multiple factors, Praful. There is the rate case which includes various tax givebacks that have to do with both the change in federal tax policy and deferred tax balances. There is GSMP II, which takes our $300 million per year prior GSMP program up to about $375 million per year program. There's still the number one investment area that we will be focused on, which is transmission and our expectations there.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14881

And then there's some expectation for a continuation of Energy Strong and energy efficiency, but not at numbers that we have completely disclosed yet. But when you add all that together that leads us to think that we're biased towards the higher end of the 7% to 9% range. But Dan, you may want to tell him the real story.

<A - Daniel J. Cregg>: Yeah. We said we're on the higher end of that and we anticipate being there. And Praful, I guess, if you think about the rate case, the rate base element of that is a couple things. One, it's the roll-in of some remaining portion of some prior clauses, but it's also rolling in the giveback on some of the tax effects. So, the way we characterized that earlier in the year was that, we always talk about our growth rate and as we continue the capital program that we have, the existing rate base goes up. So, you're jumping off of a higher base. And last year, we were at about 7% to 9% growth rate. This year we're at about 7% to 9% growth, but that higher base was really offset by some of the tax flow back that we would anticipate. So, that is what – basically the rate case and that flow back would hold you about steady. And then with the existing GSMP settlement, plus Energy Strong too, which we've talked a little bit about and plus a clean energy filing we would anticipate moving higher up within that range.

<Q - Praful Mehta>: Got you. That's super helpful. So just to clarify, I think you had said $600 million was the unpredicted DTL, on I think previous calls, is that refund expected to happen pretty soon? And is that part of like the growth that's kind of flowing into the rate base?

<A - Daniel J. Cregg>: That'll ultimately be determined in the rate case. So, I think that the bulk of the excess deferred are going to be through the average rate assumption method, which will be a longer term period. But some of that, in addition to some of the excess deferred is going to be worked through the rate case related to some other items. So, we'll know more about that as we move towards the end of the year.

<Q - Praful Mehta>: Fair enough. And then, just quickly on ZECs. Congratulations to where it's kind of come out so far, just want to understand, in terms of the three year extension, it sounds like it is if prices don't change meaningfully, you have a shot at continuous extensions, but just wanted to understand from your perspective how do you see that extension discussion going, because if you do get the three-year, what does it take to kind of have that next three year extension?

<A - Ralph Izzo>: So, first of all it's important to realize that the ZEC price is not tied to a market price, right. The ZEC price is an attribute payment for the carbon and fuel diversity dimensions of nuclear power. There is a consumer protection put in the bill that goes to simply the affordability of ZECs when viewed in the context of overall energy prices that customers have to pay, as well as a provision in the bill that anticipates a review by the BPU as to whether or not the plants are in any kind of economic duress. So, that's what the three-year review is for, right. Can New Jersey continue to afford to pay for zero emissions energy? And that's a question that BPU will have to answer on behalf of customers.

We will always be mindful both on behalf of customers, but on behalf of our shareholders as to whether or not the plants are making their cost of capital on a risk adjusted basis, and if they are not, then we will close the plants. That's not saber-rattling, that's not threatening, that's just our fiduciary responsibility and we will always work extra hard to make sure New Jersey is aware of those situations and what that means in terms of the loss of attributes. So, I just think – it's a – and as you know in nuclear space nothing happens in less than a year anyway. And in RPM and PJM world, things tend to happen in three-year increments. So, just checking in every three years as to affordability, economic viability seem like a very natural rhythm to put into public policy.

<Q - Praful Mehta>: Fair enough. Thanks so much, guys.

<A - Ralph Izzo>: Nicole, do we have any other questions?

Operator

Your next question comes from the line of Jonathan Arnold from Deutsche Bank. Please proceed with your question.

<Q - Jonathan Arnold>: Oh, good morning, guys.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14882

<A - Ralph Izzo>: Hey, Jonathan.

<A - Daniel J. Cregg>: Hi, Jonathan.

<Q - Jonathan Arnold>: Just – so on the Energy Efficiency and I hear you comment about filing by the middle of the year and then needing to go through a pre-file with the BPU. Is it a reasonable expectation that you'd be through that and able to give us a little more flavor by the time of the Analyst Day?

<A - Ralph Izzo>: Yeah. So, we should definitely have the pre-file done before the Analyst Day, Jonathan. And then, we'll tell you everything that we plan to file at that point. Correct.

<Q - Jonathan Arnold>: So, the filing itself might not have been made, but you'll have a better sense of the scope of it?

<A - Ralph Izzo>: It won't be because the pre-file meeting is – there's a 30-day clock that starts from then. And as you know, the Analyst Day is on the 31st and we haven't had the pre-file meeting yet [ph] although we are booked (00:31:57).

<Q - Jonathan Arnold>: Right, I'm hearing you'll tell us a bit more than you've told us today?

<A - Ralph Izzo>: Oh, yeah, yeah. No, we'll tell you lots more. We're just too excited not to tell you a lot more. So, this is the favorite.

<Q - Jonathan Arnold>: Switching to something a little different, slide 22, on the power generation measures. And I just wanted to understand a little better the coal cost is up $9 million, it's about – over 25% and the generation was up more like mid-single digits. So, is that just the fact that you're less hedged than you've been in the past and you're buying some spot to cover the extreme weather or is it a contract rolling off or how should we think about that as we're trying to calibrate coal costs for the rest of the year?

<A - Daniel J. Cregg>: I don't think I would put too much weight into that, Jonathan. I think that – especially if I think about it from an overall component of the generation, I think what we saw really was a little bit more reliance on coal because of the weather. And I think on an ongoing basis, I don't anticipate it to be much of an impact as we go through the rest of the year.

<A - Ralph Izzo>: Yeah. No. I don't – I didn't do the numbers, Jonathan. But if you look at that slide, you'll see that Pennsylvania is down a little bit and Connecticut is up quite a bit and Pennsylvania [ph] has got (00:33:18) more expensive coal.

<Q - Jonathan Arnold>: Okay. That's helpful. Thank you. But then, on the oil piece, presumably the denominator for those fuels – that $25 million of cost is in the gas segment?

<A - Ralph Izzo>: That's correct.

<A - Daniel J. Cregg>: Yeah.

<Q - Jonathan Arnold>: And again, I mean is there any – I'm trying to – well, I guess what I'm trying to get a feel for is, to what extent the weather may have actually hurt you in Power this quarter?

<A - Daniel J. Cregg>: Well, I think it had a lot to do with what you're seeing on the delta quarter versus quarter from the standpoint of oil, that number under normal situations would be much, much lower, and what you saw was prices moving up and gas getting a little bit tighter and gas prices going to extreme levels for the quarter. So, I think what you saw was much more an anomaly with respect to oil burn for the quarter, and that's all...

<Q - Jonathan Arnold>: Did you make that up in price so is that – was that really just lost margin?

<A - Daniel J. Cregg>: If it – we were economic when we were running on oil. So, if we weren't economic, we wouldn't have been running, but if you took a look at where gas prices were I mean, gas prices during that part of the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14883

year, the very early part of the year were drifting up looking like very healthy, age-old power prices as opposed to gas prices well, well up into the double-digits.

<Q - Jonathan Arnold>: So, it's – you don't feel that there was a net-net, this was a drag on the quarter, it's just the moving pieces within the revenue and cost lines?

<A - Daniel J. Cregg>: Yeah, I think that's right. I think some anticipated spark for earlier January wasn't quite where we would have wanted to be because gas prices basically push you into oil which had lower margin, but it was a fairly short-term phenomenon in January and an anomaly, but it really does drive all the oil burn that you see there for the quarter.

<Q - Jonathan Arnold>: Great. Thank you.

<A - Daniel J. Cregg>: Yeah.

Operator

Your next question comes from the line of Greg Gordon from Evercore ISI. Please proceed with your question.

<Q - Greg Gordon>: Thanks. Good morning. Well, we're on the subject of PSE&G Power, there are several initiatives that PJM that are sort of in their pendency, whether it's the capacity market design updates, [ph] ORDC (00:35:37) pricing, fast-start pricing. I believe [indiscernible] (00:35:41) put out a letter recently indicating that he hoped those three things would get done this year. Can you can you review what your expectation is for the timing on those and the potential impacts on Power? And then there's one thing extent, which is well the management of PJM still seems supportive of overall price reform. There hasn't been much progress there. So you can give us an update on your expectations on that front?

<A - Ralph Izzo>: Sure. Greg. So, on capacity market reform, we've been public that we prefer the two-phase approach, which is the PJM-preferred approach, even though they've submitted the Market Monitor's MOPR-based approach as well. I think we have every reason to believe that will go into effect by May of 2019, obviously that won't have any effect on the current RPM. So, I think that's the timing there. I would view fast-start as yet another piece of the price formation puzzle. I know that many people including us have talked about the inflexible unit, dimension of price formation, but fast-start does have now a proposed zero threshold – zero threshold element to it, which is characteristic of inflexible units right, that they can't move over the timeframes that PJM is seeking. We've never been one to quote whether or not the forward price curve has these numbers in it nor have we been one to quote what these changes will mean to the forward price curve, we just say the market is the best determinant of that and our own internal views will influence whether we hedge a little bit to the high side or to low side of our own internal disciplined approach.

I think, Andy himself has said that these should go into – should be able to – the energy price fixes should be able to be put in place by a little bit more than a year from now, but sometime in the summer of 2019. So that is a delay, I think that once upon a time there was talk of fall of 2018 for some of these reforms. But I think a combination of factors has introduced that bit of delay. I think the good news if I might is that the PJM Board appears to be willing to undertake what's called the liaison process as opposed to the full-fledged stakeholder process, which can put a little bit more of a limitation on the amount of time.

I should by the way point out that in terms of RPM, we prefer the status quo, but of the submittals that PJM has made, we think that the two-phase approach is better than one-phase approach. I don't think PJM has given up on the full inflexible unit pricing. They see that as part of their resiliency discussion, which continues with comments due back from I think the rest of us. The RTU has already made their comments, ours' is due back I think in the middle of June or in the middle of May, middle of May, I forgot to say. So, it's still a work in process, not over by any stretch and some things have a bit more of a date certain i.e., the capacity market reforms and the energy market reforms we think will still creep in to the market.

<Q - Greg Gordon>: Thank you for the update.

Operator

And next question comes from the line of Travis Miller from Morningstar. Please proceed with your question.

<Q - Travis Miller>: Thank you. Hi, Izzo.

<A - Ralph Izzo>: Hi, Travis.

<Q - Travis Miller>: Reading to the ZEC, It sounds like there could be out-of-state plants that would be eligible and I'm most interested in your thoughts on Peach Bottom plant if that is true if I'm in fact reading that ZEC correctly?

<A - Ralph Izzo>: Yeah. So, Travis, you actually are reading it correctly. The bill simply says that New Jersey wants 40% of its power supplied by nuclear energy and it does not limit it geographically in terms of there being more than 40% of New Jersey's electricity being deliverable by nuclear power plants whether it's Salem, Hope Creek, Peach Bottom or a variety of others. Then there's a ranking system that the BPU is encouraged to undertake that is really driven off of the greatest impact on New Jersey from an air quality point of view and various other parameters that are detailed in the legislation. But the short answer to your question is yes, out-of-state plants would be eligible, but New Jersey would not support according to legislation more than 40% of its energy being supplied by nuclear power.

<Q - Travis Miller>: Okay. With the thought that Peach Bottom would rank at the bottom, just given it's not New Jersey.

<A - Ralph Izzo>: Well, no, no, no, I don't want to, I don't want to predetermine what the BPU will do, Peach Bottom will compete with Salem and Hope Creek and Susquehanna, and Limerick. If probably doesn't have to worry about [indiscernible] (00:41:03) much, but it does, so...

<Q - Travis Miller>: Yeah, sure. So, the second question on the Clean Energy bill, what components specifically could generate rate base growth if any just clarifying a couple [ph] of your previous... (00:41:22)

<A - Ralph Izzo>: Oh, my goodness, well there's multiple, right? So, the utility has done a grid-connected solar, the utility has done rooftop solar, the utility has done energy efficiency, it has done pilot programs in battery storage technology. So, there is no shortage of opportunities that are expanded in the clean energy world. There's a transmission component to offshore wind, there's offshore wind itself. So, I think you just have to – remember what the governor said is, he sees nuclear power as an important bridge to renewable future and the renewable future he has in that bill, which he has not signed yet is a 50% renewable target in 2035, and we expect to be participants in every aspect of that sustainable energy agenda.

<Q - Travis Miller>: Okay. And then those are investments you foresee could go into rate base then not just...

<A - Ralph Izzo>: Oh, yes, yes, yes.

<Q - Travis Miller>: ...earnings neutral type collection?

<A - Ralph Izzo>: That's correct. Yeah, well I mean, you just – look the reality isn't in New Jersey just given our geographic and natural resource profile, you're not going to be able to do merchant solar or merchant offshore wind those will have to be supported through some type of regulatory revenue stream. That's either in the form of a renewable energy credit and/or some other mechanism. And again, on the offshore wind piece, I just want to emphasize that while we have a lease, we've never done that before, so we would be interested in the transmission component probably as much if not more than the actual wind farms. And we are, as I said a moment ago, we are all in on the Energy Efficiency piece.

<Q - Travis Miller>: Okay. Great.

final
Bloomberg Transcript
Bloomberg

<A - Daniel J. Cregg>: I think some elements of the legislation, Travis, talk specifically about utilities investing and having recovery on and off like the energy efficiency. Offshore wind very different situation, not specifically laid out as to how that will work out. In fact, the legislation really calls four-day study for that to be determined, things like that to be determined.

<Q - Travis Miller>: Okay. Great. Yeah. That's helpful. Thank you very much.

Operator

Your next question comes from the line of Paul Patterson from Glenrock Associates. Please proceed with your question.

<Q - Paul Patterson>: Hey, good morning.

<A - Ralph Izzo>: Hi, Paul.

<Q - Paul Patterson>: Just a – sorry if I missed this, but when is the governor expected to sign the nuclear legislation?

<A - Ralph Izzo>: Paul, so, he has – so the New Jersey governor has 45 days to act on legislation, and that action could be either an outright veto, which would require two-thirds majority of the legislature to override, something called a conditional veto, which is, hey, like this except for and then he sends it back to the legislature to change the piece that he liked except for, or to sign into law. In addition, if he doesn't act for 45 days it then automatically goes into law. So, those are the options for the governor.

<Q - Paul Patterson>: Okay. And I – okay, so, let me ask you this. If we don't get him signing it by the RPM auction, which isn't that far from now, how should we think about how that might affect, how you guys would be bidding into the capacity auction?

<A - Ralph Izzo>: You know we never comment on our bidding plans prior to the auction, but what I would say is this, that we would view things differently if he were to veto the legislation versus simply not get around to signing it yet. And so those are two [ph] things (00:45:14).

<Q - Paul Patterson>: I see. Okay, I got you. So, if he – so, okay, absent a veto, you guys sort of are expecting that this bill will be enacted?

<A - Ralph Izzo>: I think he's the governor – look you never ever want to pretend to be constraining your governor, right?

<Q - Paul Patterson>: Sure, I got you.

<A - Ralph Izzo>: He's a very important person and he's a talented person and one that we admire. So, I'm not going to try to tell him what to do on an earnings call. But having said that, I mean, he has been outspoken and supportive of nuclear as a bridge to renewable energy in the future and he's also been outspoken in support of the importance of those jobs to south New Jersey, so I feel pretty good about those public statements on his part.

<Q - Paul Patterson>: Okay. Awesome. And then, the Energy Efficiency Program, just how should we think about how that impacts the demand forecast, longer term and just in general, how we should think about how you see energy demand or electricity demand working in the state?

<A - Ralph Izzo>: You know, Paul, we've been working hard to try to remind investors that the utility growth story is really independent of demand growth. Demand growth or the actions of it has significant implications for how regulation needs to be rethought to avoid the compounding of inevitable O&M growth and regulatory lag on investment returns. But PSE&G's growth over the past 10 years and its continued future growth really is about an aging infrastructure that needs replacement and a higher degree of customer service and customer demands for a clean energy future and I am absolutely convinced that we can continue to invest in a resilient grid, cleaner energy and more efficient use of energy, which would help – that third piece would help lower customer bills and put bigger smiles on

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14886

our shareholders. So...

<Q - Paul Patterson>: Okay.

<A - Ralph Izzo>: ...I think that Energy Efficiency is an important part of controlling the bill from the point of view of the extra cost associated with renewable energy and making the grid more resilient.

<Q - Paul Patterson>: And you guys have demonstrated that too. So you guys have been ahead of the curve on that, but I guess I'm sort of wondering though, it does have an impact perhaps though on non-regulated generation, not just in your state but all over. So, what you guys might be doing could have an impact there. I'm just sort of curious as to what you guys think, just roughly speaking all these – what you see the demand forecast kind of being?

<A - Ralph Izzo>: I see, oh yeah, well I mean, I think RPM is a good example, demand forecast is down yet again. I don't know that's the nth consecutive year, where n is some large single-digit number, where, that's been the case. We've obviously made the decision in our own service territory that Power has a much bigger market in which it can play, and therefore to the extent that our own efforts cannibalize Power, we've been willing and continue to be willing to do that. I do think that the primary supply-demand economics in the wholesale market are going to be determined as much by the shrinkage of supply as it is going to be determined by any changes in demand.

<Q - Paul Patterson>: Okay. Thank you very much.

Operator

Your next question comes from the line of Michael Lapides from Goldman Sachs. Please proceed with your question.

<Q - Michael Lapides>: Hey guys, thank you for taking my question. One easy one, you have talked about this at prior earnings calls or Analyst Day, haven't circled back on this in a bit. Can you just talk about how much extra balance sheet capacity that you think the company has right now, meaning either to fund incremental rate base growth or incremental renewable growth at PS Power (sic) [PSEG Power] (00:49:07). Just kind of when you think about your credit metrics in a post-tax reform world and the balance sheet strength, how big is that balance sheet strength?

<A - Daniel J. Cregg>: Yeah, Michael, and I think you'd want to think about it really in two steps, right? We've talked about the ability to fund the capital plan, such as we have without the need for any additional equity. And then, as you mentioned consistent with how we've talked about it in the past, if you take a look at our existing credit statistics and you take a look at where some of the threshold points are, you have somewhere in the order of a billion dollars of excess at PSEG Power, which then can be utilized at the utility within the existing regulatory capital structure so that can be matched with debt and so you'd come up with about double that if you think about it from a utility overall investment incremental spend standpoint without having any impact on the existing ratings.

<Q - Michael Lapides>: Got it. And any increment for potential incremental holding company leverage or do you just think about it as if opportunities came up for incremental investment at Power or at E&G, you would simply make the leverage down at Power?

<A - Daniel J. Cregg>: Well, I think that the leverage could happen at Power or at the parent company. I think, we've had some parent company debt of late and we tend to take a look at what makes the most sense from an economics standpoint when looking to source that debt. So, I think that it could be at either location, but I think you're in the same ballpark when I talk about the numbers that I just referenced.

<Q - Michael Lapides>: Got it. Thank you, Dan. Much appreciate it.

<A - Daniel J. Cregg>: Yeah.

Operator

Bloomberg Transcript
Bloomberg

Your next question comes from the line of Paul Fremont from Mizuho. Please proceed with your question.

<Q - Paul Fremont>: Thanks. I guess, the first question would be on the Clean Energy bill. When I think of the 7% to 9% rate base growth target and the fact that you guys are seeing yourselves sort of at the upper end. Does – do the investment opportunities under the Clean Energy bill keep you within that 7% to 9% band or would that potentially put you outside of that band?

<A - Ralph Izzo>: So, I'd rather give more detail on the band at the upcoming Investor Conference, Paul, right now, because I think we'll have more information coming out of our pre-filing meeting with the Board Staff and we'll hopefully have resolution – we'll definitely have resolution of the nuclear bill by that point in time.

<Q - Paul Fremont>: Okay. And then sort of a quick question on Hope Creek, the 60 megawatt upgrade that was approved, when would that take effect?

<A - Ralph Izzo>: It was a 60 megawatt or 16 megawatt...?

<A - Kathleen A. Lally>: 16 megawatt.

<A - Ralph Izzo>: 16 megawatt, it was much smaller. I'd have to get back to you on that, Paul. I don't know the answer. Our nuclear has been jammed with broader issues than 16 megawatt out of the [ph] 1,100 megawatt (00:52:12). It wasn't equipment. I mean this was a change I believe in our probabilistic risk assessment that allow us to run the plant at different numbers. But I'm tempted to say it's coming back.

<A - Daniel J. Cregg>: I think coming out of this outage is the right answer, but we can't confirm that for you.

<Q - Paul Fremont>: Okay.

<A - Ralph Izzo>: Any questions we can answer for you, Paul?

<Q - Paul Fremont>: No, that's good. Thank you very much and congratulations.

<A - Ralph Izzo>: Thank you.

Operator

Your next question comes from the line of Angie Storozynski from Macquarie. Your line is open.

<Q - Angie Storozynski>: Thank you. So, my only question is you guys in the past mentioned that you might try to pursue electric retail in the Mid-Atlantic; we haven't actually had much – haven't heard much about it. And do you think that this is still something you will be interested in and if so do you think that this will be done organically or would you need to acquire a retail book? Thank you.

<A - Ralph Izzo>: Yeah, Angie. So, thanks for the question. We're still at work. It is exclusively an organic effort. We did look at the potential for acquisitions, but given the purely defensive nature of this effort and our desire for it to basically help us improve our margins based on our own assets there has been no book that kind of fit that to a high-enough degree of accuracy that the transaction costs wouldn't have swamped the benefits, so – because whatever book we bought we'd have to sell off a piece of it and that would be suboptimal. So, we're continuing to pursue an organic growth strategy there.

<Q - Angie Storozynski>: Cool. And my other question on the regulated side. So, even if your rate base were to grow at 9%, would you consider acquisitions of other regulated underinvested systems in your – around your service territory or in the same state?

<A - Ralph Izzo>: So, we always – there aren't too many left in our state, I don't know if any that are available in our state that are part of a bigger entity. So, we always look at those, right. But we have been very public that we are quite enamored with our organic growth strategy. And without any disrespect to our colleagues in the industry, sometimes are puzzled by the premiums that others are willing to pay and we've not been able to pencil those in the way that

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14888

works, but we always look at those possibilities.

<Q - Angie Storozynski>: Okay. Thank you.

Operator

Your next question comes from the line of Steve Fleishman from Wolfe Research. Please proceed with your question.

<Q - Steve Fleishman>: Yeah. Hi. Good morning. Sorry to bug you with some clarifications, but just on the rate base growth comment, could you clarify if what the base of your growth forecast is? Has that changed due to some of the tax reform adjustments or is it the same kind of base level period 2007 to 2009?

<A - Ralph Izzo>: Hi, Steve. I think I'll let Dan dive into that.

<A - Daniel J. Cregg>: Yeah. It's just the year-end 2016 number...

<A - Ralph Izzo>: $17 million.

<A - Daniel J. Cregg>: ...2017 number, which is $17 billion.

<Q - Steve Fleishman>: Okay. So the base is still the same base?

<A - Daniel J. Cregg>: Yeah.

<Q - Steve Fleishman>: And then, in the same way, you might be toward the high-end that is including the GSMP agreement, but nothing else different?

<A - Daniel J. Cregg>: It would include as we look forward, the opportunity – some opportunity related to future filings, right? So, I would say that if we had nothing beyond the GSMP filing, we'll be more middle of the road within that range, and with the opportunity for future filings, we could see the opportunity if we go higher than the middle of the range.

<Q - Steve Fleishman>: Okay. So, it may include some of these clean energy investments or...

<A - Daniel J. Cregg>: Yeah and any other adjustments as we step forward through time, yes, yes.

<Q - Steve Fleishman>: Okay. And then, yeah, I'm good. Thank you.

<A - Ralph Izzo>: Yeah.

Operator

Your next question comes from the line of Michael Weinstein from Credit Suisse. [indiscernible] (00:56:49). Please proceed with your question.

<Q - Michael Weinstein>: Hi, Ralph. Hey, it's Mike Weinstein. Hey, a quick question. You said before that you prefer the status quo for the current capacity market reforms I believe.

<A - Ralph Izzo>: Yeah.

<Q - Michael Weinstein>: And I've heard some similar sentiment over Exelon. I'm just wondering what is it about the status quo that's better than any of the proposals that's been put out there?

<A - Ralph Izzo>: It's just that it – the status quo has new plants being MOPARd as opposed to existing plants being MOPARd and it doesn't interfere with the state's ability to price attributes that the market isn't currently pricing. So, we just don't see a need for this kind of modification at the current time.

<Q - Michael Weinstein>: I mean, do you think any – yeah...

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14889

<A - Ralph Izzo>: Okay.

<Q - Michael Weinstein>: Is it do you think the modifications won't have an effect at all or?

<A - Ralph Izzo>: No, no, no, I mean they'll have different effects. I think that the two-phase approach at least continues to allow states to recognize the value of renewables and carbon-free energy sources, the Market Monitor's approach is this protracted administrative battle over what constitutes the appropriate minimal offer price, which as you know can be moved quite a bit depending upon whether you believe something has a 30-year life or 40-year depreciable life across the capital was x or 1.1x or 0.9x.

So, to characterize that as a correction to ensure the market is working properly I think is inaccurate. I think it's just a correction to assure administrative power reverts to people who want to have administrative power, right? And that's not necessarily consistent with markets. I mean look what we're all dancing around here is, we need a price on carbon, and then let the market pick the technology. And then I think you'd see every participant in the market sign up for that, except for maybe the carbon-heavy participants I guess.

<Q - Michael Weinstein>: Is that more handled better on the energy side basically and then....

<A - Ralph Izzo>: Yeah, absolutely.

<Q - Michael Weinstein>: Do you think? Yeah, so the capacity market reforms are kind of a distraction of some sort maybe?

<A - Ralph Izzo>: Yeah, you've got a collapse in inframarginal revenues because there's no carbon price in energy markets and because of that collapse in inframarginal revenues high-fixed cost participants are getting crushed and that's – and yet people are saying they want the attributes of these high fixed cost participants out. You know you have the decoder ring, right? The high fixed cost participant is a nuclear plant. And yet people are paying record prices of anywhere from $5 per ton to $200 per ton of carbon. And so, the markets just got these inherent inconsistencies built into it. So, if we could get a single price on carbon in energy markets then the inframarginal revenues will increase and the fixed cost recovery would be mitigated and then capacity markets could do what they were supposed to do, the reliability mechanisms and nothing more.

<Q - Michael Weinstein>: Got it. Okay. Thank you.

<A - Ralph Izzo>: You're welcome. So Nicole, I think we have time for one more question and then we'll, I think let folks have their day back.

Operator

Mr. Izzo and Mr. Cregg, there are no further questions at this time. Please continue with your presentation or closing remarks.

Ralph Izzo

It's always magic no matter where you are, whether it's a teleconference or a public speaking, if you say one more question, there's never more questions, but that's great. So anyway, so thank you folks for joining us today and I hope you heard from Dan and I that there's a lot of good things happening at PSEG. And they range from the continuation of our $13 billion to $15 billion investment program, which – 90% of which is going to the utility and leaves us to be biased towards the upper end of that 7% to 9% rate base growth looking out to 2022 off of the higher base in, at the end of 2017.

Again, we've got to give kudos to the great work done by our utility crews and our power plant operations during what were some very, very difficult circumstances certainly in January. And kudos to our regulatory team and all of our

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14890

support functions for the strides they've made on some of the policy fronts with the settlement of GSMP II and the legislation that recognizes the value of Power's nuclear generation I mean, getting 60 out of 80 votes in the assembly and 30 out of 40 votes in the Senate on a bipartisan basis. I think validates what we've been saying all along that New Jersey will recognize the importance of these plants to our environment, to our cost of energy, to our economic well-being, and they are much cheaper to keep than they are to let shut down.

And then of course, our ongoing commitment to maintain our financial strength, which gives us flexibility to support the growth in the dividend, fund these rate base growth investments, no need to issue equity and still some balance sheet capacity leftover. So, hopefully, we'll see all of you on May 31. I know that's the weekend after – that's Memorial Day. So, come in your Chubbies whatever other beachwear you have that's – and will host you, and will have a great conversation about the rate base growth in detail, where we are with RPM and I think there's a brand of clothing as well, I'm sorry and we'll see you soon. Thanks a lot everyone. Take care.

Kathleen A. Lally

Very good.

Operator

Ladies and gentlemen, thank you for standing by. My name is Shelby, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group Fourth Quarter 2017 and Year-End Earnings Conference Call and Webcast. (Operator Instructions) As a reminder, this conference is being recorded today, February 23, 2018, and will be available for telephone replay beginning at 2:00 p.m. Eastern Time today until 11:30 p.m. Eastern Time on Friday, March 2, 2018. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally - *PSEG Services Corporation - VP of IR*

Thank you, Shelby. Good morning, everyone. Thank you for participating in our earnings call. As you are aware, we released our fourth quarter and full year 2017 earnings results earlier today. The release and attachments, as mentioned, are posted on our website at www.pseg.com under the Investor section.

We also posted a series of slides that detail operating results by company for the quarter and year. Our 10-K for the period ended December 31, 2017 is expected to be filed early next week.

I'm not going to read the full disclaimer statement or the comments we have on the difference between operating earnings and GAAP results, but I do ask that you all read those comments contained in our slides and on our website.

The disclaimer statement regarding forward-looking statements details the number of risks and uncertainties that could cause actual results to differ materially from forward-looking statements made therein.

©2018 Thomson Reuters. All rights reserved. Republication or redistribution of Thomson Reuters content, including by framing or similar means, is prohibited without the prior written consent of Thomson Reuters. 'Thomson Reuters' and the Thomson Reuters logo are registered trademarks of Thomson Reuters and its affiliated companies.

THOMSON REUTERS

SI-SSA-0015-14893

Client Id: 77

And although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so even if our estimates change, unless required by applicable securities laws. We also provide commentary with regard to the difference between operating earnings and adjusted EBITDA and net income reported in accordance with generally accepted accounting principles in the United States.

PSEG believes that the non-GAAP financial measures of operating earnings and adjusted EBITDA provide a consistent and comparable measure of performance to help shareholders understand operating and financial trends, but should not be considered an alternative to our corresponding GAAP measure net income.

I'm now going to turn the call over to Ralph Izzo, Chairman, President, Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer.

At the conclusion of their remarks, there will be time for your questions. (Operator Instructions) Thank you.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Thank you, Kathleen, and thanks, everyone, for joining us today. This morning, we reported non-GAAP operating earnings for the fourth quarter of 2017 of $0.57 per share versus non-GAAP operating earnings of $0.54 per share earned in the fourth quarter of 2016.

Non-GAAP operating earnings for the full year of $2.93 per share versus 2016's non-GAAP operating earnings of $2.90 per share were above the midpoint of our guidance range, which was $2.80 to $3 per share.

Our GAAP results for the full year of $3.10 per share include one-time noncash benefits associated with the revaluation of deferred tax liabilities at Enterprise and PSEG Power associated with the reduction in the federal tax rate and expenses associated with our decision to retire the Hudson and Mercer coal-fired generating stations in June of '17.

Details on the results for the quarter and the full year can be found on Slides 5 and 6.

Successful execution of our capital program at PSE&G and increased output, coupled with strong cost control at PSEG Power, offset earnings weakness experienced earlier in the year from abnormal weather conditions.

Non-GAAP operating earnings from our regulated utility business grew 8.6% in 2017 as PSE&G's investment program expanded rate base by 12.5% to $17 billion at the end of the year.

The utility's earnings have grown at an annual rate of approximately 13% over the past 5 years, which is in line with its growth in rate base over this time frame.

While the growth in earnings occurred with PSE&G maintaining cost discipline and successfully implementing infrastructure programs that upgraded its electric and gas systems to make them both more reliable and resilient.

Importantly, PSE&G has achieved these results as customer bills have declined. This past January, the utility filed its first distribution base rate case since 2010. The filing, which was required by the 2014 Energy Strong settlement, calls for a 1% increase in revenue as it incorporates a reduction in revenue associated with the decline in the federal tax rate.

Also in January, PSE&G updated its 2018 annual transmission formula rate with the Federal Energy Regulatory Commission. The update, reflecting a lower federal corporate tax rate, reduced the transmission revenue requirement by $148 million.

The timing of the reduction in the federal tax rate and the base rate filing places us in a position to pass along tax savings to our customers and keep rates low, allowing us to continue to improve our aging infrastructure.

As important, PSE&G's achievements allowed us to maintain our best-in-class reliability. For the 16th year in a row, PSE&G worked to protect and strengthen the system, yielded recognition as the most reliable electric utility in the Mid-Atlantic region.

Also during the year, the New Jersey Board of Public Utilities approved PSE&G's plan to expand its investment in energy efficiency by $69 million. PSE&G also filed with the BPU plans to extend its innovative Gas System Modernization Program. The extension, otherwise known as GSMP II, would accelerate the pace of replacement of aging cast iron and unprotected steel. The program would entail replacing 250 miles of pipe per year over 5 years at a total cost of $2.7 billion. We hope to have a decision on this program in the second quarter.

The GSMP II filing is modeled on the process outlined in the Infrastructure Investment Program -- and as I'll refer to that in the future, I'll just say IIP -- which was approved by the BPU in January. The board's approval of IIP provides for our rate recovery mechanism that encourages and supports the continued safety, reliability and resiliency of utility infrastructure, which is essential for economic growth in New Jersey.

In the coming months, you should expect PSE&G to seek approval, once again, under the IIP process, to extend this Energy Strong-related programs. We also expect to make a filing to broaden our investment in energy efficiency. An expansion of energy efficiency is one of the best means of achieving the state's clean energy goals and simultaneously limiting growth in the customer bill.

Now let me turn my attention to PSEG Power. Power's non-GAAP operating earnings for the full year of $505 million or $1 per share were at the upper end of our guidance range. Cost discipline across the fleet and strong operations from Power's nuclear generating assets supported the better-than-forecast results.

Power's nuclear fleet operated at a 93.9% capacity factor for the year, generating record electric output of 31.8 terawatt hours. PSEG Power has also made progress on construction activities related to its 3 new natural gas combined-cycle generation stations. Two plants, the Keys and Sewaren stations, are expected to be operational during the second quarter of this year. And Bridgeport Harbor 5 is expected to achieve commercial operation during the second quarter of 2019.

Together, these units represent 1,800 megawatts of efficient, clean, gas-fired capacity that will improve Power's competitive position. The cold weather experienced early in 2018 reinforced the importance of Power's diverse fleet and, of course, making sure the assets were available when needed to meet demand. The nuclear plants ran at full power, providing baseload capacity for everyday demand as the shortage of natural gas required some of Power's stations to operate on oil.

Power's management team has continued to drive efficient operations at its fossil stations, which include the early retirement of the Hudson and Mercer coal-fired stations as well as at nuclear. Controlling cost is vital, but we face continued challenges in maintaining operations, particularly at our nuclear plants, as the average price for Power's energy hedges is expected to decline by $5 per megawatt hour in 2018 from $45 per megawatt hour in 2017 with even further erosion foreseen in '19.

On the policy front, as you know, we have been focusing on raising awareness of the financial condition of our nuclear generating assets and communicating to the State of New Jersey the detrimental impact closure would have on the state's cost of electricity, its air quality and overall economy. The loss of the approximately 32 terawatt hours of clean electric energy produced by Power's nuclear generation in 2017 would represent a severe setback to the state's ability to meet its clean energy goals and result in crushing economic impact due to resulting increases in electricity prices and major job losses. We remain involved in discussions with key stakeholders here in New Jersey and with those in charge of the wholesale energy market at FERC and PJM to secure the long-term viability of our nuclear generation assets.

A bill, as proposed in the New Jersey Legislature, would value the attributes of nuclear and create a safety net for our at-risk nuclear capacity. The bill also addresses the state's path toward a clean energy future. We're pleased that the legislature is giving this issue the careful attention it deserves and hope for timely resolution. But the risk of closure remains without a change in the financial condition of nuclear.

To that end, Power recorded a $276 million increase in its asset retirement obligation liabilities at the end of 2017 to take into account a higher assumed probability of early retirement of its nuclear units.

Client Id: 77

Our financial condition is strong given the focus we have placed on maintaining a healthy balance sheet that supports our investment goals. Our balance sheet continues to provide us with a competitive advantage as we adapt to recently enacted changes in the federal tax code.

We ended 2017 with strong credit metrics, which support continued growth in our regulated investment program without the need to issue equity. And this position is unchanged with tax reform. Our capital program for the 5-year period ending in 2022 has expanded to $13 - $15 billion from the $13 billion level outlined a year ago. And it remains focused on investments that improve the reliability and efficiency of our operations, which also advance the state's plans to a clean energy future.

The utility's investment program of roughly $11.5 billion to $13.2 billion, which accounts for 90% of the total PSEG program, addresses customers' desires for reliable, efficient and clean energy and provides for a continuation of our projected 7% to 9% compound annual growth rate for rate base off a higher 2017 base. Also, given the impacts of tax reform, we feel comfortable achieving the midpoint of that range.

PSEG Power's major capital program will be complete in 2019 following the commercial operation of Bridgeport Harbor 5. The startup of that 485-megawatt gas-fired combined-cycle unit will represent the conclusion of Power's $2 billion capital investment in 3 new gas-fired combined-cycle stations, including the previously mentioned Keys Energy Center and Sewaren, which, as I said, are scheduled to start up by the middle of this year. Power's focus will be on efficient operations, improving the returns on generating assets and resolving the fate of its nuclear units.

PSEG's strategy implemented a decade ago has transitioned our business mix to one that is more reliant on regulated earnings. PSE&G, our regulated company, has grown to represent 2/3 of consolidated non-GAAP operating earnings. PSEG Power, focused on improving its operational efficiency and maintaining a strong balance sheet, continues to provide strong cash flow in support of our investment program.

The growth in our investment program and the disciplined approach to O&M have overcome a decline in energy prices over the past 5 years and produced annual growth in consolidated non-GAAP operating earnings of approximately 4% during that time.

Despite the challenges we continue to face in the wholesale markets, especially at our nuclear units, the continued successful investment in regulated programs that provide reliability and quality service to our customers and the benefits of a reduction in the federal tax rate are expected to support continued growth in earnings.

For 2018, we are forecasting consolidated non-GAAP operating earnings of $3 to $3.20 per share, which at the midpoint represents 6% growth in earnings over 2017.

The Board of Directors' recent decision to increase the company's common dividend 4.7% to the indicative annual rate of $1.80 per share is an acknowledgment and expression of confidence in our strategy and outlook. It needs to be said that our success is the result of the outstanding effort of our dedicated workforce, and we are positioned to continue to execute on our strategy to provide long-term value to our shareholders as we meet the needs of our customers and the communities we serve.

I'll now turn the call over to Dan for more details on our operating results and will be available for your questions after his remarks.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Great. Thank you, Ralph, and good morning, everyone. As Ralph said, PSEG reported non-GAAP operating earnings for the fourth quarter of $0.57 per share versus $0.54 per share for the fourth quarter of 2016.

Our earnings in the quarter brought non-GAAP operating earnings for the full year to $2.93 per share, a 1% increase over 2016's non-GAAP operating earnings of $2.90 per share and at the upper end of our non-GAAP operating earnings guidance for 2017 of $2.80 to $3 per share.

And on Slide 5, we have provided you with a reconciliation of non-GAAP operating earnings to net income for the quarter.

Client Id: 77

We've provided you with information on Slide 11 regarding the contribution to non-GAAP operating earnings by business for the quarter. Slides 12 and 14 contain waterfall charts that take you through the quarter-over-quarter and year-over-year net changes in non-GAAP operating earnings by major business. I will review each company in more detail starting with PSE&G.

PSE&G reported net income for the fourth quarter of 2017 of $0.43 per share compared with $0.38 per share for the fourth quarter of 2016. PSE&G's full year 2017 net income was $973 million or $1.92 per share compared with net income of $889 million or $1.75 per share in 2016.

Non-GAAP operating earnings for the full year were $963 million or $1.90 per share, an 8.5% increase over 2016 non-GAAP operating earnings of $1.75 per share.

As shown on Slide 16, PSE&G's net income in the fourth quarter continue to benefit from a return on its expanded investment in transmission and distribution infrastructure, which more than offset an increase in O&M.

Growth in PSE&G's investment in transmission improved quarter-over-quarter net income comparisons by $0.03 per share. Recovery of investment made in gas distribution under PSE&G's Energy Strong and Gas System Modernization Programs increased quarter-over-quarter net income by $0.01 per share.

Colder-than-normal weather, as compared to more normal weather conditions in the year-ago quarter improved net income by $0.01 per share. An increase in O&M expenses associated with preventative and corrective maintenance reduced quarter-over-quarter net income by $0.02 per share.

Electric sales, on a weather-normalized basis, modestly declined 0.4% for the year as energy efficiency and solar net metering offset growth in a number of customers. Weather-normalized gas sales for the year increased 1.2%, led by growth from commercial and industrial customers.

PSE&G's distribution rate base filing provides it with an opportunity to reflect current estimates of electric and gas sales growth and proposes improvements in its rate design, including de-coupling and higher monthly fixed charges offset by lower volumetric rates to minimize the impact of sales variability. This aligns our interest with achieving greater energy efficiency results.

Details of the base rate filing are outlined on Slide 18. The filing is based on a test year ending June 30, 2018, with some adjustments for the following months, including a rate base of $9.6 billion as of December 31, 2018. And as Ralph mentioned, PSE&G filed for a 1% increase in revenue or $95 million. In keeping with maintenance of PSE&G's credit metrics, the request is based on a cap structure consisting of 54% common equity and reflects a 10.3% return on equity.

PSE&G's filing took into account approximately $130 million reduction in its annual revenue requirement as a result of the federal corporate income tax rate reduction from 35% to 21%. And in addition, provides for a one-time credit for estimated excess income tax collected from January 1, 2018 to the time rates go into effect.

PSE&G is also proposing to increase the amount of tax credits flowed back to customers in subsequent years. This would result in rate decreases, which would have the effect of offsetting the impact on the customer bill associated with investments, such as the GSMP II capital program.

Pursuant to a recent BPU order, we expect to make a filing to lower our rates sooner by April 1 to account for the lower federal tax rate, and we'll update our rate case filing accordingly. A decision on the base rate filing is anticipated in the fourth quarter.

PSE&G has separately updated its transmission formula rate filing for 2018 to incorporate the lower federal tax rate. The update reduced its annual revenue requirement by $148 million from the original filing which called for an increase in revenue of $212 million. This adjustment has no impact on earnings expectations.

THOMSON REUTERS

SI-SSA-0015-14897

Client Id: 77

PSE&G's investment of $3.1 billion in its transmission and distribution infrastructure in 2017 provided for approximately 13% growth in rate base to $17 billion. Of this amount, PSE&G's investment in transmission has grown to represent 46% or $7.8 billion of the company's consolidated rate base at the end of 2017.

Supported by the ongoing transmission and distribution investment program, we are forecasting continued growth in PSE&G's net income to a range of $1 billion to $1,030,000,000 in 2018.

Now let's turn to Power. As shown on Slide 21, PSEG Power reported non-GAAP operating earnings of $0.20 per share compared with non-GAAP operating earnings of $0.13 per share a year ago.

The results for the quarter brought Power's full year non-GAAP operating earnings to $505 million or $1 per share compared to 2016's non-GAAP operating earnings of $514 million or $1.01 per share. Power's adjusted EBITDA for the quarter and the year amounted to $196 million and $1,172,000,000, respectively, and this compares with adjusted EBITDA for the fourth quarter of 2016 of $155 million and adjusted EBITDA for the full year 2016 of $1,201,000,000.

We provided you with more detail on generation for the quarter and for the year on Slides 22 and 23. The earnings release as well as the earnings slides on pages 12 and 14 provide you with detailed analysis of Power's operating earnings quarter-over-quarter and year-over-year from changes in revenue and cost.

Power's earnings benefited from an increase in capacity prices in New England and PJM, which improved quarterly net income comparisons by $0.02 per share. A 2% increase in output improved net income comparisons by $0.01 per share, as colder-than-normal weather resulted in higher gas send-out, which increased net income by $0.01 per share.

A decline in the average price received on energy hedges of $4 per megawatt hour was partially offset by an increase in market prices on unhedged output, which combined to reduce quarterly net income by $0.01 per share.

A decline in O&M expense improved net income comparisons by $0.03 per share. A decline in depreciation expense associated with the retirement of Hudson and Mercer as well as the decline in interest and taxes combined to improve fourth quarter net income comparisons by $0.01 per share.

Gross margins in the fourth quarter increased to $38 per megawatt hour from $37 per megawatt hour and power prices held up vis-à-vis gas prices in response to the colder-than-normal weather. For the year, gross margins declined to $38 per megawatt hour from $40 per megawatt hour given a decline in average hedge prices for energy.

Now let's turn to Power's operations. Output from Power's generating facilities decreased 2% in the fourth quarter and quarterly comparisons were influenced by the timing of nuclear plant refueling outages and increased demand in response to colder-than-normal weather during the month of December. Based on results for the fourth quarter, output for the year of 51 terawatt hours was stronger than the forecast we provided you at the end of the third quarter, which called for full year output of 49 to 50 terawatt hours.

The nuclear fleet operated at an average capacity factor of 89.9% in the fourth quarter. And the fleet's performance in the quarter resulted in a full year capacity factor of 93.9%, producing record electric output for the year of 31.8 terawatt hours.

The fleet's output was aided by strong performance from Power's 100%-owned Hope Creek nuclear plant, which operated at 100% capacity factor for the year. And based on our normal 18-month refueling cycle, Hope Creek is scheduled for refueling this spring, in the spring of 2018.

Power's gas-fired combined-cycle fleet operated at an average capacity factor of approximately 40% for the quarter and approximately 47% for the year, producing 13.6 terawatt hours of electric energy for the year.

Output from the coal fleet declined slightly as the quarter -- during the quarter as the result of outage work at Keystone. But for the year, output from the coal fleet increased 12% as the fleet's competitiveness benefited from an increase in gas prices.

THOMSON REUTERS

SI-SSA-0015-14898

Client Id: 77

For 2018, with the addition of Keys and Sewaren combined-cycle units, Power is forecasting an increase in output to 55 to 57 terawatt hours. Following completion of the recent basic generation or BGS auction in New Jersey, approximately 80% to 85% of production for the year is hedged at an average price of $40 per megawatt hour.

Power is forecasting a further increase in output for 2019 to 59 to 61 terawatt hours with the full year of Keys and Sewaren in operation and a partial year from the new combined-cycle unit at Bridgeport Harbor.

And for 2020, Power is forecasting output of 63 to 65 terawatt hours. Approximately 55% to 60% of 2019's expected output has been hedged at an average price of $38 per megawatt hour, and approximately 25% to 30% of 2020's expected output has been hedged at an average price also of $38 per megawatt hour.

An update of Power's hedge position is provided on Slide 26. As you can see, Power has hedged its baseload nuclear and coal output for 2018 and is mostly hedged in 2019. The gas-fired combined-cycle assets remain more open to the market during those years and will be available to take advantage of spark spread opportunities that have improved based upon recent fluctuations in commodity prices.

The outlook for 2018 and 2019 has improved since our last update based on an increase in sparks in the region and power prices have not declined to the same degree as gas.

Power's non-GAAP operating earnings for 2018 are forecast at $485 million to $560 million. And the forecast represents non-GAAP adjusted EBITDA for the full year of 2018 of $1.075 billion to $1,180,000,000.

PSEG Enterprise and Other reported net income for the fourth quarter of 2017 of $126 million or $0.25 per share compared to net income of $11 million or $0.02 per share for the fourth quarter of 2016.

For the full year, PSEG Enterprise and Other reported net income of $122 million or $0.24 per share, which compares to a net loss in 2016 of $20 million or $0.04 per share. And the results for 2017 include a one-time, non-cash earnings benefit of $147 million related to the reduction in the federal corporate tax rate, resulting in a decrease in Energy Holdings' deferred tax liabilities, partially offset by an after-tax charge taken earlier in the year related to on-going challenges facing NRG REMA.

For the fourth quarter of 2017, PSEG Enterprise and Other reported a non-GAAP operating loss of $21 million or $0.04 per share compared to non-GAAP operating earnings of $17 million or $0.03 per share in the year-ago quarter. The results for the fourth quarter brought PSEG Enterprise and Other non-GAAP operating earnings for the full year to $20 million or $0.03 per share versus $72 million or $0.14 per share in 2016.

The decline in non-GAAP operating earnings in the fourth quarter reflects the impact of a $15 million after-tax contribution to the PSEG Foundation as well as certain tax items at the parent and PSEG Energy Holdings and the absence of certain tax items in the fourth quarter of 2016 at PSEG Energy Holdings.

For 2018, non-GAAP operating earnings for PSEG Enterprise and Other, which are driven by PSEG Long Island, and partially offset by parent interest expense, are forecast at $35 million.

I want to spend just a moment on the subject of tax reform. PSEG is a net beneficiary under the Tax Cuts and Jobs Act of 2017 and our financial flexibility remains strong. PSE&G, as mentioned, will be returning 100% of the benefit from the decline in the federal tax rate to its customers. And the recently filed distribution base rate request reflects a $130 million annual reduction in revenue associated with the lower federal tax rate. And as mentioned, we amended our 2018 transmission formula rate to incorporate the decline in revenue of $148 million associated with the lower federal tax rate.

Net income from PSEG Power and Enterprise is expected to benefit from the decline in the federal tax rate. And our estimate of 2018's non-GAAP operating earnings reflects an improvement in earnings of approximately $0.16 per share.

THOMSON REUTERS

SI-SSA-0015-14899

Client Id: 77

PSE&G's cash flow will be negatively impacted by the elimination of bonus depreciation and lower tax rates for ongoing tax depreciation.

PSEG Power's cash flow, on the other hand, is expected to benefit from its ability to expense 100% of its capital expenditures. PSEG Power's cash flow in 2018 will also benefit from the reduction in the federal tax rate as well as the decline in capital spending in 2018 of about$400 million with the mid-2018 completion of construction of both Keys and at Sewaren.

Given our strong balance sheet and low debt balance, we estimate that interest expense at PSEG Power and Enterprise will remain fully deductible for tax purposes.

The reduction in the federal tax rate under the Tax Act also reduced the deferred tax liability of PSEG Power and Enterprise, which was originally recorded based upon the higher 35% rate.

At PSEG Power and Energy Holdings, we recorded onetime, non-cash earnings benefits in the fourth quarter of 2017 of $588 million and $147 million, respectively, resulting from this reduction in deferred tax liabilities.

PSE&G has excess deferred taxes of approximately $2.1 billion as of December 31, 2017, and has recorded the impact of these excess deferred taxes as a regulatory liability. Approximately 70% of PSE&G's excess deferred taxes are deemed protected under the IRS normalization rules, which requires the protected deferred taxes be returned to customers over the remaining life of the assets that generated the taxes in the first place. Given the long-lived nature of utility assets, it will take many, many years for all of these protected taxes to be returned to customers.

The remaining 30% or about $600 million, some of which were included in our distribution base rate filing, will be returned to customers over a time frame that will be determined in discussions with the BPU and with FERC. Of course, as you know, the loss of bonus depreciation and the reduction of PSE&G's deferred tax balance serves to increase its rate base. We estimate that these 2 items combined will increase the annual growth in PSE&G's rate base by approximately 1% through 2022.

The net result of the change in federal tax law on PSEG's consolidated cash flow and credit metrics is manageable given our business mix and the strength of our balance sheet. We do not anticipate the need to issue equity to finance our capital program. And we continue to have excess balance sheet capacity to finance further growth.

As Ralph mentioned, our financial condition remains strong. We closed 2017 with $313 million of cash on hand and debt representing 49.6% of our consolidated capital position, and debt at Power approximating 29% of its capital base.

At year-end, Power's debt position was just over 2.1x the midpoint of our forecasted 2018 adjusted EBITDA. We are guiding to a non-GAAP operating earnings at PSEG for 2018 of $3 to $3.20 per share, which is a 6% increase over 2017. And the common dividend was recently increased 4.7% to the indicative annual level of $1.80 per share. This represents a 58% payout of earnings at the midpoint of our 2018 guidance and builds on the 3.4% annual rate of growth in the dividend over the last 10 years.

Shelby, we are now ready to take questions.

QUESTIONS AND ANSWERS

Operator

(Operator Instructions) And your first question comes from Julien Smith of Bank of America Merrill Lynch.

THOMSON REUTERS

SI-SSA-0015-14900

Client Id: 77

Josephine Moore - *BofA Merrill Lynch, Research Division - Associate*

It's Josephine here. I just was wondering, could you provide a little bit commentary on your outlook of the ongoing PJM price formation reform discussion as well as the potential for comprehensive energy legislation in New Jersey?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Sure, Josephine. So as you know, there's a due date of -- I believe it's sometime in the first week of March, where each RTO is supposed to get back to FERC on -- with respect to the FERC decision to close the DOE NOPR and to ask the question about fuel diversity and resiliency of the grid. There have been very public conversations and statements by PJM that they believe, in particular, their inflexible unit challenges are things that need to be corrected in the market. These showed up in abundance during -- the cold spell.

Josephine Moore - *BofA Merrill Lynch, Research Division - Associate*

Cold snap.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Where Andy testified in front of the Senate Energy and Natural Resources Committee that there had to be $4 million to $5 million in daily uplift payments. So without having control over the pen, I fully expect PJM management to submit comments to FERC as they have some improvements to make in their current tariff if price is, in fact, going to be the way in which the market is reliably dispatched because there continues to be out-of-market payments that are relied upon to achieve that. Switching gears on you and moving over to New Jersey, we've had some very good conversations. We had a good day yesterday with a comprehensive energy bill, which included our nuclear concerns reported out of the Senate Budget Committee and the Assembly Telecommunications and Utilities Committee getting further reference in the assembly through its budget committee, its Appropriations Committee, if you will. And I think the encouraging news there is that everyone who has testified, and we've now have 4 hearings on this, I think. With the exception of our competitors, have said they don't want to see those plants closed. And our competitors obviously want to see those plants closed because that means higher prices. I just have a high degree of confidence that New Jersey policymakers understand the value of those plants and will do the right thing. But of course, one cannot guarantee any outcome.

Josephine Moore - *BofA Merrill Lynch, Research Division - Associate*

Great. And then just one follow-up here. You talked about a roughly $80 million benefit from tax reform at the -- at Power, but increased guidance by only $50 million. Are there any headwinds that limit the ability to fully recognize that tax reform benefit?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. I think if you think about the overall impact year-over-year, we referenced the $0.16 related to tax reform. But of course, there's other impacts as you step from year-to-year. We'll see changes in capacity prices, which will help, but we also have a reduction in the average price that we sold our power. So that's a headwind that we have been fighting, and as you mentioned.

Josephine Moore - *BofA Merrill Lynch, Research Division - Associate*

That's a $5 million reduction -- $5 reduction? Okay.

THOMSON REUTERS

SI-SSA-0015-14901

Client Id: 77

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Per megawatt hour. So you think about that across the fleet and then you compare that to an uplift in capacity and a benefit from tax reform. Those are your biggest pieces.

Operator

Your next question comes from Angie Storozynski of Macquarie Capital.

Angieszka Anna Storozynski - *Macquarie Research - Head of US Utilities and Alternative Energy*

So I understand that you have a pending rate case for your utility, but your guidance for '18 seems to imply a relatively low pickup in earnings power of the utility versus what we have seen in the past. Is this just because you are waiting for your rates to be trued up in the rate case?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes, Angie, if you think about the timing of the rate case, we are essentially saying that we would expect to see rates at the end of the year. I think we referenced fourth quarter in our prepared remarks. So I think a big part of it is just related to the rate increase on the distribution side being --coming at the end of the rate case, which is towards the end of the year.

Angieszka Anna Storozynski - *Macquarie Research - Head of US Utilities and Alternative Energy*

But how about your previous expectations that there would be a rate base growth of around -- I forget -- 8% or 9% and a commensurate increase in earnings. Is that -- does this still hold? I mean, granted that we're still waiting for the outcome of the rate case.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. I think -- if you think about the 2 sides of the business, Angie, on transmission, that's going to move along by virtue of the formula rate, which is always the norm, but when we take a look at the distribution side of the business, I wouldn't expect to see anything different. We have a 6% increase to the midpoint of the range and with a rate case following on later in the year. And as we move into '19, I think that would bridge the gap for you.

Angieszka Anna Storozynski - *Macquarie Research - Head of US Utilities and Alternative Energy*

Great. On the Power side, so it seems like you've marginally reduced your expectations of volumes for the BGS auction. There's been also some news or press coverage of your interest in the retail business. How should we think about it, how you're trying to shape up the merchant power earnings given the weakness in the forward curves?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes. So I think, Angie, we've been pretty consistent that retail business is a defensive play. It's primarily targeted at improving the negativity and basis differentials that we've experienced. We're looking at it as a nice supplement, if you will, to diminution of the BGS load contract that we have seen occur over the years. What did change probably about a year or so ago was our recognition that we would not find an acquisition opportunity to just kind of step into a New Jersey-focused, PJM-centric opportunity. So we're building it organically. And that is -- that's going fine, but when you do something organically, it's a little bit more gradual than just stepping into it. So no change in strategy there at all.

THOMSON REUTERS

SI-SSA-0015-14902

Client Id: 77

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

And Angie, as we step from year to year, we will have a BGS auction roll off, right. So the state goes out to auction 1/3 of the load each year. So over 3 years, they auction everything. And so as we step from year to year to year, there could be some modest differences within volumes of the number of tranches that we would have as we go from auction to auction to auction.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Angie, I just want to supplement something that Dan mentioned before. So the rate base growth, we're still saying 7% to 9% and comfortable with the midpoint. But remember, we had a fair amount of capital that was deployed coming at the back end of GSMP I and Energy Strong that is part of the rate case proceeding we're in now. So the 12% growth in rate base that you saw last year, by necessity, as Dan correctly pointed out, is awaiting rate relief at the end of the year. And when you get it at the end of the year, you just -- and now Dan and I are repeating ourselves, it doesn't give you the full 12 months of impact. So I think we're okay there.

Operator

Your next question comes from Praful Mehta of Citi Investment.

Praful Mehta - *Citigroup Inc, Research Division - Director*

So just, firstly, wanted to just clarify, in terms of tax reform, what is exactly built into the forecast? I know on the power side, it sounds like you've incorporated the lower taxes. On the utility side, it didn't sound like it was. So I just wanted to clarify specifically what is currently built in, in tax reform and what is more left in terms of regulatory outcomes that you're waiting to see?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Praful, I think if you think about the utility side of the ledger, it's much more a cash story, especially right away. So it's about the pass back of taxes because, frankly, you're not going to end up paying taxes. So if you think about what we did, we proactively, in January, went to FERC knowing that there was going to be a rate change. And we knew we were going to pay less tax in 2018. So we proactively went to FERC to get that money back in customers' hands. Revenues come down, taxes come down, ends up being a wash. There will be some modest benefit as we step through time because if you have less deferred taxes on your books and you pass that back to customers, so your rate base will grow as you step through time with that reduction in deferred taxes. But that will grow over time and does not have really much of a P&L impact as you look at 2018, in particular, for the utility.

Praful Mehta - *Citigroup Inc, Research Division - Director*

I got you. Yes, I was, again, more focused on the cash impact specifically like, for example, the DTL refund. Is that currently incorporated within the forecast or no?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes, yes. And further to the prepared remarks as well, Praful, if you think about -- some of those are protected deferred taxes. That's the lion's share of our deferred taxes. And that will get passed back over what's called the average rate assumption method. That's over the remaining life of the asset. And I think it's a true statement to say that we are still passing back some deferred taxes from the 1986 Tax Act when it happened because we got such long-lived property. So that will go on for a period of time as those different lives end up turning. But yes, we've incorporated what we know and estimates of what we don't know into our numbers.

THOMSON REUTERS

SI-SSA-0015-14903

Client Id: 77

Praful Mehta - *Citigroup Inc, Research Division - Director*

Got you. Perfect. And then secondly, in terms of the New Jersey bill, it's helpful. And yes, the conversations clearly were productive from what we heard yesterday. How do you see that playing out from here in terms of timing? And when does it reach the governor's desk and all of that? How do you see that playing out from here?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

My high degree of confidence in the ultimate outcome is matched by my uncertainty over timing. So what I can tell you is the bill is posted for one day in the state Senate. The assembly doesn't have a voting session. I don't think at present scheduling until the end of March. So we're a 115-year-old company, Praful. Salem is 40 years old. Hope Creek is 30 years old. I'm not going to sweat a couple of weeks one direction or another, but I feel pretty good about the nature of the conversation and the clearly earnest desire on the part of all stakeholders to preserve those plants, but timing is not something I can predict.

Operator

Your next question comes from Jonathan Arnold of Deutsche Bank.

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

My question has to do on tax reform and your comments that I think you said, obviously, that you're not planning any equity, but you said you also still have excess balance sheet capacity. And I know you don't normally update that until the Analyst Day. But if I recall, at EEI, you gave us a slide which showed something like a $1.8 billion reduction or roughly halving of what it had been without tax reform. So my -- I guess my question is, is that still a good number? Or as you further refine your inputs and outputs, is that at least somewhere else?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

No. I think you're still very much in that range, Jonathan. I think that what we tried to do at that point is highlight that a number that we have provided was based in large part on FFO to debt and there was a lot of FFO that came from bonus depreciation. So by either the passage of time or by tax reform -- because at EEI, we had not had tax reform at that point in time. Unless bonus was extended, the FFO was going to come down. And so that was kind of a temporal aspect. And what we tried to do, to your good memory, was to give some indication that, that was going to come down. So the order of magnitude numbers was about $3 billion at that point, and we were highlighting that about $1.8 billion or so would go away with bonus depreciation. So that's still in the right ballpark, and I think the right way to think about it. And when I referenced before the strength of the balance sheet and the ability to fund further investments, it's still that order of magnitude.

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

And so that was, if I remember, the math was like a $300 million FFO divided by your 18% target effectively is how you got there.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes.

THOMSON REUTERS

SI-SSA-0015-14904

Client Id: 77

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

So presumably that means -- as you've put all this together, you see FFO degradation roughly in that $300 million range still?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. As you step out into -- I think our numbers were targeted around a 2020 or so time frame, right. So you kind of come off of those bonus years, but that's -- you're thinking about it exactly right, Jon.

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

Okay. Great. And then just on the guidance for Holdings is -- and the increase in '18 over '17, is that all tax-reform related or is this -- and I guess an uptick in the Long Island contract or is there anything else driving that?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

No. It's not a lot. I mean, if you have a little bit lower taxes, you'll have a little bit higher income, and $35 million is kind of a normal range. Last year, we had some tax issues coming through, and we had made a contribution to the foundation. So I think you can look at '18 as being a more normal year.

Jonathan P. Arnold - *Deutsche Bank AG, Research Division - MD and Senior Equity Research Analyst*

So it's more that '17 was a little skewed low and '18 is more normal?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

That's exactly right.

Operator

Your next question comes from Greg Gordon of Evercore ISI.

Gregory Harmon Gordon - *Evercore ISI, Research Division - Senior MD, Head of Power & Utilities Research and Fundamental Research Analyst*

A lot of my questions have been answered, and this one you may not be able to answer, but I'll try. In terms of your observation from the outside looking in at how PJM gets to the answer on implementing their price reform initiatives, it appears that there's a bit of a cart/horse issue here in that one path is to wait for the FERC to potentially order a 206 proceeding and say that their rates are unjust and unreasonable. So my first question is, are we on a path in the current FERC docket where you believe at the end of the initial filings and the responses that the FERC could look at the evidence that PJM files to show that their rates are not appropriate? Can they actually get to a place at the end of this proceeding where they could legally say, yes, you've proven your rates are unjust and unreasonable and allow them to go ahead and change the rate? Or are we realistically on a path here where they have to make a decision on whether they're going to go through the stakeholder process and then it's whether they go through a truncated process with a board vote or a more elongated process with a stakeholder vote, knowing -- understanding that the former was what they used when they did capacity performance. It's a long question, but hopefully you get the gist.

THOMSON REUTERS

SI-SSA-0015-14905

Client Id: 77

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes, we get the gist. But you were right at the start. Greg, I'm sorry, there's no way to predict that. I would point out to you though that there's multiple things going on at FERC that matter, right, from PJM. There's the capacity market reform. There's fast-start pricing. There's price formation. So there's multiple issues. There's multiple degrees of freedom. Is it a 205? Is it a 206? Is it a truncated process? Is it not? So it's just -- I think we're all visiting with the commissioners and telling them how important it is. And I think we're all seeing the same comments out of PJM. So I don't know what else to say at this point about it.

Operator

Your next question comes from Christopher Turnure of JPMorgan Securities.

Christopher James Turnure - *JP Morgan Chase & Co, Research Division - Analyst*

The only question that I have left is on the New Jersey nuclear support. You've answered a couple of questions on it already, of course. But I'm wondering if there's a couple of potential hurdles to getting across the finish line this session that you're concerned about. It seems like the governor could potentially further his environmental kind of effort and the emission-free power effort long term through this. And there's some other stakeholders that seem to have come in line here, but what might we be missing that could scuttle the entire operation?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Chris, so it's always nice to have quarterly calls where we're trying to explain the past, but now you guys are really pushing us to predict the future. It is so hard. I mean, the good news is, the governor has publicly stated on numerous occasions that those plants have to continue to operate as a bridge to a long-term renewables future. And as I said before, everyone who has testified, other than our competitors, have begun their testimony by saying, "We don't want these plants to close, but" and then they each have a but that they put in there. So are there hurdles? Yes, there are. But I stay grounded on the support, the articulated support of consumer groups, environmental groups and the governor and the legislature itself. And we have made progress in terms of the schedule and in terms of going through the committee process. So we'll just keep making sure people know what it means if they go away. And then, of course, at the risk of stating the obvious, all of our shareholders know that we will do what is right by our fiduciary responsibility in terms of those plants, regardless of New Jersey's actions.

Operator

Your next question comes from Michael Lapides of Goldman Sachs & Co.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

On PSE&G, I just want to make sure I understand the puts and takes in rates or revenue requirements that are happening this year. So on a year-over-year basis, is what you're saying is that transmission is actually down year-over-year and that's just all tax-related?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

From a pure revenue perspective, but completely neutral from an earnings perspective.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Got it. And then the distribution revenue reduction for tax is going to happen in April of this year?

THOMSON REUTERS

SI-SSA-0015-14906

Client Id: 77

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Correct.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Okay. And that's not a full year number, that's an annualized number? So it's as if it were April this year through March of next year?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes, yes, right, right.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Okay. And the rate increase won't happen for -- well, let me rephrase that. Anything tied to rate change is tied -- from the rate case won't happen until the end of the year?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

That's right. Yes.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Are there any other -- what about like tracker or GSMP I or even GSMP II-related revenue changes, are you still getting those in 2018? Or does that get -- or does -- do the things we've talked about kind of supersede that or incorporate that?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

The only thing that ends up superseding that, Michael, is when the rate case is done. And they kind of -- so they roll in as we work our way forward. They'll be done, I think, by the time we get to the rate case and sort of kind of wrap up at about the same time. But until then, we'll have roll ins as we always have.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Hold on, I want to make sure I follow this. So in 2018, you'll have the transmission revenue decline, obviously, offset by tax. You'll have the distribution revenue decline offset by tax. And then whatever you'll have in the rate case, none of the other trackers or anything will flow in, in '18, but they'll kick back in, in '19?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. So you'll have our continuing roll ins as they are from the standpoint of Energy Strong and GSMP. And then we'll have the rate case as it comes in at the end of the year. So I don't think it's any different than the norm. The only thing different than the norm, the way to think about it, really, is the 2 tax return -- tax rate -- the return of the taxes at both the distribution and the transmission side, which has no P&L impact, revenues go down and taxes go down.

THOMSON REUTERS

SI-SSA-0015-14907

Client Id: 77

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Also, I think our solar and energy efficiency filings are not part of rate case proceedings. They'll continue to have their trackers.

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Right.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Got it. And then finally, what tax rate are you assuming at both E&G and Power this year, like what's in guidance?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

It's the statutory move to 21% and then we'll have some modest moves like we normally do. So for instance, the update to taxes has eliminated a production deduction, a manufacturing deduction that Power would take to the tune of a couple of pennies. But other than that, it's still modest adjustments off of the statutory rate.

Michael Jay Lapides - *Goldman Sachs Group Inc., Research Division - VP*

Got it. Okay. And no significant state tax level added on top of that?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Yes. I mean, we do have, what is it, 9% in New Jersey?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

True, but no different and other than the fact that the federal benefit you get from states is going to change by virtue of the federal tax rate change.

Operator

(Operator Instructions) Your next question comes from Paul Fremont of Mizuho.

Paul Basch Michael Fremont - *Mizuho Securities USA LLC, Research Division - MD of Americas Research*

Does your GRC filing and the rate base numbers that are in there, does that reflect the rate base numbers after tax reform or would there be a further adjustment that we need to make?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

The -- so what we have filed within the rate case assume that we did have the tax rate -- the tax changes come through. We had also, within our base rate case filing, had a pass back of some deferred taxes within that rate case. And we will continue to do so as we make our prospective filings. Now what may end up happening in our prospective filings is some of the pass back of deferred taxes that were embedded within the filing may get swapped out compared to some of the excess taxes that we will ultimately pass back to customers. So part of the -- I guess I would say the --

THOMSON REUTERS

SI-SSA-0015-14908

Client Id: 77

as we step through the next steps of this rate case, we will have overlaid on top of it the BPU order to provide back the tax rate change, which was in our base rate case. So we will adjust the base rate case in our next filing to adjust for the fact that a separate filing will be made by virtue of the BPU order outside of the rate case.

Paul Basch Michael Fremont - *Mizuho Securities USA LLC, Research Division - MD of Americas Research*

Okay. And then can you at all discuss what the retail contribution was in 2017?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

We don't break that out, Paul. It would have been very, very modest at this point.

Paul Basch Michael Fremont - *Mizuho Securities USA LLC, Research Division - MD of Americas Research*

And I mean, can you give us maybe a metric, like how many megawatt hours did you sell?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

It was so small, I don't have the number. I just don't have that number. I don't think -- we've not broken that out. We were really -- what I can tell you is how many people we were hiring to get going, but not in megawatts we sold.

Paul Basch Michael Fremont - *Mizuho Securities USA LLC, Research Division - MD of Americas Research*

So when would be sort of the first year that you would expect any type of material contribution out of that business?

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

Depends on your definition of material, really. I mean, we don't break out a lot of the sub numbers in Power. We don't do power plant by power plant. We don't give you gas versus electric. So I don't think you should expect us to break out something that is purely an organically grown defensive mechanism -- obviously, changes in revenue recognition portrayals in the SEC documents that may be a little bit more illuminating but...

Operator

And your final question comes from Ashar Khan of Verition Fund Management.

Ashar Khan

Can I just ask one question? Is that -- you kind of referred to it that the utility growth is a little bit muted this year, but then can we expect -- what the inference I got from your comments is that we make it up in '19 because of the back-end loaded nature of the rate case. That's my one question. And the second question I had was that you mentioned the 7% to 9% growth rate in the utility rate base. And that's the same number you mentioned at your Analyst Day, but now you also mention that you have an additional $1 billion of rate base because of the tax reform. Is that $1 billion rate base included in that 7% to 9% or no? Just a clarification on those 2 issues.

©2018 Thomson Reuters. All rights reserved. THOMSON REUTERS

SI-SSA-0015-14909

Client Id: 77

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Yes. I think the way to think about it is that we jump off as we do every year from a higher base by virtue of the prior year's investment in rate base. So as rate base steps up, the ability to grow at the same rate kind of presupposes a incremental increase to rate base from a pure dollar amount. And if you take a look at the incremental rate base by virtue of the lower deferred taxes, and if you take a look at the bump up in the starting point year-over-year, it's a bit of an offset. So I think that's the -- if you think about us going from 7% to 9% on a lower base to 7% to 9% on a higher base, basically, it's tougher to do, but some of the deferred tax impacts of tax reform provides that offset and leave us at comparably the same place.

Ashar Khan

Okay. And what base are you using? Can you just mention?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

End of '17.

Ashar Khan

End of '17. Do you...

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

Right.

Ashar Khan

Okay. And then on the utility earning question?

Daniel J. Cregg - *Public Service Enterprise Group Incorporated - CFO and EVP*

I think it's essentially what we referenced before. If we have incremental spend that Ralph referenced from both GSMP and Energy Strong and that was going to roll into the rate case, and we have rates that come in towards the end of the year, you would anticipate seeing maybe a little bit of a modest shave off of rate of growth. What comes in 2019, we'll end up giving you the details on it this time next year from the standpoint of total '19 earnings guidance.

Ralph Izzo - *Public Service Enterprise Group Incorporated - Chairman, CEO and President*

So I guess that was our last question. Thank you, all. Dan and Kathleen will be on the road, hopefully, seeing many of you next week. Three of us will be on the road a couple of weeks after that. Maybe we'll see many of you then. One thing that's a little different this year, you may have noticed that we moved our analyst and investor conference to June. Please read nothing into that other than bad scheduling on my part that required some coordination of family calendars and business calendars. But nonetheless, I think we have some good things to talk to you about. And we'll know a lot more then about the New Jersey nuclear situation. We'll know a lot more about RPM, comments will be in the FERC from PJM and other folks. And so I think we have a lot of opportunities ahead of us in the next few months. With that, thank you for participating in the call, and we look forward to seeing you soon. Take care.

Presentation

Operator

Ladies and gentlemen, thank you for standing by. My name is Shelbie and I'll be your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group Third Quarter 2017 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. (Operator Instructions)

As a reminder, this conference is being recorded Tuesday, October 31, 2017, and will be available for telephone replay beginning at 1:00 PM Eastern Time today until 11:30 PM Eastern Time November 7, 2017. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen Lally, Investor Relation

Thank you, Shelbie. Good morning. Thank you for participating in PSEG's call this morning. As you are aware, we released our third quarter 2017 earnings statements earlier today. The release and attachments as mentioned are posted on our website at www.pseg.com, under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended September 30, 2017, is expected to be filed today.

As you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. And although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, unless required to do so.

Bloomberg Transcript

Our release also contains certain non-GAAP operating information. Please refer to today's 8-K or other filings for a discussion of factors that may cause results to differ from management's projections, forecasts and expectations, and for a reconciliation of our non-GAAP operating information to GAAP results.

I would now like to turn the call over to Ralph Izzo, Chairman, President, and Chief Executive Officer of Public Service Enterprise Group; and joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions.

Ralph Izzo, Chief Executive Officer

Thank you, Kathleen, and thank you, everyone for joining us today. PSEG reported results for the third quarter having executed well on major operational and policy initiatives. Despite the impact of abnormally cool weather on sales and earnings, we remain within our non-GAAP operating earnings guidance for the full year of $2.80 to $3 per share.

Earlier this morning, we reported net income for the quarter of $0.78 per share. Non-GAAP operating earnings for the third quarter of 2017 were $0.82 per share, compared with net income of $0.64 per share and non-GAAP operating earnings for the third quarter of 2016 of $0.88 per share. For the nine-month period, non-GAAP operating earnings were $2.36 per share, which is the same as non-GAAP operating earnings for 2016's first nine months.

Slides five and six contain the detail on the results for the quarter and the nine months. At PSE&G, earnings per share declined $0.01 per share from the prior year comparable quarter. The results for the third quarter were affected by cooler than normal weather, which reduced demand for electricity from air conditioning. The weather comparisons to last year are stark. For instance, the measure of average temperature and humidity was 27% below the year-ago quarter and the number of hours at temperature equal to or greater than 90 degrees was 69% below the year-ago quarter.

PSE&G's expanded investment in transmission and distribution continue to benefit customers and had a favorable impact on PSE&G's earnings. PSE&G's rate base is forecasted to grow 12% in 2017, reaching $17 billion. The forecast is based on a continuation of PSE&G's investment program to upgrade its transmission and distribution infrastructure. The upgrades will entail full year capital expenditures of approximately $3.1 billion. This figure is slightly less than our original budget of 3.4 billion and it's the result of some projects being moved to 2018 and improved efficiency related to the cost of other projects.

Based on further development of our various investment programs, we are increasingly comfortable with PSE&G's ability to achieve growth in rate base at the upper end of our forecast of 7% to 9% per year for the five-year period ending in 2021. Our updated forecast assumes reasonable reception by the New Jersey Board of Public Utilities to PSE&G's proposal to invest $540 million per year over five years to accelerate the pace of replacement of aging cast iron and unprotected steel mains and their associated services. Approval would support expansion and extension of the work currently being performed under the gas system modernization program. This filing was made in July and we expect the BPU to take action during the first half of 2018.

We also intend to request the multi-year extension of Energy Strong in the near term. PSE&G is in the final stages of work previously approved as part of Energy Strong to strengthen and harden infrastructure damaged during Hurricane Irene and Superstorm Sandy. The extension will address the remaining electric substations that need to be raised or protected in addition to other much needed work that enhances the resiliency of our system and reduces the risk of outages. That request similar to GSMP2 will be consistent with the BPU's draft regulation supporting multi-year capital investments under its infrastructure investment program. If the draft regulations are approved as we expect before year-end, utilities will be able to proceed with five-year investment programs that will allow more certainty in staffing and planning of work.

Now I want to bring you up to date on PSE&G's distribution base rate proceeding. As you may be aware following discussions with BPU Staff and Rate Counsel and as approved by the BPU at its October 20th meeting, the deadline for filing our distribution rate case was deferred from November 1st to no later than December 1st of this year. The change in the filing date is simply an administrative procedural matter. We will now be providing the BPU with three months

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14913

of actual data and nine months of forecast data for the same test year that will end on June 30th 2018.

The review of PSE&G's distribution rates, which is expected to result in a modest change in revenue, is primarily driven by the need to recover investments made outside of clause mechanisms since the last rate case, to recover storm costs and to allow PSE&G to reset assumptions for growth in sales and O&M. As part of the filing, PSE&G will also be seeking approval to decouple electric and gas distribution revenue from sales volumes and demand, which would support larger scale energy efficiency investments. We believe that with the right regulatory policies, the state's utilities can provide the energy infrastructure that meets customer requirements and creates a stronger and more efficient New Jersey.

Now let me turn to PSEG Power. At PSEG Power, non-GAAP operating earnings declined by 9% to $0.31 per share from the prior-year comparable quarter. A lower average price on energy hedges was partially offset by Power's continued efforts to lower its costs and Power's favorable gas supply position. PSEG Power also made progress on construction activities related to its three new natural gas combined cycle generation stations.

The new stations will add 1,800 megawatts of efficient capacity over 2018 and 2019, and represent a reconfiguration of Power's merchant fleet that will improve its efficiency and competitive position in the market.

The design of the wholesale energy market and whether current policies provide adequate recognition of the cost for generation to be available is getting the attention it needs. The Department of Energy issued a notice of proposed rulemaking at the end of September regarding the need to properly value base load generation with robust onsite fuel characteristics. We hope their interest in this important issue will jumpstart efforts by the Federal Energy Regulatory Commission to implement improvements in the market. It is encouraging to see that FERC has acted quickly. To meet the DOE's 60-day requirement for a response, FERC requested comments on the DOE NOPR to be filed by October 23rd with reply comments due on November 7th. A response by the FERC to the DOE NOPR is anticipated by December 11th of this year.

PSEG filed comments in support of DOE's initiative to immediately address the erosion occurring and the resiliency of our electric grid due to the risk of premature retirements of base load generation, and the subsequent trend towards greatly reduced fuel diversity. We believe that the DOE NOPR is necessary to address the challenges facing distressed yet valuable resources such as nuclear in the absence of a market solution that recognizes the attributes of fuel diversity and resilience. We recommend that measures adopted in response to the DOE NOPR should be viewed as interim until effective mechanisms can be developed that recognize these attributes in the market. The current market design distorts efficient outcomes due to the disharmony between price signals, public policies, and generation dispatch.

Implementing the DOE measure as an interim step would stabilize the earnings for qualified units until a comprehensive market-based solution can be integrated into RTO and ISO market designs. It is worth mentioning that a significant amount of generation that competes in the PJM market already falls under cost of service regulation. We believe that DOE NOPR also provides the necessary impetus to push for further action by FERC to address longstanding price formation reforms that would avoid some of the continued distortions of competitive market results that disadvantage base load resources.

The PJM energy price formation proposal should be evaluated as part of the comprehensive solution to the challenges facing base load units. As part of our response, we have requested that FERC promptly finalize the fast start pricing reforms and direct PJM through the commission's Federal Power Act Section 206 authority to submit its energy price formation proposal, especially as it pertains to inflexible units. Getting energy prices right is critical to ensuring that the correct signals are sent to incent efficient investment as well as market exit.

PSEG Power is making every effort to preserve its nuclear asset base, working in concert with the industry to identify means of improving operating efficiency without sacrificing safety, PSEG Power is on track in 2017 to reduce the all-in cost per megawatt hour of its nuclear operations by 10% from the average cost experienced during the prior three years. But energy prices influenced by the availability of natural gas have declined by a greater degree during this time frame.

State action also remains critical to prevent the loss of these units. We believe state action can be done in a way that both maintains the integrity of the wholesale market and serves as a bridge until a regional or federal solution is in

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14914

place. A strong legal foundation has been established for state action to preserve generating assets critical to meeting a state's emission related goals and to maintain the benefits to the state's economy that comes with the safe, reliable operation of nuclear power.

Successful execution of PSEG's key policy and regulatory initiatives would assure the company's ability to provide customers with the service, reliability and resiliency that they have come to expect, that is also affordable. Successful execution of our key policy and regulatory initiatives would also provide our shareholders with greater assurance of PSEG's ability to meet our objectives for returns and growth.

With that, I'll turn the call over to Dan to discuss our financials in greater detail.

Daniel Cregg, Chief Financial Officer

Thank you, Ralph, and thanks everyone for joining us today. As Ralph said, PSEG reported net income for the third quarter of 2017, of $0.78 per share versus net income of $0.64 per share in last year's third quarter. Non-GAAP operating earnings for the third quarter of 2017 were $0.82 per share versus non-GAAP operating earnings of $0.88 per share in last year's third quarter.

The reconciliation of non-GAAP operating earnings to net income for the quarter and nine months can be found on slides five and six. We've also provided you with a waterfall chart on slide 11, that takes you through the net changes in quarter-over-quarter non-GAAP operating earnings by major business and a similar chart on slide 13 provides you with the changes in non-GAAP operating earnings by major business on a year-to-date basis. I'll now review each company in more detail.

Starting with PSE&G. PSE&G reported net income of $0.49 per share for the third quarter of 2017 compared with $0.50 per share for the third quarter of 2016. Results for the quarter are shown on slide 15. Net income growth in the third quarter associated with PSE&G's expanded investment in transmission and electric and gas distribution facilities was offset by the impact on sales of weather conditions which were substantially cooler than experienced in the year ago quarter and cooler than normal.

Returns on PSE&G's expanded investment in transmission added $0.04 per share to net income in the quarter. Incremental revenue associated with the recovery of PSE&G's Energy Strong investment infrastructure program, which added $0.02 per share to net income was offset by a decline in weather normalized electric sales and in electric demand related revenues. Demand-related revenues were impacted by the significantly lower peak temperature hours, which as Ralph mentioned were 69% lower than the year-ago quarter and 47% below normal.

Net income comparisons were also hurt weather conditions, which were approximately 27% cooler than conditions experienced during 2016 in the third quarter and 5% cooler than normal. Electric sales, as a result of the cooler summer weather, declined 8.3% in the quarter. The decline was led by an approximate 14% decline in sales to residential customers. On a trailing 12-month basis, weather normalized electric sales were flat year-over-year and gas sales on a similar basis increased 1.5%, led by the commercial sector. The decline in electric residential sales reduced third quarter net income comparisons by $0.03 per share. An increase in depreciation expense of $0.01 per share associated with PSE&G's expanded capital base was offset by a decline in O&M expense. An absence of tax credits available in the year-ago quarter and other items reduced net income comparisons in the third quarter by $0.02 per share.

PSE&G's five-year capital investment plan includes approximately 6 billion to upgrade and expand transmission related facilities and investment. PSE&G filed an update of its formula rate for transmission at the Federal Energy Regulatory Commission in October of 2017 and the update, which reflects an increase in the level of PSE&G's investment in transmission and a true-up of prior year results, provides for a $212 million increase in annual transmission revenues effective January 1st of 2018.

PSE&G under Energy Strong and the clause mechanism therein adjust electric rates two times per year in March and September and gas rates are adjusted each year in September. Under the clause mechanism for the gas system modernization program, PSE&G adjusts gas rates in January of each year to reflect the investment made during the

final
Bloomberg Transcript
Bloomberg

prior year. The combined annual revenue increase for the full year in 2017 for these two programs is forecasted to be approximately $56 million.

As Ralph mentioned, PSE&G has agreed to delay the filing of its distribution rate case by one month to no later than December 1st of 2017. This filing as you recall was agreed to as part of the Energy Strong settlement and provides the opportunity for PSE&G to recover capital investments made outside of existing clause mechanisms and update for other factors such as storm costs and changes in sales growth in O&M. The distribution base rate filing will be based on a test year ending June 2018 and a 10.3% return on equity and provide for a mid-single-digit increase in revenues, still leaving overall rates below the level coming out of our last distribution base rate case in 2010. The one month delay in the filing hasn't changed any of the economics associated with the request as the test year is unchanged, but allows one incremental month of actual results to be included in the filing.

PSE&G invested approximately $2.1 billion for the nine months ended September 30th and electric and gas distribution and transmission capital projects designed to provide more reliable safe and resilient service to it's 2.2 million customers. For the year, PSE&G currently expects to invest 3.1 billion on upgrading it's infrastructure. And this is slightly lower than the 3.4 billion we originally forecast for 2017. A delay in timing on some projects and greater cost related efficiencies on others are the primary reasons for the decline in the forecasted spending for the full year.

As Ralph mentioned, as a result of identifying incremental investments, we now expect PSE&G's investment program for the five years ended 2021 will provide growth in rate base off 2016 year-end amounts at the upper end of our 7% to 9% per year growth rate. This is driven by incremental investments in our GSMP2 filing relative to what is reflected in our base capital plan and a planned expansion of our Energy Strong filing. These important initiatives build confidence in PSE&G's ability to extend it's growth beyond the end of this decade. For 2017, we are maintaining our forecast of PSE&G's net income at $945 million to $985 million.

Now let's turn to Power. PSEG Power reported net income of 136 million or $0.27 per share for the third quarter of 2017, compared with net income of 139 million or $0.27 per share for the year-ago quarter. Non-GAAP operating earnings were $0.31 per share for the third quarter of 2017 compared to non-GAAP operating earnings for the third quarter of 2016 of $0.34 per share. Non-GAAP adjusted EBITDA for the third quarter of 2017 was 356 million versus non-GAAP operating EBITDA for 2016 of 387 million. Our non-GAAP adjusted EBITDA excludes the same items as our non-GAAP operating earnings measure as well as income tax expense, interest expense and depreciation and amortization.

The earnings release and slide 19 provide you with detailed analysis of the impact on Power's non-GAAP operating earnings quarter-over-quarter. And we've also provided you with more detail on generation for the quarter and the first nine months of the year on slide 20 and 21. Power's net income in the third quarter was impacted by a decline in average energy hedge prices and the effect of cooler than normal weather on demand and output, which offset a decline in operating and maintenance expense.

During the quarter, non-GAAP operating earnings comparisons increased $0.01 per share, as a result of higher capacity prices in New England and PJM. This increase in capacity prices occurred on June 1st of 2017 and will run through May 31st of 2018. Lower average prices on energy hedges and a decline in market prices combined to reduce non-GAAP operating earnings comparisons by $0.05 per share. A 6% decline in output associated with the impact of cooler than normal weather on demand reduced non-GAAP operating earnings comparisons by an additional $0.02 per share.

Power's focus on improving operational efficiencies helped mitigate the impact of the decline in energy prices. The June 1st 2017 retirement of the Hudson and Mercer coal stations and a decline in nuclear plant related O&M improved non-GAAP operating earnings by $0.02 per share and a decline in depreciation expense associated with the retirement of Hudson and Mercer combined with a decline in interest expense and taxes improved non-GAAP operating earnings comparisons by $0.01 per share.

Now let's turn to Power's operations. Output of Power's generating stations declined 6% in the quarter. The nuclear fleet's output increased 20% in the third quarter to 8.2 terawatt hours as the fleet's capacity factor improved to 96%

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14916

from 80%. The quarter-over-quarter improvement was due to strong performance at Hope Creek, which operated at an average capacity factor of 98.4% and the absence of an extended refueling outage and repairs at the Salem Station in the year-ago quarter, which addressed the repair and replacement of baffle bolts at Salem 1 and repair of a transformer at Salem 2.

The nuclear fleet's performance for the third quarter brought the capacity factor for the nine months ended September 30th to 95%. As mentioned, cooler than normal weather limited energy pricing, peak demand requirements, and utilization of the gas-fired combined cycle and peaking fleet. Power's combined cycle fleet experienced a 29% decline in output to 3.7 terawatt hours, while an increase in the price of gas improved the competitive position of the base load coal fleet.

As we indicated earlier this year, average hedge prices during the second, third and fourth quarters of the year were expected to decline by less than what we experienced in the first quarter and by less than the average decline of $5 per megawatt hour we anticipated for the full year. This reflects the absence of weather related risk premium during the winter months that was experienced in prior years. Gas prices improved in the third quarter, but since power prices didn't move in conjunction with gas, spark spreads declined relative to year-ago levels.

Power's realized spark spreads held up better than the market declining $1 per megawatt hour quarter-over-quarter given its beneficial gas supply position. And Power's beneficial gas supply position also held gross margins in the quarter to a decline of a $1.50 per megawatt hour to $40 per megawatt hour. Power continues to forecast output for 2017 of 49 terawatt hours to 50 terawatt hours, approximately 86% of production for the remainder of the year of approximately 11 terawatt hours. It's hedged at an average price for $45 per megawatt hour.

Power has hedged approximately 70% to 75% of 2018's forecast output of 52 terawatt hours to 54 terawatt hours at an average price of $41 per megawatt hour. And for 2019, Power has hedged 30% to 35% forecast output of 58 terawatt hours to 60 terawatt hours at an average price of $39 per megawatt hour. The average price for energy hedge in 2019 is $2 per megawatt hour lower than our prior forecast and the reduction reflects a decline in market prices. The forecast of output for 2018 and 2019 remains unchanged from prior estimates.

The forecast increase in output in both 2018 and '19 reflects the commercial startup in mid '18 of 1,300 megawatts of new gas-fired combined cycle capacity at the Keys Energy Center in Maryland and at Sewaren in New Jersey. And the forecast increase is also supported by the commercial start-up in mid 2019 of the 485 megawatt gas-fired combined cycle facility in Bridgeport Harbor, Connecticut. Our forecast Power's full-year 2017 non-GAAP operating earnings remains unchanged at $435 million to $510 million. The forecast represents non-GAAP adjusted EBITDA of $1.80 billion [ph] to $1.210 billion.

Now let me turn briefly to PSEG Enterprise and Other, which reported net income of $0.02 per share for the third quarter of 2017 compared with a net loss of $0.13 per share for the third quarter of 2016. Results for the third quarter of 2016 were impacted by the impairment of the REMA leases. Non-GAAP operating earnings for the third quarter of 2017 were $0.02 per share compared with non-GAAP operating earnings of $0.04 per share for the third quarter of 2016. The decrease in non-GAAP operating earnings quarter-over-quarter reflects the absence of certain tax items recognized in the third quarter of 2016 as well as higher interest expense at the parent. And the forecast for Enterprise and Other for the full year of 2017 non-GAAP operating earnings remains unchanged at $35 million.

PSEG also closed the quarter ended September of 2017 with $287 million of cash on its balance sheet and with debt at the end of the quarter representing approximately 49% of consolidated capital. PSEG power had debt at the end of the quarter representing 31% of capital. And as Ralph mentioned, we are maintaining our guidance for 2017 non-GAAP operating earnings of $2.80 to $3 per share.

And Shelby, we are now ready to take questions.

Questions And Answers

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14917

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. (Operator Instructions) Your first question comes from Julien Smith from Bank of America Merrill Lynch.

Julien Smith, Analyst

Hey. Good morning.

Ralph Izzo, Chief Executive Officer

Hi, Julien. Welcome back to the fray.

Julien Smith, Analyst

Thank you so much. I appreciate it. So perhaps just to kick it off a little bit here on the New Jersey and some of the background of the politics there, I'd be curious. One, do you think there's potential for reform in New Jersey just given what's already going on at the FERC level? And then secondly, in that same vein of thinking, how do you think about the potential for a more comprehensive review of energy next (inaudible) you see there is some considerations with respect to solar in addition to the nuclear issues that you addressed as well as just your ongoing utility spend in the extension and expansion of those programs, so to the extent to which that legislation might be a fix for all would be curious, how that might be shaping up?

Ralph Izzo, Chief Executive Officer

Sure, Julien. Yeah, I do think that depending on what happens at the federal level, there remains the opportunity for our New Jersey to recognize certain attributes that perhaps are not explicitly identified at the federal level. To the extent that the federal level does recognize the same attributes, then you would not have redundant programs. So an example of that might be, you could have price formation, improvements at the federal level just to make the market more efficient sort of along the lines of what PJM has talked about with flexible units.

And that doesn't do anything explicitly for fuel diversity or resiliency and therefore New Jersey could have an overlay on top of that. Similarly, fuel diversity versus carbon would be mutually exclusive. But if both jurisdictions recognize carbon, then you would not have two programs overlapping each other. Those are just those types of examples I would think about in terms of state and federal programs being complementary versus redundant.

To your second question, whenever you have a change in administration and as you implied the Governor Christie is term limited now finishing his second term. There is a desire on the part of the new incoming administration to establish themselves in various ways, it could be environmental, it could be the economy, it could be education, and both candidates have talked about their desire to look at things a little bit differently when it comes to energy policy, discussions about REGI and green energy targets. And we absolutely, as we've done for 110 years, we absolutely will work with the incoming administration to understand their policy objectives and inform them as the implications both positive and negative whatever wants to be done, because as we know things cost money to do. But if the benefits outweigh the costs, then we're eager to help them pursue it. So yes, we will work closely with whoever the new Governor is to help them formulate and execute their energy policy.

Lastly, I think you're correct in your -- if I could say implicit remark that ongoing investment in infrastructure is something that no matter who comes into office will probably be supportive of and I do think that's correct. There is a widespread recognition on the part of regulators and policy makers that we have an aging infrastructure that's not perfectly suited for the growing dependency that people have on electricity now-a-days and the improvements we're

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14918

making will certainly continue to propose them and I think we'll be well received.

Julien Smith, Analyst

Excellent. Thank you for that. Just a follow-up again, congratulations on moving higher within your range here at the top end on the rate base side. Can you talk about reconciling that against earnings and some of the key factors that might be relevant in the current rate case and/or through the current period just an attempt to reconcile the rate base trajectory against kind of hitting the upper end of that earnings, perhaps items might include like an authorized equity ratio or other deferred items in the context of this case that we should be paying attention to, once it's filed?

Ralph Izzo, Chief Executive Officer

Yeah, so our last base rate case was in 2010 and we've done a very good job of controlling O&M expense. But circumstances have conspired against us by having complete absence of low growth over that time. So even a very good job of controlling O&M expense loses out to no load growth. We've also, as you know, had some of our clauses anticipate this rate case, so we had some unrecovered CapEx. And then we had some modest investment levels above depreciation that served to build the rate base to levels that were not commensurate what was in the 2010 rate case. That's a really long winded way of saying we need some rate relief, but we've managed our overall portfolio well enough that we are describing this is kind of middle single-digit type of rate increase, which will be far below the compounding of CPI over the last seven years that one might otherwise would have expected. So I think it will be something that is easily explained.

Now, the 7% to 9% CAGR in rate base is more prospective conversation. My last three minutes was really looking in the rearview mirror, but now as I look at the windshield basically, we have -- as you know in our 7% number programs that were wholly approved. Then the 7% to 9% number anticipated some fairly high degree of confidence in some program extensions. And I think what you're hearing in our voices today is that confidence has grown, as we've been able to put our engineers to work and understand some of the parts of the system both gas and electric that needs strengthening. So as you think ahead to earnings, as you know, we don't forecast earnings beyond the current year, the three levers you have in the regulated utility are earnings grow with load, I think, Kathleen, again, we're seeing 0.4%, 0.5%. Is that forecasted?

Kathleen Lally, Investor Relation

Within the last 12, that's about right. Yeah.

Ralph Izzo, Chief Executive Officer

And, then you subtract from that O&M, we've been pretty good at controlling that. And you add to that the clauses that we expect to get recovery of. So it's two additions and one subtraction and you'll get pretty close to what utility should look like in the coming five years.

Julien Smith, Analyst

Got it. So let me just make sure I mean what I'm hearing you say is, it shouldn't be all that different notwithstanding any kind of uncertainties with respect to the case.

Ralph Izzo, Chief Executive Officer

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14919

Yeah, I think that's correct. Within the limitation of, as you know, we don't smooth for pension, so some massive change in pension funding, which we don't expect, we're 92% funded right now, but the equity ratio could be adjusted in the case. We're probably going to ask for scouch more, a better word -- a bit more than we used to have in the past. So it's a yeah, the case could set a new base from which that upper end of the 7% to 9% can grow.

Julien Smith, Analyst

Excellent. All right, I'll leave it there. Thank you all very much. Good luck.

Ralph Izzo, Chief Executive Officer

Thanks, Julien.

Operator

Our next question comes from Praful Mehta of Citigroup.

Praful Mehta, Analyst

Thanks so much. Hi, guys.

Ralph Izzo, Chief Executive Officer

Hi, Praful.

Praful Mehta, Analyst

So, I got the point on the (inaudible) and the DOE being mutually exclusive. Just wanted to understand given Ralph your initial comments on the DOE initiative. How do you see it playing out, like do you see it as $1 per megawatt, $1 per megawatt hour. How do you see that actually playing out and do you see that how much in terms of benefit you expect for your facilities?

Ralph Izzo, Chief Executive Officer

So of course, I wish I could answer that definitively, but let me answer it with the way which we proposed that it be played out, which may or may not have any bearing with what actually happens. In our comments, we basically said, first of all, bringing PJM in under Section 206 to do what PJM says needs to be done, is a no brainer. So the inflexible unit treatment, the fast start reforms that is long overdue and needs to be done and that is the easy part. Others have estimated that could be anywhere from $2 megawatt hour to $4 per megawatt hour, others have estimated that.

Secondly, as it specifically pertains to the DOE recommendation put forth in a NOPR, we have pointed out that there is a substantial portion of PJM that is competitively positioned in the market, but yet receives cost of service rates from their state regulators. And on an interim basis that can be replicated at the federal level through a version of RMR type reliability must run type contracts for the units that are at risk of premature retirement. And that would be an interim solution until one comes up with a market-based solution that values the diversity associated with these different fuel types. We had proposed one method that relates to tranching of the capacity markets, others have proposed methods that relate to scarcity pricing in energy markets for different fuels, but that permanent solution will involve a longer

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14920

discussion with affected stakeholders.

So really, it's three steps, there is plenty of evidence already that fast start and inflexible unit price formation needs to be fixed now and can happen now. An interim solution for at risk premature retirement using a cost to service methodology can be put in place very easily. And then the longer term market-based solution, there are known solutions and options that people can pursue, but a more fulsome discussion would not be inappropriate in that regard.

Praful Mehta, Analyst

Got you. That's very helpful color, Ralph. And secondly, in terms of long-term views, I know you've talked about long-term the generation business probably not being a part of the consolidated business over the long term. Now given what's happening with the IPP space and either companies going public or shrinking given the mergers, how do you see that playing out? Do you see -- has that changed in any way? Do you now see PEG power being more part of the business going forward or has that view on separation still hold at this point?

Ralph Izzo, Chief Executive Officer

No, the view still holds, but I think it's pretty obvious to us at least that right now in the short term with all of the conversations taking place at FERC, at DOE, at the state with new entrants being formed and anticipating the Vistra-Dynegy combination with old entrants exiting in terms of public markets anticipating the Calpine going private. I think it's a -- this is a good time to just sort of wait and let something settle out a bit, right? So we're in great shape. Power is a cash generator, earnings producer. In about 15 months, Power will be healthy free cash flow generator.

The utility has an insatiable appetite for that cash. So, we're not in any hurry during this period of tremendous -- yeah, we'll change -- all healthy, all very healthy given the dialogues taking place at FERC and given the dialogue taking place in the state to let it kind of play out while we enjoy the benefits of the two companies being together. That doesn't change the fact that we continually assess our strategic flexibility going forward on whether these two businesses belong together or not. And I stand by my prior belief that I think over the long term, they do diverge.

Kathleen Lally, Investor Relation

Praful, and just to be clear that time of change is what a two- to three-year period, while all of this kind of settles down, you see it--

Ralph Izzo, Chief Executive Officer

Yeah. I did make that mistake about three or four years ago. And I may not be the smartest person in the world, but I do learn from those mistakes. I am not going to give you a time frame. Nice try therefore.

Praful Mehta, Analyst

All right. Thanks, guys.

Ralph Izzo, Chief Executive Officer

Kathleen started like choking me. So my voice broke a little bit, that's the reason.

Praful Mehta, Analyst

Thank you, guys.

Operator

Your next question comes from Greg Gordon of Evercore ISI.

Kevin Hogan, Analyst

Hey, it is Kevin [ph] here. Good morning.

Ralph Izzo, Chief Executive Officer

Good morning.

Kevin Hogan, Analyst

I just wanted to see if you could quantify the uplift in PJM price reform as it's currently being contemplated.

Ralph Izzo, Chief Executive Officer

So Kevin, what we quoted is what other sources have talked about. If you just take Dan's comments about 55 terawatt hours every $1 worth $55 million pre-tax. So if it's $2 to $4 I just thrown three if statements in there. So please be aware of that, you come up with the impact on us. Dan, did you want to add some color to that?

Daniel Cregg, Chief Financial Officer

I mean, I think that's right. I think there's been an awful lot of people that have put out some numbers on it. They've actually coalesced around that range pretty tightly. So we'll see as these different initiatives get done, what it ends up looking like, but I think that seems to be a reasonable place a lot of (inaudible) happened. Now, we think it's a pretty reasonable, as well Kevin.

Kevin Hogan, Analyst

Okay. So now, how would that impact your hedging, would you like hedge less or stop hedging '19, if you start to see progress or how would you think about that?

Ralph Izzo, Chief Executive Officer

So we have constantly disciplined ourselves to staying within a certain range in terms of how much we hedge. We have various parameters, gross margin at risk standard of VAR calculations. We do allow our ER&T folks, our trading organization to float high and low in that range depending upon what's going on. To the extent that the whole market anticipates price formation, you should start seeing that in the forward price curve and therefore our hedging approach would stay the same.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14922

We do challenge ourselves if we think the market is missing something to make darn sure, that we can figure out why the market would be missing it before we would push one boundary or another. But in general, we will run the place the way we always have, which is to not assume we're smarter than the market and to just stay within those limits. But again those limits are range and we do let our folks have some flexibility within that range.

Kevin Hogan, Analyst

Okay, great. Thanks a lot.

Operator

(Operator Instructions) Your next question comes from Christopher Turnure of JPMorgan.

Christopher Turnure, Analyst

Good morning, guys. I wanted to get, maybe a little bit more detail on the rate case, the test year, and in particular kind of the true-up and what's included in that? I guess that would kind of be a third quarter event after the test year ends on June 30th. But I'm just trying to get a sense as to on how next year will shape up there and what the rate case will ultimately include in terms of timing coming out of the gate?

Ralph Izzo, Chief Executive Officer

Yeah so Chris, so we had originally planned to file November 1 per the agreement we made back in May of 2014 coming out of Energy Strong. There was widespread recognition that, that would be a two in ten and there was preference for three months of actuals and nine months of forecast as opposed to two months of actuals and ten months of forecast and that was the primary driver behind the one month delay, if you will. So there is no, nothing mystical or profound going on there. So the test year still ends in June of '18. As I've mentioned before, we're expecting a mid-single digit requested increase that we'll still keep rates below where they were in 2010 when we had our last base rate case.

And remember, we have $250 million of GSMP stipulated rate base that was not covered by GSMP. We have about $100 million of Energy Strong above the $1 billion that was in the clause. And we have storm recovery cost that's I think $200 million something that was deemed prudent, but hasn't been returned to us yet. We have some new business that added to the CapEx. And candidly, we had some additional capital that was above depreciation levels that accumulated over the course of the years. So we would anticipate rates going into effect October, November of next year. And I don't want to front run the filing. We owe it to the Board staff to let them be the first ones to read the details, but, Dan if you want to add any color?

Daniel Cregg, Chief Financial Officer

Yeah. Just one thing, Chris. It sounded like your question was implying there would be a rate case and then there would be a true-up afterwards. And the way that we described the rate case is basically it is a trueing up of a host of the things that Ralph's just talked about. So we will come out of the rate case with the rates that are set within that case. And historically, we've seen a settlement in these cases in the state and that may well be where it ends up going, but we'll see.

We would look for rates next fall. Usually, these have taken about a year and we would hope to anticipate that we could get rates maybe in like the October range. But it's a little different than our transmission formula rate which is filed those rates going into effect for the following year. And then there is a separate true-up that happens the year after that.

final
Bloomberg Transcript

So just for clarity sake, there is no true-up after the rate case. Rate case itself will true up our distribution rates and we would anticipate the new rates would be in effect say October of next year.

Ralph Izzo, Chief Executive Officer

And just for -- I think most of you know this, but our rate base is roughly half transmission and half distribution right now. So tiny bit more distribution.

Christopher Turnure, Analyst

Okay. That was all very helpful context, and everything, but that's kind of what I was driving out there towards the end Dan. And just that the distribution rate case itself would have a nine-month forecasted test year, but that itself would never be trued up during the rate case process.

Daniel Cregg, Chief Financial Officer

Yeah. So the nine months, it will be a 12 year -- 12-month test year. And it will start with three months of actuals and nine months of forecast and then as we step through we will update those as we go forward.

Christopher Turnure, Analyst

Okay. So you would have some update --

Daniel Cregg, Chief Financial Officer

Yeah.

Christopher Turnure, Analyst

On O&M or little bit something during the process?

Daniel Cregg, Chief Financial Officer

Yeah.

Christopher Turnure, Analyst

Okay. Gotcha. And then just on the request for decoupling, can you help put that into context for me, just kind of understanding your motivation for that and maybe how you think it may or may not be perceived by interveners?

Ralph Izzo, Chief Executive Officer

Yeah, Chris. So we've had a series of energy efficiency filings approved for the past seven or so years. I think total amounted to about $400 million, most recently with $69 million this past summer. And we have basically worked around this issue of fixed cost recovery with the stakeholders in these processes. It's kept us from doing something in a much grander scale and we've simply decided that with the prospect of a new administration coming in and ongoing

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14924

indication that there are market imperfections that keep customers from investing in energy efficiency, despite the compelling economics of that, that we would like to do this in a much, much more significant way. But we're not going to do it and suffer fixed cost losses at the absence of recovery of fixed costs.

So given the tariff free design involved with decoupling, we thought well, since we're going in for rate case, now it's a good time to raise the issue and that's the motivation. The motivation really is not so much of this rate case, but the rate case is an opportunity to pave the way for significant energy efficiency proposals early next year.

Christopher Turnure, Analyst

Okay, great. Thanks, Ralph.

Operator

Our next question comes from Travis Miller of Morningstar, Inc.

Travis Miller, Analyst

Good morning. Thank you.

Ralph Izzo, Chief Executive Officer

Hi, Travis.

Daniel Cregg, Chief Financial Officer

Hi, Travis.

Travis Miller, Analyst

I was wondering if, we could boil down all of these power market tissues into two buckets, the price formation bucket and the fuel diversity bucket. How do you think about the next two to three years perhaps even more of capital investment based on what happens in either of those two buckets. So what happens to capital investment depending on the outcome of price formation? What happens to capital investment based on an outcome in fuel diversity?

Ralph Izzo, Chief Executive Officer

I can tell you what it means for us, Travis. We are not deploying additional capital into the power generation business. We have 1,800 megawatts of 6,000 to 6,500 [ph] heat rate power plants coming online and we're quite happy with that. At the risk of speaking for others, which is always going to be wrong, you know that PJM in particular and many other markets are in an oversupply situation and there has been reasonable demonstration of capital discipline in the most recent auctions that have taken place.

So I think that the supply-demand imbalance that exists is a separate issue that will continue to impart that capital discipline and the price formation issue is just the recognition that if you want to market to be efficient, then price should determine who runs and who doesn't and you can't keep having uplift payments and sidebar out of market payments guiding the dispatch of the system, which is what PJM has going on right now. Price is not the sole determinant of how the system is dispatched, then that's not a market, so that needs to be fixed. So two separate issues I

final
Bloomberg Transcript

guess , is what I'm saying.

Travis Miller, Analyst

Okay. And could I read into that, that you don't think there would be much capital investment in general across certainly the PJM region however this turns out?

Ralph Izzo, Chief Executive Officer

I think you could without question read into that, that's our point of view. Again, I don't want to -- I don't want to speak for others, but I know what our capital plans are. It's to finish these three projects and generate some healthy free cash flow for the utility.

Travis Miller, Analyst

Sure. Okay. All my other questions were asked and answered. Thank you.

Operator

Your next question comes from Paul Patterson of Glenrock Associates.

Paul Patterson, Analyst

I'm sorry. Can you hear me?

Ralph Izzo, Chief Executive Officer

Sure, Paul. Yeah we can.

Paul Patterson, Analyst

Sorry about that. So just to follow-up on Travis' question, what we often see with these market reforms is that others seem to deploy capital and I'm just wondering, when you see this $2 to $4 price increase in -- with price formation, or potentially seeing that, how long term do you think that would be? Or is the proposal, it's hard for me to really completely get my arms around it, is it such that you would still see locational marginal pricing being set by inflexible units even with new entry showing up in the gas-fired area, if you follow me? I mean, how should we think about sort of the sustainability of something like price formation, given what we've seen quite frankly with the capacity markets and other "market reforms" to change the price, if you follow me?

Ralph Izzo, Chief Executive Officer

All right. So Paul, I mean that's fair. I think that one has to realize that there are -- there is cyclicality in these markets that have different periodicity associated with them, right? The cyclicality in fuel prices, the cyclicality in boom bust cycles associated with oversupply and undersupply. The cyclicality in oversupply and undersupply is determined by power plants being built that is determined by pipelines being built. So to simply say that price formation will drive prices up $3 picking the midpoint in the range that Dan and I've talked about which we don't attest to, but simply quote

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14926

from others.

And then automatically concluding that that's going to lead to people running their numbers and assuming that, that number stays there and, after, they'll build plants, could be a bit risky, right? I mean what does it mean for the timing of pipelines that may change the basis differential of gas in Western PJM versus Eastern PJM? What does it mean for future carbon constraints that may or may not be part of a subsequent administration in Washington? I think all of us want to -- some people on this call may want to go see their children in their Halloween parades, otherwise I'd list 1,000 other factors that should be going into people's thought process before making those kind of investment decisions.

Daniel Cregg, Chief Financial Officer

I think -- the price that you have on market that is working better by virtue of some of the changes that need to be made is going to get you to a better answer.

Paul Patterson, Analyst

Okay. And then, with respect to the DOE proposal, I know this is kind of sort of moonshot question, I guess maybe. I mean, how much assets should we think about as being potentially, if it were to be enacted for you guys, I mean, how should we think about what the potential impact might be there? I mean, how many units -- just how do we sort of quantify that if that were to -- I mean, I know it's kind of hard question maybe to answer, but I mean, how would you suggest we think about it?

Daniel Cregg, Chief Financial Officer

I think Paul the way I'll break it down is based upon how the DOE describe the eligibility so and one of the main ones is having 90 days of fuel onsite. And if you think about what that means, that means our nuclear facilities certainly and it means our small interest in Keystone and Conemaugh.

Paul Patterson, Analyst

So all those units would theoretically be able to get rate of return, rate base or what you're getting at the utility kind of thing?

Ralph Izzo, Chief Executive Officer

We will see where the -- ultimately where the NOPR goes with it, but certainly from an eligibility standpoint those are the units that would come to mind.

Paul Patterson, Analyst

Okay. And I guess, we don't have -- do we have like a -- what the asset, what the rate base number, would be, kind of, if you follow me, associate with that. Do you follow what I'm saying? I mean --

Ralph Izzo, Chief Executive Officer

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14927

Yeah. I mean, but there is a little bit of data related to some of the nuclear facilities in the Q, but it's not on an asset-by-asset basis from a book value perspective.

Paul Patterson, Analyst

Okay. Well, I'll follow up afterwards. I mean I just was just wondering I was just curious if you had some sort of idea there, but I don't want to hold it up. Thank you so much. Have a great one.

Operator

(Operator Instructions) Your next question comes from Michael Lapides of Goldman Sachs.

Michael Lapides, Analyst

Hey, guys. A easy question on your 2017 CapEx guidance, the reduction of 300 million, can you give a little more detail about what's moving and does that get put back into a future year's CapEx and if so how far out in the future?

Daniel Cregg, Chief Financial Officer

Yeah, Michael. So it's always a bit of a split. I think we had referenced there were couple things that were going on related to the total some is frankly just doing some work more efficiently and I think there is the majority of that is on Energy Strong. You heard Ralph talk a little bit earlier about $1 billion going through the clause and about a $100 million that will await the rate case and you remember, it's about a $1.2 billion program.

So frankly, some of that work was done more efficiently and I think that's a great outcome and it's great for customers and we're pleased to be able to do it that way. And we had a little bit of the same on transmission, not a whole lot. And then the balance really is timing and the timing is not anything that's going to move dollars out three, four, five years. It's a just living '17 out into '18. So in the aggregate of -- you think of it maybe about half and half, half being just efficiencies that we've brought to the process and about half being some capital that will move into next year.

Michael Lapides, Analyst

So when you think about efficiencies, if I did half and half, do you think CapEx over the cycle by about 150 million and pushing out 150 million into the next year, is kind of that ballpark?

Daniel Cregg, Chief Financial Officer

Yeah. If you think about the 3.1 versus 3.4 [ph] that we talked about. That's about right, yeah.

Michael Lapides, Analyst

Okay.

Ralph Izzo, Chief Executive Officer

That trend towards the upper end of the rate base growth through 2021 includes all of that.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14928

Daniel Cregg, Chief Financial Officer

Right.

Michael Lapides, Analyst

Got it. Okay. And then one other, just thinking about transmission rate base growth and transmission capital needs and kind of how you're thinking about whether there is any lumpiness in some of what PJM is trying to plan around, given what's happened with the Con Ed wheel [ph] . How are you thinking about just whether there any lumpy or larger scale projects coming down the pike with transmission or is it all going to be just lots and lots and lots of kind of small and mid-sized ones?

Daniel Cregg, Chief Financial Officer

Yeah. It's more the latter than the former. I think if you had gone back three or four years, you would have found more bigger lumpier projects. A fair bit of what we are spending now is on 69 KV upgrades of 26 KV systems and that actually moves capital from the distribution area into transmission as it goes up in voltage. And those are smaller, now a lot of them are still sizable projects, but smaller than for instance the Susquehanna-Roseland type of project that we've talked about in the past. So there are more smaller projects as opposed to fewer larger projects that we've seen in the past that will move us forward.

And in fact, as we think about our 2018 revenue number that we talked about even within our prepared remarks, some of what you see there it's a step-up from what we have seen in some prior years. Even if you look back to last year, there's a pretty sizable step-up in the amount, some of that is incremental capital year-over-year in both the return on that capital and the depreciation, the return of that capital will contribute to some of that increase. But you may recall last year, part of the number that we had from a revenue increase was inclusive of a true-up and that true-up was related to bonus depreciation.

So a couple of years back, the bonus depreciation extension took place. I don't think it was December 31st, but it was awfully close to that and it was certainly after we had filed our October formula rate filing. So the impact of bonus depreciation in 2015 getting it approved, moved into 2016 after we had set our rates and a true-up in 2017 included the reduction in rate base for those excess deferred taxes for bonus depreciation. So on a year-over-year basis, you'll see a jump and a lot of that had to do with the fact that 2017 had a true-up reducing revenues for transmission related to that late enactment of bonus depreciation back in 2015.

Michael Lapides, Analyst

Got it, guys. Thank you, much appreciated. Maybe one last one, O&M at the utility has been very strong meaning you've reduced O&M this year, how much of that is just one-off stuff related to maybe storms in 2016 and how much of that is kind of active O&M management?

Daniel Cregg, Chief Financial Officer

It is the latter, it's active O&M management and we've kept O&M to a very manageable rate over frankly the last number of years and we would look to continue to do so going forward.

Michael Lapides, Analyst

Got it. Thanks, Dan. Much appreciated.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14929

Daniel Cregg, Chief Financial Officer

Thanks, Michael.

Operator

Your next question comes from Jonathan Arnold of Deutsche Bank.

Jonathan Arnold, Analyst

Hi. Good morning, guys.

Ralph Izzo, Chief Executive Officer

Hi, Jonathan.

Jonathan Arnold, Analyst

So one on the hedging data, you mentioned that you've had a $2 downtick in the average price to 39 for 2019 and the hedge amount only ticked up by 5%. Can you just remind us, does that include an estimate of the pricing on the open position or is that just the average price on the hedge piece?

Daniel Cregg, Chief Financial Officer

It's the latter, Jonathan.

Jonathan Arnold, Analyst

Okay. So then I guess following from that between over the last four quarters it's ticked down from 43 to 39, the hedging has gone from 15 to 30, how do we kind of reconcile that math?

Daniel Cregg, Chief Financial Officer

I think if you take a look at what 2019 forwards look like over that period, you've been in $29, $30 rate. And what you're doing is you're pulling down from a BGS price in those out years which is exclusive of the capacity components but inclusive of the others. So it's not an unusual trend that we start in the out year of our three-year cycle, with BGS and then we layer on flat block hedges, as well as some other load deals in those flat block hedges tend to come in at lower prices in part because the curve has come down, but also because they're energy only hedges.

Jonathan Arnold, Analyst

Okay. So there is sort of those two things going on there. And then, but also the curve has sort of traded off in the quarter and then recovered a couple of dollars since, is it fair to say these were down in the heart of the third quarter or can you give us any sense there?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14930

Daniel Cregg, Chief Financial Officer

Yeah. During the quarter, since our last update.

Jonathan Arnold, Analyst

Okay. And then one other thing, just on the enterprises, in your guidance for '17, this 35 million number, is that still the right ballpark going forward?

Daniel Cregg, Chief Financial Officer

Yeah. That's right.

Jonathan Arnold, Analyst

Okay. I think that's it. Thank you.

Daniel Cregg, Chief Financial Officer

Excellent, thanks Jonathan.

Kathleen Lally, Investor Relation

I'm sorry, we have one more question. Otherwise, I know, we've gone over allotted hours' time, but I don't want to cut anybody off with significant question, so we'll allow one more question.

Operator

Okay. Your final question comes from Ashar Khan of (inaudible).

Unidentified Participant

Hi. How are you guys doing? Can I just ask you a rough -- can you just talk a little bit about the legislation, if when we should kind of expect it or what should we expect in the last two months starting tomorrow I guess, November starts works in? And then I just had a one more question from Cregg was that, could you remind us how much of the transmission increase went into effect on January 1 of this year? You said you were going to request something like 212 million right January 1 of 2018. Could you remind us what the amount was for January 1 of 2017?

Ralph Izzo, Chief Executive Officer

So Ashar, we are just in a series of conversations with people right now. We're just making sure they understand what our nuclear plants mean to New Jersey. And yes, it is true that if New Jersey were to build a safety net, so as to guarantee or assure the continued operation of those plants, it would have required legislation, but anything more than that will be premature to discuss, right? So just a lot of conversations that we're having with folks to say. If those plants weren't here, here's what happens. So and then we have, 2017 Dan?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14931

Daniel Cregg, Chief Financial Officer

Yeah 2017 was 121 million and that was down off of the last couple years, which was 146 and 182, so it's moved around a fair bit, a lot of that is the bonus depreciation item that I talked about earlier.

Unidentified Participant

So from 121 we are not going to like 212 right, am I correct?

Daniel Cregg, Chief Financial Officer

That's right.

Unidentified Participant

Thank you so much.

Ralph Izzo, Chief Executive Officer

So just to summarize what hopefully you heard from me and Dan this morning, our power plant construction is on budget and on schedule, three power plants we hope to have online in June of next year and the subsequent June. We have a very healthy dialogue that we are active participants and going on underway on wholesale power market design and reform taking place at FERC, at DOE and at the state level. For the utility, we're now pointing toward the upper end of rate base growth that's 7% to 9% range. We're now thinking we'll be able to hit that upper end of the range between now and 2021.

We have a very busy, but a constructive regulatory agenda coming up for PSE&G, we have GSMP in play. We have a rate case, we'll have Energy Strong 2 in the near term and longer term some energy efficiency. And we're happy to go over all of that and then some with you at EEI next week, I know we have a full set of meeting set up and if you're not on the meeting schedule, I'm sure you can corner one of us in the hallway. They wouldn't let me say it at the beginning of the script, but I wish everybody have a happy Halloween now. And have a great holiday and a safe day. Thank you. We'll see you all next week.

Operator

Ladies and gentlemen, that does conclude your conference call for today. You may disconnect and thank you for participating.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Shelby, and I'll be your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group Third Quarter 2017 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later we will conduct a question-and-answer session for members of the financial community. [Operator Instructions]

As a reminder, this conference is being recorded, Tuesday, October 31, 2017, and will be available for telephone replay beginning at 1:00 PM Eastern Time today until 11:30 PM Eastern Time, November 7, 2017. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Shelby. Good morning. Thank you, for participating in PSEG's call this morning. As you are aware, we released our third quarter 2017 earnings statement earlier today. The release and attachments as mentioned are posted on our website, at www.pseg.com, under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended September 30, 2017 is expected to be filed today.

As you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. And although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, unless required to do so.

Bloomberg Transcript

Our release also contains certain non-GAAP operating information. Please refer to today's 8-K or other filings for a discussion of factors that may cause results to differ from management's projections, forecasts and expectations. And for a reconciliation of our non-GAAP operating information to GAAP results.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions.

Ralph Izzo

Thank you, Kathleen and thank you everyone for joining us today. PSEG reported results for the third quarter having executed well on major operational and policy initiatives. Despite the impact of abnormally cool weather on sales and earnings, we remain within our non-GAAP operating earnings guidance for the full year of $2.80 per share to $3 per share.

Earlier this morning, we reported net income for the quarter of $0.78 per share. Non-GAAP operating earnings for the third quarter of 2017 were $0.82 per share compared with net income of $0.64 per share and non-GAAP operating earnings for the third quarter of 2016 of $0.88 per share. For the nine month period, non-GAAP operating earnings were $2.36 per share, which is the same as non-GAAP operating earnings for 2016's first nine months. Slides 5 and 6 contain the detail on the results for the quarter and the nine months.

At PSE&G, earnings per share declined $0.01 per share from the prior year comparable quarter. The results for the third quarter were affected by cooler than normal weather which reduced demand for electricity from air conditioning. The weather comparisons for last year are stark. For instance, the measure of average temperature and humidity was 27% below the year ago quarter. And the number of hours that temperature equal to or greater than 90 degrees, was 69% below the year ago quarter.

PSE&G's expanded investment in transmission and distribution continue to benefit customers and had a favorable impact on PSE&G's earnings. PSE&G's rate base is forecasted to grow 12% in 2017, reaching $17 billion. The forecast is based on a continuation of PSE&G's investment program to upgrade its transmission and distribution infrastructure. The upgrades will entail full year capital expenditures of approximately $3.1 billion. This figure is slightly less than our original budget of $3.4 billion, and it's the result of some projects being moved to 2018 and improved efficiency related to the cost of other projects.

Based on further development of our various investment programs, we are increasingly comfortable with PSE&G's ability to achieve growth in rate base at the upper end of our forecast of 7% to 9% per year for the five year period ending in 2021. Our updated forecast assumes reasonable reception by the New Jersey Board of Public Utilities to PSE&G's proposal to invest $540 million per year over five years to accelerate the pace of replacement of aging cast iron and unprotected steel mains and their associated services. Approval would support expansion and extension of the work currently being performed, under the Gas System Modernization program. This filing was made in July and we expect the BPU to take action during the first half of 2018.

We also intend to request the multi-year extension of Energy Strong in the near term. PSE&G is in the final stages of work previously approved as part of Energy Strong to strengthen and harden infrastructure damage during Hurricane Irene and Superstorm Sandy. The extension will address the remaining electric substations that need to be raised or protected. In addition to other much needed work that enhances the resiliency of our system and reduces the risk of outages, that request similar to GSMP II will be consistent with the BPU's draft regulations supporting multi-year capital investments under its Infrastructure Investment Program. If the draft regulations are approved as we expect before year-end, the utilities will be able to proceed with five-year investment programs that will allow more certainty in staffing and planning of work.

Now, I want to bring you up to date on PSE&G's distribution base rate proceeding. As you may be aware following discussions with BPU Staff and Rate Counsel and as approved by the BPU at its October 20 meeting, the deadline for

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14934

filing our distribution rate case was deferred from November 1 to no later than December 1 of this year. The change in the filing date is simply an administrative procedural matter. We will now be providing the BPU with three months of actual data and nine months of forecast data for the same test year that will end on June 30, 2018.

The review of PSE&G's distribution rates, which is expected to result in a modest change in revenue is primarily driven by the need to recover investments made outside of clause mechanisms since the last rate case, to recover storm cost and to allow PSE&G to reset assumptions for growth and sales in O&M. As part of the filing, PSE&G will also be seeking approval to decouple electric and gas distribution revenue from sales volumes and demand which would support largest scale energy efficiency investments. We believe that with the right regulatory policies, the state's utilities can provide the energy infrastructure that meets customer requirements and creates a stronger and more efficient New Jersey.

Now, let me turn to PSEG Power. At PSEG Power, non-GAAP operating earnings declined by 9% to $0.31 per share from the prior year comparable quarter. A lower average price on energy hedges was partially offset by Power's continued efforts to lower its costs and Power's favorable gas supply position. PSEG Power also made progress on construction activities related to its three new natural gas combined cycle generation stations. The new stations will add 1,800 megawatts of efficient capacity over 2018 and 2019 and represent a reconfiguration of Power's merchant fleet that will improve its efficiency and competitive position in the market.

The design of the wholesale energy market and where the current policies provide adequate recognition of the cost for generation to be available is getting the attention it needs. The Department of Energy issued a notice of proposed rulemaking at the end of September, regarding the need to properly value base load generation with robust on-site fuel characteristics. We hope their interest in this important issue will jumpstart efforts by the Federal Energy Regulatory Commission to implement improvements in the market. It is encouraging to see that FERC has acted quickly to meet the DOE's 60-day requirement for a response, FERC requested comments on the DOE NOPR to be filed by October 23, with reply comments due on November 7. A response by the FERC to the DOE NOPR is anticipated by December 11 of this year.

PSEG filed comments in support of DOE's initiative to immediately address the erosion occurring and the resiliency of our electric grid due to the risk of premature retirements of base load generation. And the subsequent trend towards greatly reduced fuel diversity.

We believe that the DOE NOPR is necessary to address the challenges facing distressed, yet valuable resources such as nuclear, in the absence of a market solution that recognizes the attributes of fuel diversity and resilience. We recommend that measures adopted in response to the DOE NOPR should be viewed as interim until effective mechanisms can be developed that recognize these attributes in the market.

The current market design distorts efficient outcomes due to the disharmony between price signals, public policies and generation dispatch. Implementing the DOE measure is an interim step, which stabilize the earnings for qualified units until a comprehensive market based solution can be integrated into RTO and ISO market designs.

It is worth mentioning that a significant amount of generation that competes in the PJM market already falls under cost of service regulation. We believe the DOE NOPR also provides the necessary impetus to push for further action by FERC to address longstanding price formation reforms, that would avoid some of the continued distortions of competitive market results that disadvantage base load resources. The PJM energy price formation proposal should be evaluated as part of the comprehensive solution to the challenges facing base load units. As part of our response, we've requested that FERC promptly finalize the fast start pricing reforms and direct PJM through the commission's Federal Power Act Section 206 authority to submit its energy price formation proposal especially as it pertains to inflexible units.

Getting energy prices right is critical to ensuring that the correct signals are sent to incent efficient investment as well as market exit. PSEG Power is making every effort to preserve its nuclear asset base, working in concert with the industry to identify means of improving operating efficiency without sacrificing safety. PSEG Power is on track in 2017 to reduce the all-in cost per megawatt hour of its nuclear operations by 10% from the average cost experienced

final

Bloomberg
SI-SSA-0015-14935

during the prior three years. But energy prices influenced by the availability of natural gas have declined by a greater degree during this timeframe.

State action also remains critical to prevent the loss of these units. We believe state action can be done in a way that both maintains the integrity of the wholesale market and serves as a bridge until a regional or federal solution is in place. A strong legal foundation has been established for state action to preserve generating assets critical to meeting a state's emission related goals and to maintain the benefits to the state's economy that comes with the safe, reliable operation of nuclear power.

Successful execution of PSEG's key policy and regulatory initiatives would assure the company's ability to provide customers with the service, reliability and resiliency that they have come to expect, that is also affordable. Successful execution of our key policy and regulatory initiatives would also provide our shareholders with greater assurance of PSEG's ability to meet our objectives for returns and growth.

With that, I'll turn the call over to Dan to discuss our financials in greater detail.

Daniel J. Cregg

Thank you, Ralph, and thanks everyone for joining us today. As Ralph said PSEG reported net income for the third quarter of 2017 was $0.78 per share, versus net income of $0.64 per share in last year's third quarter.

Non-GAAP operating earnings for the third quarter of 2017 were $0.82 per share versus non-GAAP operating earnings of $0.88 per share in last year's third quarter. A reconciliation of non-GAAP operating earnings to net income for the quarter and nine months can be found on slides 5 and 6. We've also provided you with a waterfall chart on slide 11 that takes you through the net changes in quarter-over-quarter non-GAAP operating earnings by major business, and a similar chart on slide 13 provides you with the changes in non-GAAP operating earnings by major business on a year-to-date basis.

I'll now review each company in more detail. Starting with PSE&G. PSE&G reported net income of $0.49 per share for the third quarter of 2017 compared with $0.50 per share for the third quarter of 2016.

Results for the quarter are shown on slide 15. Net income growth in the third quarter associated with PSE&G's expanded investment in transmission and electric and gas distribution facilities was offset by the impact on sales of weather conditions, which were substantially cooler than experienced in the year ago quarter and cooler than normal.

Returns on PSE&G's expanded investment in transmission added $0.04 per share to net income in the quarter. Incremental revenue associated with the recovery of PSE&G's Energy Strong investment infrastructure program, which added $0.02 per share to net income, was offset by a decline in weather normalized electric sales and in electric demand-related revenues.

Demand related revenues were impacted by the significantly lower peak temperature hours, which as Ralph mentioned were 69% lower than the year ago quarter, and 47% below normal. Net income comparisons were also hurt by weather conditions, which were approximately 27% cooler than conditions experienced during 2016 in the third quarter and 5% cooler than normal. Electric sales as a result of the cooler summer weather declined 8.3% in the quarter. The decline was led by an approximate 14% decline in sales to residential customers.

On a trailing 12-month basis, weather-normalized electric sales were flat year-over-year and gas sales on a similar basis increased 1.5%, led by the commercial sector. The decline in electric residential sales reduced third quarter net income comparisons by $0.03 per share. An increase in depreciation expense of $0.01 per share associated with PSE&G's expanded capital base was offset by a decline in O&M expense. An absence of tax credits available in the year ago quarter and other items reduced net income comparisons in the third quarter by $0.02 per share.

PSE&G's five-year capital investment plan includes approximately $6 billion to upgrade and expand transmission related facilities and investment. PSE&G filed an update of its formula rate for transmission at the Federal Energy Regulatory Commission in October of 2017 and the update, which reflects an increase in the level of PSE&G's

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14936

investment in transmission and a true up of prior year results provides for a $212 million increase in annual transmission revenues effective January 1 of 2018.

PSE&G under Energy Strong and the clause mechanism therein adjusts electric rates 2 times per year in March and September, and gas rates are adjusted each year in September. Under the clause mechanism for the Gas System Modernization Program, PSE&G adjusts gas rates in January of each year to reflect the investment made during the prior year. The combined annual revenue increase for the full year in 2017 for these two programs is forecasted to be approximately $56 million.

As Ralph mentioned, PSE&G has agreed to delay the filing of its distribution rate case by one month to no later than December 1 of 2017. This filing, as you recall, was agreed to as part of the Energy Strong settlement, and provides the opportunity for PSE&G to recover capital investments made outside of existing clause mechanisms, and update for other factors such as storm costs and changes in sales growth and O&M.

The distribution base rate filing will be based on a test year ending June 2018, and a 10.3% return on equity and provide for a mid-single digit increase in revenues, still leaving overall rates below the level coming out of our last distribution base rate case in 2010. The one-month delay in the filing hasn't changed any of the economics associated with the request, as the test year is unchanged, but allows one incremental month of actual results to be included in the filing.

PSE&G invested approximately $2.1 billion for the nine months ended September 30 in electric and gas distribution and transmission capital projects designed to provide more reliable, safe and resilient service to its 2.2 million customers. For the year, PSE&G currently expects to invest $3.1 billion on upgrading its infrastructure, and this is slightly lower than the $3.4 billion we originally forecast for 2017. A delay in timing on some projects and greater cost related efficiencies on others are the primary reasons for the decline in the forecasted spending for the full year.

As Ralph mentioned, as a result of identifying incremental investments, we now expect PSE&G's investment program for the five years ended 2021 will provide growth in rate base off 2016 year-end amounts at the upper end of our 7% to 9% per year growth rate. This is driven by incremental investments in our GSMP II filing relative to what is reflected in our base capital plan, and a planned expansion of our Energy Strong filing. These important initiatives build confidence in PSE&G's ability to extend its growth beyond the end of this decade. For 2017, we're maintaining our forecast of PSE&G's net income at $945 million to $985 million.

Now let's turn to Power. PSEG Power reported net income of $136 million, or $0.27 per share for the third quarter of 2017, compared with net income of $139 million, or $0.27 per share for the year ago quarter. Non-GAAP operating earnings were $0.31 per share for the third quarter of 2017, compared to non-GAAP operating earnings for the third quarter of 2016 of $0.34 per share.

Non-GAAP adjusted EBITDA for the third quarter of 2017 was $356 million, versus non-GAAP operating EBITDA for 2016 of $387 million. Our non-GAAP adjusted EBITDA excludes the same items as our non-GAAP operating earnings measure, as well as income tax expense, interest expense and depreciation and amortization. The earnings release and slide 19 provide you with detailed analysis of the impact on Power's non-GAAP operating earnings quarter-over-quarter. And we've also provided you with more detail on generation for the quarter and the first nine months of the year on slide 20 and slide 21.

Power's net income in the third quarter was impacted by a decline in average energy hedged prices, and the effect of cooler than normal weather on demand and output, which offset a decline in operating and maintenance expense. During the quarter, non-GAAP operating earnings comparisons increased $0.01 per share as a result of higher capacity prices in New England and PJM. This increasing capacity prices occurred on June 1 of 2017, and will run through May 31 of 2018.

Lower average prices on energy hedges and a decline in market prices combined to reduced non-GAAP operating earnings comparisons by $0.05 per share. A 6% decline in output associated with the impact of cooler than normal weather on demand reduced non-GAAP operating earnings comparisons by an additional $0.02 per share. Power's focus on improving operational efficiencies helped mitigate the impact of the decline in energy prices.

final
Bloomberg Transcript

The June 1, 2017 retirement of the Hudson and Mercer coal stations and a decline in nuclear plant related O&M improved non-GAAP operating earnings by $0.02 per share. And a decline in depreciation expense associated with the retirement of Hudson and Mercer combined with a decline in interest expense and taxes improved non-GAAP operating earnings comparisons by $0.01 per share.

Now let's turn to Power's operations. Output of Power's generating stations declined 6% in the quarter. The nuclear fleet's output increased 20% in the third quarter to 8.2 terawatt hours as the fleet's capacity factor improved to 96% from 80%. The quarter-over-quarter improvement was due to strong performance at Hope Creek which operated at an average capacity factor of 98.4%. In the absence of an extended refueling outage and repairs at the Salem station in the year ago quarter which addressed the repair and replacement of baffle bolts at Salem 1 and repair of a transformer at Salem 2. The nuclear fleet's performance for the third quarter brought the capacity factor for the nine months ended September 30 to 95%.

As mentioned, cooler than normal weather limited energy pricing peak demand requirements and utilization of the gas-fired combined cycle and peaking fleet. Power's combined cycle fleet experienced a 29% decline in output to 3.7 terawatt hours, while an increase in the price of gas improved the competitive position of the base-load coal fleet.

As we indicated earlier this year, average hedge prices during the second, third and fourth quarters of the year were expected to decline by less than what we experienced in the first quarter and by less than the average decline of $5 per megawatt hours we anticipated for the full year. This reflects the absence of weather related risk premium during the winter months that was experienced in prior years.

Gas prices improved in the third quarter, but since power prices didn't move in conjunction with gas, spark spreads declined relative to year ago levels. Power's realized spark spreads held up better than the market declining $1 per megawatt hour quarter-over-quarter given its beneficial gas supply position. And Power's beneficial gas supply position also held gross margins in the quarter to a decline of $1.50 per megawatt hour to $40 per megawatt hour.

Power continues to forecast output for 2017 of 49 terawatt hours to 50 terawatt hours, approximately 86% of production for the remainder of the year of approximately 11 terawatt hours. It's hedged at an average price of $45 per megawatt hour. Power is hedged approximately 70% to 75% of 2018's forecast output of 52 terawatt hours to 54 terawatt hours at an average price of $41 per megawatt hour. And for 2019, Power has hedged 30% to 35% forecast output of 58 terawatt hours to 60 terawatt hours at an average price of $39 per megawatt hour.

The average price for energy hedged in 2019 is $2 per megawatt hour lower than our prior forecast and the reduction reflects a decline in market prices. The forecast of output for 2018 and 2019 remains unchanged from prior estimates.

Forecasted increase in output in both 2018 and 2019 reflects the commercial startup in mid-2018 of 1,300 megawatts of new gas-fired combined cycle capacity at the Keys Energy Center in Maryland and at Sewaren in New Jersey. And the forecast increase is also supported by the commercial start-up in mid 2019 of the 485 megawatt gas-fired combined cycle facility in Bridgeport Harbor, Connecticut.

Our forecast of Power's full year 2017 non-GAAP operating earnings remains unchanged at $435 million to $510 million. The forecast represents non-GAAP adjusted EBITDA of $1.080 billion to $1.210 billion.

Now let me turn briefly to PSEG Enterprise and Other, which reported net income of $0.02 per share for the third quarter of 2017, compared with a net loss of $0.13 per share for the third quarter of 2016. Results for the third quarter of 2016 were impacted by the impairment of the REMA leases. Non-GAAP operating earnings for the third quarter of 2017 were $0.02 per share, compared with non-GAAP operating earnings of $0.04 per share for the third quarter of 2016.

The decrease in non-GAAP operating earnings quarter-over-quarter reflects the absence of certain tax items recognized in the third quarter of 2016, as well as higher interest expense at the parent, and the forecast for Enterprise and Other for the full year of 2017 non-GAAP operating earnings remains unchanged at $35 million.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14938

PSEG also closed the quarter ended September of 2017 with $287 million of cash on its balance sheet, and with debt at the end of the quarter representing approximately 49% of consolidated capital. PSEG Power had debt at the end of the quarter representing 31% of capital. And as Ralph mentioned, we're maintaining our guidance for 2017 non-GAAP operating earnings of $2.80 to $3 per share.

And Shelby, we're now ready to take questions.

Q&A

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. [Operator Instructions] Your first question comes from Julien Smith from Bank of America Merrill Lynch.

<Q - Julien Dumoulin-Smith>: Hey, good morning.

<A - Ralph Izzo>: Hi, Julien. Welcome back to the fray.

<Q - Julien Dumoulin-Smith>: Thank you so much. I appreciate it. So, perhaps just to kick it off a little bit here on the New Jersey and some of the background of the politics here, I'd be curious, one, do you think there is potential for reform in New Jersey just given what's already going on at the FERC level. And then secondly in that same vein of thinking, how do you think about the potential for a more comprehensive review of energy next year. Obviously, there is some considerations with respect to solar in addition to the nuclear issues that you've addressed as well as just your ongoing utility spend and the extension and expansion of those programs. So to the extent to which that legislation might be a fix for all, I'd be curious how that might be shaping up?

<A - Ralph Izzo>: Sure, Julien. Yeah. I do think that depending on what happens at the federal level there remains the opportunity for New Jersey to recognize certain attributes that perhaps are not explicitly identified at the federal level, to the extent that the federal level does recognize the same attributes, then you would not have redundant programs. So, an example of that might be you could have price formation improvements at the federal level just to make the market more efficient sort of along the lines of what PJM has talked about within flexible units, and that doesn't do anything explicitly for fuel diversity or resiliency and therefore, New Jersey could have an overlay on top of that.

Similarly, fuel diversity versus carbon would be mutually exclusive. But if both jurisdictions recognized carbon, then you would not have two programs overlapping each other, those are just types of examples I would think about in terms of state and federal programs being complementary versus redundant.

To your second question, whenever you have a change in administration and as you implied, Governor Christie is term limited, now he's finishing his second term, there's a desire on the part of the new incoming administration to establish themselves in various ways, it could be environmental, it could be the economy, it could be education and both candidates have talked about their desire to look at things a little bit differently when it comes to energy policy, discussions about RGGI and green energy targets. And, as we've done for 110 years, we absolutely will work with the incoming administration to understand their policy objectives and inform them as to the implications, both positive and negative, of whatever wants to be done, because as we know things cost money to do. But if the benefits outweigh the cost, then we're eager to help them to pursue it. So, yes, we will work closely with whoever the new Governor is to help them formulate and execute their energy policy.

Lastly, I think you're correct in your, if I could say, implicit remark that an ongoing investment in the infrastructure is something that no matter who comes into office will probably be supportive of. And I do think that's correct. There's a widespread recognition on the part of regulators and policymakers that we have an aging infrastructure that's not perfectly suited for the growing dependency that people have on electricity nowadays, and the improvements we're making we'll certainly continue to propose them and I think we'll be well received.

final
Bloomberg Transcript
Bloomberg

<Q - Julien Dumoulin-Smith>: Excellent. Thank you for that. Just a follow-up. Again, congratulations on moving higher within your range here at the top end on the rate base side. Can you talk about reconciling that against earnings and some of the key factors that might be relevant in the current rate case and/or through the current period just in an attempt to reconcile the rate base trajectory against kind of hitting the upper end of that earnings? Perhaps items might include like an authorized equity ratio or other deferred items in the context of this case that we should be paying attention to once it's filed?

<A - Ralph Izzo>: Yeah. So our last base rate case was in 2010, and we've done a very good job of controlling O&M expense, but circumstances have conspired against us by having a complete absence of load growth over that time. So even a very good job of controlling O&M expense loses out to no load growth. We've also, as you know, had some of our clauses anticipate this rate case. So we had some unrecovered CapEx and we've had some modest investment levels above depreciation that serve to build the rate base to levels that were not commensurate with what was in the 2010 rate case.

That's a really longwinded way of saying we need some rate relief, but we've managed our overall portfolio well enough that we are describing this as a kind of middle single-digit type of rate increase, which will be far below the compounding of CPI over the last seven years that one might otherwise have expected. So I think it'll be something that is easily explained.

Now the 7% to 9% CAGR in rate base is more a prospective conversation. My last three minutes was really looking in the rearview mirror, but now as I look out the windshield, basically we have, as you know, in our 7% number programs that were wholly approved and the 7% to 9% number anticipated some fairly high degree of confidence in some program extensions.

And I think what you're hearing in our voices today is that that confidence has grown as we've been able to put our engineers to work and understand some of the parts of the system, both gas and electric, that need strengthening. So as you think ahead to earnings, and as you know we don't forecast earnings beyond the current year, the three levers you have in the regulated utility are, earnings grow with load. I think, Kathleen or Dan, we're seeing 0.4%, 0.5% is the forecast...

<A - Daniel J. Cregg>: Within the last 12 months, that's about right, yeah.

<A - Ralph Izzo>: And then you subtract from that O&M, we've been pretty good at controlling that, and you add to that the clauses that we expect to get recovery of. So it's two additions and one subtraction and you'll get pretty close to what the utility should look like in the coming five years.

<Q - Julien Dumoulin-Smith>: Got it. So let me just make sure what I'm hearing you say is it shouldn't be all that different, notwithstanding any kind of uncertainties with respect to the case...

<A - Ralph Izzo>: Yeah, I think that's correct within the limitation of – as you know, we don't smooth for pension. So some massive change in pension funding – which we don't expect. We're 92% funded right now, but the equity ratio could be adjusted in the case to – we're probably going to ask for a skoch more – is that a word? – a bit more than we used to have in the past. And so – yeah, the case could set a new base from which that upper end of the 7% to 9% can grow.

<Q - Julien Dumoulin-Smith>: Excellent. All right. I'll leave it there. Thank you all very much. Good luck.

<A - Ralph Izzo>: Thanks Julien.

Operator

Our next question comes from Praful Mehta of Citigroup.

<Q - Praful Mehta>: Thanks so much. Hi, guys.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14940

<A - Daniel J. Cregg>: Hi, Praful.

<A - Ralph Izzo>: Hey, Praful.

<Q - Praful Mehta>: So I got the point on the SEGS and the DOE being mutually exclusive. Just wanted to understand given, Ralph, your initial comments on the DOE initiative, how do you see it playing out? Like do you see it as a $1 per megawatt, $1 per megawatt hour? How do you see that actually playing out and do you see that – how much in terms of benefit do you expect for your facilities?

<A - Ralph Izzo>: Yeah. So, Praful, so of course – boy, I wish I could answer that with definitiveness, but let me answer it with the way which we proposed that it be played out, which may or may not have any bearing with what actually happens. In our comments to FERC, we basically said, first of all, bringing PJM in under Section 206 to do what PJM says needs to be done is a no-brainer. So the inflexible unit treatment, the fast-start reforms, that is long overdue and needs to be done. And that is the easy part. Others have estimated that could be anywhere from $2 to $4 per megawatt hour. Others have estimated that.

Secondly, as this specifically pertains to the DOE recommendations put forth in NOPR, we have pointed out that there is a substantial portion of PJM that is competitively positioned in the market but yet receives cost of service rates from their state regulators. And on an interim basis that can be replicated at the federal level through a version of RMR type – Reliability Must-Run type – contracts for the units that are at risk of premature retirement. That would be an interim solution, until one comes up with a market-based solution that values the diversity associated with these different fuel types.

We have proposed one method that relates to tranching of the capacity markets. Others have proposed methods that relate to scarcity pricing in energy markets for different fuels, but that permanent solution will involve a longer discussion with affected stakeholders. So really it's three steps. It's 'hey, there is plenty of evidence already that fast-start and inflexible unit price formation needs to be fixed now and can happen now. An interim solution for at risk of premature retirement using a cost-of-service methodology can be put in place very easily. And then the longer term market-based solutions. There are known solutions and options that people can pursue, but a more fulsome discussion would not be inappropriate in that regard.

<Q - Praful Mehta>: Got you. That's very helpful color, Ralph. And secondly, in terms of long-term views, I know you've talked about long-term, the generation business probably not being a part of the consolidated business over the long-term. Now given what's happening with the IPP space and either companies going public or shrinking given the mergers, how do you see that playing out? Has that changed in any way? Do you now see PEG Power being more a part of the business going forward or has that – the view on separation still hold at this point?

<A - Ralph Izzo>: No. The view still holds, but I think it's pretty obvious to us at least that right now in the short-term with all of the conversations taking place at FERC, at DOE, at the state, with new entrants being formed and anticipating the Vistra-Dynegy combination, with old entrants exiting in terms of public markets, anticipating Calpine going private, I think this is a good time to just sort of wait and let some things settle out a bit, right.

So we're in a great shape. Power is a cash generator and earnings producer, and in about 15 months Power will be a healthy free cash flow generator. The utility has an insatiable appetite for that cash. So we're not in any hurry during this period of tremendous change. All healthy, all very healthy, given the dialogs taking place at FERC and given the dialog taking place at the states to let it kind of play out while we enjoy the benefits of the two companies being together. That doesn't change the fact that we continually assess our strategic flexibility going forward on whether these two businesses belong together or not, and I stand by my prior belief that I think over the long-term they do diverge.

<Q - Praful Mehta>: Got you. And just to be clear, that time of change is what a two year, three year period while all of this kind of settles down? You see ...

<A - Ralph Izzo>: You know, I did make that mistake about three years or four years ago, and I may not be the smartest person in the world, but I do learn from those mistakes. I'm not going to give you – nice try though, Praful.

<Q - Praful Mehta>: All right. Thanks, guys.

<A - Ralph Izzo>: Kathleen started like choking me, so my voice broke a little bit. That's sort of the reason.

<Q - Praful Mehta>: Thank you, guys.

<A - Ralph Izzo>: Cool.

Operator

Your next question comes from Greg Gordon of Evercore ISI.

<Q - Kevin Prior>: Hey it's, Kevin, good morning.

<A - Ralph Izzo>: Hey, Kevin, good morning.

<Q - Kevin Prior>: I just wanted to see if you could quantify the uplift in PJM price reform as it's currently being contemplated?

<A - Ralph Izzo>: So, Kevin, what we quoted is what other sources have talked about. If you just take Dan's comments about 55 terawatt hours, every dollar's worth, $55 million pre-tax. So if it's $2 to $4, yeah. But I just strung three if statements in there, so please be aware of that. You come up with the impact on us. Dan, did you want to add some color there?

<A - Daniel J. Cregg>: No, I mean, I think that's right. I think there's been an awful lot of people that have put out some numbers on it, and they've actually coalesced around that range pretty tightly. So we'll see as these different initiatives get done, what it ends up looking like, but I think that seems to be a reasonable place a lot of the components are at and we think it's pretty reasonable as well, Kevin.

<Q - Kevin Prior>: Okay. So now how would that impact your hedging? Would you like hedge less or stop hedging '19, if you start to see progress? Or how do you think about that?

<A - Ralph Izzo>: So we have constantly disciplined ourselves to staying within a certain range in terms of how much we hedge. We have various parameters, gross margin at risk, standard VAR calculations. We do allow our ER&T folks, our trading organization to float high and low in that range depending upon what's going on. To the extent that the whole market anticipates price formation, you should start seeing that in the forward price curve and therefore our hedging approach would stay the same. We do challenge ourselves if we think the market is missing something to make darn sure that we can figure out why the market would be missing it before we would push one boundary or another. But in general, we'll run the place to where we always have, which is to not assume we're smarter than the market, and to just stay within those limits. But again, those limits are a range and we do let our folks have some flexibility within that range.

<Q - Kevin Prior>: Okay, great. Thanks a lot.

Operator

[Operator Instructions] Your next question comes from Christopher Turnure of JPMorgan.

<Q - Christopher James Turnure>: Good morning, guys. I wanted to get maybe a little bit more detail on the rate case, the test year, and in particular kind of the true-up and what's included in that. I guess that would kind of be a third quarter event after the test year ends on June 30. But I'm just trying to get a sense as to how next year will shape up there, and what the rate case will ultimately include in terms of timing coming out of the gate?

<A - Ralph Izzo>: Yeah, so, Chris, so we had originally planned to file November 1 per the agreement we made back in May 2014 coming out of Energy Strong. There was a widespread recognition that that would be a two and ten, and there was preference for three months of actuals and nine months of forecast as opposed to two months of actuals and

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14942

10 months of forecast, and that was the primary driver behind the one-month delay, if you will. So there is nothing mythical or profound going on there.

So the test year still ends in June '18.As I've mentioned before, we're expecting a mid-single digit requested increase that will still keep rates below where they were in 2010 when we had our last base rate case. Remember we have $250 million of GSMP stipulated rate base that was not covered by GSMP. We have about a $100 million of Energy Strong above the $1 billion that was in the clause. We have storm recovery cost that's I think $200 something million that was being prudent but hasn't been returned to us yet. We have some new business that added to the CapEx. And candidly we had some additional capital that was above depreciation levels that we've accumulated over the course of the year.

So we would anticipate rates going into effect October, November of next year, and I don't want to front-run the filing, we owe to the board's staff, so let them be the first front-run the filing. We owe it to the board staff to let them be the first ones to read the details. But Dan, if you want add any color to that?

<A - Daniel J. Cregg>: Yeah, just one thing, Chris. It sounded like your question was implying there would be a rate case and then there would be a true-up afterwards. And the way that we've described the rate case is basically it is a truing up of a host of the things that Ralph just talked about. So we will come out of the rate case with the rates that are set within that case. And historically, we've seen a settlement in these cases in the state, and that may well be where it ends up going, but we'll see.

We would look for rates next fall. Usually these have taken about a year, and we would hope to anticipate that we could get rates maybe in like the October range. But it's a little different than our transmission formula rate, which is filed. Those rates go into effect for the following year, and then there is a separate true-up that happens the year after that. So just for clarity sake, there is no true-up after the rate case. The rate case itself will true-up our distribution rates, and we would anticipate the new rates would be in effect, say, October of next year.

<A - Ralph Izzo>: And just for clarity, I think most of you know, our rate base is roughly half transmission and half distribution right now. So a tiny bit more distribution.

<Q - Christopher James Turnure>: Okay. That was all very helpful context and everything, but that's kind of what I was driving out there towards the end, Dan, just that the distribution rate case itself would have a nine-month forecasted test year, but that itself would never be trued-up during the rate case process?

<A - Daniel J. Cregg>: Yeah. So the nine months, so it'll be a 12-month test year, and it will start with three months of actuals and nine months of forecast. And then as we step through, we'll update those as we go forward.

<Q - Christopher James Turnure>: Okay. So you would have some update on...

<A - Daniel J. Cregg>: Yeah.

<Q - Christopher James Turnure>: ... on O&M or load or something during the process?

<A - Daniel J. Cregg>: Yeah, yeah.

<Q - Christopher James Turnure>: Okay, got you. And then just on the request for decoupling, can you help put that into context for me just kind of understanding your motivation for that and maybe how you think it may or may not be perceived by interveners?

<A - Ralph Izzo>: Yeah, Chris, so we've had a series of energy efficiency filings approved over the past seven or so years. I think they've in total amounted to about $400 million, most recent one was $69 million this past summer. And we have basically worked around this issue of fixed cost recovery with the stakeholders in these processes. And it's kept us from doing something in a much grander scale, and we've simply decided that with the prospect of a new administration coming in, an ongoing indication that there are market imperfections that keep customers from investing in energy efficiency, despite the compelling economics of that, that we would like to do this in a much, much more significant way. But we're not going to do it and suffer fixed cost losses in the absence of recovery of fixed costs.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14943

So given the tariff redesign involved with decoupling, we thought, well, since we're going in for rate case, now is a good time to raise the issue. And that's the motivation. The motivation really is not so much this rate case but the rate case as an opportunity to pave the way for significant energy efficiency proposals early next year.

<Q - Christopher James Turnure>: Okay, great. Thanks, Ralph.

Operator

Your next question comes from Travis Miller of Morningstar, Inc.

<Q - Travis Miller>: Good morning. Thank you.

<A - Ralph Izzo>: Hi, Travis.

<A - Daniel J. Cregg>: Hi, Travis.

<Q - Travis Miller>: I was wondering if we can boil down all of these power market issues into two buckets, the price formation bucket and the fuel diversity bucket, how do you think about the next two years to three years, perhaps even more, of capital investment based on what happens in either of those two buckets. So what happens to capital investment depending on the outcome of price formation, what happens to capital investment based on the outcome in fuel diversity?

<A - Ralph Izzo>: I can tell you what it means for us, Travis. We're not deploying additional capital into the power generation business. We have 1,800 megawatts of 6,000 to 6,500 heat rate power plants coming online, and we're quite happy with that. At the risk of speaking for others, which is always going to be wrong, you know that PJM in particular and many other markets are in an oversupply situation and there's been reasonable demonstration of capital discipline in the most recent auctions that have taken place.

So, I think that the supply/demand imbalance that exists is a separate issue that will continue in part by capital discipline, and the price formation issue is just the recognition that if you want a market to be efficient, then price should determine who runs and who doesn't, and you can't keep having uplift payments and sidebar out of market payments, guiding the dispatch of the system, which is what PJM has going on right now. I mean price is not the sole determinant of how the system is dispatched, then that's not a market, so that needs to be fixed. So two separate issues that I guess is what I am saying.

<Q - Travis Miller>: Okay. Then could I reason that that you don't think there would be much capital investment in general across certainly the PJM region, however this turns out?

<A - Ralph Izzo>: I think you could without question read into it that that's our point of view, again I don't want to speak for others. But I know what our capital plans are, and it's to finish these three projects and generate some healthy free cash flow for the utility.

<Q - Travis Miller>: Sure. Sure. Okay. All my other questions are asked and answered. Thank you.

Operator

Your next question comes from Paul Patterson of Glenrock Associates.

<Q - Paul Patterson>: I'm sorry, can you hear me.

<A - Ralph Izzo>: Sure, Paul. Yeah we can...

<Q - Paul Patterson>: Sorry about that. So just to sort of follow up on Travis' question. What we often see with these market reforms is that others seem to deploy capital. And I'm just wondering when you see this $2 to $4 price increase with price formation, we're potentially seeing that, how long term do you think that would be or is the proposal – it's

final
Bloomberg Transcript
Bloomberg

hard for me to really completely get my arms around it, is it such that you would still see location marginal pricing being set by inflexible units even with new entry showing up in the gas-fired area if you follow me. I mean how should we think about sort of the sustainability of something like price formation given what we've seen quite frankly with the capacity markets and other "market reforms" to change the price if you follow me?

<A - Ralph Izzo>: Paul, I mean that's fair. I think that one has to realize that there is cyclicality in these markets that have different periodicity associated with them, right. The cyclicality in fuel prices, the cyclicality in boom-bust cycles associated with oversupply and undersupply, the cyclicality in oversupply and undersupply is determined by power plants being built, as determined by pipelines being built. So to simply say that price formation will drive prices up $3 picking the midpoint in the range that Dan and I talked about, which we don't attest to, but simply quote from others. And then automatically, concluding that that's going to lead to people running the numbers and assuming that that number stays there in and after they build plants could be a little bit risky, right? I mean what does it mean for the timing of pipelines that may change the basis differential of gas in Western PJM versus Eastern PJM?

What does it mean for future carbon constraints that may or may not be part of a subsequent administration in Washington? I think some people on this call may want to go see their children in their Halloween Parades, otherwise I'd list a 1,000 other factors that should be going to people's thought-process before making those kind of investment decisions.

<Q - Paul Patterson>: Okay.

<A - Daniel J. Cregg>: It's just a matter of how you place it ahead of that market that is working better by virtue of some of the changes that need to be made is going to get you to a better answer.

<Q - Paul Patterson>: Okay. And then with respect to the DOE proposal, I know this is kind of sort of a moon shot question, I guess maybe, but I mean how much assets should we think about it being potentially – if it were to be enacted for you guys, I mean how should we think about what the potential impact might be there? I mean just how do we sort of quantify that, if that were to – I mean I know it's kind of a hard question maybe to answer, but I mean how would you suggest we think about it?

<A - Daniel J. Cregg>: I think Paul the way I will break it down is based upon how the DOE describe the eligibility. And one of the main ones is having 90 days of fuel onsite. And if you think about, what that means that means our nuclear facilities certainly, and it means our small interest in Keystone and Conemaugh.

<Q - Paul Patterson>: So, all those units would theoretically be able to get a rate of return, rate base of what you're getting at the utility kind of thing?

<A - Daniel J. Cregg>: We'll see ultimately where the NOPR goes with it, but certainly from an eligibility standpoint, those are the units that would come to mind.

<Q - Paul Patterson>: Okay. And, I guess, we don't have – do we have like what the asset or what the rate base number would be kind of, if you follow me, associated with that, do you follow what I'm saying?

<A - Daniel J. Cregg>: Yeah. I mean there's a little bit of data related to some of the nuclear facilities in the Q, but it's not on an asset-by-asset basis from a book value perspective.

<Q - Paul Patterson>: Okay. Well, I'll follow up afterwards, I mean I just was wondering, I was just curious if you had some sort of idea there, but I don't want to hold it up. Thank you so much. Have a great one.

<A - Daniel J. Cregg>: Yeah.

Operator

[Operator Instructions] Your next question comes from Michael Lapides of Goldman Sachs.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14945

<Q - Michael Lapides>: Hi. Hey, guys. Easy question, on your 2017 CapEx guidance, the reduction of $300 million. Can you give a little more detail about what's moving and does that get put back into a future year's CapEx, and if so how far out in the future?

<A - Daniel J. Cregg>: Yeah, Michael. So it's a little bit of a split. I think we had referenced there were a couple of things that were going on related to the total, some is frankly just doing some work more efficiently and I think the majority that is on Energy Strong. You heard Ralph talk a little bit earlier about $1 billion going through the clause and about $100 million that will await the rate case, and you remember it's about a $1.2 billion program. So frankly some of that work was done more efficiently and I think that's a great outcome and it's great for customers, and we're pleased to be able to do it that way. And we've had a little bit of the same on transmission, not a whole lot.

And then the balance really is timing and the timing is not anything that's going to move dollars out three, four, five years. It's just moving 2017 out into 2018. So, in the aggregate, if you think of it maybe about half and half, half being just efficiencies that we brought to the process, and about half being some capital that will move into next year.

<Q - Michael Lapides>: So, when you think about efficiencies, if I did half and half, reducing CapEx over the cycle by about $150 million and pushing out $150 million in the next year, kind of that ballpark?

<A - Daniel J. Cregg>: Yeah. If you think about the $3.1 billion versus $3.4 billion that we talked about, that's about right. Yeah.

<Q - Michael Lapides>: Got it. Okay.

<A - Ralph Izzo>: But that trend towards the upper end of the rate base growth for 2021 includes all of that thinking.

<A - Daniel J. Cregg>: Right.

<Q - Michael Lapides>: Got it. Okay. And then one other, just thinking about transmission rate base growth and transmission capital needs, and kind of how you're thinking about whether there is any lumpiness in some of what PJM is trying to plan around, given what happened with the Con Ed wheel. How are you thinking about just whether there are any lumpy or larger scale projects coming down the pike for transmission or is it all going to be just lots and lots and lots of kind of small and mid-sized ones?

<A - Daniel J. Cregg>: Yeah, it's more the latter than the former. I think if you had gone back three or four years you would have found more bigger, lumpier projects; a fair bit of what we are spending now is on 69kV upgrades of 26kV systems and that actually moves capital from the distribution area into transmission as it goes up in voltage. And those are smaller – now a lot of them are still sizable projects, but smaller than for instance a Susquehanna-Roseland type of project that we've talked about in the past. So, there are more smaller projects as opposed to fewer larger projects that we've seen in the past that will move us forward.

And in fact as we think about our 2018 revenue number that we talked about even within our prepared remarks, some of what you see there, it's a step up from what we have seen in some prior years, even if you look back to last year, there's a pretty sizable step up in the amount. Some of that is incremental capital year-over-year, and both the return on that capital and the depreciation, the return of that capital will contribute to some of that increase. But you may recall last year, part of the number that we had from a revenue increase was inclusive of a true-up, and that true -up was related to bonus depreciation. So a couple of years back, the bonus depreciation extension took place – I don't think it was December 31, but it was awfully close to that, and it was certainly after we had filed our October formula rate filing. So the impact of bonus depreciation in 2015, getting it approved, moved into 2016 after we had set our rates. And a true-up in 2017 included the reduction in rate base for those excess deferred taxes for bonus depreciation. So on a year-over-year basis, you'll see a jump and a lot of that had to do with the fact that 2017 had a true-up reducing revenues for transmission related to that late enactment of bonus depreciation back in 2015.

<Q - Michael Lapides>: Got it, guys. Thank you, much appreciated. Maybe one last one, O&M at the utility has been very strong, meaning you've reduced O&M this year, how much of that is just one-off stuff related to maybe storms in 2016? And how much of that is kind of active O&M management?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14946

<A - Daniel J. Cregg>: It's the latter, it's active O&M management, and we've kept O&M to a very manageable rate over, frankly, the last number of years, and we'd look to continue to do so going forward.

<Q - Michael Lapides>: Got it. Thanks Dan. Much appreciated.

<A - Daniel J. Cregg>: Thanks, Michael.

Operator

Your next question comes from Jonathan Arnold of Deutsche Bank.

<Q - Jonathan Philip Arnold>: Hey, good morning, guys.

<A - Ralph Izzo>: Hi, Jonathan.

<A - Daniel J. Cregg>: Good morning, Jonathan.

<Q - Jonathan Philip Arnold>: Just one on the hedging data. You mentioned that you'd had a $2 downtick in the average price to $39 for 2019 and the hedge amount only ticked up by 5%. Can you just remind us, does that include an estimate of the pricing on the open position or is that just the average price on the hedge piece?

<A - Daniel J. Cregg>: It's the latter, Jonathan.

<Q - Jonathan Philip Arnold>: Okay.

<Q - Jonathan Philip Arnold>: So, then, I guess, following from that, over the last four quarters, it's ticked down from $43 to $39, and the hedging has gone from $15 to $30. How do we reconcile that math?

<A - Daniel J. Cregg>: I think if you take a look at what the 2019 forwards have looked like over that period, you've been in a $29, $30 rate, and what you're doing is you're pulling down from a BGS price in those out years, which is exclusive of the capacity components, but inclusive of the others. So it's not an unusual trend that we start in the out year of our three-year cycle with BGS and then we layer-on flat block hedges as well as some other low deals and those flat block hedges tend to come in at lower prices in part because the curve has come down.

<Q - Jonathan Philip Arnold>: Right.

<A - Daniel J. Cregg>: But also because they're energy only hedges.

<Q - Jonathan Philip Arnold>: Okay. So, sort of two things going on there. And but also the curve is sort of traded off in the quarter, and then recovered a couple of dollar cents. Is it fair to say these were sort of down in the heart of the third quarter or can you give us any sense there?

<A - Daniel J. Cregg>: Yes, during the quarter, since our last update.

<Q - Jonathan Philip Arnold>: Okay. And then one other thing, just on Enterprises, and your guidance for 2017, this $35 million number, is that still sort of the right ballpark going forward?

<A - Daniel J. Cregg>: Yep, yep. That's right.

<Q - Jonathan Philip Arnold>: Okay. I think that's it. Thank you.

<A - Daniel J. Cregg>: Excellent. Thanks, Jonathan.

<A - Ralph Izzo>: Thanks, Jonathan.

<A - Kathleen A. Lally>: I'm sorry, we have one more question, otherwise, I know we've gone over our allotted hour's time, but I don't want to cut anybody off with the significant questions. So we'll allow one more question.

final
Bloomberg Transcript
Bloomberg

Operator

Okay. Your final question comes from Ashar Khan of Veratan (sic) [Visium].

<Q - Ashar Hasan Khan>: Hi. How are you guys doing?

<A - Ralph Izzo>: Great, Ashar.

<Q - Ashar Hasan Khan>: Can I just ask you Ralph, can you just talk a little bit about the legislation, when we should kind of expect it or what should we expect in the last two months starting tomorrow, I guess, November starts works in? And then, I just had one more question from Cregg was that, could you remind us how much of the transmission increase went into effect on January 1 of this year. You said you are going to request something like $212 million, right, January 1 of 2018. Could you remind us what that amount was for January 1 of 2017?

<A - Ralph Izzo>: So, Ashar, we are just in a series of conversations with people right now. We're just making sure they understand, what our nuclear plants mean to New Jersey. And yes, it is true that if New Jersey were to build a safety net, so as to guarantee or assure the continued operation of those plants that would require legislation, but anything more than that would be premature to discuss, right. So there's just a lot of conversations that we're having with folks to say, if those plants weren't here, here is what happens, so. And in 2017, Dan?

<A - Daniel J. Cregg>: Yeah, 2017 was $121 million and that was down off of the last couple of years, which is $146 million and $182 million, so it's moved around a fair bit, a lot of that is the bonus depreciation item that I talked about earlier.

<Q - Ashar Hasan Khan>: So from $121 million we are now going to like $212 million, right, am I correct?

<A - Daniel J. Cregg>: That's right.

<Q - Ashar Hasan Khan>: Thank you so much.

Ralph Izzo

So just to summarize what hopefully you heard from me and Dan this morning, our power plant construction is on budget, and on schedule, three power plants that we hope to have online in June of next year and the subsequent June. We have a very healthy dialog that we are active participants and going on underway on wholesale power market design and reform, taking place at FERC, at DOE and at the state level. For the utility, we're now pointing towards the upper end of rate base growth at 7% to 9% range, we're now thinking we'll be able to hit that upper end of the range between now and 2021. We have a very busy, but a constructive regulatory agenda coming up for PSE&G. We have GSMP in play, we have a rate case, we'll have Energy Strong 2 in the near term and longer term some energy efficiency. And we're happy to go over all of that and then some with you at EEI next week. I know we have a full set of meetings set up and if you're not on a meeting schedule, I'm sure you can corner one of us in the hallway. They wouldn't let me say it at the beginning of the script, but I wish everybody a Happy Halloween now and have a great holiday and a safe day. Thank you. We'll see you all next week.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Jamie, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group Second Quarter 2017 Earnings Conference Call and Webcast. [Operator Instructions]

As a reminder, this conference is being recorded, Friday, July 28, 2017, and will be available for telephone replay beginning at 1:00 PM Eastern Time today until 11:30 PM Eastern on Friday, August 4, 2017. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Jamie. Good morning. Thank you, everyone, for participating in our earnings call this morning. As mentioned, PSEG released earnings statement for the second quarter 2017 earlier today, and you will find the release and attachments on our website, www.pseg.com, under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended June 30, 2017 is expected to be filed shortly.

As you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. And although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if our estimate changes unless required to do so.

We also provide commentary with regard to the difference between non-GAAP operating earnings and non-GAAP adjusted EBITDA and net income reported in accordance with generally accepted accounting principles in the United States. We won't go through the full disclaimer statements or the comments we have on the difference between

Bloomberg Transcript

non-GAAP financial measures, but I do ask that you read those comments contained in our slides and on our website.

PSEG believes that the non-GAAP financial measures providing information on operating earnings and adjusted EBITDA offers a consistent and comparable measure of performance to help shareholders understand the operating and financial results.

Now I'd like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions. Thank you.

Ralph Izzo

Thank you, Kathleen, and thank you, everyone, for joining us today. PSEG delivered solid results to the second quarter and has had a good first half, putting us on a solid path to meeting our full-year objectives. Earlier this morning, we reported net income for the quarter of $0.22 per share. PSEG's non-GAAP operating earnings for the second quarter of 2017 increased 9% against the prior-year comparable quarter, reflecting strong performance at both PSE&G and PSEG Power.

The results for the quarter bring non-GAAP operating earnings for the first half of 2017 to $1.54 per share, which is a 4% increase over non-GAAP operating earnings of $1.48 per share earned in 2016's first half.

Slides 5 and 6 contain the detail on the results for the quarter and the first half. At PSE&G, earnings increased $0.06 per share from the prior year comparable quarter. Continued infrastructure investment was the primary driver of this growth. PSE&G's focus remains on providing customers with what they want in terms of enhanced reliability, resiliency and green energy, while keeping bills affordable.

PSE&G continues to make progress in its 2017 plan to invest approximately $3.4 billion in transmission and distribution upgrades. The investment will allow PSE&G to meet its commitment to provide customers with high quality service.

Yesterday, PSE&G filed for continuation and acceleration of its Gas System Modernization Program. PSE&G is proposing to invest $540 million per year over a five-year period beginning in 2019. The program would allow PSE&G to shorten to within 20 years the replacement of its aging cast iron and unprotected steel mains and associated services. The filing is consistent with the draft regulations that the BPU issued in June regarding infrastructure investment programs. We applaud the BPU's efforts in this regard.

While PSE&G has received approval from the BPU for several multiyear investment programs in recent years, they have generally been two to three years in duration, limiting the opportunity to expand as efficiently as we could with longer term programs. The BPU's infrastructure investment proposal would address this, encouraging needed infrastructure investment through timely recovery of investments and providing increased predictability by expansion of the investment time horizons of five years. The longer timeframe provides for better planning with contractors, vendors, municipalities where the work takes place, our own workforce, and of course, helps to promote economic growth in the state of New Jersey.

PSE&G has made progress advancing its investment initiatives. Earlier this week, PSE&G reached an agreement in principle with the BPU Staff and Rate Counsel, which provides for a $69 million extension of its investment in energy efficiency equipment for hospitals, multifamily housing and other sectors. The agreement represents more than 90% of PSE&G's original request and will bring PSE&G's cumulative investment in energy efficiency to approximately $400 million. We believe an investment in energy efficiency programs is a cost-effective tool to lower air emissions and control the growth in customer bills.

The work PSE&G has done in promoting solar energy in New Jersey was recently acknowledged by the Smart Electric Power Alliance, also referred to as SEPA, which named PSE&G the 2017 Investor Owned Utility of the Year. The award honors PSE&G for its ongoing commitment to increasing the amount of solar power in New Jersey and

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14951

specifically for its work to build solar farms on landfills and brownfield sites in the state.

PSE&G, as you know, will be filing a distribution base rate case with the New Jersey BPU no later than November 1 of this year. The timing of this filing was agreed to in the settlement of the Energy Strong Program. The case will provide PSE&G with the opportunity to reset assumptions on sales and O&M growth, as well as provide the opportunity to recover investments not recognized in various clauses since our last base rate proceeding, which was settled in 2010.

It will also give us the opportunity to recover prior approved storm costs. PSE&G, as part of the filing, will request approval for a decoupling of distribution revenue from sales volume to support larger-scale energy efficiency investments. We believe strongly that this latter action will incentivize continued investment in energy efficiency and help lower participating customer bills.

We expect PSE&G's initiatives to provide value for the customer and our shareholders. For the five-year period ending 2021, PSE&G's successful execution of its investment program is expected to result in compound annual growth in rate base of 7% to 9%.

At PSEG Power, non-GAAP operating earnings increased by 6% to $0.19 per share as ongoing programs to reduce operating expenses supported earnings. PSEG Power retired its Hudson and Mercer coal-fired generating stations on June 1 and made good progress on construction activities related to its three new natural gas combined cycle generation stations. The new stations will add 1,800 megawatts of efficient capacity over 2018 and 2019 and represents a reconfiguration of Power's merchant generation fleet that will improve its competitiveness in the market.

We've seen some improvement in energy pricing in the PS zone relative to the PJM West Hub. A higher gas price with the opening up of more outlets for gas supply and the completion of work on transmission lines has released congestion and improved energy prices in the East. Power's primary market in PJM has also experienced an improvement in capacity prices.

In May of this year, PJM announced the results of the RPM capacity auction for the 2020 and 2021 delivery year. Power cleared approximately 7,800 megawatts of its generating capacity at an average price of $174 per megawatt day. The average price received by Power was higher than prior auctions and continues to represent a premium to the price per capacity in the RTO. However, the number of megawatts, which cleared the auction, declined from the amount we have cleared in the past. Our results reflect the higher price resulting from the increased risk in the market associated with PJM's move to 100% capacity performance requirements, and the absence of available capacity to meet emergency situations following the retirement of Hudson and Mercer.

The results of the latest auction provide stability in Power's capacity revenue through calendar year 2020. The energy markets, on the other hand, continue to be impacted by a slight demand and excess capacity which has hurt the return on our base load resources, as the average price on energy hedges declines.

Power continues to advocate for policies at the federal level that would correct flaws in the wholesale market design that suppressed prices, and provide adequate recognition of the value that fuel diversity brings to a competitive wholesale market.

We believe that state action is also critical and can be done in a way that both maintains the integrity of the wholesale market, and serves as a bridge until a regional or federal solution is in place. A strong legal foundation for state action appears to have been set with recent district court rulings upholding the legislative and regulatory actions in Illinois and New York.

We continue to educate stakeholders at the state level about the need to preserve the diversity and resiliency of our electric generating mix. Successful execution of PSEG's key policy and regulatory initiatives would assure the company's ability to provide customers with the service, reliability and resiliencies they want and need at an affordable price in today's technologically-advanced society.

Our non-GAAP operating earnings for the first half of 2017 are solidly within our outlook for the full year. So, we are maintaining our guidance for 2017's non-GAAP operating earnings of $2.80 to $3 per share. We expect the growth prospects of PSE&G, the reconfiguration of our merchant-generating fleet and successful execution of our policy

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14952

initiatives will allow PSEG to extend its track record of delivering value for our customers and growth for our shareholders while we maintain a strong balance sheet and credit metrics.

With that, I'll turn the call over to Dan who will discuss our financials in greater detail.

Daniel J. Cregg

Thank you, Ralph and thanks, everybody for joining us today. As Ralph said, PSEG reported non-GAAP operating earnings for the second quarter of 2017 of $0.62 per share versus non-GAAP operating earnings of $0.57 per share in last year's second quarter. A reconciliation of non-GAAP operating earnings to net income for the quarter can be found on slide 4.

We've also provided you with a waterfall chart on slide 11 that takes you through the net changes in quarter-over-quarter non-GAAP operating earnings by major business and a similar chart on slide 13, which provides you the changes in non-GAAP operating earnings on a year-to-date basis.

I'll now review each company in more details starting with PSE&G. PSE&G reported net income for the second quarter of 2017 of $0.41 per share, compared with $0.35 per share for the second quarter of 2016. And results for the quarter is shown on slide 15.

PSE&G's operating results for the second quarter reflected benefits of revenue growth associated with its expanded investment and the continued control of growth and operating expenses. Growth in PSE&G's investment in transmission improved the second quarter net income comparisons by $0.04 per share. And revenue recovery from investments made to enhance system resiliency under the Energy Strong and Gas System Modernization Programs, GSMP, drove improved margin and second quarter net income comparisons by $0.02 per share. And an increase in depreciation expense is offset by a reduction in O&M and other expenses.

Recall the transmission revenues are adjusted each year to reflect an update of the company's investment program. PSE&G's investment in transmission is expected to grow to represent approximately $7.6 billion of rate base at the end of 2017, which will be 45% of the company's year-end consolidated rate base.

Under Energy Strong, electric rates are adjusted two times during the year in March and September and gas rates are adjusted each year in September. Under the Gas System Modernization Program, gas rates are adjusted each year in January to reflect the investment made during the prior year. The combined annual revenue increase in 2017 from these programs is forecasted to be approximately $56 million.

Economic conditions in New Jersey continue to show steady growth, particularly in the level of employment. On a trailing 12-month basis, weather-normalized electric sales were flat year-over-year due to the impact of increased deficiency in solar net metering, which offset customer growth.

Gas sales on the same basis were slightly higher with growth and demand from the commercial sector. PSE&G has had significant advances on a number of fronts. As mentioned by Ralph, the company filed earlier this week for an extension of the Gas System Modernization Program. This program, which calls for an average investment of $540 million per year, would accelerate the pace of replacement of aging cast iron and unprotected steel mains to 250 miles per year from the current GSMP pace of 170 miles per year.

In addition, PSE&G reached an agreement in principle with BPU Staff and Rate Counsel, which provides for $69 million increase in the company's investment in energy efficiency equipment for hospitals and multi-family housing, as well as for new residential energy efficiency offerings for smart thermostats and data analytics. The agreement calls for a 9.75% allowed ROE and is subject to review by the BPU in the near future.

PSE&G continues to advance its five-year $12.3 billion program in transmission and distribution, and continues to identify incremental investments. We expect to see growth in rate base through 2021 of 7% to 9% per year.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14953

Assumed within that $12.3 billion capital program is the extension of our existing GSMP program at the current rate of $300 million per year. Our filing yesterday reflecting investment of $540 million per year would increase our forecast capital program by investments made in excess of that $300 million per year amount. These important service quality-related initiatives build confidence in PSE&G's ability to extend its growth through its five-year capital cycle. Based on results for the first half of the year, the forecast of PSE&G's net income for 2017 remains unchanged at $945 million to $985 million.

Now let's turn to Power. PSEG Power reported a net loss for the quarter of $97 million or $0.19 per share compared with a net loss of $11 million or $0.02 per share for the year-ago quarter. Non-GAAP operating earnings was $0.19 per share and non-GAAP adjusted EBITDA was $261 million in the quarter, compared with non-GAAP operating earnings of $0.18 per share and non-GAAP adjusted EBITDA of $250 million for the second quarter of 2016. Non-GAAP adjusted EBITDA excludes the same items as our non-GAAP operating earnings measure, as well as income tax expense, interest expense and depreciation and amortization.

The earnings release and slide 20 provide you with a detailed analysis of the impact on Power's non-GAAP operating earnings quarter-over-quarter. We've also provided you with more detail on generation for the quarter and the first half of the year on slides 21 and 22.

Power's non-GAAP operating results for the second quarter of 2017 reflect the benefit of ongoing programs to reduce operating expenses and an increase in output, which offset a decline in average energy hedge prices.

PSEG Power's net loss for the second quarter reflects the impact of incremental depreciation and other expenses of $387 million pre-tax associated with the June 1, 2017 retirement of the Hudson and Mercer coal-fired generating stations. This incremental depreciation expense associated with the retirement of these units is now complete and will not continue into the second half of the year.

An increase in capacity prices in both PJM and New England on June 1 for the 2017/2018 energy year improved quarter-over-quarter non-GAAP operating earnings by $0.01 per share. Growth in output improved second quarter non-GAAP operating earnings comparisons by $0.01 per share, and a reduction in O&M associated with fewer nuclear and fossil unit outage-related days in the quarter and the June 1 retirement of the Hudson and Mercer coal stations improved non-GAAP operating earnings by $0.02 per share.

A decline in the average price received on energy hedges reduced non-GAAP operating earnings by $0.03 per share. And an increase in depreciation expense was offset by a decline in interest expense.

Power's O&M for the remainder of 2017 is expected to compare favorably against 2016. And this reflects the absence of a refueling outage at Power's 100%-owned Hope Creek nuclear station, a decline in major maintenance expense at the fossil stations and, of course, the retirement of Hudson and Mercer coal-fired generating stations.

Now let's turn to Power's operations. Output of Power's generating facilities increased 4% in the second quarter. The improvement reflects a 30-day reduction in nuclear refueling outage days in 2017 relative to the year-ago quarter, which improved the nuclear fleet's capacity factor to 89.6% from 82.7%.

And you may recall Salem 1 underwent an extended refueling outage in 2016 to inspect and replace that unit's baffle bolts. The outage lasted through the month of July and the work required during Salem 2's recent refueling outage to inspect and replace baffle bolt was less extensive and has been completed. And no further work associated with this issue at Salem is currently contemplated.

An increase in the price of gas improved the economic competitiveness of our base load coal fleet during the quarter. And during the quarter, that fleet saw an improvement in its capacity factor to 32.6% from 18.4%. Conversely, the gas-fired CCGT fleet operated at an average capacity factor of 55.3% versus 62.3% last year. As we indicated earlier this year, we experienced a more modest decline in our hedged energy pricing in the second quarter than in the first quarter, as weather related risk has not been priced into the market to the same extent as was experienced in prior years.

Gas prices have improved year-over-year, but we have not seen a similar improvement in Power prices, which has led to a compression in Western hub spark spreads. In the PS zone, spark spreads have held up relative to what we

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14954

experienced a year ago with an improvement in basis.

Power continues to forecast the output of 49 terawatt to 50 terawatt hours for 2017 and approximately 90% of production for the remainder of the year's hedge at an average price of $46 per megawatt hour. Power has hedged approximately 65% to 70% of 2018's forecast production of 52 terawatt to 54 terawatt hours at an average price of $41 per megawatt hour.

And for 2019, Power has hedged up to 30% of forecast production of 58 terawatt to 60 terawatt hours at an average price of $41 per megawatt hour. Power continues to assume deliveries in 2017 under the Basic Generation Service or BGS contract will represent approximately 11 terawatt hours of hedged volume. The forecast increase in output in both 2018 and 2019 reflects the commercial start-up in mid-2018 of 1,300 megawatts of gas-fired combined cycle capacity at the Keys Energy Center in Maryland and Sewaren facility in New Jersey, and the mid-2019 commercial startup of the 485-megawatt gas-fired combined cycle generation unit in Bridgeport Harbor, Connecticut.

Our forecast of Power's full year 2017 non-GAAP operating earnings remains unchanged at $435 million to $510 million and the forecast represents non-GAAP adjusted EBITDA of $1.80 billion to $1.210 billion.

Now, turning to PSEG Enterprise and Other, we reported a net loss of $2 million for the second quarter of 2017 versus net income of $19 million or $0.04 per share for the second quarter of 2016. Non-GAAP operating earnings for the second quarter of 2017 were $11 million or $0.02 per share compared to $19 million or $0.04 per share for the second quarter of 2016.

The net loss for the second quarter includes a pre-tax charge of $22 million related to ongoing liquidity challenges facing NRG REMA and deterioration in market conditions affecting the residual value of the leveraged lease portfolio. The decrease in non-GAAP operating earnings quarter-over-quarter reflects the absence of certain tax related items at PSEG Energy Holdings and higher parent interest expense.

Lastly, discussing our financial position. Our financial position remains strong. Moody's recent upgrade of PSEG's senior unsecured rating to Baa1 stable from Baa2 positive, a test to the strength of the balance sheet and the changing composition earnings with PSE&G forecast represent two-thirds of 2017's non-GAAP operating earnings.

PSEG closed the quarter ended June 30, 2017 with $430 million of cash on its balance sheet, with debt representing 49% of consolidated capital. PSEG Power's debt at the end of the quarter represented 31% of its capitalization, providing a debt-to-EBITDA ratio of 2.1 times at the midpoint of 2017's Power's non-GAAP adjusted EBITDA forecast.

As Ralph mentioned, we are maintaining our forecast of operating earnings for the full year at $2.80 to $3 per share. And Jamie, we are now ready to take your questions

Q&A

Operator

Ladies and gentlemen, we will now begin the question-and-answer session. [Operator Instructions] One moment please for the first question. First question is with Neel Mitra with Tudor Pickering. Please go ahead with your question.

<Q - Neel Mitra>: Hi. Good morning. I was wondering if you could comment on the dispute against the transmission ROE with the 11.68% base level. And then, basically, how it was redacted and how that process went. And if you anticipate any conflicts in the future, how we should kind of interpret that?

<A - Ralph Izzo>: Neil, I mean, three New Jersey towns did file and then they withdrew a couple of weeks later. We're not at liberty to disclose anything other than that. As you know, large customers always can challenge a lot of ROEs. But at this point, those are the only chance we've had.

Operator

The next question is from Jonathan Arnold with Deutsche Bank. Please proceed with your question.

<Q - Jonathan Philip Arnold>: Hi, guys.

<A - Ralph Izzo>: Hi, Jon.

<A - Daniel J. Cregg>: God morning, Jon.

<Q - Jonathan Philip Arnold>: Just checking if it's still morning. Feels later than that.

<A - Ralph Izzo>: What have you been doing, Jon?

<Q - Jonathan Philip Arnold>: Always not much. Waiting for your call. Ralph, I missed a little bit of this, I think you made some generic comments about support for nuclear-friendly market reforms and legislation. I'm curious whether you could just give us some insight into what you believe the prospects might be for moving something like that in New Jersey this fall. And also, from your perspective, what is the most effective format for something like that to take?

<A - Ralph Izzo>: Yeah. So, I don't want to put any kind of timing stuff, Jonathan. But I did comment that the court decisions that came out of Illinois and New York Federal Districts relevant to the states have solidified the fact that the states have the ability to act in these matters, and that's good news. We've been maintaining this is both a local and national issue, and it's good to see that it's getting national attention. But the problem, according to the forward price curve, is at New Jersey's doorstep, and there's no denying it.

So, we've continued an education campaign, and I am pleased that actually in those conversations we've received just about, not exactly, but just about universal support for the continued operation of those plants. But we're going to work at all levels, primarily at the state, but also with PJM and FERC to do what we can to just make sure those plants are continuing their operation, that they don't prematurely retire and they do so with economics that is satisfactory to customers and shareholders. So, we don't have specific solutions. We're just really right now in a kind of education mode and we're pleased with the kind of feedback we're getting.

Operator

The next question is from the line of Praful Mehta with Citigroup. Please proceed with your question.

<Q - Praful Mehta>: Thanks so much. So, I wanted to follow up a little bit on the strategic direction, I guess, and we've talked about this before but with the [ph] Zek and the Zen (28:10) discussion happening in New Jersey, obviously, is something around the nuclear support, how do you think about strategic direction of PEG Power? And also, given what IPPs are going through in terms of a number of them either merging or going private, how do you see the long-term vision of this business? Do you still see separation as a possibility or now you are thinking of it more as an integrated platform?

<A - Ralph Izzo>: So, Praful, I think the best way to look at strategic direction is to look at how we're allocating our investment dollars. And if you look back over the past 10 years, you'll probably see a 75/25 split utility PSEG Power. And if you look ahead five years, that ratio has changed a little bit. Now, it's 82% PSE&G at the utility and 18% at Power.

So, the strength of the company and its growth is clearly at PSE&G, but we are not making VCRs or buggy whips, right? We're producing electricity and power and people still need that, so we're constantly optimizing that portfolio. We retired 4,000 megawatts of uncompetitive assets. We're now building 1,800 megawatts of competitive assets and we're warning people about 3,500 megawatts that are in some parallel that, actually, is a greater parallel to the customer and policymakers than it is to our shareholders, that being nuclear.

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-14956

If there is a strategic opportunity to do something different, we'll entertain it. But right now, we're quite happy with the cash being generated by Power and the utility's ability to deploy it very, very productively, which gives us extremely healthy balance sheet, one that rating agencies are looking more favorably upon, and robust growth of the utility without any need for additional equity and solid support for dividend that continuously grow with 4% a year. So, we're in a good place.

Operator

The next question is from Paul Patterson with Glenrock Associates. Please proceed with your question.

<Q - Paul Patterson>: Good morning.

<A - Ralph Izzo>: Good morning.

<Q - Paul Patterson>: On the new rules at the BPU that they filed with New Jersey or they're going to file with the New Jersey register, I was wondering if you could just – is there any flavor you can give us in terms of what that means quantitatively in terms of earnings or where your CapEx prospects or what have you?

<A - Ralph Izzo>: So, Paul, I don't think of it necessarily as increase or decrease in earnings prospects. I think of it as greater predictability of those earnings. So, for example, we talk about GSMP and the expansion we're filing – that we filed yesterday and the reality is that our filing follow those proposed new rules. So, that makes life a little bit simpler in terms of the discussion.

But, think about this for a second, GSMP-2 is a bit of a misnomer. We could just have easily have called it GSMP-4 or GSMP-5 because it's prior incarnation it was called Capital Infrastructure Program, and then, it was called Capital Infrastructure Program 2 and then it was the Gas Improvement within Energy Strong. And so we've had great dialogue with the board's staff and consistent recognition of the need to replace this aging infrastructure. But it's been going on in 18-month increments and more recently in 36-month increments.

And from an operational point of view, it just makes life difficult. And I think the board realized it. Okay, we've got a 100 years and then we got it down at 30 years, now hopefully we get down to 20 years of this pipe that needs to be replaced. Why are we doing this in such small increment?

So, as you can see, we filed for 9.75% on the GSMP program. It's similar to what – it's exactly the same as what we've been getting on other programs. The mechanism is what's anticipated in the rule, in the proposed rule.

So it's not a question of how much more or how much less the earnings will be, but just greater predictability, greater clarity, longer duration.

<Q - Paul Patterson>: Okay. Thanks.

Operator

The next question is from Michael Lapides with Goldman Sachs. Please proceed with your question.

<Q - Michael Lapides>: Hey, guys. An easy one. Just trying to think about PSE&G's capital spending over the next three to four years, three to five years. And a little bit what's changed since your March analyst conference? If I go back and look at like that slide 13 I think or one of the other CapEx slides, how should we think about how different the CapEx level is today going forward for the next few years versus what you discussed three or four months, or four or five months ago?

<A - Daniel J. Cregg>: Michael, this is Dan. I don't think about it as being very dramatically different. I think that one of the things that we sought to address and as we talked about a 7% to 9% rate base growth, and identifying things that weren't necessarily in the base plan, but were on our radar screen to layer into the back end of the plan because of the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14957

nature of how we put forth our capital plan based upon what we know.

I think what you've seen is very, very consistent with that as we moved from a 7% rate base CAGR over five years and targeted a 9% rate base CAGR. One of the things we identified to be able to fill that gap was energy efficiency, and we talked today about $69 million being approved for energy efficiency.

Another is GSMP. And embedded within our base plan was $300 million a year on GSMP, which is the consistent run rate, but we thought that we could expand that. And we talked about maybe another $100 million or more that we could put into that plan to be able to get us from 7% to 9%. And what you saw us file was very consistent with that.

So I don't think that I would describe the capital plan as being very different. I think I would describe it as us executing on the upsides that we saw within it and being able to achieve the higher end of that range, and we will continue to look for opportunities to do exactly that same thing.

<Q - Michael Lapides>: Okay. But if I go back and look at the Analyst Day deck, and I think it was actually slide 15, that's maybe the most appropriate one or so, you kind of showed a roll-off or a roll-down of CapEx from close to $3.5 billion at E&G this year, going at $2.5 billion or even less in 2018 and beyond. Do you still think you're at that $2.5 billion level in 2018 and beyond? Or do you think the run rate might look a little bit more something closer to the 2017 level?

<A - Daniel J. Cregg>: Well, I think I would say that, directionally, it's not inconsistent with how we have talked about it in the past. And as we step forward into these years, we have been able to find appropriate investments that the system needs to have done. And as we step through time, that number has tended to grow. So 2017 is a high year for us with respect to capital. But I do think what we represented then through some historical data and how the years have progressed through time and what we anticipated on a go-forward basis was an opportunity to grow that capital program. And I think that's what we conveyed then and, I think, we still believe that now.

<Q - Michael Lapides>: Got it. Thanks, Dan. Much appreciated.

<A - Daniel J. Cregg>: Fair enough.

Operator

[Operator Instructions] The next question is from Steven Fleishman with Wolfe Research. Please proceed with your question.

<Q - Steve Fleishman>: Yeah. Hey, good morning, Ralph. You talked about the different avenues that you're watching for your nuclear generation [ph] stake (36:18), but also PJM and FERC. Could you maybe focus a little more on the PJM, FERC and DOE side and just kind of how much progress do you think is occurring there? And really, can they do enough, I guess?

<A - Ralph Izzo>: So I think if you look at DOE, first. It's just good that from a policy point of view DOE recognizes a challenge with base load generation and fuel diversity. As you know, Steve, they don't have day to day regulatory authority. They have some emergency powers and various things of that sort. But most of the attention, I think, needs, from our point of view, to be at FERC than PJM.

And there we've been talking about price formation for quite some time. The recent PJM proposals on how to deal with inflexible units is potentially quite helpful to the market overall in terms of the missing money issues associated with the fixed cost component of energy that it's not recovered as clearly the market design is to drive towards short run variable costs. I think that could benefit all power generators from the point of view of more accurate pricing.

This bifurcated capacity market or different approaches to the capacity market can also be helpful in terms of mitigated units. At the end of the day, there are some policy objectives that states and others have sought to pursue, typically environmental, but there may be resiliency policy objectives that unless they are explicitly targeted by FERC and PJM, the states will continue to reserve that right to go forward.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14958

So, I guess what I'm saying is that we're encouraged by the reception at DOE and the administration at the importance of this reliability, national security, fuel diversity issues. It's going to be up to FERC to translate that into a price. And there is a recognition that price formation has not delivered on the workshops of two years ago, all the benefits it can.

What is missing in everything I just described is the national levels of price on carbon. We don't anticipate that being made explicit in the near term. And that's probably going to be the domain that states will continue to probably add incremental value in terms of the environmental benefit.

So, to me, Steve-

<Q - Steve Fleishman>: Thanks.

<A - Ralph Izzo>: -as I said, we're not shy of our retiring plants. Hopefully, we've proved that. But in the case of nuclear, that's a state, local and national disaster in the making and we're just working double time every way we can to point that out to people that this is something that they don't want to let happen, and then say, 5 years or 10 years now, oops, what were we thinking?

<Q - Steve Fleishman>: Okay. Thank you.

Operator

[Operator Instructions] Your next question is from Jonathan Arnold with Deutsche Bank. Please proceed with your question.

<Q - Jonathan Philip Arnold>: Thank you for the follow-up. Just at the Analyst Day, in addition to the incremental items you've added, you had the expansion of ESMP or a continuation. Is that still something you see as possible? What should we be thinking around timing there and size-wise? Anything you can give us on that.

<A - Ralph Izzo>: Yeah. Sure, Jonathan. So, that one is more of a fourth-quarter event. This year, it'll be after the rate case is filed. The rate case will be over by then. You should think of that in terms of the balance of Energy Strong. If you remember back to Energy Strong, we asked for close to $3 billion. And because we had never done anything like that before, the board staff suggested that we just do the most critical components first and see how it goes. The board then actually hired a third-party consultant to oversee our work, and that's gone very, very well. So, I would say it could be an additional $200 million to $300 million per year nominally in terms of electric system modernization that we would be filing in Q4.

Well, probably in Q1 of next year, file our large – much larger energy efficiency program. So, there is no shortage of things that need to be done, some – continue the aging infrastructure replacement, for further enhancement of the grid, and balanced by the energy efficiency to help those participating customers control their bill.

<Q - Jonathan Philip Arnold>: Would that be a five-year type program, Ralph, the $200 million to $300 million you just-

<A - Ralph Izzo>: Yeah. No. You should expect in all of these cases we will comply with the infrastructure program rule – proposed rule. So, I keep stumbling on my word. So, yes. It would be a five-year for the current proposed rule.

<Q - Jonathan Philip Arnold>: Okay. So, we may see more about that in 4Q?

<A - Ralph Izzo>: Yes. You will.

<Q - Jonathan Philip Arnold>: May I just ask one other thing while I'm on?

<A - Ralph Izzo>: Sure.

<Q - Jonathan Philip Arnold>: You're up 4% in the first half. But your guidance is still midpoint. It's kind of flat in the year. Are there other specific drivers in the second half that you can point to that would sort of tamper things back

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14959

down?

<A - Ralph Izzo>: There's two things going on. Number one is that I think was only one year being the exception that we changed our numbers after Q2. It's also 72 degrees in New Jersey today on July 28, so the third quarter although not a big pricing event for Power is still a big volume event for Power. And Dan is waving at me. He may want to add to that.

<A - Daniel J. Cregg>: Yeah. Just last year there was a little bit of tax help that we saw towards the end of the year that we may not end up seeing for this year. So, that and just some of the pricing and what we'll see over the summer, and we talked a little bit within the prepared remarks about how prices are coming down. So, I would point to that and some tax help we got at the end of last year.

<Q - Jonathan Philip Arnold>: Okay. Great. Thank you.

<A - Daniel J. Cregg>: You got it, Jon.

Operator

The next question is from Travis Miller with Morningstar. Please proceed with your question.

<Q - Travis Miller>: Thank you. I was wondering if we look out a few years and if you get the nuclear support that you're thinking about, wherever that comes from, what would you think about upgrades and investments in upgrades at your existing plants?

<A - Ralph Izzo>: So, Travis, good morning. We are actually looking at a very modest upgrade [indiscernible] (43:17). And it's mostly, I don't mean to diminish this paper exercise, it's the way in which one can measure, monitor, and calculate operational risk associated with different operating parameters. So, at the risk of stating the obvious, you're not going to see any major equipment investments at the same time that I'm talking about the forward price curve coming down and putting tremendous economic pressure on the plants. But, to the extent that we have the same staffing levels and the same overhead costs and we can squeeze out a couple more megawatts by doing better probabilistic risk assessment, we're going to do that.

We do have a couple of up rates going on at our fossil plants that we've announced in the past at both our Bergen and our Bethlehem plants and those are a bit more meaningful in terms of their size. But at the nuclear plants right now at Salem and Hope Creek, we're just looking at Hope Creek and it's about 18 megawatts, I think, is the exact amount.

<A - Daniel J. Cregg>: Yeah, that's right. And so, the incremental benefit that you would get versus the incremental cost is very favorable given the fact that you have the base plant running as Ralph mentioned.

<Q - Travis Miller>: Sure. Okay. Could up-rates and promises to expand nuclear power? Do you think [ph] considerably (44:33) be part of some kind of negotiation state legislative level?

<A - Ralph Izzo>: So, from the point of view that as we just try to suggest getting a few more megawatt hours without increasing the cost is helpful. Let me be 1,000% clear. We are working our tails off to make sure we don't need any help from anybody, right. The most important thing is to control what we can control and make sure we run those plants as well as we can, as at low a cost structures as we can so that even with the flaws in the market, they can still win. And if that means paper up-rates, then we'll do that. If it means more staff optimization, we'll do that. And so that's job number one, two and three.

The comment I made before about near universal desire to see those plants operate is accurate. Obviously, our competitors don't want to see those plants operate. And that's a very rational position on their part. But I don't think we get the same universal reaction to new nuclear or building additional plants and not that we would have even considered that in the current gas price environment.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14960

So, I think to the extent that getting more out of the plant is something that helps make the more competitive answers, yes, but no one has talked to us about we'll build another plant and we'll let you keep these running. I mean that's not part of anybody's calculus right now.

<Q - Travis Miller>: Yeah. Okay. Great. Thanks so much.

Operator

Mr. Izzo and Mr. Cregg, there are no further questions at this time. Please continue with your presentation or closing remarks.

Ralph Izzo

Thank you, Jamie. So, thanks everyone for joining us and we hope you- we genuinely hope you're as pleased as we are with the results we've had here today, and also hope you're as encouraged as we are with the growth prospects that we have, anchored by the agility with programs such as GSMP. As Dan said, it's just a few months ago, we thought that was probably going to be a $300 million a year program and maybe winding down in 2019, and now we have some good hopes that it could be a $500-plus million program and have five years of life after 2019.

So, as always, Kathleen and Carlotta and the rest of the team are available to you for follow up. And with that, I'll just wish you a very happy and pleasant rest of the summer and we'll see you I'm sure on various different venues. Thanks everyone. Take care.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Dennis and I will be your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group First Quarter 2017 Earnings Conference Call and Webcast. [Operator Instructions]

As a reminder, this conference is being recorded today, Friday, April 28, 2017, and will be available for telephone replay beginning at 2:00 PM Eastern Time today until 11:30 PM Eastern Time on May 5, 2017. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Dennis. Good morning, everyone. Thank you for participating in PSEG's call this morning. As you are aware, we released our first quarter 2017 earnings statements earlier today. The release and attachments are posted on our website, www.pseg.com, under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended March 31, 2017 is expected to be filed shortly.

The disclaimer statement regarding forward-looking statements details the number of risks and uncertainties that could cause actual results to differ materially from forward-looking statements made therein. And although we may elect to update forward-looking statements from time-to-time, we specifically disclaim any obligation to do so, even in light of new information or future events unless required by applicable Securities laws.

We also provide you with commentary with regard to the difference between non-GAAP operating earnings and non-GAAP adjusted EBITDA and net income reported in accordance with generally accepted accounting principles in

Bloomberg Transcript

Bloomberg

SI-SSA-0015-14962

the United States.

I am not going to read to full disclaimer statement or the comments we have on the difference between non-GAAP operating earnings and GAAP results, but I do ask that you read those comments contained in our slides and on our website.

PSEG believes that the non-GAAP financial measures providing information on operating earnings and adjusted EBITDA offers a consistent and comparable measure of performance to help shareholders understand operating and financial trends.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service. And joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions. Thank you. Ralph?

Ralph Izzo

Thank you, Kathleen, and thank you everyone for joining us today. As you saw earlier this morning, we reported non-GAAP operating earnings for the first quarter of 2017 of $0.92 per share versus non-GAAP operating earnings of $0.91 per share in last year's first quarter.

Our GAAP results for the first quarter of $0.22 per share reflect the decision we made last year to retire the Hudson and Mercer coal-fired generating units, which will happen in June of this year. Results also reflect an increase in the reserve for the impairment of our leveraged lease investment in the Keystone, Conemaugh generating stations.

Non-GAAP operating earnings for the first quarter benefited from the ongoing successful execution of our investment program. Growth of our regulated utility business and effective cost management offset the impact on Power's earnings of a continued decline in energy prices. Our regulated utility business is expected to grow 8.5% in 2017 to represent two-thirds of our full year 2017 non-GAAP operating earnings of $2.80 to $3 per share.

We're off to a good start for the year by maintaining our usual focus on operational excellence, disciplined investment and financial strength. We've also increased our attention on achieving a few key policy objectives. First among these is getting recognition for the value of our nuclear-generating assets. As you know, nuclear generation is facing challenges that are real and serious. We've initiated discussions with key stakeholders at the federal and regional levels and here in New Jersey to improve awareness of the importance of nuclear power.

Nuclear is a clean energy resource that provides nearly 97% of the energy that is free of air emissions and is generated in New Jersey. Nuclear supports resiliency of the electric grid by adding to a diverse fuel mix and avoiding the potential reliability problem of putting all of our eggs in one fuel basket. And nuclear provide significant benefits to the regional economy.

We've been working on many fronts to secure the long-term viability of our nuclear generation assets. We've reduced staffing and cut expenses at our nuclear facilities. We've also advocated for change in wholesale market price formation that more accurately recognizes the value that these and other generation resources bring to the customer.

The common sense reality is that these plants are valuable for a variety of reasons. Nuclear-generating facilities have unique characteristics that enhance the resiliency of the system and support public policy objectives that are not recognized or priced in current markets.

While we commend the efforts that FERC is taking on price formation, time is running out for a wholesale market solution. We believe progress in recognizing the value that nuclear brings to the environment, the resiliency of the grid, and the economy of the region has been and will take place at the state level.

Enhancing the resiliency of the power system has become an important issue for our company. Superstorm Sandy was the wakeup call that affected our thinking about what is important to our 2.2 million electric customers and 1.8 million gas customers. PSE&G's $12.3 billion base capital investment program over the next five years is focused on ensuring

final
Bloomberg Transcript
Bloomberg

continued reliability and on anticipating, preparing for, and recovering from high-impact, low-frequency events.

PSE&G's investment program includes $6 billion dedicated towards transmission system improvements. $3 billion of electric distribution investment is focused on lifecycle investments to ensure continued top quartile reliability performance and even better customer service. Another $3 billion is focused on modernizing and upgrading cast iron and unprotected steel gas mains. And lastly, $250 million is directed to investments in solar and energy efficiency programs that support New Jersey energy policy objectives.

PSE&G's base capital program provides the opportunity for annual growth in rate base of 9% through 2019 and annual growth in rate base of 7% for the five years ending 2021. The expansion and/or extension of existing capital programs could lift PSE&G's five-year capital program by up to $1.5 billion and raise the growth in rate base from 7% to 9% per year over the five-year period.

At the beginning of March 2017, PSE&G filed for approval to extend its investment in energy efficiency. This request represents a capital investment of $74 million and you should expect to see PSE&G request an extension of its existing program to replace gas mains and to modernize its electric distribution system later this year.

PSEG Power's construction of 1,800 megawatts of new efficient combined cycle gas-fired capacity within PJM and New England markets is underway at a total cost of $2 billion. Earlier this month, the Connecticut Department of Energy and Environmental Protection issued the last set of regulatory permits necessary to begin construction of Bridgeport Harbor 5.

The Keys Energy Center in Maryland and the Sewaren Station in New Jersey are scheduled to begin operation in mid-2018. The Bridgeport facility is scheduled to begin operation a year later in mid-2019.

The retirement of Hudson and Mercer, and the commercial operation of the new gas-fired, combined-cycle gas turbine capacity repositions Power's portfolio more toward efficient, cleaner assets. Our company-wide investment program is focused on building an infrastructure that improves system reliability. We will update you throughout the year on our efforts to preserve the value of nuclear energy for New Jersey and to secure approval for regulatory mechanisms that provide customers clean, affordable, resilient energy supply.

As mentioned, we are maintaining our non-GAAP operating earnings guidance for the full year of $2.80 to $3 per share. With the support of our dedicated 13,000-plus employees, we expect to be able to successfully deliver on the promise of our investment program that should provide growth for our shareholders and a sustainable energy future for our customers.

With that, I'll turn the call over to Dan, who will discuss our financials in greater detail.

Daniel J. Cregg

Thank you, Ralph, and good morning, everyone. Thanks for joining us this morning. As Ralph said, PSEG reported non-GAAP operating earnings for the first quarter of 2017 of $0.92 per share versus non-GAAP operating earnings of $0.91 per share in last year's first quarter.

On slide 4, we've provided you with a reconciliation of non-GAAP operating earnings to net income for the quarter. We've also provided you with information on slide 8 regarding the contribution to non-GAAP operating earnings by business for the quarter. And in addition, slide 9 contains a waterfall chart that takes you through the net changes quarter-over-quarter in non-GAAP operating earnings by major business.

I'll now review each company in more detail, starting with PSE&G. PSE&G, as shown on slide 11, reported net income for the first quarter of 2017 of $0.59 per share compared with $0.52 per share for the first quarter of 2016. PSE&G's first quarter results reflect the ongoing successful execution of its growth initiatives and control of operating expenses. Growth in PSE&G's investment in transmission improved quarter-over-quarter net income comparisons by $0.03 per share.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14964

Revenue recovery of investments made to replace gas distribution mains under the Energy Strong and Gas System Modernization Programs improved quarter-over-quarter net income comparisons by $0.02 per share, and the reduction in O&M expense also improved quarter-over-quarter net income comparisons by $0.02 per share.

PSE&G implemented a $121 million increase in transmission revenue under the company's FERC-approved formula rate on January 1, 2017. Our transmission revenues are adjusted each year to reflect an update of the company's investment program.

PSE&G's investment in transmission is expected to grow to represent approximately $7.6 billion of rate base at the end of 2017 or 45% of the company's year-end 2017 consolidated rate base. Gas distribution revenue increased by $16 million, with the completion of gas main replacement work approved under Energy Strong and GSMP.

Under Energy Strong, electric rates are adjusted two times during the year in March and September and gas rates are adjusted each year in September. And under the Gas System Modernization Program, gas rates are adjusted each year in January to reflect the investment made during the prior year. Annual revenues in 2017 under both of these programs are forecasted to increase by approximately $55 million.

Actual and weather-normalized electric sales increased about 1.5% in the first quarter compared to the year-ago period. The increase is due to a spike in industrial use from one customer that use PSE&G service in 2017, while the dedicated generation plant that normally serves the customer was out in an outage.

So, the improvement in sales to this customer did not lead to an improvement in margin and actual and weather-normalized from gas sales increased about 3% on the quarter, and the high volatility of the weather experienced over the last few winters challenges the weather normalization calculations. But over the trailing 12-months period, we view weather-normalized electric and gas sales as essentially flat.

As Ralph mentioned, PSE&G filed with the New Jersey Board of Public Utilities in March of 2017 for approval to increase its investment in existing and new energy efficiency programs. The programs, if approved, would represent a capital investment of $74 million. As part of the petition, PSE&G is also seeking recovery of additional administrative and other costs, including costs associated with the enhancement of the information technology system. The petition has been deemed complete, which starts a 180-day clock to complete a decision on the filing. And this is expected during the third quarter.

PSE&G invested $752 million in capital expenses during the first quarter of 2017 and is on track to invest $3.4 billion in 2017 on transmission and distribution infrastructure. And we are maintaining our forecast of PSEG net income for 2017 of $945 million to $985 million.

Moving to Power, PSEG Power reported non-GAAP operating earnings for the first quarter of $0.30 per share and adjusted non-GAAP EBITDA of $359 million. This compares to non-GAAP operating earnings of $0.36 per share and non-GAAP adjusted EBITDA of $409 million for the first quarter of 2016. Non-GAAP adjusted EBITDA excludes the same items as our non-GAAP operating earnings measure, as well as income tax expense, interest expense, depreciation and amortization expense.

The earnings release and slide 17 provide you with detailed analysis of the items having an impact on Power's non-GAAP operating earnings relative to net income quarter-over-quarter. And we have also provided you with more detail on the generation for the quarter on slide 18.

PSEG Power's net loss for the quarter reflects the impact of incremental depreciation and other expenses of $564 million pre-tax associated with the decision to retire the Hudson and Mercer coal-fired generating stations on June 1 of this year. Power's results in the second quarter will also be impacted by incremental depreciation expense associated with the early retirement of these units.

A decline in the average price received on energy hedges reduced Power's quarter-over-quarter non-GAAP operating earnings by $0.09 per share. The non-GAAP quarterly operating earnings comparisons are also lower by $0.01 per share due to a decline in generation output and by $0.01 per share increase in the reserve-related to a FERC investigation of Power's cost-based bids that began in 2014.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14965

The impact on non-GAAP operating earnings from these two items was offset by a $0.02 per share improvement in off-system gas sales. A reduction in O&M as a result of cost control efforts at the nuclear stations improved non-GAAP quarter-over-quarter operating earnings comparisons by $0.03 per share.

Power's O&M for the remainder of 2017, particularly the second half of the year, is expected to compare favorably into 2016, given a reduction in pension expense, a decline in major maintenance expense at fossil, the absence of a refueling outage of Power's 100% owned Hope Creek nuclear station, and of course, the June 1 retirement of Hudson and Mercer, as I previously mentioned.

Now, let's turn to Power's operations. Output from Power's generating stations declined 2.8% in the first quarter from year-ago levels. Quarterly comparisons were affected by one fewer day of operation this year versus last year, due to leap year, and also reflect the adverse impact on energy pricing and volatility from above normal temperatures during the first two months of the year.

The nuclear fleet operated at an average capacity factor of 100% in the quarter, producing 8.4 terawatt hours of energy. Power's combined cycle fleet experienced a decline in its average capacity factor during the quarter to 41.8% from 51.7%. For the quarter, the combined cycle fleet produced 3 terawatt hours of energy as the coal-fired fleet produced 1.4 terawatt hours of energy.

During the first two months of the year, the power markets were characterized by warmer than normal weather, reducing overall demand and lowering price volatility. The impact on realized energy pricing from the decline in our average price on energy hedges was notable in the first quarter of 2017 versus 2016.

As previously disclosed, our average hedge price on energy for 2017 is expected to decline from $51 per megawatt hour in 2016 to $46 per megawatt hour in 2017. The impact on realized energy prices in the first quarter of 2017 reflected a larger decline than the average for the year, contributing to the $0.09 per share impact from recontracting I mentioned earlier.

This quarter-over-quarter decline was related to higher seasonal pricing on contracted basis in the eastern PJM region realized in the first quarter of 2016. For the remainder of 2017, we anticipate a more modest decline year-over-year in energy pricing than what we experienced in the first quarter and a lower decline than what we are forecasting for the full year.

Although Power's access to low-cost shale gas continued to provide a benefit to its margins relative to the market, power did experience a compression in spark spreads during the quarter, which had an impact on output from the gas-fired combined cycle fleet. The market has sustained higher prices since the end of February and the improvement can be attributed to higher gas prices and a reduction in congestion with the completion of some transmission work in the area.

Based on the milder weather to-date, Power's forecasting output for 2017 of 49 terawatt hours to 50 terawatt hours and the forecast is modified slightly from our prior forecast of output for the year of 49 terawatt hours to 50 terawatt hours. The change in output is primarily the result of a mild winter and the impacts on output on the combined cycle fleet. The nuclear fleet's full year forecasted capacity factor is unchanged at 92%.

Salem 2 is currently in a refueling outage that's forecasted to be longer than normal, given the decision to proactively address any needs related to the unit's baffle bolts. Approximately 90% of production for the remainder of 2017 is hedged at an average price of $46 per megawatt hour. Power has hedged approximately 55% to 60% of its forecasted production for 2018 of 52 terawatt hours to 54 terawatt hours at an average price of $41 per megawatt hour. And for 2019, Power has hedged 20% to 25% of its forecasted production of 58 terawatt hours to 60 terawatt hours at an average price of $42 per megawatt hour.

Power continues to assume BGS volumes will represent approximately 11 terawatt hours in 2017, which is consistent with 2016 volumes. Power's average hedge prices don't include any anticipated future benefit from its retail marketing efforts. We continue to forecast non-GAAP operating earnings for Power in 2017 of $435 million to $510 million. And the forecast of non-GAAP operating earnings represents an adjusted EBITDA of $1,080 million to $1,210 million for

final
Bloomberg Transcript

the full year.

Now, I'll briefly address the operating results from Enterprise and Other. For the first quarter, Enterprise and Other reported a net loss of $15 million or $0.03 per share for the first quarter of 2017 compared to net income of $17 million or $0.03 per share for the first quarter of 2016. The net loss for the first quarter of 2017 reflects the impact of a pre-tax charge of $55 million associated with the continuing liquidity issues facing NRG REMA. The charge reflects our current assessment of the ongoing matter.

Non-GAAP operating earnings for the first quarter of 2017 of $17 million or $0.03 per share were unchanged quarter-over-quarter from the first quarter of 2016 and reflect contractual payments associated with the operation of PSEG Long Island and certain tax items at PSEG Energy Holdings. And we continue to forecast full-year 2017 non-GAAP operating earnings from Enterprise and Other of $35 million.

With respect to financings, PSE&G closed the quarter with $193 million of cash on the balance sheet and with debt at the end of March of 2017, representing 47% of our consolidated capital. Debt at PSEG Power represented 30% of its capital at the end of the quarter.

In March 2017, PSEG Power and PSE&G extended the expiration dates on $4 billion of credit facilities to March of 2022. At the end of March, total available credit capacity was $3.6 billion. We remain in a position to finance our five-year base capital program of $15 billion without the need for the issuance of equity. And we remain in a position to finance an expansion of our investment program also without the need to issue equity.

Power's cash flow is forecasted to improve following the completion in 2018 and 2019 of construction of the three new combined cycle units, with the decline in annual capital spending at Power to $200 million a year from 2017's capital budget of $1.2 billion. PSE&G's internal generation of cash is expected to remain strong throughout the forecast period. We continue to forecast non-GAAP operating earnings for the full year at $2.80 to $3 per share.

That concludes our prepared remarks and now I'll turn the call back over to the operator for questions.

Q&A

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. [Operator Instructions] And your first question is from the line of Jonathan Arnold with Deutsche Bank. Please proceed with your question.

<Q - Jonathan Philip Arnold>: Hi. Good morning, guys.

<A - Ralph Izzo>: Good morning, Jonathan.

<A - Daniel J. Cregg>: Good morning, Jonathan.

<Q - Jonathan Philip Arnold>: I was curious about the REMA item. When I look back to the Analyst Day, I think you had said, when you were talking about guidance, you'd highlighted this as a write-down of what you described as the residual value. So, is it safe to assume that you have no further exposure?

<A - Daniel J. Cregg>: Jonathan, I think we're in a good place right now. The best information that we have is what we have booked to, really based upon what we know about the liquidity issues at REMA, the issues surrounding the facilities themselves, and basically the alternative outcomes through our discussions with them. So, we think based upon what we know right now, to the best of our information, we've recorded to where we think things will be when all is said and done.

<Q - Jonathan Philip Arnold>: Can you share sort of how much still on the books?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14967

<A - Daniel J. Cregg>: Yeah. Between Keystone and Conemaugh, there's about $55 million of total investment that remains on the books.

<Q - Jonathan Philip Arnold>: So, you've written off basically half of what was there?

<A - Daniel J. Cregg>: That's correct. Yes.

<Q - Jonathan Philip Arnold>: Okay, great. Thank you. And then just on the $0.01 charge you took for the FERC investigation, not much happened on that recently. And can you just clarify what's going on with that given the situation at FERC at the moment, and what led to that charge?

<A - Daniel J. Cregg>: Yeah. So, as you know, this has been an issue that's been around for a while and 2014 is when it began, and there was that $25 million charge that was taken in 2014. We are moving forward with it. There's still a fair bit of uncertainly that remains, but based upon where we are right now within the investigation and discussions, the lower end of the range of our exposure as we've seen it has raised to $35 million from that $25 million number that we had. And that was the driver behind the reserve that we know.

<Q - Jonathan Philip Arnold>: So, you were still booking the low end and that's up $10 million.

<A - Daniel J. Cregg>: That's exactly right.

<Q - Jonathan Philip Arnold>: Okay, great. That's all I had. Thank you.

<A - Daniel J. Cregg>: Okay.

Operator

Your next question is from the line of Julien Dumoulin-Smith with UBS. Please proceed with your question.

<Q - Antoine Aurimond>: Hey, guys. This is Antoine Aurimond calling for Julien. How are you?

<A - Ralph Izzo>: Good, Antoine. How are you?

<Q - Antoine Aurimond>: Good. First, after this quarter, how do you see BGSS margins trending for the full year? And more generally, how do you see gas basis in PJM is evolving in light of the recent pipeline delays?

<A - Daniel J. Cregg>: Your first question was on BGS or BGSS?

<Q - Antoine Aurimond>: BGSS. The margins for the full year.

<A - Daniel J. Cregg>: Yeah. So frankly, as we look that product in particular, most of what we'll see throughout the year takes place in the first three months of the year. So, I would say that the BGSS component of our business really will have minimal impact until we get into December, so not a whole lot of variability that we would anticipate until we get adjusted to the fourth quarter there. We have seen some delay in pipelines. I agree on that front, but we have seen some movement within the basis as well. I think that over time as we continue to see more takeaway capacity built, we will see some levelization of gas prices over time.

<Q - Antoine Aurimond>: Okay, got it. And lastly, with regards to the Con Ed wheel, given that Con Ed has been dropped out and that NYPA could possibly follow, do you see any risk of the transmission carving allocated to your utilities customers?

<A - Ralph Izzo>: So, that's a subject of ongoing dispute at FERC. I think the bottom line for us is that there's no question about recovery of investments that we make. But you're right, Antoine, there will be some healthy debate over who pays that. But at the end of the day, we are getting paid.

<Q - Antoine Aurimond>: Okay, got it. Thank you very much.

final

SI-SSA-0015-14968

Operator

Your next question is from the line of Greg Gordon with Evercore ISI. Please proceed with your question.

<Q - Greg Gordon>: Thanks. One in the weeds question and one higher level question. It looks like you have slightly lower – not just slightly lower from output for this year, but also slightly lower projected output in the subsequent years. It doesn't look like it would impact margin much, but I'm just wondering is that a function of sort of your dispatch model just being updated for current forwards?

<A - Daniel J. Cregg>: Yeah. That's all it is, Greg. I'd say the most solid impact is what we've seen year-to-date on the winter. So, the lower end of that range stay the same. We just took the top-end down by 1 terawatt hour.

<Q - Greg Gordon>: Okay, great. And then, I know that you obviously have state level activity with regard to what you believe to be the right infrastructure agenda for your customers. But at the same time, you've got this federal move with Rick Perry at DOE opening up a process. And my understanding is that FERC may consider a stakeholder process that ultimately develops into potentially a 205 proceeding to amend their tariffs to deal with the proliferation of subsidies. Can you comment on all those on whether you believe that – how you think those tensions ultimately get resolved and whether or not that's accurate.

<A - Ralph Izzo>: Hi, Greg. Yeah. We're following the DOE studies through EEI, which is we're paying very careful attention to what the future prospects are for base load generation, primarily in organized markets, but in general around the country. And the discussions we've had at every level, right, so we've been talking to people at federal levels, we've been talking to people at PJM, we've been talking to people at state, is that regional and national solutions are preferred, but given the time that's required for naming of FERC commissioners, getting your arms around the value of fuel diversity, getting your arms the value of the environmental impacts of NOx, SO2, carbon, et cetera, that states should be in the lead on those attributes that they value and those programs should go away as regional and federal programs take over. So, it's not a question of holding off on everything until we get clarity from DOE by any means.

<Q - Greg Gordon>: Okay. Do you think it's plausible that there could be a stakeholder process that ultimately results in a request for a tariff change at FERC...

<A - Ralph Izzo>: Yeah. I think it's possible. Sure.

<Q - Greg Gordon>: ... for the PJM auction in 2018?

<A - Ralph Izzo>: It's possible. Sure. We all know what the time frames are at PJM and at FERC, but, yes, it is possible.

<Q - Greg Gordon>: Okay. Thank you, guys.

Operator

Your next question is from the line of Praful Mehta with Citigroup. Please proceed with your question.

<Q - Praful Mehta>: Hi, guys. Just following up the nuclear discussion, wanted to understand what kind of timeframe do you have in your mind around getting some resolution on this? If there is no support or no exact or any other form of nuclear support, how long are you willing to wait before you take a decision on the nuclear assets?

<A - Ralph Izzo>: We haven't drawn a line in the sand, Praful. I mean, our units are hedged. And as we've said publicly that our – because of those hedges generating positive cash flow, however, as one looks at the forward price curve, as those hedges roll off, that cash flow becomes more and more challenge. And in fact, if you believe the forward price curve out three years, those cash flows turn negative. One then has to ask, well, what do you think will happen to the price curve beyond that?

final
Bloomberg Transcript
Bloomberg

So, rather than draw a line in the sand, what we've said is we ought to work collectively with people to make sure that the attributes of nuclear are being compensated in the market. And that to the extent that those attributes are not being compensated, they should look at providing a needs tests for nuclear plant to say, okay, if they are in fact not profitable and are at high risk of going away and we will regret losing those attributes, then we want to make sure they don't go away.

So, I think what we've tried to go out of our way to say is the day we announce a date, we are in a mode that is a place that nobody ought to want to be, because these assets are too valuable to the state of New Jersey for us to announce a date. So, we're doing all we can to avoid having to do that.

<Q - Praful Mehta>: Fair enough. And secondly, just a detail question. On the hedges, it look like the percentage hedge obviously comes down over time, but the price also is down, which you would expect from the forward curve down from 46% to 42%. I guess the question is, generally when you're hedging in the forward market, or hedging better periods of time, peak periods or peak hours, what do we take away from the hedge price? Does that mean that the average is actually even lower than that? Just trying to get a sense for what the 42% really means in terms of forward achievable prices for 24/7?

<A - Daniel J. Cregg>: Yeah. Maybe two ways to think about that, Praful. One is – I don't know that I would say that we are necessarily hedging the highest prices earlier and then moving down the scale. There's on-peak and off-peak hedges that get put on without a particular pattern necessarily. So, I would diffuse you of your first thought that it's definitely the higher prices. That said, as we look to the outer years of our disclosed hedge prices and into 2019, given that we've had some BGS auctions that have rolled through, some of that 2019 volume is based upon BGS and we decomposed the BGS price and pull out the capacity components, but there are some other non-energy components that are in there that give a little bit of a lift to that price. So, maybe not so much the fact that it's the higher price or the on-peak prices that have been hedged, but more so that some of the BGS volume that rolls into 2019 shows that price to be what it is. But that's the makeup of it.

<Q - Praful Mehta>: Got you. That's very helpful color. Thank you.

Operator

Your next question comes from the line of Angie Storozynski with Macquarie. Please proceed with your question.

<Q - Angie Storozynski>: Thank you. I just – I don't know if you're willing to give us a sense what would be the potential construct of that support for nuclear plants in New Jersey. It's my understanding that it wouldn't resemble the one from New York or Illinois. Would it be more like what we're seeing in Connecticut or something completely unrelated? Thank you.

<A - Ralph Izzo>: Angie, I would say right now we're in what I would call an education phase. And the only thing that we know for a fact in New Jersey is that if New Jersey were to agree to the importance of nuclear from an environmental point of view, from a regional economy point of view, from a fuel resiliency point of view is that it would require legislation. And I just have a lot of confidence that New Jersey will give it serious thought. I mean, the issues are pretty clear here. If those assets are not earning their cost of capital over the long term or if they turn cash flow negative, we'll retire them. That will be a very painful decision given the impact it has on New Jersey, but, unfortunately, it's a very clear decision for us from a shareholder point of view. So, now, the question is how do policymakers feel about the increased emissions of NOx, SO2, CO2, single-fuel dependency.

And I thank you for your question. This is not a slam against natural gas. This is not a projection that natural gas won't be abundant for decades to come. It's not a slam against renewables. This is the case for the value of fuel diversity, the value of not putting all your eggs in one basket, the value of something that does not have air emissions, the value of something that has, candidly, really good jobs, and obviously the laws of economics, supply and demand. You cannot remove 40% of the supply without having an increase in prices in New Jersey. And that's something New Jersey consumers should not like. So, once the plants become quote uneconomic, they still have enormous value to New

final
Bloomberg Transcript
Bloomberg

Jersey. So that's what we're doing right now. We're just educating people about that. To us right now, they are still positive cash flow generators.

<Q - Angie Storozynski>: So, just following this line of thinking. So, basically, the plants become free cash flow negative come 2020?

<A - Ralph Izzo>: Well, if the forward price curve is realized, the answer is yes.

<Q - Angie Storozynski>: Okay. And so -

<A - Ralph Izzo>: And we do not try to outguess the forward price curve. As you know, we run this company in accordance with a hedging program that feathers in the forward price curve. Now, we're working hard to lower our cost at nuclear and try to fight against that stream, that current.

<Q - Angie Storozynski>: Okay. But in light of that, right, you said that it's still a discussion phase in New Jersey. We're going into a capacity auction, which will cover the summer of 2020 and beyond. You have a set of assets that based on observable curves is free cash flow negative. So, what do you do going into the auction?

<A - Ralph Izzo>: Of course, we discuss that all the time and you know us well enough, Angie, to know that we're not going to disclose that. You're really asking how we we're going to bid the units in RPM and we just never talk about things like that.

<Q - Angie Storozynski>: Okay. I had to try. Thank you.

<A - Ralph Izzo>: But it's worth trying though.

<Q - Angie Storozynski>: Thank you.

<A - Ralph Izzo>: Thank you.

Operator

Your next question is from the line of Daniel Yu with Goldman Sachs. Please proceed with your question.

<Q - Daniel Yu>: Hi. Good morning.

<A - Ralph Izzo>: Good morning, Daniel.

<A - Daniel J. Cregg>: Good morning.

<Q - Daniel Yu>: Two parts to my question on Power and market fundamentals. First, are there major supply changes in New Jersey that we should keep in mind in addition to the retirement of Hudson and Mercer and the elimination of the Con Ed wheel? And second, in your view, what are the impacts of these supply changes on the energy and capacity markets?

<A - Daniel J. Cregg>: I mean, I think the one that we would point to is we have our Sewaren plant that's coming in, but maybe I would say you have the RPM auction that has happened for the past couple years. You can see what has come forth from the standpoint of new capacity there. And in the last auction, there was nothing that was in EMAAC. But that's your best indication as to what's going to happen in the near term, near term being three years out coming out of the capacity auction given indication. So, you'll be able to see what supply and demand has committed to the market three years out. And then, the other thing that we look at that we talked about briefly before is just overall supply of gas and pipeline capacity in the region.

<Q - Daniel Yu>: Great. Thank you.

Your next question is from the line of Chris Turnure with JPMorgan. Please proceed with your question.

<Q - Christopher James Turnure>: Good morning. I know that you had a couple specific things that you wanted to see changed or things that you thought were, I guess, unjust or unreasonable in regards to the PJM parameters in the transmission capacity in the eastern region. Given the changes that were announced a couple of weeks back, did they fully reflect those changes or partially reflect those changes or can you give us some color there?

<A - Ralph Izzo>: Yes, Chris, partially only. We're still confused and our technical people have a different point of view than what was published by PJM, in particular on the CETL/CETO parameters as it pertains to the PS Zone, and in particular, PS North. So, we are going to follow the appropriate communication channels to PJM. And I'm sure that they will post our communications with them on Oasis or whatever other mechanisms they choose. So, it was better the second time around, but we still either need to be educated or PJM needs to make some further changes.

<Q - Christopher James Turnure>: And when you say that, are you referring to changes for future auctions or something that could impact this year?

<A - Ralph Izzo>: Yeah, think it's more than likely for future auctions, Chris. I've lost track of time. I think today's April 28 and the auction starts in two and a half weeks. So, I think we're talking about future auctions.

<Q - Christopher James Turnure>: Okay. And then, I know you don't have that much capacity up there, but the ISO-New England proposal from I think last week was pretty interesting. Do you have any preliminary thoughts on what the impact of that might be over time and the next steps that would be required to get that in place there?

<A - Ralph Izzo>: So, as you know, the most important thing we have up in ISO-New England is the construction of a new combined-cycle gas turbine unit, which has a seven year lock on prices. So, we're good to go for the foreseeable future. So the changes that you're referring to are not of a big consequence to us.

<Q - Christopher James Turnure>: Okay. We'll have to wait and see. Thanks.

Operator

[Operator Instructions] Your next question is from the line of Paul Patterson with Glenrock Associates. Please proceed with your question.

<Q - Paul Patterson>: Good morning.

<A - Ralph Izzo>: Hi, Paul.

<A - Daniel J. Cregg>: Hi, Paul.

<Q - Paul Patterson>: A few quick ones. First of all, on the DOE examination, et cetera, just in general, are you hearing anything about perhaps something more dramatic coming out of Washington to deal with nuclear or coal plant retirement, base load retirements outside of the sort of normal stakeholder process sort of approach? Anything that would lead you to think that there'd be something outside of the stakeholder approach that we've been seeing for so many years now? Have you heard anything perhaps more dramatically happening more quickly to address some of the more imminent closures that might be happening?

<A - Ralph Izzo>: No. Paul, we haven't. I mean, the reality is last congressional stab at tax reform has some phasing out of both the production and investment tax credits. I suppose Congress could revisit that and try to further accelerate those phase-outs. The real issue is what happens in organized markets to price the attributes of fuel diversity and/or environmental attributes. And I think that's less about doing away with something and creating something and that, as the earlier questions pointed out, really lends itself more to a stakeholder process or a discussion that would play itself out over the coming months, if not, years, which is why we would say that state action is likely going to front run any federal consensus on these issues. But to be blunt, Paul, we're reading the same stuff you are and just getting feedback through EEI on what this all means.

final

Bloomberg
SI-SSA-0015-14972

<Q - Paul Patterson>: Okay, great. And then – and I apologize. I was interrupted just briefly during the call. There was this infrastructure strong proposal at the New Jersey BPU and another one of payments of it, a disc sort of setup. And I was wondering if you guys – if you've already talked about it, I apologize. But if you haven't, I was wondering if you could elaborate a little bit more about what you see happening potentially there and how could it impact you.

<A - Ralph Izzo>: Sure, yes. No, we haven't discussed it. I describe it as a step in the right direction on an issue that we and the board staff and others have been talking about now for a well over a year. You may remember, we have filed 14 trackers/clause programs over the past 10 years and had all 14 approved, not exactly as we had filed them, but with modifications.

And it's become abundantly clear to us and to the board staff that many of these programs that we've initiated have many, many years ahead of them. I mean, we have an aging infrastructure that needs replacement. And to constantly go back in because of an 18-month program's expiration is just suboptimal in terms of how much work you can do efficiently. So, things like training programs for long-term employees, permanent hires versus contractors are things that we don't do now because we don't know whether our capital program is going to end in 18 or 36 months. So, what the board has come out with, all right, we'll give things a kind of a standard recovery mechanism in a five-year life, but in exchange you have to come in for rate case every five years.

And given the actions to load growth, that seems like a very, very reasonable thing to do. Now, the devil's in the details, and based upon the straw man that was put out, there's a couple of significant improvements that we think we need to be made. I'm sure that maybe some other folks who have a different point of view. But we think it's a good step in terms of realizing that long-term ongoing infrastructure replacement should not be done in 18-month increments.

And giving us five years of clarity will help us hire the people, train the people, invest in new equipment that can help us replace miles of pipe more efficiently and reinforce circuits more efficiently and do things that customers are expecting from us. So, to be continued but certainly a constructive first step.

<Q - Paul Patterson>: Okay.

<A - Daniel J. Cregg>: And then, Paul, this all will be a public process. So, as it progresses over time, you will be able to see the discussions that are going on and how it is going.

<Q - Paul Patterson>: Any sense on the timing? I mean some of these things can – I don't know, I mean the consolidated tax seems to take forever. Do you have any idea when this might be resolved?

<A - Daniel J. Cregg>: Not resolved. Next week is the beginning of the process. I believe there's – you may see some more discussion around it next week that would give more of an indication. But I think as far as when it would end is we don't know right now.

<A - Daniel J. Cregg>: I'm going to hope that it's done this year, but we don't have a control over that schedule.

<Q - Paul Patterson>: Okay. Appreciate it.

Ralph Izzo

Sure. So, thank you all again for joining us. As is often the case, we're greatly appreciate it. As is always the case indicates, we're greatly appreciate of you spending your time with us. So, hopefully, the main messages you heard is that the utility investment program is on track. We're doing things that are valuable to customers and hopefully provide a fair risk-adjusted return to our investors. We certainly view them as being such.

Dan briefly mentioned, but it's worth repeating that the Power construction program is on schedule and on budget, so all looks okay there. We continue to realize the benefits of careful cost control in the utility, in PSEG Power and that commitment is a daily one and you can rest assure that will continue out to the future.

And lastly, we are engaged in some policy discussions that we believe can be helpful to our customers and our shareholders whether it's energy efficiency, recognizing the value of nuclear or putting in place predictable long-term infrastructure programs, all of which will help us run our system more efficiently and in a way that's safe, reliable and affordable for all involved.

I'm sure Kathleen and Dan and I will see you at various venues in weeks and months ahead, and we look forward to chatting with you at that time. Thank you.

Operator

Ladies and gentlemen, that does conclude your conference call for today. You may now disconnect and thank you for participating.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Brent, and I'm your event operator today. I would like to welcome, everyone, to today's conference, Public Service Enterprise Group Fourth Quarter 2016 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. [Operator Instructions]

As a reminder, this conference is being recorded today, Friday, February 24, 2017, and will be available for telephone replay beginning at 2:00 PM Eastern today until 11:30 PM Eastern on March 3, 2017. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Brent. Good morning, everyone. Thank you for participating in our earnings call today. As you are aware, we released our fourth quarter and full year 2016 earnings results earlier this morning. The release and attachments are posted on our website www.pseg.com under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-K for the period ended December 31, 2016, is expected to be filed early next week.

I'm not going to read the full disclaimer statement, or the comments we have on the difference between operating earnings and GAAP results, but I do ask that you all read those comments contained in our slides and on our website. The disclaimer statement regarding forward-looking statements details a number of risks and uncertainties that could cause actual results to differ materially from forward-looking statements made therein.

Bloomberg Transcript

And although, we may elect to update those forward-looking statements from time-to-time, we specifically disclaim any obligation to do so, even if our estimates change unless required by applicable securities laws.

We also provide commentary with regard to the difference between operating earnings and adjusted EBITDA and net income reported in accordance with generally accepted accounting principles in the United States. PSEG believes that the non-GAAP financial measures of operating earnings and adjusted EBITDA provide a consistent and comparable measures of performance to help shareholders understand our operating and financial trends.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group, and joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions and we ask that you limit yourself to one question and one follow-up. Thank you.

Ralph Izzo

Thank you, Kathleen, and thanks, everyone, for joining us today. This morning, we reported non-GAAP operating earnings for the full year of 2016 and as you saw we reported that the non-GAAP operating earnings for the fourth quarter were $0.54 per share versus non-GAAP operating earnings of $0.50 per share earned in the fourth quarter of 2015.

Our GAAP results for the full year of $1.75 per share reflect the impact of our decision last year, to retire the Hudson and Mercer coal-fired generating units in June of this year. The non-GAAP operating earnings for the full year of $2.90 per share were closely aligned with 2015's non-GAAP operating earnings of $2.91 per share. And they were solidly within our revised guidance of $2.80 per share to $2.95 per share, as well as within our original guidance.

Our results reflect the benefits of growth through organic investment and control of O&M expense, this helped to offset the impact on earnings from low energy prices and record mild temperatures experienced during the first quarter of the year. Actions we have taken to transition our business mix in response to changing market conditions have supported PSEG's earnings and will continue to have a positive impact. For 2017, we're focusing on our non-GAAP – forecasting, our non-GAAP operating earnings of $2.80 per share to $3 per share.

Now, let me just describe a few highlights in 2016. First off, PSE&G was named by the ReliabilityOne organization, as the most reliable utility in the mid-Atlantic region for the 15th consecutive year. The utility invested $2.8 billion during 2016 to upgrade and expand its transmission and distribution system. As part of this work to enhance the system's resiliency and its reliability, PSE&G placed into service the 345 kV northeast grid transmission line. The utility upgraded 177 miles of gas pipe in more than 80 towns under its three year, $905 million gas system modernization program.

As part of this work, PSE&G collaborated with Environmental Defense Fund to help detect methane emissions. This collaborative effort helped determine which gas pipes to replace first and that led to a greater reduction in emissions at less cost. In addition, upgrades to PSE&G's electric distribution system continue under the $1.2 billion energy strong infrastructure program. The utility also received approval during the year to expand its Solar 4 All program. The decision by the New Jersey Board of Public Utilities allows PSE&G to build an additional 33 megawatts, that's DC, of solar farms on landfills and brownfield sites in the utility serviced territory.

Solar 4 All with this latest approval grows to represent a 150 megawatt program, that's also DC. PSE&G's investment program, its supportive revenue recovery mechanisms, and tight control of O&M provided for growth of 12.9% in its net income from 2015 to 2016, increasing its contribution to 60% of consolidated non-GAAP operating earnings.

This continues PSE&G's track record of 16% compound annual growth in earnings since 2009. And we also made strides in 2016 at PSEG Power. Despite the continuation of difficult power markets, PSEG Power reported non-GAAP operating earnings for the full year within original guidance, and in excess of our revised guidance.

final

Bloomberg
SI-SSA-0015-14976

Management's ability to control expenses in response to market and operating conditions helped to offset the impact on earnings of lower volume and pricing, and speaks to the capability of our management team. Power invested $1.3 billion in capital in 2016, construction of 1800 megawatts of new, efficient combined cycle gas-fired turbine capacity within the PJM and New England markets at a total project cost of $2 billion remains on time and on budget. Also during the year, Power invested approximately $300 million, a nearly double the size of its portfolio of solar projects to 400 megawatts DC. During the year, Power announced it would be retiring the Hudson and Mercer coal-fired generating stations on June 1 2017, given the outlook for energy prices and the cost of operating these older stations. Retirement of these facilities will improve the outlook for Power's cash flow and income going forward.

The addition of the new gas-fired capacity and the retirement of Hudson and Mercer will transform Power's generation mix. Coal-fired generation is expected to represent 7% of our fuel mix in 2017. As energy produced from natural gas represents 30% and nuclear fuel generation provides 63% of our energy output. An improvement in the fleets' economic efficiency with a decline in the average heat rate will also benefit the dispatch of Power's assets.

We continue to focus on safe efficient operation of our base load nuclear fleets. Power's management team has implemented cost reduction measures in coordination with industry groups to help assure these assets operate in a safe and reliable manner. Controlling cost is vital in the current energy price environment, but even with stringent measures, these units faced continued challenges.

A key element of PSEG strategy has been to maintain a strong financial position that supports our investment goals. Our balance sheet continues to provide us with competitive advantage. We ended 2016 with strong credit metrics, which allow us to pursue investment opportunities for growth. For 2017, we intend to invest $4.7 billion to enhance the efficiency and reliability of our businesses at PSE&G and at Power. This represents a record amount for PSEG to invest in any one year. We continue to have the ability to use our financial strength to improve returns. This includes an increase in our capital program, primarily in our regulated utility. Our investment program at PSE&G for the three years ending 2019, will provide for 9% annual growth in rate base.

We plan on providing you with an update of our five-year outlook for capital spending, and our Annual Financial Conference on March 6, when we will use our time together to describe what is known and what else maybe possible. I truly believe the investment program is exciting for shareholders and customers as it is focused on meeting their needs with the platform that provides reliable, efficient clean energy at an attractive return.

The strategy we implemented over the recent past has transitioned our business mix, as it provided annual growth in earnings. Over the past four years, we have achieved annual growth in earnings at PSEG of 4.4% albeit inclusive of a flat 2016. We want to outperform our recent past and to do so we must remain focused on our principles of operational excellence, financial strength and disciplined investment.

Of course meeting our objectives would not be possible without the significant contribution made by PSEG's dedicated workforce. The continued successful deployment of free cash flow into regulated investment programs that meet customer needs, is expected to support 8.5% growth in our utility company's net income, at the midpoint of our 2017 guidance. This then would represent 66% of enterprise's forecasted 2017 non-GAAP operating earnings of $2.80 to $3 per share.

The board of directors' recent decision to increase the common dividend by nearly 5%, or $0.08 per share on an annual basis to the indicative annual level of a $1.72 per share, is an expression of confidence in our outlook, and an acknowledgment of our strong financial condition.

We do see the potential for consistent and sustainable growth in the dividend as an important means of returning cash to our shareholders.

I will now turn the call over to Dan for a more details on our operating results and will be available for your questions after his remarks.

Daniel J. Cregg

Bloomberg Transcript
Bloomberg
SI-SSA-0015-14977

Thank you, Ralph, and good morning, everyone. As Ralph said, PSEG reported non-GAAP operating earnings for the fourth quarter of $0.54 per share versus $0.50 per share for the fourth quarter of 2015. Our earnings in the quarter brought non-GAAP operating earnings for the full year to $2.90 per share, in line with 2015's non-GAAP operating earnings of $2.91 per share, and at the upper end of our revised non-GAAP operating earnings guidance for 2016 of $2.80 per share to $2.95 per share.

On slide 4, we've provided you with a reconciliation of non-GAAP operating earnings to net income for the quarter. I'll be providing you with information on slide 10, regarding the contribution to non-GAAP operating earnings by business for the quarter.

Slides 11 and 13 contain waterfall charts, that take you through the quarter-over- quarter and year-over-year changes in non-GAAP operating earnings by major business. And I'll review each company in more details starting with PSE&G. PSE&G reported net income for the fourth quarter of 2016 of $0.38 per share and that's compared with $0.31 per share for the fourth quarter of 2015, as shown on slide 15.

PSE&G's full year 2016 net income was $889 million, or $1.75 per share compared with net income of $787 million, or a $1.55 per share in 2015 for year-over-year growth of 12.9% PSE&G 's net income in the fourth quarter continued to benefit from return on its expanded investment in transmission and distribution infrastructure. Net income for the quarter improved by $0.06 per share based on growth in PSE&G's investment in transmission and the absence of an adjustment for bonus depreciation in the year-ago quarter.

More normal weather conditions relative to unseasonably mild weather in the quarter a year ago, improved net income by a $0.01 per share. And a decline an O&M of $0.03 per share and other expenses was offset by an increase in depreciation and taxes. At the start of 2017, PSE&G implemented a $121 million increase in revenue under the company's transmission formula rate. Transmission revenues are adjusted each year, to reflect an update of the company's investment program. PSE&G's investment in transmission has grown to represent 44%, or $6.7 billion of the company's consolidated rate base of $15.2 billion at the end of 2016.

Economic conditions in the service territory are stable. During the quarter, weather-normalized electric sales were flat compared to the year ago period as an increase in demand from the commercial sector offset a decline in sales to residential and industrial customers. For the year, continued decline in the industrial sector and increases in efficiency offset the positive impact on sales from growth in residential customers.

The experience in 2016 is representative of our long-term forecast for electric sales of under 0.5% per year. Weather-normalized firm gas sales declined slightly during the fourth quarter, compared to the year ago quarter, and declined 1.9% for the full year. We believe the decline in weather-normalized gas sales for the year is due to the extreme weather conditions experienced over the past two years, starting some in precision in the weather adjustments and over the long-term we forecast annual growth of a 0.5% to 1% in firm gas sales.

PSE&G invested $2.8 billion on its transmission and distribution system in 2016 and has forecasted to invest an additional $3.4 billion in 2017. We're forecasting growth in PSE&G's net income for 2017 to a range of $945 million to $985 million. And at the midpoint of that range, the forecast represents 8.5% growth in net income for the year.

Now, let's turn to Power. As shown on slide 20, PSEG Power reported non-GAAP operating earnings of $0.13 per share, compared with non-GAAP operating earnings of $0.19 per share a year ago. The results for the quarter brought Power's full-year non-GAAP operating earnings to $514 million, or $1.01 per share, compared to 2015's non-GAAP operating earnings of $653 million, or $1.29 per share.

Power's adjusted EBITDA for the quarter and the year amounted to $155 million and $1.201 billion respectively. This compares with adjusted EBITDA for the fourth quarter of 2015 of $218 million and adjusted EBITDA for the full-year of 2015 of $1.435 billion. And as of this reporting, the calculation of Power's adjusted EBITDA no longer excludes costs associated with major maintenance activities at Power's fossil generating stations.

The earnings release as well as the earnings slides on pages 11 and 13, provide you with the detailed analysis of Power's operating earnings quarter-over-quarter and year-over-year from changes in revenue and cost. We've also

final

Bloomberg

SI-SSA-0015-14978

provided you more detail on generation for the quarter and for the year on slides 22 and 23.

PSEG Power's net income for the fourth quarter reflects the impact of incremental depreciation and some other expenses of $555 million and that's associated with the decision to retire the Hudson and Mercer coal-fired generating units effective June 1 of 2017. The company's fourth quarter results also reflect the impact of a decline in energy prices on output and margins.

The decline in the average price received on energy hedges reduced Power's quarter-over-quarter net income by $0.05 per share and improvements in our system gas sales partially offset the impact of reduced output, resulting in a net reduction of a $0.01 per share in quarterly net income comparisons.

During the quarter, an increase in O&M expense of $0.03 per share, associated with the planned refueling outage of Power's 100% owned Hope Creek nuclear station, was offset by a decline in taxes and other items and for the full-year, lower O&M improved Power's net income by $0.13 per share.

Let's turn to Power's operations and the output from Power's generating facilities was 7.6% lower in the fourth quarter, compared to a year ago levels. Quarterly comparisons were affected by the planned refueling outage at Hope Creek by major maintenance on the Bergen 1 gas-fired combined cycle gas turbine unit during the quarter and by market conditions. For the year, output was 6.7% lower than the amount of energy produced in the prior year.

The nuclear fleet operated at an average capacity factor for the year of 86.9%, producing 29.6 terawatt hours of energy representing 57% of Power's total energy output for 2016. If you recall, the refueling outage at Salem 1 in the spring was extended to replace baffle bolts in the reactor and Salem 2 was removed from service during a portion of the third quarter to repair a main power transformer.

The Salem units each operated at capacity factors in excess of 98% in the fourth quarter. Power's gas-fired combined cycle fleet operated at an average capacity factor of 57% for the year, producing 16.4 terawatt hours of energy, representing 32% of Power's 2016 energy output. The coal-fired fleet primarily Keystone and Conemaugh generated 4.8 terawatt hours of energy during the year, producing 9% of Power's 2016 energy output, with the remaining output produced from our peaking assets.

Operation of our gas-fired combined cycle fleet, for the year has been affected by the timing of outages and market conditions. Although a compression in markets spark spreads could continue to influence output from the combined cycle fleet in the upcoming year, we don't forecast the deterioration in the spark spread earned by the fleet given the availability and pricing of shale gas.

We've seen an improvement in forward zonal market prices over the quarter, particularly for 2018 and 2019 pricing. The improvement stems from an increase in pipeline capacity moving gas from the Marcellus basin, as well as transmission repair work, which has supported movement of electricity. Over the long-term, however the market prices do remain backward dated.

Overall, Power's gross margin declined slightly to $37 a megawatt hour in fourth quarter, versus $38.83 per megawatt hour in the year ago quarter. For the year, Power's gross margin was $40.40 per megawatt hour versus $42.25 per megawatt hour last year. And slide 25, provides detail on Power's gross margins for both the quarter and for the year.

Power's forecasting output for 2017 of 49 terawatt hours to 51 terawatt hours, a slight reduction from the 51.5 terawatt hours of energy produced in 2016. Following completion of the BGS auction in New Jersey earlier this month, Power enters the year with a 100% of its 2017 baseload generation hedged and approximately 80% to 85% of anticipated annual production hedged, at an average price of $46 a megawatt hour.

The percent of output hedged is higher than what we've typically hedged at this time a year, and the difference is the result of a slightly lower generation forecast for the year. For 2018, we forecast annual production of 55 terawatt hours, approximately 50% to 55% of 2018's forecast generation is hedged at an average price of $43 a megawatt hour, and for 2019, Power has hedged 15% to 20% of forecasted production of 60 terawatt hours at an average price of $43 per megawatt hour.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14979

And Power assumes BGS volumes will continue to represent approximately 11 terawatt hours in 2017, which is consistent with 2016's deliveries of 11.1 terawatt hours under the BGS contract. Forecast increase in output in 2018 and 2019 reflect a commercial startup in mid-2018 of 1,300 megawatts of new gas-fired combined cycle facilities at Keys, in Maryland and at Sea Warren in New Jersey, and the mid 2019 commercial startup of the 485 megawatt gas-fired unit at Bridgeport Harbor in Connecticut.

Moving to retail, Power has received approval to operate as a third-party supplier of retail electric energy in both New Jersey and in Pennsylvania. The forecast for 2017 doesn't assume meaningful contribution from retail sales, the Power's team will begin its marketing efforts.

Power's non-GAAP operating earnings for 2017 are forecast at $435 million to $510 million. The forecast represents non-GAAP adjusted EBITDA for the full year of 2017 of $1.080 billion to $1.210 billion.

Moving to Enterprise and Other. Enterprise and Other reported net income for the fourth quarter of $11 million, or $0.02 per share, which compares to net income of $4 million for the fourth quarter of 2015. For the full year, Enterprise and Other reported a net loss of $20 million, or $0.04 per share compared to net income in 2015 of $36 million, or $0.07 per share. Net income in the fourth quarter and the full year 2017 included pre-tax charges of $10 million and a $147 million respectively, related to impairment of leveraged lease residual values and an estimated loss as a result of liquidity issues currently facing NRG REMA.

Non-GAAP operating earnings for Enterprise and Other in the fourth quarter were $17 million, or $0.03 per share compared to $4 million in the year ago quarter. The results for the fourth quarter brought full year 2016 non-GAAP operating earnings from Enterprise and Other to $72 million, or $0.14 per share compared to $36 million, or $0.07 per share in 2015. Excluding the issues related to the leases, the improvement in non-GAAP operating earnings reflects the absence of certain corporate expenditures, as well as contractual payments associated with the operation of PSEG Long Island and certain tax items. And for 2017, non-GAAP operating earnings for Enterprise and Other are forecasted at $35 million.

I'd now like to spend a moment on the subject of tax reform, and as you all know it's very early in the process, but that said, we've evaluated the impact on PSEG of key changes to the tax code that are being discussed that you've, no doubt, familiarized yourself with over the past quarter.

Slide 31 provides an overview of these key issues, and overall we believe PSEG is well-positioned and would benefit from a decline in the federal tax rate due to Power's contribution to earnings and our strong balance sheet. We anticipate any reduction in federal taxes at PSE&G would be passed through to our utility customers, and we also anticipate the customer rates would decrease as excess deferred income taxes are returned to customers. The payback period as you know is unknown at this point. But our strong balance sheet puts us in a position to comfortably manage that return of cash to customers.

And you should also expect that our November 2017 distribution base rate filing at PSE&G would reflect any changes in federal taxes that would be known at that time.

The first changes in federal taxes are expected to improve PSEG's and Power's after-tax earnings and cash flow. And we estimate that given our low debt levels, the impact of deductibility of interest expense would be moderate to us versus our peers, as with potential loss of deductibility of our relatively low property taxes paid by Power. We do bear the risk of a boarder adjustment tax on our nuclear fuel, but on balance we believe, we are well-positioned for the elements of tax reform that are currently being discussed.

Next I'd like to provide a brief update on our pension, pension and OPEB expense in 2017 is expected to be $22 million lower than our 2016 level of expense. Contributing to that reduction was a merger of our three qualified defined benefit pension plans and the assets of those plans into a single plan. As a result, total pre-tax net periodic benefit costs are expected to decrease by $48 million in 2017 from what they would have been, but for the merger of the plans. And this is due to a change in the amortization period for gains and losses for the merged plan, resulting in a lower amortization expense than that of the individual plans.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14980

Returns on our pension fund in 2016 exceeded our targets and at year end, the pension plan was well-funded with no anticipated funding required over our five-year planning horizon. With respect to financing as Ralph mentioned, our financial condition remained strong. We closed 2016 with $423 million of cash on hand and debt representing 47% of our consolidated capital position. Debt at Power represents approximately 29% of its capital base and at year-end Power's debt position was just over 2.1 time to the midpoint of our forecast for Power's non-GAAP adjusted EBITDA for 2017. During the fourth quarter, PSEG issued $700 million of three-year and five-year senior notes at favorable interest rates, and we plan to provide you with an updated five year view of capital spending at our Annual Financial Conference on March 6.

We're guiding to non-GAAP operating earnings for 2017 of $2.80 to $3 per share, in line with our 2016 operating results, as forecast growth at PSE&G offsets lower energy prices on Power's income.

The common dividend was recently increased 4.9% to the indicative annual level of a $1.72 per share, which represents the 13th increase in the last 14 years, and builds on a 3.9% average annual growth in the dividend over last 10 years.

And with that, we're ready to take your questions.

Q&A

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. [Operator Instructions] Your first question comes from the line of Greg Gordon with Evercore. Please go ahead.

<Q - Greg Gordon>: Hey, good morning, thank you.

<A - Ralph Izzo>: Good morning, Greg.

<Q - Greg Gordon>: Please correct me if I'm wrong, but I just was looking at the guidance that you last gave on a segment basis on the Q3 call versus the actual results. And it looks like PSE&G net income came in slightly below the low end of the higher articulated guidance range, but PSE&G Power had a phenomenal year, at least relative to what you thought at the end of the third quarter. Can you compare your last articulated segment guidance against the year-end results and explain where things were consistent with or inconsistent with where you thought you were going to end up the year?

<A - Ralph Izzo>: So, I'll give it to Dan, Greg, good morning, but I think basically we had a pretty cold December and great O&M control and a tax issue with the utility, but Dan do you want to...

<A - Daniel J. Cregg>: Yeah. That's exactly it, Greg. There was a tax issue that's not an ongoing issue, it's a one-time tax item at the utility that brought them just below and Power just did a great job of controlling costs as we went through the balance of the year.

<Q - Greg Gordon>: Okay, great. So when we think about the guidance for 2017 then, whatever that – and I can go over it with Kathleen offline, whatever tax issue you had is normalized in terms of expectations?

<A - Daniel J. Cregg>: Yeah. That's exactly right, Greg.

<Q - Greg Gordon>: Okay, fantastic. And when you talk about the – sorry to focus on the tax stuff because who knows three months from now, we may wind up not having any tax bill at all, but one of your other competitors that's a large nuclear generator did point out that they thought that there was a significant exposure on border tax on uranium costs since we now unfortunately import the majority of our uranium. Is that theoretically true? But in the longer term if that were the case, are there domestic sources of uranium that would be quickly brought online to mitigate that?

<A - Daniel J. Cregg>: Yeah. I mean, Greg as we think about it, we spend about $200 million a year on nuclear fuel and a little more than half of that is sourced outside of the U.S. So we show that issue, obviously, not to a major extend from the standpoint of the overall impact on Enterprise. But if you think about a border tax trying to encourage

final
Bloomberg Transcript
Bloomberg

domestic production, I don't know that it would – there is any way it would get you all the way there from the ability to source what the industry needs domestically. That said that doesn't mean that you would necessarily have it as part of tax reform. So, we're aware of the issue, watching the issue, and that would be an area, where it would have an impact on us.

<A - Ralph Izzo>: And Greg, just the risk of getting into too much detail, remember when we say nuclear fuel, that's a complicated noun to use right, because there is a whole bunch of processing that goes along with it. So, when the answer is half of it is outside, it doesn't mean that from uranium cake to fuel rod, we do half of that in the country, and half of that outside of the country, all parts of it are touched outside of the country. So, as you point out, this is an attempt to bring this product into the nation, that we don't know, how that's going to be doable.

<Q - Greg Gordon>: Okay. Thank you, guys. Take care.

<A - Daniel J. Cregg>: Thanks.

Operator

Your next question comes from the line of Julien Dumoulin-Smith with UBS. Please go ahead.

<Q - Julien Dumoulin-Smith>: Hey, good morning, guys.

<A - Ralph Izzo>: Hi, Julien.

<A - Daniel J. Cregg>: Hi, Julien.

<Q - Julien Dumoulin-Smith>: Hey, just to finalize that question, just to make sure I heard you right on the nuclear fuel piece. You should assume the vast majority of the fuel CapEx is subject to the border adjustability tax?

<A - Daniel J. Cregg>: Since the laws aren't written it's going to be tough to say, but there is different components going from uranium to enrichment to fabrication along the way, and those steps are more external than internal to the U.S. So, however they would make the determination to apply any kind of a border tax that doesn't – that isn't written as yet, we would apply that against the components of how that comes together, so we're grasping a little bit at trying to define, a number around something that doesn't exist, but if we think about it little more than half of the aggregate cost seems like it might qualify to be non-domestically resourced.

<Q - Julien Dumoulin-Smith>: Right, got it. And then vis-a-vis your cash taxes, can you remind us exactly where do you stand today and what your effective and cash tax rates would be as you look at the forecasted future?

<A - Daniel J. Cregg>: So, future would not include any tax reform, I presume. But as we think about overall tax profile, we are a taxpayer and get a little close to not being one into this year, depending upon where the results go and then move back into a tax paying position?

<Q - Julien Dumoulin-Smith>: Got it, all right. Then turning to the CapEx bucket, your GSMP program, do you have plans to increase that going into the rate case? And can you remind us of the potential upside there as you see it in terms of the next filing?

<A - Ralph Izzo>: Sure. Julien, [indiscernible] (34:20) that's a $300 million a year run rate adjusted for inflation going forward, we think that's a 30-year program, so that means we have 27 more years after this first tranche of GSMP and you remember we were operating at a $300 million a year run rate and we have gained confidence that we can push that number up higher. I'd rather leave the details of that discussion for March 6, but it will be – we certainly have the capability to do more than $300 million a year, which would of course shorten the 27 years proportionally.

<Q - Julien Dumoulin-Smith>: Got it. Thank you very much.

Operator

Your next question comes from the line of Travis Miller with Morningstar. Please go ahead.

<Q - Travis Miller>: Good morning. Thank you.

<A - Ralph Izzo>: Hi, Travis.

<A - Daniel J. Cregg>: Hi, Travis.

<Q - Travis Miller>: I was wondering if you could update us, Ralph, on your thoughts about the retail business? The speed at which you would like to ramp that up, the extent to which you might ramp that up relative to the generation output?

<A - Ralph Izzo>: So our philosophy hasn't changed, remember this is primarily a defensive move on our part. We did make clear that we were looking at possibly trying to find a couple of tuck-in niche acquisitions, but we have not, and so we've opted to pursue this organically building the capability in house. We still are targeting between 5 terawatt hours and 10 terawatt hours at its maturity. We have received licenses to market in Eastern Pennsylvania and in New Jersey.

We have a head of the operation on board that we've hired and a couple of support folks and are talking to people about some of the back-office fundamentals that we don't want to build on our own. Don't forget we still have BGS, which is the 11 terawatt hours of our 50 terawatt hours round numbers that is essentially retail product. And what we're looking to do here is to basically claw back some of the BGS that over years had gone away by some combination of migration or changing of thresholds for the BGS customer. And we think that it will help us capture some loss margin and improve our management of basis differentials. So I think from the point of view of organic growth, I'm pleased with the approach it makes it harder, but it does make it more profitable if done this way.

<Q - Travis Miller>: Yeah. Got it, thanks. And then within that retail business, would you think about doing anything unique like energy services or C&I energy management, anything like that or are we just talking plain retail?

<A - Ralph Izzo>: This is plain retail capturing better margin for our hardware that exist.

<Q - Travis Miller>: Got it. Okay. Thanks so much.

Operator

Your next question comes from the line of Michael Lapides with Goldman Sachs. Please go ahead.

<Q - Michael Lapides>: Hi, guys. Congrats on a good 2016. I want to come back to the utility and the commentary about CapEx. I think if I read the release correctly, you said $10.2 billion of total CapEx for the entire company over the next three years and 77% of that is the utility. So that's kind of roughly $7.8 billion of utility CapEx. But then, and I may have misheard this, I thought you said that 2017's CapEx at the utility is going to be $3.4 billion. So that would leave $4.5 billion for 2018 and 2019, which implies $2.2 billion a year roughly.

That's a pretty big step down in PSE&G's CapEx. a) I want to make sure I heard that correctly. b) could you walk us through whether that's the number you're likely to lay out at the Analyst Day, or at the Analyst day are you going to update that number? What are the things that are not included that could wind up in there when we think about the next couple of years?

<A - Ralph Izzo>: Okay, Michael. Well, first of all good morning, thanks for the nice words. Yes, you heard the numbers correctly. This is our age-old problem, that you now have grown accustom to, where the out years have in the past grown beyond, what we predict them to be in the current timeframe. So, what we'll do at the Analyst Day is try to explain to you, what's been approved, what's about to be filed, what we've confidence in, in terms of being a mere extension of existing programs, and we're actually going to expand a little bit at the Analyst Day to kind of give you a little bit more insights into what I would just call our opportunities set, our drawing board things which we were always working on, but we normally don't bake into our bar charts showing five-year growth.

final
Bloomberg Transcript

But at the risk of sort of doing the preview with details on the news at 11 you are once again going to see a five-year set of numbers that are higher than what we thought they were going to be last year at this time and that just seems to be the natural trend. And I wish I could always get it right in terms of the prediction, but the out years are always less certain. So – yes, you heard it correctly.

<Q - Michael Lapides>: Right. It just seems in this – and I want to make sure I understand. The CapEx you're likely to layout at the Analyst Day will differ from the $10.2 billion total number that you put in today's release, or will those two, for just the next three years, be the same number and you'll give a lot more detail about drivers and what could change it?

<A - Ralph Izzo>: Yeah. So, in terms of three years, what we'll show you is stuff that we didn't include and why didn't include it, and then we'll expand the five-year view for you.

<Q - Michael Lapides>: Got it. The only reason I ask is that when I go back over the last decade, it's really years three through five, where you would show a cliff in the slide deck at the Analyst Day, and then as we got closer to year three and year four those numbers would come up. And the only thing that differs from the detail this time is now it's [ph] FY 2002 (40:53), meaning it's the 2018 number where you kind of assume a $2.2 billion if you just assumed 2018 and 2019 were the combined equal amount of what's left over. And so I'm just wondering, are we reaching a point where CapEx at PSE&G is starting to moderate?

<A - Ralph Izzo>: So I think, I think that your observations are accurate that the turnover generally occurred in years – it slightly occurred in year three and turnover in year four and year five. The other observation I would offer those that this year is a record breaking year for PSE&G CapEx. So, I think it's a combination of kind of GSMP and ESM and Energy Strong in tandem and Solar 4 All in tandem with still some major transmission work going on in the Bergen-Linden Corridor that's feeding a record breaking year. So, that year four and year five is coming up a little bit earlier this time, but that won't change the 9% growth in rate base, which is off of a higher base, and a larger capital program than we've had in the prior years and the prospects for even more to come.

<Q - Michael Lapides>: Got it. And one thing, in thinking about rate base calcs, what is the bonus D&A impact on rate base over the next couple of years?

<A - Ralph Izzo>: It's in the numbers that we're providing, I don't have a separate breakout of what the implications of that were, we can get you a little bit color on those numbers, but we broken out with the total cash flow aspect is and then that will ripple through based upon timing.

<Q - Michael Lapides>: Got it, thanks. I can follow up with Kathleen. Much appreciated, Ralph, Dan. Much obliged.

<A - Ralph Izzo>: Thank you, Michael.

Operator

Your next question comes from the line of Paul Patterson with Glenrock Associates. Please go ahead.

<Q - Paul Patterson>: Good morning.

<A - Ralph Izzo>: Good morning, Paul.

<Q - Paul Patterson>: Really quickly. The leases, they were, as I understand, last quarter they were all being paid. Is that still the case?

<A - Daniel J. Cregg>: Yes, everything is still current on them, Paul.

<Q - Paul Patterson>: Okay. And what is the earnings impact associated with these leases for 2017? Is it anything significant?

<A - Daniel J. Cregg>: Not a significant contribution to the ongoing earnings, no.

final

<Q - Paul Patterson>: Okay. That's my only question. Everything else has been asked. Thanks.

<A - Daniel J. Cregg>: Okay. Thanks, Paul.

Operator

Your next question comes from the line of Praful Mehta with Citigroup. Please go ahead.

<Q - Praful Mehta>: Hi. Thanks, so much.

<A - Ralph Izzo>: Good morning.

<Q - Praful Mehta>: So, my first question was on the O&M operation. You said the Q4 PSEG Power costs were low and were run efficiently. I wanted to understand, is that a one-time thing? What drove that, and can that be replicated going forward or is that already reflected in your guidance?

<A - Daniel J. Cregg>: Yeah. So, our O&M forecast for 2017 is clearly included within the guidance for 2017 and we continue to manage as efficiently as we can within the facilities that we have it. I guess the items that I would think about it, as you move through time and Ralph referenced, maybe some of the operational aspects as supposed to cost specific. But you'll see Hudson and Mercer coming off from the standpoint of those units retiring, and you'll see as time moves on with some new units coming on into retail operation, coming together, you will see some cost come back on from more productive purposes.

But we have operated the Power business at an extremely efficient O&M trajectory and if you look over the last five years or so, our O&M is basically dead flat.

<Q - Praful Mehta>: Got you. And that's helpful. Any perspective on PJM capacity prices? How do you see all the supply that could impact the upcoming auction, any view on that at all?

<A - Ralph Izzo>: Yeah, we never forecast what that is going to be, largely because we don't know what that's going to be. I think, what we are paying careful attention to and I suspect everyone on the call is as well as this first of a kind footnote by PJM that they may have to revisit some of the reliability parameters in the PS Zone and PS North in particular, that's something we all expect to see updated prior to May, I know that we have launched some questions with PJM about some of the reliability assumptions made, these seem to emanate from the change in the wheeling circumstances associated with the New York ISO. So, no we don't forecast, we don't predict to the outside world, we obviously do a lot of analysis inside about what we think may happen, but right now I believe the parameters unfortunately are in a bit of flux, and they need to be fixed sooner rather than later.

<Q - Praful Mehta>: Got you. And just finally quickly on the tax reform side, you said with the reduction of corporate tax rate, obviously the excess deferred tax liability, whatever you revalue, you'll have to refund back to customers. Can you give us a sense of what that size is and what do you expect in terms of timeframe if you had to refund that?

<A - Daniel J. Cregg>: Yeah, the second question is the harder one to answer, because it is not determined yet, where that's necessarily going to come from, so that could be legislated as part of what ultimately may come out or be left to the regulatory agencies to make that determination. So, we don't know if you look back to 1986, there was something called the average rate adjustment method, which was painfully complex, and pushed the excess back on a unit-by-unit or a class-by-class as the timing difference has changed.

So it was very structured, and very complex and pushed them back over a long period of time. So as it stands right now, we don't know what that message is going to be, because nothing is in place as yet, but that's just an eyeball to history. And if you take a look, you can see just by going through the overall tax footnotes and looking at the aggregate deferred taxes that we have and grossing up at 35% and pulling down at whatever rate you think the rate is going to go to. So you'll have to determine whether you had a 15% or 20% rate or something else based upon what gets legislated. But if you're in that range, you're probably approaching about $2 billion of excess deferreds, just by doing that math off the footnotes of the 10-K.

Your next question comes from the line of Anthony Crowdell with Jefferies. Please go ahead.

<Q - Anthony C. Crowdell>: Good morning. I just have hopefully one quick question. The midpoint of the utility guidance $945 million to $985 million, what's the assumption on earned ROE?

<A - Ralph Izzo>: Yeah, that's not changing this year for any reasons that we can think of Anthony. We're looking at each other right now say, does somebody knows something that we don't. The rate case filing for base distribution will go in November my guess is those rates will be effective sometime either late in 2018 or January 1 of 2019. Our FERC formula rate has already gone through for January 1. Our clauses are all baked in already at varying degrees from 9.75% to 10.0% So, there is no ROE – there is no allowed ROE impact this year that I can think off...

<A - Daniel J. Cregg>: Yeah. I mean ultimately it becomes the sum product of all of those different rates and programs.

<Q - Anthony C. Crowdell>: I guess, have you provided what that sum product is that you're assuming for 2017 or no?

<A - Daniel J. Cregg>: No.

<A - Ralph Izzo>: No.

<Q - Anthony C. Crowdell>: Okay. Thank you.

<A - Daniel J. Cregg>: You're welcome.

Operator

Your next question comes from the line of Angie Storozynski with Macquarie. Please go ahead.

<Q - Angie Storozynski>: Thank you. Just a quick question on the Enterprise and Other. Can you help me with modeling of the future earnings power of this segment?

<A - Daniel J. Cregg>: Yeah. Far and away the biggest component there is PSEG Long Island and that's about a $0.07 to $0.08 benefit in the aggregate. Beyond that there is a little bit of corporate expenses and a little bit of interest, but mainly if you think about that, as just being PSEG Long Island it will be pretty close.

<Q - Angie Storozynski>: So why was there a step-down between – why is there a step-down between 2016 and 2019 – 2017? I'm sorry.

<A - Daniel J. Cregg>: Yeah. So there is – we had a tax benefit that came through this year, which is a onetime item, which would not be replicated on a go forward basis.

<Q - Angie Storozynski>: Okay. And then for Long Island, should I just keep it flat? Is there any growth embedded in the contract?

<A - Daniel J. Cregg>: Yeah, that there is growth basically on a kind of a CPI oriented growth. So there is no step change that you should expect from that business.

<Q - Angie Storozynski>: Okay. Thank you.

<A - Daniel J. Cregg>: You're welcome.

Operator

Your next question comes from the line of Ashar Khan with Visium. Please go ahead.

<Q - Ashar Hasan Khan>: My questions have been answered. Thank you so much.

<A - Ralph Izzo>: Hi, Ashar.

<A - Daniel J. Cregg>: Good job.

Operator

Your next question comes from the line of Andy Levi with Avon Capital Advisors. Please go ahead.

<Q - Andrew Levi>: Hey, guys. How are you doing?

<A - Ralph Izzo>: Hi, Andy.

<Q - Andrew Levi>: Hey, just two quick questions. Just on 2019 on your hedges, the $43 on the baseload, seems like a very attractive price relative to kind of what shows up on various different – like Bloomberg for example. Just wondering the timeframe when you hedged that and how you were able to get a $43 price, which is very attractive.

<A - Daniel J. Cregg>: Nothing new there Andy, what we have always done and continue to do is as we try to capture items like a full requirements contract like BGS, we, we strip-out the capacity component of it and it leaves you with some of the actual non-energy elements that remain in there. So, as you look that far out that's a bigger proportion of what the hedged amount is. So that's what it gets you to.

<A - Ralph Izzo>: And it's consistent with what we've done, whenever we give you our hedge profile.

<Q - Andrew Levi>: Okay, so that, just make sure I understand it because I'm not that smart at times. So that percent that you show there, that's mainly from BGS? Is that what you're saying?

<A - Daniel J. Cregg>: About half of it is BGS.

<Q - Andrew Levi>: Half of it is BGS, got it. Okay. And the second question is, and I don't know if you had disclosed this already, but what is the PSE&G, the utility's, CapEx for 2017?

<A - Ralph Izzo>: That was the $3.4 billion.

<Q - Andrew Levi>: $3.4 billion, okay. I did hear that correctly, okay. And then I guess I can discuss the rest with Kathleen afterwards. Okay. Thank you very much.

<A - Ralph Izzo>: But she is not going to tell you how we hedged so smartly, she is not going to give away those trade secrets to you.

<Q - Andrew Levi>: Okay. Thanks.

<A - Daniel J. Cregg>: See you, Andy.

[Operator Instructions] Your next question comes from the line of Michael Lapides with Goldman Sachs. Please go ahead.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14987

<Q - Michael Lapides>: Hey, guys. Real quick follow-up on the balance sheet. You've talked previously about how much balance sheet capacity, or excess balance sheet capacity you maintain. Can you give an update on that? And if CapEx does start to moderate at the utility some, and we know that once the gas plants come online at Power we'll start seeing CapEx moderate, and probably early, mid next year there as well. How do you think about utilizing that balance sheet?

<A - Ralph Izzo>: Yeah. So thanks for the follow-up question Michael. And your arithmetic was right before, I just, I wanted to be cautious about the use of moderation for the utility capital program as a general characterization because it's anything but, and we'll talk in greater detail about that. And we'll also give you some specifics on residual investment capacity and there is a healthy amount of residual investment capacity that we'll expand about.

That is the primary reason, why we planned to do something a little bit new on following Monday and talk about the opportunity set. Albeit with a heavy dose of qualifying that opportunity set as, yeah, so this is the stuff that's on the drawing board that oftentimes never gets to a filing and then even after filing oftentimes gets trimmed, right. So, but we just want to show you the reason why we like having that investment capacity because we're always thinking of things that are important to customers that we can do for them.

<Q - Michael Lapides>: Got it. Thank you, Ralph. Much appreciated.

Operator

Mr. Izzo or Mr. Cregg there are no further questions at this time. Please continue with your presentation or closing remarks.

Ralph Izzo

Great. So, thanks, Brent. So thanks, everyone, for being on the call. And we hope the results for 2016 and the outlook for 2017 help you understand that our strategy is successful in meeting the challenges of the market today. We will be in New York on March 6th at the stock exchange and hope you'll join us for our annual review of our business both the three year and five year look going forward.

Presumably your takeaway say at least what we tried to communicate to you is that our balance sheet remains strong. As we just discussed with Michael and with the rest of you, our capacity for growth exists beyond the 9% rate base that we've talked about and the completion of the projects of Power that are going to add 1,800 megawatts of efficient combined-cycle. We will give you a little bit more information on the range of utility opportunities and what our ongoing efforts will be to position Power's portfolio for maximum returns. In the meantime, as much as it pains me to say, please enjoy this wonderful weather. And hopefully, we'll see it bundles up in Manhattan in about seven-day. Take care, everyone.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Ginger and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group's Third Quarter 2016 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session from members of the financial community.

[Operator Instructions] As a reminder, this conference is being recorded today, Monday, October 31, 2016, and will be available for telephone replay beginning at 2:00 PM Eastern Time today until 11:30 PM Eastern Time on November 7, 2016. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I will now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Ginger. Good morning. Thank you for participating in PSEG's call this morning. As you are aware, we released third quarter 2016 earnings statements earlier this morning. The release and attachments as mentioned are posted on our website at www.pseg.com under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended September 30, 2016, is expected to be filed later today.

As you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. And although we may elect to update those forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if our estimate changes unless required to do so.

Our release also contains non-GAAP operating earnings. Please refer to today's 8-K or our other investor filings for a discussion of factors that may cause results to differ from management's projections, forecasts and expectations and for a reconciliation of non-GAAP operating earnings to GAAP results.

I would now like to turn the call over to Ralph Izzo, Chairman, President, Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Dan Cregg, Executive Vice President, Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions. Thanks. Ralph?

Ralph Izzo

Thank you, Kathleen, and thank you, everyone, for joining us today. PSEG reported strong results for the third quarter. Earlier this morning, we reported net income for the quarter of $0.64 per share versus $0.87 per share last year. Non-GAAP operating earnings for the third quarter of 2016 were $0.88 per share compared with non-GAAP operating earnings for the third quarter of 2015 of $0.80 per share.

For the nine months, we reported net income of $1.94 per share versus $2.70 per share, but non-GAAP operating earnings for the nine months ended September 30, 2016, are $2.36 per share, which compares with non-GAAP operating earnings of $2.41 per share earned during the nine months ended September 30, 2015.

Slides 4 and 5 contain the details on the results for the quarter and the nine months. We remain committed to our core operating philosophy of operational excellence, investing in a disciplined manner and maintaining a strong financial position to support the growth expected by our shareholders.

PSE&G continues to earn its return on an expanded capital investment program. PSEG Power continues to manage through very difficult energy markets, and we continue to take strong actions to optimize both businesses in this environment. PSEG Power has decided to retire the Hudson and Mercer coal-fired generation stations in 2017. This is sooner than we would have forecasted just a few short years ago, but became inevitable in the face of changes in the energy market, which were amply demonstrated this summer. While we experienced very warm weather conditions, the abundance of low cost gas supply, which is a benefit for our customers, kept energy prices low and is expected to keep power prices lower for longer.

Careful analysis indicated that it would be uneconomic to invest the capital necessary to assure the units would comply with PJM's new capacity performance reliability standards. Although the units have been dispatched infrequently, we expect the retirement of Hudson and Mercer to result in a further reduction in the fleet division's profile.

These retirements continue the evolution of PSEG Power's fleet into a portfolio of reliable, low cost, flexible assets, capable of competing in today's market. To be clear, retirement will also aid Power's future cash flow and return profile. The addition of 1,800 megawatts of new gas-fired capacity at Keys, Sewaren and Bridgeport Harbor over 2018 through 2019 will further the transformation of the fleet.

From a supply/demand standpoint, I want to remind you the capacity at Sewaren and Bridgeport Harbor will replace older steam and coal-fired capacity that we will retire. The new capacity will improve the fleet's efficiency and lower its cost structure.

The new units remain on time and on budget. These new units remain profitable even with the recent declines in market pricing, and continue to meet our hurdles for returns, which of course are in excess of our return expectations that we placed on new utility investments.

By the end of this decade, our nuclear and gas-fired generation facilities will provide more than 90% of our electric output. Our nuclear fleet represents our cleanest energy resource for the foreseeable future and our gas-fired combined cycle fleet represents an efficient flexible resource.

We remain committed to operating the fleet in a safe, reliable manner and assuring their availability over the long term. Power continues to focus on running the business efficiently and has made target reductions in its workforce and continues to identify measures to improve availability and margin in today's market.

New investment opportunities for Power do not involve the construction of additional new capacity. But we continue to look for opportunities to diversify the fleet.

Bloomberg
SI-SSA-0015-14991

PSE&G also continues to identify new opportunities for growth. PSE&G is on track to invest $3 billion in 2016 as part of its five-year $12 billion capital program. In addition, PSE&G has recently reached the settlement with key parties that provides for an extension of its existing innovative landfill and brownfield solar program subject to BPU approval.

The settlement allows PSE&G to expand its investment in solar by approximately $80 million to construct 33 megawatts of grid-connected solar facilities over three years. We believe PSE&G's involvement in grid-connected solar extends the benefit of solar to all of its customers at a lower cost. We anticipate a decision from the New Jersey Board of Public Utilities by year-end. PSE&G is also requesting approval from the BPU to partner with New Jersey Transit in the development of a new $270 million substation that both would utilize and would enhance the reliability and resilience of facilities damaged by Superstorm Sandy. The new substation would enter service by the end of 2020.

For me it's hard to believe, but there's been four years since Superstorm Sandy struck. It touched all of our customers. And to-date, we've invested more than $900 million under electric and gas programs approved by the BPU to improve our systems' resilience through raising substations, building redundancy, replacing gas pipe and even trimming trees. The collaboration with New Jersey Transit on construction of a new substation represents a continuation of this type of work.

The agreement to increase our investment in solar, our announced $300 million increase in base capital spend, and PSE&G's anticipated collaboration with New Jersey Transit represent a greater than $600 million increase in PSE&G's capital program. PSE&G's ability to earn its authorized return on investment continues to drive our forecast for double-digit growth in PSE&G's 2016 earnings.

Based on our forecast for the year, PSE&G is expected to represent more than 60% of 2016's consolidated non-GAAP operating earnings. Its investment program continues to drive annual growth and rate base of 8% for the end of the decade with the potential for up to 10% with additional programs that we have planned.

We have met significant challenges to our forecast presented by the lack of winter weather and low energy pricing. Even so, consistent with our comments on the second quarter earnings call in mid-summer, we're making a slight adjustment to the upper end of our full year guidance. We are now guiding toward 2016 non-GAAP operating earnings of $2.80 to $2.95 per share, which represents a small reduction from our prior forecast of non-GAAP operating earning earnings of $2.80 to $3 per share. We are confident that the investments we're making along with a focus on operational excellence and a strong balance sheet will drive long-term success.

With that, I'll turn the call over to Dan who will discuss our financials in greater detail.

Daniel J. Cregg

Great. Thank you, Ralph, and thank you everybody for joining us on the call this morning. As Ralph mentioned, PSEG reported net income for the third quarter 2016 of $0.64 per share versus net income of $0.87 per share in last year's third quarter.

Non-GAAP operating earnings for the third quarter of 2016 were $0.88 per share versus non-GAAP operating earnings of $0.80 per share in last year's third quarter. And a reconciliation of non-GAAP operating earnings to net income for the quarter and year-to-date can be found on slides four and five.

We've also provided you with a waterfall chart on slide nine that takes you through the net changes in quarter-over-quarter non-GAAP operating earnings by major business and a similar chart on slide 10 provides you with the changes to non-GAAP operating earnings by each business on a year-to-date basis.

And I'll now review each company in more detail, starting with PSE&G. PSE&G reported net income of $0.50 per share for the third quarter of 2016 compared with $0.44 per share for the third quarter of 2015 for 14% improvement. Results for the quarter are shown on slide 12. The improvement in PSE&G's net income for the third quarter reflects growth from its expanded investment in electric and gas transmission and distribution facilities.

final
Bloomberg Transcript
Bloomberg

Returns on PSE&G's expanded investment in transmission added $0.03 per share to net income in the quarter. And incremental revenue associated with PSE&G's Energy Strong infrastructure program added $0.02 per share to net income in the quarter. Third quarter net income comparisons also benefited by an increase in electric demand associated with weather conditions, which were approximately 30% warmer than normal and 9% warmer than conditions experienced in the third quarter of 2015. The increase in demand associated with the warmer than normal weather added $0.01 per share to third quarter net income.

An increase in depreciation and O&M and other expense was offset by a decline in taxes and other items. Retail electric sales increased 3.6% in the quarter, reflecting the much warmer summer weather that occurred in 2016. And on a weather normalized basis, total sales were slightly positive versus the third quarter of 2015. Higher sales to residential and industrial customers offset by a decline in sales to commercial customers.

As Ralph mentioned, PSE&G's capital program led by an investment in transmission is on schedule. PSE&G is expected to invest $1.8 billion in transmission during 2016 as part of a five-year $7.1 billion investment program to upgrade and expand the transmission network. PSE&G's investment in transmission is expected to grow to represent approximately 45% of year end 2016's rate base.

PSE&G recently filed an update of its formula rate for transmission at the Federal Energy Regulatory Commission. And the update which reflects an increase in the level of PSE&G's investment and transmission would provide for $121 million increase in annual transmission revenues effective January 1, 2017, subject to FERC approval. We are maintaining our forecast for PSE&G's non-GAAP operating earnings for 2016 of $900 million to $935 million.

Now let's turn to Power. PSEG Power reported net income of $139 million or $0.27 per share for the third quarter of 2016 compared with net income of $206 million or $0.40 per share for the year ago quarter. Our non-GAAP operating earnings were $0.34 per share for the third quarter of 2016 compared to non-GAAP operating earnings for the third quarter of 2015 of $0.33 per share, and non-GAAP adjusted EBITDA for the third quarter of 2016 was $397 million versus non-GAAP adjusted EBITDA for 2015 of $401 million.

Non-GAAP adjusted EBITDA excludes the same items as our non-GAAP operating earnings measure, as well as income tax expense, interest expense, depreciation and amortization and major maintenance at Power's fossil generating facilities. And the earnings release on page 18 provides you with detailed analysis of the impact on Power's non-GAAP operating earnings quarter-over-quarter. We've also provided you with more detail on generation for the quarter and for nine months of the year on slide 19 and slide 20.

Power's net income in the third quarter includes one-time pre-tax charges amounting to $114 million pre-tax, $67 million after-tax with $0.13 per share related to the early retirement of the Hudson and Mercer generating stations. These one-time charges which were excluded from Power's non-GAAP operating earnings mainly relate to the write-down of excess coal inventory and materials and supplies, as well as some other smaller items.

Power's non-GAAP operating earnings for the third quarter, reflect a decline in the average price on energy hedges, which is partially offset by lower cost to serve load, which combined to reduce quarter-over-quarter operating earnings by $0.02 per share. Decline in output during the quarter reduced operating earnings by $0.01 per share and a reduction in O&M expense improved the results by $0.03 per share. An increase in depreciation expense associated with Power's capital program was more than offset by a decline in interest expense and other items, which combined to improve quarter-over-quarter net income by a $0.01 per share.

As I mentioned, Power's third quarter results benefited from a reduction in O&M expense which added $0.03 per share to net income quarter-over-quarter. Year-to-date, a reduction in Power's O&M expense has improved net income comparisons by $0.15 per share. Management's proactive response to lower energy pricing has been a major contributor to the decline in O&M and the timing of outages and major maintenance related work has also influenced comparisons. For example in 2015, refueling outage at Hope Creek occurred in the spring and this year Hope Creek's refueling outage is currently underway in the fourth quarter.

O&M expense in 2015 was also elevated due to major maintenance related work at some of the fossil stations. Although we expect O&M expense in 2016 to decline year-over-year, we should anticipate an increase in O&M for the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14993

fourth quarter given the costs associated with the refueling of our 100% owned Hope Creek nuclear station. Over the long term, you can expect constant diligence in controlling the growth of O&M.

Now let's start with Power's operations. Output at Power's generating facilities declined 4% in the quarter and the nuclear fleet operated at an average capacity factor of 80% in the third quarter versus an average capacity factor of 95% in the year ago quarter, as output declined 12% to 6.9 terawatt hours from 7.8 terawatt hours. The decline in output reflects the impact of extended outages at the two Salem units and as we mentioned in our second quarter earnings call, output in the third quarter would be impacted by the extension of the refueling outage at Salem 1 through July, the complete repair work on the unit's baffle bolts and repair work at Salem 2 to repair an electrical fault.

Both units have since returned to service and are operating at full capacity. Output from Power's gas-fired combined-cycle fleet declined slightly to 5.2 terawatt hours from 5.4 terawatt hours last year. The warmer than normal weather conditions spurred an increase in demand for Power's coal-fired generating stations and peaking fleet, which together experienced an increase in output during the quarter to 2 terawatt hours from 1.6 terawatts hours.

Power markets in the third quarter benefited from hotter than normal weather, which had a favorable influence on the market, and Power was less hedged going into the quarter than a year ago, allowing the fleet to capture some upside in pricing. That said, a decline in Power's gross margin in the quarter to $41.74 per megawatt hour from $42.07 per megawatt hour reflects the impact of lower average prices on energy hedges.

As we've indicated, we continue to expect basis to be seasonal that is positive in the winters, assuming normal weather and neutral to negative at other times of the year until more gas pipeline takeaway capacity goes into operation. Power continues to forecast the output for 2016 of 50 terawatt hours to 52 terawatt hours. The forecast takes into account the extended outage at Salem, as well as refueling outage at Hope Creek which is currently underway.

Power has reduced its forecast of generation output for 2017 and 2018 by approximately 3% to 4%. The revised forecast recognizes the impact of low gas prices on the potential dispatch of the Keystone and Conemaugh coal-fired generating stations, with also some impact coming from the retirement of Hudson and Mercer's coal-fired generating stations in mid-2017. Approximately 75% to 80% of anticipated production in the fourth quarter of 2016 of 11 terawatt hours to 12 terawatt hours is hedged on an average price of $48 per megawatt hour. The average price for energy hedges for the full year approximates $50 per megawatt hour.

And for 2017, Power has hedged 65% to 70% of its revised forecast of 51 terawatt hours to 53 terawatt hours of output at an average price of $47 per megawatt hour. And for 2018, Power has hedged approximately 25% to 30% of its revised forecast of 56 terawatt hours to 58 terawatt hours of output at an average price of $45 per megawatt hour. The hedge data continues to assume BGS hedges will cover 11 terawatt hours to 12 terawatt hours of output.

The forecast of Power's non-GAAP operating earnings for 2016 has been revised to $460 million to $500 million, and the forecast represents non-GAAP adjusted EBITDA for the full year of $1.270 billion to $1.335 billion. I'd also like to point out that the retirement of Hudson and Mercer will continue to have an impact on Power's net income in the fourth quarter.

In addition to the one-time charges recognized in the third quarter, Power expects to recognize incremental depreciation and amortization during the remainder of 2016 of $568 million pre-tax, and then 2017 Power expects to recognize incremental depreciation and amortization of $946 million pre-tax due to the shortening of the expected economic useful lives of Hudson and Mercer.

Until the units are retired, we will continue to record normal O&M and deprecation in our non-GAAP operating earnings. On an annual basis, these expenses amount to an estimated $60 million and $50 million pre-tax, respectively. We should also see a reduction in Power's planned capital spending beyond 2017 of approximately $200 million to reflect the elimination of previously planned capital improvements at Hudson and Mercer.

Now I'll turn to PSEG Enterprise and Other, where we reported a net loss of $0.13 per share for the third quarter of 2016 compared to net income of $0.03 per share for the third quarter of 2015. Our non-GAAP operating earnings for the third quarter of 2016 were $0.04 per share compared to non-GAAP operating earnings of $0.03 per share for the

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14994

third quarter of 2015.

During the third quarter of 2016, Energy Holdings completed its review of estimated residual values embedded in the NRG REMA leveraged leases. As a result of current and expected future market conditions, an impairment of $86 million after-tax related to the residual value of these leases was recorded in net income. The increase in non-GAAP operating earnings quarter-over-quarter results reflects certain tax items at PSEG Energy Holdings and contractual payments associated with the operation of PSEG Long Island.

The forecast of PSEG Enterprise and Other full year 2016 non-GAAP operating earnings remains $65 million. PSEG also closed the quarter ended September 30, 2016, with $450 million of cash on its balance sheet with debt at the end of the quarter representing approximately 45% of consolidated capital. PSEG Power had debt at the end of the quarter representing 28% of capital. As Ralph mentioned, we've adjusted our forecast for non-GAAP operating earnings for the full year to $2.80 to $2.95 per share from $2.80 to $3 per share.

And, with that, we are ready for your questions.

Q&A

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. [Operator Instructions] Your first question is from Neel Mitra from Tudor, Pickering. Please go ahead with your question.

<Q - Neel Mitra>: Hi. Good morning.

<A - Ralph Izzo>: Good morning, Neel.

<Q - Neel Mitra>: Just based off of some of your peers' commentary. Could you comment if you're seeing any cost inflation at your nuclear plants or any upwards pressure on pricing which you're having to contain?

<A - Ralph Izzo>: Yes, Neel. So, we have been commenting and participating in industry efforts to reverse the trend of some of the escalations in both O&M and capital being driven by the considerations emanating from the NRC. So we're part of an effort called Delivering the Nuclear Promise to take the average industry cost structure of $35 a megawatt hour down to $30 a megawatt hour. We haven't released our specific cost structure, but suffice to say that we operate slightly below the industry average. So yes there are cost pressures but there's an active industry effort that we are front and center and participating to both control that escalation and reverse it.

<Q - Neel Mitra>: Got it. And then just moving to the Keys Center, some of your recent commentary is based off of fact that you like the location in Southwest MAAC within PJM. Could you comment on why that's a good location compared to some other locations in PJM for a new build?

<A - Ralph Izzo>: Sure. It's a couple reasons. First of all, it's closer to the – it is part of the PJM West Hub where we do all of our hedging. So, it does lend some balance to the portfolio which is primarily PJM East, where most of our assets are located. It is a load pocket that is experiencing some modest degree of growth. There have been years where it looked like it was going to be about 4% and it's been consistently the strongest pricing region from an energy market point of view in PJM for the past few years.

<Q - Neel Mitra>: Okay. Perfect. Thank you.

Operator

Your next question is from Travis Miller from Morningstar. Please proceed with your question.

<Q - Travis Miller>: Good morning. Thank you.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14995

<A - Ralph Izzo>: Good morning, Travis.

<A - Daniel J. Cregg>: Hi, Travis.

<Q - Travis Miller>: Looking at a high level, I know you guys would like to have a strong balance sheet, where you are right now with the growth projects that you have over the next two years to three years especially on the Power side. How do you see that leverage changing? And to the extent that it stays in this kind of range, what's the opportunities that add leverage perhaps over the parent co or some other place on the balance sheet?

<A - Ralph Izzo>: So, I think that numbers – I'll let Dan fill in – remained on average above 40% for the next three years given current market expectations. Our floor at Power is an FFO to debt of 30% and yeah, as been the case in the past, Travis, our top priority is reinvesting in the business. That predominantly means reinvesting in regulated utility assets, although we continue to look for opportunities to acquire assets in Power that fill out our portfolios in competitive markets that we're interested in, that being New York, New England and PJM.

But number one use of the balance sheet is reinvesting in the business. Number two is, given the cyclicality of the merchant generation business to provide support for the dividend and some of those ups and downs, so that we can provide a consistent growth rate in that dividend.

And last would be to repurchase shares, if we were not seeing those growth opportunities, primarily in utility or had earnings that just dwarf the growth in the dividend, but, Dan, I don't know if you want to add some color to some of those specifics?

<A - Daniel J. Cregg>: Yeah, what I would say, Travis, is, we have had a lot of success in finding opportunities to deploy capital, and we even referenced today in excess of $600 million at the utility. So rough reference is, reinvesting the capital in the businesses is opportunity number one and that's what we have been able to do, and having a strong cash flow coming from the Power side of the business, and the ability to provide financing there at the parent is enabling of that growth that we have throughout the business.

<Q - Travis Miller>: Okay. And then on those generation projects, would you expect to have a higher percentage share of debt or leverage there, such that your entire balance sheet, certainly in a small way given the relative size, would move toward more leverage. Is it a question there, simply is, is there going to be extra leverage at those projects as you go through the construction phase?

<A - Daniel J. Cregg>: Yeah, I think, if you take a look at what we're investing into the business on the Power side of the business, and you take a look at what our cash flow is coming from the business, it pretty well supports the ability to build that, a, without any equity at the parent, but without growing that leverage capacity, that leverage utilization at Power.

<A - Ralph Izzo>: And to Dan's point, Travis, both Power and the utility can support that capital program without any equity issuance in any of the forecasts that we're able to come up.

<Q - Travis Miller>: Okay. Great. Thanks a lot.

Operator

So our next question is from Angie Storozynski from Macquarie. Please proceed with your question.

<Q - Angie Storozynski>: Thank you. So, first on the Power side. Can you comment on what you're seeing on the power basis, not the gas basis, but on the power basis for your combined type of gas, it seems like the output from your New York and New Jersey units have come down slightly over year despite this hot summer. And we are hearing from other power producers, gas-fired producers in PJM that they're seeing some expansion in the negative power basis due to some congestion on transmission line, as well as the gas plants are running now, well often 24x7, is this a phenomenon you're actually seeing in your units?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14996

<A - Ralph Izzo>: Yes, Angie. That is correct. So as you know, the basis differentials are very seasonal in nature, they tend to be so much strongly negative in the shoulders – in the off-seasons, the spring and the fall, less negative in the summer and they turn positive in the winter. It's driven by two factors, you've identified both of them; one is gas basis differentials and transmission congestion. I forget the name of the transmission asset down in the BG&E area that is undergoing some renewal. It's Bagley...

<A - Daniel J. Cregg>: Bagley-Graceton yeah.

<A - Ralph Izzo>: ...Bagley-Graceton, which I believe according to PJM is scheduled for completion sometime next spring, that's all public information you should check the PJM OASIS Board for confirmation that in case I have the date wrong.

And then obviously from a gas point of view, there's a much healthier degree of infrastructure that's bringing gas from the Marcellus to the New York, New Jersey region than there is going to the PJM West region which is a bit of a misnomer, it's actually south of here. And until the infrastructure corrects that arbitrage opportunity you'll continue to see a gas-based generation being less expensive to operate up here than it is down there.

But we remain confident that over time the market does correct any anomalies that exist and arbitrage opportunities that exist and there's no shortage of projects that are up either in permitting or in construction to move gas to the south, and as I said there is a specific transmission project underway to correct the congestion that we're seeing in the BG&E area.

<Q - Angie Storozynski>: Great. And now on the utility side, in your prepared remarks, you mentioned the double-digit growth rate and then you mentioned something about 8%, can you actually or just remind me of at least your comments about the...

<A - Ralph Izzo>: Sure.

<Q - Angie Storozynski>: ...was it about the rate base growth, or was it about the longevity of the current double-digit earnings growth?

<A - Ralph Izzo>: Yeah. So as you know, we don't forecast earnings growth, and what we've been forecasting is that for the next five years the utility capital program for approved programs which support an 8% rate base growth, and for programs that are fairly straightforward extensions of existing programs that 8% becomes 10%, but they've not been approved by the BPU yet.

Of course as you know, rate base growth is a good indicator of earnings growth, but then one has to add load growth and subtract O&M growth, and those are two parts that are tougher to predict. We do good job of controlling O&M, but I would not want to promise that we will be able to control O&M at a level of zero which is about a little low than it's been growing. It's like 0.1%, 0.2%. So, it's suffice to say that the earnings growth would probably be a net subtraction from that rate base growth, but we don't give an exact number what that is.

<Q - Angie Storozynski>: Okay. Thank you.

<A - Ralph Izzo>: Welcome.

Operator

Your next question is from Praful Mehta from Citigroup. Please proceed with your question.

<Q - Praful Mehta>: Thank you. Hi, guys.

<A - Ralph Izzo>: Hi, Praful.

<Q - Praful Mehta>: Hi. First question was on the generation separation side, the PEG Power side. I know we've talked about this before, but given how ITPs are trading today, they really seem to struggle and was wondering in that market context, does it make sense to think about PEG Power being separated, or do you now reconsider and think

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-14997

more of keeping the PEG Power as part of the whole PSEG family?

<A - Ralph Izzo>: I really don't have a lot new to say about this subject. If we may – if and when or we would make such a decision it would not be a market timing decision, it would have to do with the strength of the strategic arguments in favor of separation dwarfing the tactical benefits that we continue to believe dominate the picture today in terms of staying together.

So, sure, you wouldn't try and do something in the middle of economic instability or major macroeconomic disruptions, but we're not market timers, the real question is, do we still have the financial synergies between the businesses, do we still have the build synergy between the businesses, do we still have long-term investors who see the attractiveness of both. That's kind of strategic flexibility questions that we've talked about before.

<Q - Praful Mehta>: Fair enough. Thank you. And then, going ahead with the nuclear discussion that we were having earlier, there is obviously discussion in New York to support nuclear through this X program. Do you see other states looking to implement something like this or do you see that as a possibility in New Jersey or Pennsylvania in terms of support from nuclear or carbon free generation?

<A - Ralph Izzo>: I do. I think that a lot of states are realizing that these are long-lived assets, these being nuclear plants that provide enormous benefits both from a carbon point of view, from a skill diversity point of view, from a reliability point of view. And most of our markets are fairly short-term in nature, even three-year capacity prices now capture the full benefit of what I expect to be a fairly extensive debate on how carbons should be priced in the future. So, they may – every state may not come up with its own remedy and regrettably the right remedy would be a national remedy, but we don't seem to have a lot of traction in that regard right now. So, I do see most of the action focused at state-by-state level.

<Q - Praful Mehta>: Okay. I appreciate it. Thank you.

Operator

[Operator Instructions] Your next question is from Gregg Orrill from Barclays. Please proceed with your question.

<Q - Gregg Orrill>: Yeah. Thank you. I guess two questions. First, are you able to provide what your transmission rate base is for year-end 2016 and 2017? And then what are your thoughts around acquiring nuclear and/or coal asset?

<A - Ralph Izzo>: Good morning, Gregg. Good to hear from you. So, I'm going to do. People scurry around to find the rate base number. I do know that by 2018 it's 50% of the rate base, by the end of 2018, but I don't know what it is. So, Dan has the magic numbers, where he's going to take you to.

<A - Daniel J. Cregg>: I think we are – I think what we've done historically is we put out numbers for particular years and then given some ranges in between those years. So I think you're heading towards about $7 billion as you approach 2016 and then with the overall growth in capital you'd see increases there, but we will provide kind of our normal set of numbers within our next update, [ph] like we did, yes (37:47).

<A - Ralph Izzo>: I knew you're going to make it up, Dan. That's why I referred to. I think, Gregg, your second question, interest in acquiring coal, we are believers in nuclear, but at the right price, of course, we would be interested. But we're not – we have no interest in adding coals roughly, nor would you see us be a large fleet acquirer. I do think that in general, we've signaled to our investors that our primary investment is in the regulated utility and that's where we continue to put our emphasis.

<Q - Gregg Orrill>: Thank you.

Operator

Your next question is from Mitchell Moss from Lord Abbett. Please proceed with your question.

final

Bloomberg Transcript

<Q - Mitchell Frederick Moss>: Hey, guys, just a couple of questions on, first just a follow-up on Angie's question regarding the combined cycle, how they're running with – due to transmission gas supply issues. Do you see some of these issues being resolved by 2017 in terms of just gas takeaway in transmission or do you see it longer term sort of a 2018 and beyond type of an issue?

<A - Ralph Izzo>: Yeah. So, Mitchell, of course we're operating with the same crystal ball you are which without being too critical of your crystal ball, ours is pretty cloudy. Having said that, it's more of an 2018 to 2019 timeframe that these projects we think will have a takeaway capacity impact.

<Q - Mitchell Frederick Moss>: And regarding the REMA leases that you mentioned you took a charge on. Have you been involved in any of the negotiations that NRG has mentioned with bondholders or with leaseholders as part of any, I guess, restructuring discussions?

<A - Ralph Izzo>: No, we haven't, Mitchell. I mean, we are obviously aware as you are of where the current situations are and certainly ready for discussions when the time is right, but not as yet.

<Q - Mitchell Frederick Moss>: Do you guys have a view on whether or not the REMA lease could be broken or restructured in a bankruptcy or is a bankruptcy proof, I guess?

<A - Daniel J. Cregg>: I think we're going to let that play out, but time will tell what's going to happen. I think it's a fairly complicated situation and we'll let time become our best estimate. We got some disclosures within our 10-Q which give you a little bit of sense as to, some thoughts on it, but I think where it ends is ahead of us, yeah.

<Q - Mitchell Frederick Moss>: Okay, great. Thanks so much.

Operator

[Operator Instructions]

Ralph Izzo

Thanks, Ginger. We can give back 15 minutes to the folks, if there are no further questions.

Operator

Yes. There are no further questions, presenters, please – for any closing remarks.

Ralph Izzo

Sure. So just to summarize, hopefully what you heard is that our Power capital program remains on budget, on schedule, and based on current prices is still expected to create strong value for us. The utility continues to identify new customer-driven investment opportunities that fuel its growth.

Lastly, there's no question we have a relentless focus on cost control. It's part of everyday life at PSEG. So, with that, I'll just wish everyone a Happy Halloween. I guess we look forward to seeing you next week in Phoenix and thanks for joining us this morning. Take care, everyone.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Brent and I am your event operator today. I'd like to welcome everyone to today's conference, Public Service Enterprise Group's Second Quarter 2016 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session from members of the financial community. [Operator Instructions] As a reminder, this conference is being recorded today, Friday July 29, 2016 and will be available for telephone replay beginning at 2:00 p.m. Eastern today until 11:30 p.m. Eastern on August 5, 2016. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I will now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Brent. Good morning. Thank you all for participating in PSEG's call this morning. As you are aware, we released our second quarter 2016 earnings statements earlier today. The release and attachments are posted on our website, www.pseg.com under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended June 30, 2016 is expected to be filed shortly.

I won't read the full disclaimer statement or the comments we have on the difference between operating earnings and GAAP results, but as you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. And although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligation to do so, even if our estimate changes unless of course we are required to do so. Our release also contains adjusted non-GAAP operating earnings. Please refer to today's 8-K or other filings for a discussion of factors that may cause results to differ from management's projections, forecasts and expectations and for a reconciliation of operating earnings to GAAP results.

Bloomberg Transcript

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group. Joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions.

Ralph Izzo

Thank you, Kathleen and thank you, everyone for joining us today. PSEG's results for the second quarter were characterized by a tough environment for power markets but also with continued growth associated with PSE&G's expanded capital program. Earlier this morning, we reported net income for the quarter of $0.37 per share. Operating earnings for the second quarter of 2016 were $0.57 per share. Operating earnings were in with the $0.57 per share earnings in 2015 second quarter. The results for the quarter bring operating earnings for the first half of 2016 to $1.48 per share which compares with operating earnings of $1.61 per share earned in 2015's first half. Slides four and five contain the detail on the results for the quarter and the first half.

PSE&G's execution on its expanded capital investment program continues to provide a growing source of earnings and Power's prudent management of reductions in O&M, minimize the impact of the extended outage at Salem 1 earnings. PSE&G is on track to invest $3 billion in 2016 as part of its five-year, $12 billion capital program. PSE&G's ability to earn its authorized return on investment continues to drive out forecast for double-digit growth in PSE&G's 2016 earnings.

We continue to look for opportunities to grow in a manner that meets customer demand for reliable, efficient and clean energy and provides the risk-adjusted return demanded by shareholders. In the past quarter, we have identified more than $500 million of additional investment opportunities at our regulated utility company, PSE&G. During the past quarter, PSE&G requested an extension from the New Jersey Board of Public Utilities of its existing landfill/brownfield solar program. The program would add 100 megawatts of grid-connected solar facilities over a five-year period at a cost of approximately $240 million. The program would also create 575 direct jobs in New Jersey during the construction period and allow all customers to share in the benefits of solar. We hope to see a decision on this request during the fourth quarter of this year.

In addition, PSE&G has increased its estimate of distribution capital expenditures over 2016 through 2018 by $300 million to address what is commonly referred to as new business requests and to replace certain aging equipment and infrastructure. As I mentioned, these programs together would represent an increase of more than $500 million over PSE&G's current plans to invest $12 billion over the five-year period ended 2020. PSE&G's robust investment program will ensure that it remains one of the most reliable utilities in the nation as was demonstrated during periods of intense heat and thunderstorm activity experienced over the past two weeks. The investment program will also improve on PSE&G's growth in rate base, currently forecasted at 8% per year for the five-year period ending 2020.

The Power's capital program is also an important response for the needs of today's market, which requires that we operate at greater levels of reliability and efficiency. The planned replacement of older generating capacity at the Sewaren and Bridgeport station and new capacity at Keys amounts to 1,800 megawatts of new, clean and efficient gas-fired capacity over the next three years. This will transform Power's fleet and enhance its competitive position. We will see an increase in capacity. We will see an increase in reliability. We will see an increase in efficiency and we will see a reduction in carbon emissions.

Although Power has focused on the construction of the new combined cycle units, Power's also committed to improving the efficiency of existing capacity and ensuring its long-term availability. This can be seen through completion of a small uprate at its peaking stations which added 14 megawatts to capacity. Power also plans to increase the efficiency and capacity of the Bethlehem Energy Center through advanced gas path uprates of the turbines over 2017 and 2018. When completed, this work is expected to add 58 megawatts to BEC's capacity. And the recent issuance of the final renewal permit for the Salem station that meets the requirements of Section 316(b) of the Clean Water Act helps to ensure the long-term availability of this zero carbon generating resource.

final
Bloomberg Transcript
Bloomberg

Finally, Power has made targeted reductions in its workforce and continues to identify additional means of reducing its cost structure to ensure the availability and dispatch of the fleet in the current low-price environment. The power market over the short-term continues to be characterized by an over-supply of gas. The market, however, has shown signs of improvement as gas prices have respondent to a decline in production. The improvement in the supply picture and the development of more outlets for supply has also led to an improvement in forward basis. As we've indicated in the past, we continue to expect basis to be seasonal that is positive in the winter and neutral to negative in the summer until more takeaway capacity goes into operation.

In May 2016, PJM announced the results of the RPM auction for the 2019, 2020 delivery year. Power cleared approximately 8,900 megawatts of its generating capacity at an average price of $116 per megawatt day. The average price received by Power, while lower than prior auctions, continues to represent a premium to the average price for capacity in the RTO. Prices in the most recent auction reflect PJM's downwardly revised demand forecast, changes in the emergency transfer limits due to transmission expansion and the effects of both new generation and uncleared generation from the prior year's auction.

However, the results for the RPM auction were in line with our expectations. Nearly all of Power's cleared capacity in the latest auction complies with PJM's capacity performance requirements and the fleet is expected to be in a position to meet PJM's requirement that 100% of capacity for the 2020 to 2021 delivery year must meet those CP requirements.

On the regulatory front, FERC has approved two of the five recommended steps to improve energy price formation. Further efforts to address transparency in the scheduling of capacity could lead to an improved alignment of prices with costs. The year has presented challenges, looking forward to the second half of the year. We're maintaining operating earnings guidance for 2016 of $2.80 to $3 per share. But it will be difficult to reach the upper end of the guidance even with an improvement in the power markets, expectations for warm summer weather, restoration of normal operations at Salem and ongoing cost control and management of O&M. Our highly skilled workforce has met the market's challenges through the right-sizing of resources and by identifying investments that meet customer needs. Our dedication to customer service, a strong balance sheet, and our ability to invest in the future of the company are expected to drive long-term value creation.

With that, I'll turn the call over to Dan who will discuss our financials in greater detail and then I'll be available for your questions.

Daniel J. Cregg

Thank you, Ralph, and thank you for everyone for joining us today. As Ralph said, PSEG reported operating earnings for the second quarter of 2016 of $0.57 per share, the same as operating earnings of $0.57 per share in last year's second quarter. The reconciliation of operating earnings to net income for the quarter can be found on slide four. We've also provided you with a waterfall chart on slide 10 that takes you through the net changes in the quarter-over-quarter operating earnings by major business, and a similar chart on slide 12 provides you with the changes in operating earnings by business on a year-to-date basis.

I'll now review each company in a little bit more detail, starting with PSE&G. PSE&G reported net income for the second quarter of 2016 of $0.35 per share, compared with $0.33 per share for the second quarter of 2015, for a 6% improvement in earnings. And results for the quarter are shown on slide 14. PSE&G's operating results for the second quarter reflect the impact of revenue growth associated with an expansion of the company's capital investment program. Returns on PSE&G's expanded investment in transmission added $0.03 per share to earnings for the quarter.

An increase in depreciation and O&M expense of $0.02 per share was partially offset by a decline in taxes and other items. The higher level of depreciation is related to the growth in capital spending, and higher levels of O&M reflect increased spending on vegetation management. The New Jersey economy continues to show steady growth, and employment levels have shown improvement from a year ago. The variability in quarterly data for weather-normalized electric and gas sales has been high, given extreme weather comparisons.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15003

Weather-normalized electric sales reflect growth in residential and commercial customers, which is offset by the continuing decline in the industrial sector and increased energy efficiency measures. So on a trailing 12-month basis, weather-normalized electric sales were essentially flat. PSE&G's capital program remains on schedule. PSE&G invested approximately $1.4 billion during the first half of the year as part of its planned 2016 capital program of $3 billion. And as Ralph mentioned, PSE&G has identified investment opportunities which, if approved, will increase PSE&G's five-year capital program by approximately $500 million, to $12.5 billion. And you should expect the majority of this increase in spending will occur between 2016 and 2018.

Once again, all of this growth will be funded without the need to issue new equity. As you may recall, PSE&G implemented $146 million increase in annual transmission revenue under the company's transmission formula rate filing, which took effect this past January. This increase in revenue, adjusted to reflect the impact of bonus depreciation and updates of spending in prior years, will be reflected in PSE&G's earnings throughout the year. But I'll also remind you that the quarter-to-quarter earnings comparisons associated with PSE&G's investment in transmission are not expected to be even during the second half of the year.

The recognition of bonus depreciation for 2015 and some other expenses at the end of the year reduced PSE&G's fourth quarter 2015 earnings by about $0.04 per share. The contributions to earnings from the Energy Strong capital program will also be more evident during the second half of the year, given growth in the Energy Strong-related spending and the shape of the rate structure, which places more emphasis on demand charges during the third quarter. We are increasing our forecast of PSE&G's operating earnings for 2016 to $900 million to $935 million, from $875 to $925 million and the change incorporates cost-control efforts and a strong start to summer weather.

Now let's turn to Power. PSEG Power reported a net loss for the quarter of $11 million or $0.02 per share, compared with net income of $166 million or $0.33 per share for the year-ago quarter. Operating earnings were $0.18 per share for the second quarter of 2016 and adjusted EBITDA was $272 million, as compared with operating earnings of $0.22 per share and adjusted EBITDA of $301 million for the second quarter of 2015. And our adjusted EBITDA excludes the same items as operating earnings, as well as income tax expense, interest expense, depreciation, and amortization, and major maintenance at Power's fossil generating facilities.

The earnings release and slide 20 provide you with detailed analysis of Power's operating earnings quarter-over-quarter. We've also provided you with more detail on generation for the quarter and the first half of the year on slides 22 and 23. Power's operating results for the second quarter reflect the impact of the known decline in PJM capacity revenues and average prices on energy hedges, in addition to the effect of an extended refueling outage at Salem 1. Declining capacity revenue associated with the June 2015 retirement of peaking capacity in PJM reduced quarter-over-quarter income by $0.02 per share and capacity revenue during the second half of 2016 should approximate the revenues received during the last six months of 2015.

Earnings comparisons in the quarter were also impacted by decline in the average price received on energy hedges as well as lower market prices and gas volumes which together reduced Power's quarter-over-quarter income by $0.03 per share. A decline in output reduced income by $0.01 per share. Reduction in O&M expense improved Power's quarter-over-quarter income by $0.07 per share. This improvement reflects the absence in 2016 of costs incurred during the second quarter of 2015 for the refueling outage at the Hope Creek nuclear plant which is 100% owned by Power, and major maintenance work at our combined cycle units. And the quarterly comparisons also benefited from targeted reductions in O&M at Power's nuclear and fossil stations as well as from changes in the management of work schedules associated with the Salem 1 refueling outage which minimized the overall cost of the outage.

As we mentioned during the first quarter earnings call, the Salem 1 refueling outage which began on April 14 would be extended to repair degraded baffle bolts. The bolt replacement has been completed and the unit is in the process of returning to service. During the quarter, an increase in depreciation expense was offset by declining interest expense. However, an absence in 2016 of tax credits received in the year-ago quarter and other tax items contributed to a reduction in quarter-over-quarter income of $0.05 per share.

Turning to Power's operations, output at Power's generating facilities declined 6% in the quarter as a result of lower wholesale market prices and reduced demand. Output from the gas fired combined-cycle fleet declined slightly to 4.4

terawatt hours from 4.6 terawatt hours given mild weather conditions relative to the year-ago quarter. Low gas prices impacted the dispatch of Power's coal-fired fleet and during the quarter the output from the coal fleet declined to 0.9 terawatt hours from 1.3 terawatt hours.

Output from the nuclear fleet was largely unchanged in the quarter with 7 terawatt hours in this quarter versus 7.1 terawatt hours in the year-ago quarter. The impact of the extended outage at Salem was largely offset by an increase in output at Peach Bottom and completion of the extended power uprate at Peach Bottom, added 130 megawatts in the aggregate to Power's interest in the station. Salem 2 was out of service for three days at the end of the quarter and remains out of service. The unplanned outage at Salem 2 is a result of an electrical fault in the reactor's non-nuclear balance of plant. The extension of the outage at Salem 1 into July and the unplanned outage at Salem 2 will have a continuing effect on performance in the third quarter.

Power's gross margin in the second quarter declined to $38.54 per megawatt hour from $40.15 per megawatt hour. Power's margin in the quarter experienced only a modest benefit from the gas fired combined-cycle fleet's access to low-cost gas. A lack of demand and low volatility in the market, given an excess supply of gas, pressured spark spreads.

The power markets over the last month have seen prices move to higher levels, given the impact on gas supply from hotter than normal weather and declines in production. An improvement in load and prices will help margins on base-load units as an increase in regional gas prices, but also support margins at the gas fired combined-cycle fleet. For the year, Power is revising its forecast of output to 50 terawatt hours to 52 terawatt hours from the prior forecast of 52 terawatt hours to 54 terawatt hours. And the updated forecast incorporates the results for the first half of the year and takes into account the extension of the outage of both units at Salem.

As shown on slide 26, approximately 75% to 80% of anticipated production for the second half of 2016 of 25 terawatt hours to 26 terawatt hours is hedged at an average price of $50 per megawatt hour. For 2017, Power has hedged 55% to 60% of its forecast generation of 53 terawatt hours to 55 terawatt hours at an average price of $48 a megawatt hour. And for 2018, Power has hedged approximately 25% to 30% of forecast generation of 58 terawatt hours to 60 terawatt hours at an average price of $46 per megawatt hour.

The forecasted increase in output for 2018 reflects the commercial start-up by the new gas fired combined cycle capacity at the Keys and Sewaren stations. The percentage of energy hedge for 2017 and 2018 is slightly greater than what we communicated to you earlier this year and in line with our practice. We've adjusted our forecast to Power's full year 2016 operating earnings to $460 million to $525 million from $490 million to $540 million, to incorporate the results of the first half of the year. The revised forecast represents an adjusted EBITDA of $1.27 billion to $1.375 billion.

I'll turn to PSEG Enterprise and Other. The net income for PSEG Energy Holdings and Enterprise in the second quarter of 2016 was $19 million or $0.04 per share versus net income of $12 million or $0.02 per share for the second quarter of 2015. The increase in quarter-over-quarter income reflects contractual payments associated with the operation of PSEG Long Island and certain tax items at PSEG Energy Holdings. We've raised our forecast for the full year of operations to $65 million.

Our financial position remains strong. PSEG closed the quarter ended June 30, 2016 with $648 million of cash on its balance sheet with debt at the end of the quarter representing 45% of consolidated capital. During the quarter, Power issued $700 million of 3% five-year senior notes due in the year 2021. We do not foresee the need to issue equity to finance our expanded capital program. And as Ralph mentioned, we are maintaining our forecast of operating earnings for the full year of $2.80 to $3 per share.

And with that, we'll be happy to take any questions.

Q&A

Operator

Ladies and gentlemen, we will now begin the question and answer session for members of the financial community. [Operator Instructions] Your first question comes from the line of Jonathan Arnold with Deutsche Bank. Please go ahead.

<A - Ralph Izzo>: Hi, Jonathan. Are you there?

Operator

Mr. Arnold, please make sure your line is not on mute.

<A - Ralph Izzo>: Power is still working in this building so...

Operator

Your next question comes from the line of Travis Miller with Morningstar. Please go ahead.

<Q - Travis Miller>: Good morning. Thanks.

<A - Ralph Izzo>: Hey, Travis.

<A - Daniel J. Cregg>: Good morning.

<Q - Travis Miller>: I was wondering if we look ahead more generally to 2019, 2020 when you guys have your new plant online, and PJM in your region South and the other plants that are proposed, what are your thoughts on spark spreads? Obviously, we've seen what's happened in the capacity markets. But what are your thoughts on what happens to spark spreads?

<A - Ralph Izzo>: Well, so Travis, I mean, by that point, we will have three plants up. We will have one in Connecticut, one in New Jersey and one in Maryland. And it really will depend upon the infrastructure that's being built in each of those locations. As you know, all of those sites do have gas on the property. But we're seeing an increased importance in regional spark spreads. Right now in our region, we're seeing spark spreads given our access to natural gas of about $20 down at Pepco. It's pretty close to that, the forward of this thing, it could be as high as $23. So I mean, we certainly made these investment decisions on the expectation that the combination of either locked in or anticipated capacity prices plus those spark spreads would allow us to recover our cost of capital and then some.

So, as you know, our history is we don't usually pick numbers that are different than what the market is telling us. So right now, the local spark spreads as defined region by region is in the $20 range.

<Q - Travis Miller>: Okay so pretty flat type of curve that you think?

<A - Ralph Izzo>: I think so. The dynamic will be modified as the infrastructure gets built.

<Q - Travis Miller>: Okay.

<A - Ralph Izzo>: But it's [ph] peak (24:59) now for a good six months or so.

<Q - Travis Miller>: Great. And then on the – you guys have been benefiting for quite a while on that Marcellus gas basis at Power, when does that cycle often turn to incremental growth? When does it stop being on net benefit, I suppose, relative to the previous years?

<A - Ralph Izzo>: So, therein lies the value of a diversified fleet. One would expect that as infrastructure gets built from the region to mostly southeastern markets that you'll see an a decrease in price in other parts of the country which don't have that access, and an increase in price here which will diminish our regional spark spread advantage, but that should also then help our nuclear plants. So, it's been an ongoing source of pride for us that diversity of technology and

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15006

fuel allows us to deliver some consistency in terms of the margins that we're able to capture. And then of course, one cannot ignore the seasonal variations that will persist even once the infrastructure gets built.

<Q - Travis Miller>: Sure. Okay. Thanks. I appreciate the thoughts.

Operator

Your next question comes from the line of Julien Dumoulin-Smith with UBS. Please go ahead.

<Q - Julien Dumoulin-Smith>: Hi. Good morning. Can you hear me?

<A - Ralph Izzo>: Yes, Julien. Good morning.

<Q - Julien Dumoulin-Smith>: So, I wanted to ask kind of a bigger picture strategic question about the fate of nuclear in New Jersey, if you can think through that with us. What is your current positioning on the need for support and then price for carbon in New Jersey specifically? Perhaps not just with respect to RGGI, but kind of looking at parallels for New York, how are you positioned in [ph] the state (26:50)?

<A - Ralph Izzo>: Yeah. Now, Julien, thank you for asking the question because I want to make sure that there's clarity of understanding around that. There's a lot going on in the nation around nuclear. I don't know the latest numbers. I think 10 plants to 15 plants are rumored to be at risk of retiring. Half a dozen have retired. Our dilemma is that, as active industry participants, frustrated by an absence of carbon value given to nuclear plants and seeing what's happening around us is, we're trying to engage policy makers in a conversation that nuclear is not getting the credit it deserves.

Our challenge is, our plants are quite healthy economically, so notwithstanding the importance of carbon, I think the motivation in other markets are some of the near-term economic consequences of shutting those plants, given their lack of profitability. So, we don't have that situation. We're glad we don't have that situation. But it does sort of impair our ability to have the same level of interest and participation in the discussion.

So, we've been talking about fuel diversity. We've been talking about 90%-plus capacity factors and what it would mean should long-term forces require the replacement of that, whatever those long-term forces might be. But it is kind of a difficult conversation to have, given how many pressing problems are staring policy makers in the face right this minute. So, on the one hand, yeah, I don't want to go on ad nauseam. We feel strongly that nuclear is not getting the credit, i.e., price it deserves, but we cannot and we do not make the claim that our plants are at any kind of economic risk in the near-term the way others are.

<Q - Julien Dumoulin-Smith>: So, perhaps let me expand on that, no specific efforts in New Jersey and/or thoughts on kind of nascent efforts at PJM to perhaps more appropriately price in diversity?

<A - Ralph Izzo>: Oh, no, no, no, no, no, no, no. We are having early conversations that – in both forms – about what that kind of more accurate representation of the value could look like. And we're informing people who don't study this stuff as much as we do about what's being proposed in New York State and what's been discussed in Connecticut and what didn't happen in Vermont and Massachusetts and Wisconsin and what that led to, and what doesn't appear to be happening in Illinois.

So we're not just walking around saying, boy, I wish the world was different. We're talking to people who care about these things, about what the consequences have been in places where nothing took place and what would happen – what's being proposed in other places. At PJM, I think there's much more of a focus on reliability associated with such large quantities of [ph] baseload (30:06) power that don't have the seasonal challenges of access to gas and back-up fuels. But I think that historically PJM, of course, has not viewed itself, nor should it, as an implementer of environmental policy. So the conversation can be broader at the state level than the stakeholder process at PJM.

<Q - Julien Dumoulin-Smith>: Got it. And then completely separate question, just in terms of Power. Are you guys still thinking about expanding the footprint there? Obviously, you guys have been through the different diversification

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15007

efforts. Where do you think you are with respect to having adequate scale in that business and/or desirability of further investments? I'll leave it there.

<A - Ralph Izzo>: Yeah. No, no. So I think Power has stated its desire to expand in New England, New York and PJM. We think that those are the most efficient markets, given the combination of energy and capacity value in all three of them. We have also said that we do not anticipate any new build. We felt we had three very unique situations, but in the flat demand world with pretty much an over-supply condition, arguably all three locations, but certainly in two of them, injecting new supply does not appear to be a winning proposition. From the point of view of Power's scale, I mean, in terms of its reach, I'd like to see it have a little bit more of a robust portfolio outside of PJM than it currently has, but it certainly would be one of the largest, if not the largest, independent power producer on its own if that's where you're headed with that question.

Power doesn't have a lot of megawatts, but its financial strength and its profitability, I think, are quite unique. And something that we're very proud of and we work hard to preserve that in making our operating and investment decisions. So the way we'd intend, in the near-term, to grow Power is the way we've been trying to, which is through selective acquisitions of existing supply. As you know, we've not been successful at doing that. The one project we landed was the Keys project and there, probably because our perception of construction risk management was different than others. So, hope that answers your question.

<Q - Julien Dumoulin-Smith>: Absolutely. Thank you very much.

Operator

Your next question comes from the line of Praful Mehta with Citigroup. Please go ahead.

<Q - Praful Mehta>: All right. Thank you. So just following up on that question on the future of big Power, there looks to be clearly some Texas generation that will be in the market soon. Is there any interest in partnering up with Texas or is Texas not a market that you look to enter?

<A - Ralph Izzo>: No, probably you may recall was just a few years ago that we exited Texas. And it's not a market that we would want to re-enter at this time.

<Q - Praful Mehta>: Fair enough. All right. And secondly, in terms of capacity prices, I know you mentioned in your prepared remarks that you weren't surprised by the current capacity trends. Wanted to get a sense for how you're looking at long-term capacity prices in PJM, and also what was driving or what is like the minimum threshold that you look at when you were making your investment decisions, as in, is there a particular capacity prices you need to stay at to hit your IRR?

<A - Ralph Izzo>: So in terms of longer-term, as you know, we don't forecast prices. What we think will be different about next year's auction than this year's are a couple of factors. Number one is the requirement that 100% of the assets be CP compliant. Number two, we will have a market effect due to a recent announcement, an April announcement by Con Edison that a wheel that they were party to – they will no longer make use of and that wheel has the effect of net transfer into our region of about 400 megawatts which will now no longer be the case.

Also, we don't anticipate the kind of step change in PJM's demand forecast that took place prior to the last auction. We have been the primary builder of major transmission and while we still have a very, very robust transmission program, most of those projects are not involved in significant transfer capability, they're more at the 69 KV to 230 KV level within the zone.

The second half of your question, what did we look at? So we do have an internal rate of return expectation. That is obviously well-above our utility return expectations, and we look at the combination of energy margin and capacity margin when making that decision. Suffice it to say, obviously the fact that we're going ahead and building the prices that we realized last year in the auction and this year in Connecticut were sufficient for us to go ahead.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15008

So there's no one magic number in terms of capacity that says go ahead and build. It's the combination of capacity and energy together over the long term that we look at.

<Q - Praful Mehta>: Fair enough. Thanks so much guys.

<A - Ralph Izzo>: You're welcome.

Operator

[Operator Instructions] Your next question comes from the line of Brian Chin with Bank of America. Please go ahead.

<Q - Brian J. Chin>: Hi. Good morning.

<A - Ralph Izzo>: Good morning, Brian.

<A - Daniel J. Cregg>: Good morning, Brian.

<Q - Brian J. Chin>: We've seen a number of your peers announce greater investment in utility-scale renewables and while I appreciate your earlier comment that you're not looking to expand in Power, I was wondering if you could comment on renewable outlook in the northeast given just how quickly renewable costs have been declining and how improvements in technology have changed the landscape over the last couple of years?

<A - Ralph Izzo>: Sure, Brian. Well, first of all, we don't have any peers. That's number one. I'm sorry. It's just a personal point of view. Number two, in terms of renewables, you know we've been active on two fronts. On the unregulated side, we have about 300 megawatts that are in 12 or 14 states, I've lost track. And we specifically embarked on a crawl, walk, run strategy. I'd say right now we're jogging. And those projects have done well. Every one of them have met their pro formas. In fact, most one of them have slightly exceeded their pro formas.

Most of our solar investment, however, has been concentrated in PSE&G and that's been a blend of rooftop funded solar where we don't own the assets, but we have regulatory assets that support the rooftop and then grid connected. As you know, in New Jersey, grid connected is measured in single digit megawatts as opposed to a double or triple digit megawatts.

Notwithstanding the impressive price improvements of these installations, they still are substantially above conventional technology power prices. So our estimates right now are that, in New Jersey, people pay anywhere from $4 to $6 a month for solar energy and that's typical residential homeowner obviously, the average homeowner means that there's a bunch of people who pay more, a bunch of people who pay less.

And all of our customer survey information suggest that that is at or above the level that people are comfortable paying. So our pursuit of solar in PSE&G is really driven by the RPS and the desire to achieve those policy-mandated targets at as low a price as possible and doing things 3 megawatts and 4 megawatts at a time on landfills is a lot less expensive than doing them 2 kilowatt to 3 kilowatt hours at a time on rooftops, but one has to be careful, even 3 megawatts and 5 megawatts at a time as to what the bill impact is.

So, we're long-standing fans of solar. We are not apologists for it, but we do have to balance the bill impact. And so we pursued those opportunities in state in accordance with the RPS, and in other states in accordance with those utilities need to meet their RPS and secure those investments through power purchase agreements.

<Q - Brian J. Chin>: Got it. Thank you very much. That's all I got.

Operator

Your next question comes from the line of Shar Pourreza with Guggenheim. Please go ahead.

<Q - Shar Pourreza>: Hey, Dan and Ralph.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15009

<A - Ralph Izzo>: Hey. Good morning.

<Q - Shar Pourreza>: So most of my questions were answered, but just curious, Ralph, you've, you know, historically, on the Power side, you've talked about still having potentially, let me know if I'm putting words in your mouth, of an interest in sort of the U.S. nuclear business given sort of your diversified fleet at PEG Power but sort of, you know, one of the curtailments of that business has sort of been the mechanisms or a lack of mechanisms or the constructs haven't been appropriate. But now that you're sort of looking at some of what's happening in your surrounding states, that sort of environment could be potentially improving.

So when you look at Power, you look at its balance sheet and you look at selective acquisitions to increase scale, what you're seeing around you, does it sort of open up the doors that may be looking at nuclear?

<A - Ralph Izzo>: No, Shar. I mean, let me make sure I interpreted the question correctly. In terms of new nuclear power, the economics just aren't there. Every indication of the availability of natural gas and the duration of that availability, and the likely price range that we would see, would suggest that new nuclear and emerging company would not be an economically wise thing to do.

<Q - Shar Pourreza>: No. I think what I'm relating to is pre-existing nuclear assets that could potentially have contracted cash flows for the next few years.

<A - Ralph Izzo>: Yeah. I mean, if you had contracted cash flows and they met the hurdle rate, then we certainly think that nuclear has a long-term future. But as we were saying just a few minutes ago with Julien and Paul, others seemed so [ph] invariable (41:11) when we show up to buy an existing asset, they add a couple dollars to the forward price curve and we don't tend to win. So in terms of purchasing existing assets, so much is driven by a kind of the winner's curse and your view of where forward prices are going and now this is I think more disciplined approach of saying that we are not smarter than the market. So I would think that the practicality of that would be somewhat limiting.

<Q - Shar Pourreza>: Got it. Thanks.

Operator

Your next question comes from are the line of Michael Lapides with Goldman Sachs. Please go ahead.

<Q - Michael Lapides>: Hey guys. You know, question on the regulated side. On E&G. And it's actually a handful of questions. First of all, the $300 million increase in distribution CapEx, can you talk a little bit about how you get cost recovery on that and whether – if it's not being tracked, does that increase the potential for regulatory lag at E&G over the next couple of years?

<A - Ralph Izzo>: Michael, thanks for the question. Two things, number one, part of $300 million is what's called new business. So there's new revenue that comes with new business. But equally, if not more importantly, as you know, we have to go in for a rate case in November of 2017, so we are doing some things that need to be done, and we are timing them as such that they will fit into the rate base for the test year. So they will be covered by the rate case with minimal – if any regulatory lag at all.

<Q - Michael Lapides>: Got it. Another thing. How are you thinking about the ability to manage O&M at E&G over the next – really what's in 2016 guidance but also how you're thinking about it over the next one year to two years, maybe 2017, 2018, both core O&M and then when you think about what's happened with interest rates, discount rates and what it means for the pension component of your O&M and E&G.

<A - Ralph Izzo>: Yeah. So, I'll let Dan talk about the pension. But we don't look at O&M on a – oh, it's time to check out O&M perspective. We look at it every day. So we just extended contracts with six out of our eight unions. Not all of them were in the utility. But our three largest utility unions were included in that six out of eight, and those were all at reasonable escalation. There were wage increases of 3% per year, but benefit trade-offs that reduced the overall O&M growth. So we kept utility O&M growth to a little bit over CPI, I think it's been 2%-ish, thereabouts. I don't remember exactly CPIs, but I know what our O&M growth rate has been. It's been just a little bit over 2%. And we just

final
Bloomberg Transcript

pay attention to that every day. We are not believers in getting inefficient before rate case and then taking cost out of the business right after it. First of all, it is not a great way to build confidence with regulators, and it's not a good way to manage the operation.

In terms of the pension, yeah, lower interest rates are not going to be great for the PBO, but strong market performance, which we've seen, will be. But Dan, you may want to add some more color to that.

<A - Daniel J. Cregg>: No, I mean, I think that's exactly right and it's a little bit of a wait and see. I think a lot of the, on the PBO side, exactly what Ralph referenced, the discount rate is going to be determined really when we get to the end of the year. So that is uncertain until we get there. And returns have been doing pretty well. So I think, keeping an eye on those things as we move towards year end will track where we go on the pension. And in the interim, just try to manage overall O&M spend, whether it's storms, whether it's any new requirements we have for inspections or [ph] veg (44:48) management and trying to manage it as a whole, which I think we've done successfully in the past and we would intend to do into the future, is how we'll go forward.

<Q - Michael Lapides>: Dan, have you all ever talked about what the sensitivity is to every like 25 basis points change in the interest rate? For pension O&M. Sorry.

<A - Daniel J. Cregg>: Oh, yeah. Ultimately, it's just going to have an impact, both on what the obligation turns out to be and the component of what your returns are. And, yeah, we do look at that internally, to try to see where it goes. But fact of the matter is, at the end of the day, the discount rate is going to be the discount rate. So it's something that we need to manage having come at us, because we can't control that as a rate itself.

<Q - Michael Lapides>: Got it. Thanks, guys. I'll follow up offline. Much appreciated.

<A - Ralph Izzo>: Thanks, Mike.

Operator

Your next question comes from the line of Jonathan Arnold with Deutsch Bank. Please go ahead.

<Q - Jonathan Philip Arnold>: Good morning, guys. Sorry I was offline when you called before. Ralph, you've mentioned a sort of some level of interest in the retail business as a way of – path to market, I believe. Can you update us on your thoughts there, and obviously a large book that one would imagine would have had some sort of geographic interest to you just transacted with someone else, was that a bigger type of portfolio than you might be interested in? Or any perspective there would be great.

<A - Ralph Izzo>: Sure, Jonathan. First of all, it's good to hear you. I was a little concerned when you disappeared on us before. No. We remain interested in retail for defensive purposes, managing basis risk, and not as a significant growth opportunity by any stretch of the imagination. We've looked at some boutique shops, including the transaction you just referenced right now. I suspect that we're going to run into the same issues in looking at those types of potential tuck-in acquisitions as we do with power plants, that our discipline, some would say considered approach to pricing these things, will result in us perhaps not being able to roll up what we need to roll up from an acquisitive point of view.

So we're starting to turn our attention to just building some capability in-house because again, our ambitions here are modest. They're defensive ,and it's conceivable that an organic approach could be quite a bit more profitable from a point of view of return expectations. Sorry, Jonathan. I seem to have left a deafening silence.

<Q - Jonathan Philip Arnold>: Sorry. I had the mute button on again. What stage would you describe that sort of internal look at? Have you started to put a team together, or are you just thinking about it?

<A - Ralph Izzo>: We've hired some folks and we've started looking around at kind of systems that we would need, that are a little different than the systems we have now. We're preparing to file the necessary documents that one needs to be certified or licensed, I forget the exact terminology to engage in this business – be a separate and different

final
Bloomberg Transcript

function than our current wholesale trading arm.

<Q - Jonathan Philip Arnold>: Okay. So it's actually something you're – it's beginning to move on, but starting small.

<A - Ralph Izzo>: Correct.

<Q - Jonathan Philip Arnold>: Okay. Thank you very much.

<A - Ralph Izzo>: You're welcome.

Operator

[Operator Instructions] Your next question comes from the line of Anthony Crowdell with Jefferies. Please go ahead.

<Q - Anthony C. Crowdell>: Good morning. I just had a quick question on I guess the hedge volumes, slide 26. If I look at the 2018 hedge volumes, it doesn't look like there was a big change in the percentage hedge from the first quarter announcement, but the price change went from $54 to $46. Could you provide any clarity on that?

<A - Ralph Izzo>: Yeah. Anthony, I think we were up at the midpoint of those range split up about 5% from the first quarter until now. And there's a piece that's not a huge move – a piece of it is, as well, that earlier in our overall hedging trajectory, more of the volume is BGS-oriented. So if you think about what that price is, it includes some other non-pure energy items. As we step further through our hedging, we end up with a little bit more just kind of block pure energy trades, which tends to have a more moderating effect on the price itself.

<Q - Anthony C. Crowdell>: Okay. Great. So you're saying earlier in the year when you hedged, I guess, the first hedges you put on a more BGS-oriented hedges, and as you move throughout the year and layer on more hedges, that's more of just an energy market price?

<A - Daniel J. Cregg>: Exactly. So if you think about when the BGS auction happens in February of 2015, you'll have that stub in going into 2018, and then 2016 will have the same effect on 2018. So that accounts for a higher percentage of the volume earlier on and as we step into some of the energy hedges, that number tends to go down a little bit by virtue of the nature of the hedge that we're putting on.

<Q - Anthony C. Crowdell>: It's like the wedding of Cana, I guess; the better wine first. Thanks for your help.

<A - Daniel J. Cregg>: Good one, Anthony.

<A - Ralph Izzo>: Thanks, Anthony.

<A - Daniel J. Cregg>: That's great.

Operator

[Operator Instructions] We will pause for just a moment.

<A - Ralph Izzo>: Brent, that was probably a great note to end on if there are no further questions.

<A - Daniel J. Cregg>: Nobody wants to follow that comment.

Operator

Okay. Mr. Izzo, Mr. Cregg, there are no further questions at this time. Please continue with your presentation.

Ralph Izzo

So I'm told by Kathleen that many of you folks had a very busy morning with some other calls, so I always am grateful for your participation, with a special thank you today given how much was going on prior to us.

So in keeping with prior practices, let me just summarize what I hope were the key takeaways for you. The utility growth driven by customer needs and policy maker priorities is really continuing unabated rather than showing up a year after each investor meeting and telling you about what we found, we're trying to do a better job of keeping you apprised of things as we locate them. So we have about a little bit over $500 million of new stuff that we'll be doing, $300 million which we're definitely going to do and a couple hundred million of which we're waiting for BPU feedback on.

Power remains quite focused on markets managing its cost, its performance and its investment decisions with a real disciplined adherence to what the market is telling us. So some challenging price environments, some great O&M control. And then third and final take away is that this balance sheet remains strong. There's no change in our dividend policy. We continue to have the belief or the opportunity for sustained growth in that dividend that continues and yet these expanding investment needs at the utility and opportunities at the utility can be met without any new equity.

So I think we're on a little hiatus for a couple weeks and we'll be back on the road in September and certainly see all of you early in November at EEI. So thanks very much for joining us. Have a great rest of summer, folks.

Operator

Operator

Ladies and gentlemen, thank you for standing by. My name is Brent, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group's First Quarter 2016 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. [Operator Instructions]

As a reminder, this conference is being recorded today, Friday, April 29, 2016, and will be available for telephone replay beginning at 2 o'clock PM Eastern today until 11:30 PM Eastern on May 6, 2016. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Brent. Good morning, everyone. Thank you for participating in PSEG's call this morning. As you are aware, we released our first quarter 2016 earnings statements earlier today. The release and attachments are posted on our website at www.pseg.com, under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended March 31, 2016, is expected to be filed shortly.

Please read the full disclaimer statement and the comments we have on the difference between operating earnings and GAAP results. As you know the earnings release and other matters that we will discuss in today's call contain

Bloomberg Transcript

forward-looking statements and estimates that are subject to various risks and uncertainties, and although we may elect to update forward-looking statements from time-to-time, we specifically disclaim any obligation to do so, even if our estimates changes, unless of course we're required do so.

Our release also contains adjusted non-GAAP operating earnings, as well as adjusted EBITDA for PSEG Power. Please refer to today's 8-K for our other filings for a discussion of the factors that may cause results to differ from management's projects, forecast and expectations and for a reconciliation of operating earnings and adjusted EBITDA to GAAP results.

I would now like to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group and joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer.

At the conclusion of their remarks, there will be time for your questions. Thank you.

Ralph Izzo

Thank you, Kathleen and good morning everyone and thank you for joining us today. PSEG delivered solid results for the first quarter in the face of rather mild winter temperatures and low prices for natural gas and energy.

Earlier this morning, we reported operating earnings for the first quarter of 2016 of $0.91 per share versus operating earnings of $1.04 per share in last year's first quarter. Extreme temperature differences between the first quarter of this year and the first quarter of last year provides the backdrop for this quarter's operating results.

The first quarter of 2016 was 10% warmer than normal and the fifth warmest on record. The month of March in particular was extremely mild with heating degree days 25% lower than normal. Weather for the first quarter was also 27% warmer than the first quarter of 2015, but last year was the coldest on record.

Our results were strong in the face of this headwind. PSE&G's execution on its expanded capital investment program continues to provide a growing source of earnings. PSE&G is expected to invest $3 billion in 2016 as part of its five-year $12 billion capital program. Transmission is the largest part of PSE&G's effort representing 60% of planned spending. PSE&G's investment program and the continued focus on controlling costs will help drive our forecast for double-digit growth in PSE&G's 2016 operating earnings.

PSE&G's execution of our capital program is expected to yield best-in-class growth rate in rate base of 8% per year for the five-year period ending 2020. PSE&G continues to develop a pipeline of investment opportunities that also meet New Jersey's policy objectives and have customer support.

Now as for PSEG Power, it has been focused on operating in an environment of low gas prices for years. The availability and low price of gas and the need to meet more stringent reliability requirements has added new urgency to the company's efforts to improve its cost structure and efficiency. Power's capital program also represents an important response to today's market. Power's $2 billion of investment in three new combined cycle gas turbines will add approximately 1,800 megawatts of clean, reliable and efficient capacity to its fleet. Construction of the Keys plant in Maryland and the Sewaren Unit in New Jersey are on schedule to meet their 2018 operating dates. Bridgeport Harbor is expected to be available for 2019 commercial operation date.

The addition of this new capacity will transform Power's fleet. Power's base load nuclear capacity will be complemented by a flexible low cost fleet of combined cycle gas units capable of responding to the market. The fleet's carbon footprint is also expected to decline with the addition of the new clean gas fired capacity as nuclear generation continues to represent approximately 50% of the fleet's output. As I said, we remained focused on operating efficiently and safely. PSEG Power has made judicious reductions in its nuclear workforce and is working closely with the industry to identify additional means of reducing its cost structure, to assure the availability of this clean nuclear resource well into the future. Our goal is to capture these savings for the year to help offset the impact of low gas prices on earnings.

Bloomberg
SI-SSA-0015-15015

Separately from operations, we were very pleased with some recent actions in defense of competitive markets. In particular we were delighted with the U.S. Supreme Court's unanimous decision affirming the Fourth Circuit's decision in Hughes v. Maryland. Since that decision, the U.S. Supreme Court also dismissed New Jersey case allowing to stand the lower court ruling that the so called LCAP contracts are unconstitutional. A recent action at FERC is also constructive. I am referring to the orders issued by FERC earlier this week granting the complaints filed by EPSA and others which called into question some approvals granted by the Public Utility Commission of Ohio.

A separate complaint brought by a number of generating companies regarding the scope of the minimum offer price rule under RPM is still pending at FERC. While owners of existing assets with out-of-market contracts will not be directly restricted in the upcoming base residual auction regarding how they can bid the affected units, the lack of certainty regarding FERC approval of such contracts should at least neutralize some if not all of the incentives under the contracts to bid without regard to the unit's actual cost of operations. We believe that a competitive market is the best approach for ensuring that there is a supply of electric capacity to meet customer demand at the lowest cost.

Our companywide efforts are focused on building an infrastructure that improves system reliability, reduces emissions and supports the needs of customers. Our strategy is working and it is made possible by the contribution from our dedicated employees who support our efforts in countless ways. Their focus on the mission of providing safe, reliable energy has allowed us to meet the needs of customers and shareholders.

We are maintaining our operating earnings guidance for the full year of $2.80 to $3.00 per share. Our guidance assumes normal weather for the remainder of the year. As we move forward the weather and market conditions during the third quarter will be important for both PSEG Power and PSE&G. Current market conditions and the complete absence of a winter require that we maintain our relentless focus on identifying cost efficiencies and maintaining strong operating performance.

With that, I'll turn the call over to Dan who will discuss our financials in greater detail.

Daniel J. Cregg

Thank you Ralph and good morning to everyone. As Ralph said, PSEG reported operating earnings for the first quarter of 2016 of $0.91 per share versus operating earnings of $1.04 per share in last year's first quarter.

On slide four, we've provided you with a reconciliation of operating earnings to net income for the quarter and we've provided you with information on slide eight regarding the contribution to operating earnings by business for the quarter. Additionally, slide nine contains a waterfall chart that takes you through the net changes quarter-over-quarter and operating earnings by major business and now I'll walk through each company in more detail.

For PSE&G, shown on slide 11, we reported operating earnings for the first quarter of 2016 of $0.52 per share compared with $0.47 per share for the first quarter of 2015. PSE&G's first quarter results reflect the impact of revenue growth associated with an expansion of its capital investment program, which more than offset the effective unfavorable weather conditions on electric and gas demand.

Returns on PSE&G's expanded investment in transmission added $0.04 per share to earnings in the quarter and the first quarter also benefited from the recovery of revenue on PSE&G's distribution investment under its Energy Strong program. This increase in revenue improved quarter-over-quarter earnings comparisons by a $0.01 a share.

As Ralph mentioned, weather in the first quarter was warmer than normal and significantly warmer than conditions experienced last year. The negative impact of the extreme differences in weather on gas demand on revenue quarter-over-quarter was largely offset by the gas weather normalization clause. A decline in electric sales in revenue, however, as a result of the extreme differences in weather reduced quarterly earnings comparisons by $0.02 per share.

Lower taxes more than offset an increase in O&M expense due to the absence of insurance recovery of storm costs received in the year ago quarter. These items together added $0.02 per share to quarter-over-quarter earnings.

Bloomberg
SI-SSA-0015-15016

Economic indicators continued to improve. Employment in New Jersey has increased for 28 consecutive months, as the unemployment rate has declined to 4.3% and the housing market has also experienced an improvement. However, this improvement in economic growth was outweighed during the quarter by a mild weather. The variability in quarterly data for weather normalized electric and gas sales has been high given the extreme weather conditions making it difficult to discern a trend in demand when analyzing just the quarterly data, but data for the trailing 12-months indicates weather normalized electric sales were flat for the period ended March of 2016.

And in terms of weather normalized gas demand, a 0.3% decline in sales in the first quarter was led by a 1.5% decline in heating demand from the residential sector, which also is influenced by the large weather adjustment quarter-over-quarter. But on a trailing 12-month basis gas sales increased by 1.8% year-over-year.

PSE&G's capital program remains on schedule and PSE&G invested approximately $725 million in the first quarter as part of its planned $3 billion capital investment for 2016. Also as you may recall PSE&G implemented $146 million increase in annual transmission revenue under the company's transmission formula rate filing, which took effect this past January. This increase in revenue adjusted to reflect the impact of bonus depreciation and updates of spending in prior years will be reflected in PSE&G's earnings throughout the year. We're maintaining our forecast of PSE&G's operating earnings for 2016 of $875 million to $925 million.

Moving to Power, as shown on slide 18, PSEG Power reported operating earnings for the first quarter of $0.36 per share, and adjusted EBITDA of $416 million, compared with $0.55 per share and adjusted EBITDA of $626 million for the first quarter of 2015. Adjusted EBITDA excludes the same items as our operating earnings measure, as well as income tax expense, interest expense, depreciation and amortization and major maintenance expense at Power's Fossil Generating facilities.

The earnings release in slide 19, provides you with a detailed analysis of the impact on Power's operating earnings quarter-over-quarter. We've also provided you with more detail on generation for the quarter on slide 21.

PSEG Power's first quarter results were impacted by the extremely mild weather conditions experienced this year in comparison to the year ago period. A decline in capacity revenue associated with the June 2015 retirement of the HEDD or High Electric Demand Date peaking units PJM reduced quarter-over-quarter earnings by $0.04 per share.

Lower output due to the mild weather conditions coupled with lower average prices on energy hedges reduced quarter-over-quarter earnings by $0.09 per share. And a weather related decline in total gas send out to commercial and industrial customers and lower prices combined to reduce quarter-over-quarter earnings on gas sales by $0.12 per share. Lower O&M expense improved quarter-over-quarter earnings by $0.05 per share and a reduction in interest expense added $0.01 to earnings per share.

Now, let's turn to Power's operations. Output from Power's fleet declined 9% in the quarter as a result of the reduced demand and lower wholesale market prices. Output from the coal fleet reduced during the first quarter, a decline of 1 terawatt hour from 2.5 terawatt hours in the year ago quarter, as low gas prices affected the dispatch of coal. Output from the combined cycle fleet declined 0.2 terawatt hours to 3.7 terawatt hours with the decline in demand.

The nuclear fleet, however, experienced a 0.6 terawatt hour improvement in output to 8.4 terawatt hours for the quarter. The fleet operated at an average capacity factor of 99.7% in the quarter and the nuclear fleets' performance benefited from an improvement in availability at Salem as well as an increasing capacity at Peach Bottom. You may recall that the extended power upgrade work was completed at Peach Bottom last year and this work added 130 megawatts to our share of the station's capacity.

Power's gas fired combined cycle fleet has access to low cost gas which continues to provide it with an advantage relative to market prices. However, the lack of demand and a lack of volatility in the market given the mild weather and an excess supply of gas pressured spark spreads which were significantly lower compared to last year's levels. Overall Power's gross margin declined to $43.80 per megawatt hour from $47.32 in the year ago quarter.

Power is revising its forecast of output for 2016 to 52 terawatt hours to 54 terawatt hours from its prior forecast of 54 terawatt hours to 56 terawatt hours. The updated range for output incorporates the impact of the abnormally warm

final
Bloomberg Transcript

weather in the first quarter. This range also incorporates an anticipated expansion of the Salem 1 refueling outage.

A visual inspection during the current refueling outage at Salem 1 which began on April 14 revealed damage to a series of bolts located inside the reactor vessel. The need to conduct further testing to repair and replace the bolts is expected to expand the refueling outage.

To provide some context as a rule of thumb, a delay in Salem's refueling outage of 30 days would reduce generation by approximately 0.5 terawatt hour. And under this scenario nuclear fleets' capacity factor for the year would be reduced by about 1.5% to 91% from the current forecasted capacity factor of 92.5% for the year. And the actual outage duration will be determined after ongoing inspection work is completed.

As shown on slide 24 approximately 70% to 75% of anticipated production for the April to December period of 40 terawatt hours is hedged at an average price of $49 per megawatt hour. Our open position for the remainder of 2016 is more than adequate to cover the potential for a decline in output at Salem from our original forecast.

For 2017, Power's hedged 50% to 55% of its forecast generation of 54 terawatt hours to 56 terawatt hours at an average price of $49 per megawatt hour. And for 2018, approximately 20% to 25% for the forecast generation of 59 terawatt hours to 61 terawatt hours is hedged at an average price of $49 per megawatt hour. The forecast increase in generation in 2018 reflects the commercial operation of the Keys and Sewaren combined cycle units. The hedge data for 2016 continues to assume BGS hedges representing 11 terawatt hours to 12 terawatt hours.

As we mentioned to you last quarter, there are items included in our average hedge price which influence Power's revenue but don't support Power's gross margins. Our average hedge price for the remainder of 2016 reflects an increase in cost elements such as transmission and renewables associated with serving our full requirement hedge obligations. The increase year-over-year in these non-margin revenue items is approximately 1 megawatt hours to 2 megawatt hours.

We continue to forecast operating earnings for Power in 2016 of $490 million to $540 million and the forecast for operating earnings represents adjusted EBITDA of $1.320 billion to $1.4 billion for the full year which compares to $1.563 billion of adjusted EBITDA in 2015.

I'll briefly address as well Enterprise and Other's operating results and for the first quarter we reported operating earnings of $0.03 per share compared with operating earnings of $0.02 per share recorded last year in the first quarter. The increase in operating earnings quarter-over-quarter reflects contractual payments associated with the operation of PSEG Long Island and certain tax items at PSEG Energy Holdings and we continue to forecast full year operating earnings for 2016 from PSEG Enterprise and Other of $60 million.

And finally with respect to financings and other, PSEG closed the quarter with $592 million of cash on the balance sheet with debt at the end of March representing 44% of our consolidated capital. During the quarter, PSE&G issued $850 million of securities consisting of $300 million of five year notes at 1.9% and $550 million of 30 year notes at 3.8% while redeeming a $171 million of long-term debt. And we remain in a position to finance our current capital program without the need for the issuance of equity. We continue to forecast operating earnings for the full year of $2.80 to $3 per share.

That concludes my comments and I will now turn the call back over to the operator for your questions.

Q&A

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for the members of the financial community [Operator Instructions] Your first question comes from the line of Neel Mitra with Tudor, Pickering. Please go ahead.

<Q - Neel Mitra>: Hi, good morning.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15018

<A - Ralph Izzo>: Good morning, Neel.

<Q - Neel Mitra>: I just had a quick question on the lower generation in the first quarter from the milder weather, is that actually a net negative or a positive because you could not run your fleet and then procure the Power at a lower cost to fulfill the financial hedges?

<A - Ralph Izzo>: So the hedges are supplied at a lower cost even though we've locked in the price, so that's good news. But as you know, we're naturally long, so whenever demand is down that creates a drag for Power. There is a more modest drag on the utility, it has a weather normalization on the gas business, but no such thing on the electric business. So reduced demand due to mild weather, which [indiscernible] (22:05) a slight drag there, Neel.

<Q - Neel Mitra>: So the open position on Power is hurt just because it's not running as much, is that the way to look at that?

<A - Daniel J. Cregg>: Yeah.

<A - Ralph Izzo>: That's right. So you have lower dispatch prices, you have lower – less amount of run time.

<Q - Neel Mitra>: Okay. And second question, I know you have a small stake in the PennEast Pipeline. Can you remind us when you have that going into service and then there has been recent reports on a possible delay, what your thoughts are on that?

<A - Ralph Izzo>: So we have 10% position and we are now forecasting late 2018.

<Q - Neel Mitra>: And what were you forecasting earlier?

<A - Ralph Izzo>: Late 2017.

<Q - Neel Mitra>: Okay, great, thank you.

<A - Ralph Izzo>: You're welcome.

Operator

Your next question comes from the line of Paul Patterson with Glenrock Associates. Please go ahead.

<Q - Paul Patterson>: Good morning.

<A - Ralph Izzo>: Good morning Paul.

<A - Daniel J. Cregg>: Good morning Paul.

<Q - Paul Patterson>: On the Salem plant and I apologize, I heard you talk about it, but I just want to make sure I understood it. How long is the extended outage that you guys are now expecting?

<A - Ralph Izzo>: So we don't know yet Paul, the outage started I think it was April 14 and that would have been a fairly standard refueling outage. We normally don't give dates on that for obvious reasons due to market sensitivity. But we are in the middle right now of doing some testing to see how many of the bolts are damaged. And so until we finish that we won't know exactly how long the outage is. But I should point out even when we know we typically don't announce that to the marketplace.

<Q - Paul Patterson>: Okay. And you are still looking at how many bolts or what percentage of bolts have problems?

<A - Ralph Izzo>: That's right.

<Q - Paul Patterson>: And is there any read through to any other units do you think or any other sort of sense about this?

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-15019

<A - Ralph Izzo>: Yeah, I mean so clearly Salem 2, but we did inspect Salem 2 in 2015, because I mean, this is an industry problem that's been around since I think 1998. So this is not something that is unique to us or unheard of before. But Salem 2 passed visual inspection in 2015 and Salem 1 was scheduled to have the more intrusive inspection in 2019, but we're a couple of years ahead of schedule there. I will just remind you Salem 2 is six years younger than Salem 1. To the extent that this is a degradation over time, that should have an influence.

<Q - Paul Patterson>: Okay. Thanks so much.

<A - Ralph Izzo>: No problem.

Operator

Your next question comes from the line of Michael Weinstein with UBS. Please go ahead.

<Q - Michael Weinstein>: Hi, Ralph, how are you doing? Hey, recently we saw ConEd enter into agreements to purchase gas storage and pipeline assets in Pennsylvania and New York and we've also seen other large utilities making large acquisitions of gas assets and utilities and given the PennEast interest that you have already, what is your view on the current market for gas related acquisitions and what's your own interest in expanding further?

<A - Ralph Izzo>: Yes, so I would say that our interest in expanding further is low to zero. In terms of our position in PennEast, quite candidly every gas LDC in New Jersey has a position in that and we just thought that it was important to help participate in bringing those consumer benefits to our gas customers, as you know PSE&G has almost two million gas customers.

It's a really different business, Michael. I serve on a board of a company that's involved in the pipeline business and I just think we're really good at the knitting that we do, and I'd like to stick to that. So, I'm not second guessing others, please don't misinterpret. I mean, they have their own unique reasons for moving in that direction. But typically the corporate structure is different. They're mostly MLPs. They have a fairly different financial proposition and they are not without their challenges nowadays as well. So that may be a great time to go in to buy in. There is a raft of siting challenges associated with this, we're experiencing that in PennEast. There was a major pipeline, and I'm sure you are aware of in New York State that recently had an unpleasant surprise, so it's a very challenging business with fairly different DNA than what we have in our company and I like the DNA and the match that our company has with the operations that we are responsible for.

<Q - Michael Weinstein>: Does the current PEs in the gas utility space on the LDC space, does that also put you off in terms of future opportunities?

<A - Ralph Izzo>: Yeah, so that's a different subject, but the short answer to that is yes. I mean, I understand that debt is fairly inexpensive. Dan hopefully impressed you with the numbers he reported for our utility and you can make acquisitions accretive at very, very attractive premiums to the target, but the question we always ask ourselves is just because money is relatively inexpensive what are the alternative uses for that and simply paying a very, very rich premium and still having accretion may not be your best choice and we've been very clear. Our priorities are number, one organic growth and number two supporting the dividend, and then number three will be share repurchase. As I have said to many people paying a 20 plus PE to someone seems to me to be a bad idea, when I know a great company that's trading at a 14 or 15 PE that has the ticker symbol PEG, so again I've hopefully done it, but this is not second guessing or critical of other's decisions, but those are the ones I'm comfortable for us.

<Q - Michael Weinstein>: Okay, one last question, in terms of the partnership with Vectren for competitive transmission in MISO, do you see any other opportunities to partner with other local utilities for similar type of partnerships?

<A - Ralph Izzo>: Yes, so I can't disclose any that we haven't publicly disclosed, but that is an approach that we are eager to pursue. I think that there is lot of value to be had by combining forces with someone who understands the local transmission grid and system with our expertise now having put over $2 billion to work on an annual basis for a good

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15020

number of years in terms of cost and schedule management on transmission construction. I am very proud of our team and the work that they have done, but we don't know the system everywhere in the country, so to the extent that we can combine our project management skills and our construction management knowhow with people systems knowledge, that's a win-win for everyone.

Operator

Your next question comes from the line of Travis Miller with Morningstar. Please go ahead.

<Q - Travis Miller>: Hi, thanks.

<A - Ralph Izzo>: Hi, Travis.

<Q - Travis Miller>: I wanted to think a little bit more about this $0.12 on the lower gas send out and fixed cost recovery business, how much is that just pure volume and how much is there something else there, either margin contractions there or some other factor there that might not be directly weather related?

<A - Ralph Izzo>: I'll ask Dan, if he knows the split between the two of them, my short answers is it's a combination of both. But...

<A - Daniel J. Cregg>: And that's right. I mean, Travis, I guess the way to – maybe the best way to try to think about where we are from the $0.12 impact that we saw this quarter is if you were to look at each of the last couple of quarters, you would have seen last year and the year before there was a $0.05 and a $0.04 benefit that we picked up additively over the last two quarters. So, it's very much the absence of a winter which has impact both on pricing and on volumes. I think, the volumes were down about a third and when you have that impact as well as a margin compression we really also didn't see much volatility which doesn't help in that market, so they all were contributions to the delta that you saw for this quarter.

<Q - Travis Miller>: Okay, great, that's helpful. And then Ralph without too much a dissertation here, you guys have put a lot of eggs in the transmission baskets certainly, previously and for the next three years to five years. What are your thoughts on storage and how that might disrupt the transmission plans or alternatively offer you guys investment opportunities that wouldn't be in transmission but could be in storage?

<A - Ralph Izzo>: Sure, I'm a still sort of smarting from your suggestions that I am a bit longwinded.

<Q - Travis Miller>: I am interested in the dissertation, just not this morning.

<A - Ralph Izzo>: As luck would have it, I literally just came from a presentation two weeks ago by a director of Lawrence Berkeley Labs on storage and his claim, don't ask me his name because I don't remember, but he's probably easily – easy to look up, is that we're at least a factor of two away from grid connected storage that makes economic sense and what he has found is that that translates into anywhere from a 10 to 20-year timeframe. Of course when you're talking about material science research event it's difficult to put up with precision, but we're agnostic Travis about what hardware one puts in place to serve customers. So I don't care if it's copper wires, super conducting ceramic wire, lead acid batteries, lithium batteries, flow batteries, I am running out of technologies to stop lathering, and I am starting to tread on dissertation timeframes, but yeah, we were more than happy to pursue things that have economic merits that provides the reliability our customers are demanding.

<Q - Travis Miller>: Okay, good Cliff's notes version.

<A - Ralph Izzo>: Thanks.

<Q - Travis Miller>: Thank you very much.

Your next question comes from the line of Greg Gordon with Evercore ISI. Please go ahead.

<Q - Greg Gordon>: Thanks, my questions have been asked and answered, thank you.

<A - Ralph Izzo>: Thanks, Greg.

Operator

Your next question comes from the line of Jonathan Arnold with Deutsche Bank. Please go ahead.

<Q - Jonathan Philip Arnold>: Thanks same here. Thank you though.

Operator

Your next question comes from the line of Gregg Orrill with Barclays. Please go ahead.

<Q - Gregg Orrill>: Yeah thank you. Just around the hedges at Power, you increased some of the hedges over the last quarter and just wondering where you stand with where you would normally be at this point. How you are thinking about that?

<A - Ralph Izzo>: So Gregg as you know we try not to outguess the forward market. We do, however, we've said in the past there is a tendency of the market to take a data point from 48 hours ago and a data point from 24 hours ago, and extrapolate it for the next three years, and sometimes that emotional response is not as well informed by fundamentals as we'd like, but we always stay within certain guidelines. We allow our team to drift up a little bit if we think the market is begin a bit bullish and we allow them to drift down if we think the market is begin overly bearish and you will recall in April 14, and it was the former, we said we can go ahead and edge a little bit towards the upside since the market is being somewhat bullish and it's pretty safe to conclude that right now we are drifting towards the bottom of our guidepost just given the anomalously warm winter we had and the bearishness that's crept into the market. Now having said that that bearishness is not totally unjustified given where gas storage levels are.

<A - Daniel J. Cregg>: And then just the other thing to think about too, Gregg, is that for the BGS auction to the extent that that's a contribution across our hedge horizon. That auction usually – it takes place every year in February. So, you see a little bit of a pickup in that regard in the first quarter's change.

<Q - Gregg Orrill>: Fair point. Okay, thanks.

<A - Ralph Izzo>: Thank you.

Operator

Your next question comes from the line of Michael Lapides with Goldman Sachs. Please go ahead.

<Q - Michael Lapides>: Hey, Ralph thanks for taking my question and congrats on a good start to the year. Can you on the Salem issue, can you talk a little bit about other plants over the years that have seen similar issues and whether any of those turned into any more major related items or is having issues with kind of baffle bolts, some very standard, very common occurrence. I have to be very honest as a non-nuclear engineer that the word baffle bolts is a little baffling to me?

<A - Ralph Izzo>: Thanks Michael for the question. I'm glad you asked this. So, to my knowledge, DC Cook had an issue in 2010, Indian Point had an issue starting a month or so ago. There have been a handful, I think, like six or eight European plants. These are not – to my knowledge, these are not life threatening issues, they're literally 800 bolts typically that secure these metal plates we call them baffles to the reactor vessel and they're under pressure. There is a pressure grade in because of the hot high temperature steam that flows through the holes in these baffles and you just

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15022

get a mechanical stress, in our case I think we have 832 bolts. They are typical pressurized water reactors, so that's why I mentioned earlier it's a false question that we would have to look at Salem 2, again it is extra refueling outage although it passed visual inspection in 2015. It would not be an issue for Hope Creek because that's a boiling water reactor. So, I don't want to suggest anything other than we have to complete the inspection, but none of the prior instances has this been an issue that has threatened the plants going forward integrity or anything of that nature.

<Q - Michael Lapides>: Got it, and coming to your regulated side, the ENG, as you guys do most years at your Analyst Day, you lay out a CapEx forecast that obviously shows in year three through five somewhat of a decline from years one through two, can you talk about the things, your goals in 2016 in terms of actually, I don't want to call it back filling but the types of projects that you could see showing up in the 2018 to 2020 timeframe that might keep CapEx at a more similar level to 2016 and 2017 or even at a higher level, what are the types of projects what you have to do from the regulatory construct process to get those approved?

<A - Ralph Izzo>: Sure, so there is a whole host of them, Michael; there is ongoing renewable portfolio standard commitments that could result in some additional solar work. There are a couple special projects that we haven't named publically on the distribution system that involve major customers that would benefit the entire customer base that we will be pursuing. There is always new and additional work that comes out of the PJM RTEP and that's the kind of stuff you will see us looking at and potentially announcing in 2016. However, the major backfill in the out years of the plan won't be announced in 2016 because they are pretty new and that will be continuation of our gas system monetization plan and a continuation of Energy Strong. And the reason why we won't announce those in 2016 is because we are only a year and half since Energy Strong and we are only six months into GSMP and those were both three-year programs give or take a few months on some unique aspects. So you're right to say that we have historically backfilled the years four and five. I think there is a very high probability we'll do the same this time. But I think that in terms of the goals for 2016, it will be more some significant distribution projects that we have and potentially some solar work that to keep the state on its RPS targets, you'll see as a process in the near-term.

<Q - Michael Lapides>: Got it. Thank you, Ralph. Much appreciated.

<A - Ralph Izzo>: Sure.

Operator

Your next question comes from the line of Praful Mehta with Citigroup. Please go ahead.

<Q - Praful Mehta>: Thank you. Hi, guys.

<A - Ralph Izzo>: Hi.

<A - Daniel J. Cregg>: Hi, Praful.

<Q - Praful Mehta>: So quickly on the storage point, I know it was an interesting debate and you've made a bunch of relevant points, so that was really thoughtful. I just want to understand you were mentioning storage more from a transmission perspective. But just take it back to storage more from a generation feed perspective. If you did have the 10 year to 20 year window horizon as you talked about, how would you think of the implications for your gas fleet and just generally for the markets in general? If you did think storage was coming, whenever, 10 years, 20 years down the road, how do you see the implications for the power generation for your fleet and just generally in the U.S.?

<A - Ralph Izzo>: I think there are three uses for storage, right. One is to the extent that one has some localized distribution reinforcement that can be more economically achieved through storage rather than substation enhancement. Second would be your classic arbitrage between peak and off-peak power which has become less of an economic driver nowadays just given the abundance of natural gas. Third could be sort of a similarity to that which is to offset the intermittency associated with renewables, but in terms of using batteries as peakers I mean I think that you just have to take a look again at the dollars per KW and my goodness, gas engines just keep getting more and more efficient and storages seems to be losing in that race to keep up with them.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15023

So I think that there are multiple applications, I didn't mean to suggest that we'd only consider the one. What I was trying to point out is whether the application is a supply side or whether it's a customer reliability side, whether it's providing peaking services, other ancillary services, we don't have a religious fervor around one technology or another. We look at all, all the time.

<Q - Praful Mehta>: Fair enough, that's really helpful. And then secondly, from a M&A perspective there is number of generation assets clearly in the market and potentially more coming and you've talked about at some point a separation as well. So how do you fit all that in, are you looking to get to critical mass, is there opportunity here to acquire some assets and then get to critical mass where you think you can at some point separate? How are you thinking about that opportunity right now?

<A - Ralph Izzo>: Yeah, I mean that's pretty much what we've told the world, right, that we see three very changeable tactical reasons for remaining integrated. It's the financial synergies between Power's cash generation and utility's cash needs. It's the customer build synergies between the customers that Power serves and the customers that PSE&G serves and Power prices go down, PSEG's distribution rates go up, quite candidly. And then last but not least is the benefits of scale associated with the corporate support functions.

And as Power continues to pursue growth opportunities outside PJM East, the first two issues become less important, right. You have more customers that are not PSE&G customers that we will be serving in New England and in New York State. You have more need for Power's funds from operations going to Power as opposed to going over to the utility, and as both companies get bigger, then the corporate support synergies become less on a percentage basis. And the reason why I say outside of PJM East is because we're pretty much preempted from making any acquisitions within PJM East, and given the slow growth in demand, we're not big fans of greenfield development in PJM East, it's just you quickly run into an oversupply situation.

Having said all of that, we have demonstrated that we're pretty bad at acquiring assets. By that I mean we seem to have a more conservative view of where the market is going and are consistently outbid, Keys being the one exception to that, which I believe was largely because of our confidence in our ability to manage construction risk that perhaps others did not posses and also some of the portfolio benefit it brought to us in terms of PJM West.

So, we look all the time at generation assets, we have an – I was not saying anti-coal bias, that sounds very political and I didn't mean it that way. But just given the direction of environmental regulation, you won't see us taking a look at any coal expansions in terms of new assets. But we do look in our target markets which would be the rest of PJM, New England and New York State. We just have to get it at the right price and we're going to remain disciplined in what that means for us.

<Q - Praful Mehta>: Got you. That's very helpful color, Ralph. Thank you so much.

Operator

Your next question comes from the line of Ashar Khan with Visium Asset Management. Please go ahead.

<Q - Ashar Hasan Khan>: Good morning and good results. Can I just ask you one thing which Entergy mentioned why their outage is lasting a little bit longer, is that they didn't have the equipment onsite, and I didn't know what that meant exactly, but I just wanted to ask you, Ralph, you guys, do you have the stuff on site to replace and everything, so it won't cause a longer outage?

<A - Ralph Izzo>: No, it was – hi, Ashar. So the equipment is not routinely onsite, but we are in the process right now of securing that equipment while we do the ultrasonic testing. This is a highly radiated area. It's inside the reactor vessel, but we are in conversations with at least two vendors who claim to be able to help us do the work, and we're confident we'll be able to bring them onsite. I mean as I said there is at least 10 other reactors that had this issue in the past and...

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15024

<Q - Ashar Hasan Khan>: No, I understand that. I was just trying to understand whether – they were saying their delay was caused by equipment not being on site, so I was just mentioning it...

<A - Ralph Izzo>: I think there's a robotic device that needs to go in and change out the bolts and replace those that fail the ultrasonic testing, right. It's not something you could send a person into the vessel.

<Q - Ashar Hasan Khan>: Okay.

<A - Daniel J. Cregg>: From a critical task perspective too, the inspections that are ongoing now needs to take place first, so we have some time off the critical task to be able to secure that kind of equipment.

<Q - Ashar Hasan Khan>: Equipment, okay, I appreciate it. Thank you.

Operator

Your next question comes from the line of Shar Pourreza with Guggenheim Partners. Please go ahead.

<Q - Shahriar Pourreza>: Hi, questions were answered. Thanks.

<A - Ralph Izzo>: Thanks Shar.

Operator

Your next question comes from the line of Michael Goldenberg with Luminus. Please go ahead.

<Q - Michael Goldenberg>: Good morning.

<A - Ralph Izzo>: Hey, Michael.

<A - Daniel J. Cregg>: Good morning.

<Q - Michael Goldenberg>: Hi, I just wanted to ask a question about your 2018 hedging. I wasn't clear. If I just looked at previous quarters and this quarter's, it seemed like you hedged very little, about 5% of your output, if I do the math I get about $30 or $31 incremental hedging price. I'm not understanding if that's the price or I'm doing something wrong there.

<A - Daniel J. Cregg>: And your comparison is what Michael.

<Q - Michael Goldenberg>: Versus Q4, sorry, Q4 you were a certain percentage at $54 and now you're a certain percentage $49, so if I just do the simple math I get incremental hedging down at $31?

<A - Daniel J. Cregg>: We'd have to go through the individual math which maybe we could follow up with you on, but you've also got a range of output where you're within a high or low band. So, it's going to vary, I know that some of that 2018 output is going to come from BGS which tends to have a higher price and then we are in a lower price environment as well, so it's going to be some mix of that.

<Q - Michael Goldenberg>: Got it. Thank you.

Operator

[Operator Instructions]. Your next question comes from the line of Ben Budish with Jefferies. Please go ahead.

<Q - Benjamin Budish>: Hey, everybody good morning.

<A - Ralph Izzo>: Hi, Ben.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15025

<Q - Benjamin Budish>: Just I'm wondering if I'm maybe reading into your comments you made at the beginning of the call too much about kind of the importance of Q3, it seems like maybe you're sort of guiding us to the low end of the range and I'm curious if like a strong Q3 might get us back to the midpoint or maybe we're looking at sort of below the bottom end and the strong Q3 gets us back within, is there anymore color you can kind of give on that?

<A - Ralph Izzo>: Yeah, so Ben, the range is the range and historically what we do is after Q1 we really don't modify our numbers or push people up or down, and just live with the range. After Q2 sometimes we may move a nickel one way or another if we think that there is a definitive bias one way or another in terms of verbally guiding, and then typically after Q3 is when we, if there's a need, tighten the range one way or another. So we're $2.80 to $3, it was a tough winter and we've got a lot of focus on our operations and our cost efficiencies and the range always assumes that the rest of year is normal weather. We never assume that the weather is going to suddenly do something different than what the weather service predicts is normal...

<Q - Benjamin Budish>: Okay. Great, thank you.

Operator

Mr. Izzo and Mr. Cregg, there no further questions at this time. Please continue with your presentation or any closing remarks.

Ralph Izzo

Sure, thank you Brent. So thanks everyone for being on the call and the main message I hope you took away is my favorite message, which is steady as she goes. We have a utility capital program that's proceeding as planned, Power construction program with three combined cycle units is on schedule and on budget. Our operations are strong throughout the Enterprise and the balance sheet is as solid as ever. I know Kathleen and Dan have some travels coming up in the next couple of weeks and then the three of us have some travels coming up in the next couple of months. So hopefully we'll get to you see most if not all of you during those travels. Thanks a lot and we'll talk soon.

Operator

Ladies and gentlemen, that does conclude your conference call for today. You may now disconnect. Thank you for participating.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Brent, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group's Fourth Quarter 2015 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. [Operator Instructions]

As a reminder, this conference is being recorded today, Friday, February 19, 2016, and will be available for telephone replay beginning at 2 O'clock PM Eastern today until 11:30 PM Eastern on February 26, 2016. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Brent. Good morning, everyone. Thank you for participating in our earnings call this morning. As you are aware, we released fourth quarter and full-year 2015 earnings results earlier this morning. The release and attachment as mentioned are posted on our website www.pseg.com, under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-K for the period ended December 31, 2015, is expected to be filed shortly.

I'll now go through the full disclaimer statement or the comments we have on the difference between operating earnings and GAAP results, but I do ask that you all read those comments contained in our slide and on our website.

The disclaimer statement regards forward-looking statements, detailing the number of risks and uncertainties that could cause actual results to differ materially from forward-looking statements may therein, and although we may elect to update forward-looking statements from time-to-time, we specifically disclaim any obligation to do so, even if our

Bloomberg Transcript

estimates change, unless of course, required by applicable securities laws.

We also provide commentary with regard to the difference between operating earnings and net income reported in accordance with Generally Accepted Accounting Principles in the United States. PSEG believes that the non-GAAP financial measure of operating earnings provides a consistent and comparable measure of performance to help shareholders understand trends.

I'm now going to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group, and joining Ralph on the call is Dan Cregg, Executive Vice President and Chief Financial Officer.

At the conclusion of their remarks, there will be time for your questions. Given the interest in the call, we ask that you limit yourself to one question and one follow-up. Thank you.

Ralph Izzo

Thank you, Kathleen and thanks everyone for joining us today. This morning, we reported operating earnings for the full-year 2015 and I'm pleased to report that it was a year of significant accomplishments. As you saw this morning, we reported operating earnings for the fourth quarter of $0.50 per share, versus $0.49 per share earned in the fourth quarter of 2014, despite the unseasonably mild weather this past December.

Results for the full-year were $2.91 per share or 5% greater than 2014's operating earnings of $2.76 per share. This is at the upper half of our guidance of $2.85 to $2.95 per share and it was also higher than the midpoint of our original guidance of $2.85 per share.

Our results reflect the benefits of excellent performance and robust organic growth, which offset the impact of low energy prices on earnings. We've continued to successfully deploy our strong free cash flow into customer-oriented investment programs that have supported growth. 2015's operating earnings represented a third year of growth in earnings. Now, let me just mention a few of the year's highlights.

PSE&G was named Electric Light & Power's Utility of the Year and was named the most reliable utility in the mid-Atlantic for the 14th consecutive year. But we're not resting on those laurels. PSE&G invested approximately $2.7 billion during 2015 on programs to further enhance the system's resiliency and its reliability.

During the year, PSE&G placed into service key backbone transmission lines, such as the Susquehanna-Roseland line as well as the Mickleton-Gloucester-Camden line, which are designed to meet the needs of customers today and well into the future.

PSE&G invested over $550 million on programs under its $1.2 billion Energy Strong initiative. These programs are designed to strengthen and protect the electric and gas distribution system from the impacts of extreme weather.

During the year, PSE&G also received approval from the New Jersey Board of Public Utilities to invest an additional $95 million in its award-winning energy-efficiency programs and to continue the work begun under Energy Strong, replacing aging cast iron natural gas pipes.

The $905 million Gas System Modernization Program represented the 14th multi-year investment program approved by the BPU since PSE&G's last base rate case and this speaks to the state's support of infrastructure investment that meets the needs of customers.

PSE&G's investment program, supportive revenue recovery mechanisms and tight control of O&M expenses have provided growth in PSE&G's operating earnings of approximately 13% per year for the five-year period ended 2015.

During this period, PSE&G's rate base expanded at a rate of 11% per year; and importantly, we have been able to support this growth as customer builds have declined. But 2015 was not just a year of PSE&G accomplishments. PSEG Power's strong operating performance supported earnings in line with guidance for the full-year, despite very difficult market conditions.

final
Bloomberg Transcript
Bloomberg

The nuclear fleet operated at a capacity factor of greater than 90% for the year and accounted for 54% of the fleet's output. Power's gas fired combustion turbine fleet set a new record for output. This improves on the prior record established in 2014. The fleet's performance is benefiting from investments that have improved its efficiency, increased its capacity and provided greater access to low cost gas supply.

The flexibility and diversity of Power's fleet have allowed us to provide approximately $500 million of positive free cash flow in 2015, even during soft energy market conditions. Power also plans to invest $2 billion over the next three years to four years to add approximately 1,800 megawatts of new, efficient combined cycle gas fired turbine capacity.

The Keys Energy station, which is located in Southwestern MAAC will extend Power's footprint in this core PJM market, a new efficient unit at the Sewaren station in New Jersey will replace old, inefficient steam capacity. And after clearing the most recent capacity auction in New England, Power will construct a new 485 megawatt combined cycle unit at its existing Bridgeport Harbor station site, giving us an enviable and growing position in both energy and capacity markets in Southwestern Connecticut.

The addition of these units will transform Power's generation mix as its ownership of efficient reliable gas-fired capacity will grow to exceed 5,000 megawatts in 2019. At that time, the combined cycle gas turbine fleet will surpass the size of Power's ownership in nuclear capacity and secure Power's position as a low cost generator with modern, flexible, clean assets that remain capable of meeting the demands for reliability in today's markets.

Power also grew its investment in contracted solar energy. In 2015, Power added two projects, representing an investment of approximately $75 million in utility scale grid connected solar energy. And earlier this year, Power announced that it will invest an additional $150 million in three new projects that bring its portfolio of solar projects to 240 megawatts DC of clean and renewable energy.

All projects in this portfolio are under long-term contracts with credit-worthy customers. So, as you can see, we continue to explore opportunities to expand and optimize Power's fleet, although I will add that we do not see any new generation build in the foreseeable future, although you never say never, but we don't plan any at this point in time.

Our balance sheet continues to provide us with a competitive advantage to finance our capital program without the need to access the equity markets. We ended 2015 with strong credit metrics and the extension of bonus depreciation through 2019 is expected to provide enterprise with an additional $1.7 billion of cash during this period.

Our investment program calls for a 21% increase in capital spending to $11.5 billion for the three years ended 2018 from capital invested during the three year period ended 2015. Approximately 72% of that amount or $8.3 billion over this timeframe will be invested by PSE&G on transmission and distribution infrastructure programs that customers will require for reliability. This level of investment is expected to yield growth in PSE&G's rate base for the three years ended 2018 of 10% per year, even after taking into account the impact of bonus depreciation on rate base.

The remaining approximate 27% or $3.2 billion of expected capital investments will be made at Power. The majority of Power's investments will be devoted to expanding its position in new, efficient, clean gas-fired generating capacity, as I mentioned already, all of which, Keys, Sewaren and Bridgeport Harbor are expected to exceed our longstanding and unchanged financial returns expectations.

With our strong balance sheet, we remain in a position to increase our capital investment across the company. We have a robust pipeline of opportunities and plan on providing you with an update of our five-year outlook for capital spending at our Annual Financial Conference on March 11.

In total, the investment programs at PSE&G and Power are focused on meeting customer needs and market requirements, with an energy platform that is reliable, efficient and clean. The strategy we implemented has yielded growth for our shareholders as we have met the needs of our customers. The continued successful deployment of strong free cash flow into customer-oriented regulated investment programs is expected to support 14% growth in utility's earnings to 60% of enterprise's 2016 operating earnings as the results for the full-year are forecast at $2.80 to $3 per share. Our guidance for 2016 takes into account the impact on demand from the continuation of unseasonably mild weather conditions in January and early February.

SI-SSA-0015-15029

The board of directors' recent decision to increase the common dividend by 5.1% to the indicative annual level of $1.64 per share is an expression of our confidence in our outlook, the continued growth of our regulated business and an acknowledgement of our strong financial position.

We see the potential for consistent and sustainable growth from the dividend as an important means of returning cash to our shareholders. Of course, none of our success would be possible without the contribution made by PSEG's dedicated workforce. I look forward to discussing our investment outlook in greater detail with you at our March 11 Annual Financial Conference.

But for now, I'll turn the call over to Dan for more details on our operating results and we'll be available to answer your questions after his remarks.

Daniel J. Cregg

Thank you, Ralph, and good morning, everyone. As Ralph said, PSEG reported operating earnings for the fourth quarter of $0.50 per share versus $0.49 per share for the fourth quarter of 2014. Our earnings in the quarter brought operating earnings for the full-year to $2.91 per share, or 5.4% greater than 2014's operating earnings of $2.76 per share and at the upper half of our guidance of $2.85 to $2.95 per share.

And on slide four, we provided you with a reconciliation of operating earnings to net income for the quarter. We've also provided you with information on slide 10 regarding the contribution to operating earnings by business for the quarter. And slides 11 and 13 contain waterfall charts that take you through net changes, and quarter-over-quarter and year-over-year changes in operating earnings by major business, and I'll review each company in more details starting with PSE&G.

PSE&G reported operating earnings for the fourth quarter of 2015 of $0.31 per share compared to $0.32 per share for the fourth quarter of 2014 and that's shown on slide 15. PSE&G's full-year 2015 operating earnings were $787 million or $1.55 per share compared with operating earnings of $725 million, or $1.43 per share for 2014, reflecting a growth of 8.6%.

PSE&G's earnings for the fourth quarter benefited from return on its expanded capital program, which partially offset the impact of earnings from unseasonably mild weather conditions and an increase in operating expenses.

PSE&G's return on an expanded investment in transmission and distribution programs increased quarter-over-quarter earnings by $0.03 per share. Mild weather conditions relative to normal and relative to last year, reduced electric sales and lowered earnings comparisons by $0.01 per share.

Recovery of gas revenue under the weather normalization clause, offset the impact on earnings of the abnormally warm weather on sales of gas. And higher expenses including pension, and other items reduced quarter-over-quarter earnings comparisons by $0.03 per share.

Economic conditions in the service area continued to improve. On a weather normalized basis, gas deliveries are estimated to have increased 2.1% in the quarter and 2.2% for the year. Demand continues to benefit from an improving economy and also from the impact of lower commodity prices on customer's bills. Electric sales on a weather normalized basis, are estimated to have increased by 0.8% and 0.5% for the fourth quarter and for the year, respectively. The estimated year-over-year growth on electric sales is more representative of our long-term expectations for growth.

PSE&G implemented $146 million increase in transmission revenue under the company's transmission formula rate for 2016 on January 1. PSE&G's investment and transmission grew to $5.7 billion at the end of 2015 or 43% of the company's consolidated rate base of $13.4 billion at year-end.

As you know, transmission revenues are adjusted each year to reflect an update of data that was estimated in the transmission formula rate filling. The adjustment for 2016, which we will file in mid-2017 will include the impact of the extension of bonus depreciation, which was executed after our transmission formula rate filing. This adjustment

final
Bloomberg Transcript

will reduce transmission revenue as filed by about $27 million, but we will approve that for accounting purposes in anticipation of the reduction in revenue as we report our 2016 results.

We are forecasting growth in PSE&G's operating earnings for 2016 to a range of $875 million to $925 million, and the forecast reflects the benefits of continued growth in PSE&G's rate base and a decline in pension expense.

Turning to Power, as shown on slide 19. Power reported operating earnings for the fourth quarter of $0.19 per share compared to $0.18 per share a year ago. Results for the quarter brought Power's full-year operating earnings to $653 million or $1.29 per share compared to 2014's operating earnings of $642 million or $1.27 per share.

Power's adjusted EBITDA for the quarter and the year amounted to $235 million and $1.563 billion respectively, which compares to adjusted EBITDA for the fourth quarter of 2014 of $271 million, and adjusted EBITDA for the full-year of 2014 of $1.584 billion.

The earnings release as well as the earnings slides on pages 11 and 13 provides you with a detailed analysis of the impact on Power's operating earnings quarter-over-quarter and year-over-year from changes in revenue and costs. And, we've also provided more detail on generation for the quarter and for the year on slides 21 and 22.

Power's operating earnings in the fourth quarter reflect the impact of strong hedging and tight control on operating expenses, which offset an anticipated decline in capacity revenue, and the impact of unseasonably warm weather on wholesale energy prices.

A decline in capacity revenues associated with the May 2015 retirement of the high electric demand day or HEDD peaking capacity in PJM reduced quarter-over-quarter earnings comparisons by $0.04 per share. An increase in the average price received on energy hedges coupled with a decline in fuel costs more than offset the impact on earnings from a reduction in gas sales. And, these two items together netted to a quarter-over-quarter improvement in earnings of $0.02 per share.

Power's O&M expense for the quarter was unchanged relative to year-ago levels. And an increase in depreciation expense and other miscellaneous items was more than offset by the absence of a charge in the year-ago quarter, resulting in net improvement in quarterly earnings comparisons of $0.03 per share.

Turning to Power's operations. Power's outputs during the quarter was in-line with year-ago levels. For the year, output increased 2% to 55.2 terawatt hours and the level of production achieved by the fleet in 2015 represented the second highest level of output in the fleet's history as a merchant generator. Growth was supported by improvements in the fleet's availability and efficiency.

The nuclear fleet operated at an average capacity factor of 90.4% for the year, producing 30 terawatt hours or 54% of total generation. Efficient combined cycle gas turbine capacity was rewarded in the market with an increase in dispatch levels. And Power's CCGT fleet set a generation record during the year at each of the Linden station and Bethlehem Energy Center set individual records. Output from the combined cycle fleet grew 11% to 18.4 terawatt hours or 33% of total output during the year.

Lower market demand for our coal units, reduced output from those stations to 5.8 terawatt hours for the year or 11% of output. And lastly, the fleet's peaking capacity produced just under one terawatt hour or 2% of the output for the year.

Power's gas-fired combined cycle fleet continues to benefit from its access to lower priced gas suppliers in the Marcellus region; and for the year, gas from the Marcellus supplied 75% of the fuel requirements for the PJM gas-fired assets. This supply supports how to spark spreads and implied by market pricing and allowed Power to enjoy fuel cost savings in the fourth quarter similar to the levels that enjoyed in year ago quarter, despite weak energy prices. And for the full-year, Power enjoyed positive spreads relative to the market, but year-over-year realized spark spread in 2015 were lower than what was realized in 2014, given the decline in energy prices.

Overall, Power's gross margin improved slightly to $38.83 per megawatt hour in fourth quarter versus $37.40 per megawatt hour in the year ago quarter. And for the year, Power's gross margin amounted to $42.25 per megawatt hour

versus the $42.41 per megawatt hour last year. And slide 24 provides detail on Power's gross margins for the quarter and for the year.

Power is expecting output for 2016 to remain unchanged at 54 terawatt hours to 56 terawatt hours. And following the completion of the basic generation service for BGS auction in New Jersey earlier this month, Power has 100% of its 2016 base load generation hedged.

Approximately 70% to 75% of Power's anticipated total production is hedged at an average price of $51 per megawatt hour. And Power has hedged approximately 45% to 55% of its forecast generation in 2017, a 54 terawatt hours to 56 terawatt hours at an average price of $50 per megawatt hour.

Looking forward to 2018, Power is forecasting an improvement in output to 59 terawatt hours to 61 terawatt hours with the commercial startup in mid-2018 of the Keys and Sewaren stations that Ralph mentioned earlier.

Approximately 15% to 20% of 2018's output is hedged at an average price of $54 per megawatt hour. And Power assumes BGS volumes will continue to represent approximately 11 terawatt hours to 12 terawatt hours of deliveries. And this number is very consistent with the 11.5 terawatt hours of deliveries we saw in 2015 under the BGS contract.

Our average hedge position at this point in time, represents a slightly smaller percentage of output hedged versus what you saw a year ago; and at that time, Power was able to take advantage of market prices influenced by the colder than normal weather conditions of last winter.

Average hedge pricing includes the impact of recently concluded BGS auction. And the auction for the three-year period beginning June 1, 2016 ending May 31, 2019, was priced at $96.38 per megawatt hour in the PSO. This contract for one-third of the load will replace to 2013 contract for $92.18 per megawatt hour, which expires on May 31, 2016.

And we do remind you from time-to-time that there are items included in the average hedge price, which influence Power's revenue, but don't support Power's gross margin. Our average hedge price for 2016 of $51 per megawatt hour reflects an increase in the cost developments such as transmission and renewables associated with serving our full requirements hedge obligations. And based on our current hedge position for 2016, each $2 change in spark spreads would impact earnings by about $0.04 per share.

Power's operating earnings for 2016 are forecasted at a range of $490 million to $540 million, that forecast includes an adjusted EBITDA of $1.32 billion to $1.40 billion. Forecast reflects a year-over-year decline in capacity revenues associated with the May 2015 retirement of the HEDD peaking capacity.

Operating earnings for the year will also be influenced by the re-contracting of hedges at lower average price and a decline in gas sales. And most of the decline in Power's operating earnings forecast for the full-year 2016 is expected to be experienced in the early part of 2016.

With respect to Enterprise and Other, we reported operating earnings in the fourth quarter of $4 million, which compares to a loss in operating earnings of $4 million or $0.01 per share for the fourth quarter of 2014. And results for the fourth quarter brought full-year 2015 operating earnings to $36 million or $0.07 per share, compared with 2014's operating earnings of $33 million or $0.06 per share. The difference in quarter-over-quarter operating earnings reflects the absence of prior-year tax adjustments as well as other parent-related expenses in 2015.

For the year, PSEG Long Island's earnings contributions of $0.02 per share was in line with expectations. And looking forward to 2016, operating earnings for PSEG Enterprise and Other are forecasted at $16 million.

Next, I want to provide an update on our pension. Beginning with 2016, PSEG has elected to measure service and interest costs for pension and other post-retirement benefits, by applying the specific spot rates along the yield curve to the plan's liability cash flows rather than the prior use of a single weighted average rate.

We believe the new approach provides a more precise measurement of service and interest costs by aligning the timing of the plants liability cash flows to the corresponding spot rates on the yield curve.

final

Bloomberg
SI-SSA-0015-15032

The change does not affect the measurement of the plant obligations, and we estimate this change will reduce 2016 pension and OPEB expense by approximately $34 million and $13 million, respectively, net of amounts capitalized for what it would have been without this change.

On a year-over-year basis, the pension expense is expected to decline – pension and OPEB expense is expected to decline by $25 million from 2015's level of expense. We ended 2015 with 91% of our pension obligations funded and minimal need for cash funding of obligations over the next several years.

With respect to our financial condition, it remains strong. We closed 2015 with $394 million of cash on hand and debt representing 43% of our consolidated capital position, and debt at Power representing 27% of our capital base.

PSEG's capital program for the three years ended 2018 is currently expected to approximate $11.5 billion, this represents a 21% increase over the level of capital invested over the prior three year period, as PSE&G and Power focus on modernizing their infrastructure to meet the needs of today's marketplace.

We have ample capacity to finance our current capital program. In addition, we estimate that the change in bonus depreciation, as Ralph mentioned, will provide an additional $1.7 billion of cash through 2019, most of this cash received over the three years ending 2018, and of this amount $1.2 billion of the cash will be at PSE&G and $500 million will be at Power.

And as mentioned, our forecast for double-digit growth in PSE&G's rate base through 2018, does take into account the impact of bonus depreciation on rate base, and we plan to provide an updated five-year view of capital spending at the Annual Conference on March 11.

We're guiding to earnings for 2016 of $2.80 to $3 per share, in line with our 2015 operating results, as forecast growth at PSE&G offsets the impact of lower energy prices on Power's operating earnings. The company remains on solid footing, and we continue to focus on operational excellence, we remain disciplined in our approach to investment strategy, and maintain our financial strength. Common dividend was recently increased 5.1% to the indicative annual level of $1.64 per share, and we believe we can provide shareholders with consistent and sustainable growth in the dividend going forward.

And with that, we are ready to answer your questions.

Q&A

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. [Operator Instructions] One moment please for the first question. And we'll pause for just a moment.

<A - Ralph Izzo>: Dan, we've never been so clear.

Operator

Your first question comes from the line of Jonathan Arnold with Deutsche Bank. Please go ahead.

<Q - Jonathan Philip Arnold>: Good morning, guys.

<A - Ralph Izzo>: Good morning, Jonathan.

<Q - Jonathan Philip Arnold>: A couple of questions on the change in pension accounting methodology, could you just give – is this designed to bring you more into line with standard practice or something – could you just give us some perspective around what drove that change?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15033

<A - Ralph Izzo>: Yeah, I think it will probably increasingly look more like standard practice. In applying an interest rate, we have normally done a weighted average rate, which is across all of the cash flows and some recent determination has been made that in looking at the yield curve and the timing of your actual payments and the timing of the interest by virtue of the shape of the yield curve, the more accurate method was to apply the nearer-term interest rates to the nearer-term cash flows and the longer term interest rates to the longer term cash flows. So, we've been looking at this for a while and in addition to being a more accurate method, I think you'll start to see this more and more in others.

<A - Daniel J. Cregg>: I mean...

<Q - Jonathan Philip Arnold>: Your sense is that others have not adopted this yet, but you think will go that way, is that what you're saying?

<A - Ralph Izzo>: Yeah. So, our intel from talking to our advisors is, we're probably somewhere between 30%, 40%, 50% or so companies are pursuing and a bunch of the others are investigating the same. We've seen some of this from some of the releases that we've seen from others as well.

<Q - Jonathan Philip Arnold>: Okay. And can you give us a sense, is the change we're seeing in 2016 something that would all else equal will just persist into 2017 just a change of basis one piece? And then secondly, can you parse out the impact to the utility versus power?

<A - Ralph Izzo>: Yeah. On the second piece, it's about half and half is a general way to think about it. And with the yield curve that rises over time, you will see a moderation of the benefit of this method over time, but remaining positive, based upon all the current assumptions in place through the balance of the five year plan period. It remains positive, but declines over time.

<Q - Jonathan Philip Arnold>: Okay. And could I just add one other topic, Enterprises, the uptick in 2016 is that mostly the Long Island contract, or...

<A - Daniel J. Cregg>: That was correct, Jonathan. Some of you heard.

<Q - Jonathan Philip Arnold>: Yeah, we missed the answer. Great. Thank you.

Operator

Your next question comes from the line of Keith Stanley of Wolfe Research. Please go ahead.

<Q - Keith Stanley>: Hi, good morning. The $11.5 billion of CapEx over 2016 to 2018, if you take 72% of that at the utility, it seems like utility CapEx for 2016 to 2018 is, about maybe I don't know, $750 million higher than what you showed in a chart at EEI. Can you just confirm if I'm reading that right? And if so, in what areas are you investing more money now over the next three years?

<A - Ralph Izzo>: So Keith, the answer is, you're correct. And we'll detail not only that, but the full five years on March 11, but it's the same areas we have been. It's largely transmission-related, and there's an element of Energy Strong in there as well, but we'll give you the details of that as well as any new initiatives that we plan to pursue in the five-year time horizon on March 11.

<Q - Keith Stanley>: Okay. And one other one, just what ROE are you assuming at the distribution business at PSE&G in 2016 and what ROE did you earn at distribution last year?

<A - Daniel J. Cregg>: So remember, ROEs are a blend of an allowed base, ROE of 10.3%, and then myriad 14% to be exact of various programs that we have had approved since then, that range from 9.75% to 10.3%, but with a couple of them also the beneficiary, I think that's the tax credit in some of the solar programs. So, we are earning on our allowed return, but you have to do the – some of the parts, so to speak, of each of those programs.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15034

<Q - Keith Stanley>: So, netting out some of those programs you earned 10.3% on call it core distribution last year, and I mean, are you just assuming that you're earning precisely your allowed return and that's what you're saying you earned last year?

<A - Daniel J. Cregg>: So, on the core distribution, yes, the 10.3%, and on Energy Strong, we're going to earn the 9.75% and on solar for all, we're going to earn 10%, and on energy efficiency, we're going earn 9.75% and so that's what I'm trying to point out, and because of to varying degrees contemporaneous nature of the returns we do stick to those, we do accomplish those objectives.

<Q - Keith Stanley>: Okay. Thank you.

Operator

Your next question comes from the line of Julien Dumoulin-Smith with UBS. Please go ahead.

<Q - Julien Dumoulin-Smith>: Hi, good morning, can you hear me?

<A - Ralph Izzo>: Yes, Julien.

<A - Daniel J. Cregg>: Good morning, Julien.

<Q - Julien Dumoulin-Smith>: Excellent. So, I wanted to go back a little bit to the latest BGS auction, and ask you, if you can elaborate a little bit on what exactly drove the year-over-year results? And perhaps at least our perception of a reduction in the risk premium, can you elaborate kind of what the dynamics you saw?

<A - Ralph Izzo>: Yeah, I mean, some of the bigger pieces, Julien, I think are fairly transparent from what you can see from a market perspective. I think we saw a little bit of a decline in the energy prices, which is kind of where you start as a baseline for the auction.

And then probably the couple of other areas where you've seen the biggest change is against that decline, as you've seen a bump on the transmission side and you've seen a bump related to some of the green costs that are involved. So, you can track the green cost soon in New Jersey, SRECs and you can track the transmission in fact, I think the BPU even sends out some of the transmission costs that ultimately get embedded in.

And then finally, the last big piece, which is also fairly transparent is the capacity piece and those auctions take place in advance of – by virtue of their three-year forward market and the BGS three-year forward market. They place in advance of the BGS auction. So, those are your biggest movers. And there is other pieces obviously in there, there is ancillary, and different components, but those are the biggest pieces that you see related to the changes.

<Q - Julien Dumoulin-Smith>: But just coming back, clearly some of those big changes move in year-over-year, but at least from our calculations, it seems that even adjusting for that there might have been a little bit less of a premium there, just be curious.

<A - Ralph Izzo>: I mean, we don't really talk necessarily about what kind of a premium you would see in the product, but I think you can – most of those pieces are transparent enough that you can build out and see what the elements of them are. And I think, on balance, you're seeing a bit of a decline on the energy side, and you're seeing a bit of a roll-up coming off in the other direction related to both transmission agreement.

<Q - Julien Dumoulin-Smith>: Got it. Okay. Fair enough. And maybe going back to the last question a little bit more about the utility regulatory, how are you thinking about trackers in a post-rate case scenario as you think about rolling at least the legacy programs in the base rate et cetera? Can you kind of talk about perhaps what the subsequent role might look like?

<A - Ralph Izzo>: Sure. While we are pleased with the success we've had, Julien over these past several years with these programs, we have been talking to staff about – in particular, the gas program, which clearly has a multi-decade run that it would need to do all of the work that the system requires of it, I'm talking about replacing the cast iron, that

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15035

we'd like to break away from this incremental approach and into more of a longstanding approach. For no other reason that it would be beneficial to develop the infrastructure, primarily people, that one needs to sustain these programs, right.

So, right now, the way we run the programs is we work for contractors and we bring in the folks that are needed and we enter into this conversation six months before the program expires. But will we need more? I'm not quite sure.

Well, we have to wait for the BPU, so when can you find out? I'll get back to you as soon as possible, and that's not the way we typically run 110-year old company. We like to have training programs, bring people in as an apprentice and have them climb the technical ladder and have a nice long career and that's a much more efficient way to use customer rates. So, I think that program, in particular, could be a template for the type of ongoing things we want to do, we're close second to that.

As you may recall, Energy Strong, we had put forth the 10-year plan that got approved for three years. And some of the cleaner technologies, whether it's solar or energy efficiency that will be needed to meet the state to own a renewable portfolio standard or what eventually becomes of CPP and whatever carnation takes, reincarnation that takes. I think all lend themselves to more programmatic and longstanding programs that we can anticipate and rationally equip ourselves to execute.

So, those conversations are going on with the board staff now; and to their credit, their responses well, you should have confidence, you have come in 14 times, and 14 times we said, yes. And that's true. So, the question is, how much of an investment risk are you willing to make in equipment and training programs and people, when the yes, is pretty much assured, but has different forms, right, half the programs, half the duration and maybe three quarters of the run rate. So, it's a very constructive dialog right now to be continued.

<Q - Julien Dumoulin-Smith>: Great. Thank you so much, guys.

<A - Ralph Izzo>: Sure.

Operator

Your next question comes from the line of Praful Mehta with Citigroup. Please go ahead.

<Q - Praful Mehta>: Hi, guys.

<A - Ralph Izzo>: Good morning.

<A - Daniel J. Cregg>: Good morning.

<Q - Praful Mehta>: Morning. My question firstly, you guys sit in a very interesting spot where you own all three assets, coal, gas and nuclear and it's interesting the trends you highlight with gas capacity factors increasing, coal reducing. My question is, how are you thinking about asset lives of these three classes of assets, given the market conditions you see now? And what does that mean in terms of leverage levels that you're comfortable with for the Power business?

<A - Ralph Izzo>: So, one of the things that's equally important to the fuel diversity of our assets is the technology diversity and performance features of our assets. So, obviously, gas, we have some combined cycle gas turbines, which once upon a time, we called load following, which we're looking more and more like base load. But, we also have a pretty robust and healthy peaking fleet.

And similarly in our coal assets, we have Keystone Conemaugh which are rightfully described as base load and candidly our Hudson, Mercer, and Bridgeport stations have become more peaking with Hudson and Mercer having the additional flexibility to be able to run on gas. So, it's not just a question of fuel diversity, it's what part in the dispatch queue, the asset can play and whether it starts, stops features and in that respect our diversity serves us well.

final
Bloomberg Transcript
Bloomberg

Now, you probably picked up that we would anticipate retiring the Bridgeport Harbor coal unit in five years, provided that we are successful at securing the permits for the new 500 minus combined cycle units at Bridgeport Harbor, which we don't anticipate any difficulties in doing so, given the community benefits agreement we've achieved with some important stakeholder groups in Bridgeport.

And I'll let Dan finish up on the leverage of Power; but once again, our base FFO to debt expectations are 30% and I'll give you more details when we see you in March, but we were well north of that prior to bonus depreciation, and with bonus depreciation that number has gotten even bigger. But Dan, you may want to fill in?

<A - Daniel J. Cregg>: Yeah, I mean, the only thing I would add is, obviously from a credit perspective, Power's FFO to debts are well above the 30% threshold that we have with the rating agencies to hold our existing rating. So, that's not something that we get concerned about at all. We have an awful lot of financial strength there. But I think as you do look forward, we will see a shift in the fleet and maybe that's kind of what's your question is getting at.

We've got three new efficient combined cycle plants. And if you look backwards, I said in my remarks that we have some of our HEDD units, those were older peaking units that were retired for environmental purposes and they are going to be replaced by new efficient combined cycle clean gas units. So, the fleet really will take out a different look into the future and we'll be more efficient and we'll have a better profile and be more competitive in the market.

<Q - Praful Mehta>: Got you. So, as you see that fleet profile changing, are you seeing leverage levels kind of match that in terms of increasing, given the quality of the new gas fleet that you're kind of bringing on?

<A - Daniel J. Cregg>: I think we'll see some leverage increase by virtue of the spend that will have, but I think we will remain well above where we need to from the rating agency perspective. That capacity at Power is extremely strong and is expected to remain that way, and bonus depreciation helps on that side too. On the Power side of the business, we have the benefits of bonus depreciation without the detriments of any rate base reduction.

<Q - Praful Mehta>: Yeah. Absolutely. Got it. And just secondly, is a more philosophical question. As you think about the fate of Power with the consolidated business, is there at any point a view that this business needs to be a stand-alone entity or do you kind of see this more as part of the consolidated business in the next two year, three year timeframe as well?

<A - Ralph Izzo>: Yeah. So, as I've said before, I do see over time, you're not going to get me to pick a timeframe, no. I see these businesses separating, the strategic flexibility of both would be enhanced by doing that. Some of the tactical benefits is keeping them together right now, which is the financial synergy – the financial complement that Power provides to the utility, we've talked about Power's new plants, but for the past five years and for the next five years, it looks like the utility will be out-spending Power almost 3:1 and Power is a great source of equity for that with its funds from operation.

Secondly, the complement that Power and utility provide on the customer bill, is a huge advantage to us. And the support cost synergies that exists with two companies are a big advantage to us as well. But, as Power grows in New England, as it grows in New York State and other places, it will need to use its own FFO for investment opportunities and that free cash flow that remains to help the utility will be decreased.

There'll be more customers that it will be serving outside of the utilities territory so, that complementary nature will decrease. And as they both grow, the corporate overhead vital functions that corporate support groups provide, will be a smaller piece of the overall operating budget. So, I think, over time, the tactical benefits of staying together decrease, and the strategic advantages of separating will increase. But, we're not there today. So, yet again – continue.

<Q - Praful Mehta>: Much of that's really helpful. And I know you're not talking timing, but I guess the benchmark or at least the milestones as we look for it is, those three factors in terms of that strategic benefits as that I guess reduces in terms of the fit then the probability or likelihood of some timing of separation kind of increases. Is that a fair way of thinking this?

<A - Ralph Izzo>: Yes. So, qualified yes to that. I mean, there is no magic date. There are a host of parameters one looks at, what are the market dynamics, what's the composition of the shareholder base, are there other triggering

final

Bloomberg Transcript

events that could accelerate one's point of view of where the tactical benefits are now greatly reduced. So, I don't mean to be long-winded on it, but you ask a very complicated question albeit wrapped in some shroud of simplicity that the board of directors looks at on a regular basis. And so, I'm just giving you kind of a general point of view on that. But it's fraught with detailed analysis on a pretty regular basis by us.

<Q - Praful Mehta>: Got you. Very helpful. Thank you so much.

Operator

Your next question comes from the line of Michael Lapides with Goldman Sachs. Please go ahead.

<Q - Michael Lapides>: Yeah. Hey, guys, congrats on a good year. A couple of questions and these may be for Dan, because some of them are kind of a little bit down in the weeds or in the nitty-gritty. Can you talk to us about the earnings or EBITDA contribution that maybe Power gets from things like trading or doing some of the optimization as part of the LIPA deal? And can you talk to us about the overall earnings power you expect to get over time from the broader LIPA O&M services contract?

<A - Ralph Izzo>: Even though Dan can answer it, Michael, I just want to point out that I try to pay attention to these things.

<Q - Michael Lapides>: I totally understood, Ralph.

<A - Ralph Izzo>: So, Power's trading group is about $0.01 a share for LIPA and all-in LIPA is going to grow to about $0.07 or $0.08, so I think the share will probably be closer to the $0.05 and then stepping up $0.07 or $0.08, $0.05 or $0.06 this year, close to $0.07 or $0.08 next year. But, Dan, go ahead and tell him I'm wrong if I am.

<A - Daniel J. Cregg>: That's the right order of magnitude.

<A - Ralph Izzo>: Order of magnitude.

<A - Daniel J. Cregg>: It will be at $0.07 next year across the enterprise, but there is just a small piece of that, I'll call it $0.01 or so that's at the Power side of the business, where that's coming from.

<Q - Michael Lapides>: Got it. And do you get a significant margin from things like ancillary revenues or ancillary services in PJM or ISO-New England? Just trying to think about the components not just within BGS but within your broader margin at Power?

<A - Daniel J. Cregg>: Yeah. And I don't have an ancillary number in front of me, Michael, and I don't know that we've kind of provided the breakdown of all the different components of how Power makes money. I mean, far and away the biggest pieces are your capacity margin and your energy margin. There is a host of different elements that we work our way through as we manage a portfolio as a whole.

I mean if you're kind of talking somewhere in the bucket of $0.05 a share or something like that on the ancillaries, that's probably an order of magnitude number. But we haven't broken out a lot of the pieces beyond – the biggest pieces, which I think gets folks most of the way home, if you look at your capacity margins, we're very transparent about that math and provide that within the Investor Relations decks that we end up pulling together and the same with respect to the energy side of the business.

<Q - Michael Lapides>: Got it. And finally, when we think about the combined cycle fleet at Power, I mean, you've seen a significant uptick in terms of how much they can run. Just curious from a physical standpoint, what do you think the – I guess I'll use the word the maximum output level – like how high do you think they can physically run from a capacity factor standpoint versus where they've been running for the last 12 months to 24 months?

<A - Daniel J. Cregg>: I don't think that there is a physical limit to what they can do; I mean they are ultimately going to be taking off line for maintenance just like any other facility would, but there is nothing that stops those plants from running as long as they are called. And there's not a refueling outage like you would see at a nuclear plant, where you

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15038

have to shut the unit down to refuel it; but periodically, there is major maintenance that goes on at these facilities, where the unit needs to be worked on, but I think we'll have the advantage as well within the new units that we have of having a kind of clean and new unit that won't have that effect over a period of time when it starts up.

<A - Ralph Izzo>: And then, Michael, we've also had a couple of significant improvement programs on our combined cycles, we've improved the gas path, which has actually allowed us to stretch out the major maintenance cycles and modestly improve the heat rates. And I'll double check the numbers, we'll certainly show them in March, but I think our forced outrage rates have dropped even while our capacity factors have gone up, which is always a great sign, and that just means that we are taking better care of the machines. So, they're running at about 65%, 66% capacity factor now. You never want to promise 100% on any mechanical device, but I have not picked up from any of our team that worried about us over taxing these units.

<Q - Michael Lapides>: Got it. And then last one, Ralph, just a little curious, your thoughts on the impact if any of the Ohio PPA contracts and what that means for that competitive market dynamics and design in PJM?

<A - Ralph Izzo>: Yeah. So, it depends on how that's structured right, I mean, you're clearly – there was a situation in New Jersey under what we call the LCAPP law there, their statute mandate is that winners of those contracts bid at zero and clear the auction and that was a just an egregious attempt to crush artificially capacity prices in the region.

So, we are participating in an industry group in Ohio to make sure that whatever is agreed upon doesn't artificially move the market in a way that disadvantages participants who don't have the protection of these contracts.

I'd like to think that Ohio has been a long-standing supporter of competitive markets and whatever gets structured out there gets structured in that way. But what I'd like to think that we're going to carefully monitor what actually is decided to maximize the chances that is indeed what happens.

<Q - Michael Lapides>: Got it. Thanks, Ralph. Thanks, Dan. Much appreciated, guys.

<A - Ralph Izzo>: Okay.

<A - Daniel J. Cregg>: Yeah, Michael.

Operator

Your next question comes from the line of Gregg Orrill with Barclays. Please go ahead.

<Q - Gregg Orrill>: Yeah. Thank you. I was wondering if you could revisit the topic of bonus depreciation.

<A - Daniel J. Cregg>: Sure.

<Q - Gregg Orrill>: I think you said that $1.3 billion at PSE&G and $1.7 billion overall was that 2015 to 2018, first of all?

<A - Daniel J. Cregg>: Yeah. The $1.7 billion total is $1.2 billion to the utility and $500 million to Power. And that runs you out through 2019.

<Q - Gregg Orrill>: Okay.

<A - Daniel J. Cregg>: Most of the cash comes in through 2018.

<Q - Gregg Orrill>: Okay. So, part of that you were – at the utility, you were going to be accruing into the next case, is that generally the way you're going to deal with the bonus depreciation accounting at the utility?

<A - Daniel J. Cregg>: Yeah. I think the way to think about it Gregg is that to the extent of transmission, the impact of that will come through on a contemporaneous basis. So, we will, while bonus was approved after we filed our formula rate for the 2016 year, we know that it's there and we'll accrue that from an accounting perspective and we'll do that true-up in future filings. But as we go forward, you'll see that true-up every year with respect to the transmission piece

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15039

of the bonus.

Similarly, with elements related to Energy Strong, with elements related to GSMP, all the clause-related updates will take place as we file those contemporaneous and near contemporaneous filings. And then the balance of what's left which really sits with the base amount or PSE&G that will await the next rate case.

<Q - Gregg Orrill>: Got it. Thank you.

<A - Daniel J. Cregg>: Got it, Gregg.

Operator

Your next question comes from the line of Travis Miller with Morningstar. Please go ahead.

<Q - Travis Miller>: Hi, thank you. I was wondering if you guys look across your entire CapEx program both Power and PSE&G, what parts of that make you most nervous? And either nervous that you would not meet the budget that you've set out or nervous that you wouldn't meet either the allowed returns or the hurdle rates that you've set out for those projects?

<A - Ralph Izzo>: All right. If we're nervous about anything Travis, we make sure we take action to fix it, so that we don't stay nervous, but I know you know that. I guess I'd say the biggest things that we pay attention to are regulatory and environmental mandates that don't add to the return expectations of our shareholders and then quite candidly on occasion don't really benefit customers commensurate with the costs that need to be put into it.

But other than that, as you well know, we show up at a lot of places to make acquisitions and to expand our asset base and invariably lose. So, I don't think anyone would ever accuse us of being bullish or undisciplined in how we spend our money.

And the good news is that most of that environmental spending is behind us. So, we've talked a lot about, hey we're building three combined cycle units and let's make sure we have the team in place to manage those, because they're not all within a city block of each other, we've got one in Maryland, one in New Jersey, one in Connecticut, and I probably spent an hour-and-a-half yesterday with our Head of Fossil talking about what his needs are and how we can make sure that those are met.

So, I'd say, in general, its mandates that don't produce the customer or shareholder benefit that the regulator thinks they do. Fortunately most of those are behind us and to the extent that if we didn't respond to the expanded construction program in Power, I would be nervous about that, but we are responding and I guess the proof that I put forth for you on that is, we have quadrupled in the past five years that transmission program and we've delivered those projects on schedule and on budget. So...

<Q - Travis Miller>: Okay. That's great. And then a couple more, you mentioned the word retail in the past and just wondering if you could update if that's still in the Lexicon...

<A - Ralph Izzo>: Yeah, still it is.

<Q - Travis Miller>: ...strategy?

<A - Ralph Izzo>: But it remains in the Lexicon as a defensive move to help us make sure we can be more effective in managing our basis risk and key is going to go a long way to that and it's not a retail place so there are things we can do other than retail. But we are disciplined and cautious as you know I'm not a big fan of the retail business, I think everybody falls in love with it in a declining price environment that's typically when you can make a lot of money in retail, it's when prices rise and people are caught short for whatever reason, that life isn't quite so pleasant. So, we would look at it purely as a small part of our output truly for defensive purposes in managing basis risk and we're still looking at that and working on that.

<Q - Travis Miller>: Great. Right. Thank you so much.

Operator

Your next question comes from the line of Stephen Byrd with Morgan Stanley. Please go ahead.

<Q - Stephen Calder Byrd>: Hi. Good morning.

<A - Daniel J. Cregg>: Good morning, Stephen.

<Q - Stephen Calder Byrd>: I wondered if you could lay out what the year-end rate base was for transmission and then for the utility overall?

<A - Ralph Izzo>: I don't have that number, yeah. Transmission is 40 something. $13.4 billion is the number we provided for the utility and I think 43% of that was transmission.

<Q - Stephen Calder Byrd>: Got it. Thanks very much. And you've been – on solely, you've been continuing to grow there, how do you see sort of the overall market opportunity there, ability to achieve further growth in solar?

<A - Ralph Izzo>: So, Stephen we've seen as I think you're aware we have carved out for ourselves kind of a modest sized portfolio really it's the 250 megawatts DC, I think consists of 14 or 15 projects. So, these things range in size like five megawatts to 50 megawatts and many more closer to five megawatts to 50 megawatts. And we have very rigid return expectations, they're also supported by 25 to 30 year PPAs and they meet those return expectations.

So, generally those returns are not available in some of the larger projects and we've developed a couple of partners who are really good about bringing those opportunities that they know we can execute on. So, they're willing to work with us.

I do see that continuing to grow, it's mostly driven by state RPSs and I don't think we have baked in a number in terms of what size that will be. So, when we talk about our capital program, there isn't a dollar of those projects in there yet. If I look back over the past three years or four years, we've been pretty consistently doing anywhere from $100 million to $200 million of projects.

<Q - Stephen Calder Byrd>: Great. Thank you very much.

<A - Kathleen A. Lally>: Operator?

Operator

Ladies and gentlemen. I'm sorry. Please go ahead.

<A - Kathleen A. Lally>: I was going to say I think that brings us to the end. I'm going to turn the call back over to Ralph at this time.

Ralph Izzo

Thanks, Kathleen. So, looking forward to see you all hopefully in two weeks; but really I hope there are three key points you take away from what Dan and I talked about today. First of all, we are genuinely excited about Power's positioning. We've long had low cost nuclear and we've had a pretty good highly efficient combined cycle fleet, but in three years, we're going to have just an outstanding highly efficient combined cycle fleet.

And all of our assets are going to be well positioned and I mean well positioned in a broader sense of the word, they'll be near load, they'll be clean, they'll be diverse fleet. And we'll continue to look at opportunities to improve upon that fleet, but you really should recognize that we've talked for a long time now about these three new units and I don't foresee any circumstances at present that would suggest any additional new build on the horizon for us.

final

Bloomberg
SI-SSA-0015-15041

Second point is the utility growth continues, I mean we averaged 13% growth over the last five years and if you just take our 2015 results and the midpoint of the utility guidance for 2016, we're going to grow at 14%. And yet, utility bills will go down yet again this year, because of the expiration of some charges.

So, the utility will represent 60% of earnings at the midpoint and it's doing stuff that is very important to customers and we'll just continue marching along that path. So, we had a good year is the final point and I think you'll find that when we get together on March 11 that the next five years look even better. So, look forward to explaining that further when we see you in New York. Thanks everyone.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Kelly, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group Third Quarter 2015 Earnings Conference Call and Webcast. [Operator Instructions] As a reminder, this conference is being recorded today, Friday, October 30, 2015, and will be available for telephone replay beginning at 1:00 PM Eastern Time today until 11:30 PM Eastern Time on November 6, 2015. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com. I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Kelly. Good morning. Thank you all for participating in our earnings call this morning. As you are aware, we released third quarter 2015 earnings statements earlier today. As mentioned, the release and attachments are posted on our website at www.pseg.com, under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended September 30, 2015 is expected to be filed shortly.

As you know, the earnings release and other matters that we discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. And although we may elect to update those forward-looking statements from time-to-time, we specifically disclaim any obligation to do so even if our estimate changes unless, of course, we are required to do so.

Our release also contains adjusted non-GAAP operating earnings. Please refer to today's 8-K or other filings for a discussion of the factors that may cause results to differ from management's projections, forecasts and expectations and for a reconciliation of operating earnings to GAAP results.

I would now like to turn the call over to Ralph Izzo, Chairman, President, and Chief Executive Officer of Public Service Group. And also joining Ralph on the call today is Dan Cregg, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions, and we ask that you limit yourself to one question and one follow-up to give everyone opportunity to join us on the call. Thank you.

Ralph Izzo

Thanks, Kathleen, and thank you, everyone, for joining us today. Earlier this morning, we reported operating earnings for the third quarter of 2015 of $0.80 per share. That's a 4% improvement over the $0.77 earned in 2014's third quarter. The results for the third quarter bring PSEG's operating earnings for the nine months ended September to $2.41 per share, which represents a 6% increase over the $2.27 per share earned during the first nine months of last year.

Slides four and five contain the detail on the results for the third quarter and for the nine months. We delivered solid earnings in the third quarter and year-to-date, and we made excellent progress on our objectives for growing our business.

PSE&G continues to deliver on the earnings promise of its expanded capital program, and PSEG Power achieved solid operational and financial results, driven by improved performance from its nuclear and combined cycle fleet.

During the quarter, PSE&G reached an agreement with the Staff of the New Jersey Board of Public Utilities and the New Jersey Division of Rate Counsel that provided for PSE&G to invest $905 million over a three-year period beginning next year to replace aging cast iron gas mains. Approval by the BPU later this year will allow PSE&G to continue the work begun under Energy Strong, supporting a clean, safe and reliable gas system well into the future.

This agreement follows upon BPU's support earlier this year for a $95 million expansion of PSE&G's investment in energy efficiency programs. PSE&G's focus on improving the resiliency of the grid and increasing operational efficiency has translated once again into PSE&G being recognized as the most reliable utility in the mid-Atlantic region for the 14th consecutive year.

PSE&G's responsiveness was also recognized with receipt of the Outstanding Outage Response Time award for restoring customers 30% faster than any other large investor-owned utility. But this is, by no means, the end of the infrastructure replacement needs for PSE&G and its customers.

Turning to PSEG Power, it is increasing its investment in clean, efficient gas-fired capacity. Power cleared the new 540-megawatt combined-cycle gas plant at the Sewaren Station as part of PJM's Reliability Pricing Model Base Residual Auction. The new unit represents an investment of about $625 million to $675 million. The development of new capacity at Sewaren is an addition to Power's announced plans to construct and operate a new 755-megawatt combined-cycle unit at the Keys Energy Center in Maryland for between $825 million and $875 million. Both units are expected to achieve operational status in 2018.

PSEG Power's $1.5 billion investment will expand its gas-fired combined-cycle capacity in its core PJM markets to approximately 3,800 megawatts as Power's overall gas-fired combined-cycle capacity, which includes facilities in Bethlehem, New York grows to represent 4,600 megawatts.

PJM's Capacity Performance initiative under RPM provided the correct incentives for investment. PSEG Power cleared approximately 8,700 megawatts at an average price of $215 per megawatt day. Auction prices reflected the increased risk of non-performance associated with the auction's new rules. Power adjusted its bidding strategy to reflect this new reality with an emphasis on availability and reliability under Capacity Performance. And we believe Power's fleet is well positioned to perform, given its dispatch flexibility, diverse fuel mix and anticipated improvement in efficiency.

The new paradigm underlying PJM's capacity market is one sign of a more constructive regulatory environment for wholesale-generating assets. The Federal Energy Regulatory Commission's Notice of Proposed Rulemaking on energy price formation issued in September is further recognition that rule changes may be required to appropriately compensate generation for the true cost of operation.

Our total planned investment program covering PSE&G and Power for the five-year period ending in 2019 has expanded by 20% since the start of the year and now totals $15.6 billion. Our investments in PSE&G are expected to improve the resilience of the grid as we replace aging equipment and meet customer needs for reliability. Our investment program is projected to result in annual double-digit growth in PSE&G's rate base for the coming five-year period. Our investment in PSEG Power should enhance our market position with improvements in the fleet's efficiency

final

and reliability. In a word, we're executing well in a dynamic market.

Based on the strength of our results, we are updating our guidance for 2015's operating earnings. We've narrowed our range for guidance as we've increased the lower end. For 2015, we are now forecasting operating earnings of $2.85 to $2.95 per share, which is different from our prior $2.80 to $2.95 per share. PSE&G has grown to represent more than half of our operating earnings as Power continues to provide strong free cash flow. We've maintained a disciplined approach to investing as our strong financial position supports growth without the need to issue equity. We intend to utilize our financial strength to meet the high standards for reliability expected by our customers and enhance the returns required by our shareholders.

I'll now turn the call over to Dan to review our operating results in greater detail.

Daniel J. Cregg

Thank you, Ralph, and good morning everybody. I'll review our quarterly operating earnings as well as the outlook for full-year results by subsidiary company. As Ralph noted, PSEG reported operating earnings for the third quarter of 2015 of $0.80 per share versus $0.70 per share in the third quarter of last year. For the nine months ended September 30, we reported operating earnings of $2.41 per share versus $2.27 per share last year.

We've provided you a waterfall chart on slide 10 that takes you through the net changes in quarter-over-quarter operating earnings by major business, and a similar chart on slide 12 that provides you with the changes in operating earnings by each business on a year-to-date basis. I'll now review each company in more detail starting with PSE&G.

As shown on slide 14, we reported operating earnings for the third quarter of $0.44 per share compared with $0.39 per share a year ago. PSE&G's earnings in the third quarter reflect a benefit of warmer than normal weather and an increase in revenue associated with PSE&G's expanded capital program. The improvement in revenue more than offset a moderate increase in operating expenses.

Returns from PSE&G's expanded investment in transmission added $0.03 per share to earnings in the quarter. Weather conditions, which were much warmer than normal and warmer than a year ago, improved PSE&G's earnings by $0.02 per share. Earnings comparisons also improved by $0.01 per share due to an increase in electric demand, coupled with revenue recovery and infrastructure related investment programs. And consistent with the first half of the year, PSE&G experienced an increase in pension expense, resulting in a reduction in the quarter-over-quarter earnings of $0.01 per share.

Electric sales grew 7% during the third quarter, as residential customers responded to temperatures, which produced 38% higher temperature humidity index than levels experienced in the year-ago period and 19% higher than normal. And on a weather-normalized basis, electric sales advanced 0.8% in the quarter and 0.4% for the nine months ended September. Growth for the nine-months period is in line with our long-term expectations for weather-normalized electric sales growth.

As Ralph mentioned, PSE&G reached a settlement in principle with the staff of the BPU and the New Jersey Division of Rate Counsel on the company's Gas System Modernization Program or GSMP. The settlement provides for an investment of $905 million over a three-year period beginning in 2016. And under the settlement, we would invest $650 million in the program at a 9.75% return on equity, with the remaining $255 million investment recovered as part of our next base rate case.

And you may recall that we agreed as part of our Energy Strong program to file a base rate case no later than November 1, 2017. PSE&G, with the additional programs approved and pending has increased its investment program for the five-year period ending in 2019 to $11.8 billion. And this represents a 10% increase in PSE&G's capital investment plan since the start of the year, and should support estimated annual double-digit growth in PSE&G's rate base over this timeframe.

Bloomberg Transcript

Bloomberg

SI-SSA-0015-15045

And PSE&G has also filed an update of its Formula Rate for transmission at the Federal Energy Regulatory Commission. The update supports PSE&G's ability to earn its authorized return on an expanded capital base and would increase transmission revenues in 2016 by $146 million. Remember PSE&G's investment in transmission is expected to grow to about 50% of its rate base by the end of 2019 versus approximately 40% at the end of 2014.

We've increased our forecast of PSE&G's operating earnings for 2015 given strong year-to-date results and are now forecasting operating earnings of $785 million to $805 million versus $760 million to $775 million previously.

Now turning to Power. Power reported operating earnings for the third quarter of 2015 of $0.33 per share and adjusted EBITDA of $401 million, and that's compared with operating earnings of $0.34 per share and adjusted EBITDA of $386 million for the third quarter of 2014. Power's results for the quarter reflect the impact of strong hedging, an increase in operation from the gas-fired combined cycle fleet and an improvement in spark spreads, which offset the effect of an expected decline in capacity prices.

Higher averaged prices on energy hedges, coupled with a reduction in the cost of supply, more than offset the impact on earnings of lower wholesale market prices for energy. And these items combined to increase Power's quarter-over-quarter earnings comparisons by $0.07 per share. This improvement in margin in the quarter was partially offset by an expected decline in PJM's capacity revenues, which reduced Power's quarter-over-quarter earnings by $0.03 per share. The reduction in capacity revenues reflects the retirement of 1,800 megawatts of older, inefficient peaking capacity that was no longer compliant with environmental requirements. The average price received on PJM's capacity in the third quarter was in line with year-ago levels at $186 per megawatt-day.

An increase in O&M expense reduced quarter-over-quarter earnings by $0.03 per share. This increase in operating expenses primarily reflects differences in timing of outages at PSEG Power's nuclear facilities, and is not an indicator of a higher embedded level of expenses. And lastly, the absence of prior-year tax benefits reduced quarter-over-quarter earnings by $0.02 per share.

As Ralph mentioned, in August, PJM completed the RPM capacity auction for the 2018-2019 year. More than 98% of Power's capacity that cleared the auction met the new Capacity Performance or CP standards. The price Power will receive for capacity is expected to grow to $215 per megawatt-day on average, with the capacity year beginning June 1, 2018 from the $168 per megawatt day for the current year.

And on slide 28, we have detail and results of the latest capacity auctions, including the number of megawatts that cleared the auction as well as the average price Power expects to receive for its capacity.

Power cleared a new efficient combined cycle unit at Sewaren and plans to retire a similar amount of older inefficient steam units at that cycle. With the results of the latest auction, Power should see growth in its capacity revenues through 2018.

Generating fleet's operational flexibility continues to be demonstrated during this period of low energy pricing. Improved performance from the nuclear fleet and increased production from the gas-fired combined cycle fleet offset a decline in production at the coal-fired stations.

Our nuclear fleet operated at an average capacity factor of 95% for the quarter, producing 7.8 terawatt hours of output, representing 53% of total generation. This also represents a 3% increase in output. Performance of the nuclear facilities benefited from the absence of repair work at Salem 2 in 2014 and showed improvement year-over-year in spite of an early start to the refueling outage at Peach Bottom 3.

Production from the gas-fired combined cycle fleet increased 7% to 5.4 terawatt hours for the quarter, representing 36% of total generation. The fleet operated extremely well, running at an average capacity factor of 73% during the quarter in response to market demand. Output also benefited from the completion of capacity enhancement work at the Linden and Bergen Stations, which added 94 megawatts to the two stations over the past year.

Warmer than normal summer weather had a favorable impact on the dispatch of our peaking fleet, as dispatch of our coal-fired assets was affected by lower wholesale energy prices. Wholesale market energy prices during the quarter continue to reflect the decline in the price of gas based on an overabundance of gas supply in the region. Strong

final

production of gas from the Marcellus Basin, coupled with insufficient takeaway pipeline capacity, has not unexpectedly resulted in lower prices for gas.

The Power's combined cycle fleet benefited from its access to low cost gas supply in the summer and enjoyed strong spark spreads as Power prices held up better than the price of gas. Power's fleet is expected to produce energy at the lower end of its forecasted range of output for 2015 of 55 terawatt hours to 57 terawatt hours, reflecting reduced expectations for output from our coal-fired stations. This is slightly less than our prior forecast and would provide a nominal increase in output year-over-year. Approximately 80% to 85% of anticipated production for the fourth quarter is hedged at an average price of $52 per megawatt hour.

Moving to 2016, Power has hedged 65% to 70% of its forecasted generation of 55 terawatt hours to 57 terawatt hours, at an average price of $51 per megawatt hour. For 2017, Power has hedged 35% to 40% of its forecasted generation of 55 terawatt hours to 57 terawatt hours, at an average price of $49 per megawatt hour.

The percent of energy hedged in 2016 and 2017 is consistent with, but at the lower end of the range for, Power's prescribed ratable hedging policy. And the forecast for 2016 and 2017 continues to assume that 11 to 12 terawatt hours of annual output are hedged at BGS prices. The forecast range for Power's operating earnings for 2015 has been narrowed to $620 million to $650 million from the $620 million to $680 million prior range. This forecast of operating earnings represents adjusted EBITDA for the full year in the range of $1.545 billion to $1.595 billion.

Now, turning to Enterprise and Other, where we reported operating earnings of $11 million or $0.03 per share for the third quarter of 2015 versus operating earnings of $22 million or $0.04 per share in the third quarter of 2014. And the decline in operating earnings reflects the absence of prior-year tax benefits at Energy Holdings, partially offset by lower expenses and higher interest income at the parent. And the forecast for Enterprise and other full-year operating earnings for 2015 remains $40 million to $50 million.

And lastly, relating to financing, PSEG closed the quarter with $271 million of cash on its balance sheet, with debt at the end of the quarter representing 41.5% of consolidated capital. PSEG's five-year capital program has increased to $15.6 billion, with the announced agreements for PSE&G and Power's plans to develop new capacity.

PSE&G's capital program represents 75% of our planned capital expenditures with Power's capital program representing 25%. And given our strong balance sheet and expectations for Power's free cash flow generation, we're able to finance our capital requirements without the need to issue equity.

So as mentioned, we are pleased to update our guidance for 2015's operating earnings to $2.85 to $2.95 per share and the results in this range would represent a third year of growth in operating earnings.

And we are now ready for your questions.

Kathleen A. Lally

Operator?

Q&A

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. [Operator Instructions] Your first question will come from the line of Paul Patterson with Glenrock Associates.

<Q - Paul Patterson>: Can you hear me?

<A - Ralph Izzo>: Yes, Paul.

Bloomberg Transcript

final

<Q - Paul Patterson>: Last quarter, you were discussing potentially exploring the retail market. And I was wondering if you had any update on that or any thoughts given the third quarter and what have you.

<A - Ralph Izzo>: Yeah, so Paul, it's Ralph. We did talk about it. We still are considering different options. Again, to the extent that we think about retail, it's only in the context of the effectiveness of our hedges, right? This is not an offensive play, this is how do we make sure that assets that we own and operate in places like PS-zone and in places like Eastern MAAC and places like Bethlehem, New York are effectively hedged when the liquid hub is at PJM West. So, it's really just about the effectiveness of hedging and how to make sure that we optimize that. So, one thing we did to make sure that we hedge effectively is by purchasing the Keys Energy Center, right, so that's not retail, but that's a way to get at managing basis differentials and effective hedges. So, we are still looking at it, but nothing imminent to announce.

<Q - Paul Patterson>: Okay. And then on the re-contracting and lower cost of service, again, a good quarter for that. Given where you see things heading into 2016, any thoughts about how things look with respect to that?

<A - Ralph Izzo>: Yes, so, that was definitely explicitly stated in Dan's point of view, right. So, we don't out-guess the market. We have a very clear set of guidelines that we give our trading organization in terms of how much they can hedge in terms of max and mins, all based upon characteristics of VAR and gross margin at risk. And we allow them to use their judgment in terms of how market sentiment might be affecting near-term prices that may be slightly out of whack with respect to fundamentals. And we allow them to lean a little bit heavier in their hedging as they did last year, which benefited us because prices did kind of come up pretty strong after last winter.

And as Dan pointed out right now, we're a little bit lighter than we would typically be hedged in 2017, but still within our normal range, not taking a strong point of view that the market has this all wrong, but you can infer from that that we think maybe there's a little bit more bearishness in the market than is normally the case.

<Q - Paul Patterson>: Okay. Thanks a lot.

Operator

Your next question will come from the line of Travis Miller with Morningstar.

<Q - Travis Miller>: Good morning. Thank you.

<A - Ralph Izzo>: Hi, Travis.

<Q - Travis Miller>: Real quick one, I want to clarify, do you guys expect the BPU to decide on that gas replacement program later this year? Is that right?

<A - Ralph Izzo>: Yes. We're told it's going to be on the November agenda.

<Q - Travis Miller>: November agenda. Okay. Great. And then thinking more broadly here, those plants that you retired, what did you see during the summer in terms of how that capacity and, ultimately, energy at the peak levels was replaced? Were you guys picking out some of that or were there other areas where you were seeing that replaced?

<A - Ralph Izzo>: Yes. Our Kearny peaking units did run during the summer. We did have to run our Hudson unit on gas during the summer, but C-1, the units that we replaced, did not run during the summer.

<Q - Travis Miller>: Okay. So you're picking up that mostly with your other facilities. Is that?

<A - Ralph Izzo>: That's right. So as Dan pointed out, we had some expansion in some of our combined-cycle units which ran, our LM6000s ran, but the old steam units that sometimes in the past we've had to turn on, we did not have to turn on this year.

<Q - Travis Miller>: Okay.

Bloomberg Transcript

<A - Ralph Izzo>: Yeah. I referenced as well, a little bit of the peaking units were up as well; there the coal units were where our volume was down. So I would say our peakers picked up some of that volume.

<Q - Travis Miller>: Okay. And then more strategically, how do you think now about Enterprise and what you can do there, what investments might go there, just that segment in general?

<A - Ralph Izzo>: Well, we see really two primary operating subsidiaries in Power and in Utility, Travis. The earnings that you see at Enterprise really are borne out of some residual legacy leases on real estate that are very, very small, and then, of course, LIPA, which is on a exactly-as-planned trajectory of starting out at $0.03 going to $0.08 by 2017; this year, I think it's about $0.03 or $0.04; next year, that will go up $0.06 or $0.07 and then $0.07 or $0.08 two years as per the contract. So there are no plans to put a lot up at the parent level in terms of new businesses.

<Q - Travis Miller>: Okay. Great. Thank you very much.

Operator

Your next question will come from the line of Michael Lapides with Goldman Sachs.

<Q - Michael J. Lapides>: Hey, Ralph. Thank you, guys, for taking my question. I want to know if we should see what your investment in Power is for the next couple of years as a bit of a strategy shift or a bit of a view in the market.

And the reason why I ask that is if I go back over the prior six years or seven years, six years or eight years, a lot of what you've done in Power is actually more of the harvest mode, meaning once you've finished the environmental CapEx on Hudson and Mercer, a lot of what you had done at Power had either been divesting assets or realizing the significant cash flow, the free cash flow that the remaining assets the large portfolio created.

We're now seeing a little bit of a shift and now you're becoming much more of an investor in new assets, whether it's building on existing sites or buying development projects. Is that a, you think, the market has changed type of view? Or is there some other structural view that you're trying to express in utilizing the cash flow that way versus other particular methodology? It's either allocating it to the balance sheet or allocating it even more investment at E&G, just curious.

<A - Ralph Izzo>: Yeah, no, that's a very good question, Michael. We do get that from a lot of our investors. I thank you for giving us the chance to answer it. It is definitely not a strategy shift. We believe that both businesses are quite viable, quite strong and need to be tended to in terms of their investment and growth opportunities. I think if you look at a short enough period of time, you could create whatever strategy you want to from a short enough period of time.

But if I just take you back over the last five years, PSE&G made up about 80% of the capital program versus Power being 20%. And if I look ahead five years, based on what I know today, that 80/20 becomes 75/25, and it's no more than that. So, if you think about Power in the last five years, we spent $400 million operating nuclear units, we spent a couple of hundred million dollars on peakers, we spent a couple hundred million dollars on advanced gas path upgrades.

So. now we're not doing that. Instead, we're going to take an old steam unit that has 550 megawatts of capacity, that really there was no way it could survive in a CPE future, and said okay, instead of just retiring that and leaving nothing there and losing the injection rights, let's build a combined cycle unit because we like the way those numbers look. And so, instead of upgrading and instead of expanding, we're going to build a new natural gas combined cycle unit.

As I mentioned before when I was answering Paul's questions, there are some changes going on in bases and want to know how can we manage that better. We saw a great opportunity in handling that through the Keys investment.

But at the same time, we've announced $1 billion in new utility investments between gas system maintenance, modernization and energy efficiency. And as we pointed out, that Gas System Modernization Program at $300 million a year run rate has 30 years to go. We only have three years of approval.

final

So, what we have is two very strong businesses, both worthy of investment, both which we look at where we can maximize the benefit for our customers and achieve the return expectations of our shareholders. So, really nothing has changed. Absolutely understandable why people would ask the question. If you just looked at a three-month window, all of a sudden you see, wow, Power is investing $1.6 billion and Utility is investing $1 billion. But I don't think you should look at narrow, short windows like that.

<Q - Michael J. Lapides>: Got it. And one other question. You talk about rate-based growth at the Utilities meaning double-digit rate-based growth. Do you expect earnings growth to match rate-based growth over time?

<A - Ralph Izzo>: So it will be close, but it can't match it. So the reason for that is quite simple. I am so proud of our Utility folks for controlling costs. But even in the best of years, you have labor escalation in our Union contracts that are like 2.5%. You just look at sort of management wage growth of 2.5% to 3%. And then, you look at load growth on the weather normalized basis of 0.4% on the Electric side, and I think it's like 0.8% on the Gas side. So, if you just do the arithmetic and the O&M expense outstrips the growth in load, so that bit of a drag peels away at some of the contemporaneous returns that you get from the rate-based growth. So that's why these things don't match perfectly.

<Q - Michael J. Lapides>: Got it. Thank you, Ralph. I appreciate you taking my questions.

<A - Ralph Izzo>: No problem. You're welcome.

Operator

[Operator Instructions] You have a question from the line of Sophie Karp with Citigroup.

<Q - Sophie K. Karp>: Hi. Can you hear me?

<A - Daniel J. Cregg>: Yes. Yes.

<A - Ralph Izzo>: Yeah. We can hear you. Good morning.

<Q - Sophie K. Karp>: Good morning. And thank you for taking my question. I wanted to ask you about the nuclear economics. And as we continue to see very little gas environment obviously and this prevails, do you see any meaningful change in the nuclear economics for your assets and does that change your view of their long-term strategy with respect to those assets?

<A - Daniel J. Cregg>: No, Sophie. I mean, it's an excellent question. Each of our units is over 1,000 megawatts. I think if you look at both fixed and variable O&M, I don't know if we've published the operating costs of them, but it's $37 a megawatt hour, both fixed and variable. If you look at nuclear fuel costs, it's far, far, far less than that.

So, given our capacity prices, given our variable O&M costs, our units are absolutely fine. They'd be a lot finer if gas was at $8 and $10 an MMBtu. But as you well know, some of the challenges that other units have had is number one, their size in terms of their ability to spread their fixed cost, and number two, some of the distortions that are created by the production tax credit, in particular from wind farms. That's not to minimize the competitive pressures associated with natural gas. But what we're seeing is margin compression and we're nowhere near a point of operating in anything but positive margins for those units.

So I think that there'll be a period, I don't know how long that will be, of competitive pressure on them, but eventually, there's going to be a price on carbon. I don't know if that's going to be under CPP or some other paradigm, and these units will be able to ride through these a little bit more difficult times without any problem and then really benefit from that carbon regime in the future.

<Q - Sophie K. Karp>: Thank you. And my other question was about transmission investments. Are you looking at any incremental transmission investment opportunities right now, maybe through FERC Order 1000 or any other transmission investments that are not currently in your plan or have not been contemplated previously?

Bloomberg Transcript

final

<A - Daniel J. Cregg>: Yeah. So, I mean the FERC 1000 process has been around for a while and I guess I would say has been gaining traction for a while. We've been through the most recent and first opportunity here within PJM, with Artificial Island. So, yes, we are definitely involved in there. I think that a lot of the areas in the country are still formulating the best way to move into this new regime. So I would say that the prognosis for large investments in the very near term in that regard are probably less. But I think, over time, it is still an area where we think we have the skills and expertise that we can bring to it, and we think we can be very successful in that arena.

<A - Ralph Izzo>: And, Sophie, it's important to realize that the $12 billion in the utility's prospective five-year capital program, of which I think 60% or 70% is transmission, none of that is subject to FERC Order 1000 competition. That's all stuff that doesn't meet the criteria for FERC Order 1000. I guess the exception to that is, as Dan just implied, is the $120 million of Artificial Island project that we won, that's included in that number.

<Q - Sophie K. Karp>: Thank you.

Operator

Your next question will come from the line of Gregg Orrill with Barclays.

<Q - Gregg Gillander Orrill>: Yes. Thank you. Ralph, you've talked about having an excess balance sheet capacity of I guess $2 billion to $3 billion against your FFO to debt targets.

<A - Ralph Izzo>: Right, Gregg.

<Q - Gregg Gillander Orrill>: And where does stock buyback stand in the way you're thinking of using that money and has anything changed about your thinking?

<A - Ralph Izzo>: Sure. Thanks, Gregg, for your question. So nothing has changed, really. We have this sort of three-tiered prioritization on how to use the balance sheet. Number one is reinvesting in the business, and we've been public about the fact that we will bid Bridgeport Harbor combined cycle unit in the upcoming Forward Capacity Market in New England in February. I just mentioned a minute ago that the gas system needs $300 million per year. And we have a three-year program. If you subtract three from five, that means there is two years that are unfunded in the plan right now.

And you may recall, Gregg, when we originally filed for Energy Strong, goodness gracious, two-and-a-half years ago, we asked for $3.6 million as the first part of a five-year program and we got $1.2 million approved, then it was only put into a three-year program. So, that's halfway done already. And if we take one-and-a-half from five, that means three-and-a-half years of the five-year program is unfunded. So, there's a $1 billion-plus investment opportunity there. So, just looking at those three, Bridgeport Harbor Gas and Energy Strong, you're looking at anywhere from $2.5 billion to $3 billion of additional investment opportunity that we publicly discussed.

Second thing is, look, let's say, so we know the utility is a steady grower, but we know the powers and the commodities is cyclical business, and we know how important dividends are to our investors. And we've been promising consistent growth in our dividends. So, we'd like to make sure that balance sheet has a little bit of an ability to absorb some of the ebbs and flows of the commodity markets. So, that's a second priority for us.

And then third, but not one that we would never do, but something that we talk about all the time is our cost of capital is a little out of whack because the balance sheet is a little bit too robust, and the investment opportunities are kind of far off, then let's think about share repurchase as a way to get that cost of capital back in line. So, that really hasn't changed at all in terms of the three-tiered prioritization, but perhaps maybe a little more color on the details.

<Q - Gregg Gillander Orrill>: Thank you.

<A - Ralph Izzo>: You're welcome.

Bloomberg Transcript

Operator

Mr. Izzo, Mr. Cregg, there are no further questions at this time. Please continue with your presentation or closing remarks.

Ralph Izzo

Thank you very much. So, look, I hope your takeaway is the same as the message we were trying to deliver, which is the company is in great shape. Our fleet of plants, our nuclear units, our combined cycle units are running well. The utility is hitting all of its growth targets as it executes its capital program, and the balance sheet remains very healthy. So, we hope that you all come out to meet Dan if you haven't met him just yet. He's stepped right in and done a fabulous job for us. And we'll see you in Florida in two weeks at EEI. Great. Thanks, everyone. Have a good day.

Operator

Ladies and gentlemen, that does conclude your conference call for today. You may now disconnect. And thank you for participating.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Brandy, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group Second Quarter 2015 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. [Operator Instructions] As a reminder, this conference is being recorded today, Friday, July 31, 2015, and will be available for telephone replay beginning at 1 PM Eastern today until 11:30 PM Eastern on August 7, 2015. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Brandy. Good morning. Thank you for participating in our earnings call this morning. As you are all aware, we released second quarter 2015 earnings statements earlier today. The release and attachments as mentioned are posted on our website at www.pseg.com, under the Investors section. We also have posted a series of slides that detail operating results by company for the quarter and the first half of the year. Our 10-Q for the period ended June 30, 2015, is expected to be filed shortly.

I won't go through the full disclaimer statement or the comments we have on the difference between operating, earnings, and GAAP results, however, as you know the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. Although we may elect to update forward-looking statements from time-to-time, we specifically disclaim any obligation to do so even if our estimate changes unless, of course, we are required to do so.

Our release contains adjusted non-GAAP operating earnings. Please refer to today's 8-K or other filings for a discussion of the factors that may cause results to differ from management's projections, forecasts and expectations and for a reconciliation of operating earnings to GAAP results.

I'm now going to like to turn the call over to Ralph Izzo, Chairman, President, and Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Caroline Dorsa, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions.

Ralph Izzo

Thank you, Kathleen. And thank you, everyone, for joining us today. Earlier this morning, we reported operating earnings for the second quarter of 2015 of $0.57 per share, a 16% improvement over the $0.49 per share earned in 2014 second quarter. The results for the quarter bring operating earnings for the first half of 2015 to $1.61 per share, a 7% increase over operating earnings of $1.50 per share earned in 2014's first half.

Slides 4 and 5 contain the detail on the results for the quarter in the first half. Our business is performing well and meeting the challenges of today's low energy price environment. The results for the quarter and first half of the year demonstrate the importance of strong operations in providing our customers with safe, reliable, low cost energy.

PSE&G invested $1.3 billion during the first half of the year as part of its planned capital program for 2015 of $2.6 billion. This included upgrades to the electric and gas distribution and transmission system. PSE&G's focus on improving the resiliency of the grid and increasing operational efficiency has also translated into strong performance in a number of the areas of customer satisfaction including price, billing and payment, corporate citizenship and field service.

PSE&G was recently assigned a share of the transmission upgrade work at Artificial Island. PJM's decision will increase PSE&G's transmission-related capital spending by $100 million to $130 million over the next four years. This project will add to PSE&G's robust pipeline of projects that will drive high single-digit growth in PSE&G's earnings over the three-year period ending in 2017.

The New Jersey Board of Public Utilities has begun proceedings related to PSE&G's proposed $1.6 billion Gas System Modernization Program. The investment would provide for a continuation of the work underway to replace 800 miles of cast iron and bare steel pipe over five years to enhance reliability and reduce the potential for harmful emissions of methane gas. Approval would also provide a direct boost to New Jersey's economy.

We continue to believe that this is the right time to move forward with this work, given the sizeable savings customers continue to realize from low gas prices.

PSEG Power's earnings demonstrate the strength of its asset mix. Recent economic investments have increased the capacity of existing nuclear and fossil units and have improved the fleet's operating efficiency. The completion of upgrade work at the gas-fired Bergen combined cycle unit yielded an increase in capacity of 31 megawatts, just as the completion of the first phase of the Peach Bottom upgrade which achieved 100% output at the new rating in May provided an additional 65 megawatts per Power's share of this nuclear unit.

In addition, Power recently announced plans to construct and operate a new 755-megawatt combined cycle unit at the Keys Energy Center in Maryland at a cost of $825 million to $875 million. The investment is in keeping with Power's overall strategy of investing in efficient capacity in its core markets. All three investments will enhance Power's ability to perform on the PJM's recently approved capacity performance program.

Capacity performance, with its emphasis on performance, is an example of how customer demands for reliability are increasing. The size of PSEG Power's fleet, the diversity of the fleet's fuel mix and its dispatch flexibility should support performance under the new capacity standards. The real impact of the changes in the RPM capacity auction should result over time as the market recognized the need for increased investment to maintain system reliability, particularly in light of anomalous weather patterns.

We are focused on executing our investment strategies and expanding our infrastructure in a disciplined manner, a manner that supports the goals of customers and shareholders alike. PSE&G's investment program is expected to yield double-digit growth in rate base through 2019, as the earnings contribution from our regulated business should continue

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-15054

to exceed 50% of our consolidated earnings. PSEG Power's investment program is expected to enhance the fleet's efficiency and reliability as we continue to look for opportunities to expand that fleet.

The potential investment in Artificial Island, actually the recently approved investment in Artificial Island, the announced acquisition of the Keys Energy Center and the gas system modernization program, if approved, would expand our previously announced capital program for 2015 through 2019 by 15% to 20%, or $2.2 billion.

Based on the strength of our results for the first half of the year and the outlook for the remainder of the year, we are updating our earnings guidance for 2015. We have narrowed our range for guidance to $2.80 to $2.95 per share from its original $2.75 to $2.95 per share. Our financial position remains strong. The growth in capital spending can be financed without the need to issue equity. We intend to utilize our financial strength to pursue investments that enhance operating efficiency, support our market position, and seek to improve on the high levels of reliability expected by our customers as we increase shareholder value.

With that, I'll turn the call over to Caroline, who will discuss our financials in greater detail.

Caroline D. Dorsa

Thank you, Ralph, and thank you everyone for joining us today. As Ralph said, PSEG reported operating earnings for the second quarter of 2015 of $0.57 per share versus operating earnings of $0.49 per share in last year's second quarter.

We provide you with a reconciliation of operating earnings to income from continuing operations and net income for the quarter on slide 4. And we've also provided you with a waterfall chart on slide 10 that takes you through the net changes in quarter-over-quarter operating earnings by major business and a similar chart on slide 12 provides you with changes in operating earnings by each business on a year-to-date basis.

So, now I'll review each company in a bit more detail, starting with PSE&G.

PSE&G reported operating earnings for the second quarter of 2015 of $0.33 per share, compared with $0.30 per share for 2014's second quarter, a 10% improvement. Results for the quarter are shown on slide 14. PSE&G's operating results for the second quarter continued to benefit from the expansion of its capital program and the impact of warmer-than-normal weather on demand.

Returns from PSE&G's expanded investment in transmission added $0.04 per share to earnings in the quarter. An increase in revenue at the start of the year under its transmission formula rate provides PSE&G the opportunity to continue to earn its allowed return on its transmission investments.

Electric demand benefited from the more favorable weather conditions during the quarter, that is, the weather was hotter than normal and warmer than last year, as well as the recovery of costs associated with PSE&G's capital infrastructure programs. Together, these improved earnings comparisons in the quarter by a $0.01 per share.

Gas deliveries continued to grow in response to sustained low prices. The growth in gas deliveries also increased earnings comparisons by $0.01 per share. The improvement in earnings associated with this growth and revenue was partially offset by an increase in pension expense as well as higher storm-related expenses, with those increases totaling an impact of $0.02 per share. An increase in taxes and other items reduced quarter-over-quarter earnings by $0.01 per share.

Economic indicators in the service territories such as employment and housing are showing signs of improvement. Modest growth in electric demand is reflective of the improvement in economic conditions. On a weather-normalized basis, electric sales grew by 0.2% for the quarter and about the same year-to-date.

Growth in demand by residential and commercial customers was partially offset by a decline in demand from industrial customers, but weather-normalized deliveries of gas grew 2.7% during the first half of the year in response to sustained low prices, something you'll recall we saw last year as well.

Bloomberg
SI-SSA-0015-15055

PSE&G, as part of its annual BGSS filing with the New Jersey BPU, requested a further reduction of $70 million in annual revenues, reflecting its lower cost of gas supply. When placed into effect, the BGSS rate will be reduced to $0.40 per therm from $0.45 per therm effective October 1 of this year. And including this reduction, the typical residential gas customer has experienced a reduction in his or her bill of $792, or 47%, since January of 2009.

PSE&G has maintained a steady level of capital expenditures, investing $1.3 billion in the first half of the year as part of its annual planned capital program of $2.6 billion in upgrades to the electric and gas distribution and transmission systems. The capital investment associated with PSE&G's share of recommended upgrades to the transmission system at Artificial Island will increase investment in the transmission by $100 million to $130 million during the 2016 to 2019 timeframe.

So, we are updating our forecast for PSE&G's operating earnings for the year from $735 million to $775 million, to $760 million to $775 million. Given year-to-date results, operating earnings for the full year will be influenced by the summer weather, and of course the recovery of costs associated with higher levels of capital spending.

Now, let's turn to Power. PSEG Power reported operating earnings of $0.22 per share for the second quarter of 2015, and adjusted EBITDA of $301 million, compared with operating earnings of $0.17 per share and adjusted EBITDA of $276 million for the second quarter of 2014. Power's operating results for the second quarter benefited from improved operations at its Nuclear and Fossil generating facilities, as well as higher prices on its hedged output and a decline in the cost of its gas supply. The benefit to earnings from the improvement in operations more than offset the impact on earnings from an expected decline in capacity revenue and the lower wholesale market prices for energy.

Higher average prices on energy hedges, coupled with a reduction in the cost of supply, more than offset the impact on earnings of lower wholesale market prices for energy. These items combined to increase quarter-over-quarter earnings comparisons by $0.10 per share. In addition, a 10% improvement in the output over the prior year increased quarterly earnings comparisons by $0.02 per share.

So this improvement in margin was partially offset by the expected decline in PJM capacity revenues, which reduced Power's quarter-over-quarter earnings by $0.08 per share. The reduction in capacity revenues reflects the impact, both of a lower average capacity price and the retirement of capacity that we've talked about before, the capacity that's no longer compliant with environmental regulations.

Higher levels of O&M and depreciation expense were offset by a decline in taxes of $0.03 per share, and other items, to net improve quarter-over-quarter earnings by $0.01 per share. The lower effective tax rate in the quarter of approximately 23% versus last year's 31% was anticipated, and we continue to estimate that the tax rate for the full year will approximate 38%, which is about the same rate as you saw in 2014.

The increase in adjusted EBITDA for the quarter is in line with the changes in earnings per share that I just went through on a quarter-over-quarter basis. The average price for capacity declined in the quarter to approximately $168 per megawatt-day from $217 per megawatt-day. In addition, the amount of capacity that cleared the PJM capacity auction for the 2015-2016 capacity year, which we've discussed over the past few years, was reduced by about 1,800 megawatts to 8,800 megawatts. And this reflects the retirement in May of this year of the HEDD peaking capacity that didn't meet New Jersey's nitrous oxide emissions standards.

As we move through the second half of 2015, the average price received on PJM capacity will remain stable, relative to the average price received during the second half of 2014 at about $168 per megawatt-day. However, we should continue to expect on a year-over-year basis a decline in capacity revenues during the second half of the year specifically related to that retirement of capacity under HEDD.

The fuel diversity and flexibility of Power's fleet of generating assets was demonstrated once again in the quarter. Our output increased 10% over a year-ago levels to 13.2 terawatt-hours. The nuclear fleet operated at an average capacity factor of 86%, producing 7.1 terawatt-hours of output, or about 54% of our generation. And this level of output represents a 9% improvement from year-ago levels. The performance on the nuclear fleet reflects the absence of some major repairs to Salem 2 in 2014, which led this year's fewer outage-related days in the second quarter.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15056

Production from the combined cycle gas fleet increased 26% this year to 4.6 terawatt-hours of generation or 34% of our total generation, as the fleet's capacity factor improved to 61% from 49% in the year-ago quarter.

Linden's availability improved versus 2014 as the result of upgrade and maintenance work that was occurring in the year-ago quarter. Dispatch of the combined cycle fleet was also supported by the availability of low-cost gas. Dispatch of the coal fleet, however, was hurt by a decline in the price of gas and lower wholesale energy prices.

Output from the coal fleet declined 1.3 terawatt-hours or 10% of generation during the quarter. Wholesale market energy prices have been affected by a decline in the price of gas and anomalies in the dispatch of generation associated with the volatility in pricing. Strong production of low-cost gas from Marcellus station and the lack of sufficient takeaway capacity, not unexpectedly, has resulted in a lower price for gas.

The impact on power prices from the lower cost of gas has been further compounded this summer by repair work on electric transmission lines in the Maryland-D.C. area and differentials on load, given warmer-than-normal weather in Southern PJM versus the more normal demand experienced in the northern part of PJM. That inability to dispatch energy to meet demand as a result of the transmission constraints hurt the wholesale market price for power in our region. This situation is alleviated during periods of more normal weather-related demand in the areas served by PSEG Power.

So the dynamics affecting the power markets were not wholly unexpected, given that lack of gas transmission takeaway capacity in the Marcellus basin and the work underway to alleviate the constraints on electric transmission to the south of us.

Power's combined cycle fleet continue to benefit from its access to this low-cost gas supply during the second quarter. And since power prices held up and we continue to access lower cost gas, the combined cycle fleet experienced an expansion of spark spreads and Power's fleet will continue to benefit from low gas prices and a somewhat open gas position.

As we look to the full year, the improvement in availability of Power's gas-fired and nuclear fleet combined with incremental operating capacity at the Peach Bottom 2 nuclear plant and the gas-fired Bergen Station should allow Power's fleet to produce energy at the upper end of our forecasted output for the year of 55 terawatt-hours to 57 terawatt-hours. This level of output represents a 1% to 5% increase over 2014's output of 54.2 terawatt-hours.

Approximately 70% to 75% of anticipated production for the second half of the year is hedged at an average price of $53 per megawatt hour. The average price on Power's energy hedges remains the same, approximately $4 per megawatt hour higher than the average price received on energy hedged during the second half of 2014. For 2016 and 2017, Power's forecast output will remain stable at approximately 55 terawatt-hours to 57 terawatt-hours. Of this, Power has hedged 55% to 60% of 2016's forecasted generation at an average price of $51 per megawatt-hour and about 30% to 35% of 2017's forecasted level of generation is hedged at an average price of $50 per megawatt-hour.

As Ralph mentioned, Power has acquired the rights to develop the 755-megawatt gas-fired combined cycle Keys Energy Center in Maryland. The addition of Keys, which represents an investment of approximately $825 million to $875 million, is targeted to enter commercial service in 2018. The plant's location, we believe, will complement Power's fleet in the core market and add to a fleet capable of meeting PJM's new capacity performance standards.

The forecasted range of Power's operating earnings for 2015, even with lower wholesale energy prices, remains $620 million to $680 million as guidance, and for adjusted EBITDA, it remains unchanged as well, at $1.545 billion to $1.645 billion. Results for the remainder of the year will be influenced by higher average hedge prices, that declining capacity revenue that I mentioned, and wholesale energy market prices.

Just a quick note on Enterprise and Other. Operating earnings for PSEG Energy Holdings and Enterprise in the second quarter of 2015 were $12 million, or $0.02 per share, versus operating earnings of $7 million, or a rounded $0.02 per share, for the second quarter of 2014. The improvement in the operating income for the second quarter reflects higher earnings from PSEG Long Island, lower O&M expense, and higher interest income at the parent. And we continue to forecast full-year operating earnings for PSEG Enterprise/Other of about $40 million to $45 million.

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-15057

PSEG closed the quarter ended June 30, 2015 with $597 million of cash on its balance sheet, with debt at the end of the quarter representing 41.9% of consolidated capital. During the quarter, PSE&G issued $350 million of 10-year secured medium term notes at an interest rate of 3% and $250 million of 30-year secured medium-term notes at an interest rate of 4.05%, and we also redeemed $300 million of maturing medium-term notes, yielding 2.7%.

As Ralph mentioned, we've updated our forecasted operating earnings for the full year to $2.80 to $2.95 per share, given the strong operating results at both businesses in the first half of the year. Estimates of PSEG Power's adjusted EBITDA remain unchanged at $1.545 billion to $1.645 billion.

Finally, just on a personal note, as you know, I announced a week ago my plans to retire from PSEG during the fourth quarter. I have really enjoyed working with all of you and, as I move on, I know that PSEG has an outstanding management team, led by Ralph Izzo, with a strong balance sheet and lots of opportunities to deploy it in the future, and possesses a really solid foundation for further growth.

With that, we're now ready for your questions and I'll turn it back to you, Brandy.

Q&A

Operator

[Operator Instructions] Your first question is from Daniel Eggers with Credit Suisse. Please proceed with your question.

<Q - Dan L. Eggers>: Hey, good morning, guys. Can we just talk a little bit about the Keys plant and just your thought process on the capital allocation on that front, given the fact that you've looked at a variety of other brownfield type projects in generation that haven't passed muster from your cost of capital perspective?

<A - Ralph Izzo>: Yeah, Dan. So I think in general, we're somewhat cautious about injecting new supply into a market where demand isn't growing much. So most of the investments you've seen us make have been kind of upgrades to existing units, and we've talked a lot about [indiscernible] (26:54) and replacement of existing units. This one is a little bit unique for us, in that A, it's not an existing asset, and B, it is a new development project. I think what makes this one a good fit for us is its location, it's in Southwestern MAAC, where we've seen some seasonal basis advantages.

Number two, I think we're ahead of the market in terms of the future delivery of gas to that region, which will put a 6,400 heat rate unit in a very, very strong competitive position. And number three, this one went beyond the usual forecasting of forward price risk, and included an element of construction risk that we believe ourselves particularly well-suited to manage, given the project work we've done, both in power and in the utility, and how well that has all worked out. So for a combination of reasons, we were able to see clear to some value creation here that was different from other opportunities, where I can't believe people outbid us.

So, I think what you hear me saying is that we remain cautious on injecting copious amounts of new supply in a market that's not growing, but this was a fairly special situation that we thought fit our portfolio rather nicely.

<Q - Dan L. Eggers>: And given kind of your history of being pretty conservative on using capital, is your view effectively that the energy value of the asset is going to make sense for it, since you don't have the lock on capacity that you would have had if you had done Bridgeport or something else?

<A - Ralph Izzo>: Yeah, that's right. I mean we did talk in the past about how we – we were attracted to the seven-year lock on capacity in New England. And this one obviously is more about sparks and energy margins than it is about a one-year price on capacity. But it will be clearly a CP-eligible unit.

<Q - Dan L. Eggers>: Okay. And I guess Caroline, what – you've talked in the past about how much balance sheet capacity you guys thought you had to redeploy. How much you think you have left with the Keys investment and because it is more merchant, does that lower the amount more meaningfully than just the dollars going into the project?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15058

<A - Caroline D. Dorsa>: No, Dan, so we still have plenty of capacity when I think about – remember the slide we showed in March and we know we've talked about before, we add capacity and multiple billions of dollars both at POWER and at parent, parent mostly for regulated. When I look at where we landed at the end of the second quarter, actually similar to what we've talked about before, Power ends with – does it cap at 31%, FFO to debt number is well above our floor level. So, we didn't relax any standards here in doing the analysis for Keys. We will be able to finance that on Power's balance sheet and that doesn't use it up, right? So, when we talk about those balance sheet capacities, remember I've mentioned before that that's the most conservative way to look at them because we look at them assuming they don't start contributing any FFO back and when this goes in service, it certainly will.

So, when we looked that Keys, we didn't look at it from the perspective of well, if we do Keys, we can't do anything else. We looked at it from the perspective of Keys is a really good project and by no means does it use up all of our balance sheet capacity. So, we can still continue to look at new opportunities for Power as well. So, I feel really comfortable that it's one balance sheet deployment, but it's not the only one we'll be able to do in either businesses.

<Q - Dan L. Eggers>: So, this wouldn't preclude the HEDD upgrades or something else then?

<A - Ralph Izzo>: No.

<A - Caroline D. Dorsa>: No, no, not at all. We'll not preclude other things that we may be considering, not at all.

<Q - Dan L. Eggers>: Okay. Well, Caroline, I trust we'll have you on the third quarter earnings call, so I won't say goodbye yet. And thank you guys.

<A - Caroline D. Dorsa>: Thanks, Dan. Next question.

Operator

The next question comes from Julien Dumoulin-Smith with UBS. Please go ahead with your question.

<Q - Julien Dumoulin-Smith>: Hi, good morning.

<A - Ralph Izzo>: Good morning, Julien.

<Q - Julien Dumoulin-Smith>: So, perhaps to follow-up on investment opportunities here. I'd be curious to – obviously we're moving forward or PJM is moving forward with Artificial Island at this point. I'd be curious to get your prospective on the future of FERC 1000 or FERC 1000-like investments in PJM. And specifically within that your views on the use of cost caps and just other mechanisms to be more "competitive," I suppose to what extent do you anticipate yourself and others continue to leverage those kinds of mechanisms to win as we saw with the Artificial Island example, and to what extent do you see that as impeding your ability or enhancing your ability to win, et cetera.

<A - Ralph Izzo>: So, it's interesting that I believe that PJM published an announcement that said that the identification of this project preceded the creation of Order 1000. So PJM did not feel obligated to achieve the strict terms of the tariff on Order 1000, which is a point that may be we would beg to differ on. Look, Julien, there is way to make this process look pretty. This was a painful process and I would like to chalk it up to the growing pains associated with Order 1000.

My concern, and I've expressed this to FERC and to PJM, is that we may be heading for a ubiquitous dumbing down of the transmission system as opposed to robust solutions that have advantages over the long term. The cheapest solution in the short-term may not be the cheapest solutions of long term and I don't want to do get into a full-fledged debate over how you make comparisons across two projects.

I still believe, based on everything that our engineering team has told us, that not only did we have a more robust solution, but we had a lower cost solution. So this is going to be challenging. I think efficient markets work when you have good information available to both suppliers and buyers and these are technically detailed, painful reviews done by a handful of assessors on the basis of a fairly robust set of bidders. It doesn't kind of lend itself to the transparency

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-15059

you see at the NYMEX on what's happening in gas markets. So I don't mean to give a speech, but it's showing some real challenges in terms of me having confidence that over the long term Order 1000 will yield a strong transmission system that won't be constantly second-guessed through a challenged – the quarters or more importantly over the long-term in the field as we head towards the least-cost solutions as opposed to the short-term least-cost solution.

<Q - Julien Dumoulin-Smith>: Got it. And the complement – to complement that last question a little bit, PJM is talking about reducing their load forecast this cycle, given some adjustments for efficiency and solar et cetera. I'd be curious, does that impact your – A, your current spending plans, with B, your prospective plans when you are thinking about transmission, and obviously you guys are on the both sides of power and the wires business. What do you – how does that change your business at all, if you can elaborate?

<A - Ralph Izzo>: Yes. So I think that PJM is still reviewing its re-forecasted load growth. And of course load growth is an important consideration in how one designs your delivery system. But don't underestimate this significant role played by the location of load and the location of supply in having to design the transmission system. I would contend, although I couldn't prove it to you in this call, that the reason why we've had such a strong need for transmission deployment is the fact that we no longer have an integrated system where utility planners go from generation all the way to the meter and PJM has had to respond to changes in supply, both in terms of unexpected retirements and unexpected injection of new supply. And that results in the need for an even more robust transmission system and one that you can plan from generation to user.

Now, for Power, we had nearly all of this forecast in our fundamental model – or fundamental model already. So when we looked at something like Keys and when we looked at whatever else we might be bidding into RPM, we do scenario analysis that includes diminished demand as well as more robust growth. But well, one way of saying it, it's not a single variable model, it's not just what's the demand, it's – where is the load, where is the supply and what's happening to the infrastructure that connects all the above.

<Q - Julien Dumoulin-Smith>: Excellent. Well, thank you.

<A - Caroline D. Dorsa>: Thanks, Julien. Next question.

Operator

Your next question is from Travis Miller with Morningstar Inc. Please proceed with your question.

<Q - Travis Miller>: Good morning, thank you.

<A - Ralph Izzo>: Hi, Travis.

<Q - Travis Miller>: Ralph, just a follow-up on that, the transmission discussion. When you think about the investments you're making, what's on the table, how close do those investments get us to kind of next generation grid, a grid where you can have distributable generation, smart type of grid? Is that kind of what you're talking about there, in terms of robustness and where we need to get to relative to the future?

<A - Ralph Izzo>: So I think it does get us a long way there Travis, but I think of it more as building a set of highways, so that no matter what happens on one highway you could switch over to another one and not get stuck in a traffic jam. Other people though I think talk about the future grid as being a more flexible grid so that you don't have to build big highways and you could just direct traffic flows along the back roads intelligently so that nothing gets clogged. And that's probably not the best analogy.

But I think the Internet of Things is what people speak about in terms of the ability to move power more flexibly. I'm not a big believer in that being an eventual outcome because of the connectivity that you need at the last mile, so to speak. And I'm more of a believer in the types of things that PJM is advocating, which is – look, the backhaul has to be robust, so that people can get on and off, people in the form of power plants can get on and off that backhaul system.

<Q - Travis Miller>: Okay.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15060

<A - Ralph Izzo>: It's a central station dispatch model on a robust high voltage system that I think is ultimately one that will be economically more efficient.

<Q - Travis Miller>: Sure. Okay. And then, more specifically on PSEG Power in the quarter, that re-contracting lower cost to serve, how one-time type of stuff is that? I'm guessing a lot of that was spark spread versus the BGS but the re-contracting part, what are you seeing on that part?

<A - Caroline D. Dorsa>: Sure, Travis. This is Caroline. So yes, remember that when we talk about re-contracting as well as lower cost to serve, we give you that hedging data, right, so we give you all the details on our hedging data. And as I just said, we've moved up our hedges a little bit and the prices are basically the same as where we are. So the hedges prove to be very valuable on a year-over-year basis. I remember last year at about this time we talked about the fact that we had taken advantage of some better pricing last year to put on some incremental hedges. Now hedging doesn't last forever, but when we see those opportunities we've layered on hedges as to beneficial prices and so re-contracting, that's kind of what that benefit is about.

The lower cost to serve, obviously there is lower cost to serve in terms of the wholesale market prices, but also as I mentioned in my remarks, $0.02 of that is our Leidy gas access. So, having that access to Leidy gas after the customers and PSE&G have the first call in that access, that contributed $0.02 of share in this quarter and you remember that's contributed pennies each quarters of the key quarters in the summer particularly and for each of the last two years.

Now that benefit is one that we've never said we expect to continue in perpetuity. But if you look at the delta of Leidy gas cost relative to Henry Hub, you'll still see benefit. And because we have that access, that's what gives us part of our lower cost to serve, is that Leidy access. And as I mentioned, we have higher spark spreads. We've talked about this last year in the summer, as well as starting in 2013 summer, that our spark spreads for our access to that low cost gas tended to be about 30% or more higher than the sparks seen in the overall market. So, some of the things are a hedge position, some things are a little more structural, but together, we think they give us a nice position, with a combined cycle fleet, obviously, that operates very well.

<Q - Travis Miller>: Okay. Got it. Thanks so much, and congratulations on the work that you've done while you're at PG – PSE&G.

<A - Caroline D. Dorsa>: Thank you, Travis. Next question?

Operator

The next question is from Jonathan Arnold with Deutsche Bank. Please proceed with your question.

<Q - Jonathan P. Arnold>: Yes, good morning, and my congratulations to Caroline. And thank you for all your help.

<A - Caroline D. Dorsa>: Thank you.

<Q - Jonathan P. Arnold>: But just firstly, could we get – maybe get an update on the gas main replacement program case? If I'm not wrong, the first round of settlement talks, which have happened in July; didn't seem there was a whole lot of opposition in the hearings. So, any updated thoughts on when we might see that come to a head?

<A - Ralph Izzo>: Yes, Jonathan. Thanks for your question. As you know, settlement discussions are confidential, so we can't give you a lot of detail. It's encouraging, though, that we've had them. And our hope really is that by year-end, or at the very latest early in 2016, we would have this resolved. As you correctly noted, it's something that the state recognizes needs to be done. The interventions in the case are not many, nor has there been any surprises. And I think lowering the supply tariff from $0.45 to $0.40 in October just once again points out the wisdom of doing this now. So, as I mentioned – as we've done visits with folks, I think that the debate and the arm-wrestling will be around the length of the program and the size, but we went out of our way to file conditions that were identical to what was approved at Energy Strong, and that was approved only 14 months ago.

final
Bloomberg Transcript
Bloomberg

Interest rates are exactly where they were then, and return expectations are exactly where they were then. So right now, my number one nemesis is summer vacation schedules. So we'll – I think we have a couple more settlement dates that are on the calendar for the fall, and we're well on our way to spending the $250 million for gas that was in Energy Strong that goes through early 2016. So, we wouldn't be able – even if we had an agreement today, we wouldn't be able to add a bunch of new work in the next couple of weeks anyway.

<Q - Jonathan P. Arnold>: Is there – do you see a path, a route that – where it might wrap up before these fall dates, or is that unlikely?

<A - Ralph Izzo>: No, that's possible, I wouldn't want to bet anything that I hold near and dear to my heart on that. What we really want to do is make sure we get this done well in advance of running out of the Energy Strong money, so we don't have to demobilize the contractor workforce, so we don't put pencils down on the engineering. So we just have a continuous flow and so, if we got it done in the fall, that would certainly assure that. If we get it done by the end of the year, we should be able to do that. If it gets done early in 2016, then we create a bunch of inefficiencies that the customers end up paying for, which we'd rather avoid.

<Q - Jonathan P. Arnold>: Okay. Great. And then, one other topic, just strategically, you've always been of the view that the retail business is not somewhere you want to be. But we did notice one of your merchant power peers, who have been of a similar view, is evolving somewhat in that direction this quarter, and citing poor liquidity in the forecast. I was just wondering whether you're seeing similar challenges in terms of hedging, and whether there might be any change of thought on your part on the same?

<A - Ralph Izzo>: So, I don't want to send off shockwaves in a third quarter call, I'm not a big fan of retail, but my short answer to your question is a qualified yes. I do think that, given challenges in hedging and matching those hedges with asset locations and some of the basis challenges [ph] one has seen, (44:34) the effectiveness of hedges has to be taken into consideration, in terms of whether or not some consideration has to be given to that.

So, I don't know the details behind what Calpine did, but I can certainly understand why they would think of that, given the diminishing liquidity and the effectiveness of hedges in terms of where the consumption is and where the supply is, and where one hedges relative to those two. So – but again, please don't interpret this to expect any announcement in the next few days that PSEG is launching into the retail business, but it is something we are looking at now.

<Q - Jonathan P. Arnold>: That you're at least exploring some options on that front there.

<A - Ralph Izzo>: That's right.

<Q - Jonathan P. Arnold>: Okay.

<A - Ralph Izzo>: And mostly – absolutely from a defensive posture, about how do we maximize the effectiveness of our Power business, as opposed to retail being a new growth strategy or anything of that sort.

<Q - Jonathan P. Arnold>: Okay, that makes it. Thank you.

<A - Caroline D. Dorsa>: Next question?

Operator

The next question is from Michael Lapides with Goldman Sachs.

<Q - Michael J. Lapides>: Hey, guys. Congrats, and Caroline, congrats on your announcement.

<A - Caroline D. Dorsa>: Thank you, Michael.

<Q - Michael J. Lapides>: One question on CP. Everybody – most people have been pretty bullish in terms of what the impact of CP would be. From a contrarian standpoint, what's the bear case?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15062

<A - Ralph Izzo>: I have no idea. I'm sorry, Michael. Caroline and I are looking at each other and like, no, you take it. No, I don't – so well, I guess I will default to our usual we don't forecast bullish or bearish prices. I guess the good news is today is July 31 and in 21 days we'll know the outcome. But I don't mean to be flip, I mean the bear case would be massive injection of new supply with an economy growing at 2.3%, demand growing at fractions of that. You'd have to be pretty undisciplined to inject a whole bunch of new supply but I guess that would be the bear case [indiscernible] (46:49).

<A - Caroline D. Dorsa>: Maybe there is a bear case if you are just a single asset, but we're a fleet, right?

<A - Ralph Izzo>: Right, right.

<A - Caroline D. Dorsa>: So it feels like this is a good product from our perspective.

<A - Ralph Izzo>: Yeah, that would be more of a bear outcome in terms of penalties that you may incur...

<A - Caroline D. Dorsa>: Right, right.

<A - Ralph Izzo>: If you didn't perform, right.

<Q - Michael J. Lapides>: How do you think about – I means lots of people talk about the potential higher bid price because lots of assets – or portfolios have kept kind of "embed" the risk of having penalties into their bid price. How about the folks like you guys who have really well performing assets? How do you think about what the potential for rewards are? If you're on the other side, I mean this is going to be a balancing or settling type market just like New England. How do you think about preparing for what potential rewards could be, where you're not as focused on the penalty side, but maybe you're also focused on the – hey what's my upside, if I'm actually the better performing units in the market and able to deliver more megawatts than what I cleared.

<A - Ralph Izzo>: So that happens in two ways, Michael. We do think about that a lot and think about what it means for us. One is I set a UCAP of 90% of what my ICAP is and I get the other 10% out of that particular unit, which successfully clear the auction. That's candidly an asymmetric risk-reward relationship right, because the downside is the 90% that's strung out for you, upside is the 10% of overall performance.

But for somebody like us the more significant upside is in the units that don't clear and their availability to backstop in the event that somebody else underperforms within the LDA. So we never clear 100% of our units. And when we look at our nuclear plants, they have a very low forced outage rate, our combined cycle are slightly higher but still quite low and our LM6000s – our peaking units are also very low forced outage. And so we'll make some incremental investments in some of the units that don't have the same type of operating profile, but I think really for us we have not only that sort of even better performance than in the past, but probably more important is the fact that we have a bunch of units that don't clear the auction. Some of them with high forced outage rates, but will be great insurance policies going forward.

<Q - Michael J. Lapides>: Got it. Thank you, Ralph and Caroline, much appreciated.

<A - Caroline D. Dorsa>: Thank you. Next question?

Operator

[Operator Instructions] Your next question is from [ph] Ashar Khan with Visium (49:32). Please proceed with your question.

<Q>: I'm sorry, my questions have been answered. Thank you.

<A - Caroline D. Dorsa>: Thank you, [ph] Ashar. (49:43) Next question?

Operator

Mr. Izzo, Ms. Dorsa, there are no further questions at this time. Please continue with your presentation or closing remarks.

Ralph Izzo

Okay. Thank you, Brandy. So, we tried to do a count – I think this is Caroline's 26th call. I've teamed up with her on 25, there was an August vacation I couldn't change if I remember correctly. She is going to tire of hearing me say these things, I'm not going to tire of saying these things and I'm going to do them for every one of the different audiences that we somehow manage to find ourselves in front of.

I know you've all met Caroline and have been impressed by what she has done for us as a company. I can only tell you that no matter how high your opinion is of her, you probably only know a fraction of what she's done for us as a company and what she's done for me as the leader of this company. Her presentation – preparation for these calls is just the tip of the iceberg. Her discipline, day in and day out, her knowledge of the business, her knowledge of financial markets, and while all of that isn't superstar category, all of that pales in comparison to just what a pleasure she is to work with. [indiscernible] (50:58) from the times when we've travelled around that people think that we actually like each other, but we really do like each other and I can remember the earliest days of those visits and in these calls, she would say, Ralph, you focus on the strategic issues, I'll answer the factual questions which was her delightfully professional way of saying, Ralph, you'll get it wrong [indiscernible] (51:19). So Caroline, I can't say thank you enough for our shareholders, for our investors and for me and I know I have many opportunities to repeat that in front of employees, in front of customers and various other folks.

Caroline D. Dorsa

Thank you.

Ralph Izzo

So, thank you and thank you for all you've done. With that, we'll wrap up the call. Hope for a hot, sticky humid weather for the balance of this summer, and we'll see you, I'm sure, at various conferences. Thank you all for joining us today.

Kathleen A. Lally

Thank you, Brandy.

Operator

Ladies and gentlemen, that does conclude your conference call for today. You may now disconnect and thank you for your participation.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Angela, and I'm your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group's First Quarter 2015 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. [Operator Instructions] As a reminder, this conference call is being recorded today, Friday, May 1, 2015, and will be available for telephone replay beginning at 1 o'clock PM Eastern today until 11:30 PM Eastern on May 8, 2015. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Angela. Good morning. Thank you all for participating in our earnings call this morning. As you are aware, we released our first quarter 2015 earnings statements earlier today. The release and attachments are posted on our website as mentioned, www.pseg.com, under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended March 31, 2015, is expected to be filed shortly.

I won't go through the full disclaimer statement or the comments we have on the difference between operating earnings and GAAP results, but as you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. And although, we may elect to update forward-looking statements from time-to-time, we specifically disclaim any obligation to do so, even if our estimate changes unless, of course, we are required to do so.

Our release today also contains adjusted non-GAAP operating earnings, as well as a new non-GAAP disclosure of adjusted EBITDA for PSEG Power. Please refer to today's 8-K or the other filings for a discussion of factors that may

Bloomberg Transcript

cause results to differ from management's projections, forecasts and expectations for a reconciliation of operating earnings and adjusted EBITDA to GAAP results.

I'd now like to turn the call over to Ralph Izzo, Chairman, President, and Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Caroline Dorsa, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions.

Ralph Izzo

Thank you, Kathleen. And thank you, everyone, for joining us today. PSEG performed extremely well in the first quarter. Earlier this morning, we reported operating earnings for the first quarter of 2015 of $1.04 per share, that's a 3% increase over the first quarter of 2014's operating earnings of $1.01 per share.

PSE&G continues to achieve best-in-class growth as we expand investments that are helping meet our customers' needs and helping New Jersey achieving important goals. PSE&G invested $599 million in the first quarter as part of its planned capital investment for 2015 of $2.6 billion in upgrades to the electric and gas distribution, and transmission systems.

PSE&G's capital program is on schedule and on budget. The Susquehanna-Roseland 500 kV transmission line is expected to be fully operational later this month. This will be a major achievement. SR's 2015 operational date is 12 years after the August 2003 blackout, and almost a decade after PJM identified the critical system needs required to upgrade aging infrastructure and relieve overloaded power lines. SR's completion is testament to the cooperative relationship between PSE&G and PPL Energy and the capability shown by PSE&G in navigating the lengthy permitting and licensing process at both the federal and state levels.

PSE&G's investment in transmission represented 39% of its yearend 2014 rate base. And it is forecast to grow to represent an excess of 50% of rate base in five years. The New Jersey Board of Public Utilities recently approved an expansion of PSE&G's successful energy efficiency programs. The investment of $95 million over the next three years will decrease energy costs for participants and lessen the environmental effects of energy supply. At the same time, given the structure of the program, PSE&G should be able to fully earn its authorized return of 9.75%.

In addition, the recommendation by PJM staff earlier this week to award PSE&G a share of the work required to upgrade reliability at Artificial Island would increase spending on transmission by anywhere from $100 million to $130 million. The AI investment, the Artificial Island investment was not included in our capital program as described in our March Investor Conference. So this is additive to our prior forecasting of utility investment opportunities.

We await the BPU's action later this year on PSE&G's request to invest $1.6 billion over the next five years to continue its long-term program to modernize its gas systems.

PSE&G's Gas System Modernization Program would support the replacement of approximately 160 miles of cast iron and unprotected steel gas mains per year. The replacement program would reduce the risk of leaks and it would reduce the release of methane gas.

PSE&G has been replacing and modernizing its gas pipe as part of the Energy Strong program. Approval of the Gas System Modernization program would support the extension of this work, and continue to provide a direct boost to New Jersey's economy with the creation of more than 500 jobs.

We continue to believe that this is the optimal time to move ahead with this work, given the sizeable savings customers continue to realize from low gas prices, spending on this program, which further enhanced PSE&G's already strong growth platform.

The first quarter results for Power demonstrate the quality of its asset mix. PSE&G's Power's earnings continue to benefit from strong operations and the capable management of its gas supply. The fleet's dispatch flexibility and diverse fuel mix supported operations during this past winter.

The gas-fired combined cycle gas turbines fleet's availability improved quarter-over-quarter, following conclusion of work at Linden in 2014 to increase its capacity and with a continued focus on operations. This improvement in availability aided the fleet's ability to respond to market conditions. And Power continues to benefit from the management of its gas storage and transportation agreements, which also provide substantial savings to PSE&G's residential gas customers.

In a related development, the Federal Energy Regulatory Commission has granted PJM's request to delay the RPM capacity auction. The delay provides more time for the FERC to consider PJM's proposed changes to the auction structure. We believe PJM's original Net CONE offer cap proposal was just and reasonable, but we support PJM's proposed alternative offer cap, which the FERC agrees would allow for bids up to approximately 85% of Net CONE.

The FERC's approval of the proposed changes would recognize the need for increased investment to maintain system reliability. The weather conditions experienced over the past two years exposed the critical need to maintain and improve on the resiliency of our infrastructure, the need to replace aging equipment and maintain the level of service demanded by our customers.

On a separate matter, I'm pleased with the outcome of the settlement we reached with our insurers over claims related to Superstorm Sandy losses. It's been more than two years since the storm affected our operations, but in the end we have been fully compensated for the insurable spending we made on Sandy related repairs.

Our business model is working the way it should. Operational excellence produces the financial strength that allows us to invest in a disciplined way for growth. Our balance sheet is strong, the financial capability supports our current plans to invest $13 billion through 2019, and it is sufficient to support an expansion of this investment program without the need to issue equity.

PSE&G's investment program is expected to yield double-digit growth in rate base through 2019, as the earnings contribution from our regulated business exceeds 50% of our consolidated earnings. PSEG Power's investment program is expected to enhance the fleet's efficiency and reliability, as we continue to look for opportunities to expand Power's fleet. The successful implementation of our investment plans will provide PSEG with a strong foundation to deliver customer satisfaction and shareholder value.

Based on the strong start to the current year, both operationally and financially, 2015 would represent the third year of growth in PSEG's operating earnings. But given that it is still early in 2015, we are maintaining our forecast of operating earnings for the full year of $2.75 per share to $2.95 per share.

We have a proven strategy, and a key contributor to our success is the dedication of our employees to meeting the needs of customers in a safe, reliable manner. Their skills and talent are what will propel us to achieve our long-term goals.

With that, I'll turn the call over to Caroline who will discuss our financials in greater detail.

Caroline D. Dorsa

Thank you, Ralph, and good morning, everyone. As Ralph said, PSEG reported operating earnings for the first quarter of $1.04 per share versus operating earnings of $1.01 per share in last year's first quarter. We've provided you with a reconciliation of operating earnings to income from continuing operations and net income for the quarter on slide four.

As you can see on slide eight, PSEG Power provided the largest contribution to earnings. For the quarter, Power reported operating earnings of $0.55 per share compared with $0.58 per share last year. In addition, Power reported adjusted EBITDA of $626 million compared to $651 million last year. PSE&G reported operating earnings of $0.47 per share compared with $0.42 per share last year. PSEG Enterprise/Other or the parent contributed operating earnings of $0.02 per share compared with $0.01 per share for the first quarter of 2014.

The waterfall chart on slide nine takes you through the net changes in quarter-over-quarter operating earnings by major business, and I'll now review each company in a bit more detail.

final
Bloomberg Transcript

Let's turn to PSE&G. As shown on slide 11, PSE&G reported operating earnings for the first quarter of 2015 of $0.47 per share, compared with $0.42 per share last year.

PSE&G's earnings for the first quarter reflect the benefits of the increase in revenue associated with the expansion of its capital program, an increase in demand for gas, and the recovery of insurable storm costs from the settlement of Sandy-related insurance claims.

PSE&G's expanded investment in transmission added $0.03 per share to earnings for the quarter. PSE&G is expected to invest $1.6 billion on transmission in 2015, and under PSE&G's formula rate, an increase in transmission revenue of $182 million was effective at the start of the year. This increase in revenue provides for recovery of known costs and appropriate returns associated with PSE&G's expanded transmission investment.

The winter weather was significantly colder than normal and colder than a year ago. Of course, the gas weather-normalization clause negates the impact of weather on earnings from PSE&G's gas distribution business. However, growth in customer demand for gas normalized for weather added $0.01 per share to earnings.

Quarter-over-quarter earnings comparisons also benefited from a decline in operation and maintenance expense of $0.01 per share. Decline in O&M reflects the expensed portion of PSE&G share of the Sandy-related insurance settlement, and a decline in storm-related repair cost from the higher levels experienced in 2014's first quarter.

Together, these more than offset the impact on O&M from an increase in pension expense. Economic indicators in the service area are modestly better than a year ago. Employment and housing indicators show signs of slow, but steady improvement. Electric demand has also shown modest improvement. And I stress the word modest in characterizing demand growth. On a weather-normalized basis, electric sales are estimated to have improved by 0.2% in the quarter and the improvement was led by a 0.6% growth from the commercial and industrial sector, which offset a decline in demand from residential customers.

Gas deliveries on the other hand continue to benefit from sustained low commodity prices and the signals of recovery in the economy. Weather-normalized gas deliveries in the quarter grew by 0.4% based on a 1% improvement from the residential sector.

PSE&G extended bill credits that it had provided for residential gas usage for the prior five months through April. The April bill credit cut the average bill for the typical residential customer by 32%. PSE&G received approval from the New Jersey BPU in April 2015 to increase its investment in energy efficiency. PSE&G will invest an additional $95 million over a three-year period at an authorized return on equity of 9.75%. The approval will allow PSE&G to expand its energy efficiency initiatives under several popular programs, and the structure under the agreement for revenue and cost recovery should allow PSE&G to fully earn its authorized return.

We're maintaining our forecast of PSE&G's operating earnings for 2015 of $735 million to $775 million. PSE&G's earnings for the full year will be driven by the recovery of costs associated with higher levels of capital spending.

Let's now move to PSEG Power. As shown on slide 15, PSEG Power reported operating earnings for the first quarter of $0.55 per share and adjusted EBITDA of $626 million compared with $0.58 per share and adjusted EBITDA of $651 million for the first quarter of 2014.

Adjusted EBITDA excludes the same items as our operating earnings measure, as well as income tax expense, interest expense, depreciation and amortization, and major maintenance at Power's fossil generation facilities. PSEG Power's strong operating results from the first quarter reflect an improvement in availability of its gas-fired combined cycle fleet, higher prices on its hedged energy output, and the monetization of its gas supply. Together, these help to offset the impact on earnings from a declining capacity revenue and lower wholesale market prices for energy.

An increase in the average price received on energy hedges, coupled with an increase in the percent of energy hedged in the first quarter relative to a year ago, fully offset the impact of lower wholesale market prices on earnings. We expect a decline in average PJM capacity prices to $168 per megawatt day from $242 per megawatt day last year reduced Power's quarter-over-quarter earnings by $0.09 per share. Higher gas send out to commercial and industrial

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15069

customers and strong margins on sales to the off system market in a response to the extreme weather conditions experienced throughout the quarter added $0.04 per share to quarter-over-quarter earnings. The absence of a charge in the prior year improved earnings comparisons by $0.03 per share.

And lastly, earnings comparisons were reduced by a $0.01 per share, due to an increase in O&M expense. The changes in adjusted EBITDA are directly parallel the changes in earnings per share on a quarter-over-quarter basis.

The earnings release on slide 16 provides you with detailed analysis on the impact of Power's – on Power's operating earnings quarter-over-quarter from changes in revenue and costs.

Let me now just take a moment to mention our inclusion of adjusted EBITDA, as both new disclosure and new guidance. We know that many of you track one or both operating earnings and EBITDA for Power. And we thought that by giving you our EBITDA on the same basis as operating earnings and adjusted for fossil major maintenance expenses, this would give you a better window into Power's cash flow generation potential and value over the long term.

We took out major maintenance at our Fossil plant, as this is a periodic cost versus the ongoing run rate. As I mentioned, the changes in operating earnings align with the changes in adjusted EBITDA. In other words, the reduction in EPS of $0.03 per share associated with lower wholesale energy market prices and slightly higher O&M equates directly to the $25 million reduction in adjusted EBITDA from $651 million in 2014's first quarter to $626 million in this quarter. I plan to talk about adjusted EBITDA every quarter as we go forward, to ensure we provide you with a consistent view as many of you use this for modeling purposes.

Now let's turn for a few minutes to Power's operations. Essentially, this is a tale of two winters. As you remember, the past winter was one of the coldest on record and actually colder than 2014's winter. But this past winter was also characterized by improved availability of gas supply and fewer days of extreme weather than the year-ago period, which resulted in dramatically lower wholesale energy prices than a year ago, when the market reflected scarcity pricing for a much longer period of time. The decline in wholesale energy prices in the first quarter of 2015 from the first quarter of 2014 affected the financial performance of Power's assets that were opened to the market.

The increase in the average price received on energy hedges of about $4 per megawatt hour on approximately 76% of generation hedged, help secure Power's margins during the first quarter. The net impact of the higher hedge price was offset somewhat by the need to meet increased demand under load-following contracts at fixed prices. The net impact on profitability of Power's load-following contracts however is not as severe as in the year-ago period for the reasons I just mentioned.

Once again, Power's ability to monetize gas supply position offset these market – energy market impacts, resulting in only a slight decline in adjusted EBITDA for the quarter as I mentioned, to $626 million from last year's $651 million. The flexibility and fuel diversity of Power's fleet supported strong operations in the cold weather conditions experienced in the first quarter. Output of 14.5 terawatt hours was in line with year ago level. The nuclear fleet operated at an average capacity factor of 95%, producing 7.8 terawatt hours of output or 54% of generation. This is just a slight decline from year ago levels. Production from the combined cycle fleet increased to 3.9 terawatt hours or 27% of generation, and this represents a 16% increase in output versus 2014's first quarter.

An improvement in the availability at Linden following work to increase the station's capacity, and the availability of the Bethlehem, New York facility with an increase in gas supply led to higher production from the combined cycle fleet.

The combined cycle fleet's operation was also aided by its use of oil as backup supply to maintain operations during important critical periods. The coal stations performed in line with prior period, producing about 2.5 terawatt hours of energy or about 17% of generation. Finally, output from the peaking fleet declined in response to fewer days of extreme weather.

Power is maintaining its forecasted output for 2015 of between 55 terawatt hours and 57 terawatt hours, a 1% to 5% increase over 2014's output of 54.2 terawatt hours. Approximately 70% to 75% of anticipated production for the April

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15070

to December period of this year is hedged at an average price of $52 per megawatt hour.

For 2016, Power has hedged between 50% and 55% of its forecast production of 55 terawatt hours to 57 terawatt hours at an average price of $51 per megawatt hour. And for 2017, Power has hedged 25% to 30% of its forecast generation of 55 terawatt hours to 57 terawatt hours at an average price of $52 per megawatt hour.

The hedge data for 2015 and 2016 continues to assume volumes hedged under BGS represent approximately 11 terawatt hours to 12 terawatt hours for each year. We continue to forecast operating earnings for Power in 2015 of $620 million to $680 million. The forecast of operating earnings represents forecast of adjusted EBITDA of $1.545 billion to $1.645 billion for the full year, which compares to $1.584 billion of adjusted EBITDA in 2014.

Results for the remainder of the year will be heavily influenced by an increase in the average price of hedged energy and the expected decline in year-over-year capacity revenue. I want to remind you that the average price Power receives for its PJM capacity is expected to remain at 168 megawatt – $168 per megawatt day for the capacity year, which begins on June 1st of 2015. At the same time, the number of megawatts of capacity for which Power receives revenue in PJM is expected to decline by 1,800 megawatts, and this reflects primarily the retirement of the HEDD units, which we've talked about before.

Slide 17 provides more detail on generation in the quarter, as slide 21 provides detail on Power's hedged position.

Now let me briefly address the operating results from Enterprise/Other. For the first quarter, PSEG Enterprise/Other reported operating earnings of $0.02 per share compared with operating earnings of $0.01 per share last year. The difference in operating income is primarily the result of favorable interest and other income, the contribution to income from PSEG Long Island, and a lease portfolio was steady quarter-over-quarter. And we continue to forecast full year operating earnings for 2015 from PSEG Enterprise/Other of $40 million to $45 million.

Finally, just a word on the settlement of the Sandy insurance claims. As Ralph mentioned earlier, we're very pleased that we were able to reach a settlement of claims with our insurers for coverage of Superstorm Sandy-related losses. The settlement provides a total recovery of $264 million, an amount that fully compensates PSEG for insurable spending on Sandy-related repairs. PSEG received $50 million of this amount over the 2012-2013 period, which you probably remember our talking about. Of the remaining $214 million, PSEG recognized $159 million pre-tax in the first quarter's result under a partial settlement reached with insurers, and we will recognize an additional $54 million pre-tax in the second quarter.

Power's share of the settlement proceeds are not included in operating earnings or adjusted EBITDA in the first quarter. As you recall, those expenses, when incurred, were not included in Power's operating earnings at that time. And this settlement fully closes out the claim related to Sandy.

PSEG closed the quarter with $1 billion of cash on its balance sheet with debt at the end of March 31st of 2015 representing 41.5% of consolidated capital. The level of cash on the balance sheet is high relative to normal conditions, and this reflects the cash impact of bonus depreciation on taxes and includes the receipt of Sandy-related insurance proceeds, all both occurring, of course, at a time during the year when seasonal influences on demand have a favorable impact on cash balances.

We remain in a position to finance our current capital program without the need for the issuance of equity and we look forward to seeking additional growth investments. We continue to forecast operating earnings for the full year of $2.75 to $2.95 per share.

So that concludes my comments, and I'll now turn the call back over to Angela, our operator, to open up the line for questions.

Q&A

SI-SSA-0015-15071

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. [Operator Instructions] Your first question comes from Daniel Eggers with Credit Suisse. Please proceed with your question.

<Q - Daniel Eggers>: Hey, good morning, guys. Good morning. Ralph, I was wondering if you could share your thoughts on the Artificial Island outcome. It went back and forth quite a bit. You guys got part of the project, but not all of what was originally awarded. How is that affecting your thoughts about future investment in transmission outside of the standard footprint opportunity?

<A - Ralph Izzo>: Thanks, Dan. Good morning. We have a complaint pending at FERC on the way in which PJM followed the process. And I have met with – the FERC commission is telling them that, we're a little concerned with both the unevenness with which FERC Order 1000 is being implemented nationwide and the fits and starts with which it's being implemented specifically within PJM. And we specifically filed that before PJM staff recommendation came out, because we didn't want it to be viewed as a case of either potentially sour grapes if we didn't win or beating of our chest if we did win.

So I think the best face you could put on this is that, it's a nascent program and it's undergoing some growing pains. I have some broader concerns about it that the success of any market is in, the fact that you have multiple buyers and multiple sellers, and you have visibility to pricing and the needs of customers. And this thing has not had any of those characteristics associated with it and it's hard for me to imagine that it will be the case when it gets applied nationally that the recharge here through the separate rule license.

Having said that, we're going to proceed with the complaint that the PJM [ph] FERC (29:55) recommendation to just about $120 million of $260 million project or thereabouts of round numbers. So it doesn't change our enthusiasm for transmission investment and the importance of that as it pertains to customer reliability. But the FERC Order 1000 component transmission investment, I think, still has some significant work to be done.

<Q - Daniel Eggers>: Thanks. And I guess just one other question. With CP hopefully advancing at this point, how are you guys looking at maybe generation related investment opportunities, and is there something you could do prospectively with repowering some of the old HEDD sites, if you're getting paid more for reliability than you have in the past?

<A - Ralph Izzo>: Yes, Dan. That's definitely on the table. The FT4 engines, as you know, had problems with high energy delivery date [ph] KNOX (30:51) requirements. And with some SCR improvements, we believe that those would be economically viable. And our plan would be depending upon FERC's decision, if we think the auction could achieve the kind of prices that would [ph] eat down (31:03) justify those improvements, we would go ahead and make those improvements.

<Q - Daniel Eggers>: Do they seem more viable than maybe Bridgeport did earlier this year, because of lower capital dollars and maybe a little better visibility?

<A - Ralph Izzo>: The only thing they have in common is that they are both power plants. As you know, Bridgeport is a combination of spark spread and capacity markets. And HEDD upgrade for SCR -- sorry for the alphabet soup -- is 99.9% of our capacity payments. They're highly inefficient units, and you would only need them for reliability, you wouldn't expect any energy margin from them. So, I could better answer that question once FERC decides on the rules, but at this point in time I'd say just that, they're not directly comparable.

<Q - Daniel Eggers>: Got it. Thank you, guys.

<A - Kathleen A. Lally>: Next question?

Operator

Your next question comes from Michael Weinstein with UBS.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15072

<Q - Michael Weinstein>: Hi guys.

<A - Caroline D. Dorsa>: Good morning.

<Q - Michael Weinstein>: Real quick question about, wondering if you could talk about the possibility of getting a low carbon portfolio standard in New Jersey, and how that might impact CapEx?

<A - Ralph Izzo>: Yes. Thanks Michael. So, I don't see a separate and independent low carbon portfolio standard in New Jersey in the near term. I believe, if I'm not mistaken, the state's official response and comments to the EPA 111(d) proposal was questioning actually the legality of EPA's ability to implement the program. So looking at sort of the progress we've made on the RPS in the state, I believe New Jersey is intent to proceed along those lines, as opposed to doing something more comprehensive in the form of using an energy efficiency standard or a carbon standard.

As you know, we have consistently and still feel this way, believed that a nationwide carbon program is required, and that states going alone, creates all sorts of economic distortions. That doesn't change our point of view, however, that there is a need for the carbon standard nationwide.

<Q - Michael Weinstein>: Right. And have you guys specifically mentioned, what you're going to do with proceeds from Sandy insurance recoveries?

<A - Caroline D. Dorsa>: Sure. This is Caroline. Good morning, Michael. So no, we haven't – we haven't specifically earmarked them for things, of course money – I mentioned we're getting reimbursement, a lot of money was spent for Sandy recovery. So this fully compensates us. That money large part already spent. So the dollars that come in here really just support the strength of the balance sheet that we have and the reinvestment that we're making in new things at the utility and potential new opportunities at Power. So it just gives us more strength to pursue more growth opportunities and very pleased to have the settlement behind us.

<Q - Michael Weinstein>: Okay. Thank you very much.

<A - Kathleen A. Lally>: Sure. Next question?

Operator

Your next question comes from Paul Patterson with Glenrock Associates.

<Q - Paul Patterson>: Good morning.

<A - Ralph Izzo>: Good morning, Paul.

<A - Caroline D. Dorsa>: Good morning.

<Q - Paul Patterson>: Just a few quick things. I notice that the deficiency letter, that the response that PJM made to it, there was – they didn't seem to have a problem with stop loss limits on the penalties removed, and I think you guys and maybe Exelon – I'm not sure, and tell me if I'm wrong, are not opposed to that, whereas some generators are, and I was just wondering, if you could give us a feel as to what you think might happen if those limits are removed?

<A - Ralph Izzo>: If the limits are removed, in general, Paul, I think that the greater the potential for reward which comes along with greater risk, the better it is for us. We have a highly – a high performing fleet and what's important is both halves of that sentence, A, the first half being that they're high performing and second that it's a fleet.

So the interchangeability of assets that do clear the auction with assets that don't clear the auction, the fuel flexibility, the different technologies we have, all give us greater and greater confidence about the ability of the assets to perform. So to the extent that penalties become tougher, or limits get removed, one would only expect that the reward would be commensurate with that risk, and we would perform well in that market.

<Q - Paul Patterson>: Right, no, I can see that. I guess I'm wondering if you have any sense as to quantifiably, or just obviously approximate just general idea about how much that might impact?

final

Bloomberg Transcript

<A - Ralph Izzo>: No, we don't try. Even when the rules are clear, we don't predict the outcome of the auction.

<Q - Paul Patterson>: That's true.

<A - Ralph Izzo>: The rules aren't clear. [indiscernible] (35:45)

<Q - Paul Patterson>: Okay. I think that actually satisfies the second question that I had, then, and that's it, I guess. Thanks so much.

<A - Ralph Izzo>: Thanks.

<A - Caroline D. Dorsa>: Okay.

<A - Kathleen A. Lally>: Thanks. Next question?

Operator

Your next question comes from Travis Miller with Morningstar.

<Q - Travis Miller>: Good morning. Thank you.

<A - Kathleen A. Lally>: Good morning.

<A - Ralph Izzo>: Hi, Travis.

<Q - Travis Miller>: Looking at the slide 19, want to make sure I clearly understand this. The Power fuel costs, look at that oil and gas line. So generation in the quarter was up, and yet saw a substantial reduction there in that fuel cost. So I'm wondering if you could just go through that, and how sustainable that is? It's polar vortex related, or something else?

<A - Caroline D. Dorsa>: Yeah. So you're right, exactly right, Travis. I mean, you think about where gas prices were last year and where gas prices are this year, they are lower. And so, you see that come right through that line. Of course oil prices were lower too, but gas is the predominant – predominant fuel here. You're seeing that directly come into that line.

Remember, I also mentioned that the prices for wholesale energy were lower and that goes along with that, right. So get lower gas prices and lower power prices, preserves spark spread for us and that's what also commented on the value that our hedges provided this year on a year-over-year basis because of that reduction. That is directly related to the observable market price for gas versus last year.

<Q - Travis Miller>: Got it. Is any of that gas monetization benefit in that number, in terms of reducing the fuel costs?

<A - Caroline D. Dorsa>: No. This is just the pure fuel cost, and cost of goods sold.

<Q - Travis Miller>: Okay, and is it sustainable? Do you think you'd see trends like this over the next couple quarters? Is this a one-off...

<A - Caroline D. Dorsa>: So that's really gas price forecast question, right. So we really just use what's in the forward curve when we think about gas prices going forward. The important thing to keep in mind though is we've got the base load is hedged, right, in the current year. So we're really talking about what's happening in the combined cycle, and therefore their ability to preserve the spark spread because of how gas moves, protects us to an extent, but other than using the forward curve, it's really hard to predict gas prices.

<Q - Travis Miller>: Great. Thanks so much.

<A - Caroline D. Dorsa>: Sure.

<A - Kathleen A. Lally>: Next question?

final
Bloomberg Transcript
Bloomberg

Operator

Your next question comes from Shar Pourreza with Guggenheim Partners.

<Q - Shar Pourreza>: Good morning.

<A - Ralph Izzo>: Good morning, Shar.

<A - Caroline D. Dorsa>: Good morning.

<Q - Shar Pourreza>: So if you take your energy strong program, combine it with gas modernization, sort of what is that – how many miles does that cover, as far as replacement of the cast iron steel pipes, and sort of where do you see that program expanding to?

<A - Ralph Izzo>: So I believe it's about 150 miles per year, and it would take us 30 years.

<Q - Shar Pourreza>: Okay. Got it.

<A - Ralph Izzo>: So the [indiscernible] (38:31) gas system is closer to 800 miles, but it would take us 30 years at that spending rate to replace everything.

<Q - Shar Pourreza>: Okay, got it. And one just reminder, what do you – as far as, your transmission ROE's right now? What are you earning on?

<A - Ralph Izzo>: So it varies. Shar, it's – our base ROE is 11.18%. We get a 50 basis points RTO membership adder for 11.68%. We had, I guess, we still have a couple of projects that get anywhere from 25 basis points to 125 basis points in addition. However, our last four or five projects that we filed for have not received any incremental ROE incentive component. So a long-awaited answer, but there is no one simple number. It starts at 11.18%, it goes up to 12.75% or something like that, that being the Susquehanna-Roseland project being the only one that got that big an adder.

<Q - Shar Pourreza>: Got it, and if you'd think about it from a weighted average, it's still within the range of reasonableness that you're seeing? [indiscernible] (39:34)

<A - Ralph Izzo>: It comes down to about 11.7%, which is just a fraction of a bit outside the range of reasonableness.

<Q - Shar Pourreza>: Perfect, thanks so much.

<A - Kathleen A. Lally>: Our next question?

Operator

Your next question comes from Jonathan Arnold with Deutsche Bank.

<Q - Jonathan Philip Arnold>: Well good morning, guys.

<A - Caroline D. Dorsa>: Good morning.

<A - Ralph Izzo>: Good morning, John.

<Q - Jonathan Philip Arnold>: Could you, I think you said that the amount of this Hurricane Sandy recovery that was left in the operating numbers of the utility was $0.03, roughly, in the first quarter, but there would be some amount in the second quarter, but I don't think you gave us a breakdown of how much was in Power and how much was Utility.

<A - Caroline D. Dorsa>: Right. So sure, Jonathan. So the impact to PSE&G's earnings for the first quarter benefited $0.01 to the benefit of O&M from the Sandy recovery that goes to PSE&G. The remaining piece of the settlement that

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15075

we have – the remaining about $54 million, we have to go through the allocation process, and we will do that and we'll discuss how that will flow when we do the second quarter results. So a couple of things to remember. So on the Power side, we don't flow it through operating earnings, that's below the line, which you can see in the reconciliation. We don't do that because Power spend was below the line as well.

And on the Utility side, remember that the recoveries that we got, including a portion of the $50 million – a small portion of that was for PSE&G in the past, goes primarily to balance sheet because a lot of the spend for storm recovery that's recoverable under our policy's capital spend and that's on the balance sheet. So there is balance sheet or regulatory asset offset, and just $0.01 of impact for the P&L from the first quarter for Sandy at PSE&G, and we'll do the second quarter piece when we do the second quarter results.

<Q - Jonathan Philip Arnold>: Okay, but it sounds like it's unlikely to be that material to the year in the context of the guidance or what have you.

<A - Caroline D. Dorsa>: Yeah. I think that's right in the context of guidance, correct, right. So you've seen now we're almost done with the Sandy settlement being booked, with just $54 million to go and you've got a big piece already booked in the first quarter and the P&L impact for operating earnings purposes was just $0.01. So I think, proportionally you're thinking of it the right way.

<Q - Jonathan Philip Arnold>: Okay. Thank you. And then just on one other topic. We've obviously, it's very – just recently, we're seeing the change in the dispatch or at least the generation stack with some of the coal plants no longer there. What are you guys seeing in terms of just day-to-day, as you come into this front end of the summer? Are there noticeable changes in operations or the units of the [ph] shopping (42:19) just not really participating already? What are you seeing in the markets?

<A - Ralph Izzo>: No, Jonathan. I think one of our slides shows you the capacity factors, and we had a slight dip in nuclear capacity that was purely related to an outage at Salem that wasn't planned, for and otherwise the units would have been at or better than last year in terms of nuclear. Our gas units picked up the slack from some of that, as well as some of the lower prices that Travis paid attention to earlier, but the base load coal units Keystone, Conemaugh had a strong winter season. Prices weren't – gas prices were not below that fateful $1.90 number of 2012 that resulted in some of the dispatch of those, and of course our New Jersey coal units as well as our Connecticut coal units did run a little bit during the winter months because of the unavailability. The [ph] head unit saw peakers (43:15) using the demand at the level that they would be called upon. So really no change in terms of the numbers this year from any kind of a fundamental shift in the market that we haven't over the past four years or five years.

<Q - Jonathan Philip Arnold>: Ralph, I was actually a bit more curious about sort of post the mid-April date, where [ph] MAPS (43:38) went into effect. It's obviously not in the quarter, so whether there's anyone that could just talk about more real-time?

<A - Ralph Izzo>: No, I don't think so. I think if anything the forward price curve would suggest that we'll continue to see robust capacity factors for our combined cycle gas turbine units, and nuclear units will run flat out. I mean that's pretty much the same.

<Q - Jonathan Philip Arnold>: Okay. Well, thank you very much.

<A - Kathleen A. Lally>: Next question?

Operator

[Operator Instructions] And your next question comes from Michael Lapides with Goldman Sachs.

<Q - Michael J. Lapides>: Hey, guys. Congrats on a great start to the year. Two items. One on the regulated side. Can you just highlight for us what's different in CapEx known for the next few years at E&G today, versus what you talked about at the Analyst Day? Several moving parts, just want to make sure we have them all.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15076

<A - Ralph Izzo>: Sure, Michael. The one thing that's different that has been a – so what we like to show you in the March meeting is what's been approved. So, notwithstanding our complaint in front of FERC, there's $120 million – Caroline correctly described it as $110 million to $130 million in Artificial Island was not included in the March Investor Presentation as baked in. Similarly, so that's the only change of things that have been finalized and are now part of the plan.

The other piece that's significantly different is that, we filed, have not received approval for $1.6 billion over the next five years in this gas system modernization program, and that's not in the utilities capital program that we showed you in March.

<Q - Michael J. Lapides>: Got it. The other question, thinking about your coal plants in New Jersey, so moving over to Power. Not running a lot, haven't been for a year or two. Just where are you, if at all, in the process of thinking about whether these plants will remain economic? And if not, kind of how on the edge are they, or are they clearly economic? And when you look out for the next three to five, five to seven years, they're a core part of Power's fleet?

<A - Ralph Izzo>: Could you just hold on a second, Mike. I want to get my controller off the floor, he fell down. Obviously, those plants have – we made significant environmental commitments to them, and the capital requirements going forward on those plants from any kind of regulatory point of view are minimal. The real question will be, their age and their ability to perform in a CP market and the rules there are just aren't known. So to the extent that the risk reward profile of CP changes our thinking on those plants then we would – we have to address that issue. But as of now, we're happy to run them on coal in the winter and on gas in the summer, and they do just fine for us. They are part of an overall fleet, and that fleet has multiple dimensions to it that work well for us from [indiscernible] (46:49). But I said that the new factor in the calculus will be what does CP mean?

<Q - Michael J. Lapides>: Got it. Last question. Can you just remind us the amount of the HEDD units in terms of megawatts, that are going or went off line?

<A - Ralph Izzo>: 1500 megawatts.

<Q - Michael J. Lapides>: Got it. Thank you, Ralph, much appreciated.

<A - Ralph Izzo>: Well, thank you.

<A - Kathleen A. Lally>: Sure, next question.

Operator

Mr. Izzo and Ms. Dorsa, there are no further questions at this time. Please continue with your presentation or closing remarks.

Ralph Izzo

Perhaps, this is – we're finishing ahead of schedule. Thank you all for joining us. I really do hope you view this as kind of a quintessential quarter for us as opposed to anything special. I grant you we didn't have anything fancy to tell you about just steady progress in terms of new investment opportunities at the utility and solid operations all around the company. In other words, what we like to do is just deliver on our commitments, and then some. I know that Caroline and Kathleen and to a lesser extent I, will be on the road over the next couple of months and we look forward to seeing you until then just enjoy your spring. Thank you all.

Caroline D. Dorsa

Thank you.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Brandy, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group Fourth Quarter Earnings Conference Call and Webcast.

At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. [Operator Instructions] As a reminder, this conference is being recorded today, February 20, 2015, and will be available for telephone replay beginning at 1 PM Eastern Time today until 11:30 PM Eastern Time on February 27, 2015. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Brandy. Good morning, everyone. Thank you for participating in our call today. As you are aware, we released our fourth quarter and full year 2014 earnings results earlier this morning. The release and attachments, as mentioned, are posted on our website, www.pseg.com, under the Investors section. We have also posted a series of slides that detail operating results by company for the quarter. Our 10-K for the period ended December 31, 2014 is expected to be filed shortly.

I don't typically read the full disclaimer statement or the comments we have on the difference between operating earnings and GAAP results, but I do ask that you read those comments contained in our slides and on our website. The disclaimer regards forward-looking statements, detailing a number of risks and uncertainties that could cause the actual results to differ materially from forward-looking statements made therein. And although we may elect to update forward-looking statements from time-to-time, we specifically disclaim any obligation to do so, even if our estimates change unless, of course, we are required to do so by applicable securities laws.

Bloomberg Transcript

We also provide commentary with regard to the difference between operating earnings and net income reported in accordance with Generally Accepted Accounting Principles in the United States. PSEG believes that the non-GAAP financial measure of operating earnings provides a consistent and comparable measure of performance to help shareholders understand trends.

But I would now like to turn the call over to Ralph Izzo, Chairman, President, and Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Caroline Dorsa, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions. Ralph?

Ralph Izzo

Thanks, Kathleen. And thanks, everyone, for joining us today. This morning, we reported operating earnings for the full year 2014. I'm pleased to report – actually I'm more than pleased to report that 2014 was a year in which we continued to make progress on our plans to deliver for our customers and shareholders.

Operating earnings for the fourth quarter were $0.49 per share, which equaled the $0.49 per share earned in 2013's fourth quarter, bringing results for the full year to $2.76 per share or 7% greater than 2013's operating earnings of $2.58 per share. And it was above our guidance of $2.60 to $2.75 per share. Our results are benefiting from disciplined capital allocation. PSE&G, our utility, achieved double-digit growth in earnings, adding to our track record of five years of 18% compound annual growth. As a result of an expanded capital program, earnings from our regulated company grew to represent 52% of our consolidated operating earnings, as PSE&G's investment in transmission has grown to represent 39% of its $11.4 billion rate base.

PSEG Power's successful management of its operations, including its gas supply arrangements, supported earnings in excess of guidance for the full year and delivered substantial savings to PSE&G's customers.

In addition to being a successful year for delivering on earnings, we achieved success in many areas that will provide a lasting foundation for customer satisfaction and shareholder value. By way of a reminder, we received approval to invest $1.2 billion in Energy Strong, a program that will improve the resiliency of our electric and gas distribution systems. We have begun the work on replacing and modernizing 250 miles of gas pipe and have begun the engineering and scheduling associated with upgrading and enhancing our electric substation. The investments under the Energy Strong program, as you'll recall, will take place over a period of three years to five years.

We're also executing well on our transmission investment program. We completed construction of two 230 kilovolt transmission lines during the year, as well as the New Jersey portion of the 500 kV Susquehanna-Roseland line. We expect the full Susquehanna-Roseland line to go into service this year, when the Pennsylvania portion of S-R is completed. The investment in transmission will support the reliable service our customers have come to expect and provide an important boost to New Jersey's economy, as it also adds to PSE&G's growth.

PSE&G once again was named the Mid-Atlantic regions' Most Reliable Electric Utility. This is the 13th consecutive year that PSE&G's capabilities have been recognized. In addition to that, for the first time in its history, PSE&G received J.D. Power's award for highest customer satisfaction for both electric and gas business service among large utilities in the region. This recognition, while important in itself, we think recognizes that PSE&G has always kept the needs of its customers uppermost as we pursue our major growth initiatives.

But 2014 was not just a year of PSE&G accomplishment. PSEG Power's combined cycle fleet produced at record levels as Power's fossil fleet achieved the safety performance in a tough 10% of the industry. We successfully grew PSEG solar sources portfolio. In 2014, we added projects in three states that expanded solar sources portfolio to 123 megawatts of clean renewable energy. And we had a successful first year of operating the electric system of the Long Island Power Authority. I'm particularly pleased with the efforts of our PSEG Long Island team. We're rewarded with the major improvement in customer satisfaction scores. But let me be clear, this is only the beginning of a multiyear journey for us on Long Island.

SI-SSA-0015-15080

Our core strategy focused on operational excellence, financial strength, and disciplined investment is anticipated to yield a third year of growth in operating earnings over the coming year. For 2015, we are initiating operating earnings guidance of $2.75 to $2.95 per share.

PSE&G's expanded investment in transmission is expected to support continued growth in operating earnings in 2015, as PSE&G's results for the full year are expected to represent more than 50% of consolidated earnings.

PSEG Power is expected to report operating earnings in line with its strong 2014 results. The investments made by PSEG Power are expected to enhance the competitiveness of its environmentally well-positioned fleet, capacity upgrades at our gas-fired combined cycle fleet, and that our nuclear units will increase the fleets output as Power's investment in the PennEast Pipeline enhances its already strong access to low cost gas from the Marcellus region.

PSEG Power's fleet has the characteristics envisioned by PGM's proposed standards for capacity performance. Its diversity in dispatch and fuel mix as well as the alternative fuel capability mitigates operating risk. Power's investment program will be focused on improving its reliability during periods of stress on the system.

We also look to expand the fleet when it's financially attractive. We were disappointed that our bid to construct the new 475 megawatt combined-cycle plant at our Bridgeport Harbor site in Connecticut didn't clear the New England ISO's recent capacity auction. However, we haven't abandoned this work and we'll invest when the markets support its development.

The strategy we implemented has yielded growth. We have a robust pipeline of investment opportunities that will support further expansion of our capital program over the next five years. The program is expected to yield double-digit growth in PSE&G's rate base, as we maintain the operating strength of Power's generating assets. We will update you on our capital spending plans on March 2.

Our financial position remained strong. An acknowledgment of our success and the strength of our platform going forward was the recent decision by our Board of Directors to meaningfully increase the common dividend by 5.4% to the indicative annual level of $1.56 per share. We see the potential for consistent and sustainable growth in the dividend given our business mix. Our continued positive cash flow from our generation business and our strong financial position, all supports this dividend philosophy.

We've made significant strides in meeting our objectives for growth, as we also satisfy customer requirements and we're not done. Of course, none of this would be possible without the contribution made by PSEG's dedicated employees to our continued success. I look forward to discussing our investment outlook in greater detail with you at our March 2 Annual Financial Conference.

I will now turn the call over to Caroline for more details on our results and we'll be available to answer your questions after her remarks.

Caroline D. Dorsa

Thank you, Ralph and good morning, everyone. As Ralph said, PSEG reported operating earnings for the fourth quarter of $0.49 per share equal to operating earnings of $0.49 per share in last year's fourth quarter. Our earnings for the fourth quarter brought operating earnings for the full year to $2.76 per share versus operating earnings for 2013 of $2.58 per share, or 7% growth.

On slide 4, we have provided you with a reconciliation of operating earnings to net income for the quarter. And as you can see on slide 10, PSE&G provided largest contribution to earnings for the quarter. PSE&G reported operating earnings of $0.32 per share compared to $0.29 per share last year. For the quarter, Power reported operating earnings of $0.18 per share, compared with $0.23 per share last year.

Enterprise/Other reported a small loss in operating earnings for the fourth quarter of a $0.01 per share versus the operating loss of $0.03 per share reported in the fourth quarter of 2013.

Bloomberg
SI-SSA-0015-15081

We've provided you with waterfall charts on slides 11 and 13 to take you through the net changes in quarter-over-quarter and year-over-year operating earnings by major business. So now, I will review each company in a bit more detail, starting with PSE&G.

As I mentioned, PSE&G reported operating earnings for the fourth quarter of 2014 of $0.32 per share, compared with $0.29 per share for the fourth quarter of 2013 as we show on slide 15. PSE&G's full year 2014 operating earnings were $725 million or $1.43 per share, compared with operating earnings of $612 million or $1.21 per share for 2013 for growth of 18%.

PSE&G's earnings in the fourth quarter benefited from lower operating expenses including pension and a return on its expanded capital infrastructure program, which more than offset the impact of mild weather on sales.

PSE&G's investment in transmission infrastructure increased this quarter-over-quarter earnings by $0.02 per share. The earnings improvement related to the investment in transmission in the fourth quarter was less than the earnings increases you've seen during each of the first three quarters of the year, and this reflects a reduction in PSE&G's rate base at year-end associated with the deferred tax impact of the expansion of bonus depreciation.

PSE&G's tight control of its operating expenses, including lower pension expense, resulted in a quarter-over-quarter increase in earnings of $0.04 per share. The continued improvement in weather normalized gas volume and demand, which improved quarter-over-quarter earnings by a $0.01 per share, was offset by a similar decline in electric volume and demand. And although you wouldn't think it on a day like today, weather was actually mild relative to normal and relative to the prior year on the net reduced earnings comparisons by about a $0.01 per share. Earnings comparisons were also affected by the absence of $0.02 per share to tax related change which benefited earnings in the prior year.

Economic conditions continued to exhibit signs of an improvement in the service area, which is good news. On a weather normalized basis, gas deliveries are estimated to have increased 1% in the quarter and 3.1% for the year. Demand continues to benefit from a decline in the cost of gas, which is passed on to our residential customers and an improvement in economic growth.

PSE&G announced earlier this month that it would extend through March of 2015 the credits against gas bills that it had already provided to residential customers for the months of November, December and January. A typical residential customer with these credits would experience savings on their total bill over the five months of approximately 31% or $210.

Electric sales on a weather normalized basis are estimated to have declined 2.3% in the fourth quarter. The decline in the quarter reflects a number of winter storms at the end of 2013, the increased residential consumption in that year, as well as decreases in demand this quarter from some large industrial customers.

By the way, weather normalization is generally good for temperature, but unfortunately there is not really a good way to adjust for storms. Overall, there was a 0.3% increase in weather normalized electric demand for the year, which we think is indicative of improving economic conditions, partially offset by continued customer conservation.

PSE&G implemented an increase in transmission revenue of $182 million effective on January 1 of this year. The increase in revenue under PSE&G's transmission formula rate will provide PSE&G with recovery off and a return on its forecast of transmission-related capital expenditures through the year. PSE&G's investment in transmission grew to $4.5 billion at the end of 2014 or 39% of the company's consolidated rate base of $11.4 billion, and transmission is forecasted to be well over 40% of rate base as we go forward.

Let me just mention the impact of bonus depreciation. The expansion of bonus depreciation has the effect of reducing PSE&G's transmission-related rate base with an increase in deferred taxes. We estimate PSE&G's transmission related rate base was reduced by approximately $150 million to $200 million from prior forecast levels, and this is reflected in PSE&G's yearend rate base of $11.4 billon.

The impact of this change on 2015 revenues is not reflected in the formula rate increase that I just went through, as that filing took place prior to the enactment of the extension of bonus depreciation. But our guidance for PSE&G reflects the impact on revenue associated with the extension of bonus depreciation and we estimate that impact to be

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15082

approximately $21 million.

As you know, this is really a timing related issue. We get the benefit of an increase in cash over the short-term and see a decrease in the deferred tax balance over the long term.

PSE&G's operating earnings for 2015 are forecasted to grow to $735 million to $775 million. Our forecast for 2015 reflects the continued growth in PSE&G's transmission-related rate base and the expansion of PSE&G's investment and distribution through the Energy Strong program.

Earnings for the full year will also be affected by a forecast increase in pension expense that will affect O&M. And I'll go into a little more detail on that shortly. We expect PSE&G's rate of earnings growth to improve beyond 2015, as the impact of bonus depreciation will annualize and pension expense is expected to be lower under long-term return and interest rate assumptions.

PSE&G invested approximately $2.2 billion in 2014 on capital projects that improve the systems' resilience and maintenance its reliability. We currently forecast an increase in PSE&G's average capital spending for the next three years to about $2.4 billion per year. PSE&G's investment in transmission will represent more than 50% of this new spending. We will be providing you with an updated forecast of PSE&G's capital expenditures by year for the five-year period ending 2019 at our Annual Financial Conference on March 2 of this year, and I can tell you that spending plan remains robust.

Now let's turn to PSEG Power. As shown on slide 19, Power reported operating earnings for the fourth quarter, as I mentioned, of $0.18 per share, compared with $0.23 per share a year ago. The results for the quarter brought Power's full year operating earnings to $642 million or $1.27 per share, compared to 2013's operating earnings of $710 million, or $1.40 per share. The earnings release as well as slides 11 and 13 provide you with detailed analysis of the impact on Power's operating earnings quarter-over-quarter and year-over-year from changes in revenue and costs. We've also provided you with more detail on generation in the quarter and for the year on slides 21 and 22.

Power's operating earnings for the fourth quarter were influenced by the known declining capacity revenues that we've discussed in prior calls. The monetization of Power's gas supply position, and a reduction in operating and maintenance expense helped mitigate the effects of lower market prices for energy.

As you recall, the average price for our PJM capacity declined to $166 per megawatt day from $244 per megawatt day on June 1 of 2014. The decline in price reduced Power's quarter-over-quarter earnings by $0.09 per share. A decline in the average hedge price for energy that Power realized during the quarter relative to year-ago levels and lower market prices on Power's open position were more than offset by Power's ability to monetize its gas supply position. These items together led to an improvement in quarter-over-quarter earnings of $0.01 per share.

The decline in Power's O&M expenditures during the quarter improved quarter-over-quarter earnings by $0.05 per share and the decline in expense for the quarter was greater than what we've been forecasting at the end of the third quarter. Power's management of maintenance outages at fossil stations coupled with the absence of outage related expenditures in the prior year resulted in a better than forecast reduction in O&M expense for the fourth quarter and led overall to lower O&M expense in 2014 versus the full year of 2013.

Now let's turn to the operations. Power's output increased 3.1% in the quarter from year ago levels. For the year, output increased 1.3% to 54.2 terawatt hours. The fleet's flexibility in response to volatile market conditions was demonstrated in the quarter and throughout the year. The level of production achieved by the fleet in 2014 represented the third highest level of output in the fleet's history as our merchant generator. The nuclear fleet produced 29.1 terawatt hours or 54% of generation, operating at an average capacity factor of 89.3%. Hope Creek experienced its second best year, operating at 97.9% annual capacity factor, which helped to offset the impact of the extending refueling outage at Salem 2 earlier in 2014.

The market is clearly rewarding efficient combined-cycle gas units, and Power's combined-cycle fleet set a generation record during the year. The fleet produced 16.5 terawatt hours or 30% of our generation during the year with record levels of output from the Bergen Station and Linden Unit 1. The coal fleet produces 7.4 terawatt hours or 14% of

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15083

generation and the peaking fleet's responsiveness to market conditions particularly the abnormally cold weather experienced at the start of 2014 led to full year production of 1.2 terawatt hours.

Power's gas-fired combined-cycle fleet continues to benefit from its access to lower price gas supplies in then Marcellus Basin. For the year, gas from the Marcellus Utica region supplied approximately 60% of the PJM assets fuel requirements. This represents the larger percentage of fleet's gas supply than was available in the past. Power's ability to step up its acquisition of gas from the Western Marcellus and Utica Basin in addition to the use of backhaul arrangements on existing pipe in the Eastern Marcellus improved its access to this low cost resource. This supply supports higher spark spreads than implied by market pricing and allowed Power to enjoy fuel cost savings similar to the levels it enjoyed in 2013 despite the decline in energy prices.

Overall Power's gross margin per megawatt hour in the fourth quarter was $37.40 versus $45.90 last year which was driven by the capacity price reset. For the year, gross margin amounted to $42.41 per megawatt hour versus $47.10 per megawatt hour last year. And slide 24 provides detail on Power's gross margin for the quarter and the year.

Power is forecasting a further improvement in output in 2015 to 55 terawatt hours to 57 terawatt hours. The increase is primarily the result of investments we have made to expand the capacity of our nuclear and combined cycle fleet. Following the completion of the Basic Generation Service auction in New Jersey earlier this month, Power has hedged 100% of its base flow generation in 2015 and has hedged approximately 75% to 80% of anticipated total production for 2015 at an average price $52 per megawatt hour which compares favorably to the average hedge prices in 2014 of $48 per megawatt hour.

Power has hedged approximately 50% to 55% of its forecast generation in 2016 estimated at 55 terawatt hours to 57 terawatt hours also at an average price of $52 per megawatt hour. And for 2017 Power has hedged 25% to 30% of forecast production of 55 terawatt hours to 57 terawatt hours at an average price of $52 per megawatt hour. The hedge data for 2015 and 2016 assumes BGS volumes represent approximately 11.5 terawatt hours of deliveries, about comparable to the 11.5 terawatt hours we delivered in 2014 under BGS.

Based on our current hedge position for 2015, each $2 change in spark spreads would impact earnings by only $0.04 per share. This modest impact on earnings is a result of a higher percentage of output from a intermediate and peaking fleet that is hedged at this time about 40% to 45% than we had hedged a year ago, when it was really about 35% to 40% of forecasted output for the intermediate and peaking fleet.

For 2016, a $1 change in natural gas pricing would impact earnings by $0.06 per share. And just for your reference, if we were fully open, the $1 change in natural gas pricing would impact earnings by about $0.24 per share.

The BGS auction for PSE&G customers for the three-year period beginning June 1 of 2015 and ending on May 31, 2018 was priced at $99.54 per megawatt hour. This contract for one third of the load will replace the contract for $83.88 per megawatt hour, which expires on May 31 of this year. This latest auction is based on an average price for energy at the PJM West Hub of about $37 per megawatt hour to $38 per megawatt hour, which is similar to the base price for energy seen in the last two auctions. The BGS auction continues to represent the key means for Power to hedge basis associated with baseload output.

Power's hedging strategy is consistent with what you've seen in the past. Power maintains open positions on a portion of its intermediate and load following assets and this allows Power to capture any benefits associated with weather-related demand in the summer months and contain the risks associated with fuller requirements contracts like BGS. Power took advantage of market strengths earlier in 2014 to hedge its output. And given favorable pricing, Power is also committed to serve a larger percentage of load under the BGS contract in this latest auction, which, of course, will have its proportional impact across the upcoming three years.

Power's operating earnings for 2015 are forecast at $620 million to $680 million. We're very pleased that our anticipated results are essentially in line with 2014's operating results. Comparative results for the full year will be affected by a decline in capacity revenues which will essentially be fully offset by an increase in the average price received on energy hedges and a modest increase in O&M.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15084

Turning to Enterprise and Other, PSEG Enterprise/Other reported an operating earnings loss for the fourth quarter of $4 million or about $0.01 per share, which compares to a loss in operating earnings of $11 million or $0.03 per share for the fourth quarter of 2013. The results for the fourth quarter brought full-year 2014 operating earnings to $33 million or $0.06 per share, compared with 2013's operating loss of $13 million or $0.03 per share. The difference in operating results quarter-over-quarter reflects primarily the absence of tax payments and other items which contributed $0.03 per share relative to the fourth quarter of 2013.

For 2015, operating earnings are forecasted to fall within the range of $40 million to $45 million and results will be influenced by the contractual payments associated with the operation of PSEG Long Island, income on the lease portfolio including the benefit from the renegotiation and extension of our lease on the Grand Gulf nuclear generating facility.

Let me now just add a word about pension expense. Last year, as you recall, we saw total pension income of about $0.02 per share as the success of our investments strategy created that pension income. In 2015, our funding level remains greater than 90%, but a lower discount rate and changes to mortality tables, offset the continued strong return we generated on the Trust resulting in net pension expense of slightly less than $0.07 per share, which is split about evenly between PSE&G and Power. Keep in mind, these are non-cash charges, and we anticipate to move back to pension income over the next two-year to three-year period given our solid funding and our long-term investment strategy. These impacts that I just mentioned are embedded in our financial plan and our guidance for growth at PSE&G and consistent performance in 2015 at Power. We still see a low-single digit growth in O&M across the company over the three-year horizon and we will talk more about that in greater detail on March 2.

Lastly, just a word on our financial position. We're in great shape to finance our capital program. At the end of 2014, we had $402 million of cash on hand and debt represented about 42% of our consolidated capital position, with debt at Power approximating 31% of its capital base and no parent debt. We'll be updating you on our capital program at our Annual Financial Conference but the message is the same. We can finance our robust long-term capital program and pursue a very healthy amount of growth opportunities without the need to issue equity, as we also provide our shareholders with a meaningful increase in the growth of the common dividend on sustainable basis.

We're pleased to be guiding to another year of anticipated growth in earnings for 2015 of $2.75 to $2.95 per share. Our forecast continues to reflect the benefits from PSE&G's expanded capital program and the dynamics of Power's fleet and access to low cost gas supplies.

As you know, the common dividend was recently increased 5.4% to the indicative annual level of a $1.56 per share, and we believe we can provide shareholders with consistent and sustainable growth in the dividend going forward.

With that, Brandy, I'll turn it back to you and we're now ready for your questions.

Q&A

Operator

Ladies and gentlemen, we will now begin the question and answer session for members of the financial community. [Operator Instructions] Your first question comes from the line of Julien Dumoulin-Smith with UBS.

<Q - Julien Dumoulin-Smith>: Hi. Good morning.

<A - Ralph Izzo>: Good morning, Julien.

<A - Caroline D. Dorsa>: Good morning, Julien.

<Q - Julien Dumoulin-Smith>: Hey. So, first quick question. Following the Bridgeport sort of back of clearing that asset, what's your thought about building out Power at present? I mean, are we going to look towards clearing potentially new assets in different markets or what's your overall thought about capital deployment at this point in time in Power or back at Public Service Utility?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15085

<A - Ralph Izzo>: So, Julien, our thinking on this hasn't changed. Our Power markets that we're interested in are PJM, New York and New England. We look for asset acquisitions, we look for opportunities to repower sites, we look for opportunities to extend or increase the output of our plants. As you all know, we've been much more successful on the later and not as successful on the former. So Peach Bottom uprate, advanced gas path improvements, a couple of peakers here and there have not been able to see the same price justification as others on asset acquisitions and similar thing happened in New England. In general, we like the New England markets from the point of view of newbuild because of the seven year. That's a bigger hurdle to overcome in PJM because of the one-year price.

On the regulated utility side, we'll give you more detail on March 2, but there is still very much a robust capital program that we'll be showing you for the five years, and not just in terms of transmission which has been our number one. But as we've talked about in the past, opportunities to accelerate the replacement of our cast iron mains system in the gas business, as well as some of the components of the Energy Master Plan that relate to energy efficiency and renewables.

You may recall, it's only been 10 months or so. So, I'm not suggesting we're done by any means but Energy Strong was a much bigger program than what was ultimately approved, so there will be more of that, but it's a little bit longer term than the next coming months.

So there is no shortage of opportunities to deploy the capital. We are disappointed at Bridgeport Harbor, I'm not going to deny that but we've reefed up things we can do.

<Q - Julien Dumoulin-Smith>: Great. And then perhaps moving on with what about the bidding inquiry? Any update there you can elaborate by chance where we stand?

<A - Ralph Izzo>: We're not giving any more detail on that than we have already, Julien. We don't have any new information to update our financials and we are actively involved which FERC. We meet with them on a regular basis in terms of their questions and giving them feedback. But right now we'd rather make sure that FERC has all the information before talking much more about that on our earnings call.

<Q - Julien Dumoulin-Smith>: Great. And then, if you will, I noticed PJM East just generally or specifically Public Service Zone, saw sort of a negative basis versus PJM West on a spot basis in the back half of the year. Could you talk about what dynamics you saw day-to-day in the market that would drive that and what your expectations are for forward basis East versus West hedging that specifically?

<A - Ralph Izzo>: Sure. So, Julien, as we said, the Power markets at least for the foreseeable future have been turned 180 degrees. The winter is where most of the volatility and earnings potential for Power is coming from and that hasn't changed since we started talking about that now almost two seasons ago. So when you look at basis for the year, that's a little bit of a misleading view of the world. It's a combination of moderate basis in the summer, very strong basis in the winter and weak basis, in fact, negative basis in the shoulder periods. But the flexibility of our fleet and the way in which we hedge it takes all that into account.

Over the longer term, I think what you are going to see is the market dynamic that's going to driven by significant infrastructure build of gas pipes from the Marcellus region to the Southeast and significant replacement of aging power plants that aren't able to meet environmental standards in the Southeast with highly efficient natural gas combined cycle. So we don't run the business saying that we are smarter than the market but to the extent that the market is viewed as an extend to that three-year to five-year timeframe, we still have lots of reasons to feel pretty confident in the location and quality of our asset base.

<Q - Julien Dumoulin-Smith>: Great. Thank you all very much.

<A - Kathleen A. Lally>: Next question.

Operator

Your next question comes from the line of Dan Eggers with Credit Suisse.

<Q - Dan L. Eggers>: Hey, good morning, guys.

<A - Ralph Izzo>: Good morning, Dan.

<Q - Dan L. Eggers>: Just kind of on the Power side of the outlook for Power, can you just walk through or remind us all the hedging strategies you guys are using? Obviously, you got the nice price uplift in the hedge percentages going from 100% hedged to a 100% hedged. So can you just remind us how you got that upside?

<A - Caroline D. Dorsa>: Sure. Dan, it's Caroline. Sure. Thanks. Yeah, I cited the baseload and the total and, keep in mind, that intermediate and peaking, right? So if you look at what we told you on the third quarter call, we were still a 100% hedged on the baseload. But the differences really occurred as we've added hedges in that intermediate and peaking which was 5% to 10% for 2015 on the last call and is now 40% to 45%. Now, of course, piece of that would be BGS, but if you do the math on that, you'd see that's a little less than half of the total on an estimated basis.

And really what's going on, Dan, and if you look at the curves, just look at the forward price curve, you see this there were opportunities where the prices moved up during the last quarter before they came down right at the very end, and spark spreads have been pretty robust. And so, we took advantage of those opportunities to layer on incremental hedges. And by having that incremental flexibility and putting on a little bit more and capturing those price in spark spread opportunities, that's what's really increased the numbers.

Now, if you are asking about the change in the price of baseload, you know that we actually give one consistent price across. So even though baseload was 100%, the average price of the entirety of the book, we put that across all the hedges, but we give you the granularity of where we're hedged between baseload and intermediate and peaking. So we like the impact that we had in the fourth quarter by adding on hedges. You know that BGS, of course, being full requirements also has some pass-through costs. But even if you strip that out you'd find that the hedges are really higher than they were from our last report.

<Q - Dan L. Eggers>: Okay. And then – thank you for that answer. On the outlook for the utility this year, kind of if you look at the bridge or you think about mental bridge from 2014 to 2015, maybe not as much of an increase year-on-year as we would have previously modeled. Can I think of it as basically there is going to be a drag of $0.035 or $0.04 because of pension year-on-year maybe in nickel because you had some gains in 2014. And then you get a step down from what you would have expected at transmission because of the bonus depreciation. Is that the right way to think about the step year-to-year in simple terms?

<A - Caroline D. Dorsa>: That's exactly right, Dan. So you're exactly on the right math, because when you look at those key things which, of course, if you think about interest rate, actuarial tables and bonus depreciation really aren't in our control. But you've got your finger on the right things that take the utility growth rate perhaps lower than the expectation, but a nice growth rate nonetheless because the things that we do control, the things we're doing to put capital to work obviously continue. And as I said, when you think about going out beyond 2015, you'd see the annualization of bonus deprecation in terms of the base versus a subsequent year effect, and then pension obviously we think being more of a one-time and then going back to normal. So you're exactly right on how you're thinking about it.

<Q - Dan L. Eggers>: And I guess this is the last question. You talked about $2.4 billion of utility CapEx. Is that just for 2015? Or are you guys thinking that's going to be the new repeated number kind of for the five-year plan?

<A - Caroline D. Dorsa>: So we haven't given the five-year number, but the three-year number and you'll see this in our 10-K when we file it, the three-year number averages about $2.4 billion per year in total for PSE&G, so I'm talking 2015, 2016 and 2017. And when you do that and you look at that, keep in mind that, as I said, transmission will be more than half of that. So you're going to see transmission really carrying the weight of that growth. So we're really pleased to see that on average for the next three years, and then we'll talk more about the five years on March 2.

<Q - Dan L. Eggers>: Great. Thank you, guys.

<A - Caroline D. Dorsa>: Sure. Next question?

Operator

Your next question comes from the line of [ph] Ashar Khan (42:04) with Visium.

<Q>: Good morning and congratulations.

<A - Ralph Izzo>: Thank you, [ph] Ashar Khan (42:10). Good morning.

<Q>: Well, I've been kind of attacking this I guess, Ralph, it's like – year-after-year it's like the best integrated company, and I hope we start getting discernible premium this year as we go forward.

<A - Ralph Izzo>: Thanks.

<Q>: But I wanted to go over a point that Caroline graced is that because of the all pension and all that and the hefty CapEx that you've mentioned, if I heard correctly Caroline, you expect the utility to then go back to somewhat closer to a 9% or 10% growth rate going forward if I do my math correctly based on the CapEx and everything for the next couple of years. Is that a fair thing which you referred to a little bit in your remarks because the growth got a little bit dampened this year from 2014 to 2015 from the pension and other things. But it should re-grow at a faster rate coming out of the blocks 2015 going forward, based on the CapEx and things which you have indicated. Am I on the right track?

<A - Caroline D. Dorsa>: Yeah. So, [ph] Ashar Khan (43:20), you are on the right track. I won't validate a particular number that you cited there. But, yes, think about one-time effects, when you have a year-on-year effect of something like bonus depreciation which you remember, was passed at the very, very end of 2014, that has its one-year effect and then it becomes part of the base. Pension same thing, right, lower interest rates and then mortality table, which as you probably know is once in about 10-year effect, those things come in. And so, we would expect utility growth to be higher as we go on a 2015 to 2016 basis and on a 2014 to 2015 basis for exactly the reasons you cite overlaid on the backdrop of what I just mentioned, which is a continued robust investment program averaging a little bit more on an annual basis than we actually spent last year. So the fundamentals are there to provide the driver for that opportunity and we've got these sort of one-year effects from the two items. That's the right way to think about it.

<Q>: And then, if I could just then if I'm thinking through it on an investment proposition, so it's now utility earnings with the LIPA contract and all that makeup like 55% of the earnings. And say, this is my number, if we're growing at around 9% or 10%, on the utility that would imply a consolidated growth rate of about 5% or so. And with the dividend now growing at 5%, I mean I think so we have a value proposition, which is equal to any utility or even better than the rest of the group.

<A - Caroline D. Dorsa>: So we certainly think we have a good value proposition, no doubt about that – and thank you for mentioning the dividend as well. Obviously, we don't give guidance beyond the current year, as you know, because of Power, although I think we're pretty pleased with what we've been able to deliver and the guidance we're giving for Power for this year. And frankly, going forward, expect us to do the same things we've been doing with Power for the past few years and I think relatively successfully layering in hedging, taking advantage of opportunities when we see them, and continuing to just take advantage of a well-positioned fleet. So we do think we have a good value proposition. I just mentioned and I think you were just doing the math separately. As you know, PSEG Long Island and our operating arrangement on Long Island is not part of PSE&G's results. It's part of the Enterprise, but you may have been just adding that back in your calculation.

<Q>: Okay. And if I can just end up, Ralph, we're happy on the dividend, but do you have a payout goal in mind for the consolidated entity earnings or on the utility earnings? I just wanted to get a sense. If not the board has a payout or no?

<A - Ralph Izzo>: Sure. No, we don't, [ph] Ashar (46:21). You may recall, a few years ago, maybe about five or so, we did have a number, and we found it too limiting. The dividend is something that we discuss all the time with the board, but we have a very robust conversation. We talk about where are the earnings coming from, what is the cash

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15088

being generated, where are we in the power cycle – the power price cycle, what are the cash needs of the business, what are our competitors doing, competitors for capital, that is. So it's a very fulsome discussion and not one that lends itself to simply saying x% is the payout ratio. But we do try to guide you qualitatively recognizing that the dividend decisions are the purview of the board on a quarterly basis. But the number we put forth this time we believe is consistent with that view that we can provide a sustainable growth in the dividend.

<Q>: Thank you so much. Cracking results.

<A - Ralph Izzo>: Okay.

<A - Caroline D. Dorsa>: Next question?

Operator

Your next question comes from the line of Paul Patterson with Glenrock Associates.

<Q - Paul Patterson>: Good morning, guys.

<A - Caroline D. Dorsa>: Good morning.

<A - Ralph Izzo>: Good morning, Paul.

<Q - Paul Patterson>: Just really quick, I'm sorry if I missed it. The gas monetization in Q4, could you quantify that? And is there any sort of outlook of what the opportunity might be for stuff like that going forward?

<A - Caroline D. Dorsa>: Yeah. So I didn't quantify that specifically, Paul, in terms of a number on the quarter. What I did mention was that the gas monetization benefit was essentially similar to what we saw in 2013. So you may recall in 2013 – and I'm talking about this [indiscernible] (47:51) differential base in our supply. 2013, it was about $0.05 and in 2014 it was just about the same level.

In terms of thinking about it going forward, obviously, we don't control that differential, but two things good to keep in mind. If you look at forward curves, you still see that differential. And so that's valuable and we model everything on the forward curve, including thinking about that differential. What, of course, you can always think about for us that does sustain is that access. Right? So we have the access this year, given what the team has been able to accomplish in terms of providing even more access to [indiscernible] (48:33) Marcellus and Utica gas, we've been able to step up that percentage to a total of about 60%. And so, when you have the differential and we've got this long-term access, that's going to stay with us, can't say exactly what percentage every year, but long-term significant access. When that differential is there, you'd expect us to get it.

<Q - Paul Patterson>: Okay. And then the polar vortex? It looks like we have some similar conditions out there to what we saw on January 7 of last year and the performance of plant seems to be better. And I'm wondering whether or not you think that might impact the capacity performance proceedings going on right now at FERC? Or, just in general, what do you guys see or what are you hearing out of FERC or anywhere else with respect to how that process is going or your expectations with respect to it?

<A - Ralph Izzo>: So, Paul, you're right. I mean, temperatures have been averaging about 16 degrees below average the last few days and plants are operating. But I think I know for us and I suspect for others, there were some operational changes we're able to make to reduce the amount of forced outages. Just in light of the forecast, we moved our coal piles around a little bit more so that we make sure that we didn't face them freezing up. But what hasn't changed for us and I suspect for others, the amount of capital investment that's being made in the older units, which basically never run until you get six days averaging 16 degrees below zero. And I think FERC is very cognizant of that. So there's only so much you can get out of improved performance by doing some operational prep work and eventually frictional forces that these temperatures overcome, whatever you might do in terms of preparation and those capital improvements are needed.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15089

And so, I think FERC will be supportive. I don't want to predict any outcome. I don't want to guarantee an outcome. But suffice it to say that there's really two issues that are involved in making sure a power plant runs. It's what you physically have put into the asset and what you do to ready it. And in terms of physical preparation, it's not leaving coal piles exposed, putting buildings around them, so that they are protected from the elements, that's a capital investment and you're not going to do that unless you know that you're going to get paid in the capacity market, because those typically – in our case at least, aren't units that capture energy margin.

So we're still cautiously optimistic about what FERC will do. And we are very confident that whatever FERC does, we do have the type of fleet that will benefit from it.

<Q - Paul Patterson>: Okay, great. I appreciate it.

<A - Kathleen A. Lally>: Thank you. Next question?

Operator

Your next question comes from the line of Stephen Byrd with Morgan Stanley.

<Q - Stephen Calder Byrd>: Good morning.

<A - Ralph Izzo>: Good morning, Steve.

<A - Caroline D. Dorsa>: Good morning.

<Q - Stephen Calder Byrd>: Wanted to start on the utility. For 2014 and I guess going into 2015, what was the earned ROE at the utility in 2014 and what's the assumption going into 2015 that defines the guidance?

<A - Ralph Izzo>: We earned our allowed returns, Stephen, just you may recall that we have an 11.68% return at transmission, and a blend of 10.3% at the utility for the most – at the distribution level a blend of 10.3% and some of the more recent programs are at 9.75%.

<Q - Stephen Calder Byrd>: Okay. So the actual results of 2015 were right at your earned level or were they in excess of the earned level?

<A - Ralph Izzo>: They were right at the earned level.

<Q - Stephen Calder Byrd>: Okay. And...

<A - Ralph Izzo>: We're investing heavily in the utility to make sure that's the case.

<Q - Stephen Calder Byrd>: Okay. Understood. And what's the timing for the likely filing of the rate case?

<A - Ralph Izzo>: November of 2017.

<Q - Stephen Calder Byrd>: Is when you would file?

<A - Ralph Izzo>: Is when we would file for a test year that is three months to start and nine years prospective. Typically, we may seek to push it out even further.

<Q - Stephen Calder Byrd>: Okay. And then, looking over in terms of gas infrastructure, major theme we've seen is more investment in pipelines and we saw your investment there at the Power side. Do you see other potential need for gas infrastructure that looks interesting for you in your service territories, as you look at the growth of gas infrastructure?

<A - Ralph Izzo>: No, not in our service territory. It seems to me that most of the gas pipeline build that's been proposed nowadays for a variety of reasons is going from Marcellus and Utica to the Southeast and to the South. That's a much longer conversation that we can have. There is some very good economic fundamental reasons why that's taking place. I think we're ready for the next question, operator.

Operator

Your next question comes from the line from Travis Miller with the Morningstar.

<Q - Travis Miller>: Good morning. Thank you.

<A - Ralph Izzo>: Hi, Travis.

<A - Caroline D. Dorsa>: Hi, Travis.

<Q - Travis Miller>: Hi. Wonder if you could talk about a little more of the incremental investments that you've discussed here over the last few months about Energy Strong where that stands, what filings we might see in the next three to six months opportunities, the incremental stuff, that's not been approved for Energy Strong?

<A - Ralph Izzo>: Sure, Travis. The pure Energy Strong filing, if you will, had multiple components to it. There were a series of substations, for example, that were a center piece of, I think there were 29 of them that have to be upgraded and there where we are is we're in the engineering and design phase of that work. So that work is probably going to be the longest dated one, and when we do file for additional help in that area that's likely to not be off for at least another year. Another big part of Energy Strong though was the $350 million program to replace some of the cast iron main system. And I think we've done over 200 miles of that already and that is one that is scheduled to pretty much wind down by the end of 2015.

So we'll talk more in detail about that on March 2, but that is a filing that we will be making in very, very short order to continue that program. That's important for a whole host of reasons, not the least of which is number one. You don't want to keep mobilizing and then de-mobilizing your workforce to do that. And as I said, that's winding down at the end of the year. But probably equally if not more important is the fact that we've continued to be able to pass these gas credits on to our customers. So this is the time to make the investment in infrastructure while the supply part of the bill is actually coming down, because it's something that the customer can afford to do right now. We're always mindful of the burden that we are putting on the customers.

But there are some other parts of Energy Strong that are smaller in magnitude, but those being the two biggest ones. Some of the other things we've talked about in terms of potential investments that we're still waiting to here on are the Utility 2.0 program out on Long Island. Candidly we thought that would be resolved by now, but that looks like it's going to go out a couple more quarters into this year. We had thought we were the winner of the FERC 1000 project at Artificial Island. As you know, PJM is reconsidering that, and I don't know exactly when a decision will be forthcoming there. We thought it would be Q1. But Q1 is now halfway gone and that decision isn't done. The PennEast Pipeline investment we've made is still underway. The energy efficiency filing that we made is still having very constructive dialogue with the staff on that. So, there are things in all manners, all different stages from disappointment in terms of Bridgeport Harbor, optimism in terms of energy efficiency and a whole bunch of stuff in between.

<Q - Travis Miller>: Okay. How much of all those programs that either haven't been approved or at development process are included in that $2.4 billion CapEx number?

<A - Caroline D. Dorsa>: None.

<A - Ralph Izzo>: Zero, zero.

<Q - Travis Miller>: Okay. So that's upside. Okay. Thank you very much.

<A - Caroline D. Dorsa>: Thanks, Travis. Next question?

Your next question comes from the line of Jonathan Arnold with Deutsche Bank.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15091

<Q - Jonathan Philip Arnold>: Good morning guys.

<A - Ralph Izzo>: Good morning, Jon.

<A - Caroline D. Dorsa>: Good morning.

<Q - Jonathan Philip Arnold>: Quick question on what you've said about the dividend, Ralph. You've been very clear you wanted to be, to grow consistently and sustainably. Does that mean we should anticipate similar percentage growth going forward to what you've just done or similar kind of share growth or how consistent are we talking?

<A - Ralph Izzo>: So, let's just put it this way, Jonathan, about 40 years ago or maybe, I think it was about then, we put a big increase into the dividend, I think it was about an $0.08 or $0.10 increase in the dividend. $0.12. Thank you, Jon. And we went out of our way to tell people that that was a significant resetting of the dividend and not to be expected as an ongoing change in the dividend. And we haven't used those words this time. So I really don't want to be tied to a specific number either from a cents per share or a percentage point of view, except to say that, we think this dividend increase is supportable and sustainable.

<Q - Jonathan Philip Arnold>: It seems you're growing it roughly in line with how you expect the utility earnings to grow this year, I mean, is that kind of the [ph] status policy (57:40)?

<A - Ralph Izzo>: Yeah. And again – that's a fair question, Jonathan. And I did say earlier that we look to see where the earnings in the company are coming from because, quite candidly, Power is more cyclical and the utility is more steady. But we don't have a – it's not formulaic. It's not 0.9 Utility plus 0.1 Power or 1.1 Utility plus 0.2 Power. It's clearly the fact that the utility will be well over 50% this year for the second year in a row. It depends on how you define well over. It'll be over 15% for the second year in a row, gives us more confidence in the size of the increase and the sustainability of the increase. But we absolutely know how important it is to the shareholders. We hear about it all the time.

<Q - Jonathan Philip Arnold>: Okay. And then on the credit metrics, I think you mentioned that Power's FFO-to-debt was [ph] 59% (58:33) at the end of the year. Is there anything about [indiscernible] (58:38) you're forecasting flattish earnings for 2015 in Power at the middle of the range. Is there any reason why FFO-to-debt wouldn't be similar in 2015 as in 2014?

<A - Caroline D. Dorsa>: No. So, good question, Jonathan. If you look at, you're right, where we landed the year. Power is going to continue to be in very good shape. So I think the way to think about it is FFO-to-debt will continue to be well in excess of our floor of 30% just continuing to provide a lot of investment capacity of Power for the things that Ralph has just been talking about and of course as you know we don't have any parent debt and so that provides us even more opportunity for regulated investments. So yeah, I continue to see Power a very robust and what I like about is it allows us to have that conversation of where else can we make incremental investments, because there is just a lot of room there and that's a nice way to start the conversation about extra capital investment, not talking about issuing equity.

<Q - Jonathan Philip Arnold>: So unless [ph] 2016 (59:39) is going to step down very significantly, it seems like mathematically there's no way you can be sub 50% for the 2014, 2015 average, which is I think what your EEI slide showed. Could those numbers be up by that much higher? Is that -- are we on the right track there?

<A - Caroline D. Dorsa>: Yeah. So, I won't give the specific numbers now on the call and we'll talk more about the long-term view of things on March 2, but I think the right takeaway is that balance sheet is in terrific shape and we look for as Ralph said lots of ways to deploy it. The numbers are in really, really good shape.

<Q - Jonathan Philip Arnold>: Did you come close on Bridgeport Harbor or was it...?

<A - Ralph Izzo>: Nice try, Jon.

<Q - Jonathan Philip Arnold>: All right.

<A - Ralph Izzo>: We're not going to reveal close or not close, because as soon as I give you a qualitative answer, you'll try to narrow me further.

<Q - Jonathan Philip Arnold>: Thank you.

<A - Ralph Izzo>: Thank you.

Operator

Ralph is going to have some closing remarks and then we'll complete the call. Thank you.

Ralph Izzo

Thanks, Kathleen. So something just a little bit out of character. As many of you know – as all of you know, there is probably no bigger fan of our employees than yours truly here. There is one that I just want to make special mention of that, many of you probably have never met before, but after 40 years of service in the industry and 10 years with us, eight years as our chief nuclear officer. We did announce the retirement of Tom Joyce. Tom is just the quintessential professional, not only did he just create tremendous value for our customers and our shareholders, but he did what's expected of every strong leader and that is he leaves behind an incredibly solid team and groomed a talented successor. But I just can't thank Tom enough. And I thanked him yesterday in front of employees. So I want to make sure, I thank him today in front of our investors.

As for the rest of my comments, it's simply this, for those of you in the Northeast, I hope you stay warm, hang in there. Our plants are running, our gas pressures on the system are good if not only even Northeast but you are in our service territory. And I hope to see all of you a week from Monday at our annual meeting. So I hope you're as pleased as we are with that result, and the outlook for 2015 looks even stronger. See you soon. Thank you.

Kathleen A. Lally

Thank you, operator.

Operator

Ladies and gentlemen, that does conclude your conference call for today. You may now disconnect. And thank you for your participation.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Brent and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group's Third Quarter Earnings Conference Call and webcast.

At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. [Operator Instructions] As a reminder, this conference is being recorded today, October 30, 2014, and will be available for telephone replay beginning at 2 o'clock PM Eastern today until 11:30 PM Eastern on November 6, 2014. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Brent. Good morning. Thank you all for participating in PSEG's earnings call this morning. As you are aware, we released our third quarter 2014 earnings statements earlier this morning. The release and attachments, as mentioned, are posted on our website, www.pseg.com, under the Investor section. We have also posted a series of slides that detail the operating results by company for the quarter. Our 10-Q for the period ended September 30, 2014 is expected to be filed shortly.

I'm not going to read the full disclaimer statements or the comments we have on the difference between operating earnings and GAAP results. But, as you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. And although we may elect to update forward-looking statements from time-to-time, we specifically disclaim any obligation to do so, even if our estimate changes unless, of course, we are required to do so.

Bloomberg Transcript

Our release also contains adjusted non-GAAP operating earnings. Please refer to today's 8-K or other filings for a discussion of factors that may cause results to differ from management's projections, forecast, and expectations and for a reconciliation of operating earnings to GAAP results.

I'm now going to turn the call over to Ralph Izzo, Chairman, President, and Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Caroline Dorsa, Executive Vice President and Chief Financial Officer.

At the conclusion of their remarks, there will be time for your questions. And I'm not going to limit you because [indiscernible] (2:49).

Ralph Izzo

Nice try, Kathleen. Thank you. And thank you, everyone, for joining us today. Earlier this morning, we reported operating earnings for the third quarter of 2014 of $0.77 per share, compared with operating earnings of $0.76 per share in 2013's third quarter. The results for the third quarter bring PSEG's operating earnings for the nine months ended September to $2.27 per share, which is a 9% increase over the $2,000.09 (sic) [$2.09] (3:23) per share earned during the first nine months of last year.

I'll refer you to slides four and five, as they contain the detail on the results for the third quarter and for the nine months. PSEG earnings continue to benefit from the expansion of our regulated utility capital program.

Our results also benefited from the focus placed on controlling the growth in operating expenses, which offset the impact of less favorable weather conditions on demand for electricity. Our major transmission projects are being completed on-time and on-budget. We completed construction of the $390 million North Central Reliability line and placed the $400 million Burlington-Camden line into service as well. These two 230-kilovolt lines will improve the system's power quality and voltage stability.

Construction on the New Jersey portion of the Susquehanna-Roseland line was also completed in the quarter. The work to connect the Western portion of this major 500-kilovolt project in Pennsylvania with New Jersey is underway. And it's planned to go into service around mid-2015.

We are in the midst of engineering, permitting and siting work on our remaining large projects as we also work on the upgrade and conversion of lower voltage lines. These projects are all part of our planned $6.8 billion capital investment in transmission, which provides for the double-digit growth in PSE&G's earnings in 2014, as well as the anticipated double-digit growth in rate base and earnings through 2016.

We hope to add the proposed 500-kilovolt line at Artificial Island to our stable of transmission projects. We supplemented our original proposal to meet the stability issues at Artificial Island and expect to have a decision from PJM during the first quarter of next year.

We have also accelerated the replacement of PSE&G's cast-iron gas-pipe system. Approximately $350 million of the $1.22 billion Energy Strong investment program approved by the BPU earlier this year is dedicated to this ongoing effort. This is an opportune time to pursue these investments. Major surcharges on customers' electric bills are scheduled to expire over the next two years. And the bills for PSE&G's gas customers continue to benefit from the capable management of the company's natural gas storage and transportation contracts.

The BPU approved, on a provisional basis, a 9% reduction in the gas rate paid by residential customers. The reduction, which was effective on October 1, just a few weeks ago, is the latest in a series of reductions, which have lowered customers' gas bills by 44% over the past five years. PSE&G has since indicated that it intends to implement an additional bill credit over the months of November, December and January that will return approximately $160 million to residential gas customers.

The earnings growth enjoyed by PSE&G in the quarter offset the impact on earnings from the well-known reset in Power's capacity revenues. Lower operating costs helped to offset the impact of mild weather on energy pricing and

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15095

earnings.

We're in the midst of major change in the electricity markets. An unprecedented amount of capacity is expected to retire over the next two years in response to environmental requirements and market economics.

In addition, the availability of low-cost gas in the Marcellus and Utica Basins and the lag in development of infrastructure to move the gas to market has, and is expected to continue to be, a source of volatility in gas and electricity prices. The new dynamic implies that winter is as important to the power market as the summer, as demand in the winter season can heavily influence forward prices.

Power is well-situated, its fleet of base load, intermediate, and peaking-generating assets benefits from access to low-cost gas in the summer and from price volatility in the winter. The changing dynamic in the market creates a need to review maintenance practices to ensure availability of our units during critical peak condition.

The changing market dynamic appears to be recognized by PJM. The changes proposed by PJM to the Reliability Pricing Model, RPM, as we often refer to it, are designed to incent operations-related investments as much as they are meant to encourage new investments in light of the events in the winter of 2014 and known retirements of capacity over the next two to three years. PJM's proposals which provide for a change in the demand curve as well as its capacity performance proposal could provide greater visibility to much needed market-driven price formation.

Outside PJM, the potential to receive a seven-year contract for new capacity that clears the market in New England under its revised capacity construct, has encouraged us to consider bidding a new 450-megawatt gas fired combined cycle unit into next year's auction. The new unit, which would be located at our existing Bridgeport Harbor site, would represent a $600 million investment. I do want to emphasize, however, that we would only proceed with this project if it clears in the forward capacity auction.

The potential investment in Bridgeport Harbor would represent the latest of several opportunities for PSEG. Over the past quarter, Power has announced they plan to invest $100 million to $120 million for an equity interest in the PennEast Pipeline. This 105-mile pipeline would bring gas from Pennsylvania into New Jersey and provide PSEG and its customers with increased access to low-cost natural gas supply.

Similarly, PSEG-Long Island has updated its Utility 2.0 proposal. The revised proposal to spend up to $345 million meets the customers' desire for increased investment in energy efficiency, demand resources, and distributed generation. It also limits the impact on customer bills as the increased investment would be financed by LIPA, the Long Island Power Authority.

The inclusion of a performance incentive mechanism in the proposal provides PSEG-Long Island the opportunity to earn an increased return. If preferred, the proposal also reaffirms PSEG-Long Island's original approach to fund new rate base-like investments. So, PSEG-Long Island could benefit from the Utility 2.0 investments through either the use of its own capital or proving out the effectiveness of the programs and earning under the performance mechanism.

PSE&G is also waiting the BPU's response to its request to invest approximately $100 million in programs that would extend existing energy efficiency offerings here in New Jersey. Together, if my math is right, these programs represent an investment opportunity of over $1.2 billion and extend the growth associated with our existing $13 billion capital program. These investments also provide our customers with access to low-cost gas and cost-effective technologies that reduce emissions, as they also improve system reliability.

Based on the strength of our results for the quarter and year-to-date, we are raising the low end of our full-year operating earnings guidance to $2.60 from $2.55 per share. And as we indicated last quarter, we remain on track to achieve results at the upper end of our revised operating guidance of $2.60 to $2.75 per share. Our investments are meeting our expectations, our costs are under control, and we remain well positioned to deploy our balance sheet to meet shareholder objectives for long-term growth.

I'll now turn the call over to Caroline to review our operating results in greater detail.

Caroline D. Dorsa

Thank you, Ralph, and good morning. I will review our quarterly operating earnings as well as the outlook for full-year results by each subsidiary company. As Ralph said, PSEG reported operating earnings for the third quarter of 2014 of $0.77 per share versus $0.76 per share in last year's third quarter. And for the nine months ending September 30, we reported operating earnings of $2.27 per share versus $2.09 per share last year.

Slides four and five provide a reconciliation of operating earnings to income from continuing operations and net income for the quarter and year-to-date. We've also provided you a waterfall chart on slide 10 that takes you through the net changes in quarter-over-quarter operating earnings by major business, and a similar chart on slide 12 that provides you with those changes in operating earnings by business on a year-to-date basis.

So, now, I'll review each company in more detail, starting with PSE&G. As shown on slide 14, PSE&G reported operating earnings for the third quarter of $0.39 per share compared with $0.33 per share a year ago. PSE&G's earnings in the third quarter continued to benefit from an increase in revenue associated with its expanded capital program, particularly in transmissions, and a decline in operating costs.

An approved increase in PSE&G's transmission revenue under its formula rate effective at the start of the year, supported a quarter-over-quarter increase in the net earnings contribution from transmission of $0.04 per share, bringing the total transmission-related earnings increase to $0.10 per share on a year-to-date basis. And the roll-in of our second capital infrastructure program or CIP II into our rates this past July improved earnings comparisons from distribution during the quarter by $0.01 per share.

A decline in operating expenses, particularly pension expense, led to an improvement in earnings of $0.02 per share. PSE&G's revenue was affected by weather conditions during the third quarter, which were very mild relative to normal as well as relative to conditions in the year-ago quarter.

On average, weather in the third quarter was 14% cooler than normal and 18% cooler than 2013's third quarter. The impact on demand from the mild weather reduced quarter-over-quarter earnings by $0.02 per share.

PSE&G's earnings continue to benefit from a decline in financing costs, which more than offset an increase in the level of debt on the balance sheet associated with higher levels of capital spending. The reduction in interest expense and a lower tax rate more than offset an increase in depreciation expense and netted to an increase in quarter-over-quarter earnings of $0.01 per share in the distribution business.

Economic conditions in New Jersey, as evidenced by employment in the service territory, continue to show signs of improvement. Adjusting for the weather, electric sales in the quarter grew by 0.4%, and the improvement was led by an increase in demand from the residential sector and reflects some growth in the number of customers.

So, on a year-to-date basis, weather-normalized electric sales grew by 1.1%. Weather-normalized gas sales, while less impactful to results in the third quarter, advanced 1.9% in the quarter and 4% for the nine months ended September. Of course, demand for gas continues to benefit from a decline in commodity prices and economic conditions.

Customers will see a further decline in the commodity portion of their bills during the upcoming year. The BPU approved on a provisional basis an annual reduction of 9% in residential customer gas rates that went into effect on October 1 of this year.

And given the continued availability of low-cost gas under the company's long-term supply arrangements, PSE&G has since informed the BPU that it would be implementing an additional three months bill credit of 31%, which would return approximately $160 million to customers over the months of November, December and January of 2015.

On the transmission front, PSE&G has filed for an update to its formula rate for transmission at the FERC. The update, which provides for a return on PSE&G's forecasted increase in its capital investment in transmission, would increase 2015's annual transmission revenues by an estimated $182 million at the start of the new year.

Bloomberg Transcript
Bloomberg
SI-SSA-0015-15097

You'll recall that in 2014, we added $171 million to our revenues, which has resulted in year-to-date growth earnings of $0.10 per share, something to keep in mind proportionally as you do your modeling for our filings for 2015.

The BPU also found that all but $400,000 of PSE&G's $366 million of storm costs are prudent and recoverable in a future base rate proceeding. The total spend breaks down as approximately $126 million of major storm capital expenditures and incremental O&M of approximately $240 million.

PSE&G is also awaiting a decision from the BPU on its request to invest approximately $100 million plus administrative costs on programs that would extend existing energy efficiency offerings in the residential, multifamily, hospital and self-install markets. This program is not expected to have a major impact on customer rates and we expect a decision during the first half of next year.

PSE&G is meeting its capital and operating benchmarks and earning its authorized return. For the year, we've made a slight modification to our forecast of PSE&G's operating earnings. The low end of the range has been increased to $710 million, bringing the range for operating earnings guidance to $710 million to $745 million from the prior $705 million to $745 million. Results for the remainder of the year will continue to reflect an increase in transmission and distribution revenue and a reduction in operating and maintenance expense including, importantly, pension costs.

With that, let's now turn to Power. Power reported operating earnings for the third quarter of 2014 of $0.34 per share, compared with $0.43 per share for the third quarter of 2013. Power's results reflect the full-quarter impact of the scheduled reset in the average price received on PJM capacity as well as lower market prices for energy. PJM capacity prices were reset to an average level of $166 per megawatt day on June 1 of 2014 from $242 per megawatt day in the prior-capacity year.

Recall that we now enter a period where Power's PJM fleet based on the results of past auctions is expected to experience stable capacity prices in the range of $165 to $166 per megawatt day through May 31 of 2018. Declining capacity revenues reduced Power's quarter-over-quarter earnings by $0.09 per share. Mild weather conditions relative to a year ago and lower gas prices resulted in a return to a more average spark spread for our region than those we experienced during the hot summer last year, and that reduced quarter-over-quarter earnings by $0.03 per share. A decline in Power's average hedge price for energy and lower market prices combined to further reduce quarter-over-quarter earnings by $0.04 per share.

Power's O&M expense was lower in the quarter relative to the level experienced in the year-ago quarter. The absence of major maintenance expense at the Bethlehem, New York, facility in 2014 compared to the year-ago quarter, and lower nuclear outage related costs even with the impact of Salem's extended outage in the quarter, combined with lower pension expense to improve Power's quarter-over-quarter earnings by $0.06 per share.

A reduction in the tax rate and other miscellaneous items more than offset an increase in depreciation in interest expense to improve quarter-over-quarter earnings by $0.01 per share. The availability of the Bethlehem, New York gas-fired combined cycle facility in 2014 led to a 4% improvement in the generating fleet output in the third quarter as production from the gas-fired combined cycle fleet increased 16% in the quarter to 5 terawatt hours or about 34% of output.

Output of the nuclear fleet improved slightly from year-ago levels. During the quarter, the fleet operated at a capacity factor of 92% and produced 7.6 terawatt hours or about 52% of output. Production from the coal-fired and peaking units declined 8% during the quarter to 2.1 terawatt hours, about 14% of output, due to planned outages as well as lower weather-related demand. Generation volumes in PJM, overall, were flat relative to year-ago level.

Power expects output for the full-year to be approximately 53 to 55 terawatt hours. The forecast represents a slight increase in output on a year-over-year basis, but is lower than our prior forecast for 2014, given year-to-date performance including the mild summer.

Keep in mind, we have scheduled fourth quarter outages at the Salem 1 and Peach Bottom 2 nuclear facilities. Salem 1 began a normal refueling outage earlier this month, and Peach Bottom is undergoing work associated with its planned uprate during a refueling outage.

final
Bloomberg Transcript

Approximately 80% to 85% of generation in the fourth quarter is hedged at an average price of $49 per megawatt hour. The average price for energy hedges in the full year is approximately $48 per megawatt hour versus the average hedge price for energy in 2013 of about $50 per megawatt hour.

Power is maintaining its forecast of economic generation for both 2015 and 2016 at 55 to 57 terawatt hours per year. This represents an increase in output from 2014's forecast. For 2015, Power has maintained its average hedge position at 65% to 70% of forecast generation at an average price of $50 per megawatt hour.

You'll recall that Power had increased its hedge activity earlier in the year in response to higher market prices. The current level of hedges is consistent with past practice and continues to assume BGS volumes represent about 11 terawatt hours of demand, in line with the 2014 forecast for BGS volumes.

In 2016, Power has increased its average hedge position to approximately 35% to 40% of its generation from 30% to 35%. Hedges in 2016 have been transacted at an average price overall of $49 per megawatt hour compared with our prior update, which indicated average hedge prices for 2016 of $51 per megawatt hour. The decline in the average hedge price for 2016 reflects an increase in non-BGS-related hedges, all done at market prices since our last update. And you'll recall, you've seen this pattern from us in prior periods.

As we increase the proportion of non-BGS hedges in the third year out, the weighted average math of putting in hedges at market prices, relative to the representation of BGS in that total, and remember BGS goes in at a full requirement's price less capacity, normally brings down the weighted average hedge price as we move through the year.

For example, in 2016, last quarter, BGS represented about 30% of the total amount that was hedged in our disclosures last quarter and now is closer to 25%. One thing to note is that the prices that the new hedges were put on, the market prices for the new hedges, are actually slightly higher than the energy component of BGS that cleared in February of 2014. So, again, our normal pattern as we layer in market hedges, post the clearing of BGS in February.

We've narrowed our range for Power's 2014 operating earnings guidance to $575 million to $610 million from the prior $550 million to $610 million with full-year operating results expected to be at the upper end of the range. Results for the remainder of the year are expected to be influenced by the reset in the average price received on PJM capacity that we just talked about and the decline in the average price of energy.

Power's O&M expense for the fourth quarter is expected to compare favorably with year-ago level, given a reduction in pension expense and the absence of major outage-related work. We anticipate O&M for the full-year will be flat versus 2013's level of expense, and this estimate, as always, assumes normal weather and normal operations.

As we notified you earlier this year, Power discovered errors in its cost-based bids for its New Jersey fossil-generating units in the PJM energy market, as well as additional pricing errors and differences between the quantity of energy that Power offered into the energy market and the amounts for which Power was compensated in the capacity market.

We have since been verbally notified by the FERC staff that they have initiated a preliminary, non-public staff investigation into matters discovered by Power. The investigation could result in the FERC seeking disgorgement of any over-collected amounts, civil penalties, and non-financial remedies.

Power has implemented procedures and continues to develop processes to mitigate the risk of similar issues occurring in the future, and as is usual in matters of this nature, FERC investigation may take an extended period of time to resolve. We have not, by the way, changed the reserve we took in the first quarter which still stands at $25 million.

Let me now turn briefly to the enterprise and all others. PSEG Enterprise/Other reported operating earnings of $22 million or $0.04 per share in the third quarter of 2014 versus an operating loss of $4 million or $0.01 per share during the third quarter of 2013. The results reflect the inclusion of earnings from the operating contract for PSEG-Long Island as well as a reduction in tax expense.

The conclusion of an Internal Revenue Service audit for the tax years 2007 through 2010 resulted in a $121 million cash refund and a reduction in tax expense. The reduction in taxes improved quarter-over-quarter earnings comparisons by $0.02 per share from the closure of the audit.

final
Bloomberg Transcript

In October, PSEG-Long Island updated its original Utility 2.0 proposal, which called for PSEG-Long Island to invest up to $200 million over four years in programs that would expand energy efficiency, demand resources, and distributed generation on Long Island.

The updated proposal calls for an increase in the size of the program to $345 million. As currently proposed, PSEG could fund all or some of the increased program and compensation for the part that is funded by LIPA could be performance based. We anticipate a decision on the Utility 2.0 proposal by year-end.

On the financing side, we ended the quarter with cash on hand of $703 million. The growth in PSE&G's earnings and cash flow and the cash generated by Power continue to support our financing requirements without the need to issue equity. Debt represented 41.6% of our consolidated capital structure and 31.6% of Power's capitalization at the end of September.

As Ralph mentioned earlier, we have narrowed the range of our 2014 operating earnings guidance to $2.60 to $2.75 per share and continue to expect earnings to fall at the upper end of that range. PSE&G remains on course to achieve double-digit growth and operating earnings during 2014 as its contribution to earnings is expected to exceed 50% of our forecasted earnings for the year. PSEG Power is expected to report earnings at the upper end of the forecast range for the year.

That concludes my remarks. And at this point, we're now ready for your questions, and I'll turn it back over to Brent.

Q&A

Operator

Ladies and gentlemen, we will now begin the question-and-answer session from members of the financial community. [Operator Instructions] One moment, please, for the first question. Your first question comes from the line of Kit Konolige with BGC. Please go ahead with your question.

<Q - Kit Konolige>: Good morning, guys.

<A - Caroline D. Dorsa>: Good morning.

<Q - Kit Konolige>: A couple of related areas. First of all, can you give us a sense of what kind of response you've seen in New Jersey so far to, as far as working with the commission and the authorities, in general, on 111(d)?

<A - Ralph Izzo>: Sure, Kit. We've had lots of communication staff-to-staff with New Jersey DEP. I think, it's pretty safe to assume that one of the areas that we're focusing on was the amount of credit or, candidly, the lack of credit, that's given for nuclear output and the feeling that the cleaner states, in our case, are being somewhat penalized.

The second area that I'd put – sort of lower priority, the opportunity to perhaps expand the purview of 111(d) to touch upon things that are electric-related, but not specific to power plants in New Jersey. Our leading cause of CO2 emissions is transportation, so the possibility of expanding 111(d) to include electric transport and the possibility of expanding 111(d) to include methane leakage, fugitive emissions [indiscernible] (31:31) that feed combined cycle units. But I put those two issues – electric transportation and methane leakage – as a distant second to the concern for the credit not given to nuclear.

<Q - Kit Konolige>: What, Ralph, do you have any sense so far, A, if there's been any responsiveness at the state level to crediting nuclear; and B, what kind of form would you like that to see, or can we reasonably expect that to see – to appear as?

<A - Ralph Izzo>: Yeah. So, I'd say that it's not much of an exaggeration to say that we are in lock-step with the state on their perspectives on 111(d). As you know, Kit, we have a clean fleet. Nuclear typically is 55%, 57% of our yearly output; the third quarter it was 52%. But as to the details of how that would manifest itself, I'm not sure I want to get into that on this call, we could certainly talk more about that hopefully in Dallas, if you're at EEI. But, there's no space

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15100

that I'm aware of; I'd hate to be absolutely definitive and say that there isn't any at all between us and the state's position. But, I've been briefed on this a couple of times already and I think we're in lock-step with the state in terms of the issues [indiscernible] (32:57).

<Q - Kit Konolige>: Let me ask about one particular area. You used to be in ReGGIe [Regional Greenhouse Gas Initiative] and now you're not. So, is that something you'd like to see reinstated?

<A - Ralph Izzo>: No, it isn't. Because, as we've said many times, we thought ReGGIe was a good idea to serve as a template for a national emissions trading program, and appetite in Congress to begin a national program. It doesn't seem wise for the state to diminish its economic competitiveness with respect to nearby states in joining ReGGIe

<Q - Kit Konolige>: One other separate area. What -

<A - Ralph Izzo>: [ph] It's out of (33:34) our control. Go ahead, Kit. Go ahead.

<Q - Kit Konolige>: Yeah. All right. Last one. DR, how do you expect that to play out? Obviously, there are still legal issues pending and then one way or another, presumably, PJM and FERC have to figure things out and possibly states as well.

<A - Ralph Izzo>: Yeah. So, on DR, I mean, it's just what you and everyone else on the call knows about it, right, Kit? I mean, the court decisions were very comprehensive, very deterministic, dispositive on the issue. I'm guessing, I'm inferring that the recent stay is just out of a healthy degree of respect for FERC and it's in the desire of the judicial branch to allow the executive branch to weigh its options and it's not at all a reflection that the court decided that, what they'd previously ruled upon was any kind of backpedaling whatsoever. So, I think DR is likely to come out of energy and capacity markets in the future.

Now, PJM has gone on record saying that they're going to adjust for that, that they're going to look for ways to allow DR to affect the demand curve. But, I've got to believe that once that very transparent, efficient market whereby DR providers are paid a revenue stream goes away, that that's going to candidly diminish the amount of DR that's available.

And remember, RPM stands for reliability pricing model. That's PJM's number one responsibility, reliability. And if they don't control the asset, I don't know how much they're going to be able to count on that. So, you add that [ph] to a little over (35:02) 2.5% holdback, and I think all of that weighs very positively for people with iron in the ground and generation assets that are there when needed.

<Q - Kit Konolige>: Great. Thank you.

<A - Caroline D. Dorsa>: Kit, thanks a lot. Thanks.

<A - Kathleen A. Lally>: Next question?

Operator

Your next question comes from the line of [ph] Ashar Khan with Visium (35:31). Please go ahead with your question.

<Q>: Good morning. Congratulations. Can you just talk a little bit about the plant in Connecticut, if it gets into the auction when it comes online and also on the Power's investment in the pipe, when that comes into line as to when those would be helpful to earnings?

<A - Ralph Izzo>: Yeah. So...

<Q>: If you can just revise those date – remind us what the dates are on those things?

<A - Ralph Izzo>: Sure. Sure. So, the auction is in February, I believe. And it's a three-year forward. So, it comes into service in 2018. I'm not sure what month exactly, but early or first half of 2018.

PennEast, we've been publicizing a target date of November of 2017. We've also been emphasizing that it's a greenfield project. You could take those two emphasisses – emphases? – what's the plural of emphasis? – and, for your own startup dates for PennEast. But it's a greenfield project and it will not be online before November of 2017. It wouldn't surprise me if it slips into 2018.

<Q>: Okay. And Ralph, any other transmission or any other projects, which – can you just talk about or anything which might be on the drawing board which is not in the CapEx plan?

<A - Ralph Izzo>: Yes. So, I listed about $1.2 billion worth of projects that are not in the CapEx plan and they range from Bridgeport Harbor to PennEast. And I mentioned Artificial Island, which is about $250 million and [indiscernible] (36:53). And I'm looking with a quizzical look at Kathleen and Caroline to see whether or not we've publicly announced what we've put in the open window for PJM.

<A - Caroline D. Dorsa>: No.

<A - Ralph Izzo>: We have not. Okay. So, there are other things we're working on right now. Nothing that's staggering or tilts the balance sheet, but we're always looking at ways to improve the system. And we'll definitely have an update for you on that in the not-very-distant future.

<Q>: Okay. Thank you, sir.

<A - Kathleen A. Lally>: Thank you. Next question?

Operator

Your next question comes from the line of Julien Dumoulin-Smith with UBS. Please go ahead with your question.

<Q - Julien Dumoulin-Smith>: Yeah. Perhaps to follow – well, first off, good morning.

<A - Ralph Izzo>: Good morning.

<Q - Julien Dumoulin-Smith>: But, perhaps to follow-up on the last question, I was curious, how are you thinking about the Power's strategy overall? I'd just be curious the extent to which that you're reinvesting potentially meaningful dollars in New England. Are there other markets, more broadly, other asset types? Again, you've done a few solar projects. Are we thinking about a scaling up of spend in this business at all just as a way to deploy dollars in your excess balance sheet?

<A - Ralph Izzo>: So, Julien, good morning. We like the integrated model. We love the regulated utility business. We love the power-generation business. We look at every project, whether it's a solar farm in California, – we closed on one recently, or bidding a combined cycle unit in New England or building more transmission on a discounted cash flow basis with different hurdle rates and make sure that they're NPV positive, that there is a near-term visibility to the accretion.

And the balance sheet gives us room to do both in both businesses, so there's no shortage of – us trolling around looking for these opportunities. And there's a long list of those we've walked away from, because others had a different point of view of what the future held. But no, you shouldn't interpret the Bridgeport Harbor project as any shift in our affection for the regulated utility or anything of that nature. I don't know, Caroline [indiscernible] (38:58).

<A - Caroline D. Dorsa>: Absolutely.

<A - Ralph Izzo>: Yeah.

<A - Caroline D. Dorsa>: And I think when we look at these kind of opportunities, as Ralph said, we're disciplined in looking at the NPV, using the right hurdle rates. I think the thing that makes us interested in considering Bridgeport, as you think about the capacity construct there and what they've put in place, giving a seven-year incentive, which really helps us think through how to make that work for a new investment. So, those kinds of constructs that truly can confer

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15102

final

something really can encourage new investment, we think are very good.

<Q - Julien Dumoulin-Smith>: Excellent. And then turning to the BGS auction, can we talk briefly about the ability to pass through capacity – transitionary capacity increases as a result of the capacity performance scheme and any ability from a regulatory perspective to shift the BGS contracts to be able to allow that?

<A - Ralph Izzo>: So, that has not been decided formally at this point, Julien. I would point out that as Caroline mentioned a moment ago, we've received – we've put in for transmission a formula-rate adjustment of north of $180 million. And the BPU has made it a policy that transmission increases are passed through. I believe there was a similar ruling on SRAC issues a couple of years ago.

So, in general, I think the BPU has recognized that if they want to continue to have a fully competitive active BGS market, that things that are outside of the control of the BGS suppliers have to be adjusted on an as go basis. But, they have not opined specifically on an incremental capacity auction, change that could come out of PJM's most recent concern over asset performance.

<Q - Julien Dumoulin-Smith>: But presumably that's something you would be seeking?

<A - Ralph Izzo>: Absolutely. Absolutely.

<Q - Julien Dumoulin-Smith>: Right.

<A - Ralph Izzo>: Absolutely.

<Q - Julien Dumoulin-Smith>: And then, lastly, just a quick one. Energy efficiency and just the broad, call it LIPA plan, can you talk about the incentive, in terms of EPS, perhaps a more explicit range, just to give us some kind of a sense as what this could ultimately drive?

<A - Ralph Izzo>: Yeah. So, those details have yet to be worked out. But, it would be safe to assume that they would be in the same vicinity as what a regulated return would achieve, if the investment had delivered upon the promised operational performance, right? So, don't think of this as having an effective ROE of 20% or 30%, and don't think of it as something that would be south of 10%. It's just, okay, if we think this light bulb is going to do X, and it does X, then all right, then that seems to have been a prudent investment. But there's a slight increase in risk that's taken as a result of that kind of mechanism.

<Q - Julien Dumoulin-Smith>: Got you.

<A - Caroline D. Dorsa>: And just keep in mind as you're thinking about the modeling for Long Island. And I know you know this, so just to reinforce, right? We have $0.03 per share this year rising to $0.07 to $0.08 per share by 2016, and that does not include any potential uplift that we might get from these new proposals that we're making. So, that's the base contract that's currently enforced. Something here would be additional.

<Q - Julien Dumoulin-Smith>: And a clarification there. Presumably, you would achieve these targets over time, but that you would not necessarily immediately hit the first year on the $345 million of regulated return? Or is that...

<A - Ralph Izzo>: Yeah, the numbers we gave earlier, Julien, our original program of $200 million, the expanded program of $345 million, both of those were four-year programs. So, you would not see all that programmatic emphasis or capital deployment take place in the first year. It would be over four years.

<Q - Julien Dumoulin-Smith>: Right. Okay. Sorry. Thank you.

<A - Kathleen A. Lally>: Thank you. Next question?

Operator

Your next question comes from the line of Neel Mitra with Tudor Pickering. Please go ahead.

Bloomberg Transcript

<Q - Neel Mitra>: Hi. Good morning. I had a question about the PennEast Pipeline and the off-take agreements. How does that benefit you? Is it at the utility with lower gas prices for PSE&G? Or is it kind of lower gas prices to fuel your combined cycle plants?

<A - Ralph Izzo>: Good morning, Neel. So, it's the same exact sequencing of uses as we have today. So, it's either 125,000 or 150,000 bcf a day?

<A - Caroline D. Dorsa>: 125,000 bcf.

<A - Ralph Izzo>: 125,000 bcf a day. So, the priority customer would be the utility, regulated distribution gas customer. They get first dibs at that. Second would be off-system sales. And then lastly, would be power used for burning in its plants.

So, what tends to happen under those three tiered prioritizations is that Power really doesn't get to make a lot of use of that additional low-cost gas in the winter months. A little bit more, but not a lot in the spring as we start to refill for storage reasons, but gets to use a whole of bunch of it in the summer when storage is completed and there's no heating demand. Right now, Power is using about 25%. About 25% of the gas that Power burns is from the Leidy region. It could go up on a percentage basis from that.

<Q - Neel Mitra>: Got it. Great. Thank you. And then, secondly, with the CCGT expansion in New England, could you just generally give your thoughts on the New England market? It's obviously gone very quickly from an oversupply to an undersupply. And just wanted to get your thoughts on capacity in energy looking at that project?

<A - Ralph Izzo>: So, I think that there's two things that are important in New England market. Number one is what you just mentioned, that it went to an undersupply condition as it's announced and carried through in their retirement. But number two is really what Caroline pointed out, which is the – the risk reward profile has shifted to be a little bit saner when you're making an investment and you want to recover your long run marginal costs, not just your short run marginal costs. So, the seven-year capacity payment is extremely helpful there.

I think the big question is the one that you've hinted at in New England and that's around energy markets given the lack of infrastructure for natural gas into the region. You're going to find people looking at assets that are near existing infrastructure and have a dual-fuel capability. And I'm pleased to say that we have both of those in our Bridgeport Harbor site. We have both access to gas, and we will build it for dual-fuel.

Lastly, on the capacity [ph] marks (45:17), in addition to the seven-year construct, the change in the slope on the demand curve allowing for return of some of the missing money that has plagued that region.

<Q - Neel Mitra>: Okay. Great. Perfect. Thank you.

<A - Kathleen A. Lally>: Thank you. Next question?

Operator

Your next question comes from the line of Dan Eggers with Credit Suisse. Please go ahead.

<Q - Dan L. Eggers>: Hey. Good morning, guys.

<A - Caroline D. Dorsa>: Good morning, Dan.

<Q - Dan L. Eggers>: Caroline, I hate to bring up the numbers question on the call, but when I look at the fourth quarter guidance for Power, kind of filling in the range of what you guys have full-year guidance at, basically, it means you guys will earn somewhere between I think $0.05 and $0.12 or $0.13 which is down quite a bit from prior years. Can you kind of walk me through what are the big drivers that's going to lead to that much of a decline and then how we should think about that kind of for next year from a baseline perspective?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15104

<A - Caroline D. Dorsa>: Of course. So, thanks for the question, Dan. Right. We took up the bottom end of the range, right, but we've also said that we expect to be at the high end of the range.

The one thing I think you should always keep in mind as you do the quarter-over-quarter comparisons, which you saw this quarter for the first time, it's a full quarter, right, last quarter it was just a month, is capacity, right, so capacity on a quarter-over-quarter basis. Just like you saw this quarter is a $0.09 impact. And so, you have to start there, right, that's significant dollars. But, of course, we knew that, right? We took that into account on our guidance all the way through the year. So, that's the number one thing I would suggest that you consider.

Of course, going the other direction is we do expect favorability in the O&M, as I mentioned. So, that's going to go a little bit in a positive direction, and then the normal kind of unit operations. Keep in mind, we have Salem 1 and Peach Bottom outages, which I mentioned during my remarks, that Peach Bottom outage is a good one for us, because it's the EPU going into one of the units that will give us more megawatts for the future. But, those things obviously have an impact in the expected generation.

So, if you think about the pushes and pulls, you've got Salem 1, you've got Peach Bottom, in near-term right before the winter period, of course. You've got capacity at $0.09 going the negative direction, fully anticipated. You've got O&M going in the positive direction, because full-year, we're guiding to about flat. So, you can pretty easily do the math. We were worse on O&M in the first two quarters, better in this quarter, anticipate to be better in the fourth quarter. And then, of course, there's just the normal operations and whatever the weather is at the beginning of the winter.

So, all-in, we still expect to be at that upper end of the range. We feel the bottom, but really haven't changed our thinking which is with normal operations, you'd see us be at the upper end, which is what drives the company to the upper end.

<Q - Dan L. Eggers>: Okay. So, the $0.23 or whatever it is, you take out the $0.09 of capacity revenues, which should get you to kind of $0.14, which is above the implied range right now. There are just some other maintenance issues that'll bring you down toward the high end. Is that the right way to think about it? [indiscernible] (48:20) what you said?

<A - Caroline D. Dorsa>: Well, that's right. Yeah. That's right. Think about the outages I just mentioned but still consider us, we're talking about the high end of the range.

<Q - Dan L. Eggers>: Okay. And then, could we talk a little bit on the gas basis side, 25% of gas generation came from Leidy or comes from Leidy. How does the benefit of the basis arbitrage look full-year or year-to-date 2014 versus 2013?

<A - Caroline D. Dorsa>: Yeah. Sure. So, year-to-date, not as strong as 2013. So, let's kind of wind back and remember what happen in 2013. We saw the Leidy differential really appear in 2013 at the end of the second quarter. And that Leidy differential became pretty wide as we got into the summer of 2013. Remember, we talked about differentials being as much as $2. And then, of course, there was that warm weather, and the warm weather is what drove and kept that differential from the Leidy price right to the actual market price for the energy.

This summer was quite different with the cooler weather right on the [ph] THI (49:35) basis depending on where you compare to last year or normal, 13% to 18% lower in terms of weather, right. It only makes sense if you cite [ph] THI (49:43). What we actually have is Leidy gas costs are still lower. The problem was for the summer with the lower demand and the cooler weather, the differential of Leidy to thinking about where energy is priced in our market looking at Z6 or TETCO M3, that brought those prices down. So, what happened was the differential really collapsed. Leidy was still cheaper than Henry Hub, but the differential moved together, as opposed to last summer when it's much more widely apart, because of the low demand for power.

Now, keep in mind, as we think about Leidy going forward, you think about Leidy for us, we have that access. It's about 25% of Power's overall gas use, as Ralph just mentioned. And I think what we're still expecting to see and you can see it if you look at monthly data going forward is the choppiness to the pattern of how to think about basis.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15105

Just like we've seen actually now for the last two winters, the months make a difference. And so, as we come into 2015, we still expect to see benefit from having Leidy. It's really just about how that basis differential moves relative to power prices.

And so, the winter period and the strong summer period, we would still expect to see some basis differential in our favor. This was just a tough summer because the low demand led to the lower power prices. Not because Leidy prices came up, because power prices came down.

Last year, you may recall, we had $0.03 from the Leidy benefit in the third quarter, and that's the $0.03 negative year-over-year I'm citing in this year's third quarter that I attribute to weather. It's really the spark spread going back to a normal level versus that expanded spark we had given the differential last summer.

<Q - Dan L. Eggers>: Thank you for that. I appreciate it.

<A - Caroline D. Dorsa>: Sure.

<A - Kathleen A. Lally>: Next question?

Operator

Your next question comes from the line of Paul Fremont with Jefferies. Please go ahead.

<Q - Paul B. Fremont>: Thank you very much. I guess, my first question is, at a proposed cost of about $600 million, that works out to about $1,330 per kW. How confident are you in your ability to build at that level? And I know that others in the region have experienced problems building in the Northeast.

<A - Ralph Izzo>: Yes. So, good morning, Paul. We're obviously quoting round numbers. The team is running through details right now, filing permit applications. So, just think of that as one significant figure and not three significant figures in terms of the accuracy. I think the bigger challenges people had in terms of building has been access to gas. That's the number one concern. And that one we have well in hand. We don't want to give you an exact amount on what kind of bids we're getting from folks in terms of engines. It would just be too easy to back calculate what we might bid in an auction. And that wouldn't help anyone.

<Q - Paul B. Fremont>: And then, Caroline, just to follow up on that last question, what would be the – you, I think, provided the quarter contribution as being zero this quarter versus $0.03 in the third quarter last year. What would be the year-to-date numbers on Leidy?

<A - Caroline D. Dorsa>: Yeah. So, year-to-date numbers in terms of the gas benefit, we had about a $0.03 benefit in the first quarter – remember, it was a strong winter – so, it's about neutral on a year-to-date basis, about zero.

<Q - Paul B. Fremont>: And last year year-to-date?

<A - Caroline D. Dorsa>: So last year, when the Leidy differential really started to spread, it was the end of the second quarter, so there really wasn't a sort of a first quarter last year effect. So, last year, at this time, it was about $0.03, and for the full-year, it was $0.05. But that included the fourth quarter. So, we haven't gotten to the fourth quarter yet. So, $0.05 full-year, $0.03 to this point last year, and this year is about neutral.

<Q - Paul B. Fremont>: Great. And based on the modified CTA formula that was adopted by the NJ BPU, what type of adjustment should we assume for PSE&G rate base, if you were to use that methodology?

<A - Caroline D. Dorsa>: Yeah. So, we're very pleased, obviously, with the decision. We think it reflects the right balance, right, from the perspective of the company and the rate payers. Thinking about our rate filing, which would be made by November of 2017, and then the five-year look-back period, the impact for us is de minimis. So really, not something you really should be thinking too much about as we think about our rate case numbers going forward, because by that period, you take a five-year look back, you do the adjustment, you do 75%/25%, it's truly de minimis.

<A - Ralph Izzo>: And you back out transmission as well.

<A - Caroline D. Dorsa>: And you back out transmission as well, right.

<Q - Paul B. Fremont>: Great. Thank you very much.

<A - Kathleen A. Lally>: Sure. Next question?

Operator

Your next question comes from the line of Paul Patterson with Glenrock Associates. Please go ahead.

<Q - Paul Patterson>: Hi. Can you hear me?

<A - Ralph Izzo>: Yes, Paul.

<A - Caroline D. Dorsa>: Yeah.

<Q - Paul Patterson>: You guys have sort of unique position in New York. And I was just wondering – with the stuff going on there with the REV, I mean, sort of, really kind of transformative potential for change in regulation – what you guys see as potentially happening to energy and power prices in the state?

<A - Ralph Izzo>: In New York State?

<Q - Paul Patterson>: Yeah. Well, I mean you guys have [indiscernible] (55:33), right? So, I assume you guys are pretty focused on it.

<A - Ralph Izzo>: No. No. No. Well yes, it depends -

<A - Caroline D. Dorsa>: We don't have it fully.

<A - Ralph Izzo>: That's a very complicated question, right?

<Q - Paul Patterson>: Okay. Well, I don't – I apologize then. Just sort of directionally maybe?

<A - Ralph Izzo>: Yeah. Well, I think that a lot of the distributed resources that are being advocated, they're going to put upward pressure on prices for customers, right? I mean, there are other reasons for doing things like rooftop solar, and offshore wind is being advocated just south of Long Island. And those are capturing some of the environmental benefits that are not baked in right now, the missing externalities, if you will.

Having said that, there are some other parts of the program, specifically energy efficiency, which while they will also serve to increase rates, they will bring overall bills down. So, I think a lot depends upon how aggressive people want to be in making inroads to capturing the benefits associated with the externalities. We're big advocates of this both on Long Island and New Jersey, but we never tell people that doing this stuff is going to lower their rates. You're getting a benefit, you're having to pay for it.

So, there are some things that we can do in terms of making sure that some of the reinforcements that would have to be made in the distribution system are foregone or delayed as a result of perhaps some peak shaving or some broader demand response programs that we can target. There are some parts out on Long Island, I think it's on the South Fork, where there's been a significant growth in peak demand that would otherwise command the need for some infrastructure that we'll be able to delay. But, it really is a much more complicated question than simply, gee, will doing this lower everyone's bills and lower everyone's rates. The answer really depends on what this is and how aggressive one wants to be on sort of a green agenda.

<Q - Paul Patterson>: Okay. Fair enough. And then just under the – as you know, RPM has been controversial in the past and New Jersey has been sometimes apprehensive about it. And I'm just wondering, we've had several changes with the BPU and we've had the potential for several changes happening with DR and capacity performance and

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15107

everything else. How would you describe the political situation with the general regulatory environment vis-à-vis these issues now as it was in comparison to maybe when the MOPR and the LCAP issue was going on?

<A - Ralph Izzo>: So, good questions, Paul. So, we've had a bit of a change at the BPU with all due respect to the commissioners who've gone off. We now have two new commissioners who are quite, quite astute about both energy policy in the form of President Mroz and in terms of the technology strengths, weaknesses, limitations in the form of former assemblyman Chivukula. He's a electrical engineer by training. He spent 20 years at Bell Labs. This is a very, very intelligent man who understands the complexity of capital-intensive infrastructure. And Rick is a well known entity in policy circles in New Jersey and has actually worked in the energy sphere in the past. So, I think that those are two strong additions to a balance to BPU.

The world is very different now from what it was in LCAP. In the LCAP days, you had strong basis differentials West to East. You had a coal-dominated West, a gas-dominated East. And people were always scratching their heads, saying, we don't understand why we pay so much in New Jersey.

And sadly, last month basis was the other way, right? It was lower in the West than it was in the East. And gas has kind of changed that whole dynamic. And I think as a result, you'll see people realizing that the market is working. It's doing what it's supposed to do. And prices are going to be going up for everybody, I believe, in this the new RPM market as the missing money appropriately gets restored.

So, no one likes to pay high prices for energy. There's no ifs, ands, or buts around that, but no one likes to see the lights go out either, and we came dangerously close in 2014, and a similar winter in 2015 and they probably would go out. So, I think PJM is doing the right thing in trying to address that and New Jersey knows that PJM has done a better job than just about any place in the country in making sure those lights stay on.

<Q - Paul Patterson>: Great. Thanks a lot.

Kathleen A. Lally

I think, operator, that's all the time we have for questions. So, I'll turn it over to Ralph for just some closing comments. And see you at EEI.

Ralph Izzo

Thanks, Kathleen. So, I just want to reinforce three messages or comments made by Caroline and me earlier.

First of all, the utility growth story is very much intact. Not only is it doing what we said it would do this year, but our filing at FERC is very much exactly on where we said we would be for 2015.

Secondly, hopefully, you are as impressed by Power's diverse asset base as we are in terms of not only its strong performance in current markets, whatever gas prices are doing, whatever coal prices are doing, but also how strong a performer it is and how well positioned it is even as we look forward to the ever-changing environmental rules and market design parameters. All right, I mean we have dual-fuel capability, we have units that strong in high-capacity factors. All of them will have a great position in the CP market, if the risk-reward profile in the details, as we go forward, is done sensibly, and I've every reason to believe that PJM will do that sensibly.

So, growth story intact at the utility, Power's diverse asset base, once again, demonstrating its strength. And last, but by no means least, the balance sheet remains as strong as ever.

So, as Kathleen said, we look forward to seeing you in the days ahead. And hopefully, for most of us, that means at EEI in Dallas. Thank you for your time today.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Kayla, and I am your event operator today. I would like to welcome everyone to today's conference, Public Service Enterprise Group Second Quarter 2014 Earnings Conference Call and Webcast.

At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. [Operator Instructions] As a reminder, this conference is being recorded today, July 30, 2014, and will be available for telephone replay beginning at 1:00 p.m. Eastern standard time today until 11:30 p.m. Eastern standard time on August 8, 2014. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Kayla. Good morning, everyone. Thank you for participating in PSEG's earnings call this morning. As you are aware, we released our second quarter 2014 earnings statements earlier today. And as mentioned, the release and attachments are posted on our website at www.pseg.com under the Investor section. We also posted a series of slides that detail operating results by company for the quarter. Our 10-Q for the period ended June 30, 2014, is expected to be filed shortly.

I don't go through and read the entire disclaimer statements or the comments we have on the difference between operating earnings and GAAP results, but as you know, the earnings release and other matters that we will discuss in today's call contain forward-looking statements and estimates that are subject to various risks and uncertainties. And although we may elect to update those statements from time-to-time, we specifically disclaim any obligation to do so, even if our estimate changes unless we, of course, are required to do so.

Bloomberg Transcript

Our release also contains adjusted non-GAAP operating earnings. Please refer to today's 8-K or other filings for a discussion of the factors that may cause those results to differ from management's projections, forecast and expectations as well as for a reconciliation of operating earnings to GAAP results.

I'm now going to turn the call over to Ralph Izzo, Chairman, President, Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Caroline Dorsa, Executive Vice President and Chief Financial Officer. At the conclusion of their remarks, there will be time for your questions.

Ralph Izzo

Thank you, Kathleen, and thank you everyone for joining us today. Earlier this morning, we reported operating earnings for the second quarter of 2014 of $0.49 per share and that's to be compared with $0.48 per share earned in 2013 second quarter. The results for the quarter bring operating earnings for the first half of 2014 to $1.50 per share compared with operating earnings of $1.33 per share earned in 2013's first half.

Slides 4 and 5 contain the detail on the results for the quarter and the first half. Several results for the quarter are noteworthy. We continue to see benefits to earnings from the increased deployment of capital into our regulated company. Now, that's primarily in the form of transmission infrastructure and we're completing major projects on time and on budget.

From our perspective, we're delivering on the promise both for earnings growth and improvement in reliability associated with this multi-billion-dollar investment program. We've been able to supplement that growth with a continued focus on controlling O&M costs, and supportive rate mechanisms have allowed us to earn the authorized return on our regulated company's investment program.

The improvement in earnings from our regulated company, PSE&G, offset the impact of mixed operating conditions during the quarter, on Power's results. The cost related to the extended outages at the Salem 2 nuclear facility and the gas-fired Linden combined cycle station masked the underlying strength of Power's operations. The downtime at Linden during the quarter was longer than planned and associated with extensive work being done to test and complete the installation of equipment, which has led to a 63-megawatt increase in the station's capacity.

During the recent refueling outage at Salem we discovered the need to make repairs to Salem 2's four reactor coolant pumps. The refueling outage was extended by approximately 60 days to complete the necessary repairs, and the unit was returned to service on July 14. The decision to keep the unit out of service is not made easily, however, only by taking the steps necessary in the short term in support of operational excellence will the key assets, such as Salem, be available on a reliable basis to provide substantial value for years to come.

I'm pleased to report that both Linden and Salem 2 have been operating essentially flawlessly since their return to service. Keeping the focus on operational excellence is the primary means of assuring our customers and regulators that we operate our assets in a safe and reliable manner.

We have begun the work recently approved by the New Jersey Board of Public Utilities to protect and strengthen PSE&G's electric and gas distribution systems against severe weather conditions. The $1.22 billion Energy Strong investment program represents an initial phase of work designed to upgrade and improve the resilience of our system and we intend to work with our regulators and other parties to consider additional measures at a later date. This is an opportune time to pursue these investments. Major surcharges on customers' electric bills are scheduled to expire over the next two years, and the bills for PSE&G's gas customers continue to benefit from the capable management of the company's gas supply, storage and transportation contracts.

In fact, PSE&G has filed for a further 9% reduction in the gas rate paid by residential customers. The reduction which will be effective in time for this year's heating season will be the latest in a series of reductions, which have lowered the customers' gas bills by 44% in the past five years. The availability of low-cost gas in the Marcellus Basin and the lack of infrastructure to move the gas to market has been a source of volatility in the Power markets. Power's combined-cycle assets in PJM enjoy an economic advantage given access to low-cost supplies in the Marcellus,

final

Bloomberg

final

particularly during the summer period.

As a practice, we don't, as you well know, forecast results for PSEG Power beyond the current year and outside of what is implied by market prices but we will make note of some consistent improvement in demand that is showing up here in our region.

The results of PJM's recent capacity auction point to an improving market environment with the retirement of older inefficient generating capacity as environmental rules take effect. Power's assets in PJM will also once again receive a price that continues to reflect our assets' value given their location relative to load. So, for the next four years, Power's assets will receive a price per capacity of approximately $166 per megawatt day.

The Power markets have gained greater clarity on another key environmental priority. We are pleased that the Environmental Protection Agency has issued its ruling on cooling water commonly referred to as Section 316(b). The Agency's ruling substantially addresses many of our concerns and we are working with the appropriate state environmental agencies on permitting of our affected units.

On another environmental matter, the EPA also released its proposed rules concerning a reduction in CO2 from existing generating units. We are supportive of the administration's efforts to enforce the Clean Air Act. Power has made the necessary investments to meet existing air quality environmental requirements and although we expect it may take some time to implement final rules regarding carbon, given the complexity of the proposal, Power's fleet should benefit given the generation profile that is almost 60% carbon-free.

Before I conclude, I want to bring you up to date on matters relating to Power's trading arm, Energy Resources & Trade, which we commonly refer to as ER&T. As you recall, we indicated with our release of first quarter results that Power informed FERC, PJM and the Independent Market Monitor of PJM that it found errors in some components of its cost-based bids for its New Jersey fossil generation units. We began an internal investigation and have since notified FERC, PJM and the IMM that we identified and corrected additional errors. We are working with the appropriate parties but cannot provide you with a timetable as to when this issue will be resolved or whether or not we'll be required to recognize another charge against Power's earnings. We take pride in our performance and candidly, we did not live up to our own standards of applying sufficient rigor in this area. But I can assure you that we corrected all identified errors and we are instituting new processes and controls to reduce the likelihood of a recurrence of the situation. This issue does not change the strong underlying operating performance of Power's fleet of assets that continue to provide solid earnings and good cash flow, given the fleet's favorable location, close to load, its dispatch flexibility and fuel diversity.

Despite Power's strengths, we've nonetheless changed the profile of our earnings over the past several years. Our investment program focused on improving reliability and expanding the transmission system, has yielded the anticipated outcomes. PSE&G remains on course to achieve double-digit growth in operating earnings during 2014 as its contribution to earnings is expected to exceed 50% our forecast for the year. The Energy Strong related capital investment provides further support for our forecast of double-digit growth in PSE&G's rate base and earnings over the next several years.

Given the strength of Power's operations in the first half of the year and the growth of PSE&G, we feel comfortable saying we expect operating earnings for the full year to be at the upper end of our range of guidance of $2.55 to $2.75 per share assuming normal weather and operations. The growth in our capital program doesn't diminish the strength of our financial position and our balance sheet. We remain well positioned to deploy that balance sheet strength to meet shareholder objectives for long-term growth

And with that, I'll turn the call over to Caroline who'll discuss our financials in greater detail.

Caroline D. Dorsa

Thank you, Ralph, and thank you, everyone, for joining us this morning. As Ralph said, PSEG reported operating earnings for the second quarter of 2014 of $0.49 per share versus operating earnings of $0.48 per share in last year's

Bloomberg Transcript

second quarter. We provide you with a reconciliation of operating earnings to income from continuing operations and net income for the quarter on slide four. We've also provided you a waterfall chart on slide 10 that takes you through the net changes in quarter-over-quarter operating earnings by major business and a similar chart on slide 12 that provides you with the changes in operating earnings by each business on a year-to-date basis.

So I'll now review each company in more detail, starting with the PSE&G. PSE&G reported operating earnings for the second quarter of 2014 of $0.30 per share, compared with $0.24 per share for the second quarter of 2013 and results for the quarter are shown on slide 14.

PSE&G's operating earnings continue to benefit from an increase in revenue associated with an expansion of its capital program and tight control of operating cost. PSE&G's results for the quarter were also aided by a reduction in financing costs, as weather normalized sales growth, which remains consistent in the slowly improving economy.

FERC approved increase in PSE&G's transmission revenue under the company's formula rate was effective on January 1 of 2014. The increase supported a quarter-over-quarter improvement in the net earnings contribution from transmission of $0.03 per share. Weather conditions during the quarter were unfavorable relative to normal, and in comparison to conditions experienced in the year-ago quarter. And these conditions reduced quarterly earnings comparisons by $0.01 per share and offset the favorable impact on earnings from continued growth in demand for gas.

PSE&G's focus on controlling the growth in operating expenses, including a decrease in pension expense, led to an improvement in quarter-over-quarter earnings of $0.02 per share. And, although the level of debt on PSE&G's balance sheet has grown consistent with the expansion of its capital program, the actual overall cost of debt has declined as a result of the refinancing of higher-cost debt and a decline in interest rates. This reduction in financing costs improved earnings comparisons quarter over quarter by $0.01 per share.

The service area continues to experience a slow improvement in underlying economic conditions. Sales data for the first half of the year, which in general is more reflective of trends than quarterly data, indicate weather-normalized demand for gas grew by 4.4% as decline in prices and an improvement in the economy continue to support demand.

Weather-normalized electric sales increased by 1.6% during the first half. Demand from residential customers grew in line with customer growth of about 0.5% as demand from the commercial and industrial sectors improved by 2.1% and 1.7% respectively over the six-month period.

The New Jersey Board of Public Utilities, or BPU, approved PSE&G's Energy Strong settlement during May. The agreement calls for PSE&G to invest $1.22 billion over the next three to five years to improve the resiliency of its electric and gas grid. The addition of Energy Strong brings PSE&G's five-year capital program to approximately $11.3 billion versus our prior forecast of $10.1 billion in spending over the 2014 to 2018 time period and will provide further support for our double-digit earnings growth in PSE&G's rate base, as we've mentioned before.

PSE&G's operating earnings increased 22% during the first half of the year and supports maintenance of our forecast for growth in operating earnings for 2014 to $705 million to $745 million. Results for the remainder of the year will continue to reflect an increase in transmission revenue and a reduction in operating and maintenance costs, including pension expense.

Let's now turn to Power. PSEG Power reported operating earnings of $0.17 per share for the second quarter of 2014, compared with operating earnings of $0.24 per share for the second quarter of 2013. The decline in Power's results for the quarter is the result of the impact on production and O&M expenses associated with the extended outage at the Salem 2 nuclear facility and the maintenance outage at the Linden gas-fired combined cycle facility, during which we also upgraded the equipment to increase that station's capacity.

Power's quarterly earnings comparisons continue to benefit from a net increase in capacity revenue. Power received capacity prices of $242 per megawatt day during the first two months of the quarter versus $153 per megawatt day in the year-ago period before capacity prices reset to $166 per megawatt day effective June 1 of this year. This net increase in capacity prices improved quarter-over-quarter earnings by $0.04 per share.

The capacity price benefit plus benefits from lower-cost gas offset a decline in average hedged prices and the negative impact from relatively lower market prices in the East, resulting from transmission and generation outages outside of our region. Incremental production at the coal-fired and peaking stations partly offset the lower production due to the outages at Salem 2 and the completion of the capacity upgrade work at Linden. The net reduction in output, however, reduced earnings quarter over quarter by $0.03 per share.

Operation and maintenance expense or O&M expense was higher than the year-ago quarter. Again, the cost associated with the outage and upgrade work at Linden and the repair at Salem more than offset the benefit from the lower pension expense, and altogether reduced quarter-over-quarter earnings by $0.04 per share. An increase in depreciation expense was offset by a reduction in the tax rate and other miscellaneous items.

Outputs from Power's fleet was 5% lower in the second quarter compared to year-ago levels. Power determined in mid-May at the conclusion of Salem 2's normal refueling outage that was necessary to extend the outage to inspect and repair the reactor's coolant pumps. The unit was returned to service on July 14. The extended outage reduced the nuclear fleet's output in the quarter by 9% to 6.5 terawatt hours, 54% of our generation, and lowered the nuclear fleet's average capacity factor in the quarter to 80.5%.

Production from the gas-fired combined cycle fleet declined 11% in the quarter to 3.6 terawatt hours, 30% of our production, as Linden was out of service early in the quarter to complete maintenance and the work associated with the 63-megawatt increase in the unit's capacity, which is now in place. Production from the coal-fired and peaking units increased 27% to 1.9 terawatt hours, or 16% of generation, with improved market economics.

Power was able to meet its hedged obligations from its own generation despite the decline in output, given the fleet's net long position and the availability of the coal-fired units. Power has reduced the upper end of its forecast of output for the full year to 56 terawatt hours to 57 terawatt hours from the previous 56 terawatt hours to 58 terawatt hours to take into account the results for the second quarter. Our forecast which represents an increase in output for the year of 4% to 6% continues to assume normal operations and weather. Approximately 70% to 75% of generation for the second half of the year is hedged at $50 per megawatt hour.

Power has slightly increased its forecast of economic generation for 2015 and 2016 to 55 to 57 terawatt hours per year from the previous 54 to 56 terawatt hours. To take into account, normal operations and our estimates of economic dispatch. Power has taken advantage of the strengths in market prices earlier this year to hedge the gas-fired combined cycle fleet into the third quarter and also increased percent of generation hedged in 2015 and 2016 to the upper-end of the normal limits that we would normally see at this time. That's in order to take advantage of some opportunities we saw to lock in heat rate and spark spread.

Liquidity has improved somewhat into 2016, but generally speaking, we can think of liquidity as poorer the further you get beyond 2015. Power's combined cycle fleet also benefits in the summer months from its access to low-cost Marcellus gas. Economics are particularly compelling as gas prices have declined more than power prices which has allowed Power to do that heat rate lock-in.

For 2015, Power has hedged 65% to 70% of its forecast generation at an average price of $50 per megawatt hour. For 2016, Power has hedged approximately 30% to 35% of its generation at an average price of $51 per megawatt hour. Hedge data for 2015 also reflects the change in our forecast for the BGS volumes. As a result of the extreme volatility in market prices for energy experienced earlier in the year, we have seen some return of customers to the BGS contract, but not a lot.

So our forecast for 2015 now assumes BGS volumes represent 11 terawatt hours of demand, more in line with the forecast volumes for 2014 and our prior forecast which had assumed BGS volumes of 10 terawatt hours as we move into 2015.

As Ralph mentioned, we are working with FERC, PJM and the Independent Market Monitor, or IMM, to determine the impact of identified errors in our bidding processes. We recorded a charge to operating earnings of $25 million, or $0.03 per share in the first quarter based on the information available at that time.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15114

Upon discovery of the errors, we initiated an investigation and identified additional errors in our bids and further determined that the quantity of energy that Power offered into the day-ahead energy market for its fossil peaking units differed from the amounts for which Power was compensated in the capacity market for those units. Based on information currently available to us, we've generally not seen an impact on our real-time operations for these units.

We informed the FERC, PJM and the IMM of these additional issues, and we have corrected these errors. We have not recorded an additional charge to income in the second quarter over the amount we reserved earlier this year. PSEG doesn't have access to PJM's proprietary data to determine if the differences in quantity had any impact and if so, the level of that impact. However, FERC has the authority to investigate the matter, which could result in FERC seeking disgorgement of any over-collected amounts, civil penalties, and non-financial remedies.

The forecast range of Power's operating earnings for 2014 remains unchanged at $550 million to $610 million with full-year operating earnings expected to be at the upper end of the range, assuming normal weather and normal unit operations.

Our forecast includes all of the issues we just discussed including the $0.03 per share charge in the first quarter related to the items I just discussed. Results for the remainder of the year will be influenced by a reset in the average price received on PJM capacity to $166 per megawatt day which started in June, from the $242 per megawatt day we've seen previously, as well as the decline in the average price of energy hedges.

O&M expenses expected to compare favorably in the second half of the year given a reduction in pension expense and the absence of major outage-related work in the year-ago period. For the full year, however, Power's O&M is expected to be flat against 2013's experience given the increased cost associated with the extended outages.

Let me now turn briefly to PSEG Enterprise and Other. Operating earnings for PSEG Energy Holdings/Enterprise in the second quarter of 2014 were $7 million or rounded about $0.02 per share versus operating earnings of $2 million, or basically breakeven results during the second quarter of 2013. The results for 2014 reflect the inclusion of earnings from PSEG Long Island's operating contract and the absence of some charges in the year-ago quarter.

PSEG Long Island filed its first Utility 2.0 proposal on July 1 of this year. The proposal calls for investing $200 million in energy efficiency, demand response programs, distributed generation and related programs over a four-year period, beginning in 2015. And we expect a response to our proposal by year-end. We continue to forecast full year operating earnings for PSEG Enterprise and Other of $35 million to $40 million.

Just a brief note on financing. During the quarter, PSE&G issued a total of $500 million of medium-term notes, consisting of $250 million of five-year notes at 1.8%, and 30-year notes of 4%. These funds will be used to make PSE&G's capital requirements.

PSE&G's capital budget is currently 15% to 20% greater than what we told you in the spring, and is now expected to approximate $11.3 billion over the five-year period from 2014 to 2018, which brings our plans for our consolidated PSE&G capital spending to $13 billion over that same period.

We ended the quarter with debt representing 42% of consolidated capital. The improvement in PSE&G's earnings and cash flow, as well as our continued strong earnings and cash generated by Power, support our financing requirements without the need to issue equity. And I think we've demonstrated with the growth in PSE&G's capital program, we continue to seek opportunities to deploy our investment capacity to drive growth.

We continue to forecast operating earnings for the full year of $2.55 to $2.75 per share, but we do anticipate the results for the full year to be at the upper end of our range, assuming normal weather and normal unit operations.

And with that, we're ready for your questions. So, Kayla, I'll turn it back to you.

Q&A

Operator

Bloomberg
SI-SSA-0015-15115

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. [Operator Instructions] One moment please for the first question. Your first question is from Kit Konolige with BGC. Please proceed with your question.

<Q - Kit Konolige>: Good morning.

<A - Ralph Izzo>: Good morning, Kit.

<Q - Kit Konolige>: Caroline, you just mentioned that company continues to see opportunities to redeploy cash flow to drive growth. Can you – certainly, transmission investments are one major area there. Maybe you can outline for us. Are there other areas that you see – and Energy Strong, I guess, I should say as well. So those strike me as the two big buckets. What else should we be looking for? And are there other arenas that you're considering that may not be front and center now, but could be an afterburner effect later on?

<A - Ralph Izzo>: Kit, sorry to disappoint you, but Ralph will answer that instead of Caroline. So we only talk about things that are fully baked. But because this question comes up so often, I'll just give you a couple of examples. We have been in conversation with the BPU staff about a modest – by our definition, modest, $100 million energy efficiency program.

Ralph LaRossa is the incoming chair of the American Gas Association. He was in D.C. yesterday where he heard nothing but concern expressed by the Obama administration and many other attendees on methane emissions, fugitive methane emissions from gas pipes and our BPU has just really supported a gas cast iron maintenance infrastructure replacement program and you'll probably see that as the first thing in Energy Strong that we go in for an increase on. We had our first public hearing on Long Island over Utility 2.0, a $200 million program we put in, and I would say that if there was one message that came from that meeting, it was that we were being too timid, and it needed to be bigger. Now, that's only one of several hearings that we'll have on the subject. We'll get a chance to refresh that proposal in October.

So, the RCAP, I believe, came out just this past month, if I'm not mistaken. It usually comes out in June. I shouldn't say whether or not, that did come out in June this year, and we'll be looking at the PJM open window of some of the problems identified in there. I don't want to give a number there because I just heard it from Ralph only a day ago on that and that number moves around depending on the engineering analysis.

So, I just mentioned a few things that it all start at nine figures. And as Caroline mentioned, I think our five-year capital program increased by 50% from last year to this year, and it's now up by 23% between March and July. So, I don't want to guarantee that that's what'll happen in the next quarterly call, but we don't seem to be running out of infrastructure needs in this region.

<Q - Kit Konolige>: Excellent. And just to focus on one item of infrastructure, can you give us the outlook for the Artificial Island project with the reconsideration now and how we mark our scorecards to see this going forward?

<A - Ralph Izzo>: Well, I was hoping that you would have the answer for that. I mean...

<Q - Kit Konolige>: Yeah, sure.

<A - Ralph Izzo>: This is witnessing the making of sausage, the making of law and the making of everything else. I mean in defense of PJM and they don't need me to defend them, this is a brand-new tariff in response to a brand-new regulation and a first-time major process. So, we're seeing growing pains. I would be less than 100% candid if I didn't express disappointment at the board's action last week. Having said that, what the board said is they are inviting the finalists, and we are one of the four finalists, down from whatever the original number was, which is a number I think at least double that. And they want some more information. And I don't even know the exact nature of the additional information they want. I do know that we're going to do $2.2 billion of transmission this year on top of $1.6 billion of transmission last year. And we've got a great team who will be able to answer any one of their questions and outshine the competition. So I think it's just growing pains of a brand-new tariff and a brand-new program that PJM is experiencing right now.

<Q - Kit Konolige>: Great. Okay. Thanks a lot.

<A - Kathleen A. Lally>: Next question?

Operator

The next question is from Julien Dumoulin-Smith with UBS. Please proceed with your question.

<Q - Julien Dumoulin-Smith>: Hi. Good morning.

<A - Ralph Izzo>: Hey, Julien.

<Q - Julien Dumoulin-Smith>: So, perhaps going back to the Energy Strong side of the equation, just following up there, I mean, obviously, there's a number of things that didn't ultimately get put into that package. Is there a potential to go back and pick up some of those last items and kind of reflect that in your CapEx here at some point?

<A - Ralph Izzo>: Yeah. So the answer to that, Julien, is yes, I think if I could steer you in certain directions, it's more likely that we'll go in first on the gas side because that work is expected to be complete in a two- to three-year timeframe. And just the fact that – notwithstanding that that'll be our fourth request for gas infrastructure improvement, these things take many months to get approved. So we wouldn't wait until we were running out of work, and – I'm sorry, running out of approval, because there's no chance that we'll run out of work.

On the substation work, that really is scheduled to go five years. And candidly, we are not convinced that given the amount of transmission work that we have and the 29 switching and substations that we plan to work on that we want to put the system much more in a configuration that is as tenuous as it would be with all of that electrical work going on.

Some of the stuff that went away was making the distribution system smarter. That one is a little tougher to predict. So a little bit of a long-winded answer, but the short answer is there's no doubt that before the three- to five-year period is up, we will be back in. And my prediction today would be that we would be back in on the gas pipe replacement first and foremost.

<Q - Julien Dumoulin-Smith>: Got you. Any sense of magnitude there or is it still too early here – ?

<A - Ralph Izzo>: We've tended to talk about $250 million to $300 million a year as about the size of the program that we can reasonably manage. If there were emergency issues, which we do not have, you'd somehow find a way to do more than that. But right now, the emergent issue that seems to be coming up is the order of magnitude increase in greenhouse gas effect that comes from fugitive methane emissions and the desire in the policy circles, fairly prominent policy circles to do more about that.

<Q - Julien Dumoulin-Smith>: Excellent. And then, going back to the Artificial Island side of the equation, just to be clear, is this really about capital costs and who can deliver the cheapest project, and is that where this is headed? I mean, it's tough to tell obviously. Or is this about terms, conditions ultimately indicating that you can partner with or someone else can get involved in your territory?

<A - Ralph Izzo>: No, I think it's more the former, but simply answering the question that way oversimplifies it, right. So, I mean, these are complicated engineering solutions to a sophisticated set of assets in the infrastructure. So it would be a mistake for anyone to assume that just because a project is less expensive than another, that it is preferred from a consumer point of view. That's the equivalent of saying, gee, I could buy that car for $10,000, and that car for $100,000, I should buy the $10,000 car. And then you fail to recognize, but, no, you needed that $100,000 crane because you're in the construction business, and the $10,000 Smart Car isn't going to quite help you be able to move equipment around. That's a – I'm sure I don't have the right brands and dollar amounts there, but you know my point that these are not commodity services. These are sophisticated engineering services.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15117

The terms-and-conditions issues that you allude to is – I think it's fairly well understood that some people have come in after the process and said, well, we'll guarantee a price. Well, a prudent buyer would say, well, let me understand that guarantee. Is it bumper to tailpipe? Is it just the drivetrain which doesn't fall apart but for 200,000 miles, and now you've extended the warranty from 50,000 to 75,000 miles? So there are some terms-and-conditions elements. There are some pricing elements. And I think that's why the PJM board simply said, gee, we're getting a little bit more noise in the system than we'd like to under first time in a project. And I don't mean to speak to the PJM board. I don't have that ability. But let's just ask more questions. They did not come out and say, you picked the wrong project by any stretch of the imagination. They just want more information on those issues that you implied would be front and center.

<Q - Julien Dumoulin-Smith>: Right. Excellent. Thank you.

<A - Kathleen A. Lally>: Next question?

Operator

The next question is from Paul Patterson with Glenrock Associates. Please proceed with your question.

<Q - Paul Patterson>: Good morning.

<A - Caroline D. Dorsa>: Good morning.

<A - Ralph Izzo>: Good morning, Paul.

<Q - Paul Patterson>: There was some discussion surrounding the Pepco acquisition. And of course you guys are located in New Jersey, and I'm sure you guys are aware of the press reports. I'm just wondering sort of philosophically, if you look at the potential amount of leverage that might be used in that transaction, and what you're seeing with respect to the discussion of the CTA in New Jersey, is there any change or thought that you guys might have in terms of leverage over the long term at public service?

<A - Caroline D. Dorsa>: Sure, Paul. It's Caroline. Thanks for the question. So yeah, we obviously saw what Exelon said in terms of how they were financing that acquisition. So part of that, I guess I'd characterize as not really surprising. We look at our own balance sheet, and we obviously are always in discussions with the rating agencies. Given the fact that we don't have any parent leverage, right, we have the occasional commercial paper, but our long-term debt is at our operating companies.

We talk about investment capacity, we tend to talk to you about Power and Power's debt-to-cap profile, where that stands at the end of a period, and what its investment capacity is. But we've always recognized that we do have incremental investment capacity at the parent that we could deploy. And in conversations with the rating agencies, the deployment for that to regulate it, right, investments is something that works very well.

So, the way I look at that is given where Power's performance has been, and we know where the company ended the quarter, and Power, of course, ended the quarter debt-to-cap at 32%, there's significant amount of capacity at Power, but there also is that parent-related investment capacity. And so when we talk about things internally in terms of opportunity, some of the things that Ralph was mentioning earlier, we look at that from the perspective of having a balance sheet that has a lot of room, not just the room for Power, but also the room for parent if it's oriented towards regulated. So, maybe that was the first largest announcement of use of that kind of capacity that we've seen, but we recognize that we have it as well and, of course, continuing to run our businesses appropriately and keeping the right capital structure of PSE&G, et cetera, and then seeking out regulated opportunities. So I look at that as just reinforcing the fact that we have ample room.

<Q - Paul Patterson>: Okay. And then with respect to this PJM Independent Market Monitor stuff, I wasn't completely clear exactly what you guys indicated happened. It suggested that there were some additional pricing areas in the cost base bids that were identified with the quantity of energy that Power offered into the energy market; that differed from the amount that Power was compensated in the capacity market for those units. I'm just trying to get an idea, what does that actually sort of mean in a more – for somebody who's a little bit less sophisticated on what actually

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15118

happened, I guess?

<A - Caroline D. Dorsa>: Yeah. So you had it right in terms of, in the first quarter, we talked about the cost-based bids and then the incremental information that we identified during this quarter was other errors but also this capacity issue. And so, sort of try to – say it again. So we had, we offer, of course, our units into the day-ahead energy market. We offered an amount of megawatts into the day-ahead energy market. And what we have seen is at times, we did not offer the capacity into the day-ahead energy market that was equivalent to the amount of capacity that we have, we were getting paid for from the capacity auction results.

So, as I said, generally speaking, what I'm talking about is offering into the day-ahead market that differential, not generally speaking impact on the real time operation of the units. So it's about the bidding in the day-ahead, generally speaking more than it is about the operation in the real time. So, it's a differential. As I said, we're in the process of investigating that, doing the analysis and working with the IMM and PJM and we've informed FERC. This day-ahead, this issue about the capacity difference, you may recall I mentioned in my remarks, this is about our peakers, so not about all of our units but our fossil peaking units in the day-ahead market.

<Q - Paul Patterson>: Okay. I got you. Okay, and then just finally, the methane emissions issue and the policy objective and the opportunity, you mentioned that, I think this might start with a nine figures, could you just – could you give us a little bit more of a flavor sort of the total opportunity that might be involved in that? I noticed this other stuff that was coming out yesterday from the DOE and I just suppose – I was thinking about this. Is there any more you can share with us about what that could possibly mean, these methane leaks, sort of plugging them up and the benefit there?

<A - Ralph Izzo>: We have – I think, I'm being told – 4,000 miles of cast iron main pipes that needs to be replaced. I don't know the amount of bare steel pipes that we have that needs to be replaced. And typically speaking, what Energy Strong had how much – for how many miles?

<A - Caroline D. Dorsa>: We're doing 350 miles for Energy Strong.

<A - Ralph Izzo>: 350 miles...

<A - Caroline D. Dorsa>: $1.4 million per mile.

<A - Ralph Izzo>: Yes. So, it's about $1.4 million per mile, Paul so, you could take that 4,000 miles and multiple by $1.4 million. That should give us really rough ballpark here. Yeah, it was $350 million in Energy Strong to replace 250 miles.

<Q - Paul Patterson>: But for the methane escape issue, wasn't that sort of a climate issue that's separate from Energy Strong, I thought that was an additional amount?

<A - Ralph Izzo>: Yes. Yes. Yes. That's correct, Paul. So, I was connecting two disparate thoughts. So, we've been on a longstanding program to replace our cast iron main, because it is the oldest part of our gas distribution system, it's the leakiest part of our gas distribution system. It doesn't have any safety consequences from the point of view of high pressure. It's a low-pressure, low-utilization system. But just from the point of view of good operational practices, you don't want leaky pipes. What's been added to the calculation of why it's important to do it is concern over of the greenhouse gas effect associated with methane, being I think I've read estimates of 30 to 35 tons more impactful per pound of CO_2. So that's just an added impetus for a program that's been underway for many years now to replace the cast iron main.

<Q - Paul Patterson>: So you don't have a dollar number sort of or...

<A - Ralph Izzo>: Yes, if you want to replace all 4,000 miles, you can multiply...

<Q - Paul Patterson>: Okay. Okay, I got you. Okay. Thanks so much.

<A - Kathleen A. Lally>: Thank you. Next question.

Operator

The next question is from Dan Eggers with Credit Suisse. Please proceed with your question.

<Q - Dan L. Eggers>: Hey, good morning, guys.

<A - Caroline D. Dorsa>: Good morning.

<Q - Dan L. Eggers>: Just can you maybe give us an update, or is there a way to quantify how much benefit you guys saw in the second quarter, because of the advantaged gas supply contracts at Power, and how should we think about maybe the benefit in the third quarter this year versus last year, seeing how wide based this is today?

<A - Caroline D. Dorsa>: Yeah. Sure, Dan. Thanks for the question. So, not much impact in the second quarter. So, about $0.01, even that's rounded into the numbers I gave you relative to overall pricing impacts offsetting capacity upsides. That's not so surprising to us. Remember, we talked about last year in the second quarter was when we actually first saw this differential come into play.

And actually, it had a similar impact in last year's second quarter, again, rounding to about $0.01. You may remember with the third quarter that we actually talked more about it, because with the summer season, we had a nice warm summer last year, you had that supply-demand imbalance. More supply trying to get on to the pipe, right? And so the differential widened out and we got about $0.03 a share benefit in the third quarter. So, not surprising in the shoulder season and of course, this is the season where we haven't had as normal weather as we would normally have at the end of the second quarter. It's cooler than normal and cooler than last year. You're not seeing a lot of that benefit. Not surprising, we wouldn't see as much.

So differential for [ph] LIDE (45:43) is ranging and looking a little bit ahead, $0.50 to $1 right now just given supply-demand issues as people refill storage. And that's not surprising. We saw – depending on those supply-demand conditions, you can see that base has really moved around. So we still think obviously we're well positioned. And whenever we can capture that advantage, we will take it and you'll see it come through our numbers. Can't really forecast obviously the rest of this quarter, obviously, what the summer turns out to be. Cool in my house this morning. I don't know about yours. But we'll see how that goes.

But we still have that evergreen opportunity on the pipeline with those contracts that Power has. Residential customer of course gets the first claim. That's why you don't hear us talk about it in the winter, right, because the residential customer is using it for heating. But in the summer where there's obviously not as much heating demand, we can get that benefit.

So I still think it's something you should look to us to try to capture whenever we can. We'll report on how we do at the end of the summer in the third quarter. But as I said, not surprising the 2Q is about the same as last year's 2Q, and again a reminder that that advantage Power has is an evergreen advantage. Overall, you may remember last year we said about 25% of the gas that we use for our generation on a net basis, net 25% across the year, is [ph] LIDE (47:05) source, but it's peaky, right? It's peaky in that summer period. It's much less so in the winter.

<Q - Dan L. Eggers>: Thank you for that. And yes, it was cold in the city this morning, too. So it brings me to my next question, the guidance kind of pointing to the top end of the range. How is that reflecting kind of the absence of July weather so far?

<A - Ralph Izzo>: Yeah. So, Dan, whenever we give information, it's up to the minute. So, we obviously have taken into account July and we've looked at a 10 to 14-day forecast and all of that's factored in. By the way, I just saw yesterday that it is being called a Polar Vortex again. So, evidently in July, that's 74 degrees versus the negative 17. But yes, the recent weather and the near-term forecast is included in the upper end of the guidance. Thanks for asking that because beyond that range, we would assume normal weather.

<Q - Dan L. Eggers>: Okay. And then I guess it's the last question. Caroline, how should we think about tax rate for this year given the fact the rate came in lower in the second quarter, and what would be the expectations for next year.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15120

<A - Caroline D. Dorsa>: Yeah. So, I think in terms of tax rate, you should pretty much think of our tax rate as relatively steady for the businesses. Sometimes, we have small adjustments in the tax rate, just a little bit of benefit in Power for the tax rate this year. We've closed on audits. Obviously, sometimes that affects things, production deduction, you calculate that as you look at the overall, the amount of generation that you source from the market versus what you produce. Those kinds of things I think of just noise. So, I would say, think of your tax rate as basically consistent for Power and to the utility on a year-on-year basis. The only thing that might bounce your tax rate a little bit on a quarterly basis now that we have the solar source business in Power and solar source goes into as the unit comes into service. You see that a little bit of boost benefit, if you will, right, a little bit of benefit for the portion of the ITC that you see kind of run through the P&Ls as a permanent difference. Other than that, I think you should expect it to be pretty smooth.

<Q - Dan L. Eggers>: Okay. Thank you very much.

<A - Kathleen A. Lally>: Sure. Next question?

Operator

The next question is from Travis Miller with Morningstar. Please proceed with your question.

<Q - Travis Miller>: Morning. Thanks.

<A - Caroline D. Dorsa>: Morning.

<A - Ralph Izzo>: Morning, Travis.

<Q - Travis Miller>: Wondering about the outage at Salem. Was there anything in the works that you did there that perhaps, I guess, for lack of a better term, pulled ahead work or work that you would have done or had to do in a year or two years that you're able to do at this point? Is there anything in that...

<A - Ralph Izzo>: Nothing that would meaningfully change the duration of an extra fueling outage, Travis. But believe me, that topic was front and center often as we waited for the coolant pumps to come back from the refurbishment of the vendors. But by no means are we skipping outage or nor should you think about any material shortening of the next refueling outage. It should be 18 months from now.

<Q - Travis Miller>: Okay. And a different topic, but now that you have certainty on the Energy Strong investment needs, what are your thoughts around equity needs and use of balance sheet right now and use of retained earnings financing that?

<A - Ralph Izzo>: Yes. So we consistently and remain firm that, in our belief, that we do not have any need for outside equity for the fairly robust capital program we have. Caroline, you may want to add to it.

<A - Caroline D. Dorsa>: Yeah. Travis, as I mentioned just earlier, we closed the quarter with the debt-to-capital of the company at 42%, and for Power at 32%. We also talked about the fact that we know if we had more regulated investments to do, we even have parent debt capacity. So there's lot of room on the balance sheet, not to say that we haven't used it right, consistently identified things, as Ralph has mentioned, to put balance sheet to work. But when I look at this and then I look at the things that we were just talking about earlier, whether it's more on the gas side that we might be able to do on next round of something following Energy Strong, more transmission in the open window, potential for Artificial Island if it comes our way, potential for more things that we might identify on an infrastructure basis.

And I look at a lot of those kinds of things that we identify, and they do add up. But none of them add up to suggest that the balance sheet we have can't support that and more, and of course, for things like transmission, as you know, under our formula rates, it's a real time, we're not lagging, and so cash comes back as well. So I look at this and say we have our conversations and talk about opportunities. We have a balance sheet that can support that, and nothing gets close to equity issuance.

<Q - Travis Miller>: Okay. Great. Thanks a lot.

<A - Caroline D. Dorsa>: Sure. Thank you.

<A - Kathleen A. Lally>: Next question?

Operator

And the next question is from Jonathan Arnold with Deutsche Bank. Please proceed with your question.

<Q - Jonathan P. Arnold>: Good morning, guys.

<A - Ralph Izzo>: Good morning, Jon.

<Q - Jonathan P. Arnold>: I just wanted to understand a little better the thought process behind the charge related to the cost-based bidding issues. So in the first quarter you identified the initial issue, you took a charge, you didn't tell us how much it was. And then this quarter, you are telling us how much that charge was. You've identified the issue might be broader and have some other aspects to it but you haven't added to the charge. So should we read into that that you feel that you took adequate reserve or you just have no way of estimating it? If that was the case, initially why did you come up with $25 million? So is there any context, if you can give that, Ralph?

<A - Caroline D. Dorsa>: Sure. I'll answer that, Jonathan. So thanks for asking the question. We should be clear here. So as you recall, we said we took a charge in the first quarter. We didn't identify what it was. So, obviously, that was a source of a lot of conversations. So we thought it was appropriate to tell you what we took in the first quarter, which was the $25 million, the $0.03 a share, it was all embedded into Power's operating earnings for the first quarter. And the standard on which we rely here in determining that charge is the accounting standard for contingencies. So you may be familiar with it, but if not, let me just be a little bit descriptive.

The accounting guidelines for the time for which we took the charge in the first quarter essentially work this way. You take a look at what a potential issue might be if you need to take a charge or a reserve. And if you identify a particular number that you think is the most likely number, then you book that. If you don't know a most likely number but you have a range of potential outcomes, all of which, given the level of uncertainty, you can't really ascribe differential probabilities to, then you book the low end of that range. And that's what we did in the first quarter. That's what the $25 million represented when we took the charge in the first quarter.

As I mentioned during the remarks and also in earlier question, we've identified some additional errors as well as this quantity matter that I was just describing before as well. And so, as we looked at the second quarter, we didn't have any basis on which to revise that number or change that number, and we determined that we would leave that number where it is. So that – what I'm saying here is you should not interpret that to say that is the best number. When we took the number, the charge in the first quarter, we were taking the low end of the range. And at this point, we don't have any sufficient additional information to change the value right now because we're in the process, as I mentioned, and that process could result in a change in the value.

<Q - Jonathan P. Arnold>: Okay. Thank you, Caroline. One other follow-up on that, too. Is there any aspect of this which is sort of ongoing, affecting your earnings power at Power that caused some of these changes in practice and systems you talked about? Do they – are we going to notice any of that?

<A - Caroline D. Dorsa>: No. So the guidance that we gave you and the upper end of the range guidance, we're really talking about Power's operational earnings power. And Power's operational earnings power is unchanged in how we bid the units and how the units run and the capacity factors and Salem getting back, and Linden having more megawatts. So we don't see this as changing the ability of Power to continue to garner the value it garners from its locations. So I would say no to that. This is something we need to work through, and we will update you as we go. And there may be more to say in subsequent quarters because we are just in the process now, but it doesn't change the fundamentals of how you should think about Power operating in the market.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15122

<Q - Jonathan P. Arnold>: Is this more a sort of retroactive thing, that there are either penalties or disgorgement or whatever that may occur, but the go-forward is not really affected.

<A - Caroline D. Dorsa>: So you're correct, this is something that may result in incremental charges. It may result in penalties. But we just don't know enough right now to give you any guidance in that regard.

<Q - Jonathan P. Arnold>: Okay. Do you have an update on when you think you might have some clarity on that? Apologize if you already said that.

<A - Caroline D. Dorsa>: No, that's okay, Jonathan. No, we actually – we don't. As I mentioned – or as we mentioned earlier and Ralph mentioned as well, we did inform FERC, we've been in discussions with PJM and the Independent Market Monitor. So there are many parties into this conversation, appropriately, and so we can't really give an estimate of the timeframe at this point. We're continuing to obviously work with all those parties.

<Q - Jonathan P. Arnold>: Thank you.

<A - Caroline D. Dorsa>: You're welcome.

<A - Kathleen A. Lally>: Next question?

Operator

The next question is from Paul Fremont with Jefferies. Please proceed with your question.

<Q - Paul B. Fremont>: Thank you very much. Really two things. One, can I get a reaction to the staff recommendation on the consolidated tax adjustment and what that might mean for Public Service Electric & Gas?

<A - Caroline D. Dorsa>: Sure. So, the CTA has recommended – of course, which is not final, right, it's just recommended – takes a view of taking a five-year look-back from the date of filing, also takes a view of separating out transmission from distribution, and then 75% to the company, 25% for the benefit of the customer. So we think that is a very good outcome, and we think if that were to be the final rule, we think that will be fine from a PSE&G perspective and would continue, we think, to appropriately reflect how to think about taxes and, therefore appropriately encourage incremental investment. So, if that were the outcome, which, as I said, is not the final outcome, that would be a good outcome from our perspective.

<Q - Paul B. Fremont>: And, I mean, are you able to sort of quantify the potential rate base impact if that recommendation were adopted?

<A - Caroline D. Dorsa>: Yeah. It would be de minimis. It would not be material.

<Q - Paul B. Fremont>: Okay. And then the second question I have is, you guys mentioned the 316(b) final rules at EPA. Where do you currently stand with the Salem water discharge permit?

<A - Ralph Izzo>: So, I believe our Salem water discharge permit expired some years ago, and it's been held in abeyance, waiting for the EPA rules to come out. So we have had some very preliminary meetings with DEP staff, not only on Salem but some of our fossil units that now can have their permits refreshed, given the promulgation of the rule. I'm pretty sure that the 316(b) rule as proposed by EPA named traveling Ristroph Screen as the best technology available for impingement. Entrainment is more of a site-specific determination. So what we – that rule was, the ink wasn't dry when we called the DEP and said, let's talk about these permits.

<Q - Paul B. Fremont>: So, you're essentially – you would like to see sort of a ruling that's consistent with the EPA standards then at the state level?

<A - Ralph Izzo>: Yes, yes, that's right, Paul. That's right.

<Q - Paul B. Fremont>: Okay.

<A - Kathleen A. Lally>: Thank you. Operator, I think we're going to move to closing comments right now, given the fact we're at the noon hour. So I'm going to turn it back over to Ralph for closing comments before concluding.

Ralph Izzo

Thanks, Kathleen. So, just to recap, we obviously had some help from the weather in the markets earlier in the year, mostly weather early in the year, and a little more help from the markets early in the spring, which we were able to capitalize on with some of our hedging activity, as Caroline described to you.

We're not getting any help from the weather lately, and we didn't do ourselves a favor with some of our operational challenges in the spring. But when they add up all of those challenges, whether it's weather or operational, I am pleased to guide you to the upper end of the range, even having put all that into the stew. And I'm even more happy about the fact that all of those challenges are in the rear-view mirror and that the plants are running well now. And as Caroline's dialog with Jonathan alluded to, even the bidding issues at our trading group, we've corrected it in the – the areas that we were aware of have been corrected, and that's in the rear-view mirror.

The balance sheet remains strong. The investment program is on track. We don't need new equity. We can do all of that and still support growth in the dividend.

So, with that, I'll just say thank you for joining us on the call. We'll see you in various venues in the fall, and I'm sure at EEI late in the fall and that'll be it from here. Thank you all.

Kathleen A. Lally

Thank you, operator. With that, we're going to conclude today's call.

Operator

Ladies and gentlemen, that does conclude your conference call for today. You may disconnect and thank you for participating.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Ally, and I am your event operator today. I would like to welcome everyone to today's conference call, Public Service Enterprise Group First Quarter 2014 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. [Operator Instructions] As a reminder, this conference is being recorded today, May 1, 2014 and will be available for telephone replay beginning at 1 o'clock PM Eastern Time today until 11:30 PM Eastern Time on May 8, 2014. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, Ally. I appreciate that. Good morning, everyone. I apologize for the slight delay in our call this morning. I appreciate your patience with us, as there is a lot earnings calls this morning. We do appreciate your participation in our earnings call. And as you are aware, we released first quarter 2014 earnings statements earlier this morning. And the release and the attachments are posted on our website at www.pseg.com, under the Investors section. We also posted a series of slides that detail operating results by company for the quarter. The 10-Q for the period ended March 31, 2014, is expected to be filed shortly.

I'm not going to read the full disclaimer statement nor the comments we have made on the difference between operating earnings and GAAP results, but as you know, the earnings release and other matters that we will discuss in today's call contains forward-looking statements and estimates that are subject to various risks and uncertainties. And although we may elect to update forward-looking statements from time-to-time, we specifically disclaim any obligation to do so, even if our estimate changes, unless of course, we are required to do so.

Bloomberg Transcript

Our release also contains adjusted non-GAAP operating earnings. Please refer to today's 8-K or our other filings for a discussion of factors that may cause results to differ from management's projections, forecast and expectations, and for a reconciliation of operating earnings to GAAP results.

I would now like to turn the call over to Ralph Izzo, Chairman, President, Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Caroline Dorsa, Executive Vice President and Chief Financial Officer. And at the conclusion of their remarks, there will be time for your questions.

Ralph Izzo

Thank you Kathleen, and thank you everyone for joining us today. Earlier this morning, we reported operating earnings for the first quarter of 2014 of $1.01 per share. That's a 19% increase over the first quarter of 2013's operating earnings of $0.85 per share. I'm extremely pleased with PSEG's result. We delivered on many fronts during the quarter.

For anyone on this call, listening, who resides on East Coast, I don't need to tell you how cold it was this winter. You experienced the polar vortex and we experienced it as well. The record low temperatures challenged our employees, our equipment and our markets. Our readiness was tested at a critical time, in the efforts that PSEG's employees put into secure the availability of our equipment and maintain the reliability of the system was evident and appreciated by customers.

The extreme cold weather caused stress around the system from freezing coal handling equipment at some facilities and playing havoc with other equipment, which resulted in force outages at some of our coal, gas and peaking units. And there was a need to respond to the stress, the weather placed on our electric and gas distribution system with additional repair work. Despite these challenges the strength that Power's fleet was demonstrated in the first quarter through its dispatch flexibility and diverse fuel mix.

Our dual-fuel coal units were able to run on gas and when necessary our peaking units with dual-fuel capability ran on fuel oil when gas wasn't available. And our nuclear fleet continued to perform at high level operating at a 100% capacity factor. Even though some of our gas generation was curtailed, we were able to get sufficient gas to operate our units at critical times.

Our coal and peaking stations responded to the improvement in market economics and given the responsiveness of our employees, the impact of outages was limited and the fleet was available to meet the strong demand. The extremes in weather created substantial volatility in the market, PSEG Power's diverse fuel mix and dispatch flexibility allowed Power to capture margin on its net long position as it responded to the increase in demand.

The strong interaction between our station managers and commercial teams resulted in the adjustment of scheduled outage work and assured the supply of energy and support of customer needs. We were also able to pull forward major work at our Linden units to upgrade with advance gas path technology in advance of the summer season.

Our access to low cost gas supplies continue to yield benefits for our customers. During the month of February and March, PSE&G's customers received bill credits amounting to $115 million, that's an important savings at any time of the year. Our operating earnings in the quarter also reflect the benefit of an increase in the capital invested in our stable regulated business. This increased investment continues to drive earnings growth and improvement in reliability of PSE&G, as it transforms the profiles of our company.

PSE&G's capital program remains on schedule. In 2014, PSE&G is expected to invest $2.2 billion in electric and gas infrastructure upgrades to its transmission and distribution facilities to maintain reliabilities part of a five year $10 billion capital program. We reached the milestone as part of our capital program that we are quite proud of. The first segment of the Susquehanna-Roseland 500-kV transmission line went into service during the month of April.

We expect to complete construction of the S-R towers and the lines heading West to the Delaware Water Gap this summer. Our section of the line and investment of approximately $790 million will eventually connect with PPL's portion, and Susquehanna-Roseland is expected to be fully operational in 2015, when PPL completes construction on

final
Bloomberg Transcript
Bloomberg

the western portion of the line. This will be a major achievement. S-R's 2015 operational date would be 12 years after the August 2003 block out, and almost a decade as the PJM identify the critical system needs required to upgrade aging infrastructure and relieve overloaded Power lines.

PSE&G energies the Burlington-Camden 213-kV line this week, ahead of schedule. And it is on schedule to energize the North Central Reliability transmission line this summer. These projects represent a total investment of approximately $790 million and are designed to improve Power quality and system reliability.

All three lines are part of PSE&G's ongoing transmission program, representing $6.8 billion of the $10 billion capital program I mentioned a moment ago and providing double digit growth in PSE&G's operating earnings through 2016. As PSE&G's investment in transmission is expected to drive its earnings growth, it is also expected to further diversify PSE&G's asset base as transmission grows to represent more than 45% of PSE&G's rate base over the next three years.

Transmission lines and switching stations are the backbone of our electric grid, ensuring that we can transport Power to where it's needed safely and reliably. This will assume greater importance as we begin to experience growth, although still modest and weather-normalized electric demand.

The polar vortex exposed the critical need to maintain and improve on the resiliency of our infrastructure. The need to replace aging equipment and maintain the level of service demanded by our customers. And as highlighted the everyday truth that not investing in the system can have a real cause.

We expect the Federal Energy Regulatory Commission to rule on PJM's proposed changes for a demand response prior to the upcoming RPM Auction as a switch over to Power now. We're supportive of PJM's proposals, and believe the rule changes will be a good step in recognizing the need for a more level playing field among suppliers.

So as we look ahead, Power has also invested in necessary retrofits to its fossil units to meet existing environmental requirements. Earlier this week, the U.S. Supreme Court issued a ruling of holding the environmental protection agencies Cross-State Air Pollution Rule or CSAPR as we often refer to. As you may recall, this was vacated by the D.C. Circuit Court of Appeal. We're studying the ruling and await word from EPA on its intention with regard to implementing CSAPR. With this implementation, we would see reductions in NOx emissions in addition to the SO2 reductions achieved through the implementation of the Mercury and Air Toxic rule commonly refer to as MATS. The Supreme Court ruling validities the investments we made to satisfy environmental requirements and supports expectations for the retirement of plans that don't meet EPA requirements.

As I mentioned earlier, the first quarter represented a significant challenge. Through it, we demonstrated the strength of our assets and the talent of our employees. They are focused on the mission of providing safe, reliable energy allowed us to meet the needs of our customers and shareholders. The first quarter was very strong financially and operationally. Now, we are maintaining our operating earnings guidance for 2014 of $2.55 per share to $2.75 per share, given the importance of normal weather to third quarter earnings expectations for both the utility and for power.

We have a proven strategy and we continue to reap benefits from our robust business mix. Our strong financial position will allow us to meet our goals without the need to dilute shareholders through the issuance of equity and our employees provide me with a confidence in our ability to achieve our long-term goals.

With that, I'll turn the call over to Caroline, who will discuss our financials in greater detail.

Caroline D. Dorsa

Thank you, Ralph, and good morning everyone. As Ralph said, PSEG reported operating earnings for the first quarter of 2014 of $1.01 per share versus operating earnings of $0.85 per share in last year's first quarter. We provide you with a reconciliation of operating earnings to income from continuing operations and net income for the quarter on slide four.

As you can see in slide eight, PSEG Power provided the largest contribution to earnings. For the quarter, Power reported operating earnings of $0.58 per share compared with $0.50 per share last year. PSE&G reported operating

final
Bloomberg Transcript

earnings of $0.42 per share compared with $0.35 per share last year and PSEG Enterprise/Other or the parent, contributed operating earnings of $0.01 per share compared with breakeven operating earnings during the first quarter of 2013. We've provided you with a waterfall chart on slide nine to take you through the net changes in quarter-over-quarter operating earnings by major business. And I'll now review each company in more detail.

First, let's turn to PSE&G. As shown on slide 11, PSE&G reported operating earnings for the first quarter of 2014 of $0.42 per share compared with $0.35 per share for the first quarter of 2013. PSE&G's earnings for the first quarter reflect the benefit of an increase in revenue associated with its expanded capital investment program and improvement in demand and a reduction in pension expense. Slide 12 provides a reconciliation of the items that influenced PSE&G's quarter-over-quarter earnings.

FERC authorized PSE&G's request for an annual increase in transmission revenue under the company's formula rate filing. The increase in revenue, which was effective on January 1 of this year, supported a quarter-over-quarter increase in the net earnings contribution from transmission of $0.03 per share.

Demand for electricity and gas in the quarter was influenced by weather, which was significantly colder than both normal weather and the weather of a year ago. The impact of the colder than normal weather on electric demand added a $0.01 per share to quarter-over-quarter earnings.

The impact of weather on gas demand as you would expect was recaptured in the weather normalization clause and didn't impact earnings comparisons. Apart from the weather, an improvement in the weather-normalized gas demand and volumes added $0.02 per share to quarter-over-quarter earnings.

Gas deliveries continue to benefit from sustained low commodity prices and slowly recovering economic conditions. On a weather-normalized basis, gas deliveries are estimated to have increased by about 3.4% in the quarter. Earnings also improved by $0.01 per share due to a reduction in the effective tax rate and all other items. And the reduction in PSE&G's pension expense was fully offset by some higher operating and maintenance expense associated with weather related repair costs, resulting in a flat O&M comparison quarter-over-quarter. Economic conditions in the service area, led by the housing market, are exhibiting slow but steady signs of improvement.

On a weather normalized basis, electric sales are estimated to have improved by 1.3% in the quarter, led by a 2.9% growth in sales to commercial customers. But this level of growth may be greater than the underlying improvement in economic conditions, given Sandy related adjustments to billings in the year ago quarter. And you'll recall, we mentioned last year that Sandy impacted normal billing patterns during that quarter and immediately after. Weather normalized electric sales to residential customers are estimated to have increased by a more modest 0.6% in the first quarter.

Turning to investments. Despite the extreme cold weather experienced in the quarter, PSE&G has been able to maintain its schedule for capital spending and remains on target to invest up to $2.2 billion on electric and gas infrastructure upgrades during 2014 to maintain reliability. As Ralph mentioned, a portion of the Susquehanna-Roseland transmission line was energized from the new Hopatcong switching station to Roseland earlier this year and the North Central reliability and Burlington-Camden 230-kV lines are on schedule to be in service to meet this summer's peak electricity demand.

PSE&G is earning its authorized ROE for the 12 months ended March 31, 2014. We're maintaining our forecast for double-digit growth in PSE&G's operating earnings for 2014 to $705 million to $745 million, as well as expectations for double-digit earnings growth through 2016.

Now, let's move to Power. As shown on slide 15, PSEG Power reported operating earnings for the first quarter of $0.58 per share compared with $0.50 per share a year ago. The earnings release and slide 16 provides you with detailed analysis of the impact on Power's operating earnings quarter-over-quarter from changes in revenue and costs. Power's first quarter results, which are $0.08 per share higher than last year benefited from an increase in revenue. Higher capacity prices and improvement in the economic dispatch of Power's fleet and an increase in output more than offset the impact of higher costs associated with the need to meet the increased demand as well as the need to undertake planned outages and the cost associated with completing the capacity upgrade work at Linden.

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-15128

Now let's turn to Power's operations. Power's output increased approximately 3% in the quarter from the year ago levels and Power's assets were well positioned to take advantage of market movements in the quarter given Power's hedging strategy, dispatch flexibility and diverse fuel mix. The base load nuclear fleet operated at an average capacity factor of 100% in the quarter as Ralph mentioned and it produced 55% of Power's total generation in the quarter or 8 terawatt hours.

Production from the combined cycle fleet declined 8% to 3.4 terawatt hours in the quarter or 23% of total generation. Output at the Bethlehem New York facility was hurt by a decline in gas availability and Linden's availability was affected by decision to extend an outage to complete the AGP capacity upgrade work actually ahead of schedule. An improvement in dark spread supported an increasing output from the cold stations, particularly from the Connecticut based Bridgeport Harbor Station. So production from the coal fleet increased 15% to 2.6 terawatt-hours or 18% of total generation. The cold weather and increased demand supported the economic dispatch of the steam and peaking units, which provided 4% of the fleet's output in the quarter.

Slide 17 provides more detail on the generation in the quarter. The combination of higher capacity prices and an increase in market prices on Power's un-hedged position, more than offset the impact of lower average prices on hedges and the need to meet the demand under the fixed price full-requirements BGS contract. For the quarter, Power's gross margins as shown on slide 19, expanded to $50 per megawatt-hour from $47.50 per megawatt-hour last year.

Lastly, impacting electric gross margins, Power has identified that it incorrectly calculated certain components of its cost base bids for certain generating units in the PJM energy market, with resulting over collection of revenues related to its fossil fleet. Power has self reported the issue to FERC, PJM and the PJM Independent Market Monitor on this issue. The issue is still under review and we're unable to estimate the ultimate impact or predict any resulting penalties or other costs associated with the matter at this time. The company recognized the liability in the quarter related to this matter, but this impact is included in our calculation of gross margin, which continues to show quarter-over-quarter improvement to the $50 per megawatt hour level that I just mentioned.

Turning to the gas side, the contribution from Power's burn gas transportation contracts improved quarter-over-quarter earnings by $0.05 per share. The contribution to earnings is from Power's traditional gas supply business and it reflects the positive impact on earnings from higher volumes and the ability to price gas sold to commercial and industrial customers at market.

Looking forward, Power has increased its forecast generation output for 2014 to 56 terawatt hours to 58 terawatt hours from the prior estimate of 53 terawatt hours to 55 terawatt hours. The revised forecast reflects the increase in output during the first quarter and an expected improvement in the economic dispatch of the fleet. As always, our forecast is based on normal weather conditions for the remainder of the year.

Approximately, 70% to 75% of anticipated production for the April to December period is hedged at an average price of $49 per megawatt hour. Power has also increased its forecasted economic generation in 2015 and 2016 to 54 terawatt hours to 56 terawatt hours from 53 terawatt hours to 55 terawatt hours in each year.

For 2015, Power has hedged between 50% and 55% of its forecast generation at an average price of $51 per megawatt hour. For 2016, Power has hedged 25% to 30% of its forecast generation at an average price of $51 per megawatt hour.

Hedge data, as we show on slide 20 for 2014 and 2015 continue to assume BGS volumes will represent about 11 terawatt hours in 2014 and about 10 terawatt hours in 2015. We continue to forecast full year operating earnings for Power of $550 million to $610 million. Results for the remainder of the year will be influenced by a decline in the average price received on our PJM capacity to $166 per megawatt-day on June 1 of this year from the historically high level we're currently enjoying of $242 per megawatt-day, as well as a decline in the average price of our energy hedges.

O&M is expected to compare favorably given a reduction in pension expense and the absence of major outage related works that occurred in the second half of last year for comparison purposes.

Now, let me briefly discuss the operating results from Enterprise and Other. For the first quarter, PSEG Enterprise/Other or the parent, reported operating earnings of $0.01 per share, which compares with essentially

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15129

breakeven operating results during the first quarter of 2013. Results reflected a steady contribution to earnings from the lease portfolio and a contribution from PSEG Long Island. We continue to forecast full year operating earnings for 2014 for PSEG Enterprise/Other of $35 million to $40 million.

I want to point out that in April, PSEG and Power amended their credit agreements ending in 2017, which effectively does extend the expiration dates from March of 2017 to now April 2019.

Total credit capacity as of March 31, 2014 was $4.3 billion. PSEG has credit facilities amounting to $1 billion. Power's credit facilities totaled $2.7 billion. In addition, PSEG maintains a five-year credit facility amounting to $600 million. And a significant portion of our $4.3 billion of credit capacity expires post 2018, $2 billion matures in 2018 and $2.1 billion matures in 2019 with this recent extension.

As we said many times, we can finance our capital program without the need for the issuance of equity, given the strength of Power's cash flow and our already strong balance sheet with debt at the end of March 31 of this year representing 41% of our consolidated capital. And we ended the quarter with about $655 million in cash. We continue to forecast operating earnings for the full year of $2.55 to $2.75 per share.

With that, that concludes my comments and I'll now turn the call back over to the operator, and open the line for your questions. Ally?

Q&A

Operator

Ladies and gentlemen, we will now begin the question-and-answer session for members of the financial community. [Operator Instructions] And your first question comes from Jonathan Arnold with Deutsche Bank. Please proceed with your question.

<Q - Jonathan P. Arnold>: Thanks.

<A - Caroline D. Dorsa>: Good morning.

<Q - Jonathan P. Arnold>: Just on this reserve, Caroline you talked about in the quarter the cost based bidding et cetera, could you clarify was that just a first quarter item or did you reserve against something that relates to longer period of history? How long perhaps if that's the case?

<A - Caroline D. Dorsa>: Sure. So, thanks, Jonathan. So we booked a liability in this quarter based on errors that we identified and they're in certain bid adders, such as emissions historically. And we fixed all of the errors that we've identified in the bid adder arena that resulted in any over collection. So right now, we're assessing all other aspects of our model, any other identified and quantified errors will be fixed. We can't comment any further really at this point, other than to remind you that we have self reported and what we booked as a liability is reflected still in those numbers that I gave you that results in gross margin per megawatt hour increasing quarter-over-quarter to $50 per megawatt hour.

<Q - Jonathan P. Arnold>: Do you want to give us any sort of insight into what your – whether this is – there is some kind of historical liability kind of being booked against the first quarter?

<A - Caroline D. Dorsa>: Yes. It relates to errors we've identified historically. That's exactly right. But, since we're in this self report and the appropriate regulatory process, we can't get more detail of that at this time. And when the process is complete, we'll give the full information, but we can't do that quite yet.

<Q - Jonathan P. Arnold>: Okay. But is it safe to say that some element of – with un-quantified reserve that doesn't just relate to kind of retriggering how you presented first quarter, there is some costs stopping that too?

<A - Caroline D. Dorsa>: It relates to the past, correct.

final
Bloomberg Transcript
Bloomberg

<Q - Jonathan P. Arnold>: Okay. All right. When do you think we might have a better sense of how much that affected the quarter?

<A - Caroline D. Dorsa>: Yeah. So we're in the self report process discussions with PJM and the Market Monitor and the self report we just made to FERC. We want to see that regulatory process of course through the completion and can't really predict what that timeframe would be, but when we get to that, end of that timeframe, we'll disclose it as appropriate on the final results.

<Q - Jonathan P. Arnold>: Okay. And then, I think as we've been – you've been on the phone, it looks like an 8-K has hit within the information about an Energy Strong settlement?

<A - Ralph Izzo>: Yes, Jonathan. So let me talk about that. I wanted to spell one room and confirm one room. The one room I wanted to spell is that we moved to call up an hour and I couldn't get here on time, so we started five minutes late, not accurate. But we did have some tremendous progress last night. I had discussions with all the intervenors and in particular the board staff and this morning we were just trying to dot our Is and cross our Ts and have signatures on the settlement agreement and then of course to comply with FD. We needed to make sure that information was released. The earnings release went out ahead of the dotting of Is and crossing of Ts and we now have done that.

So I'm pleased to tell you that we have a settlement agreement with the staff. We expect many of the other intervenors to join, but we don't have their signature yet. I'm okay with that, the staff who we had always want to make sure we had the agreement with. It's a $1.22 billion program, about $820 million of that is electric and $400 million of that is gas. The allowed ROE is $9.75 billion, $1 billion of that will be recovered through the accelerated recovery mechanisms. $200 million of that will be done in 2017 timeframe when we will then file a rate case in November of 2017 with a three-month historic, nine-month look ahead profile. So that will be seven years plus from our last base rate case.

We would expect the BPU to approve this. They have not as yet. The schedule for approving it will be announced shortly and that will be a partial function of how many other parties sign on, although as I said I do expect most of the participants to sign on. So I noted they are not on the phone right now, but I just have to thank the 100 plus municipalities and counties who have supported us, the unions who have supported us, the hospitals who have supported us, the other parties who are engaged in the dialog for 15 months and our regulatory team. They just did a great job and we're just pleased to get this thing going right now.

I would view this as an important start to hardening the system. There's nothing in the settlement that says we can do the full [ph] $3.9 billion (30:00), I don't mean to suggest that, but there's nothing that says we can't. So I just view this as an important start and we will be measured by our success and effectiveness in hardening the system, as we should be, but I'm glad that we can get underway.

<Q - Jonathan P. Arnold>: Thank you, Ralph. Yeah, I guess, given that it's my question, can I just ask one clarifier on this?

<A - Ralph Izzo>: Sure, sure.

<Q - Jonathan P. Arnold>: So when you say that the $1 billion will be under accelerated recovery and then the balance, $200 million will be – so the $1 billion is for 2015 and 2014 through is 2016, is that correct?

<A - Ralph Izzo>: Yeah. It's unfortunately not quite so simple, Jonathan. Some of the stuff will get done in two years, some will take three and some will take five. The five year has to do with the substations that were underwater in Irene and in Sandy. And all of those, even those that go out to five years will be under the accelerated recovery mechanism. So there is $200 million of the program that is going to be done just leading up to the rate case, so what we agreed is we would just make that part of the prudency review, since there's really not a lot of time lag between the prudency review and the capital program, because none of this stuff gets recovered until it goes into service. So, we thought that that would be okay, that there would be no lag on that $200 million.

<Q - Jonathan P. Arnold>: The rate case will be filed within nine months of 2016, three months of 2017 for 1/1/2017 rate?

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15131

<A - Ralph Izzo>: No, no. The other way around, so when it goes in November 2017, it would be three months of actuals and nine months of forecast.

<Q - Jonathan P. Arnold>: So it will go in November of 2017. Okay. I got it. Three months...

<A - Ralph Izzo>: That's good because if I have to repeat it, I might not say it's the same way twice. It's three months of actuals and nine months forward; that's been our practice.

<Q - Jonathan P. Arnold>: Okay. Great. Thank you. I'll move along.

<A - Ralph Izzo>: Thank you, Jonathan.

<A - Caroline D. Dorsa>: Next question.

Operator

And the next question comes from Kit Konolige with BGC Financial. Please proceed with your question.

<Q - Kit Konolige>: Thank you. Good morning.

<A - Ralph Izzo>: Good morning, Kit.

<A - Caroline D. Dorsa>: Good morning.

<Q - Kit Konolige>: Just to follow a little on the Energy Strong, can you quantify how much this deal would be worth say in terms of EPS or...

<A - Ralph Izzo>: So Kit, we've pretty much given you a fairly consistent rule of thumb, that at our cap structure with these kind of returns it's about $0.01 for every $100 million of investment.

<Q - Kit Konolige>: Right.

<A - Ralph Izzo>: If that needs to be refined.

<A - Caroline D. Dorsa>: That's right.

<Q - Kit Konolige>: Right. And under this settlement, when would the investment start to be made and how would the rate base ramp up as a result of this?

<A - Ralph Izzo>: So I mean you should not expect a big impact in 2014. I don't have in front of me the exact capital program calendar, but most of it will be felt in 2015, 2016, 2017 and 2018.

<A - Caroline D. Dorsa>: And you may recall Kit, as we talked about in March, right, we forecast double-digit earnings growth, but also double-digit rate base growth even without Energy Strong as we talked about. So this enhances that to reinforce the strength of the rate base growth as double-digit and the earnings, but as Ralph said, not a material item at all for 2014.

<Q - Kit Konolige>: Right. Okay. And one other area to go back to, Ralph your comment on the auction, it sounds like – did I understand you correctly to say that you view the demand resources rule changes kind of the key change in the auction?

<A - Ralph Izzo>: So we do view it as a key change right, because the import issue is more of a Western, PJM issue than it is for us, so whether it's the limited DR resources or trying to address some of the arbitrage opportunities available between the base residual auction and the incremental auctions. We think all these are positive for creating more of a level playing field in the market now. I've been running around trying to find the settlement document. So I'm just looking around at my colleagues, make sure FERC hasn't acted on this yet, right? It's supposed to happen soon, but...

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15132

<A - Caroline D. Dorsa>: That's right.

<A - Ralph Izzo>: We don't have a decision yet.

<A - Caroline D. Dorsa>: Not yet.

<Q - Kit Konolige>: Right. Okay. And so, can you give us any insight into what we should expect from the auction? Should we expect the PSEG zones to separate again? And could you give us an idea of what you're thinking is about where RTO settles?

<A - Ralph Izzo>: Yeah. So Kit, we would never do that. It's obviously a competitive auction process and so forecast or predictions would not be a good idea, and we've never done it in the past. But I will tell you though that we'll know by May 23, the bid's going on [May] 12, and from [May] 12 to [May] 16, and then PJM takes a week to assess them and so three weeks and two days from today we'll all have the answer.

<Q - Kit Konolige>: Okay. Well...

<A - Ralph Izzo>: I don't want to lead you to think that we don't analyze this and think about it.

<Q - Kit Konolige>: You're right. Right, right.

<A - Ralph Izzo>: We just don't publicize what we think is going to happen.

<Q - Kit Konolige>: Well, at least you confirm that we'll know by May 23, right?

<A - Ralph Izzo>: Yes, thanks, Kit.

<Q - Kit Konolige>: All right. Thank you.

<A - Caroline D. Dorsa>: Thank you. Next question.

Operator

And the next question comes from Dan Eggers with Credit Suisse. Please proceed with your question.

<Q - Daniel L. Eggers>: Hey, good morning, guys.

<A - Ralph Izzo>: Good morning, Dan.

<Q - Daniel L. Eggers>: With the settlement, can you just walk through maybe – because I don't have them side-by-side yet, I apologize. But walk through what were the big changes from maybe the $2.6 billion over the five years you had projected or requested, and what you guys settled today as far as where dollars weren't spent. And...

<A - Ralph Izzo>: Yeah.

<Q - Daniel L. Eggers>: How you think about the opportunity to spend those later?

<A - Ralph Izzo>: Yeah. So Dan, the most important part we viewed of the settlement was the electric substations. And all of that is covered and from the point of view of what was affected by Irene and Sandy. But there were a bunch of other areas that we thought would be beneficial. For example, we had the undergrounding of, I think, 30 miles of overhead circuits, and that was knocked out. We had some improvements to SCADA systems, data acquisition and analysis system that would help us restore those customers who were interrupted more promptly; that was knocked out.

On the gas side, we had I think 500 miles of cast iron that was affected or is in now FEMA – more at-risk areas and that 500 miles was cut back to 250 miles. We then had some movement of backyard services to the front of the home. Once again, our backyard service getting knocked out is just that much more difficult to restore, that was knocked out. We had some improvements in construction standards for some of our distribution system. And that was knocked out.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15133

So the heart, I just listed a whole bunch of stuff that was knocked out. I don't want to give the wrong impression. The heart of the program was the substations and that was fully funded. But we will go back, I mean, I think people are going to see that this has a benefit. We wouldn't have proposed it, if we didn't think so. And as we do the work and as we see the system perform, we'll go back and talk with staff and talk to the other parties. I really do take their reaction to this. Not as a no on the other stuff, but as a not yet. And just show me that, it's money well spent. And I think that that's perfectly legitimate and fair on their part and we will step up to that.

<Q - Daniel L. Eggers>: Do you have a ballpark, maybe of kind of by year, how that money is going to get spent over the next...

<A - Ralph Izzo>: We'll release further details. I don't – off the top of my head right now. And I just want to make sure the team has a chance to get the schedules all put together and then we can release that.

<Q - Daniel L. Eggers>: Okay.

<A - Ralph Izzo>: But as Caroline said in our March conference, we didn't bake into our growth projections, the utility, Energy Strong. And so, there is $1.2 billion over the next two to five years, it's really more like four will be incremental to that and we'll give you the specifics.

<Q - Daniel L. Eggers>: Okay. And I guess one other question, Ralph, been out in the market is, kind of views on you remaining in an integrated company with the distribution business on the regulated side and the competitive generation business. Can you just remind us how you guys think about combined company and what would be required and maybe how you revaluate that strategy?

<A - Ralph Izzo>: Yeah. So, Dan we talk about that often. And there is arguments on the both sides of the equation. By and large, though we don't think we're hampered from doing things on either side of the company by virtue of having the other company as part of the family. We kind of like the stable earnings growth of the utility, providing a really strong foundation for the dividend and its future growth.

We like the fact that Power is generating healthy amount of cash that could feed the equity needs of the utility. There are very obvious operational dissynergies to separating. You never say never, because we're always asking the question, but we obviously like the model right now and I just keep reminding myself that every once a while somebody says, gee, you have such a great utility, if only that was standalone and separate from that struggling Power company five years ago, we used to have the conversation, only the roles were totally reverse.

So it's not – we don't put our heads in the sand and not ask that question. We do talk about it regularly from the point of view of strategic clarity and being able to give a very specific message to our shareholders. But, right now, the cash from Power and the equity needs of the utility are really nice financial complement and the operational benefits of moving people from one organization to the other with complementary skill sets has been a big plus for us as well.

<Q - Daniel L. Eggers>: Great. Thank you, guys.

<A - Ralph Izzo>: Thanks.

<A - Caroline D. Dorsa>: Thank you. Next question?

Operator

And the next question is from Travis Miller with Morningstar, Inc. Please proceed with your question.

<Q - Travis Miller>: Thanks. Good morning.

<A - Caroline D. Dorsa>: Good morning.

<Q - Travis Miller>: Sort of back on the capacity auction, real quick. I was wondering if you could characterize how much demand response you would either expect or you've seen in the past show up in those potential impact on you

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15134

guys, specifically of your Zone specifically?

<A - Ralph Izzo>: Yeah. Travis, the ability to forecast the DR is not an inconsequential part of getting the price right. So we really wouldn't want to put that number out. And the historic DR, I would rather have you, I don't mean to make you do extra work, but check the PJM website for that rather me quoting it. The numbers that I recall are high-single-digit percentages like 8 or so., but it's better to check the PJM website. But, the CETL and CETO numbers and the transfer capability in the known assets and the known demand numbers are all out there for PJM, so really a large part of the auction turns on what you expect for DR. I will say this that most DR does happen in the higher industrial zones and in the part of PJM that we operate, we don't have a large industrial load, so this is typically a lower DR component where we are.

<Q - Travis Miller>: Okay. Fair enough. Thanks. And then, secondly, I was wondering if you could characterize the hedging environment, as you saw from – essentially February at the Analyst Day to where we are today end of March period?

<A - Ralph Izzo>: I'll start that and let Caroline fill in. To be sure, we with some of the banks and financial players leaving the market, we have seen a little bit – well we have seen less liquidity in the out years, I don't want to qualify it as less. Also given some of the infrastructure challenges of moving low cost gas out of the Marcellus to other regions combined with some fairly extreme weather conditions have really introduced a tremendous amount of volatility in the market. So we benefited greatly with our naturally long position.

We have what I would just call corridors. They're upper and lower limits in terms of how much we want to hedge. And we play within those corridors in terms of that we think the market is oversold or maybe there is some potential for upside. So we'll lean one way or another, that's why we give you ranges in our hedge position. And suffice to say that we've been pleased by the way in which we've managed our book given the increase in Power prices of late. And we've seen a modest increase coming from the CSAPR rule, how sustainable that will be, we don't outguess the market but we do capitalize on those opportunities when they come up. Caroline, please go ahead and answer when they come up.

<A - Caroline D. Dorsa>: Sure. Just a few other points then looking at some of the numbers that you saw in our slide deck and comparing them perhaps to what you say when we were at the March 7 meeting. So we did continue to layer on hedges consistent with that layering and strategy that Ralph mentioned within the corridors. Keep in mind that the numbers that you have now in today's slide deck reflect an increase in the expected terawatt hour generation from our fleet based on the economics in the market. That's a good thing obviously for us. So what its impact would be is as we continue to layer on hedges, you wouldn't see the ranges move up quite as much of the hedge percentage because the denominator is moving up. That's great from our perspective.

Also if you look at the hedge percentage for the remainder of this year, it looks a little lower than the hedge percentage we gave you for the full year earlier this year. That's normally what you see because when the first quarter rolls of you've got a greater representation from the summer period and the summer period is where we have the mid-merit in peaking, which we'd never be hedging fully because of the weather. So you normally see that percentage looking like it's going down and then it kind of goes back up after it get through the summer. So we continue to layer on our hedges. It's kind of looks the same as the progression last year if you roll the tape back. The only other thing going on there is that increased generation expectations, which is just great from our perspective that changes a little bit how to think about the numbers, but it's all because of that denominator factors we are very pleased with.

<Q - Travis Miller>: Great. Thanks so much for all the detail.

<A - Ralph Izzo>: Sure. Thanks.

<A - Caroline D. Dorsa>: Next question.

Operator

And the next question is from Paul Zimbardo with UBS. Please proceed with your question.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15135

<Q - Paul A. Zimbardo>: Hi, good morning.

<A - Ralph Izzo>: Good morning, Paul.

<A - Caroline D. Dorsa>: Hi.

<Q - Paul A. Zimbardo>: I think pretty much all of my questions have been answered. But one question on Linden and that acceleration and some of the other cost acceleration. Do you see that having an impact on the remainder of the year, if some of the costs have been accelerated?

<A - Caroline D. Dorsa>: In terms of O&M do you mean or in terms of generation?

<Q - Paul A. Zimbardo>: In terms of outage and O&M of expenses that you moved forward?

<A - Caroline D. Dorsa>: Sure. So we moved them forward because we had a Linden outage that was ongoing. So we took the opportunity to extend it a little bit, so that we could add the AGP, the [ph] up rate (45:24). So now we have 63 extra megawatts at Linden, which will be available for us for the summer. That increment was about $0.02 for the quarter, but that would have happened later on as we continue to do Linden. So we're still forecasting to have the O&M be lower at Power on a full year basis than prior year, that's what we told you earlier this year and that hasn't changed. Again, some of this is timing, but a good timing to get the AGP done sooner. Remember, both businesses continue to benefit from pension expense and that's baked into the numbers. So little bit of timing difference, good thing for us from the generation side, still going to see that O&M reduction in our current forecast, actually in both businesses on a year-over-year basis.

<Q - Paul A. Zimbardo>: Okay. Great. And I'm sorry, if I missed it. But did you say a potential timeline on when we will get our next update potential review from the BPU on the Energy Strong settlement?

<A - Ralph Izzo>: So, Paul depending upon the expense, which the settlement is universal, if all parties agree then it's conceivable that the board would act on it in the May timeframe. If all the parties are not on board and there is a reason to believe that we have a good shot at getting all the parties, but I don't know that for fact. Then it's more likely that the board will schedule an opportunity for comment on these settlement and you're looking more of a June decision.

<Q - Paul A. Zimbardo>: Okay. Great. Thank you.

<A - Ralph Izzo>: You're welcome.

Operator

And the next question is from Anthony Crowdell with Jefferies. Please proceed with your question.

<Q - Paul B. Fremont>: Yeah, actually, it's Paul Fremont. What I'm struggling with a little bit is, when I compare the uplift in commodity margin that you guys realized, which is roughly, I guess, in PJM 50 million on close to 14.5 million megawatt hours. And I compare that to Calpine, which I think had only 3.5 million megawatt hours in their north region, but had an uplift of like a 125 million megawatt hours. What is it that you would point to as the biggest differences between their profit opportunity versus your profit opportunity when both companies were sort of in a similar hedge position going into the quarter.

<A - Caroline D. Dorsa>: Thanks Paul. So don't know their situation, so I certainly can't comment on that. Obviously you saw as we provided the data in the waterfall, right, part of what you have to keep in mind for us is not just the data on the incremental generation, which we said was 3% higher. But you've got to take into account the impact of the hedges right, the hedges that we have including the full requirements, BGS, right. So when BGS has stronger demand, because of the winter weather, and it was a strong winter this winter, that BGS is a fixed price. And so that reduces some opportunities for us in taking advantage of the market, because we have that cost-to-serve. So we were about 75% hedge, about 25% open to the market for the quarter, not too distant much where we've been before, but obviously the BGS prices relative to the market prices are lower now because of where the market moved in the first quarter.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15136

<Q - Paul B. Fremont>: So I mean, does that lead you to maybe, reconsider, whether the BGS is the best hedging vehicle for the company?

<A - Ralph Izzo>: No, no, not really, Paul. I mean it's – if you think about the reliance on Power's cash generation, BGS has nicely protected us in the down markets. Yes, it does create an opportunity cost on the up-markets, but it provides a nice stable platform. If you remember, the strength of a BGS is that it is full requirements and we are uniquely capable serving full requirements because of the breadth of our technologies; the breadth meaning base-load, load-following and peaking, which allows us to incorporate a load factor premium and a risk mitigation premium. So, no, I don't think you'll see us moving away. That's why we have the 10 terawatt-hours to 11 terawatt-hours of BGS all factored into future years.

<Q - Paul B. Fremont>: Thank you very much.

<A - Caroline D. Dorsa>: You're welcome. Next question.

Operator

And the next question is from Paul Patterson with Glenrock Associates. Please proceed with your question.

<Q - Paul Patterson>: Good morning guys.

<A - Caroline D. Dorsa>: Good morning.

<A - Ralph Izzo>: Good morning, Paul.

<Q - Paul Patterson>: Just I wanted to follow up back on this energy cost bid issue. Are you guys not disclosing the liability in the quarter? Did I get that correct?

<A - Caroline D. Dorsa>: Yeah, we're not disclosing the specifics for the liability in the quarter because, as I mentioned, we're in the regulatory process. We did the self report. We're in discussions with PJM, the Market Monitor and self report to FERC. We'd rather let that regulatory process go on and complete. So, as I mentioned to you, we did book something this quarter, but it's all rolled into that gross margin per megawatt-hour that increased and we'll give more details when we finish the process.

<Q - Paul Patterson>: Okay. And then you also said that it was historical in nature, could you give us just a little bit of a flavor, just roughly speaking, over what timeframe this was?

<A - Caroline D. Dorsa>: No, I won't go into that right now, same thing. We want to handle the regulatory process as appropriate, but it is historical in nature. It's things we identified looking at historical things, for example, as I mentioned, such bid adders like emissions. Those things have been fixed and those are the kinds of errors we've been reporting.

<Q - Paul Patterson>: Did it have an impact on market prices during that period of time or can you...?

<A - Caroline D. Dorsa>: That's not something we can comment on. As I said, we'll go through the regulatory process.

<Q - Paul Patterson>: Okay.

<A - Caroline D. Dorsa>: We'll complete all of that and then we'll give additional information.

<Q - Paul Patterson>: Okay. But this is something that you guys discovered and it didn't involve the Market Monitor or anybody else? You guys are self reporting that, correct?

<A - Caroline D. Dorsa>: We self reported. That's correct. We discovered it and we self reported it to all the agencies, correct.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15137

<Q - Paul Patterson>: Okay. And then just finally there was some commentary about the replacement capacity case, I think the arbitrage and you guys have some insight as to what the outcome's going to be, is that correct or what were your thoughts...?

<A - Ralph Izzo>: No, no. Just that we, like others, have been curious about whether or not a DR actually is physically delivered or whether there's an arbitrage between the base residual auction and the incremental auction. And PJM has basically suggested some modifications to the way in which that incremental auction can take place and the physical delivery of demand response that we think will benefit the market, that's all. We have no insights other than the full public dialog on the subject.

<Q - Paul Patterson>: Okay. Well, all my other questions have been asked and answered. Thanks so much.

<A - Ralph Izzo>: Thank you, Paul.

<A - Caroline D. Dorsa>: Great. Thank you.

Operator

And the next question is from Michael Lapides with Goldman Sachs. Please proceed with your question.

<Q - Michael J. Lapides>: Hey guys, two questions actually. One, Caroline, when I look at O&M in the quarter at both Power and the E&G, up year-over-year at both places, up a good bit at E&G relative to first quarter 2013, but even a little bit at Power. Can you just walk us through the puts and takes and what of that, if any, would be recurring when we start thinking about 2015?

<A - Caroline D. Dorsa>: Okay, sure. So not really forecasting 2015 specifically, but if you look at the O&M for the quarter and you see a nice breakout I think on page nine of our deck. We've put the O&M in two pieces for you, which I think is helpful. So the lower pension expense for PSE&G is valued at about $0.02 a share on a favorable basis, right. And then there's distribution O&M, about $0.02 a share unfavorable. So the way to think about that is, we told you that pension expense for the whole company, right, would be $0.15 a share favorable, a little bit more than half is of PSE&G. So you'd see more like $0.08 for the year and [inaudible] (53:08) for the quarter.

The $0.02 on distribution O&M that was unfavorable year-over-year is primarily driven by some incremental cost from some of the storms that occurred in the winter. Can't really forecast that, right. We always forecast normal weather, sometimes we have storms in the winter; sometimes we have storms in the summer. And so, together that leads to a flat O&M on an operating earnings basis, the way we typically report it.

Keep in mind, if you're looking at the GAAP statements though, you wouldn't see the impacts I'm showing on the waterfall, because the O&M in the GAAP statements includes the O&M for clauses. We always take that out from a management perspective. But if you're looking at GAAP, you're going to see O&M that relates to the contemporaneous return clauses we have, for example, like solar and a number of other things. We've always excluded that because that's recovered within the ROEs that we get when we get those clauses. That's why we focus on the operating earnings waterfall that we show you on nine, because that's really what to think about in terms of what flows down to the bottom line without recovery.

So that's the utility piece. You should expect to see pension continue to benefit quarter-over-quarter and then the rest of the O&M really depends on the rest of our ongoing and control and whether there are any storms in the summer season, but can't be sure about that.

So in terms of Power, now if I go over to the other side, Power, we also breakout pensions, about $0.01 for the quarter, remember I said Power will be a little less than half. So Power gets on a rounded basis about $0.01 of benefit for the quarter. And then it has about $0.05 on a quarter-over-quarter impact for this quarter. And I mentioned the Linden outage, which was planned, but then extended and the extension was an impact of about an extra $0.02 this quarter for the AGP. That's a good thing because that gives us more generation. So on a year-over-year comparison, most of what you're seeing in the O&M negative is the impact of outages and outage extensions.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15138

For Power going forward, there's no Hope Creek outage in 2014, so that will be a favorable impact relative to prior year, because remember when we have outages at Hope Creek, we got 100% versus outages at Salem where we only get a portion. And also there was a BEC outage, remember I talked about last quarter for the end of the year, there won't be a BEC outage in the later part of this year.

Roll that all together, where does it all take us? We had some storms in the utility. We had to spend and couldn't anticipate. We had the extended outage for the AGP and Power that is a little negative. You've got then positive pension rolling through just the way you should expect to see it for the quarter. And when you pull all that together and you look at the rest of the year, on an operating earnings basis, setting aside utility clauses that get recovery, that's why we're still comfortable forecasting a decrease in the aggregate for each of our businesses year-over-year.

<Q - Michael J. Lapides>: Got it. And then, Ralph, just on the Energy Strong settlement, I want to make sure I followed the kind of the high level details. $1.22 billion, the bulk of the CapEx is really 2015 through 2017. There'll be a tiny bit at the end of 2014 and a tiny bit that kind of trickles after 2017, an ROE that's 30 basis points to 40 basis points lower or 30-ish basis points lower than kind of the last authorized level. And about 80% to 85% of the recovered via contemporaneous clause and the rest of it will be trued up in a rate case. Is that basically the high level just to the settlement, anything I'm leaving out?

<A - Ralph Izzo>: No, I think you got it Michael.

<Q - Michael J. Lapides>: Got it. Thanks, guys. Congrats on the settlement.

<A - Caroline D. Dorsa>: Thank you.

Operator

And the next question...

<A - Kathleen A. Lally>: I know there is another call that's about to begin, I don't want to interfere with. So we do appreciate, and turn the call back over to Ralph for any closing comments and available as well as Carlotta for any calls people will have.

Ralph Izzo

Yes. Thanks, Kathleen. So just a summary looking back at the quarter and then looking ahead, from my perspective, Power just continues to handle anything that comes its way. Now, we managed the polar vortex almost flawlessly. While that's going on, we ran 100% nuclear capacity factor and we managed to get our advanced gas path technology accelerated into the quarter at Linden to make sure it's ready for the summer.

And then looking ahead, please make note of the increase in our expectations for Power's output in the subsequent years. In utility, once again on track for double-digit earnings growth, capital program is on budget. You heard us mention a couple of transmission projects that are ahead of schedule, and of course, the good news that we've reached settlement on a $1.22 billion Energy Strong program. And last, but not least, as the weather normalize demand for gas continues to grow and we are now beginning to see growth in electric demand, and that's refreshing.

So thank you for joining us. I hope to see all of you at some point in near future on the road as we make our visits. Thanks, everyone.

Operator

Ladies and gentlemen, that does conclude your conference call for today. You may now disconnect and thank you for participating.

MANAGEMENT DISCUSSION SECTION

Operator

Ladies and gentlemen, thank you for standing by. My name is Jennifer, and I am your event operator today. I would like to welcome everyone to today's conference call, Public Service Enterprise Group Fourth Quarter 2013 Earnings Conference Call and Webcast. At this time, all participants are in a listen-only mode. Later, we will conduct a question-and-answer session for members of the financial community. [Operator Instructions] As a reminder, this conference is being recorded today, February 20, 2014 and will be available for telephone replay beginning at 1:00 PM Eastern Standard today until 11:30 PM Eastern Standard on February 28, 2014. It will also be available as an audio webcast on PSEG's corporate website at www.pseg.com.

I would now like to turn the conference over to Kathleen Lally. Please go ahead.

Kathleen A. Lally

Thank you, operator. Good morning, everyone. We appreciate your participating in our call today. As you are aware, we released our fourth quarter and full year 2013 results earlier this morning. The release and attachments as mentioned are posted on our website, www.pseg.com, under the Investors section. We have also posted a series of slides that detail the operating results by company for the quarter. Our 10-K for the period ended December 31, 2013, is expected to be filed shortly, usually by the end of February.

I'm not going to read the full disclaimer statement nor the comments we have on the difference between operating earnings and GAAP results, but I do ask that you read these comments contained in our slides and on our website. The disclaimer statement regards forward-looking statements detailing the number of risks and uncertainties that could cause actual results to differ materially from forward-looking statements. And although we may elect to update forward-looking statements from time to time, we specifically disclaim any obligations to do so even if our estimates change, unless required by applicable securities law.

Bloomberg Transcript

We also provide commentary with regard to the difference between operating earnings and net income reported in accordance with Generally Accepted Accounting Principles in the United States. PSEG believes the non-GAAP financial measure of operating earnings provides a consistent and comparable measure of performance to help shareholders understand trends.

I am now going to turn the call over to Ralph Izzo, Chairman, President and Chief Executive Officer of Public Service Enterprise Group. And joining Ralph on the call is Caroline Dorsa, Executive Vice President and Chief Financial Officer. And at the conclusion of their remarks there will be time for your questions. We ask that you limit yourself to one question and one follow-up. There's a lot of interest in today's call.

With that, Ralph?

Ralph Izzo

Great. Thank you, Kathleen, and thanks, everyone, for joining us today. This is a great day for us following a great 2013 and an even better 2014 and beyond, so now let's get into the details.

This morning we reported operating earnings for the full year of 2013 and operating earnings for the fourth quarter were $0.49 a share versus $0.41 a share in 2012 which brought results for the full year to $2.58 per share or 5.7%, almost 6% greater than 2012's operating earnings of $2.44 per share and actually was above our guidance range of $2.40 to $2.55 per share.

I hope you'll agree that PSE&G delivered outstanding results in 2013 on many levels, and let me tell you about a few of them. What made this success particularly notable is that we did it in the wake of the damage to our equipment and facilities that we sustained from Superstorm Sandy just a year earlier.

Well, first of all, PSEG was recognized for the 12th consecutive year as the Mid-Atlantic region's most reliable electric utility and was specifically recognized by EEI for excellence in its storm response during Sandy. It seems that we're tested every year and we excel in our response each and every time. We maintained that focus on improving reliability throughout the year, not just after the storm.

PSE&G invested $1.7 billion over the past year to upgrade its transmission network. The investment is part of a long-term program that has resulted in transmission growing to represent approximately 36% of PSE&G's rate base at the end of 2013. Let me remind you that'd been only 28% of the rate base at the end of 2012. This work includes work on five major transmission lines, each of which are scheduled to be operational during the course of 2014 and 2015 and each of which are on schedule and on budget.

But PSE&G's investment in transmission does not end in 2015. PSE&G was assigned construction by PJM of a new transmission project that is designed to maintain the reliability of the northeastern part of our electrical grid. This project, which has an expected in-service date of June 2018, has an estimated construction cost of up to $1.2 billion.

PSE&G has also started to invest in new solar capacity under the agreement we reached with the New Jersey Board of Public Utilities in 2013, which will allow us to spend up to $446 million over a multiyear period and result in about 143 megawatts of new renewable energy capacity through our Solar Loan and Solar 4 All programs.

We are still awaiting a response from the BPU on our Energy Strong proposal, and as you recall, we asked for approval to invest $2.6 billion over five years; the investments which strengthen PSE&G's distribution infrastructure provided with better intelligence on system outages and improve on the reliable service expected by customers.

Now, we're still in active discussion with parties to the proceeding even while evidentiary hearings are scheduled for next Tuesday, February 25, 2014. And I will give you fair notice that those negotiations are – we are required to not disclose the details of those negotiations.

Now, for the year, an increase in PSE&G's capital investment as well as sensible regulatory recovery mechanisms providing for contemporaneous return of our costs and return on our costs and PSE&G's ability to control growth in its

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15142

operating expenses all supported double-digit growth in PSE&G's operating earnings year-over-year.

Similarly, PSEG Power also did a superb job operating its power plants and especially bringing back units that were damaged by Superstorm Sandy. The Salem 2 nuclear unit operated at record levels and the nuclear fleet operated over 90% capacity factor for the ninth consecutive year.

Our fossil fleet achieved top decile safety performance in 2013 as the gas-fired Linden combined cycle generation plant had record-setting output and the coal fleet responded to an improvement in dark spreads. The fleet's fuel diversity allowed us to respond to changes in the market and its dispatch flexibility allowed it to overcome the impact of planned and unplanned outages and participate in the improvement in market prices throughout the year. And Power continues to benefit from its favorable location.

Power's earnings in 2013 benefited from the successful management of firm gas pipeline and storage contracts which provide it with access to low cost gas in the Marcellus Basin. The contracts primarily benefit PSE&G's residential customers who enjoyed a credit amounting to 33% against their gas bills in both November and December of 2013. And then they also enjoyed an additional credit of 25% against their February bills.

We'll be providing details later today about providing customers with an additional credit for the month of March. Power has become one of the largest shippers of gas in the Marcellus Basin and under our BPU approved agreement, is able to supply Power's generation fleet when capacity is not needed to meet the needs of residential customers. The availability of low-cost gas continued to provide a benefit to Power's earnings in the fourth quarter on top of the benefits seen earlier in the year.

Power is moving ahead with plans to increase the output and improve the performance of its existing gas-fired combined cycle generating capacity. Power will be investing $150 million at the Bergen-Linden and Bethlehem facilities over several years to increase the operating efficiency of the turbines at each station while adding approximately 150 megawatts of capacity. The investment should also lengthen the time between major maintenance programs and therefore yield attractive returns.

Power's approach to managing supply risk has been affirmed during the recent period of extreme weather and volatility in the Power markets. The fuel flexibility of our fleet enabled us to maintain output during this time. We successfully responded to record demand while our customers have benefited from our ability to pass along savings in gas costs.

In another area, we negotiated a new 12-year amended and restated operation services agreement with the Long Island Power Authority, which was effective at the start of this year. The new agreement will provide for an increase in our operating fee in 2016. And beginning in 2015, Power will provide LIPA with fuel procurement and power management services. The agreement is expected to add to our earnings, provide a platform of growth for our employees, and doesn't require the commitment of financial capital.

The team at PSEG Long Island hit the ground running, responding to several storms since we assumed operations and will I'm sure provide customers with the service they require and enhance our reputation for reliability. We literally had a snowstorm on January 2, 24 hours after taking over the operations, but the team is doing a fabulous job.

So we exceeded our expectations for earnings in 2013, and we expect earnings to remain strong in 2014. We're providing operating earnings guidance for 2014 of $2.55 to $2.75 per share. Now our outlook reflects the impact of the emphasis placed on the anchor principles of our strategy, first and foremost operational excellence, which yields financial strength, which we then deploy through a disciplined manner in new investments.

PSE&G is building on a strong platform and providing the opportunity for continuation of growth with an investment program that supports reliability and enhances resilience. PSE&G is expected to contribute more than half of 2014's estimated operating earnings.

PSEG Power continues to benefit from the flexibility of its fleet and a locational advantage. Recent structural changes in the gas market also favor Power, given our ability to take advantage of market volatility. Power's strong financial position also allows us to respond to changes in the market. We focus on improving operating efficiency and are investing in economically attractive capacity upgrades that add to our well-positioned fleet.

Bloomberg

SI-SSA-0015-15143

We remain committed to containing the growth in our operating expenses. We will be aided in this regard by a reduction in pension expense, which provides an ongoing benefit. The commitment to funding our pension following the market decline in 2008 and an equity-oriented investment approach has brought the value of our pension at the end of 2013 to a level which is in excess of our obligations. The improvement in return on the portfolio and an increase in the discount rate will result in our pension adding modestly to income in 2014, a substantial improvement from our recent experience.

And not to be overlooked, a strong investment-grade credit rating and robust cash flow support our growth program without the need to issue equity. We look ahead with optimism, as demonstrated by the board's recent decision to increase the common dividend by 2.8% to the indicative annual level of $1.48 per share. This is the tenth increase in the dividend in the last eleven years, and we believe we are well positioned to provide our investors with consistent sustainable growth in the dividend.

The strong commitment and dedication shown by our employees to our customers has been a major contributor to our success and provides me with confidence in our ability to achieve our long-term goals.

I will now turn the call over to Caroline for more details on our results, and we'll be available to answer your questions after her remarks.

Caroline D. Dorsa

Thanks, Ralph, and good morning everyone.

As Ralph said, PSEG reported operating earnings for the fourth quarter of $0.49 per share versus operating earnings of $0.41 per share in last year's fourth quarter. Our earnings for the fourth quarter brought operating earnings for the full year to $2.58 per share versus operating earnings for 2012 of $2.44 per share. On slide four of our deck, we have provided you with a reconciliation of operating earnings to income from continuing operations and net income for the quarter.

As you can see on slide 11, PSE&G provided the largest contribution to earnings for the quarter. PSE&G reported operating earnings of $0.29 per share compared to $0.15 per share last year. For the quarter, Power reported operating earnings of $0.23 per share compared with $0.25 per share last year. PSEG Enterprise and Other reported a loss in operating earnings of $0.03 per share compared with operating earnings of $0.01 per share in the year-ago quarter.

We provided you with waterfall charts on slide 12 and slide 14 to take you through the net changes in quarter-over-quarter and year-over-year operating earnings by the major businesses. So I'll now go into more detail on each company, starting with Power.

As shown on slide 16, PSEG Power reported operating earnings for the fourth quarter $0.23 per share compared with $0.25 per share a year ago. The results for the quarter brought Power's full-year operating earnings to $710 million or $1.40 per share compared to 2012's operating earnings of $663 million or $1.31 per share. Power's full-year operating earnings exceeded the upper end of our guidance, even if we exclude the operating earnings associated with the asset transfer we undertook at year end from holdings to Power which I'll discuss a bit later.

The earnings release as well as the earnings slides 12 and 14 provide you with detailed analysis of the impact on Power's operating earnings quarter-over-quarter and year-over-year from changes in revenue and costs.

Power's fourth quarter operating earnings benefited from higher capacity revenues, an improvement in the market price of energy on a net long position, an increase in volume and a decline in the supply cost of gas.

The improvement in gross margin during the quarter nearly offset the impact on operating earnings from a larger than expected increase in O&M expense associated with both planned and unplanned outages. Note that part of that cost included the investment for the uprate work on the combined cycle capacity at Linden which is a source, as Ralph mentioned, of future additional earnings for Power.

final
Bloomberg Transcript
Bloomberg

SI-SSA-0015-15144

Let's now turn to operations. Power's output increased 6.2% in the quarter from year-ago levels. For the year, output increase 1.8% to 53.5 terawatt hours. You saw the fleet's fuel and dispatch flexibility during the quarter, and throughout the year. The nuclear fleet produced 29.5 terawatt hours or about 55% of total generation, operating at an average capacity factor of 90.3%.

Record production from Salem 2 helped offset the impact from a refueling outage related decline and output from our 100% owned Hope Creek nuclear facility. The gas-fired combined cycle fleet produced 15.9 terawatt hours in 2013 or about 30% of total generation.

Record setting output from the Linden station helped to partially offset the impact on production from planned major maintenance work at the Bethlehem Energy Center in New York in the second half of the year.

At the coal fleet, we saw an improvement in dark spreads, so production from the base load coal-fired stations in Pennsylvania increased 20% during the year. Bridgeport Harbor's output increased in response to higher market prices and the New Jersey station, Hudson and Mercer, primarily operated on gas throughout the year. Overall, the coal stations provided approximately 14% of the fleet's output in 2013 or 7.3 terawatt hours.

As Ralph noted earlier, the gas-fired combined cycle fleet continues to benefit from its access to lower price gas supplies in the Marcellus Basin. Power's fleet enjoys higher spark spreads than implied by observed market prices. And the quarter-over-quarter impact on earnings from our spark spread advantage was not as large as experienced earlier in the year, but recall this is in line with our expectations given the need to meet utility customer heating demand in the winter period.

Slides 18 and 19 provide more detail on generation in the quarter and for the year. The combination of higher capacity prices, lower fuel costs and an increase in market prices on Power's un-hedged position, more than offset the impact of lower average price on hedges, resulting in gross margins for the fourth quarter of $46 per megawatt hour; equivalent to the level experienced in the year ago period. And for the year, gross margins amounted to $47 per megawatt hour versus $45 per megawatt hour last year.

Slide 21 in our deck provides detail on Power's gross margin for the quarter and the year. Power's forecasting output for 2014 of 53 terawatt hours to 55 terawatt hours, in line with 2013's performance. Right now, approximately 75% to 80% of anticipated production for the year is hedged at an average price of $48 per megawatt-hour which compares with average hedge prices in 2013 of about $50 per megawatt-hour.

Power has hedged approximately 45% to 55% of its forecast generation in 2015 totaling 53 terawatt hours to 55 terawatt hours at an average price of about $51 per megawatt hour. Power's forecasted total output over 2014 and 2015 is up slightly from our prior guidance, and for 2016, Power has hedged 20% to 30% of forecast production of 53 terawatt hours to 55 terawatt hours at an average price of $53 per megawatt hour.

The increase in the percentage of generation hedged over 2014 and 2015 reflects the completion of the most recent basic generation service or BGS auction in New Jersey, and we assume that BGS volumes represent about 11 terawatt hours in 2014 and 10 terawatt hours in 2015 compared with volumes in 2013 of approximately 12 terawatt hours.

The BGS auction result for PSE&G customers for the three-year period beginning June of this year and ending May 31, 2017, was priced at $97 per megawatt hour. This contract for one-third of the load will replace the contract for $94 per megawatt hour, which expires on May 31, 2014. The latest auction is based on an average price for energy at the PJM West Hub of about $38 to $39 per megawatt hour, which is similar to the base price for energy seen in the past two auctions.

You can see from the hedge data that Power's maintained a consistent strategy. Base load units are fully hedged in the current year as Power maintains open position on its intermediate and peaking assets. This strategy allows Power to contain the risk associated with its load following contracts such as BGS while being able to participate in opportunities provided by the market.

Power's operating earnings for 2013 and 2012 now reflect the inclusion of its 50% equity interest in a partnership that owns and operates the Kalaeloa generating facility in Hawaii and its wholly-owned interest in PSEG Solar Source, both of which were transferred from Energy Holdings in 2013. These assets provided $0.03 per share of operating earnings in 2013 and are included in Power's reported results compared with operating earnings in 2012 for these same assets of $0.04 per share.

So Power's operating earnings for 2013 of $710 million would have exceeded the upper the end of our guidance of $685 million even if these assets had not been included in our results. Power's operating earnings for 2014 are forecast at $550 million to $610 million. Results for the full year will be influenced by a $2 per megawatt hour reduction in the average price of energy hedges and a decline in our average PJM capacity price on June 1 of this year to $167 per megawatt day from the historically high level of $244 per megawatt day.

I'm sure you'll recall that Power's capacity price is essentially steady for the next three years given the results of already completed capacity auctions through mid-2017. Power's fuel costs should continue to benefit from firm gas transportation agreements providing access to low-cost Marcellus gas supply and O&M should compare favorably with the results of 2013 given the decline in pension expense and ongoing cost control.

Let me now turn to PSE&G. PSE&G reported operating earnings for the fourth quarter of 2013 of $0.29 per share compared with $0.15 per share for the fourth quarter of 2012 as we show on slide 26. PSE&G's full-year 2013 operating earnings were $612 million or $1.21 per share compared with operating earnings of $528 million or $1.04 per share for 2012, a growth rate of 16%.

Power's earnings for the fourth quarter reflect the benefit of an increase in revenue associated with a greater level of capital investment and a decline in O&M expense relative to the prior-year period which, as you recall, included Superstorm Sandy related restoration expenditures. An increase in transmission revenue improved the quarter-over-quarter earnings contribution by $0.04 per share. And for the year, PSE&G's investment in transmission increased earnings by $0.14 per share.

In 2013, our $1.7 billion investment in transmission increased the percentage of rate base in transmission from 28% last year to 36% at the end of 2013. PSE&G's O&M declined during the quarter given comparisons against the year-ago period which included Sandy-related restoration expenditures, and the decline in O&M increased quarter-over-quarter earnings comparisons by $0.04 per share.

Demand for electricity and gas during quarter was influenced by weather which was slightly colder than a year ago. Also, weather-normalized demand for gas continues to show improvement. The impact on quarter-over-quarter earnings from the improvement in demand in weather was about $0.01 share.

Earnings comparisons in the quarter also improved by about $0.04 per share due to a reduction in taxes and the absence of a tax related change in reserves recognized in the prior year. And all other items contributed about $0.01 per share to earnings.

Economic conditions in PSE&G's service territory appear to have stabilized and exhibit signs of slow recovery. On a weather-normalized basis, electric sales are estimated to have improved in the quarter by 2.7% and for the year, weather normalized sales declined by 1.5%.

It's too early to get excited about the improvement of weather-normalized sales in the quarter given the comparisons against the period impacted by Sandy-related outages. Gas deliveries, however, continue to point to improved demand, as a result of still low commodity prices and slowly recovering economic conditions. On a weather-normalized basis, gas deliveries increased 2.7% in the fourth quarter and now for the year total an increase of 2.2%.

PSE&G operating earnings for 2014 are forecast at $705 million to $745 million. And this implies that even at the low end of the range, we're forecasting at least 15% growth in PSE&G's operating earnings. PSE&G's growth in 2014 will continue to benefit from its ability to earn a return on its expanded investment in transmission.

The Federal Energy Regulatory Commission approved an agreement which provides for an annual increase in transmission revenue of $171 million under the company's formula rate filing, and this increase became effective on

final

Bloomberg Transcript

January 1 of this year.

Results will also reflect the recovery of capital costs associated with PSE&G's investment in Solar. And the reduction in pension expense as well as ongoing expense control is expected to result in a year-over-year reduction in O&M.

As Ralph indicated, PSE&G's significant transmission investment program is on time and on budget, and we'll be providing you with an updated forecast of PSE&G's capital expenditures for 2014 through 2018 at our annual financial conference on March 7 of this year.

Let me now turn to Enterprise and Other. Enterprise and Other reported a small operating loss for the fourth quarter of $11 million, or about $0.03 per share, compared to operating earnings of $6 million, or $0.01 per share, in the fourth quarter of 2012. The results for the fourth quarter brought the full year 2013 to an operating loss of about $13 million or $0.03 per share compared with 2012's operating earnings of $45 million or $0.09 per share.

The results for the quarter and the full year have been restated simply to reflect the distribution to PSEG Power of the 50% equity interest in the partnership that owns the Kalaeloa generating facility as well as the wholly-owned interest in Solar Source. Operating earnings on the remaining portfolio, however, were affected by a decline in lease income as well as an adjustment to the tax basis of the portfolio, which together reduced quarter-over-quarter earnings by $0.03 per share.

We'll no longer be reporting separately the results for Energy Holdings. The management team has successfully monetized non-core assets in the portfolio and significantly reduced financial risk. The focus going forward will be on managing the remaining assets in the lease portfolio.

For 2014, operating earnings are forecast to fall within the range of $35 million to $40 million. Going forward, the fee associated with the operating contract for PSEG Long Island will be reported as part of Enterprise along with the results for the remaining lease portfolio.

Next I'd like to spend just a minute talking about pension. We did close 2013 with the value of our pension assets in excess of our PBO obligations. The improved return and higher discount rate will, as Ralph mentioned, have a favorable impact on pension expense this year and going forward. In fact, we estimate there will be a positive impact on income in 2014 and in future years compared to the previous year's expense of $110 million. We will not need to make any cash contributions to our pension trust this year as well.

The benefit to earnings is essentially equally shared between PSE&G and PSEG Power, and we'll provide you with a deeper multiyear view of the impact on O&M from the improved outlook on pension at our March 7 Investor Meeting.

Lastly, a word on our financing capability; we remain in a strong position to finance our capital program. At the end of 2013, we had approximately $493 million of cash on hand. And debt represented approximately 42% of PSEG's consolidated capital, with debt at Power approximating 31% of its capital base.

Power's free cash flow remains strong and PSE&G's cash generation has improved from its ability to earn its authorized return on increased levels of capital investment. And of course, we'll provide you with an update of our capital program at our annual financial conference, but the message on equity issuance will be the same. We can finance our robust long-term capital program without the need to issue equity.

We're guiding to strong operating earnings for 2014 of $2.55 to $2.75 per share. This outlook is our best guidance for the full year, but I will note that it does not reflect any specific weather conditions related to January, consistent with our practice of not incorporating weather into our guidance until we go through the summer season.

The dividend was recently increased by 2.8% to the indicative annual level of $1.48 per share, and we believe we can provide shareholders with consistent and sustainable growth in the dividend going forward. And we'll provide more detail on our outlook at our annual financial conference on March 7.

So with that, I'll now turn it back to Jennifer and we'll be happy to take your questions.

Q&A

Operator

[Operator Instructions] And your first question comes from Travis Miller with Morningstar.

<Q - Travis Miller>: Good morning, thanks.

<A - Ralph Izzo>: Good morning, Travis.

<A - Caroline D. Dorsa>: Good morning.

<Q - Travis Miller>: I was wondering real quick if you could give some thoughts on that dividend policy. You've obviously got a strong balance sheet. You've got some pretty good visibility into earnings, at least certainly for next year and perhaps the following year, good cash flow generation. I was wondering what the thought is in terms of using some more of that cash flow capacity to perhaps increase the dividend at a faster rate.

<A - Ralph Izzo>: Travis, as you know, we don't have a target number in terms of percentage payout or percentage growth rate. It's a variety of factors. It's where the earnings are coming from, how stable are they, how predictable are they, where are we in the commodity cycle. So the words that we continue to hold on to is looking at all of that, where power prices are, where the market predictions could be, where our capital program is at the utility, that investors do have the opportunity for consistent and sustainable growth in the dividend. And I'd rather not be held to a specific number at this point.

<Q - Travis Miller>: Okay, I understand.

<A - Ralph Izzo>: All right.

<Q - Travis Miller>: And then real quick, what's the LIPA contribution for the 2014 guidance?

<A - Ralph Izzo>: It's $0.02 to $0.03 for 2014. Then it steps up in basically $0.02 increments until we get to 2016, where it's about $0.07 or $0.08.

<Q - Travis Miller>: Great, thanks so much.

<A - Kathleen A. Lally>: Next question, please?

Operator

You next question comes from Brian Chin with Merrill Lynch.

<Q - Brian J. Chin>: Hi. Good morning.

<A - Caroline D. Dorsa>: Good morning.

<Q - Brian J. Chin>: Just a clarification on the ongoing pension question. The $110 million number you referenced as the year-over-year benefit from 2013 into 2014 that's included in guidance, is that right?

<A - Caroline D. Dorsa>: That's a great question, Brian. Let me clarify that. So the $110 million was our net of capitalization, so therefore it would impact the P&L. That was our pension expense in 2013. So in 2014, you're actually going to see pension income. Instead of having $110 million in expense, you're going to see pension income. And the turnaround on a year-on-year basis is a $0.15 improvement from the impact of pension going from expense last year of $110 million to income in the teens that you're going to see in this year's numbers, split evenly between the businesses, so a $0.15 year-on-year improvement. We expect to see pension income as we forecast out during the business plans. So you're going to see continuation of value driven from pension as opposed to the history we've had in the last few years of significant pension expense.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15148

<A - Ralph Izzo>: So it's just a hedge to that account. So, Brian, it's not a step up and then a step back down in subsequent years. It's just a resetting of the level of pension, in this case no longer a burden on the income statement, but benefit. But we'll incorporate that in all of our other own and forecast in our March 7 meeting.

<Q - Brian J. Chin>: Okay, understood. And I understand that you're going to give more quantitative color on the ongoing effect of that at the Analyst Meeting. But in terms of just qualitatively, what's going on beyond 2014, the reason why there's an ongoing effect there is because presumably some degree of asset returns and adjustment in your discount rate. That would cost an ongoing pension income in the future years. Is that the right way to think about that or is there an amortization effect that's taking place?

<A - Caroline D. Dorsa>: No, so the right way to think about this, Brian, is we make long term assumptions for returns on our investment portfolio. We make the same long-term assumptions going forward that we've made prior, right. You know from our disclosures, we assume an 8% return on our asset investments. We just continue to assume that same return. We look at the discount rate from the forward curve. That's right the way everybody looks at it, right. So, you set it from wherever you land and when we look at it going forward, we're just looking at the forward curves.

So the discount rate went up for this year from last year, right. Last year was 4.2%. This year, it's 5%; just taken right off the curves at the end of 2013; so with a really steady-as-she-goes set of assumptions about rate of return, which we've set at 8%, and the discount rate, which we just used from the forward curve.

Very significant turnaround we see between 2013 and 2014 comes from the fact that in 2013, our trust returned 20%. And that comes from having that sustained, equity oriented allocation, about 70% equity. You'll see if you look at our historical, that's been the same for the past few years, we take a long-term view.

And because we don't smooth the year-end asset value, so you remember there's two types of smoothing in pension, right? There's the gain and loss smoothing. Everybody does that. But the ending assets, most companies smooth the ending asset value. In other words, what value you apply that 8% return to in your current year. Most companies use a five-year average. We use the actual value at the end of the prior year. So the fact that we had 20% return gives us that benefit as we come into 2014, purely from where the market put our assets at the end of 2013.

<Q - Brian J. Chin>: Thank you very much.

<A - Caroline D. Dorsa>: Sure.

Operator

Your next question comes from Kit Konolige from BGC.

<Q - Kit Konolige>: Good morning.

<A - Ralph Izzo>: Hi, Kit.

<Q - Kit Konolige>: So it would appear if I heard this correctly that the 2014 guidance benefits relative to 2013 actual by $0.15 from the pension, correct?

<A - Caroline D. Dorsa>: That's correct.

<Q - Kit Konolige>: Okay so, in other words basically all of the improvement in, let's say, the midpoint of 2014 versus 2013 is due to that pension improvement.

<A - Caroline D. Dorsa>: Well, there are a lot of obviously different dynamics going on in the businesses as well, so I wouldn't want you to just focus on one item and not focus on the others, right? We've got significant increases assumed in PSE&G, part of which comes from the year-on-year retention but it's much more than that, right?

<A - Ralph Izzo>: Well, and we also have huge benefits from the transmission investment offset by the decline in the hedge prices, so...

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15149

<A - Caroline D. Dorsa>: Right.

<A - Ralph Izzo>: We just need to be careful, Kit, that we don't just pick one thing...

<A - Caroline D. Dorsa>: Right.

<A - Ralph Izzo>: ...that looks like a $0.15 change and for that to be only thing that isn't watched...

<A - Caroline D. Dorsa>: Exactly.

<Q - Kit Konolige>: Right, absolutely understood, a lot of moving parts. And the transmission improvement was $0.14 2013 versus 2012, is that – did I get that down right?

<A - Caroline D. Dorsa>: Yes, that's correct.

<A - Ralph Izzo>: Yes, that's correct.

<Q - Kit Konolige>: Okay. And can you give us a sense of at PSE&G 2014 versus 2013, is the transmission improvement going to be similar to that and what should we think of in terms of the benefit from the Solar investment year-over-year?

<A - Ralph Izzo>: What we've always told you so far is that we have a $171 million increase in transmission revenues. Now, the piece that you're missing was the increase in transmission O&M. We'll give a little bit more information on March 7. The Solar 440 is a three-year program and you should assume that that's pretty evenly distributed over the three years.

<Q - Kit Konolige>: Okay.

<A - Ralph Izzo>: And that's a contemporaneous return at a 10% ROE and a 51% equity ratio, 51.8%.

<Q - Kit Konolige>: Right. Okay, great. And then my final question, on Energy Strong, there was an article in New Jersey Spotlight about, their indication was that there seemed to be a bid asked of about $1 billion from the staff and $1.9 billion that you guys had come down to. Are you in a phase, let me just ask it this way, are you in phase of negotiating about a number for Energy Strong at this point and are other issues basically settled?

<A - Ralph Izzo>: So, Kit, when that article appeared, there was an appropriate and very stern letter that came out of the presiding officer of the BPU chastising all participants, but in particular whoever was responsible for that leak which was not us, that such conversations in public would not be tolerated and sanctions unnamed would be enforced afterward. So I really don't even want to come close to answering your question other than to say yes, there was an article.

<Q - Kit Konolige>: I knew that already.

<A - Ralph Izzo>: I know you did, Kit. [indiscernible] (42:28)

<Q - Kit Konolige>: Let me just follow on that. Ralph, you've been saying all along that you expect a settlement in Energy Strong. Are you still confident that there will be a settlement rather than a full proceeding on Energy Strong?

<A - Ralph Izzo>: Yes, I am. But I was clearly wrong on the date, right. I thought we'd have it done by the end of January and I obviously missed that timeframe. But I'm still optimistic; everyone recognizes the importance of the work that's being proposed but the devil is in the details.

<Q - Kit Konolige>: Great, thank you.

Operator

Your next question comes from Paul Patterson with Glenrock Associates.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15150

<Q - Paul Patterson>: Good morning.

<A - Ralph Izzo>: Good morning, Paul

<A - Caroline D. Dorsa>: Good morning.

<Q - Paul Patterson>: Just to follow up on the transmission, this Bergen to Linden line and just all the improvements that you guys have been doing there, should we think about any potential risks to the LDA breakout?

<A - Ralph Izzo>: No, Paul. So most of the transmission work that does have impact you've seen already in the way they've been reflected in the RPM auction. So the two biggest projects that had an effect were Susquehanna-Roseland in terms of its transfer capability from Eastern MAC into PS Zone and then, the overall PS Zone; and then the Northeast Grid and its transfer capability between PS Zone and PS North. I forget the exact number. I think I saw it was about 1,500 megawatts and I think Northeast Grid was 400 megawatts or 500 megawatts. I don't remember. It's 200 megawatts to 300 megawatts, Kathleen is telling me. So, those projects have had an effect and that's fully reflected in the price. This latest project is pretty much wholly within PS North and the NYISO seam. So, this is a stability issue across the PJM and New York ISO seam.

<Q - Paul Patterson>: Okay, so no KTU or anything else that you see out there as being a problem?

<A - Ralph Izzo>: No, I don't.

<Q - Paul Patterson>: Okay. And then just finally on taxes, for the 2014 guidance could you just tell us what we should be expecting there?

<A - Ralph Izzo>: I hope Caroline can.

<A - Caroline D. Dorsa>: So, we haven't given a specific effective tax rate, but I think it's fair to assume you'll see a tax rate similar to what we've seen in Power over the past period, close to 40%. In the utility, obviously as solar installations go into effect you have a little bit of an ITC. So, there's a little bit of a tax rate benefit. It won't be quite as high as Power, but pretty much steady, nothing really dramatically different going on there.

<Q - Paul Patterson>: Great, thanks a lot.

Operator

Your next question comes from Jonathan Arnold with Deutsche Bank.

<Q - Jonathan P. Arnold>: Good morning.

<A - Caroline D. Dorsa>: Morning.

<A - Ralph Izzo>: Good morning, Jon.

<Q - Jonathan P. Arnold>: Hi. Just first on the hedging. I know just the pricing on the 2015 had gone up a little bit. Can you give us some sense on – is that primarily BGS or is there something else going on in there? Is it peak weighted or just whatever you could give me there; and then any flavor on what the composition of the 2016 hedge is on the baseload.

<A - Caroline D. Dorsa>: Sure. So, you're right, Jonathan, on 2015, a big driver here from our prior disclosure is the impact of BGS. So BGS goes in at about a low-teens impact on the total hedge booked for 2015 because the most recent auction, of course, puts a full year of BGS in there. And so that's the biggest driver of the change in the hedge percentage and the change in the hedge price, because remember, we put BGS in there at the BGS price less capacity. So it has an impact as you go into 2015 on a full-year basis and then raise the price from $48 to $51 per our last quarter disclosure.

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15151

For 2016, BGS has an impact in there as well. And the book for 2016 per your question is about a third BGS and about two-thirds West Hub hedges. As we go out further, BGS is a heftier piece of the total hedge book than it is near term because it tends to be what you can really do on a long-term basis.

<Q - Jonathan P. Arnold>: Okay, great. And secondly can you give any insight how the portfolio behaved in this January and early February pricing blowouts? Was it a net positive? Was it neutral and how you've thought about that in the context of guidance?

<A - Ralph Izzo>: So we did not factor that into the guidance we've just given you for 2014, Jonathan. But I can tell you this, the units performed well. Our gas team was able to get the fuel we needed. There were times when we were running on kerosene and not on natural gas. But the assets were up and running. We had Linden down I think for a few days because we were finishing out the AGP, the advanced gas path. But, no, we had solid operational performance, managed the fuel situation very well and did not factor that into our 2014 guidance. We have, Kathleen reminded me this morning, I forgot already. There's only 51 days gone so far; 314 to go so she didn't want me to get ahead of myself.

<Q - Jonathan P. Arnold>: But you've just basically done it as of year end?

<A - Ralph Izzo>: That's correct.

<A - Caroline D. Dorsa>: That's right.

<A - Ralph Izzo>: That's exactly right, Jon.

<A - Caroline D. Dorsa>: Which is what we've done previously.

<Q - Jonathan P. Arnold>: Okay. And then just finally, as we think about this 2014 number and the pension and the other moving parts, I don't know if this is something you'll talk about now or not. But do you see 2015 and 2016 as flat to up type of trajectory, netting everything together, or is there still hedge roll-off headwind, et cetera, offsetting some of the positives you have on the other side of the business?

<A - Ralph Izzo>: So, Jonathan, we're not going to give guidance for the out years. We will at the conference remind folks, and I'll just do it at a high level here, of what the utility rate base growth will be and how that translates into earnings. We'll present to you data that I think most of you know about, RPM, because that does carry us certainly through 2016. We'll discuss the hedge book to the extent that further detail is needed.

So what we don't do is try to outguess the forward price curve, and that's the part that keeps us from giving you precision in the out years. We're going to give you and O&M growth rate. So other than the changes in the forward price curve and how we're able to dynamically hedge, which is something that I think we're all learning to understand is a real advantage of Power, those two limitations keep us from giving you even a plus or minus for the out years. And we're going to give you five years of utility capital this time around as well.

<Q - Jonathan P. Arnold>: But if you – I'm not asking you to second guess the curve. But if you assumed the curve, can you go there?

<A - Ralph Izzo>: The reason why I wouldn't want to do that is I think that that limits us to a bias of understating our potential. Our naturally long position with our diverse asset fleet, both in terms of fuel and in terms of dispatch ability, has allowed us to benefit from the volatility quite nicely, and the greater that volatility, the greater the benefit for us. And that's a theme we've been trying to educate the investor community about for the past 18 months or so and I think we want to make sure we don't shortchange ourselves by simply saying the current prediction is a spark of x, and therefore that's all you should bake into our numbers.

<Q - Jonathan P. Arnold>: Thank you, Ralph.

<A - Ralph Izzo>: Thank you, Jon.

Operator

Your next question comes from Ashar Khan with Visium.

<Q - Ashar Khan>: Hi. How are you doing?

<A - Caroline D. Dorsa>: Good morning.

<Q - Ashar Khan>: What we should expect at the conference, would you be in a position at that time to give us – Ralph, I guess this is a question in terms of Energy Strong. Would that be done by then or not done by then? I'm just trying to see how you're going to address what is in rate base for the utility for the next five years.

<A - Ralph Izzo>: So, Ashar, I obviously did a mea culpa already on predicting it by the end of January, so I'm not going to invite a second opportunity to be wrong or beat my chest over being right by predicting a date and then not living up to it. We're in active negotiations. The hearings begin on Tuesday or Monday actually, yes, the 25th. So believe me, there's no one on this call who wants that done sooner, but not without the right terms and conditions for our shareholders and our customers. So I can't predict if we'll have more details for you. Suffice it to say that we will do what we've done in the past. We will tell you here's what has been approved and what is definitely happening. And to the extent that there are open questions, we'll tell you what those additional open questions could yield.

<Q - Ashar Khan>: Okay. And then, Caroline, just based on what you had provided earlier, and I know pensions has provided an uplift. But you had still said that going up to 2016 year-over-year, even starting from 2014 the way I understood it, that the utility company could still show double-digit EPS growth without Energy Strong. Am I fine and understanding that right? That should still be the case, from a 2014 to 2016 timeframe.

<A - Caroline D. Dorsa>: Yes, that's correct.

<Q - Ashar Khan>: Okay, thank you so much.

<A - Caroline D. Dorsa>: You're welcome.

Operator

Your next question comes from Julien Dumoulin-Smith with UBS.

<Q - Julien Dumoulin-Smith>: Hi, good morning.

<A - Ralph Izzo>: Good morning, Julien.

<A - Caroline D. Dorsa>: Good morning.

<Q - Julien Dumoulin-Smith>: So a quick first question. I'll try. In terms of at least the first 60 days here of the year, can we...

<A - Ralph Izzo>: 61 days, Julien.

<Q - Julien Dumoulin-Smith>: First couple months, can you give us any ballpark in terms of what that means for you versus plan?

<A - Ralph Izzo>: Caroline, I tried to say no. It's your turn.

<Q - Julien Dumoulin-Smith>: I tried, I swear.

<A - Caroline D. Dorsa>: No. We can't give you a ballpark, Julien, because we obviously just put out the guidance at all. But I think as Ralph said, we performed well, and we've had other periods where when opportunities present themselves, we capture them and we captured what was available to us here. But we'll be on the phone with you not too long from now doing the first quarter it seems, right, in April. But I think you should expect that we're able to do the kinds of things that our terrific ER&T group is able to do, which is take advantage of opportunities when they present themselves because our operations and our assets run really well. But beyond that, I think we'll just wait for the first

final
Bloomberg Transcript
Bloomberg
SI-SSA-0015-15153

quarter results.

<A - Ralph Izzo>: Julien, I do respect the desire for that information. We have two nuclear refueling outages ahead of us. We have a summer season that is at least as important as the winter season. So there's a lot of territory ahead of us before we start taking something to the bank.

<Q - Julien Dumoulin-Smith>: Let me jump on to the last question a little bit and ask you. In terms of, you have $1 billion, you have the $2 billion. In terms of aggregate CapEx at the utility, you talked about earnings growth. But for the next few-year period, is there an ability to accelerate other spend that you would have otherwise put into Energy Strong, should it come out at the lower end, if you get what I'm saying? Is there some level of flexibility? And maybe let me just hit at this a little bit differently. How are you thinking about Energy Holdings spending in the context of perhaps greater balance sheet latitude and getting more involved o, let's say more contracted assets on that side?

<A - Ralph Izzo>: So we do continue to invest on contracted assets on the Energy Holdings side, but it is modest compared to what's going on in the utility. And while I do want Energy Strong for all the reasons we've articulated in the past, the critical issue in the utility has been and continues to be transmission. So whether it's the Bergen-Linden 345-kV line; that was a $1.2 billion add. Now that's a gross number. We will detail for you the net impact of that because some projects are being cancelled; whether it's the possibility of the Artificial Island bid that we've made along with six other bidders, so we don't know if we'll win that; the fact that PJM is going to have an open window in April on FERC Order 1000 projects.

So we have consistently been able to find important reliability-based investments to deploy our balance sheet in the utility. And I just think given the uncertainty in the market about where assets get built, power generation assets get built and where they can shut down, that those opportunities will continue here before us and Caroline will add to that now.

<A - Caroline D. Dorsa>: And one other thing, Julien. I think we have a robust capital program. We've talked about a lot going on including the potential for Energy Strong as filed and the other thing that we will talk about in March as we always do and you would expect from our results and our cash and balance sheet position is everything we've talked has the potential for going forward including Energy Strong. None of that takes away our entire investment capacity.

So, there's more investment capacity to put to work on either good projects at the utility, additional transmission, things like uprates at Power. There's opportunity to do even more because we've run the balance sheet and have so much free cash flow coming from both businesses. So, even the things that you know, we'll still have more room to do more things as these opportunities that Ralph identified potentially come forward to us.

<Q - Julien Dumoulin-Smith>: Got you, so I'll take that as a general yes.

<A - Ralph Izzo>: That's it, right.

<Q - Julien Dumoulin-Smith>: Great, thank you.

Operator

Your next question – I'm sorry. Go ahead.

<A - Kathleen A. Lally>: I'm going to say, we have time for one more question and then we'll have closing comments after that question. Thank you.

Operator

Your next question comes from Neel Mitra from Tudor Pickering.

<Q - Neel Mitra>: Hi, good morning.

Bloomberg Transcript
Bloomberg
SI-SSA-0015-15154

<A - Caroline D. Dorsa>: Morning.

<A - Ralph Izzo>: Morning, Neel.

<Q - Neel Mitra>: In the past, you guys have detailed a slide with the amount of exports that you have from New Jersey to New York and I think the last time you put one out was about 2,500 megawatts. Ralph, can you talk about maybe how that number has changed and maybe more specifically over the last year and what projects are perhaps in the backlog that could increase the exports out of New Jersey?

<A - Ralph Izzo>: Neel, we haven't broken that number out in a number of years. I'm trying to remember when the last time was that we did break that out. I know it's been at least three years, I'm being told. So I know we have some energy and capacity sales over a VFT line that goes over to New York. We do some spot transactions but I don't know that we break out our Power book to that level of specificity.

<Q - Neel Mitra>: I'm guessing more, in the utility side.

<A - Ralph Izzo>: On the utility side?

<Q - Neel Mitra>: You talked about....

<A - Ralph Izzo>: Oh, yeah.

<Q - Neel Mitra>: Right.

<A - Ralph Izzo>: Utility isn't building any transmission into New York City. I hope I didn't misspeak before. The 345 kV is a reliability issue that affects the seam but it's all inside New Jersey.

<Q - Neel Mitra>: It's all inside New Jersey. Okay, great. And then second, with the uprates, the 150 megawatts, are you considering any other expansions at Power? I know in the past you've talked about maybe Sewaren or Essex brownfield additions. Are those off the table right now or are you happy with the 150 megawatt?

<A - Ralph Izzo>: Right now we have two major projects underway. We have an uprate of about 140 megawatts at Peach Bottom and we have the advanced gas path. And right now, that's all that we have planned.

<Q - Neel Mitra>: Okay, great. Thank you.

Ralph Izzo

Okay, yes. So, thanks, everyone, for participating in the call. Look, we had a terrific 2013. I mean, it was terrific operationally, financially, meeting the needs of the New Jersey Energy Master Plan and we firmly expect that we're going to build on that in 2014 and beyond. So we'll share some more details with you on March 7. We hope you're able to join us then in New York.

I'm told by Kathleen in celebration of the winter we had, we may actually have some sleigh rides and hot chocolate for people, but hopefully we'll have the beginning of some spring weather when we see you on March 7. So thanks for being here today and we'll see you soon. That's it.

Operator

Ladies and gentlemen, that does conclude your conference call for today. You may disconnect and thank you for your participation.

Q1 2018 Performance Update

NYSE: PEG

"We have begun 2018 with solid results. PSEG reported Net Income of 2018 of $558 million, or $1.10 per share as compared to Net Income of $114 million, or $0.22 per share, in first quarter 2017. Non-GAAP Operating Earnings were $492 million, or $0.97 per share, compared to non-GAAP Operating Earnings for first quarter 2017 of $466 million, or $0.92 per share. Our service area experienced four consecutive Nor'easters in March that wreaked havoc on trees and power lines. PSEG employees, once again, rose to the challenge, efficiently and safely completing PSE&G and PSEG Long Island customer restorations and then assisted neighboring utilities with their restoration efforts. We are re-affirming our non-GAAP Operating Earnings guidance for 2018 of $3.00 - $3.20 per share.

PSE&G reached a settlement of its Gas System Modernization Program II (GSMP II) filing with the Staff of the New Jersey Board of Public Utilities (BPU), Rate Counsel and other parties, which remains subject to BPU approval. Modeled after the BPU's recently enacted Infrastructure Investment Program (IIP) initiative, the agreement will allow PSE&G to invest $1.9 billion over five years beginning in 2019 to continue and accelerate replacement of cast iron and unprotected steel mains, in addition to other improvements to the gas system. The settlement is aligned with our investment goals and supports our forecast annual growth in PSE&G's rate base of 7%-9% through 2022.

Earlier in April, the New Jersey Legislature passed a Zero Emission Certificate bill that establishes a financial safety net for eligible nuclear plants. The Legislature also passed a Clean Energy bill requiring the state's utilities to expand the use of renewable energy and implement energy efficiency programs. These complementary legislative initiatives, awaiting the Governor's approval, support nuclear capacity and advance New Jersey's clean energy agenda. Last week, the Federal Energy Regulatory Commission (FERC) issued an order resolving PSEG Power's cost based bidding matter pending at FERC since 2014. Power has recorded an incremental $5 million pretax charge to income in the first quarter that will conclude the issue. PSEG continues to focus on its strategic investment program of $13 billion to $15 billion over the 2018 to 2022 period, and its financial flexibility will enable it to fully fund its capital program over the 5-year period without the need for equity issuance."

Ralph Izzo, Chairman, President & CEO - April 30, 2018

PSEG – Q1 2018

First Quarter Highlights

- Net Income of $1.10 vs. Net Income of $0.22 per share in Q1 2017
- Non-GAAP Operating Earnings* of $0.97 up 5.4% over $0.92 per share in Q1 2017
- Operational and Regulatory focus achieving objectives for growth as risk is managed
- PSE&G Earnings per share up 6.8% aided by growth in investment
- PSEG Power non-GAAP results up 10% aided by tax reform

Operational Excellence

- Nuclear fleet performance remains strong as Hope Creek experiences record 517 day run
- PSE&G responded to four major storms within 30 days in Q1 2018
- Power's fleet diversity/availability responsive to January cold snap

Disciplined Capital Investment Producing Results

- PSEG expected to invest ~$3.4 billion in 2018, consisting primarily of $2.7 billion at PSE&G and $0.6 billion at PSEG Power
- Regulatory/Legislative Focus: Legislative support for Nuclear and Clean Energy initiatives awaiting Governor's signature; GSMP II Settlement, subject to BPU approval, consistent with rate base growth objectives
- Major capital Initiatives: Keys Energy Center & Sewaren 7 in-service by mid-2018; Bridgeport Harbor 5 in-service mid-2019

PSEG–Re-affirming 2018 Full-Year Guidance

Growth in utility infrastructure investments and tax reform expected to drive increase in earnings

THIS DOCUMENT CONTAINS FORWARD-LOOKING INFORMATION. ACTUAL RESULTS MAY DIFFER FROM THOSE ANTICIPATED. INFORMATION DESCRIBING THE SIGNIFICANT FACTORS THAT COULD CAUSE RESULTS TO DIFFER FROM THOSE ANTICIPATED ARE DESCRIBED IN PUBLIC SERVICE ENTERPRISE GROUP'S FILINGS WITH THE SEC, WHICH ARE AVAILABLE ON OUR WEBSITE **WWW.PSEG.COM**. INFORMATION PROVIDED IS AS OF APRIL 30, 2018. ANY FORWARD-LOOKING STATEMENTS INCLUDED HEREIN REPRESENT OUR ESTIMATES AS OF THIS DATE, AND WE DISCLAIM ANY OBLIGATION TO UPDATE THE INFORMATION PROVIDED. E=ESTIMATE

GAAP Disclaimer

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items such as the revaluation of deferred tax liabilities and the impact of the retirement of the Hudson and Mercer coal stations on Power.

The presentation of non-GAAP Operating Earnings is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility. Guidance included herein is as of 4/30/2018.

These materials and other financial releases can be found on the PSEG website at www.pseg.com, under the Investors tab. From time to time, PSEG, PSE&G and PSEG Power release important information via postings on their corporate website at http://investor.pseg.com. Investors and other interested parties are encouraged to visit the corporate website to review new postings. The "email alerts" link at http://investor.pseg.com may be used to enroll to receive automatic email alerts and/or really simple syndication (RSS) feeds regarding new postings at http://investor.pseg.com/rss.

Quarterly UPDATE

Q2 2018

Q2 2018 Performance Update

NYSE: PEG

PSEG reported today Q2 2018 Net Income of $269 million, or $0.53 per share as compared to Net Income of $109 million, or $0.22 per share, in Q2 2017. Non-GAAP Operating Earnings were $325 million, or $0.64 per share, compared to non-GAAP Operating Earnings for Q2 2017 of $316 million, or $0.62 per share. Non-GAAP Operating Earnings for the quarter rose 3%, reflecting continued strong performance at PSE&G, and effective cost control and the lower corporate tax rate at PSEG Power. We are reaffirming our non-GAAP Operating Earnings guidance for 2018 of $3.00 - $3.20 per share.

PSE&G's earnings reflect continued investment in our transmission and distribution programs. PSE&G's investment in transmission is expected to grow to represent approximately 45% of the company's 2018 year-end rate base. We are completing the first phase of our Gas System Modernization Program (GSMP) and will begin work on GSMP II, recently approved by NJ regulators, in 2019. In early June, PSE&G filed for an extension of our Energy Strong Infrastructure Program (or ES2). Later this year, we plan to submit our Clean Energy Future (CEF) filing, aligning with NJ's energy policy goals, to invest $2.9 billion over 6 years in energy efficiency, electric vehicle infrastructure, and battery storage that will broadly benefit our customers by helping to lower bills and better manage energy use.

PSEG Power placed into service the Keys Energy Center and Sewaren 7 combined cycle units, and construction activities are on-going at Bridgeport Harbor 5, which we expect to bring on-line mid-2019. Once in service, it will complete a re-configuration of Power's merchant generation fleet that will improve its competitiveness in the market and improve free cash flow, with the decline in capital spending. In May, NJ Governor Murphy signed Zero Emission Certificate (ZEC) legislation that will help preserve the benefits nuclear generation provides to NJ, Power estimates it could be eligible to receive ZEC revenues of approximately $200 million per year if all 3 of our NJ nuclear units are selected. We intend to maintain our strong balance sheet and credit metrics that enable us to fund PSEG's projected capital investment program of $14 billion to $17 billion over the 2018 to 2022 period without the need to issue equity and continue providing shareholders with the opportunity for consistent and sustainable dividend growth.

Ralph Izzo, Chairman, President & CEO - August 1, 2018

PSEG – Q2 2018 Highlights

Second Quarter Highlights

- Net Income of $0.53 vs. Net Income of $0.22 per share in Q2 2017
- Non-GAAP Operating Earnings* of $0.64, up 3% over $0.62 per share in Q2 2017
- PSE&G Earnings Per Share up 12% driven by growth in T & D investment
- PSEG Power results continue to benefit from tax reform and cost control

Operational Excellence

- PSEG Power placed into service Keys Energy Center and Sewaren 7, adding 1,300 MW of clean gas-fired CCGT capacity; Sewaren 1-4 retired 445 MW
- PSE&G completed the final phase of the 345 kV Bergen-Linden Corridor upgrade project

Disciplined Investment Producing Results

- PSEG on track to invest ~$3.6 billion in 2018: $2.8 billion at PSE&G, $0.7 billion at Power
- Regulatory/Legislative Focus: GSMP II approved by BPU; Energy Strong (ES2) infrastructure program extension filed; Governor Murphy signed Nuclear ZEC and Clean Energy legislation into law
- Major Capital Initiatives: PSEG Power completed construction of Keys Energy Center and Sewaren 7; Bridgeport Harbor 5 expected to be completed in mid-2019; PSE&G completing GSMP I and Energy Strong in 2018; GSMP II to begin in 2019

GAAP Disclaimer

Management uses non-GAAP Operating Earnings in its internal analysis, and in communications with investors and analysts, as a consistent measure for comparing PSEG's financial performance to previous financial results. Non-GAAP Operating Earnings exclude the impact of returns (losses) associated with the Nuclear Decommissioning Trust (NDT), Mark-to-Market (MTM) accounting and material one-time items such as the revaluation of deferred tax liabilities and the impact of the retirement of the Hudson and Mercer coal stations on Power.

The presentation of non-GAAP Operating Earnings is intended to complement, and should not be considered an alternative to, the presentation of Net Income, which is an indicator of financial performance determined in accordance with GAAP. In addition, non-GAAP Operating Earnings as presented in this release may not be comparable to similarly titled measures used by other companies.

Due to the forward looking nature of non-GAAP Operating Earnings guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility. Guidance included herein is as of August 1, 2018.

These materials and other financial releases can be found on the PSEG website at https://investor.pseg.com. From time to time, PSEG, PSE&G and PSEG Power release important information via postings on their corporate website at https://investor.pseg.com. Investors and other interested parties are encouraged to visit the corporate website to review new postings. Q3 2018 Performance Update

NYSE: PEG

PSEG reported today Q3 2018 Net Income of $412 million, or $0.81 per share, as compared to Net Income of $395 million, or $0.78 per share, in Q3 2017. Non-GAAP Operating Earnings were $481 million, or $0.95 per share, compared to non-GAAP Operating Earnings for Q3 2017 of $417 million, or $0.82 per share. Non-GAAP Operating Earnings for the quarter rose 16%, reflecting continued investment in PSE&G capital programs and lower corporate income taxes at PSEG Power.

PSE&G's earnings reflect continued investment in capital programs and warmer summer weather that increased sales volumes over last year's mild third quarter. PSE&G achieved several milestones including the recent Board of Public Utility Commission (BPU) approval of our distribution rate case settlement agreement and the filing of our Clean Energy Future (CEF) investment programs totaling $3.6 billion over six years – Energy Efficiency, Electric Vehicle Infrastructure and Energy Storage, and Energy Cloud initiatives including Advanced Metering Infrastructure (AMI).

PSEG Power placed the Keys Energy Center and Sewaren 7 power plants into service mid-year and continues to target completion of the CCGT construction program with Bridgeport Harbor 5 in mid-2019. In addition, the BPU process to implement the Zero Emission Certificate (ZEC) program is underway, with three public hearings concluded earlier this month.

Throughout a very hot summer, both PSE&G and Power performed well and our results reflect solid contributions from both businesses. We are updating our non-GAAP Operating Earnings guidance for the year to $3.05 - $3.15 per share and adjusting the contributions from each of the businesses. Stronger sales mostly due to warmer than normal summer weather have lifted PSE&G's results above its original guidance range, while power pricing has negatively impacted our forecast for Power's results.

We remain focused on the successful execution of our key policy and regulatory initiatives to provide our shareholders with greater assurance of PSEG's ability to meet our financial objectives for returns and growth. PSEG continues to perform at high levels, safely operating the system throughout a very hot summer, which is a testament to the dedication of our 13,000 associates in New Jersey, New York, Maryland and Connecticut.

Ralph Izzo, Chairman, President & CEO - October 30, 2018

PSEG – Q3 2018 Highlights

Third Quarter Highlights

- Net Income of $0.81 vs. Net Income of $0.78 per share in Q3 2017
- Non-GAAP Operating Earnings* of $0.95, up 16% over $0.82 per share in Q3 2017
- PSE&G Earnings per share up 10% driven by growth in T & D investment and weather
- PSEG Power non-GAAP Operating Earnings* per share improved driven by lower taxes
- Updating 2018 non-GAAP Operating Earnings guidance to $3.05-$3.15 per share

Operational Excellence

- Nuclear achieved an average capacity factor of 93% for Q3 and YTD; CCGT fleet's capacity factor was 68% in Q3
- PSE&G maintained high system reliability throughout second hottest third quarter on record

Disciplined Investment - Producing Results

- PSEG on track to invest ~$3.6 billion in 2018: $2.8 billion at PSE&G, $0.7 billion at Power
- Regulatory/Legislative Focus: PSE&G settled its distribution rate case in October; CEF programs filed; Energy Strong II pending before the BPU; ZEC public hearings concluded
- Major Capital Initiatives: PSEG Power CCGT construction program expected to conclude with Bridgeport Harbor 5 completion in mid-2019; GSMP II investments to begin in 2019

Updating 2018 Full-Year Guidance

Growth in utility infrastructure investment and tax reform expected to drive earnings ~6% higher than 2017

Non-GAAP Operating Earnings* and 2018 Updated Guidance

Subsidiary contributions adjusted to reflect an increased contribution from PSE&G, balancing lower expected results at PSEG Power and Enterprise/Other

Q4 & Year-End 2017 Performance Update

NYSE: PEG

"We ended 2017 on a strong note with operating earnings for the year above the mid-point of our guidance. Successful execution of PSE&G's capital program and strong operations at PSEG Power contributed to our full year results. The successes of 2017 were the result of the outstanding effort of our dedicated workforce, and position us well as we seek to continue to execute on our strategy to provide long-term value to our shareholders by meeting the needs of our customers and the communities we serve. The recent action by the Board of Directors to increase the common dividend by 4.7% to the indicative annual rate of $1.80 per share is recognition of our financial strength and commitment to growth.

We enter 2018 from a position of financial strength aided by a strong balance sheet, continued execution of our strategic growth objectives and tax reform. For 2018, we forecast 6% growth in non-GAAP Operating Earnings at the mid-point of our guidance of $3.00 - $3.20 per share. This is possible, despite the challenges we continue to face in wholesale power markets especially at our nuclear plants, due to continued growth at PSE&G and a $0.16 per share benefit to the bottom line of our unregulated businesses from a reduction in the federal tax rate.

PSEG Power (Power) has made progress on construction activities related to its three new natural gas combined cycle generation stations, with Keys and Sewaren 7 projected to start commercial operation in mid-2018. We remain involved in discussions with key stakeholders in NJ and with those in charge of the wholesale energy market at FERC and PJM to secure the long-term viability of our nuclear generation assets. NJ legislators are considering a bill that would value the attributes of nuclear and create a safety net for our NJ at-risk nuclear capacity. The State of NJ is giving this issue the careful attention it deserves and we hope for timely legislative action, but the risk of closure remains without a change in the financial condition of nuclear."

Ralph Izzo, Chairman, President & CEO - February 23, 2018

PSEG – Q4 & FY 2017 Highlights

Exceeded mid-point of guidance in 2017, well positioned for 2018

- Net Income of $1.88 vs. Net Loss of $(0.19) per share in Q4 2016; Net Income of $3.10 in 2017 vs. $1.75 per share in 2016 – Tax reform and early retirement of Hudson & Mercer influenced results
- Non-GAAP Operating Earnings* results of $0.57 vs. $0.54 per share in Q4 2016; Full-year, non-GAAP Operating Earnings* of $2.93 vs. $2.90 in 2016 and 2017 guidance of $2.80 to $3.00 per share
- PSE&G non-GAAP per share results up 8.6%, from increased investment in electric and gas T&D
- Power results, at top end of guidance, were aided by cost control and improved nuclear performance

Operational Excellence

- PSE&G recognized for the 16th consecutive year as the Mid-Atlantic region's most reliable electric utility
- Nuclear fleet capacity factor (CF) improved to 94%; Hope Creek attained 100% (CF) & record output

PSEG Disciplined Capital Investment

- PSEG invested ~$4.2 billion in 2017: ~$3.1 billion at PSE&G and ~$1 billion at PSEG Power

Regulatory and Policy Focus

- Filed PSE&G distribution base rate case seeking a modest, low-single digit revenue increase
- PSE&G to return ~$275 million of expected benefits to customers related to lower tax rates
- Power continues to work with key stakeholders in New Jersey on legislation supporting continued operation of nuclear capacity as part of a broader bill that aligns with the state's energy policy goals

PSEG – Initiating 2018 Full-Year Guidance

Growth in utility infrastructure investments continue to drive a higher regulated earnings contribution in 2018

Due to the forward looking nature of non-GAAP Operating Earnings guidance, PSEG is unable to reconcile this non-GAAP financial measure to the most directly comparable GAAP financial measure. Management is unable to project certain reconciling items, in particular MTM and NDT gains (losses), for future periods due to market volatility. Guidance included herein is as of 02/23/2018.

These materials and other financial releases can be found on the PSEG website at www.pseg.com, under the Investors tab. From time to time, PSEG, PSE&G and PSEG Power release important information via postings on their corporate website at http://investor.pseg.com. Investors and other interested parties are encouraged to visit the corporate website to review new postings. The "email alerts" link at http://investor.pseg.com may be used to enroll to receive automatic email alerts and/or really simple syndication (RSS) feeds regarding new postings at http://investor.pseg.com/rss.
