

# Heating System safety

## To ensure that your heating system is working properly:

- have your heating system checked annually
- keep the area surrounding the heating system free of combustible items including boxes, paper, clothing, paint and other flammables
- keep vents clear

## Call 1-800-436-PSEG

**if**

- your heating equipment was exposed to floodwater
- your heating system is not working properly
- you need help lighting the pilot light

A boiler or furnace can overheat when a heating unit reaches an exceedingly high temperature and pressure and will not shut off. This condition is caused by failure of safety controls and can result in an explosion or fire.

### Your system may be overheating if it:

- will not shut off
- is a cherry red color
- has paint peeling off
- is leaking water or steam
- has temperature or pressure gauges at the highest levels
