Although PSEG fails some screens, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the AEC screens and all market concentration (HHI) screens for EC. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[43] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all the AEC pivotal supplier screens, and most of the EC pivotal supplier screens. This means that typically PSEG's generation is not necessary to serve load; and when its generation is necessary, its forward sale commitments are sufficient so that its uncommitted generation is not necessary to serve the remaining load. Finally, PSEG's market shares are never above 15 percent in PJM50 and for AEC in PJM East. Its market shares for EC are never above 25 percent in PJM East. Although greater than the 20 percent screen, PSEG's

[43] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

market shares are well below the 35 percent threshold that is typically used for imputing unilateral market power.[44]

5.5. Mitigation

PJM has a Commission-approved market monitoring and mitigation plan in place to ensure that generation facilities cannot exercise market power. The Commission has stated that Commission-approved market monitoring and mitigation plans are sufficient to mitigate market power in RTO markets.[45] In particular, the Commission found in connection with PSEG's last triennial filing that the PJM market monitoring and mitigation rules are sufficient to address market power concerns.[46]

Under the local market power mitigation procedures in PJM, if a supplier fails the "three pivotal supplier test" (TPS), it is offer-capped by the Market Monitor. The Market Monitor's TPS test is applied on an ongoing basis, potentially as frequently as every 5 minutes, to reflect day-ahead and real-time operating conditions. These offer caps provide direct protection against the exercise of locational market power by suppliers in PJME, PJM50, PJMAP and elsewhere.

The protection against the exercise of market power is enhanced by "must offer" requirements under PJM's Operating Agreement. These mandate that generation resources that are used to meet capacity requirements in PJM and

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

that are not subject to an outage must offer their available capacity in PJM's day-ahead energy market.[47] PJM has also implemented a Reliability Pricing Model (RPM) to secure sufficient capacity to meet its requirements through a series of auctions, including a Base Residual Auction (BRA) held annually for capacity 3 years in advance, and incremental auctions held at varying intervals prior to the delivery year. Various features of the RPM process work to prevent the exercise of market power in capacity markets in PJM. First, the RPM model includes bid cap rules designed to mitigate the potential exercise of market power. Second, RPM includes a must-offer requirement pursuant to which all generating units that have available capacity must bid into the RPM auctions or face disqualification from being recognized as capacity resources (and therefore from receiving any capacity payments) in the delivery year.

In addition to the local market power mitigation described above, the presence of market monitoring within PJM lessens potential concerns that PSEG might be able to exercise market power notwithstanding the indicative DPT screens. The Market Monitor has the specific responsibility under the market monitoring plan to monitor the potential of any market participant to exercise market power. To perform its market monitoring function, the Market Monitor can file reports or complaints with the Commission and other government agencies to address various market concerns including market power. The Market Monitor can also make its view known to the Commission staff and PJM members in cases where PJM does not follow its recommendations concerning complaints or requested rule changes. In addition, the Market Monitor can consult with regulatory bodies, including state commissions, regarding the need for specific investigations and monitoring activities, and to consider and evaluate additional enforcement mechanisms. The Market Monitor can also act on specific

[47] *See* PJM Operating Agreement at 1.10.1A(d).

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

complaints that have been filed by market participants to examine any potential market power issues.

In sum, the local market power mitigation rules, the role of the Market Monitor, the existence of must-offer requirements and PJM's RPM auctions address the potential for PSEG to exercise market power.

6. Vertical Market Power

In determining whether the market-based rates are in the public interest, the Commission also considers whether the Applicant has transmission market power or can erect barriers to entry.[48] None of these factors are relevant in the instant case. First, other than incidental generator interconnection facilities and the transmission assets owned by PSE&G in PJM, no transmission assets are owned by the Applicants or any of their affiliates in ISO-NE and NYISO. Transmission service over PSE&G's transmission facilities is provided under the PJM Open Access Transmission Tariff. Thus, consistent with Commission precedent, Applicants have alleviated any concerns regarding potential transmission market power. Second, PSEG has no ability to erect barriers to entry. As explained in Applicants' previous initial applications for market-based rate authority and triennial market power reports, PSEG is unable to erect barriers to entry. There has been no change in facts since the submission of those applications that would alter this conclusion.

The Commission is concerned with the ownership of natural gas pipelines or natural gas distribution facilities and the possibility that they may be used to exercise market power in electricity markets. PSEG does not own or operate any

[48] Order No. 697 at PP 397, 399.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

FERC jurisdictional natural gas pipelines in PJM, ISO-NE or NYISO.[49] PSE&G owns natural gas distribution facilities in the State of New Jersey including peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers.

7. Conclusion

PSEG and its subsidiaries do not have market power in New England, New York or PJM. PSEG is not a pivotal supplier in New England, New York or PJM. PSEG's market shares in the WMSA are below the Commission's 20 percent screening threshold in each of these market areas. PSEG is also not a pivotal supplier in the Connecticut or Southwest Connecticut sub-markets and its market shares in the WMSA are below 20 percent in these sub-markets. PSEG fails the WMSA screens in only the PJME and PJM50 sub-markets. For these sub-markets, we conducted a DPT analysis. PSEG passes all the DPT screens for the PJM50 submarket, and it only fails the Market Share Screen in the PJME submarket. Its market shares are never above 25 percent, a level that the Commission has accepted in other market-based rate matters.[50] As such, they are not evidence of actual market power.

---

[49] PSEG Power LLC currently owns a 10 percent interest in the PennEast Pipeline Company LLC which has filed an application with FERC for construction and operation of a gas transmission line.

[50] *See*, *e.g.*, *Dogwood Energy, LLC*, 135 FERC ¶ 61,089 (2011) (under the AEC measure, Dogwood failed the market share screen in seven of ten periods, with market shares ranging from 32.7% to 39.6%); *Kansas City Power & Light Company and KCP&L Greater Missouri Operation Company*, Docket No. ER10-2074-001 et al., Supplement to Change in Status Filing at 11 (Feb. 4, 2013) (accepted by Letter Order, November 22, 2013) (market shares for AEC ranging from 17 to 36%); *Shell Energy N.A. (US), L.P.*, 135 FERC ¶ 61,090 (2011) (under the AEC measure, Shell failed the market share screen for seven of ten periods, with market shares ranging from 29.3% to 37.0%); *Calpine Energy Services, L.P.*, 137 FERC ¶ 61,085 at P 21 (2011) (under the AEC measure, Calpine failed the market share screen in all ten periods, with market shares ranging from 20.4% to 28.9%); *Wildcat Power Holdings, LLC*, 136 FERC ¶ 61,013 at P 14 (2011) ("When the available economic capacity measure is used, Wildcat Power's market shares range from 22 to 24 percent in the three summer super peak and winter

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Further, PSEG operates under New England's, New York's, and PJM's market power mitigation programs, which mitigate PSEG's potential market power. Therefore, under standards for market-based rate authority articulated by the Commission in Order No. 697, PSEG has no ability to exercise market power in the relevant markets, and maintaining market-rate authority in New England, New York and PJM would be in the public interest.

Therefore, I recommend that the Commission continue to authorize PSEG to sell electric power in Northeast Region wholesale markets at market-based rates.

super peak season/load periods and zero percent in the remainder of the season/load periods."); *LS Power Marketing*, LLC,139 FERC ¶ 61,140 at P 23 (2012) (under the AEC measure, LS Power failed the market share screen in all ten periods, with market shares ranging from 20.4% to 28.9%); *Gila River Power, L.P.*, Docket Nos. ER05-1178-015, et al., Second Supplement to Updated Market Power Analysis at 4 (Jan. 12, 2011) (accepted by Letter Order, April 5, 2011) (market shares for AEC ranging from 21 to 23% in four season/load periods).

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Pursuant to 28 U.S.C. §1746, I state under penalty of perjury that the foregoing is true and correct to the best of my information, knowledge, and belief.

Executed on this 22rd day of December 2016.

John R. Morris, Ph.D.
Principal
Economists Incorporated

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

EXPERIENCE AND QUALIFICATIONS OF

Dr. John R. Morris

OVERVIEW	Dr. Morris, a recognized expert in studying competition in energy industries, currently is a Principal at Economists Incorporated. He began his research of competition in energy industries in 1985 while working for the Federal Trade Commission. Since joining Economists Incorporated in 1992, he has consulted on many mergers and acquisitions involving energy companies, examined competitive issues relating to rates, and studied issues in state restructuring proceedings. He has published articles on competition and energy matters, and he has spoken on numerous occasions concerning competition in natural gas, electric power and other industries. He has been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission, state regulatory commissions, and in federal court.
EDUCATION	Ph.D., University of Washington, August 1985 Dissertation: *Intellectual Property: Creating, Pricing, Copying* • M.A., University of Washington, December 1983 • A.B., Georgetown University, May 1981
PRESENT POSITION	Dr. Morris is a *Principal* at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Suite 1100, Washington, DC 20037. (202-223-4700) Economists Incorporated studies competition and regulation in many industries in the United States and in other countries. It is a leading firm in studying the competitive effects of mergers and acquisitions.
PREVIOUS EXPERIENCE	*Senior Vice President*, Economists Incorporated, December 2001 – December 2002 • *Vice President*, Economists Incorporated, December 1995 – December 2001 • *Senior Economist*, Economists Incorporated, June 1992 – December 1995 • *Economic Tutorial Leader*, Stanford University (Stanford in Washington), April 1993 – June 1995 • *Visiting Assistant Professor,* Department of Business Economics and Public Policy, School of Business, Indiana University, September 1991 – May 1992 • *Assistant to the Director for Antitrust,* Bureau of Economics, Federal Trade Commission, November 1989 – August 1991 • *Economic Advisor,* Office of Commissioner Machol, Federal Trade Commission, December 1988 – October 1989 • *Economist,* Division of Antitrust, Bureau of Economics, Federal Trade Commission, October 1985 – December 1988
MEMBERSHIPS	Member, International Association of Energy Economics • Associate, Energy Bar Association • Member, American Economic Association • Member, Western Economic Association International • Associate, American Bar Association

Notes:

[1] PSEG Fossil has a 22.5% interest in the Conemaugh coal-fired units.

[2] PSEG Global has a 4% interest in the Conemaugh Hydroelectric facility.

[3] PSEG Fossil has a 22.84% ownership interest in the Keystone facility.

[4] PSEG Nuclear has a 57.41% interest in the Salem Nuclear facility.

[5] PSEG Fossil has a 50% interest in the Yards Creek facility. Yards Creek is operated by Jersey Central Power & Light, and thus is controlled by JCP&L in the analysis.

[6] PSEG Nuclear has a 50% interest in the Peach Bottom Nuclear facility.

DATA AND ASSUMPTIONS FOR ECONOMISTS INCORPORATED'S DELIVERED PRICE TEST STUDY FOR PSEG

This exhibit describes data and assumptions used in the delivered price test study ("study") carried out by Economists Incorporated for PSEG. Because the data are voluminous, we provide them in electronic workpapers. In those workpapers, the Files.xlsx spreadsheet provides a brief description of the organization of the data files.

This Exhibit has six sections. Section I discusses the study's representative periods. Section II discusses the geographic region and balancing authority areas. Section III discusses generation resources, including adjustments to generating capacity for seasons, maintenance, water availability, and long-term contracts. Section IV discusses transmission, including transmission pricing and losses. Section V discusses market prices. Section VI discusses the load data.

I. Periods

The study calculates market shares and concentration indexes for electric energy for ten representative periods during the year. The year is divided into three seasons (spring/fall, summer and winter). Spring/fall and winter seasons are divided into three periods based on days of the week, times of day and load levels. Summer is divided into four periods based on days of the week, times of day and load levels. Each calculation of market shares and concentration indexes reflects average conditions (e.g., average loads) during one of the resulting ten periods during the year (e.g., Summer Low Peak).

The study places each of the periods in each season into three condition categories: off-peak, low peak, and spike. Transmission pricing (see Section

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

IV.B below) and plant availability (see Section III.A.2 below) vary among these three categories.

Table I-1 summarizes the ten periods for the destination markets.

Table I-1– Definition of Ten Periods for Destination Market

Number	*Season*	*Time*	*Condition*	*Hours*	*Description**
1	Spring/Fall	Top 10%	Spike	203	Top 10% of peak hours
2	Spring/Fall	Peak	Peak	1829	Remaining peak hours
3	Spring/Fall	Off-peak	Off-Peak	2360	Off-peak hours
4	Summer	Top 1%	Spike	11	Top 1% of peak hours
5	Summer	Top 10%	Spike	106	Top 10% of peak hours
6	Summer	Peak	Peak	950	Remaining peak hours
7	Summer	Off-peak	Off-Peak	1152	Off-peak hours
8	Winter	Top 10%	Spike	101	Top 10% of peak hours
9	Winter	Peak	Peak	907	Remaining peak hours
10	Winter	Off-peak	Off-Peak	1152	Off-peak Hours

Note: *Peak hours include hours ending 8 a.m. through 11 p.m. Eastern Time weekdays, excluding six major holidays. Off-peak hours = Hours ending 12 a.m. through 7 a.m. on weekdays and all weekend and holiday hours.

The Off-peak periods are all NERC holidays and weekend hours plus weekdays from the hour ending at midnight EPT until the hour ending at 0700.[1] The Off-peak periods have off-peak transmission pricing and plant availability.

In order to define the Top 1% and Top 10% periods for a given season, we removed all Off-peak hours from that season. We then ranked the remaining (peak) hours based on load levels in the destination market by season. We then defined as the Top 1% as the 1 percent of these remaining hours in which loads in the destination market were highest and the Top 10% as the highest 10 percent of peak hours based on load levels. These periods have spike transmission pricing and plant availability.

[1] Major holidays are New Year's, Memorial Day, 4th of July, Labor Day, Thanksgiving and Christmas. Major holidays are included in the Weekend period.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

The Peak periods are weekdays from the hour ending at 0800 until the hour ending at 2300 EPT, excluding hours in the Top 10% periods and major holidays. The Low Peak period has on-peak transmission pricing and plant availability.

II. Geographic Coverage and Market Areas

The study includes market areas that correspond to the balancing authority areas used by the North American Electric Reliability Council (NERC), and PJM submarkets as defined by FERC. Table II-1 lists these market areas and their abbreviations. There are two study destination markets, PJM East and PJM East of 5004/5005.

Table II-1– List of Eastern Market Areas and Study Destinations

Abbreviation	*Full Name*	*Study Destination*
PJME	PJM East	Yes
PJM50	PJM East of 5004/5005	Yes
PJMS	PJM East of AP South	
PJM	PJM	
NYISO	New York ISO	

III. Generation

A. Generation Capacity and Ownership

The study includes generating units located in the areas that are (1) connected to the power grid, (2) not exclusively used for self-generation, and (3) either in a plant used primarily for electric generation or a Qualifying Facility.

1. Generating Unit Data

The study uses data for summer and winter capability at the unit level reported in the Energy Velocity (EV) database available from Ventyx. The units include all

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

units with a status of operating, standby, cold standby, restart, mothballed, testing, or under construction that went online before November 30, 2015 and with a retirement date after November 30, 2015. We exclude generation units that are less than 5 MW unless they are owned by PSEG.

2. Ownership

The study uses relies on Ventyx determination of plant and unit ownership. When Ventyx reports a holding company, the ownership is assigned to the holding company. For PSEG generation, the study relies upon Appendix B data from market-based rate filings and updates from the companies to determine plant ownership and seasonal capability. Operational control of PSEG units is consistent with the methodology used for market-based rates.

3. Seasonal variation in capability

The study uses seasonal capability data from EV. Spring/fall capacities are the average of summer and winter capacities.

4. Adjustments to Generating Capability

The generating capability figures used for each period are obtained by multiplying the seasonal capabilities by an availability factor, which is based on the period, unit location, and NERC General Availability Data Systems (GADS) category of the unit. The GADS database gives national average operating information for generating units by unit type and size. For example, it gives data for coal-fired steam units with capacities between 300 MW and 399 MW.

For each period and each generating unit, the availability factor adjusts for the following.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

a) Unplanned outage rates by GADS category

For a given GADS category, the study assumes that unplanned (forced) outage rates (as a share of generating capability available after allowing for planned outages) are constant across seasons and generating units throughout the Region, regardless of owner. Based on GADS data for 2007 through 2011, the study calculates an equivalent forced outage rate (EIFOR), which measures the share of generating capability in a GADS category that is not available because of forced outages. The computation is EIFOR = (FOH)/AH, where FOH is number of forced outage hours and AH is total hours available for generation after planned outages (but before forced outages).[2]

b) Planned outage rates by GADS category and season

With four exceptions (hydro, pumped storage, wind, and solar units), the study assumes that the planned outage rate is constant for all generating units for a given GADS category and season. For a given GADS category, the share of hours of generating capability that is not available as a result of planned outages is computed as (POH + POEH)/PH; where PH are the period hours, POH are the hours not available because of planned outages, and POEH are the hours not available because of planned outage extensions

The study assumes that balancing authority areas are both summer and winter peaking. Therefore, the study assumes that all planned outages for thermal units occur during spring/fall.

[2] EIFOR differs slightly from the EFOR provided in the GADS data. EIFOR provides a better measure of a forced outage rate for peaking units that are operated a small percentage of the year.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

c) Variation in hydro availability across seasons and periods

In general, utilities use hydro facilities to generate energy during the hours when energy prices are highest, subject to constraints imposed by availability of water and reservoir capacity. In order to incorporate these constraints, the study proceeds in the following manner.

First, the study uses EIA Form 923 monthly production data for the period 2011 to 2015 to compute average hourly hydro generation by season. Average hourly generation is then divided by hydro capability to give an average hourly hydro operating rate by season.

Second, depending upon the level of the hydro operating rate for a given season, the study calculates availability factors for the spike, low peak and off-peak periods. When the historical seasonal operating rate is below 30 percent, the availability factor for each period in the season is set equal to the operating rate; the 30 percent figure is an assumed “run of river” constraint. The study assumes that prospectively the maximum operating rate is 90 percent; this is the assumed “maximum rate” constraint. When the historical seasonal operating rate is above 90 percent, the availability factor for each period is set to 90 percent.

When the seasonal operating rate is above the run of river constraint and below the maximum rate, we reason that the hydro generator owner would be likely to produce a higher level of energy during spike hours, when energy prices are highest, than during low peak hours, and that the owner would be likely to produce a higher level during low peak than during off-peak hours.

Based on this reasoning, when the seasonal operating rate is between the run of river constraint and the maximum rate, as is the case for each of the three

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

seasons, the study uses a spike availability factor of 90 percent, which is the assumed maximum operating rate, and off-peak availability factor of 30 percent, which is the assumed run-of-river constraint, and a calculated availability factor for the peak periods, as described below.

The seasonal peak availability factor is calculated using actual total seasonal hydro generation. The study then computes the hydro generation during all spike and off-peak hours, assuming the generation rates implied by the spike and off-peak derate factors computed in the manner described above. The study then calculates total peak hydro generation as the difference between total seasonal hydro generation and the sum of hydro generation during all spike and off-peak hours. The seasonal low peak availability factor is computed as total low peak hydro generation divided first by the number of hours in the off-peak period and then by hydro generating capacity.

d) Variation in pumped storage availability across seasons and periods

We assume that pumped storage units have 90 percent availability during Top 1% and Top 10% periods, 50 percent availability during Low Peak periods, and no availability during off-peak periods.

e) Wind availability

For each area, we calculate average operating rates from 2011 to 2015 by season from EIA-923 data. The average operating rates are the availability factors.

f) Solar availability

Availability for solar power is also calculated based on average operating rates from 2011 through 2015 reported in EIA-923. There is little solar power during

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

off-peak periods because of darkness. Accordingly, solar availability is weighted to on-peak periods.

B. Variable Costs of Generation

The study uses variable costs of generation that include fuel costs, sulfur dioxide and nitrogen oxide emissions costs, and variable operations and maintenance (VOM) costs. The study calculates fuel costs from unit heat rates and Platts' Gas Daily spot prices at the unit's reported natural gas hub by Energy Velocity, #2 Diesel, Low-Sulfur – Industrial for the East Coast, and Residual Fuel Oil sales to end users for the East Coast for the test period. Natural gas prices vary by hub, but were $2.67 per mmBtu at TETCO M3, the hub with the largest reported capacity in the study. Fuel costs for other fuels are based upon the average fuel costs reported in the EV data for each fuel type. Emissions prices during the test year were $2 per ton for SO2 year-round and $300 per ton for NOx in the summer season. CO_2 costs for units located in Regional Greenhouse Gas Initiative (RGGI) states are $5.21/ton, which is based upon RGGI Auction results in Dec 2014. Units in Montgomery County, MD have an additional $5/ton carbon tax on CO_2 emissions. VOM costs are from the EV database.

C. Long-term Contracts

We reviewed Appendix B data from market-based rate filings, FERC Form 1 filings, and Electric Quarterly Report ("EQR") data to obtain data on long-term contracts. Where the market-based rate filing indicates a change of operational control, we include a contract transferring control to the buyer. We leave the generation unit in the BAA where it is physically interconnected to the transmission system. When the buyer is a load-serving entity in another BAA, we give a priority firm transmission path to the BAA with the load.

Long-term contracts that expire prior to January 1, 2015 are not included in the study. Long-term contracts that expire between January 1, 2015 and July 31,

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

2015 are included only in the seasons for which they are in effect. Contracts that expire after August 31, 2015 are included in the study.

IV. Transmission

A. Transmission Network

The study incorporates a contract path transmission network for modeling purposes. Transmission pricing between balancing authority areas is represented by a traditional contract path transmission network in which the direct physical connections between balancing authority areas are also the individually priced links from which contract paths are constructed.

B. Transmission and Ancillary Services Pricing and Losses

As specified by the Commission's Appendix A, the study generally uses ceiling prices for transmission service from Schedules 1, 2 and 8 of the utility's *pro forma* open-access transmission tariff. Transmission providers may require transmission customers to purchase ancillary services under Schedule 1 (scheduling, system control and dispatch) and Schedule 2 (reactive supply and voltage control). Schedule 8 gives the rates for non-firm point-to-point transmission service. The study uses transmission prices from tariffs.

When we have tariffs available, we calculate rates for off-peak, peak and spike categories. Because of discounting and the nature of baseload purchases, off-peak rates are often lower than peak rates.[3] We use two steps to determine off-peak rates. Step 1: When a utility posts off-peak hourly rates, we use the posted rates. Step 2: When a utility does not post off-peak hourly rates, we calculate an hourly off-peak rate based on other tariff information. To calculate hourly off-

[3] For transactions longer than one hour, the *pro forma* tariff caps the amount that the purchaser pays per day by the daily rate, and the amount that the purchaser pays per week by the weekly rate.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

peak rates, we divide the weekly rate by 168, the number of hours in a week. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

We use similar steps to determine peak rates. Step 1: When a utility posts maximum hourly rates in its tariff, we use the maximum tariff rates. Step 2: When a utility does not post off-peak hourly rates, we calculate a peak rate based on other tariff information. To calculate hourly peak rates, we divide the weekly rate by 80—the "Appalachian" method. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

For spike periods, we use ceiling hourly rates from tariffs, when available. Otherwise, we use the Appalachian method.

Whenever practical, the study uses loss rates from tariffs. When these methods did not provide a loss rate for a particular utility, the study assumes that losses are three percent per utility.[4] The study assumes that transmission customers pay losses in-kind. That is, if area A exports 100 MW to area B and the losses are 3 percent, only 97 MW arrive at area B.

For areas where tariffs are not available, rates and losses are the average by period for all the reporting areas.

C. Transfer Capability and SILs

The geographic market includes only PJM and NYISO. The SILs for PJM East and PJM East of 5004/5005 comes from the 2015 Simultaneous Import Limit

[4] Losses of 3 percent are representative of the industry. See, FERC Open Access NOPR, *FERC Stats & Regs*, ¶32,514 at 33,150 (1995).

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Study filed by PJM on September 2, 2016.[5] The total imports into the destination markets may be less than the actual ability to import into the destination because not all the generation capability owned or controlled by load-serving entities within the destination markets studied in PJM have been identified in the data.

V. Market Prices

The study used December 2014-November 2015 real-time hourly prices from the RTO LMP for PJM East and PJM East of 5004/5005. Table V-1 shows the PJM East of 5004/5005 market prices in each of the ten periods, and Table V-2 shows the PJM East market prices.

Table V-1 – PJM East of 5004/5005 Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$148.44	-----
Top 10%	$62.03	$64.59	$185.57
Low Peak	$35.73	$35.56	$47.55
Off-Peak	$29.46	$24.88	$50.16

Table V-2 – PJM East Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$145.63	-----
Top 10%	$57.82	$63.88	$193.51
Low Peak	$32.73	$29.67	$50.59
Off-Peak	$26.67	$21.25	$50.94

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

VI. Load and Contract Obligations for AEC Calculations

Load data come from PJM for PJM and from Energy Velocity for the other supply areas.

To compute load requirements for market participants in New York and PJM, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[6] To account for their greater load obligations, we assume that Dominion has 100 percent responsibility for its allocation of load and that AEP has 90 percent of its allocation as opposed to the standard 70 percent.

[6] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers.

This Exhibit describes the methods used to calculate market shares and concentration in destination markets.

Allocation of scarce transmission capability is accomplished using linear and nonlinear programs that model generation dispatch and the contract path transmission system. This Exhibit provides an overview of the structure of the programs and presents the equations.

Overview of Linear Program

The linear program models control areas as nodes in a transmission system. Each node has a demand for and a supply of electric energy. The supply is based on the generators at the node and potential deliveries to the node via transmission links from other control areas. The linear program allows for net import and export limits to and from an individual control area. Given generation capability and costs and transmission capability and costs, the linear program finds the least-cost solution that satisfies the specified loads. Costs are defined as dispatch (generation) costs plus transmission costs including losses plus the default cost for "unserved" load. For each solution, the linear program determines the quantities produced in, exported from, and imported into each control area.

The Mathematical Equations

The linear program to be solved is given below:

Minimize Total Cost: $Cost = GC + TC + UC$

Subject to:

(1) Generation: $TG_a = \sum_{u}^{u \in a} G_{a,u}$ for each area *a*;

(2) Imports: $YI_a = \sum_{b}^{a,b \in network} (1 - h_{b,a}) T_{b,a}$ for each area *a*;

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

(3)	Exports:	$YE_a = \sum_{b}^{a,b \in network} T_{a,b}$	for each area *a*;
(4)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(5)	Supply/Demand Balance:	$TG_a + Y_a + U_a = D_a$	for each area *a*;
(6)	Generation Cost:	$GC = \sum_{a} \sum_{u}^{u \in a} d_{a,u} G_{a,u}$	for each area *a*;
(7)	Transmission Cost:	$TC = \sum_{a,b}^{a,b \in network} r_{a,b} T_{a,b}$	for each path *a* to *b*;
(8)	Unfilled Demand Cost:	$UC = \sum_{a} pU_a$	for each area *a*;
(9)	Generation Limits:	$g\min_{a,u} \le G_{a,u} \le g\max_{a,u}$	for each unit *u* in each area *a*;
(10)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(11)	Net Import Limits	$Y\min_{a} \le Y_a \le Y\max_{a}$	for each area *a*;

where:

a,b	are subscripts for control/transmission areas;
Cost	is total system cost;
$d_{a,u}$	is the dispatch cost of unit *u* in area *a*;
D_a	is demand for power in area *a*;
$G_{a,u}$	is generation output of unit *u* in area *a*;
GC	is total system generation cost;
$G\max_{a,u}$	is the maximum output of unit *u* in area *a*;
$G\min_{a,u}$	is the minimum output of unit *u* in area *a*;
$h_{b,a}$	is the fraction of power lost to resistance from moving power from area *b* to area *a*;
N	is a subscript to identify simultaneous transmission constraint *n*;
P	is the default price;
$r_{a,b}$	is the transmission rate from area *a* to area *b*;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

$T_{a,b}$	is the power flow from area *a* to area *b*;
TC	is total system transportation expenses;
TG_a	is total generation output in area *a*;
$t\max_{a,b}$	is the maximum power flow from area *a* to area *b*;
$t\min_{a,b}$	is the minimum power flow from area *a* to area *b*;
U	is a subscript to identify units in an area;
U_a	is the amount of demand in area *a* not met by generation or imports
UC	is total system cost of not meeting demand;
Y_a	is net imports into area *a*;
YE_a	is total exports from area *a*; and
YI_a	is total imports into area *a*;
$Y\min_a$	is minimum net imports in area *a;*
$Y\max_a$	is maximum net imports in area *a.*

This linear program is solved using the BDMLP solver in GAMS. In order to calculate concentration for different destinations, seasons, and periods, the PASS GAMS program loops through the destinations, seasons, and periods with calls to Solvers to solve the linear programs. Loads, unit availability and transmission availability are adjusted for each season-period combination.

Calculating Concentration

Transmission allocation is accomplished in four steps. In the first step the linear program finds the net-back prices in all control areas given a price at the destination control area equal to 105 percent of the pre-merger price. Suppose the pre-merger price at the destination, control area A, is $20/MWh. Then all generation capability with a dispatch cost of $21/MWh or less in the destination area would be included in the market because $21 is 105 percent of $20. If transmission cost (including losses) is $5/MWh from control area B to A, then the net-back price at B would be $16/MWh, which is the $21/MWh less the $5/MWh transmission cost between B and A. Then, all generation capability at B with dispatch costs equal to or less than $16/MWh would be included in the market if there were no transmission constraints. Calculation of net-back prices is

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

accomplished by setting the default price, *p*, equal to 105 percent of the pre-merger price at the destination, setting load at the destination to a high number and loads elsewhere to zero, setting transmission limits high enough so that the transmission system is not constrained, and setting a limited amount of generation in each area with a zero dispatch cost. The shadow prices produced by the linear program will be *p* at the destination and the relevant net-back prices in other areas.

In the second step, one calculates Economic Capacity (EC) and Available Economic Capacity (AEC) in each area. These values are then used to limit generation capability. The ownership shares of AEC and EC are calculated for each node in the system.

In the third step, the linear program determines the amount of energy that can be imported into an area given available EC (or AEC) and limits on transmission capacity. This is accomplished by limiting generation in each area to the capacity amount (EC or AEC), giving generation outside the destination market a lower cost than generation inside the destination market, and minimizing cost to serve a large load at the destination market. The amount of generation supplied to the destination is the maximum that can be imported into the destination market.

In the fourth step, transmission is allocated by the following non-linear program:

Minimize Loss: $$Loss = \sum_{\alpha}\left(\frac{C_{\alpha}^{2}}{Y_{Dest}s_{\alpha}} - 2C_{\alpha}\right)$$

Subject to:

(1) Pre Shares: $$s_{\alpha} = \frac{C\max_{\alpha}}{\sum_{\beta} C\max_{\beta}}$$ for each area α;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

(2)	Allocated Shares:	$A_\alpha = \frac{C_\alpha}{Y_{Dest}}$	for each area α;
(3)	Imports:	$YI_a = \sum_b^{a,b \in network} (1 - h_{b,a}) T_{b,a}$	for each area *a*;
(4)	Exports:	$YE_a = \sum_b^{a,b \in network} T_{a,b}$	for each area *a*;
(5)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(6)	Supply/Demand Balance:	$C_a + Y_a + U_a = D_a$	for each area *a*;
(7)	Capacity Limits:	$c\min_a \le C_a \le C\max_a$	for each area *a*;
(8)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(9)	Max Import Limit	Y_{Dest} = Maximum imports from step 3;	

where:

a,b	are subscripts for control/transmission areas;
α,β	are subscripts for control/transmission areas other than the destination market;
s_α	Is area α's share of capacity outside of the destination;
A_α	is area α's share of allocated capacity outside of the destination;
Loss	is the loss function to be minimized.

The loss function is derived from the weighted squared-errors between the pre-allocation shares and the post-allocation shares, where Y_{Dest}/s_α are the weights. For each source control area, the weighted squared-error is given by:[1]

$$W_\alpha = \frac{Y_{Dest}}{s_\alpha}(A_\alpha - s_\alpha)^2.$$

[1] This exposition ignores the adjustments necessary to give priority to minimum transfer levels from a source area to the destination.

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Accordingly, the sum of the weighted squared-errors gives rise to the loss function, which can be seen by:

$$\begin{aligned} Loss &= \sum_{\alpha} W_{\alpha} \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha} - s_{\alpha})^2 \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha}^2 - 2 s_{\alpha} A_{\alpha} + s_{\alpha}^2) \\ &= \sum_{\alpha} \left(\frac{C_{\alpha}^2}{Y_{Dest} s_{\alpha}} - 2 C_{\alpha} \right) + \text{constant}. \end{aligned}$$

The resulting shares from minimizing this loss functions preserve the relative shares of capacity behind any transmission constraint going to the destination. This can be seen from the following LaGrangian equation to be minimized:

$$L = \sum_{i} \left(\frac{C_i^2}{Y_{Dest} s_i} - 2 C_i \right) + \lambda \left(T - \sum_{i} C_i \right),$$

where *T* is the transmission limit affecting control areas *i*. The first order conditions are:

$$\frac{\partial L}{\partial C_i} = \frac{2 C_i}{Y_{Dest} s_i} - 2 - \lambda = 0,$$

which can be rearranged to give:

$$A_i = \frac{C_i}{Y_{Dest}} = \left(\frac{2 + \lambda}{2} \right) s_i,$$

which shows that the allocated market shares of those areas affected by the transmission constraint are proportional to their shares of capacity before the transmission allocation. Moreover, this is the only transmission allocation

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

method that maintains the relative shares of capacity behind any binding transmission constraint in the allocation process.

This non-linear program is solved using the COINIPOPT solver in GAMS. The calculated capacities from the nonlinear program above less transmission losses determine the capacities for the market share calculations for sources outside of the destination market. The capacities within the destination market are given full weights.

Market concentration is the HHI, which is the sum of the squared market shares. Mathematically,

$$HHI = \sum_{i=1}^{n} S_i^2,$$

where S_i is the allocated share of firm *i* and *n* is the number of firms in the market. The summary sheets combine all the firms with shares of 0.7 percent or less (other than Applicants) into the "Other" category. The collective share of the Other category does not directly enter the HHI calculation other than the represented capacity as each independent entity enters the HHI calculation. For example, if ten firms with 0.5 percent shares were in the Other category, the HHI contribution of the Other category would be 0.625 (= 10 x .5 x .5 = 10 x .0625) and ***not*** 25.

Re: Joint Owners of the Conemaugh Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Conemaugh Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Conemaugh Electric Generating Station:

1. The Owners jointly own the Conemaugh Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in East Wheatfield and West Wheatfield Townships, Indiana County, Pennsylvania (the "Station").

[1] Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Conemaugh Power LLC	3.72%
Constellation Power Source Generation, Inc.	10.56%
Duquesne Conemaugh LLC	3.83%
Exelon Generation Company, LLC	20.72%
PPL Montour, LLC	16.25%
PSEG Fossil LLC	22.50%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.45%
UGI Development Company	5.97%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

Sincerely yours,

Georgianna R. Stenger
Administrative Manager
Keystone-Conemaugh Projects

Re: Joint Owners of the Keystone Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Keystone Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Keystone Electric Generating Station:

1. The Owners jointly own the Keystone Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in Plumcreek, South Bend and Cowanshannock Townships, Armstrong County, Pennsylvania, and Armstrong Township, Indiana County, Pennsylvania (the "Station").

[1] Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Constellation Power Source Generation, Inc.	20.99%
Duquesne Keystone LLC	2.47%
Exelon Generation Company, LLC	20.99%
Keystone Power LLC	3.70%
PPL Montour, LLC	12.34%
PSEG Fossil LLC	22.84%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.67%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

Letter Regarding Control of Jointly-Owned Nuclear Facilities

Dear Ms. Peterson:

In connection with its upcoming compliance filings pursuant to Order No. 697,[1] PSEG Nuclear LLC ("PSEG") is submitting this letter in order to set forth its understanding of, and is requesting Exelon Generation Company LLC's ("Exelon") concurrence on, the respective level of control exercised by both companies with respect to the two nuclear facilities that they jointly own.[2]

PSEG avers and requests Exelon's concurrence on the following:

1. PSEG and Exelon jointly own and control two nuclear power plants, Peach Bottom Atomic Power Station located in Delta, PA and the Salem Nuclear Generating Station in Lower Alloways Creek, NJ.

2. In accordance with the Joint Owners Agreement for Peach Bottom dated November 24, 1971, as amended on thereafter, between the Parties, PSEG and Exelon each own 50% of the generating station. Under the Agreement, Exelon is the designated operator of Peach Bottom.

3. In accordance with the Joint Owners Agreement for Salem dated November 24, 1971, as amended thereafter, between the Parties, Exelon owns 42.59% and PSEG owns 57.41% of the generating station. Under the Agreement, PSEG is the designated operator of Salem.

4. Section 4.1 of each of the Joint Owners' Agreements states, "The signatories shall be entitled to shares of the installed capacity, available capacity, operating capacity and hourly energy generation of the Station in proportion to their ownership . . .."

[1] *Market-Based Rates For Wholesale Sales Of Electric Energy, Capacity And Ancillary Services By Public Utilities*, 119 FERC ¶ 61,295 (2007).

[2] PSEG has requested a letter of concurrence from Exelon in order to facilitate the Commission's review of the market power analysis submitted by PSEG with respect to facilities it jointly owns with Exelon. Exelon has no objection to PSEG's submission of this letter as part of PSEG's compliance filing,.

tel: 856.339.1100 fax: 856.339.1104
email: Thomas.Joyce@pseg.com

PSEG
Nuclear L.L.C.

5. Section 11.1 of each of the Joint Owners' Agreements provides that the generating station will be operated by the party designated as operator for the mutual benefit of PSEG and Exelon.

6. In Order No. 697 the Commission stated that under "where a jointly-owned generation facility is operated by one of the joint-owners for the benefit of and on behalf of all of the joint-owners . . . it may be reasonable to allocate capacity based on ownership percentages...." Order No. 697 at P 188.

7. In accordance with the guidance provided in Order No. 697 and with the language of each of the joint owners' agreements, PSEG and Exelon should be deemed to control each of the nuclear facilities' output in line with their proportionate ownership share of each facility. As such, PSEG and Exelon should each be deemed to control 50% of Peach Bottom's output, and PSEG should be deemed to control 57.41% of Salem's output with Exelon controlling 42.59%.

Please indicate Exelon's concurrence to the above by executing the Acknowledgement and Agreement section below.

Sincerely

Thomas P. Joyce
Senior Vice President – Operations

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

JOINT LETTER OF CONCURRENCE

Regulations of the Federal Energy Regulatory Commission (the "FERC") require each public utility with market-based rate authority to file an updated market power analysis every three years in accordance with a schedule adopted in *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 697, FERC Stat. & Regs., Regulations Preambles ¶ 31,252 (2007) ("Order No. 697"). See, 18 CFR § 35.37(a)(1). Each public utility with market-based rate authority may also be required to file a change-in-status report regarding certain changes in circumstances that occur between the dates on which its triennial market power analyses are filed. 18 CFR § 35.42. Among other matters, the market power analysis is to address the amount of generation capacity that the affected utility owns or controls. Where more than one public utility owns a generating facility, FERC requires the utility that is submitting a market power analysis seek a "letter of concurrence" from the other affected co-owning public utilities that identifies the degree to which each public utility controls the generating facility, and to submit the letter with its filing. *See* FERC Order No. 697, 119 FERC ¶ 61,295, P 187 (2007).

The Yards Creek Pumped Storage Hydroelectric Project (the "Yards Creek Project") is a FERC-licensed pumped-storage hydroelectric project with a nameplate capacity of 400 MWs, and is located in Pahaquarry and Blairstown Townships, in Warren County, New Jersey. *See* FERC Project No. P-2309.

PSEG Fossil LLC ("PSEG") and Jersey Central Power & Light Company ("JCPL") each own, as tenants in common with the other, an undivided 50% interest in the Yards Creek Project. Accordingly, if and when PSEG or JCPL submit an updated market power analysis to the FERC, each will be subject to FERC's requirement to seek a "letter of concurrence" regarding the degree to which each controls the Yards Creek Project.

Both PSEG and JCP&L (and their affiliates) own transmission facilities and provide wholesale electric service in the Northeast region, as defined in Order No. 697. Pursuant to the schedule adopted in Order No. 697, PSEG and JCP&L are each required to submit an updated market power analysis to the FERC for markets within the Northeast region in December 2010. PSEG and/or JCP&L may also be obligated to file a change-in-status report or other market power analyses before its subsequent triennial market power analysis for the Northeast region is scheduled to be filed. Therefore, for the sole purpose of enabling either PSEG or JCP&L to submit a market power analysis that addresses, among other issues (to the extent necessary), the scope of each party's control of the Yards Creek Project, PSEG and JCP&L each aver and agree as follows:

1. JCP&L operates and maintains the Yards Creek Project pursuant to the Yards Creek Pumped Storage Hydroelectric Generating Station Operating Agreement, which is dated October 6, 1965 (the "Operating Agreement').

2. Article 2 of the Operating Agreement designates JCP&L as holding sole responsibility for the operations and maintenance the Yards Creek Project. Article 2 further provides that JCPL shall operate the Yards Creek project in the same manner as if JCPL had the complete ownership interest in the Yards Creek Project.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

3. JCP&L does, in fact, operate and control the Yards Creek Project in the same manner as if JCP&L had the complete ownership interest in the Yards Creek Project in accordance with Article 2 of the Operating Agreement.

4. Accordingly, PSEG and JCP&L each agree and concur that for the purpose of the market power analyses required by Order No. 697, JCPL shall be deemed to control the Yards Creek Project generation capacity and electric energy output.

ACKNOWLEDGED AND AGREED:

Richard P. Lopriore
President, PSEG Fossil LLC

Pavant Solar II LLC, ER16-1925-002

San Isabel Solar LLC, ER16-1926-002

Bison Solar LLC, ER16-1924-002

PSEG Energy Solutions LLC, ER16-2725-002

Dear Secretary Bose:

Earlier today, PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG Fossil LLC, PSEG Nuclear LLC, PSEG New Haven LLC, Pavant Solar II LLC, San Isabel Solar LLC, Bison Solar LLC and PSEG Energy Solutions LLC (collectively the "Applicants" or "PSEG") jointly submitted their Triennial Market Power Update.

Enclosed with this transmittal letter, please find CD-ROMs containing the workpapers of Dr. John Morris supporting his analysis in support of that filing. This CD-ROM (of which six copies are included) contains: (i) proprietary information provided by Energy Velocity under an agreement that requires confidential treatment to be requested for these materials; (ii) modeling and computer programs that are the

20161230-0019 FERC PDF (Unofficial) 12/29/2016

proprietary intellectual property of Economists Incorporated, the firm by which Dr. Morris is employed; (iii) commercially sensitive information about Applicants and their affiliates; and (iv) documents and information deemed to be confidential by PJM, NYISO and ISO-NE. Accordingly, Applicants respectfully request confidential treatment for the CD-ROM pursuant to 18 C.F.R. (J 388.112 (2006), consistent with the confidential treatment accorded other applicants submitting such proprietary and commercially sensitive data. Pursuant to the Commission's rules, the public version of this filing contains all materials submitted herein except for the CD-ROM, which is labeled as "PRIVILEGED AND CONFIDENTIAL/NON-PUBLIC.

Thank you for your attention to this matter. Please direct any questions concerning this submission or the request for privileged treatment to the undersigned.

Respectfully submitted,
Public Service Electric and Gas Company

Dear Ms. Bose:

On May 25, 2018, the PSEG Affiliates submitted a notice of non-material change in status ("Notice") pursuant to section 35.42(a)(1) of the regulations of the Federal Energy Regulatory Commission ("Commission").[1] The PSEG Affiliates are submitting this supplement to the Notice to include: (1) Appendix B – Generation Assets; and (2) Appendix A-3 in Excel format as required by the Commission's regulations.

Please feel free to contact me at (973) 430-8836 if you have any questions about this matter.

Very truly yours,

Cara J. Lewis

Asset Appendix: Generation Assets								
						Location		
Filing Entity and its Energy Affiliates	**Docket # where MBR authority was granted**	**Generation Name (Plant or Unit Name)**	**Owned By**	**Controlled By**	**Date Control Transferred**	**Balancing Authority Area**	**Geographic Region**	**In-service Date**
[i] PSEG Fossil has a 22.5% interest in the Conemaugh coal fired plants.								
[ii] PSEG Global has a 4% interest Conemaugh Hydroelectric plants.								
[iii] PSEG Nuclear has a 50% interest in the Peach Bottom Nuclear Plants.								
[iv] PSEG Nuclear has a 57.41% interest in the Salem Nuclear Plants.								
[v] JCP&L – Jersey Central Power & Light Company								
[vi] PSEG Fossil has a 50% interest in each of the Yards Creek facilities.								
[vii] CL&P – The Connecticut Light and Power Company.								
[viii] PSEG Power Ventures has a 100% ownership in PSEG Hackettstown LLC.								
[ix] PSEG Power Ventures has a 100% ownership interest in PSEG Solar Source LLC								
[x] All solar assets are using AC MW ratings. PSEG's previous triennial listed the DC ratings.								
[xi] PG&E -- Pacific Gas and Electric Company								
[xii] PSE&G started installations of pole units in September of 2009. As of November 30, 2016, a total of 174,630

Dear Ms. Bose:

On May 25, 2018, the PSEG Affiliates submitted a notice of non-material change in status ("Notice") pursuant to section 35.42(a)(1) of the regulations of the Federal Energy Regulatory Commission ("Commission").[1] The PSEG Affiliates are submitting this supplement to the Notice to include: (1) Appendix B – Generation Assets; and (2) Appendix A-3 in Excel format as required by the Commission's regulations.

Please feel free to contact me at (973) 430-8836 if you have any questions about this matter.

Very truly yours,

Cara J. Lewis

Cara J. Lewis

Asset Appendix: Generation Assets								
						Location		
Filing Entity and its Energy Affiliates	**Docket # where MBR authority was granted**	**Generation Name (Plant or Unit Name)**	**Owned By**	**Controlled By**	**Date Control Transferred**	**Balancing Authority Area**	**Geographic Region**	**In-service Date**
[i] PSEG Fossil has a 22.5% interest in the Conemaugh coal fired plants.								
[ii] PSEG Global has a 4% interest Conemaugh Hydroelectric plants.								
[iii] PSEG Nuclear has a 50% interest in the Peach Bottom Nuclear Plants.								
[iv] PSEG Nuclear has a 57.41% interest in the Salem Nuclear Plants.								
[v] JCP&L – Jersey Central Power & Light Company								
[vi] PSEG Fossil has a 50% interest in each of the Yards Creek facilities.								
[vii] CL&P – The Connecticut Light and Power Company.								
[viii] PSEG Power Ventures has a 100% ownership in PSEG Hackettstown LLC.								
[ix] PSEG Power Ventures has a 100% ownership interest in PSEG Solar Source LLC								
[x] All solar assets are using AC MW ratings. PSEG's previous triennial listed the DC ratings.								
[xi] PG&E -- Pacific Gas and Electric Company								
[xii] PSE&G started installations of pole units in September of 2009. As of November 30, 2016, a total of 174,630

PSEG Keys Energy Center LLC	**ER17-2426-000**
(collectively, PSEG Affiliates)	

Dear Secretary Bose:

Pursuant to section 35.42(a)(1) of the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"),[1] the PSEG Affiliates submit this notice of non-material change in status. On November 24, 2017, the Commission accepted for filing the application of PSEG Keys Energy Center LLC ("PSEG Keys") for market-based rate authority.[2] In addition, on November 21, 2017, the Commission accepted the PSEG Affiliates updated market power analysis for the Northeast region and granted the PSEG Affiliates continuing authority to sell electric energy, capacity and ancillary service at market-based rates.[3]

[1] 18 C.F.R. Part 35.42 (2017).

[2] *PSEG Keys Energy Center LLC*, Docket No. ER17-2426-000 (November 24, 2017).

[3] *PSEG Energy Resources & Trade LLC, et al*., Docket Nos. ER10-1789-000, *et al*., (November 21, 2017).

Accordingly, each of the PSEG Affiliates has been authorized to make market-based rate sales pursuant to a filed tariff.

The purpose of this filing is to supplement the information contained in PSEG Keys' application for market-based rate authority[4] to reflect the commencement of test power deliveries from the new 585 MW Sewaren 7 plant, which is targeted to be in operation in June 2018. This notice also reflects the retirements of Sewaren units 1, 2, 3 and 4, which will retire once Sewaren 7 begins commercial operation. This change does not affect the basis upon which the Commission relied when it granted PSEG Keys' application for market-based rate authorization or the updated market power analyses submitted in the Triennial Review supporting the market-based rate authorization for the other PSEG Affiliates.

I. DESCRIPTION OF THE PSEG AFFILIATES

A. PSEG Fossil Sewaren Urban Renewal LLC

PSEG Fossil Sewaren Urban Renewal LLC, New Jersey LLC ("PSEG Sewaren"), is a direct subsidiary of PSEG Fossil LLC ("PSEG Fossil"), which is a direct subsidiary of PSEG Power LLC ("PSEG Power"), a direct subsidiary of Public Service Enterprise Group Incorporated ("PSEG"), a publicly traded company. PSEG Sewaren constructed a new, natural gas-fired, power plant and related electrical facilities required for interconnection of the plant to electric grid, on property that it owns in Woodbridge, New Jersey (the "Sewaren 7").[5] Prior to becoming commercially operational, PSEG Sewaren leased Sewaren 7 to PSEG Fossil. The Sewaren 7 generating facilities comprise a highly-efficient, dual-fuel, combined-cycle plant with a nameplate rating of 585 MW. Sewaren 7 was first connected to the electric grid on April 27, 2018 and is expected to reach commercial operation in June, 2018. PSEG Fossil will be solely responsible for all operations and maintenance for Sewaren 7 under the lease, and will have exclusive control over decisions regarding dispatch or the submission of bids or offers for plant operation. The New Jersey electricity ratepayer is not subsidizing or guaranteeing any portion of the revenue of the plant. The plant will participate in the capacity and energy markets administered by PJM Interconnection, L.L.C. ("PJM") for wholesale electric generators. All of the output of the Sewaren 7 will be sold to PSEG Fossil's affiliate, PSEG Energy Resources & Trade LLC ("PSEG ER&T").

B. Public Service Electric and Gas Company ("PSE&G")

PSE&G is a public utility operating company engaged primarily in the transmission of electricity, and the provision of gas and electric distribution service in the State of New Jersey. During the study period, PSE&G owned less than 140 MW of solar generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities. PSE&G is a member of the PJM, a FERC-approved Regional Transmission Organization, and has made all of its transmission facilities available for open access transmission service pursuant to the Open Access Transmission Tariff ("OATT") administered

[4] PSEG Keys Energy Center LLC, Application for Market-based Rate Authorization and Request for Waivers and Blanket Approvals, Docket No. ER17-2426-000 (filed September 1, 2017, amended October 4, 2017) ("PSEG Keys Application").

[5] Once Sewaren 7 begins commercial operations, PSEG Fossil will retire Sewaren 1, 2, 3 and 4.

by PJM. PSE&G is authorized to sell power at market-based rates and makes wholesale sales falling within several different categories, as described below.

Non-utility generation ("NUG") output. PSE&G's NUG output expired in 2015 and 2016 pursuant to the terms of the NUG contracts. PSE&G currently has no further NUG obligations, other than 0.6 MW of energy associated with the former Kinsley Landfill which no longer operates.

Solar. In 2007, the New Jersey legislature passed Regional Greenhouse Gas Initiative ("RGGI") legislation authorizing state utilities to invest in renewable resources such as wind or solar in order to promote increased use of renewable resources within the state and in turn reduce greenhouse gas emissions. See L. 2007, c. 340, codified at N.J.S.A. 48:98-1. The New Jersey Board of Public Utilities ("NJBPU") has approved two (2) PSE&G Solar 4 All® (S4A) programs under which PSE&G has sited, designed and built twenty-nine (29) grid connected solar facilities. PSE&G currently owns and operates approximately 125 MW DC of grid connected solar under the S4A program. In 2016, PSE&G received NJBPU approval of its Solar 4 All Extension II filing to install an additional 33 MW-DC of grid connected solar on landfills and brownfields in the PSE&G electric service territory to begin in 2017.

C. PSEG Energy Resources & Trade LLC ("PSEG ER&T")

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil LLC ("PSEG Fossil") and PSEG Nuclear LLC ("PSEG Nuclear"), each wholly-owned subsidiaries of PSEG Power, as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission.[6]

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

1. Basic Generation Services ("BGS") Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 et seq., which initiated the transition from a regulated to a competitive retail power market in New Jersey, the NJBPU annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSEG ER&T has participated directly in all of the auctions for BGS supply held since 2004, has been a winning bidder in these auctions and has incurred contractual commitments to provide supply to BGS load pursuant to NJBPU approved contracts beginning with the 2004 auction and continuing to the present.

2. Basic Gas Supply Service ("BGSS") Gas Contract. By order issued April 16, 2002, the NJBPU approved a full requirements contract for the provision of gas supply

[6] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999).

by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the NJBPU, PSEG ER&T assumed, through capacity release, FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract remains in effect and provides for annual renewals unless terminated by either party on 12 months' advance written notice.

3. Long Island Power Authority ("LIPA") Fuel Supply: On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015.

D. PSEG Fossil

PSEG Fossil is an Exempt Wholesale Generator ("EWG")[7] and is authorized to sell power at market-based rates. PSEG Fossil owns and operates electric generation facilities located within PJM and sells their entire output to its affiliate PSEG ER&T.[8] The assets of PSEG Fossil (and its subsidiary, PSEG Sewaren) are located entirely within PJM. However, PSEG Fossil's subsidiaries PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Power New York LLC ("PSEG Power NY") and PSEG New Haven LLC ("PSEG New Haven") own facilities in ISO New England Inc. ("ISO-NE") and the New York Independent System Operator, Inc. ("NYISO"). As noted below, PSEG Fossil also co-owns certain facilities in PJM.

PSEG Fossil's subsidiaries, PSEG Power CT, PSEG Keys and PSEG Sewaren, are currently constructing three new gas-fired generation units. PSEG Sewaren is constructing Sewaren7,[9] which is a 585 MW (nameplate rating) combined cycle unit in Woodbridge, New Jersey which is expected to reach commercial operations in June 1, 2018. PSEG Power CT is constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019. Once Sewaren 7 begins commercial operations, Sewaren 1, 2, 3 and 4 will be retired.

PSEG Fossil satisfies most of the electricity needs of its plants from PJM under PJM's "station power" Tariff provisions. PSEG Fossil procures gas supply for its plants from PSEG ER&T and receives gas distribution service from PSE&G at rates approved by the NJBPU on May 29, 2013.[10]

E. PSEG Power CT

[7] PSEG Fossil LLC, Docket No. EG00-3-000, 89 FERC ¶ 62,237 (December 20, 1999); PSEG Fossil LLC, 95 FERC ¶ 61,405 (June 14, 2001); PSEG Fossil LLC, 99 FERC ¶ 62,167 (June 10, 2002).

[8] These contracts were originally approved by the Commission as cost-based contracts. *See Public Service Electric and Gas Company*, et al., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Fossil obtained market based rate authority covering sales from its generating units.

[9] Once Sewaren 7 begins commercial operations, PSEG Fossil plans to retire Sewaren 1, 2, 3 and 4.

[10] NJBPU Docket No. GM12100935 (May 29, 2013).

PSEG Power CT is a Connecticut limited liability company and an EWG that owns and operates electric generation facilities in the State of Connecticut and is authorized to sell power at market-based rates.[11] Both of PSEG Power CT's generation facilities, Bridgeport Harbor and New Haven Harbor, are located in the State of Connecticut within the market administered by ISO-NE. PSEG Power CT sells the output of its generation facilities to its affiliate PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. As noted above, PSEG Power CT is currently constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

F. PSEG New Haven

PSEG New Haven is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG New Haven owns and operates a facility (the "New Haven facility") in New Haven, Connecticut with a nameplate rating of 181 MWs. The New Haven facility is located within the New Haven Harbor generation station. The New Haven facility is interconnected to the adjacent United Illuminating East Shore Substation using a 115 KV underground cable. PSEG New Haven has no other generation assets. The commercial operation date for the New Haven facility was June 1, 2012 and PSEG New Haven has obtained MBR authority from FERC.[12]

The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[13] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[14] All of the energy and capacity of the New Haven facility is sold into the ISO-NE markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA[15] has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder. The 181 MW nameplate rating of the New Haven Facility was not included in PSEG's triennial analysis.

G. PSEG Nuclear

PSEG Nuclear is an EWG[16] and is authorized to sell power at market-based rates. PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire

[12] *PSEG New Haven LLC*, Docket No. ER12-1250-000, *et al*., (May 29, 2012).

[13] *Re Review of Peaking Generation Projects*, Docket No. 08-01-01, Connecticut Department of Public Utility Control, June 25, 2008 ("Awards Decisions") (2008 WL 2587405 (Conn. D.P.U.C.)). The PURA is the successor to the Department of Public Utility Control. PURA came into being in July 2011 as part of a reorganization of Connecticut state energy agencies. For consistency, this application refers to the agency as the PURA.

[14] Section 50 of Public Act 07-242, now codified at Section 16-243u of the Connecticut General Statutes.

[15] The CFD was approved on October 29, 2010 in a letter order ruling on Motion Number 62 in Docket No. 08-01-01.

[16] *PSEG Nuclear LLC*, 97 FERC ¶ 62,191 (November 30, 2001).

output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission.[17] The assets of PSEG Nuclear are located entirely within PJM.

H. Pavant Solar LLC, San Isabel Solar LLC and Bison Solar LLC

PSEG Power Ventures portfolio includes three (3) solar companies with market-based rate authority: (1) Pavant Solar II LLC[18] is a QF which owns a 50 MW (AC) solar facility in Fillmore Utah; (2) San Isabel Solar LLC[19] is a QF which owns a 30 MW (AC) solar facility in Las Animas County, Colorado; and (3) Bison Solar LLC[20] is a QF which owns a 30 MW (AC) solar facility 25 miles north of Fort Collins, Colorado.

I. PSEG Energy Solutions LLC

PSEG Energy Solutions LLC ("PSEG Solutions") is a Delaware limited liability company and a direct subsidiary of PSEG ER&T. PSEG Solutions obtained market-based rate authority[21] and will operate within the PJM, NYISO and ISO-NE markets. PSEG Solutions will purchase power from the regional transmission organization ("RTO") at wholesale and sell it to retail customers. PSEG Solutions will not own or operate any generation assets. PSEG Solutions began its retail business in 2017.

II. Affiliated Generation Ownership

A list of the Applicants' affiliated domestic FERC jurisdictional generation assets owned is contained in Appendix B attached hereto.[22] Those additional subsidiaries of PSEG that may be considered relevant to this request are described below:

(1) Public Service Enterprise Group Incorporated ("PSEG"). PSEG, a New Jersey corporation, is a public utility holding company engaged in, among other things, the generation of electric energy and the transmission, distribution and sale of electricity and natural gas through its subsidiaries.

(2) PSEG Power LLC. PSEG Power was formed in 1999 to acquire the former generation assets of PSE&G. PSEG Power, a Delaware limited liability company, does not directly own any generation facilities or engage in any FERC jurisdictional activities but is the parent company of several FERC jurisdictional entities, including Applicants PSEG ER&T (and

[17] *Public Service Electric and Gas Company, et al.,* 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Nuclear obtained market-based rate authority.

[18] *Pavant Solar II LLC*, Docket No. QF16-1072-000.

[22] Appendix B excludes generation assets located in Hawaii as well as generation assets in which PSEG's interest is limited to a leveraged lease interest. *See* PSEG Keys Application, Docket No. ER17-2426, attached Appendix B.

its subsidiary PSEG Solutions), PSEG Fossil, PSEG Nuclear, PSEG Power CT, PSEG New Haven and PSEG Power Ventures (which owns PSEG Solar Source).

(3) PSEG Power Ventures LLC ("Power Ventures") and PSEG Solar Source LLC. PSEG Power Ventures is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source and has an indirect ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 414 MWs DC (325 MW AC) of solar capacity across the United States, including a combined 146 MWs[23] (113 MW AC) of solar capacity in PJM and approximately the following amount of MWs in the following states, all through separate project companies which have obtained QF status.

- 15 MWs (12 MW AC) in Florida
- 146 MWs in PJM (113 MW AC) – 12 MW in Ohio, 2 MW in New Jersey, 15 MW in Delaware, 103 MW in North Carolina and 13 MW in Maryland
- 45 MWs in Arizona (34 MW AC) – 25 MW Queen, approximately 20 MW Badger
- 13 MWs (10 MW AC) in Texas
- 34 MWs (25 MW AC) in California[24]
- 4 MWs (3 MW AC) in Vermont and
- 74 MWs (60 MW AC) in Colorado – 38 MW (San Isabel) and 36 MW (Bison)
- 62 MW (50 MW AC) in Utah
- 10.5 MW (8 MW AC) in Oregon
- 103 MW (79 MW AC) in North Carolina
- 11 MW DC (9 MW AC) in Long Island NY

(4) PSEG Resources LLC ("Resources"). Resources is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

(5) PSEG Power NY. PSEG Power NY is a Delaware limited liability company and an EWG that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW (nameplate rating) combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a FERC-approved cost-based contract.[25]

[23] The 146 MWs are attributed to four (9) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs), Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW), Cork Oak (26 MW), Sunflower (21 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

[24] The 28 MWs (DC) are associated with the Shasta Solar Facility in California (4 MW), Whitethorn Solar (3 MWs) the Columbia Solar Project (34 MW). All have obtained QF status.

[25] *PSEG Power New York Inc.*, Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

(6) PSEG Keys. PSEG Keys is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG Keys was formed to construct, operate and maintain the Keys Energy Center, a 755MW combined cycle power plant in Prince Georges County, Maryland. Construction began in 2015 and is expected to be completed by June 1, 2018 at which time the capacity and energy will be available in the PJM market. All of the output of the Keys Energy Center will be sold to PSEG Keys affiliate, PSEG ER&T.

(7) PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco"). Long Island and Servco are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution system ("T&D") on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco are FERC jurisdictional public utilities as neither exercises ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[26]

III. Affiliated Transmission Ownership

With the exception of the electric transmission assets owned by PSE&G, all of which are located within the PJM RTO, and the generation interconnection facilities owned by the various EWG and QF affiliates listed herein, none of the PSEG Affiliates own or operate FERC jurisdictional electric or natural gas transmission facilities within the United States. As discussed below, FERC granted PSE&G a Hinshaw exemption in 1954, finding that it was exempt from the provisions of the Natural Gas Act.

A. Jointly Owned Facilities

PSEG Nuclear is a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear is the operator of Salem and Exelon Generation is the operator of Peach Bottom. PSEG Fossil is approximately a 23% joint owner in the Conemaugh and Keystone generating stations located in Pennsylvania. As of the date of this filing, an affiliate of NRG Energy is the operator. Accordingly, for purposes of the December 2016 triennial analysis, the capacity of Salem, Peach Bottom, Conemaugh and Keystone was attributed to PSEG in accordance with PSEG's ownership interests in these facilities.

PSEG Fossil and Jersey Central Power and Light Company ("JCP&L") are each 50% co-owners of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to the unit. Accordingly, for the purpose of the December 2016 triennial market power analysis, the entire unit capacity – nominally 400 MWs – was assigned to JCP&L.

IV. NOTICE OF CHANGE IN STATUS

[26] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), *order dismissing request for rehearing*, 145 FERC ¶ 61,183 (2013).

The PSEG Affiliates submit this Notice of Change in Status to report to the Commission its addition of Sewaren 7 to the generation fleet attributable to PSEG Fossil. Sewaren 7 is a highly efficient, dual-fuel 585 MW combined-cycle plant (nameplate) that is targeted to be in-service in June, 2018. Once Sewaren 7 is in-service, Sewaren 1-4 will be retired.

The addition of Sewaren 7 and the retirements of Sewaren 1-4 results in an increase in excess of 100 MW in the PSEG Affiliate's generation capacity, but does not materially affect the conditions the Commission relied upon in granting PSEG Keys' market-based rate authority or the PSEG Affiliates' Triennial application. As discussed further below, the addition of Sewaren 7 and retirements of Sewaren 1-4 raises no market power concerns. While the PSEG Affiliates understand that the submission of indicative screens is not required for this change in status,[27] the PSEG Affiliates nevertheless submit the indicative screens to show that the addition of Sewaren 7 and retirements of Sewaren 1-4 does not have a material impact on the PSEG Affiliates market power.

V. UPDATED MARKET-BASED RATE ANALYSIS

As demonstrated in the attached market power screens, the PSEG Affiliates continue to lack market power in generation, despite adding Sewaren 7's generation capacity and retiring Sewaren 1-4's generation capacity. Further, PSEG Affiliates' addition of Sewaren 7 has no material impact on the vertical market power analysis submitted to the Commission in the PSEG Keys' application.

A. Horizontal Market Power

The Commission evaluates whether a seller can exercise horizontal market power in a relevant market through two indicative screens: (1) a pivotal supplier analysis; and (2) a wholesale market share analysis. If a seller passes both screens, there will be a rebuttable presumption that the seller lacks market power.[28] Each indicative screen is applied with respect to the "relevant geographic markets" for an applicant's generating units. The Commission requires that an applicant seeking market-based rate authority show it does not possess horizontal market power by demonstrating that it and its affiliates can pass the market power screen, "unless the seller and its affiliates do not own or control generation capacity or all of their capacity is fully committed."

Applicants that are located in ISOs/RTOs possessing sufficient market structure may consider the geographic region under the control of the ISO/RTO as the relevant default geographic region for purposes of completing their generation market power analyses. However, where the Commission has previously found a "submarket" to exist within a boundary of an RTO, such finding is controlling as to the scope of the relevant geographic market for all generation units located within that submarket for the application of the indicative screens and any delivered price test that may be performed. The Commission further listed several such submarkets, including PJM East ("PJME"), PJM East of 5004/5005 ("PJM50") and PJM East of

[27] *See Refinements to Policies and Procedures for Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 816, 153 FERC ¶ 61,065, at P 293 (2015), *order on reh'g and clarify*., Order No. 679-A. 155 FERC ¶ 61,188 (2016).

[28] 18 C.F.R. § 35.37(c)(1) (2011).

AP South ("PJMAP") that would be relevant to an MBR analysis for applicants in the Northeast Region.

As shown in the attached Appendix C, Dr. John Morris has updated the market power analysis that was submitted in the December 2016 Triennial Filing[29] and the market power study for the PJM market and relevant submarkets that were submitted on September 1, 2017 in support of PSEG Keys Application.[30] Specifically, Dr. Morris has updated the market-based rate screens contained in the PSEG Keys Application to account for the addition of the 585 MWs from the PSEG Sewaren unit and the retirements of the Sewaren 1-4 units at the same location (452.3 MWs). Dr. Morris also moved the test year of the analysis forward by one year from December 2014-November 2015 to December 2015-November 2016 because this is the latest period for which FERC Form 714 data on unplanned generator outages is available.[31] Dr. Morris also updated the overall market sizes of the PJM market and submarkets, along with the first tier areas of NYISO and MISO.[32] Finally, Dr. Morris updated load data both for the applicant and for the overall markets in the study.[33] All methods are the same as in Dr. Morris' December 2016 Affidavit.

Dr. Morris' updated analysis shows that there has been a minor decrease in the market power with the addition of Sewaren 7 since the September 2017 PSEG Keys Application. This minor decrease should not be viewed to impact the factors that Dr. Morris relied upon in his findings in either the PSEG Keys MBR Filing or the December 2016 Triennial Filing that the PSEG Affiliates with market-based rate authority have satisfied the requirements demonstrating that they lack horizontal and vertical market power. Specifically, Dr. Morris analysis shows that with the addition of Sewaren 7, the PSEG Affiliates pass all of the pivotal supplier analysis ("PSA") screens for all of the relevant markets, namely, PJM, PJMAP, PJME and PJM50.[34]

Dr. Morris' analysis also shows that the PSEG Affiliates pass two additional screens as compared to the PSEG Keys Application in the wholesale market share analysis ("WMSA").[35]

---

[29] PSEG Energy Resources & Trade LLC, *et al*., Docket Nos. ER10-1789-000, *et al*., (filed December 29, 2016) ("December 2016 Triennial Filing"), attached Exhibit A, Report of Affidavit of Dr. John R. Morris ("December 2016 Affidavit"); PSEG Keys Energy Center LLC, Docket No. ER17-2426-000 (filed September 1, 2017 and amended on October 4, 2017); attached Appendix G, Affidavit of John Morris.

[30] *See* PSEG Keys Application attached Appendices A-1, A-2.

[31] PSEG Energy Resources & Trade LLC, *et al*., Notice of Non-material Change in Status, Docket No. ER18-__-000, (filed May 25, 2018), attached Appendix C, Affidavit of Dr. John R. Morris P 2 ("Morris Affidavit").

[32] *Id.*

[33] *Id.*

[34] *See* attached Appendix A-1. The pivotal supplier analysis ("PSA") focuses on the ability of a seller to exercise unilateral market power. The screen assesses whether market demand can be met during peak times without the applicant and its affiliates. If demand can be met without the applicant and its affiliates, the applicant passes that the PSA screen.

[35] *Id.* The wholesale market share analysis ("WMSA") is applied each season to determine whether an applicant has a dominant market position based on the total number of megawatts of uncommitted capacity owned or controlled by the applicant and its affiliates in relation to the uncommitted capacity of the entire relevant

Notably, in the updated analysis, the PSEG Affiliates now pass the PJM50 for summer and fall. As a result, we submit that Dr. Morris' determination that the PSEG Affiliates could not exercise horizontal market power still stands with the addition of Sewaren 7 (and the retirement of Sewaren 1-4). As stated by Dr. Morris in his affidavit:

> Although there are some minor differences in the results from those presented with the December Affidavit, the differences are not material and do not change the conclusions made at that time. Under the standards utilized by the Commission, continuing market-based rates for PSEG and all of its Northeastern affiliates remain in the public interest. In addition, granting market-rate authority to the Sewaren LLC would also be in the public interest.[36]

Moreover, to the extent necessary, the PSEG Affiliates rely on the same PJM RTO monitoring and mitigation described in the December 2016 Triennial Filing to show that they have met the standards necessary to obtain market-based rate authority. Accordingly, it is clear that with the addition of Sewaren 7 that PSEG Fossil and the other PSEG Affiliates continue to satisfy the standards necessary for market-based rate authority.

B. Vertical Market Power

1. The Applicants Lack Transmission Market Power and Cannot Erect Entry Barriers.

In its previous order accepting PSEG Affiliates' triennial market power analysis for the Northeast Region, the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding vertical market power.[37] As demonstrated below, the PSEG Affiliates are not able to exercise vertical market power.

PSE&G is the only PSEG Affiliate that owns transmission assets in the U.S. other than incidental generator interconnection facilities. PSE&G owns transmission facilities in PJM, but transmission service over those facilities is provided under the PJM Open Access Transmission Tariff.

In addition, none of the PSEG Affiliates are able to exercise vertical market power in wholesale energy markets through affiliation, ownership or control of inputs to electric power production. As required by Section 35.37(e) of the Commission's regulations, the PSEG Affiliates provide the following information:

---

wholesale electricity market. The established threshold is 20 percent; a supplier who has less than 20 percent market share in the relevant market for all seasons passes the WMSA screen.

[36] Morris Affidavit PP 4, 6.

[37] *PSEG Energy Resources & Trade, LLC, et al,* Letter Order, June 29, 2011, Docket No. ER99-3151-017. In addition, in that letter order the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding horizontal market power.

(a) PSE&G owns and operates a natural gas distribution system that receives interstate pipeline gas within the State of New Jersey and distributes that gas to its customers within the State of New Jersey. The distribution system consists of approximately 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3 and peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers. Service over such distribution facilities is made available pursuant to state regulated tariffs on an open access type basis. PSE&G was granted a Hinshaw exemption from the FERC in 1954.[38] The gas distribution rates paid by PSEG Fossil to PSE&G have been set at rates approved by the NJBPU in an order dated May 29, 2013.

(b) Certain of the PSEG Affiliates or their affiliates own sites within the Northeast Region that would be suitable for future generating facilities. These include space at many of the existing generating sites of PSEG Fossil and at the sites of PSEG Power NY and PSEG Power CT. PSEG Nuclear's Salem facility may also be suitable for future construction. PSE&G also owns certain sites that would be suitable for generating facilities, but under New Jersey's Electric Discount and Energy Competition Act, N.J.S.A 48:3-43 et seq., PSE&G is effectively barred from owning and operating generation except "on site" generation and Class I renewable energy resources as defined in N.J.S.A. 48:3-98.1.

(c) Neither the PSEG Affiliates nor any of their affiliates own or control any physical coal supply resources or own or control who may access transportation of coal supplies.

(d) As required by section 35.37(e)(4) of the Commission's regulations, the PSEG Affiliates state that they have not erected barriers to entry into any market, including the PJM, NYISO or ISO-NE market and will not erect barriers to entry into any markets.

VI. DOCUMENTS SUBMITTED WITH FILING

The following documents are submitted with this application.[39]

Appendix A-1: Summary of Market Power Analysis for PJM
Appendix A-2: Market Power Analysis for PJM
Appendix B: December 2016 Triennial Filing
Appendix C: Affidavit of John Morris

VII. CONCLUSION

Based on the foregoing, the PSEG Affiliates submit that, with the addition of Sewaren 7 and retirements of Sewaren 1-4, they continue to lack horizontal and vertical market power and otherwise continue to satisfy the Commission's market-based rate eligibility criteria. In short,

[38] 13 F.P.C. 1348 (1954).

[39] In the event that the Commission deems it necessary to submit an Appendix B (generation assets), the PSEG Affiliates request waiver of such requirement given that the asset appendix would be the same as the one submitted in the PSEG Keys Application, but for the inclusion of the 585 MWs for Sewaren 7 and the retirements of Sewaren 1, 2, 3 and 4 (452.3 MWs).

adding Sewaren 7 to the PSEG Affiliates generation assets raises no market power concerns and does not materially affect the conditions the Commission relied on in granting PSEG Keys' and the PSEG Affiliates' demonstrations in the Triennial Review for the continuation of authorization to sell energy, capacity, and certain ancillary services at market-based rates.

Respectfully submitted,

By: *Cara Lewis*

PSEG Services Corporation

December 28, 2016

ELECRONICALLY AND VIA OVERNIGHT MAIL

Kimberly J. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, DC 20426

RE: Triennial Market Power Update in Compliance with Order No. 697:
***PSEG Energy Resources & Trade LLC*, Docket No. ER99-3151-____;**
***Public Service Electric and Gas Company*, Docket No. ER97-837-____;**
***PSEG Power Connecticut LLC*, Docket No. ER03-327 -___;**
***PSEG Fossil LLC*, Docket No. ER08-447-___;**
***PSEG Nuclear LLC*, ER08-448-___; and**
***PSEG New Haven LLC*, ER12-1250-___**
Pavant Solar II LLC, ER16-1925-___
San Isabel Solar LLC, ER16-1926-___
Bison Solar LLC, ER16-1924-___
PSEG Energy Solutions LLC, ER16-2725-___

Dear Secretary Bose:

Pursuant to the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), Public Service Electric and Gas Company ("PSE&G"), PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear"), PSEG New Haven LLC ("PSEG New Haven") Pavant Solar II LLC, San Isabel Solar LLC, Bison Solar LLC and PSEG Energy Solutions LLC (collectively the "Applicants" or "PSEG") hereby jointly submit for filing their updated market power analysis in support of their continued eligibility to engage in market-based rates

transactions. This market power analysis satisfies the requirements of Order No. 697[1] for the filing of updated market power analyses on a regional schedule basis by holders of market-based rate certificates and their affiliates. In accordance with the regional schedule for those utilities in the Northeast Region, as modified by the MBR Clarifying Order, this filing is being made by the December 2016 deadline.[2] In conformance with the Commission's requirements, except when expressly noted otherwise, the market power analysis is based on activity during the study period from December 1, 2014 through November 30, 2015 ("study period").

PSEG, through its subsidiary PSE&G, owns transmission facilities within the Northeast Region. Specifically, PSE&G owns transmission facilities in the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization. PSEG Power LLC and its subsidiaries do not own any transmission facilities other than transmission to connect generating units to the grid in PJM, the New York Independent System Operator, Inc. ("NYISO") and ISO New England Inc. ("ISO-NE").

In their original applications for market-based rate authority and previously-submitted updates to the Commission, PSEG ER&T, PSE&G, PSEG Power CT, PSEG Fossil, PSEG Nuclear and PSEG New Haven demonstrated that they and their affiliates: (a) do not exercise generation market power; (b) lack the ability to manipulate access to transmission facilities that they own or control; and (c) cannot erect any other barriers to market entry. As further demonstrated herein and in the Affidavit of Dr. John R. Morris attached hereto in the appendices, Applicants continue to satisfy the Commission's requirements to sell energy, capacity and ancillary services at market-based rates and thus should be permitted to continue to make such sales.

I. SERVICE AND COMMUNICATION

All service and correspondence related to this matter should be directed to the following individuals:

[1] 18 C.F.R. Part 35, Subpart H (2007); Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

[2] This filing is made on the three year anniversary of the December 2013 deadline set forth in Order No. 697 Appendix D.

As to the Applicants Generally:

Kenneth Carretta, Esq.
Deputy General Counsel
PSEG Services Corporation

Newark, NJ 07102
(973) 430-6451
(973) 430-5983 (facsimile)
David.Richter@PSEG.com

Applicants request waiver of Rule 203(b)(3)[3] so that a copy of any communications in these proceedings may be served on all persons listed above.

II. DESCRIPTION OF THE APPLICANTS AND RELEVANT AFFILIATES

A. The Applicants

The Applicants are each wholly owned, direct and indirect subsidiaries of Public Service Enterprise Group Incorporated ("PSEG"). PSEG is a public utility holding company engaged in, among other things, the generation of electric energy and the transmission, distribution and sale of electricity and natural gas through its subsidiaries.

1. Public Service Electric and Gas Company

PSE&G is a public utility operating company engaged primarily in the transmission of electricity, and the provision of gas and electric distribution service in the State of New Jersey. During the study period, PSE&G owned less than 140 MW of solar generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities. PSE&G is a member of the PJM Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access

[3] 18 C.F.R. § 385.203(b)(3).

Transmission Tariff ("OATT") administered by PJM. PSE&G is authorized to sell power at market-based rates and makes wholesale sales falling within several different categories, as described below.

Non-utility generation ("NUG") output. PSE&G's NUG output expired in 2015 and 2016 pursuant to the terms of the NUG contracts. PSE&G currently has no further NUG obligations, other than 0.6 MW of energy associated with the former Kinsley Landfill which no longer operates. .

Solar. In 2007, the New Jersey legislature passed Regional Greenhouse Gas Initiative ("RGGI") legislation authorizing state utilities to invest in renewable resources such as wind or solar in order to promote increased use of renewable resources within the state and in turn reduce greenhouse gas emissions. *See* L. 2007, c. 340, codified at N.J.S.A. 48:98-1. The NJBPU has approved two (2) PSE&G Solar 4 All® (S4A) programs under which PSE&G has sited, designed and built twenty-nine (29) grid connected solar facilities. PSE&G currently owns and operates approximately 115MW-dc of grid connected solar under the S4A program. PSE&G expects the S4A fleet to increase to approximately 125MW-dc by the end of 2016. In 2016, PSE&G received NJBPU approval of its Solar 4 All Extension II filing to install an additional 33MW-dc of grid connected solar on landfills and brownfields in the PSE&G electric service territory.

2. PSEG Energy Resources & Trade LLC

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.,* which initiated the transition from a regulated to a competitive retail power market in New Jersey, BPU annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSEG ER&T has participated directly in all of the auctions for BGS supply held since 2004, has been a winning bidder in these auctions and has incurred contractual

commitments to provide supply to BGS load pursuant to BPU approved contracts beginning with the 2004 auction and continuing to the present

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract remains in effect and provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply: On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015.

3. PSEG Fossil LLC

PSEG Fossil is an Exempt Wholesale Generator ("EWG") and is authorized to sell power at market-based rates. PSEG Fossil owns and operates electric generation facilities located within PJM and sells their entire output to its affiliate PSEG ER&T.[4] The assets of PSEG Fossil (and its subsidiary, PSEG Keys Energy Center LLC ("PSEG Keys")) are located entirely within PJM. However, PSEG Fossil's subsidiaries PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Power New York LLC and PSEG New Haven LLC own facilities in ISO-NE and NYISO. As noted below, PSEG Fossil also co-owns certain facilities in PJM.

PSEG Fossil and its subsidiaries PSEG Power CT and PSEG Keys are currently beginning construction on three new gas-fired generation units. PSEG Fossil is constructing Sewaren 7[5] which is a 540 MW combined cycle unit in Woodbridge, New Jersey which is expected to be in-service in 2018, PSEG Keys is constructing a 755 MW combined cycle unit in Prince George's County, Maryland which is expected to be in service in 2018 and PSEG Power CT is constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

Since the last triennial filing in December 2013 PSEG Fossil has retired 1,813.5 MWs (nameplate) inclusive of the following units:

Kearny 9 (18.6 MW)
Bergen 3 (18.6 MW)

[4]These contracts were originally approved by the Commission as cost-based contracts. *See Public Service Electric and Gas Company*, et al., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Fossil obtained market based rate authority covering sales from its generating units.

[5] Once Sewaren 7 begins commercial operation, PSEG Fossil plans to retire Sewaren 1, 2, 3 and 4.

Bridgeport 2 (179.5 MW)
Burlington 8 (18.6 MW
Burlington 9 (162.4 MW)
Burlington 11 (162.4 MW)
Edison 1 (167.4 MW)
Edison 2 (167.4 MW)
Edison 3 (167.4 MW)
Essex 10 (167.4 MW)
Essex 11 (167.4 MW)
Essex 12 (167.4 MW)
Mercer 3 (115.2 MW)
National Park (18.6 MW)
Sewaren 6 (115.2 MW)

In addition, PSEG Fossil, LLC notified PJM of its intent to retire Hudson 2 (659 MW nameplate rating) and Mercer Units 1 and 2 (652MW nameplate rating) by June 1, 2017.

PSEG Fossil satisfies most of the electricity needs of its plants from PJM under PJM's "station power" Tariff provisions. PSEG Fossil procures gas supply for its plants from PSEG ER&T and receives gas distribution service from PSE&G at a rate approved by the BPU on May 29, 2013.[6]

4. PSEG Power Connecticut LLC

PSEG Power CT is a Connecticut limited liability company and an EWG that owns and operates electric generation facilities in the State of Connecticut and is authorized to sell power at market-based rates.[7] Both of PSEG Power CT's generation facilities, Bridgeport Harbor and New Haven Harbor, are located in the State of Connecticut within the market administered by ISO-NE. PSEG Power CT sells the output of its generation facilities to its affiliate PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. As noted above, PSEG Power CT is currently constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

5. PSEG New Haven LLC

PSEG New Haven is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG New Haven owns and operates a facility (the "New Haven facility") in New Haven, Connecticut with a nameplate rating of 181 MWs. The New Haven facility is located within the New Haven Harbor generation station. The New Haven facility is interconnected to the adjacent United Illuminating East Shore Substation using a 115 KV underground cable. PSEG New Haven has no other

[6] BPU Docket No. GM12100935 (May 29, 2013).
[7] *Wisvest Corporation,* et al., 101 FERC ¶ 61,166 (2002).

generation assets. The commercial operation date for the New Haven facility was June 1, 2012 and PSEG New Haven has obtained MBR authority from FERC.[8]

The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[9] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[10] All of the energy and capacity of the New Haven facility is sold into the ISO New England ("ISO-NE") markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA[11] has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder. The 181 MW nameplate rating of the New Haven Facility has not been included in the capacity controlled by PSEG for purposes of Dr. Morris' market power analysis.

6. PSEG Nuclear LLC

PSEG Nuclear is an EWG[12] and is authorized to sell power at market-based rates. PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission.[13] The assets of PSEG Nuclear are located entirely within PJM. PSEG Nuclear performed the following uprates since the last triennial filing: (1) an uprate of 120 MWs at its Hope Creek plant in 2014, which increased its nameplate rating to 1290 MWs, (2) an uprate to Peach Bottom 2 and 3 which increases PSEG's share of the nameplate MWs by 241 MWs for a updated nameplate of 704 MW for Peach Bottom 2 and 689 MWs for Peach Bottom 3.

7. Pavant Solar LLC, San Isabel Solar LLC and Bison Solar LLC

PSEG Power Ventures portfolio includes three (3) solar companies with market-based rate authority: (1) *Pavant Solar II LLC*[14] is a QF which owns a 50 MW (AC) solar facility in Fillmore Utah; (2) *San Isabel Solar LLC*[15] is a QF which owns a 30 MW (AC)

solar facility in Las Animas County, Colorado and (3) *Bison Solar LLC*[16] is a QF which owns a 30 MW (AC) solar facility 25 miles north of Fort Collins, Colorado.

8. PSEG Energy Solutions LLC

PSEG Energy Solutions LLC ("PSEG Solutions") is a Delaware limited liability company and a direct subsidiary of PSEG ER&T. PSEG Solutions obtained market-based rate authority[17] and will operate within the PJM Interconnection, L.L.C. ("PJM"), New York Independent System Operator, Inc. ("NYISO") and ISO New England Inc. ("ISO-NE") markets. Energy Solutions will purchase power from the regional transmission organization ("RTO") at wholesale and sell it to retail customers. PSEG Solutions will not own or operate any generation assets. PSEG Solutions proposes to begin its retail business on January 1, 2017.

OTHER RELEVANT AFFILIATES

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities, as discussed below.

7. Affiliated Generation Ownership.

A list of the Applicants' affiliated domestic FERC jurisdictional generation assets owned is contained in Appendix B attached hereto. [18] Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the Northeast Region are described below:

PSEG Power LLC ("PSEG Power") was formed in 1999 to acquire the former generation assets of PSE&G. PSEG Power, a Delaware limited liability company, does not directly own any generation facilities or engage in any FERC jurisdictional activities but is the parent company of several FERC jurisdictional entities, including Applicants PSEG ER&T (and it subsidiary PSEG Energy Solutions LLC), PSEG Fossil, PSEG Nuclear, PSEG Power CT, PSEG New Haven and PSEG Power Ventures LLC (which owns PSEG Solar Source LLC).

PSEG Power Ventures LLC and PSEG Solar Source LLC. PSEG Power Ventures LLC ("Power Ventures") is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source LLC and has an in-direct ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 349 MWs DC (274 MW AC) of solar capacity across the United States, including a combined 92

[16] *Bison Solar LLC*, Docket No. QF16-711-001.
[17] See Letter Order dated December 21, 2016 in Docket No. ER16-2725-000.
[18] Appendix B excludes generation assets located in Hawaii as well as generation assets in which PSEG's interest is limited to a leveraged lease interest.

MWs[19] (72 MW AC) of solar capacity in PJM and approximately the following amount of MWs in the following states all through separate project companies which have all obtained QF status.

- 15 MWs (12 MW AC) in Florida,
- 92 MWs in PJM (72 MW AC) – 12 MWs in Ohio, 2 MW in New Jersey, 15 MW in Delaware, 50 MW in North Carolina and 13 MW in Maryland
- 45 MWs in Arizona (34 MW AC) – 25 MW Queen, approximately 20 MW Badger
- 13 MWs (10 MW AC) in Texas,
- 34 MWs (25 MW AC) in California[20]
- 4 MWs (3 MW AC) in Vermont and
- 74 MW (60 MW AC) in Colorado (to be in operation in 2016) – 38 MWs for San Isabel and 36 MWs for Bison
- 62 MW (50 MW AC) in Utah (to be in operation in 2016).
- 10.5 MW (8 MW AC) in Oregon (to be in operation in 2016).

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company and an EWG that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a FERC-approved cost-based contract.[21]

[19] The 92MWs are attributed to four (7) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs) Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

[20] The 28MWs (DC) are associated with the Shasta Solar Facility in California (4 MW), Whitehorn Solar (3 MWs) the Columbia Solar Project (19 MW). All have obtained QF status.

[21] *PSEG Power New York Inc.*, Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

PSEG Keys Energy Center LLC ("PSEG Keys") is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG Keys was formed to construct, operate and maintain the Keys Energy Center, a 755MW combined cycle power plant in Prince Georges County, Maryland. Construction began in 2015 and is expected to be completed in 2018 at which time the capacity will be available in the PJM market. All of the output of the Keys Energy Center will be sold to PSEG Keys affiliate, PSEG ER&T.

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution system ("T&D") on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco will be FERC jurisdictional public utilities as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[22]

8. Affiliated Transmission Ownership

With the exception of the electric transmission assets owned by Applicant PSE&G, all of which are located within the PJM RTO, and the generation interconnection facilities owned by the various EWG and QF affiliates listed herein, the Applicants, nor their affiliates have any affiliates that own or operate FERC jurisdictional electric or natural gas transmission facilities within the United States[23]. As discussed below, FERC granted PSE&G a Hinshaw exemption in 1954, finding that it was exempt from the provisions of the Natural Gas Act.

B. JOINTLY OWNED FACILITIES

PSEG Nuclear is a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear is the operator of Salem and Exelon Generation is the operator of Peach Bottom.[24] PSEG Fossil is approximately a 23% joint owner in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[25] Accordingly, for

[22] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), *order dismissing request for rehearing*, 145 FERC ¶ 61,183 (2013).

[23] PSEG Power LLC is a 10% owner of the PennEast Pipeline Company LLC which has filed an application for approval to construct and operate a natural gas transmission line.

[24] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in Appendix E. The ownership percentages have not changed since the date of this letter. PSEG Nuclear owns a 50% interest in Peach Bottom and a 57.41% interest in Salem.

[25] A letter of concurrence supporting the allocation of plant output based on ownership interest is attached in Appendix E. The ownership percentages have not changed since the date of this letter.

purposes of this market power analysis, the capacity of Salem, Peach Bottom, Conemaugh and Keystone has been attributed to PSEG in accordance with PSEG's ownership interests in these facilities.

PSEG Fossil and Jersey Central Power and Light Company ("JCP&L") are each 50% co-owners of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity – nominally 400 MWs – has been assigned to JCP&L.[26]

III. Applicants Fully Satisfy The Commission's Standards For Authority to Make Power Sales At Market-Based Rates.

The Commission allows power sales at market-based rates if the seller and its affiliates do not have, or have adequately mitigated, horizontal and vertical market power.[27] The Commission has also codified affiliate restrictions in its regulations which must be satisfied on an ongoing basis. In previous submissions for market-based rate authority the Applicants PSE&G, PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear, and PSEG New Haven, demonstrated compliance with each of these requirements. As detailed herein and in the attached affidavit, the Applicants continue to meet these standards.

A. The Applicants Lack, Or Have Effectively Mitigated, Any Horizontal Market Power

In the MBR Order, the Commission established two indicative screens: a pivotal supplier screen based on the control area's annual peak demand and a wholesale market share screen applied on a seasonal basis. If an applicant passes both screens, there is a rebuttable presumption that the applicant does not possess horizontal market power. Each indicative screen is applied with respect to "relevant geographic markets" for an applicant's generating units.

Applicants located in ISOs/RTOs possessing sufficient market structure may consider the geographic region under the control of the ISO/RTO as the relevant default geographic region for purposes of completing their generation market power analyses.[28] However, where the Commission has previously found a "submarket" to exist within a boundary of an RTO, such finding is controlling as to the scope of the relevant geographic market for all generation units located within that submarket for the application of the indicative screens and any delivered price test that may be performed. The Commission further listed several such submarkets, including PJM East ("PJME"),

[26] A letter of concurrence supporting this determination is attached in Appendix E. The ownership percentages have not changed since the date of this letter.
[27] MBR Order, FERC Stats. & Regs. ¶ 31,252 at P 62, 399, 408, 440.
[28] *MBR Order at* PP. 231 and 235.

Connecticut and Southwest Connecticut.[29] Subsequent to the MBR order, in approving a merger between Exelon Corporation and Constellation Energy Group, Inc., the Commission identified additional submarkets in PJM - PJM East of 5004/5005 ("PJM50") and PJM East of AP South ("PJMAP") - that would be relevant to an MBR analysis for applicants in the Northeast Region.[30]

As discussed below and in the attached Affidavit of Dr. John Morris contained in Appendix A, Applicants have conducted market power analyses of the entire PJM RTO, the PJME, PJM50 and PJMAP submarkets, the entire NYISO, the entire ISO-NE, the Connecticut submarket and the Southwest Connecticut submarket for the study period. The results are set forth below.

1. Indicative Screens

a. Pivotal Supplier Analysis

The pivotal supplier analysis ("PSA") focuses on the ability of a seller to exercise unilateral market power.[31] The screen assesses whether market demand can be met during peak times without the applicant and its affiliates. If demand can be met without the applicant and its affiliates, the applicant passes that the PSA screen. The Affidavit of Dr. John Morris, attached hereto as Appendix A, finds that the Applicants pass the PSA screen for all relevant markets: PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut, PJMAP, PJME and PJM50.[32]

b. Wholesale Market Share Analysis

The wholesale market share analysis ("WMSA") is applied each season to determine whether an applicant has a dominant market position based on the total number of megawatts of uncommitted capacity owned or controlled by the applicant and its affiliates in relation to the uncommitted capacity of the entire relevant wholesale electricity market.[33] The established threshold is 20 percent; a supplier who has less than 20 percent market share in the relevant market for all seasons passes the WMSA screen.

In his Affidavit Dr. Morris finds that the Applicants pass the WMSA screen for PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut and PJMAP but do not pass the WMSA screen for the PJME and PJM50 submarkets.[34]

---

[29] *Order No. 697* at P 236 (citing *Exelon Corp.*, 112 FERC ¶ 61,011, *reh'g denied*, 113 FERC ¶ 61, 299 (2005)). FERC eliminated the Northern PSEG zone as a default submarket in Order No. 697-A, P 99.

[30] Order Conditionally Authorizing Merger and Disposition of Jurisdictional Facilities, *Exelon Corporation, et al.*, 138 FERC ¶ 61,167 (2012).

[31] *AEP I* at P 72.

[32] *See* Morris Affidavit, at 15-29.

[33] *AEP I,* P 100.

[34] *See* Morris Affidavit, at 15-29.

c. Results of Indicative Screen Analysis

As shown in Dr. Morris's affidavit, Applicants therefore pass both indicative screen tests for PJM RTO, NYISO, ISO-NE, Connecticut and Southwest Connecticut and PJMAP. For PJME and PJM50, the Applicants pass the PSA but do not pass the WMSA.

2. Delivered Price Test Analysis For PJME and PJM50 Submarkets

In accordance with the MBR Order, applicants who fail either indicative screen test can rebut the presumption of market power through the submission of a delivered price test analysis ("DPT"). Applicants may submit this study at the same time that the results of the indicative screens are provided.[35] The DPT is based on two measurements of potential market power: economic capacity ("EC") and available economic capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting native load commitments from EC. Both calculations are performed for ten different season and load conditions.

In applying the DPT, "[a] showing of an HHI less than 2,500 in the relevant market for all season/load conditions for sellers that have also shown that they are not pivotal and do not possess a 20 percent or greater market share in any of the season/load conditions would constitute a showing of a lack of market power, absent compelling contrary evidence from intervenors."[36] However, while meeting these threshold benchmarks provides "safe harbor" protection, the Commission has found in numerous other cases that applicants lack market power even when they exceed one or more of the thresholds for particular study periods. As stated in *Public Service Company of New Mexico*, 115 FERC ¶ 61,090, P 38 (2006), "the Commission weights the results of both the economic and available economic capacity tests and considers the arguments of the applicant and intervenors." (footnote omitted.) [37]

---

[35] *Order No. 697,* P 76.

[36] *Order No. 697* at P 111.

[37] Indeed, in that case, the applicant was deemed "on balance" to have adequately rebutted a showing of market power mitigation for the PNM control area where the results exceeded the 20% safe harbor in two cases under the AEC measure and in all 10 cases at values between 35% and 41% under the EC measure. *See, e.g.*, *Kansas City Power and Light Company, et al.*, Docket Nos. ER99-1005-011 et al. (August 12, 2010) (finding no market power where applicant had EC market shares in the 40-60% range and had significant HHI failures in the KCPL and GMO markets); *Cordova Energy Company LLC et al,* Docket Nos. ER99-2156-011, *et al.*, November 13, 2007 (finding no market power in case where applicant had EC market shares in PACE control area between 53.1% and 60.0%, HHIs between 2,958 and 3,696 and was pivotal in 8 out of 10 periods.); *PacifiCorp*, Letter Order, Docket Nos. ER97-2801-007, *et al.*, February 1, 2007; *Tucson Elec. Power Co.*, 116 FERC ¶ 61,051 (2006)(finding market power standard satisfied where applicant had EC market shares above 20% in all ten season/load periods in the Tucson control area, exceeded the 2,500 HHI threshold in eight periods, and was pivotal in 5 periods); *PacifiCorp*, 115 FERC ¶ 61,349 (2006) (finding that applicants rebutted presumption of market power in the PacifiCorp East control area where under available economic capacity measure, market share is less than 20% in 8 season/load periods and 28% in the summer and winter off-peak periods, HHI does not exceed 2500 in any season/load period and applicants are not pivotal); *Kansas City Power & Light Co.*, 113 FERC ¶ 61,074 (2005) (finding

a. Results of the DPT for PJM50 Submarket

For both the AEC and EC, PSEG passes all screens in all periods except for the pivotal supplier screen in the Summer Top 1% period.

b. Results of the DPT for PJME Submarket

With respect to AEC, PSEG passes all the screens in all 10 periods. With respect to the EC, PSEG passes the Market Concentration screens in all periods. It also passes the Pivotal Supplier Screen in 8 of 10 periods, and passes the Market Share Screen in 6 of 10 periods. PSEG's market shares are never above 25 percent. Although greater than the 20 percent screen, PSEG's market shares are well below the 35 percent threshold that is typically used for imputing unilateral market power.

3. Analysis of DPT Results

Based on his analysis of the overall results, Dr. Morris concludes that, although PSEG fails limited number of screens, the failures are substantially below levels that typically indicate market power. As set forth in his Affidavit, Dr. Morris states that:

> Although PSEG fails some screens in the PJME destination market, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the AEC screens and all market concentration (HHI) screens for EC. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[38] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all the AEC pivotal supplier screens, and most of the EC pivotal supplier screens. This means that typically PSEG's generation is not necessary to serve load; and when its generation is necessary, its forward sale commitments are sufficient so that its uncommitted generation is not necessary to serve the remaining load. Finally, PSEG's market shares are never above 15 percent in PJM50 and for AEC in PJM East. Its market shares for EC are never above 25 percent in PJM East. Although greater than the 20 percent screen, PSEG's market shares are

---

no market power in the KCPL control area where applicant had EC market shares above 20% in all periods, exceeded the HHI 2,500 threshold in 5 of 10 periods and was pivotal supplier in 1 period); *Acadia Power Partners, L.P.*, 113 FERC ¶ 61,073 (2005) (finding no market power in the Cleco Power home control where, utilizing the EC measure, the applicant exceeded the thresholds set for all season/load periods using the market share measure, one season/load period using the market concentration measure, and for all season/load periods using the pivotal supplier measure).

[38] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

well below the 35 percent threshold that is typically used for imputing unilateral market power.[39]

Dr. Morris's conclusion is consistent with Commission precedent finding a lack of market power in cases in which the DPT results included more instances of findings outside of the "safe harbor" thresholds and at higher levels than exist here.[40] In these circumstances, Dr. Morris's analysis successfully rebuts any inference of market power created by the WMSA screen failures for PJME.

4. Existing RTO/ISO Mitigation Rules Also Eliminate The Potential for Exercising Market Power In the PJME, PJME PJM50 and PJMAP Submarkets

PJM mitigation rules eliminate the potential for the exercise of market power in the PJME submarket. The MBR Order specifically contemplated that RTO/ISO mitigation rules may serve as evidence that any market power has been adequately mitigated. The Commission declared, "We believe the added protections provided in structured markets with market monitoring and mitigation generally result in a market where prices are transparent and attempts to exercise of market power will be sufficiently mitigated."[41] The Order on Rehearing went even further and specifically created a presumption that any potential market power had been adequately mitigated by an established and effective RTO market monitoring scheme.[42]

Taking account of the pervasive PJM mitigation rule, Dr. Morris concludes that these rules "fully address the potential for PSEG to exercise market power" in PJME.[43] Accordingly, PJM's mitigation schemes in place are sufficient to rebut any inference of market power created by the failure to pass the WMSA screens in PJME and PJM50.

In addition, in the Applicants' last triennial approval order, the Commission found that "the PJM market monitoring and mitigation rules are sufficient to address market power concerns in the PJM-East submarket."[44]

[41] MBR Order at P 241.

[42] Order No. 697A at P 111.

[43] Morris Affidavit, pp. 24-26.

[44] *See* October 14, 2014 letter order approving Applicants' prior triennial market update in Docket No. ER10-1789-003 et al. at page 3.

a. The Applicants Lack Transmission Market Power and Cannot Erect Entry Barriers.

In its previous order accepting PSEG's triennial market power analysis for the Northeast Region, the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding vertical market power.[45] There have been no subsequent changes in status that would reflect a departure from the characteristics the Commission relied upon in granting market-based rate authority. As demonstrated below, neither Applicants nor any of its affiliates are able to exercise vertical market power.

Applicants are not able to exercise transmission market power. Neither Applicants nor any of their affiliates, except PSE&G, own transmission assets in the U.S. other than incidental generator interconnection facilities. PSE&G owns transmission facilities in PJM but transmission service over those facilities is provided under the PJM Open Access Transmission Tariff.

In addition, neither Applicants nor their affiliates are able to exercise vertical market power in wholesale energy markets through affiliation, ownership or control of inputs to electric power production. As required by Section 35.37(e) of the Commission's regulations, Applicants provide the following information:

(1) PSE&G owns and operates a natural gas distribution system that receives interstate pipeline gas within the State of New Jersey and distributes that gas to its customers within the State of New Jersey. The distribution system consists of 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3 and peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers. Service over such distribution facilities is made available pursuant to state regulated tariffs on an open access type basis. PSE&G was granted a Hinshaw exemption from the FERC in 1954.[46] The gas distribution rates paid by PSEG Fossil to PSE&G have been set at rates approved by the BPU in an order dated May 29, 2013.

(2) Certain of the Applicants and their affiliates own sites within the Northeast Region that would be suitable for future generating facilities. These include space at many of the existing generating sites of PSEG Fossil and at the sites of PSEG Power NY and PSEG Power CT. PSEG Nuclear's Salem facility may also be suitable for future construction. PSE&G also owns certain sites that would be suitable for generating facilities, but under New Jersey's Electric Discount and Energy Competition Act, N.J.S.A 48:3-43 et seq., PSE&G is effectively barred from owning and operating

[45] *Id.*
[46] 13 F.P.C. 1348 (1954).

generation except "on site" generation for supply and Class I renewable energy resources as defined in N.J.S.A. 48:3-98.1.

(3) Neither Applicants nor any of their affiliates own or control any physical coal supply resources or own or control who may access transportation of coal supplies.

(4) As required by section 35.37(e)(4) of the Commission's regulations, Applicants and its affiliates state that they have not erected barriers to entry into any market, including the PJM, NYISO or ISO-NE market and will not erect barriers to entry into any markets.

IV. REQUEST FOR CONFIDENTIAL TREATMENT

Under separate cover via UPS Overnight this office is submitting compact disks containing the workpapers of Dr. John Morris supporting his analysis in Appendix A, as required by the Commission's April 2004 Order.[47] The CD (of which six copies are included) contains: (i) proprietary information provided by Energy Velocity under an agreement that requires confidential treatment to be requested for these materials; (ii) modeling and computer programs that are the proprietary intellectual property of Economists Incorporated, the firm which employs Dr. Morris; (iii) commercially sensitive information about Applicants and their affiliates; and (iv) documents and information deemed to be confidential by PJM and ISO-NE. Accordingly, Applicants respectfully request confidential treatment for CD and the workpapers pursuant to 18 C.F.R. § 388.112 (2006), consistent with the confidential treatment accorded other applicants submitting such proprietary and commercially sensitive data.[48] Pursuant to the Commission's rules, the public version of this filing contains all materials submitted herein except for CD, which is labeled as "PRIVILEGED AND CONFIDENTIAL/NON-PUBLIC."

V. SERVICE

This filing has been served on all parties on the official service list as currently maintained by Commission in the above-referenced dockets. Applicants are also providing a copy to the New Jersey Board of Public Utilities and the New Jersey Division of Rate Counsel.

VI. ENCLOSURES

Applicants enclose the following:

- An original filing;

[47] AEP II, 107 FERC at P 61,087-88.

[48] *See, e.g., Idaho Power Company*, Docket No. ER97-1481-009 (February 3, 2006) (submission of revised Pivotal Supplier Screen and Market Share Screen calculations including similar data).

- Appendix A – Affidavit of Dr. John R. Morris;[49]
- Appendix B – List of Entities with Market-Based Rates Authority and Their Generation Assets. (This is an appendix listing the filing entities and all their energy affiliates and their associated assets);
- Appendix C – List of Entities with Market-Based Rate Authority and Their Transmission Assets;
- Appendix D – List of Long Term Power Purchase Agreements;
- Appendix E – Letters of concurrence regarding the control of certain jointly owned generation facilities;
- Appendix F – Form of notice suitable for publication in the Federal Register.

[49] Compact disks, as described above, containing the workpapers for the Affidavit of John R. Morris in Appendix A are being sent concurrently with this filing via UPS Overnight. As noted *supra*, privileged treatment is being requested for Dr. Morris's confidential workpapers submitted with the non-public version of this filing.

VII. CONCLUSION.

Applicants respectfully request the Commission

(i) to accept this market power compliance filing as meeting the Commission's requirements under Order No. 697 for the continuation of market-based rate authority for Applicants PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Nuclear LLC, PSEG Fossil LLC, Pavant Solar II, LLC, Bison Solar LLC , San Isabel Solar LLC and PSEG Energy Solutions LLC;

(ii) to grant the request for confidential treatment; and

(iii) to grant such other relief or waivers as may be appropriate or necessary.

Respectfully submitted,

Public Service Electric and Gas Company
PSEG Energy Resources & Trade LLC
PSEG Power Connecticut LLC
PSEG Fossil LLC
PSEG Nuclear LLC
PSEG New Haven LLC
Pavant Solar II, LLC
Bison Solar, LLC
San Isabel Solar, LLC

NOTICE OF FILING
( )

Take notice that on December 28, 2016: (i) PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Fossil LLC, PSEG Nuclear LLC, Pavant II Solar LLC, Bison Solar LLC, San Isabel Solar LLC and PSEG Energy Solutions LLC tendered for filing their joint triennial market power update in compliance with Order No. 679 and with prior Commission Orders granting them market-based rate authority in Docket Nos. ER99-3151, ER97-837, ER03-327, ER08-447 ER08-448, DR-12-1250, ER16-1926, ER16-1925, ER16-1924 and ER16-2725 respectively.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR §§ 385.211 and 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. Such notices, motions, or protests must be filed on or before the comment date. Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant. On or before the comment date, it is not necessary to serve motions to intervene or protests on persons other than the Applicant.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the "eFiling" link at http://www.ferc.gov. Persons unable to file

electronically should submit an original and 14 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street, N.E., Washington, D.C. 20426.

This filing is accessible on-line at http://www.ferc.gov, using the "eLibrary" link and is available for review in the Commission's Public Reference Room in Washington, D.C. There is an "eSubscription" link on the web site that enables subscribers to receive email notification when a document is added to a subscribed docket(s). For assistance with any FERC Online service, please email FERCOnlineSupport@ferc.gov, or call (866) 208-3676 (toll free). For TTY, call (202) 502-8659.

Comment Date: 5:00 pm Eastern Time on (insert date).

Report & Affidavit of
Dr. John R. Morris

December 22, 2016

20160328-5240 FERC PDF (Unofficial) 3/28/2016 8:31:16 AM

Public Service Enterprise Group Incorporated Northeast Region Market Power Study

1. Introduction

My name is Dr. John R. Morris. I am a Principal at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Washington, DC 20037. I have a bachelor's degree in economics from Georgetown University, and I have a master's degree and a Ph.D. in economics from the University of Washington. I have been studying and consulting within energy industries since joining the Federal Trade Commission in 1985. Since joining Economists Incorporated in 1992, I have consulted on many mergers involving electric and gas companies, examined competitive issues relating to utility rates, provided market power studies for applications for market-based rate authority, and studied market power issues in state restructuring proceedings. I have published articles on competition and energy matters, and I have spoken on numerous occasions concerning competition in natural gas, electric power and other industries. I have previously been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission ("FERC" or "Commission"), state commissions and in federal court. A complete listing of my experience, publications and testimony is contained in my resume, presented in Exhibit PEG-2.

Public Service Enterprise Group Incorporated ("PSEG") asked that I prepare a market power study for its subsidiaries that have market-based rate authority in the Northeast Region.[1] These subsidiaries are: Public Service Electric and Gas

[1] The Northeast Region includes ISO-New England Inc. ("ISO-NE"), Connecticut, Southwest Connecticut, New York Independent System Operator, Inc. ("NYISO"), PJM Interconnection, L.L.C. ("PJM"), PJM East, PJM East of 5004/5005 and PJM East of AP South.

("PSE&G"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear"), PSEG Power Connecticut LLC ("PSEG Power CT"). PSEG New Haven LLC ("PSEG New Haven") Pavant II Solar LLC, Bison Solar LLC and San Isabel Solar LLC.[2] The purpose of this study is to determine whether these PSEG entities have market power in any Northeast Region market under the Commission's Pivotal Supplier Analysis ("PSA") and Wholesale Market Share Analysis ("WMSA") screens as articulated in FERC Order No. 697 and if the Applicants do fail any of the screens, whether they otherwise lack market power under the Delivered Price Test ("DPT") or are subject to sufficient mitigation to guard against any market power concerns.[3]

PSEG

PSEG is a public utility holding company headquartered in in Newark, New Jersey. Through its subsidiaries, PSEG engages in the generation, transmission, distribution and sale of electric energy, and distribution and sale of natural gas to commercial, residential, and industrial customers primarily in the Northeastern and Mid-Atlantic United States. PSEG, through its subsidiaries, owns approximately 11,300 MW of seasonal generation capacity located in the Northeast Region.[4]

---

[2] Pavant II Solar LLC, Bison Solar LLC and San Isabel Solar LLC all have QF status.

[3] *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

[4] *See* Exhibit PEG-3 (accounting for retirements).

PSE&G

PSE&G is a public utility operating company engaged primarily in the transmission of electricity and the provision of gas and electric distribution service in the State of New Jersey. It is New Jersey's oldest and largest investor-owned utility. PSE&G was founded in 1903 and is based in Newark, New Jersey. It is a member of the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access Transmission Tariff ("OATT") administered by PJM. The company also owns and operates 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3. During the study period, PSE&G owned less than 140 MW of solar generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities.

PSEG ER&T

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission. PSEG ER&T also makes wholesale sales of natural gas.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.,* which initiated the transition from a regulated to a competitive retail power market in New Jersey, the New Jersey Board of Public Utilities ("BPU") annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSE&G's affiliate, PSEG ER&T, has participated directly in all of the auctions for BGS supply held since 2004 and has consistently won tranches in those auctions, including auctions for BGS service within the franchised service territory of PSE&G.

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, PSE&G's FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract, which currently remains in effect, provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply. On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which

ER&T provides fuel supply and power supply management activities for LIPA as of January 1, 2015.

PSEG Fossil

PSEG Fossil owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission under the umbrella of PSEG Fossil's market-based rate authority.[5] The assets of PSEG Fossil are located entirely within PJM.[6] Since the last triennial filing in 2013, PSEG Fossil has retired approximately 1,800 MW of capacity in the eastern portion of PJM. Much of this capacity was retired at the end of May 2015. We included this capacity in the Winter and Spring season screens and exclude the capacity for the Summer and Fall screens.

PSEG Fossil is approximately a 23 percent joint owner of interests in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[7] PSEG Fossil is a 50 percent co-owner with Jersey Central Power and Light Company ("JCP&L") of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to

---

[5] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

[6] PSEG Fossil's subsidiaries PSEG Power Connecticut LLC, PSEG New Haven LLC and PSEG Power New York LLC own generation units in Connecticut and New York respectively.

[7] A letter of concurrence supporting the allocation of these facilities' output based on ownership interests is attached in our workpapers.

the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity, nominally 400 MWs, has been assigned to JCP&L.[8]

PSEG Power CT

PSEG Power CT owns the Bridgeport Harbor and New Haven Harbor generation facilities located in the state of Connecticut within ISO-NE and is authorized to sell power at market-based rates.[9] The output of these facilities is sold to PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. PSEG Power CT is currently constructing Bridgeport 5, a 485 MW gas-fired combined cycle in Bridgeport, Connecticut, which is expected in service in 2019.

PSEG New Haven

PSEG New Haven owns and operates the New Haven facility, a gas-fired plant located in New Haven, CT that entered service in June 2012 with a nameplate capacity of 181.5 MW. The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[10] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[11] All of the energy and capacity of the New Haven facility is sold

---

[8] A letter of concurrence supporting the allocation of this facility's output to JCP&L is attached in our workpapers.

[9] *Wisvest Corporation, et al*., 101 FERC ¶ 61,166 (2002).

[10] *Re Review of Peaking Generation Projects*, Docket No. 08-01-01, Connecticut Department of Public Utility Control, June 25, 2008 ("Awards Decisions") (2008 WL 2587405 (Conn. D.P.U.C.)). The PURA is the successor to the Department of Public Utility Control (DPUC). PURA came into being in July 2011 as part of a reorganization of Connecticut state energy agencies. For consistency, this application refers to the agency as the PURA.

[11] Section 50 of Public Act 07-242, now codified at Section 16-243u of the Connecticut General Statutes.

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

into the ISO-NE markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder.[12] As such, neither PSEG New Haven nor any other PSEG affiliate has operational control of the New Haven facility. As a result, the capacity of the facility is not attributable to PSEG for the purpose of this market power analysis.

PSEG Nuclear

PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission in accordance with PSEG Nuclear's market-based rate authority.[13] PSEG Nuclear is the owner of Hope Creek and a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear operates the Salem plant and Exelon Generation is the operator of Peach Bottom.[14] Since the last triennial filing, uprates at Peach Bottom and Hope Creek plants have increased PSEG Nuclear's capacity at those facilities.

---

[12] The CFD was approved on October 29, 2010 in a letter order ruling on Motion Number 62 in Docket No. 08-01-01.

[13] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

[14] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in our workpapers.

Other Subsidiaries

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities in the United States. Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the PJM region are as follows.

PSEG Power LLC is a Delaware limited liability company. It does not directly own any generation facilities or engage in any FERC jurisdictional activities but it is the parent company of several FERC jurisdictional entities, including applicants PSEG ER&T, PSEG Fossil and PSEG Nuclear.

PSEG Power Ventures LLC ("Power Ventures") is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source LLC and has an in-direct ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 349 MWs DC (274 MW AC) of solar capacity across the United States, including a combined 92 MWs (72 MW AC) of solar capacity in PJM.[15] All of PSEG Solar Source's solar capacity has obtained QF status. Because all of this capacity is QF capacity, per Order No. 816 this capacity is not included in the market power analyses.[16]

---

[15] The 42MWs are attributed to four (7) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs) Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

[16] *Refinements to Policies and Procedures for Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 816, 80 *Fed. Reg*. 67056 (2015), FERC STAT & REGS ¶ 31,374, P55 (2015), *reh'g denied and clarification*, Order No. 816-A, 155 FERC ¶ 61,188 (2016) ("… qualifying facilities that are exempt from FPA section 205 and facilities that are behind-the-meter facilities do not need to be reported in the asset appendix or indicative screens." (note omitted))

20160328-5240 FERC PDF (Unofficial) 3/28/2016 3:16:58 PM

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. PSEG Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. PSEG Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a cost-based contract.[17]

PSEG Keys Energy Center LLC ("PSEG Keys"), direct subsidiary of PSEG Fossil, was formed to construct, operate, and maintain the Keys Energy Center, a 755 gas-fired combined cycle facility located in Prince George's County, Maryland. Construction began in 2015 and is scheduled to be completed in 2018. All the capacity and energy from PSEG Keys will be sold to PSEG ER&T.

PSEG Energy Solutions LLC ("PSEG Solutions") is a direct subsidiary of PSEG ER&T that is schedule to begin retail operations in the Northeast Region in

[17] *PSEG Power New York Inc.,* Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

January 2017. It has obtained market-rate authority to allow it to sell excess energy in wholesale markets.[18]

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution ("T&D") system on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco are FERC jurisdictional public utilities, as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[19]

When an applicant has affiliates in the relevant market, the Commission considers the combined capacity of all the affiliated entities in its market power assessment.[20] Accordingly, I have included the capacity controlled by PSE&G, PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear, and PSEG Power New York (which on a combined basis constitutes the capacity of all of PSEG's affiliates not excluded for a reason explained above). Future references in this Affidavit to PSEG are inclusive of the foregoing entities.

The primary purpose of this study is to determine whether PSEG passes the PSA and WMSA screen thresholds in ISO-NE, the NYISO and PJM. In the PSA, the Commission requires applicants to examine whether the generation owned by

---

[18] *See* December 21, 2016 letter order approving Energy Solutions request for market-based rate authority in Docket No. ER16-2725-000.

[19] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), order dismissing request for rehearing, 145 FERC ¶ 61,183 (2013).

[20] *Heartland Energy Services, Inc.,* 68 FERC ¶ 61,223 at 62,061-62,062 (1994).

the applicant is necessary to serve wholesale demand within a balancing authority area. The applicant first calculates the total generation capacity for an area. This is the total of generation in the balancing authority area plus the import capability to the area.[21] From this total, the applicant subtracts out firm contractual commitments, native load obligations, and operating reserves, giving uncommitted capacity for the area. Net uncommitted capacity is calculated by subtracting a wholesale load proxy from uncommitted capacity. Net uncommitted capacity is then compared to the applicant's uncommitted capacity within the area. When the applicant's uncommitted capacity is less than the net uncommitted capacity for the area, then all wholesale demand could be served without energy from the applicant and the applicant passes the PSA screen. When the applicant's uncommitted capacity is greater than the net uncommitted capacity, then the applicant does not pass the screen because its capacity is necessary to meet wholesale peak loads in the market.

In the WMSA, the Commission requires applicants to examine whether the generation owned by the applicant is 20 percent or more of the uncommitted capacity in each of four seasons under average daily peak conditions for the season. The applicant first calculates the total generation capacity for an area. The applicant then adds the import capability to the area. From this total, the applicant subtracts out planned outages and deratings, long-term firm contractual commitments, native load obligations, and operating reserves. The sum gives the total uncommitted capacity. The applicant then calculates its share by dividing its uncommitted capacity by the total uncommitted capacity. When the applicant's share is less than 20 percent, the applicant passes the WMSA screen.

---

[21] Import capability is the lesser of either the simultaneous import limit ("SIL") into the area or available capacity in interconnected balancing authority areas. Available capacity is equal to total generation capacity in an area less outages and derating, a native load proxy and operating reserves.

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

The Commission presumes that an applicant does not have market power when it passes both the PSA and WMSA screens. If the applicant fails either of the screens, then the applicant may present other analyses to demonstrate that it does not possess market power. Alternatively, the applicant may propose mitigation measures or accept the Commission's default mitigation measures to demonstrate that it has mitigated market power.

2. New England

2.1. Overview of Electric Power Markets in New England

New England operates a competitive wholesale power market. Substantial restructuring has taken place in New England, and many of the vertically integrated utilities have sold either most or all of their generation assets. The traditional utilities often have standard offer obligations to serve retail customers, but utilities often fulfill these obligations by securing supplies in competitive wholesale markets. For example, a utility may secure contracts in which the supplier agrees to provide power for 30 percent of the utility's standard offer obligation. The transmission system is managed by ISO-NE. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

2.2. Geographic Markets

In the case of generation wholly located in an RTO, such as ISO-NE, the Commission accepts the RTO as the relevant destination market.[22] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[23] In New England,

[22] Order No. 697 at PP 231, 235.

[23] Order No. 697 at P 236.

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

the Commission has identified two submarkets: Connecticut and Southwest Connecticut.[24] PSEG owns the Bridgeport Harbor plant in Southwest Connecticut. PSEG also owns the New Haven Harbor 1 unit in Connecticut and PSEG New Haven owns the New Haven facility. When the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[25] Accordingly, the PSA and WMSA are provided for the ISO-NE balancing authority area, and also for Connecticut and Southwest Connecticut.

2.3. Data Sources and Analysis

The data source for generation is ISO-NE Seasonal Claimed Capability (SCC) Reports.[26] Summer and winter capacities were taken from the November 2015 report. Planned outages are from the ISO-NE Form 714. Planned outages for Connecticut and Southwest Connecticut are prorated based on their shares of the total generation capacity in ISO-NE. PSEG's generation capacity in ISO-NE consists of the New Haven facility, New Haven Harbor and Bridgeport Harbor. PSEG's Northeast Region generation facilities are presented in Exhibit PEG-3.

Load data for ISO-NE are from Energy Velocity. Energy Velocity also provides load data by New England ISO zone, thus loads are calculated by sub-market as well. PSEG load obligations in New England come from PSEG's agreements to supply standard offer generation within Rhode Island. The data were supplied by PSEG.

20160328-5240 FERC PDF (Unofficial) 5/23/2018 6:31:16 PM

Import capability was taken from the ISO-NE's December 20, 2016 FERC filing.[27] This report indicates that the simultaneous transfer limits in all seasons is 4,548 MW for the ISO-NE as a whole, 3,050 MW for Connecticut, and 2,370 (Spring) to 3,200 MW (Summer) for Southwest Connecticut. PSEG has no firm transmission rights into New England.

Operating reserves are calculated as follows. ISO-NE Operating Procedure No. 8 specifies spinning reserves (or 10-minute reserves) equal to the size of the loss of the largest unit times a Contingency Reserve Adjustment Factor ("CRAF").[28] The CRAF in 2015 was 1.25.[29] The largest unit is the 1,400 MW (summer capacity) Seabrook Unit 1. In addition, 30-minute reserves require capacity to cover 50 percent of the loss of a second contingency (i.e., the second largest unit) plus 160 MW for daylight-savings time periods and 180 MW during standard time (i.e., winter). The second largest unit is the 1,200 MW (summer capacity) Millstone Unit 3. Thus, in total, operating reserves are 2,510 MW in summer.[30] Operating reserves for Connecticut and Southwest Connecticut are based on resource needs in forward reserve auctions for 2015.[31]

2.4. Results

Exhibit PEG-4 summarizes the results for the PSA and the WMSA in New England. Exhibit PEG-5 shows the calculations to determine whether PSEG is a

pivotal supplier in the three New England destination markets. PSEG passes the PSA screen in all areas. Exhibit PEG-6 presents the WMSA results for the destination areas in New England. PSEG easily passes the WMSA in all areas.

3. New York

3.1. Overview of Electric Power Markets in New York

New York also has a competitive wholesale power market. Substantial restructuring has taken place in New York, and the investor-owned vertically integrated utilities have sold either most or all of their generation assets. These utilities often have standard offer obligations to serve retail customers, and utilities can fulfill these obligations by securing supplies in competitive wholesale markets. The transmission system is operated by the NYISO, which also operates a competitive wholesale market. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

3.2. Geographic Markets

In the case of generation wholly located in an RTO such as the New York ISO, the Commission has accepted the RTO as the relevant destination market.[32] PSEG only owns generation in Albany, New York. In addition, when the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[33] Accordingly, the PSA and WMSA are provided for the NYISO only.

---

[32] Order No. 697 at PP 231, 235.

[33] Order No. 697 at footnotes 215, 217.

3.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Operations database. Planned outages are from the FERC Form 714. PSEG's generation capacity in New York consists of its ownership of the Bethlehem Energy Center in Albany, which has winter capacity of 845 MW. Information for PSEG's Northeast Region generation is presented in Exhibit PEG-3.

Load data for NYISO were downloaded from Energy Velocity.

Import capability comes from the most recent NYISO SIL filing as of December 19, 2016.[34] This filing indicates that ISO simultaneous import capability ranges from 6,850 MW in spring to 7,695 MW in summer. NYISO does not recognize physical imports, accordingly, all the SIL import capability is allocated pro rata, except for a 265 MW reservation that PSEG has from PJM to New York on the Linden VFT DC transmission line.

Operating reserves are calculated as follows. The NYISO Locational Reserve Requirements specify 30-minute total reserves equal to twice the 10-minute reserve necessary to replace the operating capability loss caused by the most severe contingency under normal transfer conditions. Thus, the operating reserves for the NYISO are 2,620 MW for each season.[35]

[35] NYISO Locational Reserve Requirements, Table 2, available at http://www.nyiso.com/public/webdocs/market_data/reports_info/nyiso_locational_reserve_reqmts.pdf

3.4. Results

Exhibit PEG-7 shows the calculations to determine whether PSEG is a pivotal supplier in New York, and PSEG passes the PSA screen. Exhibit PEG-8 presents the WMSA results for New York, and PSEG easily passes the WMSA.

4. PJM

4.1. Overview of Electric Power Markets in PJM

PJM operates a competitive wholesale power market and serves as the regional RTO for an area that covers all or parts of 13 states and the District of Columbia. PJM also plans and operates the transmission system within the RTO. Monitoring Analytics acts as the market monitor, and has a market power mitigation program in place to identify and mitigate any potential exercise of market power.

4.2. Geographic Markets

PSEG owns both generation and transmission facilities in PJM. In the case of generation wholly located in an RTO such as PJM, the Commission has accepted the RTO as the relevant destination market.[36] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[37] In PJM, the Commission has identified three submarkets: PJM East ("PJME"), PJM East of 5004/5005 ("PJM50") and PJM East of AP-South ("PJMAP").[38] The PSA and WMSA are provided for PJM and for the PJME, PJM50 and PJMAP sub-markets.

[37] Order No. 697 at P 236.

[38] *Id*. *See also* Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities, Order No. 697-A, 73 FR 25832 (May 7, 2008), FERC

4.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Ops database. Generation within PJM was assigned to submarket consistent with the definitions in PJM's SIL Study.[39] Planned outages are from the FERC Form 714. In addition, for the sub-market analysis, planned outages were allocated to PJME based on the share of total PJME generation, by season. Information for PSEG's generation in PJM and PJME is presented in Exhibit PEG-3.

Load data for PJM was downloaded from Energy Velocity. Energy Velocity also provides load data by PJM zone, thus loads are calculated for the PJM sub-markets as well.

Import capability was taken from the 2015 Simultaneous Import Limit Study Report.[40] This report indicates simultaneous transfer limits of 11,997 MW in the winter and 7,600 MW in summer. Additionally, this report indicates transmission capabilities of the PJM sub-markets. The report conservatively uses the reported SIL as the SIL amount to be allocated pro rata. This is a simplifying assumption because PSEG has no firm transmission reservations into PJM and it effectively excludes the additional 8,500 MW of firm reservations into PJM in the base case of the SIL study.

[40] *Id*.

20160328-5240 FERC PDF (Unofficial) 5/23/2016 8:31:16 AM

Operating reserves are calculated according to PJM Manual 13 as the sum of Day Ahead Scheduling Reserves (Operating), Contingency (Primary) and Synchronized (Spinning Reserve) Requirements.[41]

Data on PSEG's long-term contracts come from PSEG. The contracts were included in the area where the energy is delivered under the contract. For contracts delivered to the Western Hub in PJM, the contracts were included in the PJM, PJM50, and PJMAP destinations and not the PJME destination.

4.4. Results

Exhibit PEG-9 summarizes the results for the PSA and the WMSA in PJM. Exhibit PEG-10 shows the calculations to determine whether PSEG is a pivotal supplier in the four PJM destination markets. PSEG passes the PSA screen for all four destinations. Exhibit PEG-11 presents the WMSA results for the destination markets in PJM. PSEG easily passes the WMSA in PJM and PJM east of AP South, but has greater than a 20 percent market share in the PJM East and PJM East of 5004/5005 destination markets.

5. Delivered Price Test

When an applicant does not pass either the PSA or WMSA for a destination market, the Commission invites the applicant to provide additional information via a delivered price test ("DPT"). PSEG requested that I perform a DPT for the PJM East and PJM East of 5004/5005 sub-markets. Accordingly, I now discuss the DPT for these sub-markets.

[41] PJM Manual 13 - Emergency Operations, at 17, available at http://pjm.com/~/media/documents/manuals/m13.ashx

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

5.1. Overview of the DPT

The DPT utilizes substantially more information than the PSA or the WMSA, including additional information on generation ownership, generation costs, demand conditions, and transmission limits. The Commission considers two types of capacity: Economic Capacity ("EC") and Available Economic Capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting load commitments from EC. EC and AEC are calculated for a number of different seasonal and load conditions.

Because we do not know the firm retail obligations of the competitive suppliers, as explained below, the AEC calculation is based on the assumption that market participants serve load in proportion to their generation capacity and that 70 percent of load obligations are contracted more than one year from delivery.

For both the EC and AEC measures, the Commission prescribes three screens: (1) a pivotal supplier screen; (2) a market share screen; and (3) a Herfindahl-Hirschman Index ("HHI") screen. The HHI is the sum of the squared market shares of the firms in the market. So a market with four firms of market shares of 40, 30, 20, and 10 percent would have an HHI of 3,000 (this is calculated as $40^2 + 30^2 + 20^2 + 10^2 = 1,600 + 900 + 400 + 100 = 3,000$). A monopolist would produce a HHI of 10,000 and 10 equally-sized firms would produce a HHI of 1,000.

Although the Commission has not drawn bright lines for its review of DPT results, it has given general guidance. When (1) the applicant is not pivotal; (2) the applicants' market share is less than 20 percent; and (3) the HHI is below 2,500, the Commission is likely to conclude that the applicant does not have market power. The three standards establish a "safe harbor" for lack of market power, unless intervenors present clear and convincing contrary evidence. The Commission has also determined in some cases that an applicant did not have

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

market power when the analysis showed isolated HHI and market share results above screening levels. Finally, despite the DPT results, the Commission may conclude that an applicant does not have market power if other evidence, such as historical sales data, indicates that the DPT results do not reflect the actual competition in the marketplace.

A detailed description of data sources and methods to prepare the data for the DPT is presented in Exhibit PEG-12. An overview of the sources and methods used at Economists Incorporated for conducting the DPT is presented here.

The DPT is calculated for 10 representative periods, three for each of three seasonal conditions plus a summer super peak period. The three seasons are spring/fall, summer, and winter. Each season is divided into (1) top 10 percent of peak hours; (2) remaining peak hours; and (3) off-peak hours. In addition, there is a summer super peak period which is comprised to the top 1 percent (10 hours) of summer peak hours. These ten periods cover the range of load conditions for each season, and for the year as a whole.

The primary source for generation data is Energy Velocity. In addition to generation capacity, Energy Velocity provides data on ownership (including holding companies), fully-loaded heat rates, emission rates, and generation availability. Generation is included for all of PJM and NYISO, which is the only first-tier balancing authority area in which PSEG owns generation. Unit capabilities are derated to account for seasonal maintenance and likely plant unavailability due to forced outages. Because demand in PJM peaks in summer and winter, the planned outages are assumed to be during the spring/fall season.

The transmission system is represented by contract paths between balancing authority areas and within PJM. Limits between regions in PJM are from Energy Velocity.

Market prices come from hourly prices reported by PJM.

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

As in the PSA and WMSA, load data come from Energy Velocity. To compute load requirements for market participants, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[42] To account for their greater load obligations, we assume that Dominion, which does not operate in a restructured retail market, has 100 percent responsibility for its allocation of load and that AEP, which operates in a partly restructured retail market, has 90 percent of its allocation as opposed to the standard 70 percent.

The DPT and market share calculations were calculated using the Power Acquisition Screening System developed at Economists Incorporated. The mathematical details are presented in Exhibit PEG-13.

5.2. Results of the DPT for PJM50 Sub-market

The results of the DPT for PJM50 are presented in Exhibit PEG-14. The top part of the exhibit shows the results for AEC. PSEG passes the Pivotal Supplier Screen in all 10 periods. PSEG also passes both the Market Share Screens and the HHI Screens in all 10 periods.

The lower part of Exhibit PEG-14 shows the results for EC in PJM50. PSEG passes all the screens in all the periods, except for the pivotal supplier screen in the Summer Top 1% period.

[42] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers in restructured markets.

5.3. Results of the DPT for PJME Sub-market

The results of the DPT for PJME are presented in Exhibit PEG-15. The top part of the exhibit shows the results for AEC. PSEG passes all the screens for AEC.

The lower part of Exhibit PEG-15 shows the results for EC in PJME. PSEG passes the Market Concentration screens in all periods. It passes the Market share screens in six of ten periods, and its market share is never more than 25 percent. It passes the pivotal supplier screen in eight of ten periods.

5.4. Analysis of the DPT Results

Although PSEG fails some screens, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the AEC screens and all market concentration (HHI) screens for EC. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[43] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all the AEC pivotal supplier screens, and most of the EC pivotal supplier screens. This means that typically PSEG's generation is not necessary to serve load; and when its generation is necessary, its forward sale commitments are sufficient so that its uncommitted generation is not necessary to serve the remaining load. Finally, PSEG's market shares are never above 15 percent in PJM50 and for AEC in PJM East. Its market shares for EC are never above 25 percent in PJM East. Although greater than the 20 percent screen, PSEG's

[43] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

market shares are well below the 35 percent threshold that is typically used for imputing unilateral market power.[44]

5.5. Mitigation

PJM has a Commission-approved market monitoring and mitigation plan in place to ensure that generation facilities cannot exercise market power. The Commission has stated that Commission-approved market monitoring and mitigation plans are sufficient to mitigate market power in RTO markets.[45] In particular, the Commission found in connection with PSEG's last triennial filing that the PJM market monitoring and mitigation rules are sufficient to address market power concerns.[46]

Under the local market power mitigation procedures in PJM, if a supplier fails the "three pivotal supplier test" (TPS), it is offer-capped by the Market Monitor. The Market Monitor's TPS test is applied on an ongoing basis, potentially as frequently as every 5 minutes, to reflect day-ahead and real-time operating conditions. These offer caps provide direct protection against the exercise of locational market power by suppliers in PJME, PJM50, PJMAP and elsewhere.

The protection against the exercise of market power is enhanced by "must offer" requirements under PJM's Operating Agreement. These mandate that generation resources that are used to meet capacity requirements in PJM and

---

[44] *See*, *e.g.*, U.S. Department of Justice, 1984 Merger Guidelines, at Section 3.12, available at https://www.justice.gov/sites/default/files/atr/legacy/2007/07/11/11249.pdf ("the Department is likely to challenge the merger of any firm with a market share of at least one percent with the leading firm in the market, provided the leading firm has a market share that is at least 35 percent.")..

[45] Order No. 697 at P 241.

[46] *See* October 14, 2014 letter order approving Applicants' prior triennial market update in Docket No. ER10-1789-003 et al. at page 3.

20160328-5240 FERC PDF (Unofficial) 3/28/2016 3:16:58 PM

that are not subject to an outage must offer their available capacity in PJM's day-ahead energy market.[47] PJM has also implemented a Reliability Pricing Model (RPM) to secure sufficient capacity to meet its requirements through a series of auctions, including a Base Residual Auction (BRA) held annually for capacity 3 years in advance, and incremental auctions held at varying intervals prior to the delivery year. Various features of the RPM process work to prevent the exercise of market power in capacity markets in PJM. First, the RPM model includes bid cap rules designed to mitigate the potential exercise of market power. Second, RPM includes a must-offer requirement pursuant to which all generating units that have available capacity must bid into the RPM auctions or face disqualification from being recognized as capacity resources (and therefore from receiving any capacity payments) in the delivery year.

In addition to the local market power mitigation described above, the presence of market monitoring within PJM lessens potential concerns that PSEG might be able to exercise market power notwithstanding the indicative DPT screens. The Market Monitor has the specific responsibility under the market monitoring plan to monitor the potential of any market participant to exercise market power. To perform its market monitoring function, the Market Monitor can file reports or complaints with the Commission and other government agencies to address various market concerns including market power. The Market Monitor can also make its view known to the Commission staff and PJM members in cases where PJM does not follow its recommendations concerning complaints or requested rule changes. In addition, the Market Monitor can consult with regulatory bodies, including state commissions, regarding the need for specific investigations and monitoring activities, and to consider and evaluate additional enforcement mechanisms. The Market Monitor can also act on specific

[47] *See* PJM Operating Agreement at 1.10.1A(d).

complaints that have been filed by market participants to examine any potential market power issues.

In sum, the local market power mitigation rules, the role of the Market Monitor, the existence of must-offer requirements and PJM's RPM auctions address the potential for PSEG to exercise market power.

6. Vertical Market Power

In determining whether the market-based rates are in the public interest, the Commission also considers whether the Applicant has transmission market power or can erect barriers to entry.[48] None of these factors are relevant in the instant case. First, other than incidental generator interconnection facilities and the transmission assets owned by PSE&G in PJM, no transmission assets are owned by the Applicants or any of their affiliates in ISO-NE and NYISO. Transmission service over PSE&G's transmission facilities is provided under the PJM Open Access Transmission Tariff. Thus, consistent with Commission precedent, Applicants have alleviated any concerns regarding potential transmission market power. Second, PSEG has no ability to erect barriers to entry. As explained in Applicants' previous initial applications for market-based rate authority and triennial market power reports, PSEG is unable to erect barriers to entry. There has been no change in facts since the submission of those applications that would alter this conclusion.

The Commission is concerned with the ownership of natural gas pipelines or natural gas distribution facilities and the possibility that they may be used to exercise market power in electricity markets. PSEG does not own or operate any

[48] Order No. 697 at PP 397, 399.

20160328-5240 FERC PDF (Unofficial) 3/28/2016 3:16:58 PM

FERC jurisdictional natural gas pipelines in PJM, ISO-NE or NYISO.[49] PSE&G owns natural gas distribution facilities in the State of New Jersey including peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers.

7. Conclusion

PSEG and its subsidiaries do not have market power in New England, New York or PJM. PSEG is not a pivotal supplier in New England, New York or PJM. PSEG's market shares in the WMSA are below the Commission's 20 percent screening threshold in each of these market areas. PSEG is also not a pivotal supplier in the Connecticut or Southwest Connecticut sub-markets and its market shares in the WMSA are below 20 percent in these sub-markets. PSEG fails the WMSA screens in only the PJME and PJM50 sub-markets. For these sub-markets, we conducted a DPT analysis. PSEG passes all the DPT screens for the PJM50 submarket, and it only fails the Market Share Screen in the PJME submarket. Its market shares are never above 25 percent, a level that the Commission has accepted in other market-based rate matters.[50] As such, they are not evidence of actual market power.

---

[49] PSEG Power LLC currently owns a 10 percent interest in the PennEast Pipeline Company LLC which has filed an application with FERC for construction and operation of a gas transmission line.

[50] *See*, *e.g.*, *Dogwood Energy, LLC*, 135 FERC ¶ 61,089 (2011) (under the AEC measure, Dogwood failed the market share screen in seven of ten periods, with market shares ranging from 32.7% to 39.6%); *Kansas City Power & Light Company and KCP&L Greater Missouri Operation Company*, Docket No. ER10-2074-001 et al., Supplement to Change in Status Filing at 11 (Feb. 4, 2013) (accepted by Letter Order, November 22, 2013) (market shares for AEC ranging from 17 to 36%); *Shell Energy N.A. (US), L.P.*, 135 FERC ¶ 61,090 (2011) (under the AEC measure, Shell failed the market share screen for seven of ten periods, with market shares ranging from 29.3% to 37.0%); *Calpine Energy Services, L.P.*, 137 FERC ¶ 61,085 at P 21 (2011) (under the AEC measure, Calpine failed the market share screen in all ten periods, with market shares ranging from 20.4% to 28.9%); *Wildcat Power Holdings, LLC*, 136 FERC ¶ 61,013 at P 14 (2011) ("When the available economic capacity measure is used, Wildcat Power's market shares range from 22 to 24 percent in the three summer super peak and winter

Further, PSEG operates under New England's, New York's, and PJM's market power mitigation programs, which mitigate PSEG's potential market power. Therefore, under standards for market-based rate authority articulated by the Commission in Order No. 697, PSEG has no ability to exercise market power in the relevant markets, and maintaining market-rate authority in New England, New York and PJM would be in the public interest.

Therefore, I recommend that the Commission continue to authorize PSEG to sell electric power in Northeast Region wholesale markets at market-based rates.

super peak season/load periods and zero percent in the remainder of the season/load periods."); *LS Power Marketing*, LLC,139 FERC ¶ 61,140 at P 23 (2012) (under the AEC measure, LS Power failed the market share screen in all ten periods, with market shares ranging from 20.4% to 28.9%); *Gila River Power, L.P.*, Docket Nos. Pursuant to 28 U.S.C. §1746, I state under penalty of perjury that the foregoing is true and correct to the best of my information, knowledge, and belief.

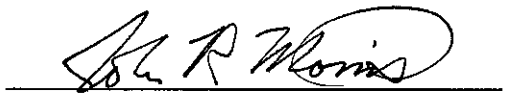
Executed on this 22rd day of December 2016.



John R. Morris, Ph.D.
Principal
Economists Incorporated

20160328-5240 FERC PDF (Unofficial) 3/28/2016 6:31:16 AM

EXPERIENCE AND QUALIFICATIONS OF

Dr. John R. Morris

OVERVIEW	Dr. Morris, a recognized expert in studying competition in energy industries, currently is a Principal at Economists Incorporated. He began his research of competition in energy industries in 1985 while working for the Federal Trade Commission. Since joining Economists Incorporated in 1992, he has consulted on many mergers and acquisitions involving energy companies, examined competitive issues relating to rates, and studied issues in state restructuring proceedings. He has published articles on competition and energy matters, and he has spoken on numerous occasions concerning competition in natural gas, electric power and other industries. He has been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission, state regulatory commissions, and in federal court.
EDUCATION	Ph.D., University of Washington, August 1985 Dissertation: *Intellectual Property: Creating, Pricing, Copying* • M.A., University of Washington, December 1983 • A.B., Georgetown University, May 1981
PRESENT POSITION	Dr. Morris is a *Principal* at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Suite 1100, Washington, DC 20037. (202-223-4700) Economists Incorporated studies competition and regulation in many industries in the United States and in other countries. It is a leading firm in studying the competitive effects of mergers and acquisitions.
PREVIOUS EXPERIENCE	*Senior Vice President*, Economists Incorporated, December 2001 – December 2002 • *Vice President*, Economists Incorporated, December 1995 – December 2001 • *Senior Economist*, Economists Incorporated, June 1992 – December 1995 • *Economic Tutorial Leader*, Stanford University (Stanford in Washington), April 1993 – June 1995 • *Visiting Assistant Professor,* Department of Business Economics and Public Policy, School of Business, Indiana University, September 1991 – May 1992 • *Assistant to the Director for Antitrust,* Bureau of Economics, Federal Trade Commission, November 1989 – August 1991 • *Economic Advisor,* Office of Commissioner Machol, Federal Trade Commission, December 1988 – October 1989 • *Economist,* Division of Antitrust, Bureau of Economics, Federal Trade Commission, October 1985 – December 1988
MEMBERSHIPS	Member, International Association of Energy Economics • Associate, Energy Bar Association • Member, American Economic Association • Member, Western Economic Association International • Associate, American Bar Association

Source: PSEG.
Notes:
[1] PSEG Fossil has a 22.5% interest in the Conemaugh coal-fired units.
[2] PSEG Global has a 4% interest in the Conemaugh Hydroelectric facility.
[3] PSEG Fossil has a 22.84% ownership interest in the Keystone facility.
[4] PSEG Nuclear has a 57.41% interest in the Salem Nuclear facility.
[5] PSEG Fossil has a 50% interest in the Yards Creek facility. Yards Creek is operated by Jersey Central Power & Light, and thus is controlled by JCP&L in the analysis.
[6] PSEG Nuclear has a 50% interest in the Peach Bottom Nuclear facility.

DATA AND ASSUMPTIONS FOR ECONOMISTS INCORPORATED'S DELIVERED PRICE TEST STUDY FOR PSEG

This exhibit describes data and assumptions used in the delivered price test study ("study") carried out by Economists Incorporated for PSEG. Because the data are voluminous, we provide them in electronic workpapers. In those workpapers, the Files.xlsx spreadsheet provides a brief description of the organization of the data files.

This Exhibit has six sections. Section I discusses the study's representative periods. Section II discusses the geographic region and balancing authority areas. Section III discusses generation resources, including adjustments to generating capacity for seasons, maintenance, water availability, and long-term contracts. Section IV discusses transmission, including transmission pricing and losses. Section V discusses market prices. Section VI discusses the load data.

I. Periods

The study calculates market shares and concentration indexes for electric energy for ten representative periods during the year. The year is divided into three seasons (spring/fall, summer and winter). Spring/fall and winter seasons are divided into three periods based on days of the week, times of day and load levels. Summer is divided into four periods based on days of the week, times of day and load levels. Each calculation of market shares and concentration indexes reflects average conditions (e.g., average loads) during one of the resulting ten periods during the year (e.g., Summer Low Peak).

The study places each of the periods in each season into three condition categories: off-peak, low peak, and spike. Transmission pricing (see Section

20160328-5240 FERC PDF (Unofficial) 3/28/2016 8:31:16 AM

IV.B below) and plant availability (see Section III.A.2 below) vary among these three categories.

Table I-1 summarizes the ten periods for the destination markets.

Table I-1– Definition of Ten Periods for Destination Market

Number	*Season*	*Time*	*Condition*	*Hours*	*Description**
1	Spring/Fall	Top 10%	Spike	203	Top 10% of peak hours
2	Spring/Fall	Peak	Peak	1829	Remaining peak hours
3	Spring/Fall	Off-peak	Off-Peak	2360	Off-peak hours
4	Summer	Top 1%	Spike	11	Top 1% of peak hours
5	Summer	Top 10%	Spike	106	Top 10% of peak hours
6	Summer	Peak	Peak	950	Remaining peak hours
7	Summer	Off-peak	Off-Peak	1152	Off-peak hours
8	Winter	Top 10%	Spike	101	Top 10% of peak hours
9	Winter	Peak	Peak	907	Remaining peak hours
10	Winter	Off-peak	Off-Peak	1152	Off-peak Hours

Note: *Peak hours include hours ending 8 a.m. through 11 p.m. Eastern Time weekdays, excluding six major holidays. Off-peak hours = Hours ending 12 a.m. through 7 a.m. on weekdays and all weekend and holiday hours.

The Off-peak periods are all NERC holidays and weekend hours plus weekdays from the hour ending at midnight EPT until the hour ending at 0700.[1] The Off-peak periods have off-peak transmission pricing and plant availability.

In order to define the Top 1% and Top 10% periods for a given season, we removed all Off-peak hours from that season. We then ranked the remaining (peak) hours based on load levels in the destination market by season. We then defined as the Top 1% as the 1 percent of these remaining hours in which loads in the destination market were highest and the Top 10% as the highest 10 percent of peak hours based on load levels. These periods have spike transmission pricing and plant availability.

[1] Major holidays are New Year's, Memorial Day, 4th of July, Labor Day, Thanksgiving and Christmas. Major holidays are included in the Weekend period.

The Peak periods are weekdays from the hour ending at 0800 until the hour ending at 2300 EPT, excluding hours in the Top 10% periods and major holidays. The Low Peak period has on-peak transmission pricing and plant availability.

II. Geographic Coverage and Market Areas

The study includes market areas that correspond to the balancing authority areas used by the North American Electric Reliability Council (NERC), and PJM submarkets as defined by FERC. Table II-1 lists these market areas and their abbreviations. There are two study destination markets, PJM East and PJM East of 5004/5005.

Table II-1– List of Eastern Market Areas and Study Destinations

Abbreviation	*Full Name*	*Study Destination*
PJME	PJM East	Yes
PJM50	PJM East of 5004/5005	Yes
PJMS	PJM East of AP South	
PJM	PJM	
NYISO	New York ISO	

III. Generation

A. Generation Capacity and Ownership

The study includes generating units located in the areas that are (1) connected to the power grid, (2) not exclusively used for self-generation, and (3) either in a plant used primarily for electric generation or a Qualifying Facility.

1. Generating Unit Data

The study uses data for summer and winter capability at the unit level reported in the Energy Velocity (EV) database available from Ventyx. The units include all

units with a status of operating, standby, cold standby, restart, mothballed, testing, or under construction that went online before November 30, 2015 and with a retirement date after November 30, 2015. We exclude generation units that are less than 5 MW unless they are owned by PSEG.

2. Ownership

The study uses relies on Ventyx determination of plant and unit ownership. When Ventyx reports a holding company, the ownership is assigned to the holding company. For PSEG generation, the study relies upon Appendix B data from market-based rate filings and updates from the companies to determine plant ownership and seasonal capability. Operational control of PSEG units is consistent with the methodology used for market-based rates.

3. Seasonal variation in capability

The study uses seasonal capability data from EV. Spring/fall capacities are the average of summer and winter capacities.

4. Adjustments to Generating Capability

The generating capability figures used for each period are obtained by multiplying the seasonal capabilities by an availability factor, which is based on the period, unit location, and NERC General Availability Data Systems (GADS) category of the unit. The GADS database gives national average operating information for generating units by unit type and size. For example, it gives data for coal-fired steam units with capacities between 300 MW and 399 MW.

For each period and each generating unit, the availability factor adjusts for the following.

a) Unplanned outage rates by GADS category

For a given GADS category, the study assumes that unplanned (forced) outage rates (as a share of generating capability available after allowing for planned outages) are constant across seasons and generating units throughout the Region, regardless of owner. Based on GADS data for 2007 through 2011, the study calculates an equivalent forced outage rate (EIFOR), which measures the share of generating capability in a GADS category that is not available because of forced outages. The computation is EIFOR = (FOH)/AH, where FOH is number of forced outage hours and AH is total hours available for generation after planned outages (but before forced outages).[2]

b) Planned outage rates by GADS category and season

With four exceptions (hydro, pumped storage, wind, and solar units), the study assumes that the planned outage rate is constant for all generating units for a given GADS category and season. For a given GADS category, the share of hours of generating capability that is not available as a result of planned outages is computed as (POH + POEH)/PH; where PH are the period hours, POH are the hours not available because of planned outages, and POEH are the hours not available because of planned outage extensions

The study assumes that balancing authority areas are both summer and winter peaking. Therefore, the study assumes that all planned outages for thermal units occur during spring/fall.

[2] EIFOR differs slightly from the EFOR provided in the GADS data. EIFOR provides a better measure of a forced outage rate for peaking units that are operated a small percentage of the year.

c) Variation in hydro availability across seasons and periods

In general, utilities use hydro facilities to generate energy during the hours when energy prices are highest, subject to constraints imposed by availability of water and reservoir capacity. In order to incorporate these constraints, the study proceeds in the following manner.

First, the study uses EIA Form 923 monthly production data for the period 2011 to 2015 to compute average hourly hydro generation by season. Average hourly generation is then divided by hydro capability to give an average hourly hydro operating rate by season.

Second, depending upon the level of the hydro operating rate for a given season, the study calculates availability factors for the spike, low peak and off-peak periods. When the historical seasonal operating rate is below 30 percent, the availability factor for each period in the season is set equal to the operating rate; the 30 percent figure is an assumed "run of river" constraint. The study assumes that prospectively the maximum operating rate is 90 percent; this is the assumed "maximum rate" constraint. When the historical seasonal operating rate is above 90 percent, the availability factor for each period is set to 90 percent.

When the seasonal operating rate is above the run of river constraint and below the maximum rate, we reason that the hydro generator owner would be likely to produce a higher level of energy during spike hours, when energy prices are highest, than during low peak hours, and that the owner would be likely to produce a higher level during low peak than during off-peak hours.

Based on this reasoning, when the seasonal operating rate is between the run of river constraint and the maximum rate, as is the case for each of the three

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

seasons, the study uses a spike availability factor of 90 percent, which is the assumed maximum operating rate, and off-peak availability factor of 30 percent, which is the assumed run-of-river constraint, and a calculated availability factor for the peak periods, as described below.

The seasonal peak availability factor is calculated using actual total seasonal hydro generation. The study then computes the hydro generation during all spike and off-peak hours, assuming the generation rates implied by the spike and off-peak derate factors computed in the manner described above. The study then calculates total peak hydro generation as the difference between total seasonal hydro generation and the sum of hydro generation during all spike and off-peak hours. The seasonal low peak availability factor is computed as total low peak hydro generation divided first by the number of hours in the off-peak period and then by hydro generating capacity.

d) Variation in pumped storage availability across seasons and periods

We assume that pumped storage units have 90 percent availability during Top 1% and Top 10% periods, 50 percent availability during Low Peak periods, and no availability during off-peak periods.

e) Wind availability

For each area, we calculate average operating rates from 2011 to 2015 by season from EIA-923 data. The average operating rates are the availability factors.

f) Solar availability

Availability for solar power is also calculated based on average operating rates from 2011 through 2015 reported in EIA-923. There is little solar power during

off-peak periods because of darkness. Accordingly, solar availability is weighted to on-peak periods.

B. Variable Costs of Generation

The study uses variable costs of generation that include fuel costs, sulfur dioxide and nitrogen oxide emissions costs, and variable operations and maintenance (VOM) costs. The study calculates fuel costs from unit heat rates and Platts' Gas Daily spot prices at the unit's reported natural gas hub by Energy Velocity, #2 Diesel, Low-Sulfur – Industrial for the East Coast, and Residual Fuel Oil sales to end users for the East Coast for the test period. Natural gas prices vary by hub, but were $2.67 per mmBtu at TETCO M3, the hub with the largest reported capacity in the study. Fuel costs for other fuels are based upon the average fuel costs reported in the EV data for each fuel type. Emissions prices during the test year were $2 per ton for SO2 year-round and $300 per ton for NOx in the summer season. CO_2 costs for units located in Regional Greenhouse Gas Initiative (RGGI) states are $5.21/ton, which is based upon RGGI Auction results in Dec 2014. Units in Montgomery County, MD have an additional $5/ton carbon tax on CO_2 emissions. VOM costs are from the EV database.

C. Long-term Contracts

We reviewed Appendix B data from market-based rate filings, FERC Form 1 filings, and Electric Quarterly Report ("EQR") data to obtain data on long-term contracts. Where the market-based rate filing indicates a change of operational control, we include a contract transferring control to the buyer. We leave the generation unit in the BAA where it is physically interconnected to the transmission system. When the buyer is a load-serving entity in another BAA, we give a priority firm transmission path to the BAA with the load.

Long-term contracts that expire prior to January 1, 2015 are not included in the study. Long-term contracts that expire between January 1, 2015 and July 31,

2015 are included only in the seasons for which they are in effect. Contracts that expire after August 31, 2015 are included in the study.

IV. Transmission

A. Transmission Network

The study incorporates a contract path transmission network for modeling purposes. Transmission pricing between balancing authority areas is represented by a traditional contract path transmission network in which the direct physical connections between balancing authority areas are also the individually priced links from which contract paths are constructed.

B. Transmission and Ancillary Services Pricing and Losses

As specified by the Commission's Appendix A, the study generally uses ceiling prices for transmission service from Schedules 1, 2 and 8 of the utility's *pro forma* open-access transmission tariff. Transmission providers may require transmission customers to purchase ancillary services under Schedule 1 (scheduling, system control and dispatch) and Schedule 2 (reactive supply and voltage control). Schedule 8 gives the rates for non-firm point-to-point transmission service. The study uses transmission prices from tariffs.

When we have tariffs available, we calculate rates for off-peak, peak and spike categories. Because of discounting and the nature of baseload purchases, off-peak rates are often lower than peak rates.[3] We use two steps to determine off-peak rates. Step 1: When a utility posts off-peak hourly rates, we use the posted rates. Step 2: When a utility does not post off-peak hourly rates, we calculate an hourly off-peak rate based on other tariff information. To calculate hourly off-

[3] For transactions longer than one hour, the *pro forma* tariff caps the amount that the purchaser pays per day by the daily rate, and the amount that the purchaser pays per week by the weekly rate.

peak rates, we divide the weekly rate by 168, the number of hours in a week. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

We use similar steps to determine peak rates. Step 1: When a utility posts maximum hourly rates in its tariff, we use the maximum tariff rates. Step 2: When a utility does not post off-peak hourly rates, we calculate a peak rate based on other tariff information. To calculate hourly peak rates, we divide the weekly rate by 80—the "Appalachian" method. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

For spike periods, we use ceiling hourly rates from tariffs, when available. Otherwise, we use the Appalachian method.

Whenever practical, the study uses loss rates from tariffs. When these methods did not provide a loss rate for a particular utility, the study assumes that losses are three percent per utility.[4] The study assumes that transmission customers pay losses in-kind. That is, if area A exports 100 MW to area B and the losses are 3 percent, only 97 MW arrive at area B.

For areas where tariffs are not available, rates and losses are the average by period for all the reporting areas.

C. Transfer Capability and SILs

The geographic market includes only PJM and NYISO. The SILs for PJM East and PJM East of 5004/5005 comes from the 2015 Simultaneous Import Limit

[4] Losses of 3 percent are representative of the industry. See, FERC Open Access NOPR, *FERC Stats & Regs*, ¶32,514 at 33,150 (1995).

20160328-5240 FERC PDF (Unofficial) 3/28/2016 8:31:58 AM

Study filed by PJM on September 2, 2016.[5] The total imports into the destination markets may be less than the actual ability to import into the destination because not all the generation capability owned or controlled by load-serving entities within the destination markets studied in PJM have been identified in the data.

V. Market Prices

The study used December 2014-November 2015 real-time hourly prices from the RTO LMP for PJM East and PJM East of 5004/5005. Table V-1 shows the PJM East of 5004/5005 market prices in each of the ten periods, and Table V-2 shows the PJM East market prices.

Table V-1 – PJM East of 5004/5005 Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$148.44	-----
Top 10%	$62.03	$64.59	$185.57
Low Peak	$35.73	$35.56	$47.55
Off-Peak	$29.46	$24.88	$50.16

Table V-2 – PJM East Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$145.63	-----
Top 10%	$57.82	$63.88	$193.51

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

VI. Load and Contract Obligations for AEC Calculations

Load data come from PJM for PJM and from Energy Velocity for the other supply areas.

To compute load requirements for market participants in New York and PJM, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[6] To account for their greater load obligations, we assume that Dominion has 100 percent responsibility for its allocation of load and that AEP has 90 percent of its allocation as opposed to the standard 70 percent.

[6] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers.

This Exhibit describes the methods used to calculate market shares and concentration in destination markets.

Allocation of scarce transmission capability is accomplished using linear and nonlinear programs that model generation dispatch and the contract path transmission system. This Exhibit provides an overview of the structure of the programs and presents the equations.

Overview of Linear Program

The linear program models control areas as nodes in a transmission system. Each node has a demand for and a supply of electric energy. The supply is based on the generators at the node and potential deliveries to the node via transmission links from other control areas. The linear program allows for net import and export limits to and from an individual control area. Given generation capability and costs and transmission capability and costs, the linear program finds the least-cost solution that satisfies the specified loads. Costs are defined as dispatch (generation) costs plus transmission costs including losses plus the default cost for "unserved" load. For each solution, the linear program determines the quantities produced in, exported from, and imported into each control area.

The Mathematical Equations

The linear program to be solved is given below:

Minimize Total Cost: $Cost = GC + TC + UC$

Subject to:

(1) Generation: $TG_a = \sum_{u}^{u \in a} G_{a,u}$ for each area *a*;

(2) Imports: $YI_a = \sum_{b}^{a,b \in network} (1 - h_{b,a}) T_{b,a}$ for each area *a*;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

(3)	Exports:	$YE_a = \sum_{b}^{a,b \in network} T_{a,b}$	for each area *a*;
(4)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(5)	Supply/Demand Balance:	$TG_a + Y_a + U_a = D_a$	for each area *a*;
(6)	Generation Cost:	$GC = \sum_{a} \sum_{u}^{u \in a} d_{a,u} G_{a,u}$	for each area *a*;
(7)	Transmission Cost:	$TC = \sum_{a,b}^{a,b \in network} r_{a,b} T_{a,b}$	for each path *a* to *b*;
(8)	Unfilled Demand Cost:	$UC = \sum_{a} pU_a$	for each area *a*;
(9)	Generation Limits:	$g\min_{a,u} \le G_{a,u} \le g\max_{a,u}$	for each unit *u* in each area *a*;
(10)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(11)	Net Import Limits	$Y\min_{a} \le Y_a \le Y\max_{a}$	for each area *a*;

where:

a,b	are subscripts for control/transmission areas;
Cost	is total system cost;
$d_{a,u}$	is the dispatch cost of unit *u* in area *a*;
D_a	is demand for power in area *a*;
$G_{a,u}$	is generation output of unit *u* in area *a*;
GC	is total system generation cost;
$G\max_{a,u}$	is the maximum output of unit *u* in area *a*;
$G\min_{a,u}$	is the minimum output of unit *u* in area *a*;
$h_{b,a}$	is the fraction of power lost to resistance from moving power from area *b* to area *a*;
N	is a subscript to identify simultaneous transmission constraint *n*;
P	is the default price;
$r_{a,b}$	is the transmission rate from area *a* to area *b*;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

$T_{a,b}$	is the power flow from area *a* to area *b*;
TC	is total system transportation expenses;
TG_a	is total generation output in area *a*;
t $\max_{a,b}$	is the maximum power flow from area *a* to area *b*;
t $\min_{a,b}$	is the minimum power flow from area *a* to area *b*;
U	is a subscript to identify units in an area;
U_a	is the amount of demand in area *a* not met by generation or imports
UC	is total system cost of not meeting demand;
Y_a	is net imports into area *a*;
YE_a	is total exports from area *a*; and
YI_a	is total imports into area *a*;
Y $\min_a$	is minimum net imports in area *a;*
Y $\max_a$	is maximum net imports in area *a.*

This linear program is solved using the BDMLP solver in GAMS. In order to calculate concentration for different destinations, seasons, and periods, the PASS GAMS program loops through the destinations, seasons, and periods with calls to Solvers to solve the linear programs. Loads, unit availability and transmission availability are adjusted for each season-period combination.

Calculating Concentration

Transmission allocation is accomplished in four steps. In the first step the linear program finds the net-back prices in all control areas given a price at the destination control area equal to 105 percent of the pre-merger price. Suppose the pre-merger price at the destination, control area A, is $20/MWh. Then all generation capability with a dispatch cost of $21/MWh or less in the destination area would be included in the market because $21 is 105 percent of $20. If transmission cost (including losses) is $5/MWh from control area B to A, then the net-back price at B would be $16/MWh, which is the $21/MWh less the $5/MWh transmission cost between B and A. Then, all generation capability at B with dispatch costs equal to or less than $16/MWh would be included in the market if there were no transmission constraints. Calculation of net-back prices is

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

accomplished by setting the default price, *p*, equal to 105 percent of the pre-merger price at the destination, setting load at the destination to a high number and loads elsewhere to zero, setting transmission limits high enough so that the transmission system is not constrained, and setting a limited amount of generation in each area with a zero dispatch cost. The shadow prices produced by the linear program will be *p* at the destination and the relevant net-back prices in other areas.

In the second step, one calculates Economic Capacity (EC) and Available Economic Capacity (AEC) in each area. These values are then used to limit generation capability. The ownership shares of AEC and EC are calculated for each node in the system.

In the third step, the linear program determines the amount of energy that can be imported into an area given available EC (or AEC) and limits on transmission capacity. This is accomplished by limiting generation in each area to the capacity amount (EC or AEC), giving generation outside the destination market a lower cost than generation inside the destination market, and minimizing cost to serve a large load at the destination market. The amount of generation supplied to the destination is the maximum that can be imported into the destination market.

In the fourth step, transmission is allocated by the following non-linear program:

Minimize Loss: $$Loss = \sum_{\alpha}\left(\frac{C_{\alpha}^{2}}{Y_{Dest}s_{\alpha}} - 2C_{\alpha}\right)$$

Subject to:

(1) Pre Shares: $$s_{\alpha} = \frac{C\max_{\alpha}}{\sum_{\beta} C\max_{\beta}}$$ for each area α;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

(2)	Allocated Shares:	$A_\alpha = \frac{C_\alpha}{Y_{Dest}}$	for each area α;
(3)	Imports:	$YI_a = \sum_b^{a,b \in network} (1 - h_{b,a}) T_{b,a}$	for each area *a*;
(4)	Exports:	$YE_a = \sum_b^{a,b \in network} T_{a,b}$	for each area *a*;
(5)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(6)	Supply/Demand Balance:	$C_a + Y_a + U_a = D_a$	for each area *a*;
(7)	Capacity Limits:	$c\min_a \le C_a \le C\max_a$	for each area *a*;
(8)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(9)	Max Import Limit	Y_{Dest} = Maximum imports from step 3;	

where:

a,b	are subscripts for control/transmission areas;
α,β	are subscripts for control/transmission areas other than the destination market;
s_α	Is area α's share of capacity outside of the destination;
A_α	is area α's share of allocated capacity outside of the destination;
Loss	is the loss function to be minimized.

The loss function is derived from the weighted squared-errors between the pre-allocation shares and the post-allocation shares, where Y_{Dest}/s_α are the weights. For each source control area, the weighted squared-error is given by:[1]

$$W_\alpha = \frac{Y_{Dest}}{s_\alpha}(A_\alpha - s_\alpha)^2.$$

[1] This exposition ignores the adjustments necessary to give priority to minimum transfer levels from a source area to the destination.

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

Accordingly, the sum of the weighted squared-errors gives rise to the loss function, which can be seen by:

$$\begin{aligned} Loss &= \sum_{\alpha} W_{\alpha} \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha} - s_{\alpha})^2 \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha}^2 - 2 s_{\alpha} A_{\alpha} + s_{\alpha}^2) \\ &= \sum_{\alpha} \left(\frac{C_{\alpha}^2}{Y_{Dest} s_{\alpha}} - 2 C_{\alpha} \right) + \text{constant}. \end{aligned}$$

The resulting shares from minimizing this loss functions preserve the relative shares of capacity behind any transmission constraint going to the destination. This can be seen from the following LaGrangian equation to be minimized:

$$L = \sum_{i} \left(\frac{C_i^2}{Y_{Dest} s_i} - 2 C_i \right) + \lambda \left(T - \sum_{i} C_i \right),$$

where *T* is the transmission limit affecting control areas *i*. The first order conditions are:

$$\frac{\partial L}{\partial C_i} = \frac{2 C_i}{Y_{Dest} s_i} - 2 - \lambda = 0,$$

which can be rearranged to give:

$$A_i = \frac{C_i}{Y_{Dest}} = \left(\frac{2 + \lambda}{2} \right) s_i,$$

which shows that the allocated market shares of those areas affected by the transmission constraint are proportional to their shares of capacity before the transmission allocation. Moreover, this is the only transmission allocation

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

method that maintains the relative shares of capacity behind any binding transmission constraint in the allocation process.

This non-linear program is solved using the COINIPOPT solver in GAMS. The calculated capacities from the nonlinear program above less transmission losses determine the capacities for the market share calculations for sources outside of the destination market. The capacities within the destination market are given full weights.

Market concentration is the HHI, which is the sum of the squared market shares. Mathematically,

$$HHI = \sum_{i=1}^{n} S_i^2,$$

where S_i is the allocated share of firm *i* and *n* is the number of firms in the market. The summary sheets combine all the firms with shares of 0.7 percent or less (other than Applicants) into the "Other" category. The collective share of the Other category does not directly enter the HHI calculation other than the represented capacity as each independent entity enters the HHI calculation. For example, if ten firms with 0.5 percent shares were in the Other category, the HHI contribution of the Other category would be 0.625 (= 10 x .5 x .5 = 10 x .0625) and ***not*** 25.

Re: Joint Owners of the Conemaugh Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Conemaugh Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Conemaugh Electric Generating Station:

1. The Owners jointly own the Conemaugh Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in East Wheatfield and West Wheatfield Townships, Indiana County, Pennsylvania (the "Station").

---

1 Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20160328-5240 FERC PDF (Unofficial) 5/23/2008 8:31:36 PM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Conemaugh Power LLC	3.72%
Constellation Power Source Generation, Inc.	10.56%
Duquesne Conemaugh LLC	3.83%
Exelon Generation Company, LLC	20.72%
PPL Montour, LLC	16.25%
PSEG Fossil LLC	22.50%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.45%
UGI Development Company	5.97%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

Sincerely yours,

Georgianna R. Stenger
Administrative Manager

Re: Joint Owners of the Keystone Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Keystone Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Keystone Electric Generating Station:

1. The Owners jointly own the Keystone Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in Plumcreek, South Bend and Cowanshannock Townships, Armstrong County, Pennsylvania, and Armstrong Township, Indiana County, Pennsylvania (the "Station").

[1] Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20160328-5240 FERC PDF (Unofficial) 5/23/2018 3:16:58 PM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Constellation Power Source Generation, Inc.	20.99%
Duquesne Keystone LLC	2.47%
Exelon Generation Company, LLC	20.99%
Keystone Power LLC	3.70%
PPL Montour, LLC	12.34%
PSEG Fossil LLC	22.84%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.67%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

Sincerely yours,

Georgianna R. Stenger
Administrative Manager
Keystone-Conemaugh Projects

Carol Peterson
Vice President Finance
Exelon Nuclear
4300 Winfield Road
Warrenville, IL 60555

Letter Regarding Control of Jointly-Owned Nuclear Facilities

Dear Ms. Peterson:

In connection with its upcoming compliance filings pursuant to Order No. 697,[1] PSEG Nuclear LLC ("PSEG") is submitting this letter in order to set forth its understanding of, and is requesting Exelon Generation Company LLC's ("Exelon") concurrence on, the respective level of control exercised by both companies with respect to the two nuclear facilities that they jointly own.[2]

PSEG avers and requests Exelon's concurrence on the following:

1. PSEG and Exelon jointly own and control two nuclear power plants, Peach Bottom Atomic Power Station located in Delta, PA and the Salem Nuclear Generating Station in Lower Alloways Creek, NJ.

2. In accordance with the Joint Owners Agreement for Peach Bottom dated November 24, 1971, as amended on thereafter, between the Parties, PSEG and Exelon each own 50% of the generating station. Under the Agreement, Exelon is the designated operator of Peach Bottom.

3. In accordance with the Joint Owners Agreement for Salem dated November 24, 1971, as amended thereafter, between the Parties, Exelon owns 42.59% and PSEG owns 57.41% of the generating station. Under the Agreement, PSEG is the designated operator of Salem.

4. Section 4.1 of each of the Joint Owners' Agreements states, "The signatories shall be entitled to shares of the installed capacity, available capacity, operating capacity and hourly energy generation of the Station in proportion to their ownership . . .."

[1] *Market-Based Rates For Wholesale Sales Of Electric Energy, Capacity And Ancillary Services By Public Utilities*, 119 FERC ¶ 61,295 (2007).

[2] PSEG has requested a letter of concurrence from Exelon in order to facilitate the Commission's review of the market power analysis submitted by PSEG with respect to facilities it jointly owns with Exelon. Exelon has no objection to PSEG's submission of this letter as part of PSEG's compliance filing,.

Thomas P. Joyce
Senior Vice President

P.O. Box 236, Hancocks Bridge, NJ 08038
tel: 856.339.1100 fax: 856.339.1104
email: Thomas.Joyce@pseg.com

PSEG
Nuclear L.L.C.

5. Section 11.1 of each of the Joint Owners' Agreements provides that the generating station will be operated by the party designated as operator for the mutual benefit of PSEG and Exelon.

6. In Order No. 697 the Commission stated that under "where a jointly-owned generation facility is operated by one of the joint-owners for the benefit of and on behalf of all of the joint-owners . . . it may be reasonable to allocate capacity based on ownership percentages...." Order No. 697 at P 188.

7. In accordance with the guidance provided in Order No. 697 and with the language of each of the joint owners' agreements, PSEG and Exelon should be deemed to control each of the nuclear facilities' output in line with their proportionate ownership share of each facility. As such, PSEG and Exelon should each be deemed to control 50% of Peach Bottom's output, and PSEG should be deemed to control 57.41% of Salem's output with Exelon controlling 42.59%.

Please indicate Exelon's concurrence to the above by executing the Acknowledgement and Agreement section below.

Sincerely

Thomas P. Joyce
Senior Vice President – Operations

20160328-5240 FERC PDF (Unofficial) 5/23/2016 8:31:16 5804 PM

JOINT LETTER OF CONCURRENCE

Regulations of the Federal Energy Regulatory Commission (the "FERC") require each public utility with market-based rate authority to file an updated market power analysis every three years in accordance with a schedule adopted in *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 697, FERC Stat. & Regs., Regulations Preambles ¶ 31,252 (2007) ("Order No. 697"). See, 18 CFR § 35.37(a)(1). Each public utility with market-based rate authority may also be required to file a change-in-status report regarding certain changes in circumstances that occur between the dates on which its triennial market power analyses are filed. 18 CFR § 35.42. Among other matters, the market power analysis is to address the amount of generation capacity that the affected utility owns or controls. Where more than one public utility owns a generating facility, FERC requires the utility that is submitting a market power analysis seek a "letter of concurrence" from the other affected co-owning public utilities that identifies the degree to which each public utility controls the generating facility, and to submit the letter with its filing. *See* FERC Order No. 697, 119 FERC ¶ 61,295, P 187 (2007).

The Yards Creek Pumped Storage Hydroelectric Project (the "Yards Creek Project") is a FERC-licensed pumped-storage hydroelectric project with a nameplate capacity of 400 MWs, and is located in Pahaquarry and Blairstown Townships, in Warren County, New Jersey. *See* FERC Project No. P-2309.

PSEG Fossil LLC ("PSEG") and Jersey Central Power & Light Company ("JCPL") each own, as tenants in common with the other, an undivided 50% interest in the Yards Creek Project. Accordingly, if and when PSEG or JCPL submit an updated market power analysis to the FERC, each will be subject to FERC's requirement to seek a "letter of concurrence" regarding the degree to which each controls the Yards Creek Project.

Both PSEG and JCP&L (and their affiliates) own transmission facilities and provide wholesale electric service in the Northeast region, as defined in Order No. 697. Pursuant to the schedule adopted in Order No. 697, PSEG and JCP&L are each required to submit an updated market power analysis to the FERC for markets within the Northeast region in December 2010. PSEG and/or JCP&L may also be obligated to file a change-in-status report or other market power analyses before its subsequent triennial market power analysis for the Northeast region is scheduled to be filed. Therefore, for the sole purpose of enabling either PSEG or JCP&L to submit a market power analysis that addresses, among other issues (to the extent necessary), the scope of each party's control of the Yards Creek Project, PSEG and JCP&L each aver and agree as follows:

1. JCP&L operates and maintains the Yards Creek Project pursuant to the Yards Creek Pumped Storage Hydroelectric Generating Station Operating Agreement, which is dated October 6, 1965 (the "Operating Agreement').

2. Article 2 of the Operating Agreement designates JCP&L as holding sole responsibility for the operations and maintenance the Yards Creek Project. Article 2 further provides that JCPL shall operate the Yards Creek project in the same manner as if JCPL had the complete ownership interest in the Yards Creek Project.

3. JCP&L does, in fact, operate and control the Yards Creek Project in the same manner as if JCP&L had the complete ownership interest in the Yards Creek Project in accordance with Article 2 of the Operating Agreement.

4. Accordingly, PSEG and JCP&L each agree and concur that for the purpose of the market power analyses required by Order No. 697, JCPL shall be deemed to control the Yards Creek Project generation capacity and electric energy output.

ACKNOWLEDGED AND AGREED:

Richard P. Lopriore
President, PSEG Fossil LLC

Dated: 12/21/10

UNITED STATES OF AMERICA

BEFORE THE

FEDERAL ENERGY REGULATORY COMMISSION

PSEG Fossil Sewaren Urban Renewal Entity LLC	))))	Docket No. ER17-____-000

Affidavit of
Dr. John R. Morris

May 25, 2018

20180525-5240 FERC PDF (Unofficial) 5/25/2018 3:36:30 PM

Public Service Enterprise Group Incorporated
Sewaren Market Power Study

1. My name is Dr. John R. Morris. I am a Principal at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Washington, DC 20037. I am the same Dr. John R. Morris who filed Public Service Enterprise Group Incorporated's ("PSEG") market power study for the Northeast Region in December 2016 under this docket. See Report & Affidavit of Dr. John R. Morris, FERC Accession Number 20161228-5212, December 28, 2016. I also filed a Change in Status application to reflect the addition of Keys Energy Center and the retirement of Hudson and Mercer generating stations in September 2017 for PSEG in Docket No. ER17-2426-000. PSEG has asked that I update the September 2017 market power study for the PJM market and relevant submarkets in order to account for the addition of PSEG Fossil Sewaren Urban Renewal Entity LLC, hereinafter "Sewaren LLC", which owns Sewaren Unit 7, a natural gas combined cycle plant with a generating capacity of 585 MW currently under construction in Woodbridge Township, New Jersey. When Sewaren LLC enters service, PSEG will retire Sewaren Units 1-4 at the same location.[1]

2. Per PSEG's request, I added the new 585 MW Sewaren Unit 7 in the PJM East market and retired Sewaren Units 1-4, which are located in PJM East. I moved the test year of the analysis forward by one year from December 2014-November 2015 to December 2015-November 2016, as this is the latest period for which FERC Form 714 data on unplanned generator outages is

[1] The relevant markets are PJM Interconnection, L.L.C. ("PJM"), PJM East, PJM East of 5004/5005 and PJM East of AP South.

20180525-5240 FERC PDF (Unofficial) 5/25/2018 3:36:30 PM

available. I also updated the overall market sizes of the PJM market and submarkets, along with the first tier areas of NYISO and MISO. I updated load data both for the applicant and for the overall markets in the study. All methods are the same as in the December Affidavit.

3. The results of the pivotal supplier and market share assessments are provided in Exhibit No. PEG-2.

4. Although there are some minor differences in the results from those presented with the December Affidavit, the differences are not material and do not change the conclusions made at that time.

5. Although there are some Wholesale Market Share screen failures in the PJM East and PJM 5004/5005 submarkets, Sewaren LLC and most of the PSEG generation is located in PJM, which has Commission approved market power monitoring and mitigation. The Commission has adopted a rebuttable presumption that existing Commission approved RTO/ISO market monitoring and mitigation is sufficient to address any market power concerns. See Order No. 697, FERC Stats. & Regs. ¶ 31,252 at P 240-42, P 246, P 290; Order No. 697-A, FERC Stats. & Regs. ¶ 31,268 at P 111.

6. Under the standards utilized by the Commission, continuing market-based rates for PSEG and all of its Northeastern affiliates remain in the public interest. In addition, granting market-rate authority to the Sewaren LLC would also be in the public interest.

7. This concludes my affidavit.

20180525-5240 FERC PDF (Unofficial) 5/25/2018 3:36:30 PM

Pursuant to 28 U.S.C. §1746, I state under penalty of perjury that the foregoing is true and correct to the best of my information, knowledge, and belief.

Executed on this 25th day of May 2018.

John R. Morris, Ph.D.

RE: Supplemental Notice of Non-Material Change in Status
***PSEG Energy Resources & Trade LLC*, Docket No. ER10-1789-004;**
***Public Service Electric and Gas Company*, Docket No. ER10-1768-003;**
***PSEG Power Connecticut LLC,* Docket No. ER10-1793-003;**
***PSEG Fossil LLC,* Docket No. ER10-1770-003;**
***PSEG Nuclear LLC,* ER10-1771-003;**
***PSEG New Haven LLC,* ER12-1250-003:**

Dear Secretary Bose:

PSEG Energy Resources & Trade LLC ("PSEG ERT") hereby submits for filing this notice of a non-material change in status,[1] in compliance with the reporting requirements adopted by the Federal Energy Regulatory Commission ("Commission") in Order No. 652.[2] Specifically, PSEG ERT hereby notifies the Commission that it has executed with the Long Island Power Authority ("LIPA") a Contract Providing Power Supply Management Services dated November 26, 2013 ("the 2013 Contract"). Under the 2013 Contract, which will be fully implemented on January 1, 2015, PSEG ERT will provide LIPA with Power Supply Management Front and Back Office Services ("PSMFB Services").[3] Such PSMFB Services are, in all respects pertaining to the sale or transmission of electric energy, the same services that Consolidated Edison Energy, Inc. ("Con Edison Energy") has been providing to LIPA since January 1, 2010 pursuant to an agreement between Con Edison Energy and LIPA dated December 1, 2008 (the "2008 Contract").[4]

[1] This notice supplements the notice that was filed on November 13, 2014 (Accession No.: 201411135228).

[2] Reporting Requirement for Changes in Status for Public Utilities with Market-Based Rate Authority, 110 FERC ¶ 61,097 (Order No. 652), order on reh'g, 111 FERC ¶ 61,413 (2005) (Order No. 652-A).

[3] While the 2013 Contract will be fully implemented on January 1, 2015, to begin the transition from Con Edison Energy to PSEG ERT, PSEG ERT began performing PSMFB Services as to LIPA's rights (i) to seven must-take qualifying facilities (about 230 MW) on September 16, 2014; (ii) to 29 oil combustion generating units (about 1,520 MW) on October 14, 2014; and (iii) to four Northport steam generating units (about 1,600 MW) on October 28, 2014.

[4] Currently, two affiliates of PSEG ERT (PSEG Long Island LLC and Long Island Electric Utility Servco LLC) provide certain management, operations and maintenance services to LIPA with respect to LIPA's transmission and distribution system. In *PSEG Long Island LLC*, 145 FERC ¶ 61,010 at P 4 (2013), the Commission disclaimed jurisdiction under Section 201(e) of the Federal Power Act over these two affiliates based on a finding that LIPA and its Board will retain ultimate control and decision-making authority over the transmission and distribution facilities.

20141114-5149 FERC PDF (Unofficial) 11/14/2014 1:49:39 PM

In connection with the 2008 Contract between Con Edison Energy and LIPA, on April 7, 2009, Con Edison Energy submitted to the Commission a notice of a non-material change in status, which was accepted by the Commission by letter order on June 8, 2009.[5] Con Edison Energy's April 7, 2009 notice is attached hereto as Attachment A, and the Commission's June 8, 2009 acceptance letter is attached hereto as Attachment B.

Like Con Edison Energy's change in status notification, PSEG ERT hereby submits this notice of a non-material change in status, notifying the Commission that, as of January 1, 2015, it will take over the functions that are currently performed by Con Edison Energy under the 2008 Contract.[6] PSEG ERT's execution of the 2013 Contract and its performance of services thereunder will not provide PSEG ERT with ownership of, or control over, the Power Supply Resources. PSEG ERT will perform services under the 2013 Contract as an agent for, or representative of, LIPA (in the same manner that Con Edison Energy currently performs services for LIPA), and, therefore, control over the Power Supply Resources at all times will remain with LIPA, as it did with respect to the 2008 Contract between Con Edison Energy and LIPA. Thus, PSEG ERT's execution of the 2013 Contract and its performance of the services on behalf of LIPA do not constitute a material change in status as contemplated by the Commission's regulations.[7]

PSEG ERT also notes that, on December 23, 2013, PSEG ERT and its affiliates with market-based rate authorization except PSEG New Haven LLC submitted their triennial market power update with the Commission in Docket Nos. ER99-3151 et al.[8] In that filing (at page 5), PSEG ERT provided the Commission with notice of the 2013 Contract, stating: "On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015." The Commission accepted this triennial update filing on October 14, 2014.

In sum, PSEG ERT hereby notifies the Commission of the foregoing non-material change in status and requests that the Commission accept this filing on the same grounds that it accepted the April 8, 2009 Con Edison Energy filing.

Sincerely,

Jodi L. Moskowitz

[5] *See* June 8, 2009 Letter Order accepting Con Edison Energy's notice of change in status in Docket Nos. ER98-2491-015 et al.

[6] *See supra* n.2 at 1.

[7] In Order 652, the Commission stated that the requirement to make a change in status filing is triggered by a change in "ownership" or "control" of generation or transmission facilities. Order 652 at PP 2, 18.

[8] PSEG New Haven LLC was not included in the 2013 triennial market power update because it received initial MBR authority on May 29, 2012 in Docket No. ER12-1250-00 and therefore was not yet due to make a triennial update filing.

Notification of Non-Material Change in Status

Dear Ms. Bose:

Consolidated Edison Energy, Inc. ("Con Edison Energy") submits for filing this notice of a non-material change in status, in compliance with the reporting requirements adopted by the Federal Energy Regulatory Commission ("Commission") in Order No. 652.[1] The change in circumstance is the execution by Con Edison Energy and the Long Island Power Authority ("LIPA") of a Contract for Providing Power Supply Management Front and Back Office Services dated December 1, 2008 ("Contract").[2]

Con Edison Energy does not believe that it has obtained control over the facilities affected by the Contract and, thus, that the Contract is not a change in status as contemplated by the Commission's regulations. Nevertheless, even if the Contract were deemed to convey control to Con Edison Energy, this change in status does not reflect a material change from the characteristics the Commission relied upon in granting CEE market-based rate authorization[3] or the results of the last triennial market power analysis submitted on behalf of Con Edison Energy and its affiliates ("the Con Edison Companies).[4]

---

[1] *Reporting Requirement for Changes in Status for Public Utilities with Market-Based Rate Authority*, 110 FERC ¶ 61,097 (Order No. 652), *order on reh'g*, 111 FERC ¶ 61,413 (2005) (Order No. 652-A).

[2] The Contract is conditioned upon its approval by the New York State Comptroller, which was granted on March 13, 2009.

[3] *Consolidated Edison Energy, Inc.*, 83 FERC ¶ 61,236 (1998).

[4] The Commission recently accepted a triennial market power analysis on behalf of the Con Edison Companies. *Consolidated Edison Company of New York, Inc.*, Dkt. No. ER99-2251-003,

Under the Contract, Con Edison Energy will provide specified services, as an agent, to LIPA with respect to certain resources (referred to in the Contract as "Power Supply Resources") that LIPA will use to serve its retail load, including (i) electric generating facilities owned by or under contract to LIPA having a total rating of 6,683 MW, (ii) LIPA's long-term transmission rights over the Cross Sound Cable and the Neptune Cable ("CSC and Neptune"), and (iii) LIPA's rights to certain emissions credits, transmission congestion contracts and financial transmission rights. The services that Con Edison Energy will perform on behalf of LIPA with respect to the Power Supply Resources include (i) the purchase and sale of capacity, energy, ancillary services, and transmission congestion contracts to meet the needs of LIPA's retail customers; (ii) the bidding and scheduling in wholesale electric markets of energy, capacity and ancillary services associated with the Power Supply Resources in order to serve the requirements of LIPA's retail load; and (iii) associated accounting, settlement, dispute resolution support, and reporting.

Commencing on January 1, 2010 and continuing for a base term of five years, Con Edison Energy will assume full responsibility for bidding and scheduling all of the Power Supply Resources in wholesale electric markets. In mid to late-2009, Con Edison Energy may undertake limited bidding and scheduling activities for one or more of the Power Supply Resources as part of training and pre-implementation preparations for bidding and scheduling activities.

Con Edison Energy's execution of the Contract and its performance of services thereunder do not vest Con Edison Energy with ownership of, or control over, the Power Supply Resources. The Contract does not alter the ownership of the Power Supply Resources in any respect. Because Con Edison Energy will perform services under the Contract as an agent for or representative of LIPA, control over the Power Supply Resources will remain with LIPA, as LIPA acknowledges in the enclosed concurrence letter. Thus, Con Edison Energy's execution of the Contract and its performance of services for LIPA do not constitute a material change in status as contemplated by the Commission's regulations.

With respect to LIPA's transmission rights over the CSC and Neptune, these transmission facilities are operationally controlled by ISO New England and PJM Interconnection, with transmission service scheduled over each facility pursuant to

---

et al., *Letter Order*, June 24, 2008. At the time it was filed, that analysis included the following Con Edison Companies with market-based rate authority: Newington Energy, L.L.C.; CED Rock Springs, Inc.; Consolidated Edison Energy Massachusetts; Lakewood Cogeneration, L.P.; and Ocean Peaking Power, L.L.C. The Commission subsequently authorized the transfer of these companies to North American Energy Alliance, LLC. *See Consolidated Edison Development, Inc. et al.*, 123 FERC ¶ 61,022 (2008). As such, this non-material change in status is not being filed in the dockets in which these divested companies received market-based rate authority.

specific rules set forth in the ISO-NE and PJM Open Access Transmission Tariffs on file with the Commission. In contracting for long-term transmission service rights over CSC and Neptune, LIPA did not acquire any ownership or operational control over those transmission facilities. Accordingly, by executing the Contract, LIPA did not convey to Con Edison Energy any operational control over the CSC or Neptune transmission facilities.

Even if the Contract were deemed to vest Con Edison Energy with control over the Power Supply Resources and with localized market power, that change in status would not reflect a material change from the characteristics the Commission relied upon in granting Con Edison Energy market-based rate authorization or in the results of the last triennial market power analysis submitted on behalf of Con Edison Energy and its affiliates. Currently, a subsidiary of National Grid USA manages LIPA's generation and energy portfolio.[5] Notwithstanding those services, the Commission recently concluded that the National Grid USA subsidiary satisfies the Commission's standards for market-based rate authority.[6] As a successor to the National Grid USA subsidiary, Con Edison Energy will manage LIPA's generation and energy portfolio after the current arrangement between LIPA and the National Grid USA subsidiary expires. Under the Contract, Con Edison Energy has no responsibility with respect to operation or management of LIPA's transmission and distribution systems. Accordingly, the Commission's prior conclusion and rationale apply equally to Con Edison Energy.

Accordingly, Con Edison Energy advises the Commission of the foregoing non-material change in status and requests that the Commission accept this filing and confirm Con Edison Energy's continued authorization to sell power at market-based rates.

Respectfully submitted,

Reference: Notice of Change in Status

Dear Mr. Wemple:

Pursuant to the authority delegated to the Director, Division of Tariffs and Market Development - West, under 18 C.F.R. § 375.307, your submittal filed in the referenced dockets is accepted for filing.

On April 8, 2009, you filed on behalf of ConEdison a notice of change in status to inform the Commission that ConEdison entered into a Contract for Providing Power Supply Management Front and Back Office Services with Long Island Power Authority. You state that the execution of this contract does not affect the conditions the Commission relied upon when granting ConEdison market-based rate authority. Based on your representations, the notice of change in status is accepted for filing.

Your filing was noticed on April 8, 2009, with comments, protests or interventions due on or before April 29, 2009. None was filed.

This action does not constitute approval of any service, rate, charge, classification, or any rule, regulation, or practice affecting such rate or service provided for in the filed documents; nor shall such action be deemed as recognition of any claimed contractual right or obligation affecting or relating to such service or rate; and such acceptance is without prejudice to any findings or orders which have been or may hereafter be made by

20090608-5049 FERC PDF (Unofficial) 06/08/2009 1:49:39 PM

the Commission in any proceeding now pending or hereafter instituted by or against any of the applicant(s).

This order constitutes final agency action. Requests for rehearing by the Commission may be filed within 30 days of the date of issuance of this order, pursuant to 18 C.F.R. § 385.713.

Questions regarding the above order should be directed to:

Federal Energy Regulatory Commission

Kimberly J. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, DC 20426

RE: Triennial Market Power Update and Revised Market-Based Rates Tariff in Compliance with Order No. 697:

***PSEG Energy Resources & Trade LLC*, Docket No. ER99-3151-____;**

***Public Service Electric and Gas Company*, Docket No. ER97-837-____;**

***PSEG Power Connecticut LLC*, Docket No. ER03-327 -___;**

***PSEG Fossil LLC*, Docket No. ER08-447-___;**

***PSEG Nuclear LLC*, ER08-448-___; and**

***PSEG New Haven LLC*, ER12-1250-___**

Dear Secretary Bose:

Pursuant to the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), Public Service Electric and Gas Company ("PSE&G"), PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear") and PSEG New Haven LLC ("PSEG New Haven") (collectively the "Applicants" or "PSEG") hereby jointly submit for filing their updated market power analysis in support of their continued eligibility to engage in market-based rates transactions. This market power analysis satisfies the requirements of Order No. 697[1] for the filing of updated market power analyses on a regional schedule basis by holders of market-based rate certificates and their affiliates. In accordance with the regional

[1] 18 C.F.R. Part 35, Subpart H (2007); Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

schedule for those utilities in the Northeast Region, as modified by the MBR Clarifying Order, this filing is being made by the December 2013 deadline.[2] In conformance with the Commission's requirements, except when expressly noted otherwise, the market power analysis is based on activity during the study period from December 1, 2011 through November 30, 2012 ("study period").

PSEG, through its subsidiary PSE&G, owns transmission facilities within the Northeast Region. Specifically, PSE&G owns transmission facilities in the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization. PSEG Power LLC and its subsidiaries do not own any transmission facilities other than transmission to connect generating units to the grid in PJM, the New York Independent System Operator, Inc. ("NYISO") and ISO New England Inc. ("ISO-NE").

In their original applications for market-based rate authority and previously-submitted updates to the Commission, PSEG ER&T, PSE&G, PSEG Power CT, PSEG Fossil, PSEG Nuclear and PSEG New Haven demonstrated that they and their affiliates: (a) do not exercise generation market power; (b) lack the ability to manipulate access to transmission facilities that they own or control; and (c) cannot erect any other barriers to market entry. As further demonstrated herein and in the Affidavit of Dr. John R. Morris attached hereto in the appendices, Applicants continue to satisfy the Commission's requirements to sell energy, capacity and ancillary services at market-based rates and thus should be permitted to continue to make such sales.

I. SERVICE AND COMMUNICATION

All service and correspondence related to this matter should be directed to the following individuals:

II. DESCRIPTION OF THE APPLICANTS AND RELEVANT AFFILIATES

A. The Applicants

The Applicants are each wholly owned, direct and indirect subsidiaries of Public Service Enterprise Group Incorporated ("PSEG"). PSEG is a public utility holding company engaged in, among other things, the generation of electric energy and the transmission, distribution and sale of electricity and natural gas through its subsidiaries.

1. Public Service Electric and Gas Company

PSE&G is a public utility operating company engaged primarily in the transmission of electricity, and the provision of gas and electric distribution service in the State of New Jersey. During the study period, PSE&G owned less than 100 MW of solar generation and otherwise did not own or operate any electric generation facilities. PSE&G is a member of the PJM Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access Transmission Tariff ("OATT") administered by PJM. PSE&G is authorized to sell power at market-based rates and makes wholesale sales falling within several different categories, as described below.

Non-utility generation ("NUG") output. Pursuant to certain long-term contracts entered into under the Public Utility Regulatory Policy Act of 1978 ("PURPA") or restructured successor contracts to PURPA contracts that PSE&G originally entered into with Qualifying Facilities ("QFs"), PSE&G has a continuing obligation to purchase certain quantities of energy and capacity. The total maximum quantity that PSE&G is

[3] 18 C.F.R. § 385.203(b)(3).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

contractually obligated to purchase from non-utility generators ("NUGs") is approximately 257 MW in installed capacity and associated energy. PSE&G sells the energy quantities purchased under these contracts into the PJM-administered spot market pursuant to its market-based rate authority. With respect to capacity from the facilities, PSE&G receives non-unit specific capacity rights covering the vast bulk of its capacity purchases – about 195 MWs – which are settled financially with the counterparty. The remainder of the capacity purchased by PSE&G under three (3) NUG contracts – about 62 MWs – is bid directly into the RPM auctions. Since PSE&G has a contractually-based obligation to offer the NUG capacity into the market, which obligation is also set forth in a New Jersey Board of Public Utilities ("BPU") Order approving a rate stipulation involving PSE&G,[4] the capacity has not been attributed to PSE&G for purposes of this market power analysis.

Solar. In 2007, the New Jersey legislature passed Regional Greenhouse Gas Initiative ("RGGI") legislation authorizing state utilities to invest in renewable resources such as wind or solar in order to promote increased use of renewable resources within the state and in turn reduce greenhouse gas emissions. *See* L. 2007, c. 340, codified at N.J.S.A. 48:98-1. In the fall of 2009, the BPU approved PSE&G's "Solar 4 All" program under which PSE&G is able to install, own and operate on a regulated basis solar generation up to a maximum of 80 MWs DC. PSE&G currently owns and operates approximately 77 MWs DC of solar power under the Solar 4 All program. In May 2013, the BPU approved PSE&G's "Solar 4 All Extension" to allow PSE&G to install, own and operate an additional 45 MWs DC of solar generation.

2. PSEG Energy Resources & Trade LLC

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.*, which initiated the transition from a regulated to a competitive retail power market in New Jersey, BPU annually approves statewide auctions to determine the entities that will supply Basic

[4] The stipulation states that "the parties agree that the Company will continue to sell NUG power into the PJM Spot Market unless and until the Board determines that a different selling protocol is appropriate." *In the Matter of Public Service Electric and Gas Company for Approval of Changes in Electric Rates*, Docket No. ER02050303, ¶ 18 (2003).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSEG ER&T has participated directly in all of the auctions for BGS supply held since 2004, has been a winning bidder in these auctions and has incurred contractual commitments to provide supply to BGS load pursuant to BPU approved contracts beginning with the 2004 auction and continuing to the present

RMR Tariff for PJM Units. As explained in PSEG ER&T's 2010 triennial submission, ER&T began providing reliability services to PJM pursuant to Reliability Must-Run ("RMR") tariffs covering operations at PSEG Fossil's Hudson 1 generating unit in 2005. The RMR tariff for the Hudson 1 unit expired effective as of December 7, 2011. Additionally, the Hudson 1 unit and its 454.8 MWs were retired when the RMR was terminated.

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract remains in effect and provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply: On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015.

3. PSEG Fossil LLC

PSEG Fossil is an Exempt Wholesale Generator ("EWG") and is authorized to sell power at market-based rates. PSEG Fossil owns and operates electric generation facilities located within PJM and sells their entire output to its affiliate PSEG ER&T.[5] The assets of PSEG Fossil are located entirely within PJM. However, PSEG Fossil's subsidiaries PSEG Power Connecticut LLC, PSEG Power New York LLC and PSEG New Haven LLC own facilities in ISO-NE and NYISO. As noted below, PSEG Fossil also co-owns certain facilities in PJM.

[5]These contracts were originally approved by the Commission as cost-based contracts. *See Public Service Electric and Gas Company*, et al., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Fossil obtained market based rate authority covering sales from its generating units.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

On December 7, 2011, PSE&G retired Hudson 1 and its 454.8 MW (and the accompanying RMR Agreement). Additionally, on June 1, 2012, PSEG Fossil energized six (6) new combustion turbines at its Kearny site in New Jersey. Four (4) units – designated "Kearny 13" - have a combined generator nameplate rating of 242 MWs. Two (2) other units – designated "Kearny 14" - have a combined generator nameplate rating of 142.3 MWs. The addition of this new peaking generation coincided with the retirement of Kearny 10 and 11 with nameplate ratings of 146.3 MWs each.

PSEG Fossil notified PJM in April 2010 that it planned to retire Kearny 9, a unit with a capacity nameplate rating of 18.6 MW, on or about March 2013. However, in November 2011, PSEG Fossil notified PJM that, although Kearny 9 would not have any capacity commitments after May 31, 2013, it would be available for energy and ancillary services. In addition, PSEG Fossil has notified PJM that it will retire the following units on the following dates:

Burlington 9 – June 1, 2014
Salem 3 – June 1, 2015[6]
Bergen 3 – June 1, 2015
Burlington 8 – June 1, 2015
National Park – June 1, 2015
Mercer 3 – June 1, 2015
Sewaren 6 – June 1, 2015
Burlington 11 – June 1, 2015
Edison 1 – 3 – June 1, 2015
Essex 10 – 12 – June 1, 2015

PSEG Fossil satisfies most of the electricity needs of its plants from PJM under PJM's "station power" Tariff provisions and receives station power for its National Park station from PSE&G under a retail tariff approved by the BPU. PSEG Fossil procures gas supply for its plants from PSEG ER&T and receives gas distribution service from PSE&G at a rate approved by the BPU on May 29, 2013.[7]

4. PSEG Power Connecticut LLC

PSEG Power CT is a Connecticut limited liability company and an EWG that owns and operates electric generation facilities in the State of Connecticut and is authorized to sell power at market-based rates.[8] Both of PSEG Power CT's generation facilities, Bridgeport Harbor and New Haven Harbor, are located in the State of Connecticut within the market administered by ISO-NE. PSEG Power CT sells the output of its generation facilities to its affiliate PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority.

---

[6] No longer available as a capacity resource in PJM though still available to supply emergency back-up generation for the Salem 1 and 2 nuclear units.
[7] BPU Docket No. GM12100935 (May 29, 2013).
[8] *Wisvest Corporation,* et al., 101 FERC ¶ 61,166 (2002).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

5. PSEG New Haven LLC

PSEG New Haven is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG New Haven owns and operates a facility (the "New Haven facility") in New Haven, Connecticut with a nameplate rating of 181 MWs. The New Haven facility is located within the New Haven Harbor generation station. The New Haven facility is interconnected to the adjacent United Illuminating East Shore Substation using a 115 KV underground cable. PSEG New Haven has no other generation assets. The commercial operation date for the New Haven facility was June 1, 2012 and PSEG New Haven has obtained MBR authority from FERC.[9]

The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[10] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[11] All of the energy and capacity of the New Haven facility is sold into the ISO New England ("ISO-NE") markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA[12] has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder. The 181 MW nameplate rating of the New Haven Facility has not been included in the capacity controlled by PSEG for purposes of Dr. Morris' market power analysis.

6. PSEG Nuclear LLC

PSEG Nuclear is an EWG[13] and is authorized to sell power at market-based rates. PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission.[14] The assets of PSEG Nuclear are located entirely within PJM. PSEG Nuclear performed an uprate of 120 MWs at its Hope Creek plant in 2009, which increased its nameplate rating to 1290 MWs.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

OTHER RELEVANT AFFILIATES

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities, as discussed below.

7. Affiliated Generation Ownership.

A list of the Applicants' affiliated domestic FERC jurisdictional generation assets owned is contained in Appendix B attached hereto. [15] Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the Northeast Region are described below:

PSEG Power LLC ("PSEG Power") was formed in 1999 to acquire the former generation assets of PSE&G. PSEG Power, a Delaware limited liability company, does not directly own any generation facilities or engage in any FERC jurisdictional activities but is the parent company of several FERC jurisdictional entities, including Applicants PSEG ER&T, PSEG Fossil, PSEG Nuclear, PSEG Power CT and PSEG New Haven.

PSEG Global LLC ("PSEG Global") is an indirect subsidiary of PSEG and owns an indirect interest in a domestic power plant in Hawaii.[16]

PSEG Solar Source LLC ("Solar Source") A PSEG Global subsidiary, PSEG Solar Source LLC owns a combined 29 MWs[17] of solar capacity in PJM, about 15 MWs in Florida, 37 MWs in Arizona and 3 MWs in California, all through separate project companies which have all obtained QF status.[18] By the end of 2013, all of the Solar Source facilities will be transferred to a new subsidiary of PSEG Power – PSEG Power Ventures LLC - which will be a Delaware limited liability company that will not itself be an operating company. As a result, these companies will become subsidiaries of PSEG Power rather than subsidiaries of

---

[15] Appendix B excludes generation assets located in Hawaii as well as generation assets in which PSEG's interest is limited to a leveraged lease interest.

[16] PSEG Global previously owned indirect interests in facilities in California and New Hampshire and a hydro plant in Pennsylvania. Since the last PSEG triennial market power update, PSEG Global has (i) sold its 40% interest in Bridgewater Holdings LLC (the New Hampshire facility) on May 11, 2012 (ii) shut down operations of its plants in California on February 24, 2012 and (iii) sold its interest in Pennsylvania Renewable Resource's two 7.5 MW (net) hydro facilities in May 2011.

[17] The 29MWs are attributed to three (3) separate project companies that have QF status: PSEG Solar Source Hackettstown (2 MW); PSEG Solar Source Delaware (15 MW) and PSEG Solar Source Ohio (12 MW).

[18] The 3MWs (DC) are associated with the Shasta Solar Facility in California, which began testing energy on December 20, 2013. PSEG Global is also under contract to purchase ownership of the Acacia Solar Project, which is expected to produce 20 MW DC beginning in the first quarter 2014. Both Shasta and Acacia will have QF status.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

PSEG Global. This is simply a change in upstream ownership that will not affect the operations of the facilities.[19]

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company and an EWG that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a FERC-approved cost-based contract.[20]

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution system ("T&D") on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco will be FERC jurisdictional public utilities as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[21]

8. Affiliated Transmission Ownership

With the exception of the electric transmission assets owned by Applicant PSE&G, all of which are located within the PJM RTO, and the generation interconnection facilities owned by the various EWG and QF affiliates listed herein, the Applicants do not have any affiliates that own or operate FERC jurisdictional electric or natural gas transmission facilities within the United States. As discussed below, FERC granted PSE&G a Hinshaw exemption in 1954, finding that it was exempt from the provisions of the Natural Gas Act.

---

[19] It should be noted that the Hawaii generating facility referenced above will also be transferred to PSEG Power Ventures LLC as of the end of 2013.

[20] *PSEG Power New York Inc.*, Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

[21] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), *order dismissing request for rehearing*, 145 FERC ¶ 61,183 (2013).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

B. JOINTLY OWNED FACILITIES

PSEG Nuclear is a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear is the operator of Salem and Exelon Generation is the operator of Peach Bottom.[22] PSEG Fossil is approximately a 23% joint owner in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[23] Accordingly, for purposes of this market power analysis, the capacity of Salem, Peach Bottom, Conemaugh and Keystone has been attributed to PSEG in accordance with PSEG's ownership interests in these facilities.

PSEG Fossil and Jersey Central Power and Light Company ("JCP&L") are each 50% co-owners of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity – nominally 400 MWs – has been assigned to JCP&L.[24]

III. Applicants Fully Satisfy The Commission's Standards For Authority to Make Power Sales At Market-Based Rates.

The Commission allows power sales at market-based rates if the seller and its affiliates do not have, or have adequately mitigated, horizontal and vertical market power.[25] The Commission has also codified affiliate restrictions in its regulations which must be satisfied on an ongoing basis. In previous submissions for market-based rate authority the Applicants PSE&G, PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear and PSEG New Haven demonstrated compliance with each of these requirements. As detailed herein and in the attached affidavit, the Applicants continue to meet these standards.

A. The Applicants Lack, Or Have Effectively Mitigated, Any Horizontal Market Power

In the MBR Order, the Commission established two indicative screens: a pivotal supplier screen based on the control area's annual peak demand and a wholesale market share screen applied on a seasonal basis. If an applicant passes both screens, there is a rebuttable presumption that the applicant does not possess generation market power.

---

[22] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in Appendix D. The ownership percentages have not changed since the date of this letter. PSEG Nuclear owns a 50% interest in Peach Bottom and a 57.41% interest in Salem.

[23] A letter of concurrence supporting the allocation of plant output based on ownership interest is attached in Appendix D. The ownership percentages have not changed since the date of this letter.

[24] A letter of concurrence supporting this determination is attached in Appendix D. The ownership percentages have not changed since the date of this letter.

[25] MBR Order, FERC Stats. & Regs. ¶ 31,252 at P 62, 399, 408, 440.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Each indicative screen is applied with respect to "relevant geographic markets" for an applicant's generating units.

Applicants located in ISOs/RTOs possessing sufficient market structure may consider the geographic region under the control of the ISO/RTO as the relevant default geographic region for purposes of completing their generation market power analyses.[26] However, where the Commission has previously found a "submarket" to exist within a boundary of an RTO, such finding is controlling as to the scope of the relevant geographic market for all generation units located within that submarket for the application of the indicative screens and any delivered price test that may be performed. The Commission further listed several such submarkets, including PJM East ("PJME"), Connecticut and Southwest Connecticut.[27] Subsequent to the MBR order, in approving a merger between Exelon Corporation and Constellation Energy Group, Inc., the Commission identified additional submarkets in PJM - PJM East of 5004/5005 ("PJM50") and PJM East of AP South ("PJMAP") - that would be relevant to an MBR analysis for applicants in the Northeast Region.[28]

As discussed below and in the attached Affidavit of Dr. John Morris contained in Appendix A, Applicants have conducted market power analyses of the entire PJM RTO, the PJME, PJM50 and PJMAP submarkets, the entire NYISO, the entire ISO-NE, the Connecticut submarket and the Southwest Connecticut submarket for the study period. The results are set forth below.

1. Indicative Screens

a. Pivotal Supplier Analysis

The pivotal supplier analysis ("PSA") focuses on the ability of a seller to exercise unilateral market power.[29] The screen assesses whether market demand can be met during peak times without the applicant and its affiliates. If demand can be met without the applicant and its affiliates, the applicant passes that the PSA screen. The Affidavit of Dr. John Morris, attached hereto as Appendix A, finds that the Applicants pass the PSA screen for all relevant markets: PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut, PJMAP, PJME and PJM50.[30]

[30] *See* Morris Affidavit, at 15-28.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

b. Wholesale Market Share Analysis

The wholesale market share analysis ("WMSA") is applied each season to determine whether an applicant has a dominant market position based on the total number of megawatts of uncommitted capacity owned or controlled by the applicant and its affiliates in relation to the uncommitted capacity of the entire relevant wholesale electricity market.[31] The established threshold is 20 percent; a supplier who has less than 20 percent market share in the relevant market for all seasons passes the WMSA screen.

In his Affidavit Dr. Morris finds that the Applicants pass the WMSA screen for PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut and PJMAP but do not pass the WMSA screen for the PJME and PJM50 submarkets.[32]

c. Results of Indicative Screen Analysis

As shown in Dr. Morris's affidavit, Applicants therefore pass both indicative screen tests for PJM RTO, NYISO, ISO-NE, Connecticut, Southwest Connecticut and PJMAP. For PJME and PJM50, the Applicants pass the PSA but do not pass the WMSA.

2. Delivered Price Test Analysis For PJME and PJM50 Submarkets

In accordance with the MBR Order, applicants who fail either indicative screen test can rebut the presumption of market power through the submission of a delivered price test analysis ("DPT"). Applicants may submit this study at the same time that the results of the indicative screens are provided.[33] The DPT is based on two measurements of potential market power: economic capacity ("EC") and available economic capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting native load commitments from EC. Both calculations are performed for twelve different seasonal and load conditions.

In applying the DPT, "[a] showing of an HHI less than 2,500 in the relevant market for all season/load conditions for sellers that have also shown that they are not pivotal and do not possess a 20 percent or greater market share in any of the season/load conditions would constitute a showing of a lack of market power, absent compelling contrary evidence from intervenors."[34] However, while meeting these threshold benchmarks provides "safe harbor" protection, the Commission has found in numerous other cases that applicants lack market power even when they exceed one or more of the thresholds for particular study periods. As stated in *Public Service Company of New Mexico*, 115 FERC ¶ 61,090, P 38 (2006), "the Commission weights the results of both

the economic and available economic capacity tests and considers the arguments of the applicant and intervenors." (footnote omitted.) [35]

a. Results of the DPT for PJM50 Submarket

With respect to AEC, PSEG passes all screens in all periods. For EC, PSEG passes the HHI Screen and market share screens for all periods but does not pass the PSA screen in 6 of 10 periods.

b. Results of the DPT for PJME Submarket

With respect to AEC, PSEG passes all screens in all periods. For EC, PSEG does not pass the PSA screen in 2 of 10 periods and has marginal Market Share screen failures in 4 of 10 periods.

3. Analysis of DPT Results

Based on his analysis of the overall results, Dr. Morris concludes that, although PSEG fails limited number of screens, the failures appear to be more in the nature of technical violations and not indicators of market power. As set forth in his Affidavit, Dr. Morris states that:

> Although PSEG fails some of the screens for EC in both the PJM50 and the PJME destination markets, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the market concentration (HHI) screens. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically

[35] Indeed, in that case, the applicant was deemed "on balance" to have adequately rebutted a showing of market power mitigation for the PNM control area where the results exceeded the 20% safe harbor in two cases under the AEC measure and in all 10 cases at values between 35% and 41% under the EC measure. *See, e.g., Kansas City Power and Light Company, et al.*, Docket Nos. ER99-1005-011 et al. (August 12, 2010) (finding no market power where applicant had EC market shares in the 40-60% range and had significant HHI failures in the KCPL and GMO markets); *Cordova Energy Company LLC et al,* Docket Nos. ER99-2156-011, *et al.*, November 13, 2007 (finding no market power in case where applicant had EC market shares in PACE control area between 53.1% and 60.0%, HHIs between 2,958 and 3,696 and was pivotal in 8 out of 10 periods.); *PacifiCorp*, Letter Order, Docket Nos. ER97-2801-007, *et al.*, February 1, 2007; *Tucson Elec. Power Co.*, 116 FERC ¶ 61,051 (2006)(finding market power standard satisfied where applicant had EC market shares above 20% in all ten season/load periods in the Tucson control area, exceeded the 2,500 HHI threshold in eight periods, and was pivotal in 5 periods); *PacifiCorp*, 115 FERC ¶ 61,349 (2006) (finding that applicants rebutted presumption of market power in the PacifiCorp East control area where under available economic capacity measure, market share is less than 20% in 8 season/load periods and 28% in the summer and winter off-peak periods, HHI does not exceed 2500 in any season/load period and applicants are not pivotal); *Kansas City Power & Light Co.*, 113 FERC ¶ 61,074 (2005) (finding no market power in the KCPL control area where applicant had EC market shares above 20% in all periods, exceeded the HHI 2,500 threshold in 5 of 10 periods and was pivotal supplier in 1 period); *Acadia Power Partners, L.P.*, 113 FERC ¶ 61,073 (2005) (finding no market power in the Cleco Power home control where, utilizing the EC measure, the applicant exceeded the thresholds set for all season/load periods using the market share measure, one season/load period using the market concentration measure, and for all season/load periods using the pivotal supplier measure).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

> substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[36] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all pivotal supplier screens for AEC. This shows that, given commitments to serve load, its generation was not necessary to serve remaining wholesale load. In other words, although PSEG fails the pivotal supplier tests for some periods with EC, once accounting for its actual forward sales commitments, PSEG's uncommitted generation is not necessary to meet total demand in any of the regions in any period. Thus, PSEG has little to no ability to exercise unilateral market power. Finally, PSEG's market shares are not above 20 percent for any of the Market Share Screens, except only four (4) periods for EC in PJM East. Although greater than 20 percent, PSEG's market shares during these four (4) periods are not substantially above 20 percent. The highest share is only 22.4 percent. Hence, although PSEG fails the Market Share Screens and the Pivotal Supplier Screens for EC in some instances, the failures are more in the nature of technical violations and not true indicators of market power.[37]

As noted above, Dr. Morris' conclusion that the limited DPT screen failures identified through his study are "in the nature of technical violations" is consistent with Commission precedent finding a lack of market power in cases in which the DPT results included more instances of findings outside of the "safe harbor" thresholds and at higher levels than exist here.[38] In these circumstances, Dr. Morris's analysis successfully rebuts any inference of market power created by the WMSA screen failures for PJME and PJM50.

4. Existing RTO/ISO Mitigation Rules Also Eliminate The Potential for Exercising Market Power In the PJME, PJME PJM50 and PJMAP Submarkets

PJM mitigation rules eliminate the potential for the exercise of market power in the PJME and PJM50 submarkets. The MBR Order specifically contemplated that RTO/ISO mitigation rules may serve as evidence that any market power has been adequately mitigated. The Commission declared, "We believe the added protections provided in structured markets with market monitoring and mitigation generally result in a market where prices are transparent and attempts to exercise of market power will be sufficiently mitigated."[39] The Order on Rehearing went even further and specifically

---

[36] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

[37] Morris Affidavit at 32-33.

[38] *See Public Service Company of New Mexico*, 115 FERC ¶ 61,090 (2006) discussed above and cases discussed in fn. 38 above.

[39] MBR Order at P 241.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

created a presumption that any potential market power had been adequately mitigated by an established and effective RTO market monitoring scheme.[40]

Taking account of the pervasive PJM mitigation rule, Dr. Morris concludes that these rules "address the potential for PSEG to exercise market power" in PJME and PJM50.[41] Accordingly, PJM's mitigation schemes in place are sufficient to rebut any inference of market power created by the failure to pass the WMSA screens in PJME and PJM50.

In addition, in the Applicants' last triennial approval order, the Commission found that "the PJM market monitoring and mitigation rules are sufficient to address market power concerns in the PJM-East submarket."[42]

a. The Applicants Lack Transmission Market Power and Cannot Erect Entry Barriers.

In its previous order accepting PSEG's triennial market power analysis for the Northeast Region, the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding vertical market power.[43] There have been no subsequent changes in status that would reflect a departure from the characteristics the Commission relied upon in granting market-based rate authority. As demonstrated below, neither Applicants nor any of its affiliates are able to exercise vertical market power.

Applicants are not able to exercise transmission market power. Neither Applicants nor any of their affiliates, except PSE&G, own transmission assets in the U.S. other than incidental generator interconnection facilities. PSE&G owns transmission facilities in PJM but transmission service over those facilities is provided under the PJM Open Access Transmission Tariff.

In addition, neither Applicants nor their affiliates are able to exercise vertical market power in wholesale energy markets through affiliation, ownership or control of inputs to electric power production. As required by Section 35.37(e) of the Commission's regulations, Applicants provide the following information:

(1) PSE&G owns and operates a natural gas distribution system that receives interstate pipeline gas within the State of New Jersey and distributes that gas to its customers within the State of New Jersey. The distribution system consists of 17,709.5 miles of gas distribution pipe and an additional 61.5 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3 and peak-

[40] Order No. 697A at P 111.
[41] Morris Affidavit, pp. 35.
[42] *See* June 29, 2011 letter order approving Applicants' prior triennial market update in Docket No. ER99-3151-017 at page 4.
[43] *Id.*

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers. Service over such distribution facilities is made available pursuant to state regulated tariffs on an open access type basis. PSE&G was granted a Hinshaw exemption from the FERC in 1954.[44] The gas distribution rates paid by PSEG Fossil to PSE&G have been set at rates approved by the BPU in an order dated May 29, 2013.

(2) Certain of the Applicants and their affiliates own sites within the Northeast Region that would be suitable for future generating facilities. These include space at many of the existing generating sites of PSEG Fossil and at the sites of PSEG Power NY and PSEG Power CT. PSEG Nuclear's Salem facility may also be suitable for future construction. PSE&G also owns certain sites that would be suitable for generating facilities, but under New Jersey's Electric Discount and Energy Competition Act, N.J.S.A 48:3-43 et seq., PSE&G is effectively barred from owning and operating generation except "on site" generation for supply and Class I renewable energy resources as defined in N.J.S.A. 48:3-98.1.

(3) Neither Applicants nor any of their affiliates own or control any physical coal supply resources or ownership or control over who may access transportation of coal supplies.

(4) As required by section 35.37(e)(4) of the Commission's regulations, Applicants state that they have not erected barriers to entry into the PJM, NYISO or ISO-NE market and will not erect barriers to entry into those markets.

IV. REQUEST FOR CONFIDENTIAL TREATMENT

Under separate cover via UPS Overnight this office is submitting compact disks containing the workpapers of Dr. John Morris supporting his analysis in Appendix A, as required by the Commission's April 2004 Order.[45] Disk 1 (of which six copies are included) contains publicly available information. Disk 2 (of which one copy is included) contains: (i) proprietary information provided by Energy Velocity under an agreement that requires confidential treatment to be requested for these materials; (ii) modeling and computer programs that are the proprietary intellectual property of Economists Incorporated, the firm which employs Dr. Morris; (iii) commercially sensitive information about Applicants and their affiliates; and (iv) documents and information deemed to be confidential by PJM and ISO-NE. Accordingly, Applicants respectfully request confidential treatment for Disk 2 pursuant to 18 C.F.R. § 388.112 (2006), consistent with the confidential treatment accorded other applicants submitting such proprietary and commercially sensitive data.[46] Pursuant to the Commission's rules,

---

[44] 13 F.P.C. 1348 (1954).

[45] AEP II, 107 FERC at P 61,087-88.

[46] *See, e.g., Idaho Power Company*, Docket No. ER97-1481-009 (February 3, 2006) (submission of revised Pivotal Supplier Screen and Market Share Screen calculations including similar data).

the public version of this filing contains all materials submitted herein except for Disk 2, which is labeled as "PRIVILEGED AND CONFIDENTIAL/NON-PUBLIC."

V. SERVICE

This filing has been served on all parties on the official service list as currently maintained by Commission in the above-referenced dockets. Applicants are also providing a copy to the New Jersey Board of Public Utilities and the New Jersey Division of Rate Counsel.

VI. ENCLOSURES

Applicants enclose the following:

- An original filing;
- Appendix A – Affidavit of Dr. John R. Morris;[47]
- Appendix B – List of Entities with Market-Based Rates Authority and Their Generation Assets. (This is an appendix listing the filing entities and all their energy affiliates and their associated assets);
- Appendix C – List of Entities with Market-Based Rate Authority and Their Transmission Assets;
- Appendix D – Letters of concurrence regarding the control of certain jointly owned generation facilities;
- Appendix E – Form of notice suitable for publication in the Federal Register.

VII. CONCLUSION.

Applicants respectfully request the Commission:

i. to accept this market power compliance filing as meeting the Commission's requirements under Order No. 697 for the continuation of market-based rate authority for Applicants PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Nuclear LLC and PSEG Fossil LLC;

ii. to grant the request for confidential treatment; and

iii. to grant such other relief or waivers as may be appropriate or necessary.

[47] Compact disks, as described above, containing the workpapers for the Affidavit of John R. Morris in Appendix A are being sent concurrently with this filing via UPS Overnight. As noted *supra*, privileged treatment is being requested for Dr. Morris's confidential workpapers submitted with the non-public version of this filing.

Public Service Enterprise Group Incorporated Northeast Region Market Power Study

1. Introduction

My name is Dr. John R. Morris. I am a Principal at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Washington, DC 20037. I have a bachelor's degree in economics from Georgetown University, and I have a master's degree and a Ph.D. in economics from the University of Washington. I have been studying and consulting within energy industries since joining the Federal Trade Commission in 1985. Since joining Economists Incorporated in 1992, I have consulted on many mergers involving electric and gas companies, examined competitive issues relating to utility rates, provided market power studies for applications for market-based rate authority, and studied market power issues in state restructuring proceedings. I have published articles on competition and energy matters, and I have spoken on numerous occasions concerning competition in natural gas, electric power and other industries. I have previously been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission ("FERC" or "Commission"), state commissions and in federal court. A complete listing of my experience, publications and testimony is contained in my resume, presented in Exhibit PEG-2.

Public Service Enterprise Group Incorporated ("PSEG") asked that I prepare a market power study for its subsidiaries that have market-based rate authority in the Northeast Region.[1] These subsidiaries are: Public Service Electric and Gas

[1] The Northeast Region includes ISO-New England Inc. ("ISO-NE"), Connecticut, Southwest Connecticut, New York Independent System Operator, Inc. ("NYISO"), PJM Interconnection, L.L.C. ("PJM"), PJM East, PJM East of 5004/5005 and PJM East of AP South.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

("PSE&G"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear"), PSEG Power Connecticut LLC ("PSEG Power CT") and PSEG New Haven LLC ("PSEG New Haven"). The purpose of this study is to determine whether these PSEG entities have market power in any Northeast Region market under the Commission's Pivotal Supplier Analysis ("PSA") and Wholesale Market Share Analysis ("WMSA") screens as articulated in FERC Order No. 697 and if the Applicants do fail any of the screens, whether they otherwise lack market power under the Delivered Price Test ("DPT") or are subject to sufficient mitigation to guard against any market power concerns.[2]

PSEG

PSEG is a public utility holding company headquartered in in Newark, New Jersey. Through its subsidiaries, PSEG engages in the generation, transmission, distribution and sale of electric energy, and distribution and sale of natural gas to commercial, residential, and industrial customers primarily in the Northeastern and Mid-Atlantic United States. PSEG, through its subsidiaries, owns approximately 13,000 MW of seasonal generation capacity located in the Northeast Region.[3]

PSE&G

PSE&G is a public utility operating company engaged primarily in the transmission of electricity and the provision of gas and electric distribution service in the State of New Jersey. It is New Jersey's oldest and largest investor-owned

---

[2] *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

[3] *See* Exhibit PEG-3.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

utility. PSE&G was founded in 1903 and is based in Newark, New Jersey. It is a member of the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access Transmission Tariff ("OATT") administered by PJM. The company also owns and operates 17,709.5 miles of gas distribution pipe and an additional 61.5 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3.

PSEG ER&T

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission. PSEG ER&T also makes wholesale sales of natural gas.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.*, which initiated the transition from a regulated to a competitive retail power market in New Jersey, the New Jersey Board of Public Utilities ("BPU") annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSE&G's affiliate, PSEG ER&T, has participated directly in all of the auctions for BGS supply held since 2004 and has consistently won tranches in those auctions, including auctions for BGS service within the franchised service territory of PSE&G.

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, PSE&G's FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract, which currently remains in effect, provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply. On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015.

PSEG Fossil

PSEG Fossil owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission under the umbrella of PSEG Fossil's

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

market-based rate authority.[4] The assets of PSEG Fossil are located entirely within PJM.[5] As explained in PSEG ER&T's previous triennial submission, ER&T began providing reliability services to PJM pursuant to Reliability Must-Run ("RMR") tariffs covering operations at PSEG Fossil's Sewaren and Hudson 1 generating units in 2005. The RMR tariff for the Sewaren units expired effective as of September 1, 2008. The RMR tariff for the Hudson 1 unit expired effective as of December 7, 2011. Additionally, the Hudson 1 unit and its 454.8 MWs were retired when the RMR was terminated. Thus, the capacity attributable to Hudson 1 is not included in the subject market power analysis.

PSEG Fossil is approximately a 23 percent joint owner of interests in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[6] PSEG Fossil is a 50 percent co-owner with Jersey Central Power and Light Company ("JCP&L") of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity, nominally 400 MWs, has been assigned to JCP&L.[7]

PSEG Power CT

---

4 *Public Service Electric and Gas Company, et al.*, 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

5 PSEG Fossil's subsidiaries PSEG Power Connecticut LLC, PSEG New Haven LLC and PSEG Power New York LLC own generation units in Connecticut and New York respectively.

6 A letter of concurrence supporting the allocation of these facilities' output based on ownership interests is attached in our workpapers.

7 A letter of concurrence supporting the allocation of this facility's output to JCP&L is attached in our workpapers.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

PSEG Power CT owns the Bridgeport Harbor and New Haven Harbor generation facilities located in the state of Connecticut within ISO-NE and is authorized to sell power at market-based rates.[8] The output of these facilities is sold to PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority.

PSEG New Haven

PSEG New Haven owns and operates the New Haven facility, a gas-fired plant located in New Haven, CT that entered service in June 2012 with a nameplate capacity of 181.5 MW. The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[9] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[10] All of the energy and capacity of the New Haven facility is sold into the ISO-NE markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder.[11] As such, neither PSEG New Haven nor any other PSEG affiliate has operational control of

---

[8] *Wisvest Corporation, et al.*, 101 FERC ¶ 61,166 (2002).

[9] *Re Review of Peaking Generation Projects*, Docket No. 08-01-01, Connecticut Department of Public Utility Control, June 25, 2008 ("Awards Decisions") (2008 WL 2587405 (Conn. D.P.U.C.)). The PURA is the successor to the Department of Public Utility Control (DPUC). PURA came into being in July 2011 as part of a reorganization of Connecticut state energy agencies. For consistency, this application refers to the agency as the PURA.

[10] Section 50 of Public Act 07-242, now codified at Section 16-243u of the Connecticut General Statutes.

[11] The CFD was approved on October 29, 2010 in a letter order ruling on Motion Number 62 in Docket No. 08-01-01.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

the New Haven facility. As a result, the capacity of the facility is not attributable to PSEG for the purpose of this market power analysis.

PSEG Nuclear

PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission in accordance with PSEG Nuclear's market-based rate authority.[12] PSEG Nuclear is a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear operates the Salem plant and Exelon Generation is the operator of Peach Bottom.[13]

Other Subsidiaries

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities in the United States. Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the PJM region are as follows.

PSEG Power LLC is a Delaware limited liability company. It does not directly own any generation facilities or engage in any FERC jurisdictional activities but it is the parent company of several FERC jurisdictional entities, including applicants PSEG ER&T, PSEG Fossil and PSEG Nuclear.

---

[12] *Public Service Electric and Gas Company, et al.*, 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

[13] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in our workpapers.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

PSEG Global LLC ("PSEG Global") is an indirect subsidiary of PSEG and owns an indirect interest in a domestic power plant in Hawaii.[14]

PSEG Solar Source LLC ("Solar Source") is a PSEG Global subsidiary that owns a combined 29 MWs of solar capacity in the PJM region (through three separate project companies), about 15 MWs in Florida, 37 MWs in Arizona and 3 MWs in California, all through separate project companies which have all obtained QF status.[15] By the end of 2013, all of the Solar Source facilities will be transferred to a new subsidiary of PSEG Power – PSEG Power Ventures LLC - which will be a Delaware limited liability company that will not itself be an operating company. As a result, these companies will become subsidiaries of PSEG Power rather than subsidiaries of PSEG Global. This is simply a change in upstream ownership that will not affect the operations of the facilities.[16]

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. PSEG Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. PSEG Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not

---

[14] PSEG Global previously owned indirect interests in facilities in California and New Hampshire and a hydro plant in Pennsylvania. Since the last PSEG triennial market power update, PSEG Global has (i) sold its 40 percent interest in Bridgewater Holdings LLC (the New Hampshire facility) on May 11, 2012 (ii) shut down operations of its plants in California on February 24, 2012 and (iii) sold its interest in Pennsylvania Renewable Resource's two 7.5 MW (net) hydro facilities in May 2011..

[15] The 3MWs (DC) are associated with the Shasta Solar Facility in California, which began testing energy on December 20, 2013. PSEG Global is also under contract to purchase ownership of the Acacia Solar Project, which is expected to produce 20 MW DC beginning in the first quarter 2014. Both Shasta and Acacia will have QF status.

[16] It should be noted that the Hawaii generating facility referenced above will also be transferred to PSEG Power Ventures LLC as of the end of 2013.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a cost-based contract.[17]

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution ("T&D") system on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco are FERC jurisdictional public utilities, as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[18]

When an applicant has affiliates in the relevant market, the Commission considers the combined capacity of all the affiliated entities in its market power assessment.[19] Accordingly, I have included the capacity controlled by PSE&G,

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear, PSEG Global subsidiaries and PSEG Power New York (which on a combined basis constitutes the capacity of all of PSEG's affiliates). Future references in this Affidavit to PSEG are inclusive of the foregoing entities.

The primary purpose of this study is to determine whether PSEG passes the PSA and WMSA screen thresholds in ISO-NE, the NYISO and PJM. In the PSA, the Commission requires applicants to examine whether the generation owned by the applicant is necessary to serve wholesale demand within a balancing authority area. The applicant first calculates the total generation capacity for an area. This is the total of generation in the balancing authority area plus the import capability to the area.[20] From this total, the applicant subtracts out firm contractual commitments, native load obligations, and operating reserves, giving uncommitted capacity for the area. Net uncommitted capacity is calculated by subtracting a wholesale load proxy from uncommitted capacity. Net uncommitted capacity is then compared to the applicant's uncommitted capacity within the area. When the applicant's uncommitted capacity is less than the net uncommitted capacity for the area, then all wholesale demand could be served without energy from the applicant and the applicant passes the PSA screen. When the applicant's uncommitted capacity is greater than the net uncommitted capacity, then the applicant does not pass the screen because its capacity is necessary to meet wholesale peak loads in the market.

In the WMSA, the Commission requires applicants to examine whether the generation owned by the applicant is 20 percent or more of the uncommitted capacity in each of four seasons under average daily peak conditions for the

[20] Import capability is the lesser of either the simultaneous import limit ("SIL") into the area or available capacity in interconnected balancing authority areas. Available capacity is equal to total generation capacity in an area less outages and derating, a native load proxy and operating reserves.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

season. The applicant first calculates the total generation capacity for an area. The applicant then adds the import capability to the area. From this total, the applicant subtracts out planned outages and deratings, long-term firm contractual commitments, native load obligations, and operating reserves. The sum gives the total uncommitted capacity. The applicant then calculates its share by dividing its uncommitted capacity by the total uncommitted capacity. When the applicant's share is less than 20 percent, the applicant passes the WMSA screen.

The Commission presumes that an applicant does not have market power when it passes both the PSA and WMSA screens. If the applicant fails either of the screens, then the applicant may present other analyses to demonstrate that it does not possess market power. Alternatively, the applicant may propose mitigation measures or accept the Commission's default mitigation measures to demonstrate that it has mitigated market power.

2. New England

2.1. Overview of Electric Power Markets in New England

New England operates a competitive wholesale power market. Substantial restructuring has taken place in New England, and many of the vertically integrated utilities have sold either most or all of their generation assets. The traditional utilities often have standard offer obligations to serve retail customers, but utilities often fulfill these obligations by securing supplies in competitive wholesale markets. For example, a utility may secure contracts in which the supplier agrees to provide power for 30 percent of the utility's standard offer obligation. The transmission system is managed by ISO-NE. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

2.2. Geographic Markets

In the case of generation wholly located in an RTO, such as ISO-NE, the Commission accepts the RTO as the relevant destination market.[21] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[22] In New England, the Commission has identified two submarkets: Connecticut and Southwest Connecticut.[23] PSEG owns the Bridgeport Harbor plant in Southwest Connecticut. PSEG also owns the New Haven Harbor 1 unit in Connecticut and PSEG New Haven owns the New Haven facility. When the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[24] Accordingly, the PSA and WMSA are provided for the ISO-NE balancing authority area, and also for Connecticut and Southwest Connecticut.

2.3. Data Sources and Analysis

The data source for generation is ISO-NE Seasonal Claimed Capability (SCC) Reports.[25] Generation for December 2011, January-March 2012 and August 2012 are directly from these monthly reports, and the minimum of the values of these months is taken as generation for other months, to be conservative. Planned outages are from the ISO-NE Form 714. Planned outages for Connecticut and Southwest Connecticut are prorated based on their shares of the total generation capacity in ISO-NE. PSEG's generation capacity in

---

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

ISO-NE consists of the New Haven facility, New Haven Harbor and Bridgeport Harbor. PSEG's Northeast Region generation facilities are presented in Exhibit PEG-3.

Load data for ISO-NE are from Energy Velocity. Energy Velocity also provides load data by New England ISO zone, thus loads are calculated by sub-market as well. PSEG load obligations in New England come from PSEG's agreements to supply standard offer generation within Rhode Island. The data were supplied by PSEG.

Import capability was taken from the ISO-NE's November 20, 2013 FERC filing.[26] This report indicates that the simultaneous transfer limits in all seasons is 4,548 MW for the ISO-NE as a whole, 2,500 MW for Connecticut, and 2,450 (Winter) to 3,200 MW (Summer) for Southwest Connecticut. The Table 1 and Table 2 data for the SILs are presented in workpapers.

Operating reserves are calculated as follows. ISO-NE Operating Procedure No. 8 specifies spinning reserves (or 10-minute reserves) equal to the size of the loss of the largest unit.[27] The largest unit is the 1,400 MW (summer capacity) Seabrook Unit 1. In addition, 30-minute reserves require capacity to cover 50 percent of the loss of a second contingency (i.e., the second largest unit). The second largest unit is the 1,200 MW (summer capacity) Millstone Unit 3. Thus, in total, operating reserves are 2,000 MW in summer.[28] Operating reserves for

---

[27] ISO New England Operating Procedure No. 8, at 5-6, available at http://www.iso-ne.com/rules_proceds/operating/isone/op8/op8_rto_final.pdf.

[28] 2,000 MW = 1,400 MW + 50% x 1,200 MW.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Connecticut and Southwest Connecticut are based on resources offered for the summer 2012 and winter 2012/2013 forward reserve auction.[29]

2.4. PSA-Entire New England

Exhibit PEG-4 shows the calculations to determine whether PSEG passes the PSA screen in the ISO-NE balancing authority area. The peak load in 2012 occurred in July. The ISO-NE balancing authority area had 31,969 MW of generation capability in the summer of 2012. In addition, 4,548 MW of imports in summer of 2012 were available to serve load. Therefore there were 36,517 MW of total generation resources. Of this amount, 30,993 MW of the generation, and 4,260 MW of the imports are from non-affiliate sources. Thus, total non-affiliate generation resources are 35,274 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for ISO-NE were calculated to be 20,917 MW. Operating reserves were 2,000 MW. Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 13,600 MW.

The proxy for the wholesale load is the difference between the peak load of 25,880 MW and the native load proxy of 20,917 MW. Therefore, the proxy for the wholesale load is 4,963 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 8,637 MW.

In comparison, PSEG has 955 MW of uncommitted capacity from its generation assets. Additionally, PSEG has 288 MW of imports from its generation assets. After subtracting 314 MW of load and 61 MW of reserves, PSEG has a total of 868 MW of uncommitted capacity. This leaves other

[29] ISO New England, Inc. 2012 Regional System Plan ("Regional System Plan"), available at http://www.iso-ne.com/trans/rsp/2012/, Table 4.9 at p.56.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

generation companies with 7,769 MW of net uncommitted supply. Accordingly, as Exhibit PEG-4 shows, PSEG passes the PSA screen in New England.

2.5. WMSA-Entire New England ISO

Exhibit PEG-5 presents the WMSA. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 816 MW in fall to 890 MW in summer. PSEG's share of uncommitted capacity ranges from 4.5 percent in winter to 5.6 percent in summer. These shares are substantially below the 20 percent screening threshold adopted by the Commission. Therefore, PSEG passes the WMSA screen in this area.

2.6. PSA-Connecticut

Exhibit PEG-6 shows the calculations to determine whether PSEG passes the PSA screen in the Connecticut area. The peak load in 2012 in the Connecticut area occurred in July. The Connecticut area had 7,979 MW of generation capability in the summer of 2012. In addition, 2,500 MW of imports in summer of 2012 were available to serve load. Therefore there were 10,479 MW of total generation resources. Of this amount, 7,013 MW of the generation, and 2,444 MW of the imports are from non-affiliate sources. Thus, total non-affiliate generation resources are 9,457 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for the Connecticut area were calculated to be 5,425 MW. Operating reserves were 765 MW.[30] Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 4,289 MW.

---

[30] *See* ISO New England Inc., 2012 Regional System Plan, November 2, 2012, Table 4-9 at 56.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

The proxy for the wholesale load is the difference between the peak load of 6,957 MW and the native load proxy of 5,425 MW. Therefore, the proxy for the wholesale load is 1,532 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 2,757 MW.

In comparison, PSEG has 872 MW of uncommitted capacity from its generation assets. Additionally, PSEG has 56 MW of imports for a total of 928 MW of uncommitted capacity. This leaves other generation companies with 1,829 MW of net uncommitted supply. Accordingly, as Exhibit PEG-6 shows, PSEG passes the PSA screen in the Connecticut area.

2.7. WMSA-Connecticut

Exhibit PEG-7 presents the WMSA. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 810 MW in fall to 918 MW in summer. PSEG's share of uncommitted capacity ranges from 15.8 percent in spring to 18.5 percent in summer. These shares are below the 20 percent screening threshold adopted by the Commission. Therefore, PSEG passes the WMSA screen in the Connecticut area.

2.8. PSA-Southwest Connecticut

Exhibit PEG-8 shows the calculations to determine whether PSEG passes the PSA screen in the Southwest Connecticut area. The peak load in 2012 occurred in July. The Southwest Connecticut area had 2,798 MW of generation capability in the summer of 2012. In addition, 3,200 MW of imports in summer of 2012 were available to serve load. Therefore there were 5,998 MW of total generation resources. Of this amount, 2,270 MW of the generation, and 3,100 MW of the imports are from non-affiliate sources. Thus, total non-affiliate

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

generation resources are 5,370 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for Southwest Connecticut were calculated to be 2,687 MW. Operating reserves were 0 MW.[31] Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 3,311 MW. The proxy for the wholesale load is the difference between the peak load of 3,419 MW and the native load proxy of 2,687 MW. Therefore, the proxy for the wholesale load is 732 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 2,579 MW.

In comparison, PSEG has 528 MW of uncommitted capacity from its generation assets. Additionally, PSEG has 100 MW of imports for a total of 628 MW of uncommitted capacity. This leaves other generation companies with 1,951 MW of net uncommitted supply. Accordingly, as Exhibit PEG-8 shows, PSEG passes the PSA screen in the Southwest Connecticut area.

2.9. WMSA-Southwest Connecticut

Exhibit PEG-9 presents the WMSA. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the Southwest Connecticut area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 545 MW in fall to 616 MW in summer. PSEG's share of uncommitted capacity ranges from 15.3 percent in spring to 17.0 percent in winter. These shares are below the 20 percent screening threshold adopted by the Commission in for all seasons. Therefore, PSEG passes the WMSA screen in the Southwest Connecticut area.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

3. New York

3.1. Overview of Electric Power Markets in New York

New York also has a competitive wholesale power market. Substantial restructuring has taken place in New York, and the investor-owned vertically integrated utilities have sold either most or all of their generation assets. These utilities often have standard offer obligations to serve retail customers, and utilities can fulfill these obligations by securing supplies in competitive wholesale markets. The transmission system is operated by the NYISO, which also operates a competitive wholesale market. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

3.2. Geographic Markets

In the case of generation wholly located in an RTO such as the New York ISO, the Commission has accepted the RTO as the relevant destination market.[32] PSEG only owns generation in Albany, New York. In addition, when the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[33] Accordingly, the PSA and WMSA are provided for the NYISO only.

3.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Operations database. Planned outages are from the FERC Form 714. PSEG's

---

[32] Order No. 697 at PP 231, 235.

[33] Order No. 697 at footnotes 215, 217.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

generation capacity in New York consists of its ownership of the Bethlehem Energy Center in Albany, which has winter capacity of 845 MW. Information for PSEG's Northeast Region generation is presented in Exhibit PEG-3.

Load data for the NYISO were downloaded from Energy Velocity.

Import capability comes from the most recent NYISO SIL filing as of December 19, 2013.[34] This filing indicates that ISO simultaneous import capability ranges from 7,360 MW in spring to 8,130 MW in fall. NYISO does not recognize physical imports, accordingly, all the SIL import capability is allocated pro rata, except for a 250 MW reservation that PSEG has from PJM to New York. The Table 1 and Table 2 SIL data in the study is presented in workpapers.

Operating reserves are calculated as follows. The NYISO Locational Reserve Requirements specify 30-minute total reserves equal to one and one half the 10-minute reserve necessary to replace the operating capability loss caused by the most severe contingency under normal transfer conditions. Thus, the operating reserves for the NYISO are 1,965 MW for each season.[35]

3.4. PSA-NYISO

Exhibit PEG-10 shows the calculations to determine whether PSEG passes the PSA screen in the NYISO balancing authority area. The peak load in 2012 occurred in July. The NYISO had 38,493 MW of generation capability in the summer of 2012. In addition, 7,820 MW of imports in summer were available to serve load. Therefore, there were 46,313 MW of total generation resources. Of this amount, 37,739 MW of the generation, and 6,465 MW of the imports are from

---

[34] New York Independent System Operator, Inc., *Informational Filing Regarding the Simultaneous Import Limitation Study*, Docket No. AD10-2-001, December 19, 2013.

[35] NYISO Locational Reserve Requirements, Table 2, available at http://www.nyiso.com/public/webdocs/market_data/reports_info/nyiso_locational_reserve_reqmts.pdf

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

non-affiliate sources. Thus, total non-affiliate generation resources are 44,204 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for NYISO were calculated to be 27,324 MW. Operating reserves were 1,965 MW. Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 17,024 MW. The proxy for the wholesale load is the difference between the peak load of 32,439 MW and the native load proxy of 27,324 MW. Therefore, the proxy for the wholesale load is 5,116 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 11,909 MW.

In comparison, PSEG has 716 MW of uncommitted capacity from its generation assets in New York, and 1,355 MW of imports for a total of 2,071 MW of uncommitted capacity. This leaves other generation companies with 9,838 MW of net uncommitted supply. Accordingly, as Exhibit PEG-10 shows, PSEG passes the PSA screen in the New York ISO.

3.5. WMSA-NYISO

Exhibit PEG-11 presents the WMSA for the NYISO. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 1,264 MW in spring to 1,381 MW in summer. PSEG's share of uncommitted capacity ranges from 5.9 percent in winter to 7.2 percent in summer. These shares are below the 20 percent screening threshold adopted by the Commission. Therefore, PSEG passes the WMSA screen in the NYISO.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

4. PJM

4.1. Overview of Electric Power Markets in PJM

PJM operates a competitive wholesale power market and serves as the regional RTO for an area that covers all or parts of 13 states and the District of Columbia. PJM also plans and operates the transmission system within the RTO. Monitoring Analytics acts as the market monitor, and has a market power mitigation program in place to identify and mitigate any potential exercise of market power.

4.2. Geographic Markets

PSEG owns both generation and transmission facilities in PJM. In the case of generation wholly located in an RTO such as PJM, the Commission has accepted the RTO as the relevant destination market.[36] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[37] In PJM, the Commission has identified three submarkets: PJM East ("PJME"), PJM East of 5004/5005 ("PJM50") and PJM East of AP-South ("PJMAP").[38] The PSA and WMSA are provided for PJM and for the PJME, PJM50 and PJMAP sub-markets.

4.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Ops database. Generation within PJM was assigned to submarket consistent with the

---

[37] Order No. 697 at P 236.

[38] *Id. See also* Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities, Order No. 697-A, 73 FR 25832 (May 7, 2008), FERC Stats, & Regs. ¶ 31,268 (2008) at P 90; Order Conditionally Authorizing Merger and Disposition of Jurisdictional Facilities, *Exelon Corporation, et al.*, 138 FERC ¶ 61,167 (2012).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

definitions in PJM's SIL Study.[39] Planned outages are from the FERC Form 714. In addition, for the sub-market analysis, planned outages were allocated to PJME based on the share of total PJME generation, by season. Information for PSEG's generation in PJM and PJME is presented in Exhibit PEG-3.

Load data for PJM was downloaded from Energy Velocity. Energy Velocity also provides load data by PJM zone, thus loads are calculated for the PJM sub-markets as well.

Import capability was taken from the 2012 Simultaneous Import Limit Study Report.[40] This report indicates simultaneous transfer limits of 10,194 MW in the winter and 8,434 MW in summer. Additionally, this report indicates transmission capabilities of the PJM sub-markets. The report conservatively uses the reported SIL as the SIL amount to be allocated pro rata. This is a simplifying assumption because PSEG has no firm transmission reservations into PJM and it effectively excludes the additional 4,000 MW of net imports into PJM in the base case of the SIL study. The Table 1 and Table 2 data for the study are presented in workpapers.

Operating reserves are calculated according to PJM Manual 13 as the sum of Day Ahead Scheduling Reserves (Operating), Contingency (Primary) and Synchronized (Spinning Reserve) Requirements.[41]

Data on PSEG's long-term contracts come from PSEG. The contracts were included in the area where the energy is delivered under the contract. For

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

contracts delivered to the Western Hub in PJM, the contracts were included in the PJM, PJM50, and PJMAP destinations and not the PJME destination.

4.4. PSA – PJM

Exhibit PEG-12 shows the calculations to determine whether PSEG passes the PSA screen in the PJM balancing authority area. The peak load in 2012 occurred in July. PJM had 193,478 MW of generation capability in the summer of 2012. In addition, 8,434 MW of imports in summer were available to serve load. Therefore, there were 201,912 MW of total generation resources. Of this amount, 182,128 MW of the generation, and 8,310 MW of the imports are from non-affiliate sources. Thus, total non-affiliate generation resources are 192,545 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for PJM were calculated to be 133,565 MW. Operating reserves were 12,510 MW. Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 55,837 MW. The proxy for the wholesale load is the difference between the peak load of 154,339 MW and the native load proxy of 133,565 MW. Therefore, the proxy for the wholesale load is 20,774 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 35,063 MW.

In comparison, PSEG has 5,362 MW of uncommitted capacity from its generation assets in PJM, and 124 MW of imports, for a total of 5,486 MW of uncommitted capacity. This leaves other generation companies with 29,577 MW of net uncommitted supply. Accordingly, as Exhibit PEG-12 shows, PSEG passes the PSA screen in PJM as a whole.

4.5. WMSA – Entire PJM

Exhibit PEG-13 presents the WMSA for PJM. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total,

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 5,393 MW in spring to 6,118 MW in summer. PSEG's share of uncommitted capacity ranges from 4.7 percent in winter to 5.5 percent in summer. These shares are below the 20 percent screening threshold adopted by the Commission. Therefore, PSEG passes the WMSA screen in PJM as a whole.

4.6. PSA – PJME Sub-market

Exhibit PEG-14 shows the calculations to determine whether PSEG passes the PSA screen in the PJME sub-market of PJM's balancing authority area. The peak load in 2012 occurred in July. The PJME sub-market area had 34,847 MW of generation capability in the summer of 2012. In addition, 6,993 MW of imports in summer were available to serve load. Therefore, there were 41,840 MW of total generation resources. Of this amount, 25,407 MW of the generation, and 6,883 MW of the imports are from non-affiliate sources. Thus, total non-affiliate generation resources are 32,277 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for the PJME sub-market were calculated to be 26,061 MW. Operating reserves were 2,551 MW. Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 13,229 MW. The proxy for the wholesale load is the difference between the peak load of 32,542 MW and the native load proxy of 26,061 MW. Therefore, the proxy for the wholesale load is 6,481 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 6,747 MW.

In comparison, PSEG has 5,695 MW of uncommitted capacity from its generation assets in PJME and 110 MW of imports, for a total of 5,805 MW of uncommitted capacity. This leaves other generation companies with 942 MW of net uncommitted supply. Accordingly, as Exhibit PEG-14 shows, PSEG passes the PSA screen in PJME.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

4.7. WMSA – PJME Sub-market

Exhibit PEG-15 presents the WMSA for the PJME sub-market. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 5,886 MW in spring to 6,546 MW in fall. PSEG's share of uncommitted capacity ranges from 27.1 percent in winter to 37.2 percent in summer. These shares are above the 20 percent screening threshold adopted by the Commission. Therefore, PSEG fails the WMSA screen in the PJME sub-market.

4.8. PSA – PJM East of 5004/5005 Sub-market

Exhibit PEG-16 shows the calculations to determine whether PSEG passes the PSA screen in the PJM50 sub-market of PJM's balancing authority area. The peak load in 2012 occurred in July. The PJM50 sub-market area had 59,995 MW of generation capability in the summer of 2012. In addition, 7,956 MW of imports in summer were available to serve load. Therefore, there were 67,951 MW of total generation resources. Of this amount, 49,433 MW of the generation, and 7,870 MW of the imports are from non-affiliate sources. Thus, total non-affiliate generation resources are 59,410 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for the PJM50 sub-market were calculated to be 46,146 MW. Operating reserves were 4,400 MW. Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 17,404 MW. The proxy for the wholesale load is the difference between the peak load of 56,172 MW and the native load proxy of 46,146 MW. Therefore, the proxy for the wholesale load is 10,025 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 7,379 MW.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

In comparison, PSEG has 4,988 MW of uncommitted capacity from its generation assets in PJM50 and 86 MW of imports, for a total of 5,074 MW of uncommitted capacity. This leaves other generation companies with 2,305 MW of net uncommitted supply. Accordingly, as Exhibit PEG-10 shows, PSEG passes the PSA screen in PJM50.

4.9. WMSA – PJM East of 5004/5005 Sub-market

Exhibit PEG-17 presents the WMSA for the PJM50 sub-market. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 4,882 MW in spring to 5,709 MW in summer. PSEG's share of uncommitted capacity ranges from 16.5 percent in winter to 23.8 percent in summer. The summer share is above the 20 percent screening threshold adopted by the Commission. Therefore, PSEG fails the WMSA screen in the PJM50 sub-market.

4.10. PSA – PJM East of AP South Sub-market

Exhibit PEG-18 shows the calculations to determine whether PSEG passes the PSA screen in the PJMAP sub-market of PJM's balancing authority area. The peak load in 2012 occurred in July. The PJMAP sub-market area had 82,198 MW of generation capability in the summer of 2012. In addition, 7,489 MW of imports in summer were available to serve load. Therefore, there were 89,687 MW of total generation resources. Of this amount, 73,743 MW of the generation, and 7,393 MW of the imports are from non-affiliate sources. Thus, total non-affiliate generation resources are 81,136 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for the PJMAP sub-market were calculated to be 62,753 MW. Operating reserves were 5,911 MW. Subtracting native load obligations and operating reserves from total generation resources gives

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

uncommitted supply of 21,023 MW. The proxy for the wholesale load is the difference between the peak load of 75,082 MW and the native load proxy of 62,753 MW. Therefore, the proxy for the wholesale load is 12,329 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 8,694 MW.

In comparison, PSEG has 4,988 MW of uncommitted capacity from its generation assets in PJMAP and 96 MW of imports, for a total of 5,084 MW of uncommitted capacity. This leaves other generation companies with 3,610 MW of net uncommitted supply. Accordingly, as Exhibit PEG-18 shows, PSEG passes the PSA screen in PJMAP.

4.11. WMSA – PJM East of AP South Sub-market

Exhibit PEG-19 presents the WMSA for the PJMAP sub-market. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 4,876 MW in spring to 5,718 MW in summer. PSEG's share of uncommitted capacity ranges from 14.0 percent in winter to 19.0 percent in summer.

These shares are below the 20 percent screening threshold adopted by the Commission. Therefore, PSEG passes the WMSA screen in the PJMAP sub-market.

5. Delivered Price Test

When an applicant does not pass either the PSA or WMSA for a destination market, the Commission invites the applicant to provide additional information via a delivered price test ("DPT"). PSEG requested that I perform a DPT for the PJM

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

East and PJM East of 5004/5005 sub-markets. Accordingly, I now discuss the DPT for these sub-markets.

5.1. Overview of the DPT

The DPT utilizes substantially more information than the PSA or the WMSA, including additional information on generation ownership, generation costs, demand conditions, and transmission limits. The Commission considers two types of capacity: Economic Capacity ("EC") and Available Economic Capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting load commitments from EC. EC and AEC are calculated for a number of different seasonal and load conditions.

Because we do not know the firm retail obligations of the competitive suppliers, as explained below, the AEC calculation is based on the assumption that market participants serve load in proportion to their generation capacity and that 70 percent of load obligations are contracted more than one year from delivery.

For both the EC and AEC measures, the Commission prescribes three screens: (1) a pivotal supplier screen; (2) a market share screen; and (3) a Herfindahl-Hirschman Index ("HHI") screen. The HHI is the sum of the squared market shares of the firms in the market. So a market with four firms of market shares of 40, 30, 20, and 10 percent would have an HHI of 3,000 (this is calculated as $40^2 + 30^2 + 20^2 + 10^2 = 1{,}600 + 900 + 400 + 100 = 3{,}000$). A monopolist would produce a HHI of 10,000 and 10 equally-sized firms would produce a HHI of 1,000.

Although the Commission has not drawn bright lines for its review of DPT results, it has given general guidance. When (1) the applicant is not pivotal; (2) the applicants' market share is less than 20 percent; and (3) the HHI is below 2,500, the Commission is likely to conclude that the applicant does not have

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

market power. The three standards establish a "safe harbor" for lack of market power, unless intervenors present clear and convincing contrary evidence. The Commission has also determined in some cases that an applicant did not have market power when the analysis showed isolated HHI and market share results above screening levels. Finally, despite the DPT results, the Commission may conclude that an applicant does not have market power if other evidence, such as historical sales data, indicates that the DPT results do not reflect the actual competition in the marketplace.

A detailed description of data sources and methods to prepare the data for the DPT is presented in Exhibit PEG-20. An overview of the sources and methods used at Economists Incorporated for conducting the DPT is presented here.

The DPT is calculated for 10 representative periods, three for each of three seasonal conditions plus a summer super peak period. The three seasons are spring/fall, summer, and winter. Each season is divided into (1) top 10 percent of peak hours; (2) remaining peak hours; and (3) off-peak hours. In addition, there is a summer super peak period which is comprised to the top 1 percent (10 hours) of summer peak hours. These ten periods cover the range of load conditions for each season, and for the year as a whole.

The primary source for generation data is Energy Velocity. In addition to generation capacity, Energy Velocity provides data on ownership (including holding companies), fully-loaded heat rates, emission rates, and generation availability. Generation is included for all of PJM and for surrounding areas. Unit capabilities are derated to account for seasonal maintenance and likely plant unavailability due to forced outages. Because demand in PJM peaks in summer and winter, the planned outages are assumed to be during the spring/fall season.

The transmission system is represented by contract paths between balancing authority areas and within PJM. Limits between regions in PJM are from Energy Velocity.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Market prices come from hourly prices reported by PJM.

As in the PSA and WMSA, load data come from Energy Velocity. To compute load requirements for market participants, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[42] To account for their greater load obligations, we assume that Dominion, which does not operate in a restructured retail market, has 100 percent responsibility for its allocation of load and that AEP, which operates in a partly restructured retail market, has 90 percent of its allocation as opposed to the standard 70 percent.

The DPT and market share calculations were calculated using the Power Acquisition Screening System developed at Economists Incorporated. The mathematical details are presented in Exhibit PEG-21.

5.2. Results of the DPT for PJM50 Sub-market

The results of the DPT for PJM50 are presented in Exhibit PEG-22. The top part of the exhibit shows the results for AEC. PSEG passes the Pivotal Supplier Screen in all 10 periods. PSEG also passes both the Market Share Screens and the HHI Screens in all 10 periods.

The lower part of Exhibit PEG-22 shows the results for EC in PJM50. PSEG passes the Pivotal Supplier Screen in 4 out of 10 periods. PSEG passes the Market Share Screens and HHI Screens in all 10 periods.

[42] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers in restructured markets.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

5.3. Results of the DPT for PJME Sub-market

The results of the DPT for PJME are presented in Exhibit PEG-23. The top part of the exhibit shows the results for AEC. PSEG passes the Pivotal Supplier Screen in all 10 periods. It also passes the Market Share Screens and the HHI Screens in all 10 periods.

The lower part of Exhibit PEG-23 shows the results for EC in PJME. PSEG passes the Pivotal Supplier Screen in 8 out of 10 periods. PSEG passes the Market Share Screens in 6 periods, and passes the HHI Screens in all 10 periods.

5.4. Analysis of the DPT Results

Although PSEG fails some of the screens for EC in both the PJM50 and the PJME destination markets, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the market concentration (HHI) screens. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[43] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all pivotal supplier screens for AEC. This shows that, given commitments to serve load, its generation was not necessary to serve remaining wholesale load. In other words, although PSEG fails the pivotal supplier tests for some periods with EC, once accounting for its expected forward sales commitments, PSEG's uncommitted generation is not necessary to meet total demand in any of the regions in any period. Thus, PSEG has little to no

[43] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

ability to exercise unilateral market power given current market conditions. Finally, PSEG's market shares are not above 20 percent for any of the Market Share Screens, except in only four (4) periods for EC in PJM East. Although greater than 20 percent, PSEG's market shares during these four (4) periods are not substantially above 20 percent. The highest share is only 22.4 percent. Hence, although PSEG fails the Market Share Screens and the Pivotal Supplier Screens for EC in some instances, the failures are more in the nature of technical violations and not true indicators of market power.

5.5. Mitigation

PJM has a Commission-approved market monitoring and mitigation plan in place to ensure that generation facilities cannot exercise market power. The Commission has stated in general that Commission-approved market monitoring and mitigation plans are sufficient to mitigate market power in RTO markets.[44] In particular, the Commission found in connection with PSEG's last triennial filing that the PJM market monitoring and mitigation rules are sufficient to address market power concerns.[45]

Under the local market power mitigation procedures in PJM, if a supplier fails the "three pivotal supplier test" (TPS), it is offer-capped by the Market Monitor. The Market Monitor's TPS test is applied on an ongoing basis, potentially as frequently as every 5 minutes, to reflect day-ahead and real-time operating conditions. These offer caps provide direct protection against the exercise of locational market power by suppliers in PJME, PJM50, PJMAP and elsewhere.

---

[44] Order No. 697 at P 241.

[45] *PSEG Energy Resources and Trade*, Docket Nos. ER99-3151-017, et al. (June 29, 2011).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

The protection against the exercise of market power is enhanced by "must offer" requirements under PJM's Operating Agreement. These mandate that generation resources that are used to meet capacity requirements in PJM and that are not subject to an outage must offer their available capacity in PJM's day-ahead energy market.[46] PJM has also implemented a Reliability Pricing Model (RPM) to secure sufficient capacity to meet its requirements through a series of auctions, including a Base Residual Auction (BRA) held annually for capacity 3 years in advance, and incremental auctions held at varying intervals prior to the delivery year. Various features of the RPM process work to prevent the exercise of market power in capacity markets in PJM. First, if PJM's Market Monitor determines that the market structure test is failed, bids of those failing the test are cost-capped. Second, RPM includes a must-offer requirement pursuant to which all generating units that have available capacity must bid into the RPM auctions or face disqualification from being recognized as capacity resources (and therefore from receiving any capacity payments) in the delivery year.

In addition to the local market power mitigation described above, the presence of market monitoring within PJM lessens potential concerns that PSEG might be able to exercise market power notwithstanding the indicative DPT screens. The Market Monitor has the specific responsibility under the market monitoring plan to monitor the potential of any market participant to exercise market power. To perform its market monitoring function, the Market Monitor can file reports or complaints with the Commission and other government agencies to address various market concerns including market power. The Market Monitor can also make its view known to the Commission staff and PJM members in cases where PJM does not follow its recommendations concerning complaints or requested rule changes. In addition, the Market Monitor can consult with regulatory bodies, including state commissions, regarding the need for specific

[46] *See* PJM Operating Agreement at 1.10.1A(d).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

investigations and monitoring activities, and to consider and evaluate additional enforcement mechanisms. The Market Monitor can also act on specific complaints that have been filed by market participants to examine any potential market power issues.

In sum, the local market power mitigation rules, the role of the Market Monitor, the existence of must-offer requirements and PJM's RPM auctions address any potential for PSEG to exercise market power.

6. Vertical Market Power

In determining whether the market-based rates are in the public interest, the Commission also considers whether the Applicant has transmission market power or can erect barriers to entry.[47] None of these factors are relevant in the instant case. First, other than incidental generator interconnection facilities and the transmission assets owned by PSE&G in PJM, no transmission assets are owned by the Applicants or any of their affiliates in ISO-NE and NYISO. Transmission service over PSE&G's transmission facilities is provided under the PJM Open Access Transmission Tariff. Thus, consistent with Commission precedent, Applicants have alleviated any concerns regarding potential transmission market power. Second, PSEG has no ability to erect barriers to entry. As explained in Applicants' previous initial applications for market-based rate authority and triennial market power reports, PSEG is unable to erect barriers to entry. There has been no change in facts since the submission of those applications that would alter this conclusion.

The Commission is concerned with the ownership of natural gas pipelines or natural gas distribution facilities and the possibility that they may be used to

[47] Order No. 697 at PP 397, 399.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

exercise market power in electricity markets. PSEG does not own or operate any FERC jurisdictional natural gas pipelines in PJM, ISO-NE or NYISO. PSE&G owns natural gas distribution facilities in the State of New Jersey including peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers.

7. Conclusion

PSEG and its subsidiaries do not have market power in New England, New York or PJM. PSEG is not a pivotal supplier in New England, New York or PJM. PSEG's market shares in the WMSA are below the Commission's 20 percent screening threshold in each of these market areas. PSEG is also not a pivotal supplier in the Connecticut or Southwest Connecticut sub-markets and its market shares in the WMSA are below 20 percent in these sub-markets. PSEG fails the WMSA screens in only the PJME and PJM50 sub-markets. For these sub-markets, we conducted a DPT analysis. PSEG passes all the DPT screens for AEC in both submarkets, and it fails the Market Share Screens and the Pivotal Supplier Screens in only a few instances for EC. Accordingly, the market share screen failures are more of a technical nature than true indicators of market power. As such, they are not evidence of actual market power.

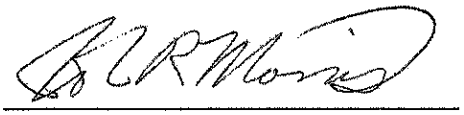
Further, PSEG operates under New England's, New York's, and PJM's market power mitigation programs, which mitigate PSEG's potential market power. Therefore, under standards for market-based rate authority articulated by the Commission in Order No. 697, PSEG has no ability to exercise market power in the relevant markets, and maintaining market-rate authority in New England, New York and PJM would be in the public interest.

Therefore, I recommend that the Commission continue to authorize PSEG to sell electric power in Northeast Region wholesale markets at market-based rates.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Pursuant to 28 U.S.C. §1746, I state under penalty of perjury that the foregoing is true and correct to the best of my information, knowledge, and belief.

Executed on this 23rd day of December 2013.



John R. Morris, Ph.D.
Principal
Economists Incorporated

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

EXPERIENCE AND QUALIFICATIONS OF

Dr. John R. Morris

OVERVIEW	Dr. Morris, a recognized expert in studying competition in energy industries, currently is a Principal at Economists Incorporated. He began his research of competition in energy industries in 1985 while working for the Federal Trade Commission. Since joining Economists Incorporated in 1992, he has consulted on many mergers and acquisitions involving energy companies, examined competitive issues relating to rates, and studied issues in state restructuring proceedings. He has published articles on competition and energy matters, and he has spoken on numerous occasions concerning competition in natural gas, electric power and other industries. He has been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission, state regulatory commissions, and in federal court.
EDUCATION	Ph.D., University of Washington, August 1985 Dissertation: *Intellectual Property: Creating, Pricing, Copying* • M.A., University of Washington, December 1983 • A.B., Georgetown University, May 1981
PRESENT POSITION	Dr. Morris is a *Principal* at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Suite 1100, Washington, DC 20037. (202-223-4700) Economists Incorporated studies competition and regulation in many industries in the United States and in other countries. It is a leading firm in studying the competitive effects of mergers and acquisitions.
PREVIOUS EXPERIENCE	*Senior Vice President*, Economists Incorporated, December 2001 – December 2002 • *Vice President*, Economists Incorporated, December 1995 – December 2001 • *Senior Economist*, Economists Incorporated, June 1992 – December 1995 • *Economic Tutorial Leader*, Stanford University (Stanford in Washington), April 1993 – June 1995 • *Visiting Assistant Professor*, Department of Business Economics and Public Policy, School of Business, Indiana University, September 1991 – May 1992 • *Assistant to the Director for Antitrust*, Bureau of Economics, Federal Trade Commission, November 1989 – August 1991 • *Economic Advisor*, Office of Commissioner Machol, Federal Trade Commission, December 1988 – October 1989 • *Economist*, Division of Antitrust, Bureau of Economics, Federal Trade Commission, October 1985 – December 1988
MEMBERSHIPS	Member, International Association of Energy Economics • Associate, Energy Bar Association • Member, American Economic Association • Member, Western Economic Association International • Associate, American Bar Association

Source: PSEG.

Notes:

[1] PSEG Fossil has a 22.5% interest in the Conemaugh coal-fired units.

[2] PSEG Global has a 4% interest in the Conemaugh Hydroelectric facility.

[3] PSEG Fossil has a 22.84% ownership interest in the Keystone facility.

[4] PSEG Nuclear has a 57.41% interest in the Salem Nuclear facility.

[5] PSEG Fossil has a 50% interest in the Yards Creek facility. Yards Creek is operated by Jersey Central Power & Light, and thus is controlled by JCP&L in the analysis.

[6] PSEG Nuclear has a 50% interest in the Peach Bottom Nuclear facility.

DATA AND ASSUMPTIONS FOR ECONOMISTS INCORPORATED'S DELIVERED PRICE TEST STUDY FOR PSEG

This exhibit describes data and assumptions used in the delivered price test study ("study") carried out by Economists Incorporated for PSEG. Because the data are voluminous, we provide them in electronic workpapers. In those workpapers, the Files.xlsx spreadsheet provides a brief description of the organization of the data files.

This Exhibit has six sections. Section I discusses the study's representative periods. Section II discusses the geographic region and balancing authority areas. Section III discusses generation resources, including adjustments to generating capacity for seasons, maintenance, water availability, and long-term contracts. Section IV discusses transmission, including transmission pricing and losses. Section V discusses market prices. Section VI discusses the load data.

I. Periods

The study calculates market shares and concentration indexes for electric energy for ten representative periods during the year. The year is divided into three seasons (spring/fall, summer and winter). Spring/fall and winter seasons are divided into three periods based on days of the week, times of day and load levels. Summer is divided into four periods based on days of the week, times of day and load levels. Each calculation of market shares and concentration indexes reflects average conditions (e.g., average loads) during one of the resulting ten periods during the year (e.g., Summer Low Peak).

The study places each of the periods in each season into three condition categories: off-peak, low peak, and spike. Transmission pricing (see Section

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

IV.B below) and plant availability (see Section III.A.2 below) vary among these three categories.

Table I-1 summarizes the ten periods for the destination markets.

Table I-1– Definition of Ten Periods for Destination Market

Number	*Season*	*Time*	*Condition*	*Hours*	*Description**
1	Spring/Fall	Top 10%	Spike	102	Top 5% of peak hours
2	Spring/Fall	Low Peak	Low Peak	1727	Remaining peak hours
3	Spring/Fall	Off-peak	Off-Peak	2360	Off-peak hours
4	Summer	Top 1%	Spike	10	Top 10% of peak hours
5	Summer	Top 10%	Spike	102	Next 10% of peak hours
6	Summer	Low Peak	Low Peak	871	Remaining peak hours
7	Summer	Off-peak	Off-Peak	1184	Off-peak hours
8	Winter	Top 10%	Spike	102	Next 10% of peak hours
9	Winter	Low Peak	Low Peak	871	Remaining peak hours
10	Winter	Off-peak	Off-Peak	1136	Off-peak Hours

Note: *Peak hours include hours ending 7 a.m. through 10 p.m. Central Time weekdays, excluding six major holidays. Off-peak hours = Hours ending 11 p.m. through 6 a.m. on weekdays and all weekend and holiday hours.

The Off-peak periods are all NERC holidays and weekend hours plus weekdays from the hour ending at midnight EPT until the hour ending at 0700.[1] The Off-peak periods have off-peak transmission pricing and plant availability.

In order to define the Top 1% and Top 10% periods for a given season, we removed all Off-peak hours from that season. We then ranked the remaining (peak) hours based on load levels in the destination market by season. We then defined as the Top 1% as the 1 percent of these remaining hours in which loads in the destination market were highest and the Top 10% as the highest 10 percent of peak hours based on load levels. These periods have spike transmission pricing and plant availability.

[1] Major holidays are New Year's, Memorial Day, 4th of July, Labor Day, Thanksgiving and Christmas. Major holidays are included in the Weekend period.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

The Low Peak periods are weekdays from the hour ending at 0800 until the hour ending at 2300 EPT, excluding hours in the Top 10% periods and major holidays. The Low Peak period has on-peak transmission pricing and plant availability.

It is important to divide the year initially into three seasons to avoid aggregating across hours in which the suppliers in the market that have available economic capacity (e.g., summer peaking vs. winter peaking utilities) are different. In addition, the division of the year into three seasons makes it possible to take into account seasonal differences in generation availability, contracts, transmission pricing, and transfer capability.

II. Geographic Coverage and Market Areas

The study includes market areas that correspond to the balancing authority areas used by the North American Electric Reliability Council (NERC), and PJM submarkets as defined by FERC. Table II-1 lists these market areas and their abbreviations. There are two study destination markets, PJM East and PJM East of 5004/5005.

Table II-1– List of Eastern Market Areas and Study Destinations

Abbreviation	*Full Name*	*Study Destination*
PJME	PJM East	Yes
PJMC	PJM East of 5004/5005	Yes
PJMS	PJM East of AP South	
PJM	PJM	
NYISO	New York ISO	
DUK	Duke Energy Carolinas	
CPLE	Carolina Power & Light East	
CPLW	Carolina Power & Light West	
LGEE	Louisville Gas & Electric	
OVEC	Ohio Valley Electric Corp.	
TVA	Tennessee Valley Authority	
EKPC	Eastern Kentucky Power Cooperative	

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

III. Generation

A. Generation Capacity and Ownership

The study includes generating units located in the areas that are (1) connected to the power grid, (2) not exclusively used for self-generation, and (3) either in a plant used primarily for electric generation or a Qualifying Facility.

1. Generating Unit Data

The study uses data for summer and winter capability at the unit level reported in the Energy Velocity (EV) database available from Ventyx. The units include all units with a status of operating, standby, cold standby, restart, mothballed, testing, or under construction that will be online before November 30, 2012 and a retirement date after November 30, 2012. We exclude generation units that are less than 5 MW unless they are owned by PSEG.

2. Ownership

The study uses relies on Ventyx determination of plant and ownership. When Ventyx reports a holding company, the ownership is assigned to the holding company. For PSEG generation, the study relies upon Appendix B data from market-based rate filings and updates from the companies to determine plant ownership and seasonal capability. Operational control of PSEG units is consistent with the methodology used for market-based rates.

3. Seasonal variation in capability

The study uses seasonal capability data from EV. Spring/fall capacities are the average of summer and winter capacities.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

4. Adjustments to Generating Capability

The generating capability figures used for each period are obtained by multiplying the seasonal capabilities by an availability factor, which is based on the period, unit location, and NERC General Availability Data Systems (GADS) category of the unit. The GADS database gives national average operating information for generating units by unit type and size. For example, it gives data for coal-fired steam units with capacities between 300 MW and 399 MW.

For each period and each generating unit, the availability factor adjusts for the following.

a) Unplanned outage rates by GADS category

For a given GADS category, the study assumes that unplanned (forced) outage rates (as a share of generating capability available after allowing for planned outages) are constant across seasons and generating units throughout the Region, regardless of owner. Based on GADS data for 2007 through 2011, which are the most recent data in the EV database, the study calculates an equivalent forced outage rate (EIFOR), which measures the share of generating capability in a GADS category that is not available because of forced outages. The computation is EIFOR = (FOH)/AH, where FOH is number of forced outage hours and AH is total hours available for generation after planned outages (but before forced outages).[2]

b) Planned outage rates by GADS category and season

With four exceptions (hydro, pumped storage, wind, and solar units), the study assumes that the planned outage rate is constant for all generating units for a

[2] EIFOR differs slightly from the EFOR provided in the GADS data. EIFOR provides a better measure of a forced outage rate for peaking units that are operated a small percentage of the year.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

given GADS category and season. For a given GADS category, the share of hours of generating capability that is not available as a result of planned outages is computed as (POH + POEH)/PH; where PH are the period hours, POH are the hours not available because of planned outages, and POEH are the hours not available because of planned outage extensions

The study assumes that balancing authority areas are both summer and winter peaking. Therefore, the study assumes that all planned outages for thermal units occur during spring/fall.

c) Variation in hydro availability across seasons and periods

In general, utilities use hydro facilities to generate energy during the hours when energy prices are highest, subject to constraints imposed by availability of water and reservoir capacity. In order to incorporate these constraints, the study proceeds in the following manner.

First, the study uses EIA Form 923 monthly production data for the period 2011 to 2012 to compute average hourly hydro generation by season. Average hourly generation is then divided by hydro capability to give an average hourly hydro operating rate by season.

Second, depending upon the level of the hydro operating rate for a given season, the study calculates availability factors for the spike, low peak and off-peak periods. When the historical seasonal operating rate is below 30 percent, the availability factor for each period in the season is set equal to the operating rate; the 30 percent figure is an assumed "run of river" constraint. The study assumes that prospectively the maximum operating rate is 90 percent; this is the assumed "maximum rate" constraint. When the historical seasonal operating rate is above 90 percent, the availability factor for each period is set to 90 percent.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

When the seasonal operating rate is above the run of river constraint and below the maximum rate, we reason that the hydro generator owner would be likely to produce a higher level of energy during spike hours, when energy prices are highest, than during low peak hours, and that the owner would be likely to produce a higher level during low peak than during off-peak hours.

Based on this reasoning, when the seasonal operating rate is between the run of river constraint and the maximum rate, as is the case for each of the three seasons, the study uses a spike availability factor of 90 percent, which is the assumed maximum operating rate, and off-peak availability factor of 30 percent, which is the assumed run-of-river constraint, and a calculated availability factor for the low peak periods, as described below.

The seasonal low peak availability factor is calculated with actual total seasonal hydro generation. The study then computes the hydro generation during all spike and off-peak hours, assuming the generation rates implied by the spike and off-peak derate factors computed in the manner described above. The study then calculates total low peak hydro generation as the difference between total seasonal hydro generation and the sum of hydro generation during all spike and off-peak hours. The seasonal low peak availability factor is computed as total low peak hydro generation divided first by the number of hours in the off-peak period and then by hydro generating capacity.

d) Variation in pumped storage availability across seasons and periods

We assume that pumped storage units have 90 percent availability during Top 1% and Top 10% periods, 50 percent availability during Low Peak periods, and no availability during off-peak periods.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

e) Wind availability

For each area-owner combination, we calculate average operating rates in 2011 and 2012 by season from EIA-923 data. The average operating rates are the availability factors. When operating rates are not available for an owner in an area, we use the average operating rate for that area.

f) Solar availability

Availability for solar power is also calculated based on average operating rates for 2011 and 2012 reported in EIA-923. There is little solar power during off-peak periods because of darkness. Accordingly, solar availability is weighted to on-peak periods.

B. Variable Costs of Generation

The study uses variable costs of generation that include fuel costs, sulfur dioxide and nitrogen oxide emissions costs, and variable operations and maintenance (VOM) costs. The study calculates fuel costs from unit heat rates and Platts' Gas Daily spot prices at the unit's reported natural gas hub by Energy Velocity, #2 Diesel, Low-Sulfur – Industrial for the East Coast, and Residual Fuel Oil sales to end users for the East Coast for the years 2011-2012. Natural gas prices vary by hub, but were $3.78 per mmBtu at TETCO M3, the hub with the largest reported capacity in the study. The prices for oil units are as follows: #2 fuel oil $20.43 per mmBtu, and residual fuel oil $14.47 per mmBtu. Fuel costs for other fuels are based upon the average fuel costs reported in the EV data for each fuel type. Emissions prices for 2011-2012 are $0.75 per ton for SO2 year-round and $39 per ton for NOx in the summer season. CO_2 costs for units located in Regional Greenhouse Gas Initiative (RGGI) states are $1.93/ton, which is based upon RGGI Auction results in 2012. Units in Montgomery County, MD have an

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

additional $5/ton carbon tax on CO_2 emissions. VOM costs are from the EV database.

C. Long-term Contracts

We reviewed Appendix B data from market-based rate filings and FERC Form 1 filings to obtain data on long-term contracts. Where the market-based rate filing indicates a change of operational control, we include a contract transferring control to the buyer. We leave the generation unit in the BAA where it is physically interconnected to the transmission system. When the buyer is a load-serving entity in another BAA, we give a priority firm transmission path to the BAA with the load.

Long-term contracts that expire prior to December 1, 2011 are not included in the study. Long-term contracts that expire between December 1, 2011 and August 31, 2012 are included only in the seasons for which they are in effect. Contracts that expire after September 1, 2012 are included in the study.

IV. Transmission

A. Transmission Network

The study incorporates a contract path transmission network for modeling purposes. Transmission pricing between balancing authority areas is represented by a traditional contract path transmission network in which the direct physical connections between balancing authority areas are also the individually priced links from which contract paths are constructed.

B. Transmission and Ancillary Services Pricing and Losses

As specified by the Commission's Appendix A, the study generally uses ceiling prices for transmission service from Schedules 1, 2 and 8 of the utility's *pro*

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

forma open-access transmission tariff. Transmission providers may require transmission customers to purchase ancillary services under Schedule 1 (scheduling, system control and dispatch) and Schedule 2 (reactive supply and voltage control). Schedule 8 gives the rates for non-firm point-to-point transmission service. The study uses transmission prices from tariffs.

When we have tariffs available, we calculate rates for off-peak, peak and spike categories. Because of discounting and the nature of baseload purchases, off-peak rates are often lower than peak rates.[3] We use two steps to determine off-peak rates. Step 1: When a utility posts off-peak hourly rates, we use the posted rates. Step 2: When a utility does not post off-peak hourly rates, we calculate an hourly off-peak rate based on other tariff information. To calculate hourly off-peak rates, we divide the weekly rate by 168, the number of hours in a week. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

We use similar steps to determine peak rates. Step 1: When a utility posts maximum hourly rates in its tariff, we use the maximum tariff rates. Step 2: When a utility does not post off-peak hourly rates, we calculate a peak rate based on other tariff information. To calculate hourly peak rates, we divide the weekly rate by 80—the "Appalachian" method. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

For spike periods, we use ceiling hourly rates from tariffs, when available. Otherwise, we use the Appalachian method.

---

[3] For transactions longer than one hour, the *pro forma* tariff caps the amount that the purchaser pays per day by the daily rate, and the amount that the purchaser pays per week by the weekly rate.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Whenever practical, the study uses loss rates from tariffs. When these methods did not provide a loss rate for a particular utility, the study assumes that losses are three percent per utility.[4] The study assumes that transmission customers pay losses in-kind. That is, if area A exports 100 MW to area B and the losses are 3 percent, only 97 MW arrive at area B.

For areas where tariffs are not available, rates and losses are the average by period for all the reporting areas.

C. Transfer Capability and SILs

The geographic market includes only PJM and first tier BAAs. Per the recent *NRG/GenOn* order, transmission into a destination market from first tier areas is to be limited only by the simultaneous import limit ("SIL").[5] Accordingly, the transfer capability from each first tier area to the destination market is set to 99,999 MW. The SIL for PJM East and PJM East of 5004/5005 comes from the 2012 Simultaneous Import Limit Study Report filed by PJM on October 1, 2013.[6] The total imports into the destination markets may be less than the actual ability to import into the destination because not all the generation capability owned or controlled by load-serving entities within the destination markets studied in PJM have been identified in the data.

---

[4] Losses of 3 percent are representative of the industry. See, FERC Open Access NOPR, *FERC Stats & Regs*, ¶32,514 at 33,150 (1995).

V. Market Prices

The study used December 2011-November 2012 real-time hourly prices from the RTO LMP for PJM East and PJM East of 5004/5005. Table V-1 shows the PJM East of 5004/5005 market prices in each of the ten periods, and Table V-2 shows the PJM East market prices.

Table V-1 – PJM East of 5004/5005 Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$181.98	-----
Top 10%	$66.65	$107.58	$60.87
Low Peak	$38.72	$42.40	$34.68
Off-Peak	$28.24	$28.32	$30.46

Table V-2 – PJM East Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$188.24	-----
Top 10%	$66.52	$109.22	$61.53
Low Peak	$37.36	$42.17	$34.72
Off-Peak	$27.77	$28.67	$29.97

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

VI. Load and Contract Obligations for AEC Calculations

Load data come from PJM for PJM and from Energy Velocity for the other supply areas.

To compute load requirements for market participants in New York and PJM, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[7] To account for their greater load obligations, we assume that Dominion has 100 percent responsibility for its allocation of load and that AEP has 90 percent of its allocation as opposed to the standard 70 percent. Utilities south of PJM have traditional load obligations and have 100 percent load responsibility for their respective planning area loads. Small utilities for which have not load data available were not imputed a share of PJM or NYISO load were assumed to have no AEC.

[7] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

This Exhibit describes the methods used to calculate market shares and concentration in destination markets.

Allocation of scarce transmission capability is accomplished using linear and nonlinear programs that model generation dispatch and the contract path transmission system. This Exhibit provides an overview of the structure of the programs and presents the equations.

Overview of Linear Program

The linear program models control areas as nodes in a transmission system. Each node has a demand for and a supply of electric energy. The supply is based on the generators at the node and potential deliveries to the node via transmission links from other control areas. The linear program allows for net import and export limits to and from an individual control area. Given generation capability and costs and transmission capability and costs, the linear program finds the least-cost solution that satisfies the specified loads. Costs are defined as dispatch (generation) costs plus transmission costs including losses plus the default cost for "unserved" load. For each solution, the linear program determines the quantities produced in, exported from, and imported into each control area.

The Mathematical Equations

The linear program to be solved is given below:

Minimize Total Cost: $Cost = GC + TC + UC$

Subject to:

(1) Generation: $TG_a = \sum_{u}^{u \in a} G_{a,u}$ for each area *a*;

(2) Imports: $YI_a = \sum_{b}^{a,b \in network} (1 - h_{b,a}) T_{b,a}$ for each area *a*;

© *Economists Incorporated*, Washington, DC, 2008, 2013

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

(3)	Exports:	$YE_a = \sum_{b}^{a,b \in network} T_{a,b}$	for each area *a*;
(4)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(5)	Supply/Demand Balance:	$TG_a + Y_a + U_a = D_a$	for each area *a*;
(6)	Generation Cost:	$GC = \sum_{a} \sum_{u}^{u \in a} d_{a,u} G_{a,u}$	for each area *a*;
(7)	Transmission Cost:	$TC = \sum_{a,b}^{a,b \in network} r_{a,b} T_{a,b}$	for each path *a* to *b*;
(8)	Unfilled Demand Cost:	$UC = \sum_{a} pU_a$	for each area *a*;
(9)	Generation Limits:	$g\min_{a,u} \le G_{a,u} \le g\max_{a,u}$	for each unit *u* in each area *a*;
(10)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(11)	Net Import Limits	$Y\min_{a} \le Y_a \le Y\max_{a}$	for each area *a*;

where:

a,b	are subscripts for control/transmission areas;
Cost	is total system cost;
$d_{a,u}$	is the dispatch cost of unit *u* in area *a*;
D_a	is demand for power in area *a*;
$G_{a,u}$	is generation output of unit *u* in area *a*;
GC	is total system generation cost;
$G\max_{a,u}$	is the maximum output of unit *u* in area *a*;
$G\min_{a,u}$	is the minimum output of unit *u* in area *a*;
$h_{b,a}$	is the fraction of power lost to resistance from moving power from area *b* to area *a*;
N	is a subscript to identify simultaneous transmission constraint *n*;
P	is the default price;
$r_{a,b}$	is the transmission rate from area *a* to area *b*;

© ***Economists Incorporated***, Washington, DC, 2008, 2013

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

$T_{a,b}$	is the power flow from area *a* to area *b*;
TC	is total system transportation expenses;
TG_a	is total generation output in area *a*;
$t\max_{a,b}$	is the maximum power flow from area *a* to area *b*;
$t\min_{a,b}$	is the minimum power flow from area *a* to area *b*;
U	is a subscript to identify units in an area;
U_a	is the amount of demand in area *a* not met by generation or imports
UC	is total system cost of not meeting demand;
Y_a	is net imports into area *a*;
YE_a	is total exports from area *a*; and
YI_a	is total imports into area *a*;
$Y\min_a$	is minimum net imports in area *a;*
$Y\max_a$	is maximum net imports in area *a.*

This linear program is solved using the BDMLP solver in GAMS. In order to calculate concentration for different destinations, seasons, and periods, the PASS GAMS program loops through the destinations, seasons, and periods with calls to Solvers to solve the linear programs. Loads, unit availability and transmission availability are adjusted for each season-period combination.

Calculating Concentration

Transmission allocation is accomplished in four steps. In the first step the linear program finds the net-back prices in all control areas given a price at the destination control area equal to 105 percent of the pre-merger price. Suppose the pre-merger price at the destination, control area A, is $20/MWh. Then all generation capability with a dispatch cost of $21/MWh or less in the destination area would be included in the market because $21 is 105 percent of $20. If transmission cost (including losses) is $5/MWh from control area B to A, then the net-back price at B would be $16/MWh, which is the $21/MWh less the $5/MWh transmission cost between B and A. Then, all generation capability at B with dispatch costs equal to or less than $16/MWh would be included in the market if there were no transmission constraints. Calculation of net-back prices is

© ***Economists Incorporated***, Washington, DC, 2008, 2013

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

accomplished by setting the default price, *p*, equal to 105 percent of the pre-merger price at the destination, setting load at the destination to a high number and loads elsewhere to zero, setting transmission limits high enough so that the transmission system is not constrained, and setting a limited amount of generation in each area with a zero dispatch cost. The shadow prices produced by the linear program will be *p* at the destination and the relevant net-back prices in other areas.

In the second step, one calculates Economic Capacity (EC) and Available Economic Capacity (AEC) in each area. These values are then used to limit generation capability. The ownership shares of AEC and EC are calculated for each node in the system.

In the third step, the linear program determines the amount of energy that can be imported into an area given available EC (or AEC) and limits on transmission capacity. This is accomplished by limiting generation in each area to the capacity amount (EC or AEC), giving generation outside the destination market a lower cost than generation inside the destination market, and minimizing cost to serve a large load at the destination market. The amount of generation supplied to the destination is the maximum that can be imported into the destination market.

In the fourth step, transmission is allocated by the following non-linear program:

Minimize Loss: $$Loss = \sum_{\alpha}\left(\frac{C_{\alpha}^{2}}{Y_{Dest}s_{\alpha}} - 2C_{\alpha}\right)$$

Subject to:

(1) Pre Shares: $$s_{\alpha} = \frac{C\max_{\alpha}}{\sum_{\beta} C\max_{\beta}}$$ for each area α;

© ***Economists Incorporated***, Washington, DC, 2008, 2013

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

(2)	Allocated Shares:	$A_\alpha = \frac{C_\alpha}{Y_{Dest}}$	for each area α;
(3)	Imports:	$YI_a = \sum_b^{a,b \in network} (1 - h_{b,a}) T_{b,a}$	for each area *a*;
(4)	Exports:	$YE_a = \sum_b^{a,b \in network} T_{a,b}$	for each area *a*;
(5)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(6)	Supply/Demand Balance:	$C_a + Y_a + U_a = D_a$	for each area *a*;
(7)	Capacity Limits:	$c\min_a \le C_a \le C\max_a$	for each area *a*;
(8)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(9)	Max Import Limit	Y_{Dest} = Maximum imports from step 3;	

where:

a,b	are subscripts for control/transmission areas;
α,β	are subscripts for control/transmission areas other than the destination market;
s_α	Is area α's share of capacity outside of the destination;
A_α	is area α's share of allocated capacity outside of the destination;
Loss	is the loss function to be minimized.

The loss function is derived from the weighted squared-errors between the pre-allocation shares and the post-allocation shares, where Y_{Dest}/s_α are the weights. For each source control area, the weighted squared-error is given by:[1]

$$W_\alpha = \frac{Y_{Dest}}{s_\alpha}(A_\alpha - s_\alpha)^2.$$

[1] This exposition ignores the adjustments necessary to give priority to minimum transfer levels from a source area to the destination.

© ***Economists Incorporated***, Washington, DC, 2008, 2013

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Accordingly, the sum of the weighted squared-errors gives rise to the loss function, which can be seen by:

$$\begin{aligned} Loss &= \sum_{\alpha} W_{\alpha} \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha} - s_{\alpha})^2 \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha}^2 - 2s_{\alpha}A_{\alpha} + s_{\alpha}^2) \\ &= \sum_{\alpha} \left(\frac{C_{\alpha}^2}{Y_{Dest}s_{\alpha}} - 2C_{\alpha} \right) + \text{constant}. \end{aligned}$$

The resulting shares from minimizing this loss functions preserve the relative shares of capacity behind any transmission constraint going to the destination. This can be seen from the following LaGrangian equation to be minimized:

$$L = \sum_{i} \left(\frac{C_i^2}{Y_{Dest}s_i} - 2C_i \right) + \lambda \left(T - \sum_{i} C_i \right),$$

where T is the transmission limit affecting control areas i. The first order conditions are:

$$\frac{\partial L}{\partial C_i} = \frac{2C_i}{Y_{Dest}s_i} - 2 - \lambda = 0,$$

which can be rearranged to give:

$$A_i = \frac{C_i}{Y_{Dest}} = \left(\frac{2+\lambda}{2} \right) s_i,$$

which shows that the allocated market shares of those areas affected by the transmission constraint are proportional to their shares of capacity before the transmission allocation. Moreover, this is the only transmission allocation

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

method that maintains the relative shares of capacity behind any binding transmission constraint in the allocation process.

This non-linear program is solved using the COINIPOPT solver in GAMS. The calculated capacities from the nonlinear program above less transmission losses determine the capacities for the market share calculations for sources outside of the destination market. The capacities within the destination market are given full weights.

Market concentration is the HHI, which is the sum of the squared market shares. Mathematically,

$$HHI = \sum_{i=1}^{n} S_i^2,$$

where S_i is the allocated share of firm i and n is the number of firms in the market. The summary sheets combine all the firms with shares of 0.7 percent or less (other than Applicants) into the "Other" category. The collective share of the Other category does not directly enter the HHI calculation other than the represented capacity as each independent entity enters the HHI calculation. For example, if ten firms with 0.5 percent shares were in the Other category, the HHI contribution of the Other category would be 0.625 (= 10 x .5 x .5 = 10 x .0625) and ***not*** 25.

[3] Please note that this number is 120 MW higher than the nameplate rating number provided in Appendix B of the 2010 triennial filing in Docket No. ER08-448-007 and the PSEG New Haven initial MBR filing in Docket No. ER12-1250-000. This is due to the fact that a capacity increase associated with an uprate to the Hope Creek nuclear unit was inadvertently not included in the nameplate number included in Appendix B. This capacity uprate was, however, discussed in the 2007 and 2010 triennial applications themselves.

Re: Joint Owners of the Conemaugh Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Conemaugh Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Conemaugh Electric Generating Station:

1. The Owners jointly own the Conemaugh Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in East Wheatfield and West Wheatfield Townships, Indiana County, Pennsylvania (the "Station").

---

1 Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Conemaugh Power LLC	3.72%
Constellation Power Source Generation, Inc.	10.56%
Duquesne Conemaugh LLC	3.83%
Exelon Generation Company, LLC	20.72%
PPL Montour, LLC	16.25%
PSEG Fossil LLC	22.50%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.45%
UGI Development Company	5.97%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

Sincerely yours,

Georgianna R. Stenger
Administrative Manager

Re: Joint Owners of the Keystone Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Keystone Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Keystone Electric Generating Station:

1. The Owners jointly own the Keystone Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in Plumcreek, South Bend and Cowanshannock Townships, Armstrong County, Pennsylvania, and Armstrong Township, Indiana County, Pennsylvania (the "Station").

[1] Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Constellation Power Source Generation, Inc.	20.99%
Duquesne Keystone LLC	2.47%
Exelon Generation Company, LLC	20.99%
Keystone Power LLC	3.70%
PPL Montour, LLC	12.34%
PSEG Fossil LLC	22.84%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.67%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

PSEG
Nuclear L.L.C.

Carol Peterson
Vice President Finance
Exelon Nuclear
4300 Winfield Road
Warrenville, IL 60555

Letter Regarding Control of Jointly-Owned Nuclear Facilities

Dear Ms. Peterson:

In connection with its upcoming compliance filings pursuant to Order No. 697,[1] PSEG Nuclear LLC ("PSEG") is submitting this letter in order to set forth its understanding of, and is requesting Exelon Generation Company LLC's ("Exelon") concurrence on, the respective level of control exercised by both companies with respect to the two nuclear facilities that they jointly own.[2]

PSEG avers and requests Exelon's concurrence on the following:

1. PSEG and Exelon jointly own and control two nuclear power plants, Peach Bottom Atomic Power Station located in Delta, PA and the Salem Nuclear Generating Station in Lower Alloways Creek, NJ.

2. In accordance with the Joint Owners Agreement for Peach Bottom dated November 24, 1971, as amended on thereafter, between the Parties, PSEG and Exelon each own 50% of the generating station. Under the Agreement, Exelon is the designated operator of Peach Bottom.

3. In accordance with the Joint Owners Agreement for Salem dated November 24, 1971, as amended thereafter, between the Parties, Exelon owns 42.59% and PSEG owns 57.41% of the generating station. Under the Agreement, PSEG is the designated operator of Salem.

4. Section 4.1 of each of the Joint Owners' Agreements states, "The signatories shall be entitled to shares of the installed capacity, available capacity, operating capacity and hourly energy generation of the Station in proportion to their ownership . . .."

---

[1] *Market-Based Rates For Wholesale Sales Of Electric Energy, Capacity And Ancillary Services By Public Utilities*, 119 FERC ¶ 61,295 (2007).

[2] PSEG has requested a letter of concurrence from Exelon in order to facilitate the Commission's review of the market power analysis submitted by PSEG with respect to facilities it jointly owns with Exelon. Exelon has no objection to PSEG's submission of this letter as part of PSEG's compliance filing,.

tel: 856.339.1100 fax: 856.339.1104
email: Thomas.Joyce@pseg.com

PSEG
Nuclear L.L.C.

5. Section 11.1 of each of the Joint Owners' Agreements provides that the generating station will be operated by the party designated as operator for the mutual benefit of PSEG and Exelon.

6. In Order No. 697 the Commission stated that under "where a jointly-owned generation facility is operated by one of the joint-owners for the benefit of and on behalf of all of the joint-owners . . . it may be reasonable to allocate capacity based on ownership percentages...." Order No. 697 at P 188.

7. In accordance with the guidance provided in Order No. 697 and with the language of each of the joint owners' agreements, PSEG and Exelon should be deemed to control each of the nuclear facilities' output in line with their proportionate ownership share of each facility. As such, PSEG and Exelon should each be deemed to control 50% of Peach Bottom's output, and PSEG should be deemed to control 57.41% of Salem's output with Exelon controlling 42.59%.

Please indicate Exelon's concurrence to the above by executing the Acknowledgement and Agreement section below.

Sincerely

Thomas P. Joyce

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

JOINT LETTER OF CONCURRENCE

Regulations of the Federal Energy Regulatory Commission (the "FERC") require each public utility with market-based rate authority to file an updated market power analysis every three years in accordance with a schedule adopted in *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 697, FERC Stat. & Regs., Regulations Preambles ¶ 31,252 (2007) ("Order No. 697"). See, 18 CFR § 35.37(a)(1). Each public utility with market-based rate authority may also be required to file a change-in-status report regarding certain changes in circumstances that occur between the dates on which its triennial market power analyses are filed. 18 CFR § 35.42. Among other matters, the market power analysis is to address the amount of generation capacity that the affected utility owns or controls. Where more than one public utility owns a generating facility, FERC requires the utility that is submitting a market power analysis seek a "letter of concurrence" from the other affected co-owning public utilities that identifies the degree to which each public utility controls the generating facility, and to submit the letter with its filing. *See* FERC Order No. 697, 119 FERC ¶ 61,295, P 187 (2007).

The Yards Creek Pumped Storage Hydroelectric Project (the "Yards Creek Project") is a FERC-licensed pumped-storage hydroelectric project with a nameplate capacity of 400 MWs, and is located in Pahaquarry and Blairstown Townships, in Warren County, New Jersey. *See* FERC Project No. P-2309.

PSEG Fossil LLC ("PSEG") and Jersey Central Power & Light Company ("JCPL") each own, as tenants in common with the other, an undivided 50% interest in the Yards Creek Project. Accordingly, if and when PSEG or JCPL submit an updated market power analysis to the FERC, each will be subject to FERC's requirement to seek a "letter of concurrence" regarding the degree to which each controls the Yards Creek Project.

Both PSEG and JCP&L (and their affiliates) own transmission facilities and provide wholesale electric service in the Northeast region, as defined in Order No. 697. Pursuant to the schedule adopted in Order No. 697, PSEG and JCP&L are each required to submit an updated market power analysis to the FERC for markets within the Northeast region in December 2010. PSEG and/or JCP&L may also be obligated to file a change-in-status report or other market power analyses before its subsequent triennial market power analysis for the Northeast region is scheduled to be filed. Therefore, for the sole purpose of enabling either PSEG or JCP&L to submit a market power analysis that addresses, among other issues (to the extent necessary), the scope of each party's control of the Yards Creek Project, PSEG and JCP&L each aver and agree as follows:

1. JCP&L operates and maintains the Yards Creek Project pursuant to the Yards Creek Pumped Storage Hydroelectric Generating Station Operating Agreement, which is dated October 6, 1965 (the "Operating Agreement').

2. Article 2 of the Operating Agreement designates JCP&L as holding sole responsibility for the operations and maintenance the Yards Creek Project. Article 2 further provides that JCPL shall operate the Yards Creek project in the same manner as if JCPL had the complete ownership interest in the Yards Creek Project.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

3. JCP&L does, in fact, operate and control the Yards Creek Project in the same manner as if JCP&L had the complete ownership interest in the Yards Creek Project in accordance with Article 2 of the Operating Agreement.

4. Accordingly, PSEG and JCP&L each agree and concur that for the purpose of the market power analyses required by Order No. 697, JCPL shall be deemed to control the Yards Creek Project generation capacity and electric energy output.

ACKNOWLEDGED AND AGREED:

Richard P. Lopriore

NOTICE OF FILING
( )

Take notice that on December 23, 2013 that: (i) PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Fossil LLC and PSEG Nuclear LLC tendered for filing their joint triennial market power update in compliance with Order No. 679 and with prior Commission Orders granting them market-based rate authority in Docket Nos. ER99-3151, ER97-837, ER03-327, ER08-447 ER08-448 and DR-12-1250 respectively.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR §§ 385.211 and 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. Such notices, motions, or protests must be filed on or before the comment date. Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant. On or before the comment date, it is not necessary to serve motions to intervene or protests on persons other than the Applicant.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the "eFiling" link at http://www.ferc.gov. Persons unable to file electronically should submit an original and 14 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street, N.E., Washington, D.C. 20426.

This filing is accessible on-line at http://www.ferc.gov, using the "eLibrary" link and is available for review in the Commission's Public Reference Room in Washington, D.C. There is an "eSubscription" link on the web site that enables subscribers to receive email notification when a document is added to a subscribed docket(s). For assistance with any FERC Online service, please email FERCOnlineSupport@ferc.gov, or call (866) 208-3676 (toll free). For TTY, call (202) 502-8659.

RE: Triennial Market Power Update in Compliance with Order No. 697:
***PSEG Energy Resources & Trade LLC*, Docket No. ER99-3151-____;**
***Public Service Electric and Gas Company*, Docket No. ER97-837-____;**
***PSEG Power Connecticut LLC*, Docket No. ER03-327 -___;**
***PSEG Fossil LLC*, Docket No. ER08-447-___;**
***PSEG Nuclear LLC*, ER08-448-___; and**
***PSEG New Haven LLC*, ER12-1250-___**
Pavant Solar II LLC, ER16-1925-___
San Isabel Solar LLC, ER16-1926-___
Bison Solar LLC, ER16-1924-___
PSEG Energy Solutions LLC, ER16-2725-___

Dear Secretary Bose:

Pursuant to the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), Public Service Electric and Gas Company ("PSE&G"), PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear"), PSEG New Haven LLC ("PSEG New Haven") Pavant Solar II LLC, San Isabel Solar LLC, Bison Solar LLC and PSEG Energy Solutions LLC (collectively the "Applicants" or "PSEG") hereby jointly submit for filing their updated market power analysis in support of their continued eligibility to engage in market-based rates

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

transactions. This market power analysis satisfies the requirements of Order No. 697[1] for the filing of updated market power analyses on a regional schedule basis by holders of market-based rate certificates and their affiliates. In accordance with the regional schedule for those utilities in the Northeast Region, as modified by the MBR Clarifying Order, this filing is being made by the December 2016 deadline.[2] In conformance with the Commission's requirements, except when expressly noted otherwise, the market power analysis is based on activity during the study period from December 1, 2014 through November 30, 2015 ("study period").

PSEG, through its subsidiary PSE&G, owns transmission facilities within the Northeast Region. Specifically, PSE&G owns transmission facilities in the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization. PSEG Power LLC and its subsidiaries do not own any transmission facilities other than transmission to connect generating units to the grid in PJM, the New York Independent System Operator, Inc. ("NYISO") and ISO New England Inc. ("ISO-NE").

In their original applications for market-based rate authority and previously-submitted updates to the Commission, PSEG ER&T, PSE&G, PSEG Power CT, PSEG Fossil, PSEG Nuclear and PSEG New Haven demonstrated that they and their affiliates: (a) do not exercise generation market power; (b) lack the ability to manipulate access to transmission facilities that they own or control; and (c) cannot erect any other barriers to market entry. As further demonstrated herein and in the Affidavit of Dr. John R. Morris attached hereto in the appendices, Applicants continue to satisfy the Commission's requirements to sell energy, capacity and ancillary services at market-based rates and thus should be permitted to continue to make such sales.

I. SERVICE AND COMMUNICATION

All service and correspondence related to this matter should be directed to the following individuals:

[1] 18 C.F.R. Part 35, Subpart H (2007); Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

[2] This filing is made on the three year anniversary of the December 2013 deadline set forth in Order No. 697 Appendix D.

(973) 430-5983 (facsimile)
David.Richter@PSEG.com

Applicants request waiver of Rule 203(b)(3)[3] so that a copy of any communications in these proceedings may be served on all persons listed above.

II. DESCRIPTION OF THE APPLICANTS AND RELEVANT AFFILIATES

A. The Applicants

The Applicants are each wholly owned, direct and indirect subsidiaries of Public Service Enterprise Group Incorporated ("PSEG"). PSEG is a public utility holding company engaged in, among other things, the generation of electric energy and the transmission, distribution and sale of electricity and natural gas through its subsidiaries.

1. Public Service Electric and Gas Company

PSE&G is a public utility operating company engaged primarily in the transmission of electricity, and the provision of gas and electric distribution service in the State of New Jersey. During the study period, PSE&G owned less than 140 MW of solar generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities. PSE&G is a member of the PJM Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access

[3] 18 C.F.R. § 385.203(b)(3).

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Transmission Tariff ("OATT") administered by PJM. PSE&G is authorized to sell power at market-based rates and makes wholesale sales falling within several different categories, as described below.

Non-utility generation ("NUG") output. PSE&G's NUG output expired in 2015 and 2016 pursuant to the terms of the NUG contracts. PSE&G currently has no further NUG obligations, other than 0.6 MW of energy associated with the former Kinsley Landfill which no longer operates. .

Solar. In 2007, the New Jersey legislature passed Regional Greenhouse Gas Initiative ("RGGI") legislation authorizing state utilities to invest in renewable resources such as wind or solar in order to promote increased use of renewable resources within the state and in turn reduce greenhouse gas emissions. *See* L. 2007, c. 340, codified at N.J.S.A. 48:98-1. The NJBPU has approved two (2) PSE&G Solar 4 All® (S4A) programs under which PSE&G has sited, designed and built twenty-nine (29) grid connected solar facilities. PSE&G currently owns and operates approximately 115MW-dc of grid connected solar under the S4A program. PSE&G expects the S4A fleet to increase to approximately 125MW-dc by the end of 2016. In 2016, PSE&G received NJBPU approval of its Solar 4 All Extension II filing to install an additional 33MW-dc of grid connected solar on landfills and brownfields in the PSE&G electric service territory.

2. PSEG Energy Resources & Trade LLC

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.,* which initiated the transition from a regulated to a competitive retail power market in New Jersey, BPU annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSEG ER&T has participated directly in all of the auctions for BGS supply held since 2004, has been a winning bidder in these auctions and has incurred contractual

commitments to provide supply to BGS load pursuant to BPU approved contracts beginning with the 2004 auction and continuing to the present

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract remains in effect and provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply: On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015.

3. PSEG Fossil LLC

PSEG Fossil is an Exempt Wholesale Generator ("EWG") and is authorized to sell power at market-based rates. PSEG Fossil owns and operates electric generation facilities located within PJM and sells their entire output to its affiliate PSEG ER&T.[4] The assets of PSEG Fossil (and its subsidiary, PSEG Keys Energy Center LLC ("PSEG Keys")) are located entirely within PJM. However, PSEG Fossil's subsidiaries PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Power New York LLC and PSEG New Haven LLC own facilities in ISO-NE and NYISO. As noted below, PSEG Fossil also co-owns certain facilities in PJM.

PSEG Fossil and its subsidiaries PSEG Power CT and PSEG Keys are currently beginning construction on three new gas-fired generation units. PSEG Fossil is constructing Sewaren 7[5] which is a 540 MW combined cycle unit in Woodbridge, New Jersey which is expected to be in-service in 2018, PSEG Keys is constructing a 755 MW combined cycle unit in Prince George's County, Maryland which is expected to be in service in 2018 and PSEG Power CT is constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

Since the last triennial filing in December 2013 PSEG Fossil has retired 1,813.5 MWs (nameplate) inclusive of the following units:

Kearny 9 (18.6 MW)
Bergen 3 (18.6 MW)

[4]These contracts were originally approved by the Commission as cost-based contracts. *See Public Service Electric and Gas Company*, et al., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Fossil obtained market based rate authority covering sales from its generating units.

[5] Once Sewaren 7 begins commercial operation, PSEG Fossil plans to retire Sewaren 1, 2, 3 and 4.

Bridgeport 2 (179.5 MW)
Burlington 8 (18.6 MW
Burlington 9 (162.4 MW)
Burlington 11 (162.4 MW)
Edison 1 (167.4 MW)
Edison 2 (167.4 MW)
Edison 3 (167.4 MW)
Essex 10 (167.4 MW)
Essex 11 (167.4 MW)
Essex 12 (167.4 MW)
Mercer 3 (115.2 MW)
National Park (18.6 MW)
Sewaren 6 (115.2 MW)

In addition, PSEG Fossil, LLC notified PJM of its intent to retire Hudson 2 (659 MW nameplate rating) and Mercer Units 1 and 2 (652MW nameplate rating) by June 1, 2017.

PSEG Fossil satisfies most of the electricity needs of its plants from PJM under PJM's "station power" Tariff provisions. PSEG Fossil procures gas supply for its plants from PSEG ER&T and receives gas distribution service from PSE&G at a rate approved by the BPU on May 29, 2013.[6]

4. PSEG Power Connecticut LLC

PSEG Power CT is a Connecticut limited liability company and an EWG that owns and operates electric generation facilities in the State of Connecticut and is authorized to sell power at market-based rates.[7] Both of PSEG Power CT's generation facilities, Bridgeport Harbor and New Haven Harbor, are located in the State of Connecticut within the market administered by ISO-NE. PSEG Power CT sells the output of its generation facilities to its affiliate PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. As noted above, PSEG Power CT is currently constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

5. PSEG New Haven LLC

PSEG New Haven is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG New Haven owns and operates a facility (the "New Haven facility") in New Haven, Connecticut with a nameplate rating of 181 MWs. The New Haven facility is located within the New Haven Harbor generation station. The New Haven facility is interconnected to the adjacent United Illuminating East Shore Substation using a 115 KV underground cable. PSEG New Haven has no other

[6] BPU Docket No. GM12100935 (May 29, 2013).
[7] *Wisvest Corporation,* et al., 101 FERC ¶ 61,166 (2002).

generation assets. The commercial operation date for the New Haven facility was June 1, 2012 and PSEG New Haven has obtained MBR authority from FERC.[8]

The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[9] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[10] All of the energy and capacity of the New Haven facility is sold into the ISO New England ("ISO-NE") markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA[11] has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder. The 181 MW nameplate rating of the New Haven Facility has not been included in the capacity controlled by PSEG for purposes of Dr. Morris' market power analysis.

6. PSEG Nuclear LLC

PSEG Nuclear is an EWG[12] and is authorized to sell power at market-based rates. PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission.[13] The assets of PSEG Nuclear are located entirely within PJM. PSEG Nuclear performed the following uprates since the last triennial filing: (1) an uprate of 120 MWs at its Hope Creek plant in 2014, which increased its nameplate rating to 1290 MWs, (2) an uprate to Peach Bottom 2 and 3 which increases PSEG's share of the nameplate MWs by 241 MWs for a updated nameplate of 704 MW for Peach Bottom 2 and 689 MWs for Peach Bottom 3.

7. Pavant Solar LLC, San Isabel Solar LLC and Bison Solar LLC

PSEG Power Ventures portfolio includes three (3) solar companies with market-based rate authority: (1) *Pavant Solar II LLC*[14] is a QF which owns a 50 MW (AC) solar facility in Fillmore Utah; (2) *San Isabel Solar LLC*[15] is a QF which owns a 30 MW (AC)

---

solar facility in Las Animas County, Colorado and (3) *Bison Solar LLC*[16] is a QF which owns a 30 MW (AC) solar facility 25 miles north of Fort Collins, Colorado.

8. PSEG Energy Solutions LLC

PSEG Energy Solutions LLC ("PSEG Solutions") is a Delaware limited liability company and a direct subsidiary of PSEG ER&T. PSEG Solutions obtained market-based rate authority[17] and will operate within the PJM Interconnection, L.L.C. ("PJM"), New York Independent System Operator, Inc. ("NYISO") and ISO New England Inc. ("ISO-NE") markets. Energy Solutions will purchase power from the regional transmission organization ("RTO") at wholesale and sell it to retail customers. PSEG Solutions will not own or operate any generation assets. PSEG Solutions proposes to begin its retail business on January 1, 2017.

OTHER RELEVANT AFFILIATES

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities, as discussed below.

7. Affiliated Generation Ownership.

A list of the Applicants' affiliated domestic FERC jurisdictional generation assets owned is contained in Appendix B attached hereto. [18] Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the Northeast Region are described below:

PSEG Power LLC ("PSEG Power") was formed in 1999 to acquire the former generation assets of PSE&G. PSEG Power, a Delaware limited liability company, does not directly own any generation facilities or engage in any FERC jurisdictional activities but is the parent company of several FERC jurisdictional entities, including Applicants PSEG ER&T (and it subsidiary PSEG Energy Solutions LLC), PSEG Fossil, PSEG Nuclear, PSEG Power CT, PSEG New Haven and PSEG Power Ventures LLC (which owns PSEG Solar Source LLC).

PSEG Power Ventures LLC and PSEG Solar Source LLC. PSEG Power Ventures LLC ("Power Ventures") is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source LLC and has an in-direct ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 349 MWs DC (274 MW AC) of solar capacity across the United States, including a combined 92

[16] *Bison Solar LLC*, Docket No. QF16-711-001.
[17] See Letter Order dated December 21, 2016 in Docket No. ER16-2725-000.
[18] Appendix B excludes generation assets located in Hawaii as well as generation assets in which PSEG's interest is limited to a leveraged lease interest.

MWs[19] (72 MW AC) of solar capacity in PJM and approximately the following amount of MWs in the following states all through separate project companies which have all obtained QF status.

- 15 MWs (12 MW AC) in Florida,
- 92 MWs in PJM (72 MW AC) – 12 MWs in Ohio, 2 MW in New Jersey, 15 MW in Delaware, 50 MW in North Carolina and 13 MW in Maryland
- 45 MWs in Arizona (34 MW AC) – 25 MW Queen, approximately 20 MW Badger
- 13 MWs (10 MW AC) in Texas,
- 34 MWs (25 MW AC) in California[20]
- 4 MWs (3 MW AC) in Vermont and
- 74 MW (60 MW AC) in Colorado (to be in operation in 2016) – 38 MWs for San Isabel and 36 MWs for Bison
- 62 MW (50 MW AC) in Utah (to be in operation in 2016).
- 10.5 MW (8 MW AC) in Oregon (to be in operation in 2016).

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company and an EWG that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a FERC-approved cost-based contract.[21]

[19] The 92MWs are attributed to four (7) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs) Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

[20] The 28MWs (DC) are associated with the Shasta Solar Facility in California (4 MW), Whitehorn Solar (3 MWs) the Columbia Solar Project (19 MW). All have obtained QF status.

[21] *PSEG Power New York Inc.*, Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

PSEG Keys Energy Center LLC ("PSEG Keys") is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG Keys was formed to construct, operate and maintain the Keys Energy Center, a 755MW combined cycle power plant in Prince Georges County, Maryland. Construction began in 2015 and is expected to be completed in 2018 at which time the capacity will be available in the PJM market. All of the output of the Keys Energy Center will be sold to PSEG Keys affiliate, PSEG ER&T.

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution system ("T&D") on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco will be FERC jurisdictional public utilities as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[22]

8. Affiliated Transmission Ownership

With the exception of the electric transmission assets owned by Applicant PSE&G, all of which are located within the PJM RTO, and the generation interconnection facilities owned by the various EWG and QF affiliates listed herein, the Applicants, nor their affiliates have any affiliates that own or operate FERC jurisdictional electric or natural gas transmission facilities within the United States[23]. As discussed below, FERC granted PSE&G a Hinshaw exemption in 1954, finding that it was exempt from the provisions of the Natural Gas Act.

B. JOINTLY OWNED FACILITIES

PSEG Nuclear is a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear is the operator of Salem and Exelon Generation is the operator of Peach Bottom.[24] PSEG Fossil is approximately a 23% joint owner in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[25] Accordingly, for

[22] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), *order dismissing request for rehearing*, 145 FERC ¶ 61,183 (2013).

[23] PSEG Power LLC is a 10% owner of the PennEast Pipeline Company LLC which has filed an application for approval to construct and operate a natural gas transmission line.

[24] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in Appendix E. The ownership percentages have not changed since the date of this letter. PSEG Nuclear owns a 50% interest in Peach Bottom and a 57.41% interest in Salem.

[25] A letter of concurrence supporting the allocation of plant output based on ownership interest is attached in Appendix E. The ownership percentages have not changed since the date of this letter.

purposes of this market power analysis, the capacity of Salem, Peach Bottom, Conemaugh and Keystone has been attributed to PSEG in accordance with PSEG's ownership interests in these facilities.

PSEG Fossil and Jersey Central Power and Light Company ("JCP&L") are each 50% co-owners of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity – nominally 400 MWs – has been assigned to JCP&L.[26]

III. Applicants Fully Satisfy The Commission's Standards For Authority to Make Power Sales At Market-Based Rates.

The Commission allows power sales at market-based rates if the seller and its affiliates do not have, or have adequately mitigated, horizontal and vertical market power.[27] The Commission has also codified affiliate restrictions in its regulations which must be satisfied on an ongoing basis. In previous submissions for market-based rate authority the Applicants PSE&G, PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear, and PSEG New Haven, demonstrated compliance with each of these requirements. As detailed herein and in the attached affidavit, the Applicants continue to meet these standards.

A. The Applicants Lack, Or Have Effectively Mitigated, Any Horizontal Market Power

In the MBR Order, the Commission established two indicative screens: a pivotal supplier screen based on the control area's annual peak demand and a wholesale market share screen applied on a seasonal basis. If an applicant passes both screens, there is a rebuttable presumption that the applicant does not possess horizontal market power. Each indicative screen is applied with respect to "relevant geographic markets" for an applicant's generating units.

Applicants located in ISOs/RTOs possessing sufficient market structure may consider the geographic region under the control of the ISO/RTO as the relevant default geographic region for purposes of completing their generation market power analyses.[28] However, where the Commission has previously found a "submarket" to exist within a boundary of an RTO, such finding is controlling as to the scope of the relevant geographic market for all generation units located within that submarket for the application of the indicative screens and any delivered price test that may be performed. The Commission further listed several such submarkets, including PJM East ("PJME"),

[26] A letter of concurrence supporting this determination is attached in Appendix E. The ownership percentages have not changed since the date of this letter.
[27] MBR Order, FERC Stats. & Regs. ¶ 31,252 at P 62, 399, 408, 440.
[28] *MBR Order at* PP. 231 and 235.

Connecticut and Southwest Connecticut.[29] Subsequent to the MBR order, in approving a merger between Exelon Corporation and Constellation Energy Group, Inc., the Commission identified additional submarkets in PJM - PJM East of 5004/5005 ("PJM50") and PJM East of AP South ("PJMAP") - that would be relevant to an MBR analysis for applicants in the Northeast Region.[30]

As discussed below and in the attached Affidavit of Dr. John Morris contained in Appendix A, Applicants have conducted market power analyses of the entire PJM RTO, the PJME, PJM50 and PJMAP submarkets, the entire NYISO, the entire ISO-NE, the Connecticut submarket and the Southwest Connecticut submarket for the study period. The results are set forth below.

1. Indicative Screens

a. Pivotal Supplier Analysis

The pivotal supplier analysis ("PSA") focuses on the ability of a seller to exercise unilateral market power.[31] The screen assesses whether market demand can be met during peak times without the applicant and its affiliates. If demand can be met without the applicant and its affiliates, the applicant passes that the PSA screen. The Affidavit of Dr. John Morris, attached hereto as Appendix A, finds that the Applicants pass the PSA screen for all relevant markets: PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut, PJMAP, PJME and PJM50.[32]

b. Wholesale Market Share Analysis

The wholesale market share analysis ("WMSA") is applied each season to determine whether an applicant has a dominant market position based on the total number of megawatts of uncommitted capacity owned or controlled by the applicant and its affiliates in relation to the uncommitted capacity of the entire relevant wholesale electricity market.[33] The established threshold is 20 percent; a supplier who has less than 20 percent market share in the relevant market for all seasons passes the WMSA screen.

In his Affidavit Dr. Morris finds that the Applicants pass the WMSA screen for PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut and PJMAP but do not pass the WMSA screen for the PJME and PJM50 submarkets.[34]

---

[29] *Order No. 697* at P 236 (citing *Exelon Corp.*, 112 FERC ¶ 61,011, *reh'g denied*, 113 FERC ¶ 61, 299 (2005)). FERC eliminated the Northern PSEG zone as a default submarket in Order No. 697-A, P 99.

[30] Order Conditionally Authorizing Merger and Disposition of Jurisdictional Facilities, *Exelon Corporation, et al.*, 138 FERC ¶ 61,167 (2012).

[31] *AEP I* at P 72.

[32] *See* Morris Affidavit, at 15-29.

[33] *AEP I,* P 100.

[34] *See* Morris Affidavit, at 15-29.

c. Results of Indicative Screen Analysis

As shown in Dr. Morris's affidavit, Applicants therefore pass both indicative screen tests for PJM RTO, NYISO, ISO-NE, Connecticut and Southwest Connecticut and PJMAP. For PJME and PJM50, the Applicants pass the PSA but do not pass the WMSA.

2. Delivered Price Test Analysis For PJME and PJM50 Submarkets

In accordance with the MBR Order, applicants who fail either indicative screen test can rebut the presumption of market power through the submission of a delivered price test analysis ("DPT"). Applicants may submit this study at the same time that the results of the indicative screens are provided.[35] The DPT is based on two measurements of potential market power: economic capacity ("EC") and available economic capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting native load commitments from EC. Both calculations are performed for ten different season and load conditions.

In applying the DPT, "[a] showing of an HHI less than 2,500 in the relevant market for all season/load conditions for sellers that have also shown that they are not pivotal and do not possess a 20 percent or greater market share in any of the season/load conditions would constitute a showing of a lack of market power, absent compelling contrary evidence from intervenors."[36] However, while meeting these threshold benchmarks provides "safe harbor" protection, the Commission has found in numerous other cases that applicants lack market power even when they exceed one or more of the thresholds for particular study periods. As stated in *Public Service Company of New Mexico*, 115 FERC ¶ 61,090, P 38 (2006), "the Commission weights the results of both the economic and available economic capacity tests and considers the arguments of the applicant and intervenors." (footnote omitted.) [37]

---

[35] *Order No. 697,* P 76.

[36] *Order No. 697* at P 111.

[37] Indeed, in that case, the applicant was deemed "on balance" to have adequately rebutted a showing of market power mitigation for the PNM control area where the results exceeded the 20% safe harbor in two cases under the AEC measure and in all 10 cases at values between 35% and 41% under the EC measure. *See, e.g.*, *Kansas City Power and Light Company, et al.*, Docket Nos. ER99-1005-011 et al. (August 12, 2010) (finding no market power where applicant had EC market shares in the 40-60% range and had significant HHI failures in the KCPL and GMO markets); *Cordova Energy Company LLC et al,* Docket Nos. ER99-2156-011, *et al.*, November 13, 2007 (finding no market power in case where applicant had EC market shares in PACE control area between 53.1% and 60.0%, HHIs between 2,958 and 3,696 and was pivotal in 8 out of 10 periods.); *PacifiCorp*, Letter Order, Docket Nos. ER97-2801-007, *et al.*, February 1, 2007; *Tucson Elec. Power Co.*, 116 FERC ¶ 61,051 (2006)(finding market power standard satisfied where applicant had EC market shares above 20% in all ten season/load periods in the Tucson control area, exceeded the 2,500 HHI threshold in eight periods, and was pivotal in 5 periods); *PacifiCorp*, 115 FERC ¶ 61,349 (2006) (finding that applicants rebutted presumption of market power in the PacifiCorp East control area where under available economic capacity measure, market share is less than 20% in 8 season/load periods and 28% in the summer and winter off-peak periods, HHI does not exceed 2500 in any season/load period and applicants are not pivotal); *Kansas City Power & Light Co.*, 113 FERC ¶ 61,074 (2005) (finding

a. Results of the DPT for PJM50 Submarket

For both the AEC and EC, PSEG passes all screens in all periods except for the pivotal supplier screen in the Summer Top 1% period.

b. Results of the DPT for PJME Submarket

With respect to AEC, PSEG passes all the screens in all 10 periods. With respect to the EC, PSEG passes the Market Concentration screens in all periods. It also passes the Pivotal Supplier Screen in 8 of 10 periods, and passes the Market Share Screen in 6 of 10 periods. PSEG's market shares are never above 25 percent. Although greater than the 20 percent screen, PSEG's market shares are well below the 35 percent threshold that is typically used for imputing unilateral market power.

3. Analysis of DPT Results

Based on his analysis of the overall results, Dr. Morris concludes that, although PSEG fails limited number of screens, the failures are substantially below levels that typically indicate market power. As set forth in his Affidavit, Dr. Morris states that:

> Although PSEG fails some screens in the PJME destination market, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the AEC screens and all market concentration (HHI) screens for EC. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[38] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all the AEC pivotal supplier screens, and most of the EC pivotal supplier screens. This means that typically PSEG's generation is not necessary to serve load; and when its generation is necessary, its forward sale commitments are sufficient so that its uncommitted generation is not necessary to serve the remaining load. Finally, PSEG's market shares are never above 15 percent in PJM50 and for AEC in PJM East. Its market shares for EC are never above 25 percent in PJM East. Although greater than the 20 percent screen, PSEG's market shares are

---

no market power in the KCPL control area where applicant had EC market shares above 20% in all periods, exceeded the HHI 2,500 threshold in 5 of 10 periods and was pivotal supplier in 1 period); *Acadia Power Partners, L.P.*, 113 FERC ¶ 61,073 (2005) (finding no market power in the Cleco Power home control where, utilizing the EC measure, the applicant exceeded the thresholds set for all season/load periods using the market share measure, one season/load period using the market concentration measure, and for all season/load periods using the pivotal supplier measure).

[38] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

> well below the 35 percent threshold that is typically used for imputing unilateral market power.[39]

Dr. Morris's conclusion is consistent with Commission precedent finding a lack of market power in cases in which the DPT results included more instances of findings outside of the "safe harbor" thresholds and at higher levels than exist here.[40] In these circumstances, Dr. Morris's analysis successfully rebuts any inference of market power created by the WMSA screen failures for PJME.

4. Existing RTO/ISO Mitigation Rules Also Eliminate The Potential for Exercising Market Power In the PJME, PJME PJM50 and PJMAP Submarkets

PJM mitigation rules eliminate the potential for the exercise of market power in the PJME submarket. The MBR Order specifically contemplated that RTO/ISO mitigation rules may serve as evidence that any market power has been adequately mitigated. The Commission declared, "We believe the added protections provided in structured markets with market monitoring and mitigation generally result in a market where prices are transparent and attempts to exercise of market power will be sufficiently mitigated."[41] The Order on Rehearing went even further and specifically created a presumption that any potential market power had been adequately mitigated by an established and effective RTO market monitoring scheme.[42]

Taking account of the pervasive PJM mitigation rule, Dr. Morris concludes that these rules "fully address the potential for PSEG to exercise market power" in PJME.[43] Accordingly, PJM's mitigation schemes in place are sufficient to rebut any inference of market power created by the failure to pass the WMSA screens in PJME and PJM50.

In addition, in the Applicants' last triennial approval order, the Commission found that "the PJM market monitoring and mitigation rules are sufficient to address market power concerns in the PJM-East submarket."[44]

a. The Applicants Lack Transmission Market Power and Cannot Erect Entry Barriers.

In its previous order accepting PSEG's triennial market power analysis for the Northeast Region, the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding vertical market power.[45] There have been no subsequent changes in status that would reflect a departure from the characteristics the Commission relied upon in granting market-based rate authority. As demonstrated below, neither Applicants nor any of its affiliates are able to exercise vertical market power.

Applicants are not able to exercise transmission market power. Neither Applicants nor any of their affiliates, except PSE&G, own transmission assets in the U.S. other than incidental generator interconnection facilities. PSE&G owns transmission facilities in PJM but transmission service over those facilities is provided under the PJM Open Access Transmission Tariff.

In addition, neither Applicants nor their affiliates are able to exercise vertical market power in wholesale energy markets through affiliation, ownership or control of inputs to electric power production. As required by Section 35.37(e) of the Commission's regulations, Applicants provide the following information:

(1) PSE&G owns and operates a natural gas distribution system that receives interstate pipeline gas within the State of New Jersey and distributes that gas to its customers within the State of New Jersey. The distribution system consists of 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3 and peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers. Service over such distribution facilities is made available pursuant to state regulated tariffs on an open access type basis. PSE&G was granted a Hinshaw exemption from the FERC in 1954.[46] The gas distribution rates paid by PSEG Fossil to PSE&G have been set at rates approved by the BPU in an order dated May 29, 2013.

(2) Certain of the Applicants and their affiliates own sites within the Northeast Region that would be suitable for future generating facilities. These include space at many of the existing generating sites of PSEG Fossil and at the sites of PSEG Power NY and PSEG Power CT. PSEG Nuclear's Salem facility may also be suitable for future construction. PSE&G also owns certain sites that would be suitable for generating facilities, but under New Jersey's Electric Discount and Energy Competition Act, N.J.S.A 48:3-43 et seq., PSE&G is effectively barred from owning and operating

[45] *Id.*
[46] 13 F.P.C. 1348 (1954).

generation except "on site" generation for supply and Class I renewable energy resources as defined in N.J.S.A. 48:3-98.1.

(3) Neither Applicants nor any of their affiliates own or control any physical coal supply resources or own or control who may access transportation of coal supplies.

(4) As required by section 35.37(e)(4) of the Commission's regulations, Applicants and its affiliates state that they have not erected barriers to entry into any market, including the PJM, NYISO or ISO-NE market and will not erect barriers to entry into any markets.

IV. REQUEST FOR CONFIDENTIAL TREATMENT

Under separate cover via UPS Overnight this office is submitting compact disks containing the workpapers of Dr. John Morris supporting his analysis in Appendix A, as required by the Commission's April 2004 Order.[47] The CD (of which six copies are included) contains: (i) proprietary information provided by Energy Velocity under an agreement that requires confidential treatment to be requested for these materials; (ii) modeling and computer programs that are the proprietary intellectual property of Economists Incorporated, the firm which employs Dr. Morris; (iii) commercially sensitive information about Applicants and their affiliates; and (iv) documents and information deemed to be confidential by PJM and ISO-NE. Accordingly, Applicants respectfully request confidential treatment for CD and the workpapers pursuant to 18 C.F.R. § 388.112 (2006), consistent with the confidential treatment accorded other applicants submitting such proprietary and commercially sensitive data.[48] Pursuant to the Commission's rules, the public version of this filing contains all materials submitted herein except for CD, which is labeled as "PRIVILEGED AND CONFIDENTIAL/NON-PUBLIC."

V. SERVICE

This filing has been served on all parties on the official service list as currently maintained by Commission in the above-referenced dockets. Applicants are also providing a copy to the New Jersey Board of Public Utilities and the New Jersey Division of Rate Counsel.

VI. ENCLOSURES

Applicants enclose the following:

- An original filing;

[47] AEP II, 107 FERC at P 61,087-88.
[48] *See, e.g., Idaho Power Company*, Docket No. ER97-1481-009 (February 3, 2006) (submission of revised Pivotal Supplier Screen and Market Share Screen calculations including similar data).

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

- Appendix A – Affidavit of Dr. John R. Morris;[49]
- Appendix B – List of Entities with Market-Based Rates Authority and Their Generation Assets. (This is an appendix listing the filing entities and all their energy affiliates and their associated assets);
- Appendix C – List of Entities with Market-Based Rate Authority and Their Transmission Assets;
- Appendix D – List of Long Term Power Purchase Agreements;
- Appendix E – Letters of concurrence regarding the control of certain jointly owned generation facilities;
- Appendix F – Form of notice suitable for publication in the Federal Register.

[49] Compact disks, as described above, containing the workpapers for the Affidavit of John R. Morris in Appendix A are being sent concurrently with this filing via UPS Overnight. As noted *supra*, privileged treatment is being requested for Dr. Morris's confidential workpapers submitted with the non-public version of this filing.

VII. CONCLUSION.

Applicants respectfully request the Commission

(i) to accept this market power compliance filing as meeting the Commission's requirements under Order No. 697 for the continuation of market-based rate authority for Applicants PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Nuclear LLC, PSEG Fossil LLC, Pavant Solar II, LLC, Bison Solar LLC , San Isabel Solar LLC and PSEG Energy Solutions LLC;

(ii) to grant the request for confidential treatment; and

(iii) to grant such other relief or waivers as may be appropriate or necessary.

Respectfully submitted,

Public Service Electric and Gas Company
PSEG Energy Resources & Trade LLC
PSEG Power Connecticut LLC
PSEG Fossil LLC
PSEG Nuclear LLC
PSEG New Haven LLC

NOTICE OF FILING
( )

Take notice that on December 28, 2016: (i) PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Fossil LLC, PSEG Nuclear LLC, Pavant II Solar LLC, Bison Solar LLC, San Isabel Solar LLC and PSEG Energy Solutions LLC tendered for filing their joint triennial market power update in compliance with Order No. 679 and with prior Commission Orders granting them market-based rate authority in Docket Nos. ER99-3151, ER97-837, ER03-327, ER08-447 ER08-448, DR-12-1250, ER16-1926, ER16-1925, ER16-1924 and ER16-2725 respectively.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR §§ 385.211 and 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. Such notices, motions, or protests must be filed on or before the comment date. Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant. On or before the comment date, it is not necessary to serve motions to intervene or protests on persons other than the Applicant.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the "eFiling" link at http://www.ferc.gov. Persons unable to file

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

electronically should submit an original and 14 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street, N.E., Washington, D.C. 20426.

This filing is accessible on-line at http://www.ferc.gov, using the "eLibrary" link and is available for review in the Commission's Public Reference Room in Washington, D.C. There is an "eSubscription" link on the web site that enables subscribers to receive email notification when a document is added to a subscribed docket(s). For assistance with any FERC Online service, please email FERCOnlineSupport@ferc.gov, or call (866) 208-3676 (toll free). For TTY, call (202) 502-8659.

Comment Date: 5:00 pm Eastern Time on (insert date).

Report & Affidavit of
Dr. John R. Morris

December 22, 2016

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Public Service Enterprise Group Incorporated Northeast Region Market Power Study

1. Introduction

My name is Dr. John R. Morris. I am a Principal at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Washington, DC 20037. I have a bachelor's degree in economics from Georgetown University, and I have a master's degree and a Ph.D. in economics from the University of Washington. I have been studying and consulting within energy industries since joining the Federal Trade Commission in 1985. Since joining Economists Incorporated in 1992, I have consulted on many mergers involving electric and gas companies, examined competitive issues relating to utility rates, provided market power studies for applications for market-based rate authority, and studied market power issues in state restructuring proceedings. I have published articles on competition and energy matters, and I have spoken on numerous occasions concerning competition in natural gas, electric power and other industries. I have previously been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission ("FERC" or "Commission"), state commissions and in federal court. A complete listing of my experience, publications and testimony is contained in my resume, presented in Exhibit PEG-2.

Public Service Enterprise Group Incorporated ("PSEG") asked that I prepare a market power study for its subsidiaries that have market-based rate authority in the Northeast Region.[1] These subsidiaries are: Public Service Electric and Gas

[1] The Northeast Region includes ISO-New England Inc. ("ISO-NE"), Connecticut, Southwest Connecticut, New York Independent System Operator, Inc. ("NYISO"), PJM Interconnection, L.L.C. ("PJM"), PJM East, PJM East of 5004/5005 and PJM East of AP South.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

("PSE&G"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear"), PSEG Power Connecticut LLC ("PSEG Power CT"). PSEG New Haven LLC ("PSEG New Haven") Pavant II Solar LLC, Bison Solar LLC and San Isabel Solar LLC.[2] The purpose of this study is to determine whether these PSEG entities have market power in any Northeast Region market under the Commission's Pivotal Supplier Analysis ("PSA") and Wholesale Market Share Analysis ("WMSA") screens as articulated in FERC Order No. 697 and if the Applicants do fail any of the screens, whether they otherwise lack market power under the Delivered Price Test ("DPT") or are subject to sufficient mitigation to guard against any market power concerns.[3]

PSEG

PSEG is a public utility holding company headquartered in in Newark, New Jersey. Through its subsidiaries, PSEG engages in the generation, transmission, distribution and sale of electric energy, and distribution and sale of natural gas to commercial, residential, and industrial customers primarily in the Northeastern and Mid-Atlantic United States. PSEG, through its subsidiaries, owns approximately 11,300 MW of seasonal generation capacity located in the Northeast Region.[4]

---

[2] Pavant II Solar LLC, Bison Solar LLC and San Isabel Solar LLC all have QF status.

[3] *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

[4] *See* Exhibit PEG-3 (accounting for retirements).

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

PSE&G

PSE&G is a public utility operating company engaged primarily in the transmission of electricity and the provision of gas and electric distribution service in the State of New Jersey. It is New Jersey's oldest and largest investor-owned utility. PSE&G was founded in 1903 and is based in Newark, New Jersey. It is a member of the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access Transmission Tariff ("OATT") administered by PJM. The company also owns and operates 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3. During the study period, PSE&G owned less than 140 MW of solar generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities.

PSEG ER&T

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission. PSEG ER&T also makes wholesale sales of natural gas.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.,* which initiated the transition from a regulated to a competitive retail power market in New Jersey, the New Jersey Board of Public Utilities ("BPU") annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSE&G's affiliate, PSEG ER&T, has participated directly in all of the auctions for BGS supply held since 2004 and has consistently won tranches in those auctions, including auctions for BGS service within the franchised service territory of PSE&G.

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, PSE&G's FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract, which currently remains in effect, provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply. On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

ER&T provides fuel supply and power supply management activities for LIPA as of January 1, 2015.

PSEG Fossil

PSEG Fossil owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission under the umbrella of PSEG Fossil's market-based rate authority.[5] The assets of PSEG Fossil are located entirely within PJM.[6] Since the last triennial filing in 2013, PSEG Fossil has retired approximately 1,800 MW of capacity in the eastern portion of PJM. Much of this capacity was retired at the end of May 2015. We included this capacity in the Winter and Spring season screens and exclude the capacity for the Summer and Fall screens.

PSEG Fossil is approximately a 23 percent joint owner of interests in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[7] PSEG Fossil is a 50 percent co-owner with Jersey Central Power and Light Company ("JCP&L") of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to

---

[5] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

[6] PSEG Fossil's subsidiaries PSEG Power Connecticut LLC, PSEG New Haven LLC and PSEG Power New York LLC own generation units in Connecticut and New York respectively.

[7] A letter of concurrence supporting the allocation of these facilities' output based on ownership interests is attached in our workpapers.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity, nominally 400 MWs, has been assigned to JCP&L.[8]

PSEG Power CT

PSEG Power CT owns the Bridgeport Harbor and New Haven Harbor generation facilities located in the state of Connecticut within ISO-NE and is authorized to sell power at market-based rates.[9] The output of these facilities is sold to PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. PSEG Power CT is currently constructing Bridgeport 5, a 485 MW gas-fired combined cycle in Bridgeport, Connecticut, which is expected in service in 2019.

PSEG New Haven

PSEG New Haven owns and operates the New Haven facility, a gas-fired plant located in New Haven, CT that entered service in June 2012 with a nameplate capacity of 181.5 MW. The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[10] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[11] All of the energy and capacity of the New Haven facility is sold

---

[8] A letter of concurrence supporting the allocation of this facility's output to JCP&L is attached in our workpapers.

[9] *Wisvest Corporation, et al*., 101 FERC ¶ 61,166 (2002).

[10] *Re Review of Peaking Generation Projects*, Docket No. 08-01-01, Connecticut Department of Public Utility Control, June 25, 2008 ("Awards Decisions") (2008 WL 2587405 (Conn. D.P.U.C.)). The PURA is the successor to the Department of Public Utility Control (DPUC). PURA came into being in July 2011 as part of a reorganization of Connecticut state energy agencies. For consistency, this application refers to the agency as the PURA.

[11] Section 50 of Public Act 07-242, now codified at Section 16-243u of the Connecticut General Statutes.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

into the ISO-NE markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder.[12] As such, neither PSEG New Haven nor any other PSEG affiliate has operational control of the New Haven facility. As a result, the capacity of the facility is not attributable to PSEG for the purpose of this market power analysis.

PSEG Nuclear

PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission in accordance with PSEG Nuclear's market-based rate authority.[13] PSEG Nuclear is the owner of Hope Creek and a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear operates the Salem plant and Exelon Generation is the operator of Peach Bottom.[14] Since the last triennial filing, uprates at Peach Bottom and Hope Creek plants have increased PSEG Nuclear's capacity at those facilities.

---

[12] The CFD was approved on October 29, 2010 in a letter order ruling on Motion Number 62 in Docket No. 08-01-01.

[13] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

[14] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in our workpapers.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Other Subsidiaries

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities in the United States. Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the PJM region are as follows.

PSEG Power LLC is a Delaware limited liability company. It does not directly own any generation facilities or engage in any FERC jurisdictional activities but it is the parent company of several FERC jurisdictional entities, including applicants PSEG ER&T, PSEG Fossil and PSEG Nuclear.

PSEG Power Ventures LLC ("Power Ventures") is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source LLC and has an in-direct ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 349 MWs DC (274 MW AC) of solar capacity across the United States, including a combined 92 MWs (72 MW AC) of solar capacity in PJM.[15] All of PSEG Solar Source's solar capacity has obtained QF status. Because all of this capacity is QF capacity, per Order No. 816 this capacity is not included in the market power analyses.[16]

---

[15] The 42MWs are attributed to four (7) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs) Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

[16] *Refinements to Policies and Procedures for Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 816, 80 *Fed. Reg*. 67056 (2015), FERC STAT & REGS ¶ 31,374, P55 (2015), *reh'g denied and clarification*, Order No. 816-A, 155 FERC ¶ 61,188 (2016) ("… qualifying facilities that are exempt from FPA section 205 and facilities that are behind-the-meter facilities do not need to be reported in the asset appendix or indicative screens." (note omitted))

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. PSEG Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. PSEG Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a cost-based contract.[17]

PSEG Keys Energy Center LLC ("PSEG Keys"), direct subsidiary of PSEG Fossil, was formed to construct, operate, and maintain the Keys Energy Center, a 755 gas-fired combined cycle facility located in Prince George's County, Maryland. Construction began in 2015 and is scheduled to be completed in 2018. All the capacity and energy from PSEG Keys will be sold to PSEG ER&T.

PSEG Energy Solutions LLC ("PSEG Solutions") is a direct subsidiary of PSEG ER&T that is schedule to begin retail operations in the Northeast Region in

[17] *PSEG Power New York Inc.,* Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

January 2017. It has obtained market-rate authority to allow it to sell excess energy in wholesale markets.[18]

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution ("T&D") system on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco are FERC jurisdictional public utilities, as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[19]

When an applicant has affiliates in the relevant market, the Commission considers the combined capacity of all the affiliated entities in its market power assessment.[20] Accordingly, I have included the capacity controlled by PSE&G, PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear, and PSEG Power New York (which on a combined basis constitutes the capacity of all of PSEG's affiliates not excluded for a reason explained above). Future references in this Affidavit to PSEG are inclusive of the foregoing entities.

The primary purpose of this study is to determine whether PSEG passes the PSA and WMSA screen thresholds in ISO-NE, the NYISO and PJM. In the PSA, the Commission requires applicants to examine whether the generation owned by

the applicant is necessary to serve wholesale demand within a balancing authority area. The applicant first calculates the total generation capacity for an area. This is the total of generation in the balancing authority area plus the import capability to the area.[21] From this total, the applicant subtracts out firm contractual commitments, native load obligations, and operating reserves, giving uncommitted capacity for the area. Net uncommitted capacity is calculated by subtracting a wholesale load proxy from uncommitted capacity. Net uncommitted capacity is then compared to the applicant's uncommitted capacity within the area. When the applicant's uncommitted capacity is less than the net uncommitted capacity for the area, then all wholesale demand could be served without energy from the applicant and the applicant passes the PSA screen. When the applicant's uncommitted capacity is greater than the net uncommitted capacity, then the applicant does not pass the screen because its capacity is necessary to meet wholesale peak loads in the market.

In the WMSA, the Commission requires applicants to examine whether the generation owned by the applicant is 20 percent or more of the uncommitted capacity in each of four seasons under average daily peak conditions for the season. The applicant first calculates the total generation capacity for an area. The applicant then adds the import capability to the area. From this total, the applicant subtracts out planned outages and deratings, long-term firm contractual commitments, native load obligations, and operating reserves. The sum gives the total uncommitted capacity. The applicant then calculates its share by dividing its uncommitted capacity by the total uncommitted capacity. When the applicant's share is less than 20 percent, the applicant passes the WMSA screen.

---

[21] Import capability is the lesser of either the simultaneous import limit ("SIL") into the area or available capacity in interconnected balancing authority areas. Available capacity is equal to total generation capacity in an area less outages and derating, a native load proxy and operating reserves.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

The Commission presumes that an applicant does not have market power when it passes both the PSA and WMSA screens. If the applicant fails either of the screens, then the applicant may present other analyses to demonstrate that it does not possess market power. Alternatively, the applicant may propose mitigation measures or accept the Commission's default mitigation measures to demonstrate that it has mitigated market power.

2. New England

2.1. Overview of Electric Power Markets in New England

New England operates a competitive wholesale power market. Substantial restructuring has taken place in New England, and many of the vertically integrated utilities have sold either most or all of their generation assets. The traditional utilities often have standard offer obligations to serve retail customers, but utilities often fulfill these obligations by securing supplies in competitive wholesale markets. For example, a utility may secure contracts in which the supplier agrees to provide power for 30 percent of the utility's standard offer obligation. The transmission system is managed by ISO-NE. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

2.2. Geographic Markets

In the case of generation wholly located in an RTO, such as ISO-NE, the Commission accepts the RTO as the relevant destination market.[22] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[23] In New England,

[22] Order No. 697 at PP 231, 235.

[23] Order No. 697 at P 236.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

the Commission has identified two submarkets: Connecticut and Southwest Connecticut.[24] PSEG owns the Bridgeport Harbor plant in Southwest Connecticut. PSEG also owns the New Haven Harbor 1 unit in Connecticut and PSEG New Haven owns the New Haven facility. When the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[25] Accordingly, the PSA and WMSA are provided for the ISO-NE balancing authority area, and also for Connecticut and Southwest Connecticut.

2.3. Data Sources and Analysis

The data source for generation is ISO-NE Seasonal Claimed Capability (SCC) Reports.[26] Summer and winter capacities were taken from the November 2015 report. Planned outages are from the ISO-NE Form 714. Planned outages for Connecticut and Southwest Connecticut are prorated based on their shares of the total generation capacity in ISO-NE. PSEG's generation capacity in ISO-NE consists of the New Haven facility, New Haven Harbor and Bridgeport Harbor. PSEG's Northeast Region generation facilities are presented in Exhibit PEG-3.

Load data for ISO-NE are from Energy Velocity. Energy Velocity also provides load data by New England ISO zone, thus loads are calculated by sub-market as well. PSEG load obligations in New England come from PSEG's agreements to supply standard offer generation within Rhode Island. The data were supplied by PSEG.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Import capability was taken from the ISO-NE's December 20, 2016 FERC filing.[27] This report indicates that the simultaneous transfer limits in all seasons is 4,548 MW for the ISO-NE as a whole, 3,050 MW for Connecticut, and 2,370 (Spring) to 3,200 MW (Summer) for Southwest Connecticut. PSEG has no firm transmission rights into New England.

Operating reserves are calculated as follows. ISO-NE Operating Procedure No. 8 specifies spinning reserves (or 10-minute reserves) equal to the size of the loss of the largest unit times a Contingency Reserve Adjustment Factor ("CRAF").[28] The CRAF in 2015 was 1.25.[29] The largest unit is the 1,400 MW (summer capacity) Seabrook Unit 1. In addition, 30-minute reserves require capacity to cover 50 percent of the loss of a second contingency (i.e., the second largest unit) plus 160 MW for daylight-savings time periods and 180 MW during standard time (i.e., winter). The second largest unit is the 1,200 MW (summer capacity) Millstone Unit 3. Thus, in total, operating reserves are 2,510 MW in summer.[30] Operating reserves for Connecticut and Southwest Connecticut are based on resource needs in forward reserve auctions for 2015.[31]

2.4. Results

Exhibit PEG-4 summarizes the results for the PSA and the WMSA in New England. Exhibit PEG-5 shows the calculations to determine whether PSEG is a

pivotal supplier in the three New England destination markets. PSEG passes the PSA screen in all areas. Exhibit PEG-6 presents the WMSA results for the destination areas in New England. PSEG easily passes the WMSA in all areas.

3. New York

3.1. Overview of Electric Power Markets in New York

New York also has a competitive wholesale power market. Substantial restructuring has taken place in New York, and the investor-owned vertically integrated utilities have sold either most or all of their generation assets. These utilities often have standard offer obligations to serve retail customers, and utilities can fulfill these obligations by securing supplies in competitive wholesale markets. The transmission system is operated by the NYISO, which also operates a competitive wholesale market. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

3.2. Geographic Markets

In the case of generation wholly located in an RTO such as the New York ISO, the Commission has accepted the RTO as the relevant destination market.[32] PSEG only owns generation in Albany, New York. In addition, when the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[33] Accordingly, the PSA and WMSA are provided for the NYISO only.

[33] Order No. 697 at footnotes 215, 217.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

3.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Operations database. Planned outages are from the FERC Form 714. PSEG's generation capacity in New York consists of its ownership of the Bethlehem Energy Center in Albany, which has winter capacity of 845 MW. Information for PSEG's Northeast Region generation is presented in Exhibit PEG-3.

Load data for NYISO were downloaded from Energy Velocity.

Import capability comes from the most recent NYISO SIL filing as of December 19, 2016.[34] This filing indicates that ISO simultaneous import capability ranges from 6,850 MW in spring to 7,695 MW in summer. NYISO does not recognize physical imports, accordingly, all the SIL import capability is allocated pro rata, except for a 265 MW reservation that PSEG has from PJM to New York on the Linden VFT DC transmission line.

Operating reserves are calculated as follows. The NYISO Locational Reserve Requirements specify 30-minute total reserves equal to twice the 10-minute reserve necessary to replace the operating capability loss caused by the most severe contingency under normal transfer conditions. Thus, the operating reserves for the NYISO are 2,620 MW for each season.[35]

3.4. Results

Exhibit PEG-7 shows the calculations to determine whether PSEG is a pivotal supplier in New York, and PSEG passes the PSA screen. Exhibit PEG-8 presents the WMSA results for New York, and PSEG easily passes the WMSA.

4. PJM

4.1. Overview of Electric Power Markets in PJM

PJM operates a competitive wholesale power market and serves as the regional RTO for an area that covers all or parts of 13 states and the District of Columbia. PJM also plans and operates the transmission system within the RTO. Monitoring Analytics acts as the market monitor, and has a market power mitigation program in place to identify and mitigate any potential exercise of market power.

4.2. Geographic Markets

PSEG owns both generation and transmission facilities in PJM. In the case of generation wholly located in an RTO such as PJM, the Commission has accepted the RTO as the relevant destination market.[36] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[37] In PJM, the Commission has identified three submarkets: PJM East ("PJME"), PJM East of 5004/5005 ("PJM50") and PJM East of AP-South ("PJMAP").[38] The PSA and WMSA are provided for PJM and for the PJME, PJM50 and PJMAP sub-markets.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

4.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Ops database. Generation within PJM was assigned to submarket consistent with the definitions in PJM's SIL Study.[39] Planned outages are from the FERC Form 714. In addition, for the sub-market analysis, planned outages were allocated to PJME based on the share of total PJME generation, by season. Information for PSEG's generation in PJM and PJME is presented in Exhibit PEG-3.

Load data for PJM was downloaded from Energy Velocity. Energy Velocity also provides load data by PJM zone, thus loads are calculated for the PJM sub-markets as well.

Import capability was taken from the 2015 Simultaneous Import Limit Study Report.[40] This report indicates simultaneous transfer limits of 11,997 MW in the winter and 7,600 MW in summer. Additionally, this report indicates transmission capabilities of the PJM sub-markets. The report conservatively uses the reported SIL as the SIL amount to be allocated pro rata. This is a simplifying assumption because PSEG has no firm transmission reservations into PJM and it effectively excludes the additional 8,500 MW of firm reservations into PJM in the base case of the SIL study.

Stats, & Regs. ¶ 31,268 (2008) at P 90; Order Conditionally Authorizing Merger and Disposition of Jurisdictional Facilities, *Exelon Corporation, et al.*, 138 FERC ¶ 61,167 (2012).

[39] PJM Interconnection, L.L.C., *Informational Filing of 2015 Simultaneous Import Limit Study Report for PJM Region*, Docket No. AD1-2-007, September 2, 2016, Accession No. 20160902-5155.

[40] *Id*.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Operating reserves are calculated according to PJM Manual 13 as the sum of Day Ahead Scheduling Reserves (Operating), Contingency (Primary) and Synchronized (Spinning Reserve) Requirements.[41]

Data on PSEG's long-term contracts come from PSEG. The contracts were included in the area where the energy is delivered under the contract. For contracts delivered to the Western Hub in PJM, the contracts were included in the PJM, PJM50, and PJMAP destinations and not the PJME destination.

4.4. Results

Exhibit PEG-9 summarizes the results for the PSA and the WMSA in PJM. Exhibit PEG-10 shows the calculations to determine whether PSEG is a pivotal supplier in the four PJM destination markets. PSEG passes the PSA screen for all four destinations. Exhibit PEG-11 presents the WMSA results for the destination markets in PJM. PSEG easily passes the WMSA in PJM and PJM east of AP South, but has greater than a 20 percent market share in the PJM East and PJM East of 5004/5005 destination markets.

5. Delivered Price Test

When an applicant does not pass either the PSA or WMSA for a destination market, the Commission invites the applicant to provide additional information via a delivered price test ("DPT"). PSEG requested that I perform a DPT for the PJM East and PJM East of 5004/5005 sub-markets. Accordingly, I now discuss the DPT for these sub-markets.

[41] PJM Manual 13 - Emergency Operations, at 17, available at http://pjm.com/~/media/documents/manuals/m13.ashx

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

5.1. Overview of the DPT

The DPT utilizes substantially more information than the PSA or the WMSA, including additional information on generation ownership, generation costs, demand conditions, and transmission limits. The Commission considers two types of capacity: Economic Capacity ("EC") and Available Economic Capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting load commitments from EC. EC and AEC are calculated for a number of different seasonal and load conditions.

Because we do not know the firm retail obligations of the competitive suppliers, as explained below, the AEC calculation is based on the assumption that market participants serve load in proportion to their generation capacity and that 70 percent of load obligations are contracted more than one year from delivery.

For both the EC and AEC measures, the Commission prescribes three screens: (1) a pivotal supplier screen; (2) a market share screen; and (3) a Herfindahl-Hirschman Index ("HHI") screen. The HHI is the sum of the squared market shares of the firms in the market. So a market with four firms of market shares of 40, 30, 20, and 10 percent would have an HHI of 3,000 (this is calculated as $40^2 + 30^2 + 20^2 + 10^2 = 1{,}600 + 900 + 400 + 100 = 3{,}000$). A monopolist would produce a HHI of 10,000 and 10 equally-sized firms would produce a HHI of 1,000.

Although the Commission has not drawn bright lines for its review of DPT results, it has given general guidance. When (1) the applicant is not pivotal; (2) the applicants' market share is less than 20 percent; and (3) the HHI is below 2,500, the Commission is likely to conclude that the applicant does not have market power. The three standards establish a "safe harbor" for lack of market power, unless intervenors present clear and convincing contrary evidence. The Commission has also determined in some cases that an applicant did not have

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

market power when the analysis showed isolated HHI and market share results above screening levels. Finally, despite the DPT results, the Commission may conclude that an applicant does not have market power if other evidence, such as historical sales data, indicates that the DPT results do not reflect the actual competition in the marketplace.

A detailed description of data sources and methods to prepare the data for the DPT is presented in Exhibit PEG-12. An overview of the sources and methods used at Economists Incorporated for conducting the DPT is presented here.

The DPT is calculated for 10 representative periods, three for each of three seasonal conditions plus a summer super peak period. The three seasons are spring/fall, summer, and winter. Each season is divided into (1) top 10 percent of peak hours; (2) remaining peak hours; and (3) off-peak hours. In addition, there is a summer super peak period which is comprised to the top 1 percent (10 hours) of summer peak hours. These ten periods cover the range of load conditions for each season, and for the year as a whole.

The primary source for generation data is Energy Velocity. In addition to generation capacity, Energy Velocity provides data on ownership (including holding companies), fully-loaded heat rates, emission rates, and generation availability. Generation is included for all of PJM and NYISO, which is the only first-tier balancing authority area in which PSEG owns generation. Unit capabilities are derated to account for seasonal maintenance and likely plant unavailability due to forced outages. Because demand in PJM peaks in summer and winter, the planned outages are assumed to be during the spring/fall season.

The transmission system is represented by contract paths between balancing authority areas and within PJM. Limits between regions in PJM are from Energy Velocity.

Market prices come from hourly prices reported by PJM.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

As in the PSA and WMSA, load data come from Energy Velocity. To compute load requirements for market participants, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[42] To account for their greater load obligations, we assume that Dominion, which does not operate in a restructured retail market, has 100 percent responsibility for its allocation of load and that AEP, which operates in a partly restructured retail market, has 90 percent of its allocation as opposed to the standard 70 percent.

The DPT and market share calculations were calculated using the Power Acquisition Screening System developed at Economists Incorporated. The mathematical details are presented in Exhibit PEG-13.

5.2. Results of the DPT for PJM50 Sub-market

The results of the DPT for PJM50 are presented in Exhibit PEG-14. The top part of the exhibit shows the results for AEC. PSEG passes the Pivotal Supplier Screen in all 10 periods. PSEG also passes both the Market Share Screens and the HHI Screens in all 10 periods.

The lower part of Exhibit PEG-14 shows the results for EC in PJM50. PSEG passes all the screens in all the periods, except for the pivotal supplier screen in the Summer Top 1% period.

[42] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers in restructured markets.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

5.3. Results of the DPT for PJME Sub-market

The results of the DPT for PJME are presented in Exhibit PEG-15. The top part of the exhibit shows the results for AEC. PSEG passes all the screens for AEC.

The lower part of Exhibit PEG-15 shows the results for EC in PJME. PSEG passes the Market Concentration screens in all periods. It passes the Market share screens in six of ten periods, and its market share is never more than 25 percent. It passes the pivotal supplier screen in eight of ten periods.

5.4. Analysis of the DPT Results

Although PSEG fails some screens, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the AEC screens and all market concentration (HHI) screens for EC. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[43] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all the AEC pivotal supplier screens, and most of the EC pivotal supplier screens. This means that typically PSEG's generation is not necessary to serve load; and when its generation is necessary, its forward sale commitments are sufficient so that its uncommitted generation is not necessary to serve the remaining load. Finally, PSEG's market shares are never above 15 percent in PJM50 and for AEC in PJM East. Its market shares for EC are never above 25 percent in PJM East. Although greater than the 20 percent screen, PSEG's

[43] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

market shares are well below the 35 percent threshold that is typically used for imputing unilateral market power.[44]

5.5. Mitigation

PJM has a Commission-approved market monitoring and mitigation plan in place to ensure that generation facilities cannot exercise market power. The Commission has stated that Commission-approved market monitoring and mitigation plans are sufficient to mitigate market power in RTO markets.[45] In particular, the Commission found in connection with PSEG's last triennial filing that the PJM market monitoring and mitigation rules are sufficient to address market power concerns.[46]

Under the local market power mitigation procedures in PJM, if a supplier fails the "three pivotal supplier test" (TPS), it is offer-capped by the Market Monitor. The Market Monitor's TPS test is applied on an ongoing basis, potentially as frequently as every 5 minutes, to reflect day-ahead and real-time operating conditions. These offer caps provide direct protection against the exercise of locational market power by suppliers in PJME, PJM50, PJMAP and elsewhere.

The protection against the exercise of market power is enhanced by "must offer" requirements under PJM's Operating Agreement. These mandate that generation resources that are used to meet capacity requirements in PJM and

---

[44] *See*, *e.g.*, U.S. Department of Justice, 1984 Merger Guidelines, at Section 3.12, available at https://www.justice.gov/sites/default/files/atr/legacy/2007/07/11/11249.pdf ("the Department is likely to challenge the merger of any firm with a market share of at least one percent with the leading firm in the market, provided the leading firm has a market share that is at least 35 percent.")..

[45] Order No. 697 at P 241.

[46] *See* October 14, 2014 letter order approving Applicants' prior triennial market update in Docket No. ER10-1789-003 et al. at page 3.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

that are not subject to an outage must offer their available capacity in PJM's day-ahead energy market.[47] PJM has also implemented a Reliability Pricing Model (RPM) to secure sufficient capacity to meet its requirements through a series of auctions, including a Base Residual Auction (BRA) held annually for capacity 3 years in advance, and incremental auctions held at varying intervals prior to the delivery year. Various features of the RPM process work to prevent the exercise of market power in capacity markets in PJM. First, the RPM model includes bid cap rules designed to mitigate the potential exercise of market power. Second, RPM includes a must-offer requirement pursuant to which all generating units that have available capacity must bid into the RPM auctions or face disqualification from being recognized as capacity resources (and therefore from receiving any capacity payments) in the delivery year.

In addition to the local market power mitigation described above, the presence of market monitoring within PJM lessens potential concerns that PSEG might be able to exercise market power notwithstanding the indicative DPT screens. The Market Monitor has the specific responsibility under the market monitoring plan to monitor the potential of any market participant to exercise market power. To perform its market monitoring function, the Market Monitor can file reports or complaints with the Commission and other government agencies to address various market concerns including market power. The Market Monitor can also make its view known to the Commission staff and PJM members in cases where PJM does not follow its recommendations concerning complaints or requested rule changes. In addition, the Market Monitor can consult with regulatory bodies, including state commissions, regarding the need for specific investigations and monitoring activities, and to consider and evaluate additional enforcement mechanisms. The Market Monitor can also act on specific

[47] *See* PJM Operating Agreement at 1.10.1A(d).

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

complaints that have been filed by market participants to examine any potential market power issues.

In sum, the local market power mitigation rules, the role of the Market Monitor, the existence of must-offer requirements and PJM's RPM auctions address the potential for PSEG to exercise market power.

6. Vertical Market Power

In determining whether the market-based rates are in the public interest, the Commission also considers whether the Applicant has transmission market power or can erect barriers to entry.[48] None of these factors are relevant in the instant case. First, other than incidental generator interconnection facilities and the transmission assets owned by PSE&G in PJM, no transmission assets are owned by the Applicants or any of their affiliates in ISO-NE and NYISO. Transmission service over PSE&G's transmission facilities is provided under the PJM Open Access Transmission Tariff. Thus, consistent with Commission precedent, Applicants have alleviated any concerns regarding potential transmission market power. Second, PSEG has no ability to erect barriers to entry. As explained in Applicants' previous initial applications for market-based rate authority and triennial market power reports, PSEG is unable to erect barriers to entry. There has been no change in facts since the submission of those applications that would alter this conclusion.

The Commission is concerned with the ownership of natural gas pipelines or natural gas distribution facilities and the possibility that they may be used to exercise market power in electricity markets. PSEG does not own or operate any

[48] Order No. 697 at PP 397, 399.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

FERC jurisdictional natural gas pipelines in PJM, ISO-NE or NYISO.[49] PSE&G owns natural gas distribution facilities in the State of New Jersey including peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers.

7. Conclusion

PSEG and its subsidiaries do not have market power in New England, New York or PJM. PSEG is not a pivotal supplier in New England, New York or PJM. PSEG's market shares in the WMSA are below the Commission's 20 percent screening threshold in each of these market areas. PSEG is also not a pivotal supplier in the Connecticut or Southwest Connecticut sub-markets and its market shares in the WMSA are below 20 percent in these sub-markets. PSEG fails the WMSA screens in only the PJME and PJM50 sub-markets. For these sub-markets, we conducted a DPT analysis. PSEG passes all the DPT screens for the PJM50 submarket, and it only fails the Market Share Screen in the PJME submarket. Its market shares are never above 25 percent, a level that the Commission has accepted in other market-based rate matters.[50] As such, they are not evidence of actual market power.

---

[49] PSEG Power LLC currently owns a 10 percent interest in the PennEast Pipeline Company LLC which has filed an application with FERC for construction and operation of a gas transmission line.

[50] *See*, *e.g.*, *Dogwood Energy, LLC*, 135 FERC ¶ 61,089 (2011) (under the AEC measure, Dogwood failed the market share screen in seven of ten periods, with market shares ranging from 32.7% to 39.6%); *Kansas City Power & Light Company and KCP&L Greater Missouri Operation Company*, Docket No. ER10-2074-001 et al., Supplement to Change in Status Filing at 11 (Feb. 4, 2013) (accepted by Letter Order, November 22, 2013) (market shares for AEC ranging from 17 to 36%); *Shell Energy N.A. (US), L.P.*, 135 FERC ¶ 61,090 (2011) (under the AEC measure, Shell failed the market share screen for seven of ten periods, with market shares ranging from 29.3% to 37.0%); *Calpine Energy Services, L.P.*, 137 FERC ¶ 61,085 at P 21 (2011) (under the AEC measure, Calpine failed the market share screen in all ten periods, with market shares ranging from 20.4% to 28.9%); *Wildcat Power Holdings, LLC*, 136 FERC ¶ 61,013 at P 14 (2011) ("When the available economic capacity measure is used, Wildcat Power's market shares range from 22 to 24 percent in the three summer super peak and winter

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Further, PSEG operates under New England's, New York's, and PJM's market power mitigation programs, which mitigate PSEG's potential market power. Therefore, under standards for market-based rate authority articulated by the Commission in Order No. 697, PSEG has no ability to exercise market power in the relevant markets, and maintaining market-rate authority in New England, New York and PJM would be in the public interest.

Therefore, I recommend that the Commission continue to authorize PSEG to sell electric power in Northeast Region wholesale markets at market-based rates.

super peak season/load periods and zero percent in the remainder of the season/load periods."); *LS Power Marketing*, LLC,139 FERC ¶ 61,140 at P 23 (2012) (under the AEC measure, LS Power failed the market share screen in all ten periods, with market shares ranging from 20.4% to 28.9%); *Gila River Power, L.P.*, Docket Nos. ER05-1178-015, et al., Second Supplement to Updated Market Power Analysis at 4 (Jan. 12, 2011) (accepted by Letter Order, April 5, 2011) (market shares for AEC ranging from 21 to 23% in four season/load periods).

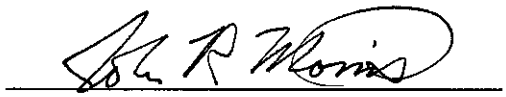
Pursuant to 28 U.S.C. §1746, I state under penalty of perjury that the foregoing is true and correct to the best of my information, knowledge, and belief.

Executed on this 22rd day of December 2016.



John R. Morris, Ph.D.
Principal
Economists Incorporated

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

EXPERIENCE AND QUALIFICATIONS OF

Dr. John R. Morris

OVERVIEW	Dr. Morris, a recognized expert in studying competition in energy industries, currently is a Principal at Economists Incorporated. He began his research of competition in energy industries in 1985 while working for the Federal Trade Commission. Since joining Economists Incorporated in 1992, he has consulted on many mergers and acquisitions involving energy companies, examined competitive issues relating to rates, and studied issues in state restructuring proceedings. He has published articles on competition and energy matters, and he has spoken on numerous occasions concerning competition in natural gas, electric power and other industries. He has been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission, state regulatory commissions, and in federal court.
EDUCATION	Ph.D., University of Washington, August 1985 Dissertation: *Intellectual Property: Creating, Pricing, Copying* • M.A., University of Washington, December 1983 • A.B., Georgetown University, May 1981
PRESENT POSITION	Dr. Morris is a *Principal* at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Suite 1100, Washington, DC 20037. (202-223-4700) Economists Incorporated studies competition and regulation in many industries in the United States and in other countries. It is a leading firm in studying the competitive effects of mergers and acquisitions.
PREVIOUS EXPERIENCE	*Senior Vice President*, Economists Incorporated, December 2001 – December 2002 • *Vice President*, Economists Incorporated, December 1995 – December 2001 • *Senior Economist*, Economists Incorporated, June 1992 – December 1995 • *Economic Tutorial Leader*, Stanford University (Stanford in Washington), April 1993 – June 1995 • *Visiting Assistant Professor,* Department of Business Economics and Public Policy, School of Business, Indiana University, September 1991 – May 1992 • *Assistant to the Director for Antitrust,* Bureau of Economics, Federal Trade Commission, November 1989 – August 1991 • *Economic Advisor,* Office of Commissioner Machol, Federal Trade Commission, December 1988 – October 1989 • *Economist,* Division of Antitrust, Bureau of Economics, Federal Trade Commission, October 1985 – December 1988
MEMBERSHIPS	Member, International Association of Energy Economics • Associate, Energy Bar Association • Member, American Economic Association • Member, Western Economic Association International • Associate, American Bar Association

Notes:

[1] PSEG Fossil has a 22.5% interest in the Conemaugh coal-fired units.

[2] PSEG Global has a 4% interest in the Conemaugh Hydroelectric facility.

[3] PSEG Fossil has a 22.84% ownership interest in the Keystone facility.

[4] PSEG Nuclear has a 57.41% interest in the Salem Nuclear facility.

[5] PSEG Fossil has a 50% interest in the Yards Creek facility. Yards Creek is operated by Jersey Central Power & Light, and thus is controlled by JCP&L in the analysis.

[6] PSEG Nuclear has a 50% interest in the Peach Bottom Nuclear facility.

DATA AND ASSUMPTIONS FOR ECONOMISTS INCORPORATED'S DELIVERED PRICE TEST STUDY FOR PSEG

This exhibit describes data and assumptions used in the delivered price test study ("study") carried out by Economists Incorporated for PSEG. Because the data are voluminous, we provide them in electronic workpapers. In those workpapers, the Files.xlsx spreadsheet provides a brief description of the organization of the data files.

This Exhibit has six sections. Section I discusses the study's representative periods. Section II discusses the geographic region and balancing authority areas. Section III discusses generation resources, including adjustments to generating capacity for seasons, maintenance, water availability, and long-term contracts. Section IV discusses transmission, including transmission pricing and losses. Section V discusses market prices. Section VI discusses the load data.

I. Periods

The study calculates market shares and concentration indexes for electric energy for ten representative periods during the year. The year is divided into three seasons (spring/fall, summer and winter). Spring/fall and winter seasons are divided into three periods based on days of the week, times of day and load levels. Summer is divided into four periods based on days of the week, times of day and load levels. Each calculation of market shares and concentration indexes reflects average conditions (e.g., average loads) during one of the resulting ten periods during the year (e.g., Summer Low Peak).

The study places each of the periods in each season into three condition categories: off-peak, low peak, and spike. Transmission pricing (see Section

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

IV.B below) and plant availability (see Section III.A.2 below) vary among these three categories.

Table I-1 summarizes the ten periods for the destination markets.

Table I-1– Definition of Ten Periods for Destination Market

Number	*Season*	*Time*	*Condition*	*Hours*	*Description**
1	Spring/Fall	Top 10%	Spike	203	Top 10% of peak hours
2	Spring/Fall	Peak	Peak	1829	Remaining peak hours
3	Spring/Fall	Off-peak	Off-Peak	2360	Off-peak hours
4	Summer	Top 1%	Spike	11	Top 1% of peak hours
5	Summer	Top 10%	Spike	106	Top 10% of peak hours
6	Summer	Peak	Peak	950	Remaining peak hours
7	Summer	Off-peak	Off-Peak	1152	Off-peak hours
8	Winter	Top 10%	Spike	101	Top 10% of peak hours
9	Winter	Peak	Peak	907	Remaining peak hours
10	Winter	Off-peak	Off-Peak	1152	Off-peak Hours

Note: *Peak hours include hours ending 8 a.m. through 11 p.m. Eastern Time weekdays, excluding six major holidays. Off-peak hours = Hours ending 12 a.m. through 7 a.m. on weekdays and all weekend and holiday hours.

The Off-peak periods are all NERC holidays and weekend hours plus weekdays from the hour ending at midnight EPT until the hour ending at 0700.[1] The Off-peak periods have off-peak transmission pricing and plant availability.

In order to define the Top 1% and Top 10% periods for a given season, we removed all Off-peak hours from that season. We then ranked the remaining (peak) hours based on load levels in the destination market by season. We then defined as the Top 1% as the 1 percent of these remaining hours in which loads in the destination market were highest and the Top 10% as the highest 10 percent of peak hours based on load levels. These periods have spike transmission pricing and plant availability.

[1] Major holidays are New Year's, Memorial Day, 4th of July, Labor Day, Thanksgiving and Christmas. Major holidays are included in the Weekend period.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

The Peak periods are weekdays from the hour ending at 0800 until the hour ending at 2300 EPT, excluding hours in the Top 10% periods and major holidays. The Low Peak period has on-peak transmission pricing and plant availability.

II. Geographic Coverage and Market Areas

The study includes market areas that correspond to the balancing authority areas used by the North American Electric Reliability Council (NERC), and PJM submarkets as defined by FERC. Table II-1 lists these market areas and their abbreviations. There are two study destination markets, PJM East and PJM East of 5004/5005.

Table II-1– List of Eastern Market Areas and Study Destinations

Abbreviation	*Full Name*	*Study Destination*
PJME	PJM East	Yes
PJM50	PJM East of 5004/5005	Yes
PJMS	PJM East of AP South	
PJM	PJM	
NYISO	New York ISO	

III. Generation

A. Generation Capacity and Ownership

The study includes generating units located in the areas that are (1) connected to the power grid, (2) not exclusively used for self-generation, and (3) either in a plant used primarily for electric generation or a Qualifying Facility.

1. Generating Unit Data

The study uses data for summer and winter capability at the unit level reported in the Energy Velocity (EV) database available from Ventyx. The units include all

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

units with a status of operating, standby, cold standby, restart, mothballed, testing, or under construction that went online before November 30, 2015 and with a retirement date after November 30, 2015. We exclude generation units that are less than 5 MW unless they are owned by PSEG.

2. Ownership

The study uses relies on Ventyx determination of plant and unit ownership. When Ventyx reports a holding company, the ownership is assigned to the holding company. For PSEG generation, the study relies upon Appendix B data from market-based rate filings and updates from the companies to determine plant ownership and seasonal capability. Operational control of PSEG units is consistent with the methodology used for market-based rates.

3. Seasonal variation in capability

The study uses seasonal capability data from EV. Spring/fall capacities are the average of summer and winter capacities.

4. Adjustments to Generating Capability

The generating capability figures used for each period are obtained by multiplying the seasonal capabilities by an availability factor, which is based on the period, unit location, and NERC General Availability Data Systems (GADS) category of the unit. The GADS database gives national average operating information for generating units by unit type and size. For example, it gives data for coal-fired steam units with capacities between 300 MW and 399 MW.

For each period and each generating unit, the availability factor adjusts for the following.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

a) Unplanned outage rates by GADS category

For a given GADS category, the study assumes that unplanned (forced) outage rates (as a share of generating capability available after allowing for planned outages) are constant across seasons and generating units throughout the Region, regardless of owner. Based on GADS data for 2007 through 2011, the study calculates an equivalent forced outage rate (EIFOR), which measures the share of generating capability in a GADS category that is not available because of forced outages. The computation is EIFOR = (FOH)/AH, where FOH is number of forced outage hours and AH is total hours available for generation after planned outages (but before forced outages).[2]

b) Planned outage rates by GADS category and season

With four exceptions (hydro, pumped storage, wind, and solar units), the study assumes that the planned outage rate is constant for all generating units for a given GADS category and season. For a given GADS category, the share of hours of generating capability that is not available as a result of planned outages is computed as (POH + POEH)/PH; where PH are the period hours, POH are the hours not available because of planned outages, and POEH are the hours not available because of planned outage extensions

The study assumes that balancing authority areas are both summer and winter peaking. Therefore, the study assumes that all planned outages for thermal units occur during spring/fall.

[2] EIFOR differs slightly from the EFOR provided in the GADS data. EIFOR provides a better measure of a forced outage rate for peaking units that are operated a small percentage of the year.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

c) Variation in hydro availability across seasons and periods

In general, utilities use hydro facilities to generate energy during the hours when energy prices are highest, subject to constraints imposed by availability of water and reservoir capacity. In order to incorporate these constraints, the study proceeds in the following manner.

First, the study uses EIA Form 923 monthly production data for the period 2011 to 2015 to compute average hourly hydro generation by season. Average hourly generation is then divided by hydro capability to give an average hourly hydro operating rate by season.

Second, depending upon the level of the hydro operating rate for a given season, the study calculates availability factors for the spike, low peak and off-peak periods. When the historical seasonal operating rate is below 30 percent, the availability factor for each period in the season is set equal to the operating rate; the 30 percent figure is an assumed “run of river” constraint. The study assumes that prospectively the maximum operating rate is 90 percent; this is the assumed “maximum rate” constraint. When the historical seasonal operating rate is above 90 percent, the availability factor for each period is set to 90 percent.

When the seasonal operating rate is above the run of river constraint and below the maximum rate, we reason that the hydro generator owner would be likely to produce a higher level of energy during spike hours, when energy prices are highest, than during low peak hours, and that the owner would be likely to produce a higher level during low peak than during off-peak hours.

Based on this reasoning, when the seasonal operating rate is between the run of river constraint and the maximum rate, as is the case for each of the three

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

seasons, the study uses a spike availability factor of 90 percent, which is the assumed maximum operating rate, and off-peak availability factor of 30 percent, which is the assumed run-of-river constraint, and a calculated availability factor for the peak periods, as described below.

The seasonal peak availability factor is calculated using actual total seasonal hydro generation. The study then computes the hydro generation during all spike and off-peak hours, assuming the generation rates implied by the spike and off-peak derate factors computed in the manner described above. The study then calculates total peak hydro generation as the difference between total seasonal hydro generation and the sum of hydro generation during all spike and off-peak hours. The seasonal low peak availability factor is computed as total low peak hydro generation divided first by the number of hours in the off-peak period and then by hydro generating capacity.

d) Variation in pumped storage availability across seasons and periods

We assume that pumped storage units have 90 percent availability during Top 1% and Top 10% periods, 50 percent availability during Low Peak periods, and no availability during off-peak periods.

e) Wind availability

For each area, we calculate average operating rates from 2011 to 2015 by season from EIA-923 data. The average operating rates are the availability factors.

f) Solar availability

Availability for solar power is also calculated based on average operating rates from 2011 through 2015 reported in EIA-923. There is little solar power during

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

off-peak periods because of darkness. Accordingly, solar availability is weighted to on-peak periods.

B. Variable Costs of Generation

The study uses variable costs of generation that include fuel costs, sulfur dioxide and nitrogen oxide emissions costs, and variable operations and maintenance (VOM) costs. The study calculates fuel costs from unit heat rates and Platts' Gas Daily spot prices at the unit's reported natural gas hub by Energy Velocity, #2 Diesel, Low-Sulfur – Industrial for the East Coast, and Residual Fuel Oil sales to end users for the East Coast for the test period. Natural gas prices vary by hub, but were $2.67 per mmBtu at TETCO M3, the hub with the largest reported capacity in the study. Fuel costs for other fuels are based upon the average fuel costs reported in the EV data for each fuel type. Emissions prices during the test year were $2 per ton for SO2 year-round and $300 per ton for NOx in the summer season. CO_2 costs for units located in Regional Greenhouse Gas Initiative (RGGI) states are $5.21/ton, which is based upon RGGI Auction results in Dec 2014. Units in Montgomery County, MD have an additional $5/ton carbon tax on CO_2 emissions. VOM costs are from the EV database.

C. Long-term Contracts

We reviewed Appendix B data from market-based rate filings, FERC Form 1 filings, and Electric Quarterly Report ("EQR") data to obtain data on long-term contracts. Where the market-based rate filing indicates a change of operational control, we include a contract transferring control to the buyer. We leave the generation unit in the BAA where it is physically interconnected to the transmission system. When the buyer is a load-serving entity in another BAA, we give a priority firm transmission path to the BAA with the load.

Long-term contracts that expire prior to January 1, 2015 are not included in the study. Long-term contracts that expire between January 1, 2015 and July 31,

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

2015 are included only in the seasons for which they are in effect. Contracts that expire after August 31, 2015 are included in the study.

IV. Transmission

A. Transmission Network

The study incorporates a contract path transmission network for modeling purposes. Transmission pricing between balancing authority areas is represented by a traditional contract path transmission network in which the direct physical connections between balancing authority areas are also the individually priced links from which contract paths are constructed.

B. Transmission and Ancillary Services Pricing and Losses

As specified by the Commission's Appendix A, the study generally uses ceiling prices for transmission service from Schedules 1, 2 and 8 of the utility's *pro forma* open-access transmission tariff. Transmission providers may require transmission customers to purchase ancillary services under Schedule 1 (scheduling, system control and dispatch) and Schedule 2 (reactive supply and voltage control). Schedule 8 gives the rates for non-firm point-to-point transmission service. The study uses transmission prices from tariffs.

When we have tariffs available, we calculate rates for off-peak, peak and spike categories. Because of discounting and the nature of baseload purchases, off-peak rates are often lower than peak rates.[3] We use two steps to determine off-peak rates. Step 1: When a utility posts off-peak hourly rates, we use the posted rates. Step 2: When a utility does not post off-peak hourly rates, we calculate an hourly off-peak rate based on other tariff information. To calculate hourly off-

[3] For transactions longer than one hour, the *pro forma* tariff caps the amount that the purchaser pays per day by the daily rate, and the amount that the purchaser pays per week by the weekly rate.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

peak rates, we divide the weekly rate by 168, the number of hours in a week. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

We use similar steps to determine peak rates. Step 1: When a utility posts maximum hourly rates in its tariff, we use the maximum tariff rates. Step 2: When a utility does not post off-peak hourly rates, we calculate a peak rate based on other tariff information. To calculate hourly peak rates, we divide the weekly rate by 80—the "Appalachian" method. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

For spike periods, we use ceiling hourly rates from tariffs, when available. Otherwise, we use the Appalachian method.

Whenever practical, the study uses loss rates from tariffs. When these methods did not provide a loss rate for a particular utility, the study assumes that losses are three percent per utility.[4] The study assumes that transmission customers pay losses in-kind. That is, if area A exports 100 MW to area B and the losses are 3 percent, only 97 MW arrive at area B.

For areas where tariffs are not available, rates and losses are the average by period for all the reporting areas.

C. Transfer Capability and SILs

The geographic market includes only PJM and NYISO. The SILs for PJM East and PJM East of 5004/5005 comes from the 2015 Simultaneous Import Limit

[4] Losses of 3 percent are representative of the industry. See, FERC Open Access NOPR, *FERC Stats & Regs*, ¶32,514 at 33,150 (1995).

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Study filed by PJM on September 2, 2016.[5] The total imports into the destination markets may be less than the actual ability to import into the destination because not all the generation capability owned or controlled by load-serving entities within the destination markets studied in PJM have been identified in the data.

V. Market Prices

The study used December 2014-November 2015 real-time hourly prices from the RTO LMP for PJM East and PJM East of 5004/5005. Table V-1 shows the PJM East of 5004/5005 market prices in each of the ten periods, and Table V-2 shows the PJM East market prices.

Table V-1 – PJM East of 5004/5005 Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$148.44	-----
Top 10%	$62.03	$64.59	$185.57
Low Peak	$35.73	$35.56	$47.55
Off-Peak	$29.46	$24.88	$50.16

Table V-2 – PJM East Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$145.63	-----
Top 10%	$57.82	$63.88	$193.51
Low Peak	$32.73	$29.67	$50.59
Off-Peak	$26.67	$21.25	$50.94

VI. Load and Contract Obligations for AEC Calculations

Load data come from PJM for PJM and from Energy Velocity for the other supply areas.

To compute load requirements for market participants in New York and PJM, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[6] To account for their greater load obligations, we assume that Dominion has 100 percent responsibility for its allocation of load and that AEP has 90 percent of its allocation as opposed to the standard 70 percent.

[6] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers.

This Exhibit describes the methods used to calculate market shares and concentration in destination markets.

Allocation of scarce transmission capability is accomplished using linear and nonlinear programs that model generation dispatch and the contract path transmission system. This Exhibit provides an overview of the structure of the programs and presents the equations.

Overview of Linear Program

The linear program models control areas as nodes in a transmission system. Each node has a demand for and a supply of electric energy. The supply is based on the generators at the node and potential deliveries to the node via transmission links from other control areas. The linear program allows for net import and export limits to and from an individual control area. Given generation capability and costs and transmission capability and costs, the linear program finds the least-cost solution that satisfies the specified loads. Costs are defined as dispatch (generation) costs plus transmission costs including losses plus the default cost for "unserved" load. For each solution, the linear program determines the quantities produced in, exported from, and imported into each control area.

The Mathematical Equations

The linear program to be solved is given below:

Minimize Total Cost: $Cost = GC + TC + UC$

Subject to:

(1) Generation: $TG_a = \sum_{u}^{u \in a} G_{a,u}$ for each area *a*;

(2) Imports: $YI_a = \sum_{b}^{a,b \in network} (1 - h_{b,a}) T_{b,a}$ for each area *a*;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

(3)	Exports:	$YE_a = \sum_{b}^{a,b \in network} T_{a,b}$	for each area *a*;
(4)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(5)	Supply/Demand Balance:	$TG_a + Y_a + U_a = D_a$	for each area *a*;
(6)	Generation Cost:	$GC = \sum_{a} \sum_{u}^{u \in a} d_{a,u} G_{a,u}$	for each area *a*;
(7)	Transmission Cost:	$TC = \sum_{a,b}^{a,b \in network} r_{a,b} T_{a,b}$	for each path *a* to *b*;
(8)	Unfilled Demand Cost:	$UC = \sum_{a} pU_a$	for each area *a*;
(9)	Generation Limits:	$g\min_{a,u} \le G_{a,u} \le g\max_{a,u}$	for each unit *u* in each area *a*;
(10)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(11)	Net Import Limits	$Y\min_{a} \le Y_a \le Y\max_{a}$	for each area *a*;

where:

a,b	are subscripts for control/transmission areas;
Cost	is total system cost;
$d_{a,u}$	is the dispatch cost of unit *u* in area *a*;
D_a	is demand for power in area *a*;
$G_{a,u}$	is generation output of unit *u* in area *a*;
GC	is total system generation cost;
$G\max_{a,u}$	is the maximum output of unit *u* in area *a*;
$G\min_{a,u}$	is the minimum output of unit *u* in area *a*;
$h_{b,a}$	is the fraction of power lost to resistance from moving power from area *b* to area *a*;
N	is a subscript to identify simultaneous transmission constraint *n*;
P	is the default price;
$r_{a,b}$	is the transmission rate from area *a* to area *b*;

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

$T_{a,b}$	is the power flow from area *a* to area *b*;
TC	is total system transportation expenses;
TG_a	is total generation output in area *a*;
$t\max_{a,b}$	is the maximum power flow from area *a* to area *b*;
$t\min_{a,b}$	is the minimum power flow from area *a* to area *b*;
U	is a subscript to identify units in an area;
U_a	is the amount of demand in area *a* not met by generation or imports
UC	is total system cost of not meeting demand;
Y_a	is net imports into area *a*;
YE_a	is total exports from area *a*; and
YI_a	is total imports into area *a*;
$Y\min_a$	is minimum net imports in area *a;*
$Y\max_a$	is maximum net imports in area *a.*

This linear program is solved using the BDMLP solver in GAMS. In order to calculate concentration for different destinations, seasons, and periods, the PASS GAMS program loops through the destinations, seasons, and periods with calls to Solvers to solve the linear programs. Loads, unit availability and transmission availability are adjusted for each season-period combination.

Calculating Concentration

Transmission allocation is accomplished in four steps. In the first step the linear program finds the net-back prices in all control areas given a price at the destination control area equal to 105 percent of the pre-merger price. Suppose the pre-merger price at the destination, control area A, is $20/MWh. Then all generation capability with a dispatch cost of $21/MWh or less in the destination area would be included in the market because $21 is 105 percent of $20. If transmission cost (including losses) is $5/MWh from control area B to A, then the net-back price at B would be $16/MWh, which is the $21/MWh less the $5/MWh transmission cost between B and A. Then, all generation capability at B with dispatch costs equal to or less than $16/MWh would be included in the market if there were no transmission constraints. Calculation of net-back prices is

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

accomplished by setting the default price, *p*, equal to 105 percent of the pre-merger price at the destination, setting load at the destination to a high number and loads elsewhere to zero, setting transmission limits high enough so that the transmission system is not constrained, and setting a limited amount of generation in each area with a zero dispatch cost. The shadow prices produced by the linear program will be *p* at the destination and the relevant net-back prices in other areas.

In the second step, one calculates Economic Capacity (EC) and Available Economic Capacity (AEC) in each area. These values are then used to limit generation capability. The ownership shares of AEC and EC are calculated for each node in the system.

In the third step, the linear program determines the amount of energy that can be imported into an area given available EC (or AEC) and limits on transmission capacity. This is accomplished by limiting generation in each area to the capacity amount (EC or AEC), giving generation outside the destination market a lower cost than generation inside the destination market, and minimizing cost to serve a large load at the destination market. The amount of generation supplied to the destination is the maximum that can be imported into the destination market.

In the fourth step, transmission is allocated by the following non-linear program:

Minimize Loss: $$Loss = \sum_{\alpha}\left(\frac{C_{\alpha}^{2}}{Y_{Dest}s_{\alpha}} - 2C_{\alpha}\right)$$

Subject to:

(1) Pre Shares: $$s_{\alpha} = \frac{C\max_{\alpha}}{\sum_{\beta} C\max_{\beta}}$$ for each area α;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

(2)	Allocated Shares:	$A_\alpha = \frac{C_\alpha}{Y_{Dest}}$	for each area α;
(3)	Imports:	$YI_a = \sum_b^{a,b \in network} (1 - h_{b,a}) T_{b,a}$	for each area *a*;
(4)	Exports:	$YE_a = \sum_b^{a,b \in network} T_{a,b}$	for each area *a*;
(5)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(6)	Supply/Demand Balance:	$C_a + Y_a + U_a = D_a$	for each area *a*;
(7)	Capacity Limits:	$c\min_a \le C_a \le C\max_a$	for each area *a*;
(8)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(9)	Max Import Limit	Y_{Dest} = Maximum imports from step 3;	

where:

a,b	are subscripts for control/transmission areas;
α,β	are subscripts for control/transmission areas other than the destination market;
s_α	Is area α's share of capacity outside of the destination;
A_α	is area α's share of allocated capacity outside of the destination;
Loss	is the loss function to be minimized.

The loss function is derived from the weighted squared-errors between the pre-allocation shares and the post-allocation shares, where Y_{Dest}/s_α are the weights. For each source control area, the weighted squared-error is given by:[1]

$$W_\alpha = \frac{Y_{Dest}}{s_\alpha}(A_\alpha - s_\alpha)^2.$$

[1] This exposition ignores the adjustments necessary to give priority to minimum transfer levels from a source area to the destination.

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Accordingly, the sum of the weighted squared-errors gives rise to the loss function, which can be seen by:

$$\begin{aligned} Loss &= \sum_{\alpha} W_{\alpha} \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha} - s_{\alpha})^2 \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha}^2 - 2 s_{\alpha} A_{\alpha} + s_{\alpha}^2) \\ &= \sum_{\alpha} \left(\frac{C_{\alpha}^2}{Y_{Dest} s_{\alpha}} - 2 C_{\alpha} \right) + \text{constant}. \end{aligned}$$

The resulting shares from minimizing this loss functions preserve the relative shares of capacity behind any transmission constraint going to the destination. This can be seen from the following LaGrangian equation to be minimized:

$$L = \sum_{i} \left(\frac{C_i^2}{Y_{Dest} s_i} - 2 C_i \right) + \lambda \left(T - \sum_{i} C_i \right),$$

where *T* is the transmission limit affecting control areas *i*. The first order conditions are:

$$\frac{\partial L}{\partial C_i} = \frac{2 C_i}{Y_{Dest} s_i} - 2 - \lambda = 0,$$

which can be rearranged to give:

$$A_i = \frac{C_i}{Y_{Dest}} = \left(\frac{2 + \lambda}{2} \right) s_i,$$

which shows that the allocated market shares of those areas affected by the transmission constraint are proportional to their shares of capacity before the transmission allocation. Moreover, this is the only transmission allocation

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

method that maintains the relative shares of capacity behind any binding transmission constraint in the allocation process.

This non-linear program is solved using the COINIPOPT solver in GAMS. The calculated capacities from the nonlinear program above less transmission losses determine the capacities for the market share calculations for sources outside of the destination market. The capacities within the destination market are given full weights.

Market concentration is the HHI, which is the sum of the squared market shares. Mathematically,

$$HHI = \sum_{i=1}^{n} S_i^2,$$

where S_i is the allocated share of firm *i* and *n* is the number of firms in the market. The summary sheets combine all the firms with shares of 0.7 percent or less (other than Applicants) into the "Other" category. The collective share of the Other category does not directly enter the HHI calculation other than the represented capacity as each independent entity enters the HHI calculation. For example, if ten firms with 0.5 percent shares were in the Other category, the HHI contribution of the Other category would be 0.625 (= 10 x .5 x .5 = 10 x .0625) and ***not*** 25.

Re: Joint Owners of the Conemaugh Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Conemaugh Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Conemaugh Electric Generating Station:

1. The Owners jointly own the Conemaugh Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in East Wheatfield and West Wheatfield Townships, Indiana County, Pennsylvania (the "Station").

[1] Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Conemaugh Power LLC	3.72%
Constellation Power Source Generation, Inc.	10.56%
Duquesne Conemaugh LLC	3.83%
Exelon Generation Company, LLC	20.72%
PPL Montour, LLC	16.25%
PSEG Fossil LLC	22.50%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.45%
UGI Development Company	5.97%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

Sincerely yours,

Georgianna R. Stenger

Re: Joint Owners of the Keystone Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Keystone Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Keystone Electric Generating Station:

1. The Owners jointly own the Keystone Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in Plumcreek, South Bend and Cowanshannock Townships, Armstrong County, Pennsylvania, and Armstrong Township, Indiana County, Pennsylvania (the "Station").

[1] Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Constellation Power Source Generation, Inc.	20.99%
Duquesne Keystone LLC	2.47%
Exelon Generation Company, LLC	20.99%
Keystone Power LLC	3.70%
PPL Montour, LLC	12.34%
PSEG Fossil LLC	22.84%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.67%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

Sincerely yours,

Georgianna R. Stenger
Administrative Manager

Carol Peterson
Vice President Finance
Exelon Nuclear
4300 Winfield Road
Warrenville, IL 60555

Letter Regarding Control of Jointly-Owned Nuclear Facilities

Dear Ms. Peterson:

In connection with its upcoming compliance filings pursuant to Order No. 697,[1] PSEG Nuclear LLC ("PSEG") is submitting this letter in order to set forth its understanding of, and is requesting Exelon Generation Company LLC's ("Exelon") concurrence on, the respective level of control exercised by both companies with respect to the two nuclear facilities that they jointly own.[2]

PSEG avers and requests Exelon's concurrence on the following:

1. PSEG and Exelon jointly own and control two nuclear power plants, Peach Bottom Atomic Power Station located in Delta, PA and the Salem Nuclear Generating Station in Lower Alloways Creek, NJ.

2. In accordance with the Joint Owners Agreement for Peach Bottom dated November 24, 1971, as amended on thereafter, between the Parties, PSEG and Exelon each own 50% of the generating station. Under the Agreement, Exelon is the designated operator of Peach Bottom.

3. In accordance with the Joint Owners Agreement for Salem dated November 24, 1971, as amended thereafter, between the Parties, Exelon owns 42.59% and PSEG owns 57.41% of the generating station. Under the Agreement, PSEG is the designated operator of Salem.

4. Section 4.1 of each of the Joint Owners' Agreements states, "The signatories shall be entitled to shares of the installed capacity, available capacity, operating capacity and hourly energy generation of the Station in proportion to their ownership . . .."

[1] *Market-Based Rates For Wholesale Sales Of Electric Energy, Capacity And Ancillary Services By Public Utilities*, 119 FERC ¶ 61,295 (2007).

[2] PSEG has requested a letter of concurrence from Exelon in order to facilitate the Commission's review of the market power analysis submitted by PSEG with respect to facilities it jointly owns with Exelon. Exelon has no objection to PSEG's submission of this letter as part of PSEG's compliance filing,.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Thomas P. Joyce
Senior Vice President

P.O. Box 236, Hancocks Bridge, NJ 08038
tel: 856.339.1100 fax: 856.339.1104
email: Thomas.Joyce@pseg.com

PSEG
Nuclear L.L.C.

5. Section 11.1 of each of the Joint Owners' Agreements provides that the generating station will be operated by the party designated as operator for the mutual benefit of PSEG and Exelon.

6. In Order No. 697 the Commission stated that under "where a jointly-owned generation facility is operated by one of the joint-owners for the benefit of and on behalf of all of the joint-owners . . . it may be reasonable to allocate capacity based on ownership percentages...." Order No. 697 at P 188.

7. In accordance with the guidance provided in Order No. 697 and with the language of each of the joint owners' agreements, PSEG and Exelon should be deemed to control each of the nuclear facilities' output in line with their proportionate ownership share of each facility. As such, PSEG and Exelon should each be deemed to control 50% of Peach Bottom's output, and PSEG should be deemed to control 57.41% of Salem's output with Exelon controlling 42.59%.

Please indicate Exelon's concurrence to the above by executing the Acknowledgement and Agreement section below.

Sincerely

Thomas P. Joyce
Senior Vice President – Operations

Acknowledged and Agreed to

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

JOINT LETTER OF CONCURRENCE

Regulations of the Federal Energy Regulatory Commission (the "FERC") require each public utility with market-based rate authority to file an updated market power analysis every three years in accordance with a schedule adopted in *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 697, FERC Stat. & Regs., Regulations Preambles ¶ 31,252 (2007) ("Order No. 697"). See, 18 CFR § 35.37(a)(1). Each public utility with market-based rate authority may also be required to file a change-in-status report regarding certain changes in circumstances that occur between the dates on which its triennial market power analyses are filed. 18 CFR § 35.42. Among other matters, the market power analysis is to address the amount of generation capacity that the affected utility owns or controls. Where more than one public utility owns a generating facility, FERC requires the utility that is submitting a market power analysis seek a "letter of concurrence" from the other affected co-owning public utilities that identifies the degree to which each public utility controls the generating facility, and to submit the letter with its filing. *See* FERC Order No. 697, 119 FERC ¶ 61,295, P 187 (2007).

The Yards Creek Pumped Storage Hydroelectric Project (the "Yards Creek Project") is a FERC-licensed pumped-storage hydroelectric project with a nameplate capacity of 400 MWs, and is located in Pahaquarry and Blairstown Townships, in Warren County, New Jersey. *See* FERC Project No. P-2309.

PSEG Fossil LLC ("PSEG") and Jersey Central Power & Light Company ("JCPL") each own, as tenants in common with the other, an undivided 50% interest in the Yards Creek Project. Accordingly, if and when PSEG or JCPL submit an updated market power analysis to the FERC, each will be subject to FERC's requirement to seek a "letter of concurrence" regarding the degree to which each controls the Yards Creek Project.

Both PSEG and JCP&L (and their affiliates) own transmission facilities and provide wholesale electric service in the Northeast region, as defined in Order No. 697. Pursuant to the schedule adopted in Order No. 697, PSEG and JCP&L are each required to submit an updated market power analysis to the FERC for markets within the Northeast region in December 2010. PSEG and/or JCP&L may also be obligated to file a change-in-status report or other market power analyses before its subsequent triennial market power analysis for the Northeast region is scheduled to be filed. Therefore, for the sole purpose of enabling either PSEG or JCP&L to submit a market power analysis that addresses, among other issues (to the extent necessary), the scope of each party's control of the Yards Creek Project, PSEG and JCP&L each aver and agree as follows:

1. JCP&L operates and maintains the Yards Creek Project pursuant to the Yards Creek Pumped Storage Hydroelectric Generating Station Operating Agreement, which is dated October 6, 1965 (the "Operating Agreement').

2. Article 2 of the Operating Agreement designates JCP&L as holding sole responsibility for the operations and maintenance the Yards Creek Project. Article 2 further provides that JCPL shall operate the Yards Creek project in the same manner as if JCPL had the complete ownership interest in the Yards Creek Project.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

3. JCP&L does, in fact, operate and control the Yards Creek Project in the same manner as if JCP&L had the complete ownership interest in the Yards Creek Project in accordance with Article 2 of the Operating Agreement.

4. Accordingly, PSEG and JCP&L each agree and concur that for the purpose of the market power analyses required by Order No. 697, JCPL shall be deemed to control the Yards Creek Project generation capacity and electric energy output.

ACKNOWLEDGED AND AGREED:

Richard P. Lopriore

[i] PSEG Fossil has a 22.5% interest in the Conemaugh coal fired plants.								
[ii] PSEG Global has a 4% interest Conemaugh Hydroelectric plants.								
[iii] PSEG Nuclear has a 50% interest in the Peach Bottom Nuclear Plants.								
[iv] PSEG Nuclear has a 57.41% interest in the Salem Nuclear Plants.								
[v] JCP&L – Jersey Central Power & Light Company								
[vi] PSEG Fossil has a 50% interest in each of the Yards Creek facilities.								
[vii] CL&P – The Connecticut Light and Power Company.								
[viii] PSEG Power Ventures has a 100% ownership in PSEG Hackettstown LLC.								
[ix] PSEG Power Ventures has a 100% ownership interest in PSEG Solar Source LLC								
[x] All solar assets are using AC MW ratings. PSEG's previous triennial listed the DC ratings.								
[xi] PG&E -- Pacific Gas and Electric Company								
[xii] PSE&G started installations of pole units in September of 2009. As of November 30, 2016, a total of 174,630

Dear Secretary Bose:

On December 28, 2016, PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG Fossil LLC, PSEG Nuclear LLC, PSEG New Haven LLC, Pavant Solar II LLC, San Isabel Solar LLC, Bison Solar LLC, and PSEG Energy Solutions LLC, ("Applicants") jointly submitted their updated market power analysis in support of their continued eligibility to engage in market-based rate transactions. This letter clarifies that, in addition to the approvals sought in the December 28, 2016 filing, Applicants (other than Public Service Electric and Gas Company and PSEG Energy Solutions LLC) ("Generator Applicants") are seeking the waivers set forth in Order No. 807, *Open Access and Priority Rights on Interconnection Customer's Interconnection Facilities*, Order No. 807, 150 FERC ¶ 61,211, Docket No. RM14-11-000 (2015).

Generator Applicants do not own or control any transmission facilities other than the interconnection facilities necessary to interconnect with the transmission grid. The generator interconnection facilities that Generator Applicants own and control are limited and discrete radial facilities that do not form an integrated transmission grid and are used solely to interconnect Generator Applicants' facilities to the grid. Generator Applicants

20171004-5176 FERC PDF (Unofficial) 10/4/2017 4:38:44 PM

affirm to the Commission that they (together with their affiliates) are eligible for priority rights and waiver under Order No. 807, *Id.* at P 165, such that Generator Applicants and their affiliates are immune from the Open Access Requirements to the extent set forth under Order No. 807, without the need for further filings or orders.

Thank you for your attention to this matter.

Respectfully submitted,

Cara J. Lewis

Dear Secretary Bose:

On December 28, 2016, PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG Fossil LLC, PSEG Nuclear LLC, PSEG New Haven LLC, Pavant Solar II LLC, San Isabel Solar LLC, Bison Solar LLC, and PSEG Energy Solutions LLC, ("Applicants") jointly submitted their updated market power analysis in support of their continued eligibility to engage in market-based rate transactions.

Applicants' application included the Report & Affidavit of Dr. John R. Morris ("Morris Affidavit"), which contained the following exhibits: PEG-2; PEG-3; PEG-4; PEG-5; PEG-6; PEG-7; PEG-8; PEG-9; PEG-10; and PEG-11. In the instant filing, Applicants are resubmitting the above-mentioned exhibits to the Morris Affidavit in Excel format as required by the Commission's regulations.

Thank you for your attention to this matter.

Respectfully submitted,

Cara J. Lewis

Washington, D.C. 20426

Re: Order No. 580
Docket No. RM 94-14-000

Dear Secretary Bose and Deputy Secretary Davis:

In accordance with 18 CFR § 35.33(d), attached is the financial reports furnished by our trustee, Mellon Bank, for PSEG Nuclear LLC's ("PSEG") Qualified and Non-Qualified Nuclear Decommissioning Trust Funds for the year ending December 31, 2012.

On December 31, 2012 assets in the trust funds totaled $1,505,604,227.68, included in this balance are amounts collected through FERC jurisdictional rates totaling $14,694,132.34. This total represents the contributions and earnings on the funds since its inception in 1988. During 2011, there were no contributions made to the PSEG trust funds.

If you have any questions, or would like to see the detailed information that comprise the numbers shown on the Mellon Bank statements, please contact Peter Caruso at (973) 430-5222.

Sincerely,

Alexander C, Stern

Alexander C. Stern

Notifications

IRS CIRCULAR 230 NOTICE: To the extent that this message or any attachment concerns tax matters, it is not intended to be used and cannot be used by a taxpayer for the purpose of avoiding penalties that may be imposed by law. For more information about this notice, see http://www.northerntrust.com/circular230.

Please note that this report has been created using the best available data. This report may also contain information provided by third parties, derived by third parties or derived from third party data and/or data that may have been categorized or otherwise reported based upon client direction - Northern Trust assumes no responsibility for the accuracy, timeliness or completeness of any such information. If you have questions regarding third party data or direction as it relates to this report, please contact your Northern Trust relationship team.

The term "Tax Credit" refers to local market terminology for the taxation associated with an income event. It makes no representation or warranty relating to the ability of the recipient to utilise the value as a "credit", "offset" or other benefit for their own tax purposes. Investors should seek their own tax advice relating to the specific tax considerations of investments in such markets. The Tax Credit is informational only data in the context of this report.

Please note where a client may be eligible to reclaim taxes, these are calculated and accrued for as a tax recoverable on ex date. The net amount may include the accrual of withholding taxes, tax credits or both.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

PJM Interconnection, L.L.C.	)	**Docket Nos. ER18-1314-000**
	)	**ER18-1314-001**
	)	
	)	

PROTEST OF EXELON CORPORATION

PJM Interconnection, L.L.C. ("PJM") has filed two alternative tariff revisions seeking approval under Section 205. Neither is just and reasonable. But Option B is particularly indefensible. By forbidding resources receiving compensation under state environmental programs from making offers reflecting that compensation, Option B makes the Commission's markets less efficient, procures redundant capacity, and distorts energy markets—while drawing arbitrary distinctions between favored and disfavored programs. The Commission should reject PJM's filing.

INTRODUCTION

PJM declares—as its filing's core premise—that when states choose to make payments that recognize the environmental benefits of renewable and nuclear generators, states are "distorting" price signals, and action is needed to redress the supposed distortion.[1] The effect of PJM's requested relief, under either option, will be to pad profits for fossil-fuel generators, on the backs of customers forced to pay more. Option B would prevent state-supported clean generators from clearing *at all*, replacing them with polluting units. Perversely, that will not just force customers

[1] PJM, Capacity Repricing or in the Alternative MOPR-Ex Proposal: Tariff Revisions to Address Impacts of State Public Policies on the PJM Capacity Market at 25-26, 45, Docket No. ER18-1314-000 (Apr. 9, 2018) ("PJM Filing"); *see also id.* at 6, 15, 20, 34, 36, 37, 38, 39.

to pay higher electricity prices, but also will inflict on customers the *additional* costs of grappling with the pollution Option B has created. In three respects, PJM's premise is wrong, and the relief it seeks is badly misguided.

First, PJM's filing ignores basic economics, and gets the nature of the "distortion" exactly backwards. Sound economics recognizes that some generators emit harmful pollutants imposing costs on society, which clean generators avoid—known as "externalities." And sound economics understands that when states tax polluting generators, or pay clean generators for their environmental value, they do not "distort" price signals. They reduce distortions and account for true economic costs and benefits. The only *distortion* comes from treating clean and polluting generators as the same when they are not. For decades, fossil-fuel generators have reaped profits without paying for the pollution they have imposed on society. They now have prevailed upon PJM that not only should they be allowed to continue their free ride, but that PJM should adopt market rules designed to *frustrate* states' modest attempts to compensate clean generators that help to avoid this harm.

Second, PJM's view is inconsistent with the Commission's market design and bedrock principles of federalism. While the "Commission's policies are fuel-neutral,"[2] the Commission has long recognized that the real world is *not*.[3] If *no one* addresses environmental externalities, the Commission's markets could never achieve their goal to provide for "the selection of the least-cost set of resources."[4] So the Commission has designed its markets to complement efforts by other authorities—state and federal—to regulate in this gap. In particular, states have long exercised authority as regulators of "facilities used for the generation of electric energy"[5] to

[2] *ISO New England Inc.*, 162 FERC ¶ 61,205, at P 26 (2018) ("CASPR Order").
[3] *Infra* at 18-22.
[4] CASPR Order at P 21.
[5] 16 U.S.C. § 824(b)(1).

regulate and tax emitting generators and to compensate clean generators for their environmental value. While PJM implies that states forfeited this authority when they chose to restructure retail markets, it cites nothing to support this claim—which is badly misguided. Under our federal system, these programs are in the heartland of states' authority. Thus, both federalism and sound economics require accommodating state efforts to address environmental externalities by allowing state-supported resources to make auction offers reflecting that support (as Option A would do). But these principles also require that those offers be allowed to influence the market price (which Option A would prevent). And in all events, these principles cannot tolerate the result that Option B would yield—forcing customers to pay more to buy capacity from resources that pollute, by preventing clean, state-supported resources from clearing.

Thus far, the Commission's actions have always accorded with the sound principles set forth above—recognizing that when generators receive payments reflecting environmental benefits or other services not captured by the Commission's markets, bids should not be mitigated, because they reflect generators' true economic costs and benefits. PJM's departure from these principles would yield results that are especially untenable because even PJM acknowledges that over the medium term, markets must evolve—one way or the other—to address "currently unvalued" environmental externalities. There is no reason to adopt efficiency-reducing "reforms" that move the markets in the *opposite* direction of what PJM admits is the "theoretical ideal market approach."[6] The Commission should thus reject PJM's filing.

Third, PJM's proposals are not consistent with the Federal Power Act's mandate "to encourage the orderly development of plentiful supplies of electricity … at reasonable prices."[7]

[6] PJM Filing at 54.
[7] *PJM Interconnection, L.L.C.*, 155 FERC ¶ 61,157, at P 30 n.39 (2016) (quoting *Pub. Utils. Comm'n of Cal. v. FERC*, 367 F.3d 925, 929 (D.C. Cir. 2004)).

That mandate is amply satisfied in PJM today. Supplies are plentiful, new gas resources continue to enter the market, and prices paid by customers are historically low. PJM hypothesizes that state environmental programs may undermine investor confidence and reduce willingness to invest. But investors have understood for well over a decade that states can, and do, regulate to affect the generation mix's environmental profile. The possibility that states would continue marching along the path they have set by *expanding* these environmental policies—via joining cap-and-trade programs, reducing emissions permits, or promoting emissions-free generation by increasing renewable targets or maintaining emissions-free nuclear facilities—is just one of many regulatory risks that sophisticated investors consider. With no evidence of any genuine problem—that supply is tightening, that investors are unwilling to invest, or that market participants are incapable of factoring in these regulatory risks as they do myriad other risks—it would not be just and reasonable to approve tariff reforms whose main consequence is to increase the prices paid by customers. Instead, the Commission should continue to narrowly apply mitigation as it traditionally has done in PJM: to new resources, not existing resources, in order to prevent the exercise of buyer-side market power. In short, the Commission should let the market work.

Finally, to the extent that the Commission does believe action is warranted, any just and reasonable capacity market reform must respect five fundamental principles:

(1) The Commission should allow the mix of resources selected by the capacity market to reflect the impact of state programs addressing environmental externalities. Under basic economics, identifying the least-cost set of resources requires accounting for environmental effects. State environmental programs thus complement the Commission's markets to produce a more efficient outcome.

(2) The Commission should approach state environmental programs in a spirit of cooperative federalism. Under the Federal Power Act's division of authority, and pursuant to their historic police powers, states have traditionally regulated the environmental effects of generation. The Commission should respect that role, accepting that state environmental programs will influence which capacity resources are in the market, what costs those capacity resources will need to recover from the market, and what the ultimate market price will be.

(3) The Commission should avoid forcing customers to overprocure capacity. If the Commission adopts market changes that do not allow state-supported resources to clear, the result will be unnecessary overprocurement: Customers will continue to support the environmentally friendly resources their states seek to encourage, and those resources will still provide capacity to the system (though without compensation). Yet customers will be forced to pay for additional capacity that appears to be needed only because the Commission has chosen to ignore the state-supported resources. That is not just or reasonable.

(4) The Commission should treat all government support in an even-handed and nondiscriminatory manner. Distinctions among forms of government support should reflect genuine differences in how the policies affect wholesale markets. Otherwise, those distinctions are arbitrary and are not just or reasonable.

(5) The Commission should avoid taking actions in capacity markets that will worsen existing price suppression in energy markets. Price suppression in energy markets is already a big problem, as PJM admits. Capacity market changes cannot be just and reasonable if they risk exacerbating these problems.

Option B (also called MOPR-Ex) satisfies none of these principles. *First*, it selects an inefficient set of resources by countermanding, rather than accommodating, state environmental policies. It would select an inefficient coal unit at the margin in place of an emissions-free nuclear plant, even though the nuclear plant is lower cost after accounting for environmental externalities.

Second, Option B does not respect the legitimacy of state regulation. Option B works from the theory that, once states decided to depend on wholesale markets for resource adequacy, they forfeited their power to encourage clean over polluting generation.[8] That view is inconsistent with the Federal Power Act ("FPA"), under which states continue to regulate electric generation facilities, even when they sell at wholesale. It is also bad policy. Organized wholesale markets exist because states have decided they are valuable. If states must forfeit core historic police powers—their authority to legislate for "the protection of the lives, limbs, health, comfort, and quiet of all persons"[9]—as the price of admission, then many states may decide that the price is too high. The Commission's policy has always been to complement, not countermand, state environmental programs.

Third, Option B would over-procure capacity and inflate costs. It would require PJM to ignore capacity provided by a state-supported nuclear resource whose mitigated capacity offer is too high to clear, and instead procure redundant capacity. That result is particularly perverse because nuclear plants are the highest-performing and most reliable capacity resources.

Fourth, Option B draws a host of arbitrary distinctions among programs that have equivalent economic effects on wholesale prices. It does so because Option B is the product of a political logroll, not a just and reasonable economic theory. Indeed, before flip-flopping, PJM was

[8] PJM Filing at 21.
[9] *Metro. Life Ins. Co. v. Massachusetts*, 471 U.S. 724, 756 (1985) (quotation marks omitted).

against Option B—telling stakeholders that it could not "recommend[]" this approach because it was "not sustainable."[10] Likewise, the Independent Market Monitor ("IMM") has long opposed many of the exemptions that Option B creates, accepting them only as part of back-room dealmaking with stakeholders that, otherwise, favored the status quo.

For example, Option B exempts certain RPS programs based on whether the state procurement process is sufficiently "competitive and non-discriminatory" to satisfy the IMM. Yet as PJM concedes, RPS programs affect wholesale market prices by inducing the entry of new resources that would be unprofitable without state support. If the goal of Option B is to prevent state policies from affecting wholesale prices, there is no basis for mitigating nuclear and offshore wind, but exempting solar and onshore wind. Option B also arbitrarily excludes from mitigation recipients of non-environmental state subsidy programs, as well as federal production tax credits and tax incentives such as the wind Production Tax Credit and solar Investment Tax Credit. These subsidies indisputably affect wholesale market prices, including by increasing how often energy prices fall below zero. Option B likewise arbitrarily excludes resources that would not be cost-competitive if forced to rely on PJM market revenues alone, but which are able to maintain operation due to guaranteed cost recovery through retail rates. PJM acknowledges that 25% of the resources in the RTO receive guaranteed cost recovery through retail rates. Thus, if the Michigan Public Service Commission decides to promote a zero-emissions policy by allowing the Donald C. Cook Nuclear Plant to recover any market losses through retail rates, no mitigation is applied. But if the Illinois Commerce Commission pursues the same policy by allowing Quad Cities to sell Zero Emission Credits to retail utilities, mitigation is applied. That distinction is indefensible.

[10] *Infra* at 42-43.

Option B also categorically exempts public power, even though doing so invites the direct exercise of buyer-side market power.

Finally, by unnecessarily procuring more capacity than is needed, Option B fails to set "price signals that guide … orderly entry and exit,"[11] resulting in price suppression in the energy markets. PJM admits this will occur. But PJM has done no study to even consider these adverse consequences.[12] That failure is yet another reason why Option B is not just or reasonable.

As explained above, Exelon does not believe that either PJM proposal is just or reasonable. Option A, however, does far less violence to the five key principles that should inform any capacity market reform. It will select the most efficient set of resources by accommodating state environmental programs, and it views such state efforts as complementary to the Commission's goals in wholesale rate-setting. It will procure the right amount of capacity, not additional unneeded capacity. It avoids some of Option B's most egregiously arbitrary distinctions. And it will not worsen energy market price suppression.

Option A could be improved, however, in two respects. First, it unjustifiably exempts from repricing any resource of less than 20 MW. Yet Option A purports to be addressing the aggregate effect of state support payments on capacity prices. Resources smaller than 20 MW are important contributors to that aggregate effect. Second, the proposed materiality screen that triggers repricing—3.5% of the reliability requirement for an LDA or 5,000 MW RTO-wide—is arbitrary. Instead, the Commission should require a screen that is connected to the supposed problem that repricing is purported to solve—the need to attract new investment to ensure reliability.

[11] CASPR Order at P 21.

[12] Indeed, the Issue Charge of the Capacity Construct/Public Policy Senior Task Force excluded consideration of energy market effects. *See* PJM, Issue Charge: Assess state public policy initiatives and the PJM capacity construct (2017), http://www.pjm.com/-/media/committees-groups/task-forces/ccppstf/postings/ccppstf-issue-charge.ashx?la=en.

SI-SSA-0010-6087

Accordingly, the Commission should require a price-based materiality screen, so that repricing would not occur when supply remains plentiful, but would be triggered in the event that PJM markets fail to elicit needed new entry. That would achieve PJM's objectives but prevent unnecessary price increases for customers.

PROTEST

I. The Commission Should Reject PJM's Filing Outright Because Its "Two Alternative[]" Approach Contravenes PJM's Tariff And Section 205.

PJM has filed "two alternative[]" proposals under Section 205, inviting "the Commission to decide" what PJM characterizes as the "federal policy question" that divides the alternatives—"accommodate" state programs (PJM's "preferred" approach), or "mitigate" them.[13] Section 205, however, is the wrong procedural vehicle for the relief PJM seeks. If PJM wishes to obtain guidance on policy questions, it should petition for a declaratory order. And if PJM wishes to confer on the Commission broad policy discretion to refashion market rules, it can attempt to carry the burden to invoke Section 206. Section 205, however, does not permit PJM to set a broad policy choice before the Commission by presenting two alternatives that are worlds apart.

To begin, PJM's Tariff plainly does not authorize PJM's approach. True, the tariff of ISO-New England contains a "jump ball" provision that allows submission of an "alternative … proposal."[14] PJM's Tariff, however, nowhere contains authorization to file alternative tariff proposals under Section 205.[15]

Section 205 also does not authorize PJM to present "alternative" tariffs asking the Commission to choose between widely divergent policies. Tellingly, the avenues that allow the Commission to exercise this type of broad discretion—petitions for declaratory orders and Section

[13] PJM Filing at 6, 17-18, 36, 42.

[15] *See* PJM Tariff § 9.2(a) (setting forth PJM's Section 205 filing rights).

SI-SSA-0010-6088

206—do not include the tight timeline that governs Section 205 filings. That is appropriate: When the Commission is exercising that type of broad discretion, deliberation is needed. By contrast, what enables the accelerated litigation that Section 205 demands is the "passive and reactive role" that Section 205 requires the Commission to play: It reviews "the proposed rate scheme" and must "accept or reject the proposal," aside from suggesting "minor" changes, as permitted by *NRG Power Marketing, LLC v. FERC*.[16] That rule protects stakeholders by focusing litigation on the precise proposal presented.[17]

PJM's approach is inconsistent with Section 205's structure. Rather than accepting the Commission's "passive" role[18]—which requires PJM to resolve, in the first instance, each "federal policy question" raised by its filing[19]—PJM asks the Commission to decide. PJM's approach, moreover, would substantially expand the Commission's power under Section 205 beyond what Congress conferred. No longer would the Commission be limited to rejecting or approving (with minor modifications) a *single* proposed tariff. Instead, PJM has offered the Commission two proposals on opposite ends of the spectrum, asking the Commission to approve either one. Given how far apart are Option A and Option B, that vastly expands the range of outcomes.

If the Commission accepts PJM's gambit here, moreover, the Commission can expect to receive many more such Section 205 filings from ISOs and RTOs in the future. Instead of proposing a single tariff revision under Section 205, which may result in a dissatisfied group of stakeholders, RTOs and ISOs can punt to the Commission the responsibility for making divisive policy choices, and require it to do so on the compressed timing required by Section 205. Indeed, PJM has not only submitted two proposed rates (Option A and Option B), but its "affirmative

[19] PJM Filing at 17-18.

SI-SSA-0010-6089

notice" inviting the Commission to approve Option B *without* the RPS Exemption effectively adds a third—and arguably, a fourth, as PJM further "offers the option of either (i) applying the standards set forth in Capacity Repricing to govern the treatment of renewables" under Option B, or "(ii) identifying this question for further stakeholder consideration in subsequent processes."[20] The result is that a single tariff may in reality contain dozens of permutations of proposed rates, each of which stakeholders must analyze and comment on; indeed, already public interest organizations have noted the burdens of the need "analyze and prepare detailed comments on not one but two highly complex proposals" in a short comment period.[21] That system is inconsistent not just with the notice that Section 205 is meant to provide, but also the "passive and reactive role" that the Commission must play under Section 205.[22] Instead of approving or rejecting tariffs proposed by utilities, the Commission will face a shelf full of choose-your-own-adventure tariff filings.

The Commission should not entertain PJM's attempt to twist Section 205 to create a new procedural vehicle. If PJM wants to solicit general policy guidance, or to give the Commission broad discretion to reshape market rules, a petition for a declaratory order or Section 206 filing allow PJM to seek such relief. But PJM cannot claim the benefits of these vehicles without accepting their burdens. Because Section 205 does not allow the filing PJM has made, the Commission should reject PJM's filing or, alternatively, decline to consider PJM's Option B.

II. The Commission Must Accommodate State Payments That Account For Environmental Externalities.

A. Accounting For Environmental Externalities Improves Efficiency And Complements The Design Objective Of PJM's Markets.

By credulously accepting fossil-fuel generators' refrain about the "distorting effect of state subsidies" to "uneconomic" resources,[23] PJM forgets what any first-year economics undergraduate knows: Markets cannot be efficient when large externalities go unaddressed, and subsidies that address externalities make markets *more* efficient, not less. This point is explained at length in the Declaration of Dr. Robert Willig, attached to this filing.[24] But in short: When fossil-fuel generators produce electricity, they create pollutants such as carbon dioxide, sulfur dioxide, nitrogen oxide, ozone, mercury, and particulate matter.[25] These pollutants are harmful to human health and the environment, but these costs generally fall on society, not the generators that produce them. Put otherwise, the costs are "externalized," and hence these pollutants create "negative externalities."[26] These externalities are, economically, a subsidy. Fossil-fuel generators produce this harm, but do not pay. Indeed, for carbon dioxide alone, estimates put this subsidy's value for fossil-fuel generators across PJM at $12.1 billion to $17.7 billion dollars *annually*.[27] Conversely, when clean generators produce electricity without creating this harmful pollution, thereby abating the pollution that would result in their absence, they benefit society. But they do

[23] PJM Filing at 6, 32.
[24] Many of the same points are explained in an April 2018 report by the Institute for Policy Integrity, also attached to this filing. *See* Institute for Policy Integrity, *Capacity Markets and Externalities: Avoiding Unnecessary and Problematic Reforms* (April 2018), http://policyintegrity.org/files/publications/Capacity_Markets_and_Externalities_Report.pdf ("*Capacity Markets and Externalities*").

SI-SSA-0010-6091

not receive compensation from the Commission-regulated markets for providing this benefit. Instead, the benefit is externalized—a positive externality.[28]

Externalities distort incentives, and so result in inefficiencies. When the fossil-fuel generator decides how much to produce, it considers only its private costs, not the full costs to society.[29] When the clean generator weighs the same decision, the same mismatch occurs in the opposite direction. The fossil-fuel generator will produce too much, and the clean generator, too little. As Dr. Willig explains, when incentives are misaligned, the outcome will not be efficient.[30]

This misalignment is fixable. Command-and-control regulation, for example, can forbid especially polluting methods. But markets are often superior. The polluting activity can be taxed to allow consideration of private costs and social costs.[31] Or clean generators can be paid for the benefits they provide to society—again, aligning private incentives with social benefits.[32]

The Commission's approach to these issues has been one of cooperative federalism—one that "fulfill[s the Commission's] statutory mandate under the FPA to ensure that … rates … are just, reasonable and not unduly discriminatory or preferential" by "respect[ing] the traditional role of states."[33] The Commission thus far has elected to make its market rules "fuel-neutral,"[34] and has not attempted itself to redress the externalities described above—for example, by incorporating a Commission-established carbon price into wholesale markets. Instead, the Commission has looked to other regulators—in particular, states—to address these externalities.[35] By statute and by history, states are well-suited to do so. The FPA expressly protects states' authority over

"facilities used for the generation of electric energy,"[36] and the Supreme Court has explained that "regulation of utilities is one of the most important of the functions traditionally associated with the police power of the states."[37] Likewise, "[l]egislation designed to free from pollution the very air that people breathe clearly falls within the exercise of even the most traditional concept of … the police power."[38]

The range of actions states have taken with respect to environmental externalities—cap-and-trade programs, environmental tax credits, RPS programs, zero-emissions credit programs, and others—have furthered the Commission's "first principles of capacity markets" set forth in the CASPR Order.[39] The Commission's markets fulfill all of their goals *better* when states are addressing environmental externalities and the Commission's markets can operate against the backdrop of such state environmental programs.[40] When private and social costs are better aligned, "competition" is more "robust," and the markets' "price signals" more accurately "guide the orderly entry and exit of capacity resources" to select the "set of resources" that is truly "least cost."[41] By contrast, if the Commission designed its market rules to insulate its markets from the effects of state environmental initiatives, yet did not itself incorporate any carbon price, that would recreate the same type of "regulatory void" that the Commission was created to address[42] and doom the Commission's markets to inefficiency. Wholesale rates designed to *prevent* consideration of environmental externalities could never be just and reasonable.

These basic principles—the economics of externalities—are what is missing from PJM's contrived picture of how state payments "[s]ignificantly and [a]dversely [a]ffect [w]holesale [m]arket [p]articipants" by unjustly "impos[ing] costs on market participants."[43] In PJM's narrow view, externalities do not exist, the "right" price is the one free of any state environmental policy, and the result of state intervention is that one market participant effectively funds subsidies to another. But in the real world, externalities are front-and-center. So, for example, PJM asserts that payments to compensate zero-emission resources for their environmental benefits might reduce capacity market revenues for a 1,000 MW coal plant by $6.75 million.[44] But PJM ignores that, from carbon dioxide alone, "the annual external damages … [from] a typical 1,000 MW coal plant … would amount to $234.3 million."[45] Intervention, by states or the Commission, is essential to address such externalities. And absent such intervention, the result is that fossil-fuel generators impose the costs of their pollution on everyone else, allowing them to bid lower than they would be able to bid if they were forced to internalize those costs.[46] Indeed, consistent with these principles, the Commission correctly rejected the argument that ISO-New England's former renewables exemption would "result in an inappropriate wealth transfer."[47]

Correcting PJM's hypotheticals shows what PJM misses.[48] As in PJM's hypothetical, suppose a system has 200 MWs of load, and three resources, each with 100 MWs of capacity. Two burn fossil fuels: A "competitive" resource needs at least $40/MW-day to meet its avoided costs, and a "marginal" resource needs $45/MW-day. The third is a "zero emission" resource, which requires $50/MW-day but avoids at least $10/MW-day in pollution costs that the other two

plants emit. As shown in Figure 1, with no intervention, the Competitive and Marginal Resources clear at a clearing price of $45/MW-day, and the Zero Emission Resource does not and retires.

Figure 1: Without State Intervention

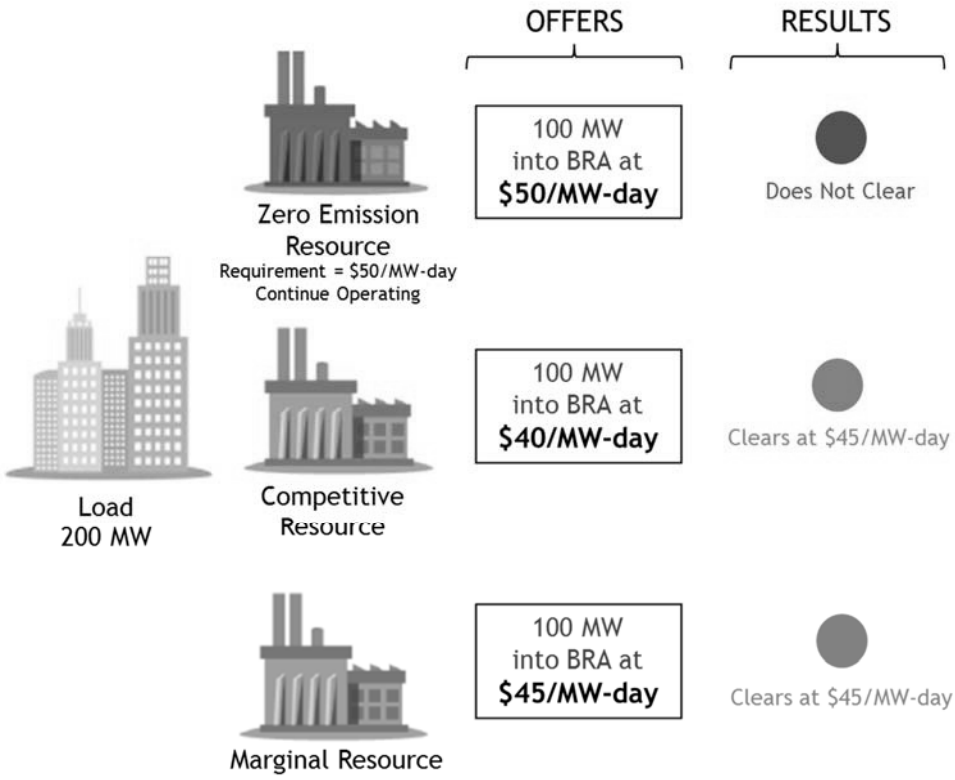

Figure 2 takes this system and adds an environmental attribute payment of $10/MW-day to the Zero Emission Resource, to compensate for the pollution avoided. With this payment, the Zero Emission Resource will bid as low as $40/MW-day, accounting for its $50/MW-day costs and the $10/MW-day attribute payment. As a result, the Competitive Resource and the Zero Emission Resource clear; the Marginal Resource does not clear.

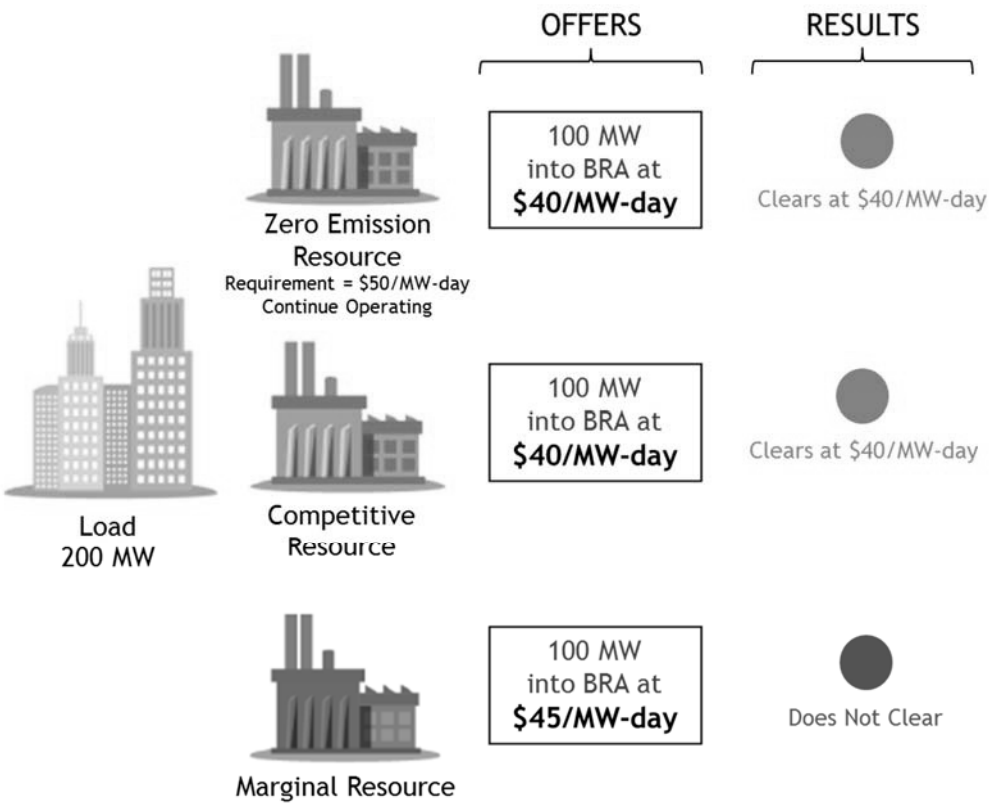
Figure 2: With State Intervention



This result is more efficient. The first market selected the polluting Marginal Resource over the Zero Emission Resource, even though the Marginal Resource, when pollution costs are taken into account, is more costly: $45/MW-day in avoided costs, plus $10/MW-day in pollution costs. The attribute payment fixes this flaw, with the result that the market selects the two resources that are least cost all things considered.[49] To be sure, the Marginal Resource is worse off: It no longer clears. But the Marginal Resource *should not* clear an efficient market.[50] Likewise, as in PJM's hypothetical, the Competitive Resource in some sense "pays" for part of the attribute payment: It loses $5/MW-day due to the market clearing at $40/MW-day instead of $45/MW-day. But that is not unfair or inefficient: The Competitive Resource benefits from not having to pay the $10/MW-

[49] Willig Decl. ¶¶ 43, 52; *see Capacity Markets and Externalities* at 7.
[50] Willig Decl. ¶¶ 43, 52; *see Capacity Markets and Externalities* at 7.

day in pollution costs that it creates, and the price reduction only partially offsets the windfall.

The upshot is that actions to address externalities promote the efficiency of the Commission's markets. PJM's proposals cannot be just and reasonable when they are premised on ignoring that fact.

B. The Commission Has Properly Accommodated State Payments For Environmental Attributes In Its Markets.

The Commission's decisions, unlike PJM's filing, have always been consistent with the sound economic principles outlined above. The Commission has not given *all* state policies a free pass: When state policies reflect exercises of buyer-side market power and "artificially depress[] capacity prices" by supporting new entry that is truly "uneconomic," the Commission has acted.[51] But when policies address environmental externalities, the Commission has explained that these "policy objectives" are "legitimate,"[52] and it has always made sure that those policies would be accommodated. Never has it sought to *thwart* their effects. Thus, the Commission has long recognized that state command-and-control "environmental regulation … driv[es] significant changes in the mix of resources" by increasing costs of fossil-fuel generators, and "resulting in the early retirement of some coal-fired generation."[53] The Commission has not attempted to *counteract* those pro-efficiency results by rejiggering auction rules to offset the costs of regulation. Likewise, when states have exercised their authority to incentivize clean generators, the Commission has affirmed that states may "encourage renewable or other types of resources" even when doing so "allow[s] states to affect the [wholesale] price" or makes clean generation "more competitive in a cost comparison with fossil-fueled generation."[54] States are "free" to incentivize

[51] *PJM Interconnection, L.L.C.*, 135 FERC ¶ 61,022, at P 141 (2011).

clean generation, the Commission has explained, "even if the price signals in the regional wholesale capacity market indicate that [those] resources are [not] needed."[55]

PJM implies that, by restructuring their retail markets and joining PJM, states forfeited their right to take actions affecting "resource entry and exit."[56] If accepted, this view would condemn a broad swath of state programs, from tax credits and RPS programs to pollution controls and cap-and-trade. It would also frustrate states' attempts to comply with the Clean Air Act ("CAA"), which sets air-quality standards for many pollutants produced by fossil-fuel plants. For example, the Environmental Protection Agency recently designated 22 areas—including in several PJM states—as nonattainment for ozone.[57] On PJM's view, if states favor clean over fossil-fuel resources to meet CAA obligations, these resources' bids are subject to mitigation.[58]

PJM, however, cites no case or Commission decision that supports its view. And it is false. Restructured states retain the, like other states, authority they have exercised for centuries over "facilities used for the generation of electric energy," which the FPA expressly protects.[59] Indeed, there is "a strong presumption against finding" that the "powers traditionally exercised by states" have been superseded under the FPA.[60] In no manner did states give up their authority to regulate the environmental effects of generation by restructuring and joining PJM. To the contrary, the D.C. Circuit has held that restructured states "retain the right to forbid new entrants from

[55] Amicus Br. of United States at 33, *Hughes v. Talen Energy Mktg., LLC*, 136 S. Ct. 1288 (2016) (No. 14-614), 2016 WL 344494.

[60] *Niagara Mohawk Power Corp. v. Hudson River-Black River Regulating Dist.*, 673 F.3d 84, 94 (2d Cir. 2012).

providing new capacity, to require retirement of existing generators, to limit new construction to more expensive, environmentally-friendly units, or to take any other action in their role as regulators of generation facilities."[61] And proof positive that states did not, by joining PJM, give up this authority is that PJM also contains *unrestructured* states. PJM does not attempt to explain how membership in PJM can be incompatible with state actions to affect the generation mix when some PJM states exercise virtually *plenary* authority over the generation mix.

Indeed, the Commission has *ensured* that state environmental programs can affect wholesale markets—even in restructured states. For example, the Commission approved the proposal of the California Independent System Operator Corporation ("CAISO") to lower its "bid floor" in energy markets "from negative $30/MWh to negative $150/MWh."[62] It permitted "variable energy resources" to bid at such extremely low prices because they "generally receive, in addition to market revenues, production tax credits, renewable energy credits, and contractual energy payments."[63] As a result, such variable resources are allowed to submit large negative energy offers, and presumably reduce energy market revenues for other participants—because the Commission understood that the negative $150/MWh offer reflects the "opportunity cost" of not receiving significant revenues tied to clean energy production.[64] Likewise in New England, the Commission approved the deduction of revenues from REC payments in the calculation of the offer review trigger price applicable to new renewable resources,[65] and exempted 200 MW of new renewable generation from ISO-NE's MOPR[66]—until expansion of renewables mandates made

[66] *ISO New England Inc.*, 158 FERC ¶ 61,138, at P 4 (2017).

clear that *yet more* accommodation of renewable resources was necessary, which the Commission supplied in the CASPR Order.

The Commission's acceptance of state environmental programs as complementary to its markets is consistent with a more general principle: When generators receive compensation for services not captured by the Commission's markets, they properly take account of that compensation in their bids. That is why the Commission has held that resources operating pursuant to reliability services support agreements ("RSSAs") should be permitted to submit *de minimis* bids into capacity markets: Because the units "are needed for reliability and would clear a capacity market that also reflected local reliability needs, RSSA revenues received by these resources reflect the value of the services provided by these resources to customers."[67] Similarly, revenues from state environmental programs represent the "value of the [environmental] services provided by these resources."[68] The Commission should follow its precedent and reject proposed market reforms intended to insulate market prices from the effects of state environmental programs.

Even on the one occasion where the Commission did reset market prices to a higher level than would result from offers reflecting state compensation, the Commission made clear that it did so in the spirit of cooperative federalism and in recognition of states' legitimate role. In the CASPR Order, ISO-NE explained to the Commission that "New England states recently have significantly increased both their targets and their efforts to promote the development of renewable resources," and the Commission observed that ISO-NE's existing exemption from its MOPR for renewable resources "would not be able to accommodate" the region's new clean energy

[68] *Id.*

initiatives.[69] So ISO-NE created CASPR "to better accommodate [these] actions."[70] And the Commission approved CASPR as just and reasonable because it succeeded in this goal by "accommodat[ing] the entry of new Sponsored Policy Resources into the FCM over time" and so providing a "'better way to integrate these state policies into the competitive wholesale markets.'"[71] Exelon recognizes that some parties have argued on rehearing that CASPR's design may not be effective in achieving its goals, but the key point is that the Commission approved CASPR on the premise that it "provides a reasonable opportunity to accommodate state sponsored resources in the FCM."[72] Accepting Option B, in particular, would require the Commission to overturn this long line of precedent.

C. The ZEC Program, Which The PJM Filing Targets, Is A Legitimate And Unusually Efficient State Effort To Account For Environmental Externalities.

PJM's filing makes no secret that it targets Illinois' Zero Emission Credit ("ZEC") Program.[73] But there could not be a less justified occasion for the Commission to depart from its precedent of accommodating state environmental programs. The ZEC Program is distinctive only in that it is unusually *efficient*. It does not warrant mitigation under any defensible theory.[74]

In its purpose, the ZEC Program is similar to the RPS and renewable energy credit ("REC") programs the Commission has long accommodated and allowed to affect wholesale prices. It aims to ensure Illinois can "achieve the State's environmental objectives and [ ] reduce the adverse impact of emitted air pollutants on the health and welfare of the State's citizens."[75] Illinois

[74] *See generally* Willig Decl. ¶¶ 47-60.
[75] Illinois SB 2814, § 1.5, 99th Gen. Assemb. (Ill. 2016), http://www.ilga.gov/legislation/99/SB/PDF/09900SB2814enr.pdf ("Ill. 2016 Energy Act").

determined that action on nuclear generation was necessary because, despite its enormous environmental benefits, nuclear energy had thus far been excluded from the state's environmental initiatives, putting plants at risk of retirement. State agencies had concluded that premature closure of nuclear plants would significantly increase greenhouse gas emissions and inflict billions of dollars in harm.[76] The legislature thus found that "Illinois must expand its commitment to zero emission energy generation and value the environmental attributes of zero emission generation that currently falls outside the scope of the existing renewable portfolio standard, including … nuclear power."[77]

Illinois employed the same mechanism that REC programs use. Under the ZEC Program, the Illinois Power Agency ("IPA"), a state agency, will procure contracts for ZECs from nuclear facilities capable of generating zero-emissions credits cost-effectively in an amount equal to 16% of electricity used in Illinois in 2014. Like a REC, a ZEC values the environmental attributes of zero-emissions generation. One ZEC reflects one megawatt-hour of zero-emission production. Of necessity, the ZEC Program selects participants and sets prices administratively: Nuclear plants are few in number, and auctions would invite anticompetitive conduct. Illinois thus charged the IPA with developing a procurement plan and selecting participating plants based on public interest factors, including 1) "minimizing carbon dioxide emissions that result from electricity consumed in Illinois," 2) minimizing sulfur dioxide, nitrogen oxide, and particulate matter emissions that adversely affect the citizens of the State," and 3) "the incremental environmental benefits resulting from the procurement, such as any existing environmental benefits that are preserved by the

Commerce Comm'n et al., *Potential Nuclear Power Plant Closings in Illinois: Impacts and Market-Based Solutions* at 122 (Jan. 5, 2015), https://www.nirs.org/wp-content/uploads/neconomics/illhr1146report115.pdf (estimating the societal cost of carbon occurring during 2020-29 associated with nuclear plant closures at $2.5-$18.6 billion).
[77] Ill. 2016 Energy Act § 1.5(3).

procurements … and would cease to exist if the procurements were not held, including the preservation of zero emission facilities."[78] On January 25, 2018, the IPA announced that that the Quad Cities and Clinton plants had been selected.[79]

The ZEC Program's pricing mechanism ensures that it will be more economically efficient than other state environmental initiatives. The ZEC Program sets the value of ZEC payments based on the social cost of carbon, as reported by the United States Interagency Working Group in effect at the time of the law's promulgation, multiplied by the emissions rate of a natural gas combined-cycle plant.[80] ZEC payments can never exceed that amount. As a result, participating nuclear plants will never receive payments that exceed their environmental value. And in estimating that value, the ZEC price is conservative. First, it measures only nuclear plants' carbon benefits, ignoring their value in avoiding other harmful pollutants, such as particulate matter and mercury. Second, the ZEC price assumes that combined-cycle gas plants would replace retiring nuclear plants—but in fact, in the PJM region, the marginal resources that would likely replace nuclear plants have even higher emissions than the gas plants assumed in setting the ZEC value.[81] Moreover, two additional caps further limit the payments that ZEC plants can receive.[82]

Dr. Willig explains why the ZEC Program's unusually efficient structure cannot warrant mitigation under any defensible theory. By compensating nuclear plants for the environmental benefits they provide, the program addresses an environmental externality and brings private incentives back in line with social costs and benefits.[83] And because payments are capped at a conservative estimate of this environmental value, the ZEC Program's outcome is guaranteed to

[78] *Id.* at (d-5) Zero emission standard (1) (C).
[79] Willig Decl. ¶ 48.
[80] *Id.* ¶ 49.
[81] *Id.* ¶ 50.

[83] Willig Decl. ¶¶ 51-54.

be efficient: The plants will rationally choose to operate only if their value to society—reflected in the market revenues for their electricity, capacity, and ancillary services, plus the ZEC payments for their environmental benefits—exceed their costs.[84] If not, the ZEC Program will not save the plants. The ZEC Program does not protect participating plants against risks that prices will fall, or their costs will increase, to levels that render these plants uneconomic even taking account of their environmental benefits. In this respect, the ZEC Program compares favorably with REC programs, which do not cap payments at the resources' environmental value, and can yield payments that are vastly in excess of any plausible estimate of this value—like the payments of $2,575/MW-day and $4,751/MW-day noted by PJM's expert, Dr. Giacomoni.[85]

The ZEC Program's carefully crafted scheme thus brings the Commission's markets closer to what perfect economic efficiency would dictate.[86] In so doing, the ZEC Program may well displace marginal fossil-fuel generators that, absent the ZEC Program, would have cleared. But that is efficient: In a market that takes into account full social costs and benefits, these plants *should not* clear, and ZEC plants should. And the generators that *do* clear still make a profit. All receive a market clearing price equal to or in excess of their offers.[87]

D. PJM Fails To Justify Why "Workably Competitive" Wholesale Markets Should Be Insulated From Pro-Efficiency State Programs That Address Environmental Externalities, Particularly Given The Many Actions That Go Unmitigated.

PJM's decision to target programs redressing environmental externalities is especially indefensible given its admission that wholesale markets are affected by "all manner of distortions that might make prices imperfectly competitive," and that "benefit … some at the expense of

[84] Willig Decl. ¶¶ 51, 62-63.
[85] Giacomoni Aff. ¶ 35; *see also* Willig Decl. ¶¶ 56, 59.
[86] Willig Decl. ¶ 54.
[87] *Id.* ¶ 52.

others."[88] PJM invokes the "Commission's 'workably competitive' standard"[89] without explaining why that standard requires action to target programs addressing environmental externalities—which, when well designed, only improve efficiency—and *not* myriad interventions that affect wholesale markets with weaker or no pro-efficiency justifications.

A good starting point for a list of subsidies that affect wholesale markets comes, ironically enough, from PJM's enumeration of the "local, state, and federal subsidies" that it "propos[es] to *exclude* … from consideration" in its definition of "Actionable Subsidies."[90]

- "[P]ayments (including payments in lieu of taxes), concessions, rebates, subsidies, or incentives designed to incent, or participation in a program, contract or other arrangement that utilizes criteria designed to incent or promote, general industrial development in an area";

- "[P]ayments, concessions, rebates, subsidies or incentives designed to incent, or participation in a program, contract or other arrangements from a county or other local governmental authority using eligibility or selection criteria designed to incent, siting facilities in that county or locality rather than another county or locality"; or

- "[F]ederal government production tax credits, investment tax credits, and similar tax advantages or incentives that are available to generators without regard to the geographic location of the generation."[91]

Some marginal gas-fired generators would not exist without subsidies from various economic development programs. Likewise, the pervasive practice of states and localities of offering subsidies "designed to incent … siting facilities in" particular locations assuredly results in development of some resources that, otherwise, would not exist *at all*. Indeed, some of these programs are enacted or expanded to spur development of *particular* plants. In Pennsylvania, for example, a coal-to-gas conversion was the "anchor tenant" for a new "Keystone Opportunity Expansion Zone"—which enabled this plant to be built by eliminating state and local taxes through

2023.[92] Indisputably, those subsidies affect who participates in PJM's auctions and the prices that result. Yet PJM ignores them. PJM's sudden and selective urgency is especially unjustified because these subsidies, unlike environmental programs, have no sound economic justification.

PJM's defense is that "these exclusions are the same as those employed … prior to" the *NRG* remand.[93] But that is no justification. The prior MOPR was solely "a mechanism that seeks to prevent the exercise of buyer-side market power," and the Commission found that the type of subsidies discussed above "do not raise price suppression concerns" reflecting "buyer-side market power."[94] PJM's present filing, however, gives mitigation a new and vastly broader purpose—to combat any "material price suppression effect," whether or not due to buyer-side market power.[95] With this expanded role, there is no justification for excluding these subsidies.

Likewise unjustified is PJM's sudden concern about state environmental programs when it continues to exclude from mitigation "vertically integrated, cooperative, and municipal utilities."[96] The regulatory structure that supports such entities is, economically, a subsidy—and a massively distorting one at that. Such entities sell energy and capacity in wholesale markets, but if their revenues are less than their costs, captive ratepayers make up the difference. That guarantee is a subsidy, insuring the utility against losses that, otherwise, it would have to bear.[97] This subsidy, moreover, affects which resources participate in wholesale markets and, hence, the prices that result—exactly what PJM's filing purports to target. Consider, for example, a high-cost coal plant. If its owner had to rely solely on market revenues, it might well retire. A vertically integrated

[97] Willig Decl. ¶ 80.

utility, however, can continue running the plant, shifting losses to captive ratepayers. And because this utility can bid this high-cost coal plant into the auctions as a price taker, it will pull down clearing prices.[98] Indeed, the Commission has *acknowledged* "the potential competitive impact of" vertically integrated utilities.[99] Yet PJM has not seen fit to act in response to those impacts.

Again, PJM's selective targeting is particularly untenable because there is no sound pro-efficiency justification for exempting vertically integrated utilities. To the contrary, it has long been understood that, as a result of the implicit subsidy given to vertically integrated utilities, they have incentives to overinvest.[100] Yet PJM not only exempts this subsidy from mitigation, but it *doubles down* on the permissible distortion by authorizing vertically integrated utilities to overbuild by up to 1300 MWs—roughly the size of the Quad Cities plant targeted by PJM—without mitigation.[101] What is more, PJM's filing perversely embraces the ability of states with vertically integrated utilities to take the same actions that, when taken by other states, PJM *condemns* as "price suppression." If a nuclear power plant owned by a vertically integrated utility is not covering its full costs in the wholesale markets, a state that wishes to preserve the plant's environmental benefits can authorize the plant to recover its full costs from ratepayers. That is no mere hypothetical: To avoid the risk that it might lose the environmental benefits of nuclear plants, Minnesota is considering guaranteeing those plants cost recovery as "carbon reduction facilities."[102] A regulated PJM state, such as Michigan or Virginia, might someday choose to do

SI-SSA-0010-6107

the same. PJM offers no persuasive reason why out-of-market revenue derived from guaranteed retail rate recovery should be exempt from mitigation, yet revenue derived from ZECs purchased by retail utilities should be subject to mitigation. Both advance the same policy of supporting zero-emissions facilities that would otherwise retire.

Tellingly, PJM does not claim that the *effects* of vertically integrated utilities are less than the state environmental programs its filing targets. Nor could it. A *quarter* of generation in PJM's markets "is owned by traditionally regulated, vertically integrated public utilities or public power."[103] And there can be no doubt that a substantial part of this generation would be uneconomic without the implicit subsidy provided by captive ratepayers. As a conservative estimate, PJM contains 5.5 UCAP GW of small and medium coal plants under 600 MW owned by vertically integrated utilities, which almost certainly would not be economic outside the vertically integrated model.[104] That dwarfs the PJM capacity receiving payments under the Illinois ZEC Program. Instead, PJM's only justification is—again—that the Commission previously exempted vertically integrated utilities from PJM's MOPR because they "do not raise concerns of possible price suppressive intent."[105] That justification fails for the same reason already explained: The self-supply exemption may be justified so long as mitigation remains limited to addressing buyer-side market power, but the entire *premise* of PJM's filing is that mitigation should be expanded to address any "material price suppression effect."[106] Indeed, PJM elsewhere proclaims that mitigation should apply "regardless of intent."[107]

SI-SSA-0010-6108

When PJM tries to explain why its "Actionable Subsidy" definition excludes federal subsidies, its filing descends into incoherence. PJM does not claim that it has excluded federal subsidies because their effects are small, or especially pro-efficiency. Nor could it. Every year, the U.S. government subsidizes *fossil-fuel generators* to the tune of $4.7 billion.[108] That massive subsidy has *no* pro-efficiency justification. The federal government's pro-environmental subsidies, such as the Production Tax Credit ("PTC") for wind, likewise are large and have significant effects: Without the PTC, wind generation would not be built, and the low wind bids that result from the PTC reduce capacity prices by 2.4% across PJM and 6.1% in the ComEd zone

Table 1: Impact Of Subsidized Wind On PJM Capacity Prices

Estimated Impact of Subsidized Renewables on PJM Capacity Prices in 2020/21 Base Residual Auction
WIND ONLY

	Cleared Renewable UCAP (MW)				2020/21	Estimated BRA Price if Wind	Price Suppression

Biomass assumed to include wood, other gas, and other liquid resource categories. Price impact of renewables estimated based on PJM 2020/21 RPM Base Residual Auction sensitivity analysis.

The PTC cashes out to $815/MW-day, which vastly exceeds any plausible estimate of wind power's environmental benefits.[109]

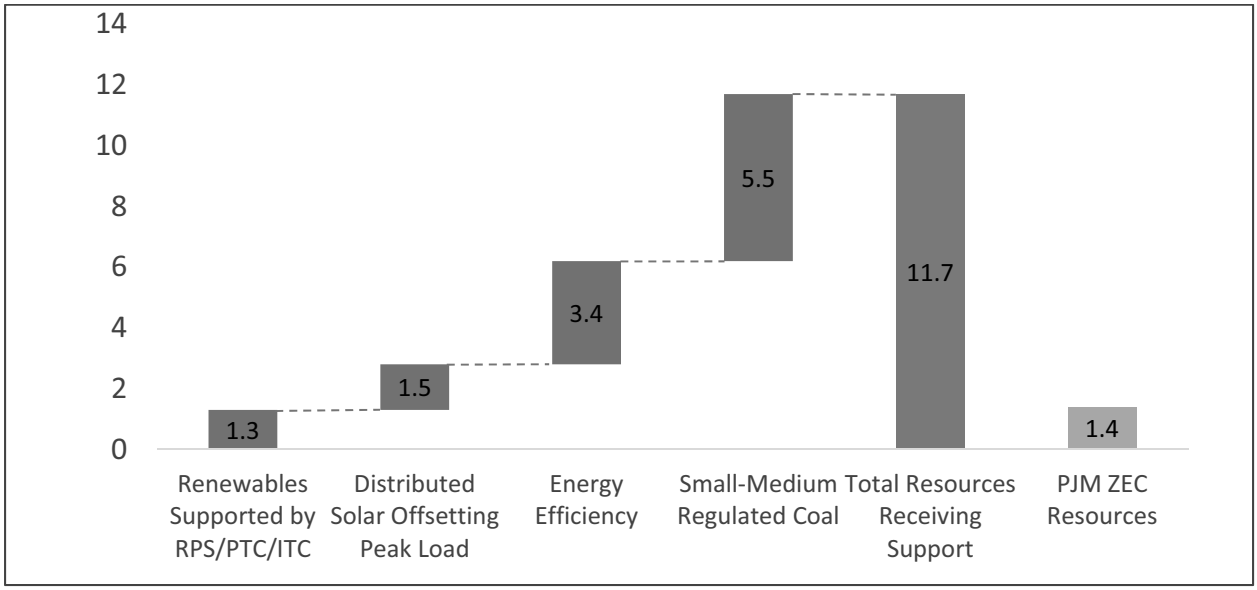
PJM can only aver that it "strains credibility to believe that the Commission's jurisdiction under the FPA would extend to countermand other acts of Congress, including … the production tax credit."[110] But the premise of PJM's Capacity Repricing proposal, at least, is that "this approach result[s] in *respecting and accommodating* state policy choices."[111] PJM cannot say with

[108] *Capacity Markets and Externalities* at 17.
[109] This number is based on the same assumptions used in the Giacomoni Affidavit—a 28% capacity factor and 15% capacity credit for wind—and the $18.2/MWh PTC applicable to new builds commencing construction in 2018.
[110] PJM Filing at 71.
[111] *Id.* at 46 (emphasis added).

a straight face that the *same action*—repricing—is respectful and accommodating when it comes to states, but "countermand[ng]" as to federal policies. And if applying Capacity Repricing (or MOPR-Ex) *were* tantamount to countermanding federal policies, PJM does not try to explain why the Commission would have *greater* authority to take that step as to state environmental policies given states' exclusive jurisdiction to regulate "facilities used for the generation of electric energy."[112] Indeed, PJM's position here would also appear to require an exemption for units receiving federally mandated cost-of-service recovery under Section 202(c) of the FPA, despite the obvious effects such contracts would have on auction results. That too would be arbitrary.

Here is the bottom line: Myriad resources have long received support via subsidy payments, as reflected in Figure 3.

Figure 3: RPM Capacity Resources Receiving Long-Standing Support (UCAP GW)



Notes: Renewables includes all RPM-cleared wind, solar, and wood biomass resources. Distributed solar is PJM forecast for 2020 per the 2017 Load Forecast. Energy efficiency includes all RPM-cleared energy-efficiency resources, virtually all of which receives rebates or other state support connected with state energy-efficiency programs. Energy Efficiency includes past energy-efficiency resources that are now incorporated into load forecast. Small-medium regulated coal includes all regulated coal units with capacity less than 600 MW.

[112] 16 U.S.C. § 824(b)(1).

This data is conservative, as it excludes many tax credits and development incentives outlined above. But conservatively estimated, the resources *already* receiving support dwarfs the capacity affected by the ZEC Program that PJM targets. PJM bears the burden to show that its proposed tariff is just and reasonable. PJM cannot make that showing when its proposals target pro-efficiency state environmental programs affecting 1.4 GW, leaving untouched myriad other interventions affecting more than ten times that amount that yield just as much "material price … effect," and many of which make the Commission's markets less efficient.

III. It Is Not Just And Reasonable To Alter Capacity Rules To Increase Capacity Prices When There Remains Significant Over-Supply And Robust New Entry.

PJM's proposals are not just and reasonable, but if a dearth of new entry jeopardized resource adequacy, they would at least be understandable. The markets, however, are working well. Prices are low (benefitting consumers), yet new entry is robust (confirming that the markets continue to attract investment). In such circumstances, it would violate the Commission's statutory mandate to raise prices via administrative action, as PJM's proposals would do.

A. The Commission Should Not Change Capacity Market Rules To Combat Low Prices At A Time Of Plentiful Supply.

The Commission's mandate under the FPA is "to encourage the orderly development of plentiful supplies of electricity … at reasonable prices."[113] Absent concrete evidence of a danger to that mandate, or of the exercise of buyer-side market power, the Commission has declined to apply mitigation.[114] Today, the wholesale markets are providing plentiful supplies at low prices.

---

[113] *PJM Interconnection, L.L.C.*, 155 FERC ¶ 61,157, at 30 n.39 (2016) (quoting *Pub. Utilities Comm'n of Cal. v. FERC*, 367 F.3d 925, 929 (D.C. Cir. 2004)).

[114] *E.g.*, *ISO New England Inc.*, 158 FERC ¶ 61,138, at P 28 (2017) ("Generators have not shown that the renewables exemption will, in fact, suppress prices over time such that the capacity market is unable to perform its function of attracting and retaining sufficient capacity to maintain reliability … at a just and reasonable price."); *id.* P 58 ("[W]e are not persuaded that there is substantial evidence that FCM capacity prices will be so low as to prevent sufficient entry into the FCM to meet ISO-NE's reliability targets, on average over time. Thus, we consider Generators' assertions that the renewables exemption will result in an inappropriate wealth transfer — i.e. that Generators will be effectively paying for the cost of the renewable resources — to be a misunderstanding of the purpose of the FCM. It

And while the CASPR Order indicated that part of the Commission places weight on whether there is a "level of investor confidence" that ensures that supplies remain plentiful going forward,[115] the markets are succeeding in that respect too.

PJM's filing relies on theoretical claims about how state environmental policies make "investment … less sustainable over time."[116] Those claims should sound familiar: The Commission has heard them since Illinois and New York passed ZEC programs in 2016. The Commission was told that Illinois' legislation posed an "existential threat,"[117] and was "poised to drop onto the RPM market like an anvil onto a woeful coyote beginning with the Base Residual Auction for … 2020/2021."[118] It heard the same thing about New York's ZEC Program and the markets of the New York Independent System Operator, Inc. ("NYISO").[119]

Today, that rhetoric is testable. The coyote is alive and well. New York's ZEC Program was adopted nearly two years ago, and Illinois' is more than a year old, including spanning a cycle of PJM's Base Residual Auction. These programs have thus been understood and factored into both markets for some time. And if they were undermining resource adequacy or investor confidence, the data would show it. Yet PJM presents no evidence of any adverse market impacts. And the *real* data show the opposite. In both regions, capacity is plentiful. In PJM's most recent Base Residual Auction, 165.1 GW of unforced capacity cleared.[120] Including commitments under

---

is the purpose of the FCM to attract and retain sufficient capacity to meet ISO-NE's reliability targets on average over time, at least cost to customers, given the renewable generation that will enter as a result of state programs.").

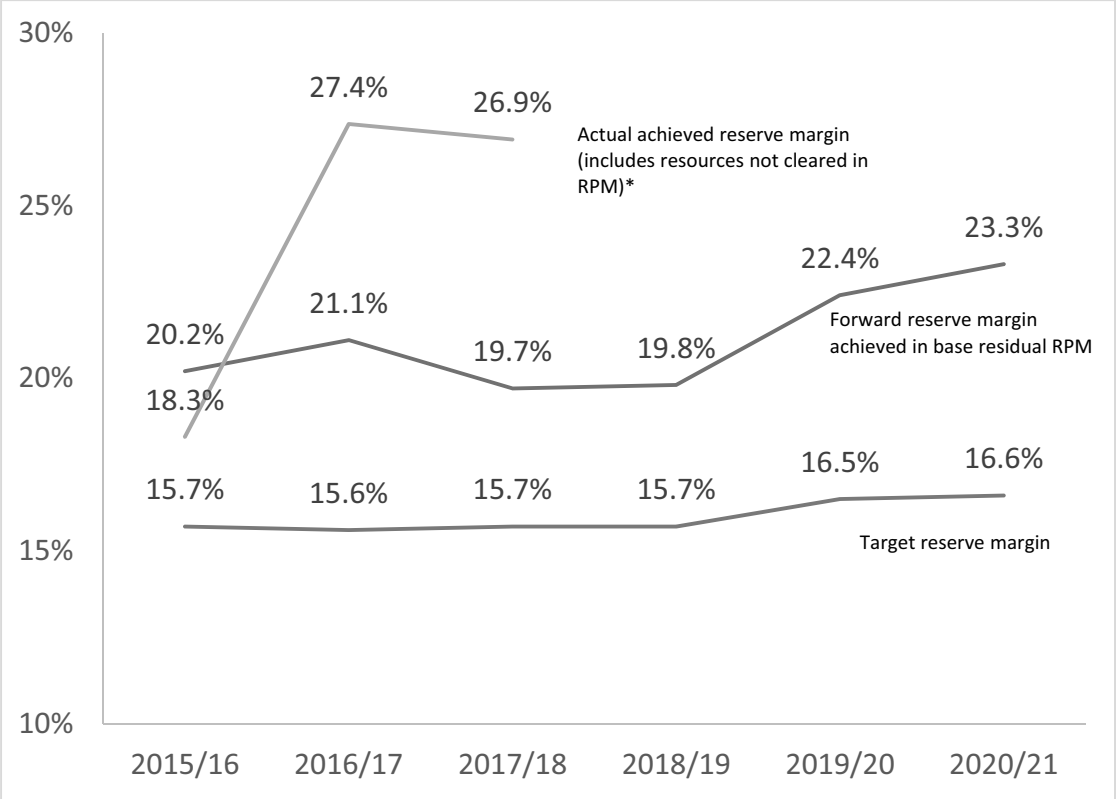
SI-SSA-0010-6112

Fixed Resource Requirement plans, PJM's reserve margin is 23.3%, or 6.7% higher than the target.[121] The achieved margin, which includes resources that did not clear in the Base Residual Auction, is even higher, at 26.9% in 2017/18. That pattern is stable, as the following figure shows:

Figure 4: PJM Achieved Versus Target Reserve Margins



Note: Data are per NERC summer reliability assessments.

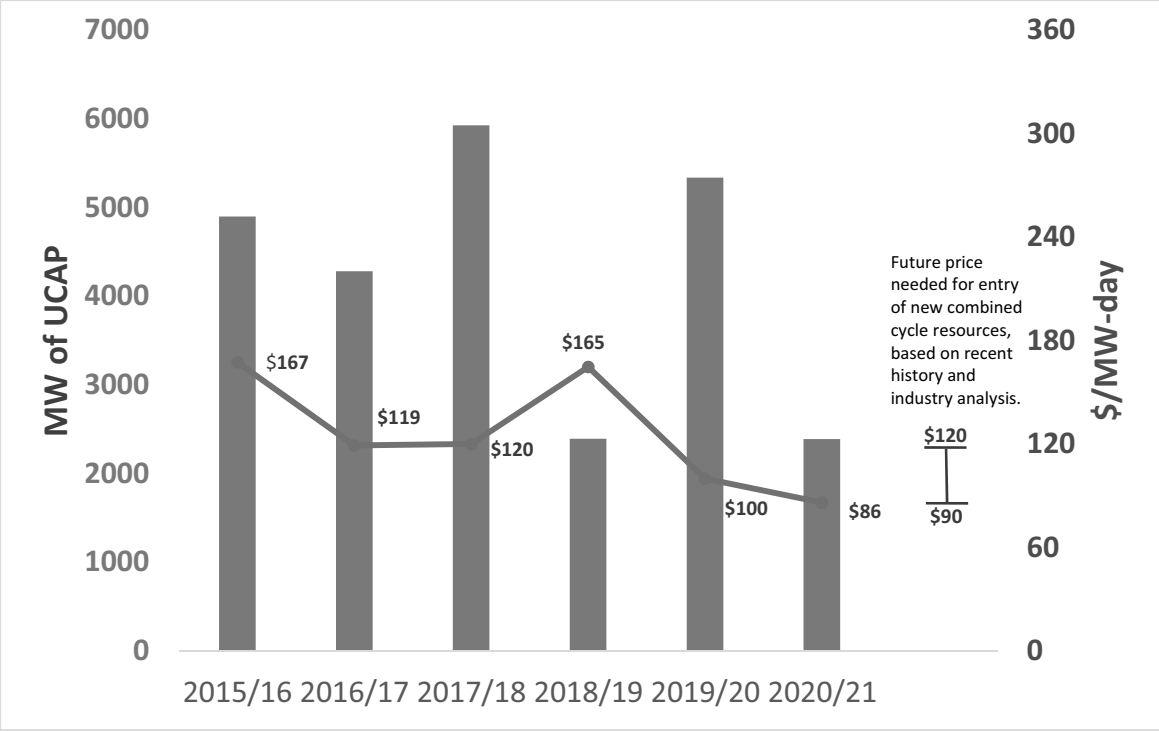
PJM contends that state environmental programs will lead investors to distrust market price signals, and they will refuse to invest. But for two decades, states have been implementing REC programs, as well as many other programs that impact wholesale market profits, including demand response and energy efficiency programs that reduce demand, net metering programs, and subsidies for storage. Sophisticated investors have always considered these types of regulatory risks. Today's risks are nothing new. Against this backdrop, it is not just and reasonable to revise

[121] *See id.*

market rules for the purpose of increasing prices without evidence that supply is tightening or investors are unwilling to invest even as prices approach or exceed Net CONE.

Even at today's low prices, moreover, new gas units are regularly entering both markets. The most recent Base Residual Auction attracted 2,350 MW of new combined-cycle gas resources, despite clearing prices between approximately 26% and 66% of PJM's Net Cost of New Entry ("Net CONE").[122] Thus, the capacity market is clearing enough new and existing resources to more than satisfy the reserve margin, at prices well below Net CONE. That has been true for years. In the last six Base Residual Auctions, at least 2 GW of new generation (often 4-5 GW) has cleared:

Figure 5: New Build Capacity Cleared And Clearing Prices In PJM Base Residual Auction, 2015-16 – 2021/21

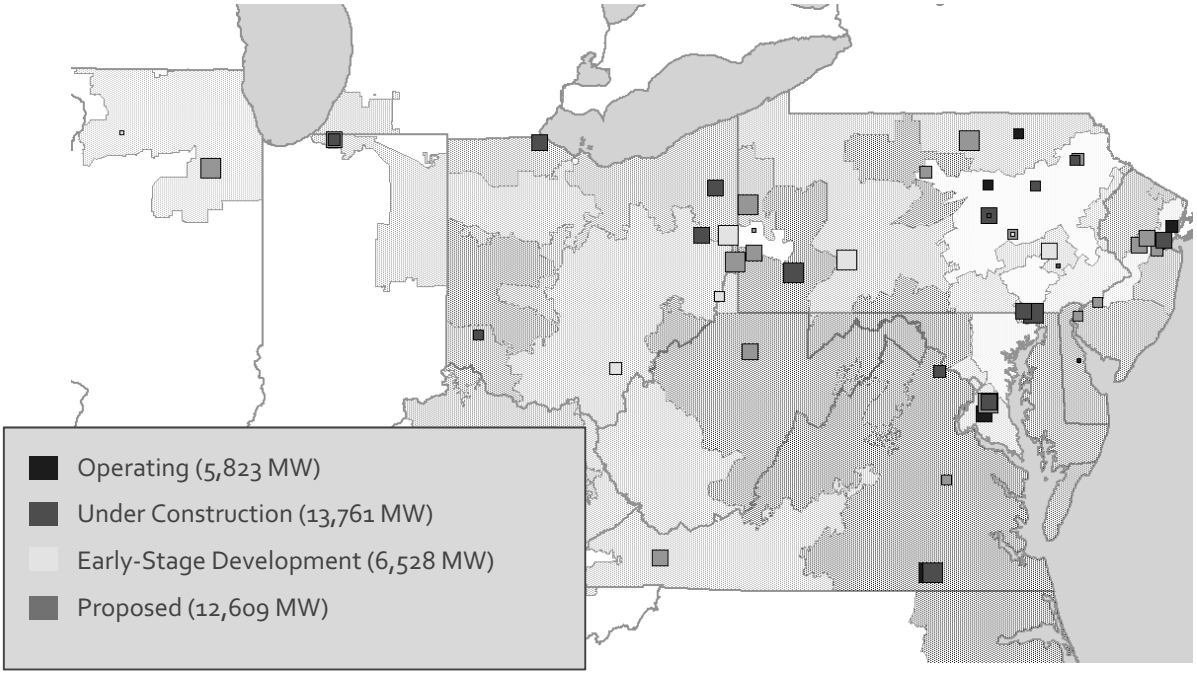


Note: Includes all RTO and MAAC capacity. New build clearing price is higher of RTO and MAAC. Excludes EMAAC new entrant capacity in years where EMAAC price separated and cleared higher than MAAC price. Does not include uprates.
Source: PJM Interconnection Base Residual Auction Reports, various years. http://www.pjm.com/markets-and-operations/rpm.aspx.

[122] *Id.* Thus, the facts refute the assertion made at the Technical Conference that new investments are not being made.

To the extent that the pace of new entry is slowing, that is because the market is responding to oversupply. Nevertheless, looking forward, there are almost 40 GW of recently entered or potential near-term entrant gas combined-cycle plants spread across PJM—25% of the market:

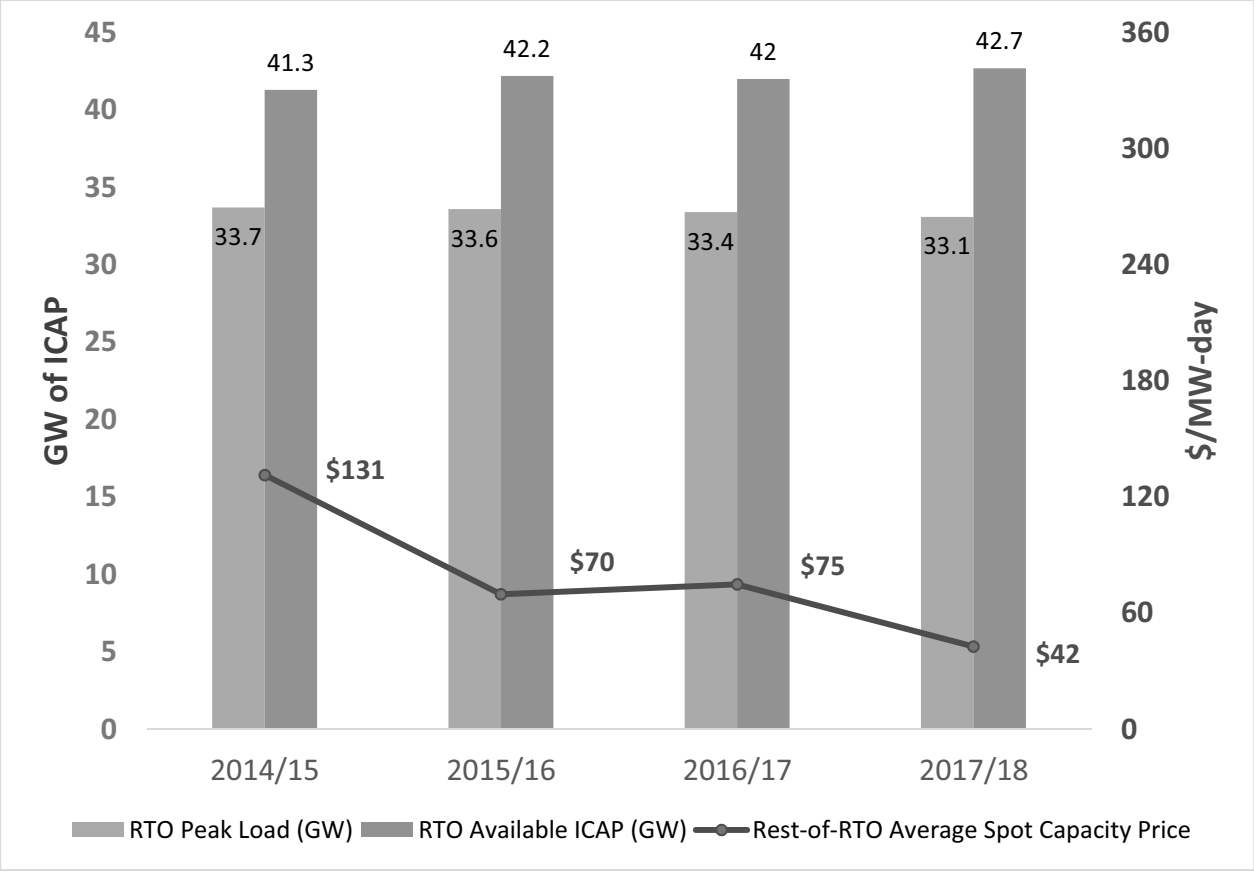
Figure 6: The 40 GW Of Recently Entered Or Potential Near-Term Entrant Gas Combined-Cycle Plants In PJM



Note: Box size denotes relative size of each unit in net summer capacity.

NYISO's story is similar. While new entry has not taken place at the same pace, reserve margins are even higher—25.6% in 2015/16, 26.0% in 2016/17, and 29.1% in 2017/18—at lower clearing prices of around $42 per MW/day. If new entry is needed, NYISO would likely see substantial new entry at modest prices. Even at current prices, New York will add two new combined-cycle gas plants, including the 1,100 MW Cricket Valley plant, over the next few years. There is no resource adequacy issue, as the following figure underscores:

Figure 7: NYISO Reserve Margins And Capacity Prices, 2014/15 – 2017/18



Source: New York ISO ICAP Market Reports, July 2014 through April 2018.

There is no reason to doubt that these trends will continue. PJM's markets are *designed* to maintain equilibrium, and safeguard resource adequacy, across a broad range of conditions. For example, if state programs reduce capacity prices, but tightening supply indicates that new entry is needed, prices will rise, and the downward sloping demand curve will ensure that the capacity price adjusts to reflect the costs of the generators that are necessary for resource adequacy.[123] In these circumstances, without any concrete evidence of a threat to reliability or investor confidence resulting from state environmental programs, it is not just or reasonable to approve tariff changes designed to increase prices for certain resources.

[123] *Capacity Markets and Externalities* at 18; *see* Willig Decl. ¶ 46.

B. The Commission Should Not Expand Capacity Market Mitigation Beyond The Purpose For Which It Was Adopted—Combatting Buyer-Side Market Power.

On the present record, it is not just and reasonable to embark on the two unprecedented expansions to buyer-side capacity market mitigation sought in PJM's filing. First, PJM's filing would expand such mitigation beyond its original purpose: avoiding buyer-side market power. Second, it would sweep in a vast universe of additional resources by mitigating existing resources.

Expansion beyond buyer-side market power. Combatting buyer-side market power is undoubtedly a legitimate concern under the FPA. Rates are "unjust and unreasonable … in violation of section 205(a) of the FPA" when they are "due to the exercise of market power."[124] The Commission narrowly crafted PJM's MOPR to address the concern that "net buyers might have an incentive to depress market clearing prices by offering … at less than a competitive level," and it found that the MOPR was "a reasonable method of assuring that net buyers do not exercise monopsony power."[125] The Commission has continued to describe the "very purpose"[126] and the "underlying objective[]" of "PJM's MOPR" as "to prevent the exercise of buyer-side market power."[127] Likewise, when the Commission has weighed modifications to PJM's MOPR, it has assessed whether those modifications are necessary to address buyer-side market power.[128]

---

[124] *Portland Gen. Exch., Inc.*, 51 FERC ¶ 61,108, 61,243-44 (1990).
[125] *PJM Interconnection, L.L.C.*, 117 FERC ¶ 61,331, at PP 103, 104 (2006).
[126] *PJM Interconnection, L.L.C.*, 135 FERC ¶ 61,022, at P 104 (2011).
[127] *PJM Interconnection, L.L.C.*, 143 FERC ¶ 61,090, at P 20 (2013) (describing "PJM's MOPR [as] a mechanism that seeks to prevent the exercise of buyer-side market power").
[128] *See, e.g.*, *PJM Interconnection, L.L.C.*, 135 FERC ¶ 61,022, at P 70 (2011) (revised threshold "reasonabl[y] … protect[s] against unreasonable exercises of market power"); *id.* at P 88 (amending rule that was "ineffective at protecting against buyer market power"); *PJM Interconnection, L.L.C.*, 143 FERC ¶ 61,090, at P 25 (2013) (self-supply exemption approved because it "will operate to identify those self-supply entities lacking the incentive to exercise buyer-side market power"); *id.* at P 109 (declining to "categorially exempt self-supply" because a "blanket exemption" would allow an "unacceptable opportunity to exercise buyer market power"); *id.* at P 56 (approving competitive entry exemption because qualifying entities "do[] not raise buyer-side market power concerns"); *id.* at P 166 (limiting MOPR to gas-fired generation as the "most likely" to "be used to exercise market power").

Under this precedent, PJM's filing fails at the threshold. PJM does not allege that buyers are exercising market power, or that its proposals are designed to prevent the exercise of buyer-side market power. Instead, PJM seeks to transform mitigation rules into a roving tool to address any "material price … effect in the wholesale capacity market" from external influences outside the market. But such external influences are omnipresent and inescapable, as PJM elsewhere acknowledges.[129] And as PJM's incoherent proposals show, the project of "draw[ing] … lines between actionable and un-actionable" influences[130] is fraught. Under present conditions, it is not just and reasonable to embark on that difficult task by unmooring buyer-side mitigation from its foundations.[131]

Exelon recognizes that, in ISO-New England, the CASPR Order applied mitigation rules for a broader purpose. But the Commission stressed that its "acceptance of th[at] proposal" was "only … a finding … on the record before" it.[132] On the record *here*, PJM has failed to identify either sufficient justification for departing from the existing scope of PJM's mitigation rules, or a just and reasonable proposal to implement some broader purpose.

Expansion to existing resources. The CASPR Order only underscores the second unprecedented change sought by PJM's filing. Buyer-side mitigation has *always* been limited to new resources,[133] including in CASPR.[134] That is for good reason. If the intent is to exercise buyer-side market power by lowering prices, the best way to do it is with new resources that can

[134] CASPR Order at P 8.

be built quickly and have high capacity factors—specifically, new gas-fired plants. That is why the Commission found that PJM had properly limited its MOPR to new "gas-fired resources" as "those resources most likely to raise price suppression concerns," which the Commission determined "appropriately balanc[ed] the need for mitigation of buyer-side market power against the risk of over-mitigation."[135]

By contrast, existing resources are not a promising tool for exercising buyer-side market power, and MOPR's remedy does not fit. Existing resources already are participating in the market, and their capacity has contributed to prices the Commission has found just and reasonable. When PJM proposed extending the mitigation period to three years, the Commission rejected that request because, "given the market's demonstration of its need for the resource," there was "no reasonable basis for continuing to apply the MOPR."[136] Likewise, the mitigation remedy—resetting bids to Net CONE * B—does not fit existing resources. Their costs are largely sunk. Thus, as the Commission explained, this remedy "could lead to over-mitigation by requiring a commercially operational resource to bid at an offer floor … substantially above its going-forward costs."[137] These principles apply with particular force to nuclear resources, which have supplied capacity for decades and predate the capacity markets. Their cost of construction has already been sunk, and they have been licensed by the Nuclear Regulatory Commission ("NRC") to operate for years. The Commission should reject the notion that a nuclear unit's continued supply of capacity through the end of its NRC license somehow distorts the capacity market, and should maintain its longstanding and well-grounded limitation of buyer-side mitigation to new entrants only.

IV. MOPR-Ex Violates Each Of The Core Principles That Should Guide Commission Decisionmaking.

As explained above, Exelon does not believe that either proposal is just and reasonable. But if the Commission deems some reform warranted, it should adhere to five principles grounded in Commission precedent.

First, the Commission should allow the mix of resources selected by the capacity market to be affected by state programs that address environmental externalities. So long as the Commission keeps its policies "fuel neutral,"[138] it must accommodate actions of other regulators addressing the reality that fuels have different environmental impacts. If the Commission's markets were designed to *prevent* states from influencing the mix of resources selected in the auction, and if the Commission does not itself step into the gap and adopt a carbon price, then the Commission's markets would not fulfill their "first principles" of "facilitat[ing] robust competition" and "select[ing] … the least-cost set of resources."[139] Polluting plants would receive an implied subsidy, and the resources selected would not be the set that minimizes social costs.

Second, if the Commission decides to accept market rule changes, it should do so in the spirit of cooperative federalism and accommodate state choices as much as possible. Wherever possible, the Commission must "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role."[140]

Third, the Commission should avoid putting customers in the position of having to over-procure capacity via market rules that prevent state-supported resources from clearing. As the Commission has recognized, while the harsh medicine of the MOPR may be effective and

[138] *Id.* at P 26.

appropriate to deter against exercises of buyer-side market power, that remedy is neither effective nor appropriate in response to environmental policies that states are committed to pursuing.[141] Mitigating state-supported resources only leads to the retention of unneeded capacity.

Fourth, the Commission should treat compensation from environmental programs in an even-handed and nondiscriminatory manner. Distinctions in treatment must reflect differences in how policies affect wholesale markets. Otherwise, the Commission is inappropriately sitting in judgment on state policies with no basis in the FPA. Likewise, the Commission should not distinguish between federal and state policies when effects on wholesale markets are identical.

Fifth, the Commission should avoid taking actions in capacity markets that will exacerbate existing price suppression in energy markets. There is no justification for embarking on a purported cure that may well be worse than the disease.

Option B's MOPR-Ex violates each of these principles. First, it selects the *wrong* resources by favoring inefficient polluting resources over clean resources whose costs, all things considered, are lower. Second, it treats state environmental programs as hostile to, rather than complementary of, the Commission's markets. Third, MOPR-Ex selects *too many* resources by ignoring the capacity that will be provided by state-supported resources whose mitigated bids do not allow them to clear. Fourth, even as Option B purports to aim at protecting the market from influences of state policies, it is riddled with arbitrary exceptions. Far from being fuel-neutral, it is gerrymandered to target nuclear and offshore wind. Fifth, MOPR-Ex will suppress energy market prices.

MOPR Ex's flaws are no secret to its sponsors, PJM and its IMM, which developed MOPR-Ex. Just a few months ago, PJM's management emphasized it could not "recommend[]" the "MOPR-Ex … approach to the PJM Board," having concluded that it "is not sustainable and does

[141] CASPR Order at P 45.

SI-SSA-0010-6121

not strike an appropriate balance between legitimate state interests and wholesale market integrity."[142] The IMM has long pushed for an expanded MOPR. But even the IMM understands that MOPR-Ex's distinctions are arbitrary: On April 11, 2016 the IMM filed testimony in support of an expanded MOPR, supposedly based on the IMM's own economic analysis. That proposal would have expanded the MOPR broadly—including to several categories of resources exempted from MOPR-Ex, such as qualifying facilities, public power resources that do not meet the requirements for the self-supply exemption, and state RPS programs (aside from REC payments).[143] MOPR-Ex's newfound exemptions do not stem from any *change* in the IMM's analysis. They are politics. A substantial majority of PJM stakeholders supported the status quo over the IMM's proposal[144]—until the IMM log-rolled powerful voting blocs with exemptions for public power, existing RPS programs, and qualifying facilities. Meanwhile, fossil-fuel generators needed no inducement to support a proposal that harms their cleaner competitors.

No deference should be afforded to the failed stakeholder vote on MOPR-Ex. The proposal did not receive the required supermajority support, and the economically unsound and politically motivated exemptions doled out by the IMM were essential to garnering even the modest level of support the proposal obtained.[145] Regardless, stakeholder votes cannot render a proposal just and reasonable. That determination remains with the Commission.

A. Option B's MOPR-Ex Would Result In An Inefficient Selection Of Resources.

PJM admits that the "theoretical ideal market approach" would account for externalities via, for example, "a carbon emissions objective embedded in the wholesale market."[146] Judged by those principles, Option A's Capacity Repricing improperly adjusts prices in its second-stage auction and treats payments under state environmental programs as subject to mitigation. But Capacity Repricing at least selects the correct resources. MOPR-Ex is far worse.[147] It artificially raises bids of clean resources receiving payments for environmental attributes—resources that, accounting for externalities, are economic.[148] So instead of clearing these economic clean resources, the market clears marginal fossil-fuel-fired resources that, when pollution costs are accounted for, are not economic.[149] In so doing, MOPR-Ex contravenes the mandate that market rules should provide "price signals that guide … orderly entry and exit" to "the selection of the least-cost set of resources."[150] Indeed, approving MOPR-Ex would require the Commission to disavow all of its precedent accommodating state environmental programs, from its CAISO order to the just-issued CASPR Order.[151] And this departure from Commission precedent would be especially harmful as to the nuclear plants MOPR-Ex targets. If MOPR-Ex forces them to retire, they are gone forever. Yet there is broad agreement that, over the medium term, markets should evolve to account for clean generation's environmental benefits.[152] There is no justification for

enacting, in the short term, rules that intentionally lead PJM's resource mix away from the direction that a broad swath of stakeholders—including several fossil-fuel generators that Exelon expects to support MOPR-Ex—believe it should head.

B. MOPR-Ex Is Inconsistent With The Accommodative And Cooperative Approach Endorsed In The CASPR Order.

MOPR-Ex also violates the prime directive of the FPA's scheme of cooperative federalism—that the Commission must, when possible, "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role."[153] MOPR-Ex is expressly "punitive" and "mitigative in nature."[154] But even if the Commission determines that action is needed to address the effects of state environmental programs on capacity prices, the Commission should take such action in the spirit of cooperative federalism—seeking to design its markets to ensure just and reasonable prices while complementing, rather than countermanding or punishing, such state programs. Indeed, the Commission has *already* approved, in CASPR, a model that addresses state programs' effects on wholesale markets in a spirit of cooperative federalism. As explained above, CASPR promised "to better accommodate" state environmental policies in wholesale markets, and the Commission approved CASPR only after it concluded that CASPR would "provide[] a reasonable opportunity to accommodate state sponsored resources."[155] With the more accommodating model of Capacity Repricing available, it is not just and reasonable to adopt an approach that goes out of its way to frustrate state policy choices.

[155] CASPR Order at P 102.

SI-SSA-0010-6124

C. MOPR-Ex Would Over-Procure Capacity And Distort Energy Prices.

Option B is also far worse than Option A because it yields *too much* capacity. The Commission has recognized that when states are pursuing clean energy policies, they will continue to support clean generation even if market rules preclude that generation from clearing. Thus, the CASPR Order observed that such capacity "will be developed by the operation of state environmental and clean energy mandates, whether that capacity clears the [market] or not."[156] In this respect, mitigating clean generation policies differs from mitigating exercises of buyer-side market power. If a buyer's goal is to suppress capacity prices by introducing new capacity, then applying the MOPR means the anti-competitive capacity will not get built *at all*. Building that capacity would be irrational because it cannot further the buyer's price-suppressive goals.

Clean energy is different. As the Commission has recognized, states are likely to continue promoting clean generation even if it cannot clear—because even if the capacity does not clear, it still provides environmental benefits. Thus, as PJM admits, the clean generation will continue to be built and to operate.[157] That means applying the MOPR is likely to "send an incorrect signal to construct new capacity that is not needed."[158] State-supported clean generation will go forward, yet the wholesale markets—ignoring that capacity—will signal that further capacity is needed. The Commission has always acted to avoid that result, either by exempting clean generation policies from mitigation,[159] or by ensuring that any mitigation provides a pathway to accommodate clean generation policies and avoid over-procurement, as in CASPR. Capacity Repricing, despite

[156] *Id.* at P 45.
[157] PJM Filing at 56 ("In many cases, loss of capacity revenues likely will not induce retirement of the subsidized resource, and loads will be paying for more resources than it needs."); *see* Willig Decl. ¶¶ 72-73.
[158] *ISO New England Inc.*, 158 FERC ¶ 61,138, at P 9 (2017).
[159] *Id.* at P 48 (exemption "for state-subsidized resources … so that customers may avoid having to pay for duplicative capacity").

its flaws, also avoids these problems.[160] MOPR-Ex runs headlong into them. As PJM admits, MOPR-Ex is likely to "disqualify[]" clean generators "from clearing as capacity, and will clear other resources to meet capacity needs."[161] As a result, several years hence, the PJM region will have far more capacity than it needs and customers will pay more to support the excess.[162]

That excess capacity will yield a second problem: MOPR-Ex is likely to "enable[e] price suppression in the wholesale energy and ancillary service markets."[163] Because PJM's system will include both the clean generation that the capacity markets ignore, and the replacement generation that the capacity markets acknowledge, there will be "greater supply in the energy market than economic conditions … justify," which will—in turn—"suppress prices."[164]

PJM's failure to grapple with this energy market suppression is reason enough to reject MOPR-Ex. While MOPR-Ex purports to address "suppress[ed] capacity market clearing prices,"[165] PJM does not even attempt to quantify MOPR-Ex's energy market price suppression. As a result, the problem that MOPR-Ex creates may be even worse than the supposed problem that it addresses. Indeed, adopting MOPR-Ex would leave the Commission's work half unfinished: It would be guaranteeing itself the need to take up a new set of energy market issues in short order, but without any indication of how PJM will propose to *solve* the problems it has created.

Risking new and unquantified price suppression in the energy market is especially wrongheaded because energy market price suppression is *already* a big problem. As PJM explained a few months ago, "under the current market rules, inflexible units are not permitted to

[160] PJM Filing at 56 ("Capacity Repricing avoids … duplication, because it allows state-selected resources to commit as capacity….").
[161] *Id.*
[162] *Id.*
[163] *Id.* at 57.
[164] *Id.*; *see* Willig Decl. ¶ 74.
[165] PJM Filing at 17.

SI-SSA-0010-6126

set price," even when they are "needed to serve demand."[166] When that occurs, PJM's locational marginal price "does not accurately reflect the true incremental cost to serve load," and "energy and reserve prices" are "suppress[ed]."[167] PJM cannot defensibly exacerbate these problems when it admittedly has no idea whether it is creating a bigger problem than it is solving.

Price suppression in energy markets has a particularly pernicious effect on baseload resources that earn most of their revenue in the energy market. Thus, rather than creating a disincentive for additional state support programs, as MOPR-Ex's proponents suggest, it may *exacerbate* economic pressure on baseload nuclear resources, which in turn may spur additional action from states to avoid the environmental consequences of widespread nuclear retirements.

D. MOPR-Ex's Exemptions Draw Arbitrary Distinctions Among State Programs And Are Otherwise Unlawful.

Even if one accepted MOPR-Ex's incorrect premise that capacity markets should be "protected" from the influence of some state environmental policies, the proposal is indefensible as a matter of market design. It is full of discriminatory exemptions betraying that it is a political logroll, not a just and reasonable market reform. A more apt name would be "MOPR-Exemption." MOPR-Ex's exemptions are also unlawful in numerous ways.

1. The RPS Exemption Is Unduly Discriminatory And Not Just And Reasonable.

MOPR-Ex exempts from its definition of Capacity Resources with Actionable Subsidies any resources qualifying for an "RPS Exemption." The exemption "grandfathers" renewable resources procured or subject to an RFP issued before December 31, 2018, and going forward, it exempts any renewable resources procured under an RPS that is what MOPR-Ex calls

[166] PJM, *Proposed Enhancements to Energy Price Formation* at 2 (Nov. 15, 2017), http://www.pjm.com/-/media/library/reports-notices/special-reports/20171115-proposed-enhancements-to-energy-price-formation.ashx ("PJM Proposed Enhancements"); *see* Comments and Responses of PJM Interconnection, L.L.C., at 74-75, Case No. AD-18-7-000 (Mar. 9, 2018) (noting that resiliency problems may be exacerbated by suppressed energy market prices, and that "because [certain units] are not able to set clearing prices, those clearing prices are artificially low[]").
[167] PJM Proposed Enhancements at 2.

SI-SSA-0010-6127

"competitive and non-discriminatory"—which MOPR-Ex defines to *forbid* discrimination against "renewable Capacity Resources," but to *permit* discrimination "restricting imports from other states," and to *require* discrimination against "offshore wind," and "coal, natural gas, or nuclear thermal resources."[168] The intent is to "accommodate most state RPS programs," but to mitigate other state environmental policies based on disfavored technologies or procurement processes. For two reasons, this RPS Exemption is unduly discriminatory, and not just and reasonable.

First, under MOPR-Ex's rationale, the RPS Exemption is untenable. MOPR-Ex purports to target "material state subsidies" with "price suppressive effects … on … clearing prices."[169] RPS standards are exactly this.[170] Indeed, PJM *admits* as much: It concedes that the RPS Exemption is *not* based on a judgment that "renewable generation resources … do not suppress prices."[171] That concession was necessary because PJM's filing is replete with evidence that these resources *do* affect prices, and PJM's filing identifies them as "subsidies of concern."[172] PJM's expert, Dr. Anthony Giacomoni, explains that "RPS/REC programs contribute significantly to the installation of renewable resource capacity," and "bring forth more renewable resources … than would have developed absent the programs."[173] Today, RPS requirements require "4,969 MWs of 'around-the-clock' capacity … located and metered in the PJM Region," which is expected to grow to "8,000 MWs by 2025."[174] Indeed, the capacity price effects of renewables—most of which receive support under RPS programs qualifying for the RPS Exemption—are significant. As the below table shows, prices across PJM are 4.1% lower than they would be if renewables had to bid without the benefit of subsidies, and prices in the ComEd and EMAAC zones are 6.5% lower.

Taking MOPR-Ex's stated purpose as its word, the RPS Exemption is untenable. When the Commission approves exemptions, it does so because the resources that qualify do not have the characteristics deemed to warrant mitigation in the first place.[175] Never has the Commission found that a class of resources has the characteristics deemed to warrant mitigation, yet exempted them anyway. But that is what MOPR-Ex does. The reason, presumably, is that some stakeholders regard the MOPR-Ex's core policy choice—that state environmental policies should be mitigated—as unacceptable when applied in a principled manner, but were willing to go along so long as a one-off exemption was made for politically popular RPS programs. Nor can the RPS Exemption be defended as an exercise in incrementalism that exempts programs *least likely* to affect price: The exemption's main trigger—whether a procurement process is "competitive and nondiscriminatory"—has nothing to do with whether a program is likely have significant effects.

While PJM justifies the RPS Exemption as reflecting "deference to [state] public policies,"[176] that deference only underscores the second reason that the RPS Exemption is

[175] For example, the Commission approved the self-supply exemption because PJM's existing MOPR "[wa]s a mechanism that seeks to prevent the exercise of buyer-side market power," and self-supply entities that qualify for the exemption lacked the ability and "the incentive to exercise buyer-side market power." *PJM Interconnection, L.L.C.*, 143 FERC ¶ 61,090, at PP 20, 25 (2013).
[176] PJM Filing at 114.

arbitrary. MOPR-Ex's deference is unjustifiably selective. It awards an exemption *only* to the renewable/RPS model, excluding other state environmental policies regardless of whether the effects on capacity auctions are similar and even if the disfavored policies are more efficient. As Dr. Willig explains, the archetype of a well-designed environmental policy is one that limits payments to the externality being addressed. Illinois' ZEC Program follows that mandate, but there is no guarantee RPS programs will do so.[177] Yet MOPR-Ex exempts payments under RPS programs even if they are inefficiently high, while mitigating environmental programs that may be perfectly efficient. That is arbitrary and undue discrimination.

MOPR-Ex's RPS Exemption is especially egregious because it compels discrimination against non-renewable technologies that provide the same environmental benefits as renewable technologies.[178] The RPS Exemption provides that the "renewable characteristic" must be the "only screen for participation" and specifies that "renewable does not include coal, natural gas, or nuclear thermal resources."[179] So suppose that a state wishes to address the externalities of carbon emissions and recognizes that supporting nuclear power plants may be its most efficient solution—indeed, so efficient that it is concerned that other zero-emitting technologies, such as wind and solar, would not be able to compete head-to-head with nuclear in a zero-emission credit market open to all non-emitting technologies. The RPS Exemption not only would penalize the state for creating a nuclear-specific program in order to protect its support for wind and solar, but also would even penalize the state if it decided to instead impose a zero-carbon purchase obligation rather than create an RPS program. Doing so would result in the mitigation of any units receiving

[177] Willig Decl. ¶¶ 59, 82-87.
[178] *Id.* ¶ 86.
[179] Proposed PJM Tariff, Attachment DD § 5.14(h)(10)(b)(ii) (Option B). The RPS Exemption would also thus apparently require mitigation if states adopt carve-outs for particular renewable technologies, such as solar.

payments under the program, including renewable generators, because the "renewable characteristic" would not be the "only screen" for participation in the program.[180]

Similarly indefensible is the discrimination in the RPS Exemption's "grandfathering" provision.[181] That exemption purports to protect "seller expectations," and PJM defends it as a "reasonable transition" because "commitments were likely made based on RPM's longstanding practice of applying the MOPR to only gas-fired generation resources."[182] But non-renewable generators also have expectations at stake. The Quad Cities plant, for example, was procured under Illinois' ZEC Program at a time when PJM's MOPR only applied to gas-fired generation and had never applied to existing resources of *any* type. Expectations, to the extent they are a legitimate basis to exempt resources, must be respected consistently.

MOPR-Ex's selectivity violates not just sound economics, but the FPA's division of authority. As explained above, the FPA protects states' authority, as regulators of "facilities used for the generation of electric energy,"[183] to enact programs that address the environmental aspects of electricity generation, including selecting *which resources* benefit from state policies. The Commission, for its part, has some authority to tailor its market rules in light of state policies—but only to the extent that state policies "affect[] wholesale rates."[184] This principle forbids the Commission from approving market rules that attempt to micromanage the design of state policies regarding generation facilities, absent evidence of materially different effects on federal markets that result from different state policy designs.

SI-SSA-0010-6131

PJM does not genuinely defend MOPR-Ex's RPS Exemption. PJM says it "targets the mitigation action to the most recent state actions."[185] Vintage, however, is not a principled distinction, especially because RPS programs today are *larger* than they have ever been and growing every year.[186] Yet no matter how large they get, they will enjoy the RPS Exemption. PJM also avers that the RPS Exemption targets "state actions … focused on … specific units."[187] But that distinction also has no basis in economics. RPS standards supporting 4,969 MWs of renewable resources from dozens or hundreds of units may have similar effects as a program supporting a single 1,400 MW nuclear plant,[188] and the nuclear program may be more efficient.[189] The nuclear program's focus on "specific units" reflects only that nuclear plants are large and discrete. It has nothing to do with anything that should matter under PJM's market rules.

2. The RPS Exemption Delegates Excessive Discretion To Make Mitigation Decisions, In Violation Of Order No. 719.

In Order No. 719, the Commission admonished RTOs to ensure that "mitigation tariff provisions [are] as non-discretionary as possible,"[190] and it has stressed that "mitigation is supposed to be nondiscretionary in nature."[191] That is especially important where, as here, the IMM makes mitigation decisions. "[T]here is an inherent conflict of interest in an MMU conducting mitigation and also opining on the state of the market, the health of which may in part reflect the results of its mitigation."[192] Only nondiscretionary criteria temper that conflict;

SI-SSA-0010-6132

discretion exacerbates it. Hence, the Commission has rejected a PJM proposal that would have "provid[ed] the IMM with unfettered discretion" to make mitigation decisions.[193]

The RPS Exemption violates these principles by conferring nearly unbounded discretion to determine whether an RPS program is "competitive and nondiscriminatory." While the exemption sets forth eight factors to provide a patina of objectivity, these factors merely cover for boundless discretion. For example, a program's requirements must be "fully objective and transparent."[194] Who decides what this means? The IMM, with nothing objective or transparent to limit its discretion. Likewise, the RPS exemption warns that programs must not include criteria that "could give preference to" new or existing resources, or "use indirect means" to discriminate based on vintage—with nothing to constrain the discretion in applying these vague terms.[195]

3. Under *NRG*, The RPS Exemption Cannot Be Severed, As PJM Suggests.

Rather than genuinely defend the RPS Exemption, PJM invites the Commission to sever this exemption. But under *NRG Power Marketing, LLC v. FERC*, the Commission cannot do so. *NRG* holds that the Commission can only change proposed rates under § 205 when the change is "minor."[196] Eliminating the RPS Exemption is not. PJM's filing is about what to do about "state subsidy programs" with a "material price suppression effect,"[197] and in myriad ways, RPS programs are the most significant such subsidy. They are the most widespread (existing in all PJM states except two),[198] they are the largest in megawatt terms (and perhaps also dollar terms),[199] and

[199] Giacomoni Aff. ¶ 29.

they are the most popular. In no sense is a tariff that mitigates RPS programs only a "minor" modification to a proposal that exempts these programs.[200]

PJM suggests that even if eliminating the RPS Exemption is not a minor change, the Commission can do so because PJM has provided "affirmative notice" that it would accept this change.[201] But that is not what *NRG* held. The question *NRG* asked was "whether Section 205 allows FERC to suggest modifications that are more than 'minor.'"[202] The answer, *NRG* said, is no.[203] And *NRG* did not stop there: It underscored that a "utility's consent is relevant when FERC proposes 'minor' modifications"—and otherwise, not.[204] While *NRG* also invoked notice concerns as one reason supporting its holding,[205] it nowhere suggested that an RTO can expand the Commission's power to propose non-minor changes by providing "notice" that it will accept them.

Indeed, reading *NRG* to permit PJM's stratagem would badly undermine the stakeholder process. As *NRG* explains, for ISOs and RTOs like PJM, the stakeholder process is crucial for negotiating and vetting contentious proposals.[206] But now PJM, while purporting to propose the MOPR-Ex approach that appeared on the stakeholder ballot, effectively disavows a central plank of that approach. Never did stakeholders have the chance to vote on the Option-B-minus-RPS-Exemption approach that PJM now invites the Commission to adopt. If they had, Exelon suspects that proposal would have failed overwhelmingly—but because PJM bypassed the stakeholder process, the Commission will never know.

4. MOPR-Ex's Myriad Other Exceptions Are Unduly Discriminatory And Not Just And Reasonable.

Like Capacity Repricing, MOPR-Ex exempts a variety of state subsidies aimed at promoting "general industrial development" or "siting" in a particular location, and federal production tax credits and tax incentives like the PTC for wind and the Investment Tax Credit for solar.[207] MOPR-Ex also exempts vertically integrated utilities via the "Self-Supply Exemption."[208] These exemptions are arbitrary for the same reasons explained above: These subsidies affect wholesale prices in amounts that would exceed any "materiality"[209] threshold the Commission could apply.[210] Moreover, these subsidies lack the efficiency justification of environmental programs, and they are certainly less economically efficient than the ZEC Program that MOPR-Ex targets.[211] Likewise, PJM's attempt to defend these arbitrary exemptions fails for the same reasons already explained. PJM stresses that these exemptions track exemptions under PJM's existing MOPR.[212] But the justification for the existing MOPR is narrowly focused on combatting buyer-side market power. If that is the MOPR's purpose, then these exemptions might make sense. But MOPR-Ex is an expansion of the MOPR that applies the MOPR more broadly to address any "material price suppression effect,"[213] without regard to whether buyer-side market power is being exercised. These exemptions are incompatible with that broader purpose.

[207] PJM Filing at 100-01 (noting that Capacity Repricing and MOPR-Ex use the same definition of "Capacity Resource with Actionable Subsidy").

5. MOPR-Ex's "Public Entity Exemption" Is An Invitation To Buyer-Side Market Power.

PJM's Option B creates a new "Public Entity Exemption" for vertically integrated utilities that are publicly owned. The Self-Supply Exemption would normally govern these entities' ability to obtain an exemption, except that the MOPR-Ex proposal creates an exemption specific to public power. This exemption has all the discriminatory problems of the Self-Supply Exemption, plus another glaring flaw: It invites exercises of buyer-side market power.[214]

The Commission has linked approval of the self-supply exemption to strict net-short and net-long thresholds. In 2011, the Commission rejected an "across-the-board exemption from MOPR for new resources designated as self-supply" that lacked such thresholds, finding it "allow[ed] for an unacceptable opportunity to exercise buyer market power."[215] And when the Commission approved the exemption in 2013, it stressed that its approval "depend[ed] critically on" these thresholds.[216] Only these thresholds, the Commission found, adequately "limit[ed] the incentive of self-supply entities to influence market-clearing capacity prices."[217]

Under this precedent, the Public Entity Exemption is indefensible. It disposes with a quantitative net short threshold altogether, and allows an entity that serves only a few hundred MWs of load to go approximately 600 MWs long. Public power entities with the incentive to exercise buyer-side market power gain the ability to exercise it, subject to practically no mitigation whatsoever. Indeed, the Public Entity Exemption resembles nothing so much as the across-the-broad exemption that the Commission rejected in 2011. There is no legal or economic rationale

---

[214] *Consol. Edison Co. of N.Y., Inc.*, 150 FERC ¶ 61,139, at P 2 (2013) ("The original purpose of buyer-side mitigation rules—and minimum offer price rules (MOPR) generally—was to address buyer-side market power, i.e., the market power exhibited by entities seeking to lower capacity market prices for the capacity they buy."); Brief of Respondent FERC at 11, *NRG Power Marketing, LLC v. FERC*, 862 F.3d 108 (D.C. Cir. 2017) (No. 15-1452), 2016 WL 5405117 ("The Minimum Offer Price Rule was designed to prevent the exercise of monopsony power ….").

[217] *Id.*

for this exemption. It is merely a politically motivated concession to one group of stakeholders to garner support for an attack on disfavored resources. PJM defends its free pass to 600 MW of net long capacity on the theory that the existing Self-Supply Exemption sets a net long threshold of 15% of an entity's capacity obligation for entities with obligations between 500 MW and 5,000 MW—and 600 MW "is equal to 15% of 4,000."[218] But this is arbitrary: Many public entities serve far less than 5,000 MW, and 600 MW is far more than 15% of their capacity obligations:[219]

Table 3: Public Entities Serving Small Amounts Of Load

Muni/Coop	Peak Load (MW; approx.)
Central Virginia Electric Coop.	222
Allegheny Electric Coop.	735
Southern Maryland Electric Coop.	844
Northern Virginia Electric Coop.	1,028
Old Dominion Electric Coop.	2,750
East Kentucky Power Coop.	2,890

Source: U.S. Energy Information Administration, 2016 Form EIA-861 data.

On the short side, PJM points to the requirement that "over the entity's long-term planning horizon, [it] must plan on having under its control a quantity of capacity resources that is 'planned to be less than or equal to' its retail load capacity obligations."[220] But this vague standard is no substitute for the quantitative threshold on which the Commission's prior approval "depend[ed] critically."[221]

6. MOPR-Ex' Unit-Specific Exception Process Is Unlawful.

Even if the Commission could require generators to exclude from "competitive" bids the revenues they receive from environmental programs, MOPR-Ex's unit-specific exception process violates the FPA. That exception allows a generator subject to the MOPR to request "a unit-specific offer price that is consistent with the competitive, cost-based, fixed, net cost of new entry

[218] PJM Filing at 110.

SI-SSA-0010-6137

were the resource to rely solely on revenues from PJM-administered markets."[222] But if PJM's Office of Interconnection does not deem the generator's proposed price "acceptable," PJM calculates its own proxy bid.[223] The proposed tariff makes no provision for the generator to object to the proxy bid by seeking a determination from the Commission that its unit-specific offer price was just and reasonable under Section 205. That omission is arbitrary and inconsistent with the rights acknowledged as to similar issues in other sections of PJM's Tariff.[224] Depriving generators of this important right also violates Section 205. Suppliers of capacity in PJM's capacity auction are public utilities entitled to file, under Section 205, the rates they seek to charge for their capacity—manifested, in this context, in auction bids—unless the Commission determines that those rates are not just and reasonable.[225]

V. To The Extent The Commission Accepts Option A, It Should Require Certain Changes.

To the extent the Commission accepts Option A, several adjustments are warranted.

First, Option A unjustifiably exempts from repricing any resource of less than 20 MW—an exemption that, in practice, will mostly eliminate solar and wind resources from coverage. Option A's premise, however, is that RPS-supported renewable resources *in the aggregate* affect capacity prices.[226] It makes no sense to exempt renewables that happen to affect prices in small increments. Indeed, this rule is ripe for manipulation: Solar and wind power rely on small

[226] PJM Filing at 27-28.

SI-SSA-0010-6138

individual pieces wired together at a single interconnection point and developers can configure these assemblies as desired to trigger or avoid repricing.

Second, in order to minimize the impact of repricing on customers and prevent the unnecessary imposition of costs, the Commission should create a price-based materiality screen. PJM proposes its own quantity-based materiality screen of 5,000 MW, RTO-wide, receiving an Actionable Subsidy, or 3.5% of the reliability requirement for an LDA. But these numbers are plucked from the air, unmoored from any theory of what purposes PJM's capacity auction serves or when action is needed to safeguard those purposes. Indeed, despite PJM's claim that its materiality threshold is a desirable "transition mechanism" that "provide[s] the market time to adjust to the[] new rules," PJM buries in a footnote its admission that the ComEd LDA *already* exceeds PJM's threshold, and thus the market will have *no* time to adjust.

In the stakeholder process, Exelon proposed a better materiality screen—one derived from the core purpose of PJM's capacity markets, and that would provide a genuine chance for these markets to adjust. These markets exist to ensure resource adequacy at reasonable cost.[227] So, under Exelon's proposal, repricing occurs only if there is evidence of a threat to resource adequacy due to insufficient needed new entry.

In particular, the first auction stage would run as in PJM's Option A and identify the resources that would receive capacity obligations based on bids reflecting the receipt of state payments. In the next stage, PJM would run a screening auction. It would reprice resources with "Actionable Subsidies" to the default offer cap, Net CONE * B, for the relevant locational delivery area, and then re-run the auction with those repriced bids. This repriced figure—Net CONE * B—

[227] *Cf.* CASPR Order at P 25 ("In evaluating whether, under CASPR, the FCM will continue to maintain resource adequacy at just and reasonable rates, we must assess, as an initial matter, whether the FCM can continue to attract and maintain resource investment when the system requires it, and to do so at a reasonable cost.").

is what PJM and its IMM have identified as a "competitive" bid. If the Stage 2 auction still clears below Net CONE * B for a locational delivery area, this means that "competitive" (and non-repriced) offers are sufficient to drive the clearing price. Repricing is not needed to ensure "competition" or incentivize new entry. Likewise, given the mechanics of the demand curve, a clearing price below the default offer cap implies that the cleared reserve margin exceeds the target reserve margin—so reliability is not in danger either. In these circumstances, the auction meets the Commission's "workably competitive" standard,[228] and repricing is unnecessary. The clearing price in the initial first-stage auction thus would stand.

If, however, the screening auction cleared at (or above) Net CONE * B, that would indicate that competitive bids are not sufficient to drive clearing prices. Instead, new entry is called for, and repricing would proceed as in the second stage of PJM's proposal to incentivize that new entry.

CONCLUSION

The Commission should reject PJM's filing as not just or reasonable.

REQUEST FOR REHEARING OF EXELON CORPORATION

Pursuant to Rule 713 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("the Commission"), 18 C.F.R. § 385.713, Exelon Corporation ("Exelon") hereby submits the following Request for Rehearing in the above-captioned dockets.

INTRODUCTION

The Commission's Order[1] finds PJM's capacity market to be unjust and unreasonable on the ground that its current minimum offer price rule ("MOPR") "does not address subsidies to

[1] *Calpine Corp. v. PJM Interconnection, L.L.C.*, 163 FERC ¶ 61,236 (2018) ("Order").

existing resources."[2] This is a problem, according to the Order, because subsidies allow for the retention of "resources that the market does not regard as economic," which leads to "suppresse[d] prices."[3] The Commission's analysis wholly ignores the economic testimony submitted by Exelon, as well as by others such as the Institute for Policy Integrity, explaining that an efficient market must account for the costs of pollution (which are a type of externality). Accordingly, polluting plants that appear "able to clear the market based on their costs alone" are only able to do so because they do not actually pay their full costs.[4] They pollute for free, and impose those costs on society. Meanwhile, state-supported non-emitting resources, such as nuclear plants, *are* economic once environmental externalities are considered. The capacity price that results from their participation in the market is not "suppressed"; it is the just and reasonable price that results from competitive bids, after accounting for the value of the environmental services these units provide to the public for which they are compensated through attribute credits. This is Economics 101, and it is arbitrary and capricious for the Commission to entirely ignore textbook economics.

Additionally, the Commission's finding that the PJM capacity market is unjust and unreasonable because "out-of-market payments … have reached a level sufficient to significantly impact … the integrity of the … price signals on which investors and consumers rely to guide the orderly entry and exit of capacity resources"[5] is conclusory and entirely fails to engage with the relevant evidence. The actual evidence from recent PJM auction is that capacity resources have considered entering the market in substantial numbers (and that there is significant excess capacity), and have exited the market in substantial numbers. The Commission fails to meaningfully engage with this data, let alone explain what evidence it relies upon for the notion

[2] Order at P 154.
[3] *Id.*
[4] *Id.*
[5] *Id.* at P 155.

that "orderly entry and exit of capacity resources" has somehow been disrupted. The Commission fails to explain why there is excess capacity and robust new entry despite state attribute payments to retain existing clean resources. And the Commission also fails to explain why retaining existing clean resources for their environmental value disrupts "orderly … exit." Such resources *should* be retained once their environmental value is accounted for.

Furthermore, the Commission's determination that prices are "suppressed"—in other words, too low to be just or reasonable—is detached from the statutory "just and reasonable" standard the Commission is supposed to apply. As the Supreme Court has explained, just and reasonable rates are those that balance consumer and investor interests "to encourage the orderly development of plentiful supplies of electricity … at reasonable prices."[6] That is exactly what PJM has today: plentiful supplies of electricity—a reserve margin that significantly exceeds the target reserve margin, and robust entry by new natural gas units—at reasonable prices. The Commission does not explain why, in light of these circumstances, it makes sense to institute market reforms designed to goose investment by increasing prices. To the extent the Commission believes that state regulation creates uncertainty for investors, regulatory uncertainty is inherent in this industry, and it has not deterred the thousands of megawatts of new natural gas-fired plants that have entered the market over the last several years.

Finally, while Exelon disagrees with the Commission's determination that the current Tariff is not just or reasonable, the Commission rightly concluded that the MOPR alone is not a just or reasonable remedy.[7] Instead, a just and reasonable revision to the market rules must provide states with some avenue to promote their environmental goals within the federal capacity

[6] *NAACP v. FPC*, 425 U.S. 662, 670 (1976).
[7] Order at PP 158-60.

construct. As Exelon will argue in comments filed in the Commission's paper hearing, a resource-specific FRR is an appropriate mechanism.

I. STATEMENT OF ISSUES AND SPECIFICATIONS OF ERROR

Pursuant to Rule 713(c)(2), 18 C.F.R. § 385.713(c)(2), Exelon provides the following statement of issues:

1. The Commission acted arbitrarily and capriciously in failing to address evidence presented by the parties that, under elementary principles of economics, efficient entry and exit as well as efficient market prices should reflect the cost of pollution or, conversely, the benefits of avoiding pollution. *See* Order at PP 150-56; *Motor Vehicles Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (an agency must "examine the relevant data and articulate a satisfactory explanation for its action including a rational connection between the facts found and the choice made."); *NorAm Gas Transmission Co. v. FERC*, 148 F.3d 1158, 1165 (D.C. Cir. 1998) (agency will be reversed when it does not "engage the arguments raised before it").

2. The Commission acted arbitrarily and capriciously in concluding that changes to market rules were needed to protect the integrity of the market, without addressing evidence that the market continues to attract plentiful supply and significant new entry. *See* Order at PP 150-56; *Motor Vehicles Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983) (an agency must "examine the relevant data and articulate a satisfactory explanation for its action including a rational connection between the facts found and the choice made."); *NorAm Gas Transmission Co. v. FERC*, 148 F.3d 1158, 1165 (D.C. Cir. 1998) (agency will be reversed when it does not "engage the arguments raised before it"); *Farmers Union Cent. Exch., Inc. v. FERC*, 734 F.2d 1486, 1520 (D.C. Cir. 1984) ("[S]elf-contradictory, wandering logic does not constitute an adequate explanation" of agency action).

SI-SSA-0010-6146

3. The Commission acted arbitrarily and capriciously in concluding that changes to market rules were needed to protect the integrity of the market, without substantial evidence to support its claim that resource adequacy or investor confidence were threatened by state support for clean resources. *See Pacific Gas & Elec. Co. v. FERC*, 306 F.3d 1112, 1115–16 (D.C. Cir. 2002) (FERC "must be able to demonstrate that it has made a reasoned decision based upon substantial evidence in the record").

4. The Commission's Order violates Section 206 insofar as it finds capacity markets to be too low to be just or reasonable, when supply remains plentiful and new entry robust. 16 U.S.C. § 824e; *NAACP v. FPC*, 425 U.S. 662, 670 (1976) (purpose of Federal Power Act is "to encourage the orderly development of plentiful supplies of electricity … at reasonable prices.").

II. THE ORDER FAILS TO ACCOUNT FOR ENVIRONMENTAL EXTERNALITIES—NAMELY, THE SOCIAL COST OF POLLUTION.

The Order concludes that out-of-market revenue, such as environmental attribute payments for clean generation, results in "unreasonable price distortions … regardless of the generation type or quantity of the resources support by such out-of-market support."[8] That is because, the Order states, "out-of-market support to existing resources may allow even uncompetitive resources, for whom a competitive offer would be significantly higher than zero, to submit low or zero priced offers into the capacity market."[9] The Commission's analysis is premised on the notion that an efficient market is one unaffected by state environmental attribute payments, and that a "competitive offer" is one based solely on a resource's production costs. That premise, however, ignores basic economic principles, which the Commission's Order does not even acknowledge or attempt to reconcile.

[8] Order at P 150.
[9] *Id.* at P 151.

As Exelon explained in its Protests in the consolidated dockets, supported by testimony from noted economist Dr. Robert Willig,[10] as well as a study by the Institute for Policy Integrity,[11] the field of economics has long understood that for market outcomes to be efficient, markets must account for externalities of production. Pollution is the classic externality. When fossil-fuel generators produce electricity, they create pollutants such as carbon dioxide, sulfur dioxide, nitrogen oxide, ozone, mercury, and particulate matter. These pollutants are harmful to human health and the environment, but these costs generally fall on society, not the generators that produce them. Put otherwise, the costs are "externalized," and hence electric generation creates "negative externalities." In an efficient market, the polluting generators will bear the costs of their pollution—thereby internalizing the externality. Otherwise, society will end up with more polluting generation resources than is efficient.[12] As Dr. Willig notes, this is textbook economics.[13]

The ability to pollute while generating electricity without paying the cost of pollution is, from the standpoint of economics, a subsidy.[14] Society bears a cost that should properly be treated

[10] Protest of Exelon Corp., Docket No. ER18-1314 at 12-22 (May 7, 2018) ("Exelon PJM Protest") and Declaration of Robert D. Willig at 17-29 ("Willig Decl.") (attached to Exelon PJM Protest); *see also* Protest of Exelon Corp., Docket No. EL16-49 at 19-30 (Jan. 30, 2017) ("Exelon CPV Protest") & Declaration of Robert D. Willig at 8-16 (attached to Exelon CPV Protest).

[12] As Commissioner Glick put it: "[T]he order ignores the fact that governmental policies that internalize the externalities associated with electricity generation are essential to reaching an efficient market outcome…. Without policies addressing these externalities, PJM's capacity market will produce a sub-optimal outcome." Order, Dissent of Commissioner Glick at 6 ("Glick Dissent").

Rubinfeld, *Microeconomics*, 639-657 (2d ed. 1992); A.C. Pigou, *The Economics of Welfare* (4th ed. 1932); W.J. Baumol & W.E. Oates, The theory of environmental policy, Ch. 3 (2d ed. 1995)); *see* Motion for Leave to Answer and Answer of Exelon Corp. and PSEG Companies, Docket No. ER18-1314, at 2-3, 16-17 (May 22, 2018) ("Exelon PJM Answer").

[14] Exelon PJM Protest at 12.

as a cost of production. Indeed, for carbon dioxide alone, estimates put this subsidy's value for fossil-fuel generators across PJM at $12.1 billion to $17.7 billion dollars annually.[15] As Dr. Willig explains, the resulting market outcome will not be efficient. Polluting resources are able to submit bids that are far lower than their true competitive offers would be, because they do not need to account for the cost of pollution. Moreover, resources that would exit the market if forced to bear the costs of pollution—such as aging coal plants—will remain in the market.[16] In other words, the market's failure to account for the costs of pollution leads precisely to the harms that the Order purports to address: "unreasonable price distortions and cost shifts,"[17] non-competitive offers that are not "based on actual costs,"[18] the retention of "resources that [an efficient] market does not regard as economic,"[19] and "resulting price signals" that do not promote "the orderly entry and exit of capacity resources."[20]

States have chosen to address this inefficiency in two ways. Some have taxed polluting generation—by, for example, joining a cap-and-trade program like the Regional Greenhouse Gas Initiative. Others have compensated non-emitting generation for displacing polluting generation, through environmental attribute payments like Zero Emission Credits ("ZECs") and Renewable Energy Credits ("RECs"). As Dr. Willig explains, these initiatives help to ensure that private production decisions account for the cost of pollution (or the benefits of non-pollution). The result is a more efficient market outcome.[21] Yet the Order stands economics on its head by labeling the

[15] These figures reflect 291.9 million tons of CO_2 emitted in PJM in 2017 and 426.6 million tons emitted in 2016, at a cost of $41.40 per ton. *See* Monitoring Analytics, LLC, *2017 State of the Market Report for PJM, Volume 2: Detailed Analysis*, at 361 (Mar. 2018); Exelon PJM Protest at 12.

[21] Willig Decl. ¶¶ 47-60.

resulting prices unjust and unreasonable. The Order does not acknowledge its deviation from basic economics or rely on any economic principles for its conclusion. Nor does the Order explain why market rules are unjust and unreasonable if they allow market prices to be influenced by state programs addressing the environmental externalities of production. Indeed, a market designed to be insulated from such policies—by resetting bids to offset attempts to account for those externalities—would inevitably and necessarily result in inefficient outcomes and the continued operation of resources that, after accounting for externalities, are uneconomic. Such a market design could never be just or reasonable. The Order's failure to address "an important aspect of the problem,"[22] and "to engage the arguments raised before it,"[23] is arbitrary and capricious and a failure of reasoned decisionmaking.

III. THE ORDER IS ARBITRARY AND CAPRICIOUS BECAUSE IT FAILED TO GRAPPLE WITH EVIDENCE THAT THE CAPACITY MARKET CONTINUES TO FUNCTION PROPERLY, AND CITES NO EVIDENCE TO JUSTIFY ITS FINDING TO THE CONTRARY.

The Order is also arbitrary and capricious because it finds that the PJM capacity market is unjust and unreasonable without even addressing unrebutted evidence that the market has a healthy reserve margin and continues to attract new entry and promote exit of uneconomic resources. The evidence concerning the market's performance cannot be reconciled with the Commission's assertion that "out-of-market payments by certain PJM states have reached a level sufficient to significantly impact … the integrity of the resulting price signals on which investors and consumers rely to guide the orderly entry and exit of capacity resources."[24] Indeed, the Commission's conclusion that state environmental attribute payments "will significantly affect the

[24] Order at P 156.

PJM capacity market" in a manner detrimental to that market's integrity is not supported by any evidence at all.

A. The Commission Failed to Address Evidence That the Market Has a Large Reserve Margin and Continues to Foster Orderly Entry and Exit.

As pointed out by Exelon and many others,[25] the actual data concerning the PJM capacity market's performance demonstrates that, by all measures, the market is performing well. There is no sign at all of any resource adequacy concern on the horizon. "PJM currently has far more generating capacity than it needs to reliably meet the region's electricity needs, even several years out."[26] In the most recent Base Residual Auction, PJM's reserve margin was 21.5%, which is 5.7% higher than the target reserve margin of 15.8%.[27] That is down slightly (1.8%) from the prior year's auction, showing that the market has responded to oversupply through exit, but there still remains significantly more capacity on the system than is needed for resource adequacy, as has been the case since the RPM mechanism was adopted. The current and historical reserve margins are shown in the chart below:[28]

	Auction Results		
Delivery Year	Resource Clearing Price	Cleared UCAP (MW)	Reserve Margin
2007/2008	$ 40.80	129,409.2	19.1%
2008/2009	$ 111.92	129,597.6	17.4%
2009/2010	$ 102.04	132,231.8	17.6%
2010/2011	$ 174.29	132,190.4	16.4%
2011/2012[1]	$ 110.00	132,221.5	17.9%
2012/2013	$ 16.46	136,143.5	20.5%
2013/2014[2]	$ 27.73	152,743.3	19.7%
2014/2015[3]	$ 125.99	149,974.7	18.8%
2015/2016[4]	$ 136.00	164,561.2	19.3%
2016/2017[5]	$ 59.37	169,159.7	20.3%
2017/2018	$ 120.00	167,003.7	19.7%
2018/2019	$ 164.77	166,836.9	19.8%
2019/2020	$ 100.00	167,305.9	22.4%
2020/2021[6]	$ 76.53	165,109.2	23.3%
2021/2022	$ 140.00	163,627.3	21.5%

Moreover, despite oversupply and low prices, the capacity auction continues to attract new entry. In the Base Residual Auction for 2020/21, which occurred after the Illinois Zero Emissions Credit Program went into effect, more than 2,300 MW of new combined-cycle gas resources cleared the market.[29] In the Base Residual Auction for 2021/22, PJM attracted another 890 MW of new entry plus 508 MW of generation upgrades, for a total of more than 1,400 MW of new generation.[30] As Exelon pointed out in its comments,[31] looking forward, there are almost 40 GW of recently entered or potential near-term entrant gas combined-cycle plants spread across PJM—equivalent to 25% of the market. Over half of that capacity is an advanced state of development:

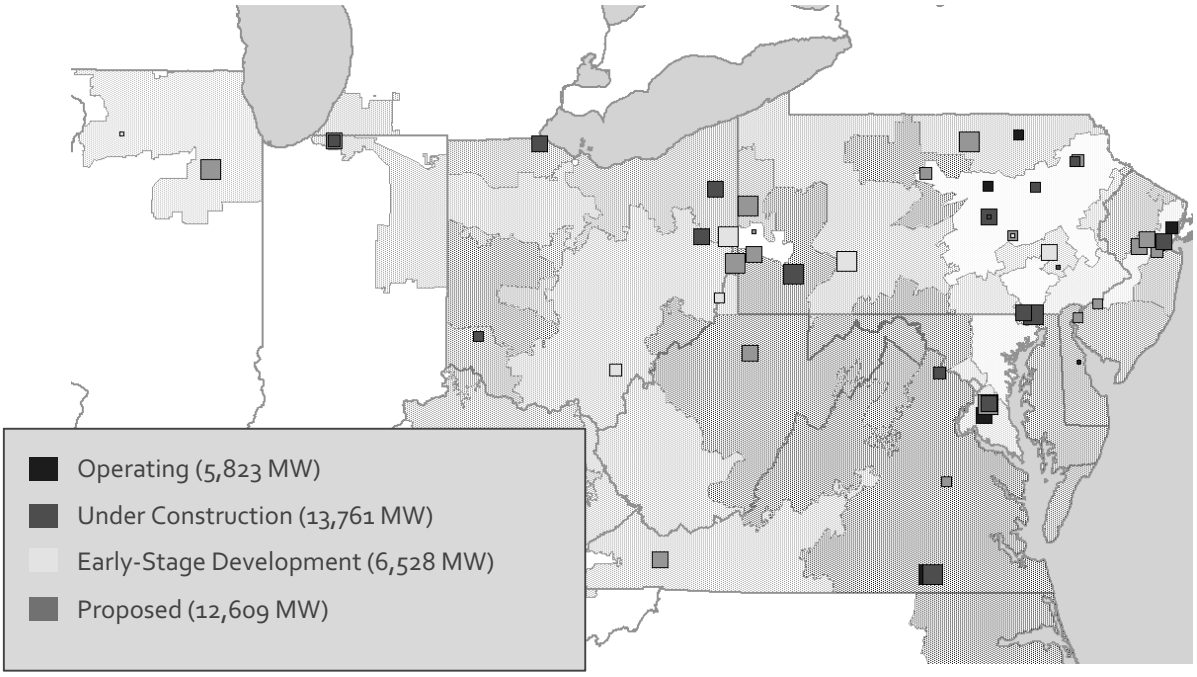
40 GW Of Recently Entered Or Potential Near-Term Entrant Gas Combined-Cycle Plants In PJM



Note: Box size denotes relative size of each unit in net summer capacity.

The Commission's Order does not even acknowledge this evidence, let alone explain how it can be reconciled with the Commission's determination that it can "no longer rely on [the current market] construct to harness competitive forces and produce just and reasonable rates."[32] That omission renders the Commission's Order arbitrary and capricious.[33]

B. The Commission's Finding That Rates Are Unjust and Unreasonable Is Unsupported by Substantial Evidence.

Instead of engaging with actual evidence concerning the market's performance, the Commission's Order instead relies on *ipse dixit* to find that the market construct is unjust and unreasonable. The Commission states that because state support is enough "to significantly affect whether a resource receiving such support chooses to remain in operation[,] [t]herefore, we find

[32] Order at P 156.
[33] *See State Farm,* 463 U.S. at 43; *NorAm Gas*, 148 F.3d at 1165.

that PJM's Tariff is unjust and unreasonable because PJM's MOPR does not address subsidies to existing resources."[34] That conclusory statement does not explain why a market construct is unjust and unreasonable simply because it allows entry and exit decisions to be significantly affected by public policy concerns. Indeed, as Exelon's Protest pointed out and as Commissioner Glick emphasizes in his dissent, subsidies are ubiquitous, and even the broad MOPR that PJM contemplates does not even begin to address all of the various subsidies that power plants enjoy. "The PJM states have adopted over 100 programs to subsidize all forms of energy sources."[35] Approximately one-fifth of PJM's capacity is subsidized through guaranteed cost recovery via retail rates.[36] And, of course, the ability of fossil fuel generators to pollute the air without paying for the cost is the largest subsidy of all.

To the extent the Commission's Order rests on the premise that it must respond to a growing trend of state subsidies—"[w]e are compelled by the evidence … to conclude that out-of-market payments by certain PJM states *have reached a level sufficient to significantly impact* the capacity market clearing prices and the integrity of the resulting price signals on which investors and consumers rely"[37]—the Commission's decision is not justified by evidence. The Commission nowhere explains what it regards as a "significant[] impact" on prices, nor does it document the evidence showing that the cumulative impact of state subsidies on capacity prices has significantly increased in recent years. The Commission also cites no evidence actually documenting any erosion in investor and consumer reliance on capacity market price signals.

[37] Order at P 156.

SI-SSA-0010-6154

The only actual evidence on which the Commission relies is an affidavit from a PJM economist, Dr. Anthony Giacomoni, which does not support the sweeping conclusions that the Commission has reached. The Giacomoni affidavit merely describes various state environmental attribute programs, and using the arithmetic, converts the attribute payments into $/MWh quantities.[38] Dr. Giacomoni says nothing to support the Commission's conclusion that, despite widespread subsidies for the capacity market's entire history, suddenly "out-of-market payments … have reached a level sufficient to significantly impact … the integrity of the resulting price signals."[39] Indeed, Dr. Gianconomi does not even address the integrity of the capacity market's price signals. Neither his testimony nor the Order "meaningfully link[] the existence of those programs to the claim that PJM's capacity market may not result in just and reasonable rates."[40]

The Order refers to uncertainty,[41] but in reality, as Commissioner Glick explains, "[u]ncertainty in many forms—commodity price uncertainty, demand uncertainty, and yes, policy uncertainty—pervades the electricity industry and the Commission leaves it to private companies to manage that uncertainty."[42] Exelon made the same point in its Protest.[43] Yet the Order says nothing about "why the uncertainty created by certain state policies is any different or why that difference is sufficient to render PJM's Tariff unjust and unreasonable."[44]

SI-SSA-0010-6155

III. THE ORDER'S ANALYSIS IS DISCONNECTED FROM THE RELEVANT CONSIDERATIONS UNDER SECTIONS 205 AND 206.

The Commission should also rehear the Order because it fails to consider the proper criteria when assessing PJM's Tariff under Section 206. In charging the Commission to set just and reasonable rates, Congress intended for the Commission "to encourage the orderly development of plentiful supplies of electricity … at reasonable prices."[45] That mandate is amply satisfied in PJM today. As discussed above, supplies are plentiful, new gas resources continue to enter the market, and prices paid by customers are historically low. There is no resource adequacy issue on the horizon, and the Order does not claim otherwise.[46]

Under these circumstances, it is arbitrary and capricious, and contrary to the purpose of Section 206, for the Commission to mandate market reforms on the theory that prices are too low and that investors have insufficient confidence in the market.

IV. THE ORDER CORRECTLY CONCLUDES THAT A MOPR ALONE WOULD NOT BE A JUST AND REASONABLE REMEDY.

As discussed above, Exelon disagrees with the Order that the current Tariff is unjust and unreasonable. However, to the extent the Commission disagrees, it correctly concluded that imposing a MOPR alone would not be a just or reasonable remedy. The Order identifies "two aspects to our proposed replacement rate."[47] The first is an expanded MOPR with "few or no exceptions" that, as the Order puts it, "should protect PJM's capacity market from the price suppressive effects of resources receiving out-of-market support."[48] The second aspect is a method

[45] *PJM Interconnection, L.L.C.*, 155 FERC ¶ 61,157, at P 30 n.39 (2016) (quoting *Pub. Utils. Comm'n of Cal. v. FERC*, 367 F.3d 925, 929 (D.C. Cir. 2004)); *NAACP*, 425 U.S. at 670.
[46] Exelon PJM Answer at 4.
[47] Order at P 158.
[48] *Id.*

for "accommodat[ing] resources that receive out-of-market support" outside the capacity auction.[49] Specifically, the Order proposes a resource-specific FRR Alternative.[50]

A mechanism for accommodation is necessary for the tariff to be just and reasonable. First, allowing resources receiving state support to provide capacity to customers within PJM—albeit outside of the capacity auction—ensures that states will still have some mechanism for valuing and addressing the environmental externalities of production. As discussed above, the Commission should not design its markets to stand in the way of "valid policy goals,"[51] including state efforts to account for environmental externalities. The Federal Power Act assigns to states the power to regulate generation facilities and fuel type. The Commission's markets should be designed to make room for states to exercise that power. A MOPR-only remedy fails to make such room; it counteracts, rather than accommodates, valid state policy choices.

Second, a MOPR-only remedy would impose unjust and unreasonable costs on consumers by leading to the over-procurement of capacity. If state-supported resources are in fact providing capacity to the system, that capacity should be counted and compensated. It would not be just or reasonable to design market rules so as to require customers to procure a quantity of capacity through the capacity auction that ignores the existence of state-supported capacity and its actual contribution to system reliability. As the Commission recognized, "if PJM's MOPR applies to state subsidized resources with few or no exceptions, and yet the states continue to support those resources, some ratepayers may be obligated to pay for capacity both through the state programs providing out-of-market support and through the capacity market."[52] Designing market rules that

[49] *Id.* at P 160.
[50] *Id.*
[51] *Id.*
[52] *Id.* at P 159.

foreseeably lead to significant over-procurement of capacity is particularly misguided at a time when, as discussed above, the system already has a large amount of excess capacity.

Thus, to the extent the Commission affirms its finding that the current Tariff is unjust and unreasonable, it should also reaffirm that a MOPR-only remedy would not be just or reasonable, and that a just and reasonable remedy must accommodate state-supported resources by "continu[ing] to … recognize[them] as capacity on the system."[53]

V. CONCLUSION.

For the foregoing reasons, the Request for Rehearing should be granted.

Dated: July 30, 2018

Marianne Alvarez
Exelon Corporation

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

PJM Interconnection, L.L.C.	)	**Docket Nos. ER18-1314-000**
	)	**ER18-1314-001**
	)	
	)	

MOTION FOR LEAVE TO ANSWER AND ANSWER OF EXELON CORP. AND THE PSEG COMPANIES

Pursuant to Rules 212 and 213 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("Commission"),[1] Exelon Corp. ("Exelon") and the PSEG Companies[2] move for leave to answer, and submit their answer, to the comments and protests filed in the above-captioned dockets.

MOTION FOR LEAVE TO ANSWER

Exelon and the PSEG Companies respectfully request that the Commission permit this Answer, and the attached Declaration of Michael M. Schnitzer ("Schnitzer Decl."), to protests and comments filed in the above-captioned dockets on May 7, 2018. The protests and comments include new evidence, including many new expert affidavits. Moreover, the protests and comments stake out novel positions—not just advocating for and against Capacity Repricing and MOPR-Ex, but suggesting modified versions of both, as well as entirely new approaches. Several protests and comments also respond to PJM's Section 205 filing by urging the Commission to act under Section 206. The Commission has allowed answers to protests where the answer provides

[1] 18 C.F.R. §§ 385.212, 385.213 (2017).
[2] The PSEG Companies include: Public Service Electric and Gas Company, PSEG Power LLC and PSEG Energy Resources & Trade LLC.

information that assists the Commission in its decision.[3] Exelon and the PSEG Companies respectfully suggest that this Answer will do so. In particular, the Schnitzer Declaration provides important new evidence concerning the Capacity Repricing proposal, in response to comments submitted by other parties.

ANSWER

The commenters clamoring for an expanded MOPR seek to exploit the Commission's commitment to markets and competition for ends that are profoundly anti-market and anti-competitive. While they purport to be purifying the Commission's markets from state intrusions, in reality they are seeking to entrench an unfair advantage they have enjoyed for decades: continuing to exploit the market's failure to value certain environmental attributes, and thereby imposing harm on society without paying for the costs. It is not a "level playing field" to treat resources that pollute as though they did not. When a coal or gas plant can underbid a wind farm, or a nuclear generator, by polluting the air we breathe, this is not a triumph of markets' power to drive efficient results. It is a market failure. When state policies attempt to internalize the pollution externality—through subsidies, taxes, or otherwise—they make markets more competitive and market outcomes more efficient.[4] This is, literally, textbook economics.[5] That is why there is broad agreement—even among advocates of MOPR-Ex—that markets should and must evolve, one way or another, to take into account environmental externalities like carbon.[6]

SI-SSA-0010-6161

The Commission, of course, has decided so far that its market mechanism should be fuel-neutral. But the Commission can afford to ignore the different environmental profiles of different generation types only because *states'* policies are *not* fuel neutral. Resources thus bring with them to the Commission's fuel-neutral markets a cost structure that reflects whatever fuel-related benefits or penalties states have chosen to impose in light of state environmental priorities. The Commission's market mechanism selects the least-cost set of resources against the backdrop of those state policies. As Exelon's Protest showed, the Commission thus far has always crafted market rules to respect and accommodate state programs addressing environmental externalities.[7] Doing so adheres to the principle that the Commission must, whenever possible, "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role,"[8] consistent with the Federal Power Act's purpose to "complement," not "usurp[] … State regulatory authority."[9] For two decades, this is how the Commission's markets have operated. Thus, there is no truth to the allegation that this proceeding is a referendum on the Commission's commitment to markets.[10]

Advocates of MOPR-Ex ask the Commission to sweep away this market-based model of cooperative federalism in favor of one that countermands state environmental policies, so that the Commission's market yields the outcome that would result if the state policies did not exist. The Commission should not be fooled by these parties' rhetoric: while they cloak themselves in the language of market integrity and fairness, what these generators really want is to protect the market advantage they gain by polluting without paying. They urge PJM market rules that would neuter state policies compensating for the real benefits of cleaner fuels, and thus would strangle

SI-SSA-0010-6162

competition from cleaner generators that, when pollution costs are taken into account, would outcompete the polluters.

As Exelon and the PSEG Companies showed in their Protests, such action is not only inconsistent with sound economics and principles of cooperative federalism, but also is unjustified in light of current PJM market conditions. The Commission's markets are achieving what the Supreme Court has identified as "the principal purpose of" the Federal Power Act: "the orderly development of plentiful supplies of electricity … at reasonable prices."[11] Supply is plentiful, prices are low, and new entry remains significant. The commenters declaring that the markets are on the verge of collapse never address this reality, nor offer any evidence at all to support their panicked assertions that PJM is in the midst of a crisis.

For these reasons, the Commission should reject both PJM proposals. But if the Commission nevertheless determines to take some action to bring capacity prices closer to the levels that would exist without state environmental policies, the Commission should approve Capacity Repricing. Advocates of MOPR-Ex, of course, prefer MOPR-Ex, because it shields them from competition and furthers their goal of ridding the capacity markets of their non-emitting competitors. But if the Commission is compelled to act and finds Capacity Repricing, "PJM's preferred approach,"[12] to be just and reasonable (or that it can be rendered just and reasonable with an appropriate conditional acceptance), the Commission must approve it without reaching MOPR-Ex. Capacity Repricing satisfies the Commission's standard for market design—that it be "workably competitive."[13] And even if the comparison to MOPR-Ex were relevant, from a policy standpoint, Capacity Repricing is clearly superior to MOPR-Ex.

[13] *See, e.g.*, *PJM Interconnection, L.L.C.*, 110 FERC ¶ 61,053, at P 84 (2005).

SI-SSA-0010-6163

Under MOPR-Ex: (1) The wrong resources clear (because clean resources should have the chance to out-compete polluters, after environmental harm is accounted for); (2) Too many resources clear (given the likelihood that the clean resources excluded by MOPR-Ex will continue to supply capacity without compensation from the market); and (3) Energy market price signals are corrupted (suppressed by forced overprocurement). The MOPR's proponents claim this harm is good because it "disincentiv[izes]" states.[14] But the Commission has no business trying to deter states from protecting citizens' health and welfare, and it is doubtful that the Commission could do so in any event.

Capacity Repricing avoids all these problems. The correct resources clear, after accounting for environmental harm; the right quantity of resources clears; and energy market prices are not distorted. Advocates of MOPR-Ex nevertheless argue that Capacity Repricing must be rejected because it yields a price-quantity pairing that is not on the demand curve, and because it may create opportunities for strategic bidding. But these critiques, even if true, are not fatal to Capacity Repricing, and they certainly are no reason to select MOPR-Ex in its stead. As to the price-quantity issue, this theoretical criticism has only modest practical effects. And MOPR-Ex *also* yields a price-quantity pairing that is not on the demand curve, once one accounts for the reality that states will continue support environmentally friendly resources that will effectively provide capacity to the system. Likewise, as to alleged incentives for strategic bidding, any effects "are likely to be modest and would reduce the cost of repricing to customers."[15] To the extent there is any effect, strategic bidding will tend to result in a clearing price that is still significantly higher than the status quo, but lower than the MOPR-Ex clearing price would be. In effect, Capacity Repricing strikes a middle ground. If the Commission remains concerned about bidding incentives, they can be

[14] IMM Comments at 14-15; EPSA Protest at 28-29.
[15] Schnitzer Decl. ¶ 15.

fixed. One example of a potential fix would be including an "opportunity cost" payment in the Capacity Repricing model. Such payments, by making resources indifferent between clearing and not, could virtually eliminate these bidding incentives. In a variety of contexts, the Commission has approved similar payments to align incentives with efficient behavior.

Thus, while there are good reasons to reject any mitigation of environmental payments, including Capacity Repricing, the broad criticisms of Capacity Repricing are overblown. Capacity Repricing is flawed because clean resources should be allowed to account for environmental attribute revenues and other state compensation in making capacity bids. These revenues reflect payments for separate services, and thus those resources, to cover their going forward costs, do not need to receive those amounts from the capacity market. But if the Commission disagrees, Capacity Repricing is the only proposed workable—and "workably competitive"—alternative.

I. The Comments Confirm That PJM's "Two Alternative[]" Approach Violates Section 205.

The comments underscore why Section 205 prohibits alternative filings like PJM's. Arrayed before the Commission are dozens of comments advocating for or against an unbounded universe of potential tariffs: Capacity Repricing,[16] MOPR-Ex,[17] and assorted permutations of MOPR-Ex without certain exemptions (with various commentators seeking to sever versions of the RPS Exemption, Self-Supply Exemption, Public Entity Exemption, Competitive Entry Exemption, and the carve out for federal subsidies, among others).[18] By placing this free-for-all

[16] A number of commentators show that no change is warranted, but that Capacity Repricing is vastly superior to MOPR-Ex. *See* Comments of American Electric Power Service Corp. at 1 ("American Electric Comments"); Protest of Dominion Energy Services, Inc. at 9-11 ("Dominion Comments"); Exelon Protest at 8; Comments of Nuclear Energy Institute at 1 ("NEI Comments"); Protest and Motion to Reject of the PSEG Companies at 2 ("PSEG Protest").

SI-SSA-0010-6165

before the Commission, instead of proposing a single tariff "stating plainly the change or changes to be made,"[19] PJM's filing is inconsistent with the "passive and reactive role" that Section 205 requires the Commission to play.[20] If PJM wishes to give the Commission broad discretion to set policy, it must attempt to carry Section 206's heavy burden, or else seek a declaratory judgment. Because Section 205 does not sanction PJM's approach, the Commission must reject its filing.

II. The Comments Confirm That The Commission Should Not Hesitate To Reject Both Of PJM's Proposals And Preserve The Status Quo.

Stakeholders of every stripe have identified significant problems with both of PJM's proposals. Yet proponents of mitigation urge the Commission to press ahead anyway based on claims that the sky is falling—that state programs are "wreak[ing] havoc with PJM's markets,"[21] which are supposedly facing a "serious threat"[22] and "will collapse."[23] These are serious charges that, if true, would yield evidence for all to see. But what the comments of mitigation proponents reveal, more than anything, is that no *evidence* backs up this rhetoric. And the *actual* evidence confirms that the crisis is manufactured. As shown by Exelon, the PSEG Companies, and others, reserve margins are historically high (23.3% for the 2020-21 BRA) at prices that are historically low ($86/MW-day)—yet still, new entry continues at a significant pace (including almost 40 GW of recently entered or potential near-term entrants across PJM).[24] These high reserve margins, moreover, have been sustained despite years of claims that the capacity markets face "imminent

[19] 16 U.S.C. § 824d(d).

SI-SSA-0010-6166

and substantial," and even "existential," "threat[s]."[25] The efficacy of PJM's capacity markets, and investors' faith in them, speaks for itself.

While PJM does not need to point to a crisis to justify tariff revisions under Section 205, the absence of any on-the-ground problem means that the Commission should not hesitate to reject both of PJM's proposals. Instead, until PJM formulates a new tariff that is genuinely just and reasonable, the Commission should leave PJM's capacity market rules where they are—with the MOPR limited, as it has been, to counteracting buyer-side market power by new resources.[26] That cautious approach avoids all the problems that come from expanding mitigation. And it respects stakeholders' wishes: Of the comments filed that take a position on the merits, a substantial majority urge the Commission to reject both proposals.[27] That preference has been consistent since November 2017, when 64% of stakeholders stated that they preferred the status quo.[28]

III. Although The Capacity Repricing Proposal Is Unwarranted And Flawed, Claims That The Proposal Is Unworkable Are Incorrect.

Exelon and the PSEG Companies agree with the commenters who criticize Capacity Repricing as unwarranted and unnecessary because it needlessly raises prices for customers at a

SI-SSA-0010-6167

time of oversupply with no corresponding benefit, and because it incorrectly mitigates payments recognizing the environmental value of clean generation. But to the extent the Commission disagrees and deems some departure from the status quo necessary, it is not "free to accept the better of the two approaches filed under Section 205," as the IMM incorrectly asserts.[29] PJM has identified Capacity Repricing as its "prefer[red]" approach, and thus the Commission must "assess first whether it can accept Option A, even if subject to suspension and further proceedings."[30] If the Commission determines Capacity Repricing is just and reasonable (or, with an appropriate conditional acceptance, can be *made* just and reasonable), it cannot reach MOPR-Ex. And while Capacity Repricing is unnecessary, the broader attacks on it are meritless. Capacity Repricing's auction mechanism can meet the Commission's "workably competitive" standard,[31] and can accommodate state programs while insulating capacity prices from those programs' effects.

A. The Criticisms Of Capacity Repricing's Auction Design Are Overstated And Can Be Remedied.

Several commentators note strategic bidding incentives that exist under Capacity Repricing's two-stage design—three such incentives, in particular. First, if a portfolio owner has high-cost resources that cannot hope to receive a capacity commitment at Stage 1, it might inflate the bids for those resources in the hope of contributing to higher Stage 2 clearing prices for other resources (what the Wilson Affidavit calls "clear-out-the-top").[32] Second, some "in between" resources—which might be economic at the Stage 2 clearing price, but cannot clear at Stage 1—may drop out.[33] Third, if resources would be economic at the anticipated Stage 2 clearing prices, they may have incentives to make offers below their forward costs in order to increase their

[33] EPSA Protest at 11 n.46 and Affidavit of David W. DeRamus and Collin Cain ¶¶ 49-53.

SI-SSA-0010-6168

chances of receiving a capacity commitment at Stage 1 (what the Wilson Affidavit calls "race-to-the-bottom").[34] The first two incentives tend to increase prices; the third, to decrease prices.

Even if these incentives exist, they are not *per se* fatal. Indeed, as the Schnitzer Declaration explains, "[w]hile commenters' witnesses point out these strategic bidding behaviors, they do not provide any well-supported analysis of their combined net impact."[35] And careful analysis shows that the concerns about Capacity Repricing are overblown. Any incentives to "clear-out-the-top" reflect issues that are already addressed by existing market rules, such as seller offer caps and the risk of Commission enforcement penalties for manipulative bidding.[36] Likewise, the effect of "in between" resources dropping out of the market will be limited given PJM's deep well of potential new entrants.[37] Finally, as between the three incentives, the effect termed "race-to-the-bottom" likely will affect a broader range of resources, and this price-reducing effect will likely swamp the other two price-increasing effects.[38] This effect, however, is also self-limiting: If a resource were the *only* one pursuing this strategy, perhaps it might steeply reduce its bid, predicting that Stage 2 would increase the clearing price.[39] But bidders take into account others' expected behavior.[40] And here, a resource will know that other bidders are also likely to reduce their bids—and thus if the resource reduces its bid too steeply, it risks losing money even at the higher Stage 2 price.[41] This will limit incentives to reduce bids.

The upshot of these incentives will be to mitigate the price increases that would otherwise result from Capacity Repricing. For example, one witness estimates that Capacity Repricing (and

[41] *Id.*

SI-SSA-0010-6169

MOPR-Ex) would increase capacity prices by about 50% absent strategic bidding.[42] The bidding incentives, on plausible assumptions, lower this amount slightly to 39%.[43] Exelon and the PSEG Companies have shown that Capacity Repricing and MOPR-Ex both "will raise capacity market prices and costs for consumers"; the bidding incentives produced by Capacity Repricing thus somewhat limit that effect, yielding prices that are "elevated relative to the status quo, but below MOPR-Ex."[44] That is a reason to prefer it to MOPR-Ex.[45] Whatever the theoretical criticisms of Capacity Repricing's design, it cashes out as a compromise. It respects state policies by allowing state-supported clean generation to clear while still raising prices to offset this support—albeit not as much as certain fossil-fuel generators hope to achieve via MOPR-Ex.[46]

If the Commission remains concerned about Capacity Repricing's effects on bidding incentives, there are potential solutions. For example, the Schnitzer Declaration explains that resources whose offers are above the Stage 1 clearing price but below the Stage 2 clearing price could receive a "lost opportunity cost" payment equal to the difference between their offers and the Stage 2 clearing price.[47] The lower the offer, the higher the payment.

A "lost opportunity cost" payment largely could eliminate all three incentives detailed above: It could eliminate "clear-out-the-top" (artificially inflated offers would be costly, as they would reduce lost opportunity cost payments); the drop out of "in between" resources (who would receive an incentive, via the lost opportunity cost payment, to submit a bid); and the "race to the

[42] *Id.* ¶ 61.
[43] *Id.*
[44] *Id.* ¶¶ 18, 61.
[45] *Id.* ¶ 64.
[46] EPSA also contends that the effect termed "race-to-the-bottom" will cause the auction to procure too much capacity—because when the demand curve slopes down, lower offer prices will yield a larger quantity. EPSA Protest at 11. Because the demand curve is so steep, however, any such effect will be very small—on the order of 0.1% of the market, or 167 MW. Schnitzer Decl. ¶ 63.
[47] Schnitzer Decl. ¶ 67.

bottom" (as failing to clear at Stage 1 would no longer harm resources that can beat the Stage 2 price).[48] This modification could also address the concern that Stage 2 clearing prices will be set by resources with no capacity commitment at stake: A lost opportunity cost payment means that *all* resources that can beat the Stage 2 price have something at stake.[49] The size of these payments would likely be small—0.75% of total capacity payments.[50]

Nor would such payments amount to money for nothing: preparing bids is costly,[51] and PJM would be compensating generators for their expense in preparing cost-based bids that help the PJM market operate efficiently. Opportunity cost payments are already used by PJM to align bidder incentives with efficient behavior—for example, to address out-of-market dispatch for reliability reasons in energy markets, and in operating reserves markets.[52]

If the Commission concludes that a modification to Capacity Repricing is warranted, Exelon and the PSEG Companies respectfully suggest that the appropriate next step would be to reject the current filing as unjust and unreasonable, but indicate that the Commission would accept a Section 205 filing including such a modification.

B. The Broader Attacks On Capacity Repricing Are Meritless.

The broader attacks on Capacity Repricing—many pressed by fossil-fuel generators hoping to drive the Commission toward an unwarranted expansion of the MOPR—are baseless.

Clearance by state-supported resources. One supposed flaw is that clean generators receiving payments for their environmental value clear at the expense of other generators.[53] But this is Capacity Repricing's key *virtue*. As Dr. Willig's Declaration explains, this is the efficient

SI-SSA-0010-6171

result when environmental externalities are taken into account,[54] and by permitting this result, Capacity Repricing avoids the costly overprocurement and distorting energy market effects that plague MOPR-Ex (as discussed further below). In this respect, Capacity Repricing follows the CASPR Order's lead—which also permitted, through a different mechanism, state-supported clean resources to replace existing polluting resources.

Effects on other states. Next, the proponents of a broader MOPR claim Capacity Repricing "would create a significant externality" by allowing "states … to shift th[e] costs of th[eir] polices … onto other" states.[55] Not so. State policies themselves do not impose any costs on other states—for example, the funds for Illinois' ZEC Program come entirely from Illinois customers—and the whole *point* of Capacity Repricing is to set prices where they would have been without state payments that qualify as Actionable Subsidies. That does not export any costs onto other states, or alter prices received by other generators. To the contrary, states *benefit* other states when they support clean generation, because the benefits of pollution abatement are experienced by citizens of all states, not only the state paying for the pollution abatement.

EPSA also repackages similar arguments as constitutional objections, claiming that Capacity Repricing unconstitutionally "[a]llow[s] [s]tates [t]o [r]egulate [b]eyond [t]heir [b]orders" by permitting "the actions of one state to affect[] … other states."[56] The Commerce Clause prohibits states from enacting extraterritorial legislation that "directly regulates transactions which take place across state lines."[57] Never could the Commission's *federal* approval of market rules violate that restriction on state authority. And regardless, EPSA does not

[54] Willig Decl. ¶ 52; *see* Institute for Policy Integrity, *Capacity Markets and Externalities: Avoiding Unnecessary and Problematic Reforms* at 10-12 (April 2018), http://policyintegrity.org/files/publications/Capacity_Markets_and_Externalities_Report.pdf.

[56] *Id.* at 21 (internal quotation marks omitted).
[57] *Edgar v. MITE Corp.*, 457 U.S. 624, 641 (1982).

point to any "direct[] regulat[ion]" of interstate commerce;[58] at most, it alleges that one state's actions may have effects elsewhere.[59] But mere extraterritorial effects do not violate the Commerce Clause: "it is inevitable that a state's law … will have extraterritorial effects," and the "Supreme Court has never suggested that the … Commerce Clause" precludes such effects.[60] Indeed, EPSA's argument proves vastly too much. Whenever states have subsidized fossil-fuel plants, they have required citizens "in other states to shoulder much of the burden"—in less efficient wholesale electricity markets, and in more polluted air.[61] On EPSA's theory, all such subsidies would be unconstitutional. The Commerce Clause has never stretched so far.

Violation of constitutional limits on ratemaking. EPSA's other constitutional objection fares no better. EPSA argues that, as to resources that offer below the Stage 2 clearing price but do not receive a capacity commitment at Stage 1, Capacity Repricing violates the Constitution (and FPA) because it does not provide these resources the "*opportunity* to recover [their] costs,"[62] invoking *FPC v. Hope Natural Gas Co.*[63] and *Bridgeport Energy, LLC*.[64] That standard, however, does not apply here. When a utility is compelled to provide service to the public, as with a traditionally regulated utility, this standard forbids "confiscatory" rates for compelled service.[65] Likewise, when a generator is compelled to remain operational for reliability, the same standard governs.[66] In PJM, however, generators are not compelled to provide capacity. To be sure, generators that have sold capacity generally have a must offer obligation into the Reliability

[66] *Bridgeport Energy, LLC*, 113 FERC ¶ 61,311, at P 29 (2005).

Pricing Model. But if these resources choose to retire, they can do so upon 90 days' notice (and, presumably, upon covering any outstanding capacity obligations)—regardless of reliability implications.[67] In such circumstances, the Commission has held that "there can be no question of confiscation of a resource's property."[68]

Seller-side market power. The American Petroleum Institute ("API") claims, uniquely, that state support generally, and Capacity Repricing in particular, "facilitate the exercise of *supplier*"—not buyer—"market power"[69] via three anticompetitive tactics: (1) "predatory pricing"; (2) "entry deterrence"; and (3) "economic withholding" of a portion of an owner's portfolio.[70] As best Exelon and the PSEG Companies can discern, API's argument appears to be that these tactics require that the owner have the financial wherewithal to withstand temporary losses or losses in part of its portfolio, and that subsidies and Capacity Repricing "facilitate" these tactics by giving generators more money overall. But that money could just as well come from *anywhere*—utility operations, capital markets, or tax reductions. API's argument has nothing to do with Capacity Repricing.

Price/quantity pair not on the demand curve. EPSA criticizes Capacity Repricing because it yields a result that does not fall on "RPM's sloped demand curve": Because Stage 1 determines the quantity procured, and Stage 2 determines the price, Capacity Repricing yields a "price/quantity relationship" that does not appear on the demand curve.[71] But that theoretical flaw

---

[67] PJM Open Access Transmission Tariff, § 113.

[68] *Id.*; *see also N.Y. Indep. Sys. Operator, Inc.*, 124 FERC ¶ 61301, at P 58 (2008) (similar). To the extent EPSA's argument is that Capacity Repricing is unreasonable under the FPA because it does not "represent[] an appropriate balancing of consumer and investor interests," EPSA Protest at 19, Exelon and the PSEG Companies agree—but EPSA gets the imbalance backwards. For consumers, Capacity Repricing strikes the wrong balance because it raises prices with no sound justification. But for investors, it is not unfair that some polluting resources fail to clear due to states' efforts to address environmental externalities—which remains true even if these resources could have beaten the Stage 2 clearing price.

SI-SSA-0010-6174

is no reason to reject Capacity Repricing absent some evidence that it is *actually* unworkable. And certainly, it is no reason to select MOPR-Ex over Capacity Repricing: As the Schnitzer Declaration explains, "the same is true of MOPR-Ex," which *also* yields a "price and quantity pair [that] does not fall on the demand curve," once one accounts for the resources that will continue to receive state support and effectively provide capacity to the system, even though they are not selected in the capacity auction.[72] "Indeed, because MOPR-Ex results in *significant over-procurement*, the effective price-quantity pair that results is even further away from the demand curve than Capacity Repricing."[73]

IV. The Proposals To Expand The MOPR Are Fundamentally Flawed.

Even if the Commission determined that a change must be made and that it could not approve Capacity Repricing (or a variant), it could not approve MOPR-Ex or any of the expansions of the MOPR proposed here. Both in theory and in execution, they are fundamentally flawed.

A. The Proposals To Expand The MOPR Are Flawed In Theory.

The commentators pushing for an expanded MOPR depict competitive markets as, by definition, insulated from the effects of state policies—which, when those policies involve payments for environmental benefits, they derisively call "subsidies."[74] Thus, they proclaim that "*all* subsidies" "are bad," "evil[]," and a "problem[]."[75] But the Commission will not find a citation to any economic authority that supports that broad proposition. That is because this proposition is false—for reasons Exelon has explained. Markets are not efficient when fossil-fuel generators inflict pollution on society without paying.[76] And state policies that attempt to

[72] Schnitzer Decl. ¶ 22.
[73] *Id.* ¶ 15 (emphasis added).
[74] *See, e.g.*, API Comments at 5; EPSA Protest at 12; NGSA Comments at 1-2; P3 Protest at 3.
[75] P3 Protest at 11 & Aff. of Roy J. Shanker, attached thereto, at PP 10, 34.
[76] Willig Decl. ¶¶ 13(c)-(d), 31.

internalize this externality, whether by taxing or penalizing pollution, or by supporting clean generation that abates pollution, make markets more efficient and competitive.[77] This is Economics 101.[78]

In reality, the MOPR's proponents do not really believe that *all* state interventions must be mitigated; instead, their pious rhetoric is only meant to encourage the Commission to adopt changes that harm cleaner competitors, while leaving untouched the massive subsidies they have long reaped. Thus, P3 proposes a supposedly "Clean MOPR" that removes MOPR-Ex's enumerated exemptions and also the carve-out from the definition of "Actionable Subsidy" for "federal production and investment tax credits."[79] But tellingly, P3 does not seek to remove the exclusion for various siting- or development-based subsidies—subsidies that happen to go to gas-fired generators. Likewise, there is not a peep about the untold billions in subsidies that coal-fired generators have and continued to receive, including both direct subsidies—$4.7 billion, just on the federal side, every year[80]—and indirect support, such as Pennsylvania's sales-tax exclusion for coal.[81] And all of this is in addition to the *implicit* subsidy that fossil-fuel generators receive from the ability to pollute without paying, which Exelon showed comes to $12.1 to $17.7 billion annually.[82] There is no justification for targeting government policies for mitigation *only* when they promote clean generation and make the Commission's markets more efficient.

SI-SSA-0010-6176

The MOPR's proponents have no adequate answer for how their approach undermines not just sound economics, but federalism principles the Commission has long respected. As explained by Exelon and others, states have long exercised their FPA-protected authority as regulators of "facilities used for the generation of electric energy,"[83] and the Commission has reaffirmed that it must, whenever possible, "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role."[84] That means that when states regulate generators to protect the air citizens breathe, the Commission should not attempt to thwart or disincentivize those policies, no matter how much rhetorical noise the policies' opponents employ.

The MOPR's proponents insist that an expanded MOPR does not seek to thwart state environmental policies. But in more candid moments, they admit the opposite—that an expanded MOPR aims to create "a disincentive" for state policymaking favoring clean generation.[85] That is consistent with PJM's statement that applying the MOPR to federal payments to wind and solar resources would, in effect, "countermand … acts of Congress."[86] But under the FPA, the Commission has no authority to establish market rules that seek to deter states from legislating to protect their citizens' health and welfare, or to countermand state actions that do so.[87]

Again and again, the MOPR's proponents labor to narrowly limit the state authority over generation that the Commission must respect. First, they put states to an all-or-nothing choice—claiming that states forfeited any ability to influence the generation mix when they joined "an organized capacity market," and that states wishing to make any "policy decision[s]" concerning generation must "pursue Fixed Resource Requirement ('FRR') treatment."[88] But as many

[88] P3 Protest at 21.

SI-SSA-0010-6177

commentators note, that claim mocks history: In myriad states, restructuring went hand-in-hand with RPS programs.[89] That is why the D.C. Circuit has held that restructured states "retain the right to forbid new entrants from providing new capacity, to require retirement of existing generators, to limit new construction to more expensive, environmentally-friendly units, or to take any other action in their role as regulators of generation facilities."[90] Likewise, states' ability to fulfill their obligations under *other* cooperative-federalism statutes, like the Clean Air Act, often *depends* on influencing the generation mix that serves them.[91] Indeed, the Commission's organized markets have earned sustainable support precisely *because* the Commission has not required, as a condition of entry, that states give up their authority to influence the generation mix. To the contrary, in myriad ways, the Commission has actively "accommodate[d]" such policies.[92]

Second, the MOPR's proponents insist that states must make the perfect the enemy of the good. The IMM, for example, avers that states can address the harm caused by carbon dioxide only if they can agree on "a carbon price."[93] But unlike the IMM, states cannot wait for "[t]he theoretical ideal market approach."[94] They want to protect citizens *today*. Thus, acting under their police powers, states can—and often must—"take reform 'one step at a time, addressing [themselves] to the phase of the problem which seems most acute."[95] States, like the Commission, are permitted to adopt market-based approaches, entirely non-market mechanisms, or something

in-between. As Dr. Willig explains, well-designed environmental initiatives like Illinois' ZEC Program, which tie compensation to the value of the externality being abated and procure resources based on their environmental contribution, result in more efficient markets. There is no justification for thwarting those efforts simply because a carbon price would be superior.

Third, the MOPR's proponents imply that the Commission need not respect state policy choices because states may have different views about what externalities are most important to address—noting that FirstEnergy has identified, as "externalities," "fuel diversity" and "fuel security," and that resources possessing these attributes may be different from the clean generators targeted by MOPR-Ex.[96] But this concern is purely hypothetical. The *real* programs that states have enacted, and that MOPR-Ex targets, address environmental externalities like air pollution. Such environmental externalities are the easiest and clearest case. They are "the classic example found in almost every economics textbook."[97] So while the IMM disingenuously says that action may be warranted "[*i*]*f* society determines that carbon is a pollutant with a negative value"[98]—implying that carbon *might not* be a harmful pollutant—nobody *really* doubts that air pollution is a harmful externality, and that addressing it makes markets more efficient. At the May 2017 technical conference, even representatives of Calpine and NRG agreed that "carbon [is] an externality" that should be "price[d]."[99] Indeed, the federal government has *already found* that carbon is a harmful pollutant (in, for example, the EPA's "endangerment finding," which was affirmed on judicial review)[100]—and in any event, states need not wait for the federal government

to address threats to citizens' health and welfare. Whatever the scope of the externalities that states can permissibly address, environmental externalities are in the heartland of what states have historically addressed, and should be encouraged to address.

B. The Proposals To Expand The MOPR Are Flawed In Execution.

Apart from its conceptual flaws, MOPR-Ex is indefensible purely as a matter of auction design. The same is true of the broader variants, like "MOPR Clean." All should be rejected.

Proponents suggest that an expanded MOPR *must be* just and reasonable because PJM has a MOPR rule, which "already reflects stakeholder compromises."[101] Not so. The present MOPR is narrow in its purpose (combatting buyer-side market power), in the fuel sources it covers (gas only), and in the vintage it targets (only new generators).[102] The broader MOPRs proposed in this proceeding would twist this rule for a sweeping new purpose, and to a new universe of resources—counteracting the effects of disfavored state policies on wholesale markets, for both new and existing resources of any fuel type. PJM's MOPR was not designed for this new role, and has never been applied in this far-reaching manner. Stakeholders' agreement to, or the Commission's approval of, the narrow existing MOPR provides no support for the sea change sought here.[103]

Moreover, the comments confirm that the expanded MOPR's Swiss-cheese exceptions are incurably arbitrary. Stakeholders from all walks—generators, environmental groups, customer advocates—agree that the RPS Exemption is discriminatory: It exempts favored RPS programs for renewables, while mitigating environmental programs based on disfavored technologies (like nuclear or offshore wind), disfavored procurement processes, and even RPS programs with

[101] IMM Comments at 10; *see* API Protest at 10.
[102] Exelon Protest at 38-40.
[103] *Id.*

SI-SSA-0010-6180

technology-specific tiers.[104] It does so even though the favored and disfavored programs pursue the same purposes and have the same effects on capacity markets, and even though disfavored programs like Illinois' ZEC Program may be more economically efficient than the exempted programs, by capping payments at the value of the environmental externality being abated.[105]

Likewise, myriad commentators explain why the Self-Supply and Public Entity exemptions are indefensible under MOPR-Ex's proposed new purpose of counteracting effects of state policies on wholesale markets. Because of the implicit subsidy provided by captive ratepayers, the vertically integrated utilities that qualify for these exemptions can build or maintain generation that "may be uneconomic" and that "would not have been built" or maintained, "but for being backed by ratepayer funds."[106] The state policies favoring the vertically integrated business model may be *older* than the pro-environmental policies that have spread over the last two decades. But that does not justify differential treatment.

Contra the suggestion of some fossil-fuel generators, these problems cannot be solved by blue-penciling MOPR-Ex's enumerated exemptions. One reason—again, acknowledged by several commentators—is that *NRG Power Marketing, LLC v. FERC*[107] precludes doing so.[108] But the more important reason is that once the Commission starts down the path of applying the MOPR to some disfavored policies—even state environmental policies that promote market efficiency—there is no non-arbitrary stopping point. The comments illustrate the point. Many commenters, as noted above, explain that MOPR's enumerated RPS Exemption, Self-Supply Exemption, and Public Entity Exemption are discriminatory. But even if the Commission severed these

SI-SSA-0010-6181

exemptions, that would still leave the sundry additional subsidies that PJM excludes from the definition of "Actionable Subsidy"—subsidies that "promote … general industrial development in an area," subsidies that "incent … siting facilities in [a particular] locality," and federal tax credits.[109] As many commentators show, those subsidies also affect wholesale capacity markets by supporting resources that might not otherwise be economic, and they may be less efficient than well-designed state environmental programs.[110] There is no justification for applying the MOPR to state environmental policies, but not to these distorting subsidies. P3 trumpets its support for a "Clean MOPR."[111] But as explained above, P3 only proposes eliminating the exclusion for federal subsidies to renewables, not the state and local subsidies that generally benefit gas and coal generators. Even if those exclusions were eliminated, that would still leave the various upstream subsidies fossil-fuel generators receive—for example, Pennsylvania's sales tax exemption for coal.[112] The solution to this problem is not to embark along the path proposed by MOPR-Ex.

If, however, PJM's market rules exempt *some* state policies from an expanded MOPR, then the market rules must, at the least, exempt Illinois' ZEC Program. As Exelon has established, that program is more efficient than state RPS programs—not to mention state policies favoring vertically integrated utilities—because it links the externality payment to a conservative estimate of the participating plants' environmental value.[113] Failing to exempt the ZEC Program thus would be arbitrary. The ratepayer advocates for the District of Columbia, Maryland, and New Jersey defend an RPS-specific exemption on the theory that RPS programs are "long-standing" and

[109] *See* proposed PJM Tariff § 1, Definitions L-M-N (Option B).
[110] Exelon Protest at 24-25; *see* Clean Energy Advocates Protest at 8, 54-55; Duquesne Comments at 5; FirstEnergy Protest at 19-20; NEI Protest at 10-11; PSEG Protest at 10; Solar RTO Protest at 19, 25-26.
[111] P3 Protest at 20.
[112] Clean Energy Advocate Protest at 90.
[113] Exelon Protest at 24-25.

widespread across PJM.[114] Exelon and the PSEG Companies agree that RPS programs should not be subject to the MOPR, but once the Commission begins applying the MOPR to environmental programs, neither the vintage nor the political popularity of RPS programs is a reasoned ground for exempting them.[115]

The proponents of an expanded MOPR also have no adequate answer for the gross overprocurement of capacity that it will yield. They predict—without evidence—that an expanded MOPR will deter states from supporting clean resources. There is no reason to think that is so, and every reason to think the opposite. Despite ISO-New England's limited MOPR exemption for 200 MW of renewables, for example, states issued the Multi-State Clean Energy request for proposals, which aims to procure 460 MW of new renewable resources, and Massachusetts enacted the 2016 Massachusetts Energy Diversity Act, which requires clean energy procurements in the range of 2,800 MW.[116] And in PJM, if the unsupported predictions of the MOPR's proponents prove wrong, the result will be a massive overprocurement of capacity estimated to cost customers $14-24.6 billion annually.[117] The Commission should not adopt a policy premised on speculation that states will abandon *en masse* policies in which they have invested for a decade and to which they have shown increasing commitment in recent years. In the CASPR Order, the Commission found that clean energy "will be developed by the operation of state environmental and clean

[114] DC/MD/NJ Ratepayers Protest at 22.

[115] The ratepayer advocates also aver that RPS programs are different because they are "designed to bring new resources … online," rather than to "prevent[] the retirement of … older facilities." DC/MD/NJ Ratepayers Protest at 22. This is backwards: PJM's MOPR has only ever applied to *new* resources, precisely because those resources are better vehicles for buyer-side market power. *See* Exelon Protest at 39-40. The ratepayer advocates assert that the "long lead time for new entry" provides time for the market to "anticipate[] and absorb[]" these resources. DC/MD/NJ Ratepayers Protest at 22. But to the extent this argument is meant to distinguish RPS programs from the ZEC Program, it does not. Nuclear generators have been in operation for decades, and have been part of the markets from their origin. Market prices have always accounted for their operation.

SI-SSA-0010-6183

energy mandates, whether that capacity clears the [market] or not."[118] There is no reason to think that PJM states will act any differently.[119]

MOPR proponents say that if states do not acquiesce to the "disincentive" provided by an expanded MOPR, the overprocurement is states' fault.[120] But this ignores the FPA's jurisdictional lines. States regulate generation, while capacity requirements—how much must be procured, and what resources count toward satisfying the administratively determined obligations—rest with the Commission.[121] So if capacity is procured inefficiently—or if more capacity is procured than is needed to ensure resource adequacy, because the Commission is ignoring capacity provided by state-supported resources—that error is squarely within the Commission's domain. Moreover, proponents of the MOPR-Ex badly disrespect state authority in claiming that states can avoid overprocurement by relinquishing the ability to legislate to protect their citizens' health and welfare. Never has the Commission sought to deter states from implementing legitimate environmental policies in their domain by punishing their citizens—and those elsewhere in PJM, too—with unnecessary capacity costs. Instead, the Commission has made sure to accommodate those policies.[122]

MOPR's proponents also have no answer to the price suppression in energy markets this overprocurement will yield. PJM identified this problem in its filing.[123] Yet the MOPR's proponents barely attempt to respond. The Commission cannot approve an expanded MOPR when the problems it creates may be larger than the problems it purports to solve.[124]

SI-SSA-0010-6184

Finally, the MOPR's proponents cannot account for the CASPR Order, which made clear that the Commission's policy is to accommodate rather than countermand state initiatives. This policy is not new: more than a decade ago, the Commission likewise emphasized that it must, whenever possible, "fulfill [its] jurisdictional responsibilities while also respecting the states' traditional role."[125] MOPR proponents make much of the CASPR Order's statement that the Commission would use "the MOPR as our standard solution" "[a]bsent a showing that a different method would" be effective.[126] But that statement referred to ISO-New England's narrower MOPR applying to only new resources, and even then, only two Commissioners endorsed it. The CASPR Order's actual *holding* was that ISO-New England's proposed reforms were just and reasonable precisely because the Commission concluded that they would succeed in ISO-England's goal of reasonably "accommodat[ing] state sponsored resources … over time."[127] Moreover, Exelon and the PSEG Companies respectfully suggest that it would be unwise for the Commission to establish a rule that it will apply the MOPR unless a different "market design proposal[]" is "developed by [an RTO] and [its] stakeholders,"[128] and is "the result of extensive compromise."[129] Under that rule, stakeholders that will financially benefit from an expanded MOPR—like EPSA's fossil-fuel generators—will never compromise, knowing that a default Commission action will award them what they cannot achieve through negotiation.

C. If The Commission Finds That It Cannot Approve Either Of PJM's Proposals, It Should Not Proceed Under Section 206.

A few stakeholders urge that, if the Commission rejects both Capacity Repricing and MOPR-Ex, it should proceed under Section 206 and craft new rules itself.[130] Exelon respectfully suggests that this would be a mistake. It would require the Commission to carry the dual burdens of showing that "existing rates are 'entirely outside the zone of reasonableness,'" and that the solution crafted by the Commission is just and reasonable.[131] In turn, that would require the Commission to show, based on substantial evidence, that it is necessary for just and reasonable rates to raise prices at a time of vast oversupply, and to apply PJM's MOPR for the first time to existing resources receiving payments for their clean-energy benefits under state environmental programs. The Commission would also have to craft new rules that avoid all of the fatal flaws that parties have correctly identified in PJM's proposals, and amass a majority of Commissioners to support them. The Commission should not embark on this venture. No imminent—or even foreseeable—threat to reliability or investment has been shown, and the Commission should instead simply reject PJM's filing.

[130] *See, e.g.*, *id.* at 2; NRG Protest at 1.
[131] *NRG*, 862 F.3d at 114 n.2; *see Mkt.-Based Rates for Wholesale Sales of Elec. Energy, Capacity & Ancillary Servs. by Pub. Utilities*, 123 FERC ¶ 61,055, at P 24 (2008).

SI-SSA-0010-6186

CONCLUSION

The Commission should reject PJM's filing as not just or reasonable.

Dated: May 22, 2018

MOTION FOR LEAVE TO ANSWER AND ANSWER OF EXELON CORPORATION

Pursuant to Rules 212 and 213 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("the Commission"), 18 C.F.R. §§ 385.212 and 385.213 (2014), Exelon Corporation ("Exelon") hereby moves for leave to submit this Answer to address an issue raised in reply comments that is crucial to the functioning of the resource-specific Fixed Resource Requirement ("FRR-RS") Alternative proposed by the Commission: the relative roles of the states and the Commission in the procurement of capacity. In reply comments by PJM Interconnection, L.L.C. ("PJM"), Direct Energy and NextEra Energy Resources ("Direct/NextEra"), NRG Power Marketing LLC ("NRG"), the Electric Power Supply Association ("EPSA"), and LS Power

Associates, L.P. ("LS Power"),[1] there have been suggestions that the Commission's jurisdictional responsibilities, and specifically its exclusive authority to set just and reasonable wholesale rates, limit the ability of states to utilize the proposed capacity market opt-out. This limited Answer addresses those arguments and the guidance needed from the Commission for states to implement the FRR-RS Alternative. It also addresses the Commission's intervening decision in *CXA La Paloma, LLC*, 165 FERC ¶ 61,148 (2018).

MOTION FOR LEAVE TO ANSWER

Exelon respectfully requests that the Commission permit this Answer to arguments made for the first time in reply briefs concerning the scope of states' role in capacity procurements undertaken pursuant to the FRR-RS Alternative (or in PJM's terminology, the Resource Carve-Out ("RCO")); the Commission's jurisdiction over the rates paid to resources under those procurements; the ability of suppliers to rely on market-based tariffs to make sales pursuant to state-sponsored capacity procurements; and the applicability of the Commission's affiliate rules to such transactions.[2] Certain parties have also made new arguments concerning the allocation of capacity participating in the resource-specific FRR to load. These issues are critically important to the successful design of the resource-specific FRR. The Commission has also issued a new

[1] *See* Reply Submission of PJM Interconnection, L.L.C. (Feb. 6, 2018) ("PJM Reply"); Reply Comments of Direct Energy and NextEra Energy Resources (Nov. 6, 2018) ("Direct/NextEra Reply"); Reply Brief of NRG Power Marketing LLC (Nov. 6, 2018) ("NRG Reply Br."); Reply Brief of the Electric Power Supply Ass'n (Nov. 6, 2018) ("EPSA Reply Br."); Reply Brief of LS Power Assocs., L.P. (Nov. 6, 2018) ("LS Power Reply Br.").

[2] As explained in our reply brief, the mechanics of the FRR-RS proposal endorsed by ratepayer advocates, environmental organizations, renewable advocates, and nuclear generation owners including Exelon are generally similar to the RCO proposal offered by PJM. *See* Reply Brief of Exelon Corporation (Nov. 6, 2018) at 1 n.2 ("Exelon Reply Br."); *id.* at 42-44. Differences between those two proposals are addressed in a variety of reply comments, including our own, and are not repeated here. As noted in those replies, however, there is widespread agreement that any expansion of the Minimum Offer Price Rule ("MOPR") must be paired with a workable state accommodation mechanism such as the FRR-RS or RCO.

order in *CXA La Paloma* which bears on issues in this docket. Accordingly, Exelon respectfully suggests that its Answer will assist the Commission in its decisional process as the Commission evaluates the comments it has received.[3]

ANSWER OF EXELON CORPORATION

In this docket, the need for clear guidance from the Commission is unusually significant. The FRR-RS Alternative envisioned by the Commission's Order can be a significant step forward, but it will require many states to make legislative or administrative changes authorizing the procurement of resources outside of PJM's market. Clarity is thus essential: when legislators or regulators convene to hammer out new legislation or rules, they must know the parameters within which they are operating. The Commission should avoid putting states in the position of undertaking time-intensive legislative or regulatory changes only to later find out after subsequent clarifications from the Commission that further actions are needed or, worse yet, that prior actions are exposed to unforeseen litigation risk.

Importantly, the Commission's order in this docket will lay the ground rules for clean energy policy going forward for the fourteen jurisdictions in the PJM footprint. While some parties appear to believe that this case is only about how to treat existing programs,[4] states have far greater clean energy ambition than is represented by existing laws.[5] The Commission's order must give

[3] The Commission has allowed answers to protests where the answer provides information that will assist the Commission in its decision. *See, e.g.*, *Southwest Power Pool, Inc*., 113 FERC ¶ 61,014, at P 7 (2005); *Southwest Power Pool Inc*., 112 FERC ¶ 61,319, at P 56 (2005); *see also Midwest Indep. Transmission Sys. Operator, Inc*. 116 FERC ¶ 61,140, at P 18 (2006); *PJM Transmission Owners*, 115 FERC ¶ 61,345, at PP 10, 12 (2006).

[4] For example, PJM contends that the Extended RCO proposal will not significantly increase customer costs because only three nuclear plants are likely to be removed from the supply stack. PJM Reply at 28. That ignores the reality of the climate challenge and the commitment of states to increase their clean energy ambition.

[5] In 2018, voters elected seven new governors who promoted 100 percent clean energy by 2050. If those promises result in policies, nearly one in five states will have such policies. *See, e.g.*, Jeff

SI-SSA-0010-6191

guidance not just to states that have already acted, but to those that wish to expand clean energy investments in the future. To the extent that the Commission adopts its Order's preliminary view that a MOPR is justified when states provide additional compensation to clean energy resources, thus depriving many of those resources a capacity payment, states will need to understand how they may compensate those resources for providing capacity. Answers to the following questions are needed to formulate legislation and regulations:

- **What products should be procured from FRR-RS resources?**

A state that wishes to incentivize investment in clean energy resources will need to decide how to structure its procurement of resources under the FRR-RS construct. In recognition of the state's authority under the Federal Power Act to regulate both the procurement decisions of its utilities and the generation facilities serving its citizens, the Commission should afford states flexibility to decide how to structure procurements under the FRR-RS construct. Some states may wish to procure "clean capacity"—that is, a capacity-only product—and therefore limit procurement eligibility to non-emitting resources. Other states may choose to procure capacity from zero-emitting resources and also provide a separate compensation scheme for environmental attributes through a supplemental, unbundled transaction. Still other states may seek to procure capacity bundled with environmental attributes. The Commission should allow states freedom to choose the structure that best serves the state's policy goals and administrative structures.

NRG argues that states should be forbidden from procuring capacity from FRR-RS resources and should only be permitted to procure state-jurisdictional products such as environmental attributes.[6] That approach makes no sense. FRR-RS resources will be providing

McMahon, "These Seven New Governors May Be The Biggest Election Boon For Climate And Clean Energy," *Forbes*, Nov. 13, 2018, https://bit.ly/2A9ReaW.

[6] NRG Reply Br. at 13-14.

capacity to the system and will be subject to all of the requirements of Capacity Performance resources. Given that PJM is receiving capacity from these resources and treating them as Capacity Resources for purposes of their performance obligations, FRR-RS resources must receive compensation for providing that product. The purpose of the FRR-RS, as expressed in the Commission's June 29, 2018 Order, is to allow compensation for capacity to flow outside the RPM auction through a state-directed mechanism.[7] The only rule that is consistent with this purpose is one allowing states to procure capacity from FRR-RS resources (whether by itself or bundled with attributes) and to arrange for those resources to be compensated for the capacity they provide. Moreover, NRG's rule would be incompatible with existing state procurements that the Commission has long accepted, such as New Jersey's Basic Generation Service ("BGS") procurement and Maryland's Standard Offer Service procurement, which already procure capacity bundled with other products.[8]

EPSA and Direct/NextEra, meanwhile, take the opposite position and contend that an FRR-RS resource should be compensated *only* for capacity and should not be permitted to sell that capacity bundled with environmental attributes.[9] According to them, "irrespective of how a given state subsidy may have been characterized for other purposes, that subsidy must be included in the

[7] 163 FERC ¶ 61,236, P 162 (2018) ("[T]he bifurcated capacity construct should make more transparent which capacity costs are the result of competition in the capacity market and which capacity costs are being incurred as a result of state policy decisions.") ("Order").

[8] *See, e.g.*, "Overview," bgs-auction.com ("The winners of the BGS-RSCP Auction become BGS-RSCP suppliers and are responsible for fulfilling all the requirements of a PJM Load Serving Entity (LSE) including capacity, energy, ancillary services, transmission, and any other service as may be required by PJM."), http://www.bgs-auction.com/bgs.auction.overview.asp; Maryland Standard Offer Service Model Full Requirements Service Contract at 4 (defining "full requirements" to include capacity), https://bit.ly/2OSem2I.

[9] EPSA Reply Br. at 22; Direct/NextEra Reply at 9.

deemed price for the associated capacity in an RCO/FRR Alternative transaction."[10] The Commission should reject that position as well. The Commission has long held that states have authority to create environmental attributes, which are "state-created and state-issued instruments certifying that electric energy was generated pursuant to certain requirements and standards."[11] Moreover, the Commission has permitted attributes to be bundled for sale with Commission-jurisdictional products,[12] and nothing in the Commission's rules or practices precludes a bilateral transaction for capacity bundled with attributes. There is no reason for the Commission to apply any different rule when that bilateral transaction is entered pursuant to the FRR-RS framework—particularly when the existence of the attribute payments is what triggers a resource's eligibility for the FRR-RS Alternative to begin with.

PJM, meanwhile, argues that FRR-RS resources *must* sell attributes in addition to capacity, and *cannot* be compensated for capacity alone.[13] Thus, for example, PJM argues that a state-directed payment for capacity cannot itself count as a subsidy triggering eligibility for the FRR-RS, and that eligibility for the FRR-RS should be limited to resources that already have a separately established material subsidy. That limitation also makes no sense. Attribute payments, and state capacity procurements limited to resources meeting state policy objectives, are two identical paths to the same destination. If a state wishes to recognize the value of clean generation, it can do so through attribute payments such as RECs or ZECs, either unbundled or bundled with capacity. Alternatively, the state can simply procure capacity that is clean, and value that clean capacity in

[10] EPSA Reply Br. at 22.

SI-SSA-0010-6194

accordance with the benefits it provides.[14] Under such a procurement, the only product procured would be capacity, but eligibility would be limited to the types of resources that can satisfy the state's public policy goals. The public policy value these resources provide to the state would be reflected in "clean capacity" prices that would likely be higher than the RPM clearing price. This higher price, in substance, reflects the incremental value to the state of the environmental attribute: additional revenues are being provided to these resources—in the form of clean capacity payments—in recognition of their public policy value. The FRR-RS mechanism should therefore be available to states pursuing either of these procurement paths. Restricting the FRR-RS mechanism to those states that first establish a material subsidy, and then separately procure capacity through the FRR-RS, would be illogical, unnecessarily complicated, and inconsistent with the Commission's stated goal of respecting state authority.

In sum, the Commission should reject the mutually incompatible rules proposed by NRG, EPSA, Direct/NextEra, and PJM that would restrict state flexibility. All of the various approaches that states might elect, and that one or another commenter seeks to forbid—payments for capacity separate from the unbundled sale of attributes; payments for capacity bundled with attributes; and payments for "clean capacity"—have the same substantive outcome: they are methods by which the state can ensure the new entry and continued operation of resources important to the state's public policy goals, without relying on RPM market revenues. The Commission should not force legislatures or state agencies to select one over the other. Instead, the Commission should afford states the maximum flexibility in deciding how to arrange payments to FRR-RS resources.

---

[14] *E.g.*, Specified State Agencies and Electric Distribution Companies in Connecticut, Massachusetts, and Rhode Island, Notice of Request for Proposals from Private Developers for Clean Energy and Transmission (Nov. 12, 2015), https://cleanenergyrfpdotcom.files.wordpress.com/2015/11/clean-energy-rfp-final-111215.pdf (seeking procurement of clean energy, RECs, or clean energy bundled with RECs).

- **How should a state select the resources to be compensated under the FRR-RS framework?**

Just as states require their load-serving entities to acquire a certain number of RECs or ZECs, so too states will determine the quantity of FRR-RS resources they seek to compensate outside the RPM market. In making that determination, states will need to evaluate which resources are to be selected to receive such compensation. In light of states' broad authority to regulate their load-serving entities' procurement decisions,[15] the Commission's Order should affirm the ability of states to tailor selection procedures to the particular energy goals within the state. Some states, for example, may choose to hold competitive procurements open to certain types of technologies (for example, non-emitting resources), in which the state would receive bids and select the winning bidders either directly through a power agency or indirectly through regulated load-serving entities. In selecting winning bidders, some states may wish to base their decision on price factors alone. Other states may seek to maximize the environmental benefits they receive from the procurement—and the most cost-effective set of resources from the standpoint of the state's ultimate environmental goal may not be the same as the cheapest set of resources.[16] Still other states may adopt a "clean peak" standard or a "clean capacity" portfolio standard and allow LSEs to enter bilateral contracts with resources that satisfy state eligibility

[15] *See, e.g.*, *S. Cal. Edison Co.*, 70 FERC ¶ 61,215, 61,676 (1995) (acknowledging "that resource planning and resource decisions are the prerogative of state commissions and that states may wish to diversify their generation mix to meet environmental goals in a variety of ways," and that a "state may choose to require a utility to construct generation capacity of a preferred technology or to purchase power from the supplier of a particular type of resource").

[16] For example, under the Illinois ZEC program, the Illinois Power Agency selected resources based upon their environmental contribution to Illinois. *See* Illinois Power Agency, Zero Emission Standard Procurement Plan (Oct. 31, 2017), at 32-45, https://www2.illinois.gov/sites/ipa/Documents/2018ProcurementPlan/Zero-Emission-Standard-Procurement-Plan-Approved.PDF.

requirements. The Commission's Order should not impose arbitrary limits on the ability of states to choose the procurement structure that best fits the state's public policy needs.

- **What rate should be paid to FRR-RS resources?**

Just as states must know how they may procure capacity under the FRR-RS, they also must know how they can compensate FRR-RS resources for that capacity. The Commission, of course, retains the final word on whether payments for capacity are just and reasonable, and its Order must provide guidance to states on how the Commission will make such a determination in the context of compensation paid under an FRR-RS arrangement. The state's involvement in procuring FRR-RS resources—and the ability of the state to decide *not* to procure FRR-RS resources if the price is too high, as well as the seller's ability to decline to participate as an FRR-RS resource if the price is too low—should give the Commission comfort that rates emerging from state-directed procurement processes remain just and reasonable, and reflect an appropriate balance between investors' interests in receiving sufficient compensation to operate and consumers' interests in not overpaying. Accordingly, as discussed further below, the Commission should affirm that market-based rate sellers may use existing authority to make FRR-RS sales, subject to EQR reporting. This approach affords leeway to states—whose citizens, after all, will be paying for the resources—without in any way ceding the Commission's jurisdiction over wholesale sales or its ultimate responsibility to ensure that all wholesale rates are just and reasonable.[17]

[17] *See California ex rel. Lockyer v. FERC*, 383 F.3d 1006, 1013 (9th Cir. 2004) (upholding market-based rate authority premised on reporting requirements to FERC to enable FERC review for justness and reasonableness); *La. Pub. Serv. Comm'n v. FERC*, 761 F.3d 540, 552 (5th Cir. 2014) (upholding FERC's incorporation of a state commission-determined depreciation expense into the federal rate, even though the state commission's method for calculating depreciation diverged from FERC's own method, because "FERC exercised its role when it initially reviewed and accepted the … formula incorporating the state agencies' depreciation rates" as just and reasonable, and because "FERC has clarified that it will continue to exercise oversight of the state rates in a Section 206 complaint proceeding."); *La. Pub. Serv. Comm'n v. FERC*, 860 F.3d 691, 696 (D.C. Cir. 2017) ("[W]e … conclude that there has been no unlawful subdelegation because FERC has exercised,

PJM contends that under no circumstances can a state arrange for an FRR-RS resource to be compensated for its capacity at a price pegged to the RPM clearing price.[18] That limitation is irrational. States are free to compensate FRR-RS resources as they see fit, so long as the capacity price is just and reasonable. And the RPM clearing price plainly is a just and reasonable price for the capacity commitment that an FRR-RS resource would make. PJM nevertheless contends that such an arrangement would be inappropriate because the FRR-RS resource has elected not to participate in the RPM auction.[19] But an FRR-RS resource does not receive any compensation from the RPM auction. Instead, it relies on state-directed compensation paid outside the auction. If a state wishes to ensure that its citizens pay no more for capacity outside the auction than they would inside the auction, and therefore proposes that the FRR-RS resource be compensated at a rate pegged to the RPM clearing price, there is no basis for the Commission to conclude that such a rate would be unjust or unreasonable.[20]

Indeed, under the existing FRR tariff provisions, which FERC has found just and reasonable, the unconstrained RPM clearing price is the default rate that load-serving entities in a restructured state are to be charged for capacity procured by the FRR entity, absent an alternative state compensation mechanism.[21] In the context of bilateral transactions as well, the Commission

[20] For example, a state might adopt this approach with respect to resources that separately sell unbundled environmental attributes.

[21] *See PJM Interconnection, L.L.C.*, 143 FERC ¶ 61,164, at P 3 (2013) (quoting PJM Reliability Assurance Agreement Sched. 8.1 § D.8: "In the absence of a state compensation mechanism, the

contemplates that contracting parties will use prices emerging from the Commission's auction markets as indices or benchmarks for transactions outside those markets.[22] Thus, Commission precedent supports the ability of states, subject to Commission review and supervision, to peg the capacity rate to be paid to FRR-RS resources to the RPM clearing price.

PJM cites two paragraphs of the Commission's Order that, it claims, hold that "subsidized resources should not be paid the same as non-subsidized Capacity Resources."[23] PJM is mischaracterizing the Commission's Order. The Order said that PJM's *repricing* proposal was not just or reasonable because subsidized resources should not receive the same capacity price as unsubsidized resources "for purposes of ratemaking *in PJM's FERC-jurisdictional wholesale capacity market*"—i.e., in the RPM auction.[24] But under the FRR-RS approach, subsidized resources do not participate in PJM's wholesale capacity market. Consistent with the Order, such resources are subject to a "different ratemaking treatment"[25]—the rate they are paid is derived from the state's procurement process, not the RPM market rules. If the state decides to pay such

applicable alternative retail LSE shall compensate the FRR Entity at the capacity price in the unconstrained portions of the PJM Region, as determined in accordance with Attachment DD to the PJM Tariff, provided that the FRR Entity may, at any time, make a filing with FERC under Sections 205 of the Federal Power Act [FPA] proposing to change the basis for compensation to a method based on the FRR Entity's cost or such other basis shown to be just and reasonable, and a retail LSE may at any time exercise its rights under Section 206 of the FPA."); *see also* Reliability Assurance Agreement Sched. 8.1 App. (stating, with respect to the Ohio Power Company, "[f]or purposes of administering the state compensation mechanism, the wholesale rate shall be equal to the adjusted final zonal PJM RPM rate in effect for the rest of the RTO region for the current PJM delivery year").

[24] Order at P 68.

[25] *Id.*

resources a capacity rate that is pegged to the RPM auction price, that rate is still a function of the state's procurement process, and thus is fully consistent with the Commission's Order. The Commission should expressly confirm that states are free, if they wish, to peg capacity payments made under the FRR-RS framework to RPM clearing prices.

While some states may choose to peg FRR-RS capacity payments to the RPM clearing price, other states may choose a different approach. Thus, the Commission should also make clear that the RPM price is not the *only* just and reasonable price for capacity, and that different approaches to procuring capacity from FRR-RS resources may result in different capacity rates, each of which may be just and reasonable. For example, some states may wish to procure clean capacity through an auction mechanism and pay a single clearing price to the resources that are selected. Such an approach will likely result in a capacity price that is higher than the RPM clearing price. But the state is getting a product that is different from the generic resource adequacy product sold through the RPM auction: for example, the state may be procuring zero-emitting capacity that is more valuable to the state, in light of its public policy priorities, than generic capacity.[26] Indeed, no party has responded to the extended discussion in Exelon's brief, and the briefs of other parties, regarding the existence of environmental externalities and the importance of addressing those externalities in order to promote more efficient markets.[27]

[26] *CXA La Paloma, LLC*, 165 FERC ¶ 61,148, at PP 12, 77 (2018) (rejecting argument that CAISO capacity market is unjust and unreasonable because renewable resources procured through state-administered procurements are paid four to seven times more for their capacity than resources receive through the CAISO resource adequacy construct).

[27] Initial Br. of Exelon Corp. (Oct. 2, 2018) at 13-14 ("Exelon Init. Br."); Protest of Exelon Corp., Docket No. ER18-1314 (May 7, 2018), at 12-25; Decl. of Robert D. Willig at 17-28, Ex. A to Protest of Exelon Corp., Docket No. ER18-1314 (May 7, 2018); Comments of Inst. for Policy Integrity at N.Y.U. School of Law (Oct. 2, 2018) at 6-18, 25-32; Exelon Reply Br. at 29-35.

As noted above, states also might have different preferences as to the particular products they wish to procure, with some procuring a clean capacity (capacity-only) product, and other states procuring capacity bundled with attributes. Sales might be made in some FRR-RS procurements through cost-based contracts akin to reliability must-run arrangements, subject to Commission review under Section 205. In the normal course, however, transactions under an FRR-RS procurement are more likely to be undertaken pursuant to a seller's market-based rate authorization, with the terms and conditions of transactions reported on the EQR. With respect to bundled procurements of capacity and attributes, the Commission has recognized that bundled contracts sometimes separately state a price for each of the bundled products, and sometimes do not.[28] In the event that the Commission may need to review the justness and reasonableness of market-based payments for a bundled FRR-RS procurement (such as in response to a complaint or if the Commission believes it must review affiliate transactions), the Commission should create a safe harbor in its upcoming order for a bundled price that is less than or equal to the sum of the RPM price and any explicit state valuation of the attribute. For example, some states have chosen explicitly to value the state-jurisdictional attribute as equal to the social cost of carbon abated through clean production.[29] If the bundled rate is less than the sum of the RPM price and the attribute value assigned by the state (in this example, the social cost of carbon), then the Commission should treat the bundled rate as falling within the safe harbor. Customers are paying no more for capacity than they would pay through the RPM auction, and are paying no more for attributes than the state has determined those attributes are worth to it.[30]

[29] *See, e.g.*, 20 ILCS 3855/1-75(d-5)(1)(B)(i) (Illinois); State of N.Y., Pub. Serv. Comm'n, Order Adopting a Clean Energy Standard, Case 15-E-0302, Case 16-E-0270 (Aug. 1, 2016), at 131-35.

[30] *See Boston Edison Co.*, 55 FERC ¶ 61,382, 62,169 (1991) (recognizing, in context of affiliate transactions, that justness and reasonableness can be established by "benchmark evidence which

States may also wish to adopt price caps and other mechanisms intended to protect retail customers from paying more to FRR-RS resources than those customers can afford to pay, or paying more to FRR-RS resources than those resources are worth to the state. Such measures will of course impact the capacity price ultimately received by the FRR-RS resources. But so long as the Commission retains ultimate review authority to ensure the justness and reasonableness of the price, and the power to override or disallow any rate derived from the state-directed process, the Commission does not cede its jurisdiction—and states do not intrude on its jurisdiction—when states decide how much they are willing to direct customers to pay to FRR-RS resources.[31]

- **Through what mechanism will the Commission review the rates paid to FRR-RS resources?**

States, of course, are not public utilities and would not themselves file rates with the Commission under Section 205. Rather, FRR-RS resources, as the suppliers of capacity, will be responsible for obtaining Commission approval of the rates they will receive under the FRR-RS framework. There is no need, however, for the Commission to require individual Section 205 filings from every FRR-RS resource. As noted above, the Commission should affirm that existing market-based rate authority can be used for sales undertaken pursuant to an FRR-RS procurement, subject to the normal EQR reporting protocols so that the Commission can exercise active oversight and intervene as necessary to adjust any rates it deems unjust or unreasonable.

Several parties contend that the sale of capacity pursuant to a state-sponsored procurement cannot be made under the seller's market-based tariff.[32] According to these parties, the premise

---

shows the prices, and terms and conditions of sales made by nonaffiliated sellers"); 18 C.F.R. § 2.25(c) (allowing emissions allowances to be valued based upon indexed prices).

[31] *See supra* nn. 17, 21.

[32] EPSA Reply Br. at 17-19; Direct/NextEra Reply at 11-13.

of a market-based sale is that, in a competitive market where neither the seller nor buyer have market power, one can assume that the terms of voluntary exchanges are reasonable. But under the FRR-RS, they contend, the transactions result from state regulation, not from competitive forces. However, several methods of state procurement under the FRR-RS may in fact harness competitive forces and thus satisfy the predicates for market-based rates. And regardless, the same presumption of reasonableness applied to market-based rates should likewise apply to rates resulting from state-sponsored procurements under the FRR-RS, irrespective of whether the procurements are competitive.

First, several procurement methods *directly* ensure competition, and for such procurements, sellers should continue to be able to rely on their market-based tariffs. For example, if a state conducts a clean energy procurement open to all non-emitting resources able to serve the state's load, and imposes rules such as bid caps that limit any party's ability to exercise market power, sales taking place pursuant to that procurement should be permitted under the sellers' market-based tariffs. Indeed, such a procurement is no different than the many types of state-sponsored procurements that already exist today, in respect to which sellers rely on their market-based tariff. For example, the Illinois Power Agency currently procures capacity for Ameren's non-shopping customers by holding a procurement event, receiving bids, and selecting the winners.[33] The resulting sales of capacity are made pursuant to the sellers' market-based tariffs. Similarly, several states in PJM—including New Jersey and Maryland—conduct procurement events to obtain a bundled product of energy and capacity to be supplied to non-shopping

[33] *E.g.*, Illinois Power Agency, Electricity Procurement Plan: 2018 Plan (Sept. 25, 2017) at 70 (recommending "procurement of a portion of the Ameren Illinois capacity needs for the 2017-2018 and 2018-2019 delivery years through bilateral capacity purchases obtained through the IPA competitive procurement process, with the remainder of its capacity needs procured through the MISO PRA.").

customers.[34] The resulting sales are made pursuant to sellers' market-based tariffs. Likewise, three New England states conducted a joint procurement of energy from qualifying non-emitting generators and, again, sales were made pursuant to the sellers' market-based rate authority.[35] And these are just a few examples. If the Commission were to deny the ability of sellers to rely on their market-based tariffs in making sales pursuant to state-directed FRR-RS procurements, it would call into question whether sellers in any of these other state-directed procurements have authority for their transactions.

Second, even where states do not employ a competitive procurement, the Commission would still be justified in allowing market-based rate sellers to rely on existing authorization, as long as the seller complies with EQR reporting so that the Commission can oversee the rates. Just as competitive forces prevent a supplier from exercising market power, thus justifying the Commission's ex ante approval of whatever rate emerges from the competitive process, so too under the FRR-RS framework, the state's political control prevents a supplier from exercising market power. The state acts *in parens patriae* on behalf of its citizens, and nothing requires the state to direct its load to enter into the procurement of the FRR-RS resource. The state is not captive to the resource seeking compensation under an FRR-RS framework; to the contrary, the resource is captive to the state. The state has tremendous power to ensure that its citizens pay a just and reasonable price, and the resulting transaction will be the product of a voluntary decision by the seller to sell and a political decision by a democratically accountable state government to buy. Just as the Commission has made the judgment that competitive market forces by and large will produce just and reasonable rates, so too it should make the judgment that the state's

[34] *See supra* at n.8.

[35] *See* Draft PPA, RPS Class I Renewable Draft PPA, § 3.5(l), *available at* https://cleanenergyrfp.com/documents/.

involvement in overseeing a procurement will by and large produce just and reasonable rates, justifying ex ante approval accompanied by ex post reporting.[36]

For similar reasons, and contrary to the suggestion of several parties,[37] the Commission should allow waiver of its affiliate rules for state-directed procurements of FRR-RS resources. As Exelon has already explained in its Initial Brief, and as EPSA acknowledges, the purpose of the affiliate rules is to prevent "the risk of self-dealing and other affiliate abuse that arises when a franchised utility transacts with its affiliates."[38] As the Commission explained in *Edgar*, in an affiliate transaction, "the rate may not be just and reasonable because the buyer potentially may have unduly favored the rates offered by its affiliate seller over lower rates offered by other nonaffiliate sellers."[39] That concern is absent when the load is directed by the state to enter into the transaction, and takes place only if the state chooses to go forward. In those circumstances, the franchised utility has no ability to favor its affiliates, and the generator has no ability to use its affiliate relationship with the utility in order to extract higher prices than it would otherwise be able to obtain. After all, the transaction takes place at the state's direction and following the state-sponsored procurement process, and the state has no incentive to force customers to pay any more than the minimum needed to procure the resource. Accordingly, the Commission should allow

[36] Such a judgment is particularly warranted when the state benchmarks its capacity price to the RPM clearing price—a rate that emerges from a competitive auction process and that the Commission has determined is just and reasonable. As the Commission has held in the context of affiliate transactions, a market-based benchmark can establish the justness and reasonableness of prices emerging from a non-competitive process. *Boston Edison Co.*, 55 FERC ¶ 61,382, 62,169 (1991) (holding that affiliated seller may rely on "benchmark evidence which shows the prices, and terms and conditions of sales made by nonaffiliated sellers").

SI-SSA-0010-6205

state-directed affiliate transactions to take place under an FRR-RS framework without requiring an individual Section 205 filing.[40]

- **How should FRR-RS capacity be allocated to load-serving entities?**

The Commission must also give clear guidance concerning how FRR-RS capacity should be allocated to load-serving entities, and how much flexibility states have in assigning that capacity to load-serving entities within their jurisdiction. NRG accuses Exelon of having argued that resources that elect the FRR-RS framework should be able to decide unilaterally what load should be credited with their capacity.[41] That is not our position. While the FRR-RS resource should have the obligation to *inform* PJM which load is matched to its capacity, the *decision* as to which load should be matched is one that the relevant state should make (except, of course, in the event of a bilateral capacity contract that the state has not directed).[42] Exelon supports a default rule, consistent with the default rule currently in place for the existing FRR, that the capacity of FRR-RS resources will be allocated on a pro rata basis to load-serving entities within the state that is supporting the FRR-RS resource.[43] Contrary to the arguments made by some commenters, this approach is easy for PJM to administer using existing accounting mechanisms. Currently, PJM

[40] Even if a Section 205 filing were required, the Commission should still adopt a safe harbor under which the rate for a bundled purchase of capacity and attributes is deemed just and reasonable if it less than the sum of the RPM clearing price and the explicit state valuation of the attributes being procured. *See supra* at 13. It should also find an affiliate transaction to be just and reasonable if the capacity price is pegged to the RPM clearing price, which is the kind of "benchmark evidence which shows the prices, and terms and conditions of sales made by nonaffiliated sellers" that should dispel any concern of affiliate abuse. *Boston Edison Co.*, 55 FERC ¶ 61,382, 62,169 (1991).

[41] NRG Reply Br. at 10.

[42] *See* Exelon Init. Br. at 22 ("FRR-RS resources procured by a state in this manner would submit the state procurement order or other state directive to indicate the corresponding load to be removed.").

[43] PJM Reliability Assurance Agreement Sched. 8.1 § D.8.

collects payments from load and then makes corresponding payments to capacity resources. Under the proposed approach, PJM will credit load for any FRR-RS capacity that is allocated to it, and PJM will not make any RPM-related payment to the FRR-RS resource.

But the default would only apply to the extent that the state does not opt for a different allocation method for the capacity of FRR-RS resources. Nor should this default rule foreclose any state decision regarding how to allocate the *cost* of procuring FRR-RS resources. For example, a state could choose to place the cost on a Distribution Utility, which would then recover the cost through a non-bypassable charge.

- **Additional Matters, Including the Commission's Decision in *CXA La Paloma.***

Finally, we briefly address two other matters raised in reply briefs, as well as the Commission's intervening decision in *CXA La Paloma, LLC*.[44]

First, several parties support LS Power's proposal to cap the number of megawatts permitted to participate in the FRR-RS framework. Exelon opposes such a cap for the reasons it has already discussed—in particular, any cap would be arbitrary, particularly given an existing FRR framework which allows the withdrawal of an entire zone's load from the RPM auction.[45] LS Power's proposed cap improperly intrudes on states' authority to expand clean energy goals. And a cap on FRR-RS participation would be particularly unjustified if the Commission adopts PJM's proposed MOPR exemption for self-supply resources. The combination of a self-supply exemption plus an FRR-RS cap would effectively allow vertically integrated states an unlimited ability to support resources for state public policy reasons, while curtailing the ability of restructured states to do so. Both vertically integrated states and restructured states have the same

[44] 165 FERC ¶ 61,148 (2018).

[45] Exelon Reply Br. at 49-50.

inherent police power over generation facilities, and attribute payments are simply a mechanism by which restructured states can continue to exercise control over the generation mix consistent with the regulatory structure adopted by the state. There is no justification for the Commission to constrain states' abilities to achieve their public policy goals through attribute payments, while allowing states unfettered ability to achieve their public policy goals through retail rate recovery. If the Commission is going to apply a cap—and it should not—it would need to apply that cap consistently to both restructured states and vertically integrated ones, including self-supply.

Second, in defending its Extended RCO concept, PJM claims that repricing will not significantly increase customer costs. It justifies that conclusion by pointing to "simulations of the clearing price effects if the three nuclear plants likely to receive ZEC payments were removed from the supply stack."[46] But of course, these three plants will not be the only ones removed from the supply stack under PJM's proposal—and particularly as states expand their clean energy commitments and seek to induce significant new entry of renewables. PJM is assuming a static view of the world in order to justify the Extended RCO, despite previously having defended an expanded MOPR on the ground that states could be expected to significantly expand their support of clean resources in coming years.[47] Moreover, even assuming that only three nuclear plants will be removed from the supply stack, the price impact of the Extended RCO will still be very significant: nearly $2 billion per year based on PJM's own numbers.[48] Moreover, PJM

[46] PJM Reply at 28.

[47] Order at PP 102-03.

[48] PJM Reply at Attachment A. PJM calculates the total RTO costs for the status quo (labeled "Sim 1") at $8.78 billion per year and the Extended RCO (labeled "Sim 2") at $10.65 billion per year. Thus, the Extended RCO amounts to an incremental increase of $1.87 billion over the status quo. Note that this calculation does not include any costs associated with infra-marginal rent payments to the extent that those are ultimately borne by customers as well.

acknowledges that the bulk of that increase will be borne by customers in EMAAC. PJM thus fails in its attempt to downplay the very significant burden on customers that would result from the Extended RCO.

Finally, the Commission's intervening decision in *CXA La Paloma* only underscores that the proposed resource-specific FRR Alternative is a just and reasonable market design, and that opponents' contrary arguments are ill-conceived. In that case, the Commission rejected the very arguments that MOPR-only advocates make here: that a bifurcated capacity construct is unjust and unreasonable because it tends to lead to low prices in the residual market and thereby threatens resource adequacy over the long term; that the only just and reasonable capacity construct is a mandatory centralized capacity market; and that the Commission should not accommodate state authority to conduct capacity procurements aimed at achieving important state public policy goals.[49]

The Commission rejected each of these arguments in *CXA La Paloma*, and its reasons for doing so apply with equal force to the same arguments made by some of the same parties in this proceeding. The Commission noted that, notwithstanding the significant state role in overseeing capacity procurement, CAISO still had enough capacity "to reliably operate the grid, while respecting the role of local regulatory authorities, such as the CPUC."[50] Indeed, the Commission noted that the complainants had not provided "credible evidence that any … reliability violations are likely in the foreseeable future" and that "the current resource adequacy paradigm will ensure sufficient reserve margins through 2021."[51] In PJM, too, there is a large surplus of capacity, and

[49] *CXA La Paloma, LLC*, 165 FERC ¶ 61,148, at PP 9-10, 12, 15, 46-50.

[50] *Id.* at P 70.

[51] *Id.* at P 73.

the sloped demand curve ensures that prices in the RPM auction will rise if that surplus diminishes over time.[52]

The Commission also noted that the bifurcated capacity construct it had approved for California "respects the jurisdictional boundaries of the FPA while recognizing the states' historical role in ensuring resource adequacy."[53] That is so notwithstanding that the CPUC conducts capacity procurements limited to resources that advance the state's public policy goals and that result in capacity prices significantly higher (indeed, four to seven times higher) than those received through CAISO's residual resource adequacy program.[54] Likewise, the resource-specific FRR construct proposed in this docket respects state policy choices and should afford states significant flexibility in designing capacity procurements for resources of public policy interest. That construct is fully consistent with the Commission's final authority and responsibility to ensure that the rates charged for capacity are just and reasonable.[55]

The Commission further held in *CXA La Paloma* that the mere fact that low prices emerged from the competitive residual capacity market did not, "in and of themselves, demonstrate that a market is not just and reasonable," and it cited another recent proceeding in which it had rejected similar claims.[56] Thus, it concluded, "generalized claims about revenue insufficiency do not satisfy" the burden to show that a market design is unjust or unreasonable.[57] Similarly here, arguments that the FRR-RS construct will result in the continuation of low prices does not

[52] Exelon Reply Br. at 37.

[56] *CXA La Paloma, LLC*, 165 FERC ¶ 61,148, at P 72.

[57] *Id.*

demonstrate that the FRR-RS construct is unjust or unreasonable. The Commission's Order in this docket properly focuses on ensuring that offers in the RPM auction are competitive and are unaffected by state subsidies—not on the ultimate price level emerging from that competitive process.[58]

The Commission also confirmed in *CXA La Paloma* that it had "not required a centralized capacity market as part of a just and reasonable market design," and cited several recent decisions in which it had affirmed a bifurcated capacity market that respected states' role in resource procurement—notwithstanding allegations that the residual capacity market yielded low prices.[59] Indeed, the Commission underscored that it "has not imposed a centralized capacity market in an RTO/ISO or found that it is the only just and reasonable resource adequacy construct to attract and retain sufficient capacity."[60] As to the eastern RTOs, such as PJM, the Commission noted that "the capacity markets" in those regions "originated through section 205 filings or developed through settlements."[61] They were not imposed by the Commission. Thus, the Commission should reject arguments made in this docket that a mandatory centralized capacity market is the only just and reasonable market design. To the contrary, the proposed resource-specific FRR Alternative is a just and reasonable approach, tailored to the specific needs and circumstances in the PJM region, that respects traditional state authority while ensuring political accountability for state decisions, preventing capacity over-procurement, and ensuring competitive offers in the auction market.

[61] *Id.*

In sum, the Commission should adopt the resource-specific FRR Alternative it proposed in its Order. However, its final Order must provide guidance on the questions detailed above, so that states can legislate with confidence. The Commission should afford states wide flexibility to design FRR-RS procurements and determine the compensation to be paid to FRR-RS resources, subject to ex post review by the Commission in the exercise of its authority to ensure the justness and reasonableness of wholesale rates.

INITIAL BRIEF OF EXELON CORPORATION

Pursuant to ordering paragraph (F) of the June 29, 2018 Order Rejecting Proposed Tariff Revisions, Granting In Part and Denying In Part Complaint, and Instituting Proceeding Under Section 206 of the Federal Power Act ("Order") and the August 22, 2018 Notice of Extension of Time issued by the Federal Energy Regulatory Commission ("Commission"),[1] Exelon Corporation ("Exelon") hereby submits the following comments addressing proposed changes to the Open Access Transmission Tariff ("Tariff") of PJM Interconnection, L.L.C. ("PJM"), discussed by the Commission in the June 29, 2018 Order Rejecting Proposed Tariff Revisions, Granting In Part and Denying In Part Complaint, and Instituting Proceeding Under Section 206 of the Federal Power Act ("Order").

[1] 18 C.F.R. § 385.212 (2017).

INTRODUCTION

The Commission's Order requesting comments reached two clear conclusions.[2] First, the Commission identified a need to protect "PJM's capacity market from the price suppressive effects of resources receiving out-of-market support by ensuring that such resources are not able to offer below a competitive price" in the RPM auction.[3] Accordingly, the Commission proposed an expanded minimum offer price rule (MOPR) "with few or no exceptions."[4] Second, at the same time, the Commission recognized that it is necessary to respect "states' right to pursue valid policy goals" concerning the generation mix and "mitigate or avoid the potential for double payment and over procurement."[5] Accordingly, the Commission requested comment on "a resource-specific FRR Alternative option" that would "accommodate such resources by allowing them to remain on the system, despite their inability to compete in the capacity market based on their costs, by permitting them to exit the capacity market with a commensurate amount of load and operating reserves."[6]

If properly designed, Exelon believes that this "bifurcated capacity construct"[7] will succeed in balancing the Commission's concern regarding the integrity of capacity market bidding with respecting state policy choices—while also increasing transparency for all stakeholders. This will only be the case, however, if the resource-specific FRR ("FRR-RS") mechanism is workable

[2] *Calpine Corp. v. PJM Interconnection, L.L.C.*, 163 FERC ¶ 61,236 (2018) ("Order").

[3] Order at P 158.

[4] *Id.*

[5] *Id.* at PP 159-60.

[6] *Id.* at P 160.

[7] *Id.* at PP 161-62. Exelon has sought rehearing of the Commission's findings in the Order that that the existing PJM tariff provisions are unjust and unreasonable. The comments herein as to the appropriate structure for the FRR-RS should not be construed as waiving, or in any way undermining, the positions taken in that request for rehearing. For purposes of these comments, Exelon is taking the Order as it now stands and proposing a path forward with respect to the FRR-RS as contemplated in that Order.

for the states. The Commission doubtless will receive comments from certain stakeholders urging the Commission to adopt a MOPR with few exceptions, as proposed, but to abandon the resource-specific FRR Alternative outright or adopt overly burdensome mechanics that would render the resource-specific FRR Alternative unusable by states.[8] Contrary to the position of these commenters, the Commission must do more than just pay lip service to states' legitimate energy policy interests. An overly burdensome or restrictive approach that states cannot readily use would be, in effect, the same as the "MOPR-Ex" rejected by the Commission. Such an approach would not be a just or reasonable balancing of the Commission's key concerns. It would result in a significant over-procurement of capacity, with the capacity market ignoring clean state-supported resources that are in fact on the system and contributing to system reliability.

Advocates of a MOPR-only solution (or of a MOPR combined with a resource-specific FRR that is difficult for states to use) may respond that the Commission should not be concerned with over-procurement, as states remain free to pay for the consequences of their policy choices. The Commission should not be persuaded by that glib response. States across PJM have set ambitious clean energy targets, and the quantity of state-supported resources is likely to increase significantly over the next decade.[9] If the Commission adopts a capacity market design that fails to recognize the existence of these resources—thereby forcing customers to procure redundant capacity, at significant unnecessary cost—the capacity markets will no longer be serving customers' interests. States would face the choice of (1) continuing to bear increasing and

[8] For example, the Commission should resist calls to require resources to commit to remaining an FRR-RS resource for an extended period of time or the life of the unit, or to impose burdensome and costly requirements on an FRR-RS resource that seeks to reenter the RPM auction. It also should not attempt to micro-manage or restrict the processes by which states might choose to select resources of public policy interest or the mechanisms by which states may choose to arrange for their compensation. As discussed further below, many resources of state public policy interest are owned by the affiliates of load-serving entities. The Commission should not allow parties to use the affiliate rules to challenge and undermine state-administered procurements of such resources.

[9] *See* PJM Filing at Attach. F (Aff. of Dr. Anthony Giacomoni & Attach. 1).

unnecessary costs to procure unneeded capacity from the PJM market, (2) withdrawing entirely from the PJM capacity market through the existing FRR (or from PJM altogether) in order to maintain their right to control the resource mix, or (3) effectively forfeiting their authority to make decisions in "their role as regulators of generation facilities" regarding how to satisfy their capacity needs.[10] Putting states to this choice is not a tenable policy. Doing so would disregard the cooperative federalist framework of the Federal Power Act, and it would weaken federal markets in the long run by pushing states to exit. Unless and until the Commission is ready to approve carbon pricing so that state clean energy policies are integrated into wholesale energy market prices, the Commission must at the very least adopt market rules with the flexibility to accommodate state policy initiatives.

To that end, Exelon supports a resource-specific FRR Alternative ("FRR-RS") that is workable for states seeking to exercise control over their generation mix, and that allows states the flexibility to conduct an out-of-market capacity procurement of the resources they wish to support for public policy reasons. States should have flexibility in designing such procurements and compensation, with resulting wholesale sales of capacity subject to the Commission's jurisdiction under the Federal Power Act and, if undertaken using market-based rate authority, reported to and monitored by the Commission through the supplier's EQR and subject to Commission review under Section 206. Resources receiving out-of-market revenue, or that have had their capacity procured by states pursuant to an out-of-market capacity procurement, would be removed from the capacity market along with matching load identified by the supplier in advance of the Base Residual Auction. Load would be matched according to bilateral agreements presented by the

[10] *Connecticut Dep't of Pub. Utility Control v. FERC*, 569 F.3d 477, 481 (D.C. Cir. 2009); *Coalition for Competitive Electricity v. Zibelman*, No. 17-2654 (2d Cir. Sept. 27, 2018), slip op. at 12 ("The states are … authorized to regulate energy production … and facilities used for the generation of electric energy.").

supplier in the event that the FRR-RS resource has sold its capacity bilaterally, or as designated by the procuring state in the event that capacity is procured through a state-administered process. Although FRR-RS resources will be selling their capacity outside the RPM market, these resources would still be making capacity commitments to PJM pursuant to the FRR-RS, and accordingly they would take on all the obligations of Capacity Performance resources, thereby ensuring reliability.

Exelon shares this vision of a workable FRR-RS mechanism with a broad range of other stakeholders, who have agreed to a set of shared principles filed in this docket on October 1, 2018.[11] Exelon submits these additional comments to describe in greater detail how those principles should be implemented by the Commission and to address matters not otherwise addressed in those shared principles, such as the proper scope and application of the MOPR. Proposed tariff language implementing Exelon's combined proposal is attached as Attachment A.

Under our proposal, eligibility for the FRR-RS should be tied to the application of the MOPR: if a resource will be subject to a MOPR because it is receiving state support, then it should be able to exit the RPM market by electing the FRR-RS Alternative. And resources should be subject to the MOPR if they are receiving any out-of-market payments that, taken together, exceed a materiality threshold of one percent of the revenues the plant would expect to receive in the PJM markets. To the extent the Commission seeks to apply the MOPR to prevent units from bidding in the RPM auction below their going-forward costs, there is no economic rationale for applying the MOPR to resources receiving environmental attribute payments, but exempting resources receiving guaranteed cost recovery through retail rates, or development incentives that make it possible for a plant to have been built. Any such out-of-market revenue allows the resource

[11] Joint Brief of Consumer Advocates, NGOs, and Industry Stakeholders, Docket Nos. EL18-178, *et al*. (Oct. 1, 2018).

SI-SSA-0010-6218

receiving it to bid lower in the capacity market than it would otherwise be able to do, and the Commission's logic concerning the MOPR applies to all such sources of revenue. Thus, the Commission should reject PJM's definition of "Material Subsidy," which exempts from the MOPR resources receiving subsidies promoting general economic development or siting. For the same reason, the Commission should reject calls to exempt self-supply and vertically integrated resources from the MOPR. These units receive guaranteed cost recovery through retail rates, and thus they can offer into the capacity market as price takers freed from the need to make competitive offers. Given that the Commission's goal is to "ensure that all resources participating in the capacity market … offer competitively"[12]—by which the Commission appears to mean, without having their offers influenced by out-of-market revenue—the Commission must not allow a MOPR exception for any type of out-of-market support.

Requiring self-supply and vertically integrated resources to either accept a MOPR or elect the FRR-RS Alternative will not interfere with their traditional business models. A properly designed FRR-RS Alternative would give these entities all the flexibility they need to maintain their existing business models, and will not impair state oversight of their integrated resource planning. Indeed, allowing states that kind of resource-planning flexibility is the entire point of the FRR-RS Alternative. The FRR-RS Alternative will also provide sufficient flexibility for resources receiving development or siting incentives. To the extent a state is committed to siting a new generation facility within its boundaries, and the facility does not expect to clear the capacity market if its offer is mitigated, that facility can elect the FRR-RS, and the state can ensure the procurement of its capacity so that the full costs of supporting that resource are transparent to customers and policymakers.

[12] Order at P 162.

Finally, the Commission should express its willingness to entertain a Section 205 filing from PJM incorporating carbon pricing. A wide array of stakeholders, including some of those that have been most vocal in advocating a MOPR for state-supported resources, have acknowledged that carbon pricing is the most efficient approach to addressing the environmental externalities of emitting generation,[13] which is the primary driver underlying many of the state policies giving rise to this proceeding. Integrating a carbon price into PJM's markets would reduce or eliminate the need for states to address carbon emissions from the power sector in other ways, and would allow resources that will exit the RPM auction under the Commission's Order to reenter that market. PJM has explained how it can run its markets incorporating state-imposed carbon prices while respecting the choice of other states not to impose such a price,[14] and Exelon has similarly proposed ways PJM could allow for carbon pricing with border adjustments to ensure that the effects of carbon pricing are contained within those states adopting it. The Commission should direct PJM to conduct stakeholder discussions to evaluate options for integrating carbon pricing into its market rules.

[13] The following comments supportive of carbon pricing were filed on June 22, 2017 in *State Policies and Wholesale Markets Operated by ISO New England Inc., New York Independent System Operator, Inc., and PJM Interconnection, L.L.C.*, Docket No. AD17-11-000: Comments of American Municipal Power, Inc. at 9-10; Comments of American Wind Energy Association at 5-7; Comments of Brookfield Renewable, Conservation Law Foundation, and NextEra Energy Resources, LLC at 1-2; Comments of Calpine Corp. at 3; Comments of Canadian Electricity Association at 4; Comments of Clean Energy Industries at 5-6; Comments of Connecticut at 12-13; Comments of Dominion Energy Services, Inc. at 7; Comments of Dynegy Inc. at 4; Comments of Electric Power Supply Association at 8-9; Comments of Independent Market Monitor for PJM at 10; Comments of Invenergy Wind Development LLC, Invenergy Thermal Development LLC, Invenergy Storage Development LLC, and Invenergy Solar Development LLC at 5; Comments of Independent Power Producers of New York, Inc. at 2; Comments of Massachusetts Department of Public Utilities at 6; Comments of New England States Committee on Electricity at 10; Comments of New York Power Authority at 6-7; Comments of Nuclear Energy Institute at 2; Comments of Noble Environmental Power, LLC at 3; Comments of Natural Resources Defense Council and Sustainable FERC Project at 1; Comments of NRG Energy, Inc. at 4, 13; Comments of PJM Interconnection, L.L.C. at 4-5, 10; Comments of Andrew G. COMMENTS

I. A Mechanism for Accommodation Is a Necessary Counterpart to an Expanded MOPR.

The Commission's Order rightly recognizes that a market reform adopting an expanded MOPR alone would be incomplete and have negative consequences. As both the courts and the Commission have held, states have a right to pursue valid policy goals.[15] The Commission therefore expressed concern that, "if PJM's MOPR applies to state subsidized resources with few or no exceptions, and yet the states continue to support those resources, some ratepayers may be obligated to pay for capacity both through the state programs providing out-of-market support and through the capacity market."[16] That outcome would result in the significant over-procurement of capacity resources—particularly as states increase their commitment to a clean energy future. Indeed, by 2025, approximately 13 GW of capacity resources (in unforced capacity terms) will be supported by state environmental mandates, such as portfolio standards, compared to about 6 GW today.[17] These figures will be even higher if states committed to clean energy decide to further increase their procurement targets between now and 2025.[18] Indeed, that is likely. Rapid decarbonization of the power sector is necessary for our society to avoid the worst impacts of climate change, and in the absence of a national policy, states are likely to ramp up their commitment to carbon-free generation.[19]

---

[16] Order at P 158.

[17] See PJM Filing at Attach. F (Aff. of Dr. Anthony Giacomoni & Attach. 1).

[18] A number of states have recently significantly increased their clean energy commitments, including California, Illinois, Maryland, Michigan, New Jersey, New York, Oregon, and a number of New England states.

[19] Decarbonization is not merely a matter of increasing the zero-emissions share of current generation resources. Even reference-case electrification scenarios envision a one-third increase in electricity consumption by 2050. To meet even modest carbon-free generation targets, states will need to support large quantities of new carbon-free

SI-SSA-0010-6221

Applying a MOPR to these resources without also allowing them some avenue like the FRR-RS to sell their capacity outside the RPM market would, in effect, pretend that these resources do not exist—even though they are actually on the system and contributing to system reliability. It would not be just and reasonable for the Commission to adopt market rules that force customers in PJM to procure redundant capacity at a significant unnecessary cost. And doing so is all the more unjustifiable in present circumstances, when the market already has a significant overhang of excess supply, such that PJM is procuring well beyond its reserve margin.[20]

It is no answer to say, as some stakeholders have contended, that it is appropriate for states to bear these unnecessary costs. According to these stakeholders, such costs are the natural consequence of the states' policy decisions. However, the Commission is correct that it is "just and reasonable to accommodate resources that receive out-of-market support" through state policies concerning the generation mix, rather than adopting rules that will foreseeably lead to "double payment and over procurement."[21] The Commission should reject these stakeholders' calls to adopt capacity market rules that willfully ignore the capacity provided by state-supported resources. That is so for four reasons.

First, the Commission should not impose costly capacity purchase obligations that are entirely unnecessary to ensure system reliability. Customers would be forced, by virtue of such rules, to pay hundreds of millions of dollars per year to procure capacity that is not actually needed

generation.*See* Nat'l Renewable Energy Laboratory, Electrification & Decarbonization: Exploring U.S. Energy Use and Greenhouse Gas Emissions in Scenarios with Widespread Electrification and Power Sector Decarbonization at 17 (July 2017), https://www.nrel.gov/docs/fy17osti/68214.pdf; Electric Power Research Inst., U.S. Nat'l Electrification Assessment at 9 (April 2018), http://mydocs.epri.com/docs/PublicMeetingMaterials/ee/000000003002013582.pdf.

[20] The 2021/2022 BRA cleared 163.6 GW of unforced capacity and a reserve margin of 21.5% (including commitments under Fixed Resource Requirement plans), or 5.7% higher than the target margin of 15.8%. That pattern is stable: the last seven auctions have cleared reserve margins above 19%. PJM, 2021/2022 RPM Base Residual Auction Results at 3, 6, http://www.pjm.com/-/media/markets-ops/rpm/rpm-auction-info/2021-2022/2021-2022-base-residual-auction-report.ashx.

[21] Order at P 160.

for reliability. Such a market design choice would be akin to refusing to acknowledge that some load-serving entities own their own generation and self-supply capacity, and forcing those entities to buy redundant capacity in the market, a position the Commission has never taken. And for good reason: such a policy would impose costly requirements while ignoring the realities that make those requirements unnecessary, and therefore would not constitute reasoned decision-making.[22] Nor could the Commission disclaim responsibility for imposing these unnecessary costs. The Commission is responsible through the PJM Tariff for establishing capacity requirements for load-serving entities, and if its rules ignore capacity that is actually on the system serving load (regardless whether the capacity is self-supplied or supported by state clean energy programs), the unnecessary costs of procuring redundant capacity would be traceable to the Commission's market-design choice.

Second, market rules that impose unnecessary costs on customers are ultimately unsustainable. A MOPR-only approach forces states onto the horns of dilemma. In order to maintain their authority to adopt policies supporting particular resources, states would either be forced to pay increasing sums for unneeded capacity or to withdraw entirely from the PJM capacity market through the existing FRR (or from PJM altogether) and reclaim responsibility for all resource adequacy. As the Commission recognizes, "the states, should they so choose, undeniably have the power simply to reregulate—i.e., to revert to an era and regulatory model in which competition amongst utilities was not prevalent."[23] The Commission should reject the call by

[22] *See Michigan v. EPA*, 135 S. Ct. 2699, 2707-08 (2015) ("Agencies have long treated cost as a centrally relevant factor when deciding whether to regulate. Consideration of cost reflects the understanding that reasonable regulation ordinarily requires paying attention to the advantages and the disadvantages of agency decisions. It also reflects the reality that too much wasteful expenditure devoted to one problem may well mean considerably fewer resources available to deal effectively with other (perhaps more serious) problems." (internal quotation marks omitted).

[23] Order at P 163 (internal quotation marks omitted).

certain stakeholders for market rules that would force states to exit the PJM capacity market entirely in order to pursue state energy policies.

Third, to the extent that MOPR-only advocates hope that states will choose a third approach—abandoning their energy policies—and view the MOPR as a method to deter such policies, deterrence is not an appropriate basis for Commission action. This would be akin to the Commission declaring that states have no legitimate role in selecting generation resources, which is contradicted by the plain language of the Federal Power Act. The FPA expressly protects states' authority over "facilities used for the generation of electric energy,"[24] and the Supreme Court has explained that "regulation of utilities is one of the most important of the functions traditionally associated with the police power of the states."[25] Likewise, "[l]egislation designed to free from pollution the very air that people breathe clearly falls within the exercise of even the most traditional concept of . . . the police power."[26] As a letter to the Commission from a coalition of seventeen governors indicates:

> The Commission must let states retain their historical right to choose their own mix of energy generating resources and policies with minimal federal interference. The Commission must discover ways to regulate markets in ways that complement state policy preferences and objectives rather than overriding or negating them.
>
> The governors respectfully urge the Commissioners to refocus their policy decisions on reliability and efficient power markets – recognizing that utilities, consumers, and states will be making resource choices, which are fully within their authority and which has been the longstanding practice in the nation's electricity markets.[27]

[24] 16 U.S.C. § 824(b)(1).

[27] Governors' Wind & Solar Energy Coalition Letter, EL18-178 (Aug. 29, 2018).

Consistent with this precedent, the Commission has long sought to "respect the traditional role of states,"[28] and whenever the Commission has confronted policies addressing environmental externalities, the Commission has explained that these "policy objectives" are "legitimate."[29] And the courts have agreed, concluding that "the need [for the Commission] to make adjustments in light of states' exercise of their lawful powers does not diminish the scope of those powers."[30] A market design that sought to deter states from exercising the authority that Congress expressly reserved to them, by forcing states exercising that authority to bear large and unnecessary costs, would be no more respectful of the FPA's division between state and federal authority than a state program that targeted wholesale prices and tried to adjust them.[31]

Moreover, given states' long-standing authority to pursue energy policies, and their relationship to core state police powers, there is no reason to believe that states will stop supporting the resources that they believe are necessary to meet their policy goals. In the CASPR Order, the Commission found that clean energy "will be developed by the operation of state environmental and clean energy mandates, whether that capacity clears the [market] or not."[32] There is no basis for believing that PJM states will act any differently. Thus, a strategy to deter states from

[31] *See FERC v. Elec. Power Supply Ass'n*, 136 S. Ct. 760, 775 ("The above conclusion does not end our inquiry into the Commission's statutory authority; to uphold the Rule, we also must determine that it does not regulate retail electricity sales. That is because, as earlier described, § 824(b) … reserv[es] regulatory authority over retail sales (as well as intrastate wholesale sales) to the States…. FERC cannot take an action transgressing that limit no matter how direct, or dramatic, its impact on wholesale rates."); *Coalition for Competitive Electricity*, *supra*, Slip Op. at 22 ("FERC uses auctions to set wholesale prices and to promote efficiency with the background assumption that the FPA establishes a dual regulatory system between the states and federal government and that the states engage in public policies that affect the wholesale markets.").

[32] *ISO New England Inc.*, 162 FERC ¶ 61,205, at P 45 (2018).

exercising their congressionally granted authority would likely be doomed to failure in any event. More likely, such a strategy would only result in unnecessary costs on customers, and would encourage states to withdraw altogether from the federal markets.

Fourth, adopting market rules intended to stymie legitimate state action promoting environmentally friendly methods of producing electricity would entrench inefficient market outcomes, and consequently would be arbitrary and capricious.[33] Certain forms of generation produce socially harmful pollution. When emitting generators are not forced to internalize those costs—and when the value of clean production is not recognized—the result is a resource mix that produces a greater amount of pollution than is socially desirable. An efficient market should seek to align private incentives with social costs and benefits, either by making polluting resources internalize the cost of pollution (leading them to produce less than they otherwise would) or by allowing clean resources to be compensated for the benefits of clean production (leading them to produce more than they otherwise would). This is textbook economics.[34]

The Commission has chosen to remain agnostic to environmental externalities, but has sensibly been able to do so only because of states' traditional role in regulating them. Working in tandem, federal market design and state policy can drive toward a more efficient outcome—even if a Commission-imposed carbon price is the most efficient solution.[35] By contrast, a market reform intended to *deter* states from regulating environmental externalities, by adopting market

[33] To be sure, not all state subsidy programs seek to address environmental externalities. For example, development incentives and regulated retail rates ensuring cost recovery do not. But the programs discussed by the Commission as primarily motivating its decision to revamp the capacity market rules—REC and ZEC programs—are aimed toward reducing such externalities by incentivizing the emissions-free production of electricity.

[34] Decl. of Robert D. Willig at 17-28, Ex. A to Protest of Exelon Corporation, Docket No. ER18-1314 (May 7, 2018) ("Willig Decl."); Institute for Policy Integrity, *Capacity Markets and Externalities: Avoiding Unnecessary and Problematic Reforms* (April 2018), http://policyintegrity.org/files/publications/Capacity_Markets_and_Externalities_Report.pdf.

[35] Willig Decl. at 29-35.

SI-SSA-0010-6226

rules that countermand the effects of state environmental policies, would mark a dramatic change in policy and lead to irrational results. The effect would be to ensure that the market produces foreseeably inefficient outcomes. Wholesale market rules adopted in order to *prevent* an accounting of environmental externalities could never be just and reasonable.

For these reasons, the Commission's Order correctly viewed a mechanism for accommodating state policy initiatives as a necessary corollary to any expanded MOPR.

II. A Properly Designed Resource-Specific FRR Alternative Is an Appropriate Mechanism for Accommodation.

The Commission's Order sought comment on a proposed mechanism for accommodation that would "allow, on a resource-specific basis, resources receiving out-of-market support to choose to be removed from the PJM capacity market, along with a commensurate amount of load, for some period of time."[36] This approach would "allow[] resources that receive out-of-market support to remain in PJM's energy and ancillary services markets, and continue to be recognized as capacity on the system."[37] As the Commission described the FRR-RS, "[r]esources and load that take advantage of this new resource-specific FRR Alternative would not participate in the PJM capacity market."[38]

The Commission found that this approach would yield "increased transparency for investors, consumers, and policymakers."[39] According to the Commission, removing subsidized resources from the capacity market would ensure that all capacity offers in the market are "competitive," that is, unaffected by out-of-market sources of revenue; this would improve the

[36] Order at P 160.

[37] *Id.* at P 162.

[38] *Id.*

[39] *Id.*

SI-SSA-0010-6227

clarity of capacity market price signals and promote more robust competition within the market.[40] Consumers, meanwhile, would have a transparent view into "which capacity costs are the result of competition in the capacity market and which capacity costs are being incurred as a result of state policy decisions."[41] States would need to take responsibility for the full cost of maintaining a state-supported resource, and to the extent consumers regard that cost as too high, the transparency provided by the bifurcated market structure would allow policymakers to be held politically accountable.[42] Thus, "the construct will provide the information that states and all other stakeholders will need in order to make informed decisions about the degree to which they prefer to rely on the capacity market versus out-of-market mechanisms, and it will manage the results of those decisions in an orderly fashion."[43]

The Commission identified "a number of details" on which it requested comment. These include "[t]he appropriate scope of out-of-market support to be mitigated by the expanded MOPR, thereby rendering a resource eligible for the new resource-specific FRR Alternative"; how the Tariff should address the FRR-RS election "procedurally and substantively"; "[h]ow to identify the load that will be removed"; "whether part of a resource should be eligible" for the FRR-RS; "the length of time resources receiving out-of-market support who chose the [FRR-RS] must remain outside of the PJM capacity market auction"; and other implementation issues. With respect to the MOPR, the Commission requested comment on "the types of MOPR exemptions that should be included," and what minimum offer price to apply.[44]

SI-SSA-0010-6228

This Part describes in detail our proposal for a workable FRR-RS Alternative, consistent with the shared principles supported by Exelon and other commenters. Proposed Tariff language is attached as Attachment A.

A. Eligibility: Resources Receiving a Material Subsidy.

1. Application of the MOPR Should Be Paired With Eligibility for the FRR-RS Alternative.

The Commission's Order contemplates that the MOPR and the FRR-RS are two sides of the coin: a resource that is subject to mitigation on account of a Material Subsidy should be eligible to elect the FRR-RS Alternative if it chooses.[45] Exelon agrees that these two concepts—the MOPR and the FRR-RS—should be connected in this manner. The point of the FRR-RS Alternative is to provide a mechanism for states to support resources for policy reasons, when application of the MOPR could leave those resources unable to clear the capacity market. Thus, the application of the MOPR should remain connected to eligibility for the FRR-RS Alternative, regardless of how a Material Subsidy is defined.

2. Material Subsidies Should Include State-Directed Capacity Procurements.

The Commission should recognize that, once an FRR-RS mechanism is in place, states may choose to support resources of public policy interest by directing the procurement of capacity from those resources. States may find a state-administered, centralized capacity procurement outside the PJM auction to be the most efficient means to assure that resources of state public policy interest will receive compensation for their capacity, and for assuring that the associated costs are allocated equitably and in a competitively neutral manner among the state's load-serving entities. The Commission's Order should make clear that a state-directed capacity procurement of

[45] *Id.* at P 165.

SI-SSA-0010-6229

this kind constitutes a Material Subsidy that would allow the resource to elect the FRR-RS and sell its capacity pursuant to the state procurement, rather than through the RPM auction.

3. The Commission Should Define Material Subsidy to Include All Types of Out-of-Market Revenue.

With respect to what types of support should constitute a Material Subsidy—thereby triggering mitigation as well as eligibility for the FRR-RS—that definition should include any form of out-of-market revenue, regardless of its purpose. Under the Commission's logic for expanding the MOPR's application, there should be "few or no exceptions,"[46] since any subsidy makes it possible for the resource receiving the subsidy to offer into the capacity market at a level below its actual going-forward costs. The Commission's goal is to ensure that all capacity market offers are "competitive," and allowing some subsidized entities to be exempt from mitigation is incompatible with that goal. When paired with an FRR-RS mechanism that is readily available for states, however, a stringent MOPR will not unduly interfere with state authority or with any existing business models. Instead, consistent with the Commission's goals, a MOPR with few or no exceptions will increase transparency, by enabling all stakeholders to have a clear view of the relative costs of the capacity market and out-of-market mechanisms.

a. Development Incentives Are Material Subsidies.

Based on its prior filing and statements during the stakeholder process, PJM's proposed definition of Material Subsidy excludes payments that promote "general industrial development in an area" or "siting" in a particular location.[47] That carve-out is arbitrary. Development and siting incentives raise the identical concerns that the Commission has identified regarding transparency and the competitiveness of offers in the capacity market. These types of incentives may induce

[46] *Id.* at P 158.

[47] *Id.* at P 165 n.294.

investments that would not otherwise have occurred—indeed, that is their entire point. For example, as Exelon has noted previously, in Pennsylvania, a coal-to-gas conversion was the "anchor tenant" for a new "Keystone Opportunity Expansion Zone," which enabled this plant to be built by eliminating state and local taxes through 2023.[48] These types of subsidies also allow generators to make offers in the capacity market that do not reflect their full going-forward costs. There is therefore no basis for carving this type of state support out of the definition of Material Subsidy.

b. The Commission Should Not Exempt Self-Supply and Vertically Integrated Resources From the MOPR.

Some stakeholders have argued that the Commission should continue to recognize MOPR exemptions for self-supply and vertically integrated resources. There is no reasoned basis for the Commission to do so. Self-supply and vertically integrated units typically offer into the capacity market as price takers, because they do not require capacity market revenues in order to cover their costs. Instead, they are guaranteed cost recovery through retail rates, and any capacity market revenues are credited as an offset against costs. Guaranteed cost recovery through retail rates frees these resources from any competitive discipline and allows them to take whatever market price is paid, because retail rate recovery "protects [them] from the potential downside of that bidding behavior."[49] In no way are these resources making "competitive offers."[50]

[48] Oil & Gas 360, Sunbury Generation Lands First Tenant for Old Trail Industrial Park KOEZ (Oct. 28, 2015), https://www.oilandgas360.com/sunbury-generation-lands-first-tenant-for-old-trail-industrial-park-koez-with-announcement-of-financing-of-panda-hummel-station-power-plant/.

[49] Order at P 153.

[50] *Id.*

SI-SSA-0010-6231

Resources with guaranteed cost recovery *today* comprise almost 20% of PJM's cleared capacity—approximately 30 GW.[51] That is nearly twice the number of gigawatts that PJM forecasts will be supported by states for environmental reasons *in 2025*, to which the Commission cites in finding that reforms to the PJM tariff are needed. To exempt from the MOPR resources that receive cost recovery through retail rates is to rip a large tear—not a mere loophole—in the fabric of the proposed market design. If the Commission includes such an exemption, it cannot achieve the objectives it has set forth in its Order, which include a capacity market in which all participants are making what the Commission regards as competitive offers, and transparency for consumers and state policymakers regarding the full cost of their regulatory choices. Indeed, it would make little sense for the Commission to mitigate resources receiving attribute payments in order to convey transparent information to states about the costs of state *re*-regulation, but exempt from the MOPR resources receiving guaranteed retail rate recovery, and thereby obscure the costs of *maintaining* state regulation.

Self-supply and vertically integrated entities have advanced two main arguments for an exemption, but neither withstands scrutiny. First, they argue that utilities that use their generation resources for self-supply have no incentive to exercise buyer-side market power. But that argument, even if factually accurate, misses the point. The Order's premise is that the MOPR in PJM should no longer be restricted to combatting buyer-side market power; instead, it should be used to ensure that offers reflect a resource's going-forward costs, "regardless of intent" (and irrespective of externalities).[52]

[51] This includes both self-supply (24.8 GW) and public power (6.2 GW), which totals 18.9% of PJM's cleared capacity. *See* Declaration of Michael M. Schnitzer ¶ 15, attached to Protest of Exelon Corporation and the PSEG Companies, Docket No. EL18-169 (June 20, 2018).

[52] Order at P 155.

Second, advocates of an exemption have argued that self-supply and vertical integration are longstanding business models. That does not provide a basis for treating them differently. For one thing, attribute payments are also longstanding: they first emerged in the late 1990s, at the same time the organized energy markets were formed, and prior to the introduction of capacity markets a decade later; and they similarly draw upon the historic power reserved to states to regulate generation facilities.[53] More fundamentally, vintage is no justification for exempting units that, under the Commission's reasoning, are making non-competitive offers.

In any event, mitigating self-supply and vertically integrated units would not disrupt their business model, because they can always elect the FRR-RS Alternative (or the existing FRR) and arrange to serve associated load outside the capacity market in exchange for payments made by retail customers. Indeed, that model more truly replicates their long-standing business model than one in which capacity supported by retail ratepayers pursuant to state mandate must nevertheless be bid into the RPM market as a price taker, with retail customers then billed for costs net of market revenues.

For these reasons, it would be arbitrary for the Commission to distinguish between existing self-supply resources and other existing resources receiving state support with respect to the MOPR and eligibility for the FRR-RS.

c. Small Units Should Not Be Exempt.

Some have proposed exempting units 20 MW or less from mitigation. The Commission should not grant that exemption for two reasons. First, because the unforced capacity value of renewable resources is typically substantially de-rated compared to nameplate capacity, this will

[53] *See generally, e.g.*, Barry Rabe, *Race to the Top: The Expanding Role of U.S. State Renewable Portfolio Standards*, 7 Sustainable Dev. L. & Pol'y 10 (2007); Br. of Amici Curiae Electricity Regulation Scholars, *Village of Old Mill Creek v. Star*, Nos. 17-2433, 17-2445 (cons.), at 10-18 (7th Cir. Nov. 3, 2017); *see also* 16 U.S.C. § 824(b)(1).

SI-SSA-0010-6233

result in many individual renewable projects of typical sizes being exempted. For example, with the typical wind capacity credit of 13%, any wind project of less than 150 MW nameplate, a very typical size for a wind farm, will be exempted. This will invite gamesmanship in the design of renewable energy projects, as well as needless litigation over whether co-located 20 MW groups of solar panels or wind turbines should be treated as a single resource or as multiple resources. Second, even if any particular 20 MW resource is viewed as having a de minimis effect on the market, the aggregate quantity of such resources is considerable, particularly given that many typical renewable projects would fall at or below this threshold. Indeed, in the 2020/21 Base Residual Auction, we estimate that there were more than 800 MW of unforced capacity offered by wind and solar facilities of 20 MW or less.[54] Allowing forty 20 MW wind farms to offer as price takers has the same effect as allowing one 800 MW nuclear unit to do so. If the Commission is not willing to allow the latter, neither should it allow the former.

B. Election of the FRR-RS Alternative and Matching of Load.

As discussed above, a resource subject to mitigation should be permitted to elect participation in the FRR-RS Alternative. Consistent with the timing for the existing FRR Alternative, a resource electing to participate in the FRR-RS should be required to make its election 120 days prior to the Base Residual Auction from which it seeks to be relieved of its must-offer obligation. A resource can make its election by certifying that it will receive a Material Subsidy in the Delivery Year—for example, from the sale of RECs or ZECs, or from the recovery of its costs through retail rates—or by demonstrating that its capacity and attributes have been procured for the Delivery Year under a state-sponsored forward procurement.

[54] This consists of 430 MW of wind and 386 MW of solar. The calculation is based on *PJM 2021/22 RPM Resource Model*, available at https://www.pjm.com/-/media/markets-ops/rpm/rpm-auction-info/2021-2022/2021-2022-rpm-resource-model.ashx?la=en.

A resource electing the FRR-RS should also be required to identify, no fewer than 120 days prior to the Base Residual Auction, what corresponding load will be removed from the auction. Some resources electing the FRR-RS Alternative may choose to sell their capacity to load-serving entities through bilateral contracts outside the auction. This might be the case, for example, with a resource receiving REC payments. Such resources would present their bilateral contracts to indicate the corresponding load to be removed. Other resources may sell their capacity through a state-administered procurement, under which the state, pursuant to state law, would assign the capacity credit to load-serving entities under its jurisdiction. FRR-RS resources procured by a state in this manner would submit the state procurement order or other state directive to indicate the corresponding load to be removed. The compensation to be received by the FRR-RS resource (whether a sum certain or a formula) should also be set forth in the documentation identifying the load to be matched to the FRR-RS resource. The FRR-RS election and documentation setting forth compensation would then be confirmed by an LSE or other relevant entity (such as a state power authority) no later than 30 days prior to the Base Residual Auction. This approach would ensure that both the election of the FRR-RS and load-matching occur prior to the Base Residual Auction, and would facilitate the Commission's goal of providing transparency to consumers and policymakers regarding the relative cost of capacity resources procured through the market and those procured outside the market as FRR-RS resources.[55]

Although the foregoing process would ensure orderly implementation of the FRR-RS mechanism in the normal course, additional time may be necessary for the first year in which the FRR-RS is available. In order to give states sufficient lead time to make any necessary legislative

[55] Any concern that the FRR-RS Alternative will be abused by states seeking to withdraw load from the capacity market in order to suppress capacity market prices can be addressed through the Commission's prohibition on market manipulation. That prohibition should be applied to manipulative uses of the FRR-RS Alternative. The Commission has the full ability and means to police and punish any such misuse.

or regulatory changes following the Commission's final order in this proceeding, Exelon suggests that for the first year in which the FRR-RS is implemented the deadlines for election and load-matching should be reduced to 45 days prior to the Base Residual Auction.

In addition, the FRR-RS mechanism must maintain the existing ability under the PJM Tariff to partially offer resources into the capacity market. Many resources are owned by more than one owner; in those cases, PJM's tariff allows each owner to submit its own capacity offer for the portion of the resource that it owns, and to submit different offers for discrete segments of the same resource. Sometimes ownership of a resource is split between entities with different business models—for example, one portion of a plant may enjoy cost recovery through retail rates, while the rest of the plant does not. And some state support payments (for example, the Illinois ZECs paid to Quad Cities) are received only by one owner in respect to the fraction of the plant it owns. Because partial resources already offer into the capacity market, partial resources are subsidized, and as a result partial resources can be subject to mitigation, it makes sense that partial resources should also be able to elect the FRR-RS Alternative, consistent with existing tariff provisions governing segmented offers.[56]

C. Compensation and Payment Mechanics.

For ease of administration, PJM should provide states the option of using PJM's existing billing and accounting mechanisms to collect FRR-RS costs from the matched load and to disburse payment to FRR-RS resources. The FRR-RS resource would indicate whether to use these billing and accounting mechanisms in its election.

[56] PJM OATT, Att. DD, Sec. 5.6.1 (a)(ii) ("The Sell Offer may take the form of offer segments with varying price-quantity pairs for varying output levels from the underlying resource, but may not take the form of an offer curve with nonzero slope").

SI-SSA-0010-6236

Compensation should be provided consistent with the documentation submitted at the time of the FRR-RS resource's election. The sale of capacity from an FRR-RS resource is of course a sale subject to the Commission's jurisdiction, so the Commission must retain regulatory oversight over the terms and conditions of that sale to ensure their justness and reasonableness. If the sale is undertaken pursuant to the seller's market-based rate authority, compensation would be reported to the Commission during the Delivery Year on the FRR-RS resource's EQR. And the Commission should make clear that it retains the power under Section 206 to deem the wholesale capacity price unjust and unreasonable, and to replace it with a just and reasonable rate.

However, the Commission should make clear in its Order that it seeks to afford substantial flexibility to states in proposing methods of compensation, subject to the Commission's regulation of the resulting wholesale sale. For example, the Commission should state in its Order that a state conducting a capacity procurement could adopt one of many different compensation mechanisms, including a cost-based metric, competitive offers arising from a request for proposals or a state-run clean energy auction, or a mechanism based on RPM clearing prices plus an attribute price based on the value of the environmental externality abated (such as the social cost of carbon). There may be other potential approaches to compensation as well. The role for states is similar to the role contemplated under the existing FRR provisions, which incorporate a state compensation mechanism, while still preserving the Commission's ultimate authority over the justness and reasonableness of any resulting wholesale rate.[57]

[57] RAA, Sched. 8.1 § D.8; *see Am. Elec. Power Serv. Corp.*, 134 FERC ¶ 61,039, PP 8-13 (2011) (deferring to state compensation mechanism).

SI-SSA-0010-6237

D. The Commission Should Provide Advance Authorization for Affiliate Transactions Arising from a State-Directed Procurement.

In restructured states, many load-serving entities are affiliated with generation companies that own or may develop resources of state public policy interest. Indeed, approximately 50 percent of the clean energy generation in PJM is owned by affiliates of load-serving entities. Thus, in order for states to be able to use the FRR-RS mechanism as an effective means for procuring resources of public policy importance, the Commission will need to address potential affiliate transactions that arise from state-directed procurements by load-serving entities subject to state jurisdiction.

To that end, the Commission should clarify that wholesale sales of capacity undertaken pursuant to a state-directed procurement shall not be subject to the Commission's affiliate transaction rules.[58] When a state legislature or regulatory commission directs an affiliate transaction pursuant to state policy mandate, the concerns underlying the Commission's affiliate rules are absent. Those rules were adopted to prevent a regulated utility from using its captive retail customers to cross-subsidize an unregulated generation affiliate.[59] The economic theory behind the policy is that, if such an affiliate transaction were permitted, the generation company may have market power over the utility's captive customers, and could use that position to extract excessive payments from them.[60]

There is no such concern when a state political body is directing the procurement of capacity in furtherance of its policy goals. In those circumstances, the transaction does not result

[58] 18 C.F.R. § 35.39(b).

[59] *Elec. Power Supply Ass'n v. FirstEnergy Solutions Corp.*, 155 FERC ¶ 61,101, P 59 (2016) (explaining that the Commission's "fundamental goal" in its affiliate rules "is to protect consumers served by franchised public utilities from inappropriately subsidizing the market-regulated or non-utility affiliates of the franchised public utility or otherwise being financially harmed as a result of affiliate transactions and activities.").

[60] *Id.*

from the generator's exploitation of the utility's captive customer base to exercise market power. Instead, the transaction results from a determination by a democratically accountable political body that the transaction is in the public interest and must occur. Any affiliate relationship between the buyer and seller is a happenstance irrelevant to the state directing the procurement, not the motivating reason for the sale, as is true in cases of affiliate abuse. If customers disagree with their elected representatives about where the public interest lies, they will make that known at the ballot box.

Subjecting transactions to the affiliate rules even when undertaken pursuant to state direction would make the FRR-RS Alternative unworkable for many states. The concept of the FRR-RS Alternative is to provide a path for states to make their own policy judgments regarding which resources are to receive state support and to allow these resources to enjoy that support without second-guessing. Applying the affiliate transaction rules to state-directed capacity procurements would allow those rules to be used to undermine the FRR-RS and, in some instances, could effectively block the states from carrying out their public policy. Nor would it be appropriate for opponents of the bifurcated market structure to undermine the FRR-RS mechanism by litigating individual affiliate transaction approvals or for the Commission to use the affiliate rules to micromanage how states carry out their procurements—for example, by approving FRR-RS transactions only when a state conducts a competitive solicitation process and selects the lowest bidder. In pursuing clean energy policies, states seek to balance cost considerations with their environmental goals. This is why the Illinois ZEC and New Jersey ZEC statutes each contemplate procurements that select resources based on their environmental contributions, subject to a cost cap.[61] In Illinois, the Illinois Power Agency implemented these environmental statutory criteria

[61] *See* 20 ILCS 3855/1-75(d-5)(1)(C) (directing IPA to select ZEC plants based on "minimizing carbon dioxide emissions that result from electricity consumed in Illinois"; "minimizing sulfur dioxide, nitrogen dioxide, and

by modeling the impact of resources participating in the procurement on state air quality and carbon emissions, and selected the resources that best satisfied these environmental criteria.[62] Reviewing procurements under this program would put the Commission in the untenable position of second-guessing the state's evaluation of such environmental criteria. The FRR-RS Alternative should enable states to pursue their own policy priorities, and the Commission's affiliate rules should not be used to stymie states' ability to support the resources that best serve the states' environmental goals, merely because they happen to be owned by generation affiliates of load-serving entities subject to the state's jurisdiction.

The Commission therefore should clarify in this proceeding that market-based rate sellers can seek waiver of their tariffs and the Commission's regulations with respect to the filing of wholesale sales undertaken pursuant to a state clean energy program. An advance authorization for affiliate transactions resulting from a state-directed procurement would not conflict with recent precedent regarding proposed affiliate transactions. In the Ohio affiliate cases, for example, the regulated utilities sought to enter power purchase agreements with their unregulated generation affiliates as part of a utility-initiated "electric security plan." While the Ohio Commission reviewed the resulting power purchase agreement for prudence, it did not direct the agreement;

particulate matter emissions that adversely affect the citizens" of Illinois; and "any existing environmental benefits that are preserved by" selection of the winning facilities); N.J. Stat. Ann. § 48:3-87.5 (directing Board of Public Utilities to select ZEC plants "based on how well the nuclear plants satisfy" environmental criteria, including "demonstrat[ing] to the satisfaction of the board that [the plant] makes a significant and material contribution to the air quality in the State by minimizing emissions that result from electricity consumed in New Jersey, … minimizes harmful emissions that adversely affect the citizens of the State, and if the nuclear power plant were to be retired, that that retirement would significantly and negatively impact New Jersey's ability to comply with State air emissions reduction requirements.").

[62] Illinois Power Agency, Public Notice of Successful Bidders and Average Prices (Jan. 25, 2018), https://www.ipa-energyrfp.com/?wpfb_dl=1450; Illinois Power Agency, Zero Emission Standard Procurement Plan (July 31, 2017) at 31-47, https://www.illinois.gov/sites/ipa/Documents/2018ProcurementPlan/Zero-Emission-Standard-Procurement-Plan-ICC-Filing.pdf. The New Jersey Board's selection process is still being formulated.

SI-SSA-0010-6240

rather, the transaction originated with the utility, not the state.[63] The reactive role played by the Ohio Commission in those cases is quite different from the proactive role that a state legislature or commission would play in conducting or directing the capacity procurement of an FRR-RS resource. The latter involves an affirmative policy decision by the state to support a particular resource in order to promote the public interest. The Commission should respect that policy judgment, which arises from the public political process, not the private exercise of market power; and accordingly, to the extent such state-directed procurements involve affiliate transactions, the Commission should provide advance authorization under its affiliate rules. Alternatively, at the very least, the Commission should treat state involvement in the procurement of capacity by a load-serving entity from an affiliated generation company as strong evidence pointing against any affiliate abuse.

E. Capacity Performance Requirements.

A resource electing the FRR-RS Alternative makes a capacity commitment to PJM through that election. Such a resource should be subject to all of the obligations of any capacity resource, including all performance requirements, non-performance charges, and bonus payments. That will ensure that the FRR-RS Alternative will not have any adverse reliability consequences.

F. Market-Clearing Process.

Consistent with the Commission's Order, and as discussed above, "[r]esources and load that take advantage of the [FRR-RS] would not participate in the PJM capacity market, and would neither make nor receive payments from that capacity market."[64] However, with respect to the mechanics of clearing the PJM capacity auction in a manner that respects all locational constraints,

[63] *See* Ohio Rev. Code § 4928.143 (providing that "an electric distribution utility may file an application for public utilities commission approval of an electric security plan"); *Elec. Power Supply Ass'n*, 155 FERC ¶ 61,101 at P 6.

[64] Order at P 160.

SI-SSA-0010-6241

PJM may elect to include FRR-RS resources and associated load in running its market-clearing algorithm. For purposes of PJM's algorithm only, the FRR-RS resources could be treated as "self-supplied" and the matched load would remain in the demand curve. This approach would allow PJM to avoid making any adjustments to the demand curve and would automatically ensure that load procures the appropriate amount of reserves in the aggregate, and that load collectively respects all locational constraints. Consistent with the Commission's Order, however, the FRR-RS resources would not make any offers, nor sell any capacity or receive any compensation, in the capacity market. Their inclusion in the market-clearing algorithm would be solely for administrative ease on PJM's part. Thus, in the financial settlement process, FRR-RS resources will not be paid the RPM clearing price, and the load matched to FRR-RS resources will receive a credit for the amount not paid to such resources.

G. Term Length.

The Commission should not impose any minimum term for FRR-RS resources to remain the FRR-RS Alternative. It also should not impose any onerous conditions that an FRR-RS resource must meet to reenter the RPM auction. Over time, market conditions may change and make state support unnecessary. Requiring FRR-RS resources to remain outside the RPM market in such circumstances, or imposing burdensome reentry conditions that effectively consign such resources to remaining outside the RPM market, will only reduce market liquidity in the long run and harm consumers.

H. Mitigation Level.

For resources receiving Material Subsidies that choose to continue participating in the capacity market subject to the expanded MOPR, the Commission must decide on an appropriate minimum offer price. In the capacity performance proceeding, the Commission determined that

"an appropriate competitive offer includes all of the marginal and opportunity costs faced by a resource."[65] For resources with avoided cost rates of less than Net CONE multiplied by the balancing ratio B, the competitive offer price was determined to be equal to Net CONE * B, the balancing ratio.[66] This amount reflects the opportunity cost of taking on a commitment as a capacity performance resource. That is, a resource "will be willing to take on a capacity obligation as long as the amount it can earn for capacity (including both capacity auction revenues as well as net Performance Bonus Payments) exceeds the amount it could earn in Performance Bonus Payments by participating in the energy market only."[67] And the amount it could expect to earn in Performance Bonus Payments by participating in the energy market only is equal to Net CONE multiplied by the balancing ratio B.[68] Consistent with this existing approach for new resources, the Commission should set the minimum offer level for both new and existing resources subject to the MOPR at Net CONE * B, the opportunity cost of taking on a capacity commitment. This approach would be transparent and simple to administer.

The Commission should not allow unit-specific exceptions to these offer levels. The Commission's rationale for applying a MOPR to resources receiving Material Subsidies, and providing those resources with a path out of the PJM capacity market, is to ensure that offers in the capacity market reflect competitive forces. Offers based on a unit-specific exception process, however, are not based on competitive forces; they are set administratively, based on the Independent Market Monitor's own assessment of the unit's costs. That process is opaque to outsiders, and in Exelon's experience, highly subjective. Creating an avenue for resources

[65] *PJM Interconnection, L.L.C.*, 151 FERC ¶ 61,208, P 335 (2015), *on rehearing*, 155 FERC ¶ 61,157, at PP 174, 185 (2016).

[67] *Id.* at P 336.

[68] *Id.* at PP 337-38.

receiving subsidies to remain in the capacity market, but then to bid below their opportunity cost based on a unit-specific exception process, would run counter to the very reason the Commission took action in this proceeding: transparency and robust competition. Moreover, introducing such complexity for existing resources is unnecessary as long as a workable FRR-RS mechanism is available to resources that receive out-of-market revenue and do not wish to offer into the capacity market at a mitigated level. It is therefore appropriate for the Commission to now eliminate the unit-specific exception. If the Commission nevertheless were to allow unit-specific exceptions, the calculation of the offer floor under such an exception should still be required to reflect the opportunity cost of taking on a capacity commitment, which is common across all units and is equal to Net CONE times B.

III. The Proposed Resource-Specific FRR Alternative, Combined With a MOPR Applied to All Subsidized Resources Participating in the Capacity Market, Will Achieve the Commission's Goals.

The proposed FRR-RS Alternative set forth above, together with a MOPR applied to all resources participating in the capacity market but receiving out-of-market revenues, would satisfy the Commission's objectives: ensuring greater "integrity of [the capacity market's] price signals," as capacity market offers would be unaffected by out-of-market payments;[69] "avoid[ing] the potential for double payment and over procurement" of capacity;[70] and "increas[ing] transparency for investors, consumers, and policymakers."[71]

First, regarding capacity market integrity, the proposal outlined in the Commission's Order would ensure that no resource participating in the capacity market would be able to bid below its costs by virtue of receiving out-of-market revenue. The Commission's Order indicated that, in the

[69] Order at P 156

[70] *Id.* at P 160.

[71] *Id.* at P 162.

Commission's view, this is important to the integrity of the capacity market and to ensuring that (in the Commission's words) "all resources participating in the capacity market, whether or not these resources receive out-of-market support, offer competitively."[72] The rates that emerge from these offers will, in the Commission's view, be "the result of competitive market forces."[73]

Second, a workable FRR-RS Alternative would avoid the potential for double payment and capacity over-procurement by allowing states a mechanism for withdrawing load from the capacity market to be served by resources of public policy interest outside that market. This was one of the core goals of the Commission's pairing of a MOPR with limited or no exceptions with a mechanism pursuant to which states could implement payments outside of the PJM capacity market for preferred resources.

Third, the combination of these policies would result in increased transparency for all stakeholders. Investors would know that the prices emerging from the capacity market reflect competitive bidding among market participants, and they can plan entry and exit accordingly. Consumers would have visibility into "which capacity costs are the result of competition in the capacity market and which capacity costs are being incurred as a result of state policy decisions."[74] And policymakers would have "the information that states and all other stakeholders will need to make informed decisions about the degree to which they prefer to rely on the capacity market versus out-of-market mechanisms."[75] The "bifurcated approach" identified by the Commission,

---

[72] *Id.*

[73] *Id.* at P 158. To be clear, while the Commission's proposed bifurcated market structure will improve competitive market outcomes considerably, such rates will not completely reflect all competitive market forces, as they ignore the negative externalities associated with pollution. A truly competitive market is one that accounts for the externalities of production. Exelon explained this point at length in its July 30, 2018 Petition for Rehearing in these consolidated dockets.

[74] *Id.* at P 162.

[75] *Id.* at P 163.

SI-SSA-0010-6245

and described in more detail above, "will manage the results of those decisions in an orderly fashion."[76]

Some commenters are likely to argue that the FRR-RS Alternative is incompatible with the Commission's conclusion that market prices have been unjustly and unreasonably suppressed by non-competitive offers. According to these commenters, removing FRR-RS resources and matching load from the capacity market will not result in any change in capacity market prices—those prices will be just as low as they were previously. Thus, these commenters will argue, the FRR-RS Alternative cannot be just or reasonable. The Commission should reject that argument for several reasons.

First, the argument assumes that states will necessarily provide out-of-market capacity payments for all subsidized resources. That assumption may not turn out to be true, in which case at least some subsidized resources will offer into the capacity market at a mitigated level—thereby tending to increase the market clearing price. Because one cannot predict exactly how states will respond to the availability of an FRR-RS Alternative, one cannot draw any definitive conclusion regarding what effect the FRR-RS Alternative will have on market prices.

Second, even accepting the dubious premise of these commenters' argument, the Commission did not—nor did it purport to—predetermine a particular price level for RPM auctions as "just and reasonable" or "unjust and unreasonable." Rather, it determined that capacity prices would be just and reasonable if they result from "competitive market forces."[77] The construct set forth in the Commission's Order, and described above, is consistent with that determination. Sellers participating in the capacity market would "not [be] able to offer below a

[76] *Id.* at PP 162-63.

[77] *Id.* at P 158.

competitive price."[78] The market price that emerges from these offers will, *ipso facto*, reflect "competitive market forces."[79] That is so regardless of what the market price is—indeed, it is so even if the market price is no different from what it is today.

Third, regardless what the new market price is, it will *not* be derived from below-cost offers by subsidized competitors. Under the FRR-RS construct, resources receiving out-of-market support are either mitigated and forced to make offers reflecting their costs, or instead exit the market altogether. They make no market offer and receive no market compensation.[80] Thus, the "price suppression" alleged by opponents of the FRR-RS is not a consequence of below-cost capacity market offers. Instead, what opponents label "price suppression" is simply the consequence of reduced capacity market demand, as a result of state policy decisions to withdraw a portion of their load from the capacity market to be served outside that market by resources of special public policy interest. Thus, the capacity market might be smaller—there may be less load for competitive resources to serve, resulting in lower prices. But "all resources participating in the capacity market" to serve that remaining load will "offer competitively."[81]

The argument that the FRR-RS Alternative must be rejected if the market price of capacity does not rise ultimately rests on the flawed assumption that the Commission can compel load to remain in the PJM market. The Commission cannot do so. As the Commission recognized, "the states, should they so choose, undeniably have the power simply to reregulate—i.e., to revert to an era and regulatory model in which 'competition among utilities was not prevalent.'"[82] Thus, for

[78] *Id.*

[79] *Id.*

[80] *Id.* at PP 160-61.

[81] *Id.* at P 162.

[82] *Id.* at P 163.

example, a state can choose, if it wishes, to have its franchised utility self-supply capacity. The result of that choice is to reduce the amount of load to be served by the capacity market. PJM has always recognized that reality by clearing self-supply resources in its auction as price-takers—effectively removing the load served by those resources from the capacity market. Or the state can withdraw its entire load from the capacity market by opting into the FRR. These steps would similarly tend to lower capacity market prices by removing load from the market. But there is nothing "artificial" or "suppressive" about the resulting price: it is the natural consequence of a state policy choice to have its load served through a mechanism other than the PJM capacity market. There is nothing preordained regarding the amount of load that procures capacity through the PJM market, versus outside that market. That is a function of choices made by other regulators, not the Commission.

The FRR-RS Alternative is simply a more modest version of what states already can do. Instead of requiring states to make an all-or-nothing choice concerning how their load is served—either all through the capacity market or all through an FRR Plan—the FRR-RS Alternative allows a state to withdraw a *portion* of its load from the capacity market, to be served outside of the market by resources that the state wishes to support for public policy reasons. Doubtless, commenters hostile to the FRR-RS Alternative would prefer for the Commission to force each state into a binary choice between either fully withdrawing all of its load from the capacity market (by electing the full FRR or by leaving PJM altogether) or requiring all of the state's load to be served by the capacity market, while subjecting state-supported resources to a MOPR. But not only is such a coercive policy unlawful (as discussed above), the Commission's FRR-RS proposal recognizes that it would be unwise—for customers, who would be foreclosed from participating in and gaining the efficiency benefits of markets if they wished to procure any portion of their capacity outside

the market, or alternatively would be forced to pay twice for capacity; for investors, who as a result might well end up serving an even smaller competitive market, at even lower prices; for states, which would be forced to either forfeit their authority over resource mix or abandon the Commission's markets altogether; and for the markets themselves, which would be increasingly unsustainable against a backdrop of increasing state commitment to clean energy.

Accordingly, the Commission has correctly pursued a more nuanced approach—one that "will not interfere with the states' ability to choose the path of re-regulation, whether via a conscious policy decision or a simple failure to take steps to prevent reregulation … on an unplanned basis," but will "provide the information that states and all other stakeholders will need in order to make informed decisions" about the wisdom of those state policies.[83]

Finally, whatever market price emerges from the intersection of supply and remaining capacity market demand will accurately reflect the value of capacity sold in that market. If a state chooses to pay higher costs to maintain or induce the entry of non-emitting resources, that choice will be rooted in a desire to distinguish between different types of capacity resources depending on their environmental profile, and to pay extra for the clean attributes of non-emitting resources. To the extent that the market price of emitting capacity sold in the Base Residual Auction turns out to be lower than some commenters may wish, that price will not be the product of below-cost bidding by resources in that market; rather, it will be the result of the fact that states have withdrawn a portion of their demand from that market to be served outside of it by non-emitting resources. The RPM price will be the competitive price for the generic capacity sold in the PJM market. And the cost of non-emitting capacity sold outside the PJM market will be transparent for customers and policymakers alike.

[83] *Id.*

SI-SSA-0010-6249

CONCLUSION

For the foregoing reasons, the Commission should adopt a Resource-Specific FRR Alternative as described herein.

Dated: October 2, 2018

Respectfully submitted,

Attachment A
Proposed Tariff Language

PJM OPEN ACCESS

TRANSMISSION TARIFF

1. Definitions

Unless the context otherwise specifies or requires, capitalized terms used in this PJM Tariff shall have the respective meanings assigned herein or in the Schedules hereto, or in the PJM Operating Agreement or RAA if not otherwise defined in this PJM Tariff, for all purposes of this PJM Tariff (such definitions to be equally applicable to both the singular and the plural forms of the terms defined). Unless otherwise specified, all references herein to sections, Schedules, Exhibits or Appendices are to sections, Schedules, Exhibits or Appendices of this Agreement. As used in this Agreement.

Definitions – A – B

Abnormal Condition:
"Abnormal Condition" shall mean any condition on the Interconnection Facilities which, determined in accordance with Good Utility Practice, is: (i) outside normal operating parameters such that facilities are operating outside their normal ratings or that reasonable operating limits have been exceeded; and (ii) could reasonably be expected to materially and adversely affect the safe and reliable operation of the Interconnection Facilities; but which, in any case, could reasonably be expected to result in an Emergency Condition. Any condition or situation that results from lack of sufficient generating capacity to meet load requirements or that results solely from economic conditions shall not, standing alone, constitute an Abnormal Condition.

Acceleration Request:
"Acceleration Request" shall mean a request pursuant to Operating Agreement, Schedule 1, section 1.9.4A, and the parallel provisions of Tariff, Attachment K-Appendix, section 1.9.4A, to accelerate or reschedule a transmission outage scheduled pursuant to Operating Agreement, Schedule 1, section 1.9.2 or Operating Agreement, Schedule 1, section 1.9.4, and the parallel provisions of Tariff, Attachment K-Appendix, section 1.9.2 or Tariff, Attachment K-Appendix, section 1.9.4.

Actionable Subsidy:
A Material Subsidy shall be an "Actionable Subsidy" when the total amount of all Material Subsidies received by a Capacity Market Seller for a particular Capacity Resource is greater than one percent of the total revenues that such Capacity Resource would actually or reasonably anticipate receiving from markets administered by the Office of Interconnection.

Additional Day-ahead Scheduling Reserves Requirement:
"Additional Day-ahead Scheduling Reserves Requirement" shall mean the portion of the Dayahead Scheduling Reserves Requirement that is required in addition to the Base Day-ahead Scheduling Reserves Requirement to ensure adequate resources are procured to meet real-time load and operational needs, as specified in the PJM Manuals.

Affected System:
"Affected System" shall mean an electric system other than the Transmission Provider's Transmission System that may be affected by a proposed interconnection or on which a proposed interconnection or addition of facilities or upgrades may require modifications or upgrades to the Transmission System.

Affected System Operator:
"Affected System Operator" shall mean an entity that operates an Affected System or, if the Affected System is under the operational control of an independent system operator or a regional transmission organization, such independent entity.

Affiliate:
"Affiliate" shall mean any two or more entities, one of which controls the other or that are under common control. "Control" shall mean the possession, directly or indirectly, of the power to direct

the management or policies of an entity. Ownership of publicly-traded equity securities of another entity shall not result in control or affiliation for purposes of the Tariff or Operating Agreement if the securities are held as an investment, the holder owns (in its name or via intermediaries) less than 10 percent of the outstanding securities of the entity, the holder does not have representation on the entity's board of directors (or equivalent managing entity) or vice versa, and the holder does not in fact exercise influence over day-to-day management decisions. Unless the contrary is demonstrated to the satisfaction of the Members Committee, control shall be presumed to arise from the ownership of or the power to vote, directly or indirectly, ten percent or more of the voting securities of such entity.

Agreements:
"Agreements" shall mean the Amended and Restated Operating Agreement of PJM Interconnection, L.L.C., the PJM Open Access Transmission Tariff, the Reliability Assurance Agreement, and/or other agreements between PJM Interconnection, L.L.C. and its Members.

Ancillary Services:
"Ancillary Services" shall mean those services that are necessary to support the transmission of capacity and energy from resources to loads while maintaining reliable operation of the Transmission Provider's Transmission System in accordance with Good Utility Practice.

Annual Demand Resource:
"Annual Demand Resource" shall have the meaning specified in the Reliability Assurance Agreement.

Annual Energy Efficiency Resource:
"Annual Energy Efficiency Resource" shall have the meaning specified in the Reliability Assurance Agreement.

Annual Resource:
"Annual Resource" shall mean a Generation Capacity Resource, an Annual Energy Efficiency Resource or an Annual Demand Resource.

Annual Resource Price Adder:
"Annual Resource Price Adder" shall mean, for Delivery Years starting June 1, 2014 and ending May 31, 2017, an addition to the marginal value of Unforced Capacity and the Extended Summer Resource Price Adder as necessary to reflect the price of Annual Resources required to meet the applicable Minimum Annual Resource Requirement.

Annual Revenue Rate:
"Annual Revenue Rate" shall mean the rate employed to assess a compliance penalty charge on a Curtailment Service Provider under Tariff, Attachment DD, section 11.

Annual Transmission Costs:
"Annual Transmission Costs" shall mean the total annual cost of the Transmission System for purposes of Network Integration Transmission Service shall be the amount specified in

Attachment H for each Zone until amended by the applicable Transmission Owner or modified by the Commission.

Applicable Laws and Regulations:
"Applicable Laws and Regulations" shall mean all duly promulgated applicable federal, State and local laws, regulations, rules, ordinances, codes, decrees, judgments, directives, or judicial or administrative orders, permits and other duly authorized actions of any Governmental Authority having jurisdiction over the relevant parties, their respective facilities, and/or the respective services they provide.

Applicable Regional Entity:
"Applicable Regional Entity" shall mean the Regional Entity for the region in which a Network Customer, Transmission Customer, New Service Customer, or Transmission Owner operates.

Applicable Standards:
"Applicable Standards" shall mean the requirements and guidelines of NERC, the Applicable Regional Entity, and the Control Area in which the Customer Facility is electrically located; the PJM Manuals; and Applicable Technical Requirements and Standards.

Applicable Technical Requirements and Standards:
"Applicable Technical Requirements and Standards" shall mean those certain technical requirements and standards applicable to interconnections of generation and/or transmission facilities with the facilities of an Interconnected Transmission Owner or, as the case may be and to the extent applicable, of an Electric Distributor, as published by Transmission Provider in a PJM Manual provided, however, that, with respect to any generation facilities with maximum generating capacity of 2 MW or less (synchronous) or 5 MW or less (inverter-based) for which the Interconnection Customer executes a Construction Service Agreement or Interconnection Service Agreement on or after March 19, 2005, "Applicable Technical Requirements and Standards" shall refer to the "PJM Small Generator Interconnection Applicable Technical Requirements and Standards." All Applicable Technical Requirements and Standards shall be publicly available through postings on Transmission Provider's internet website.

Applicant:
"Applicant" shall mean an entity desiring to become a PJM Member, or to take Transmission Service that has submitted the PJMSettlement credit application, PJMSettlement credit agreement and other required submittals as set forth in Tariff, Attachment Q.

Application:
"Application" shall mean a request by an Eligible Customer for transmission service pursuant to the provisions of the Tariff.

Attachment Facilities:
"Attachment Facilities" shall mean the facilities necessary to physically connect a Customer Facility to the Transmission System or interconnected distribution facilities.

Attachment H:

"Attachment H" shall refer collectively to the Attachments to the PJM Tariff with the prefix "H-" that set forth, among other things, the Annual Transmission Rates for Network Integration Transmission Service in the PJM Zones.

Auction Revenue Rights:
"Auction Revenue Rights" or "ARRs" shall mean the right to receive the revenue from the Financial Transmission Right auction, as further described in Operating Agreement, Schedule 1, section 7.4, and the parallel provisions of Tariff, Attachment K-Appendix, section 7.4.

Auction Revenue Rights Credits:
"Auction Revenue Rights Credits" shall mean the allocated share of total FTR auction revenues or costs credited to each holder of Auction Revenue Rights, calculated and allocated as specified in Operating Agreement, Schedule 1, section 7.4.3, and the parallel provisions of Tariff, Attachment K-Appendix, section 7.4.3.

Authorized Government Agency:
"Authorized Government Agency" means a regulatory body or government agency, with jurisdiction over PJM, the PJM Market, or any entity doing business in the PJM Market, including, but not limited to, the Commission, State Commissions, and state and federal attorneys general.

Avoidable Cost Rate:
"Avoidable Cost Rate" shall mean a component of the Market Seller Offer Cap calculated in accordance with Tariff, Attachment DD, section 6.

Balancing Congestion Charges:
"Balancing Congestion Charges" shall be equal to the sum of congestion charges collected from Market Participants that are purchasing energy in the Real-time Energy Market minus [the sum of congestion charges paid to Market Participants that are selling energy in the Real-time Energy Market plus any congestion charges calculated pursuant to the Joint Operating Agreement between the Midcontinent Independent Transmission System Operator, Inc. and PJM Interconnection, L.L.C. (PJM Rate Schedule FERC No. 38), plus any congestion charges calculated pursuant to the Joint Operating Agreement Among and Between New York Independent System Operator Inc. and PJM Interconnection, L.L.C. (PJM Rate Schedule FERC No. 45), plus any congestion charges calculated pursuant to agreements between the Office of the Interconnection and other entities, plus any charges or credits calculated pursuant to Operating Agreement, Schedule 1, section 3.8, and the parallel provisions of Tariff, Attachment K-Appendix, section 3.8, as applicable)].

Balancing Ratio:
"Balancing Ratio" shall have the meaning provided in Tariff, Attachment DD, section 10A.

Base Capacity Demand Resource:
"Base Capacity Demand Resource" shall have the meaning specified in the Reliability Assurance Agreement.

Base Capacity Demand Resource Constraint:

"Base Capacity Demand Resource Constraint" for the PJM Region or an LDA, shall mean, for the 2018/2019 and 2019/2020 Delivery Years, the maximum Unforced Capacity amount, determined by PJM, of Base Capacity Demand Resources and Base Capacity Energy Efficiency Resources that is consistent with the maintenance of reliability. As more fully set forth in the PJM Manuals, PJM calculates the Base Capacity Demand Resource Constraint for the PJM Region or an LDA, by first determining a reference annual loss of load expectation ("LOLE") assuming no Base Capacity Resources, including no Base Capacity Demand Resources or Base Capacity Energy Efficiency Resources. The calculation for the PJM Region uses a daily distribution of loads under a range of weather scenarios (based on the most recent load forecast and iteratively shifting the load distributions to result in the Installed Reserve Margin established for the Delivery Year in question) and a weekly capacity distribution (based on the cumulative capacity availability distributions developed for the Installed Reserve Margin study for the Delivery Year in question). The calculation for each relevant LDA uses a daily distribution of loads under a range of weather scenarios (based on the most recent load forecast for the Delivery Year in question) and a weekly capacity distribution (based on the cumulative capacity availability distributions developed for the Installed Reserve Margin study for the Delivery Year in question). For the relevant LDA calculation, the weekly capacity distributions are adjusted to reflect the Capacity Emergency Transfer Limit for the Delivery Year in question. For both the PJM Region and LDA analyses, PJM then models the commitment of varying amounts of Base Capacity Demand Resources and Base Capacity Energy Efficiency Resources (displacing otherwise committed generation) as interruptible from June 1 through September 30 and unavailable the rest of the Delivery Year in question and calculates the LOLE at each DR and EE level. The Base Capacity Demand Resource Constraint is the combined amount of Base Capacity Demand Resources and Base Capacity Energy Efficiency Resources, stated as a percentage of the unrestricted annual peak load, that produces no more than a five percent increase in the LOLE, compared to the reference value. The Base Capacity Demand Resource Constraint shall be expressed as a percentage of the forecasted peak load of the PJM Region or such LDA and is converted to Unforced Capacity by multiplying [the reliability target percentage] times [the Forecast Pool Requirement] times [the forecasted peak load of the PJM Region or such LDA, reduced by the amount of load served under the FRR Alternative].

Base Capacity Demand Resource Price Decrement:
"Base Capacity Demand Resource Price Decrement" shall mean, for the 2018/2019 and 2019/2020 Delivery Years, a difference between the clearing price for Base Capacity Demand Resources and Base Capacity Energy Efficiency Resources and the clearing price for Base Capacity Resources and Capacity Performance Resources, representing the cost to procure additional Base Capacity Resources or Capacity Performance Resources out of merit order when the Base Capacity Demand Resource Constraint is binding.

Base Capacity Energy Efficiency Resource:
"Base Capacity Energy Efficiency Resource" shall have the meaning specified in the Reliability Assurance Agreement.

Base Capacity Resource:
"Base Capacity Resource" shall mean a Capacity Resource as described in Tariff, Attachment DD, section 5.5A(b).

Base Capacity Resource Constraint:
"Base Capacity Resource Constraint" for the PJM Region or an LDA, shall mean, for the 2018/2019 and 2019/2020 Delivery Years, the maximum Unforced Capacity amount, determined by PJM, of Base Capacity Resources, including Base Capacity Demand Resources and Base Capacity Energy Efficiency Resources, that is consistent with the maintenance of reliability. As more fully set forth in the PJM Manuals, PJM calculates the above Base Capacity Resource Constraint for the PJM Region or an LDA, by first determining a reference annual loss of load expectation ("LOLE") assuming no Base Capacity Resources, including no Base Capacity Demand Resources or Base Capacity Energy Efficiency Resources. The calculation for the PJM Region uses the weekly load distribution from the Installed Reserve Margin study for the Delivery Year in question (based on the most recent load forecast and iteratively shifting the load distributions to result in the Installed Reserve Margin established for the Delivery Year in question) and a weekly capacity distribution (based on the cumulative capacity availability distributions developed for the Installed Reserve Margin study for the Delivery Year in question). The calculation for each relevant LDA uses a weekly load distribution (based on the Installed Reserve Margin study and the most recent load forecast for the Delivery Year in question) and a weekly capacity distribution (based on the cumulative capacity availability distributions developed for the Installed Reserve Margin study for the Delivery Year in question). For the relevant LDA calculation, the weekly capacity distributions are adjusted to reflect the Capacity Emergency Transfer Limit for the Delivery Year in question. Additionally, for the PJM Region and relevant LDA calculation, the weekly capacity distributions are adjusted to reflect winter ratings.

For both the PJM Region and LDA analyses, PJM models the commitment of an amount of Base Capacity Demand Resources and Base Capacity Energy Efficiency Resources equal to the Base Capacity Demand Resource Constraint (displacing otherwise committed generation). PJM then models the commitment of varying amounts of Base Capacity Resources (displacing otherwise committed generation) as unavailable during the peak week of winter and available the rest of the Delivery Year in question and calculates the LOLE at each Base Capacity Resource level. The Base Capacity Resource Constraint is the combined amount of Base Capacity Demand Resources, Base Capacity Energy Efficiency Resources and Base Capacity Resources, stated as a percentage of the unrestricted annual peak load, that produces no more than a ten percent increase in the LOLE, compared to the reference value. The Base Capacity Resource Constraint shall be expressed as a percentage of the forecasted peak load of the PJM Region or such LDA and is converted to Unforced Capacity by multiplying [the reliability target percentage] times [one minus the pool-wide average EFORd] times [the forecasted peak load of the PJM Region or such LDA, reduced by the amount of load served under the FRR Alternative].

Base Capacity Resource Price Decrement:
"Base Capacity Resource Price Decrement" shall mean, for the 2018/2019 and 2019/2020 Delivery Years, a difference between the clearing price for Base Capacity Resources and the clearing price for Capacity Performance Resources, representing the cost to procure additional Capacity Performance Resources out of merit order when the Base Capacity Resource Constraint is binding.

Base Day-ahead Scheduling Reserves Requirement:

"Base Day-ahead Scheduling Reserves Requirement" shall mean the thirty-minute reserve requirement for the PJM Region established consistent with the Applicable Standards, plus any additional thirty-minute reserves scheduled in response to an RTO-wide Hot or Cold Weather Alert or other reasons for conservative operations.

Base Load Generation Resource
"Base Load Generation Resource" shall mean a Generation Capacity Resource that operates at least 90 percent of the hours that it is available to operate, as determined by the Office of the Interconnection in accordance with the PJM Manuals.

Base Offer Segment:
"Base Offer Segment" shall mean a component of a Sell Offer based on an existing Generation Capacity Resource, equal to the Unforced Capacity of such resource, as determined in accordance with the PJM Manuals. If the Sell Offers of multiple Market Sellers are based on a single Existing Generation Capacity Resource, the Base Offer Segments of such Market Sellers shall be determined pro rata based on their entitlements to Unforced Capacity from such resource.

Base Residual Auction:
"Base Residual Auction" shall mean the auction conducted three years prior to the start of the Delivery Year to secure commitments from Capacity Resources as necessary to satisfy any portion of the Unforced Capacity Obligation of the PJM Region not satisfied through Self- Supply.

Batch Load Demand Resource:
"Batch Load Demand Resource" shall mean a Demand Resource that has a cyclical production process such that at most times during the process it is consuming energy, but at consistent regular intervals, ordinarily for periods of less than ten minutes, it reduces its consumption of energy for its production processes to minimal or zero megawatts.

Behind The Meter Generation:
"Behind The Meter Generation" shall refer to a generation unit that delivers energy to load without using the Transmission System or any distribution facilities (unless the entity that owns or leases the distribution facilities has consented to such use of the distribution facilities and such consent has been demonstrated to the satisfaction of the Office of the Interconnection); provided, however, that Behind The Meter Generation does not include (i) at any time, any portion of such generating unit's capacity that is designated as a Generation Capacity Resource; or (ii) in an hour, any portion of the output of such generating unit that is sold to another entity for consumption at another electrical location or into the PJM Interchange Energy Market.

Black Start Service:
"Black Start Service" shall mean the capability of generating units to start without an outside electrical supply or the demonstrated ability of a generating unit with a high operating factor (subject to Transmission Provider concurrence) to automatically remain operating at reduced levels when disconnected from the grid.

Breach:

"Breach" shall mean the failure of a party to perform or observe any material term or condition of Tariff, Part IV or Part VI, or any agreement entered into thereunder as described in the relevant provisions of such agreement.

Breaching Party:
"Breaching Party" shall mean a party that is in Breach of Tariff, Part IV or Part VI and/or an agreement entered into thereunder.

Business Day:
"Business Day" shall mean a day in which the Federal Reserve System is open for business and is not a scheduled PJM holiday.

Buy Bid:
"Buy Bid" shall mean a bid to buy Capacity Resources in any Incremental Auction.

Definitions – C-D

Canadian Guaranty:
"Canadian Guaranty" shall mean a Corporate Guaranty provided by an Affiliate of a Participant that is domiciled in Canada, and meets all of the provisions of Tariff, Attachment Q.

Cancellation Costs:
"Cancellation Costs" shall mean costs and liabilities incurred in connection with: (a) cancellation of supplier and contractor written orders and agreements entered into to design, construct and install Attachment Facilities, Direct Assignment Facilities and/or Customer-Funded Upgrades, and/or (b) completion of some or all of the required Attachment Facilities, Direct Assignment Facilities and/or Customer-Funded Upgrades, or specific unfinished portions and/or removal of any or all of such facilities which have been installed, to the extent required for the Transmission Provider and/or Transmission Owner(s) to perform their respective obligations under Tariff, Part IV and/or Tariff, Part VI.

Capacity:
"Capacity" shall mean the installed capacity requirement of the Reliability Assurance Agreement or similar such requirements as may be established.

Capacity Emergency Transfer Limit:
"Capacity Emergency Transfer Limit" or "CETL" shall have the meaning provided in the Reliability Assurance Agreement.

Capacity Emergency Transfer Objective:
"Capacity Emergency Transfer Objective" or "CETO" shall have the meaning provided in the Reliability Assurance Agreement.

Capacity Export Transmission Customer:
"Capacity Export Transmission Customer" shall mean a customer taking point to point transmission service under Tariff, Part II to export capacity from a generation resource located in the PJM Region that has qualified for an exception to the RPM must-offer requirement as described in Tariff, Attachment DD, section 6.6(g).

Capacity Import Limit:
"Capacity Import Limit" shall have the meaning provided in the Reliability Assurance Agreement.

Capacity Interconnection Rights:
"Capacity Interconnection Rights" shall mean the rights to input generation as a Generation Capacity Resource into the Transmission System at the Point of Interconnection where the generating facilities connect to the Transmission System.

Capacity Market Buyer:
"Capacity Market Buyer" shall mean a Member that submits bids to buy Capacity Resources in any Incremental Auction.

Capacity Market Seller:

"Capacity Market Seller" shall mean a Member that owns, or has the contractual authority to control the output or load reduction capability of, a Capacity Resource, that has not transferred such authority to another entity, and that offers such resource in the Base Residual Auction or an Incremental Auction.

Capacity Performance Resource:
"Capacity Performance Resource" shall mean a Capacity Resource as described in Tariff, Attachment DD, section 5.5A(a).

Capacity Performance Transition Incremental Auction:
"Capacity Performance Transition Incremental Auction" shall have the meaning specified in Tariff, Attachment DD, section 5.14D.

Capacity Resource:
"Capacity Resource" shall have the meaning provided in the Reliability Assurance Agreement.

Capacity Resource Clearing Price:
"Capacity Resource Clearing Price" shall mean the price calculated for a Capacity Resource that offered and cleared in a Base Residual Auction or Incremental Auction, in accordance with Tariff, Attachment DD, section 5.

Capacity Storage Resource:
"Capacity Storage Resource" shall mean any hydroelectric power plant, flywheel, battery storage, or other such facility solely used for short term storage and injection of energy at a later time to participate in the PJM energy and/or Ancillary Services markets and which participates in the Reliability Pricing Model.

Capacity Resources with Actionable Subsidies:
A Capacity Resource that meets any of the following criteria shall be deemed to be a "Capacity Resource with Actionable Subsidy":

(a) The Capacity Market Seller formally or informally, directly or indirectly, receives, or is authorized and intends to receive, an Actionable Subsidy with regard to such Capacity Resource; or

(b) The Capacity Market Seller is guaranteed recovery of the costs of its Capacity Resource from retail customers.

If an officer of the Capacity Market Seller certifies that the Capacity Resource will forgo any revenues that would be available under any known mechanism that would otherwise qualify the Capacity Resource as a Capacity Resource with an Actionable Subsidy, such mechanism will not be considered an Actionable Subsidy with respect to such Capacity Resource.

Capacity Transfer Right:
"Capacity Transfer Right" shall mean a right, allocated to LSEs serving load in a Locational Deliverability Area, to receive payments, based on the transmission import capability into such Locational Deliverability Area, that offset, in whole or in part, the charges attributable to the

Locational Price Adder, if any, included in the Zonal Capacity Price calculated for a Locational Delivery Area.

Capacity Transmission Injection Rights:
"Capacity Transmission Injection Rights" shall mean the rights to schedule energy and capacity deliveries at a Point of Interconnection of a Merchant Transmission Facility with the Transmission System. Capacity Transmission Injection Rights may be awarded only to a Merchant D.C. Transmission Facility and/or Controllable A.C. Merchant Transmission Facilities that connects the Transmission System to another control area. Deliveries scheduled using Capacity Transmission Injection Rights have rights similar to those under Firm Point-to-Point Transmission Service or, if coupled with a generating unit external to the PJM Region that satisfies all applicable criteria specified in the PJM Manuals, similar to Capacity Interconnection Rights.

Cold/Warm/Hot Notification Time:
"Cold/Warm/Hot Notification Time" shall mean the time interval between PJM notification and the beginning of the start sequence for a generating unit that is currently in its cold/warm/hot temperature state. The start sequence may include steps such as any valve operation, starting feed water pumps, startup of auxiliary equipment, etc.

Cold/Warm/Hot Start-up Time:
For all generating units that are not combined cycle units, "Cold/Warm/Hot Start-up Time" shall mean the time interval, measured in hours, from the beginning of the start sequence to the point after generator breaker closure, which is typically indicated by telemetered or aggregated State Estimator megawatts greater than zero for a generating unit in its cold/warm/hot temperature state. For combined cycle units, "Cold/Warm/Hot Start-up Time" shall mean the time interval from the beginning of the start sequence to the point after first combustion turbine generator breaker closure in its cold/warm/hot temperature state, which is typically indicated by telemetered or aggregated State Estimator megawatts greater than zero. For all generating units, the start sequence may include steps such as any valve operation, starting feed water pumps, startup of auxiliary equipment, etc. Other more detailed actions that could signal the beginning of the start sequence could include, but are not limited to, the operation of pumps, condensers, fans, water chemistry evaluations, checklists, valves, fuel systems, combustion turbines, starting engines or systems, maintaining stable fuel/air ratios, and other auxiliary equipment necessary for startup.

Cold Weather Alert:
"Cold Weather Alert" shall mean the notice that PJM provides to PJM Members, Transmission Owners, resource owners and operators, customers, and regulators to prepare personnel and facilities for expected extreme cold weather conditions.

Collateral:
"Collateral" shall be a cash deposit, including any interest, or letter of credit in an amount and form determined by and acceptable to PJMSettlement, provided by a Participant to PJMSettlement as security in order to participate in the PJM Markets or take Transmission Service.

Collateral Call:

"Collateral Call" shall mean a notice to a Participant that additional Collateral, or possibly early payment, is required in order to remain in, or to regain, compliance with Tariff, Attachment Q.

Commencement Date:
"Commencement Date" shall mean the date on which Interconnection Service commences in accordance with an Interconnection Service Agreement.

Committed Offer:
The "Committed Offer" shall mean 1) for pool-scheduled resources, an offer on which a resource was scheduled by the Office of the Interconnection for a particular clock hour for an Operating Day, and 2) for self-scheduled resources, either the offer on which the Market Seller has elected to schedule the resource or the applicable offer for the resource determined pursuant to Operating Agreement, Schedule 1, section 6.4, or Operating Agreement, Schedule 1, section 6.6 for a particular clock hour for an Operating Day.

Completed Application:
"Completed Application" shall mean an application that satisfies all of the information and other requirements of the Tariff, including any required deposit.

Compliance Aggregation Area (CAA):
"Compliance Aggregation Area" or "CAA" shall mean a geographic area of Zones or sub-Zones that are electrically-contiguous and experience for the relevant Delivery Year, based on Resource Clearing Prices of, for Delivery Years through May 31, 2018, Annual Resources and for the 2018/2019 Delivery Year and subsequent Delivery Years, Capacity Performance Resources, the same locational price separation in the Base Residual Auction, the same locational price separation in the First Incremental Auction, the same locational price separation in the Second Incremental Auction, the same locational price separation in the Third Incremental Auction.

Conditional Incremental Auction:
"Conditional Incremental Auction" shall mean an Incremental Auction conducted for a Delivery Year if and when necessary to secure commitments of additional capacity to address reliability criteria violations arising from the delay in a Backbone Transmission upgrade that was modeled in the Base Residual Auction for such Delivery Year.

CONE Area:
"CONE Area" shall mean the areas listed in Tariff, Attachment DD, section 5.10(a)(iv)(A) and any LDAs established as CONE Areas pursuant to Tariff, Attachment DD, section 5.10(a)(iv)(B).

Confidential Information:
"Confidential Information" shall mean any confidential, proprietary, or trade secret information of a plan, specification, pattern, procedure, design, device, list, concept, policy, or compilation relating to the present or planned business of a New Service Customer, Transmission Owner, or other Interconnection Party or Construction Party, which is designated as confidential by the party supplying the information, whether conveyed verbally, electronically, in writing, through inspection, or otherwise, and shall include, without limitation, all information relating to the producing party's technology, research and development, business affairs and pricing, and any

information supplied by any New Service Customer, Transmission Owner, or other Interconnection Party or Construction Party to another such party prior to the execution of an Interconnection Service Agreement or a Construction Service Agreement.

Congestion Price:
"Congestion Price" shall mean the congestion component of the Locational Marginal Price, which is the effect on transmission congestion costs (whether positive or negative) associated with increasing the output of a generation resource or decreasing the consumption by a Demand Resource, based on the effect of increased generation from or consumption by the resource on transmission line loadings, calculated as specified in Operating Agreement, Schedule 1, section 2, and the parallel provisions of Tariff, Attachment K-Appendix, section 2.

Consolidated Transmission Owners Agreement, PJM Transmission Owners Agreement or Transmission Owners Agreement:
"Consolidated Transmission Owners Agreement," "PJM Transmission Owners Agreement" or "Transmission Owners Agreement" shall mean the certain Consolidated Transmission Owners Agreement dated as of December 15, 2005, by and among the Transmission Owners and by and between the Transmission Owners and PJM Interconnection, L.L.C. on file with the Commission, as amended from time to time.

Constructing Entity:
"Constructing Entity" shall mean either the Transmission Owner or the New Services Customer, depending on which entity has the construction responsibility pursuant to Tariff, Part VI and the applicable Construction Service Agreement; this term shall also be used to refer to an Interconnection Customer with respect to the construction of the Customer Interconnection Facilities.

Construction Party:
"Construction Party" shall mean a party to a Construction Service Agreement. "Construction Parties" shall mean all of the Parties to a Construction Service Agreement.

Construction Service Agreement:
"Construction Service Agreement" shall mean either an Interconnection Construction Service Agreement or an Upgrade Construction Service Agreement.

Control Area:
"Control Area" shall mean an electric power system or combination of electric power systems bounded by interconnection metering and telemetry to which a common automatic generation control scheme is applied in order to:

(1) match the power output of the generators within the electric power system(s) and energy purchased from entities outside the electric power system(s), with the load within the electric power system(s);

(2) maintain scheduled interchange with other Control Areas, within the limits of Good Utility Practice;

(3) maintain the frequency of the electric power system(s) within reasonable limits in accordance with Good Utility Practice; and

(4) provide sufficient generating capacity to maintain operating reserves in accordance with Good Utility Practice.

Control Zone:
"Control Zone" shall have the meaning given in the Operating Agreement.

Controllable A.C. Merchant Transmission Facilities:
"Controllable A.C. Merchant Transmission Facilities" shall mean transmission facilities that (1) employ technology which Transmission Provider reviews and verifies will permit control of the amount and/or direction of power flow on such facilities to such extent as to effectively enable the controllable facilities to be operated as if they were direct current transmission facilities, and (2) that are interconnected with the Transmission System pursuant to Tariff, Part IV and Tariff, Part VI.

Coordinated External Transaction:
"Coordinated External Transaction" shall mean a transaction to simultaneously purchase and sell energy on either side of a CTS Enabled Interface in accordance with the procedures of Operating Agreement, Schedule 1, section 1.13, and the parallel provisions of Tariff, Attachment K-Appendix, section 1.13.

Coordinated Transaction Scheduling:
"Coordinated Transaction Scheduling" or "CTS" shall mean the scheduling of Coordinated External Transactions at a CTS Enabled Interface in accordance with the procedures of Operating Agreement, Schedule 1, section 1.13, and the parallel provisions of Tariff, Attachment K-Appendix, section 1.13.

Corporate Guaranty:
"Corporate Guaranty" shall mean a legal document used by an entity to guaranty the obligations of another entity.

Cost of New Entry:
"Cost of New Entry" or "CONE" shall mean the nominal levelized cost of a Reference Resource, as determined in accordance with Tariff, Attachment DD, section 5.

Costs:
As used in Tariff, Part IV, Tariff, Part VI and related attachments, "Costs" shall mean costs and expenses, as estimated or calculated, as applicable, including, but not limited to, capital expenditures, if applicable, and overhead, return, and the costs of financing and taxes and any Incidental Expenses.

Counterparty:

"Counterparty" shall mean PJMSettlement as the contracting party, in its name and own right and not as an agent, to an agreement or transaction with a Market Participant or other entities, including the agreements and transactions with customers regarding transmission service and other transactions under the PJM Tariff and the Operating Agreement. PJMSettlement shall not be a counterparty to (i) any bilateral transactions between Members, or (ii) any Member's self-supply of energy to serve its load, or (iii) any Member's self-schedule of energy reported to the Office of the Interconnection to the extent that energy serves that Member's own load .

Credit Available for Export Transactions:
"Credit Available for Export Transactions" shall mean a designation of credit to be used for Export Transactions that is allocated by each Market Participant from its Credit Available for Virtual Transactions, and which reduces the Market Participant's Credit Available for Virtual Transactions accordingly.

Credit Available for Virtual Transactions:
"Credit Available for Virtual Transactions" shall mean the Market Participant's Working Credit Limit for Virtual Transactions calculated on its credit provided in compliance with its Peak Market Activity requirement plus available credit submitted above that amount, less any unpaid billed and unbilled amounts owed to PJMSettlement, plus any unpaid unbilled amounts owed by PJMSettlement to the Market Participant, less any applicable credit required for Minimum Participation Requirements, FTRs, RPM activity, or other credit requirement determinants as defined in Tariff, Attachment Q.

Credit Breach:
"Credit Breach" shall mean the status of a Participant that does not currently meet the requirements of Tariff, Attachment Q or other provisions of the Agreements.

Credit-Limited Offer:
"Credit-Limited Offer" shall mean a Sell Offer that is submitted by a Market Participant in an RPM Auction subject to a maximum credit requirement specified by such Market Participant.

Credit Score:
"Credit Score" shall mean a composite numerical score scaled from 0-100 as calculated by PJMSettlement that incorporates various predictors of creditworthiness.

CTS Enabled Interface:
"CTS Enabled Interface" shall mean an interface between the PJM Control Area and an adjacent Control Area at which the Office of the Interconnection has authorized the use of Coordinated Transaction Scheduling ("CTS"). The CTS Enabled Interfaces between the PJM Control Area and the New York Independent System Operator, Inc. Control Area shall be designated in the Joint Operating Agreement Among and Between New York Independent System Operator Inc. and PJM Interconnection, L.L.C., Schedule A (PJM Rate Schedule FERC No. 45). The CTS Enabled Interfaces between the PJM Control Area and the Midcontinent Independent System Operator, Inc. shall be designated consistent with Attachment 3, section 2 of the Joint Operating Agreement between Midcontinent Independent System Operator, Inc. and PJM Interconnection, L.L.C.

CTS Interface Bid:
"CTS Interface Bid" shall mean a unified real-time bid to simultaneously purchase and sell energy on either side of a CTS Enabled Interface in accordance with the procedures of Operating Agreement, Schedule 1, section 1.13, and the parallel provisions of Tariff, Attachment K-Appendix, section 1.13.

Curtailment:
"Curtailment" shall mean a reduction in firm or non-firm transmission service in response to a transfer capability shortage as a result of system reliability conditions.

Curtailment Service Provider:
"Curtailment Service Provider" or "CSP" shall mean a Member or a Special Member, which action on behalf of itself or one or more other Members or non-Members, participates in the PJM Interchange Energy Market, Ancillary Services markets, and/or Reliability Pricing Model by causing a reduction in demand.

Customer Facility:
"Customer Facility" shall mean generation facilities or Merchant Transmission Facilities interconnected with or added to the Transmission System pursuant to an Interconnection Request under Tariff, Part IV, subpart A.

Customer-Funded Upgrade:
"Customer-Funded Upgrade" shall mean any Network Upgrade, Local Upgrade, or Merchant Network Upgrade for which cost responsibility (i) is imposed on an Interconnection Customer or an Eligible Customer pursuant to Tariff, Part VI, section 217, or (ii) is voluntarily undertaken by a New Service Customer in fulfillment of an Upgrade Request. No Network Upgrade, Local Upgrade or Merchant Network Upgrade or other transmission expansion or enhancement shall be a Customer-Funded Upgrade if and to the extent that the costs thereof are included in the rate base of a public utility on which a regulated return is earned.

Customer Interconnection Facilities:
"Customer Interconnection Facilities" shall mean all facilities and equipment owned and/or controlled, operated and maintained by Interconnection Customer on Interconnection Customer's side of the Point of Interconnection identified in the appropriate appendices to the Interconnection Service Agreement and to the Interconnection Construction Service Agreement, including any modifications, additions, or upgrades made to such facilities and equipment, that are necessary to physically and electrically interconnect the Customer Facility with the Transmission System.

Daily Deficiency Rate:
"Daily Deficiency Rate" shall mean the rate employed to assess certain deficiency charges under Tariff, Attachment DD, section 7, Tariff, Attachment DD, section 8, Tariff, Attachment DD, section 9, or Tariff, Attachment DD, section 13.

Daily Unforced Capacity Obligation:

"Daily Unforced Capacity Obligation" shall mean the capacity obligation of a Load Serving Entity during the Delivery Year, determined in accordance with Reliability Assurance Agreement, Schedule 8, or, as to an FRR entity, in Reliability Assurance Agreement, Schedule 8.1.

Day-ahead Congestion Price:
"Day-ahead Congestion Price" shall mean the Congestion Price resulting from the Day-ahead Energy Market.

Day-ahead Energy Market:
"Day-ahead Energy Market" shall mean the schedule of commitments for the purchase or sale of energy and payment of Transmission Congestion Charges developed by the Office of the Interconnection as a result of the offers and specifications submitted in accordance with Operating Agreement, Schedule 1, section 1.10 and the parallel provisions of Tariff, Attachment K-Appendix, section 1.10.

Day-ahead Energy Market Injection Congestion Credits:
"Day-ahead Energy Market Injection Congestion Credits" shall mean those congestion credits paid to Market Participants for supply transactions in the Day-ahead Energy Market including generation schedules, Increment Offers, Up-to Congestion Transactions, import transactions, and Day-Ahead Pseudo-Tie Transactions.

Day-ahead Energy Market Transmission Congestion Charges:
"Day-ahead Energy Market Transmission Congestion Charges" shall be equal to the sum of Day-ahead Energy Market Withdrawal Congestion Charges minus [the sum of Day-ahead Energy Market Injection Congestion Credits plus any congestion charges calculated pursuant to the Joint Operating Agreement between the Midcontinent Independent Transmission System Operator, Inc. and PJM Interconnection, L.L.C. (PJM Rate Schedule FERC No. 38), plus any congestion charges calculated pursuant to the Joint Operating Agreement Among and Between New York Independent System Operator Inc. and PJM Interconnection, L.L.C. (PJM Rate Schedule FERC No. 45), plus any congestion charges calculated pursuant to agreements between the Office of the Interconnection and other entities, as applicable)].

Day-ahead Energy Market Withdrawal Congestion Charges:
"Day-ahead Energy Market Withdrawal Congestion Charges" shall mean those congestion charges collected from Market Participants for withdrawal transactions in the Day-ahead Energy Market from transactions including Demand Bids, Decrement Bids, Up-to Congestion Transactions, Export Transactions, and Day-Ahead Pseudo-Tie Transactions.

Day-ahead Loss Price:
"Day-ahead Loss Price" shall mean the Loss Price resulting from the Day-ahead Energy Market.

Day-ahead Prices:
"Day-ahead Prices" shall mean the Locational Marginal Prices resulting from the Day-ahead Energy Market.

Day-Ahead Pseudo-Tie Transaction:

"Day-Ahead Pseudo-Tie Transaction" shall mean a transaction scheduled in the Day-ahead Energy Market to the PJM-MISO interface from a generator within the PJM balancing authority area that Pseudo-Ties into the MISO balancing authority area.

Day-ahead Scheduling Reserves:
"Day-ahead Scheduling Reserves" shall mean thirty-minute reserves as defined by the Reliability*First* Corporation and SERC.

Day-ahead Scheduling Reserves Market:
"Day-ahead Scheduling Reserves Market" shall mean the schedule of commitments for the purchase or sale of Day-ahead Scheduling Reserves developed by the Office of the Interconnection as a result of the offers and specifications submitted in accordance with Operating Agreement, Schedule 1, section 1.10 and the parallel provisions of Tariff, Attachment K-Appendix, section 1.10.

Day-ahead Scheduling Reserves Requirement:
"Day-ahead Scheduling Reserves Requirement" shall mean the sum of Base Day-ahead Scheduling Reserves Requirement and Additional Day-ahead Scheduling Reserves Requirement.

Day-ahead Scheduling Reserves Resources:
"Day-ahead Scheduling Reserves Resources" shall mean synchronized and non-synchronized generation resources and Demand Resources electrically located within the PJM Region that are capable of providing Day-ahead Scheduling Reserves.

Day-ahead Settlement Interval:
"Day-ahead Settlement Interval" shall mean the interval used by settlements, which shall be every one clock hour.

Day-ahead System Energy Price:
"Day-ahead System Energy Price" shall mean the System Energy Price resulting from the Day-ahead Energy Market.

Deactivation:
"Deactivation" shall mean the retirement or mothballing of a generating unit governed by Tariff, Part V.

Deactivation Avoidable Cost Credit:
"Deactivation Avoidable Cost Credit" shall mean the credit paid to Generation Owners pursuant to Tariff, Part V, section 114.

Deactivation Avoidable Cost Rate:
"Deactivation Avoidable Cost Rate" shall mean the formula rate established pursuant to Tariff, Part V, section 115 .

Deactivation Date:

"Deactivation Date" shall mean the date a generating unit within the PJM Region is either retired or mothballed and ceases to operate.

Decrement Bid:
"Decrement Bid" shall mean a type of Virtual Transaction that is a bid to purchase energy at a specified location in the Day-ahead Energy Market. A cleared Decrement Bid results in scheduled load at the specified location in the Day-ahead Energy Market.

Default:
As used in the Interconnection Service Agreement and Construction Service Agreement, "Default" shall mean the failure of a Breaching Party to cure its Breach in accordance with the applicable provisions of an Interconnection Service Agreement or Construction Service Agreement.

Delivering Party:
"Delivering Party" shall mean the entity supplying capacity and energy to be transmitted at Point(s) of Receipt.

Delivery Year:
"Delivery Year" shall mean the Planning Period for which a Capacity Resource is committed pursuant to the auction procedures specified in Tariff, Attachment DD, or pursuant to an FRR Capacity Plan under Reliability Assurance Agreement, Schedule 8.1.

Demand Bid:
"Demand Bid" shall mean a bid, submitted by a Load Serving Entity in the Day-ahead Energy Market, to purchase energy at its contracted load location, for a specified timeframe and megawatt quantity, that if cleared will result in energy being scheduled at the specified location in the Day-ahead Energy Market and in the physical transfer of energy during the relevant Operating Day.

Demand Bid Limit:
"Demand Bid Limit" shall mean the largest MW volume of Demand Bids that may be submitted by a Load Serving Entity for any hour of an Operating Day, as determined pursuant to Operating Agreement, Schedule 1, section 1.10.1B, and the parallel provisions of Tariff, Attachment K-Appendix, section 1.10.1B.

Demand Bid Screening:
"Demand Bid Screening" shall mean the process by which Demand Bids are reviewed against the applicable Demand Bid Limit, and rejected if they would exceed that limit, as determined pursuant to Operating Agreement, Schedule 1, section 1.10.1B, and the parallel provisions of Tariff, Attachment K-Appendix, section 1.10.1B.

Demand Resource:
"Demand Resource" shall mean a resource with the capability to provide a reduction in demand.

Demand Resource Factor or DR Factor:
"Demand Resource Factor" or ("DR Factor") shall have the meaning specified in the Reliability Assurance Agreement.

Designated Agent:
"Designated Agent" shall mean any entity that performs actions or functions on behalf of the Transmission Provider, a Transmission Owner, an Eligible Customer, or the Transmission Customer required under the Tariff.

Designated Entity:
"Designated Entity" shall have the same meaning provided in the Operating Agreement.

Direct Assignment Facilities:
"Direct Assignment Facilities" shall mean facilities or portions of facilities that are constructed for the sole use/benefit of a particular Transmission Customer requesting service under the Tariff. Direct Assignment Facilities shall be specified in the Service Agreement that governs service to the Transmission Customer and shall be subject to Commission approval.

Direct Load Control:
"Direct Load Control" shall mean load reduction that is controlled directly by the Curtailment Service Provider's market operations center or its agent, in response to PJM instructions.

Dispatch Rate:
"Dispatch Rate" shall mean the control signal, expressed in dollars per megawatt-hour, calculated and transmitted continuously and dynamically to direct the output level of all generation resources dispatched by the Office of the Interconnection in accordance with the Offer Data.

Dynamic Schedule:
"Dynamic Schedule" shall have the same meaning provided in the Operating Agreement.

Dynamic Transfer:
"Dynamic Transfer" shall have the same meaning provided in the Operating Agreement.

Definitions – E - F

Economic-based Enhancement or Expansion:
"Economic-based Enhancement or Expansion" shall have the same meaning provided in the Operating Agreement.

Economic Load Response Participant:
"Economic Load Response Participant" shall mean a Member or Special Member that qualifies under Operating Agreement, Schedule 1, section 1.5A, and the parallel provisions of Tariff, Attachment K-Appendix, section 1.5A, to participate in the PJM Interchange Energy Market and/or Ancillary Services markets through reductions in demand.

Economic Maximum:
"Economic Maximum" shall mean the highest incremental MW output level, submitted to PJM market systems by a Market Participant, that a unit can achieve while following economic dispatch.

Economic Minimum:
"Economic Minimum" shall mean the lowest incremental MW output level, submitted to PJM market systems by a Market Participant, that a unit can achieve while following economic dispatch.

Effective FTR Holder:
"Effective FTR Holder" shall mean:

(i) For an FTR Holder that is either a (a) privately held company, or (b) a municipality or electric cooperative, as defined in the Federal Power Act, such FTR Holder, together with any Affiliate, subsidiary or parent of the FTR Holder, any other entity that is under common ownership, wholly or partly, directly or indirectly, or has the ability to influence, directly or indirectly, the management or policies of the FTR Holder; or

(ii) For an FTR Holder that is a publicly traded company including a wholly owned subsidiary of a publicly traded company, such FTR Holder, together with any Affiliate, subsidiary or parent of the FTR Holder, any other PJM Member has over 10% common ownership with the FTR Holder, wholly or partly, directly or indirectly, or has the ability to influence, directly or indirectly, the management or policies of the FTR Holder; or

(iii) (iii) an FTR Holder together with any other PJM Member, including also any Affiliate, subsidiary or parent of such other PJM Member, with which it shares common ownership, wholly or partly, directly or indirectly, in any third entity which is a PJM Member (e.g., a joint venture).

EFORd:
"EFORd" shall have the meaning specified in the PJM Reliability Assurance Agreement.

Electrical Distance:
"Electrical Distance" shall mean, for a Generation Capacity Resource geographically located outside the metered boundaries of the PJM Region, the measure of distance, based on impedance and in accordance with the PJM Manuals, from the Generation Capacity Resource to the PJM Region.

Eligible Customer:
"Eligible Customer" shall mean:
(i) Any electric utility (including any Transmission Owner and any power marketer), Federal power marketing agency, or any person generating electric energy for sale for resale is an Eligible Customer under the Tariff. Electric energy sold or produced by such entity may be electric energy produced in the United States, Canada or Mexico. However, with respect to transmission service that the Commission is prohibited from ordering by Section 212(h) of the Federal Power Act, such entity is eligible only if the service is provided pursuant to a state requirement that the Transmission Provider or Transmission Owner offer the unbundled transmission service, or pursuant to a voluntary offer of such service by a Transmission Owner.

(ii) Any retail customer taking unbundled transmission service pursuant to a state requirement that the Transmission Provider or a Transmission Owner offer the transmission service, or pursuant to a voluntary offer of such service by a Transmission Owner, is an Eligible Customer under the Tariff. As used in Tariff, Part VI, Eligible Customer shall mean only those Eligible Customers that have submitted a Completed Application.

Emergency Action:
"Emergency Action" shall mean any emergency action for locational or system-wide capacity shortages that either utilizes pre-emergency mandatory load management reductions or other emergency capacity, or initiates a more severe action including, but not limited to, a Voltage Reduction Warning, Voltage Reduction Action, Manual Load Dump Warning, or Manual Load Dump Action.

Emergency Condition:
"Emergency Condition" shall mean a condition or situation (i) that in the judgment of any Interconnection Party is imminently likely to endanger life or property; or (ii) that in the judgment of the Interconnected Transmission Owner or Transmission Provider is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to, the Transmission System, the Interconnection Facilities, or the transmission systems or distribution systems to which the Transmission System is directly or indirectly connected; or (iii) that in the judgment of Interconnection Customer is imminently likely (as determined in a non-discriminatory manner) to cause damage to the Customer Facility or to the Customer Interconnection Facilities. System restoration and black start shall be considered Emergency Conditions, provided that a Generation Interconnection Customer is not obligated by an Interconnection Service Agreement to possess black start capability. Any condition or situation that results from lack of sufficient generating capacity to meet load requirements or that results solely from economic conditions shall not constitute an Emergency Condition, unless one or more of the enumerated conditions or situations identified in this definition also exists.

Emergency Load Response Program:
"Emergency Load Response Program" shall mean the program by which Curtailment Service Providers may be compensated by PJM for Demand Resources that will reduce load when dispatched by PJM during emergency conditions, and is described in Operating Agreement, Schedule 1, section 8 and the parallel provisions of Tariff, Attachment K-Appendix, section 8.

Energy Efficiency Resource:
"Energy Efficiency Resource" shall have the meaning specified in the PJM Reliability Assurance Agreement.

Energy Market Opportunity Cost:
"Energy Market Opportunity Cost" shall mean the difference between (a) the forecasted cost to operate a specific generating unit when the unit only has a limited number of available run hours due to limitations imposed on the unit by Applicable Laws and Regulations, and (b) the forecasted future Locational Marginal Price at which the generating unit could run while not violating such limitations. Energy Market Opportunity Cost therefore is the value associated with a specific generating unit's lost opportunity to produce energy during a higher valued period of time occurring within the same compliance period, which compliance period is determined by the applicable regulatory authority and is reflected in the rules set forth in PJM Manual 15. Energy Market Opportunity Costs shall be limited to those resources which are specifically delineated in Operating Agreement, Schedule 2.

Energy Resource:
"Energy Resource" shall mean a generating facility that is not a Capacity Resource.

Energy Settlement Area:
"Energy Settlement Area" shall mean the bus or distribution of busses that represents the physical location of Network Load and by which the obligations of the Network Customer to PJM are settled.

Energy Storage Resource:
"Energy Storage Resource" shall mean flywheel or battery storage facility solely used for short term storage and injection of energy at a later time to participate in the PJM energy and/or Ancillary Services markets as a Market Seller.

Energy Transmission Injection Rights:
"Energy Transmission Injection Rights" shall mean the rights to schedule energy deliveries at a specified point on the Transmission System. Energy Transmission Injection Rights may be awarded only to a Merchant D.C. Transmission Facility that connects the Transmission System to another control area. Deliveries scheduled using Energy Transmission Injection Rights have rights similar to those under Non-Firm Point-to-Point Transmission Service.

Environmental Laws:
"Environmental Laws" shall mean applicable Laws or Regulations relating to pollution or protection of the environment, natural resources or human health and safety.
Environmentally-Limited Resource:

"Environmentally-Limited Resource" shall mean a resource which has a limit on its run hours imposed by a federal, state, or other governmental agency that will significantly limit its availability, on either a temporary or long-term basis. This includes a resource that is limited by a governmental authority to operating only during declared PJM capacity emergencies.

Equivalent Load:
"Equivalent Load" shall mean the sum of a Market Participant's net system requirements to serve its customer load in the PJM Region, if any, plus its net bilateral transactions.

Existing Generation Capacity Resource:
"Existing Generation Capacity Resource" shall have the meaning specified in the Reliability Assurance Agreement.

Export Credit Exposure:
"Export Credit Exposure" is determined for each Market Participant for a given Operating Day, and shall mean the sum of credit exposures for the Market Participant's Export Transactions for that Operating Day and for the preceding Operating Day.

Export Nodal Reference Price:
"Export Nodal Reference Price" at each location is the 97th percentile, shall be, the real-time hourly integrated price experienced over the corresponding two-month period in the preceding calendar year, calculated separately for peak and off-peak time periods. The two-month time periods used in this calculation shall be January and February, March and April, May and June, July and August, September and October, and November and December.

Export Transaction:
"Export Transaction" shall be a transaction by a Market Participant that results in the transfer of energy from within the PJM Control Area to outside the PJM Control Area. Coordinated External Transactions that result in the transfer of energy from the PJM Control Area to an adjacent Control Area are one form of Export Transaction.

Export Transaction Price Factor:
"Export Transaction Price Factor" for a prospective time interval shall be the greater of (i) PJM's forecast price for the time interval, if available, or (ii) the Export Nodal Reference Price, but shall not exceed the Export Transaction's dispatch ceiling price cap, if any, for that time interval. The Export Transaction Price Factor for a past time interval shall be calculated in the same manner as for a prospective time interval, except that the Export Transaction Price Factor may use a tentative or final settlement price, as available. If an Export Nodal Reference Price is not available for a particular time interval, PJM may use an Export Transaction Price Factor for that time interval based on an appropriate alternate reference price.

Export Transaction Screening:
"Export Transaction Screening" shall be the process PJM uses to review the Export Credit Exposure of Export Transactions against the Credit Available for Export Transactions, and deny or curtail all or a portion of an Export Transaction, if the credit required for such transactions is greater than the credit available for the transactions.

Export Transactions Net Activity:
"Export Transactions Net Activity" shall mean the aggregate net total, resulting from Export Transactions, of (i) Spot Market Energy charges, (ii) Transmission Congestion Charges, and (iii) Transmission Loss Charges, calculated as set forth in Operating Agreement, Schedule 1 and the parallel provisions of Tariff, Attachment K-Appendix. Export Transactions Net Activity may be positive or negative.

Extended Primary Reserve Requirement:
"Extended Primary Reserve Requirement" shall equal the Primary Reserve Requirement in a Reserve Zone or Reserve Sub-zone, plus 190 MW, plus any additional reserves scheduled under emergency conditions necessary to address operational uncertainty. The Extended Primary Reserve Requirement is calculated in accordance with the PJM Manuals.

Extended Summer Demand Resource:
"Extended Summer Demand Resource" shall have the meaning specified in the Reliability Assurance Agreement.

Extended Summer Resource Price Adder:
"Extended Summer Resource Price Adder" shall mean, for Delivery Years through May 31, 2018, an addition to the marginal value of Unforced Capacity as necessary to reflect the price of Annual Resources and Extended Summer Demand Resources required to meet the applicable Minimum Extended Summer Resource Requirement.

Extended Synchronized Reserve Requirement:
"Extended Synchronized Reserve Requirement" shall equal the Synchronized Reserve Requirement in a Reserve Zone or Reserve Sub-zone, plus 190 MW, plus any additional reserves scheduled under emergency conditions necessary to address operational uncertainty. The Extended Synchronized Reserve Requirement is calculated in accordance with the PJM Manuals.

External Market Buyer:
"External Market Buyer" shall mean a Market Buyer making purchases of energy from the PJM Interchange Energy Market for consumption by end-users outside the PJM Region, or for load in the PJM Region that is not served by Network Transmission Service.

External Resource:
"External Resource" shall mean a generation resource located outside the metered boundaries of the PJM Region.

Facilities Study:
"Facilities Study" shall be an engineering study conducted by the Transmission Provider (in coordination with the affected Transmission Owner(s)) to: (1) determine the required modifications to the Transmission Provider's Transmission System necessary to implement the conclusions of the System Impact Study; and (2) complete any additional studies or analyses documented in the System Impact Study or required by PJM Manuals, and determine the required modifications to the Transmission Provider's Transmission System based on the conclusions of

such additional studies. The Facilities Study shall include the cost and scheduled completion date for such modifications, that will be required to provide the requested transmission service or to accommodate a New Service Request. As used in the Interconnection Service Agreement or Construction Service Agreement, Facilities Study shall mean that certain Facilities Study conducted by Transmission Provider (or at its direction) to determine the design and specification of the Customer Funded Upgrades necessary to accommodate the New Service Customer's New Service Request in accordance with Tariff, Part VI, section 207.

Federal Power Act:
"Federal Power Act" shall mean the Federal Power Act, as amended, 16 U.S.C. §§ 791a, et seq.

FERC or Commission:
"FERC" or "Commission" shall mean the Federal Energy Regulatory Commission or any successor federal agency, commission or department exercising jurisdiction over the Tariff, Operating Agreement and Reliability Assurance Agreement.

FERC Market Rules:
"FERC Market Rules" mean the market behavior rules and the prohibition against electric energy market manipulation codified by the Commission in its Rules and Regulations at 18 CFR §§ 1c.2 and 35.37, respectively; the Commission-approved PJM Market Rules and any related proscriptions or any successor rules that the Commission from time to time may issue, approve or otherwise establish.

Final Incremental Auction:
"Final Incremental Auction" shall mean an Incremental Auction conducted three months before the Delivery Year to which it relates for the 2021/2022 Delivery Year and all subsequent Delivery Years.

Final Offer:
"Final Offer" shall mean the offer on which a resource was dispatched by the Office of the Interconnection for a particular clock hour for the Operating Day.

Final RTO Unforced Capacity Obligation:
"Final RTO Unforced Capacity Obligation" shall mean the capacity obligation for the PJM Region, determined in accordance with RAA, Schedule 8.

Financial Close:
"Financial Close" shall mean the Capacity Market Seller has demonstrated that the Capacity Market Seller or its agent has completed the act of executing the material contracts and/or other documents necessary to (1) authorize construction of the project and (2) establish the necessary funding for the project under the control of an independent third-party entity. A sworn, notarized certification of an independent engineer certifying to such facts, and that the engineer has personal knowledge of, or has engaged in a diligent inquiry to determine, such facts, shall be sufficient to make such demonstration. For resources that do not have external financing, Financial Close shall mean the project has full funding available, and that the project has been duly authorized to proceed with full construction of the material portions of the project by the appropriate governing body of

the company funding such project. A sworn, notarized certification by an officer of such company certifying to such facts, and that the officer has personal knowledge of, or has engaged in a diligent inquiry to determine, such facts, shall be sufficient to make such demonstration.

Financial Transmission Right:
"Financial Transmission Right" or "FTR" shall mean a right to receive Transmission Congestion Credits as specified in Operating Agreement, Schedule 1, section 5.2.2 and the parallel provisions of Tariff, Attachment K-Appendix, section 5.2.2.

Financial Transmission Right Obligation:
"Financial Transmission Right Obligation" shall mean a right to receive Transmission Congestion Credits as specified in Operating Agreement, Schedule 1, section 5.2.2(b), and the parallel provisions of Tariff, Attachment K-Appendix, section 5.2.2(b).

Financial Transmission Right Option:
"Financial Transmission Right Option" shall mean a right to receive Transmission Congestion Credits as specified in Operating Agreement, Schedule 1, section 5.2.2(c), and the parallel provisions of Tariff, Attachment K-Appendix, section 5.2.2(c).

Firm Point-To-Point Transmission Service:
"Firm Point-To-Point Transmission Service" shall mean Transmission Service under the Tariff that is reserved and/or scheduled between specified Points of Receipt and Delivery pursuant to Tariff, Part II.

Firm Transmission Feasibility Study:
"Firm Transmission Feasibility Study" shall mean a study conducted by the Transmission Provider in accordance with Tariff, Part II, section 19.3 and Tariff, Part III, section 32.3.

Firm Transmission Withdrawal Rights:
"Firm Transmission Withdrawal Rights" shall mean the rights to schedule energy and capacity withdrawals from a Point of Interconnection of a Merchant Transmission Facility with the Transmission System. Firm Transmission Withdrawal Rights may be awarded only to a Merchant D.C. Transmission Facility that connects the Transmission System with another control area. Withdrawals scheduled using Firm Transmission Withdrawal Rights have rights similar to those under Firm Point-to-Point Transmission Service.

First Incremental Auction:
"First Incremental Auction" shall mean an Incremental Auction conducted 20 months prior to the start of the Delivery Year to which it relates.

Flexible Resource:
"Flexible Resource" shall mean a generating resource that must have a combined Start-up Time and Notification Time of less than or equal to two hours; and a Minimum Run Time of less than or equal to two hours.

Forecast Pool Requirement:

"Forecast Pool Requirement" shall have the meaning specified in the Reliability Assurance Agreement.

Foreign Guaranty:
"Foreign Guaranty" shall mean a Corporate Guaranty provided by an Affiliate of a Participant that is domiciled in a foreign country, and meets all of the provisions of Tariff, Attachment Q.

Form 715 Planning Criteria:
"Form 715 Planning Criteria" shall have the same meaning provided in the Operating Agreement.

FRR-RS Resource:
"FRR-RS Resource" shall mean, for the duration of such election, a Capacity Resource, or portion thereof, that has elected the FRR-RS Alternative.

FTR Credit Limit:
"FTR Credit Limit" shall mean the amount of credit established with PJMSettlement that an FTR Participant has specifically designated to be used for FTR activity in a specific customer account. Any such credit so set aside shall not be considered available to satisfy any other credit requirement the FTR Participant may have with PJMSettlement.

FTR Credit Requirement:
"FTR Credit Requirement" shall mean the amount of credit that a Participant must provide in order to support the FTR positions that it holds and/or for which it is bidding. The FTR Credit Requirement shall not include months for which the invoicing has already been completed, provided that PJMSettlement shall have up to two Business Days following the date of the invoice completion to make such adjustments in its credit systems. FTR Credit Requirements are calculated and applied separately for each separate customer account.

FTR Flow Undiversified:
"FTR Flow Undiversified" shall have the meaning established in Tariff, Attachment Q, section V.G.

FTR Historical Value:
For each FTR for each month, "FTR Historical Value" shall mean the weighted average of historical values over three years for the FTR path using the following weightings: 50% - most recent year; 30% - second year; 20% - third year.

FTR Holder:
"FTR Holder" shall mean the PJM Member that has acquired and possesses an FTR.

FTR Monthly Credit Requirement Contribution:
For each FTR, for each month, "FTR Monthly Credit Requirement Contribution" shall mean the total FTR cost for the month, prorated on a daily basis, less the FTR Historical Value for the month. For cleared FTRs, this contribution may be negative; prior to clearing, FTRs with negative contribution shall be deemed to have zero contribution.

FTR Net Activity:
"FTR Net Activity" shall mean the aggregate net value of the billing line items for auction revenue rights credits, FTR auction charges, FTR auction credits, and FTR congestion credits, and shall also include day-ahead and balancing/real-time congestion charges up to a maximum net value of the sum of the foregoing auction revenue rights credits, FTR auction charges, FTR auction credits and FTR congestion credits.

FTR Participant:
"FTR Participant" shall mean any Market Participant that provides or is required to provide Collateral in order to participate in PJM's FTR auctions.

FTR Portfolio Auction Value:
"FTR Portfolio Auction Value" shall mean for each customer account of a Market Participant, the sum, calculated on a monthly basis, across all FTRs, of the FTR price times the FTR volume in MW.

Fuel Cost Policy:
"Fuel Cost Policy" shall mean the document provided by a Market Seller to PJM and the Market Monitoring Unit in accordance with PJM Manual 15 and Operating Agreement, Schedule 2, which documents the Market Seller's method used to price fuel for calculation of the Market Seller's cost-based offers for a generation resource.

Full Notice to Proceed:
"Full Notice to Proceed" shall mean that all material third party contractors have been given the notice to proceed with construction by the Capacity Market Seller or its agent, with a guaranteed completion date backed by liquidated damages.

Definitions – L – M – N

Limited Demand Resource:
"Limited Demand Resource**"** shall have the meaning specified in the Reliability Assurance Agreement.

Limited Demand Resource Reliability Target:
"Limited Demand Resource Reliability Target**"** for the PJM Region or an LDA, shall mean the maximum amount of Limited Demand Resources determined by PJM to be consistent with the maintenance of reliability, stated in Unforced Capacity that shall be used to calculate the Minimum Extended Summer Demand Resource Requirement for Delivery Years through May 31, 2017 and the Limited Resource Constraint for the 2017/2018 and 2018/2019 Delivery Years for the PJM Region or such LDA. As more fully set forth in the PJM Manuals, PJM calculates the Limited Demand Resource Reliability Target by first: i) testing the effects of the ten-interruption requirement by comparing possible loads on peak days under a range of weather conditions (from the daily load forecast distributions for the Delivery Year in question) against possible generation capacity on such days under a range of conditions (using the cumulative capacity distributions employed in the Installed Reserve Margin study for the PJM Region and in the Capacity Emergency Transfer Objective study for the relevant LDAs for such Delivery Year) and, by varying the assumed amounts of DR that is committed and displaces committed generation, determines the DR penetration level at which there is a ninety percent probability that DR will not be called (based on the applicable operating reserve margin for the PJM Region and for the relevant LDAs) more than ten times over those peak days; ii) testing the six-hour duration requirement by calculating the MW difference between the highest hourly unrestricted peak load and seventh highest hourly unrestricted peak load on certain high peak load days (e.g., the annual peak, loads above the weather normalized peak, or days where load management was called) in recent years, then dividing those loads by the forecast peak for those years and averaging the result; and (iii) (for the 2016/2017 and 2017/2018 Delivery Years) testing the effects of the six-hour duration requirement by comparing possible hourly loads on peak days under a range of weather conditions (from the daily load forecast distributions for the Delivery Year in question) against possible generation capacity on such days under a range of conditions (using a Monte Carlo model of hourly capacity levels that is consistent with the capacity model employed in the Installed Reserve Margin study for the PJM Region and in the Capacity Emergency Transfer Objective study for the relevant LDAs for such Delivery Year) and, by varying the assumed amounts of DR that is committed and displaces committed generation, determines the DR penetration level at which there is a ninety percent probability that DR will not be called (based on the applicable operating reserve margin for the PJM Region and for the relevant LDAs) for more than six hours over any one or more of the tested peak days. Second, PJM adopts the lowest result from these three tests as the Limited Demand Resource Reliability Target. The Limited Demand Resource Reliability Target shall be expressed as a percentage of the forecasted peak load of the PJM Region or such LDA and is converted to Unforced Capacity by multiplying [the reliability target percentage] times [the Forecast Pool Requirement] times [the DR Factor] times [the forecasted peak load of the PJM Region or such LDA, reduced by the amount of load served under the FRR Alternative].

Limited Resource Constraint:

"Limited Resource Constraint" shall mean, for the 2017/2018 Delivery Year and for FRR Capacity Plans the 2017/2018 and Delivery Years, for the PJM Region or each LDA for which the Office of the Interconnection is required under Tariff, Attachment DD, section 5.10(a) to establish a separate VRR Curve for a Delivery Year, a limit on the total amount of Unforced Capacity that can be committed as Limited Demand Resources for the 2017/2018 Delivery Year in the PJM Region or in such LDA, calculated as the Limited Demand Resource Reliability Target for the PJM Region or such LDA, respectively, minus the Short Term Resource Procurement Target for the PJM Region or such LDA, respectively.

Limited Resource Price Decrement:
"Limited Resource Price Decrement" shall mean, for the 2017/2018 Delivery Year, a difference between the clearing price for Limited Demand Resources and the clearing price for Extended Summer Demand Resources and Annual Resources, representing the cost to procure additional Extended Summer Demand Resources or Annual Resources out of merit order when the Limited Resource Constraint is binding.

List of Approved Contractors:
"List of Approved Contractors" shall mean a list developed by each Transmission Owner and published in a PJM Manual of (a) contractors that the Transmission Owner considers to be qualified to install or construct new facilities and/or upgrades or modifications to existing facilities on the Transmission Owner's system, provided that such contractors may include, but need not be limited to, contractors that, in addition to providing construction services, also provide design and/or other construction-related services, and (b) manufacturers or vendors of major transmission-related equipment (e.g., high-voltage transformers, transmission line, circuit breakers) whose products the Transmission Owner considers acceptable for installation and use on its system.

Load Management:
"Load Management" shall mean a Demand Resource ("DR") as defined in the Reliability Assurance Agreement.

Load Management Event:
"Load Management Event" shall mean a) a single temporally contiguous dispatch of Demand Resources in a Compliance Aggregation Area during an Operating Day, or b) multiple dispatches of Demand Resources in a Compliance Aggregation Area during an Operating Day that are temporally contiguous.

Load Ratio Share:
"Load Ratio Share" shall mean the ratio of a Transmission Customer's Network Load to the Transmission Provider's total load.

Load Reduction Event:
"Load Reduction Event" shall mean a reduction in demand by a Member or Special Member for the purpose of participating in the PJM Interchange Energy Market.

Load Serving Entity (LSE):

"Load Serving Entity" or "LSE" shall have the meaning specified in the Reliability Assurance Agreement.

Load Shedding:
"Load Shedding" shall mean the systematic reduction of system demand by temporarily decreasing load in response to transmission system or area capacity shortages, system instability, or voltage control considerations under Tariff, Part II or Part III.

Local Upgrades:
"Local Upgrades" shall mean modifications or additions of facilities to abate any local thermal loading, voltage, short circuit, stability or similar engineering problem caused by the interconnection and delivery of generation to the Transmission System. Local Upgrades shall include:

(i) Direct Connection Local Upgrades which are Local Upgrades that only serve the Customer Interconnection Facility and have no impact or potential impact on the Transmission System until the final tie-in is complete; and

(ii) Non-Direct Connection Local Upgrades which are parallel flow Local Upgrades that are not Direct Connection Local Upgrades.

Location:
"Location" as used in the Economic Load Response rules shall mean an end-use customer site as defined by the relevant electric distribution company account number.

LOC Deviation:
"LOC Deviation," shall mean, for units other than wind units, the LOC Deviation shall equal the desired megawatt amount for the resource determined according to the point on the Final Offer curve corresponding to the Real-time Settlement Interval real-time Locational Marginal Price at the resource's bus and adjusted for any Regulation or Tier 2 Synchronized Reserve assignments and limited to the lesser of the unit's Economic Maximum or the unit's Generation Resource Maximum Output, minus the actual output of the unit. For wind units, the LOC Deviation shall mean the deviation of the generating unit's output equal to the lesser of the PJM forecasted output for the unit or the desired megawatt amount for the resource determined according to the point on the Final Offer curve corresponding to the Real-time Settlement Interval integrated realtime Locational Marginal Price at the resource's bus, and shall be limited to the lesser of the unit's Economic Maximum or the unit's Generation Resource Maximum Output, minus the actual output of the unit.

Locational Deliverability Area (LDA):
"Locational Deliverability Area" or "LDA" shall mean a geographic area within the PJM Region that has limited transmission capability to import capacity to satisfy such area's reliability requirement, as determined by the Office of the Interconnection in connection with preparation of the Regional Transmission Expansion Plan, and as specified in Reliability Assurance Agreement, Schedule 10.1.

Locational Deliverability Area Reliability Requirement:
"Locational Deliverability Area Reliability Requirement" shall mean the projected internal capacity in the Locational Deliverability Area plus the Capacity Emergency Transfer Objective for the Delivery Year, as determined by the Office of the Interconnection in connection with preparation of the Regional Transmission Expansion Plan, less the minimum internal resources required for all FRR Entities in such Locational Deliverability Area.

Locational Price Adder:
"Locational Price Adder" shall mean an addition to the marginal value of Unforced Capacity within an LDA as necessary to reflect the price of Capacity Resources required to relieve applicable binding locational constraints.

Locational Reliability Charge:
"Locational Reliability Charge" shall have the meaning specified in the Reliability Assurance Agreement.

Locational UCAP:
"Locational UCAP" shall mean unforced capacity that a Member with available uncommitted capacity sells in a bilateral transaction to a Member that previously committed capacity through an RPM Auction but now requires replacement capacity to fulfill its RPM Auction commitment. The Locational UCAP Seller retains responsibility for performance of the resource providing such replacement capacity.

Locational UCAP Seller:
"Locational UCAP Seller" shall mean a Member that sells Locational UCAP.

Long-lead Project:
"Long-lead Project" shall have the same meaning provided in the Operating Agreement.

Long-Term Firm Point-To-Point Transmission Service:
"Long-Term Firm Point-To-Point Transmission Service" shall mean firm Point-To-Point Transmission Service under Tariff, Part II with a term of one year or more.

Loss Price:
"Loss Price" shall mean the loss component of the Locational Marginal Price, which is the effect on transmission loss costs (whether positive or negative) associated with increasing the output of a generation resource or decreasing the consumption by a Demand Resource based on the effect of increased generation from or consumption by the resource on transmission losses, calculated as specified in Operating Agreement, Schedule 1, section 2, and the parallel provisions of Tariff, Attachment K-Appendix, section 2.

M2M Flowgate:
"M2M Flowgate" shall have the meaning provided in the Joint Operating Agreement between the Midcontinent Independent Transmission System Operator, Inc. and PJM Interconnection, L.L.C.

Maintenance Adder:

"Maintenance Adder" shall mean an adder that may be included to account for variable operation and maintenance expenses in a Market Seller's Fuel Cost Policy. The Maintenance Adder is calculated in accordance with the applicable provisions of PJM Manual 15, and may only include expenses incurred as a result of electric production.

Manual Load Dump Action:
"Manual Load Dump Action" shall mean an Operating Instruction, as defined by NERC, from PJM to shed firm load when the PJM Region cannot provide adequate capacity to meet the PJM Region's load and tie schedules, or to alleviate critically overloaded transmission lines or other equipment.

Manual Load Dump Warning:
"Manual Load Dump Warning" shall mean a notification from PJM to warn Members of an increasingly critical condition of present operations that may require manually shedding load.

Market Monitor:
"Market Monitor**"** means the head of the Market Monitoring Unit.

Market Monitoring Unit or MMU:
"Market Monitoring Unit" or "MMU" means the independent Market Monitoring Unit defined in 18 CFR § 35.28(a)(7) and established under the PJM Market Monitoring Plan (Attachment M) to the PJM Tariff that is responsible for implementing the Market Monitoring Plan, including the Market Monitor. The Market Monitoring Unit may also be referred to as the IMM or Independent Market Monitor for PJM

Market Monitoring Unit Advisory Committee or MMU Advisory Committee:
"Market Monitoring Unit Advisory Committee" or "MMU Advisory Committee" shall mean the committee established under Tariff, Attachment M, section III.H.

Market Operations Center:
"Market Operations Center" shall mean the equipment, facilities and personnel used by or on behalf of a Market Participant to communicate and coordinate with the Office of the Interconnection in connection with transactions in the PJM Interchange Energy Market or the operation of the PJM Region.

Market Participant:
"Market Participant" shall mean a Market Buyer, a Market Seller, an Economic Load Response Participant, or all three, except when such term is used in Tariff, Attachment M, in which case Market Participant shall mean an entity that generates, transmits, distributes, purchases, or sells electricity, ancillary services, or any other product or service provided under the PJM Tariff or Operating Agreement within, into, out of, or through the PJM Region, but it shall not include an Authorized Government Agency that consumes energy for its own use but does not purchase or sell energy at wholesale.

Market Participant Energy Injection:

"Market Participant Energy Injection" shall mean transactions in the Day-ahead Energy Market and Real-time Energy Market, including but not limited to Day-ahead generation schedules, realtime generation output, Increment Offers, internal bilateral transactions and import transactions, as further described in the PJM Manuals.

Market Participant Energy Withdrawal:
"Market Participant Energy Withdrawal" shall mean transactions in the Day-ahead Energy Market and Real-time Energy Market, including but not limited to Demand Bids, Decrement Bids, real-time load (net of Behind The Meter Generation expected to be operating, but not to be less than zero), internal bilateral transactions and Export Transactions, as further described in the PJM Manuals.

Market Seller Offer Cap:
"Market Seller Offer Cap" shall mean a maximum offer price applicable to certain Market Sellers under certain conditions, as determined in accordance with Tariff, Attachment DD. section 6 and Tariff, Attachment M-Appendix, section II.E.

Market Violation:
"Market Violation" shall mean a tariff violation, violation of a Commission-approved order, rule or regulation, market manipulation, or inappropriate dispatch that creates substantial concerns regarding unnecessary market inefficiencies, as defined in 18 C.F.R. § 35.28(b)(8).

Material Modification:
"Material Modification" shall mean any modification to an Interconnection Request that has a material adverse effect on the cost or timing of Interconnection Studies related to, or any Network Upgrades or Local Upgrades needed to accommodate, any Interconnection Request with a later Queue Position.

Material Subsidy:
"Material Subsidy" shall mean:

(1) material payments, rebates, or subsidies directly or indirectly from any state or local governmental entity connected to the construction, development, production, or operation of the Capacity Resource;

(2) other material support or payments, obtained in any state-sponsored or state-mandated processes, connected to the construction, development, production, or operation of the Capacity Resource; or

(3) payments outside the RPM Auction for the procurement of capacity or energy from a Capacity Resource, obtained through a state-sponsored or state-directed procurement process.

Maximum Daily Starts:
"Maximum Daily Starts" shall mean the maximum number of times that a generating unit can be started in an Operating Day under normal operating conditions.

Maximum Emergency:
"Maximum Emergency" shall mean the designation of all or part of the output of a generating unit for which the designated output levels may require extraordinary procedures and therefore are available to the Office of the Interconnection only when the Office of the Interconnection declares a Maximum Generation Emergency and requests generation designated as Maximum Emergency to run. The Office of the Interconnection shall post on the PJM website the aggregate amount of megawatts that are classified as Maximum Emergency.

Maximum Facility Output:
"Maximum Facility Output" shall mean the maximum (not nominal) net electrical power output in megawatts, specified in the Interconnection Service Agreement, after supply of any parasitic or host facility loads, that a Generation Interconnection Customer's Customer Facility is expected to produce, provided that the specified Maximum Facility Output shall not exceed the output of the proposed Customer Facility that Transmission Provider utilized in the System Impact Study.

Maximum Generation Emergency:
"Maximum Generation Emergency" shall mean an Emergency declared by the Office of the Interconnection to address either a generation or transmission emergency in which the Office of the Interconnection anticipates requesting one or more Generation Capacity Resources, or Non-Retail Behind The Meter Generation resources to operate at its maximum net or gross electrical power output, subject to the equipment stress limits for such Generation Capacity Resource or Non-Retail Behind The Meter resource in order to manage, alleviate, or end the Emergency.

Maximum Generation Emergency Alert:
"Maximum Generation Emergency Alert" shall mean an alert issued by the Office of the Interconnection to notify PJM Members, Transmission Owners, resource owners and operators, customers, and regulators that a Maximum Generation Emergency may be declared, for any Operating Day in either, as applicable, the Day-ahead Energy Market or the Real-time Energy Market, for all or any part of such Operating Day.

Maximum Run Time:
"Maximum Run Time" shall mean the maximum number of hours a generating unit can run over the course of an Operating Day, as measured by PJM's State Estimator.

Maximum Weekly Starts:
"Maximum Weekly Starts" shall mean the maximum number of times that a generating unit can be started in one week, defined as the 168 hour period starting Monday 0001 hour, under normal operating conditions.

Member:
"Member" shall have the meaning provided in the Operating Agreement.

Merchant A.C. Transmission Facilities:

"Merchant A.C. Transmission Facility" shall mean Merchant Transmission Facilities that are alternating current (A.C.) transmission facilities, other than those that are Controllable A.C. Merchant Transmission Facilities.

Merchant D.C. Transmission Facilities:
"Merchant D.C. Transmission Facilities" shall mean direct current (D.C.) transmission facilities that are interconnected with the Transmission System pursuant to Tariff, Part IV and Part VI.

Merchant Network Upgrades:
"Merchant Network Upgrades" shall mean additions to, or modifications or replacements of, physical facilities of the Interconnected Transmission Owner that, on the date of the pertinent Transmission Interconnection Customer's Upgrade Request, are part of the Transmission System or are included in the Regional Transmission Expansion Plan.

Merchant Transmission Facilities:
"Merchant Transmission Facilities" shall mean A.C. or D.C. transmission facilities that are interconnected with or added to the Transmission System pursuant to Tariff, Part IV and Part VI and that are so identified in Tariff, Attachment T, provided, however, that Merchant Transmission Facilities shall not include (i) any Customer Interconnection Facilities, (ii) any physical facilities of the Transmission System that were in existence on or before March 20, 2003 ; (iii) any expansions or enhancements of the Transmission System that are not identified as Merchant Transmission Facilities in the Regional Transmission Expansion Plan and Attachment T to the Tariff, or (iv) any transmission facilities that are included in the rate base of a public utility and on which a regulated return is earned.

Merchant Transmission Provider:
"Merchant Transmission Provider" shall mean an Interconnection Customer that (1) owns, controls, or controls the rights to use the transmission capability of, Merchant D.C. Transmission Facilities and/or Controllable A.C. Merchant Transmission Facilities that connect the Transmission System with another control area, (2) has elected to receive Transmission Injection Rights and Transmission Withdrawal Rights associated with such facility pursuant to Tariff, Part IV, section 36, and (3) makes (or will make) the transmission capability of such facilities available for use by third parties under terms and conditions approved by the Commission and stated in the Tariff, consistent with Tariff, section 38.

Metering Equipment:
"Metering Equipment" shall mean all metering equipment installed at the metering points designated in the appropriate appendix to an Interconnection Service Agreement.

Minimum Annual Resource Requirement:
"Minimum Annual Resource Requirement" shall mean, for Delivery Years through May 31, 2017, the minimum amount of capacity that PJM will seek to procure from Annual Resources for the PJM Region and for each Locational Deliverability Area for which the Office of the Interconnection is required under Tariff, Attachment DD, section 5.10(a) to establish a separate VRR Curve for such Delivery Year. For the PJM Region, the Minimum Annual Resource Requirement shall be equal to the RTO Reliability Requirement minus [the Sub-Annual Resource

Reliability Target for the RTO in Unforced Capacity]. For an LDA, the Minimum Annual Resource Requirement shall be equal to the LDA Reliability Requirement minus [the LDA CETL] minus [the Sub-Annual Resource Reliability Target for such LDA in Unforced Capacity]. The LDA CETL may be adjusted pro rata for the amount of load served under the FRR Alternative.

Minimum Down Time:
For all generating units that are not combined cycle units, "Minimum Down Time" shall mean the minimum number of hours under normal operating conditions between unit shutdown and unit startup, calculated as the shortest time difference between the unit's generator breaker opening and after the unit's generator breaker closure, which is typically indicated by telemetered or aggregated State Estimator megawatts greater than zero. For combined cycle units, "Minimum Down Time" shall mean the minimum number of hours between the last generator breaker opening and after first combustion turbine generator breaker closure, which is typically indicated by telemetered or aggregated State Estimator megawatts greater than zero.

Minimum Extended Summer Resource Requirement:
"Minimum Extended Summer Resource Requirement" shall mean, for Delivery Years through May 31, 2017, the minimum amount of capacity that PJM will seek to procure from Extended Summer Demand Resources and Annual Resources for the PJM Region and for each Locational Deliverability Area for which the Office of the Interconnection is required under Tariff, Attachment DD, section 5.10(a) to establish a separate VRR Curve for such Delivery Year. For the PJM Region, the Minimum Extended Summer Resource Requirement shall be equal to the RTO Reliability Requirement minus [the Limited Demand Resource Reliability Target for the PJM Region in Unforced Capacity]. For an LDA, the Minimum Extended Summer Resource Requirement shall be equal to the LDA Reliability Requirement minus [the LDA CETL] minus [the Limited Demand Resource Reliability Target for such LDA in Unforced Capacity]. The LDA CETL may be adjusted pro rata for the amount of load served under the FRR Alternative.

Minimum Generation Emergency:
"Minimum Generation Emergency" shall mean an Emergency declared by the Office of the Interconnection in which the Office of the Interconnection anticipates requesting one or more generating resources to operate at or below Normal Minimum Generation, in order to manage, alleviate, or end the Emergency.

Minimum Participation Requirements:
"Minimum Participation Requirements" shall mean a set of minimum training, risk management, communication and capital or collateral requirements required for Participants in the PJM Markets, as set forth herein and in the Form of Annual Certification set forth as Tariff, Attachment Q, Appendix 1. Participants transacting in FTRs in certain circumstances will be required to demonstrate additional risk management procedures and controls as further set forth in the Annual Certification found in Tariff, Attachment Q, Appendix 1.

Minimum Run Time:
For all generating units that are not combined cycle units, "Minimum Run Time" shall mean the minimum number of hours a unit must run, in real-time operations, from the time after generator breaker closure, which is typically indicated by telemetered or aggregated State Estimator

megawatts greater than zero, to the time of generator breaker opening, as measured by PJM's State Estimator. For combined cycle units, "Minimum Run Time" shall mean the time period after the first combustion turbine generator breaker closure, which is typically indicated by telemetered or aggregated State Estimator megawatts greater than zero, and the last generator breaker opening as measured by PJM's State Estimator.

MISO:
"MISO" shall mean the Midcontinent Independent System Operator, Inc. or any successor thereto.

Multi-Driver Project:
"Multi-Driver Project" shall have the same meaning provided in the Operating Agreement.

Native Load Customers:
"Native Load Customers" shall mean the wholesale and retail power customers of a Transmission Owner on whose behalf the Transmission Owner, by statute, franchise, regulatory requirement, or contract, has undertaken an obligation to construct and operate the Transmission Owner's system to meet the reliable electric needs of such customers.

NERC:
"NERC" shall mean the North American Electric Reliability Corporation or any successor thereto.

NERC Interchange Distribution Calculator:
"NERC Interchange Distribution Calculator" shall mean the NERC mechanism that is in effect and being used to calculate the distribution of energy, over specific transmission interfaces, from energy transactions.

Net Benefits Test:
"Net Benefits Test" shall mean a calculation to determine whether the benefits of a reduction in price resulting from the dispatch of Economic Load Response exceeds the cost to other loads resulting from the billing unit effects of the load reduction, as specified in Operating Agreement, Schedule 1, section 3.3A.4 and the parallel provisions of Tariff, Attachment K-Appendix, section 3.3A.4.

Net Cost of New Entry:
"Net Cost of New Entry" shall mean the Cost of New Entry minus the Net Energy and Ancillary Service Revenue Offset.

Net Obligation:
"Net Obligation" shall mean the amount owed to PJMSettlement and PJM for purchases from the PJM Markets, Transmission Service, (under Tariff, Parts II and III , and other services pursuant to the Agreements, after applying a deduction for amounts owed to a Participant by PJMSettlement as it pertains to monthly market activity and services. Should other markets be formed such that Participants may incur future Obligations in those markets, then the aggregate amount of those Obligations will also be added to the Net Obligation.

Net Sell Position:

"Net Sell Position" shall mean the amount of Net Obligation when Net Obligation is negative.

Network Customer:
"Network Customer" shall mean an entity receiving transmission service pursuant to the terms of the Transmission Provider's Network Integration Transmission Service under Tariff, Part III.

Network External Designated Transmission Service:
"Network External Designated Transmission Service" shall have the meaning set forth in Reliability Assurance Agreement, Article I.

Network Integration Transmission Service:
"Network Integration Transmission Service" shall mean the transmission service provided under Tariff, Part III.

Network Load:
"Network Load" shall mean the load that a Network Customer designates for Network Integration Transmission Service under Tariff, Part III. The Network Customer's Network Load shall include all load (including losses) served by the output of any Network Resources designated by the Network Customer. A Network Customer may elect to designate less than its total load as Network Load but may not designate only part of the load at a discrete Point of Delivery. Where an Eligible Customer has elected not to designate a particular load at discrete points of delivery as Network Load, the Eligible Customer is responsible for making separate arrangements under Tariff, Part II for any Point-To-Point Transmission Service that may be necessary for such non-designated load.

Network Operating Agreement:
"Network Operating Agreement" shall mean an executed agreement that contains the terms and conditions under which the Network Customer shall operate its facilities and the technical and operational matters associated with the implementation of Network Integration Transmission Service under Tariff, Part III.

Network Operating Committee:
"Network Operating Committee" shall mean a group made up of representatives from the Network Customer(s) and the Transmission Provider established to coordinate operating criteria and other technical considerations required for implementation of Network Integration Transmission Service under Tariff, Part III.

Network Resource:
"Network Resource" shall mean any designated generating resource owned, purchased, or leased by a Network Customer under the Network Integration Transmission Service Tariff. Network Resources do not include any resource, or any portion thereof, that is committed for sale to third parties or otherwise cannot be called upon to meet the Network Customer's Network Load on a non-interruptible basis, except for purposes of fulfilling obligations under a reserve sharing program.

Network Service User:
"Network Service User" shall mean an entity using Network Transmission Service.

Network Transmission Service:
"Network Transmission Service" shall mean transmission service provided pursuant to the rates, terms and conditions set forth in Tariff, Part III, or transmission service comparable to such service that is provided to a Load Serving Entity that is also a Transmission Owner.

Network Upgrades:
"Network Upgrades" shall mean modifications or additions to transmission-related facilities that are integrated with and support the Transmission Provider's overall Transmission System for the general benefit of all users of such Transmission System. Network Upgrades shall include:

(i) **Direct Connection Network Upgrades** which are Network Upgrades that only serve the Customer Interconnection Facility and have no impact or potential impact on the Transmission System until the final tie-in is complete; and

(ii) **Non-Direct Connection Network Upgrades** which are parallel flow Network Upgrades that are not Direct Connection Network Upgrades.

Neutral Party:
"Neutral Party" shall have the meaning provided in Tariff, Part I, section 9.3(v).

New PJM Zone(s):
"New PJM Zone(s)" shall mean the Zone included in the Tariff, along with applicable Schedules and Attachments, for Commonwealth Edison Company, The Dayton Power and Light Company and the AEP East Operating Companies (Appalachian Power Company, Columbus Southern Power Company, Indiana Michigan Power Company, Kentucky Power Company, Kingsport Power Company, Ohio Power Company and Wheeling Power Company).

New Service Customers:
"New Service Customers" shall mean all customers that submit an Interconnection Request, a Completed Application, or an Upgrade Request that is pending in the New Services Queue.

New Service Request:
"New Service Request" shall mean an Interconnection Request, a Completed Application, or an Upgrade Request.

New Services Queue:
"New Service Queue" shall mean all Interconnection Requests, Completed Applications, and Upgrade Requests that are received within each six-month period ending on April 30 and October 31 of each year shall collectively comprise a New Services Queue.

New Services Queue Closing Date:
"New Services Queue Closing Date" shall mean each April 30 and October 31 shall be the Queue Closing Date for the New Services Queue comprised of Interconnection Requests, Completed Applications, and Upgrade Requests received during the six-month period ending on such date.

New York ISO or NYISO:

"New York ISO" or "NYISO" shall mean the New York Independent System Operator, Inc. or any successor thereto.

Nodal Reference Price:
The "Nodal Reference Price" at each location shall mean the 97th percentile price differential between day-ahead and real-time prices experienced over the corresponding two-month reference period in the prior calendar year. Reference periods will be Jan-Feb, Mar-Apr, May- Jun, Jul-Aug, Sept-Oct, Nov-Dec. For any given current-year month, the reference period months will be the set of two months in the prior calendar year that include the month corresponding to the current month. For example, July and August 2003 would each use July- August 2002 as their reference period.

No-load Cost:
"No-load Cost" shall mean the hourly cost required to create the starting point of a monotonically increasing incremental offer curve for a generating unit.

Nominal Rated Capability:
"Nominal Rated Capability" shall mean the nominal maximum rated capability in megawatts of a Transmission Interconnection Customer's Customer Facility or the nominal increase in transmission capability in megawatts of the Transmission System resulting from the interconnection or addition of a Transmission Interconnection Customer's Customer Facility, as determined in accordance with pertinent Applicable Standards and specified in the Interconnection Service Agreement.

Nominated Demand Resource Value:
"Nominated Demand Resource Value" shall mean the amount of load reduction that a Demand Resource commits to provide either through direct load control, firm service level or guaranteed load drop programs. For existing Demand Resources, the maximum Nominated Demand Resource Value is limited, in accordance with the PJM Manuals, to the value appropriate for the method by which the load reduction would be accomplished, at the time the Base Residual Auction or Incremental Auction is being conducted.

Nominated Energy Efficiency Value:
"Nominated Energy Efficiency Value" shall mean the amount of load reduction that an Energy Efficiency Resource commits to provide through installation of more efficient devices or equipment or implementation of more efficient processes or systems.

Non-Firm Point-To-Point Transmission Service:
"Non-Firm Point-To-Point Transmission Service" shall mean Point-To-Point Transmission Service under the Tariff that is reserved and scheduled on an as-available basis and is subject to Curtailment or Interruption as set forth in Tariff, Part II, section 14.7. Non-Firm Point-To-Point Transmission Service is available on a stand-alone basis for periods ranging from one hour to one month.

Non-Firm Sale:
"Non-Firm Sale" shall mean an energy sale for which receipt or delivery may be interrupted for any reason or no reason, without liability on the part of either the buyer or seller.

Non-Firm Transmission Withdrawal Rights:
"No-Firm Transmission Withdrawal Rights" shall mean the rights to schedule energy withdrawals from a specified point on the Transmission System. Non-Firm Transmission Withdrawal Rights may be awarded only to a Merchant D.C. Transmission Facility that connects the Transmission System to another control area. Withdrawals scheduled using Non-Firm Transmission Withdrawal Rights have rights similar to those under Non-Firm Point-to-Point Transmission Service.

Non-Performance Charge:
"Non-Performance Charge" shall mean the charge applicable to Capacity Performance Resources as defined in Tariff, Attachment DD, section 10A(e).

Nonincumbent Developer:
"Nonincumbent Developer" shall have the same meaning provided in the Operating Agreement.

Non-Regulatory Opportunity Cost:
"Non-Regulatory Opportunity Cost" shall mean the difference between (a) the forecasted cost to operate a specific generating unit when the unit only has a limited number of starts or available run hours resulting from (i) the physical equipment limitations of the unit, for up to one year, due to original equipment manufacturer recommendations or insurance carrier restrictions, (ii) a fuel supply limitation, for up to one year, resulting from an event of Catastrophic Force Majeure; and, (b) the forecasted future Locational Marginal Price at which the generating unit could run while not violating such limitations. Non-Regulatory Opportunity Cost therefore is the value associated with a specific generating unit's lost opportunity to produce energy during a higher valued period of time occurring within the same period of time in which the unit is bound by the referenced restrictions, and is reflected in the rules set forth in PJM Manual 15. Non-Regulatory Opportunity Costs shall be limited to those resources which are specifically delineated in Operating Agreement, Schedule 2.

Non-Retail Behind The Meter Generation:
"Non-Retail Behind The Meter Generation" shall mean Behind the Meter Generation that is used by municipal electric systems, electric cooperatives, or electric distribution companies to serve load.

Non-Synchronized Reserve:
"Non-Synchronized Reserve" shall mean the reserve capability of non-emergency generation resources that can be converted fully into energy within ten minutes of a request from the Office of the Interconnection dispatcher, and is provided by equipment that is not electrically synchronized to the Transmission System.

Non-Synchronized Reserve Event:
"Non-Synchronized Reserve Event" shall mean a request from the Office of the Interconnection to generation resources able and assigned to provide Non-Synchronized Reserve in one or more specified Reserve Zones or Reserve Sub-zones, within ten minutes to increase the energy output by the amount of assigned Non-Synchronized Reserve capability.

Non-Variable Loads:

"Non-Variable Loads" shall have the meaning specified in Operating Agreement, Schedule 1, section 1.5A.6, and the parallel provisions of Tariff, Attachment K-Appendix, section 1.5A.6.

Non-Zone Network Load:
"Non-Zone Network Load shall mean Network Load that is located outside of the PJM Region.

Normal Maximum Generation:
"Normal Maximum Generation" shall mean the highest output level of a generating resource under normal operating conditions.

Normal Minimum Generation:
"Normal Minimum Generation" shall mean the lowest output level of a generating resource under normal operating conditions.

Ramping Capability:
"Ramping Capability" shall mean the sustained rate of change of generator output, in megawatts per minute.

Real-time Congestion Price:
"Real-time Congestion Price" shall mean the Congestion Price resulting from the Office of the Interconnection's dispatch of the PJM Interchange Energy Market in the Operating Day.

Real-time Loss Price:
"Real-time Loss Price" shall mean the Loss Price resulting from the Office of the Interconnection's dispatch of the PJM Interchange Energy Market in the Operating Day.

Real-time Energy Market:
"Real-time Energy Market" shall mean the purchase or sale of energy and payment of Transmission Congestion Charges for quantity deviations from the Day-ahead Energy Market in the Operating Day.

Real-time Offer:
"Real-time Offer" shall mean a new offer or an update to a Market Seller's existing cost-based or market-based offer for a clock hour, submitted after the close of the Day-ahead Energy Market.

Real-time Prices:
"Real-time Prices" shall mean the Locational Marginal Prices resulting from the Office of the Interconnection's dispatch of the PJM Interchange Energy Market in the Operating Day.

Real-time Settlement Interval:
"Real-time Settlement Interval" shall mean the interval used by settlements, which shall be every five minutes.

Real-time System Energy Price:
"Real-time System Energy Price" shall mean the System Energy Price resulting from the Office of the Interconnection's dispatch of the PJM Interchange Energy Market in the Operating Day.

Reasonable Efforts:
"Reasonable Efforts" shall mean, with respect to any action required to be made, attempted, or taken by an Interconnection Party or by a Construction Party under Tariff, Part IV or Part VI, an Interconnection Service Agreement, or a Construction Service Agreement, such efforts as are timely and consistent with Good Utility Practice and with efforts that such party would undertake for the protection of its own interests.

Receiving Party:
"Receiving Party" shall mean the entity receiving the capacity and energy transmitted by the Transmission Provider to Point(s) of Delivery.

Referral:
"Referral" shall mean a formal report of the Market Monitoring Unit to the Commission for investigation of behavior of a Market Participant, of behavior of PJM, or of a market design flaw, pursuant to Tariff, Attachment M, section IV.I.

Reference Resource:
"Reference Resource" shall mean a combustion turbine generating station, configured with two General Electric Frame 7FA turbines with inlet air cooling to 50 degrees, Selective Catalytic Reduction technology all CONE Areas, dual fuel capability, and a heat rate of 10.096 Mmbtu/ MWh.

Regional Entity:
"Regional Entity" shall have the same meaning specified in the Operating Agreement.

Regional Transmission Expansion Plan:
"Regional Transmission Expansion Plan" shall mean the plan prepared by the Office of the Interconnection pursuant to Operating Agreement, Schedule 6 for the enhancement and expansion of the Transmission System in order to meet the demands for firm transmission service in the PJM Region.

Regional Transmission Group (RTG):
"Regional Transmission Group" or "RTG" shall mean a voluntary organization of transmission owners, transmission users and other entities approved by the Commission to efficiently coordinate transmission planning (and expansion), operation and use on a regional (and interregional) basis.

Regulation:
"Regulation" shall mean the capability of a specific generation resource or Demand Resource with appropriate telecommunications, control and response capability to seperately increase and decrease its output or adjust load in response to a regulating control signal, in accordance with the specifications in the PJM Manuals.

Regulation Zone:
"Regulation Zone" shall mean any of those one or more geographic areas, each consisting of a combination of one or more Control Zone(s) as designated by the Office of the Interconnection in the PJM Manuals, relevant to provision of, and requirements for, regulation service.

Relevant Electric Retail Regulatory Authority:
"Relevant Electric Retail Regulatory Authority" or "RERRA" shall mean an entity that has jurisdiction over and establishes prices and policies for competition for providers of retail electric service to end- customers, such as the city council for a municipal utility, the governing board of a cooperative utility, the state public utility commission, a State legislature, or any other such entity.

Reliability Assurance Agreement or PJM Reliability Assurance Agreement:
"Reliability Assurance Agreement" or " PJM Reliability Assurance Agreement" shall mean that certain Reliability Assurance Agreement Among Load Serving Entities in the PJM Region, on file

with FERC as PJM Interconnection L.L.C. Rate Schedule FERC No. 44, and as amended from time to time thereafter.

Reliability Pricing Model Auction:
"Reliability Pricing Model Auction" or "RPM Auction" shall mean the Base Residual Auction or any Incremental Auction, or, for the 2016/2017 and 2017/2018 Delivery Years, any Capacity Performance Transition Incremental Auction.

Required Transmission Enhancements:
"Regional Transmission Enhancements" shall mean enhancements and expansions of the Transmission System that (1) a Regional Transmission Expansion Plan developed pursuant to Operating Agreement, Schedule 6 or (2) any joint planning or coordination agreement between PJM and another region or transmission planning authority set forth in Tariff, Schedule 12-Appendix B ("Appendix B Agreement") designates one or more of the Transmission Owner(s) to construct and own or finance. Required Transmission Enhancements shall also include enhancements and expansions of facilities in another region or planning authority that meet the definition of transmission facilities pursuant to FERC's Uniform System of Accounts or have been classified as transmission facilities in a ruling by FERC addressing such facilities constructed pursuant to an Appendix B Agreement cost responsibility for which has been assigned at least in part to PJM pursuant to such Appendix B Agreement.

Reserved Capacity:
"Reserved Capacity" shall mean the maximum amount of capacity and energy that the Transmission Provider agrees to transmit for the Transmission Customer over the Transmission Provider's Transmission System between the Point(s) of Receipt and the Point(s) of Delivery under Tariff, Part II. Reserved Capacity shall be expressed in terms of whole megawatts on a sixty (60) minute interval (commencing on the clock hour) basis.

Reserve Penalty Factor:
"Reserve Penalty Factor" shall mean the cost, in $/MWh, associated with being unable to meet a specific reserve requirement in a Reserve Zone or Reserve Sub-zone. A Reserve Penalty Factor will be defined for each reserve requirement in a Reserve Zone or Reserve Sub-zone.

Reserve Sub-zone:
"Reserve Sub-zone" shall mean any of those geographic areas wholly contained within a Reserve Zone, consisting of a combination of a portion of one or more Control Zone(s) as designated by the Office of the Interconnection in the PJM Manuals, relevant to provision of, and requirements for, reserve service.

Reserve Zone:
"Reserve Zone" shall mean any of those geographic areas consisting of a combination of one or more Control Zone(s), as designated by the Office of the Interconnection in the PJM Manuals, relevant to provision of, and requirements for, reserve service.

Residual Auction Revenue Rights:

"Residual Auction Revenue Rights" shall mean incremental stage 1 Auction Revenue Rights created within a Planning Period by an increase in transmission system capability, including the return to service of existing transmission capability, that was not modeled pursuant to Operating Agreement, Schedule 1, section 7.5 and the parallel provisions of Tariff, Attachment K- Appendix, section 7.5 in compliance with Operating Agreement, Schedule 1, section 7.4.2 (h) and the parallel provisions of Tariff, Attachment K-Appendix, section 7.4.2(h), and, if modeled, would have increased the amount of stage 1 Auction Revenue Rights allocated pursuant to Operating Agreement, Schedule 1, section 7.4.2 and the parallel provisions of Tariff, Attachment K-Appendix, section 7.4.2; provided that, the foregoing notwithstanding, Residual Auction Revenue Rights shall exclude: 1) Incremental Auction Revenue Rights allocated pursuant to Tariff, Part VI; and 2) Auction Revenue Rights allocated to entities that are assigned cost responsibility pursuant to Operating Agreement, Schedule 6 for transmission upgrades that create such rights.

Residual Metered Load:
"Residual Metered Load" shall mean all load remaining in an electric distribution company's fully metered franchise area(s) or service territory(ies) after all nodally priced load of entities serving load in such area(s) or territory(ies) has been carved out.

Resource-Specific Fixed Resource Requirement Alternative or FRR-RS Alternative:
"Resource-Specific Fixed Resource Requirement Alternative" or "FRR-RS Alternative" shall mean an alternative method by which a Member that owns, or has the contractual authority to control the output or load reduction capability of, a Capacity Resource can obtain a capacity commitment for that Capacity Resource.

Resource Substitution Charge:
"Resource Substitution Charge" shall mean a charge assessed on Capacity Market Buyers in an Incremental Auction to recover the cost of replacement Capacity Resources.

Revenue Data for Settlements:
"Revenue Data for Settlements" shall mean energy quantities used in accounting and billing as determined pursuant to Tariff, Attachment K-Appendix and the corresponding provisions of Operating Agreement, Schedule 1.

RPM Seller Credit:
"RPM Seller Credit" shall mean an additional form of Unsecured Credit defined in Tariff, Attachment Q, section IV.

Scheduled Incremental Auctions:
"Scheduled Incremental Auctions" shall refer to the First, Second, or Third Incremental Auction for Delivery Years prior to the 2021/2022 Delivery Year; and the First or Final Incremental Auction for the 2021/2022 Delivery Year and all subsequent Delivery Years.

Schedule of Work:
"Schedule of Work" shall mean that schedule attached to the Interconnection Construction Service Agreement setting forth the timing of work to be performed by the Constructing Entity pursuant to the Interconnection Construction Service Agreement, based upon the Facilities Study and

subject to modification, as required, in accordance with Transmission Provider's scope change process for interconnection projects set forth in the PJM Manuals.

Scope of Work:
"Scope of Work" shall mean that scope of the work attached as a schedule to the Interconnection Construction Service Agreement and to be performed by the Constructing Entity(ies) pursuant to the Interconnection Construction Service Agreement, provided that such Scope of Work may be modified, as required, in accordance with Transmission Provider's scope change process for interconnection projects set forth in the PJM Manuals.

Seasonal Capacity Performance Resource:
"Seasonal Capacity Performance Resource" shall have the same meaning specified in Tariff, Attachment DD, section 5.5A.

Secondary Systems:
"Secondary Systems" shall mean control or power circuits that operate below 600 volts, AC or DC, including, but not limited to, any hardware, control or protective devices, cables, conductors, electric raceways, secondary equipment panels, transducers, batteries, chargers, and voltage and current transformers.

Second Incremental Auction:
"Second Incremental Auction" shall mean an Incremental Auction conducted ten months before the Delivery Year to which it relates. A Second Incremental Auction is conducted for Delivery Years prior to the 2021/2022 Delivery Year but is not conducted for the 2021/2022 Delivery Year and all subsequent Delivery Years.

Security:
"Security" shall mean the security provided by the New Service Customer pursuant to Tariff, section 212.4 or Tariff, Part VI, section 213.4 to secure the New Service Customer's responsibility for Costs under the Interconnection Service Agreement or Upgrade Construction Service Agreement and Tariff, Part VI, section 217.

Segment:
"Segment" shall have the same meaning as described in Operating Agreement, Schedule 1, section 3.2.3(e).

Self-Supply:
"Self-Supply" shall mean Capacity Resources secured by a Load-Serving Entity, by ownership or contract, outside a Reliability Pricing Model Auction, and used to meet obligations under this Attachment or the Reliability Assurance Agreement through submission in a Base Residual Auction or an Incremental Auction of a Sell Offer indicating such Market Seller's intent that such Capacity Resource be Self-Supply. Self-Supply may be either committed regardless of clearing price or submitted as a Sell Offer with a price bid. A Load Serving Entity's Sell Offer with a price bid for an owned or contracted Capacity Resource shall not be deemed "Self- Supply," unless it is designated as Self-Supply and used by the LSE to meet obligations under this Attachment or the Reliability Assurance Agreement.

Sell Offer:
"Sell Offer" shall mean an offer to sell Capacity Resources in a Base Residual Auction, Incremental Auction, or Reliability Backstop Auction.

Service Agreement:
"Service Agreement" shall mean the initial agreement and any amendments or supplements thereto entered into by the Transmission Customer and the Transmission Provider for service under the Tariff.

Service Commencement Date:
"Service Commencement Date" shall mean the date the Transmission Provider begins to provide service pursuant to the terms of an executed Service Agreement, or the date the Transmission Provider begins to provide service in accordance with Tariff, Part II, section 15.3 or Tariff, Part III, section 29.1.

Short-Term Firm Point-To-Point Transmission Service:
"Short-Term Firm Point-To-Point Transmission Service" shall mean Firm Point-To-Point Transmission Service under Tariff, Part II with a term of less than one year.

Short-term Project:
"Short-term Project" shall have the same meaning provided in the Operating Agreement.

Short-Term Resource Procurement Target:
"Short-Term Resource Procurement Target" shall mean, for Delivery Years through May 31, 2018, as to the PJM Region, for purposes of the Base Residual Auction, 2.5% of the PJM Region Reliability Requirement determined for such Base Residual Auction, for purposes of the First Incremental Auction, 2% of the of the PJM Region Reliability Requirement as calculated at the time of the Base Residual Auction; and, for purposes of the Second Incremental Auction, 1.5% of the of the PJM Region Reliability Requirement as calculated at the time of the Base Residual Auction; and, as to any Zone, an allocation of the PJM Region Short-Term Resource Procurement Target based on the Preliminary Zonal Forecast Peak Load, reduced by the amount of load served under the FRR Alternative. For any LDA, the LDA Short-Term Resource Procurement Target shall be the sum of the Short-Term Resource Procurement Targets of all Zones in the LDA.

Short-Term Resource Procurement Target Applicable Share:
"Short-Term Resource Procurement Target Applicable Share" shall mean, for Delivery Years through May 31, 2018: (i) for the PJM Region, as to the First and Second Incremental Auctions, 0.2 times the Short-Term Resource Procurement Target used in the Base Residual Auction and, as to the Third Incremental Auction for the PJM Region, 0.6 times such target; and (ii) for an LDA, as to the First and Second Incremental Auctions, 0.2 times the Short-Term Resource Procurement Target used in the Base Residual Auction for such LDA and, as to the Third Incremental Auction, 0.6 times such target.

Site:

"Site" shall mean all of the real property, including but not limited to any leased real property and easements, on which the Customer Facility is situated and/or on which the Customer Interconnection Facilities are to be located.

Small Commercial Customer:
"Small Commercial Customer," as used in RAA, Schedule 6 and Tariff, Attachment DD-1, shall mean a commercial retail electric end-use customer of an electric distribution company that participates in a mass market demand response program under the jurisdiction of a RERRA and satisfies the definition of a "small commercial customer" under the terms of the applicable RERRA's program, provided that the customer has an annual peak demand no greater than 100kW.

Small Generation Resource:
"Small Generation Resource" shall mean an Interconnection Customer's device of 20 MW or less for the production and/or storage for later injection of electricity identified in an Interconnection Request, but shall not include the Interconnection Customer's Interconnection Facilities. This term shall include Energy Storage Resources and/or other devices for storage for later injection of energy.

Small Inverter Facility:
"Small Inverter Facility" shall mean an Energy Resource that is a certified small inverter-based facility no larger than 10 kW.

Small Inverter ISA:
"Small Inverter ISA" shall mean an agreement among Transmission Provider, Interconnection Customer, and Interconnected Transmission Owner regarding interconnection of a Small Inverter Facility under Tariff, Part IV, section 112B.

Special Member:
"Special Member" shall mean an entity that satisfies the requirements of Operating Agreement, Schedule 1, section 1.5A.02, and the parallel provisions of Tariff, Attachment K-Appendix, section 1.5A.02, or the special membership provisions established under the Emergency Load Response and Pre-Emergency Load Response Programs.

Spot Market Backup:
"Spot Market Backup" shall mean the purchase of energy from, or the delivery of energy to, the PJM Interchange Energy Market in quantities sufficient to complete the delivery or receipt obligations of a bilateral contract that has been curtailed or interrupted for any reason.

Spot Market Energy:
"Spot Market Energy" shall mean energy bought or sold by Market Participants through the PJM Interchange Energy Market at System Energy Prices determined as specified in Operating Agreement, Schedule 1, section 2, and the parallel provisions of Tariff, Attachment K-Appendix, section 2.

Start Additional Labor Costs:

"Start Additional Labor Costs" shall mean additional labor costs for startup required above normal station manning levels.

Start-Up Costs:
"Start-Up Costs" shall mean the unit costs to bring the boiler, turbine and generator from shutdown conditions to the point after breaker closure which is typically indicated by telemetered or aggregated state estimator megawatts greater than zero and is determined based on the cost of start fuel, total fuel-related cost, performance factor, electrical costs (station service), start maintenance adder, and additional labor cost if required above normal station manning. Start-Up Costs can vary with the unit offline time being categorized in three unit temperature conditions: hot, intermediate and cold.

State:
"State" shall mean the District of Columbia and any State or Commonwealth of the United States.

State Commission:
"State Commission" shall mean any state regulatory agency having jurisdiction over retail electricity sales in any State in the PJM Region.

State Estimator:
"State Estimator" shall mean the computer model of power flows specified in Operating Agreement, Schedule 1, section 2.3 and the parallel provisions of Tariff, Attachment K- Appendix, section 2.3.

Station Power:
"Station Power" shall mean energy used for operating the electric equipment on the site of a generation facility located in the PJM Region or for the heating, lighting, air-conditioning and office equipment needs of buildings on the site of such a generation facility that are used in the operation, maintenance, or repair of the facility. Station Power does not include any energy (i) used to power synchronous condensers; (ii) used for pumping at a pumped storage facility; (iii) used for compressors at a compressed air energy storage facility; (iv) used for charging an Energy Storage Resource or a Capacity Storage Resource; or (v) used in association with restoration or black start service.

Sub-Annual Resource Constraint:
"Sub-Annual Resource Constraint" shall mean, for the 2017/2018 Delivery Year and for FRR Capacity Plans the 2017/2018 and 2018/2019 Delivery Years, for the PJM Region or for each LDA for which the Office of the Interconnection is required under Tariff, Attachment DD, section 5.10(a) to establish a separate VRR Curve for a Delivery Year, a limit on the total amount of Unforced Capacity that can be committed as Limited Demand Resources and Extended Summer Demand Resources for the 2017/2018 Delivery Year in the PJM Region or in such LDA, calculated as the Sub-Annual Resource Reliability Target for the PJM Region or for such LDA, respectively, minus the Short-Term Resource Procurement Target for the PJM Region or for such LDA, respectively.

Sub-Annual Resource Price Decrement:

"Sub-Annual Resource Price Decrement" shall mean, for the 2017/2018 Delivery Year, a difference between the clearing price for Extended Summer Demand Resources and the clearing price for Annual Resources, representing the cost to procure additional Annual Resources out of merit order when the Sub-Annual Resource Constraint is binding.

Sub-Annual Resource Reliability Target:
"Sub-Annual Reliability Target" for the PJM Region or an LDA, shall mean the maximum amount of the combination of Extended Summer Demand Resources and Limited Demand Resources in Unforced Capacity determined by PJM to be consistent with the maintenance of reliability, stated in Unforced Capacity, that shall be used to calculate the Minimum Annual Resource Requirement for Delivery Years through May 31, 2017 and the Sub-Annual Resource Constraint for the 2017/2018 and 2018/2019 Delivery Years. As more fully set forth in the PJM Manuals, PJM calculates the Sub-Annual Resource Reliability Target, by first determining a reference annual loss of load expectation ("LOLE") assuming no Demand Resources. The calculation for the unconstrained portion of the PJM Region uses a daily distribution of loads under a range of weather scenarios (based on the most recent load forecast and iteratively shifting the load distributions to result in the Installed Reserve Margin established for the Delivery Year in question) and a weekly capacity distribution (based on the cumulative capacity availability distributions developed for the Installed Reserve Margin study for the Delivery Year in question). The calculation for each relevant LDA uses a daily distribution of loads under a range of weather scenarios (based on the most recent load forecast for the Delivery Year in question) and a weekly capacity distribution (based on the cumulative capacity availability distributions developed for the Capacity Emergency Transfer Objective study for the Delivery Year in question). For the relevant LDA calculation, the weekly capacity distributions are adjusted to reflect the Capacity Emergency Transfer Limit for the Delivery Year in question.

For both the PJM Region and LDA analyses, PJM then models the commitment of varying amounts of DR (displacing otherwise committed generation) as interruptible from May 1 through October 31 and unavailable from November 1 through April 30 and calculates the LOLE at each DR level. The Extended Summer DR Reliability Target is the DR amount, stated as a percentage of the unrestricted peak load, that produces no more than a ten percent increase in the LOLE, compared to the reference value. The Sub-Annual Resource Reliability Target shall be expressed as a percentage of the forecasted peak load of the PJM Region or such LDA and is converted to Unforced Capacity by multiplying [the reliability target percentage] times [the Forecast Pool Requirement] times [the DR Factor] times [the forecasted peak load of the PJM Region or such LDA, reduced by the amount of load served under the FRR Alternative].

Sub-meter:
"Sub-meter" shall mean a metering point for electricity consumption that does not include all electricity consumption for the end-use customer as defined by the electric distribution company account number. PJM shall only accept sub-meter load data from end-use customers for measurement and verification of Regulation service as set forth in the Economic Load Response rules and PJM Manuals.

Summer-Period Capacity Performance Resource:

"Summer-Period Capacity Performance Resource" shall have the same meaning specified in Tariff, Attachment DD, section 5.5A.

Switching and Tagging Rules:
"Switching and Tagging Rules" shall mean the switching and tagging procedures of Interconnected Transmission Owners and Interconnection Customer as they may be amended from time to time.

Synchronized Reserve:
"Synchronized Reserve" shall mean the reserve capability of generation resources that can be converted fully into energy or Demand Resources whose demand can be reduced within ten minutes from the request of the Office of the Interconnection dispatcher, and is provided by equipment that is electrically synchronized to the Transmission System.

Synchronized Reserve Event:
"Synchronized Reserve Event" shall mean a request from the Office of the Interconnection to generation resources and/or Demand Resources able, assigned or self-scheduled to provide Synchronized Reserve in one or more specified Reserve Zones or Reserve Sub-zones, within ten minutes, to increase the energy output or reduce load by the amount of assigned or self- scheduled Synchronized Reserve capability.

Synchronized Reserve Requirement:
"Synchronized Reserve Requirement" shall mean the megawatts required to be maintained in a Reserve Zone or Reserve Sub-zone as Synchronized Reserve, absent any increase to account for additional reserves scheduled to address operational uncertainty. The Synchronized Reserve Requirement is calculated in accordance with the PJM Manuals.

System Condition:
"System Condition" shall mean a specified condition on the Transmission Provider's system or on a neighboring system, such as a constrained transmission element or flowgate, that may trigger Curtailment of Long-Term Firm Point-to-Point Transmission Service using the curtailment priority pursuant to Tariff, Part II, section 13.6. Such conditions must be identified in the Transmission Customer's Service Agreement.

System Energy Price:
"System Energy Price" shall mean the energy component of the Locational Marginal Price, which is the price at which the Market Seller has offered to supply an additional increment of energy from a resource, calculated as specified in Operating Agreement, Schedule 1, section 2 and the parallel provisions of Tariff, Attachment K-Appendix, section 2.

System Impact Study:
"System Impact Study" shall mean an assessment by the Transmission Provider of (i) the adequacy of the Transmission System to accommodate a Completed Application, an Interconnection Request or an Upgrade Request, (ii) whether any additional costs may be incurred in order to provide such transmission service or to accommodate an Interconnection Request, and (iii) with respect to an Interconnection Request, an estimated date that an Interconnection Customer's

Customer Facility can be interconnected with the Transmission System and an estimate of the Interconnection Customer's cost responsibility for the interconnection; and (iv) with respect to an Upgrade Request, the estimated cost of the requested system upgrades or expansion, or of the cost of the system upgrades or expansion, necessary to provide the requested incremental rights.

System Protection Facilities:
"System Protection Facilities" shall refer to the equipment required to protect (i) the Transmission System, other delivery systems and/or other generating systems connected to the Transmission System from faults or other electrical disturbance occurring at or on the Customer Facility, and (ii) the Customer Facility from faults or other electrical system disturbance occurring on the Transmission System or on other delivery systems and/or other generating systems to which the Transmission System is directly or indirectly connected. System Protection Facilities shall include such protective and regulating devices as are identified in the Applicable Technical Requirements and Standards or that are required by Applicable Laws and Regulations or other Applicable Standards, or as are otherwise necessary to protect personnel and equipment and to minimize deleterious effects to the Transmission System arising from the Customer Facility.

ATTACHMENT M – APPENDIX

I. CONFIDENTIALITY OF DATA AND INFORMATION

A. Party Access:

1. No Member shall have a right hereunder to receive or review any documents, data or other information of another Member, including documents, data or other information provided to the Market Monitoring Unit, to the extent such documents, data or information have been designated as confidential pursuant to the procedures adopted by the Market Monitoring Unit or to the extent that they have been designated as confidential by such other Member; provided, however, a Member may receive and review any composite documents, data and other information that may be developed based on such confidential documents, data or information if the composite does not disclose any individual Member's confidential data or information.

2. Except as may be provided in this Appendix, the Plan, the PJM Operating Agreement or in the PJM Tariff, the Market Monitoring Unit shall not disclose to PJM Members or to third parties, any documents, data, or other information of a Member or entity applying for Membership, to the extent such documents, data, or other information has been designated confidential pursuant to the procedures adopted by the Market Monitoring Unit or by such Member or entity applying for membership; provided that nothing contained herein shall prohibit the Market Monitoring Unit from providing any such confidential information to its agents, representatives, or contractors to the extent that such person or entity is bound by an obligation to maintain such confidentiality.

The Market Monitoring Unit, its designated agents, representatives, and contractors shall maintain as confidential the electronic tag ("e-Tag") data of an e-Tag Author or Balancing Authority (defined as those terms are used in FERC Order No. 771) to the same extent as Member data under this section I. Nothing contained herein shall prohibit the Market Monitoring Unit from sharing with the market monitor of another Regional Transmission Organization ("RTO"), Independent System Operator ("ISO"), upon their request, the e-Tags of an e-Tag Author or Balancing Authority for intra-PJM Region transactions and interchange transactions scheduled to flow into, out of or through the PJM Region, to the extent such market monitor has requested such information as part of its investigation of possible market violations or market design flaws, and to the extent that such market monitor is bound by a tariff provision requiring that the e-Tag data be maintained as confidential, or in the absence of a tariff requirement governing confidentiality, a written agreement with the Market Monitoring Unit consistent with FERC Order No. 771, and any clarifying orders and implementing regulations.

The Market Monitoring Unit shall collect and use confidential information only in connection with its authority under this Appendix, the Plan, the PJM Operating Agreement or in the PJM Tariff and the retention of such information shall be in accordance with the Office of the Interconnection's data retention policies.

3. Nothing contained herein shall prevent the Market Monitoring Unit from releasing a Member's confidential data or information to a third party provided that the Member has delivered to the Market Monitoring Unit specific, written authorization for such release setting forth the data

or information to be released, to whom such release is authorized, and the period of time for which such release shall be authorized. The Market Monitoring Unit shall limit the release of a Member's confidential data or information to that specific authorization received from the Member. Nothing herein shall prohibit a Member from withdrawing such authorization upon written notice to the Market Monitoring Unit, who shall cease such release as soon as practicable after receipt of such withdrawal notice.

4. Reciprocal provisions to this section I hereof, delineating the confidentiality requirements of the Office of the Interconnection and PJM members, are set forth in Operating Agreement, section 18.17.

B. Required Disclosure:

1. Notwithstanding anything in the foregoing section to the contrary, and subject to the provisions of section I.C below, if the Market Monitoring Unit is required by applicable law, order, or in the course of administrative or judicial proceedings, to disclose to third parties, information that is otherwise required to be maintained in confidence pursuant to the PJM Tariff, PJM Operating Agreement, Tariff, Attachment M or this Appendix, the Market Monitoring Unit may make disclosure of such information; provided, however, that as soon as the Market Monitoring Unit learns of the disclosure requirement and prior to making disclosure, the Market Monitoring Unit shall notify the affected Member or Members of the requirement and the terms thereof and the affected Member or Members may direct, at their sole discretion and cost, any challenge to or defense against the disclosure requirement. The Market Monitoring Unit shall cooperate with such affected Members to the maximum extent practicable to minimize the disclosure of the information consistent with applicable law. The Market Monitoring Unit shall cooperate with the affected Members to obtain proprietary or confidential treatment of such information by the person to whom such information is disclosed prior to any such disclosure.

2. Nothing in this section I shall prohibit or otherwise limit the Market Monitoring Unit's use of information covered herein if such information was: (i) previously known to the Market Monitoring Unit without an obligation of confidentiality; (ii) independently developed by or for the Office of the Interconnection and/or the Market Monitoring Unit using non-confidential information; (iii) acquired by the Office of the Interconnection and/or the Market Monitoring Unit from a third party which is not, to the Office of the Interconnection's or Market Monitoring Unit's knowledge, under an obligation of confidence with respect to such information; (iv) which is or becomes publicly available other than through a manner inconsistent with this section I.

3. The Market Monitoring Unit shall impose on any contractors retained to provide technical support or otherwise to assist with the implementation of the Plan or this Appendix a contractual duty of confidentiality consistent with the Plan or this Appendix. A Member shall not be obligated to provide confidential or proprietary information to any contractor that does not assume such a duty of confidentiality, and the Market Monitoring Unit shall not provide any such information to any such contractor without the express written permission of the Member providing the information.

C. Disclosure to FERC and CFTC:

1. Notwithstanding anything in this section I to the contrary, if the FERC, the Commodity Futures Trading Commission ("CFTC") or the staff of those commissions, during the course of an investigation or otherwise, requests information from the Market Monitoring Unit that is otherwise required to be maintained in confidence pursuant to the PJM Tariff, the PJM Operating Agreement, the Plan or this Appendix, the Market Monitoring Unit shall provide the requested information to the FERC, CFTC or their staff, within the time provided for in the request for information. In providing the information to the FERC or its staff, the Market Monitoring Unit may request, consistent with 18 C.F.R. §§ 1b.20 and 388.112, or to the CFTC or its staff, the Market Monitoring Unit may request, consistent with 17 C.F.R. §§ 11.3 and 145.9, that the information be treated as confidential and non-public by the respective commission and its staff and that the information be withheld from public disclosure. The Market Monitoring Unit shall promptly notify any affected Member(s) if the Market Monitoring Unit receives from the FERC, CFTC or their staff, written notice that the commission has decided to release publicly or has asked for comment on whether such commission should release publicly, confidential information previously provided to a commission Market Monitoring Unit.

2. The foregoing section I.C.1 shall not apply to requests for production of information under Subpart D of the FERC's Rules of Practice and Procedure (18 CFR Part 385) in proceedings before FERC and its administrative law judges. In all such proceedings, the Office of the Interconnection and/or the Market Monitoring Unit shall follow the procedures in section I.B.

D. Disclosure to Authorized Commissions:

1. Notwithstanding anything in this section I to the contrary, the Market Monitoring Unit shall disclose confidential information, otherwise required to be maintained in confidence pursuant to the PJM Tariff, the PJM Operating Agreement, the Plan or this Appendix, to an Authorized Commission under the following conditions:

(i) The Authorized Commission has provided the FERC with a properly executed Certification in the form attached to the PJM Operating Agreement as Operating Agreement, Schedule 10A. Upon receipt of the Authorized Commission's Certification, the FERC shall provide public notice of the Authorized Commission's filing pursuant to 18 C.F.R. § 385.2009. If any interested party disputes the accuracy and adequacy of the representations contained in the Authorized Commission's Certification, that party may file a protest with the FERC within 14 days of the date of such notice, pursuant to 18 C.F.R. § 385.211. The Authorized Commission may file a response to any such protest within seven days. Each party shall bear its own costs in connection with such a protest proceeding. If there are material changes in law that affect the accuracy and adequacy of the representations in the Certification filed with the FERC, the Authorized Commission shall, within thirty (30) days, submit an amended Certification identifying such changes. Any such amended Certification shall be subject to the same procedures for comment and review by the FERC as set forth above in this paragraph.

(ii) Neither the Office of the Interconnection nor the Market Monitoring Unit may disclose data to an Authorized Commission during the FERC's consideration of the Certification and any filed protests. If the FERC does not act upon an Authorized Commission's Certification

within 90 days of the date of filing, the Certification shall be deemed approved and the Authorized Commission shall be permitted to receive confidential information pursuant to this Section I. In the event that an interested party protests the Authorized Commission's Certification and the FERC approves the Certification, that party may not challenge any Information Request made by the Authorized Commission on the grounds that the Authorized Commission is unable to protect the confidentiality of the information requested, in the absence of a showing of changed circumstances.

(iii) Any confidential information provided to an Authorized Commission pursuant to this section I shall not be further disclosed by the recipient Authorized Commission except by order of the FERC.

(iv) The Market Monitoring Unit shall be expressly entitled to rely upon such Authorized Commission Certifications in providing confidential information to the Authorized Commission, and shall in no event be liable, or subject to damages or claims of any kind or nature hereunder, due to the ineffectiveness or inaccuracy of such Authorized Commission Certifications.

(v) The Authorized Commission may provide confidential information obtained from the Market Monitoring Unit to such of its employees, attorneys and contractors as needed to examine or handle that information in the course and scope of their work on behalf of the Authorized Commission, provided that (a) the Authorized Commission has internal procedures in place, pursuant to the Certification, to ensure that each person receiving such information agrees to protect the confidentiality of such information (such employees, attorneys or contractors to be defined hereinafter as "Authorized Persons"); (b) the Authorized Commission provides, pursuant to the Certification, a list of such Authorized Persons to the Office of the Interconnection and the Market Monitoring Unit and updates such list, as necessary, every ninety (90) days; and (c) any third-party contractors provided access to confidential information sign a nondisclosure agreement in the form attached to the PJM Operating Agreement as Operating Agreement, Schedule 10 before being provided access to any such confidential information.

2. The Market Monitoring Unit may, in the course of discussions with an Authorized Person, orally disclose information otherwise required to be maintained in confidence, without the need for a prior Information Request. Such oral disclosures shall provide enough information to enable the Authorized Person or the Authorized Commission with which that Authorized Person is associated to determine whether additional Information Requests are appropriate. The Market Monitoring Unit will not make any written or electronic disclosures of confidential information to the Authorized Person pursuant to this section I.D.2. In any such discussions, the Market Monitoring Unit shall ensure that the individual or individuals receiving such confidential information are Authorized Persons as defined herein, orally designate confidential information that is disclosed, and refrain from identifying any specific Affected Member whose information is disclosed. The Market Monitoring Unit shall also be authorized to assist Authorized Persons in interpreting confidential information that is disclosed. The Market Monitoring Unit shall provide any Affected Member with oral notice of any oral disclosure immediately, but not later than one (1) Business Day after the oral disclosure. Such oral notice to the Affected Member shall include the substance of the oral disclosure, but shall not reveal any confidential information of any other Member and must be received by the Affected Member before the name of the Affected Member is released to the Authorized Person; provided however, disclosure of the identity of the Affected

Party must be made to the Authorized Commission with which the Authorized Person is associated within two (2) Business Days of the initial oral disclosure.

3. As regards Information Requests:

(i) Information Requests to the Office of the Interconnection and/or Market Monitoring Unit by an Authorized Commission shall be in writing, which shall include electronic communications, addressed to the Market Monitoring Unit, and shall: (a) describe the information sought in sufficient detail to allow a response to the Information Request; (b) provide a general description of the purpose of the Information Request; (c) state the time period for which confidential information is requested; and (d) re-affirm that only Authorized Persons shall have access to the confidential information requested. The Market Monitoring Unit shall provide an Affected Member with written notice, which shall include electronic communication, of an Information Request by an Authorized Commission as soon as possible, but not later than two (2) Business Days after the receipt of the Information Request.

(ii) Subject to the provisions of section I.D.3(iii) below, the Market Monitoring Unit shall supply confidential information to the Authorized Commission in response to any Information Request within five (5) Business Days of the receipt of the Information Request, to the extent that the requested confidential information can be made available within such period; provided however, that in no event shall confidential information be released prior to the end of the fourth (4th) Business Day without the express consent of the Affected Member. To the extent that the Market Monitoring Unit cannot reasonably prepare and deliver the requested confidential information within such five (5) day period, it shall, within such period, provide the Authorized Commission with a written schedule for the provision of such remaining confidential information. Upon providing confidential information to the Authorized Commission, the Market Monitoring Unit shall either provide a copy of the confidential information to the Affected Member(s), or provide a listing of the confidential information disclosed; provided, however, that the Market Monitoring Unit shall not reveal any Member's confidential information to any other Member.

(iii) Notwithstanding section I.D.3(ii), above, should the Office of the Interconnection, the Market Monitoring Unit or an Affected Member object to an Information Request or any portion thereof, any of them may, within four (4) Business Days following the Market Monitoring Unit's receipt of the Information Request, request, in writing, a conference with the Authorized Commission to resolve differences concerning the scope or timing of the Information Request; provided, however, nothing herein shall require the Authorized Commission to participate in any conference. Any party to the conference may seek assistance from FERC staff in resolution of the dispute or terminate the conference process at any time. Should such conference be refused or terminated by any participant or should such conference not resolve the dispute, then the Office of the Interconnection, Market Monitoring Unit, or the Affected Member may file a complaint with the FERC pursuant to Rule 206 objecting to the Information Request within ten (10) Business Days following receipt of written notice from any conference participant terminating such conference. Any complaints filed at the FERC objecting to a particular Information Request shall be designated by the party as a "fast track" complaint and each party shall bear its own costs in connection with such FERC proceeding. The grounds for such a complaint shall be limited to the following: (a) the Authorized Commission is no longer able to preserve the confidentiality of the requested information due to changed circumstances relating to the Authorized Commission's

ability to protect confidential information arising since the filing of or rejection of a protest directed to the Authorized Commission's Certification; (b) complying with the Information Request would be unduly burdensome to the complainant, and the complainant has made a good faith effort to negotiate limitations in the scope of the requested information; or (c) other exceptional circumstances exist such that complying with the Information Request would result in harm to the complainant. There shall be a presumption that "exceptional circumstances," as used in the prior sentence, does not include circumstances in which an Authorized Commission has requested wholesale market data (or Market Monitoring Unit workpapers that support or explain conclusions or analyses) generated in the ordinary course and scope of the operations of the Market Monitoring Unit. There shall be a presumption that circumstances in which an Authorized Commission has requested personnel files, internal emails and internal company memos, analyses and related work product constitute "exceptional circumstances" as used in the prior sentence. If no complaint challenging the Information Request is filed within the ten (10) day period defined above, the Office of the Interconnection and/or Market Monitoring Unit shall utilize its best efforts to respond to the Information Request promptly. If a complaint is filed, and the Commission does not act on that complaint within ninety (90) days, the complaint shall be deemed denied and the Market Monitoring Unit shall use its best efforts to respond to the Information Request promptly.

(iv) Any Authorized Commission may initiate appropriate legal action at the FERC within ten (10) Business Days following receipt of information designated as "Confidential," challenging such designation. Any complaints filed at FERC objecting to the designation of information as "Confidential" shall be designated by the party as a "fast track" complaint and each party shall bear its own costs in connection with such FERC proceeding. The party filing such a complaint shall be required to prove that the material disclosed does not merit "Confidential" status because it is publicly available from other sources or contains no trade secret or other sensitive commercial information (with "publicly available" not being deemed to include unauthorized disclosures of otherwise confidential data).

4. In the event of any breach of confidentiality of information disclosed pursuant to an Information Request by an Authorized Commission or Authorized Person:

(i) The Authorized Commission or Authorized Person shall promptly notify the Market Monitoring Unit, who shall, in turn, promptly notify any Affected Member of any inadvertent or intentional release, or possible release, of confidential information provided pursuant to this section I.

(ii) The Office Market Monitoring Unit shall terminate the right of such Authorized Commission to receive confidential information under this section I upon written notice to such Authorized Commission unless: (i) there was no harm or damage suffered by the Affected Member; or (ii) similar good cause is shown. Any appeal of the Market Monitoring Unit's actions under this section I shall be to Commission. An Authorized Commission shall be entitled to reestablish its certification as set forth in section I.D.1 by submitting a filing with the Commission showing that it has taken appropriate corrective action. If the Commission does not act upon an Authorized Commission's recertification filing with sixty (60) days of the date of the filing, the recertification shall be deemed approved and the Authorized Commission shall be permitted to receive confidential information pursuant to this section.

(iii) The Office of the Interconnection, the Market Monitoring Unit, and/or the Affected Member shall have the right to seek and obtain at least the following types of relief: (a) an order from the FERC requiring any breach to cease and preventing any future breaches; (b) temporary, preliminary, and/or permanent injunctive relief with respect to any breach; and (c) the immediate return of all confidential information to the Market Monitoring Unit.

(iv) No Authorized Person or Authorized Commission shall have responsibility or liability whatsoever under this section for any and all liabilities, losses, damages, demands, fines, monetary judgments, penalties, costs and expenses caused by, resulting from, or arising out of or in connection with the release of confidential information to persons not authorized to receive it, provided that such Authorized Person is an agent, servant, employee or member of an Authorized Commission at the time of such unauthorized release. Nothing in this section I.D.4(iv) is intended to limit the liability of any person who is not an agent, servant, employee or member of an Authorized Commission at the time of such unauthorized release for any and all economic losses, damages, demands, fines, monetary judgments, penalties, costs and expenses caused by, resulting from, or arising out of or in connection with such unauthorized release.

(v) Any dispute or conflict requesting the relief in section I.D.4(ii) or I.D.4(iii)(a) above, shall be submitted to the FERC for hearing and resolution. Any dispute or conflict requesting the relief in section I.D.4(iii)(c) above may be submitted to FERC or any court of competent jurisdiction for hearing and resolution.

E. <u>Market Monitoring:</u>

1. Subject to the requirements of section E.2, the Market Monitoring Unit may release confidential information of Public Service Electric & Gas Company ("PSE&G"), Consolidated Edison Company of New York ("ConEd"), and their affiliates, and the confidential information of any Member regarding generation and/or transmission facilities located within the PSE&G Zone to the New York Independent System Operator, Inc. ("New York ISO"), the market monitoring unit of New York ISO and the New York ISO Market Advisor to the limited extent that the Office of the Interconnection or the Market Monitoring Unit determines necessary to carry out the responsibilities of PJM, New York ISO or the market monitoring units of the Office of the Interconnection and the New York ISO under FERC Opinion No. 476 (see Consolidated Edison Company v. Public Service Electric and Gas Company, et al., 108 FERC ¶ 61,120, at P 215 (2004)) to conduct joint investigations to ensure that gaming, abuse of market power, or similar activities do not take place with regard to power transfers under the contracts that are the subject of FERC Opinion No. 476.

2. The Market Monitoring Unit may release a Member's confidential information pursuant to section I.E.1 to the New York ISO, the market monitoring unit of the New York ISO and the New York ISO Market Advisor only if the New York ISO, the market monitoring unit of the New York ISO and the New York ISO Market Advisor are subject to obligations limiting the disclosure of such information that are equivalent to or greater than the limitations on disclosure specified in this Section I.E. Information received from the New York ISO, the market monitoring unit of the New York ISO, or the New York ISO Market Advisor under section I.E.1 that is designated as confidential shall be protected from disclosure in accordance with this section I.E.

II. DEVELOPMENT OF INPUTS FOR PROSPECTIVE MITIGATION

A. Offer Price Caps:

1. The Market Monitor or his designee shall advise the Office of the Interconnection whether it believes that the cost references, methods and rules included in the Cost Development Guidelines are accurate and appropriate, as specified in the PJM Manuals.

2. The Market Monitoring Unit shall review the incremental costs (defined in Operating Agreement, Schedule 1, section 6.4.2 and the parallel provisions of Tariff, Attachment K-Appendix, section 6.4.2) included in the Offer Price Cap of a generating unit in order to ensure that the Market Seller has correctly applied the Cost Development Guidelines, including its PJM-approved Fuel Cost Policy, and that the level of the Offer Price Cap is otherwise acceptable. The Market Monitoring Unit shall inform PJM if it believes a Market Seller has submitted a cost- based offer that is not compliant with these criteria and whether it recommends that PJM assess the applicable penalty therefor, pursuant to Operating Agreement, Schedule 2.

3. On or before the 21st day of each month, the Market Monitoring Unit shall calculate in accordance with the applicable criteria whether each generating unit with an offer cap calculated under Operating Agreement, Schedule 1, section 6.4.2 and the parallel provisions of Tariff, Attachment K-Appendix, section 6.4.2 is eligible to include an adder based on Frequently Mitigated Unit or Associated Unit status, and shall issue a written notice of the applicable adder, with a copy to the Office of the Interconnection, to the Market Seller for each unit that meets the criteria for Frequently Mitigated Unit or Associated Unit status.

4. Notwithstanding the number of jointly pivotal suppliers in any hour, if the Market Monitoring Unit determines that a reasonable level of competition will not exist based on an evaluation of all facts and circumstances, it may propose to the Commission the removal of offer-capping suspensions otherwise authorized by Operating Agreement, Schedule 1, section 6.4 and the parallel provisions of Tariff, Attachment K-Appendix, section 6.4. Such proposals shall take effect upon Commission acceptance of the Market Monitoring Unit's filing.

5. The Market Monitoring Unit shall review all Fuel Cost Policies submitted by Market Sellers for market power concerns. The Market Monitoring Unit shall communicate its determination regarding these criteria to PJM and the Market Seller pursuant to the process further described in PJM Manual 15.

B. Minimum Generator Operating Parameters:

1. For the 2014/2015 through 2017/2018 Delivery Years, the Market Monitoring Unit shall provide to the Office of the Interconnection a table of default unit class specific parameter limits to be known as the "Parameter Limited Schedule Matrix" to be included in Operating Agreement, Schedule 1, section 6.6(c) and the parallel provisions of Tariff, Attachment K- Appendix, section 6.6(c). The Parameter Limited Schedule Matrix shall include default values on a unit-type basis as specified in Operating Agreement, Schedule 1, section 6.6(c) and the parallel provisions of Tariff, Attachment K-Appendix, section 6.6(c). The Market Monitoring Unit shall review the Parameter Limited Schedule Matrix annually, and, in the event it determines that revision is

appropriate, shall provide a revised matrix to the Office of the Interconnection by no later than December 31 prior to the annual enrollment period.

2. The Market Monitoring Unit shall notify Market Sellers of generating units and the Office of the Interconnection no later than April 1 of its determination of market power concerns raised regarding each request for a period exception or persistent exception to a value specified in the Parameter Limited Schedule Matrix or the parameters defined in Operating Agreement, Schedule 1, section 6.6 and the parallel provisions of Tariff, Attachment K-Appendix, section 6.6 and the PJM Manuals, provided that the Market Monitoring Unit receives such request by no later than February 28.

If, prior to the scheduled termination date, a Market Seller submits a request to modify a temporary exception, the Market Monitoring Unit shall review such request using the same standard utilized to evaluate period exception and persistent exception requests, and shall provide its determination of whether the request raises market power concerns, and, if so, any modifications that would alleviate those concerns, to the Market Seller, with a copy to Office of the Interconnection, by no later than 15 Business Days from the date of the modification request.

3. When a Market Seller notifies the Market Monitoring Unit of a material change to the facts relied upon by the Market Monitoring Unit and/or the Office of the Interconnection to support a parameter limited schedule period or persistent exception, the Market Monitoring Unit shall make a determination, and provide written notification to the Office of the Interconnection and the Market Seller, of any change to its determination regarding the exemption request, based on the material change in facts, by no later than 15 Business Days after receipt of such notice.

4. The Market Monitoring Unit shall notify the Office of the Interconnection of any risk premium to which it and a Market Seller owning or operating nuclear generation resource agree or its determination if agreement is not obtained. If a Market Seller submits a risk premium for its nuclear generation resource that is inconsistent with its agreement or inconsistent with the Market Monitoring Unit's determination regarding such risk premium, the Market Monitoring Unit may exercise its powers to inform Commission staff of its concerns pursuant to Tariff, Attachment M.

C. RPM Must-Offer Requirement:

1. The Market Monitoring Unit shall maintain, post on its website and provide to the Office of the Interconnection prior to each RPM Auction (updated, as necessary, on at least a quarterly basis), a list of Existing Generation Capacity Resources located in the PJM Region that are subject to the RPM must-offer requirement set forth in Tariff, Attachment DD, section 6.6.

2. The Market Monitoring Unit shall evaluate requests submitted by Capacity Market Sellers for a determination that a Generation Capacity Resource, or any portion thereof, be removed from Capacity Resource status or exempted from status as a Generation Capacity Resource subject to section II.C.1 above and inform both the Capacity Market Seller and the Office of the Interconnection of such determination in writing by no later ninety (90) days prior to the commencement of the offer period for the applicable RPM Auction. A Generation Capacity Resource located in the PJM Region shall not be removed from Capacity Resource status to the extent the resource is committed to service of PJM loads as a result of an RPM Auction, FRR

Capacity Plan, FRR-RS Alternative, Locational UCAP transaction and/or by designation as a replacement resource under Tariff, Attachment DD.

3. The Market Monitoring Unit shall evaluate the data and documentation provided to it by a potential Capacity Market Seller to establish the EFORd to be included in a Sell Offer applicable to each resource pursuant to Tariff, Attachment DD, section 6.6(b). If a Capacity Market Seller timely submits a request for an alternative maximum level of EFORd that may be used in a Sell Offer for RPM Auctions held prior to the date on which the final EFORds used for a Delivery Year are posted, the Market Monitoring Unit shall attempt to reach agreement with the Capacity Market Seller on the alternate maximum level of the EFORd by no later than ninety (90) days prior to the commencement of the offer period for the Base Residual Auction for the applicable Delivery Year. By no later than ninety (90) days prior to the commencement of the offer period for the Base Residual Auction for the applicable Delivery Year, the Market Monitoring Unit shall notify the Office of the Interconnection in writing, notifying the Capacity Market Seller by copy of the same, of any alternative maximum EFORd to which it and the Capacity Market Seller agree or its determination of the alternative maximum EFORd if agreement is not obtained.

4. The Market Monitoring Unit shall consider the documentation provided to it by a potential Capacity Market Seller pursuant to Tariff, Attachment DD, section 6.6 of Attachment DD, and determine whether a resource owned or controlled by such Capacity Market Seller meets the criteria to qualify for an exception to the RPM must-offer requirement because the resource (i) is reasonably expected to be physically unable to participate in the relevant auction; (ii) has a financially and physically firm commitment to an external sale of its capacity; or (iii) was interconnected to the Transmission System as an Energy Resource and not subsequently converted to a Capacity Resource. The Market Monitoring Unit shall notify the Capacity Market Seller and the Office of the Interconnection of its determination by no later than ninety (90) days prior to the commencement of the offer period for the applicable RPM Auction.

In order to establish that a resource is reasonably expected to be physically unable to participate in the relevant auction as set forth in (i) above, the Capacity Market Seller must demonstrate that:

A. It has a documented plan in place to retire the resource prior to or during the Delivery Year, and has submitted a notice of Deactivation to the Office of the Interconnection consistent with Tariff, Part V, section 113.1, without regard to whether the Office of the Interconnection has requested the Capacity Market Seller to continue to operate the resource beyond its desired deactivation date in accordance with Tariff, Part V, section 113.2 for the purpose of maintaining the reliability of the PJM Transmission System and the Capacity Market Seller has agreed to do so;

B. Significant physical operational restrictions cause long term or permanent changes to the installed capacity value of the resource, or the resource is under major repair that will extend into the applicable Delivery Year, that will result in the imposition of RPM performance penalties pursuant to Tariff, Attachment DD;

C. The Capacity Market Seller is involved in an ongoing regulatory proceeding (e.g. – regarding potential environmental restrictions) specific to the resource and has received an order,

decision, final rule, opinion or other final directive from the regulatory authority that will result in the retirement of the resource; or,

D. A resource considered an Existing Generating Capacity Resource because it cleared an RPM Auction for a Delivery Year prior to the Delivery Year of the relevant auction, but which is not yet in service, is unable to achieve full commercial operation prior to the Delivery Year of the relevant auction. The Capacity Market Seller must submit to the Office of the Interconnection and the Market Monitoring Unit a written sworn, notarized statement of a corporate officer certifying that the resource will not be in full commercial operation prior to the referenced Delivery Year.

5. If a Capacity Market Seller submits for the portion of a Generation Capacity Resource that it owns or controls, and the Office of Interconnection accepts, a Sell Offer (i) at a level of installed capacity that the Market Monitoring Unit believes is inconsistent with the level established under Tariff, Attachment DD, section 5.6.6, (ii) at a level of installed capacity inconsistent with its determination of eligibility for an exception listed in section II.C.4 above, or (iii) a maximum EFORd that the Market Monitoring Unit believes is inconsistent with the maximum level determined under section II.C.3 of this Appendix, the Market Monitoring Unit may exercise its powers to inform Commission staff of its concerns and/or request a determination from the Commission that would require the Generation Capacity Resource to submit a new or revised Sell Offer, notwithstanding any determination to the contrary made under Tariff, Attachment DD, section 6.6.

The Market Monitoring Unit shall also consider the documentation provided by the Capacity Market Seller pursuant to Tariff, Attachment DD, section 6.6, for generation resources for which the Office of the Interconnection has not approved an exception to the RPM must-offer requirement as set forth in Tariff, Attachment DD, section 6.6(g), to determine whether the Capacity Market Seller's failure to offer part or all of one or more generation resources into an RPM Auction would result in an increase of greater than five percent in any Zonal Capacity Price determined through such auction as required by Tariff, Attachment DD, section 6.6(i), and shall inform both the Capacity Market Seller and the Office of the Interconnection of its determination by no later than two (2) Business Days after the close of the offer period for the applicable RPM Auction.

~~**D. Unit Specific Minimum Sell Offers:**~~

~~1. If a Capacity Market Seller timely submits an exception request, with all of the required documentation as specified in Tariff, Attachment DD, section 5.14(h), the Market Monitoring Unit shall review the request and documentation and shall provide in writing to the Capacity Market Seller and the Office of the Interconnection by no later than ninety (90) days prior the commencement of the offer period for the RPM Auction in which it seeks to submit its Sell Offer (a) its determination whether the level of the proposed Sell Offer raises market power concerns, and (b) if so it shall calculate and provide to such Capacity Market Seller a minimum Sell offer Based on the data and documentation received.~~

~~2. All data submitted to the Office of the Interconnection or the Market Monitoring Unit by a Market Participant is subject to verification by the Market Monitoring Unit.~~

~~E.~~D. Market Seller Offer Caps:

1. Based on the data and calculations submitted by the Capacity Market Sellers for each Existing Generation Capacity Resource and the formulas specified in Tariff, Attachment DD, section 6.7(d), the Market Monitoring Unit shall calculate the Market Seller Offer Cap for each such resource and provide it to the Capacity Market Seller and the Office of the Interconnection by no later than ninety (90) days before the commencement of the offer period for the applicable RPM Auction.

2. The Market Monitoring Unit must attempt to reach agreement with the Capacity Market Seller on the appropriate level of the Market Seller Offer Cap by no later than ninety (90) days prior to the commencement of the offer period for the applicable RPM Auction. If such agreement cannot be reached, then the Market Monitoring Unit shall inform the Capacity Market Seller and the Office of the Interconnection of its determination of the appropriate level of the Market Seller Offer Cap by no later than ninety (90) days prior to the commencement of the offer period for the applicable RPM Auction, and the Market Monitoring Unit may pursue any action available to it under Attachment M.

3. Nothing herein shall preclude any Capacity Market Seller and the Market Monitoring Unit from agreeing to, nor require either such entity to agree to, an alternative market seller offer cap determined on a mutually agreeable basis. Any such alternative offer cap shall be filed with the Commission for its approval. This provision is duplicated in Tariff, Attachment DD, section 6.4(a).

~~F.~~E. Mitigation of Offers from Planned Generation Capacity Resources:

Pursuant to Tariff, Attachment DD, section 6.5, the Market Monitoring Unit shall evaluate Sell Offers for Planned Generation Capacity Resources to determine whether market power mitigation should be applied and notify in writing each Capacity Market Seller whose Sell Offer has been determined to be non-competitive and subject to mitigation, with a copy to the Office of the Interconnection, by no later than one (1) Business Day after the close of the offer period for the applicable RPM Auction.

~~G.~~F. Data Submission:

Pursuant to Tariff, Attachment DD, section 6.7, the Market Monitoring Unit may request additional information from any potential auction participant as deemed necessary by the Market Monitoring Unit, including, without limitation, additional cost data on resources in a class that is not otherwise expected to include the marginal price setting resource. All data submitted to the Office of the Interconnection or the Market Monitoring Unit by a Market Participant is subject to verification by the Market Monitoring Unit.

~~H.~~G. Determination of Default Avoidable Cost Rates:

1. The Market Monitoring Unit shall conduct an annual review of the table of default Avoidable Cost Rates included in Tariff, Attachment DD, section 6.7(c) and calculated on the bases set forth therein, and determine whether the values included therein need to be updated. If the Market Monitoring Unit determines that the Avoidable Cost Rates need to be updated, it shall

provide to the Office of the Interconnection updated values or notice of its determination that updated values are not needed by no later than September 30th of each year.

2. The Market Monitoring Unit shall indicate in its posted reports on RPM performance the number of Generation Capacity Resources and megawatts per LDA that use the retirement default Avoidable Cost Rates.

3. If a Capacity Market Seller does not elect to use a default Avoidable Cost Rate and has timely provided to the Market Monitoring Unit its request to apply a unit-specific Avoidable Cost Rate, along with the data described in Tariff, Attachment DD, section 6.7, the Market Monitoring Unit shall calculate the Avoidable Cost Rate and provide a unit-specific value to the Capacity Market Seller for each such resource, and notify the Capacity Market Seller and the Office of the Interconnection in writing by no later than ninety (90) days prior to the commencement of the offer period for the applicable RPM Auction whether it agrees that the unit-specific Avoidable Cost Rate is acceptable. The Capacity Market Seller and Office of the Interconnection's deadlines relating to the submittal and acceptance of a request for a unit- specific Avoidable Cost Rate are delineated in Tariff, Attachment DD, section 6.7(d).

~~I.~~H. Determination of PJM Market Revenues:

The Market Monitoring Unit shall calculate the Projected PJM Market Revenues for any Generation Capacity Resource to which the Avoidable Cost Rate is applied pursuant to Tariff, Attachment DD, section 6.8(d), and notify the Capacity Market Seller and the Office of the Interconnection of its determination in writing by no later than ninety (90) days prior to the commencement of the offer period for the applicable RPM Auction.

~~J.~~I. Determination of Opportunity Costs:

The Market Monitoring Unit shall review and verify the documentation of prices available to Existing Generation Capacity Resources in markets external to PJM and proposed for inclusion in Opportunity Costs pursuant to Tariff, Attachment DD, section 6.7(d)(ii). The Market Monitoring Unit shall notify, in writing, such Generation Capacity Resource and the Office of the Interconnection if it is dissatisfied with the documentation provided and whether it objects to the inclusion of such Opportunity Costs in a Market Seller Offer by no later than ninety (90) days prior to the commencement of the offer period for the applicable RPM Auction. If such Generation Capacity Resource submits a Market Seller Offer that includes Opportunity Costs that have not been documented and verified to the Market Monitoring Unit's satisfaction, then the Market Monitoring Unit may exercise its powers to inform Commission staff of its concerns and request a determination that would require the Generation Capacity Resource to remove them.

III. BLACKSTART SERVICE

A. Upon the submission by a Black Start Unit owner of a request for Black Start Service revenue requirements and changes to the Black Start Service revenue requirements for the Black Start Unit, the Black Start Unit owner and the Market Monitoring Unit shall attempt to agree to values on the level of each component included in the Black Start Service revenue requirements by no later than May 14 of each year. The Market Monitoring Unit shall calculate the revenue

requirement for each Black Start Unit and provide its calculation to the Office of the Interconnection by no later than May 14 of each year.

B. Pursuant to the terms of Tariff, Schedule 6A and the PJM Manuals, the Market Monitoring Unit will analyze any requested generator black start cost changes on an annual basis and shall notify the Office of the Interconnection of any costs to which it and the Black Start Unit owner have agreed or the Market Monitoring Unit's determination regarding any cost components to which agreement has not been obtained. If a Black Start Unit owner includes a cost component inconsistent with its agreement or inconsistent with the Market Monitoring Unit's determination regarding such cost component, and the Office of the Interconnection accepts the Black Start Service revenue requirements submitted by the Black Start Unit owner, the Market Monitoring Unit may exercise its powers to inform Commission staff of its concerns and request a determination that would require the Black Start Service generator to utilize the values determined by the Market Monitoring Unit or the Office of the Interconnection or such other values as determined by the Commission.

IV. DEACTIVATION RATES

1. Upon receipt of a notice to deactivate a generating unit under Tariff, Part V from the Office of the Interconnection forwarded pursuant to Tariff, Part V, section 113.1, the Market Monitoring Unit shall analyze the effects of the proposed deactivation with regard to potential market power issues and shall notify the Office of the Interconnection and the generator owner (of, if applicable, its designated agent) within 30 days of the deactivation request if a market power issue has been identified. Such notice shall include the specific market power impact resulting from the proposed deactivation of the generating unit, as well as an initial assessment of any steps that could be taken to mitigate the market power impact.

2. The Market Monitoring Unit and the generating unit owner shall attempt to come to agreement on the level of each component included in the Deactivation Avoidable Cost Credit. In the case of cost of service filing submitted to the Commission in alternative to the Deactivation Cost Credit, the Market Monitoring Unit shall indicate to the generating unit owner in advance of filing its views regarding the proposed method or cost components of recovery. The Market Monitoring Unit shall notify the Office of the Interconnection of any costs to which it and the generating unit owner have agreed or the Market Monitoring Unit's determination regarding any cost components to which agreement has not been obtained. If a generating unit owner includes a cost component inconsistent with its agreement or inconsistent with the Market Monitoring Unit's determination regarding such cost components, the Market Monitoring Unit may exercise its powers to inform Commission staff of its concerns and seek a determination that would require the Generating unit to include an appropriate cost component. This provision is duplicated in Tariff, Part V, section 114 and Tariff, Part V, section 119.

V. OPPORTUNITY COST CALCULATION

The Market Monitoring Unit shall review requests for opportunity cost compensation under Operating Agreement, Schedule 1, section 3.2.3(f-3) and Operating Agreement, Schedule 1, section 3.2.3B(h) and the parallel provisions of Tariff, Attachment K-Appendix, section 3.2.3(f-3) and Tariff, Attachment K-Appendix, section 3.2.3B(h), discuss with the Office of the

Interconnection and individual Market Sellers the amount of compensation, and file exercise its powers to inform Commission staff of its concerns and request a determination of compensation as provided by such sections. These requirements are duplicated in Operating Agreement, Schedule 1, section 3.2.3(f-3) and Operating Agreement, Schedule 1, section 3.2.3B(h) and the paralelle provisions of Tariff, Attachment K-Appendix, section 3.2.3(f-3) and Tariff, Attachment K-Appendix, section 3.2.3B9H).

VI. FTR FORFEITURE RULE

The Market Monitoring Unit shall calculate Transmission Congestion Credits as required under Operating Agreement, Schedule 1, section 5.2.1(b) and Tariff, Attachment K-Appendix, section 5.2.1(b), including the determination of the identity of the Effective FTR Holder and an evaluation of the overall benefits accrued by an entity or affiliated entities trading in FTRs and Virtual Transactions in the Day-ahead Energy Market, and provide such calculations to the Office of the Interconnection. Nothing in this section shall preclude the Market Monitoring Unit from action to recover inappropriate benefits from the subject activity if the amount forfeited is less than the benefit derived by the Effective FTR Holder. If the Office of the Interconnection imposes a forfeiture of the Transmission Congestion Credit in an amount that the Market Monitoring Unit disagrees with, then it may exercise its powers to inform Commission staff of its concerns and request an adjustment.

VII. FORCED OUTAGE RULE

1. The Market Monitoring Unit shall observe offers submitted in the Day-ahead Energy Market to determine whether all or part of a generating unit's capacity (MW) is designated as Maximum Emergency and (i) such offer in the Real-time Energy Market designates a smaller amount of capacity from that unit as Maximum Emergency for the same time period, and (ii) there is no physical reason to designate a larger amount of capacity as Maximum Emergency in the offer in the Day-ahead Energy Market than in the Real-time Energy Market, the Market Monitoring Unit shall notify the Office of Interconnection.

2. If the Market Monitoring Unit observes that (i) an offer submitted in the Day-ahead Energy market designates all or part of capacity (MW) of a Generating unit as economic maximum that is less than the economic maximum designated in the offer in the Real-time Energy Market, and (ii) there is no physical reason to designate a lower economic maximum in the offer in the Day-ahead Energy Market than in the offer in the Real-time Energy Market, the Market Monitoring Unit shall notify the Office of Interconnection.

VIII. DATA COLLECTION AND VERIFICATION

The Market Monitoring Unit shall gather and keep confidential detailed data on the procurement and usage of fuel to produce electric power transmitted in the PJM Region in order to assist the performance of its duties under Tariff, Attachment M. To achieve this objective, the Market Monitoring Unit shall maintain on its website a mechanism that allows Members to conveniently and confidentially submit such data and develop a manual in consultation with stakeholders that describes the nature of and procedure for collecting data. Members of PJM owning a Generating unit that is located in the PJM Region (including Dynamic Transfer units), or is included in a PJM

Black Start Service plan, committed as a Generation Capacity Resource for the current or future Delivery Year, or otherwise subject to a commitment to provide service to PJM, shall provide data to the Market Monitoring Unit.

ATTACHMENT DD

Reliability Pricing Model

References to section numbers in this Attachment DD refer to sections of this Attachment DD, unless otherwise specified.

1. INTRODUCTION

This Attachment sets forth the terms and conditions governing the Reliability Pricing Model for the PJM Region. In the event of a conflict between this Attachment DD and Attachment M and its Appendix with respect to the responsibilities of the Market Monitoring Unit, the provisions of Attachment M and its Appendix shall control. As more fully set forth in this Attachment and the PJM Manuals, and in conjunction with the Reliability Assurance Agreement, the Reliability Pricing Model provides:

(a) support for LSEs in satisfying Daily Unforced Capacity Obligations for future Delivery Years through Self Supply of Capacity Resources;

(b) a competitive auction mechanism to secure the forward commitment of additional Capacity Resources and Qualifying Transmission Upgrades as necessary to satisfy the portion of LSEs' Unforced Capacity Obligations not satisfied through Self-Supply, in order to ensure the reliability of the PJM Region for future Delivery Years;

(c) long-term pricing signals for the development of Capacity Resources, including demand resources and planned generation resources, to ensure the reliability of the PJM Region;

(d) recognition for the locational benefits of Capacity Resources;

(e) deficiency charges to ensure progress toward, and fulfillment of, forward commitments by demand and generation resources to satisfy capacity requirements;

(f) measures to identify and mitigate capacity market structure deficiencies; ~~and~~

(g) a means for states to procure, outside of the auction mechanism, Capacity Resources of state public policy interest; and

~~(g)~~(h) a Reliability Backstop mechanism to ensure that sufficient generation, transmission and demand response solutions will be available to preserve system reliability.

2. [Reserved for Future Use]

3. RESPONSIBILITIES OF THE OFFICE OF THE INTERCONNECTION

3.1 Support for Self-Supply and Bilateral Transactions

The Office of the Interconnection shall:

(a) support electronic tools to facilitate communication by Market Sellers and Market Buyers of information to the Office of the Interconnection concerning Self- Supply arrangements;

(b) support an electronic bulletin board providing a forum for prospective buyers and sellers to transact Capacity Resources outside the Reliability Pricing Model Auctions, including Locational UCAP transactions (including mechanisms to allow prospective Sellers with partial-year resources to explore voluntary opportunities to combine their resources such that they can be offered together for a full Delivery Year) and support electronic tools to report bilateral capacity transactions between Market Participants to the Office of the Interconnection, in accordance with procedures set forth in the PJM Manuals; and

(c) define one or more capacity trading hubs and determine and publicize values for such hubs based on the capacity prices determined for one or more Locational Deliverability Areas, in accordance with the PJM Manuals.

3.2 Administration of the Base Residual Auction and Incremental Auctions

The Office of the Interconnection shall conduct and administer the Base Residual Auction and Incremental Auctions in accordance with this Attachment, the Operating Agreement, and the Reliability Assurance Agreement. Administration of the Base Residual Auction and Incremental Auctions shall include, but not be limited to, the following:

a) Determining the qualification of entities to become Capacity Market Sellers and Capacity Market Buyers;

b) Determining PJM Region Peak Load Forecasts and Locational Deliverability Area Reliability Requirements;

c) Determining the Minimum Annual Resource Requirements and the Minimum Extended Summer Resource Requirements for the PJM Region and applicable LDAs for Delivery Years starting June 1, 2014 and ending May 31, 2017;

d) Determining Limited Resource Constraints and Sub-Annual Resource Constraints for the 2017/2018 Delivery Year;

e) Determining Base Capacity Demand Resource Constraints and Base Capacity Resource Constraints for the 2018/2019 and 2019/2020 Delivery Years;

f) Determining the need, if any, for a Conditional Incremental Auction and providing appropriate prior notice of any such auction

g) Calculating the EFORd for each Generation Capacity Resource in the PJM Region to be used in the Third Incremental Auction;

h) Receiving Buy Bids and Sell Offers, determining Locational Deliverability Requirements and Variable Resource Requirement Curves, and determining the clearing price that reflects all such inputs;

i) Conducting settlements for auction transactions, including but not limited to rendering bills to, receiving payments from, and disbursing payments to, participants in Base Residual Auctions and Incremental Auctions.

j) Maintaining such records of Sell Offers and Buy Bids, clearing price determinations, and other aspects of auction transactions, as may be appropriate to the administration of Base Residual Auctions and Incremental Auctions; and

k) Posting of selected non-confidential data used in Reliability Pricing Model Auctions to calculate clearing prices and other auction results, as appropriate to inform market participants of auction conditions.

3.3 Records and Reports

The Office of the Interconnection shall prepare and maintain such records as are required for the administration of the Base Residual Auction and Incremental Auctions. For each auction conducted, the Office of the Interconnection shall, consistent with section 18.17 of the Operating Agreement, publish the following: (i) Zonal Capacity Prices for each LDA; (ii) Capacity Resource Clearing Prices for each LDA; (iii) Locational Price Adders; (iv) the total megawatts of Unforced Capacity that cleared; and (v) such other auction data as may be appropriate to the efficient and competitive conduct of the Base Residual Auction and Incremental Auctions. Such information shall be available on the PJM internet site through the end of the Delivery Year to which such auctions apply.

3.4 Counterparty

(a) PJMSettlement shall be the Counterparty to the transactions arising from the cleared Base Residual Auctions and Incremental Auctions; provided, however, PJMSettlement shall not be a contracting party to (i) any bilateral transactions between Market Participants, or (ii) with respect to Self-Supply for which designation of Self-Supply has been reported to the Office of the Interconnection.

(b) Charges. PJMSettlement shall be the Counterparty with respect to the obligations to pay, and the payment of, charges pursuant to this Attachment DD.

4. GENERAL PROVISIONS

4.1 Capacity Market Sellers

Only Capacity Market Sellers shall be eligible to submit Sell Offers into the Base Residual Auction and Incremental Auctions. Capacity Market Sellers shall comply with the terms and conditions of all Sell Offers, as established by the Office of the Interconnection in accordance with this Attachment, Attachment M, Attachment M - Appendix and the Operating Agreement.

4.2 Capacity Market Buyers

Only Capacity Market Buyers shall be eligible to submit Buy Bids into an Incremental Auction. Capacity Market Buyers shall comply with the terms and conditions of all Buy Bids, as established by the Office of the Interconnection in accordance with this Attachment, Attachment M, Attachment M - Appendix and the Operating Agreement.

4.3 Agents

A Capacity Market Seller may participate in a Base Residual Auction or Incremental Auction through an Agent, provided that the Capacity Market Seller informs the Office of the Interconnection in advance in writing of the appointment and authority of such Agent. A Capacity Market Buyer may participate in an Incremental Auction through an Agent, provided that the Capacity Market Buyer informs the Office of the Interconnection in advance in writing of the appointment and authority of such Agent. A Capacity Market Buyer or Capacity Market Seller participating in such an auction through an Agent shall be bound by all of the acts or representations of such Agent with respect to transactions in such auction. Any written instrument establishing the authority of such Agent shall provide that any such Agent shall comply with the requirements of this Attachment and the Operating Agreement.

4.4 General Obligations of Capacity Market Buyers and Capacity Market Sellers

Each Capacity Market Buyer and Capacity Market Seller shall comply with all laws and regulations applicable to the operation of the Base Residual and Incremental Auctions and the use of these auctions shall comply with all applicable provisions of this Attachment, Attachment M, Attachment M - Appendix, the Operating Agreement, and the Reliability Assurance Agreement, and all procedures and requirements for the conduct of the Base Residual and Incremental Auctions and the PJM Region established by the Office of the Interconnection in accordance with the foregoing.

4.5 Confidentiality

The following information submitted to the Office of the Interconnection in connection with any Base Residual Auction, Incremental Auction, Reliability Backstop Auction, or Capacity Performance Transition Incremental Auction shall be deemed confidential information for purposes of Section 18.17 of the Operating Agreement, Attachment M and Attachment M - Appendix: (i) the terms and conditions of the Sell Offers and Buy Bids; and (ii) the terms and conditions of any bilateral transactions for Capacity Resources.

4.6 Bilateral Capacity Transactions

(a) Unit-Specific Internal Capacity Bilateral Transaction Transferring All Rights and Obligations ("Section 4.6(a) Bilateral").

(i) Market Participants may enter into unit-specific internal bilateral capacity contracts for the purchase and sale of title and rights to a specified amount of installed capacity from a specific generating unit or units. Such bilateral capacity contracts shall be for the transfer of rights to capacity to and from a Market Participant and shall be reported to the Office of the Interconnection in accordance with this Attachment DD and the Office of the Interconnection's rules related to its eRPM tools.

(ii) For purposes of clarity, with respect to all Section 4.6(a) Bilateral transactions, the rights to, and obligations regarding, the capacity that is the subject of the transaction shall pass to the buyer under the contract at the location of the unit and further transactions and rights and obligations associated with such capacity shall be the responsibility of the buyer under the contract. Such obligations include any charges, including penalty charges, relating to the capacity under this Attachment DD. In no event shall the purchase and sale of the rights to capacity pursuant to a Section 4.6(a) Bilateral constitute a transaction with the Office of the Interconnection or PJMSettlement or a transaction in any auction under this Attachment DD.

(iii) All payments and related charges associated with a Section 4.6(a) Bilateral shall be arranged between the parties to the transaction and shall not be billed or settled by the Office of the Interconnection or PJMSettlement. The Office of the Interconnection, PJMSettlement, and the Members will not assume financial responsibility for the failure of a party to perform obligations owed to the other party under a Section 4.6(a) Bilateral reported to the Office of the Interconnection under this Attachment DD.

(iv) With respect to capacity that is the subject of a Section 4.6(a) Bilateral that has cleared an auction under this Attachment DD prior to a transfer, the buyer of the cleared capacity shall be considered in the Delivery Year the party to a transaction with PJMSettlement as Counterparty for the cleared capacity at the Capacity Resource Clearing Price published for the applicable auction.

(v) A buyer under a Section 4.6(a) Bilateral contract shall pay any penalties or charges associated with the capacity transferred under the contract. To the extent the capacity that is the subject of a Section 4.6(a) Bilateral contract has cleared an auction under this Attachment DD prior to a transfer, then the seller under the contract also shall guarantee and indemnify the Office of the Interconnection, PJMSettlement, and the Members for the buyer's obligation to pay any penalties or charges associated with the capacity and for which payment is not made to PJMSettlement by the buyer as determined by the Office of the Interconnection. All claims regarding a default of a buyer to a seller under a Section 4.6(a) Bilateral contract shall be resolved solely between the buyer and the seller.

(vi) To the extent the capacity that is the subject of the Section 4.6(a) Bilateral transaction already has cleared an auction under this Attachment DD, such bilateral capacity transactions shall be subject to the prior consent of the Office of the Interconnection and its

determination that sufficient credit is in place for the buyer with respect to the credit exposure associated with such obligations.

(b) Bilateral Capacity Transaction Transferring Title to Capacity But Not Transferring Performance Obligations ("Section 4.6(b) Bilateral").

(i) Market Participants may enter into bilateral capacity transactions for the purchase and sale of a specified megawatt quantity of capacity that has cleared an auction pursuant to this Attachment DD. The parties to a Section 4.6(b) Bilateral transaction shall identify (1) each unit from which the transferred megawatts are being sold, and (2) the auction in which the transferred megawatts cleared. Such bilateral capacity transactions shall transfer title and all rights with respect to capacity and shall be reported to the Office of the Interconnection on an annual basis prior to each Delivery Year in accordance with this Attachment DD and pursuant to the Office of the Interconnection's rules related to its eRPM tools. Reported transactions with respect to a unit will be accepted by the Office of the Interconnection only to the extent that the total of all bilateral sales from the reported unit (including Section 4.6(a) Bilaterals, Section 4.6(b) Bilaterals, and Locational UCAP bilaterals) do not exceed the unit's cleared unforced capacity.

(ii) For purposes of clarity, with respect to all Section 4.6(b) Bilateral transactions, the rights to the capacity shall pass to the buyer at the location of the unit(s) specified in the reported transaction. In no event shall the purchase and sale of the rights to capacity pursuant to a Section 4.6(b) Bilateral constitute a transaction with PJMSettlement or the Office of the Interconnection or a transaction in any auction under this Attachment DD.

(iii) With respect to a Section 4.6(b) Bilateral, the buyer of the cleared capacity shall be considered in the Delivery Year the party to a transaction with PJMSettlement as Coutnerparty for the cleared capacity at the Capacity Resource Clearing Price published for the applicable auction; provided, however, with respect to all Section 4.6(b) Bilateral transactions, such transactions do not effect a novation of the seller's obligations to make RPM capacity available to PJM pursuant to the terms and conditions originally agreed to by the seller; provided further, however, the buyer shall indemnify PJMSettlement, the LLC, and the Members for any failure by a seller under a Section 4.6(b) Bilateral to meet any resulting obligations, including the obligation to pay deficiency penalties and charges owed to PJMSettlement, associated with the capacity.

(iv) All payments and related charges associated with a Section 4.6(b) Bilateral shall be arranged between the parties to the contract and shall not be billed or settled by the Office of the Interconnection or PJMSettlement. The Office of the Interconnection, PJMSettlement, and the Members will not assume financial responsibility for the failure of a party to perform obligations owed to the other party under a Section 4.6(b) Bilateral capacity contract reported to the Office of the Interconnection under this Attachment DD.

(v) All claims regarding a default of a buyer to a seller under a Section 4.6(b) Bilateral shall be resolved solely between the buyer and the seller.

(c) Locational UCAP Bilateral Transactions Between Capacity Sellers.

(i) Market Participants may enter into Locational UCAP bilateral transactions which shall be reported to the Office of the Interconnection in accordance with this Attachment DD and the LLC's rules related to its eRPM tools.

(ii) For purposes of clarity, with respect to all Locational UCAP bilateral transactions, the rights to the Locational UCAP that are the subject of the Locational UCAP bilateral transaction shall pass to the buyer under the Locational UCAP bilateral contract subject to the provisions of section 5.3A. In no event, shall the purchase and sale of Locational UCAP pursuant to a Locational UCAP bilateral transaction constitute a transaction with the Office of the Interconnection or PJMSettlement, or a transaction in any auction under this Attachment DD.

(iii) A Locational UCAP Seller shall have the obligation to make the capacity available to PJM in the same manner as capacity that has cleared an auction under this Attachment DD and the Locational UCAP Seller shall have all obligations for charges and penalties associated with the capacity that is the subject of the Locational UCAP bilateral contract; provided, however, the buyer shall indemnify PJMSettlement, the LLC, and the Members for any failure by a seller to meet any resulting obligations, including the obligation to pay deficiency penalties and charges owed to PJMSettlement, associated with the capacity. All claims regarding a default of a buyer to a seller under a Locational UCAP bilateral contract shall be resolved solely between the buyer and the seller.

(iv) All payments and related charges for the Locational UCAP associated with a Locational UCAP bilateral contract shall be arranged between the parties to such bilateral contract and shall not be billed or settled by the Office of the Interconnection or PJMSettlement. The LLC, PJMSettlement, and the Members will not assume financial responsibility for the failure of a party to perform obligations owed to the other party under a Locational UCAP bilateral contract reported to the Office of the Interconnection under this Attachment DD.

(d) The bilateral transactions provided for in this section 4.6 shall be for the physical transfer of capacity to or from a Market Participant and shall be reported to and coordinated with the Office of the Interconnection in accordance with this Attachment DD and pursuant to the Office of the Interconnection's rules relating to its eRPM tools. Bilateral transactions that do not contemplate the physical transfer of capacity to and from a Market Participant are not subject to this Attachment DD and shall not be reported to and coordinated with the Office of the Interconnection.

5. CAPACITY RESOURCE COMMITMENT

5.1 Introduction

In accordance with the Reliability Assurance Agreement, each Load Serving Entity is obligated to pay a Locational Reliability Charge for each Zone in which it serves load based on the Daily Unforced Capacity Obligation of its loads in such Zone. An LSE may offset the Locational Reliability charge for a Delivery Year, in whole or in part, by: (a) Self-Supply of Capacity Resources in the Base Residual Auction or an Incremental Auction; (b) offering and clearing Capacity Resources in the Base Residual Auction or an Incremental Auction (but only to the extent of the additional resources committed to meet Unforced Capacity Obligations through such Incremental Auction); (c) receiving payments from Capacity Transfer Rights; ~~or~~ (d) offering and clearing Qualifying Transmission Upgrades in the Base Residual Auction~~.~~; or (e) matching its load to the capacity supplied by a Capacity Resource outside the RPM Auction pursuant to the FRR-RS Alternative

5.2 Nomination of Self Supplied Capacity Resources

A Capacity Market Seller, including a Load Serving Entity, may designate a Capacity Resource as Self-Supply for a Delivery year by submitting a Sell Offer for such resource in the Base Residual Auction or an Incremental Auction in accordance with the procedure and time schedule set forth in the PJM Manuals. The LSE shall indicate its intent in the Sell Offer that the Capacity Resource be deemed Self-Supply and shall indicate whether it is committing the resource regardless of clearing price or with a price bid. Any such Sell Offer shall be subject to the minimum offer price rule set forth in section 5.14(h). Upon receipt of a Self-Supply Sell Offer, the Office of the Interconnection will verify that the designated Capacity Resource is available, in accordance with Section 5.6, and, if the LSE indicated that it is committing the resource regardless of clearing price, will treat such Capacity Resource as committed in the clearing process of the Reliability Pricing Model Auction for which it was offered for such Delivery Year. To address capacity obligation quantity uncertainty associated with the Variable Resource Requirement Curve, a Load Serving Entity may submit a Sell Offer with a contingent designation of a portion of its Capacity Resources as either Self-Supply (to the extent required to meet a portion (as specified by the LSE) of the LSE's peak load forecast in each transmission zone) or as not Self-Supply (to the extent not so required) and subject to an offer price, in accordance with the PJM Manuals. PJMSettlement shall not be the Counterparty with respect to a Capacity Resource designated as Self-Supply.

5.2A Election of FRR-RS Alternative.

A Member that owns, or has the contractual authority to control the output or load reduction capability of, a Capacity Resource with an Actionable Subsidy may elect to commit that Capacity Resource, or a segment of that Capacity Resource, outside the RPM Auction by electing the FRR-RS Alternative.

a) No less than 45 days before the conduct of the Base Residual Auction for the 2022/23 Delivery Year, and no less than 120 days before the conduct of any subsequent Base Residual Auction which the FRR-RS Alternative election is to be effective, any Member seeking to elect the FRR-RS Alternative for any Capacity Resource, or segment of a Capacity Resource pursuant to Section 5.6.1(a)(ii) of Attachment DD, shall notify the Office of the Interconnection in writing of such election. The notification shall include documentation (i) certifying that the FRR-RS Resource is a Capacity Resource with Actionable Subsidy and identifying the Actionable Subsidy; and (ii) identifying the quantity of Unforced Capacity that the FRR-RS Resource will provide pursuant to the FRR-RS Alternative.

b) The notification submitted pursuant to paragraph (a) of this Section 5.2A shall also identify the Load Serving Entity or Entities that shall receive credit toward their Daily Unforced Capacity Obligation for the Unforced Capacity provided by the FRR-RS Resource. If more than one Load Serving Entity is to receive credit, then the Member electing the FRR-RS Alternative shall specify how the FRR-RS Resource's Unforced Capacity provided pursuant to the FRR-RS Alternative shall be allocated among those Load Serving Entities.

c) Notwithstanding paragraph (b) of this Section 5.2A, if the FRR-RS Resource is procured through a state-directed procurement process, and the procuring state regulatory jurisdiction has implemented retail choice, the notification pursuant to Section 5.2A(a) of Attachment DD need not identify the particular Load Serving Entity or Entities that shall receive credit toward their Daily Unforced Capacity Obligation, but instead may identify the LDA that will provide compensation to the FRR-RS Resource. The Relevant Electric Retail Regulatory Authority shall determine how to allocate an FRR-RS Resource's capacity among the Load Serving Entities subject to its jurisdiction. No later than two months before the Delivery Year, the FRR-RS Resource shall supplement the documentation submitted pursuant to Section 5.2A(a) of Attachment to indicate the Relevant Electric Retail Regulatory Authority's allocation. Nothing in this Tariff shall preclude a Relevant Electric Retail Regulatory Authority from allocating an FRR-RS Entity's capacity among Load Serving Entities subject to its jurisdiction even if the FRR-RS Entity receives compensation from a third party, including but not limited to a non-bypassable charge assessed by an Electric Distributor (as defined in the RAA) pursuant to a Relevant Electric Retail Regulatory Authority's directive. A Load Serving Entity allocated any FRR-RS capacity by the Relevant Electric Retail Regulatory Authority, or any other aggrieved party, may, at any time, exercise its rights under Section 206 of the Federal Power Act to challenge the allocation of capacity among Load Serving Entities, and/or the compensation paid to the FRR-RS Resource for its capacity, as unjust and unreasonable.

d) No later than one month before the Base Residual Auction, the Load Serving Entity or Entities to be credited with the FRR-RS Resource's capacity pursuant to Section 5.2A(b) shall confirm the quantity of capacity to be credited toward each Load Serving Entity's

Daily Unforced Capacity Obligation, or the Relevant Electric Retail Regulatory Authority that has directed the procurement of the FRR-RS Resource's capacity pursuant to Section 5.2A(c) shall confirm the quantity of capacity to be credited toward an identified LDA. In addition, the Member electing the FRR-RS Alternative shall provide documentation setting forth the compensation the FRR-RS Resource will receive for committing its capacity pursuant to the FRR-RS Alternative. Such compensation shall additionally be reported to the Commission on the FRR-RS Resource's EQR and shall be subject to the Commission's review under Section 206 of the Federal Power Act.

e) An FRR-RS Resource receiving compensation for its capacity from an affiliated LSE or Electric Distributor with captive customers may seek waiver of the Section 205 filing requirement under the FRR-RS Resource's market-based rate tariff if the transaction is undertaken at the direction of a state procurement authority or Relevant Electric Retail Regulatory Authority. However, any aggrieved party may challenge the transaction as affiliate abuse under Section 206 of the Federal Power Act.

f) The FRR-RS Resource shall be subject to the Non-Performance Charge for Capacity Performance Resources as provided in Section 10A of Attachment DD, and all other obligations of Capacity Performance Resources, including, as applicable, requirements and milestones for Planned Generation Capacity Resources and Planned Demand Resources. An FRR-RS Resource must commit unit-specific capacity. The election of the FRR-RS Alternative may not be based on a "slice of system" or similar agreements that are not unit specific.

g) An FRR-RS Resource may terminate its election of the FRR-RS Alternative effective with the commencement of any Delivery Year following the first Delivery Year by providing written notice of such termination to the Office of the Interconnection no later than two months prior to the Base Residual Auction for such Delivery Year. Absent such termination, the election of the FRR-RS Alternative in respect to a Capacity Resource shall remain in effect so long as the Capacity Resource is a Capacity Resource with Actionable Subsidy, provided that the Member electing the FRR-RS Alternative annually update the documentation required under Section 5.2A(b) and/or 5.2A(c) of Attachment DD not later than one month before the Base Residual Auction.

h) To ensure the deliverability of any FRR-RS Resource to the Load Serving Entity or Entities that shall receive credit for the FRR-RS Resource's capacity, PJM shall treat the FRR-RS Resource as a Self-Supply Resource belonging to those Load Serving Entities or future LSEs in the relevant load zone (as indicated in the documentation required under Section 5.2A(a), (b) and (c) of Attachment DD) for purposes of its auction-clearing mechanism. However, FRR-RS Resources shall not be compensated in such auction and the Load Serving Entities credited with an FRR-RS Resource's capacity shall use the value of such foregone compensation to offset the LSE's Locational Reliability Charge for the relevant Delivery Year.

i) PJMSettlement shall be the Counterparty with respect to an FRR-RS Resource for the purpose of managing the transfer accounting associated with the crediting of Load-Serving Entities for capacity supplied by an FRR-RS Resource, and shall administer the collection and payment of amounts pursuant to the allocation method and compensation set forth in the FRR-RS Entity's documentation submitted pursuant to Sections 5.2A(b) and 5.2A(c).

5.3 Commitment of Contractually Purchased Capacity Resources

A Load Serving Entity that has purchased the right to the capacity output of a generation resource and desires to commit such right as a Capacity Resource for a Delivery Year shall be considered a Capacity Market Seller. Such an LSE must submit a Sell Offer in the Base Residual Auction for such Delivery Year, in accordance with the procedure and time schedule set forth in the PJM Manuals. In such Sell Offer, the Capacity Resource offered by the LSE may be submitted as Self-Supply or with an offer price. PJMSettlement shall not be the Counterparty with respect to a Capacity Resource designated as Self-Supply.

5.3A Locational UCAP Bilateral Transactions

A Member that has committed capacity through an RPM Auction for a Delivery Year may purchase Locational UCAP as replacement capacity from a Member with available uncommitted capacity for such Delivery Year in accordance with the terms of this section and the PJM Manuals. Locational UCAP may not be sold or purchased prior to the date that the final EFORD is established for such Delivery Year, and if designated to PJM by the Locational UCAP Seller as sold prior to the Third Incremental Auction for a Delivery Year must be confirmed by the buyer prior to such Third Incremental Auction as purchased for replacement capacity, or such transaction shall be rejected. In accordance with procedures specified in the PJM Manuals, the parties to a Locational UCAP transaction must notify PJM of such transaction, which notification must specify: i) the buyer, ii) the Locational UCAP Seller, iii) the start and end dates of the transaction (which may not be retroactive), iv) the Locational UCAP amount (no less than 0.1 megawatts), v) the demand or generation resource with available uncommitted capacity that is the basis for the sale, and vi) the Locational Delivery Area in which the resource is located. The Locational UCAP Seller shall be responsible for any charges imposed under sections 7, 8, 9, 10, 10A, 11, or 13, as applicable, for such Delivery Year, with respect to the increment of capacity sold as Locational UCAP; any other settlement of charges under the Locational UCAP transaction shall be between the parties. A purchaser of Locational UCAP may not offer such capacity into an RPM Auction.

5.4 Reliability Pricing Model Auctions

The Office of the Interconnection shall conduct the following Reliability Pricing Model Auctions:

a) Base Residual Auction.

PJM shall conduct for each Delivery Year a Base Residual Auction to secure commitments of Capacity Resources as needed to satisfy the portion of the RTO Unforced Capacity Obligation not satisfied through Self-Supply of Capacity Resources for such Delivery Year. All Self-Supply Capacity Resources must be offered in the Base Residual Auction. As set forth in section 6.6, all other Capacity Resources, and certain other existing generation resources, must be offered in the Base Residual Auction. The Base Residual Auction shall be conducted in the month of May that is three years prior to the start of such Delivery Year. The cost of payments to Capacity Market Sellers for Capacity Resources that clear such auction shall be paid by PJMSettlement from amounts collected by PJMSettlement from Load Serving Entities through the Locational Reliability Charge during such Delivery Year. PJMSettlement shall be the Counterparty to the sales that clear in such auction and to the obligations to pay, and the payments, by Load Serving Entities; provided, however, that PJMSettlement shall not be a Counterparty to committed Self-Supply Capacity Resources.

b) Scheduled Incremental Auctions.

PJM shall conduct for each Delivery Year a First, a Second, and a Third Incremental Auction for the purposes set forth in section 2.34. The First Incremental Auction shall be conducted in the month of September that is twenty months prior to the start of the Delivery Year; the Second Incremental Auction shall be conducted in the month of July that is ten months prior to the start of the Delivery Year; and the Third Incremental Auction shall be conducted in the month of February that is three months prior to the start of the Delivery Year.

c) Adjustment through Scheduled Incremental Auctions of Capacity Previously Committed.

The Office of the Interconnection shall recalculate the PJM Region Reliability Requirement and each LDA Reliability Requirement prior to each Scheduled Incremental Auction, based on an updated peak load forecast, updated Installed Reserve Margin and an updated Capacity Emergency Transfer Objective; shall update such reliability requirements for the Third Incremental Auction to reflect any change from such recalculation; and shall update such reliability requirements for the First Incremental Auction or Second Incremental Auction only if the change is greater than or equal to the lesser of: (i) 500 MW or (ii) one percent of the applicable prior reliability requirement. Based on such update, the Office of the Interconnection shall, under certain conditions, seek through the Scheduled Incremental Auction to secure additional commitments of capacity or release sellers from prior capacity commitments. Specifically, the Office of the Interconnection shall:

1) seek additional capacity commitments to serve the PJM Region or an LDA if the PJM Region Reliability Requirement or LDA Reliability Requirement utilized in the most recent prior auction conducted for the Delivery Year (including any reductions to such reliability

requirements as a result of any Price Responsive Demand with a PRD Reservation Price equal to or lower than the clearing price in the Base Residual Auction for such Delivery Year) is less than, respectively, the updated PJM Region Reliability Requirement or updated LDA Reliability Requirement; provided, however, that in the First Incremental Auction or Second Incremental Auction the Office of the Interconnection shall seek such additional capacity commitments only if such shortfall is in an amount greater than or equal to the lesser of: (i) 500 MW or (ii) one percent of the applicable prior reliability requirement;

2) seek additional capacity commitments to serve the PJM Region or an LDA if:

i) the updated PJM Region Reliability Requirement less, for Delivery Years through May 31, 2018, the PJM Region Short-Term Resource Procurement Target utilized in the most recent auction conducted for the Delivery Year, or if the LDA Reliability Requirement less, for Delivery Years through May 31, 2018, the LDA Short Term Resource Procurement Target applicable to such auction, exceeds the total capacity committed in all prior auctions in such region or area, respectively, for such Delivery Year by an amount greater than or equal to the lesser of: (A) 500 MW or (B) one percent of the applicable prior reliability requirement; or

ii) PJM conducts a Conditional Incremental Auction for such Delivery Year and does not obtain all additional commitments of Capacity Resources sought in such Conditional Incremental Auction, in which case, PJM shall seek in the Incremental Auction the commitments that were sought in the Conditional Incremental Auction but not obtained.

3) seek agreements to release prior capacity commitments to the PJM Region or to an LDA if:

i) the PJM Region Reliability Requirement or LDA Reliability Requirement utilized in the most recent prior auction conducted for the Delivery Year (including any reductions to such reliability requirements as a result of any Price Responsive Demand with a PRD Reservation Price equal to or lower than the clearing price in the Base Residual Auction for such Delivery Year) exceeds, respectively, the updated PJM Region Reliability Requirement or updated LDA Reliability Requirement; provided, however, that in the First Incremental Auction or Second Incremental Auction the Office of the Interconnection shall seek such agreements only if such excess is in an amount greater than or equal to the lesser of: (A) 500 MW or (B) one percent of the applicable prior reliability requirement; or

ii) PJM obtains additional commitments of Capacity Resources in a Conditional Incremental Auction, in which case PJM shall seek release of an equal number of megawatts (comparing the total purchase amount for all LDAs and the PJM Region related to the delay in Backbone Transmission with the total sell amount for all LDAs and the PJM Region related to the delay in Backbone Transmission) of prior committed capacity that would not have been committed

had the delayed Backbone Transmission upgrade that prompted the Conditional Incremental Auction not been assumed, at the time of the Base Residual Auction, to be in service for the relevant Delivery Year; and if PJM obtains additional commitments of capacity in an incremental auction pursuant to subsection c.2.ii above, PJM shall seek in such Incremental Auction to release an equal amount of capacity (in total for all LDAs and the PJM Region related to the delay in Backbone Transmission) previously committed that would not have been committed absent the Backbone Transmission upgrade.

4) The cost of payments to Market Sellers for additional Capacity Resources cleared in such auctions, and the credits from payments from Market Sellers for the release of previously committed Capacity Resources, shall be apportioned to Load Serving Entities in the PJM Region or LDA, as applicable, through adjustments to the Locational Reliability Charge for such Delivery Year.

5) PJMSettlement shall be the Counterparty to the sales (including releases) of Capacity Resources that clear in such auctions and to the obligations to pay, and the payments, by Load Serving Entities, provided, however, that PJMSettlement shall not be a Counterparty to committed Self-Supply Capacity Resources.

d) Commitment of Replacement Capacity through Scheduled Incremental Auctions.

Each Scheduled Incremental Auction for each Delivery Year shall allow Capacity Market Sellers that committed Capacity Resources in any prior Reliability Pricing Model Auction for such Delivery Year to submit Buy Bids for replacement Capacity Resources. Capacity Market Sellers that submit Buy Bids into an Incremental Auction must specify the type of Unforced Capacity desired, i.e., Annual Resource, Extended Summer Demand Resource, or Limited Demand Resource. The need to purchase replacement Capacity Resources may arise for any reason, including but not limited to resource retirement, resource cancellation or construction delay, resource derating, EFORd increase, a decrease in the Nominated Demand Resource Value of a Planned Demand Resource, delay or cancellation of a Qualifying Transmission Upgrade, or similar occurrences. The cost of payments to Capacity Market Sellers for Capacity Resources that clear such auction shall be paid by PJMSettlement from amounts collected by PJMSettlement from Capacity Market Buyers that purchase replacement Capacity Resources in such auction. PJMSettlement shall be the Counterparty to the sales and purchases that clear in such auction, provided, however, PJMSettlement shall not be a Counterparty to committed Self-Supply Capacity Resources.

e) Conditional Incremental Auction.

PJM shall conduct for any Delivery Year a Conditional Incremental Auction if the in service date of a Backbone Transmission Upgrade that was modeled in the Base Residual Auction is announced as delayed by the Office of the Interconnection beyond July 1 of the Delivery Year for which it was modeled and if such delay causes a reliability criteria violation. If conducted, the Conditional Incremental Auction shall be for the purpose of securing commitments of additional capacity for the PJM Region or for any LDA to address the identified reliability criteria violation. If PJM determines to conduct a Conditional Incremental Auction, PJM shall

post on its website the date and parameters for such auction (including whether such auction is for the PJM Region or for an LDA, and the type of Capacity Resources required) at least one month prior to the start of such auction. The cost of payments to Market Sellers for Capacity Resources cleared in such auction shall be collected by PJMSettlement from Load Serving Entities in the PJM Region or LDA, as applicable, through an adjustment to the Locational Reliability Charge for such Delivery Year. PJMSettlement shall be the Counterparty to the sales that clear in such auction and to the obligations to pay, and payments, by Load Serving Entities, provided, however, that PJMSettlement shall not be a Counterparty to committed Self- Supply Capacity Resources.

5.5 Eligibility for Participation in RPM Auctions

A Capacity Market Seller may submit a Sell Offer for a Capacity Resource in a Base Residual Auction, Incremental Auction, or Capacity Performance Transition Incremental Auction only if such seller owns or has the contractual authority to control the output or load reduction capability of such resource and has not transferred such authority to another entity prior to submitting such Sell Offer. Capacity Resources must satisfy the capability and deliverability requirements of Schedules 9 and 10 of the PJM Reliability Assurance Agreement, the requirements for Demand Resources or Energy Efficiency Resources in Attachment DD-1 and Schedule 6 of the Reliability Assurance Agreement, as applicable, and, for the 2018/2019 Delivery Year and subsequent Delivery Years, the criteria in section 5.5A.

5.5A Capacity Resource Types

(a) Capacity Performance Resources

Capacity Performance Resources are Capacity Resources which, to the extent such resources cleared in a Reliability Pricing Model Auction or are otherwise committed as a Capacity Resource, are obligated to deliver energy during the relevant Delivery Year as scheduled and/or dispatched by the Office of Interconnection during the Performance Assessment Hours. As further detailed in Section 10A of this Attachment, Capacity Performance Resources that fail to meet this obligation will be subject to a Non-Performance Charge, unless excused pursuant to Section 10A(d) of this Attachment. Subject to 5.5A(a)(i), the following types of Capacity Resources are eligible to submit a Sell Offer as a Capacity Performance Resource: internal or external Generation Capacity Resources; Annual Demand Resources; Capacity Storage Resources; Annual Energy Efficiency Resources; and Qualifying Transmission Upgrades. To the extent the underlying Capacity Resource is an external Generation Capacity Resource, such resource must meet, *to the extent subsection (b) or (c) of this section is applicable to offers from such resource, meet the applicable requirements of such subsection, and if neither subsection (b) or (c) is applicable, then offers from such resource must* the criteria for obtaining an exception to the Capacity Import Limit as contained in article 1 of the Reliability Assurance Agreement.

(i) Process for Support and Review of Capacity Performance Resource Offers

A. The Capacity Market Seller shall provide to the Office of the Interconnection and the Market Monitoring Unit, upon their request, all supporting data and information requested by either the Office of the Interconnection or the Market Monitoring Unit to evaluate whether the underlying Capacity Resource can meet the operational and performance requirements of Capacity Performance Resources. The Capacity Market Seller shall have an ongoing obligation through the closing of the offer period for the RPM Auction to update the request to reflect any material changes.

B. The Office of the Interconnection and the Market Monitoring Unit shall review any requested supporting data and information, and the Office of the Interconnection, considering advice and recommendation from the Market Monitoring Unit, shall reject a request for a resource to offer as a Capacity Performance Resource if the Capacity Market Seller does not demonstrate that it can reasonably be expected to meet its Capacity Performance obligations consistent with the resource's offer by the relevant Delivery Year. The Office of Interconnection shall provide its determination to reject eligibility of the resource as a Capacity Performance Resource, and notify the Market Monitoring Unit, by no later than sixty-five (65) days prior to the date on which the offer period for the applicable RPM Auction commences. A Capacity Market Seller that is dissatisfied with any determination hereunder may seek any remedies available to it from FERC; provided, however, that the Office of the Interconnection will proceed with administration of the Tariff and market rules unless and until ordered to do otherwise by FERC.

(b) Offers from External Generation Capacity Resources for the 2020/2021 Delivery Year and Subsequent Delivery Years—General Rule

For the 2020/2021 Delivery Year and any subsequent Delivery Year and for Capacity Performance Resource Sell Offers in any RPM Auction conducted for the 2018/2019 Delivery Year or 2019/2020 Delivery Year after May 9, 2017, unless excepted pursuant to subsection (c) below, a Capacity Market Seller may submit a Sell Offer for an external Generation Capacity Resource in an RPM Auction if the Capacity Market Seller demonstrates to PJM, by no later than five (5) business days prior to the commencement of the offer period for the relevant RPM Auction, that such resource meets all of the following requirements:

(i) The Capacity Market Seller has obtained a determination that the Pseudo-Tie required for its external Generation Capacity Resource is feasible, including (without limitation) that such Pseudo-Tie meets the following requirements:

(A) meets the Electrical Distance requirements established in the PJM Manuals for Pseudo-Ties;

(B) at least one generation resource that has a historic economic minimum offer lower than its historic economic maximum offer, located inside the metered boundaries of the PJM Region, has a minimum flow distribution impact at the level specified in the PJM Manuals on each eligible coordinated flowgate resulting from such Pseudo-Tie;

(C) each external entity with which PJM may be required to coordinate flowgates under an agreed congestion management process maintains a network model that produces results for such flowgates that are within two percent of the results produced by the PJM network model for such flowgates;

(D) the Capacity Market Seller has secured written acknowledgement from the external Balancing Authority Areas that such Pseudo-Tie does not require tagging and that firm allocations associated with any coordinated flowgates applicable to the external Generation Capacity Resource under any agreed congestion management process then in effect between PJM and such Balancing Authority Area will be allocated to PJM.

and the Capacity Market Seller has committed in writing that it will take all steps necessary to implement such Pseudo-Tie prior to the start of the relevant Delivery Year;

(ii) it has, for transmission outside PJM, obtained long-term firm point-to-point transmission service (evaluated for deliverability from the unit-specific physical location of the resource to PJM load pursuant to a study that is reviewed and approved by PJM in accordance with PJM deliverability criteria to ensure uniformity for internal and external resource deliverability requirements), with rollover rights for the term of the transmission service that is confirmed by the Balancing Authority for the Balancing Authority Area where such resource is geographically located; and, as to transmission within PJM, has obtained Network External Designated Transmission Service; and

(iii) it is, by written commitment of the Capacity Market Seller, subject to the same obligations imposed on Generation Capacity Resources located in the PJM Region by Tariff, Attachment DD, section 6.6 to offer their capacity into RPM Auctions.

A Capacity Market Seller that satisfies the above requirements with respect to an external Generation Capacity Resource Sell Offer submitted in an RPM Auction for a Delivery Year shall be required to demonstrate satisfaction of such requirements for any Sell Offer with respect to such resource submitted in an RPM Auction for any subsequent Delivery Year, including, without limitation, demonstration that the required external transmission service continues to satisfy PJM's deliverability standards.

(c) Offers from external Generation Capacity Resources for the 2020/2021 Delivery Year and Subsequent Delivery Years—Exception.

A Capacity Market Seller of a Prior CIL Exception External Resource may continue to submit Sell Offers for such resource for any RPM Auction for any Delivery Year up to and including the 2021/2022 Delivery Year (or, solely for any such resource that is (1) owned by a Load Serving Entity and used to self-supply (under arrangements initiated before June 1, 2016, with a duration of at least ten years) such entity's PJM Region load or (2) the subject of a contract for energy or capacity or equivalent written agreement entered into on or before June 1, 2016 for a term of ten years or longer with a purchaser that is an internal PJM load customer, for any Delivery Year during the life of such resource for subparagraph (1) or for the term of the agreement under subparagraph (2)) so long as it continues to comply with all conditions on the grant of its exception to the Capacity Import Limit, subject to the following additional conditions:

(i) for any Delivery Year, beginning with the 2017/2018 Delivery Year, for which such Prior CIL Exception External Resource has cleared an RPM Auction, PJM may in its sole judgment determine that the resource is not Operationally Deliverable for such Delivery Year because it does not satisfy the requirements of subsection (b). If PJM determines a Prior CIL Exception External Resource is not Operationally Deliverable for a Delivery Year, it must notify the Capacity Market Seller of its determination by no later than October 1 immediately preceding such Delivery Year. After receiving such notice, the Capacity Market Seller may elect to:

(A) take the necessary actions to make the Prior CIL Exception External Resource Operationally Deliverable, in PJM's sole judgment, prior to the beginning of such Delivery Year, provided that PJM will, if transmission upgrades are required to make such resource Operationally Deliverable, facilitate the performance of transmission studies and otherwise cooperate with the external Transmission Provider of the system on which such upgrades are required to identify the upgrades required to meet PJM's deliverability standards;

(B) be relieved of its capacity obligation for such Delivery Year, with no entitlement to any capacity revenues based on such resource, with no requirement to seek replacement for such capacity for such Delivery Year, with no penalty for non-performance or lack of commitment for such Delivery Year, and with no further must-offer obligation that would otherwise arise solely from clearing such capacity for such Delivery Year; or

(C) procure, by purchase or otherwise, replacement in a sufficient quantity to replace the capacity that would have been provided by the Prior CIL

Exception External Resource but for PJM's determination that such resource is not Operationally Deliverable.

(ii) Such Capacity Market Seller's continued ability to offer such resource under this exception is conditioned on external Transmission Providers continuing to honor the firm status of the Capacity Market Seller's transmission service for all Delivery Years for which such seller offers such resource under the exceptions provided in this subsection (c).

(iii) A Capacity Market Seller offering and clearing a Prior CIL Exception External Resource pursuant to this subsection (c) shall be relieved of its must-offer obligation that would otherwise arise solely from clearing such capacity. Such relief of the must-offer obligation shall be for any Delivery Year after the last Delivery Year for which it is permitted to offer such resource under this subsection (c).

(d) Base Capacity Resources

For the 2018/2019 and 2019/2020 Delivery Years, following types of Capacity Resources eligible to submit a Sell Offer as a Base Capacity Resource: Generation Capacity Resources, Capacity Storage Resources, Annual Demand Resources, Base Capacity Demand Resources, and Base Capacity Energy Efficiency Resources. Each resource that clears a RPM Auction as a Base Capacity Resource must provide energy output to PJM if called during Performance Assessment Hours occurring in the calendar months of June through September, including any necessary recall of such capacity and energy from service to areas outside the PJM Region. As further detailed in Section 10A of this Attachment, Base Capacity Resources that fail to meet this obligation will be subject to a Non-Performance Charge, unless excused pursuant to Section 10A(d) of this section.

(e) Seasonal Capacity Performance Resource

For the 2020/2021 Delivery Year and subsequent Delivery Years, a Seasonal Capacity Performance Resource shall mean a Summer-Period Capacity Performance Resource or Winter-Period Capacity Performance Resource, as defined below.

i) Summer-Period Capacity Performance Resource

For the 2020/2021 Delivery Year and subsequent Delivery Years, the following types of Capacity Resources are eligible to submit a Sell Offer as a Summer-Period Capacity Performance Resource: Summer Period Demand Resource, Summer-Period Energy Efficiency Resource, and Capacity Storage Resource, Intermittent Resource, or Environmentally-Limited Resource that has an average expected energy output during summer peak-hour periods consistently and measurably greater than its average expected energy output during winter peakhour periods. To the extent such resource clears an RPM Auction or is otherwise committed as a Summer-Period Capacity Performance Resource, it is obligated to deliver energy as scheduled and/or dispatched by the Office of Interconnection during Performance Assessment Hours occurring in the calendar months of June through October and the following May of the Delivery Year, and must satisfy the requirements of a Capacity Performance Resource for such period of time. As further

detailed in section 10A of this Attachment, Summer-Period Capacity Performance Resources that fail to meet this obligation will be subject to a Non-Performance Charge, unless excused pursuant to section 10A(d) of this Attachment.

ii) Winter-Period Capacity Performance Resource

For the 2020/2021 Delivery Year and subsequent Delivery Years, the following types of Capacity Resources are eligible to submit a Sell Offer as a Winter-Period Capacity Performance Resource: Capacity Storage Resource, Intermittent Resource, and Environmentally-Limited Resource that has an average expected energy output during winter peak-hour periods consistently and measurably greater than its average expected energy output during summer peak-hour periods. To the extent such resource clears an RPM Auction or is otherwise committed as a Winter-Period Capacity Performance Resource, it is obligated to deliver energy as scheduled and/or dispatched by the Office of Interconnection during Performance Assessment Hours occurring in the calendar months of November through April of the Delivery Year, and must satisfy the requirements of a Capacity Performance Resource for such period of time. As further detailed in section 10A of this Attachment, Winter-Period Capacity Performance Resources that fail to meet this obligation will be subject to a Non-Performance Charge, unless excused pursuant to section 10A(d) of this Attachment.

5.6 Sell Offers

Sell Offers shall be submitted or withdrawn via the internet site designated by the Office of the Interconnection, under the procedures and time schedule set forth in the PJM Manuals.

5.6.1 Specifications

A Sell Offer shall state quantities in increments of 0.1 megawatts and shall specify, as appropriate:

a) Identification of the Generation Capacity Resource, Demand Resource, Capacity Storage Resource or Energy Efficiency Resource on which such Sell Offer is based;

b) Minimum and maximum megawatt quantity of installed capacity that the Capacity Market Seller is willing to offer (notwithstanding such specification, the product offered shall be Unforced Capacity), or designate as Self-Supply, from a Generation Capacity Resource;

i) Price, in dollars and cents per megawatt-day, that will be accepted by the Capacity Market Seller for the megawatt quantity of Unforced Capacity offered from such Generation Capacity Resource.

ii) The Sell Offer may take the form of offer segments with varying price-quantity pairs for varying output levels from the underlying resource, but may not take the form of an offer curve with nonzero slope.

c) EFORd of each Generation Capacity Resource offered.

i) If a Capacity Market Seller is offering such resource in a Base Residual Auction, First Incremental Auction, Second Incremental Auction, or Conditional Incremental Auction occurring before the Third Incremental Auction, the Capacity Market Seller shall specify the EFORd to apply to the offer.

ii) If a Capacity Market Seller is committing the resource as Self-Supply, the Capacity Market Seller shall specify the EFORd to apply to the commitment.

iii) The EFORd applied to the Third Incremental Auction will be the final EFORd established by the Office of the Interconnection six (6) months prior to the Delivery Year, based on the actual EFORd in the PJM Region during the 12-month period ending September 30 that last precedes such Delivery Year.

d) The Nominated Demand Resource Value for each Demand Resource offered and the Nominated Energy Efficiency Value for each Energy Efficiency Resource offered. The Office of the Interconnection shall, in both cases, convert such value to an Unforced Capacity basis by multiplying such value by the DR Factor (for Delivery Years through May 31, 2018) times the Forecast Pool Requirement. Demand Resources shall specify the LDA in which the Demand Resource is located, including the location of such resource within any Zone that includes more than one LDA as identified on Schedule 10.1 of the RAA.

e) For Delivery Years through May 31, 2018, a Demand Resource with the potential to qualify as two or more of a Limited Demand Resource, Extended Summer Demand Resource or Annual Demand Resource may submit separate but coupled Sell Offers for each Demand Resource type for which it qualifies at different prices and the auction clearing algorithm will select the Sell Offer that yields the least-cost solution. For such coupled Demand Resource offers, the offer price of an Annual Demand Resource offer must be at least $.01 per MW-day greater than the offer price of a coupled Extended Summer Demand Resource offer and the offer price of a Extended Summer Demand Resource offer must be at least $.01 per MW-day greater than the offer price of a coupled Limited Demand Resource offer.

f) For a Qualifying Transmission Upgrade, the Sell Offer shall identify such upgrade, and the Office of the Interconnection shall determine and certify the increase in CETL provided by such upgrade. The Capacity Market Seller may offer the upgrade with an associated increase in CETL to an LDA in accordance with such certification, including an offer price that will be accepted by the Capacity Market Seller, stated in dollars and cents per megawatt-day as a price difference between a Capacity Resource located outside such an LDA and a Capacity Resource located inside such LDA; and the increase in CETL into such LDA to be provided by such Qualifying Transmission Upgrade, as certified by the Office of the Interconnection.

g) For the 2018/2019 and 2019/2020 Delivery Years, each Capacity Market Seller owning or controlling a resource that qualifies as both a Base Capacity Resource and a Capacity Performance Resource may submit separate but coupled Sell Offers for such resource as a Base Capacity Resource and as a Capacity Performance Resource, at different prices, and the auction clearing algorithm will select the Sell Offer that yields the least-cost solution. Submission of a coupled Base Capacity Resource Sell Offer shall be mandatory for any Capacity Performance Resource Sell Offer that exceeds a Sell Offer Price equal to the applicable Net Cost of New Entry times the Balancing Ratio as provided for in section 6.4. For such coupled Sell Offers, the offer price of a Capacity Performance Resource offer must be at least $.01 per MW-day greater than the offer price of a coupled Base Capacity Resource offer.

(h) For the 2018/2019 Delivery Year and subsequent Delivery Years, a Capacity Market Seller that owns or controls one or more Capacity Storage Resources, Intermittent Resources, Demand Resources, or Energy Efficiency Resources may submit a Sell Offer as a Capacity Performance Resource in a MW quantity consistent with their average expected output during peak-hour periods. Alternatively, for the 2018/2019 Delivery Year and subsequent Delivery Years, a Capacity Market Seller that owns or controls one or more Capacity Storage Resources, Intermittent Resources, Demand Resources, Energy Efficiency Resources, or Environmentally-Limited Resources may submit a Sell Offer which represents the aggregated Unforced Capacity value of such resources, where such Sell Offer shall be considered to be located in the smallest modeled LDA common to the aggregated resources. Such aggregated resources shall be owned by or under contract to the Capacity Market Seller, including all such resources obtained through bilateral contract and reported to the Office of the Interconnection in accordance with the Office of the Interconnection's rules related to its eRPM tools. For the 2018/2019 and 2019/2020 Delivery Years, any such offer may be submitted as Capacity Performance Resource, Base Capacity Resource, or as a coupled offer for Capacity Performance Resource and Base Capacity Resource, provided that, for any such coupled Sell Offers, the offer price of a Capacity Performance Resource offer must be at least $.01 per MW-day greater than the offer price of a

coupled Base Capacity Resource offer. For the 2020/2021 Delivery Year and subsequent Delivery Years, any such offer must be submitted as a Capacity Performance Resource.

(i) For the 2020/2021 Delivery Year and subsequent Delivery Years, a Capacity Market Seller that owns or controls a resource that qualifies as a Summer-Period Capacity Performance Resource may submit a Sell Offer as a Capacity Performance Resource in a MW quantity consistent with the average expected output of such resource during peak-hour periods, and may submit a separate Sell Offer as a Summer-Period Capacity Performance Resource in a MW quantity consistent with the average expected output of such resource during summer peak-hour periods, provided the total Sell Offer MW quantity submitted as both a Capacity Performance Resource and a Summer-Period Capacity Performance Resource does not exceed the Unforced Capacity value of the resource. For the 2020/2021 Delivery Year and subsequent Delivery Years, a Capacity Market Seller that owns or controls a resource that qualifies as a Winter-Period Capacity Performance Resource may submit a Sell Offer as a Capacity Performance Resource in a MW quantity consistent with the average expected output of such resource during peak-hour periods, and may submit a separate Sell Offer as a Winter-Period Capacity Performance Resource in a MW quantity consistent with the average expected output of such resource during winter peak-hour periods, provided the total Sell Offer MW quantity submitted as both a Capacity Performance Resource and a Winter-Period Capacity Performance Resource does not exceed the Unforced Capacity value of the resource. Each segment of a Seasonal Capacity Performance Resource Sell Offer must be submitted as a flexible Sell Offer segment with the minimum MW quantity offered set to zero.

5.6.2 Compliance with PJM Credit Policy

Capacity Market Sellers shall comply with the provisions of the PJM Credit Policy as set forth in Attachment Q to this Tariff, including the provisions specific to the Reliability Pricing Model, prior to submission of Sell Offers in any Reliability Pricing Model Auction. A Capacity Market Seller desiring to submit a Credit-Limited Offer shall specify in its Sell Offer the maximum auction credit requirement, in dollars, and the maximum amount of Unforced Capacity, in megawatts, applicable to its Sell Offer.

5.6.3 [reserved]

5.6.4 Qualifying Transmission Upgrades

A Qualifying Transmission Upgrade may not be the subject of any Sell Offer in a Base Residual Auction unless it has been approved by the Office of the Interconnection, including certification of the increase in Import Capability to be provided by such Qualifying Transmission Upgrade, no later than 45 days prior to such Base Residual Auction. No such approval shall be granted unless, at a minimum, a Facilities Study Agreement has been executed with respect to such upgrade, and such upgrade conforms to all applicable standards of the Regional Transmission Expansion Plan process.

5.6.5 Market-based Sell Offers

Subject to section 6, a Market Seller authorized by FERC to sell electric generating capacity at market-based prices, or that is not required to have such authorization, may submit Sell Offers that specify market-based prices in any Base Residual Auction or Incremental Auction.

5.6.6 Availability of Capacity Resources for Sale

(a) The Office of the Interconnection shall determine the quantity of megawatts of available installed capacity that each Capacity Market Seller must offer in any RPM Auction pursuant to Section 6.6 of Attachment DD, through verification of the availability of megawatts of installed capacity from: (i) all Generation Capacity Resources owned by or under contract to the Capacity Market Seller, including all Generation Capacity Resources obtained through bilateral contract; (ii) the results of prior Reliability Pricing Model Auctions, if any, for such Delivery Year (including consideration of any restriction imposed as a consequence of a prior failure to offer); and (iii) such other information as may be available to the Office of the Interconnection. The Office of the Interconnection shall reject Sell Offers or portions of Sell Offers for Capacity Resources in excess of the quantity of installed capacity from such Capacity Market Seller's Capacity Resource that it determines to be available for sale.

(b) The Office of the Interconnection shall determine the quantity of installed capacity available for sale in a Base Residual Auction or Incremental Auction as of the beginning of the period during which Buy Bids and Sell Offers are accepted for such auction, as applicable, in accordance with the time schedule set forth in the PJM Manuals. Removal of a resource from Capacity Resource status shall not be reflected in the determination of available installed capacity unless the associated unit-specific bilateral transaction is approved, the designation of such resource (or portion thereof) as a network resource for the external load is demonstrated to the Office of the Interconnection, or equivalent evidence of a firm external sale is provided prior to the deadline established therefor. The determination of available installed capacity shall also take into account, as they apply in proportion to the share of each resource owned or controlled by a Capacity Market Seller, any approved capacity modifications, and existing capacity commitments established in a prior RPM Auction, an FRR Capacity Plan, Locational UCAP transactions and/or replacement capacity transactions under this Attachment DD. To enable the Office of the Interconnection to make this determination, no bilateral transactions for Capacity Resources applicable to the period covered by an auction will be processed from the beginning of the period for submission of Sell Offers and Buy Bids, as appropriate, for that auction until completion of the clearing determination for such auction. Processing of such bilateral transactions will reconvene once clearing for that auction is completed. A Generation Capacity Resource located in the PJM Region shall not be removed from Capacity Resource status to the extent the resource is committed to service of PJM loads as a result of an RPM Auction, FRR Capacity Plan, Locational UCAP transaction and/or by designation as a replacement resource under this Attachment DD.

(c) In order for a bilateral transaction for the purchase and sale of a Capacity Resource to be processed by the Office of the Interconnection, both parties to the transaction must notify the Office of the Interconnection of the transfer of the Capacity Resource from the seller to the buyer in accordance with procedures established by the Office of the Interconnection and set forth in the PJM Manuals. If a material change with respect to any of the prerequisites for the application of Section 5.6.6 to the Generation Capacity Resource occurs, the Capacity Resource Owner shall immediately notify the Market Monitoring Unit and the Office of the Interconnection.

5.7 Buy Bids

Buy Bids may be submitted in any Incremental Auction. Buy Bids shall specify, as appropriate:

a) The quantity of Unforced Capacity desired, in increments of 0.1 megawatt;

b) The maximum price, in dollars and cents per megawatt per day, that will be paid by the buyer for the megawatt quantity of Unforced Capacity desired;

c) The type of Unforced Capacity desired, i.e., Annual Resource, Extended Summer Demand Resource, or Limited Demand Resource; and

d) The desired LDA for a replacement Capacity Resource. In the event of delay or cancellation of a Qualifying Transmission Upgrade, the Buy Bid shall specify Capacity Resources in the LDA for which such Qualifying Transmission Upgrade was to increase CETL.

5.8 Submission of Sell Offers and Buy Bids

The Office of the Interconnection shall evaluate and accept or reject Sell Offers and Buy Bids submitted by Capacity Market Sellers on the basis of the following requirements and criteria:

a) A Sell Offer or Buy Bid that fails to specify a positive megawatt quantity shall be rejected by the Office of the Interconnection.

b) A Buy Bid that fails to specify price shall be rejected by the Office of the Interconnection. A Sell Offer that fails to either designate such offer as self-scheduled or to specify an offer price shall be rejected by the Office of the Interconnection.

c) A Buy Bid that fails to designate the type of Unforced Capacity desired, i.e., an Annual Resource, Extended Summer Demand Resource, or Limited Demand Resource, shall be rejected by the Office of the Interconnection.

d) All Sell Offers and Buy Bids must be received by the Office of the Interconnection during a specified period, as determined by the Office of the Interconnection, in accordance with the PJM Manuals. A Sell Offer or Buy Bid may be withdrawn by a notification of withdrawal received by the Office of the Interconnection at any time during the foregoing period, but may not be withdrawn after such period.

e) Sell Offers or Buy Bids shall be submitted or withdrawn via the Internet site designated by the Office of the Interconnection; provided, however, that if the Internet site cannot be accessed at any time during the period specified for the applicable auction, a Sell Offer or Buy Bid may be submitted or withdrawn by electronic mail transmitted to the e-mail address, or faxed to the fax number specified by the Office of the Interconnection.

f) Sell Offers must be based on the Capacity Market Seller's Capacity Resource position at the opening of the auction's bidding window.

g) The Office of the Interconnection shall accept a Sell Offer only up to the megawatt amount of installed capacity of Capacity Resources owned or controlled by such Capacity Market Seller that has not previously been committed for the applicable Delivery Year.

h) No Sell Offer shall be accepted from an FRR Entity unless it meets the requirements applicable to such offers under Schedule 8.1 of the Reliability Assurance Agreement.

i) The Office of the Interconnection shall have final authority to determine whether to accept or reject a Sell Offer in accordance with the terms of the Tariff and the PJM Manuals.

j) A Capacity Market Seller and Capacity Market Buyer may submit any Sell Offer or Buy Bid, respectively, that it chooses or make a decision not to offer a committed resource, provided that the Office of the Interconnection determines that: (i) the Capacity Market Seller has participated in the review process conducted by the Market Monitoring Unit (without regard to whether an agreement is obtained) if required by the Tariff; (ii) the Sell Offer is no higher, in the case of seller market power, or lower, in the case of buyer side market power, than the level to which the Capacity Market Seller has committed or agreed in the course of its participation in such

review process; and (iii) the Sell Offer or Buy Bid is compliant with the Tariff and PJM Manuals. Capacity Market Sellers and Capacity Market Buyers assume exclusive responsibility for their Sell Offers and Buy Bids, respectively, and any adverse findings at the Commission related to its Sell Offers and Buy Bids.

5.9 Time Standard

All deadlines for the submission or withdrawal of Sell Offers or Buy Bids, or for other purposes specified in this Attachment, shall be determined by the prevailing time observed in the Eastern Time zone.

5.10 Auction Clearing Requirements

The Office of the Interconnection shall clear each Base Residual Auction and Incremental Auction for a Delivery Year in accordance with the following:

a) Variable Resource Requirement Curve

The Office of the Interconnection shall determine Variable Resource Requirement Curves for the PJM Region and for such Locational Deliverability Areas as determined appropriate in accordance with subsection (a)(iii) for such Delivery Year to establish the level of Capacity Resources that will provide an acceptable level of reliability consistent with the Reliability Principles and Standards. It is recognized that the variable resource requirement reflected in the Variable Resource Requirement Curve can result in an optimized auction clearing in which the level of Capacity Resources committed for a Delivery Year exceeds the PJM Region Reliability Requirement (for Delivery Years through May 31, 2018, less the Short-Term Resource Procurement Target) or Locational Deliverability Area Reliability Requirement (for Delivery Year through May 31, 2018, less the Short-Term Resource Procurement Target for the Zones associated with such LDA) for such Delivery Year. For any auction, the Updated Forecast Peak Load, and Short-Term Resource Procurement Target applicable to such auction, shall be used, and Price Responsive Demand from any applicable approved PRD Plan, including any associated PRD Reservation Prices, shall be reflected in the derivation of the Variable Resource Requirement Curves, in accordance with the methodology specified in the PJM Manuals.

i) Methodology to Establish the Variable Resource Requirement Curve

Prior to the Base Residual Auction, in accordance with the schedule in the PJM Manuals, the Office of the Interconnection shall establish the Variable Resource Requirement Curve for the PJM Region as follows:

- Each Variable Resource Requirement Curve shall be plotted on a graph on which Unforced Capacity is on the x-axis and price is on the y-axis;
- For the 2015/2016, 2016/2017, and 2017/2018 Delivery Years, the Variable Resource Requirement Curve for the PJM Region shall be plotted by combining (i) a horizontal line from the y-axis to point (1), (ii) a straight line connecting points (1) and (2), (iii) a straight line connecting points (2) and (3), and (iv) a vertical line from point (3) to the x-axis, where:
    - • For point (1), price equals: {the greater of [the Cost of New Entry] or [1.5 times (the Cost of New Entry minus the Net Energy and Ancillary Service Revenue Offset)]} divided by (one minus the pool-wide average EFORd) and Unforced Capacity equals: [the PJM Region Reliability Requirement multiplied by (100% plus the approved PJM Region Installed Reserve Margin ("IRM")% minus 3%) divided by (100% plus IRM%)], and for Delivery Years through May 31, 2018, minus the Short-Term Resource Procurement Target;

- For point (2), price equals: (the Cost of New Entry minus the Net Energy and Ancillary Service Revenue Offset) divided by (one minus the pool-wide average EFORd) and Unforced Capacity equals: [the PJM Region Reliability Requirement multiplied by (100% plus IRM% plus 1%) divided by (100% plus IRM%)], and for Delivery Years through May 31, 2018, minus the Short-Term Resource Procurement Target; and

- For point (3), price equals [0.2 times (the Cost of New Entry minus the Net Energy and Ancillary Service Revenue Offset)] divided by (one minus the pool-wide average EFORd) and Unforced Capacity equals: [the PJM Region Reliability Requirement multiplied by (100% plus IRM% plus 5%) divided by (100% plus IRM%)], and for Delivery Years through May 31, 2018, minus the Short-Term Resource Procurement Target;

- For the 2018/2019 Delivery Year and subsequent Delivery Years, the Variable Resource Requirement Curve for the PJM Region shall be plotted by combining (i) a horizontal line from the y-axis to point (1), (ii) a straight line connecting points (1) and (2), and (iii) a straight line connecting points (2) and (3), where:

  - For point (1), price equals: {the greater of [the Cost of New Entry] or [1.5 times (the Cost of New Entry minus the Net Energy and Ancillary Service Revenue Offset)]} divided by (one minus the pool-wide average EFORd) and Unforced Capacity equals: [the PJM Region Reliability Requirement multiplied by (100% plus the approved PJM Region Installed Reserve Margin ("IRM")% minus 0.2%) divided by (100% plus IRM%)] minus the Short-Term Resource Procurement Target;

  - For point (2), price equals: [0.75 times (the Cost of New Entry minus the Net Energy and Ancillary Service Revenue Offset)] divided by (one minus the pool-wide average EFORd) and Unforced Capacity equals: [the PJM Region Reliability Requirement multiplied by (100% plus IRM% plus 2.9%) divided by (100% plus IRM%)] minus the Short-Term Resource Procurement Target; and

  - For point (3), price equals zero and Unforced Capacity equals: [the PJM Region Reliability Requirement multiplied by (100% plus IRM% plus 8.8%) divided by (100% plus IRM%)] minus the Short-Term Resource Procurement Target.

ii) For any Delivery Year, the Office of the Interconnection shall establish a separate Variable Resource Requirement Curve for each LDA for which:

A. the Capacity Emergency Transfer Limit is less than 1.15 times the Capacity Emergency Transfer Objective, as determined by the Office of the Interconnection in accordance with NERC and Applicable Regional Entity guidelines; or

B. such LDA had a Locational Price Adder in any one or more of the three immediately preceding Base Residual Auctions; or

C. such LDA is determined in a preliminary analysis by the Office of the Interconnection to be likely to have a Locational Price Adder, based on historic offer price levels; provided however that for the Base Residual Auction conducted for the Delivery Year commencing on June 1, 2012, the Eastern Mid-Atlantic Region ("EMAR"), Southwest Mid-Atlantic Region ("SWMAR"), and Mid-Atlantic Region ("MAR") LDAs shall employ separate Variable Resource Requirement Curves regardless of the outcome of the above three tests; and provided further that the Office of the Interconnection may establish a separate Variable Resource Requirement Curve for an LDA not otherwise qualifying under the above three tests if it finds that such is required to achieve an acceptable level of reliability consistent with the Reliability Principles and Standards, in which case the Office of the Interconnection shall post such finding, such LDA, and such Variable Resource Requirement Curve on its internet site no later than the March 31 last preceding the Base Residual Auction for such Delivery Year. The same process as set forth in subsection (a)(i) shall be used to establish the Variable Resource Requirement Curve for any such LDA, except that the Locational Deliverability Area Reliability Requirement for such LDA shall be substituted for the PJM Region Reliability Requirement and, for Delivery Years through May 31, 2018, the LDA Short-Term Resource Procurement Target shall be substituted for the PJM Region Short-Term Resource Procurement Target. For purposes of calculating the Capacity Emergency Transfer Limit under this section, all generation resources located in the PJM Region that are, or that qualify to become, Capacity Resources, shall be modeled at their full capacity rating, regardless of the amount of capacity cleared from such resource for the immediately preceding Delivery Year.

For each such LDA, for the 2018/2019 Delivery Year and subsequent Delivery Years, the Office of the Interconnection shall (a) determine the Net Cost of New Entry for each Zone in such LDA, with such Net Cost of New Entry equal to the applicable Cost of New Entry value for such Zone minus the Net Energy and Ancillary Services Revenue Offset value for such Zone, and (b) compute the average of the Net Cost of New Entry values of all such Zones to determine the Net Cost of New Entry for such LDA; provided however, that the Net Cost of New Entry for an LDA may be greater than,

but shall be no less than, the Net Cost of New Entry determined for any other LDA in which the first LDA resides (immediately or successively) including the Net Cost of New Entry for the RTO. The Net Cost of New Entry for use in an LDA in any Incremental Auction for the 2015/2016, 2016/2017, and 2017/2018 Delivery Years shall be the Net Cost of New Entry used for such LDA in the Base Residual Auction for such Delivery Year.

iii) Procedure for ongoing review of Variable Resource Requirement Curve shape.

Beginning with the Delivery Year that commences June 1, 2018, and continuing no later than for every fourth Delivery Year thereafter, the Office of the Interconnection shall perform a review of the shape of the Variable Resource Requirement Curve, as established by the requirements of the foregoing subsection. Such analysis shall be based on simulation of market conditions to quantify the ability of the market to invest in new Capacity Resources and to meet the applicable reliability requirements on a probabilistic basis. Based on the results of such review, PJM shall prepare a recommendation to either modify or retain the existing Variable Resource Requirement Curve shape. The Office of the Interconnection shall post the recommendation and shall review the recommendation through the stakeholder process to solicit stakeholder input. If a modification of the Variable Resource Requirement Curve shape is recommended, the following process shall be followed:

A) If the Office of the Interconnection determines that the Variable Resource Requirement Curve shape should be modified, Staff of the Office of the Interconnection shall propose a new Variable Resource Requirement Curve shape on or before May 15, prior to the conduct of the Base Residual Auction for the first Delivery Year in which the new values would be applied.

B) The PJM Members shall review the proposed modification to the Variable Resource Requirement Curve shape.

C) The PJM Members shall either vote to (i) endorse the proposed modification, (ii) propose alternate modifications or (iii) recommend no modification, by August 31, prior to the conduct of the Base Residual Auction for the first Delivery Year in which the new values would be applied.

D) The PJM Board of Managers shall consider a proposed modification to the Variable Resource Requirement Curve shape, and the Office of the Interconnection shall file any approved modified Variable Resource Requirement Curve shape with the FERC by October 1, prior to the conduct of the Base Residual Auction for the first Delivery Year in which the new values would be applied.

iv) Cost of New Entry

A) For the Incremental Auctions for the 2015/2016, 2016/2017, and 2017/2018 Delivery Years, the Cost of New Entry for the PJM Region and for each LDA shall be the respective value used in the Base Residual Auction for such Delivery Year and LDA. For the Delivery Year commencing on June 1, 2018, and continuing thereafter unless and until changed pursuant to subsection (B) below, the Cost of New Entry for the PJM Region shall be the average of the Cost of New Entry for each CONE Area listed in this section as adjusted pursuant to subsection (a)(iv)(B).

Geographic Location Within the PJM Region Encompassing These Zones	Cost of New Entry in $/MW-Year
PS, JCP&L, AE, PECO, DPL, RECO ("CONE Area 1")	132,200
BGE, PEPCO ("CONE Area 2")	130,300
AEP, Dayton, ComEd, APS, DQL, ATSI, DEOK, EKPC, Dominion ("CONE Area 3")	128,900
PPL, MetEd, Penelec ("CONE Area 4")	130,300

B) Beginning with the 2019/2020 Delivery Year, the CONE for each CONE Area shall be adjusted to reflect changes in generating plant construction costs based on changes in the Applicable United States Bureau of Labor Statistics ("BLS") Composite Index, in accordance with the following:

(1) The Applicable BLS Composite Index for any Delivery Year and CONE Area shall be the most recently published twelve-month change, at the time CONE values are required to be posted for the Base Residual Auction for such Delivery Year, in a composite of the BLS Quarterly Census of Employment and Wages for Utility System Construction (weighted 20%), the BLS Producer Price Index for Construction Materials and Components (weighted 50%), and the BLS Producer Price Index Turbines and Turbine Generator Sets (weighted 30%), as each such index is further specified for each CONE Area in the PJM Manuals.

(2) The CONE in a CONE Area shall be adjusted prior to the Base Residual Auction for each Delivery Year by applying the Applicable BLS Composite Index for such CONE Area to the Benchmark CONE for such CONE Area.

(3) The Benchmark CONE for a CONE Area shall be the CONE used for such CONE Area in the Base Residual Auction for the prior Delivery Year (provided, however that the Gross CONE values stated in subsection (a)(iv)(A) above shall be the Benchmark CONE values for the 2018/2019 Delivery Year to which the Applicable BLS Composite Index shall be applied to determine the CONE for subsequent Delivery Years).

(4) Notwithstanding the foregoing, CONE values for any CONE Area for any Delivery Year shall be subject to amendment pursuant to appropriate filings with FERC under the Federal Power Act, including, without limitation, any filings resulting from the process described in section 5.10(a)(vi)(C) or any filing to establish new or revised CONE Areas.

v) Net Energy and Ancillary Services Revenue Offset

A) The Office of the Interconnection shall determine the Net Energy and Ancillary Services Revenue Offset each year for the PJM Region as (A) the annual average of the revenues that would have been received by the Reference Resource from the PJM energy markets during a period of three consecutive calendar years preceding the time of the determination, based on (1) the heat rate and other characteristics of such Reference Resource; (2) fuel prices reported during such period at an appropriate pricing point for the PJM Region with a fuel transmission adder appropriate for such region, as set forth in the PJM Manuals, assumed variable operation and maintenance expenses for such resource of $6.47 per MWh, and actual PJM hourly average Locational Marginal Prices recorded in the PJM Region during such period; and (3) an assumption that the Reference Resource would be dispatched for both the Day-Ahead and Real-Time Energy Markets on a Peak-Hour Dispatch basis; plus (B) ancillary service revenues of $2,199 per MW-year.

B) For the Incremental Auctions for the 2015/2016, 2016/2017 and 2017/2018 Delivery Years, the Office of the Interconnection will employ for purposes of the Variable Resourcce Requirement Curves for such Delivery Years the same calculations of the sub-regional Net Energy and Ancillary Services Revenue Offsets that were used in the Base Residual Auctions for such Delivery year and sub-region. For the 2018/2019 Delivery Year and subsequent Delivery Years, the Office of the Interconnection also shall determine a Net Energy and Ancillary Service Revenue Offset each year for each Zone, using the same procedures and methods as set forth in the previous subsection; provided, however, that: (1) the average hourly LMPs for such Zone shall be used in place of the PJM Region average hourly LMPs; (2) if such Zone was not integrated into the PJM Region for the entire applicable period, then the offset shall be calculated using only those whole calendar years during which the Zone was integrated; and (3) a posted fuel pricing point in such Zone, if available, and (if such pricing point is not available in such Zone) a fuel transmission adder appropriate to such Zone from an appropriate PJM Region pricing point shall be used for each such Zone.

vi) Process for Establishing Parameters of Variable Resource Requirement Curve

A) The parameters of the Variable Resource Requirement Curve will be established prior to the conduct of the Base Residual Auction for a Delivery Year and will be used for such Base Residual Auction.

B) The Office of the Interconnection shall determine the PJM Region Reliability Requirement and the Locational Deliverability Area Reliability Requirement for each Locational Deliverability Area for which a Variable Resource Requirement Curve has been established for such Base Residual Auction on or before February 1, prior to the conduct of the Base Residual Auction for the first Delivery Year in which the new values will be applied, in accordance with the Reliability Assurance Agreement.

C) Beginning with the Delivery Year that commences June 1, 2018, and continuing no later than for every fourth Delivery Year thereafter, the Office of the Interconnection shall review the calculation of the Cost of New Entry for each CONE Area.

1) If the Office of the Interconnection determines that the Cost of New Entry values should be modified, the Staff of the Office of the Interconnection shall propose new Cost of New Entry values on or before May 15, prior to the conduct of the Base Residual Auction for the first Delivery Year in which the new values would be applied.

2) The PJM Members shall review the proposed values.

3) The PJM Members shall either vote to (i) endorse the proposed values, (ii) propose alternate values or (iii) recommend no modification, by August 31, prior to the conduct of the Base Residual Auction for the first Delivery Year in which the new values would be applied.

4) The PJM Board of Managers shall consider Cost of New Entry values, and the Office of the Interconnection shall file any approved modified Cost of New Entry values with the FERC by October 1, prior to the conduct of the Base Residual Auction for the first Delivery Year in which the new values would be applied.

D) Beginning with the Delivery Year that commences June 1, 2018, and continuing no later than for every fourth Delivery Year thereafter, the Office of the Interconnection shall review the methodology set forth in this Attachment for determining the Net

Energy and Ancillary Services Revenue Offset for the PJM Region and for each Zone.

1) If the Office of the Interconnection determines that the Net Energy and Ancillary Services Revenue Offset methodology should be modified, Staff of the Office of the Interconnection shall propose a new Net Energy and Ancillary Services Revenue Offset methodology on or before May 15, prior to the conduct of the Base Residual Auction for the first Delivery Year in which the new methodology would be applied.

2) The PJM Members shall review the proposed methodology.

3) The PJM Members shall either vote to (i) endorse the proposed methodology, (ii) propose an alternate methodology or (iii) recommend no modification, by August 31, prior to the conduct of the Base Residual Auction for the first Delivery Year in which the new methodology would be applied.

4) The PJM Board of Managers shall consider the Net Revenue Offset methodology, and the Office of the Interconnection shall file any approved modified Net Energy and Ancillary Services Revenue Offset values with the FERC by October 1, prior to the conduct of the Base Residual Auction for the first Delivery Year in which the new values would be applied.

b) Locational Requirements

The Office of Interconnection shall establish locational requirements prior to the Base Residual Auction to quantify the amount of Unforced Capacity that must be committed in each Locational Deliverability Area, in accordance with the PJM Reliability Assurance Agreement.

c) Resource Requirements and Constraints

Prior to the Base Residual Auction and each Incremental Auction for the Delivery Years starting on June 1, 2014 and ending May 31, 2017, the Office of the Interconnection shall establish the Minimum Annual Resource Requirement and the Minimum Extended Summer Resource Requirement for the PJM Region and for each Locational Deliverability Area for which the Office of the Interconnection is required under section 5.10(a) of this Attachment DD to establish a separate VRR Curve for such Delivery Year. Prior to the Base Residual Auction and Incremental Auctions for the 2017/2018 Delivery Year, the Office of the Interconnection shall establish the Limited Resource Constraints and the Sub-Annual Resource Constraints for the PJM Region and for each Locational Deliverability Area for which the Office of the Interconnection is required under section 5.10(a) of this Attachment DD to establish a separate VRR Curve for such Delivery Year. Prior to the Base Residual Auction and Incremental

Auctions for 2018/2019 and 2019/2020 Delivery Years, the Office of the Interconnection shall establish the Base Capacity Demand Resource Constraints and the Base Capacity Resource Constraints for the PJM Region and for each Locational Deliverability Area for which the Office of the Interconnection is required under section 5.10(a) of this Attachment DD to establish a separate VRR Curve for such Delivery Year.

d) Preliminary PJM Region Peak Load Forecast for the Delivery Year

The Office of the Interconnection shall establish the Preliminary PJM Region Load Forecast for the Delivery Year in accordance with the PJM Manuals by February 1, prior to the conduct of the Base Residual Auction for such Delivery Year.

e) Updated PJM Region Peak Load Forecasts for Incremental Auctions

The Office of the Interconnection shall establish the updated PJM Region Peak Load Forecast for a Delivery Year in accordance with the PJM Manuals by February 1, prior to the conduct of the First, Second, and Third Incremental Auction for such Delivery Year.

5.11 Posting of Information Relevant to the RPM Auctions

a) In accordance with the schedule provided in the PJM Manuals, PJM will post the following information for a Delivery Year prior to conducting the Base Residual Auction for such Delivery Year:

i) The Preliminary PJM Region Peak Load Forecast (for the PJM Region, and allocated to each Zone);

ii) The PJM Region Installed Reserve Margin, the Pool-wide average EFORd, the Forecast Pool Requirement, and all applicable Capacity Import Limits;

iii) For the Delivery Years through May 31, 2018, the Demand Resource Factor;

iv) The PJM Region Reliability Requirement, and the Variable Resource Requirement Curve for the PJM Region, including the details of any adjustments to account for Price Responsive Demand and any associated PRD Reservation Prices;

v) The Locational Deliverability Area Reliability Requirement and the Variable Resource Requirement Curve for each Locational Deliverability Area for which a separate Variable Resource Requirement Curve has been established for such Base Residual Auction, including the details of any adjustments to account for Price Responsive Demand and any associated PRD Reservation Prices, and the CETO and CETL values for all Locational Deliverability Areas;

vi) For the Delivery Years starting June 1, 2014 and ending May 31, 2017, the Minimum Annual Resource Requirement and the Minimum Extended Summer Resource Requirement for the PJM Region and for each Locational Deliverability Area for which PJM is required under section 5.10(a) of this Attachment DD to establish a separate VRR Curve for such Delivery Year; and for the 2017/2018 Delivery Year , the Limited Resource Constraints and the Sub-Annual Resource Constraints for the PJM Region and for each Locational Deliverability Area for which PJM is required under section 5.10(a) of this Attachment DD to establish a separate VRR Curve for such Delivery Year. For the 2018/2019 and 2019/2020 Delivery Years, the Office of the Interconnection shall establish the Base Capacity Demand Resource Constraints and the Base Capacity Resource Constraints for the PJM Region and for each Locational Deliverability Area for which the Office of the Interconnection is required under section 5.10(a) of this Attachment DD to establish a separate VRR Curve for such Delivery Year;

vii) Any Transmission Upgrades that are expected to be in service for such Delivery Year, provided that a Transmission Upgrade that is Backbone Transmission satisfies the project development milestones set forth in section 5.11A;

viii) The bidding window time schedule for each auction to be conducted for such Delivery Year; and

ix) The Net Energy and Ancillary Services Revenue Offset values for the PJM Region for use in the Variable Resource Requirement Curves for the PJM Region and each

Locational Deliverability Area for which a separate Variable Resource Requirement Curve has been established for such Base Residual Auction.

~~b)~~b) In addition to the information required to be posted by subsection (a), PJM will post for a Delivery Year, at least sixty (60) days prior to conducting the Base Residual Auction for such Delivery Year (and at least thirty (30) days prior to conducting the first Base Residual Auction for which the FRR-RS Alternative is effective), the aggregate megawatt quantity of the Capacity Resources that have elected the FRR-RS Alternative for the PJM Region and for each LDA.

c) The information listed in (a) will be posted and applicable for the First, Second, Third, and Conditional Incremental Auctions for such Delivery Year, except to the extent updated or adjusted as required by other provisions of this Tariff.

~~c~~d) In accordance with the schedule provided in the PJM Manuals, PJM will post the Final PJM Region Peak Load Forecast and the allocation to each zone of the obligation resulting from such final forecast, following the completion of the final Incremental Auction (including any Conditional Incremental Auction) conducted for such Delivery Year;

~~d~~e) In accordance with the schedule provided in the PJM Manuals, PJM will advise owners of Generation Capacity Resources of the updated EFORd values for such Generation Capacity Resources prior to the conduct of the Third Incremental Auction for such Delivery Year.

~~e~~f) After conducting the Reliability Pricing Model Auctions, PJM will post the results of each auction as soon thereafter as possible, including any adjustments to PJM Region or LDA Reliability Requirements to reflect Price Responsive Demand with a PRD Reservation Price equal to or less than the applicable Base Residual Auction clearing price. The posted results shall include graphical supply curves that are (a) provided for the entire PJM Region, (b) provided for any Locational Deliverability Area for which there are four (4) or more suppliers, and (c) developed using a formulaic approach to smooth the curves using a statistical technique that fits a smooth curve to the underlying supply curve data while ensuring that the point of intersection between supply and demand curves is at the market clearing price. At such time, PJM also shall post the aggregate megawatt quantity of Capacity Resources with Actionable Subsidies.

If PJM discovers an error in the initial posting of auction results for a particular Reliability Pricing Model Auction, it shall notify Market Participants of the error as soon as possible after it is found, but in no event later than 5:00 p.m. of the fifth Business Day following the initial publication of the results of the auction. After this initial notification, if PJM determines it is necessary to post modified results, it shall provide notification of its intent to do so, together with all available supporting documentation, by no later than 5:00 p.m. of the seventh Business Day following the initial publication of the results of the auction. Thereafter, PJM must post on its Web site any corrected auction results by no later than 5:00 p.m. of the tenth Business Day following the initial publication of the results of the auction. Should any of the above deadlines pass without the associated action on the part of the Office of the Interconnection, the originally posted results will be considered final. Notwithstanding the foregoing, the deadlines set forth

above shall not apply if the referenced auction results are under publicly noticed review by the FERC.

5.11 A Backbone Transmission Upgrade Project Development Milestones

A Transmission Upgrade including transmission facilities at voltages of 500 kV or higher that is in an approved Regional Transmission Expansion Plan ("Backbone Transmission") shall be included in the system model for an RPM Auction only if it satisfies the project development milestones set forth in this section.

a) Base Residual Auction

Backbone Transmission shall be included in the system model used for a Base Residual Auction only if:

i) No later than 60 days before posting of the planning parameters for the Base Residual Auction, a corporate officer of the project sponsor submits a current critical path project development schedule containing intermediate milestones and showing the project in full commercial operation no later than the start of the Delivery Year corresponding to such Base Residual Auction, and must certify that such schedule is reasonably achievable based on information then known to and reasonably anticipated by the project sponsor. Such notice must identify all states in which such project is subject to the requirement to obtain a certificate of public convenience and necessity, or functional equivalent approval or licensure requirement, and must describe the nature and current status of such approval requirement;

ii) such development schedule additionally must show the scope, schedule, and current status of all other key milestones, including, at a minimum, right-of-way acquisition, engineering design, equipment procurement, construction permitting, and construction activities;

iii) applications for certificates of public convenience and necessity (or for equivalent approval) have been filed in all states applicable to such project that have such requirement.

b) Incremental Auctions

A Backbone Transmission project shall be included in the system models for Incremental Auctions only if the following requirements are satisfied no later than 60 days before each Incremental Auction, as indicated below:

i) a corporate officer submits, and certifies to, an updated project development schedule for the First Incremental Auction that shows, among other things, that 50% of the right-of-way by linear distance has been secured;

ii) a corporate officer submits, and certifies to, an updated project development schedule for the Second Incremental Auction that shows, among other things, that 75% of the right-of-way by linear distance has been secured, and that all certificates of public convenience and necessity (or equivalent approvals) have been issued by the responsible regulatory bodies;

iii) a corporate officer submits, and certifies to, an updated project development schedule for the Third Incremental Auction that shows, among other things, that 100% of the right-of-way by linear distance has been secured.

c) Audit, Removal from System Model, and Reinstatement in System Model

i) for the Backbone Transmission project to remain in the applicable system model, the Office of the Interconnection or independent third party with established expertise in such area must audit the project development schedule and affirm, no later than 30 days before each applicable auction, that the schedule is reasonable and remains on progress to full commercial operation prior to the commencement of the relevant Delivery Year. Audits may include site visits as deemed necessary by the auditor to verify progress.

ii) a Backbone Transmission project that fails to satisfy any of the requirements indicated for the Base Residual Auction shall not be included in the system model for such Base Residual Auction or any Incremental Auction for the relevant Delivery Year. A Backbone Transmission project that fails to satisfy any of the requirements indicated for an Incremental Auction shall not be included in the system model for such Incremental Auction or any subsequent Incremental Auction for the relevant Delivery Year.

iii) a Backbone Transmission project that is excluded from the system model for any RPM Auction for a Delivery Year may be included in the system model for RPM Auctions for a subsequent Delivery Year only if it demonstrates that all deficiencies have been cured and the project is on schedule for full commercial operation prior to such subsequent Delivery Year.

5.12 Conduct of RPM Auctions

The Office of the Interconnection shall employ an optimization algorithm for each Base Residual Auction and each Incremental Auction to evaluate the Sell Offers and other inputs to such auction to determine the Sell Offers that clear such auction.

a) Base Residual Auction

For each Base Residual Auction, the optimization algorithm shall consider:

- all Sell Offers submitted in such auction;
- the Variable Resource Requirement Curves for the PJM Region and each LDA;
- any constraints resulting from the Locational Deliverability Requirement and any applicable Capacity Import Limit;
- for Delivery Years starting June 1, 2014 and ending May 31, 2017, the Minimum Annual Resource Requirement and the Minimum Extended Summer Resource Requirement for the PJM Region and for each Locational Deliverability Area for which a separate VRR Curve is required by Tariff, Attachment DD, section 5.10(a); for the 2017/2018 Delivery Year, the Limited Resource Constraints and the Sub-Annual Resource Constraints for the PJM Region and for each Locational Deliverability Area for which a separate VRR Curve is required by Tariff, Attachment DD, section 5.10(a); and for the 2018/2019 and 2019/2020 Delivery Years, the Base Capacity Demand Resource Constraints and the Base Capacity Resource Constraints for the PJM Region and for each Locational Deliverability Area for which a separate VRR Curve is required by Tariff, Attachment DD, section 5.10(a);
- For the Delivery Years through May 31, 2018, the PJM Region Reliability Requirement minus the Short-Term Resource Procurement Target;
- For the 2018/2019 Delivery Year and subsequent Delivery Years, the PJM Reliability Requirement; and
- For the 2020/2021 Delivery Year and subsequent Delivery Years, the requirement that the cleared quantity of Summer-Period Capacity Performance Resources equal the cleared quantity of Winter-Period Capacity Performance Resources for the PJM Region.

The optimization algorithm shall be applied to calculate the overall clearing result to minimize the cost of satisfying the reliability requirements across the PJM Region, regardless of whether the quantity clearing the Base Residual Auction is above or below the applicable target quantity, while respecting all applicable requirements and constraints, including any restrictions specified in any

Credit-Limited Offers. Where the supply curve formed by the Sell Offers submitted in an auction falls entirely below the Variable Resource Requirement Curve, the auction shall clear at the price-capacity point on the Variable Resource Requirement Curve corresponding to the total Unforced Capacity provided by all such Sell Offers. Where the supply curve consists only of Sell Offers located entirely below the Variable Resource Requirement Curve and Sell Offers located entirely above the Variable Resource Requirement Curve, the auction shall clear at the price-capacity point on the Variable Resource Requirement Curve corresponding to the total Unforced Capacity provided by all Sell Offers located entirely below the Variable Resource Requirement Curve. In determining the lowest-cost overall clearing result that satisfies all applicable constraints and requirements, the optimization may select from among multiple possible alternative clearing results that satisfy such requirements, including, for example (without limitation by such example), accepting a lower-priced Sell Offer that intersects the Variable Resource Requirement Curve and that specifies a minimum capacity block, accepting a higher-priced Sell Offer that intersects the Variable Resource Requirement Curve and that contains no minimum-block limitations, or rejecting both of the above alternatives and clearing the auction at the higher-priced point on the Variable Resource Requirement Curve that corresponds to the Unforced Capacity provided by all Sell Offers located entirely below the Variable Resource Requirement Curve. For the 2020/2021 Delivery Year and subsequent Delivery Years, the supply curve formed by the Sell Offers submitted within an LDA for which a separate VRR Curve is established, shall only consider the quantity of MW from Summer-Period Capacity Performance Resources that are equally matched with Winter-Period Capacity Performance Resources within the LDA, such that only the equally matched quantity of opposite-season Sell Offers are considered in satisfying the LDA's reliability requirement.

The Sell Offer price of a Qualifying Transmission Upgrade shall be treated as a capacity price differential between the LDAs specified in such Sell Offer between which CETL is increased, and the Import Capability provided by such upgrade shall clear to the extent the difference in clearing prices between such LDAs is greater than the price specified in such Sell Offer. The Capacity Resource clearing results and Capacity Resource Clearing Prices so determined shall be applicable for such Delivery Year. The Capacity Resource clearing results and Capacity Resource Clearing Prices determined for Summer-Period Capacity Performance Resources shall be applicable for the calendar months of June through October and the following May of such Delivery Year; and shall be applicable for Winter-Period Capacity Performance Resources for the calendar months of November through April of such Delivery Year.

b) Scheduled Incremental Auctions.

For purposes of a Scheduled Incremental Auction, the optimization algorithm shall consider:

- For the Delivery years through May 31, 2018, the PJM Region Reliability Requirement, less the Short-term Resource Procurement Target;
- For the 2018/2019 Delivery Year and subsequent Delivery Years, the PJM Reliability Requirement;
- Updated LDA Reliability Requirements taking into account any updated Capacity Emergency Transfer Objectives;

- The Capacity Emergency Transfer Limit used in the Base Residual Auction, or any updated value resulting from a Conditional Incremental Auction;

- All applicable Capacity Import Limits;

- For the Delivery Years through May 31, 2018, for each LDA, such LDA's updated Reliability Requirement, less such LDA's Short-Term Resource Procurement Target;

- For the 2018/2019 Delivery Year and subsequent Delivery Years, for each LDA, such LDA's updated Reliability Requirement

- For Delivery Years starting June 1, 2014 and ending May 31, 2017, the Minimum Annual Resource Requirement and the Minimum Extended Summer Resource Requirement for the PJM Region and for each LDA for which PJM is required to establish a separate VRR Curve for the Base Residual Auction for the relevant Delivery Year; for the 2017/2018 Delivery Year, the Limited Resource Constraints and the Sub-annual Resource Constraints for the PJM Region and for each Locational Deliverability Area for which a separate VRR Curve is required by Tariff, Attachment DD, section 5.10(a); and for the 2018/2019 and 2019/2020 Delivery Years, the Base Capacity Demand Resource Constraints and the Base Capacity Resource Constraints for the PJM Region and for each Locational Deliverability Area for which a separate VRR Curve is required by Tariff, Attachment DD, section 5.10(a);

- For the 2020/2021 Delivery Year and subsequent Delivery Years, the requirement that the cleared quantity of Summer-Period Capacity Performance Resources equal the cleared quantity of Winter-Period Capacity Performance Resources for the PJM Region;

- A demand curve consisting of the Buy Bids submitted in such auction and, if indicated for use in such auction in accordance with the provisions below, the Updated VRR Curve Increment;

- The Sell Offers submitted in such auction; and

- The Unforced Capacity previously committed for such Delivery Year.

(i) When the requirement to seek additional resource commitments in a Scheduled Incremental Auction is triggered by Tariff, Attachment DD, section 5.4(c)(2), the Office of the Interconnection shall employ in the clearing of such auction the Updated VRR Curve Increment.

(ii) When the requirement to seek additional resource commitments in a Scheduled Incremental Auction is triggered by Tariff, Attachment DD, section 5.4(c)(1), and the conditions stated in Tariff, Attachment DD, section 5.4(c)(2) do not apply, the Office of the Interconnection first shall determine the total quantity of (A) the amount that the Office of the

Interconnection sought to procure in prior Scheduled Incremental Auctions for such Delivery Year that does not clear such auction, plus, for the Delivery Years through May 31, 2018, the Short-Term Resource Procurement Target Applicable Share for such auction, minus (B) the amount that the Office of the Interconnection sought to sell back in prior Scheduled Incremental Auctions for such Delivery Year that does not clear such auction, plus (C) the difference between the updated PJM Region Reliability Requirement or updated LDA Reliability Requirement and, respectively, the PJM Region Reliability Requirement, or LDA Reliability Requirement, utilized in the most recent prior auction conducted for such Delivery Year plus any amount required by section 5.4(c)(2)(ii), plus (D) the reduction in Unforced Capacity commitments associated with the transition provisions of Tariff, Attachment DD, sections 5.14B, 5.14C, 5.14E, and 5.5A(c)(i)(B) and RAA, Schedule 6, section L.9, minus (E) the quantity of new Unforced Capacity commitments for the 2016/2017 and 2017/2018 Delivery Years associated with the transition provisions in Tariff, Attachment DD, section 5.14D where this quantity is assumed to have been procured in the form of non-Capacity Performance Resources for purposes of this paragraph E. If the result of such equation is a positive quantity, the Office of the Interconnection shall employ in the clearing of such auction a portion of the Updated VRR Curve Increment extending right from the left-most point on that curve in a megawatt amount equal to that positive quantity defined above, to seek to procure such quantity. If the result of such equation is a negative quantity, with exception for the Third Incremental Auction for the 2017/2018 Delivery Year, the Office of the Interconnection shall employ in the clearing of the auction a portion of the Updated VRR Curve Decrement, extending and ascending to the left from the right-most point on that curve in a megawatt amount corresponding to the negative quantity defined above, to seek to sell back such quantity. In seeking to sell back such quantity for the Third Incremental Auction for the 2017/2018 Delivery Year, the Office of the Interconnection shall employ in the clearing of the auction a curve represented by a straight line connecting two points with the first point located at 0 megawatts and at a price set to the lowest price point of the Updated VRR Curve Decrement and the second point located at a megawatt amount corresponding to the negative quantity defined above and at a price set to the Resource Clearing Price of the 2017/2018 Base Residual Auction.

(iii) When the possible need to seek agreements to release capacity commitments in any Scheduled Incremental Auction is indicated for the PJM Region or any LDA by Tariff, Attachment DD, section 5.4(c)(3)(i), the Office of the Interconnection first shall determine the total quantity of (A) the amount that the Office of the Interconnection sought to procure in prior Scheduled Incremental Auctions for such Delivery Year that does not clear such auction, plus, for the Delivery Years through May 31, 2018, the Short-Term Resource Procurement Target Applicable Share for such auction, minus (B) the amount that the Office of the Interconnection sought to sell back in prior Scheduled Incremental Auctions for such Delivery Year that does not clear such auction, plus (C) the difference between the updated PJM Region Reliability Requirement or updated LDA Reliability Requirement and, respectively, the PJM Region Reliability Requirement, or LDA Reliability Requirement, utilized in the most recent prior auction conducted for such Delivery Year minus any capacity sell-back amount determined by PJM to be required for the PJM Region or such LDA by Tariff, Attachment DD, section 5.4(c)(3)(ii), plus (D) the reduction in Unforced Capacity commitments associated with the transition provisions of Tariff, Attachment DD, sections 5.14B, 5.14C, 5.14E, *and 5.5A(c)(i)(B)* and RAA, Schedule 6, section L.9, minus (E) the quantity of new Unforced Capacity commitments for the 2016/2017 and 2017/2018 Delivery Years associated with the transition provisions in Tariff, Attachment DD, section 5.14D where this quantity is assumed to have been procured in the

form of non-Capacity Performance Resources for purposes of this paragraph E; provided, however, that the amount sold in total for all LDAs and the PJM Region related to a delay in a Backbone Transmission upgrade may not exceed the amounts purchased in total for all LDAs and the PJM Region related to a delay in a Backbone Transmission upgrade. If the result of such equation is a positive quantity, the Office of the Interconnection shall employ in the clearing of such auction a portion of the Updated VRR Curve Increment extending right from the left-most point on that curve in a megawatt amount equal to that positive quantity defined above, to seek to procure such quantity. If the result of such equation is a negative quantity, with exception for the Third Incremental Auction for the 2017/2018 Delivery Year, the Office of the Interconnection shall employ in the clearing of the auction a portion of the Updated VRR Curve Decrement, extending and ascending to the left from the right-most point on that curve in a megawatt amount corresponding to the negative quantity defined above, to seek to sell back such quantity. In seeking to sell back such quantity for the Third Incremental Auction for the 2017/2018 Delivery Year, the Office of the Interconnection shall employ in the clearing of the auction a curve represented by a straight line connecting two points with the first point located at 0 megawatts and at a price set to the lowest price point of the Updated VRR Curve Decrement and the second point located at a megawatt amount corresponding to the negative quantity defined above and at a price set to the Resource Clearing Price of the 2017/2018 Base Residual Auction.

(iv) If none of the tests for adjustment of capacity procurement in subsections (i), (ii), or (iii) is satisfied for the PJM Region or an LDA in a Scheduled Incremental Auction, the Office of the Interconnection first shall determine the total quantity of (A) the amount that the Office of the Interconnection sought to procure in prior Scheduled Incremental Auctions for such Delivery Year that does not clear such auction, plus, for the Delivery Years through May 31, 2018, the Short-Term Resource Procurement Target Applicable Share for such auction, minus (B) the amount that the Office of the Interconnection sought to sell back in prior Scheduled Incremental Auctions for such Delivery Year that does not clear such auction. If the result of such equation is a positive quantity, the Office of the Interconnection shall employ in the clearing of such auction a portion of the Updated VRR Curve Increment extending right from the left-most point on that curve in a megawatt amount equal to that positive quantity defined above, to seek to procure such quantity. If the result of such equation is a negative quantity, the Office of the Interconnection shall employ in the clearing of the auction a portion of the Updated VRR Curve Decrement, extending and ascending to the left from the right-most point on that curve in a megawatt amount corresponding to the negative quantity defined above, to seek to sell back such quantity. For the Delivery Years through May 31, 2018, if more than one of the tests for adjustment of capacity procurement in subsections (i), (ii), or (iii) is satisfied for the PJM Region or an LDA in a Scheduled Incremental Auction, the Office of the Interconnection shall not seek to procure the Short-Term Resource Procurement Target Applicable Share more than once for such region or area for such auction

(v) If PJM seeks to procure additional capacity in an Incremental Auction for the 2014-15, 2015-16 or 2016-17 Delivery Years due to a triggering of the tests in subsections (i), (ii), (iii) or (iv) then the Minimum Annual Resource Requirement for such Auction will be equal to the updated Minimum Annual Resource Requirement (based on the latest DR Reliability Targets) minus the amount of previously committed capacity from Annual Resources, and the Minimum Extended Summer Resource Requirement for such Auction will be equal to the updated Minimum Extended Summer Resource Requirement (based on the latest DR Reliability Targets)

minus the amount of previously committed capacity in an Incremental Auction for the 2014-15, 2015-16 or 2016-17 Delivery Years from Annual Resources and Extended Summer Demand Resources. If PJM seeks to release prior committed capacity due to a triggering of the test in subsection (iii) then PJM may not release prior committed capacity from Annual Resources or Extended Summer Demand Resources below the updated Minimum Annual Resource Requirement and updated Minimum Extended Summer Resource Requirement, respectively.

(vi) If the above tests are triggered for an LDA and for another LDA wholly located within the first LDA, the Office of the Interconnection may adjust the amount of any Sell Offer or Buy Bids otherwise required by subsections (i), (ii), or (iii) above in one LDA as appropriate to take into account any reliability impacts on the other LDA.

(vii) The optimization algorithm shall calculate the overall clearing result to minimize the cost to satisfy the Unforced Capacity Obligation of the PJM Region to account for the updated PJM Peak Load Forecast and the cost of committing replacement capacity in response to the Buy Bids submitted, while satisfying or honoring such reliability requirements and constraints, in the same manner as set forth in subsection (a) above.

(viii) Load Serving Entities may be entitled to certain credits ("Excess Commitment Credits") under certain circumstances as follows:

(A) For either or both of the Delivery Years commencing on June 1, 2010 or June 1, 2011, if the PJM Region Reliability Requirement used for purposes of the Base Residual Auction for such Delivery Year exceeds the PJM Region Reliability Requirement that is based on the last updated load forecast prior to such Delivery Year, then such excess will be allocated to Load Serving Entities as set forth below;

(B) For any Delivery Year beginning with the Delivery Year that commences June 1, 2012, the total amount that the Office of the Interconnection sought to sell back pursuant to subsection (b)(iii) above in the Scheduled Incremental Auctions for such Delivery Year that does not clear such auctions, less the total amount that the Office of the Interconnection sought to procure pursuant to subsections (b)(i) and (b)(ii) above in the Scheduled Incremental Auctions for such Delivery Years that does not clear such auctions, will be allocated to Load Serving Entities as set forth below;

(C) the amount from (A) or (B) above for the PJM Region shall be allocated among Locational Deliverability Areas pro rata based on the reduction for each such Locational Deliverability Area in the peak load forecast from the time of the Base Residual Auction to the time of the Third Incremental Auction; provided, however, that the amount allocated to a Locational Deliverability Area may not exceed the reduction in the corresponding Reliability Requirement for such Locational Deliverability Area; and provided further that any LDA with an increase in its load forecast shall not be allocated any Excess Commitment Credits;

(D) the amount, if any, allocated to a Locational Deliverability Area shall be further allocated among Load Serving Entities in such areas that are charged a Locational Reliability Charge based on the Daily Unforced Capacity Obligation of such Load Serving Entities as of June 1 of the Delivery Year and shall be constant for the entire Delivery Year. Excess Commitment Credits may be used as Replacement Capacity or traded bilaterally.

c) Conditional Incremental Auction

For each Conditional Incremental Auction, the optimization algorithm shall consider:

- The quantity and location of capacity required to address the identified reliability concern that gave rise to the Conditional Incremental Auction;
- All applicable Capacity Import Limits;
- the same Capacity Emergency Transfer Limits that were modeled in the Base Residual Auction, or any updated value resulting from a Conditional Incremental Auction; and
- the Sell Offers submitted in such auction.

The Office of the Interconnection shall submit a Buy Bid based on the quantity and location of capacity required to address the identified reliability violation at a Buy Bid price equal to 1.5 times Net CONE.

The optimization algorithm shall calculate the overall clearing result to minimize the cost to address the identified reliability concern, while satisfying or honoring such reliability requirements and constraints.

d) Equal-priced Sell Offers

If two or more Sell Offers submitted in any auction satisfying all applicable constraints include the same offer price, and some, but not all, of the Unforced Capacity of such Sell Offers is required to clear the auction, then the auction shall be cleared in a manner that minimizes total costs, including total make-whole payments if any such offer includes a minimum block and, to the extent consistent with the foregoing, in accordance with the following additional principles:

1) as necessary, the optimization shall clear such offers that have a flexible megawatt quantity, and the flexible portions of such offers that include a minimum block that already has cleared, where some but not all of such equal-priced flexible quantities are required to clear the auction, pro rata based on their flexible megawatt quantities; and

2) when equal-priced minimum-block offers would result in equal overall costs, including make-whole payments, and only one such offer is required to clear the auction, then the offer that was submitted earliest to the Office of the Interconnection, based on its assigned timestamp, will clear.

5.13 [Reserved]

5.14 Clearing Prices and Charges

a) Capacity Resource Clearing Prices

For each Base Residual Auction and Incremental Auction, the Office of the Interconnection shall calculate a clearing price to be paid for each megawatt-day of Unforced Capacity that clears in such auction. The Capacity Resource Clearing Price for each LDA will be the marginal value of system capacity for the PJM Region, without considering locational constraints, adjusted as necessary by any applicable Locational Price Adders, Annual Resource Price Adders, Extended Summer Resource Price Adders, Limited Resource Price Decrements, Sub-Annual Resource Price Decrements, Base Capacity Demand Resource Price Decrements, and Base Capacity Resource Price Decrements, all as determined by the Office of the Interconnection based on the optimization algorithm. If a Capacity Resource is located in more than one Locational Deliverability Area, it shall be paid the highest Locational Price Adder in any applicable LDA in which the Sell Offer for such Capacity Resource cleared. The Annual Resource Price Adder is applicable for Annual Resources only. The Extended Summer Resource Price Adder is applicable for Annual Resources and Extended Summer Demand Resources.

The Locational Price Adder applicable to each cleared Seasonal Capacity Performance Resource is determined during the post-processing of the RPM Auction results consistent with the manner in which the auction clearing algorithm recognizes the contribution of Seasonal Capacity Performance Resource Sell Offers in satisfying an LDA's reliability requirement. For each LDA with a positive Locational Price Adder with respect to the immediate higher level LDA, starting with the lowest level constrained LDAs and moving up, PJM determines the quantity of equally matched Summer-Period Capacity Performance Resources and Winter-Period Capacity Performance Resources located and cleared within that LDA. Up to this quantity, the cleared Summer-Period Capacity Performance Resources and Winter-Period Capacity Performance Resources with the lowest Sell Offer prices will be compensated using the highest Locational Price Adder applicable to such LDA; and any remaining Seasonal Capacity Performance Resources cleared within the LDA are effectively moved to the next higher level constrained LDA, where they are considered in a similar manner for compensation.

b) Resource Make-Whole Payments

If a Sell Offer specifies a minimum block, and only a portion of such block is needed to clear the market in a Base Residual or Incremental Auction, the MW portion of such Sell Offer needed to clear the market shall clear, and such Sell Offer shall set the marginal value of system capacity. In addition, the Capacity Market Seller shall receive a Resource Make-Whole Payment equal to the Capacity Resource Clearing Price in such auction times the difference between the Sell Offer's minimum block MW quantity and the Sell Offer's cleared MW quantity. If the Sell Offer price of a cleared Seasonal Capacity Performance Resource exceeds the applicable Capacity Resource Clearing Price, the Capacity Market Seller shall receive a Resource Make-Whole Payment equal to the difference between the Sell Offer price and Capacity Resource Clearing Price in such RPM Auction. The cost for any such Resource Make-Whole Payments required in a Base Residual Auction or Incremental Auction for adjustment of prior capacity commitments shall be collected pro rata from all LSEs in the LDA in which such payments were made, based on their Daily Unforced Capacity Obligations. The cost for any such Resource Make-Whole

Payments required in an Incremental Auction for capacity replacement shall be collected from all Capacity Market Buyers in the LDA in which such payments were made, on a pro-rata basis based on the MWs purchased in such auction.

c) New Entry Price Adjustment

A Capacity Market Seller that submits a Sell Offer based on a Planned Generation Capacity Resource that clears in the BRA for a Delivery Year may, at its election, submit Sell Offers with a New Entry Price Adjustment in the BRAs for the two immediately succeeding Delivery Years if:

1. Such Capacity Market Seller provides notice of such election at the time it submits its Sell Offer for such resource in the BRA for the first Delivery Year for which such resource is eligible to be considered a Planned Generation Capacity Resource. When the Capacity Market Seller provides notice of such election, it must specify whether its Sell Offer is contingent upon qualifying for the New Entry Price Adjustment. The Office of the Interconnection shall not clear such contingent Sell Offer if it does not qualify for the New Entry Price Adjustment.

2. All or any part of a Sell Offer from the Planned Generation Capacity Resource submitted in accordance with section 5.14(c)(1) is the marginal Sell Offer that sets the Capacity Resource Clearing Price for the LDA.

3. Acceptance of all or any part of a Sell Offer that meets the conditions in section 5.14(c)(1)-(2) in the BRA increases the total Unforced Capacity committed in the BRA (including any minimum block quantity) for the LDA in which such Resource will be located from a megawatt quantity below the LDA Reliability Requirement, minus the Short Term Resource Procurement Target, to a megawatt quantity at or above a megawatt quantity at the price-quantity point on the VRR Curve at which the price is 0.40 times the applicable Net CONE divided by (one minus the pool-wide average EFORd).

4. Such Capacity Market Seller submits Sell Offers in the BRA for the two immediately succeeding Delivery Years for the entire Unforced Capacity of such Generation Capacity Resource committed in the first BRA under section 5.14(c)(1)-(2) equal to the lesser of: A) the price in such seller's Sell Offer for the BRA in which such resource qualified as a Planned Generation Capacity Resource that satisfies the conditions in section 5.14(c)(1)-(3); or B) 0.90 times the Net CONE applicable in the first BRA in which such Planned Generation Capacity Resource meeting the conditions in section 5.14(c)(1)-(3) cleared, on an Unforced Capacity basis, for such LDA.

5. If the Sell Offer is submitted consistent with section 5.14(c)(1)-(4) the foregoing conditions, then:

(i) in the first Delivery Year, the Resource sets the Capacity Resource Clearing Price for the LDA and all cleared resources in the LDA receive the Capacity Resource Clearing Price set by the Sell Offer as the marginal offer, in accordance with sections 5.12(a) and 5.14(a).

(ii) in either of the subsequent two BRAs, if any part of the Sell Offer from the Resource clears, it shall receive the Capacity Resource Clearing Price for such LDA for its cleared capacity and for any additional minimum block quantity pursuant to section 5.14(b); or

(iii) if the Resource does not clear, it shall be deemed resubmitted at the highest price per MW-day at which the megawatt quantity of Unforced Capacity of such Resource that cleared the first-year BRA will clear the subsequent-year BRA pursuant to the optimization algorithm described in section 5.12(a) of this Attachment, and

(iv) the resource with its Sell Offer submitted shall clear and shall be committed to the PJM Region in the amount cleared, plus any additional minimum-block quantity from its Sell Offer for such Delivery Year, but such additional amount shall be no greater than the portion of a minimum-block quantity, if any, from its first-year Sell Offer satisfying section 5.14(c)(1)-(3) that is entitled to compensation pursuant to section 5.14(b) of this Attachment; and

(v) the Capacity Resource Clearing Price, and the resources cleared, shall be re-determined to reflect the resubmitted Sell Offer. In such case, the Resource for which the Sell Offer is submitted pursuant to section 5.14(c)(1)-(4) shall be paid for the entire committed quantity at the Sell Offer price that it initially submitted in such subsequent BRA. The difference between such Sell Offer price and the Capacity Resource Clearing Price (as well as any difference between the cleared quantity and the committed quantity), will be treated as a Resource Make-Whole Payment in accordance with Section 5.14(b). Other capacity resources that clear the BRA in such LDA receive the Capacity Resource Clearing Price as determined in Section 5.14(a).

6. The failure to submit a Sell Offer consistent with Section 5.14(c)(i)-(iii) in the BRA for Delivery Year 3 shall not retroactively revoke the New Entry Price Adjustment for Delivery Year 2. However, the failure to submit a Sell Offer consistent with section 5.14(c)(4) in the BRA for Delivery Year 2 shall make the resource ineligible for the New Entry Pricing Adjustment for Delivery Years 2 and 3.

7. For each Delivery Year that the foregoing conditions are satisfied, the Office of the Interconnection shall maintain and employ in the auction clearing for such LDA a separate VRR Curve, notwithstanding the outcome of the test referenced in Section 5.10(a)(ii) of this Attachment.

8. On or before August 1, 2012, PJM shall file with FERC under FPA section 205, as determined necessary by PJM following a stakeholder process, tariff changes to establish a long-term auction process as a not unduly discriminatory means to provide adequate long-term revenue assurances to support new entry, as a supplement to or replacement of this New Entry Price Adjustment.

d) Qualifying Transmission Upgrade Payments

A Capacity Market Seller that submitted a Sell Offer based on a Qualifying Transmission Upgrade that clears in the Base Residual Auction shall receive a payment equal to the Capacity Resource Clearing Price, including any Locational Price Adder, of the LDA into which the Qualifying Transmission Upgrade is to increase Capacity Emergency Transfer Limit, less the Capacity Resource Clearing Price, including any Locational Price Adder, of the LDA from which the upgrade was to provide such increased CETL, multiplied by the megawatt quantity of increased CETL cleared from such Sell Offer. Such payments shall be reflected in the Locational Price Adder determined as part of the Final Zonal Capacity Price for the Zone associated with such LDAs, and shall be funded through a reduction in the Capacity Transfer Rights allocated to Load-Serving Entities under section 5.15, as set forth in that section. PJMSettlement shall be the Counterparty to any cleared capacity transaction resulting from a Sell Offer based on a Qualifying Transmission Upgrade.

e) Locational Reliability Charge

In accordance with the Reliability Assurance Agreement, each LSE shall incur a Locational Reliability Charge (subject to certain offsets and other adjustments as described in sections 5.14B, 5.14C, 5.14D, 5.14E and 5.15) equal to such LSE's Daily Unforced Capacity Obligation in a Zone during such Delivery Year multiplied by the applicable Final Zonal Capacity Price in such Zone. PJMSettlement shall be the Counterparty to the LSEs' obligations to pay, and payments of, Locational Reliability Charges.

f) The Office of the Interconnection shall determine Zonal Capacity Prices in accordance with the following, based on the optimization algorithm:

i) The Office of the Interconnection shall calculate and post the Preliminary Zonal Capacity Prices for each Delivery Year following the Base Residual Auction for such Delivery Year. The Preliminary Zonal Capacity Price for each Zone shall be the sum of: 1) the marginal value of system capacity for the PJM Region, without considering locational constraints; 2) the Locational Price Adder, if any, for the LDA in which such Zone is located; provided however, that if the Zone contains multiple LDAs with different Capacity Resource Clearing Prices, the Zonal Capacity Price shall be a weighted average of the Capacity Resource Clearing Prices for such LDAs, weighted by the Unforced Capacity of Capacity Resources cleared in each such LDA; 3) an adjustment, if required, to account for adders paid to Annual Resources and Extended Summer Demand Resources in the LDA for which the zone is located; 4) an adjustment, if required, to account for Resource Make-Whole Payments; and (5) an adjustment, if required to provide sufficient revenue for payment of any PRD Credits, all as determined in accordance with the optimization algorithm.

ii) The Office of the Interconnection shall calculate and post the Adjusted Zonal Capacity Price following each Incremental Auction. The Adjusted Zonal Capacity Price for each Zone shall equal the sum of: (1) the average marginal value of system capacity weighted by the Unforced Capacity cleared in all auctions previously conducted for such Delivery Year (excluding any Unforced Capacity cleared as replacement capacity); (2) the average Locational Price Adder weighted by the Unforced Capacity cleared in all auctions previously conducted for

such Delivery Year (excluding any Unforced Capacity cleared as replacement capacity); (3) an adjustment, if required, to account for adders paid to Annual Resources and Extended Summer Demand Resources for all auctions previously conducted for such Delivery Year (excluding any Unforced Capacity cleared as replacement capacity); (4) an adjustment, if required, to account for Resource Make-Whole Payments for all actions previously conducted (excluding any Resource Make-Whole Payments to be charged to the buyers of replacement capacity); and (5) an adjustment, if required to provide sufficient revenue for payment of any PRD Credits. The Adjusted Zonal Capacity Price may decrease if Unforced Capacity is decommitted or the Resource Clearing Price decreases in an Incremental Auction.

iii) The Office of the Interconnection shall calculate and post the Final Zonal Capacity Price for each Delivery Year after the final auction is held for such Delivery Year, as set forth above. The Final Zonal Capacity Price for each Zone shall equal the Adjusted Zonal Capacity Price, as further adjusted to reflect any decreases in the Nominated Demand Resource Value of any existing Demand Resource cleared in the Base Residual Auction and Second Incremental Auction.

g) Resource Substitution Charge

Each Capacity Market Buyer in an Incremental Auction securing replacement capacity shall pay a Resource Substitution Charge equal to the Capacity Resource Clearing Price resulting from such auction multiplied by the megawatt quantity of Unforced Capacity purchased by such Market Buyer in such auction.

h) Minimum Offer Price Rule for Certain Generation Capacity Resources

(1) General Rule. Any Sell Offer based on a Capacity Resource with Actionable Subsidy submitted in any RPM Auction shall have an offer price no lower than the MOPR Floor Offer Price.

(2) Process for Establishing a Capacity Resource with Actionable Subsidy.

(a) By no later than one hundred twenty (120) days prior to the commencement of the offer period of any RPM Auction each Capacity Market Seller must provide for each Generation Capacity Resource, and uprate, or planned uprate, of a Generation Capacity Resource that the seller intends to offer into the RPM Auction, information needed to determine whether such Capacity Resource qualifies as a Capacity Resource with Actionable Subsidy. In addition to the documentation identified herein and in the PJM Manuals, the Capacity Market Seller shall provide any additional supporting information reasonably requested by the Office of the Interconnection or the Market Monitoring Unit to evaluate whether such Capacity Resource is a Capacity Resource with Actionable Subsidy. The Capacity Market Seller shall have an ongoing obligation through the closing of the offer period for the RPM Auction to update the Office of the Interconnection and the Market Monitoring Unit regarding any material changes in the qualifications of the Capacity Resource. The Office of Interconnection and the Market Monitoring Unit may request additional information from the Capacity Market Seller prior to the commencement of the offer period for the RPM Auction. Such Capacity Market Seller shall provide any requested information to the Office of Interconnection and Market

Monitoring Unit within five (5) business days upon receipt of the request for additional information.

(b) For each Capacity Resource, an officer of the Capacity Market Seller must certify whether or not such Capacity Resource is a Capacity Resource with Actionable Subsidy.

(c) Once a Capacity Resource is a Capacity Resource with Actionable Subsidy, the status of such Capacity Resource will remain unchanged unless and until the Capacity Market Seller provides notification of a change in such status or the Office of the Interconnection removes such status, or by Commission order. All Capacity Market Sellers shall have an ongoing obligation to provide notification of any change in status.

(4) MOPR Floor Offer Price. The MOPR Floor Offer Price for a Capacity Resource with Actionable Subsidy shall be the Net Cost of New Entry times the Balancing Ratio.

(5) Procedures and Remedies in Cases of Suspected Fraud or Material Misrepresentation or Omissions in Connection with a Capacity Resource with Actionable Subsidy. In the event the Office of the Interconnection reasonably believes that a certification of a Capacity Resource's status contains or is based on fraudulent or material misrepresentations or omissions such that the Capacity Market Seller's Capacity Resource is a Capacity Resource with Actionable Subsidy, then:

(a) the Office of the Interconnection will provide written notice of suspected fraudulent or material misrepresentation or omission to the Capacity Market Seller no later than thirty (30) days prior to the commencement of the offer period for the RPM Auction for which the seller submitted the certification. In such event, a resource that is a Capacity Resource with Actionable Subsidy shall be subject to the Minimum Offer Price Rule. The Office of the Interconnection shall make any filings with FERC that the Office of the Interconnection deems necessary. A Capacity Market Seller may challenge the Office of Interconnection's determination of suspected fraudulent or material misrepresentation or omission by filing a petition with FERC;

(b) if the Office of the Interconnection does not provide written notice of suspected fraudulent or material misrepresentation or omission at least thirty (30) days before the start of the relevant RPM Auction, then the Office of the Interconnection may file the certification that contains any alleged fraudulent or material misrepresentation or omission with FERC. The Office of the Interconnection shall implement any remedies ordered by FERC; and

(c) prior to applying the Minimum Offer Price Rule, the Office of the Interconnection, with advice and input of the Market Monitoring Unit, shall notify the affected Capacity Market Seller and, to the extent practicable, provide the Capacity Market Seller an opportunity to explain the alleged fraudulent or material misrepresentation or omission. Any filing to FERC under this provision shall seek fast track treatment and neither the name nor any identifying characteristics of the Capacity Market Seller or the resource shall be publicly revealed, but otherwise the filing shall be public. The Capacity Market Seller may submit a revised certification for that Capacity Resource for subsequent RPM Auctions, including RPM Auctions held during the pendency of the FERC proceeding. In the event that the Capacity Market Seller is cleared by FERC from such allegations of fraudulent or material misrepresentations or omissions then the certification shall be restored to the extent and in the

manner permitted by FERC. The remedies required by this subsection 5.14(h)(5) to be requested in any filing to FERC shall not be exclusive of any other actions, remedies, or penalties that may be pursued against the Capacity Market Seller by, including but not limited to, the Office of the Interconnection, the MMU, or others.

i) Net Cost of New Entry.

(1) For purposes of this section, the Net ~~Asset Class Costs~~Cost of New Entry shall be ~~asset-class estimates~~an estimate of competitive, cost-based nominal levelized Cost of New Entry, net of energy and ancillary service revenues. Determination of the gross Cost of New Entry component of the Net Asset Class Cost of New Entry shall be consistent with the methodology used to determine the Cost of New Entry set forth in Section 5.10(a)(iv)(A) of this Attachment.

The gross Cost of New Entry component of Net ~~Asset Class~~ Cost of New Entry shall be, for purposes of the 2018/2019 Delivery Year and subsequent Delivery Years, the values indicated in the table below for each CONE Area for a combustion turbine generator ("CT"), and a combined cycle generator ("CC") respectively, and shall be adjusted for subsequent Delivery Years in accordance with subsection (~~h)(2) below. For purposes of Incremental Auctions for the 2015/2016, 2016/2017 and 2017/2018 Delivery Years, the MOPR Floor Offer Price shall be the same as that used in the Base Residual Auction for such Delivery Year.~~i)(2) below. The estimated energy and ancillary service revenues for each type of plant shall be determined as described in subsection (~~h)(3) below. Notwithstanding the foregoing, the Net Asset Class Cost of New Entry shall be zero for: (i) Sell Offers based on nuclear, coal or Integrated Gasification Combined Cycle facilities; or (ii) Sell Offers based on hydroelectric, wind, or solar facilities.~~i)(3) below.

	CONE Area 1	CONE Area 2	CONE Area 3	CONE Area 4
CT $/MW-yr	132,200	130,300	128,900	130,300
CC $/MW-yr	185,700	176,000	172,600	179,400

(2) Beginning with the Delivery Year that begins on June 1, 2019, the gross Cost of New Entry component of the Net ~~Asset Class~~ Cost of New Entry shall be adjusted to reflect changes in generating plant construction costs in the same manner as set forth for the cost of new entry in section 5.10(a)(iv)(B), provided, however, that the Applicable BLS Composite Index used for CC plants shall be calculated from the three indices referenced in that section but weighted 25% for the wages index, 60% for the construction materials index, and 15% for the turbines index, and provided further that nothing herein shall preclude the Office of the Interconnection from filing to change the Net ~~Asset Class~~ Cost of New Entry for any Delivery Year pursuant to appropriate filings with FERC under the Federal Power Act.

(3) For purposes of this provision, the net energy and ancillary services revenue estimate for a combustion turbine generator shall be that determined by section 5.10(a)(v)(A) of this Attachment DD, provided that the energy revenue estimate for each CONE Area shall be based on the Zone within such CONE Area that has the highest energy revenue estimate calculated under the methodology in that subsection. The net energy and ancillary services revenue estimate for a combined cycle generator shall be determined in the same manner as that prescribed for a combustion turbine generator in the previous sentence, except

that the heat rate assumed for the combined cycle resource shall be 6.722 MMbtu/Mwh, the variable operations and maintenance expenses for such resource shall be $3.23 per MWh, the Peak-Hour Dispatch scenario for both the Day-Ahead and Real-Time Energy Markets shall be modified to dispatch the CC resource continuously during the full peak-hour period, as described in section 2.46, for each such period that the resource is economic (using the test set forth in such section), rather than only during the four-hour blocks within such period that such resource is economic, and the ancillary service revenues shall be $3198 per MW-year.

(4) Any Sell Offer that is based on:

i) a Generation Capacity Resource located in the PJM Region ~~that is submitted in an RPM Auction for a Delivery Year unless a Sell Offer based on that resource has cleared an RPM Auction for that or any prior Delivery Year, or until a Sell Offer based on that resource clears an RPM auction for that or any subsequent Delivery Year~~; or

ii) a Generation Capacity Resource located outside the PJM Region (where such Sell Offer is based solely on such resource) that requires sufficient transmission investment for delivery to the PJM Region to indicate a long-term commitment to providing capacity to the PJM Region, ~~unless a Sell Offer based on that resource has cleared an RPM Auction for that or any prior Delivery Year, or until a Sell offer based on that resource clears an RPM Auction for that or any subsequent Delivery Year, in any LDA for which a separate VRR Curve is established for use in the Base Residual Auction for the Delivery Year relevant to the RPM Auction in which such offer is submitted, and that is less than 90 percent of the applicable Net Asset Class Cost of New Entry or, if there is no applicable Net Asset Class Cost of New Entry, less than 70 percent of the Net Asset Class Cost of New Entry for a combustion turbine generator as provided in subsection (h)(1) above shall be set to equal 90 percent of the applicable Net Asset Class Cost of New Entry (or set equal to 70 percent of such cost for a combustion turbine, where there is no otherwise applicable net asset class figure), unless the Capacity Market Seller obtains the prior determination from the Office of the Interconnection described in subsection (5) hereof. This provision applies to Sell Offers submitted in Incremental Auctions conducted after December 19, 2011, provided that the Net Asset Class Cost of New Entry values for any such Incremental Auctions for the 2012-13 or 2013-14 Delivery Years shall be the Net Asset Class Cost of New Entry values posted by the Office of the Interconnection for the Base Residual Auction for the 2014-15 Delivery Year.~~

~~(5) Unit-Specific Exception. A Sell Offer meeting the criteria in subsection (4) shall be permitted and shall not be re-set to the price level specified in that subsection if the Capacity Market Seller obtains a determination from the Office of the Interconnection or the Commission, prior to the RPM Auction in which it seeks to submit the Sell Offer, that such Sell Offer is permissible because it is consistent with the competitive, cost-based, fixed, net cost of new entry were the resource to rely solely on revenues from PJM-administered markets . The following process and requirements shall apply to requests for such determinations:~~

~~i) The Capacity Market Seller may request such a determination by no later than one hundred twenty (120) days prior to the commencement of the offer period for the RPM Auction in which it seeks to submit its Sell Offer, by submitting simultaneously to the Office of the Interconnection and the Market Monitoring Unit a written request with all of the~~

required documentation as described below and in the PJM Manuals. For such purpose, the Office of the Interconnection shall post, by no later than one hundred fifty (150) days prior to the commencement of the offer period for the relevant RPM Auction, a preliminary estimate for the relevant Delivery Year of the minimum offer level expected to be established under subsection (4). If the minimum offer level subsequently established for the relevant Delivery Year is less than the Sell Offer, the Sell Offer shall be permitted and no exception shall be required.

ii) As more fully set forth in the PJM Manuals, the Capacity Market Seller must include in its request for an exception under this subsection documentation to support the fixed development, construction, operation, and maintenance costs of the planned generation resource, as well as estimates of offsetting net revenues. Estimates of costs or revenues shall be supported at a level of detail comparable to the cost and revenue estimates used to support the Net Asset Class Cost of New Entry established under this section 5.14(h). As more fully set forth in the PJM Manuals, supporting documentation for project costs may include, as applicable and available, a complete project description; environmental permits; vendor quotes for plant or equipment; evidence of actual costs of recent comparable projects; bases for electric and gas interconnection costs and any cost contingencies; bases and support for property taxes, insurance, operations and maintenance ("O&M") contractor costs, and other fixed O&M and administrative or general costs; financing documents for construction period and permanent financing or evidence of recent debt costs of the seller for comparable investments; and the bases and support for the claimed capitalization ratio, rate of return, cost-recovery period, inflation rate, or other parameters used in financial modeling. Such documentation also shall identify and support any sunk costs that the Capacity Market Seller has reflected as a reduction to its Sell Offer The request shall include a certification, signed by an officer of the Capacity Market Seller, that the claimed costs accurately reflect, in all material respects, the seller's reasonably expected costs of new entry and that the request satisfies all standards for an exception hereunder. The request also shall identify all revenue sources relied upon in the Sell Offer to offset the claimed fixed costs, including, without limitation, long-term power supply contracts, tolling agreements, or tariffs on file with state regulatory agencies, and shall demonstrate that such offsetting revenues are consistent, over a reasonable time period identified by the Capacity Market Seller, with the standard prescribed above. In making such demonstration, the Capacity Market Seller may rely upon forecasts of competitive electricity prices in the PJM Region based on well defined models that include fully documented estimates of future fuel prices, variable operation and maintenance expenses, energy demand, emissions allowance prices, and expected environmental or energy policies that affect the seller's forecast of electricity prices in such region, employing input data from sources readily available to the public. Documentation for net revenues also may include, as available and applicable, plant performance and capability information, including heat rate, start-up times and costs, forced outage rates, planned outage schedules, maintenance cycle, fuel costs and other variable operations and maintenance expenses, and ancillary service capabilities. In addition to the documentation identified herein and in the PJM Manuals, the Capacity Market Seller shall provide any additional supporting information reasonably requested by the Office of the Interconnection or the Market Monitoring Unit to evaluate the Sell Offer. Requests for additional documentation will not extend the deadline by which the Office of the Interconnection or the Market Monitoring Unit must provide their determinations of the Minimum Offer Price Rule exception request.

~~iii) A Sell Offer evaluated hereunder shall be permitted if the information provided reasonably demonstrates that the Sell Offer's competitive, cost-based, fixed, net cost of new entry is below the minimum offer level prescribed by subsection (4), based on competitive cost advantages relative to the costs estimated for subsection (4), including, without limitation, competitive cost advantages resulting from the Capacity Market Seller's business model, financial condition, tax status, access to capital or other similar conditions affecting the applicant's costs, or based on net revenues that are reasonably demonstrated hereunder to be higher than estimated for subsection (4). Capacity Market Sellers shall be asked to demonstrate that claimed cost advantages or sources of net revenue that are irregular or anomalous, that do not reflect arm's-length transactions, or that are not in the ordinary course of the Capacity Market Seller's business are consistent with the standards of this subsection. Failure to adequately support such costs or revenues so as to enable the Office of the Interconnection to make the determination required in this section will result in denial of an exception hereunder by the Office of the Interconnection.~~

~~iv) The Market Monitoring Unit shall review the information and documentation in support of the request and shall provide its findings whether the proposed Sell Offer is acceptable, in accordance with the standards and criteria hereunder, in writing, to the Capacity Market Seller and the Office of the Interconnection by no later than ninety (90) days prior to the commencement of the offer period for such auction. The Office of the Interconnection shall also review all exception requests and documentation and shall provide in writing to the Capacity Market Seller, and the Market Monitoring Unit, its determination whether the requested Sell Offer is acceptable and if not it shall calculate and provide to such Capacity Market Seller, a minimum Sell Offer based on the data and documentation received, by no later than sixty-five (65) days prior to the commencement of the offer period for the relevant RPM Auction. If the Office of the Interconnection determines that the requested Sell Offer is acceptable, the Capacity Market Seller Shall notify the Market Monitoring Unit and the Office of the Interconnection, in writing, of the minimum level of Sell Offer to which it agrees to commit by no later than sixty (60) days prior to the commencement of the offer period for the relevant RPM Auction~~

~~i~~that is less than the MOPR Floor Offer Price as defined in Attachment DD, Section 5.14(h)(4), shall be set to equal to the MOPR Floor Offer Price.

j) Capacity Export Charges and Credits

(1) Charge

Each Capacity Export Transmission Customer shall incur for each day of each Delivery Year a Capacity Export Charge equal to the Reserved Capacity of Long-Term Firm Transmission Service used for such export ("Export Reserved Capacity") multiplied by (the Final Zonal Capacity Price for such Delivery Year for the Zone encompassing the interface with the Control Area to which such capacity is exported minus the Final Zonal Capacity Price for such Delivery Year for the Zone in which the resources designated for export are located, but not less than zero). If more than one Zone forms the interface with such Control Area, then the amount of Reserved Capacity described above shall be apportioned among such Zones for purposes of the above calculation in proportion to the flows from such resource through each such Zone directly

to such interface under CETO/CETL analysis conditions, as determined by the Office of the Interconnection using procedures set forth in the PJM Manuals. The amount of the Reserved Capacity that is associated with a fully controllable facility that crosses such interface shall be completely apportioned to the Zone within which such facility terminates.

(2) Credit

To recognize the value of firm Transmission Service held by any such Capacity Export Transmission Customer, such customer assessed a charge under section 5.14(i)(1) also shall receive a credit, comparable to the Capacity Transfer Rights provided to Load-Serving Entities under section 5.15. Such credit shall be equal to the locational capacity price difference specified in section 5.14(ij)(1) times the Export Customer's Allocated Share determined as follows:

Export Customer's Allocated Share equals

(Export Path Import * Export Reserved Capacity) /

(Export Reserved Capacity + Daily Unforced Capacity Obligations of all LSEs in such Zone).

Where:

"Export Path Import" means the megawatts of Unforced Capacity imported into the export interface Zone from the Zone in which the resource designated for export is located.

If more than one Zone forms the interface with such Control Area, then the amount of Export Reserved Capacity shall be apportioned among such Zones for purposes of the above calculation in the same manner as set forth in subsection (ij)(1) above.

(3) Distribution of Revenues

Any revenues collected from the Capacity Export Charge with respect to any capacity export for a Delivery Year, less the credit provided in subsection (ij)(2) for such Delivery Year, shall be distributed to the Load Serving Entities in the export-interface Zone that were assessed a

Locational Reliability Charge for such Delivery Year, pro rata based on the Daily Unforced Capacity Obligations of such Load-serving Entities in such Zone during such Delivery Year. If more than one Zone forms the interface with such Control Area, then the revenues shall be apportioned among such Zones for purposes of the above calculation in the same manner as set forth in subsection (ij)(1) above.

5.14A [Reserved.]

5.14B Generating Unit Capability Verification Test Requirements Transition Provision for RPM Delivery Years 2014/2015, 2015/2016, and 2016/2017

A. This transition provision applies only with respect to Generation Capacity Resources with existing capacity commitments for the 2014/2015, 2015/2016, or 2016/2017 Delivery Years that

experience reductions in verified installed capacity available for sale as a direct result of revised generating unit capability verification test procedures effective with the summer 2014 capability tests, as set forth in the PJM Manuals. A Generation Capacity Resource meeting the description of the preceding sentence, and the Capacity Market Seller of such a resource, are hereafter in this section 5.14B referred to as an "Affected Resource" and an "Affected Resource Owner," respectively.

B. For each of its Affected Resources, an Affected Resource Owner is required to provide documentation to the Office of the Interconnection sufficient to show a reduction in installed capacity value as a direct result of the revised capability test procedures. Upon acceptance by the Office of the Interconnection, the Affected Resource's installed capacity value will be updated in the eRPM system to reflect the reduction, and the Affected Resource's Capacity Interconnection Rights value will be updated to reflect the reduction, effective June 1, 2014. The reduction's impact on the Affected Resource's existing capacity commitments for the 2014/2015 Delivery Year will be determined in Unforced Capacity terms, using the final EFORd value established by the Office of the Interconnection for the 2014/2015 Delivery Year as applied to the Third Incremental Auction for the 2014/2015 Delivery Year, to convert installed capacity to Unforced Capacity. The reduction's impact on the Affected Resource's existing capacity commitments for each of the 2015/2016 and 2016/2017 Delivery Years will be determined in Unforced Capacity terms, using the EFORd value from each Sell Offer in each applicable RPM Auction, applied on a pro-rata basis, to convert installed capacity to Unforced Capacity. The Unforced Capacity impact for each Delivery Year represents the Affected Resource's capacity commitment shortfall, resulting wholly and directly from the revised capability test procedures, for which the Affected Resource Owner is subject to a Capacity Resource Deficiency Charge for the Delivery Year, as described in section 8 of this Attachment DD, unless the Affected Resource Owner (i) provides replacement Unforced Capacity, as described in section 8.1 of this Attachment DD, prior to the start of the Delivery Year to resolve the Affected Resource's total capacity commitment shortfall; or (ii) requests relief from Capacity Resource Deficiency Charges that result wholly and directly from the revised capability test procedures by electing the transition mechanism described in this section 5.14B ("Transition Mechanism").

C. Under the Transition Mechanism, an Affected Resource Owner may elect to have the Unforced Capacity commitments for all of its Affected Resources reduced for the 2014/2015, 2015/2016, or 2016/2017 Delivery Years to eliminate the capacity commitment shortfalls, across all of its Affected Resources, that result wholly and directly from the revised capability test procedures, and for which the Affected Resource Owner otherwise would be subject to Capacity Resource Deficiency Charges for the Delivery Year. In electing this option, the Affected Resource Owner relinquishes RPM Auction Credits associated with the reductions in Unforced Capacity commitments for all of its Affected Resources for the Delivery Year, and Locational Reliability Charges as described in section 5.14(e) of this Attachment DD are adjusted accordingly. Affected Resource Owners wishing to elect the Transition Mechanism for the 2015/2016 Delivery Year must notify the Office of the Interconnection by May 30, 2014. Affected Resource Owners wishing to elect the Transition Mechanism for the 2016/2017 Delivery Year must notify the Office of the Interconnection by July 25, 2014.

D. The Office of the Interconnection will offset the total reduction (across all Affected Resources and Affected Resource Owners) in Unforced Capacity commitments associated with

the Transition Mechanism for the 2015/2016 and 2016/2017 Delivery Years by applying corresponding adjustments to the quantity of Buy Bid or Sell Offer activity in the upcoming Incremental Auctions for each of those Delivery Years, as described in sections 5.12(b)(ii) and 5.12(b)(iii) of this Attachment DD.

E. By electing the Transition Mechanism, an Affected Resource Owner may receive relief from applicable Capacity Resource Deficiency Charges for the 2014/2015, 2015/2016, or 2016/2017 Delivery Years, and a Locational UCAP Seller that sells Locational UCAP based on an Affected Resource owned by the Affected Resource Owner may receive relief from applicable Capacity Resource Deficiency Charges for the 2014/2015 Delivery Year, to the extent that the Affected Resource Owner demonstrates, to the satisfaction of the Office of the Interconnection, that an inability to deliver the amount of Unforced Capacity previously committed for the 2014/2015, 2015/2016, or 2016/2017 Delivery Years is due to a reduction in verified installed capacity available for sale as a direct result of revised generating unit capability verification test procedures effective with the summer 2014 capability tests, as set forth in the PJM Manuals; provided, however, that the Affected Resource Owner must provide the Office of the Interconnection with all information deemed necessary by the Office of the Interconnection to assess the merits of the request for relief.

5.14C Demand Response Operational Resource Flexibility Transition Provision for RPM Delivery Years 2015/2016 and 2016/2017

A. This transition provision applies only to Demand Resources for which a Curtailment Service Provider has existing RPM commitments for the 2015/2016 or 2016/2017 Delivery Years (alternatively referred to in this section 5.14C as "Applicable Delivery Years" and each an "Applicable Delivery Year") that (i) cannot satisfy the 30-minute notification requirement as described in Section A.2 of Attachment DD-1 of the Tariff and the parallel provision of Schedule 6 of the RAA; (ii) are not excepted from the 30-minute notification requirement as described in Section A.2 of Attachment DD-1 of the Tariff and the parallel provision of Schedule 6 of the RAA; and (iii) cleared in the Base Residual Auction or First Incremental Auction for the 2015/2016 Delivery Year, or cleared in the Base Residual Auction for the 2016/2017 Delivery Year. A Demand Resource meeting these criteria and the Curtailment Service Provider of such a resource are hereafter in this section 5.14C referred to as an "Affected Demand Resource" and an "Affected Curtailment Service Provider," respectively.

B. For this section 5.14C to apply to an Affected Demand Resource, the Affected Curtailment Service Provider must notify the Office of the Interconnection in writing, with regard to the following information by the applicable deadline:

i) For each applicable Affected Demand Resource: the number of cleared megawatts of Unforced Capacity for the Applicable Delivery Year by end-use customer site that the Affected Curtailment Service Provider cannot deliver, calculated based on the most current information available to the Affected Curtailment Service Provider; the end-use customer name; electric distribution company's account number for the end-use customer; address of end-use customer; type of Demand Resource (i.e., Limited DR, Annual DR, Extended Summer DR); the Zone or sub-Zone in which the end-use customer is located; and, a detailed description of why

the end-use customer cannot comply with the 30-minute notification requirement or qualify for one of the exceptions to the 30-minute notification requirement provided in Section A.2 of Attachment DD-1 of the Tariff and the parallel provision of Schedule 6 of the RAA.

ii) If applicable, a detailed analysis that quantifies the amount of cleared megawatts of Unforced Capacity for the Applicable Delivery Year for prospective customer sales that could not be contracted by the Affected Curtailment Service Provider because of the 30-minute notification requirement provided in Section A.2 of Attachment DD-1 of the Tariff and the parallel provision of Schedule 6 of the RAA that the Affected Curtailment Service Provider cannot deliver, by type of Demand Resource (i.e. Limited DR, Annual DR, Extended Summer DR) and by Zone and sub-Zone, as applicable. The analysis should include the amount of Unforced Capacity expected from prospective customer sales for each Applicable Delivery Year and must include supporting detail to substantiate the difference in reduced sales expectations. The Affected Curtailment Service Provider should maintain records to support its analysis.

1. For the 2015/2016 Delivery Year, the notice shall be provided by no later than seven (7) days prior to the posting by the Office of the Interconnection of planning parameters for the Third Incremental Auction for the 2015/2016 Delivery Year. Such Affected Curtailment Service Provider that utilizes this transition provision may not sell or offer to sell megawatts in the modeled LDA or sub-LDA where an Affected Demand Resource is located in the Third Incremental Auction for the 2015/2016 Delivery Year.

. For the 2016/2017 Delivery Year, the notice shall be provided by no later than seven (7) days prior to the posting by the Office of the Interconnection of planning parameters for the Second Incremental Auction for the 2016/2017 Delivery Year. Such Affected Curtailment Service Provider that utilizes this transition provision may not sell or offer to sell megawatts in the modeled LDA or sub-LDA where an Affected Demand Resource is located in the Second or Third Incremental Auctions for the 2016/2017 Delivery Year.

3. For the 2016/2017 Delivery Year, the notice shall be provided by no later than seven (7) days prior to the posting by the Office of the Interconnection of planning parameters for the Third Incremental Auction for the 2016/2017 Delivery Year. Such Affected Curtailment Service Provider that utilizes this transition provision must not have sold or offered to sell megawatts in the modeled LDA or sub-LDA where an Affected Demand Resource is located in the Second Incremental Auction for the 2016/2017 Delivery Year, and may not sell or offer to sell megawatts in the modeled LDA or sub-LDA where an Affected Demand Resource is located in the Third Incremental Auction for the 2016/2017 Delivery Year.

C. For the Third Incremental Auction for the 2015/2016 Delivery Year and the First, Second, and Third Incremental Auctions for the 2016/2017 Delivery Year, the Office of the Interconnection shall publish aggregate information on the undeliverable megawatts declared under this transition provision (hereafter, "non-viable megawatts"), by type of Demand Resource and by Zone or sub-Zone, concurrently with its posting of planning parameters for the applicable Scheduled Incremental Auction. Non-viable megawatts for a Scheduled Incremental Auction for

an Applicable Delivery Year represent those megawatts meeting the criteria of subsection A above and declared in accordance with subsection B above. Prior to each Third Incremental Auction for an Applicable Delivery Year, the Office of the Interconnection shall apply adjustments equal to the declared non-viable megawatt quantity to the quantity of Buy Bid or Sell Offer activity in the upcoming Scheduled Incremental Auctions for the Applicable Delivery Year, as described in sections 5.12(b)(ii) and 5.12(b)(iii) of this Attachment DD. Prior to the Second Incremental Auction for the 2016/2017 Delivery Year, the Office of the Interconnection shall adjust the recalculated PJM Region Reliability Requirement and recalculated LDA Reliability Requirements, as described in section 5.4(c) of this Attachment DD, by the applicable quantity of declared non-viable megawatts, and shall update the PJM Region Reliability Requirement and each LDA Reliability Requirement for such Second Incremental Auction only if the combined change of the applicable adjustment and applicable recalculation is greater than or equal to the lessor of (i) 500 megawatts or (ii) one percent of the prior PJM Region Reliability Requirement or one percent of the prior LDA Reliability Requirement, as applicable.

D. Prior to the start of each Applicable Delivery Year, the Office of the Interconnection shall reduce, by type of Demand Resource and by Zone or sub-Zone, the capacity commitment of each Affected Curtailment Service Provider that utilizes this transition provision for the Applicable Delivery Year based on the non-viable megawatts declared by the Affected Curtailment Service Provider under this transition provision. If the Affected Curtailment Service Provider cleared megawatts from multiple Affected Demand Resources of the same type and Zone or sub-Zone, or cleared megawatts in multiple RPM Auctions for the Applicable Delivery Year, the Office of the Interconnection shall allocate the reduction in capacity commitment by type of Demand Resource and by Zone or sub-Zone across the applicable Affected Demand Resources and relevant RPM Auctions. Such allocation shall be performed on a pro-rata basis, based on megawatts cleared by the Affected Demand Resources in the relevant RPM Auctions.

E. For each Applicable Delivery Year, an Affected Curtailment Service Provider that utilizes this transition provision for the Applicable Delivery Year relinquishes an Affected Demand Resource's RPM Auction Credits for the amount of capacity commitment reduction as determined under subsection D above. Locational Reliability Charges as described in section 5.14(e) of this Attachment DD are also adjusted accordingly.

5.14D Capacity Performance and Base Capacity Transition Provision for RPM Delivery Years 2016/2017 and 2017/2018

A. This transition provision applies only for procuring Capacity Performance Resources for the 2016/2017 and 2017/2018 Delivery Years.

B. For both the 2016/2017 and 2017/2018 Delivery Years, PJM will hold a Capacity Performance Transition Incremental Auction to procure Capacity Performance Resources.

1. For each Capacity Performance Transition Incremental Auction, the optimization algorithm shall consider:

- the target quantities of Capacity Performance Resources specified below;

- the Sell Offers submitted in such auction.

The Office of the Interconnection shall submit a Buy Bid based on the quantity of Capacity Performance Resources specified for that Delivery Year. For the 2016/2017 Delivery Year, the Office of the Interconnection shall submit a Buy Bid, at a price no higher than 0.5 times the Net CONE value for the PJM Region determined for the Base Residual Auction for that Delivery Year, for a quantity of Capacity Performance Resources equal to 60 percent of the updated Reliability Requirement for the PJM Region. For the 2017/2018 Delivery Year, the Office of the Interconnection shall submit a Buy Bid, at a price no higher than 0.6 times the Net CONE value for the PJM Region determined for the Base Residual Auction for that Delivery Year, for a quantity of Capacity Performance Resources equal to 70 percent of the updated Reliability Requirement for the PJM Region.

2. For each Capacity Performance Transition Incremental Auction, the Office of the Interconnection shall calculate a clearing price to be paid for each megawatt-day of Unforced Capacity that clears in such auction. For the 2016/2017 Delivery Year, the Capacity Resource Clearing Price for any Capacity Performance Transition Incremental Auction shall not exceed

0.5 times the Net CONE value for the PJM Region determined for the Base Residual Auction for that Delivery Year. For the 2017/2018 Delivery Year, the Capacity Resource Clearing Price for any Capacity Performance Transition Incremental Auction shall not exceed 0.6 times the Net CONE value for the PJM Region determined for the Base Residual Auction for that Delivery Year.

3. A Capacity Market Seller may offer any Capacity Resource that has not been committed in an FRR Capacity Plan, that qualifies as a Capacity Performance Resource under section 5.5A(a) and that (i) has not cleared an RPM Auction for that Delivery Year; or (ii) has cleared in an RPM Auction for that Delivery Year. A Capacity Market Seller may offer an external Generation Capacity Resource to the extent that such resource: (i) is reasonably expected, by the relevant Delivery Year, to meet all applicable requirements to be treated as equivalent to PJM Region internal generation that is not subject to NERC tagging as an interchange transaction; (ii) has long-term firm transmission service confirmed on the complete transmission path from such resource into PJM; and (iii) is, by written commitment of the Capacity Market Seller, subject to the same obligations imposed on Generation Capacity Resources located in the PJM Region by section 6.6 of Attachment DD of the PJM Tariff to offer their capacity into RPM Auctions.

4. Capacity Resources that already cleared an RPM Auction for a Delivery Year, retain the capacity obligations for that Delivery Year, and clear in a Capacity Performance Transition Incremental Auction for the same Delivery Year shall: (i) receive a payment equal to the Capacity Resource Clearing Price as established in that Capacity Performance Transition Incremental Auction; and (ii) not be eligible to receive a payment for clearing in any prior RPM Auction for that Delivery Year.

D. All Capacity Performance Resources that clear in a Capacity Performance Transition Incremental Auction will be subject to the Non-Performance Charge set forth in section 10A.

5.~~14 E~~14E Demand Response Legacy Direct Load Control Transition Provision for RPM Delivery Years 2016/2017, 2017/2018, and 2018/2019

A. This transition provision applies only to Demand Resources for which a Curtailment Service Provider has existing RPM commitments for the 2016/2017, 2017/2018, or 2018/2019 Delivery Years (alternatively referred to in this section 5.14E as "Applicable Delivery Years" and each an "Applicable Delivery Year") that (i) qualified as Legacy Direct Load Control before June 1, 2016 as described in Section G of Attachment DD-1 of the Tariff and the parallel provision of Schedule 6 of the RAA; (ii) cannot meet the requirements for using statistical sampling for residential non-interval metered customers as described in Section K of Attachment DD-1 of the Tariff and the parallel provision of Schedule 6 of the RAA; and (iii) cleared in the Base Residual Auction or First Incremental Auction for the 2016/2017 Delivery Year, cleared in the Base Residual Auction for the 2017/2018 Delivery Year, or cleared in the Base Residual Auction for the 2018/2019 Delivery Year. A Demand Resource meeting these criteria and the Curtailment Service Provider of such a resource are hereafter in this section 5.14E referred to as an "Affected Demand Resource" and an "Affected Curtailment Service Provider," respectively.

B. For this section 5.14E to apply to an Affected Demand Resource, the Affected Curtailment Service Provider must notify the Office of the Interconnection in writing, with regard to the following information, by the applicable deadline:

i) For each applicable Affected Demand Resource: the number of cleared megawatts of Unforced Capacity for the Applicable Delivery Year by end-use customer site that the Affected Curtailment Service Provider cannot deliver, calculated based on the most current information available to the Affected Curtailment Service Provider; electric distribution company's account number for the end-use customer; address of end-use customer; type of Demand Resource (i.e., Limited DR, Annual DR, Extended Summer DR); the Zone or sub-Zone in which the end-use customer is located; and, a detailed description of why the endues customer cannot comply with statistical sampling for residential non-interval metered customers requirement as described in Section K of Attachment DD-1 of the Tariff and the parallel provision of Schedule 6 of the RAA.

ii) If applicable, a detailed analysis that quantifies the amount of cleared megawatts of Unforced Capacity for the Applicable Delivery Year for prospective customer sales that could not be contracted by the Affected Curtailment Service Provider because of the statistical sampling for residential non-interval metered customers requirement as described in Section K of Attachment DD-1 of the Tariff and the parallel provision of Schedule 6 of the RAA that the Affected Curtailment Service Provider cannot deliver, by type of Demand Resource (i.e. Limited DR, Annual DR, Extended Summer DR) and by Zone and sub-Zone, as applicable. The analysis should include the amount of Unforced Capacity expected from prospective customer sales for each Applicable Delivery Year and must include supporting detail to substantiate the difference in reduced sales expectations. The Affected Curtailment Service Provider should maintain records to support its analysis.

1. For the 2016/2017 Delivery Year, the notice shall be provided by no later than seven (7) days prior to the posting by the Office of the Interconnection of planning parameters for the Second and/or Third Incremental Auction for the 2016/2017 Delivery Year. Such Affected Curtailment Service Provider that utilizes this transition provision may not sell or offer to sell megawatts in the matching LDA or sub-LDA where an Affected Demand Resource is located in the Second or Third Incremental Auction for the 2016/2017 Delivery Year.

2. For the 2017/2018 Delivery Year, the notice shall be provided by no later than seven (7) days prior to the posting by the Office of the Interconnection of planning parameters for the First, Second and/or Third Incremental Auction for the 2017/2018 Delivery Year. Such Affected Curtailment Service Provider that utilizes this transition provision may not sell or offer to sell megawatts in the matching LDA or sub-LDA where an Affected Demand Resource is located in the First, Second or Third Incremental Auctions for the 2017/2018 Delivery Year.

3. For the 2018/2019 Delivery Year, the notice shall be provided by no later than seven (7) days prior to the posting by the Office of the Interconnection of planning parameters for the First, Second and/or Third Incremental Auction for the 2018/2019 Delivery Year. Such Affected Curtailment Service Provider that utilizes this transition provision may not sell or offer to sell megawatts in the matching LDA or sub-LDA where an Affected Demand Resource is located in the First, Second or Third Incremental Auctions for the 2018/2019 Delivery Year.

C. For the Second and Third Incremental Auction for the 2016/2017 Delivery Year, the First, Second, and Third Incremental Auctions for the 2017/2018 Delivery Year, and the First, Second, and Third Incremental Auctions for the 2018/2019 Delivery Year, the Office of the Interconnection shall publish aggregate information on the undeliverable megawatts declared under this transition provision (hereafter, "non-viable megawatts"), by type of Demand Resource and by Zone or sub-Zone, concurrently with its posting of planning parameters for the applicable Scheduled Incremental Auction. Non-viable megawatts for a Scheduled Incremental Auction for an Applicable Delivery Year represent those megawatts meeting the criteria of subsection A above and declared in accordance with subsection B above. Prior to each Scheduled Incremental Auction for an Applicable Delivery Year, the Office of the Interconnection shall apply adjustments equal to the declared non-viable megawatt quantity to the quantity of Buy Bid or Sell Offer activity in the upcoming Scheduled Incremental Auctions for the Applicable Delivery Year, as described in sections 5.12(b)(ii) and 5.12(b)(iii) of this Attachment DD. Prior to the Second Incremental Auction for the 2016/2017 Delivery Year, the First and Second Incremental Auction for the 2017/2018 Delivery Year, and the First and Second Incremental Auction for the 2018/2019 Delivery Year, the Office of the Interconnection shall adjust the recalculated PJM Region Reliability Requirement and recalculated LDA Reliability Requirements, as described in section 5.4(c) of this Attachment DD, by the applicable quantity of declared non-viable megawatts, and shall update the PJM Region Reliability Requirement and each LDA Reliability Requirement for such Incremental Auction only if the combined change of the applicable adjustment and applicable recalculation is greater than or equal to the lessor of (i) 500 megawatts or (ii) one percent of the prior PJM Region Reliability Requirement or one percent of the prior LDA Reliability Requirement, as applicable.

D. Prior to the start of each Applicable Delivery Year, the Office of the Interconnection shall reduce, by type of Demand Resource and by Zone or sub-Zone, the capacity commitment of each

Affected Curtailment Service Provider that utilizes this transition provision for the Applicable Delivery Year based on the non-viable megawatts declared by the Affected Curtailment Service Provider under this transition provision. If the Affected Curtailment Service Provider cleared megawatts from multiple Affected Demand Resources of the same type and Zone or sub-Zone, or cleared MWs in multiple RPM Auctions for the Applicable Delivery Year, the Office of the Interconnection shall allocate the reduction in capacity commitment by type of Demand Resource and by Zone or sub-Zone across the applicable Affected Demand Resources and relevant RPM Auctions. Such allocation shall be performed on a pro-rata basis, based on megawatts cleared by the Affected Demand Resources in the relevant RPM Auctions.

E. For each Applicable Delivery Year, an Affected Curtailment Service Provider that utilizes this transition provision for the Applicable Delivery Year relinquishes an Affected Demand Resource's RPM Auction credits for the amount of capacity commitment reduction as determined under subsection D above. Locational Reliability Charges as described in section 5.14(e) of this Attachment DD are also adjusted accordingly.

5.15 Capacity Transfer Rights

(a) To recognize the value of Import Capability and provide a partial offset to potential Locational Price Adders that may be determined for an LDA (as to any Zone that encompasses two or more LDAs, the term "LDA" as used herein shall refer to such Zone, rather than to the LDAs it encompasses), the Office of the Interconnection shall allocate Capacity Transfer Rights to each LSE serving load in such LDA pro rata based on such LSE's Daily Unforced Capacity Obligation in such LDA. The total megawatts of Capacity Transfer Rights available for allocation shall equal the megawatts of Unforced Capacity imported into such LDA determined based on the results of the Base Residual Auction and Incremental Auctions ("Capacity Imported"), less any megawatts of CETL increase into such LDA attributable to Qualifying Transmission Upgrades cleared in an RPM Auction and any Incremental Capacity Transfer Rights into such LDA allocated pursuant to section 5.16 (but not less than zero), and shall be subject to change in subsequent Delivery Years as a result of changes in the quantity of such Capacity Imported into such LDA. Each change in an LSE's Daily Unforced Capacity Obligation during a Delivery Year shall result in a corresponding change in the Capacity Transfer Rights allocated to such LSE.

(b) For LDAs in which the RPM Auctions for the Delivery Year resulted in a positive average weighted Locational Price Adder with respect to the immediate higher level LDA, the holder of the Capacity Transfer Rights in such LDA shall receive a payment during the Delivery Year equal to (i) the average weighted Locational Price Adder for such LDA determined with respect to the immediate higher level LDA as a result of all RPM Auctions for such Delivery Year, multiplied by (ii) the megawatt quantity of the Capacity Transfer Right allocated to such LSE in such LDA.

(c) Capacity Transfer Rights shall be transferable. A purchaser of Capacity Transfer Rights from the original party allocated such rights shall receive any payments due under this section or section 5.16, provided the seller and purchaser of such rights timely notify the Office of the Interconnection of such purchase, in accordance with procedures specified in the PJM manuals.

5.16 Incremental Capacity Transfer Rights

(a) The Office of the Interconnection shall allocate Incremental Capacity Transfer Rights to a New Service Customer obligated to fund a transmission facility or upgrade through a rate or charge specific to such facility or upgrade, to the extent such upgrade or facility increases the Import Capability into a Locational Deliverability Area, with respect to any such transmission facility interconnected to or an upgrade of the Transmission System pursuant to Part IV and/or Part VI of this Tariff, including transmission facilities interconnected to or upgrades of the Transmission System pursuant to Part IV and/or Part VI prior to the effective date of this Attachment. Incremental Capacity Transfer Rights shall be available for a facility or upgrade for a Delivery Year only if the Office of the Interconnection certifies the quantity of Import Capability provided by such facility or upgrade at least 45 days prior to the Base Residual Auction for such Delivery Year. The megawatt quantity of Incremental Capacity Transfer Rights allocated to such a New Service Customer shall equal the megawatt quantity of the increase in Import Capability across a locational constraint resulting from such upgrade or facility, provided that the total Incremental Capacity Transfer Rights awarded as to an LDA (including those allocated pursuant to Schedule 12A of the Tariff) may not exceed the total Capacity Transfer Rights determined as to such LDA. A Capacity Market Seller that offers and clears a Qualifying Transmission Upgrade in the Base Residual Auction for a Delivery Year shall not receive Incremental Capacity Transfer Rights with respect to such upgrade for such Delivery Year. Terms and conditions for the allocation of Incremental Capacity Transfer Rights to New Service Customers shall be as further set forth in Part VI of this Tariff, and those for the allocation of Incremental Capacity Transfer Rights to Responsible Customers shall be as further set forth in Schedule 12A of this Tariff.

(b) For LDAs in which the RPM Auctions for such Delivery Year result in a positive average weighted Locational Price Adder with respect to the immediate higher level LDA, the holder of an Incremental Capacity Transfer Right into such LDA shall receive a payment equal to the average weighted Locational Price Adder for the LDA into which the associated facility or upgrade increased Import Capability, multiplied by the megawatt quantity of the Incremental Capacity Transfer Right allocated to such Interconnection Customer.

6. MARKET POWER MITIGATION

6.1 Applicability

The provisions of the Market Monitoring Plan (in Tariff, Attachment M and Attachment - M Appendixand this section 6) shall apply to the Reliability Pricing Model Auctions.

6.2 Process

(a) [Reserved for Future Use]

(b) In accordance with the schedule specified in the PJM Manuals, following PJM's conduct of a Base Residual Auction or Incremental Auction pursuant to Tariff, Attachment DD, section 5.12, but prior to the Office of the Interconnection's final determination of clearing prices and charges pursuant to Tariff, Attachment DD, section 5.14, the Office of the Interconnection shall: (i) apply the Market Structure Test to any LDA having a Locational Price Adder greater than zero and to the entire PJM region; (ii) apply Market Seller Offer Caps, if required under this section 6; and (iii) recompute the optimization algorithm to clear the auction with the Market Seller Offer Caps in place.

(c) Within seven days after the deadline for submission of Sell Offers in a Base Residual Auction or Incremental Auction, the Office of the Interconnection shall file with FERC a report of any determination made pursuant to Tariff, Attachment DD, section 5.14(h), Tariff, Attachment DD, section 6.5(a)(ii), or Tariff, Attachment DD, section 6.7(c) identified in such sections as subject to the procedures of this section. Such report shall list each such determination, the information considered in making each such determination, and an explanation of each such determination. Any entity that objects to any such determination may file a written objection with FERC no later than seven days after the filing of the report. Any such objection must not merely allege that the determination was in error, and must provide support for the objection, demonstrating that the determination overlooked or failed to consider relevant evidence. In the event that no objection is filed, the determination shall be final. In the event that an objection is filed, FERC shall issue any decision modifying the determination no later than 60 days after the filing of such report; otherwise, the determination shall be final. Final auction results shall reflect any decision made by FERC regarding the report.

6.3 Market Structure Test

(a) [Reserved for Future Use]

(b) Market Structure Test.

A constrained LDA or the PJM Region shall fail the Market Structure Test, and mitigation shall be applied to all jointly pivotal suppliers (including all Affiliates of such suppliers, and all third-party supply in the relevant LDA controlled by such suppliers by contract), if, as to the Sell Offers that comprise the incremental supply determined pursuant to section 6.3(c) below that are based on Generation Capacity Resources, there are not more than three jointly pivotal suppliers. The Office of the Interconnection shall apply the Market Structure Test. The Office of the

Interconnection shall confirm the results of the Market Structure Test with the Market Monitoring Unit.

(c) Determination of Incremental Supply

In applying the Market Structure Test, the Office of the Interconnection shall consider all (i) incremental supply (provided, however, that the Office of the Interconnection shall consider only such supply available from Generation Capacity Resources) available to solve the constraint applicable to a constrained LDA offered at less than or equal to 150% of the cost-based clearing price; or (ii) supply for the PJM Region, offered at less than or equal to 150% of the cost-based clearing price, provided that supply in this section includes only the lower of cost-based or market-based offers from Generation Capacity Resources. Cost-based clearing prices are the prices resulting from the RPM auction algorithm using the lower of cost-based or price-based offers for all Capacity Resources.

6.4 Market Seller Offer Caps

(a) The Market Seller Offer Cap, stated in dollars per MW/day of unforced capacity, applicable to price-quantity offers within the Base Offer Segment for an Existing Generation Capacity Resource shall be the Avoidable Cost Rate for such resource, less the Projected PJM Market Revenues for such resource, stated in dollars per MW/day of unforced capacity, provided, however, that the default Market Seller Offer Cap for any Capacity Performance Resource shall be the product of (the Net Cost of New Entry applicable for the Delivery Year and Locational Deliverability Area for which such Capacity Performance Resource is offered times the average of the Balancing Ratios in the three consecutive calendar years (during the Performance Assessment Intervals in such calendar years) that precede the Base Residual Auction for such Delivery Year), however, for the Base Residual Auction for the 2021/2022 Delivery Year, the Balancing Ratio used in the determination of the default Market Seller Offer Cap shall be 78.5 percent, and provided further that the submission of a Sell Offer with an Offer Price at or below the revised Market Seller Offer Cap permitted under this proviso shall not, in and of itself, be deemed an exercise of market power in the RPM market. Notwithstanding the previous sentence, a Capacity Market Seller may seek and obtain a Market Seller Offer Cap for a Capacity Performance Resource that exceeds the revised Market Seller Offer Cap permitted under the prior sentence, if it supports and obtains approval of such alternative offer cap pursuant to the procedures and standards of subsection (b) of this section 6.4. A Capacity Market Seller may not use the Capacity Performance default Market Seller Offer Cap, and also seek to include any one or more categories of the Avoidable Cost Rate defined in Tariff, Attachment DD, section 6.8 below. The Market Seller Offer Cap for an Existing Generation Capacity Resource shall be the Opportunity Cost for such resource, if applicable, as determined in accordance with Tariff, Attachment DD, section 6.7. Nothing herein shall preclude any Capacity Market Seller and the Market Monitoring Unit from agreeing to, nor require either such entity to agree to, an alternative market seller offer cap determined on a mutually agreeable basis. Any such alternative offer cap shall be filed with the Commission for its approval. This provision is duplicated in Tariff, Attachment M-Appendix, section II.E.3.

(b) For each Existing Generation Capacity Resource, a potential Capacity Market Seller must provide to the Market Monitoring Unit and the Office of the Interconnection data and

documentation required under section 6.7 below to establish the level of the Market Seller Offer Cap applicable to each resource by no later than one hundred twenty (120) days prior to the commencement of the offer period for the applicable RPM Auction. The Capacity Market Seller must promptly address any concerns identified by the Market Monitoring Unit regarding the data and documentation provided, review the Market Seller Offer Cap proposed by the Market Monitoring Unit, and attempt to reach agreement with the Market Monitoring Unit on the level of the Market Seller Offer Cap by no later than ninety (90) days prior to the commencement of the offer period for the applicable RPM Auction. The Capacity Market Seller shall notify the Market Monitoring Unit in writing, with a copy to the Office of the Interconnection, whether an agreement with the Market Monitoring Unit has been reached or, if no agreement has been reached, specifying the level of Market Seller Offer Cap to which it commits by no later than eighty (80) days prior to the commencement of the offer period for the applicable RPM Auction. The Office of the Interconnection shall review the data submitted by the Capacity Market Seller, make a determination whether to accept or reject the requested unit-specific Market Seller Offer Cap, and notify the Capacity Market Seller and the Market Monitoring Unit of its determination in writing, by no later than sixty-five (65) days prior to the commencement of the offer period for the applicable RPM Auction. If the Market Monitoring Unit does not provide its determination to the Capacity Market Seller and the Office of the Interconnection by the specified deadline, by no later than sixty-five (65) days prior to the commencement of the offer period for the applicable RPM Auction the Office of the Interconnection will make the determination of the level of the Market Seller Offer Cap, which shall be deemed to be final. If the Capacity Market Seller does not notify the Market Monitoring Unit and the Office of the Interconnection of the Market Seller Offer Cap it desires to utilize by no later than eighty (80) days prior to the commencement of the offer period for the applicable RPM Auction, it shall be required to utilize a Market Seller Offer Cap determined using the applicable default Avoidable Cost Rate specified in section 6.7(c) below.

(c) Nothing in this section precludes the Capacity Market Seller from filing a petition with FERC seeking a determination of whether the Sell Offer complies with the requirements of the Tariff.

(d) For any Third Incremental Auction for Delivery Years through the 2017/2018 Delivery Year, the Market Seller Offer Cap for an Existing Generation Capacity Resource shall be determined pursuant to subsection (a) of this Section 6.4, or if elected by the Capacity Market Seller, shall be equal to 1.1 times the Capacity Resource Clearing Price in the Base Residual Auction for the relevant LDA and Delivery Year. For any Third Incremental Auction for the 2018/2019 or 2019/2020 Delivery Years, the Market Seller Offer Cap for an Existing Generation Capacity Resource offering as a Base Capacity resource shall be determined pursuant to subsection (a) of this Section 6.4, or if elected by the Capacity Market Seller, shall be equal to 1.1 times the Capacity Resource Clearing Price in the Base Residual Auction for the relevant LDA and Delivery Year. For any Third Incremental Auction *or Final Incremental Auction, as applicable*, for the 2018/2019 Delivery Year or any subsequent Delivery Year, the Market Seller Offer Cap for an Existing Generation Capacity Resource offering as a Capacity Performance Resource shall be determined pursuant to subsection (a) of this Section 6.4, or if elected by the Capacity Market Seller, shall be equal to the greater of the Net Cost of New Entry times the Balancing Ratio for the relevant LDA and Delivery Year or 1.1 times the Capacity Resource Clearing Price in the Base Residual Auction for the relevant LDA and Delivery Year.

6.5 Mitigation

The Office of the Interconnection shall apply market power mitigation measures in any Base Residual Auction or Incremental Auction for any LDA, Unconstrained LDA Group, or the PJM Region that fails the Market Structure Test.

(a) Mitigation for Generation Capacity Resources.

i) Existing Generation Capacity Resource

Mitigation will be applied on a unit-specific basis and only if the Sell Offer of Unforced Capacity from an Existing Generation Capacity Resource: (1) is greater than the Market Seller Offer Cap applicable to such resource; and (2) would, absent mitigation, increase the Capacity Resource Clearing Price in the relevant auction. If such conditions are met, such Sell Offer shall be set equal to the Market Seller Offer Cap.

ii) Planned Generation Capacity Resources

(A) Sell Offers based on Planned Generation Capacity Resources (including External Planned Generation Capacity Resources) shall be presumed to be competitive and shall not be subject to market power mitigation in any Base Residual Auction or Incremental Auction for which such resource qualifies as a Planned Generation Capacity Resource, but any such Sell Offer shall be rejected if it meets the criteria set forth in subsection (C) below, unless the Capacity Market Seller obtains approval from FERC for use of such offer prior to the close of the offer period for the applicable RPM Auction.

(B) Sell Offers based on Planned Generation Capacity Resources (including Planned External Generation Capacity Resources) shall be deemed competitive and not be subject to mitigation if: (1) collectively all such Sell Offers provide Unforced Capacity in an amount equal to or greater than two times the incremental quantity of new entry required to meet the LDA Reliability Requirement; and (2) at least two unaffiliated suppliers have submitted Sell Offers for Planned Generation Capacity Resources in such LDA. Notwithstanding the foregoing, any Capacity Market Seller, together with Affiliates, whose Sell Offers based on Planned Generation Capacity Resources in that modeled LDA are pivotal, shall be subject to mitigation.

(C) Where the two conditions stated in subsection (B) above are not met, or the Sell Offer is pivotal, the Sell Offer shall be rejected if it exceeds 140 percent of: 1) the average of location-adjusted Sell Offers for Planned Generation Capacity Resources from the same asset class as such Sell Offer, submitted (and not rejected) (Asset-Class New Plant Offers) for such Delivery Year; or 2) if there are no Asset-Class New Plant Offers for such Delivery Year, the average of Asset-Class New Plant Offers for all prior Delivery Years; or 3) if there are no Asset-Class New Plant

Offers for any prior Delivery Year, the Net CONE applicable for such Delivery Year in the LDA for which such Sell Offer was submitted. For purposes of this section, asset classes shall be as stated in section 6.7(c) below as effective for such Delivery Year, and Asset-Class New Plant Offers shall be location-adjusted by the ratio between the Net CONE effective for such Delivery Year for the LDA in which the Sell Offer subject to this section was submitted and the average, weighted by installed capacity, of the Net CONEs for all LDAs in which the units underlying such Asset Class New Plant Offers are located. Following the conduct of the applicable auction and before the final determination of clearing prices, in accordance with Section 6.2(b) above, each Capacity Market Seller whose Sell Offer is so rejected shall be notified in writing by the Office of the Interconnection by no later than one (1) Business Day after the close of the offer period for the applicable RPM Auction and allowed an opportunity to submit a revised Sell Offer that does not exceed such threshold within one (1) Business Day of the Office of the Interconnection's rejection of such Sell Offer. If such revised Sell Offer is accepted by the Office of the Interconnection, the Office of the Interconnection then shall clear the auction with such revised Sell Offer in place. Pursuant to Tariff, Attachment M-Appendix, Section II.F, the Market Monitoring Unit shall notify in writing each Capacity Market Seller whose Sell Offer has been determined to be non-competitive and subject to mitigation, with a copy to the Office of the Interconnection, by no later than one (1) Business Day after the close of the offer period for the applicable RPM Auction.

(b) Mitigation for Demand Resources

The Market Seller Offer Cap shall not be applied to Sell Offers of Demand Resources or Energy Efficiency Resources.

6.6 Offer Requirement for Capacity Resources

(a) To avoid application of subsection (h) below, all of the installed capacity of all Existing Generation Capacity Resources located in the PJM Region shall be offered by the Capacity Market Seller that owns or controls all or part of such resource (which may include submission as Self-Supply) in all RPM Auctions for each Delivery Year, less any amount determined by the Office of the Interconnection to be eligible for an exception to this RPM must-offer requirement, where installed capacity is determined as of the date on which bidding commences for each RPM Auction pursuant to Tariff, Attachment DD, section 5.6.6. The Unforced Capacity of such resources is determined using the EFORd value that is submitted by the Capacity Market Seller in its Sell Offer, which shall not exceed the maximum EFORd for that resource as defined in section 6.6(b). If a resource should be included on the list of Existing Generation Capacity Resources subject to the RPM must-offer requirement that is maintained by the Market Monitoring Unit pursuant to Tariff, Attachment M-Appendix, section II.C.1, but is omitted therefrom whether by mistake of the Market Monitoring Unit or failure of the Capacity Market Seller that owns or controls all or part of such resource to provide information about the

resource to the Market Monitoring Unit, this shall not excuse such resource from the RPM must-offer requirement.

(b) For each Existing Generation Capacity Resource, a potential Capacity Market Seller must timely provide to the Market Monitoring Unit and the Office of the Interconnection all data and documentation required under this section 6.6 to establish the maximum EFORd applicable to each resource in accordance with standards and procedures specified in the PJM Manuals. The maximum EFORd that may be used in a Sell Offer for RPM Auctions held prior to the date on which the final EFORds used for a Delivery Year are posted, is the greater of (i) the average EFORd for the five consecutive years ending on the September 30 that last precedes the Base Residual Auction, or (ii) the EFORd for the 12 months ending on the September 30 that last precedes the Base Residual Auction.

Notwithstanding the foregoing, a Capacity Market Seller may request an alternate maximum EFORd for Sell Offers submitted in such auctions if it has a documented, known reason that would result in an increase in its EFORd, by submitting a written request to the Market Monitoring Unit and Office of the Interconnection, along with data and documentation required to support the request for an alternate maximum EFORd, by no later one hundred twenty (120) days prior to the commencement of the offer period for the Base Residual Auction for the applicable Delivery Year. The Capacity Market Seller must address any concerns identified by the Market Monitoring Unit and/or the Office of the Interconnection regarding the data and documentation provided and attempt to reach agreement with the Market Monitoring Unit on the level of the alternate maximum EFORd by no later than ninety (90) days prior to the commencement of the offer period for the Base Residual Auction for the applicable Delivery Year. As further described in Tariff, Attachment M-Appendix, section II.C, the Market Monitoring Unit shall notify the Capacity Market Seller and the Office of the Interconnection in writing of its determination of the requested alternate maximum EFORd by no later than ninety (90) days prior to the commencement of the offer period for the Base Residual Auction for the applicable Delivery Year. By no later than eighty (80) days prior to the commencement of the offer period for the Base Residual Auction for the applicable Delivery Year, the Capacity Market Seller shall notify the Office of the Interconnection and the Market Monitoring Unit in writing whether it agrees with the Market Monitoring Unit on the alternate maximum EFORd or, if no agreement has been reached, specifying the level of alternate maximum EFORd to which it commits. If a Capacity Market Seller fails to request an alternate maximum EFORd prior to the specified deadlines, the maximum EFORd for the applicable RPM Auction shall be deemed to be the default EFORd calculated pursuant to this section.

The maximum EFORd that may be used in a Sell Offer for a Third or Final Incremental Auction, and for Conditional Incremental Auctions held after the date on which the final EFORd used for a Delivery Year is posted, is the EFORd for the 12 months ending on the September 30 that last precedes the submission of such offers.

(c) [Reserved for Future Use]

(d) In the event that a Capacity Market Seller and the Market Monitoring Unit cannot agree on the maximum level of the alternate EFORd that may be used in a Sell Offer for RPM Auctions held prior to the date on which the final EFORds used for a Delivery Year are posted,

the Office of the Interconnection shall make its own determination of the maximum level of the alternate EFORd based on the requirements of the Tariff and the PJM Manuals, per Tariff, Attachment DD, section 5.8, by no later than sixty-five (65) days prior to the commencement of the offer period for the Base Residual for the applicable Delivery Year, and shall notify the Capacity Market Seller and the Market Monitoring Unit in writing of such determination.

(e) Nothing in this section precludes the Capacity Market Seller from filing a petition with FERC seeking a determination of whether the EFORd complies with the requirements of the Tariff.

(f) Notwithstanding the foregoing, a Capacity Market Seller may submit an EFORd that it chooses for an RPM Auction held prior to the date on which the final EFORd used for a Delivery Year is posted, provided that (i) it has participated in good faith with the process described in this section 6.6 and in Tariff, Attachment M-Appendix, section II.C, (ii) the offer is no higher than the level defined in any agreement reached by the Capacity Market Seller and the Market Monitoring Unit that resulted from the foregoing process, and (iii) the offer is accepted by the Office of the Interconnection subject to the criteria set forth in the Tariff and the PJM Manuals.

(g) A Capacity Market Seller that owns or controls an existing generation resource in the PJM Region that is capable of qualifying as an Existing Generation Capacity Resource as of the date on which bidding commences for an RPM Auction may not avoid the rule in subsection (a) or be removed from Capacity Resource status by failing to qualify as a Generation Capacity Resource, or by attempting to remove a unit previously qualified as a Generation Capacity Resource from classification as a Capacity Resource for that RPM Auction. However, generation resource may qualify for an exception to the RPM must-offer requirement, as shown by appropriate documentation, if the Capacity Market Seller that owns or controls such resource demonstrates that it: (i) is reasonably expected to be physically unable to participate in the relevant Delivery Year; (ii) has a financially and physically firm commitment to an external sale of its capacity, ~~or~~ (iii) was interconnected to the Transmission System as an Energy Resource and not subsequently converted to a Capacity Resource, or (iv) is a Capacity Resource with Actionable Subsidy that has elected to commit its capacity through the FRR-RS Alternative pursuant to Section 5.2A of Attachment DD.

In order to establish that a resource is reasonably expected to be physically unable to participate in the relevant auction as set forth in (i) above, the Capacity Market Seller must demonstrate that:

A. It has a documented plan in place to retire the resource prior to or during the Delivery Year, and has submitted a notice of Deactivation to the Office of the Interconnection consistent with Tariff, Part V, section 113.1, without regard to whether the Office of the Interconnection has requested the Capacity Market Seller to continue to operate the resource beyond its desired deactivation date in accordance with Tariff, Part V, section 113.2 for the purpose of maintaining the reliability of the PJM Transmission System and the Capacity Market Seller has agreed to do so;

B. Significant physical operational restrictions cause long term or permanent changes to the installed capacity value of the resource, or the resource is under major repair that will extend into the applicable Delivery Year, that will result in the imposition of RPM performance penalties pursuant to Tariff, Attachment DD;

C. The Capacity Market Seller is involved in an ongoing regulatory proceeding (e.g. – regarding potential environmental restrictions) specific to the resource and has received an order, decision, final rule, opinion or other final directive from the regulatory authority that will result in the retirement of the resource; or

D. A resource considered an Existing Generating Capacity Resource because it cleared an RPM Auction for a Delivery Year prior to the Delivery Year of the relevant auction, but which is not yet in service, is unable to achieve full commercial operation prior to the Delivery Year of the relevant auction. The Capacity Market Seller must submit to the Office of the Interconnection and the Market Monitoring Unit a written sworn, notarized statement of a corporate officer certifying that the resource will not be in full commercial operation prior to the referenced Delivery Year.

In order to establish that a resource has a financially and physically firm commitment to an external sale of its capacity as set forth in (ii) above, the Capacity Market Seller must demonstrate that it has entered into a unit-specific bilateral transaction for service to load located outside the PJM Region, by a demonstration that such resource is identified on a unit-specific basis as a network resource under the transmission tariff for the control area applicable to such external load, or by an equivalent demonstration of a financially and physically firm commitment to an external sale. The Capacity Market Seller additionally shall identify the megawatt amount, export zone, and time period (in days) of the export.

A Capacity Market Seller that seeks to remove a Generation Capacity Resource from PJM Capacity Resource status and/or seeks approval for an exception to the RPM must-offer requirement, for any reason other than the reason specified in Paragraph A above, shall first submit such request in writing, along with all supporting data and documentation, to the Market Monitoring Unit for evaluation, notifying the Office of the Interconnection by copy of the same, by no later than one hundred twenty (120) days prior to the commencement of the offer period for the applicable RPM Auction.

In order to obtain an exception to the RPM must-offer requirement for the reason specified in Paragraph A above, a Capacity Market Seller shall first submit a preliminary exception request in writing, along with supporting data and documentation indicating the reasons and conditions upon which the Capacity Market Seller is relying in its analysis of whether to retire such resource, to the Market Monitoring Unit for evaluation, notifying the Office of the Interconnection by copy of the same, by no later than (a) November 1, 2013 for the Base Residual Auction for the 2017/2018 Delivery Year, (b) the September 1 that last precedes the Base Residual Auction for the 2018/2019 and subsequent Delivery Years, and (c) two hundred forty (240) days prior to the commencement of the offer period for the applicable Incremental Auction. By no later than five (5) Business Days after receipt of any such preliminary exception requests, the Office of the Interconnection will post on its website a

summary of the number of megawatts of Generation Capacity Resources for which it has received notification of preliminary exception requests, on an aggregate basis by Zone and Locational Deliverability Area that comprises a subset of a Zone, as specified in the PJM Manuals.

Thereafter, as applicable, such Capacity Market Seller shall by no later than (a) the December 1 that last precedes the Base Residual Auction for the applicable Delivery Year, or (b) one hundred twenty (120) days prior to the commencement of the offer period for the applicable Incremental Auction, either (a) notify the Office of the Interconnection and the Market Monitoring Unit in writing that it is withdrawing its preliminary exception request and explaining the changes to its analysis of whether to retire such resource that support its decision to withdraw, or (b) demonstrate that it has met the requirements specified under Paragraph A above. By no later than five (5) Business Days after receipt of such notification, the Office of the Interconnection will post on its website a revised summary of the number of megawatts of Generation Capacity Resources for which it has received requests for exceptions to the RPM must-offer requirement for the reason specified in Paragraph A above, on an aggregate basis by Zone and Locational Deliverability Area that comprises a subset of a Zone, as specified in the PJM Manuals.

A Capacity Market Seller may only remove the Generation Capacity Resource from PJM Capacity Resource status if (i) the Market Monitoring Unit has determined that the Generation Capacity Resource meets the applicable criteria set forth in Tariff, Attachment DD, sections 5.6.6 and this section 6.6 and the Office of the Interconnection agrees with this determination, or (ii) the Commission has issued an order terminating the Capacity Resource status of the resource. Nothing herein shall require a Market Seller to offer its resource into an RPM Auction prior to seeking to remove a resource from Capacity Resource status, subject to satisfaction of this section 6.6.

If the Capacity Market Seller disagrees with the Market Monitoring Unit's determination of its request to remove a resource from Capacity Resource status or its request for an exception to the RPM must-offer requirement, it must notify the Market Monitoring Unit in writing, with a copy to the Office of the Interconnection, of the same by no later than eighty (80) days prior to the commencement of the offer period for the applicable RPM Auction. After the Market Monitoring Unit has made its determination of whether a resource has satisfied the RPM must-offer requirement or meets one of the exceptions thereto and has notified the Capacity Market Seller and the Office of the Interconnection of the same pursuant to Tariff, Attachment M-Appendix, section II.C.4, the Office of the Interconnection shall approve or deny the exception request. The exception request shall be deemed to be approved by the Office of the Interconnection, consistent with the determination of the Market Monitoring Unit, unless the Office of the Interconnection notifies the Capacity Market Seller and Market Monitoring Unit, by no later than sixty-five (65) days prior to the date on which the offer period for the applicable RPM Auction commences, that the exception request is denied.

If the Market Monitoring Unit does not timely notify the Capacity Market Seller and the Office of the Interconnection of its determination of the request to remove a Generation Capacity Resource from Capacity Resource status or for an exception to the RPM must-offer requirement, the Office of the Interconnection shall make the determination whether the request shall be

approved or denied, and will notify the Capacity Market Seller of its determination in writing, with a copy to the Market Monitoring Unit, by no later than sixty-five (65) days prior to the date on which the offer period for the applicable RPM Auction commences.

After the Market Monitoring Unit and the Office of the Interconnection have made their determinations of whether a resource meets the criteria to qualify for an exception to the RPM must-offer requirement, the Capacity Market Seller must notify the Market Monitoring Unit and the Office of the Interconnection whether it intends to exclude from its Sell Offer some or all of the subject capacity on the basis of an identified exception by no later than sixty-five (65) days prior to the date on which the offer period for the applicable RPM Auction commences. PJM does not make determinations of whether withholding of capacity constitutes market power. A Generation Capacity Resource that does not qualify for submission into an RPM Auction because it is not owned or controlled by the Capacity Market Seller for a full Delivery Year is not subject to the offer requirement hereunder; provided, however, that a Capacity Market Seller planning to transfer ownership or control of a Generation Capacity Resource during a Delivery Year pursuant to a sale or transfer agreement entered into after March 26, 2009 shall be required to satisfy the offer requirement hereunder for the entirety of such Delivery Year and may satisfy such requirement by providing for the assumption of this requirement by the transferee of ownership or control under such agreement.

If a Capacity Market Seller doesn't timely seek to remove a Generation Capacity Resource from Capacity Resource status or timely submit a request for an exception to the RPM must-offer requirement, the Generation Capacity Resource shall only be removed from Capacity Resource status, and may only be approved for an exception to the RPM must-offer requirement, upon the Capacity Market Seller requesting and receiving an order from FERC, prior to the close of the offer period for the applicable RPM Auction, directing the Office of the Interconnection to remove the resource from Capacity Resource status and/or granting an exception to the RPM must-offer requirement or a waiver of the RPM must-offer requirement as to such resource.

(h) Any existing generation resource located in the PJM Region that satisfies the criteria in the definition of Existing Generation Capacity Resource as of the date on which bidding commences for the Base Residual Auction for a Delivery Year, that is not offered into such Base Residual Auction, and that does not meet any of the exceptions stated in the prior subsection (g): (i) may not participate in any subsequent Incremental Auctions conducted for such Delivery Year; (ii) shall not receive any payments under Tariff, Attachment DD, section 5.14 for such Delivery Year for the capacity of such Generation Capacity Resources; and (iii) shall not be permitted to satisfy any LSE's Unforced Capacity Obligation, or any entity's obligation to obtain the commitment of Capacity Resources, for such Delivery Year.

All generation resources located in the PJM Region that satisfy the criteria in the definition of Existing Generation Capacity Resource as of the date on which bidding commences for an Incremental Auction for a particular Delivery Year, but that did not satisfy such criteria as of the date that on which bidding commenced in the Base Residual Auction for that Delivery Year, that is not offered into that Incremental Auction, and that does not meet any of the exceptions stated in the prior subsection (g): (i) may not participate in any subsequent Incremental Auctions conducted for such Delivery Year; (ii) shall not receive any payments under Tariff, Attachment DD, section 5.14 for such Delivery Year for the capacity of such

Generation Capacity Resources; and (iii) shall not be permitted to satisfy any LSE's Unforced Capacity Obligation, or any entity's obligation to obtain the commitment of Capacity Resources, for such Delivery Year.

All Existing Generation Capacity Resources that are offered into a Base Residual Auction or Incremental Auction for a particular Delivery Year but do not clear in such auction, that are not offered into each subsequent Incremental Auction, and that do not meet any of the exceptions stated in the prior subsection (g): (i) may not participate in any Incremental Auctions conducted for such Delivery Year subsequent to such failure to offer; (ii) shall not receive any payments under Tariff, Attachment DD, section 5.14 for such Delivery Year for the capacity of such Generation Capacity Resources; and (iii) shall not be permitted to satisfy any LSE's Unforced Capacity Obligation, or any entity's obligation to obtain the commitment of Capacity Resources, for such Delivery Year.

Any such Existing Generation Capacity Resources may also be subject to further action by the Market Monitoring Unit under the terms of Tariff, Attachment M and Tariff, Attachment M – Appendix.

(i) In addition to the remedies set forth in subsections (g) and (h) above, if the Market Monitoring Unit determines that one or more Capacity Market Sellers' failure to offer part or all of one or more existing generation resources, for which the Office of the Interconnection has not approved an exception to the RPM must-offer requirement, into an RPM Auction as required by this Section 6.6 would result in an increase of greater than five percent in any Zonal Capacity Price determined through such auction, and the Office of the Interconnection agrees with that determination, the Office of the Interconnection shall apply to FERC for an order, on an expedited basis, directing such Capacity Market Seller to participate in the relevant RPM Auction, or for other appropriate relief, and PJM will postpone clearing the auction pending FERC's decision on the matter. If the Office of the Interconnection disagrees with the Market Monitoring Unit's determination and does not apply to FERC for an order directing the Capacity Market Seller to participate in the auction or for other appropriate relief, the Market Monitoring Unit may exercise its powers to inform Commission staff of its concerns and to seek appropriate relief.

6.~~6 A~~6A Offer Requirement for Capacity Performance Resources

(a) For the 2018/2019 Delivery Year and subsequent Delivery Years, the installed capacity of every Generation Capacity Resource located in the PJM Region that is capable (or that reasonably can become capable) of qualifying as a Capacity Performance Resource shall be offered as a Capacity Performance Resource by the Capacity Market Seller that owns or controls all or part of such resource (which may include submission as Self-Supply) in all RPM Auctions for each such Delivery Year, less any amount determined by the Office of the Interconnection to be eligible for an exception to the Capacity Performance Resource must-offer requirement, where installed capacity is determined as of the date on which bidding commences for each RPM Auction pursuant to Tariff, Attachment DD, section 5.6.6.

(b) Determinations of EFORd and Unforced Capacity made under this section 6.6 as to a Generation Capacity Resource shall govern the offers required under this section as to the same Generation Capacity Resource.

(c) Exceptions to the requirement in subsection (a) shall be permitted only for a resource which the Capacity Market Seller demonstrates is reasonably expected to be physically incapable of satisfying the requirements of a Capacity Performance Resource. Intermittent Resources, Capacity Storage Resources, Demand Resources, and Energy Efficiency Resources shall not be required to offer as a Capacity Performance Resource, but shall not be precluded from being offered as a Capacity Performance Resource at a level that demonstrably satisfies such requirements. Exceptions shall be determined using the same timeline and procedures as specified in section 6.6.

(d) A resource not exempted or excepted under subsection (c) hereof that is capable of qualifying as a Capacity Performance Resource and does not offer into an RPM Auction as a Capacity Performance Resource shall be subject to the same restrictions on subsequent offers, and other possible remedies, as specified in section 6.6.

6.6 Data Submission

(a) Potential participants in any PJM Reliability Pricing Model Auction shall submit, together with supporting documentation for each item, to the Market Monitoring Unit and the Office of the Interconnection no later than one hundred twenty (120) days prior to the posted date for the conduct of such auction, a list of owned or controlled generation resources by PJM transmission zone for the specified Delivery Year, including the amount of gross capacity, the EFORd and the net (unforced) capacity. A potential participant intending to offer any Capacity Performance Resource at or below the default Market Seller Offer Cap described in Tariff, Attachment DD, section 6.4(a) must provide the associated offer cap and the MW to which the offer cap applies.

(b) Except as provided in subsection (c) below, potential participants in any PJM Reliability Pricing Model Auction in any LDA or Unconstrained LDA Group that request a unit specific Avoidable Cost Rate shall, in addition, submit the following data, together with supporting documentation for each item, to the Market Monitoring Unit no later than one hundred twenty (120) days prior to the commencement of the offer period for such auction:

i. If the Capacity Market Seller intends to submit a non-zero price in its Sell Offer in any such auction, the Capacity Market Seller shall submit a calculation of the Avoidable Cost Rate and Projected PJM Market Revenues, as defined in subsection (d) below, together with detailed supporting documentation.

ii. If the Capacity Market Seller intends to submit a Sell Offer based on opportunity cost, the Capacity Market Seller shall also submit a calculation of Opportunity Cost, as defined in subsection (d), with detailed supporting documentation.

(c) Potential auction participants identified in subsection (b) above need not submit the data specified in that subsection for any Generation Capacity Resource:

CONCLUSION.....64

REPLY BRIEF OF EXELON CORPORATION

Pursuant to the Federal Energy Regulatory Commission's ("the Commission's") June 29, 2018 Order Rejecting Proposed Tariff Revisions, Granting In Part and Denying In Part Complaint, and Instituting Proceeding Under Section 206 of the Federal Power Act ("Order"),[1] Exelon Corporation ("Exelon") hereby submits the following reply brief addressing the Order's proposed changes to the Open Access Transmission Tariff ("Tariff") of PJM Interconnection, L.L.C. ("PJM").

INTRODUCTION

The comments submitted in this docket present the Commission with a stark choice. On one side is the resource-specific Fixed Resource Requirement Alternative preliminarily proposed by the Commission and supported by a wide swath of stakeholders representing a broad coalition of interests, including state regulators, consumer advocates, generators, load-serving entities, environmental organizations, and PJM itself.[2] Done correctly, this approach—whether labeled a "resource-specific FRR," an "FRR-RS," or, per PJM, a "Resource Carve-Out" or "RCO"—strikes a just and reasonable balance among equally important policy goals. It makes room for states to pursue energy policy initiatives favoring particular types of generation resources, by allowing states to provide for the procurement of their capacity outside the PJM auction market—but credits load for that capacity, thus avoiding unnecessary costs for customers. Moreover, because states

SI-SSA-0010-6422

would take on full responsibility for arranging compensation for the capacity procured outside the RPM market, the full cost of state policies will be transparent for all to see. Meanwhile, resources competing in PJM's capacity auction to serve remaining load would compete on a resource-neutral, least production-cost basis in an auction market free from subsidized bids. And, as a result, states choosing to rely exclusively on the RPM auction would not be forced to pay to support resources favored by other states.

On the other side, owners of fossil-fuel generation contend that accommodation of state policies is incompatible with a just and reasonable market design. According to them, state energy policies that advance decarbonization by supporting non-emitting generation pose a mortal threat to federal markets and must be combatted and deterred. They demand that the Commission apply a minimum offer price rule ("MOPR") to subsidized resources, *without* allowing such resources any ability to serve load outside the RPM market. Their position amounts to a mandate that, in order for a state to be part of PJM, the state must procure all of its capacity in a centralized market, with bidding rules that override state efforts to account for the environmental costs and benefits of different generation types. States that wish to recognize the reality that generators differ in their environmental profile must either exit the PJM capacity market entirely or pay twice for capacity—by procuring capacity outside the PJM market but receiving no credit from the PJM market for that capacity via reduced load requirements.[3] This approach would raise capacity bills for EMAAC customers alone by over $700 million per year—a 37 percent increase in capacity costs,

[3] The IMM's proposal—which he labels the "Sustainable Market Rule"—is essentially indistinguishable from the MOPR-only approach and would suffer from all the same flaws of overprocurement, double payment, and disrespect for state policy concerning the generation resource mix. But in one sense it is even worse: it deems a "competitive offer" to be one based on the IMM's calculation of the unit's net going forward costs, or ACR. This approach would effectively replace competition—in which suppliers decide how to offer in light of their own costs and their expectations about the market—with administrative rate-setting. The IMM, through unit-specific review, would determine what every supplier can bid. *See* Br. of the Independent Market Monitor for PJM at 15-18 (Oct. 2, 2018) ("IMM Brief").

SI-SSA-0010-6423

based on the most recent Base Residual Auction. The total RTO-wide incremental cost to consumers would exceed $900 million per year.[4] Of this, approximately $100 million annually would be attributable to over-procurement.[5]

For good reason, the Commission has already rejected such a draconian approach.[6] Rather, the Commission has acknowledged that the Federal Power Act ("FPA") establishes a cooperative federalist framework in which the Commission and state regulators each have a role to play. States should not be forced to forfeit their role—or be forced to require customers to incur significant unnecessary expense in order to exercise that role—in order to remain part of PJM.

The main argument made by opponents of the Commission's resource-specific FRR proposal is that clearing prices in the capacity market will remain "suppressed." Under the Commission's proposal, however, the MOPR will ensure that all bids to serve the load procuring capacity through the RPM auction are "competitive," thereby ensuring market integrity. The resulting price will be derived from these competitive bids; it is not "suppressed." States, meanwhile, are free to make a policy choice as to how their load should procure capacity, whether from the RPM market or instead outside that market.

Opponents' true argument is that states should not be allowed to make that policy choice, and that suppliers are entitled to serve *all* load through the RPM auction. But suppliers have no such entitlement. States always have the final word as to how their load procures capacity, and the Commission has long recognized that principle. In PJM, the existing FRR allows states to withdraw their load from the PJM auction market. This has been a feature of PJM's capacity construct since its inception, and no one questions its continued justness and reasonableness. The

[4] Declaration of Michael Schnitzer ¶ 55 (Nov. 6, 2018), attached hereto as Exhibit A ("Schnitzer Decl.").

[5] *Id.*

[6] Order at PP 158-162.

SI-SSA-0010-6424

proposed resource-specific FRR is simply a lesser version of what already exists: rather than requiring a state to withdraw either *all* of its load from the auction market or none, the resource-specific FRR permits a state to make a more tailored policy choice that will have a smaller impact on the PJM market and on customers than the withdrawal of all load. In other regions, such as MISO and CAISO, the Commission has found capacity constructs to be just and reasonable that provide similar opportunities for partial procurement—exactly what MOPR-only advocates disparage for PJM.[7]

MOPR-only advocates also assert that allowing a resource-specific FRR will create inefficiencies by substituting lower-cost generation with higher-cost, state-supported generation. These opponents ignore textbook economics in espousing an unduly constricted view of "efficiency." The state programs they seek to frustrate are designed to account for the reality that different generation resources have different environmental profiles. Emitting generation imposes costs on the rest of society that the emitting generator does not bear, and PJM's market mechanism does not value those costs. Emitting generators only *appear* more efficient because they are not internalizing the costs of their pollution. But in reality, they are not more efficient. Instead, they are heavily subsidized via their ability to pollute a common resource—the air—without paying for the costs.[8]

But even ignoring basic economics, states still are entitled under the FPA to make a policy choice to pay more for capacity in pursuit of their own environmental goals. The Commission

[7] *See, e.g., California Indep. Sys. Operator Corp.*, 116 FERC ¶ 61,274, at PP 1117-18 (2006) (deferring to state and local regulatory authorities in California in the first instance to ensure resource adequacy); *Midcontinent Indep. Sys. Operator, Inc.*, 162 FERC ¶ 61,176, at PP 2, 61-66 (2018) (accepting MISO's version of a partial FRR mechanism).

[8] Eastern Generation departs from this perspective by calling on the Commission to direct PJM to work toward internalizing the cost of pollution into the wholesale market, a move Exelon endorses. *See* Init. Br. of Eastern Generation LLC at 6-9 (Oct. 1, 2018) ("Eastern Gen. Init. Br.").

should not pass judgment on these policy goals, penalize them, or make it more costly for states to achieve them. Instead, the Commission should accommodate those state policies, while ensuring that their costs are as transparent as possible and that states and their constituents can make informed choices. The resource-specific FRR accomplishes that. It should be approved as a necessary corollary to a broad MOPR for subsidized resources that continue to sell within the PJM capacity market.

For all of the same reasons, however, PJM's *Extended* RCO proposal should be rejected. That proposal allows states to withdraw resources and matching loads from the PJM auction, but then reprices the auction results to mimic a world in which the same amount of load must be served by a supply stack in which those resources did not exist. As a result, PJM's proposal would greatly inflate capacity prices well beyond levels that would occur in a MOPR-only world, massively increasing costs to customers: for EMAAC customers, by as much as $2.2 billion per year, and RTO-wide, by approximately $2.6 billion per year.[9] And the higher prices would reflect capacity offers by resources that are not actually needed to serve load, and would therefore "signal that the market would buy capacity from higher cost resources than actually clear the market and receive capacity commitments"[10]—the same disconnect between price and quantity that led the Commission to reject PJM's earlier repricing proposal in Docket No. ER18-1314.

PJM's repricing proposal not only is punitive to customers, but also is based on the same flawed premise as the MOPR-only approach: that the only just and reasonable price is the one that would result if *all* load were required to procure capacity through an auction construct that overrides state policies differentiating between emitting and non-emitting generation. There is no

[9] Schnitzer Decl. ¶ 76.

[10] Order at P 65.

basis for that conclusion, given that states have authority to support non-emitting generation and to decide how their load is served. The efficient price is the one that results from competitive offers to serve whatever load seeks to procure capacity through the PJM auction, after states have carved out the portion of their load that they wish to be served outside that market.[11]

To the extent the Commission nonetheless wishes to adopt some form of repricing, it still could not accept PJM's proposal. In setting the price at stage 2, PJM irrationally proposes to ignore reality by removing RCO resources from the supply curve entirely, rather than inserting RCO resources into the supply curve at "competitive" levels. PJM's proposal thus does *not* mimic the price that would result in the absence of any state support. Instead, it boosts customer costs by more than *three times* that level. At the very least, then, if the Commission were to adopt repricing, it would need to modify PJM's proposal by placing RCO resources into the stage 2 supply curve at competitive levels.[12] That is the only logical way that repricing could be implemented.

But for all the reasons already discussed, the far better approach is to adopt the framework that the Commission initially proposed: a resource-specific FRR that allows states to withdraw load from the RPM auction to be served outside it, combined with a broad MOPR applied to all subsidized resources remaining within the auction.

[11] Schnitzer Decl. ¶¶ 26-38.

[12] The Commission would also need to modify PJM's proposal to make RCO resources pay for the "lost opportunity costs" of resources that are not needed for resource adequacy, but that would have cleared if all load were forced to procure capacity through the RPM market. That allocation of costs punishes states electing the RCO by effectively forcing them to pay emitting resources every time they pay non-emitting ones, and is also inconsistent with cost-causation principles.

ARGUMENT

I. The Bifurcated Capacity Market Proposed by the Commission Is Just and Reasonable.

A. The Benefits of a Bifurcated Capacity Construct Are Essentially Undisputed.

In the Order, the Commission identified at least six important policy objectives that a resource-specific FRR Alternative would achieve. These include:

1. **Respect for legitimate state policies aimed at regulating the generation mix located in or serving a state.**[13] The FPA expressly reserves to states the authority to regulate generation facilities, notwithstanding the reality that such state regulation will inevitably affect federal wholesale markets in which those facilities sell.[14] "It is a fact of economic life that the wholesale and retail markets in electricity, as in every other known product, are not hermetically sealed from each other."[15] To preserve the cooperative federalism embedded in the FPA, the Commission's rules must accommodate the multiplicity of state policy choices, not seek to deter or override them.

2. **"[M]itigat[ing] or avoid[ing] the potential for double payment and over procurement"** by customers that would result if the federal capacity construct ignored capacity actually provided by state-supported resources.[16]

3. **"[I]ncreasing the integrity of the PJM capacity market"** by preventing suppliers participating in the RPM auction from submitting non-competitive offers.[17]

4. **"[I]ncreased transparency for investors."**[18] All capacity offers in the PJM auction would be "competitive"—that is, unaffected by out-of-market sources of revenue—and the resulting capacity price would accurately reflect the value of residual capacity procured through that market.

---

[13] Order at PP 159-60.

[14] 16 U.S.C. § 824(b)(1); *Connecticut Dep't of Pub. Utility Control v. FERC*, 569 F.3d 477, 481 (D.C. Cir. 2009); *Coalition for Competitive Electricity v. Zibelman*, 906 F.3d 41 (2d Cir. 2018) ("The states are … authorized to regulate energy production … and facilities used for the generation of electric energy.").

[15] *FERC v. Elec. Power Supply Ass'n*, 136 S. Ct. 760, 776 (2016) ("*EPSA*").

[16] Order at PP 159-60.

[17] *Id*. at PP 161-62.

[18] *Id.*

5. **"[I]ncreased transparency for … policymakers."**[19] If a state wishes to support a capacity resource outside of the PJM auction because of particular characteristics that resource possesses—for example, that it does not emit pollutants—the state will need to take onto its own books the entire cost of doing so. Thus, "the construct will provide the information that states and all other stakeholders will need in order to make informed decisions about the degree to which they prefer to rely on the capacity market versus out-of-market mechanisms, and it will manage the results of those decisions in an orderly fashion."[20]

6. **"[I]ncreased transparency for … consumers."**[21] Because a state will need to take onto its own ledger the full cost of supporting a capacity resource valued for its environmental or other attributes, consumers will see transparently "which capacity costs are the result of competition in the capacity market and which capacity costs are being incurred as a result of state policy decisions."[22] That transparency, in turn, will allow customers to hold their elected officials accountable for deciding to expand or contract state energy policy initiatives.

These benefits of a bifurcated capacity construct are essentially undisputed. Even opponents of the resource-specific FRR Alternative do not dispute that the construct would allow the Commission to regulate cooperatively with states exercising their reserved authority under the FPA; prevent the over-procurement of capacity and the unnecessary costs to customers that would result from a MOPR-only approach; ensure that offers in the PJM capacity auction are competitive; and increase transparency and political accountability regarding state policy choices.

Instead, opponents of the resource-specific FRR largely contend that the Commission should disregard the importance of these policy goals, and give greater weight to the purported need to maintain high capacity prices.[23] For example, some opponents contend that the

[22] *Id.*

[23] Exelon renews its arguments, presented in its Application for Rehearing of the Order, that there is no need for the Commission to seek to increase capacity prices at a time when supply remains abundant—

SI-SSA-0010-6429

Commission should *not* attempt to prevent consumers from double-paying for capacity.[24] They misleadingly cite a Third Circuit decision for the proposition that the Commission should have no compunction about forcing customers to pay twice for capacity, on the ground that states should be forced to shoulder the costs of their regulatory choices.[25] That is not what the Third Circuit held. Rather, it held that the FPA did not *categorically preclude* the Commission from making that decision.[26] But, like any decision within the Commission's discretion, the Commission must make such decisions in a reasoned way and consider the merits and disadvantages of the options before it. And when the Commission sets rates, among the core considerations it must consider is whether proposed rates unduly burden customers—including whether those rates impose unnecessary costs.[27] Here, imposing a MOPR without a corresponding resource-specific FRR would increase capacity costs for EMAAC customers alone by over $700 million per year—about a 37 percent increase over the most recent Base Residual Auction. Approximately $100 million

indeed, available in quantities that far exceed the target reserve margin. *See* Request for Rehearing of Exelon Corp., Docket No. ER18-1314 (July 30, 2018) at 8-14.

[24] That is, customers pay once for the capacity acquired in the capacity market to satisfy the Commission-imposed reliability requirement and again for resources that were procured outside the market, so do not "count" for purposes of satisfying the reliability requirement, but nevertheless do in reality provide capacity to the system.

[25] *E.g.*, Init. Br. of Electric Power Supply Ass'n (Oct. 2, 2018) at 10 ("EPSA Init. Br.") ("[T]here is nothing wrong with requiring states to 'pay twice' for capacity"); *id.* at 22; Init. Br. of NRG Power Marketing, LLC (Oct. 2, 2018) at 12 ("NRG Init. Br."); Init. Br. of the PJM Power Providers Group (Oct. 2, 2018) at 13 ("P3 Init. Br.") (all citing *New Jersey Bd. of Pub. Utilities v. FERC*, 744 F.3d 74, 97 (3d Cir. 2014)).

[26] *New Jersey Bd. of Pub. Utilities v. FERC*, 744 F.3d 74, 98-100 (3d Cir. 2014) (reviewing Commission's choice for reasoned decision-making under the Administrative Procedure Act).

[27] *See Michigan v. EPA*, 135 S. Ct. 2699, 2707-08 (2015) ("Agencies have long treated cost as a centrally relevant factor when deciding whether to regulate. Consideration of cost reflects the understanding that reasonable regulation ordinarily requires paying attention to the advantages and the disadvantages of agency decisions. It also reflects the reality that too much wasteful expenditure devoted to one problem may well mean considerably fewer resources available to deal effectively with other (perhaps more serious) problems." (internal quotation marks omitted)); *NAACP v. FPC*, 425 U.S. 662, 670 (1976) (holding that just and reasonable rates are those that "encourage the orderly development of plentiful supplies of electricity … at reasonable prices").

of that annual cost increase would be due to over-procurement of capacity. The total incremental cost increase to customers RTO-wide would exceed $900 million each year.[28]

Nor could the Commission disclaim responsibility for adopting a regulatory construct that ignores the capacity supplied by state-supported resources. States retain authority under the FPA over generation facilities; they have for decades exercised that authority to support particular generation resources; and a mountain of evidence proves that this support will continue and expand in the years and decades ahead.[29] When the Commission assesses whether its market rules are just and reasonable, it cannot ignore these realities. If the Commission nonetheless chooses to pretend that state-supported capacity does not exist, the consequences of that choice—including the billions of dollars in excessive and unnecessary costs—would properly fall at the Commission's feet. That is why the Commission's Order was exactly right to prioritize avoiding a market structure that would lead to capacity over-procurement and double payment, and instead to pursue a construct that would prevent needless expense by crediting consumers for *all* resources contracted to provide capacity.[30]

Some of the same opponents, misconstruing the Commission's amicus brief in *EPSA v. Star*, contend that non-preemption of state programs is accommodation enough.[31] The Commission's brief, however, merely said that preemption was unnecessary because the

SI-SSA-0010-6431

Commission "can exercise its responsibility under the Federal Power Act to ensure just and reasonable prices in the wholesale markets subject to its jurisdiction."[32] The brief did not address *how* just and reasonable market rules should be designed in a manner consistent with the FPA's cooperative federalism.

That question, unanswered by the *Star* amicus brief, is now before the Commission. Contrary to the claims of MOPR-only advocates, Sections 205 and 206 do not require the Commission to attempt to thwart state policies, nor stamp out any effect of those policies on the Commission's markets. Otherwise, Congress's decision to divide authority between federal and state regulators would make little sense. Congress made that choice knowing that "what states do in the exercise of their powers affects interstate sales, just as what the FERC does in the exercise of its powers affects the need for and economic feasibility of plants over which the states possess authority…. [E]ach use of authorized power necessarily affects tasks that have been assigned elsewhere."[33] That interplay is an inherent part of the legislative design, and the effects of that interplay pose no barrier to the Commission's ability to set just and reasonable wholesale rates. Indeed, the Commission has never expressed such a narrow view with respect to how state policies should be reflected in markets and in fact has only suggested the opposite.[34]

The Commission's proposed resource-specific FRR appropriately embraces the FPA's cooperative federalism framework. It leaves room for states to pursue their energy policies alongside, but outside of, the federal-jurisdictional capacity auction—by withdrawing load to be

served through a separate mechanism. Meanwhile, the resource-specific FRR preserves the capacity auction for the remainder of supply and load *not* subject to a state procurement mandate. The Commission's proposal thereby appropriately balances the relevant interests—consumers' interests in avoiding over-procurement and double payment; investors' interests in an auction market "untainted" by "non-competitive" offers; and the statute's commitment to a federalist framework in which states exercise important regulatory authority over generation.

B. The Resource-Specific FRR Is a Less Extreme, More Tailored Variation on a Construct the Commission Has Already Approved as Just and Reasonable.

1. The Resource-Specific FRR Is Consistent With Market Constructs That the Commission Has Already Found to Be Just and Reasonable.

A number of MOPR-only advocates depict the resource-specific FRR Alternative as a radical change from PJM's current market design.[35] It is not. It is a more tailored version of the existing FRR Alternative, which similarly allows load to be withdrawn from the market to be served outside it—and which has been a part of the PJM capacity construct since its inception.

In the numerous Commission orders addressing the PJM capacity market since its inception, the Commission's focus has always been on ensuring competitive offers by suppliers selling within the RPM market—not on conscripting load into the RPM market.[36] Accordingly, the Commission has emphasized the importance of an alternative outside the RPM market for states wishing to pursue their own public policies. For example, when the Commission first

[35] *E.g.*, NRG Init. Br. at 23-26.

[36] From the outset of RPM, the Commission has required that an alternative FRR mechanism be available. *See PJM Interconnection, L.L.C.*, 115 FERC ¶ 61,079, at P 103 (2006) ("We find that the use of a sloped demand curve, in a forward procurement auction, as proposed by PJM, would be a just and reasonable option for acquiring capacity as long as load can choose to avoid the auction and, instead, satisfy a fixed resource requirement through the more traditional alternative of self-supplying sufficient capacity to meet its obligations."); *see also id.* at PP 70-71, 110-11; *PJM Interconnection, L.L.C.*, 135 FERC ¶ 61,022, at P 193 (2011); *PJM Interconnection, L.L.C.*, 137 FERC ¶ 61,145 at P 160 (2011); *PJM Interconnection, L.L.C.*, 151 FERC ¶ 61,208, at PP 202-12 (2015) (preserving FRR in the Capacity Performance reforms).

applied the MOPR to new state-sponsored resources, it noted its interest in preventing "below-cost offers into the RPM auction"—but emphasized that its bidding rules did not "encroach on a state's ability to act within its borders to ensure resource adequacy or to favor particular types of new generation."[37] That is because, as the Commission explained, PJM's tariff allowed states to remove their load from the capacity auction: "[S]tates seeking full independence in resource procurement choices can implement a form of capacity procurement that complements the RPM or can opt out of the RPM markets via the FRR alternative."[38]

To be sure, the full FRR remains an option for states seeking to support particular resources of public policy interest. But for that end, it is an overbroad and needlessly cumbersome tool for states that have imposed a procurement mandate on only a portion of their load. The withdrawal of an entire zone's load could significantly reduce the size of the RPM market, reducing the market's depth, efficiency, and scale more than is necessary to accommodate the state program. And for states that have implemented retail competition, the full FRR is more difficult to use than a resource-specific FRR.[39] In sum, it makes little sense for the Commission to force states to withdraw their *entire* load from the RPM market when the state seeks to have only a *portion* of that load procure capacity from resources of public policy interest. For example, if Illinois has carbon-reduction goals that can be met by procuring less generation than is needed to serve all of the state's load, there is no reason why Illinois should be required to withdraw all of the in-state load from the RPM market.

[37] *PJM Interconnection, L.L.C.*, 135 FERC ¶ 61,022, at P 142 (2011).

[38] *Id.* at P 141 n.76; *id.* at P 193 ("The FRR option is the alternative for load serving entities that wish to secure their own capacity resources outside of a competitive market, whether as directed by state-authorized integrated resource plans, or pursuant to other considerations.").

[39] Schnitzer Decl. ¶¶ 58-64.

LS Power and EPSA point out that PJM previously did not want to allow a partial FRR.[40] PJM explained to the Commission its concern that, if a partial FRR was available, a load-serving entity could use the partial FRR to obtain the long-term reliability benefits of the sloped VRR demand curve, while protecting its load from paying for the full short-term economic costs of procuring in excess of the Installed Reserve Margin ("IRM").[41] This prior concern, however, was in the context of a self-supplying *market participant* implementing a partial FRR. At issue here is whether the partial FRR should be available for a *state* exercising its sovereign authority to implement energy policies supporting particular generation facilities. Denying the states the ability to use the FRR partially would be tantamount to dictating the resources that a state is required to support. Nevertheless, if the Commission disagrees and is concerned about the interaction between reserve margins and an FRR-RS to serve partial load, we note that PJM proposes to adjust the capacity credit received by a load-serving entity matched with an FRR-RS resource to account for the *actual* reserve margin procured by PJM using the sloped VRR demand curve—and *not* simply the IRM.[42] That adjustment would avoid the problem previously identified by PJM.

NRG, meanwhile, argues that the FRR was intended for vertically integrated utilities, not for load in restructured states.[43] However, no such limitation is found in the actual language of the FRR option. Rather, as PJM explained to the Commission in defending the existing FRR, "the

[40] Init. Br. of LS Power Assocs. L.P. at 21 (Oct. 2, 2018) ("LS Power Init. Br."); EPSA Init. Br. at 27.

[41] LS Power Init. Br. at 21 & EPSA Init. Br. at 27 (citing *PJM Interconnection, L.L.C.*, 137 FERC ¶ 61,145, at PP 175-76).

[43] NRG Init. Br. at 22.

SI-SSA-0010-6435

FRR option expressly accommodates retail choice jurisdictions."[44] The goal was to allow states a mechanism "to secure their own capacity resources outside of a competitive market, whether as directed by state-authorized integrated resource plans, *or pursuant to other considerations*."[45] The resource-specific FRR aims toward the same goal.

NRG also contends that the resource-specific FRR is more likely than the existing FRR to have price-reducing impacts on the RPM market, because it is specifically designed for resources that would not clear in the RPM market if subjected to a MOPR.[46] This argument is flawed. The existing FRR also reduces prices unless *every* FRR resource would have been infra-marginal if it had participated in RPM. The resource-specific FRR is exactly the same. Any resource that is part of an FRR plan, but would not have cleared the RPM market, has the exact same price impact as a resource that is an FRR-RS resource and that would not have cleared the RPM market. But NRG provides no reason at all to assume that *every* traditional FRR resource would have cleared the RPM market if it had been forced to bid at its avoidable costs. Vertically integrated utilities are likely to retain at least some units that are used for self-supply but that would not clear in the RPM market if subjected to a MOPR—whether to avoid imposing stranded costs on customers from an early retirement, or for other public policy reasons. For example, a number of the units contained in 2021/22 FRR capacity plans are similar to uneconomic units that have announced retirement.[47] Thus, states have used the existing FRR to retain units that would not clear in RPM. Moreover, as

[44] *PJM Interconnection, L.L.C.*, 137 FERC ¶ 61,145 at P 177 (2011).

[45] *PJM Interconnection, L.L.C.*, 135 FERC ¶ 61,022, at P 193 (2011) (emphasis added).

[46] NRG Init. Br. at 22-23.

[47] For example, the most recent set of units designated in FRR plans for the 2021/22 auction include three gigawatts (GW) of older (1950s-60s vintage), smaller (under 400 MW per unit) coal units that closely resemble the types of units that have largely otherwise retired across PJM. Further, FRR plans include nine GW of larger (400 MW or more) coal units whose economics are uncertain. A number of units this size also have retired in PJM. *See* "Resources Designated for FRR" and "Resource Model," available at https://www.pjm.com/markets-and-operations/rpm.aspx.

noted above, nothing in the existing FRR limits its use to vertically integrated utilities. A state that wishes to promote environmental priorities, and elects the full FRR to pursue those priorities unencumbered by the MOPR, will have the same or greater effect on price as a state that invokes the resource-specific FRR to remove only as much load as necessary to match the capacity resources of state policy interest.[48]

Finally, EPSA argues that the resource-specific FRR is potentially more dangerous than the full FRR because load-serving entities could use the resource-specific FRR to engage in the exercise of buyer market power—withdrawing some load from the PJM market in order to reduce the RPM clearing price for the remainder of its load still participating in that market.[49] Yet the programs on which the Commission has focused—and which have prompted the Commission to propose reforms—are all state-sponsored environmental programs aimed at supporting non-emitting resources. To the extent that the Commission is presented in the future with an instance of anti-competitive conduct, it has the enforcement tools it needs to investigate and punish that conduct. All capacity transactions taking place under a resource-specific FRR remain subject to Commission jurisdiction as wholesale sales. The Commission will therefore have transparency into the costs being incurred and the basis for the state procurement. If it determines that parties are engaged in market manipulation or anti-competitive conduct, it has the power under Sections 205 and 206 to reject rates submitted to it, as well as other enforcement tools. Finally, to the extent any danger still exists, that is a danger shared just as much by the existing FRR. Under that existing construct, a state with multiple load-serving entities could attempt to do what EPSA describes—

[48] Schnitzer Decl. ¶¶ 59-61, 63.

[49] *See* Aff. of Paul M. Sotkiewicz, Ph.D., Attach. A to EPSA Init. Br., at ¶¶ 19-26 ("Sotkiewicz Aff."); *see also* NRG Init. Br. 16.

SI-SSA-0010-6437

but that has not prevented the Commission from affirming that the existing FRR is just and reasonable.[50]

The Commission should not lose sight of what EPSA is asking it to do by conjuring the specter of buyer-side market power: the cost of avoiding that speculative possibility will be to impose, with certainty, more than $900 million annually in unnecessary costs on customers RTO-wide—and $700 million annually on EMAAC customers alone.[51] The Commission should adopt the resource-specific FRR to avoid the concrete harm, rather than imposing concrete costs to avoid a theoretical loophole that it has other tools to address.

2. The Prediction That the Resource-Specific FRR Will Be Easier for States to Use Than the Existing FRR Is Not a Valid Ground for Opposing It.

To the extent MOPR-only advocates view the resource-specific FRR as more dangerous than the existing FRR construct because it is easier for states to use—and thus, under the resource-specific FRR, states within PJM will not be sufficiently deterred from attempting to regulate the generation mix—that rationale would violate the FPA and the Tenth Amendment. "Legislation designed to free from pollution the very air that people breathe clearly falls within the exercise of even the most traditional concept of … the police power" reserved to states under the Tenth Amendment.[52] The FPA preserves that traditional police power by expressly protecting states' authority over "facilities used for the generation of electric energy."[53] And in reliance on that

[50] Moreover, under PJM's proposed MOPR rule—which many other parties support—self-supply would be exempt from the MOPR. If that exemption is accepted, self-supply will be a much less burdensome path than the resource-specific FRR for load-serving entities seeking to "exercise buyer market power." Such entities could simply bilaterally contract for capacity and then offer that capacity into RPM as a price taker.

[51] Schnitzer Decl. ¶ 55.

[52] *Huron Portland Cement Co. v. City of Detroit*, 362 U.S. 440, 442 (1960).

SI-SSA-0010-6438

authority, states have restructured their retail electric industries, giving up the command-and-control regulatory authority they exercised over vertically integrated utilities, but with the expectation and understanding that they still would be able to exercise control over the generation mix serving their states through renewable energy credit programs and other mechanisms regulating procurement by load-serving entities.[54]

Thus, at RPM's inception, PJM's tariff largely exempted new state-supported resources from the MOPR, and even after that exemption was eliminated, the MOPR was never targeted specifically at state-supported resources, but instead was applied to the predominant type of new resources (gas-fired combustion turbines and combined cycle units) regardless of whether they were receiving state support. And states were still free to use financial incentives to influence the existing resource mix, including through environmental attribute payments, to encourage or delay retirements of particular types of generation resources. In many states, these programs now cover one-fifth or more of the state's electricity consumption.[55] When states permitted their utilities to join PJM, states had no reason to think that, by doing so, they would be forfeiting their authority to regulate generation facilities within their jurisdictions so as to promote their environmental goals.

MOPR-only advocates now support a bait and switch. Having attracted states into the PJM market on terms that would allow states to continue to exercise their authority over the generation mix, they now urge the Commission to adopt market rules that force states into a trilemma: states

[54] Br. of Amici Curiae Electricity Regulation Scholars, *Village of Old Mill Creek v. Star*, Nos. 17-2433, 17-2445 (cons.), at 10-18 (7th Cir. Nov. 3, 2017), available at https://statepowerproject.files.wordpress.com/2017/02/electricity-regulation-scholars-brief-webposting.pdf; *see infra* n.60 (collecting authorities establishing state authority over utility procurement).

[55] "Renewable Energy Requirements by PJM State," Attach. 1 to Aff. of Dr. Anthony Giacomoni at 2, Attach. F to PJM Interconnection L.L.C., Capacity Repricing or in the Alternative MOPR-Ex Proposal, Docket No. ER18-1314 (Apr. 9, 2018).

must leave PJM altogether or opt into the existing FRR, which (according to MOPR-only advocates) is unattractive and costly; remain in the RPM auction but forfeit their ability to regulate the generation mix; or remain in the RPM auction and incur substantial and unnecessary capacity costs in order to exercise the authority that Congress reserved to them and that lies at the core of their police powers—and on which they have relied in establishing renewable portfolio standards, zero emission credit programs, and other state programs.

However, as the Supreme Court recently reaffirmed in *NFIB v. Sebelius*, the federal government cannot induce states to rely on a cooperative federalist scheme and then leverage that reliance to coerce states into giving up control over core sovereign powers.[56] In *Sebelius*, for example, the Supreme Court held that although Congress had the power to attach conditions to Medicaid spending in order to encourage states to regulate in a manner favored by the federal government, Congress could not lure states into dependency on the Medicaid program and then use its Spending Clause power to force states to yield additional regulatory authority to the federal government.[57] Similarly here, MOPR-only advocates seek to leverage state dependence on PJM membership and then use the Commission's wholesale rate-setting powers to force states to surrender their efforts to influence the generation resource mix—a core police power that Congress expressly reserved to states and which states expected to be able to continue to exercise when they joined PJM. That violates the Federal Power Act (and its protection for states' authority over "facilities used for the generation of electric energy"), and the Tenth Amendment (which protects states' policymaking powers from federal commandeering). And while states theoretically could

[56] *Nat'l Fed'n of Indep. Bus. v. Sebelius*, 567 U.S. 519, 575-84 (2012).

[57] *See id.* at 576-77 ("The legitimacy of Congress's exercise of the spending power thus rests on whether the State voluntarily and knowingly accepts the terms of the 'contract.'" (internal quotation marks omitted)).

re-regulate, that choice would certainly be extremely costly and disruptive to an industry that provides an essential service to citizens.

Sebelius's rationale powerfully underscores why the Commission properly proposed a resource-specific FRR, and why proposals for a MOPR-only solution are pernicious. As *Sebelius* explains, political accountability vanishes when the federal government leverages state dependence on a federal regulatory construct in order to force states into regulatory changes. When that happens, "it may be state officials who will bear the brunt of public disapproval, while the federal officials who devised the regulatory program may remain insulated from the electoral ramifications of their decision."[58] Here, for example, if the Commission were to accept a MOPR-only solution, states that wished to maintain their preexisting regulatory programs concerning the generation mix would be forced to pay for redundant capacity at significant expense. Even though the Commission's regulatory scheme forced states into that bind, state decision-makers would bear the brunt of public disapproval for the consequences, and the federal government (through the Commission) would remain insulated from the electoral ramifications. To the extent states succumb and abandon their environmental initiatives to avoid the significant costs of over-procuring capacity, again it is state policymakers that would bear the political costs—even though the bind into which they are placed is the consequence of the Commission's regulatory program. That "would threaten the political accountability key to our federal system."[59]

The resource-specific FRR proposal, by contrast, places political accountability in the right place. States are free to rely on state-procured resources to provide capacity, but the resource-

[58] *Id.* at 578 (internal citations, quotation marks omitted).

[59] *Id.*

specific FRR ensures that the costs of state policy choices will be transparent. As a result, the right decisionmakers can be held accountable. The Commission's proposal is consistent with basic federalism principles that form the bedrock division of authority in the FPA.

3. The Resource-Specific FRR Is Consistent With the Commission's Exclusive Rate-Setting Authority.

To the extent opponents contend that the resource-specific FRR is inconsistent with the Commission's exclusive authority to set wholesale rates, their argument rests on a misunderstanding of the state's role in arranging for the procurement of capacity under the resource-specific FRR. States will not be setting wholesale capacity prices, nor usurping the Commission's role in determining whether capacity prices are just and reasonable. Rather, states will be establishing procurement processes for capacity, just as many PJM states (such as Illinois, New Jersey, Maryland, and others) already do for energy to be resold to non-shopping retail customers. The FPA assigns states the power to direct utility procurement and permits states to establish procurement processes subject to state supervision—including procurement rules establishing the maximum cost that it would be prudent for buyers to incur, in light of the state's authority over cost recovery from retail customers.[60]

---

[60] *See Southern Cal. Edison Co.*, 70 FERC ¶ 61,215, 61,676 (1995) (acknowledging "that resource planning and resource decisions are the prerogative of state commissions and that states may wish to diversify their generation mix to meet environmental goals in a variety of ways," and that a "state may choose to require a utility to construct generation capacity of a preferred technology or to purchase power from the supplier of a particular type of resource"); *Promoting Wholesale Competition Through Open Access Non-Discriminatory Transmission Services by Public Utilities,* Order No. 888 (1996), at 434 n.544 (noting "state authority in such traditional areas as … utility buy-side and demand-side decisions …; authority over utility generation and resource portfolios; and authority to impose non-bypassable distribution or retail stranded cost charges." (emphasis added)); *Midwest Power Systems*, 78 FERC ¶ 61,067, 61,246 (1997) (state policy is "consistent with federal law to the extent that [it] require[s] electric utilities located in [the state] to purchase from certain types of generating facilities"); *Southern California Edison Co.*, 71 FERC ¶ 61,269, 62,080 (1995) (noting "broad powers under state law to direct the planning and resource decisions of utilities under their jurisdiction. States may, for example, order utilities to build renewable generators themselves, or deny certification of other types of facilities if state law so permits. They also, assuming state law permits, may order utilities to purchase renewable generation."); *see also Pike County Light & Power Co. v. Penn. Pub. Utility Comm'n*, 465 A.2d 735, 738 (Comm. Ct. Pa. 1983); *Appalachian Power*

Capacity suppliers, meanwhile, will decide whether or not they wish to sell their capacity pursuant to the state procurement, through the RPM auction, through a bilateral contract, or in some other way. The state will not be exercising any regulatory authority over the capacity supplier with respect to its capacity sales. Any resulting sale of capacity pursuant to the resource-specific FRR will thus fall comfortably within the seller's market-based tariff, which allows a supplier to sell at a price for which it can find a buyer. Such sales will be reported to the Commission on the seller's EQR. The Commission will thus be informed of those sales and can review them, and the Commission will have the final word regarding whether or not the price is just and reasonable. If not, the Commission has the power under Section 206 to replace the rate with a different one.[61] Similar provisions have long been part of the PJM Tariff.[62]

This framework is consistent with the FPA's division of authority and the Commission's exclusive power to set wholesale rates. For example, in *Allco Finance Ltd. v. Klee*, the Second Circuit rejected a field preemption challenge to a Connecticut procurement statute that directed wholesale purchases of energy bundled with RECs by its utilities from renewable developers chosen by the state.[63] The court reasoned that the state's procurement resulted in "the kind of traditional bilateral contracts that are subject to FERC review for justness and reasonableness," and that the request-for-proposals at issue specifically required that any resulting contract be filed

with FERC under Section 205.[64] "Because FERC has the ability to review any bilateral contracts that arise out of Connecticut's RFPs, we hold that Connecticut's 2015 RFP … is not preempted by the FPA."[65]

Nothing in *Hughes v. Talen Energy Marketing, LLC* is to the contrary. *Hughes* dealt with a contract-for-differences in which the state payment was conditioned on clearing the PJM auction. In conditioning payment on auction clearance, the state disregarded or adjusted a rate that FERC had already set—namely, the PJM auction clearing price. Thus, the Court held, "States interfere with FERC's authority by disregarding interstate wholesale rates FERC has deemed just and reasonable."[66] By contrast, a resource-specific FRR would be implemented pursuant to a Commission order contemplating a state procurement process *outside* the PJM auction, with resulting capacity contracts that would then be subject to Commission review for justness and reasonableness. Such a structure does not disregard any Commission-established rate. It respects

[64] *Id.* at 99.

[65] *Id.* at 100; *see also La. Pub. Serv. Comm'n v. FERC*, 761 F.3d 540, 552 (5th Cir. 2014) (upholding FERC's incorporation of a state commission-determined depreciation expense into the federal rate, even though the state commission's method for calculating depreciation diverged from FERC's own method, because "FERC exercised its role when it initially reviewed and accepted the … formula incorporating the state agencies' depreciation rates" as just and reasonable, and because "FERC has clarified that it will continue to exercise oversight of the state rates in a Section 206 complaint proceeding."); *La. Pub. Serv. Comm'n v. FERC*, 860 F.3d 691, 696 (D.C. Cir. 2017) ("[W]e … conclude that there has been no unlawful subdelegation because FERC has exercised, and intends to continue to exercise, its § 206 review authority."); *Coalition for Fair & Equitable Regulation of Docks on Lake of the Ozarks v. FERC*, 297 F.3d 771, 779 (8th Cir. 2002) (rejecting subdelegation challenge to license where "FERC retains authority to require the modification of the project and its plans and specifications, to accomplish the outlined goals…. Therefore, the license represents no real delegation of power …, because FERC retains the right to require modification of … [the] program."). To the extent opponents rely on U.*S. Telecom Ass'n v. FCC*, 359 F.3d 554 (D.C. Cir. 2004), that case is easily distinguished: the Court found an improper subdelegation by the FCC where the agency "lets the states make crucial decisions" reserved to the FCC by statute "with FCC oversight neither timely nor assured." *Id*. at 567. Here, the Commission's oversight is both timely and assured under Sections 205 and 206.

[66] 136 S. Ct. 1288, 1299 (2016).

the jurisdictional lines drawn in the FPA while advancing the statute's cooperative federalism framework.

C. Whether Clearing Prices Change Is Irrelevant.

The main argument of parties opposing the resource-specific FRR is that, if load is allowed to exit the RPM market along with subsidized capacity resources, applying the MOPR will not end up increasing capacity prices.[67] The Commission should not be swayed by this argument, for several reasons.

As an initial matter, the argument is speculative. It is premised on the assumption that states will continue to subsidize at the same rate even after they are required to take responsibility for the subsidized resources' capacity revenue. One goal of the resource-specific FRR is to bring additional transparency to states' policy choices, so that those choices can be better informed.[68] There is no guarantee that states will procure capacity in addition to other attributes for *every* subsidized resource; those subsidized resources whose capacity revenues are not replaced through the resource-specific FRR will participate in the RPM auction but be subject to a MOPR, resulting in increased capacity prices relative to the status quo.[69]

Second, and more fundamentally, the Commission's goal in granting the Section 206 complaint and imposing a new capacity market design should not be to guarantee a generator any particular price level. Instead, it should be to ensure that the prices that emerge from the RPM market reflect genuine competition among suppliers to serve residual RPM demand by requiring

[68] Order at P 162.

[69] *See, e.g.*, *ISO New England Inc.*, 162 FERC ¶ 61,205, at P 73 (2018) (noting possibility that new resources will be discouraged by CASPR market design and "it is not clear that past offer behavior will reasonably predict future offer behavior under alternative market designs").

that their bids reflect the cost of supplying capacity, but not other attributes that PJM's market does not value. The Commission's Order is consistent with this goal. The Commission did not focus on prices in the abstract, but rather on the "price suppressive effects" of capacity sell offers by subsidized resources that were "below a competitive price."[70] As the Commission explained, "out-of-market support to existing resources may allow even uncompetitive resources, for whom a competitive offer would be significantly higher than zero, to submit low or zero priced offers into the capacity market."[71] The prevalence of these below-cost offers, the Commission said, had become sufficiently widespread that they had begun to "compromise the capacity market's integrity."[72] Thus, the Commission's solution was not to order an administrative increase in prices, but instead was to impose a bidding rule that would ensure that all capacity market offers were "competitive." The Commission explained, "An expanded MOPR, with few or no exceptions, should protect PJM's capacity market from the price suppressive effects of resources receiving out-of-market support by ensuring that such resources are not able to offer below a competitive price."[73] As a result, "the rates … in the capacity market [would be] the result of competitive market forces, and therefore … just and reasonable."[74] The Commission appropriately focused its Order on fixing the mechanism that polices suppliers' auction bids, not the resulting prices—in other words, the auction inputs, not the outputs.

MOPR-only advocates respond that RPM prices will still be affected by state subsidy decisions, because all else being equal, auction clearing prices will decline when demand is

[70] Order at P 158.

SI-SSA-0010-6446

removed from the auction to be satisfied outside the market by FRR-RS resources. Their position boils down to the assertion that suppliers are entitled to serve *all* load through the RPM auction.[75] But the Commission has never sought to dictate load's participation in a capacity auction as the exclusive method of capacity supply procurement. Even the name for the RPM auction—the Base *Residual* Auction—acknowledges that the auction is a default aggregate procurement after accounting for commitments undertaken outside of the auction.

From a legal and market design perspective, there is an important difference between auction clearing prices being "suppressed" by non-competitive bids submitted by auction participants, and auction clearing prices decreasing because of a reduction in demand reflecting a state's policy decision to withdraw load from the auction.[76] The Commission's core responsibility with respect to the RPM auction is to protect the integrity of the auction process, by ensuring that suppliers are making competitive offers, so that the clearing price reflects robust competition among suppliers to serve the available load. By contrast, the Commission does not have the last word on whether states rely on the auction to serve their load. That decision is up to the states.

[75] EPSA Init. Br. at 5 ("[T]he fact remains that an expanded MOPR and the FRR Alternative are fundamentally in conflict and cannot coexist, because the latter will effectively nullify the former"); Sotkiewicz Aff. ¶ 132 ("[I]t is simply not possible to accommodate [state] polices and preserve efficient and just and reasonable outcomes in the PJM capacity market."); P3 Init. Br. at 17 ("Again, the door is open for any state … that wants to go its own way. But for those who stay, playing in a regional wholesale market that does not tolerate price suppression because of the subsidization of politically selected resources, is a trade off that a state must be willing to make."); Aff. of Roy J. Shanker, Ph.D., Attach. to P3 Init. Br., ¶ 26 ("Shanker Aff.") ("While 'counting' rules related to the amount of load removed under the type of proposal suggested by the Commission can mitigate the magnitude of the suppression, *it can't be eliminated if any load is removed*." (emphasis in original)).

[76] Dr. Sotkiewicz contends that demand does not exit the market even when it procures outside the RPM auction, *see* Sotkiewicz Aff. ¶¶ 8-9, 13-14, but this is word play. Of course, load-serving entities must satisfy their obligations under the Reliability Assurance Agreement; in this sense, load cannot be withdrawn from the PJM market—unless a load-serving entity leaves PJM altogether. But, as the Commission recognized, load can satisfy its obligations to procure capacity in different ways—including through the existing FRR outside of PJM's capacity auction, or through PJM's capacity auction.

SI-SSA-0010-6447

The states' policy decision to remove their load from the auction may indirectly affect auction prices, but it does not render the auction rules unjust or unreasonable.

The existing FRR construct, which the Commission has long deemed just and reasonable, reflects the distinction between regulating supplier offers *within* the RPM auction, and regulating states' policy decisions regarding how their load-serving entities procure capacity. States can direct their load-serving entities to elect the existing FRR construct, even though such a choice, as MOPR-only advocates concede, has price effects on the RPM auction that are at least as large as a more tailored resource-specific FRR.[77] Nevertheless, in approving the FRR, the Commission saw no conflict between its mandate to "protect the integrity of PJM's wholesale capacity markets under RPM," and state authority to direct load-serving entities "to secure their own capacity resources outside of a competitive market."[78] As the Commission explained, the FRR provided "an alternative for those load serving entities that wish to bring new generation resources into the PJM capacity market without risk of being mitigated under the MOPR."[79]

Indeed, the Commission has repeatedly approved the existing FRR as just and reasonable without ever expressing any concern about its potential impact on RPM prices.[80] It has also expressly considered the argument that the existing FRR cannot be just and reasonable because of its potential price-reducing effects—but approved the FRR nonetheless.[81] The Commission has

[77] Shanker Aff. ¶ 8 (acknowledging that the existing FRR is "still price suppressive"); *id.* at ¶ 41 ("The existing FRR mechanism does admittedly raise similar price suppression concerns."); Sotkiewicz Aff. ¶¶ 60-67 (acknowledging that large price effects could result from use of the current FRR).

The New Jersey Board asserts that if load serving entities and states decide that FRR is the best option, the proliferation of FRR service areas could reduce the auction clearing price and accelerate capacity retirements.").

never sought to micromanage the particular price levels that result from competitive offers to supply the remaining load procuring through the RPM auction.[82]

Likewise, in other regions, the Commission has approved capacity market constructs that recognize state authority to decide whether load should be served from supply procured within or outside the RTO/ISO capacity construct. In MISO, for example, the Commission has made clear that the capacity auction is voluntary, and that "most [utilities] will continue to obtain most—if not all—of their supplies outside the auction."[83] Over objections, the Commission has held that the resulting capacity auction prices nevertheless are just and reasonable, because they result from competition among suppliers to serve whatever demand exists in that market. And in CAISO, the Commission does not administer any centralized capacity market at all, but instead requires CAISO to impose a backstop resource adequacy procurement mechanism in the event that a state-administered resource adequacy construct fails.[84] MOPR-only advocates have no explanation for why these other constructs can be just and reasonable, yet the resource-specific FRR is not.

Moreover, even if the Commission could theoretically mandate that all PJM capacity be procured through a centralized auction construct, imposing such a mandate would not be good policy. Everyone agrees that states can ultimately direct their load-serving entities to withdraw from PJM. Because states have the last word, it behooves the Commission to adopt a capacity construct that is workable for states and that allows them to pursue their policy priorities while remaining part of the RTO.

SI-SSA-0010-6449

Finally, in light of all this, there is no merit to Calpine's argument that current market prices are confiscatory.[85] Any supplier that has cleared the capacity market, and thus has a capacity commitment, submitted an offer less than or equal to the clearing price and so presumably was willing to accept that level of compensation. Suppliers that do not clear the capacity market have no capacity commitment—so nothing is being confiscated from them. Calpine's real argument is that it invested in capacity hoping that states would rely only on the RPM market to satisfy their demand. But Calpine made its investments against a backdrop in which states were free to withdraw their load to be served in other ways, especially to achieve environmental aims that many of its facilities cannot satisfy. The risk that states would do so is a risk that Calpine and other investors knowingly assumed.

D. The Resource-Specific FRR Allows States to Select Resources That Are Economic and Least-Cost Once Externalities Are Considered, and the Resulting RPM Price Is Efficient.

MOPR-only advocates also argue that the resource-specific FRR will result in the wrong set of resources being selected to provide capacity. The least-cost set of resources, they say, consists of the resources that RPM's market mechanism would select absent the state programs deemed "actionable subsidies." To the extent states procure capacity from other resources outside RPM, they contend, states create inefficiencies that raise costs to customers.[86]

To start, this argument is irrelevant because it ignores the same federalism principles set forth above and memorialized in the FPA: states retain final authority over the generation facilities that serve their people, and when they exercise this sovereign authority, they are not bound to select the resources that MOPR-only advocates—or indeed, the Commission itself—view as the

[85] Calpine Init. Br. at 11-13.

[86] *See, e.g.*, Sotkiewicz Aff. ¶¶ 15-18.

most efficient. The Commission's proper concern extends only to whether *RPM's market mechanism* selects an efficiently competitive set of resources from among the suppliers participating *in that market*.

But even judged solely by efficiency, the MOPR-only advocates are wrong. Because the RPM mechanism ignores externalities like pollution, it inefficiently selects the wrong resources and sets the wrong price. By contrast, the state environmental attribute programs, like REC and ZEC programs, that trigger eligibility for the resource-specific FRR make outcomes *more* efficient—as to both resource selection and clearing prices. They do so by moving the world closer to what virtually everyone agrees would be the economic ideal: a market that internalizes the cost of carbon pollution.

For MOPR-only advocates, externalities are the elephant in the room. Their various analyses strikingly ignore the RPM mechanism's failure to account for the cost of pollution.[87] Those are real costs that impose real harm on society, and without accounting for them, RPM cannot select the most efficient set of resources. Exelon has explained these points at length,[88] and only summarizes them here. When the fossil-fuel generators owned by MOPR-only advocates produce electricity, they create pollutants—notably, carbon dioxide.[89] These pollutants harm human health and the environment, but their costs generally fall on society, not generators that

[87] For example, NRG's witness Robert Stoddard asserts that the "true costs" of FRR-RS resources would place them in the highest part of the supply stack, but does not consider that any concept of a resource's "true costs" must account for the costs it externalizes onto society. *See* Affidavit of Robert B. Stoddard ¶ 39 (attached to NRG Init. Br.).

[88] Initial Br. of Exelon Corp. (Oct. 2, 2018) at 13-14 ("Exelon Init. Br."); Protest of Exelon Corp., Docket No. ER18-1314 (May 7, 2018), at 12-25; Decl. of Robert D. Willig at 17-28, Ex. A to Protest of Exelon Corp., Docket No. ER18-1314 (May 7, 2018) ("Willig Decl.").

[89] Willig Decl. ¶¶ 13(a), 27; *see, e.g.*, *Coal. for Responsible Regulation, Inc. v. EPA*, 684 F.3d 102, 121 (D.C. Cir. 2012), *aff'd in part, rev'd in part on other grounds sub nom. Util. Air Regulatory Grp. v. EPA*, 134 S. Ct. 2427 (2014).

produce them—making them negative externalities.[90] Conversely, clean generators reduce emissions by displacing emitting resources but do not receive compensation for this benefit—positive externalities.[91] Externalities distort incentives, and so result in inefficiencies.[92] When the fossil-fuel generator decides how much to produce, it considers only its private costs, not the full costs to society.[93] When the clean generator weighs the same decision, the same mismatch occurs in the opposite direction. The fossil-fuel generator will produce too much, and the clean generator, too little. As Dr. Willig and Mr. Schnitzer explain, when incentives are misaligned, the outcome will not be efficient.[94] The fossil-fuel generator may continue operating when it should retire, and the clean generator may retire when it should continue operating—or the clean generator may never be constructed at all.

Indeed, the ability of fossil-fuel generators to produce electricity without paying for the social harm caused by pollution amounts to a subsidy—a massively distorting one. Society bears part of the cost of that generation, rather than the plant owners. For carbon dioxide alone, estimates put this subsidy's value for fossil-fuel generators across PJM at $12.1 billion to $17.7 billion

[90] Willig Decl. ¶¶ 27, 32.

[91] *Id.*

[92] Schnitzer Decl. ¶ 27.

[93] Willig Decl. ¶¶ 33-36.

[94] *Id.* ¶ 33; Schnitzer Decl. ¶ 27; *see* Institute for Policy Integrity, *Capacity Markets and Externalities: Avoiding Unnecessary and Problematic Reforms*, at 7 (Apr. 2018), http://policyintegrity.org/files/publications/Capacity_Markets_and_Externalities_Report.pdf; Comments of Inst. for Policy Integrity at N.Y.U. School of Law (Oct. 2, 2018) at 6-18, 25-32. Even PJM's witness, Hung-Po Chao, agrees that "a state-sponsored subsidy program to assist domestic production could, in principle, be justified as a second-best policy intervention to promote the economic welfare of the state when there is … a divergence between the marginal social cost (or value) of particular domestic production and the marginal private cost (or value) of that production"—*i.e.*, an externality. *See* Affidavit of Hung-Po Chao, Ph.D., Attach. C to Initial Submission of PJM Interconnection, L.L.C. (Oct. 2, 2018), at ¶ 5 ("Chao Aff."); *see also id.* ("[I]f a divergence is caused by a domestic state policy that is *not* tailored to address a market imperfection or externality, it is categorized as a market distortion." (emphasis added)). Yet Dr. Chao inexplicably fails to follow that analysis through in examining the PJM market and the impact of state environmental programs on efficiency. *See id.* ¶¶ 8-11.

dollars *annually*.[95] That means when fossil-fuel generators offer into wholesale markets, their offers are artificially low: they do not reflect the true costs of producing electricity using fossil fuels. As a result, these generators may clear at the expense of cleaner generators that would outcompete the polluters if environmental harm were taken into account.[96] That inefficient result—ignored by MOPR-only advocates—is what a MOPR-only approach would yield.

By contrast, the attribute payments that would trigger eligibility for the resource-specific FRR improve efficiency—selecting a more efficient set of resources, and yielding clearing prices that come closer to the efficient ideal. Most agree (as is plainly true) that a carbon price in the energy market is the economic ideal.[97] That ideal world would increase the energy-market bids of emitting resources by the costs of the carbon emissions they produce—with effects on resource selection and clearing prices, in both energy and capacity markets.[98]

- In energy markets, the clearing price would increase by the carbon cost of the marginal resource—likely an emitting natural gas or coal plant.[99] Net revenues for clean generators that clear would increase by this amount: they receive the carbon-enhanced clearing price, but because they do not emit carbon, they do not have to pay the carbon price.[100]

- Meanwhile, in capacity markets, clean generators would lower their bids: expecting higher net revenues from energy markets, they would rely less on

[95] These figures reflect 291.9 million tons of CO_2 emitted in PJM in 2017 and 426.6 million tons emitted in 2016, at a cost of $41.40 per ton. *See* Monitoring Analytics, LLC, *2017 State of the Market Report for PJM, Volume 2: Detailed Analysis*, at 361 (Mar. 2018).

[99] *Id.*

[100] *Id.*

> capacity revenues in order to continue operating.[101] Accordingly, clearing prices in capacity markets would fall.[102]

The net result would be that some emitting resources—no longer able to cover their costs from energy markets, capacity markets, and ancillary services, once forced to internalize the costs of their pollution—would be revealed as uneconomic and would retire.[103] Replacing them would be cleaner generators, correctly identified by the market as competitive once their environmental benefits are taken into account.[104] *This* is the truly efficient outcome—not the outcome that results from the current auction design that ignores externalities.[105]

State attribute payments like RECs and ZECs partially replicate this efficient outcome by providing the economic equivalent of a carbon price for the resources that participate.[106] Depending on the level at which it is set, the attribute payment either provides or partially provides the higher net revenues that these resources would receive from energy markets that correctly valued carbon.[107] And with these higher non-capacity revenues in hand, participating clean generators can reduce their competitive bids in capacity markets. So long as the attribute payments do not exceed the environmental value that zero-emissions resources provide, REC and ZEC programs are a step toward greater efficiency.[108] Resources participating in these programs will continue operating only if the value of their energy, capacity, and ancillary services, plus the value

[108] Willig Decl. ¶¶ 59; Schnitzer Decl. ¶ 36.

of their environmental benefits—as captured in REC or ZEC payments—exceed their costs.[109] If they do not, these resources will shut down. And when some of these clean generators clear at the expense of some emitting generators, and when clearing prices in capacity markets fall, the market is moving closer to the efficient ideal that would exist with a carbon price.[110] True enough, the result does not move all the way: these programs do not cover all methods of achieving emissions reductions (such as demand-side measures); they do not distinguish among different types of emitting generators (such as natural gas and coal); and, depending on the level of the attribute payment, they may benefit clean resources less than a carbon price would.[111] But these programs are far better than continuing to ignore externalities altogether. And because the resource-specific FRR respects states' authority to enact such programs, and yields a resource mix and price similar to what would prevail if the PJM markets themselves accounted for externalities, the resource-specific FRR enhances efficiency.[112]

The fundamental flaw in a MOPR-only approach, from an efficiency perspective, is that it seeks to counteract these pro-efficiency results. Not only would the Commission's markets continue to ignore economic realities, but states that aim to decarbonize by paying generators for their environmental benefits would find their efforts frustrated—able to proceed, if at all, only in the most inefficient way imaginable. Such states will be forced to continue procuring capacity through the RPM auction from emitting resources that impose significant costs on society but do not include those costs in their market offers. Meanwhile, such states will be forced to make a double payment for capacity to the non-emitting resources that do not impose those costs on

[109] Willig Decl. ¶¶ 13(e), 53.

society and, all things considered, are the more efficient resources. This would not be a just and reasonable result.[113]

E. Other Arguments Against the Resource-Specific FRR Are Without Merit.

Commenters make various other arguments against the resource-specific FRR, which the Commission should reject.

EPSA contends that the Commission's proposed adoption of the resource-specific FRR violates Section 206, because it exceeds the Commission's remedial powers. According to EPSA, the problem the Commission diagnosed was price suppression, but the resource-specific FRR does nothing to fix price suppression. And, EPSA says, the Commission's "discretion is not so broad as to empower the Commission to perform a nose job when it has diagnosed the ratemaking equivalent of a ruptured spleen."[114]

EPSA's argument is without merit. The Commission determined that the remedial tool it would use to ensure competitive outcomes, a broad MOPR with few or no exceptions, created its own problem that needed to be addressed in order for rates to be just and reasonable: the possibility that customers would "have[] to pay twice for capacity."[115] The Commission noted that it did "not take this concern—or the states' right to pursue valid policy goals—lightly."[116] Accordingly, it "reject[ed]" a MOPR-only approach, "even as an interim remedy."[117] It proposed a replacement

[113] Certain commentators have complained about the manner in which states select resources for attribute payments—for example, that procurements are not competitive, or that not all technologies are eligible. But unless the Commission is prepared to impose a carbon price itself, it is not for the Commission to pass judgment on how states implement these programs. Regardless of how they select participating resources, these programs are a large improvement on the status quo.

[114] EPSA Init. Br. at 29; *id.* at 27-31.

[117] *Id.* at P 149.

SI-SSA-0010-6456

rate that "modif[ied] two aspects of the PJM Tariff" that were intertwined and would avoid the problems created by applying the MOPR alone: "PJM should expand the MOPR for those resources seeking to participate in the capacity auction and implement a resource-specific FRR Alternative option, under which a resource receiving out-of-market support may remain on the system, outside of the capacity market."[118] This was well within the bounds of the Commission's authority under Section 206. The authority cited by EPSA affirms that the Commission has authority under Section 206 "to adopt a remedy proportionate to the problem being addressed."[119] Here, a MOPR-only solution would not be a suitable remedy for the reasons explained by the Commission. Instead, a resource-specific FRR is a necessary corollary to a broad MOPR, in order to avoid imposing unneeded excess costs on customers or unduly hampering states in their pursuit of legitimate policy goals pursuant to their reserved authority.[120] To use EPSA's medical analogy, the Commission's proposed solution was akin to surgically repairing a ruptured spleen while taking all necessary steps to avoid post-surgical infection. Nothing in Section 206 required the Commission to ignore and leave unresolved the deleterious consequences of imposing a MOPR-only solution.

Other commenters argue that the resource-specific FRR will impair reliability in the long term by suppressing RPM prices below the level needed for competitive entry.[121] This argument is flawed in two respects.

[118] *Id.* at P 157.

[119] *United Distribution Cos. v. FERC*, 88 F.3d 1105, 1132 (D.C. Cir. 1996).

[120] Order at PP 160-162.

[121] *E.g.*, NRG Init. Br. at 15.

SI-SSA-0010-6457

First, most fundamentally, it ignores that the market mechanism is dynamic. RPM prices are currently low in large part because of a significant amount of surplus capacity.[122] If resources exit the market, and new entry is needed, prices will rise to provide the signal to enter. Indeed, the PJM demand curve is designed so that if the amount of capacity falls below the target installed reserve margin, the market clearing price for capacity *must* rise above the cost of new entry. Opponents contend that the resource-specific FRR will undermine market participants' confidence in that market signal, since states could choose to withdraw additional demand from the auction to be served outside of it. But the risk that states will choose to withdraw their load from the capacity auction has been a feature of the capacity market since its inception, and there is no evidence to suggest that it has deterred new investment. In the fifteen Delivery Years for which the RPM auction has facilitated capacity procurement, PJM has received 50 GW of new capacity and uprates.[123] Approximately 30 GW of has entered since the Base Residual Auction for the 2015/16 Delivery Year.[124]

Second, the argument ignores the residual nature of the Base Residual Auction, in which load procures generic capacity—that is, capacity without regard to the technology or emissions characteristics of the capacity resource. But because different generation technologies impose different costs on society, states and their citizens are not actually indifferent to the type of capacity resources they procure from. They are willing to pay more for non-generic capacity—for example, zero emissions or renewable capacity—that provides environmental benefits. The Commission's

[122] Aff. of Dr. James Letzelter at 9, App. B to Initial Comments of the Md. Pub. Serv. Comm'n (Oct. 2, 2018) ("MDPSC Comments").

SI-SSA-0010-6458

markets have always been neutral with respect to specific resource characteristics such as technology, vintage, and or other characteristics that do not bear on the ability of the resource to supply the product in question, and so do not allow states or customers to express their preference for particular types of generation resources by paying more for the resource adequacy provided by those resources. The resource-specific FRR is a mechanism for allowing those preferences to influence the generation mix, without interfering with the neutrality of the PJM auction to specific resource characteristics. Whatever price emerges in the residual market for generic capacity reflects the actual value of that generic capacity to customers, and by definition, any resource willing to satisfy the demand for generic capacity at the market clearing price is making a profit. If more generic capacity is needed, the price will rise.[125]

NRG contends that the resource-specific FRR will have interzonal effects—that is, a state's decision to withdraw load from the PJM auction may affect prices in other zones.[126] But those effects are not unique to the resource-specific FRR. Most state policies, including the existing FRR mechanism, have interzonal effects on capacity markets, as well as energy and ancillary services markets. When a state imposes environmental controls on its coal plants, that increases RTO-wide costs; so too when a state joins an emission cap-and-trade program. And when a state loosens environmental restrictions, or sites transmission lines or approves gas pipelines, or promotes retail demand response or energy efficiency programs, that reduces RTO-wide costs. The Commission and the courts recognize that in a cooperative federalist structure, where the federal and state spheres are not "hermetically sealed" one from the other, the policy choices made by some states may affect prices in the interstate market.[127] Consequently, in designing its market

[125] Schnitzer Decl. ¶ 32.

[126] NRG Init. Br. at 18-20.

[127] *EPSA*, 136 S. Ct. at 776.

SI-SSA-0010-6459

rules, the Commission cannot realistically attempt to insulate its own market prices from the influence of such state policies. Instead, its goal—as expressed in the Order—should be to ensure that the cost of state policies is transparent to states and customers, so that decision-makers can be held politically accountable. Thus, the problem identified in the Order is not simply that one state's subsidies affect the price paid by another state's customers. That type of cross-boundary effect is pervasive and unavoidable. Rather, the specific problem identified by the Order is that customers in the subsidizing state do not see the full cost of supporting the resource, because customers in other zones are paying a part of those costs through the capacity market.[128] As the Order concluded, the resource-specific FRR would solve that problem by requiring a state to be fully financial accountable for the capacity revenues of resources it wishes to support.[129]

The Maryland Public Service Commission ("Maryland PSC") argues that the resource-specific FRR is incompatible with REC programs, because RECs are not necessarily tied to units located in a particular state and frequently are not procured until just prior to the Delivery Year.[130] But there is no reason why the load purchasing a resource's RECs needs to be the same load matched to the resource's capacity. After all, RECs sold just prior to the Delivery Year have been unbundled from capacity. Thus, for example, a state could direct LSEs within its jurisdiction to procure capacity from a particular renewable resource, and that resource's capacity would be matched to those LSEs for purposes of the clearing the auction. But the resource would then remain free to sell its RECs as it wished, to any party, during the Delivery Year. Alternatively, a state could direct the procurement of RECs bundled with capacity in advance of the Base Residual

[128] Order at P 162 ("[T]he status quo requires consumers in some PJM states to subsidize the policy decisions of other PJM states.").

[129] *Id.* ("[T]he new resource-specific FRR Alternative … should help confine the cost of a particular state policy decision to consumers within the state that made that policy decision.").

[130] MDPSC Comments at 8-9.

SI-SSA-0010-6460

Auction. It is also plausible that new renewable resources, foreclosed from earning capacity revenue through the PJM capacity auction due to the MOPR, would increase their REC offer prices to make up for the lost capacity revenue. Either way, there is no incompatibility between the resource-specific FRR and the structure of REC programs. To the extent that the Maryland PSC is concerned that its current authorities do not permit it to direct the procurement of capacity and that it will need time to obtain new legislative authority to enact a new regulatory construct based on existing statutes,[131] Exelon is sympathetic to the need for states to have some lead time.

Accordingly, the Commission should expedite its decision and provide sufficient clarity so that states can put into place the mechanisms needed to implement the FRR-RS in time for the upcoming Base Residual Auction or delay application of its new policy until the May 2020 auction, to allow states adequate time to put into place the mechanisms needed to implement the resource-specific FRR. Under no circumstances, however, should the Commission apply an expanded MOPR before a workable structure for the resource-specific FRR is in place and states have had the opportunity to legislate or make regulatory changes in response to it. The resource-specific FRR is a necessary corollary to the expanded MOPR; the latter without the former would not be just or reasonable, even on a temporary transitional basis, for all the reasons discussed above.

Other commenters argue that the resource-specific FRR is incompatible with retail choice, presupposing a structure where specific load must be matched to a resource three years forward. Exelon's proposal (and PJM's) avoids that problem.[132] For purposes of accounting for FRR-RS resources and then clearing the Base Residual Auction, PJM will adopt the default rule that an FRR-RS resource will be matched proportionally to load in the state that has arranged for

[131] *Id.* at 13.

[132] Argument of the Ohio Pub. Utilities Comm'n (Oct. 2, 2018) at 7-9; Argument of Retail Energy Supply Ass'n (Oct. 2, 2018) at 7-8; NRG Init. Br. 31; Calpine Init. Br. at 8.

SI-SSA-0010-6461

procurement of that resource's capacity.[133] The actual allocation of capacity to load can be financially settled by PJM during the Delivery Year.[134] With respect to how states might choose to allocate capacity to load-serving entities subject to their jurisdiction, that is a policy choice that states may make (subject to Commission review). States can elect an allocation method that ensures competitive neutrality among retail suppliers—for example, by allocating capacity to all load-serving entities in the State proportional to their share of load, and recovering the cost of procurement from those load-serving entities or through a non-bypassable charge collected by the distribution utility.

Finally, NRG and Direct assert that the resource-specific FRR will create the need for Commission review of affiliate transactions.[135] Indeed, as Exelon noted in its initial brief, the Commission's final Order should address potential affiliate transactions that arise from state-directed procurements by load-serving entities subject to state jurisdiction.[136] Many load-serving entities are affiliated with generation companies that own or may develop resources of state public policy interest. Applying the affiliate rules to state-directed transactions between these entities will make the resource-specific FRR unworkable for many resources of state policy interest. Accordingly, the Commission should clarify that state-directed affiliate transactions arising from state-administered procurements of FRR-RS resources shall not be subject to the Commission's affiliate transaction rules. As Exelon's initial brief explained, the concerns driving the Commission's affiliate rules are absent when a state governmental entity directs an affiliate

SI-SSA-0010-6462

transaction. The affiliate rules are intended to prevent a regulated utility from exploiting captive customers for the economic benefit of its unregulated generation affiliate. That concern is not presented when the transaction is directed by a state governmental entity for the state's public policy purposes.[137]

* * *

In sum, the Commission should approve a resource-specific FRR as a necessary corollary to an expanded MOPR.

II. Parties Broadly Agree Regarding the Key Elements of the Resource-Specific FRR, But the Commission Should Reject the Extended RCO Concept and the Onerous Reentry Conditions Proposed by PJM.

There is broad overlap among parties' various proposals for structuring a resource-specific FRR. In particular, the essential components of PJM's RCO proposal are consistent with the elements of the proposed FRR-RS submitted jointly by Consumer Advocates, NGOs, and Industry Stakeholders and supported by numerous other parties. Specifically:

- Any resource subject to the MOPR due to an entitlement to a material subsidy should be eligible for the resource-specific FRR.[138]

- Under the resource-specific FRR, states could arrange for the procurement of capacity outside the RPM market using their own processes. Capacity transactions outside the RPM auction would be reported to the Commission and subject to Commission review.[139]

---

[137] *See id.*; *see also* Joint Consumer Comments at 24-25 (advocating "that wholesale sales from an RS-FRR resource with FERC market-based rate authority to an affiliated LSE with captive customers, if undertaken pursuant to a state-sponsored clean capacity procurement, should not be subject" to the Section 205 filing requirement for affiliate transactions under the seller's market-based tariff).

[138] *See* Order at P 165 (asking parties to identify the "appropriate scope of out-of-market support to be mitigated by the expanded MOPR, thereby rendering a resource eligible for the new resource-specific FRR Alternative"); Initial Submission of PJM Interconnection, L.L.C. Br. at 16-17, 21-24.

SI-SSA-0010-6463

- A load-serving entity entering a bilateral contract for capacity from an RCO/FRR-RS resource will be matched to that resource. A state that procures capacity from a resource participating in the resource-specific FRR can indicate, subject to Commission review, what load subject to its jurisdiction should be matched to the resource, and load-matching can be settled financially in the Delivery Year.[140]

- For resources with split ownership, participation in the resource-specific FRR Alternative by one owner shall not affect RPM participation by the other.[141]

- PJM's market-clearing mechanism would ensure that all locational constraints are satisfied.[142]

- Resources participating in the resource-specific FRR can be and will be subject to all Capacity Performance requirements and rules.[143]

The Commission should issue a final Order consistent with the broad agreement among stakeholders and PJM regarding these core elements of a resource-specific FRR Alternative.

In two respects, however, PJM's resource-specific FRR proposal should be rejected. The first concerns PJM's "Extended RCO" or repricing proposal. PJM presents this as an add-on to its core proposal, to the extent that the Commission continues to be concerned about price levels in the RPM market even after all bidders are submitting competitive offers.[144] In reality, this add-on would increase the capacity costs paid by customers by billions of dollars a year—and not only in states choosing to provide to support to certain types of resources, but in other states as well. The

[140] *See* Order at P 166 (asking parties to "identify the load that will be removed from the PJM capacity market auction in connection with resource owners choosing the resource-specific FRR Alternative"); PJM Submission at 58-63; Joint Stakeholders Br. at 9; Exelon Init. Br. at 16-17, 21-24.

SI-SSA-0010-6464

Commission should therefore reject this aspect of PJM's proposal. Because this is a Section 206 proceeding, PJM's proposal warrants no deference or presumption in its favor. If, however, the Commission nevertheless seeks to implement some version of repricing in the residual market, the Commission cannot rationally adopt the Extended RCO as proposed. Under PJM's proposal, the stage 2 price is set as though state-supported resources did not exist at all, even though many would be selected by the market even after application of a MOPR.[145] As a result, PJM's Extended RCO would result in prices that are significantly higher even than those that would result from a MOPR. Instead, the only logical method for repricing is to insert state-supported resources into the stage 2 supply curve at levels consistent with their MOPR floor.

The second respect in which the Commission should reject PJM's proposal concerns the conditions governing the reentry of resources from the resource-specific FRR Alternative back into the RPM market. The unreasonable reentry conditions proposed by PJM would raise a resource's offer price to account for costs that have already been sunk.[146] But there is no reason why any rational resource owner would raise a bid to recover sunk costs. Thus, PJM's proposed mitigation for reentering resources is unjust and reasonable and must be rejected.

A. PJM's Extended RCO Proposal Is Not Just or Reasonable.

The Extended RCO purports to "restore the residual [capacity] market clearing price closer to the economically correct outcome."[147] But in reality it would result in an even more inflated market price than applying the MOPR alone. Indeed, Mr. Schnitzer estimates that the Extended RCO would increase capacity costs by approximately *$2.2 billion* each year for EMAAC

[145] *Id.* at 66 ("In stage two, PJM will remove from the supply stack all resources that elected the RCO option.").

[146] *Id.* at 48-50.

[147] *Id.* at 10.

SI-SSA-0010-6465

customers alone, and by approximately *$2.6 billion* annually RTO-wide—about three times as much as a MOPR alone.[148]

The Extended RCO results in such massively inflated customer costs because of a fatal design flaw: PJM proposes to set the stage 2 price—which cleared resources would be paid—by removing RCO resources from the supply curve entirely.[149] In other words, rather than resetting the bids of RCO resources to "competitive" levels at stage 2, as the MOPR purports to do, the Extended RCO simply acts as though the RCO resources do not exist. That makes no sense. There is no basis for concluding categorically that *no* state-supported resource would ever clear the capacity market, and thus omitting all such resources from the stage 2 supply curve. Indeed, PJM elsewhere acknowledges that existing renewable resources have a competitive offer level of zero, even though they receive state subsidies.[150] As a consequence of PJM's exclusion of all state-supported resources from the stage 2 supply curve, the market could potentially clear at the RPM price cap of 1.5 times Net CONE, even though the market is not actually physically under-supplied (and in fact may be substantially over-supplied). In other words, by ignoring these resources, the price of capacity will be set by the demand curve, even though the ignored resources would undoubtedly be available for a price below the demand curve, even after application of the MOPR. This outcome is particularly likely to happen in LDAs that are constrained and in which the number of non-RCO may be limited. But it could even occur RTO-wide.[151]

Moreover, the concept of repricing should be rejected because it rests on the same flawed premise advanced by opponents of the resource-specific FRR: that without repricing, RPM prices

[148] Schnitzer Decl. ¶¶ 74-76.

[149] PJM Submission at 66.

[150] *Id.* at 46.

[151] Schnitzer Decl. ¶ 76.

SI-SSA-0010-6466

will be "suppress[ed]" by state policy decisions to withdraw load from the RPM auction, and that these decisions will inefficiently "crowd[] out" some generators making "competitive" offers.[152]

As already explained above, however, RPM prices are not "suppressed" when states choose to withdraw load from the RPM auction. Instead, the price emerging from residual offers to serve the remaining RPM load is the competitive price for that market. Repricing, by contrast, would "signal that the market would buy capacity from higher cost resources than actually clear the market and receive capacity commitments."[153] This is the very same disconnect between price and quantity that led the Commission to reject PJM's earlier repricing proposal in Docket No. ER18-1314-000.

Moreover, as also explained above, resources receiving attribute payments from state environmental programs are not "uneconomic"; nor are the resources "crowded out" as a result of these state programs economic.[154] Rather, state environmental attribute programs help to identify the efficient set of capacity resources once externalities are taken into account. Resources "crowded out" by clean generators receiving attribute payments do not clear because, when pollution costs are even *partially* taken into account, they are uneconomic. As then-Chairman LaFleur stated at the May 2017 Technical Conference, "if what you are doing is re-pricing resources that a state re-priced and then you are re-pricing them back, it's neither accommodating nor will it lead to harmony."[155] This is exactly what the Extended RCO would do. It should be rejected in its entirety.

---

[152] PJM Submission at 65, 71.

[153] Order at P 65.

[154] *Supra* at pp. 29-34; *see* Schnitzer Decl. ¶ 73.

[155] Technical Conference on State Policies and Wholesale Markets, Docket No. AD17-11, Tr. 565 (May 2, 2017).

SI-SSA-0010-6467

To the extent the Commission disagrees and nevertheless wishes to adopt some form of repricing, it cannot accept the Extended RCO proposal in its current form. There is no rational reason to ignore RCO resources entirely when repricing the auction at stage 2, given that PJM's own analysis acknowledges that at least some would be able to clear the capacity market regardless of whether they receive state support.[156] To mimic the RPM prices that would result if all load were served through the capacity auction and if state support did not exist, PJM must insert state-supported resources into the stage 2 supply curve at prices reflecting "competitive" offers—not ignore those resources altogether.[157]

B. PJM's Proposal Regarding Reentry of RCO Resources Punishes Customers and Is Not Just or Reasonable.

The Commission should also reject PJM's proposal regarding the conditions for an RCO resource to reenter the capacity auction. PJM suggests that RCO resources reentering the RPM market should be subject to a MOPR—even when they no longer have a subsidy—plus an adder for any capital investment undertaken while the resource was an RCO/FRR-RS resource.[158] The

[156] PJM Submission at 46.

[157] Schnitzer Decl. ¶ 77. The Commission also cannot accept PJM's proposal to make RCO resources pay for the "lost opportunity costs" of the "in between" resources that do not receive capacity commitments but which set price at stage 2. PJM Submission at 74-75. *First*, PJM's proposal piles inefficiency on top of inefficiency by forcing non-emitting resources—which properly should be *rewarded* for emissions-free generation—to transfer "lost profits" to emitting resources that are not economic once the cost of pollution is considered, and that should exit the market. Such a forced transfer distorts the resource mix, discourages the retirement of uneconomic emitting resources, increases the cost of state environmental programs, and perversely requires states to pay emitting generators every time they seek to support non-emitting generators. *See* Schnitzer Decl. ¶¶ 78-79. *Second*, PJM's rationale for its cost allocation proposal cannot withstand scrutiny. According to PJM, that allocation of costs is appropriate because the RCO resources somehow *caused* the lost opportunity costs to be incurred. PJM Submission at 74-75; Chao Aff. ¶¶ 17-19. That is wrong. In a world without subsidies, the "in between" resources would clear, and load would pay *both* their costs *and* their infra-marginal rents. Under the Extended RCO, these "in between" resources no longer earn their costs. But they still are paid their infra-marginal rents in the form of lost opportunity costs. Thus, "in between" resources receive infra-marginal rents with or without the Extended RCO, and with or without the presence of RCO resources. RCO resources do not create any *new* RPM costs. Accordingly, cost causation principles do not justify the allocation of these costs to RCO resources.

[158] PJM Submission at 48-50.

SI-SSA-0010-6468

Commission should be clear-eyed about what PJM is proposing: when a resource no longer receives state support and seeks to reenter the RPM auction, PJM seeks a provision that will *prevent* the resource from bidding its going-forward costs. PJM instead wants to raise the resource's bid to include costs that have already been sunk. If the reentering resource consequently fails to clear, and retires, the RPM auction will have selected a resource with *higher* going-forward costs.

Such a provision is inconsistent with the purpose of mitigation, which is to identify the offer level consistent with a unit's *going-forward* costs—not its sunk costs.[159] The true purpose of the reentry provision seems to be to punish customers for electing to withdraw load from the RPM market, and to penalize capital intensive units for supplying capacity as RCO resources, by making it more difficult for these resources to return to the RPM market after they no longer receive state support. Once costs are sunk, there is no justification for mitigating a capacity offer to account for them.

The Commission should instead focus on forward-looking value to the consumer. If the resource seeking to reenter the capacity auction is no longer receiving any out-of-market revenue, then the resource presumably will offer at no lower than its going-forward costs; a below-cost offer, if accepted, could leave the resource operating at a loss. There is no basis for mitigating such an offer, let alone for selecting a different resource with higher going-forward costs.[160]

---

[159] *PJM Interconnection, L.L.C.*, 161 FERC ¶ 61,252, at PP 49-51 (2017) (rejecting proposal to extend MOPR from one year to three years as unjust and unreasonable because it would "prevent a developer from accurately reflecting its actual going-forward costs," and explaining that "the one-year application of the MOPR permits a resource to submit a competitive offer price reflecting its going-forward costs that do not include sunk construction costs, after it has cleared and incurred significant construction costs"); *PJM Interconnection, L.L.C.*, 153 FERC ¶ 61,066, at P 77 (2015) ("Construction costs incurred prior to subsequent BRAs are sunk costs; they are not part of its going-forward costs that will affect its future decisions because competitive offers are based on going-forward costs, not sunk costs.").

[160] Schnitzer Decl. ¶¶ 40-42.

SI-SSA-0010-6469

To the extent the Commission is nonetheless concerned about the potential for gamesmanship, where resources might elect the resource-specific FRR for a single year to make major capital investments funded by the state and then reenter the RPM auction after those costs have been sunk, that possibility could theoretically be addressed by imposing a minimum stay-out requirement, such the five-year stay-out required for the existing FRR. From the consumer's perspective, however, even this approach makes little sense. It is a truism that once costs are sunk, they can no longer be avoided. A competitive bid should not account for sunk costs, and the Commission should not artificially inflate a competitive offer to favor marginal units or new entry.

C. Other Proposed Alternatives Should Be Rejected.

Some parties seek to place certain caps on elements of the resource-specific FRR. The Commission should reject these proposals. For example, LS Power proposes to cap the total quantity of resources that can elect the resource-specific FRR to 6 GW.[161] But as discussed above, the Commission has never sought to force load to remain in the PJM auction. Accordingly, the existing FRR has no cap—it allows the withdrawal of all load and places no limitation on how many LSEs can avail themselves of the option. And other auction constructs, such as MISO, allow states to decide what amount of load should be procured through the capacity auction and what amount should be procured outside it. LS Power does not explain why a cap should be imposed if states choose to withdraw *less* than all of their load from the PJM auction, when these other provisions allowing the withdrawal of *all* load are just and reasonable. Moreover, a cap of 6 GW on resource-specific FRR capacity is likely to result in massive oversubscription, to the point that it is likely to be essentially indistinguishable from a MOPR-only approach.[162] Thus, LS Power's

[161] LS Power Init. Br. at 14-18.

[162] Schnitzer Decl. ¶¶ 65-68.

proposal has all the flaws of the MOPR-only approach—including double payment by customers—while failing to offer genuine accommodation to states.

The Illinois Attorney General proposes to cap the price that can be paid to a resource electing the resource-specific FRR.[163] But the Commission should not hamstring states' policy flexibility by dictating that they employ a cost-based procurement mechanism. States may instead wish to adopt other types of procurement mechanisms—for example, a clean capacity auction in which resources of public policy interest would compete for state procurement, and would be paid a single market clearing price; or a competitive procurement for clean capacity in which resources would submit proposals and those selected would be paid consistent with their proposals. If states wish instead to employ a cost-based procurement mechanism, consistent with the Attorney General's proposal, they can of course do so. But the Commission should not limit state flexibility at the outset.

The Illinois Attorney General also makes allegations of economic withholding.[164] Just as in previous capacity auctions in which Exelon's bids were reviewed by the market monitor and the auction results were declared competitive, in the most recent auction Exelon offered its carbon-free nuclear generation at a competitive price based on each plant's costs and risks of operation. Exelon did so in full compliance with all rules governing PJM capacity auctions. As PJM has explained, "The 2021/2022 Base Residual Auction was conducted in accordance with all Tariff-specified requirements and rules, including those rules related to the application of offer caps. The

[163] Initial Br. of the People of the State of Illinois (Oct. 2, 2018) at 14-17.

[164] *Id.* at 8.

PJM Tariff codifying these rules has been approved by FERC as just and reasonable, and as such, the results of the auction conducted according to those rules are also just and reasonable."[165]

Other parties propose different methods altogether for accommodating state policies. None of these is just and reasonable, let alone superior to the resource-specific FRR proposed by the Commission.

For example, Vistra proposes using a modified version of CASPR, the market design approved in ISO-NE.[166] That approach is not just and reasonable for the PJM market. PJM and ISO-NE face significantly different substantive challenges. The core issue in ISO-NE proceeding was state support for the entry of *new* renewable resources.[167] Thus, in New England, a system of transfer payments to induce exit of existing resources to make room for a preferred type of new resources—which would then be freed from any MOPR—might make sense. In PJM, however, the Commission is considering how best to address not only state support for new renewables, but also for *existing* resources that may continue to have going-forward costs. Thus, the transfer payments simply would occur between existing resources. Moreover, requiring such payments would thwart the policy goals that states are trying to achieve, by forcing clean resources to disgorge the state payments they receive to recognize their environmental attributes, and transfer them to polluting assets—a particularly perverse result when the environmental externalities described above are considered.

Moreover, even if the CASPR approach could work for PJM as a matter of mechanics, it does not follow that it would be the right approach for PJM. After all, in the ISO-NE proceeding,

[166] Comments of Vistra Energy Corp. (Oct. 2, 2018) at 13-25.

[167] *ISO New England Inc.*, 162 FERC ¶ 61,205 at PP 4-5 (2018).

SI-SSA-0010-6472

CASPR came to the Commission through a Section 205 filing, and the Commission was obligated to accept it as long as it was just and reasonable. In this proceeding under Section 206, by contrast, the Commission can select the most appropriate option for PJM. And PJM already has a robust and well-established structure for accommodating state policy interests that involves state-directed withdrawal of load: the existing FRR. ISO-NE has no similar framework. Thus, while it may have made sense in ISO-NE to adopt a CASPR structure to accommodate state policy initiatives, the better solution in PJM is to build on what already exists, rather than impose an entirely new structure on top of the existing one. Finally, the Commission, PJM members, and PJM have already spent significant time developing the resource-specific FRR option, and very specific proposals including tariff language have been developed and filed.[168] Even if the Commission believes that the CASPR solution might be a just and reasonable alternative, it can approve the resource-specific FRR in time for the next BRA while sending CASPR to the PJM stakeholder process for further development.

The Maryland PSC proposes a regional procurement of clean energy resources to be conducted by PJM.[169] While a regional approach may serve as a sound starting point, the core elements of this proposal are not clear from the Maryland PSC's filing, and the concept would need further study and development. PJM has already noted that it plans to study the Maryland PSC proposal but cannot implement it in time for the 2019 auction.[170] The Commission should allow that PJM process to unfold and need not rule on the viability of the Maryland PSC proposal

[170] Letter from Andrew L. Ott to OPSI President Hon. John R. Rosales, Oct. 15, 2018, https://www.pjm.com/-/media/about-pjm/who-we-are/public-disclosures/20181017-correspondence-opsi-20181011.ashx?la=en.

SI-SSA-0010-6473

at this stage. But in any event, the proposal could be an addition to, and not a replacement for, a resource-specific FRR. Different states may have a different view about which resource types warrant state support. For example, Maryland may wish to procure offshore wind; Illinois may wish to procure nuclear; and West Virginia may wish to procure coal plants with carbon capture and sequestration. A multi-state procurement overseen by PJM for resources with common attributes would not preclude use of the resource-specific FRR framework for resources of interest to a particular state. Limiting states only to an aggregated procurement of a single type of capacity would be inconsistent with the Commission's apparent intent in proposing the resource-specific FRR to give each state the flexibility to pursue its own policy objectives.

Finally, the Ohio Consumer Counsel argues that an FRR-RS/RCO resource should be excluded from energy and ancillary services markets.[171] FRR-RS/RCO resources will have Capacity Performance obligations in order to ensure that the resource-specific FRR has no adverse impact on reliability or resource adequacy. Consequently, participating resources not only should be eligible to participate in energy and ancillary services markets, but they *must* offer into those markets, just like any other Capacity Performance resource.

D. Exelon Supports Carbon Pricing, But Any Interim Measure Must Accommodate State Policies That Support Non-Emitting Resources.

Exelon strongly supports Eastern Gen's proposal that the Commission incorporate a carbon adder into PJM's dispatch.[172] As Exelon noted in its opening comments, a carbon adder ultimately is the best way to integrate state environmental initiatives into federal market design.[173] States have felt the need to provide out-of-market revenue to compensate the environmental attributes of

[171] Comments by Office of Ohio Consumer's Counsel (Oct. 2, 2018) at 4, 10-12 ("OCC Comments").

[173] Exelon Init. Br. at 4, 7.

SI-SSA-0010-6474

zero emissions resources precisely because the federal markets have failed to recognize the full cost of emitting facilities and the full benefits of non-emitting ones. If the federal markets integrated state environmental policy goals by including a carbon adder, that would reduce the need for states to invoke their reserved authority over generation facilities to provide non-emitting resources with compensation outside the market.

A carbon adder enjoys the broad support of stakeholders, including the fossil fuel generators that brought the Complaint initiating this proceeding.[174] To the extent that the Commission is concerned about the interzonal effects of a carbon price—specifically, the impact on states that do not support a carbon price—the Commission can direct PJM to apply a border adjustment similar to the provisions the Commission has approved for the California ISO. PJM would add a constraint to carbon pricing zones that is akin to a reserve constraint, and would then co-optimize states' carbon constraint with the energy market.[175] That approach would integrate states' environmental goals in the wholesale markets, while respecting the reality that different states will have different policies toward carbon pricing.

The Commission has the legal authority to adopt a carbon adder. The Commission need not itself impose a carbon price or decide what price is the right price, although such action might prove expeditious. Rather, states would choose whether, and at what level, to impose a carbon price. The Commission would simply approve tariff provisions that would optimize dispatch in light of those state policy decisions—just as dispatch currently reflects myriad other state policy

[174] *See* Exelon Init. Br. at 7 n.13 (collecting comments supportive of carbon pricing filed in *State Policies and Wholesale Markets Operated by ISO New England Inc., New York Independent System Operator, Inc., and PJM Interconnection, L.L.C.*, Docket No. AD17-11-000).

SI-SSA-0010-6475

decisions. The FPA is designed to facilitate, not forbid, that kind of "interplay between state and federal regulation."[176] Moreover, the FPA gives the Commission authority to take account of environmental factors when regulating wholesale markets. Section 201(a) states that "the business of transmitting and selling electric energy for ultimate distribution to the public is affected with a public interest."[177] While the FPA's main purpose was certainly "to encourage the orderly development of plentiful supplies of electricity … at reasonable prices," the Supreme Court has also recognized that "there are undoubtedly other subsidiary purposes," including "conservation [and] environmental … questions."[178] Likewise, in Section 202(a), Congress authorized the Commission to establish ISOs/RTOs "[f]or the purpose of assuring an abundant supply of electric energy ... with the greatest possible economy *and with regard to the proper utilization and conservation of natural resources*."[179] And, of course, the Commission has wide discretion to consider non-cost factors—such as the integration of state environmental policies—when assessing the justness and reasonableness of rates.[180] The Commission should move expeditiously on this path.

Exelon strongly disagrees with Eastern Gen, however, that a MOPR-only solution is the best approach in the meantime.[181] The state initiatives that the resource-specific FRR is intended to accommodate help to bring the generation mix closer to the result that a carbon price would yield. Using a MOPR to cut off capacity revenue to non-emitting resources, and potentially forcing

SI-SSA-0010-6476

those resources into retirement, is nonsensical as an interim measure, when the ultimate goal is to apply market rules that recognize those resources' environmental value—a value that the market currently does not compensate, but should.

To the extent the Commission is seeking a transitional mechanism to a carbon price—which it should—the resource-specific FRR is a just and reasonable transition mechanism. It will allow states to take necessary action to retain existing non-emitting generation that would clear the RPM market if environmental factors were reflected in federal market prices.

III. The Commission Should Reject Calls for a Swiss Cheese MOPR.

The Commission's Order calls for an "expanded MOPR, with few or no exceptions, [to] protect PJM's capacity market from the price suppressive effects of resources receiving out-of-market support by ensuring that such resources are not able to offer below a competitive price."[182] The Commission was correct that the expanded MOPR adopted in conjunction with a resource-specific FRR should be broad and inclusive of all resources that could make offers in the RPM auction freed from competitive discipline by virtue of their receipt of out-of-market revenues. There is no merit to the arguments of commentators who seek exemptions for self-supply resources, resources of less than 20 MW, and resources receiving REC revenue.

A. Self-Supply Resources Should Be Subject to MOPR.

PJM and several commenters urge the Commission to create an exemption for self-supply resources—principally, on the ground that vertically integrated utilities aspire to maintain a generally balanced position and thus "do not have the incentive to suppress prices in the RPM"[183]

[182] Order ¶ 158.

[183] Comments of Dominion Energy Services, Inc. (Oct. 2, 2018) at 3 ("Dominion Comments").

SI-SSA-0010-6477

or engage in "intentional price suppression."[184] But the *whole point* of the Commission's Order is that PJM's MOPR is no longer "limited to deterring the exercise of buyer-side market power"[185] and applies "even [to] resources … not built to exercise buyer-side market power."[186] Instead, the expanded MPR's goal is to "ensure that all resources participating in the capacity market … offer competitively"—meaning, in the Commission's view, without their offers influenced by out-of-market revenue—"regardless of intent."[187]

Self-supply resources controlled by vertically integrated utilities fall squarely within what the Order targets. Such resources do not "offer competitively" into the action.[188] Assured of cost recovery through retail rates, such resources typically offer into the capacity market as price takers—not based on their competitive costs. This guaranteed cost recovery frees these resources from any competitive discipline and allows them to take whatever market price is paid, "protect[ed] from the potential downside of that bidding behavior."[189] Meanwhile, the effect of these noncompetitive offers is huge—much larger than the effect of one plant's participation in the Illinois ZEC program or REC revenues for new renewable projects. Resources with guaranteed cost recovery today comprise almost 20% of PJM's cleared capacity—approximately 30 GW, or

nearly double the gigawatts that PJM forecasts will be supported by states for environmental reasons in 2025.[190] A self-supply exemption would not be a mere loophole, but rather would amount to the abandonment of the goals set forth in the Order—a capacity market in which all participants are making what the Commission regards as competitive offers, and transparency for consumers and state policymakers regarding the full cost of their regulatory choices.

Advocates of a self-supply exemption cannot wish away these facts with assertions that vertically integrated utilities have "minimal" effects "in the [l]ong [r]un."[191] Even if noncompetitive bids from self-supply entities suppress capacity prices in some years, these advocates say, in other years these entities are likely to be net short capacity and so increase prices.[192] These assurances are unsubstantiated, but more fundamentally they are beside the point. Regardless of whether self-supply entities are net short or net long, they still offer in their self-supply capacity at a price that is undisciplined by any competitive pressure: they know they will make up for any loss through retail rate recovery so are content to take whatever price the PJM market gives.[193] Thus, accepting the logic of the Commission's Order, a self-supply exemption would undermine the competitive integrity of the market and its transparency.

Applying the MOPR to self-supply resources is especially imperative because no significant consideration militates *against* doing so. Advocates for an exemption say an expanded MOPR "threaten[s] to undermine" the longstanding business model of vertically integrated utilities by requiring customers to "pay[] twice for capacity."[194] But there is no such threat: so long as the

SI-SSA-0010-6479

Commission ensures that the resource-specific FRR alternative is workable and usable, vertically integrated utilities can use it (or the existing FRR) to arrange to serve associated load outside the capacity market in exchange for payments made by retail customers. Customers need not pay twice. Indeed, that model more truly replicates their long-standing business model than one in which capacity supported by retail ratepayers pursuant to state mandate must nevertheless be bid into the RPM market as a price taker, with retail customers then billed for costs net of market revenues. Nor, in any event, does the long history of the vertically integrated business model justify treating it differently. Self-supply resources make offers that, under the Commission's reasoning, are noncompetitive. Their vintage does not justify an exemption.[195]

Alternatively, if the Commission approves an exemption for self-supply resources, that exemption should under no circumstances apply to their net long resources. The purported justification for the self-supply exemption is that the vertically integrated model seeks a "balance of supply and demand."[196] But that justification runs out when self-supply resources sell excess capacity. Indeed, the 1,300 MW safe harbor given to self-supply entities who are net long is the approximately the size of the PJM portion of the Illinois ZEC program. There is no rational basis for concluding that self-supply entities can be permitted to liquidate 1,300 MW of excess supply in the RPM market without any detrimental effect on the market, while at the same time concluding that the Illinois ZEC program threatens the integrity of the market by allowing 1,300 MW of

[195] Indeed, attribute payments are also longstanding: they first emerged in the late 1990s, at the same time the organized energy markets were formed, and prior to the introduction of capacity markets a decade later; and they similarly draw upon the historic power reserved to states to regulate generation facilities. *See generally, e.g.*, Barry Rabe, *Race to the Top: The Expanding Role of U.S. State Renewable Portfolio Standards*, 7 Sustainable Dev. L. & Pol'y 10 (2007); Br. of Amici Curiae Electricity Regulation Scholars, *Village of Old Mill Creek v. Star*, Nos. 17-2433, 17-2445 (cons.), at 10-18 (7th Cir. Nov. 3, 2017); *see also* 16 U.S.C. § 824(b)(1).

[196] Dominion Comments at 5.

SI-SSA-0010-6480

nuclear capacity to offer into the RPM market. Given the Order's concern with "the price suppressive effects" of resources "offer[ing] below a competitive price,"[197] the Commission cannot defensibly allow self-supply entities to liquidate their excess capacity in the market free from any competitive discipline on their bids.

B. The Commission Should Not Exempt Resources of Less Than 20 MW.

PJM proposes to exempt from the MOPR resources smaller than 20 MW of unforced capacity, claiming that the Commission has "previously accepted … different rules based on a 20 MW threshold," and that such resources are "too small, individually or collectively, to meaningfully impact price outcomes."[198] Because the unforced capacity value of renewable resources is typically substantially de-rated compared to nameplate capacity, this exemption will exclude from the MOPR many individual renewable projects of typical sizes—for example, any wind project of less than 150 MW nameplate.[199] PJM's justifications for this broad exemption are nonsensical, and the Commission should reject it.

That the Commission has "previously accepted" a 20 MW threshold—under PURPA, for "govern[ing] interconnection," or even for prior iterations of the MOPR[200]—says nothing about whether to carve this exemption from the expanded MOPR. The Order's purpose in expanding the MOPR is clear and broad—to "ensur[e] that … resources are not able to offer below a competitive price" in the PJM capacity auction, thereby "protect[ing] PJM's capacity market from the price suppressive effects" that result from such offers.[201] It is plainly false to claim that

[200] *Id.*

[201] Order at P 158.

SI-SSA-0010-6481

resources smaller than 20 MW will not affect clearing prices "individually *or collectively*."[202] One stone, individually, is too small to do much of anything. But collectively, they can build the pyramids or the Great Wall. So, too, with generation. PJM's witness Adam Keech finds that 931 MW of unforced capacity offered by wind and solar facilities came from facilities of 20 MW or less—an amount that will only grow as states expand their commitment to clean energy.[203] That scale is easily comparable to a nuclear plant. Indeed, PJM betrays how far it departs from the Order when it trumpets that "a 20 MW materiality threshold will not significantly impact the participation of renewables in the capacity market"—meaning that this threshold will protect most renewables from the expanded MOPR.[204] The Order's goal was not to protect favored generators from the MOPR. Quite the opposite. It was, again, to expand the MOPR in order to "protect PJM's capacity market" from "resources"—any resources—"receiving out-of-market support."[205]

PJM's 20 MW threshold is especially indefensible because it invites gamesmanship and litigation. With PJM's free pass in hand, a developer who intends to build, say, 60 MW of wind or solar will subdivide its enterprise into three 20 MW "projects." The price suppressive effects will be the same. But the MOPR's application will not be. The only way to *avoid* this irrational result will be to challenge the subdivision—that those three groups of solar panels, or wind turbines, are not *really* different resources but function as one. This will yield pointless litigation over arbitrary distinctions. Further, it creates an administrative incentive for states and others who seek zero-emission capacity to favor certain types of zero-emission resources over others (those

[202] PJM Submission at 18 (emphasis added).

[203] Keech Aff. ¶ 35.

[204] PJM Submission at 17.

[205] Order at P 158.

that can be scaled to 20 MW or less), which hampers the efficient procurement of such resources and dampens innovation.[206] The Commission should reject PJM's unsupported 20 MW threshold.

C. The Commission Should Not Exempt Resources Receiving REC Revenue.

A number of parties contend that resources receiving REC revenues should be exempt from the MOPR because RECs revenues are too unpredictable to drive capacity market bidding or entry decisions.[207] While it is true that REC revenues change over time, that does not mean they are irrelevant to investment decisions. REC programs facilitate the construction and operation of renewable generation by compensating their environmental attributes, and renewable developers (or their off-takers) take forecasted compensation into account when deciding whether to pursue a project. States require customers to spend hundreds of millions of dollars a year on the premise that these expenditures are needed in order to promote the growth of renewable generation. Either these states are wasting their money and REC programs should be ended, or these programs do indeed have their intended effect and induce renewable entry that would not otherwise occur. And if the latter, then under the Commission's view of the MOPR's purpose, the MOPR should plainly apply. Anticipated REC revenues enable new renewable resources to offer into the capacity market at levels below their cost.

Some parties also argue that there should at least be an exemption for renewable resources that sell their RECs in a competitive procurement.[208] That makes no sense. A competitive REC procurement only means that less costly renewable resources are selected over more costly ones; but the less costly resources still receive out-of-market revenue by virtue of the procurement, and thus are able to offer at a lower level in the capacity market than they otherwise would be able to

[206] Schnitzer Decl. ¶¶ 43-44.

[207] *E.g.*, AEE Comments at 11-14; AWEA Comments at 13-17.

[208] *E.g.*, AEE Comments at 22-23; AWEA Comments at 20-21.

SI-SSA-0010-6483

do. The Commission has stated that an "expanded MOPR … should protect PJM's capacity market from the price suppressive effects of resource receiving out-of-market support *by ensuring that such resources are not able to offer below a competitive price*."[209] If that is the rationale for a MOPR, then the MOPR should apply to renewable resources that participate in a competitive REC procurement just as surely as it should apply to any other resource that receives out-of-market revenue and can use that revenue to reduce its capacity market offer.[210]

D. Other Exemptions Should Be Rejected.

Some parties argue that demand response and energy efficiency resources should be exempted from the MOPR.[211] Again, there is no basis for an exception given the Commission's articulation of why it is imposing a MOPR. If resources of any kind receive state-sponsored out-of-market revenue that allows them to offer at less than the level that the Commission deems competitive, then those resources should be subject to a MOPR.

Finally, the Ohio Consumers Counsel argues that a partial FRR-RS resource should be subject to unit-specific review with respect to the portion of the unit participating in RPM.[212] Existing PJM rules concerning mitigation and the FRR already adequately address how to treat a unit with multiple owners, each of which submits its own bid for its share of the unit.[213] There is

---

[209] Order at P 158 (emphasis added).

[210] AES suggests what it terms a "proportional MOPR" as well as a 15% materiality threshold. See Comments of AES Corp. (Oct. 2, 2017) at 12-19 ("AES Comments"). It is not exactly clear how the "proportional MOPR" would work—AES's example notwithstanding—and a 15 percent materiality standard is high enough to allow offers that are substantially below cost. As we have demonstrated (*see* Exelon Init. Br. 17-21)—and contrary to AES's statement that "[a]ll subsidies are not equal," AES Comments at 2—all subsidies have the same market impact and can impact the owner's offer strategy. In recognition of this, the Commission proposed a MOPR with "few or no exceptions" for good reason. Order at P 158. If it is going to adopt a MOPR at all, it should stick to that proposal.

[211] *E.g.*, AEE Comments at 20-22; MDPSC Comments at 11-12.

[212] OCC Comments at 20-22.

[213] *See* PJM Manual 18, § 5.4.4.

SI-SSA-0010-6484

no reason for the Commission to adopt different rules to govern the resource-specific FRR, or to rethink the rules that already exist. If the portion of the unit participating in the RPM market is not receiving any subsidy, it should not be subject to a MOPR—regardless whether a different portion of the unit under separate ownership receives a subsidy or is participating in the resource-specific FRR.

CONCLUSION

For the foregoing reasons, the Commission should adopt a Resource-Specific FRR Alternative.

DECLARATION OF MICHAEL M. SCHNITZER

November 6, 2018

TABLE OF CONTENTS

I. QUALIFICATIONS, ASSIGNMENT AND SUMMARY OF CONCLUSIONS 1

A. QUALIFICATIONS 1
B. BACKGROUND AND PURPOSE OF TESTIMONY 1
C. SUMMARY OF CONCLUSIONS 3

II. PJM'S BASE PROPOSAL, WITHOUT THE "EXTENDED RCO," IS, AFTER EXELON'S PROPOSAL, THE MOST ECONOMICALLY-EFFICIENT AND LEAST COSTLY SOLUTION THAT IS CONSISTENT WITH THE COMMISSION'S ORDER 7

A. PJM'S BASE PROPOSAL IS GENERALLY CONSISTENT WITH THE COMMISSION'S ORDER 7
B. OTHER THAN EXELON'S PROPOSAL, PJM'S BASE PROPOSAL IS THE MOST ECONOMICALLY EFFICIENT OPTION 9
C. CERTAIN FEATURES OF PJM'S BASE PROPOSAL DETRACT FROM ITS EFFICIENCY AND/OR WORKABILITY AND SHOULD BE ADJUSTED 16

III. MOPR-ONLY PROPOSALS ARE ECONOMICALLY INEFFICIENT, COSTLY FOR CONSUMERS AND SOCIETY, AND INCONSISTENT WITH THE COMMISSION'S ORDER ... 19

A. MOPR-ONLY CREATES UNNECESSARY PRICE INFLATION AND OTHER INEFFICIENCIES ... 19
B. THE EXISTING FRR IS CONCEPTUALLY SIMILAR TO THE FRR-RS OR RCO, BUT IS LESS EFFICIENT THAN EITHER FOR ACCOMMODATING STATE PROGRAMS 25
C. A CAP ON THE TOTAL AMOUNT OF CAPACITY THAT CAN ELECT THE RCO SUFFERS FROM THE SAME PROBLEMS AS MOPR-ONLY PROPOSALS 27

IV. PJM'S EXTENDED RCO PROPOSAL RESULTS IN ECONOMICALLY INEFFICIENT PRICES, UNNECESSARILY RAISES COSTS FOR CONSUMERS, AND INAPPROPRIATELY TRANSFERS COSTS TO CLEAN RESOURCES 29

I. QUALIFICATIONS, ASSIGNMENT AND SUMMARY OF CONCLUSIONS

A. QUALIFICATIONS

1. My name is Michael M. Schnitzer. I am a director of The NorthBridge Group, Inc ("NorthBridge"). NorthBridge is a consulting firm that provides economic and strategic advice to the electric and natural gas industries. My business address is 30 Monument Square, Concord MA 01742.

2. In 1992, I co-founded NorthBridge. Before that, I was a Managing Director of Putnam, Hayes & Bartlett, which I joined in 1979. I have experience working with private sector clients in the electric utility, natural gas, and private power industries, as well as with public and nonprofit agencies. My electric industry work has focused on regulatory policy, finance, and market structure issues. I received an A.B. in chemistry, with honors, from Harvard University, and an M.S. in management from the Sloan School, Massachusetts Institute of Technology.

3. I have testified before the Commission on many matters and have participated in Commission technical conferences and workshops on capacity market and energy market design issues. I have also testified before the public utility commissions of Arkansas, California, Delaware, Illinois, Indiana, Louisiana, Maine, Maryland, Massachusetts, Mississippi, Missouri, New Hampshire, New Mexico, New Orleans, New York, Ohio, Pennsylvania, Rhode Island, Texas, Vermont, and Wisconsin.

B. BACKGROUND AND PURPOSE OF TESTIMONY

4. On April 9, 2018, PJM Interconnection, LLC ("PJM") filed at the Federal Energy Regulatory Commission ("FERC" or "Commission") two proposals to modify its capacity market design.[1] In its filing, PJM requested that the Commission approve its preferred capacity market repricing proposal (referred to as "Capacity Repricing" or "Option A"), or if the Commission cannot approve PJM's preferred proposal, that it approve in the alternative PJM's MOPR-Ex proposal (referred to as "Option B").

[1] PJM Interconnection, L.L.C., Capacity Repricing or in the Alternative MOPR-Ex Proposal: Tariff Revisions to Address Impacts of State Public Policies on the PJM Capacity Market, FERC Docket No. ER18-1314-000, April 9, 2018.

5. I filed a reply declaration in response to PJM's proposal that concluded that both the Capacity Repricing and MOPR-Ex proposals produced outcomes that were less efficient than the status quo and that social surplus is maximized by allowing states to support environmentally beneficial resources via attribute payments with no further mitigation of the resources' offers in the capacity market.[2]

6. On June 29, 2018, the Commission issued an Order[3] in this proceeding rejecting both of PJM's proposed capacity market design modifications and finding the current capacity market design to be unjust and unreasonable. The Commission proposed an alternative conceptual design for the capacity market that would combine an expanded Minimum Offer Price Rule ("Expanded MOPR") with a Resource Specific Fixed Resource Requirement ("FRR-RS") alternative. The Commission requested comments on the specific design elements of both of these components to its proposal.

7. Numerous parties, including PJM, the Independent Market Monitor for PJM ("IMM") and many market participants and other stakeholders filed initial comments on or around October 2nd, 2018. In its comments, PJM advanced both a base proposal for modifications to the capacity market responsive to the Order ("Base Proposal") and an optional "Extended RCO" proposal.[4] PJM's Base Proposal combined an expansion of its Minimum Offer Price Rule ("MOPR") to cover both existing and new resources and all technology types, with a Resource Carve Out Option ("RCO") that is generally consistent with the Commission's FRR-RS concept, which allows state-supported resources to remove themselves from the capacity market along with a matched quantity of load. Because these state-supported resources do not participate in the capacity market or receive any capacity market payments, compensation for their capacity must come from outside the market. The Extended RCO includes the Base Proposal but adds an additional step whereby market clearing prices are adjusted by removing the RCO resources from the supply curve while leaving their matched load in the market. In addition to PJM's proposals, the IMM and many other parties also advanced various proposals, many of which advocated for a design that included only an expanded MOPR, without a workable FRR-RS.

[2] Declaration of Michael M. Schnitzer, Docket Nos. ER18-1314-000 and ER18-1314-001, May 22, 2018.

[3] *Calpine Corp. v. PJM Interconnection, L.L.C.*, 163 FERC ¶ 61,236 (2018) ("Order").

[4] Initial Submission of PJM Interconnection, October 2, 2018 ("PJM Comments").

8. Exelon Corporation filed initial comments[5] on October 2, 2018 that included a proposal ("Exelon's Proposal") to combine a MOPR with minimal exceptions with an FRR-RS option, consistent with the Commission's Order. Exelon's Proposal is similar to PJM's Base Proposal in many ways but differs in that it has proposes fewer exemptions to the MOPR, does not adjust prices as in PJM's Extended RCO, and does not apply the MOPR to former FRR-RS resources seeking to re-enter the RPM.

9. The purpose of my testimony is to evaluate the market designs proposed by PJM, Exelon, and certain other parties in this proceeding with respect to their economic efficiency, impact on consumers, and workability.

C. SUMMARY OF CONCLUSIONS

10. My conclusions are as follows:

11. The Order reached two clear conclusions. First, the Commission identified a need to remove from the PJM capacity market the impact of resources receiving out-of- market support by ensuring that such resources are not able to offer below the Commission's view of a competitive price in the RPM auction.[6] To address this concern, the Commission proposed an Expanded MOPR with few or no exceptions. Second, the Commission recognized that it is necessary to respect states' rights to pursue valid policy goals concerning the generation mix, while at the same time avoiding potential uneconomic outcomes such as resource double payment and over procurement. The FRR-RS alternative option proposed by the Commission to accompany the Expanded MOPR accomplishes this goal by allowing resources receiving out-of-market state support to elect to remove themselves from the capacity market with a commensurate amount of load and planning reserves. Any design for the PJM resource adequacy construct developed in response to the Order must adhere to the core concepts of the Order in its entirety. That is, any design must combine both an Expanded MOPR and a workable FRR-RS option. This combination will ensure that resources receiving out-of-market support are not able to offer below the

[5] Initial Brief of Exelon Corporation, Oct 2, 2018 ("Exelon Comments").

[6] As I discuss further in my Declaration, the offers from resources receiving out-of-market compensation designed to compensate for positive environmental externalities, which comprise all current and likely most future resources subject to PJM's proposal, are competitive under the current status quo to the extent that the size of the payment is set at or below the value of the positive externality produced by the resource in question. The Commission's Order, however, takes the view that offers from such resources are not competitive.

Commission's view of a competitive price in the RPM auction while at the same time accommodating state policy goals. The combined construct thus achieves the Commission's twin goals of maintaining competitive pricing in the RPM and respecting state's rights to exert control over their generation mix while providing a higher level of economic efficiency than an option that does not include a strong and workable FRR-RS.

12. Leaving aside a price on carbon, which most parties agree is the most efficient means of appropriately valuing environmental externalities, of all the proposals offered by parties in response to the Order, other than Exelon's Proposal, PJM's Base Proposal (as distinct from their "Extended RCO" proposal) is the most economically efficient, and the least-costly for consumers. While Exelon's Proposal and PJM's Base Proposal are similar in most respects, there are certain aspects of PJM's Base Proposal that make it less efficient than Exelon's, but which could easily be modified to make PJM's Base Proposal equivalent in terms of efficiency. Furthermore, unlike certain other proposals, PJM's Base Proposal adheres to both the letter and spirit of the Order. PJM's Base Proposal combines a revised and expanded MOPR with a RCO option that allows resources supported by states seeking to support specific types of generation resources in pursuit of state goals to elect to remove themselves from the capacity market, along with a matched quantity of load, and receive capacity compensation outside of the capacity market mechanism while still having their capacity counted for resource adequacy purposes. The RCO, with a fix to the resource re-entry provision, provides a workable implementation of the Commission's FRR-RS concept for states seeking to support zero-emission resources in pursuit of environmental goals to continue to do so without undue disruption or cost, consistent with the Order. Further, with a modification to the re-entry provision, this approach is the most economically-efficient because state programs that provide appropriately-priced attribute payments to environmentally-valuable resources make the market more efficient, rather than less efficient, as these resources are economic when their environmental attributes are properly valued. Forcing such units to offer into the capacity market at an artificial higher price due to the application of a strict MOPR is inefficient. Proposals which lack a reasonable FRR-RS pathway will result in those resources being inserted into the capacity market at an inefficiently high offer level and will result in inefficient outcomes both with respect to price and the portfolio of resources selected to receive a capacity obligation. PJM's Base Proposal avoids this inefficiency by providing a viable alternative pathway via the RCO for such resources to avoid capacity market participation at an inefficient

offer level and instead have their contribution to resource adequacy be recognized and compensated by their supporting state. Because of this, PJM's Base Proposal does not result in a significant degradation in economic efficiency relative to the status quo, avoids unnecessary price inflation, and results in an economically-efficient portfolio of capacity resources.

13. Exelon's Proposal is very similar to PJM's Base Proposal but differs in several respects which make it incrementally more efficient than PJM's Base Proposal. In particular, Exelon's Proposal includes more efficient, workable rules for re-entry of former FRR-RS or RCO resources into the RPM and avoids the arbitrary and unnecessary exemption of resources from the MOPR due to PJM's proposed size-based materiality threshold. These issues could be easily fixed in PJM's Base Proposal and if they are PJM's Base Proposal would have similar efficiency to Exelon's.

14. A number of parties in the proceeding have offered proposals that are very similar to PJM's original MOPR-Ex proposal in that they include an expanded MOPR, but do not include a workable RCO or similar FRR-RS mechanism. Such proposals hinder state policy goals and produce economically inefficient outcomes. They unnecessarily inflate market prices to an inefficient level by forcing resources with environmental attributes that would otherwise elect the RCO to instead offer into the capacity market at an inefficiently high "MOPR Floor" level. In the event that states continue to support these resources for policy reasons, such an approach results in over procurement and unnecessary costs borne by consumers. Conversely, if such an approach deters or causes states to abandon the support of resources chosen for environmental policy reasons, economically-valuable low or zero emission resources will exit the market, resulting in an overall loss of social surplus. Neither outcome is desirable, and both are less efficient than a policy that includes a workable pathway, such as the RCO, for state-supported resources to exit the RPM while still having their contribution to resource adequacy recognized and credited to the states that choose to support them. I estimate that the overall incremental cost to consumers in Eastern MAAC of a MOPR-only approach relative to PJM's Base Proposal would have been approximately $700 million annually (or a 37% increase in capacity costs) based on PJM's most recent RPM Base Residual Auction ("BRA") and the existing resources that are likely to be subject to MOPR in the near-term based on PJM's proposal. Further, due to the ripple effects on the larger market, customers in the broader RTO outside of Eastern MAAC would see their costs rise by over $200 million annually, resulting in a total incremental cost to consumers of over $900 million per

year. Other alternatives which have been proposed which artificially limit the FRR-RS or RCO option, such as reliance only on the existing "full" FRR mechanism in the PJM tariff, or a cap on the overall quantity of resources that may elect the RCO option, are not workable and produce inefficiencies similar to having no RCO at all.

15. PJM's Extended RCO proposal, which adds an RPM capacity re-pricing element to its Base Proposal, is economically inefficient, potentially greatly inflates prices for consumers, and impedes a states' pursuit of efficiency enhancing environmental programs by inappropriately "taxing" RCO resources with a portion of inefficient cost increases unnecessarily created by the proposal. The Extended RCO adds a "re-pricing" step after resources are selected in the RPM that removes the RCO resources from the price formation mechanism without any commensurate reduction in load, with the potential to result in prices even higher than if the RCO resources were subject to a MOPR. This re-pricing is inappropriate because the efficient price for RCO resources supported for environmental reasons is their unadjusted status quo offer price, and any approach that implicitly inflates their offers above this level – as PJM's Extended RCO proposal does -- will result in inefficient and unnecessarily inflated market prices. Further, removing the RCO resources from the supply curve entirely has the potential to inflate prices even further above the efficient level, particularly in constrained regions. I estimate that the overall incremental cost to consumers in Eastern MAAC of PJM's Extended RCO proposal would be approximately $2.2 billion annually (or roughly a 100% increase in capacity costs) based on PJM's most recent BRA and assuming about 3.7 GW of existing resources elect RCO in the near-term. Further, customers outside EMAAC would see their costs rise by over $400 million annually due to the ripple effect on the RTO supply curve, resulting in an overall incremental cost to consumers of $2.6 billion annually. Finally, the Extended RCO proposal includes a provision to pay "infra-marginal rent" payments to resources that do not clear the RPM but whose offers fall below the clearing price determined in the re-pricing step. PJM proposes to allocate the cost of these payments to the RCO resources because PJM claims that they are the cause of the need for the re-pricing step and thus the cause of the market inefficiencies that the re-pricing step corrects. This cost allocation approach is economically-backwards because the RCO resources reduce, rather than increase, market inefficiency because they partially correct for the lack of a carbon price in the current market.

16. At their core, PJM's Extended RCO proposal and the various MOPR-only proposals all ask the Commission to implicitly conclude that all retention/entry associated with state-

sponsored resources is uneconomic. The assumption of uneconomic retention/entry is the only thing that might justify either approach. That proposed implicit conclusion stands in stark contrast to the Commission's expressed intent to accommodate state interests, and to the undeniable state jurisdiction over resource planning, should it choose to assert it. It also flies in the face of the evidence offered here that the state-sponsored resources comprise, in the main, economic entry/retention when environmental attributes are taken into account. This core failing is the primary reason that both proposals produce such economically inefficient outcomes with unnecessary price inflation and violate the intent of the Commission's Order. For this reason, the Commission should reject all the proposals that fall in these categories.

II. AFTER THE EXELON PROPOSAL, PJM'S BASE PROPOSAL, WITHOUT THE "EXTENDED RCO," IS THE MOST ECONOMICALLY-EFFICIENT AND LEAST COSTLY SOLUTION THAT IS CONSISTENT WITH THE COMMISSION'S ORDER

A. PJM'S BASE PROPOSAL IS GENERALLY CONSISTENT WITH THE COMMISSION'S ORDER

17. The Commission very clearly identified in its Order its view that there is a need to remove resources receiving out-of-market support from the PJM capacity market or to apply the MOPR to their offers, and that the current construct is both unjust and unreasonable because it fails to do this. As such, the current status quo for the PJM RPM auction has been rejected by the Commission and the structure must be adjusted to account for this finding

18. The Commission's solution to this issue is very specific. It recommends the implementation of an expanded MOPR for all resources, existing and new, bidding into the PJM capacity market that receive material out-of-market state (and going-forward, potentially federal) subsidies.

19. However, the Commission also had a very clear second conclusion. The Commission found it necessary to "accommodate resources that receive out-of-market support," thereby respecting a state's right to pursue valid policy goals concerning generation mix and "mitigating or avoiding the potential for double payment and over procurement."

20. To ensure the accommodation of these resources without over procurement, the Commission proposed a FRR-RS option. Such a structure would accommodate the resources

receiving out-of-market payments by allowing them to stay on the system despite their inability to compete in the capacity market as currently designed based on their costs. In coming to this conclusion, the Commission demonstrated an understanding that there is merit in the state support programs that are at issue and that the changes that PJM will make to its capacity market should not be biased against the resources receiving these supports.

21. The Order's two recommended policies are clearly meant to work in concert. Solutions that only include one but not the other, or that implement one of the policies in a flawed or unworkable manner are not consistent with the intent and underlying economic logic of the Order. With a few fixes, PJM's Base Proposal implements each of the Commission's recommended policies in a workable and effective manner.

22. First, PJM proposes an expanded MOPR that covers both new and existing resources and all technology types. PJM's MOPR design re-sets the offers from affected resources to a technology- or resource-specific competitive proxy offer price (the "MOPR Floor Price") that excludes the impact of any out-of-market payments. Consistent with the Commission's intent, this design thus removes the impact of subsidy-affected bids from the market clearing outcome. For those resources that remain in the RPM auction under PJM's Base Proposal, all bids will reflect the full costs of these resources with no impact of identified subsidies. However, through its proposed size-based materiality threshold, PJM provides what amounts to a de-facto exemption for most existing and new renewable resources. As I will discuss later, this size exemption produces uneconomic incentives and should be eliminated.

23. Second, PJM proposes a RCO that addresses the Commission's recommendation for an FRR-RS option. The RCO provides resources receiving state environmental attribute payments with a pathway whereby they can receive compensation outside the capacity market for both their capacity and their environmental attributes.

24. As proposed by PJM, the RCO is generally workable for both the resources in question and their sponsoring states, in that it has reasonable rules for election of the RCO option, matching of load and resources, and for payment and billing of the cost of RCO resources. PJM's proposed rules for re-entry of RCO resources back into the market are not workable or efficient, but, as I discuss later, can easily be modified to eliminate these problems in a manner consistent with Exelon's Proposal.

25. The RCO is also workable and efficient from the perspective of reliability in that 1) PJM ensures that all locational constraints are respected by the market as a whole, and that the cost of any binding transfer limits is appropriately allocated among load serving entities , and 2) PJM's proposed mechanics for treatment of RCO resources within the larger market clearing algorithm ensures that loads matched to RCO resources are effectively assigned a share of responsibility for the overall realized PJM reserve margin.

B. OTHER THAN EXELON'S PROPOSAL, PJM'S BASE PROPOSAL IS THE MOST ECONOMICALLY EFFICIENT OPTION

26. As far as I am able to determine, all of the current "actionable subsidies" that would result in existing resources being targeted for MOPR treatment under PJM's proposal are forms of compensation for the positive environmental attributes associated with these resources. These take the form of Zero-Emission Credits ("ZECs") for nuclear resources, Renewable Energy Credits ("RECs") for renewable resources of various types, and in some cases long-term bundled contracts for specific renewable resources. All of these resources are distinguished by producing energy with zero or very low emissions. States value the environmental attributes of these resources, but the PJM power markets do not value environmental attributes,[7] and state-level tax or cap and trade programs would not be nearly as effective or efficient.

27. As I discuss below, if these resources elect the RCO under PJM's Base Proposal, their resulting treatment in PJM's overall market-clearing algorithm in the RPM is economically efficient and least cost for consumers and the market as a whole, once all public and private costs are considered. And, contrary to the contention of many parties in this proceeding, the resulting market prices are not "suppressed" nor are "economic" resources excluded from the market. The reason for this is that the "actionable subsidies" in question are all intended, in varying formats, to correct distortions caused by the failure of current PJM markets to price negative externalities associated with carbon emissions. By correcting this distortion, at least for the resources in question, these state programs enhance, rather than impede market efficiency, and by allowing a

[7] Two PJM states (Delaware and Maryland) plus the District of Columbia participate in the Regional Greenhouse Gas Initiative ("RGGI") that does place a price on carbon for generation located within these states. However, the RGGI carbon price, at about $5 per ton, is about 10% of the Social Cost of Carbon, and is thus far too low to accomplish a socially-optimal level of carbon reduction. Furthermore, RGGI's carbon reduction efforts, particularly in the PJM states, have been greatly limited by leakage of carbon emissions from neighboring non-RGGI states. These concerns have been a significant factor in constraining RGGI to a relatively low carbon price.

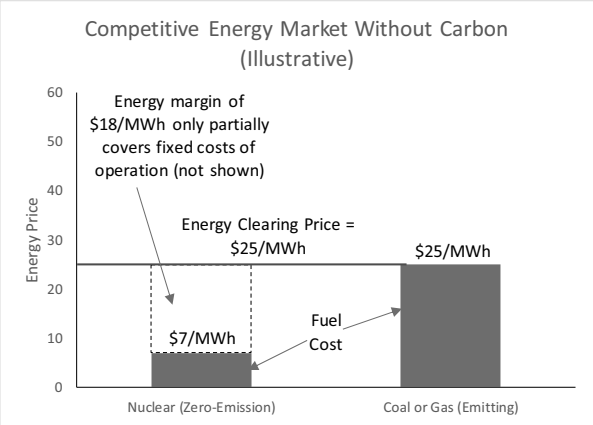
pathway for states to pursue these programs without being subject to potentially costly and inefficient MOPR treatment, the RCO thus enhances overall market efficiency relative to a MOPR-only solution.

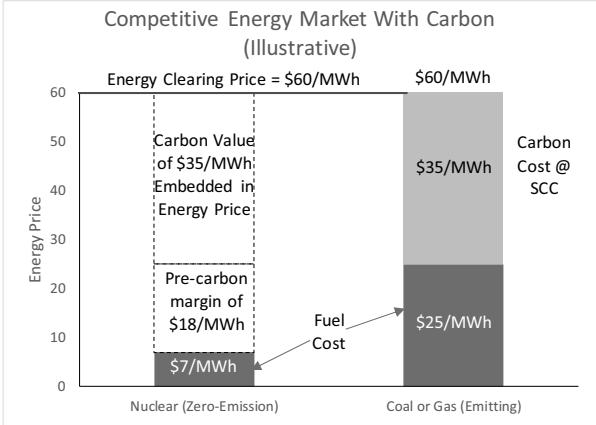
28. Many commenters[8] in this proceeding agree that the most economically efficient means of valuing carbon emissions attributes within PJM markets would be to institute a market-wide carbon price. A carbon price, assuming it is set at the economic cost it imposes on society, or the Social Cost of Carbon ("SCC"),[9] values emission attributes by aligning the public and private cost of carbon-emitting generators through the addition of a carbon charge, based on a market-wide carbon price and resource-specific emissions, to offers to sell energy into the market. Through this mechanism, emitting generators are charged for the social cost of the negative carbon pollution externality that they create when the produce energy. Because of this additional variable cost, in a competitive single-price clearing energy market such as PJM, the price of energy will rise by the amount of the carbon cost embedded in the energy offer of the marginal resource, which will generally be a carbon-emitting natural gas or coal unit under most conditions. Under a carbon price, zero-emission resources need not be paid directly for their zero-emission attribute, but rather benefit from the increase in energy price while avoiding any incremental carbon charge due to their low-emission profile. The incremental benefit per Megawatt hour of energy produced for a zero-carbon resource will generally be approximated by the carbon price multiplied by the average marginal emission rate in the market (in tons of carbon per MWh). Figure 1 below illustrates how a carbon price affects both zero-emission and emitting resources in a centralized competitive energy market such as PJM:

[8] Commenters who have agreed that a carbon price is the most efficient solution include PJM (Capacity Repricing or in the Alternative MOPR-Ex Proposal: Tariff Revisions to Address Impacts of State Public Policies on the PJM Capacity Market, Docket No. ER18-1314-000, April 9, 2018, at 54-55), the IMM (Comments of the Independent Market Monitor for PJM, Docket No. ER18-1314-000, May 7, 2018, at 10), and Eastern Generation (Initial Brief of Eastern Generation, LLC, Oct 2, 2018). See also Initial Brief of Exelon Corp. (Oct. 2, 2018) at 7 n.13 (collecting citations to comments supportive of carbon pricing).

[9] Those states that have sought to pursue environmental policies that explicitly value emission attributes, such as the nuclear support payments in Illinois, New Jersey, and New York have chosen zero-emission attribute compensation levels that are consistent with the estimate of the Social Cost of Carbon developed by the U.S. Government as of August 2016 which is approximately $51.50 per short ton in nominal terms for the 2022/23 PJM power year (*See* U.S. Government Interagency Working Group on Social Cost of Greenhouse Gases, Technical Support Document: Technical Update of the Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866, August 2016). The U.S. Government has withdrawn this estimate and is currently utilizing a lower interim estimate. However, because it has generally been adopted by the relevant states in this context the August 2016 estimate of the SCC is the most relevant yardstick for valuing and evaluating the economics of the policies in question.

Figure 1





29. As Figure 1 shows, the incremental value that accrues to a zero-emission resource under a carbon price is approximately equal to the incremental cost of carbon emissions associated with the marginal resource. In the example, the increase in the marginal cost of the emitting resource is $35 per MWh, and the incremental energy price gain for the zero-emitting nuclear resource is thus also $35 per MWh. While under a carbon pricing framework this value is achieved by pricing the negative externality of carbon emissions, in the absence of a carbon price, an identical valuation of the resource's zero-emission attribute can be achieved by providing out-of-market compensation set at the SCC times the estimated marginal emission rate for the market for each MWh of zero-emission generation output. In the example in Figure 1, this could be achieved by paying the nuclear unit an attribute payment of $35 for each MWh generated. This mode of compensation values zero-emission attributes as a positive externality associated with the avoidance of emissions driven by each MWh of zero-emission output. Thus, to the extent a resource that is uneconomic in the current market is made economic by the attribute payment, it will enter or remain in the market when it would not otherwise have done so, and overall social costs are reduced when all public and private costs are considered, including the cost of carbon emissions. In the absence of a carbon price, this is the approach taken by states seeking to achieve environmental goals.

30. The environmental attribute payment approach is not as efficient as a true carbon price because it only values the positive externality associated with zero-carbon generation, and thus does not distinguish between different types of emitting generation (e.g. between natural gas and coal) and other types of emission reductions (such as demand-side reductions) that may not be covered by the attribute payments. Relative to a baseline of doing nothing, however, such

compensation enhances efficiency and lowers costs for consumers once the public costs of carbon emissions are considered because it enables the retention and entry of economic zero-carbon resources that would not otherwise occur.

31. If a PJM-wide carbon price were implemented there is no disagreement that the capacity offer price for a zero-emission resource should include the incremental value of the zero-emission attribute, because, as discussed above, in the case of a carbon price this value is embedded in energy revenues, which all commenters agree is an in-market revenue source, and not an out-of-market subsidy. Thus, relative to the no-carbon status quo in PJM markets today, the capacity market offers of these resources would be reduced by the incremental value of the zero-carbon attribute embedded in the energy price. In the case of the nuclear resource shown in the example in Figure 1, if we assume it has a gross Avoidable Cost Rate ("ACR") of $593 per MW-day (the technology-class gross ACR PJM proposes for existing dual-unit nuclear plants), under the current market structure, its offsetting energy net revenues of $18 per MWh would reduce its offer by roughly $400 per MW-day, leading to a status quo offer of $193 per MW-day without any state support. If the energy price were to rise by $35 per MWh due to carbon it would receive additional offsetting energy revenue of about $775 per MW-day, which is more than sufficient to drive its resulting competitive capacity offer to zero. This capacity offer price is economically efficient and competitive. It follows from this that the resulting market-clearing outcome incorporating these offer prices is also economically-efficient both with respect to price and the quantity and identity of resources that are cleared.

32. Compensating zero-carbon resources via an attribute payment is economically equivalent to a carbon price from the perspective of those resources. In the case of the nuclear resource in the example in Figure 1, an attribute payment of $35 per MWh would be equivalent to a carbon price at the SCC. However, because those payments are received outside of PJM markets, they are not included in energy revenues. Economically, however, this distinction does not matter. If the attribute compensation is at or below the SCC, it enhances economic efficiency and its inclusion in the formation of a capacity offer price for the resource results in an economically-efficient offer price that is essentially equivalent to how those resources would have offered in the presence of a market-wide carbon price, and will generally result in low or zero price offers from most of the resources in question. For example, based on PJM's proposed default ACRs, the capacity offer for an existing dual-unit nuclear plant with a carbon price of $15 per ton would be

zero.[10] Just as it would be under a carbon price, the market-clearing outcome that results from such offers is economically-efficient both with respect to price and resource selection. Contrary to suggestions from various witnesses in this proceeding, this outcome does not represent "price suppression" but rather produces the correct and efficient price. The capacity price that results when zero-emission resources reflect the value of attribute payments in their offers can be viewed as the price for unbundled, environmentally-agnostic capacity whereby the offers for differentially environmentally-valuable resources are effectively adjusted downward (through inclusion of the attribute payment value in their offers) to reflect their enhanced value relative to dirtier resources. Whatever price emerges from the resulting auction represents this unbundled value of environmentally-agnostic capacity, and all resources, zero-emission or otherwise, that are able to provide it at that price or below realize a profit from the auction. To the extent that more such capacity is needed, the relatively low barriers to entry for new entrants in PJM combined with the sloped capacity demand curve ensure that the price will rise as needed to meet the need.

33. While these difficulties could be resolved by implementing a market-wide carbon price as Exelon and other commenters have urged the Commission to consider,[11] in the present market a carbon price is not a viable option for a single state acting alone. While it is feasible to implement a state-specific carbon price, its effectiveness in both reducing emissions and providing the desired price signals would be greatly hampered by emission leakage to other states that lack carbon price both within and external to the PJM footprint. The attribute payment approach, while it does not impact as broad a spectrum of emission-affecting activities as a carbon price, does not suffer from leakage issues and is thus the only realistic means by which PJM states in the current market can efficiently achieve emission reduction goals.

34. With a couple of minor exceptions, the attribute compensation that PJM states pay to zero-carbon resources is at or below the SCC. The SCC for 2022/23 is approximately $51.50 per short ton, which translates into a value of approximately $35 of avoided emission costs per MWh

[10] PJM proposes a generic technology-specific gross ACRs for existing dual-unit nuclear resources of $593 per MW-day (in ICAP terms) for the 2022/23 auction and provides an estimate of new nuclear unit energy and ancillary services revenues of $366 per MW-day, leading to a competitive offer price of $227 per MW-day for an existing nuclear resource without a carbon (gross ACR less energy and ancillary revenues). A carbon price of $15/ton translates into incremental energy value of about $10.35/MWh assuming a 0.69 tons per MWh marginal emission rate, which further translates into incremental energy revenues of $228/MW-day for a nuclear resource operating at a 92% capacity factor, which would be sufficient to drive the competitive offer price to zero.

[11] Exelon comments at 7, Initial Brief of Eastern Generation, LLC, Oct 2, 2018 at 6.

of zero-emission generation on the PJM system, assuming a marginal emission rate of 0.69 tons per MWh. The ZEC payments to nuclear resources in Illinois and New Jersey, which are calibrated explicitly based on the SCC, both fall below this level. Similarly, RECs for wind and solar in most PJM states range between $5 and $10 per MWh,[12] also well below the SCC. Even if these REC payments are added to the $9.3 per MWh[13] value from the 40% Production Tax Credit payments for which most wind resources entering the market in 2022/23 are eligible, the total payments are less than the SCC. Thus, the payments made by states for zero-emission attributes are generally economically efficient in practice because they pay at or below the economic value of the attribute to society as a whole.

35. MOPR treatment for resources receiving environmental attribute compensation, however, is clearly inefficient, because it removes the attribute payment credit against the ACR for the resource in question and re-sets its offer to a higher MOPR floor price that does not include any consideration of the value of the zero-carbon attribute. This higher offer price ignores the value of the public benefits of emission avoidance produced by the resource and is thus economically inefficient and too high. If PJM's proposed expanded MOPR were applied to these resources absent an RCO option, it risks producing a market clearing outcome with inefficient, unnecessarily high market prices and a cleared resource portfolio that excludes zero-emission resources that are economic when the value of their emission avoidance is considered.

36. The outcome whereby resources receiving environmental attribute payments reflect those payments in their offers without modification is broadly consistent with the current status quo in PJM. I have previously argued that the status quo is the most economically-efficient outcome with respect to the treatment of environmental attribute payments. While the Commission's Order finds that the status quo is not just and reasonable, it is nonetheless the case that any implementation of the Commission's order that achieves an economic outcome close or

[12] *See* Platt's Megawatt Daily, Oct 25 2018, at 10. Listing competitive REC market prices of $5.50/REC for MD Tier I, $5.75/REC for NJ Tier I, $5.00/REC for OH Tier I, and $5.75/REC for PA Tier I, along with $7.00/SREC for MD Solar RECs, $6.50/SREC for OH Solar RECs and $13.25/SREC for PA Solar RECs. New Jersey solar RECs are much higher due to market structure differences.

[13] $9.6 per MWH production tax credit for 10-years (40% of the full $24/MWh value) translates to a levelized pre-tax value of $9.3 per MWH assuming a 20% tax rate, 20-year life, and 2% inflation

identical to the status quo with respect to its treatment of resources supported for environmental reasons will be more economically-efficient than an implementation that does not.

37. The FRR-RS and for the most part, the RCO, allow resources receiving environmental attribute payments a pathway whereby they can receive compensation outside the capacity market for both their capacity and their environmental attributes and also, by removing them from the market, avoids inserting them into the capacity market at an inefficient offer level that fails to consider the value of their attributes and thus inefficiently raises market prices. Indeed, PJM's proposed mechanical implementation of the RCO for the purposes of price formation, which enters the RCO resources into the supply curve as price takers while leaving the demand curves unchanged, is very similar to how these resources would offer and markets would clear under the status quo. Many commenters have pointed out this feature of the RCO. While some commenters claim this feature makes the RCO "price suppressive" and not workable,[14] the opposite is true. Rather, to the extent that resources receiving environmental payments elect the RCO, PJM's approach treats them in the most efficient manner that is possible consistent with the Commission's Order. Any approach that results in higher prices and/or non-selection of the resources in question needlessly raises prices for consumers and potentially deprives the market of environmentally-valuable resources. Thus, of the various proposed implementations of the FRR-RS component of Commission's order, only the Exelon's Proposal and the PJM's Base Proposal with the RCO (with certain fixes discussed in the next section) avoids degradation in market efficiency relative to the status quo.

38. As I will discuss later, however, this conclusion only applies to the PJM's Base Proposal, and not the "Extended RCO" option, which the Commission should reject. The Extended RCO essentially bolts on a revised version of PJM's capacity re-pricing proposal to PJM's Base Proposal which reduces the efficiency of the RCO mechanism and needlessly raises

[14] Commenters taking this position include the IMM (*See* Brief of the Independent Market Monitor for PJM, Oct 2, 2018), PJM Power Providers Group with their witness Roy Shanker (*See* Initial Brief of PJM Power Providers Group, Oct 2, 2018), the Electric Power Supply Association and their witness Paul Sotkiewicz (*See* Initial Brief of the Electric Power Supply Association, Oct 2, 2018), LS Power and their witnesses Kurt Strunk and Willis Geffert (*See* Initial Brief of LS Power Associates, L.P., Oct 2, 2018), NRG and their witness Robert Stoddard (*See* Initial Brief of NRG Power Marketing LLC, Oct 2, 2018), and Vistra Energy and their witness Christopher Russo (*See* Comments of Vistra Energy Corp. and Dynegy Marketing and Trade, LLC, Oct 2, 2018).

costs for consumers. That said, as PJM has acknowledged, the Extended RCO is an optional addition to PJM's Base Proposal and is completely severable.

C. CERTAIN FEATURES OF PJM'S BASE PROPOSAL DETRACT FROM ITS EFFICIENCY AND/OR WORKABILITY AND SHOULD BE ADJUSTED

39. Exelon's Proposal is very similar in concept to PJM's Base Proposal in that it envisions a MOPR with very few exceptions and a workable implementation of the RS-FRR concept. Exelon's Proposal differs from PJM's in two key respects: the re-entry provisions for ex-RCO/RS-FRR resources to the RPM and the presence of a size-based materiality threshold. While PJM's Base Proposal is generally workable, its provisions with respect to these two aspects unnecessarily detract from its economic efficiency and should be rejected and replaced with the provisions contained in Exelon's Proposal.

40. First, while PJM reasonably proposes that both the MOPR and eligibility for the RCO apply for the life of the subsidy for a given resource, they further propose that in the event that a former RCO resource (that is, resources no longer receiving a state-sponsored subsidy) seeks to re-enter the RPM post-subsidy, then that resource should be subject to the MOPR on a continuing basis until it has cleared one BRA, and further that the MOPR floor price for the resource be increased by the amortized value of capital expenditures made to the resource during its time as an RCO resource. The effect of this is that these resources will have their offers adjusted to a very high MOPR floor price, despite that resource not receiving any current out-of-market payments, making it very unlikely that that resource will ever clear in the RPM. This provision renders RCO largely unworkable and appears to be entirely intended to deter re-entry of RCO resources regardless of economics, and to punish resources for electing the RCO option in the first place. This provision is thus both unnecessary and inefficient. As discussed above, the economically efficient offer price for a RCO resource during the duration of the RCO is what it would have offered under the current status quo, or at or near zero in most cases. To the extent the resource exits the RCO for any reason, this offer will continue to be the correct, economically efficient offer. Application of the MOPR needlessly inflates the offer price and makes it likely that the resource will not clear, depriving the market of an otherwise-economic resource. Further, to the extent this provision deters states from supporting economically efficient zero-emission resources in the first place, it will detract from overall market efficiency because, as discussed previously,

such state programs enhance efficiency. To the extent that the Commission decides that some form of deterrent against resources toggling between the RCO and RPM is warranted, the five year stay-out provision utilized by the existing FRR is likely a more efficient and better targeted solution than PJM's proposed approach of applying a punitive MOPR to former RCO resources.

41. A simple example illustrates the absurdity of this provision. If a carbon price at the SCC were implemented either PJM-wide or nationally, as discussed previously, there would no longer be a need for attribute payments from states to zero-carbon resources and most if not all such payments would likely be discontinued. The resources in question would now be economic based on market prices alone and would seek to re-enter the RPM with an offer price that reflected the value of carbon embedded in energy markets. This offer price would be the efficient and correct price for these resources under a carbon-pricing structure, and most, it not all would likely clear the market on that basis. Application of the MOPR with an elevated floor price to such resources is clearly highly economically inefficient and would lead to inefficiencies such as nuclear plants retiring despite being economically viable relying only on market revenues.

42. Exelon's Proposal allows former RCO resources to offer into the RPM without application of the MOPR or other modification and thus avoids the problems inherent in PJM's approach. The Commission should reject PJM's proposed approach and replace it with a re-entry provision that does not modify the offers of the former RCO resources.

43. Second, PJM proposes a "materiality threshold" for application of the MOPR that would exempt resources with capacity below 20 MW in Unforced Capacity ("UCAP") terms. This provision amounts to a de-facto exemption from MOPR treatment for a majority of existing renewables, and likely all to-be-built renewables. PJM witness Adam Keech finds that 931 MW out of 1,560 MW, or about 60%, of existing renewables fall below the materiality threshold, and that 322 MW out of 946 MW of new build renewables in the queue with a 50% or higher chance of completion, or about 35%, also fall below the materiality threshold.[15] The reason that so many renewable projects fall below the threshold is that the UCAP value awarded to wind and solar capacity is scaled down considerably from their nameplate value due to the production shape and intermittent nature of these resources. The UCAP assigned to wind is typically scaled down to

[15] Affidavit of Adam J. Keech on Behalf of PJM Interconnection L.L.C., Oct 2, 2018, at 10-12.

13% of nameplate, while solar is typically scaled down to 38%. Thus, a 150 MW wind farm, a very typical size for a PJM onshore wind facility, would be assigned a UCAP value below 20 MW and would thus fall below the materiality threshold. Looking forward, however, most types of renewables have the flexibility to scale their facility capacity to fit under the materiality threshold because a wind or solar farm is not a singular machine, but rather a aggregation of much smaller wind turbines (typically 1-3 MW nameplate each) or solar panels (typically less than 0.5 MW nameplate each) that can be aggregated in whatever numbers are desired. Thus, it is likely that in the future nearly all wind and solar facilities will scale their capacity to fall under the threshold. As Mr. Keech's analysis demonstrates, even if these resources individually are small, collectively they amount to a significant block of capacity – currently over 900 MW of UCAP and growing to over 1,200 MW, or easily comparable to a nuclear plant– and will likely continue to grow in coming years. Further, because the capacity value of wind resources (currently the largest class of renewables in PJM) are scaled down by considerably more than their average energy output (i.e. a wind resource receiving a 13% UCAP credit will typically have an annualized capacity factor of 30 to 40%), these resources also have much more significant energy market impacts than their total capacity value would suggest, particularly during off-peak periods when their energy output is highest.

44. For renewables the materiality threshold is not necessary and creates inefficient incentives. The RCO option is available to and workable for renewables that receive state payments such as RECs, SRECs, or long-term contracts. To the extent they seek to avoid MOPR treatment, they may elect this option. While exempting these resources may seem like an easier way to accomplish the same effect, it is not the same, and introduces potentially harmful and innovation-stifling incentives for states, resource owners, and equipment manufacturers. This is because states and others that seek zero-carbon resources will have a clear administrative incentive to favor certain technologies, namely land-based wind and solar, over others that cannot be easily scaled or do not receive a large de-rate to nameplate due to intermittency, such as nuclear, carbon-capture and sequestration, hydro, and potentially other pre-commercial technologies. Similarly, the threshold also creates an incentive to favor smaller projects that fit below the threshold relative to larger projects that may achieve more economies of scale. This incentive is entirely driven by administrative rules, not economics, and could result in states favoring unnecessarily favoring

higher-cost zero-carbon resources and stifling innovation in resources that do not easily fall under the materiality threshold. For this reason, PJM should eliminate the MOPR materiality threshold.

45. Exelon's Proposal does not include a size-based materiality threshold at any level and thus avoids these inefficiencies. Consistent with Exelon's approach, the Commission should reject PJM's size-based materiality threshold.

III. MOPR-ONLY PROPOSALS ARE ECONOMICALLY INEFFICIENT FOR RESOURCES THAT RECEIVE ENVIRONMENTAL PAYMENTS, COSTLY FOR CONSUMERS AND SOCIETY, AND INCONSISTENT WITH THE COMMISSION'S ORDER

A. MOPR-ONLY CREATES UNNECESSARY PRICE INFLATION AND OTHER INEFFICIENCIES

46. Certain commenters, in particular the IMM, PJM Power Providers, the Electric Power Supply Association, and LS Power, propose that the Commission reject PJM's RCO, or any other approach that implements a FRR-RS as suggested in the Commission's order, and instead simply implement an expanded MOPR targeting both new and existing resources. In addition to being inconsistent with the Commission's order, which clearly identified the need to reasonably accommodate state's resource choices, such an approach would be both economically inefficient and costly for consumers.

47. When a zero-emission resource that receives environmental payments is subjected to MOPR, as discussed previously, its offer is re-set to an alternative MOPR Floor price that is too high and not efficient because the environmental payments that resource receives are cost-effective compensation for actual valuable environmental attributes provided by the resource that are not compensated in the market today. The efficient offer for such a resource is its status quo offer, which implicitly incorporates the impact of the environmental payments. It follows that the resulting market clearing outcome after application of the MOPR produces a price that is inefficiently high, because resource's offers are re-set to an inefficiently high price, and may result in otherwise economic resources not being selected in favor of dirtier resources that are higher cost once their negative emission externalities are considered. Because of this structure, a MOPR-only approach will lead to one of two outcomes in practice, both of which are bad for consumers and the market as a whole.

48. First, if the RCO or similar workable FRR-RS option is not provided, and states are not deterred in pursuing programs seeking to preserve resources for policy reasons, a stand-alone Expanded MOPR will result in inefficient over-procurement of capacity resources. A MOPR operates by adjusting the bids of targeted resources to a higher level, seeking to undo the effect of out-of-market payments resulting from state actions. PJM would then clear the market in a single step incorporating these higher, modified bids. As a result, the resources targeted by the MOPR will likely not clear the capacity market and will instead be replaced by other resources that would not have cleared had the targeted resources' offers not been adjusted upwards. However, the targeted resources will nonetheless remain in the market if state action is not deterred – they will just be compensated through out-of-market means at the state level. The additional resources procured in their place under the MOPR will also remain in the market. This over-procurement will effectively cause the market to retain a much larger portfolio of capacity resources than is needed for resource adequacy purposes. In addition, in those cases where these state programs continue without a RCO or similar, it is very likely that customers within the states implementing these out-of-market subsidies will be forced to over-pay for capacity with no incremental benefits. PJM will fully charge these customers for their share of the RPM capacity costs, including for those capacity resources that replaced the resources targeted by the MOPR that did not clear due their upwardly adjusted bids. The customers will then also pay through out-of-market charges levied by their states for these targeted resources that did not clear the capacity auction but remain in service supported by these out-of-market subsidies. Under the RCO, this would not occur as these resources would be pulled out of the RPM auction along with an off-setting amount of state-specific load that would no longer be charged for RPM capacity but would instead pay for the capacity associated with the state-supported resource through a compensation mechanism outside of the RPM.

49. Second, to the extent that the implementation of an Expanded MOPR with no RCO does deter states from making out-of-market payments to an economically-efficient zero-emission resource, PJM would then be selecting the wrong set of resources to provide capacity and causing the inefficient exit of economic resources, when all public and private costs are considered. Under this scenario, states will either cease actions when the resources in question are targeted by the MOPR, or never engage in state programs they would otherwise have engaged in due to the threat

of MOPR treatment. In either case, total social surplus is reduced because environmentally-valuable, economically-efficient resources would exit the market due to the loss of this support.

50. In either case, by inserting the resource into the supply curve at an inefficient, too-high MOPR floor price, the MOPR will result in inefficient and unnecessarily high prices for consumers. Many commenters in this proceeding claim that the MOPR is needed to eliminate "price suppression" that occurs if these resources are not subject to MOPR treatment, and that the RCO, by allowing the resources to avoid MOPR treatment also causes price suppression. However, viewed against the efficient outcome, which is to enter these resources into the supply curve at their original pre-MOPR offer price (as in the status quo) or allow them to elect the RCO (as in PJM's Base Proposal), a MOPR-only solution causes uneconomic price inflation, not price suppression.

51. In practical terms, when viewed against the results of the recent 2021/22 auction, an expanded MOPR applicable to existing resources would cause prices to increase from the levels at which they actually cleared (with one idiosyncratic exception). Commenters, including the IMM, provide a number of examples that instead purport to show that the RCO causes price suppression. But these examples all proceed not from the status quo outcome, but rather from a hypothetical starting point where zero-emission resources are either not compensated for their attributes by states or choose to ignore that compensation when determining their offers. This is not the right starting point because it represents an inefficient hypothetical state of the world which is not consistent with the reality on the ground today in PJM.

52. The reality today in PJM is that almost all he existing resources that would be affected by an expanded MOPR in the absence of an RCO actually cleared the most recent 2021/22 RPM BRA. Specifically, essentially all renewable resources (roughly 2 GW) cleared the market, the Quad Cities plant in Illinois (which receives ZEC payments) fully cleared the market (1.35 GW), and approximately 2.7 GW of 3.4 GW of New Jersey nuclear capacity that could potentially be supported by recently-passed legislation cleared the market.[16] While the specific bids for these resources are not public, if they were all subject to MOPR, their offers would have likely increased,

[16] "PJM: Reviewing the Auction Impact on Equities," Bank of America Merrill Lynch, May 25, 2018, at 3.

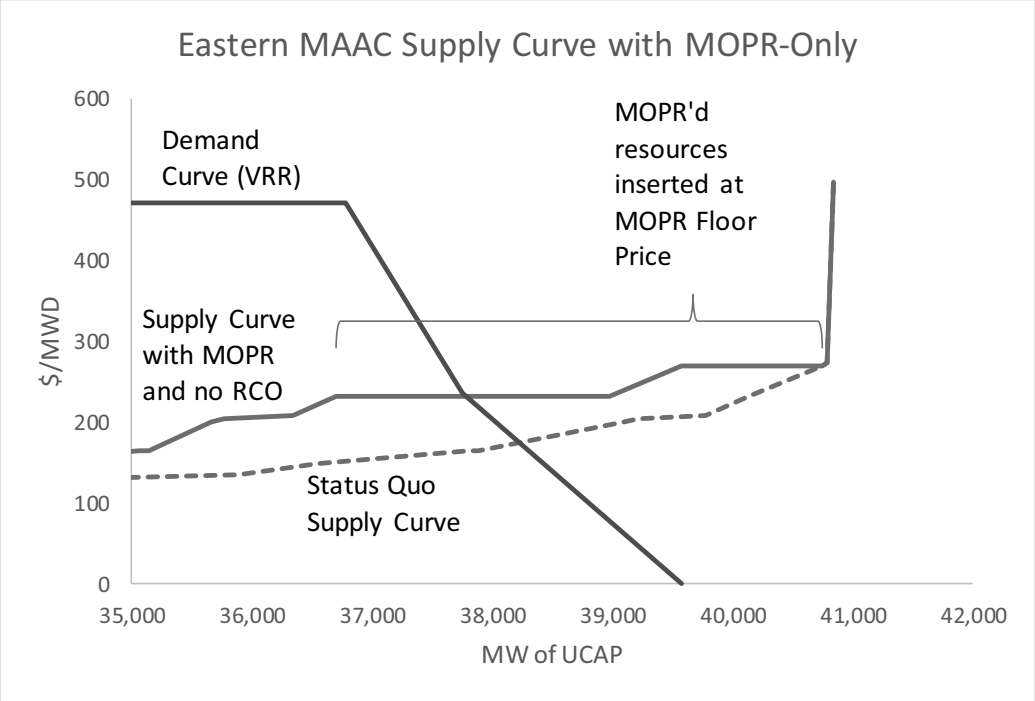
clearing prices in most cases would have been higher, and customers would have paid more for capacity.

53. Using the scenario analysis of the 2021/22 BRA provided by PJM, I have estimated the impact on market prices in Eastern MAAC and rest of RTO that would have resulted if the nuclear units identified above were removed from the supply curve and re-inserted at a higher MOPR floor price. I have not performed a similar analysis for ComEd because the IMM's scenario analysis of the 2021/22 RPM suggests that the ComEd LDA has a very flat supply curve in the marginal region with a considerable amount of uncleared capacity that would result in the application of the MOPR having little or no impact on market prices and thus minimal impact on customer costs. This does not appear to be a general result, but rather an idiosyncratic feature of the ComEd supply curve in this particular auction. For the purposes of this analysis, without knowing the final form of the MOPR or the specific costs of the plants involved I have assumed that the MOPR floor price for the nuclear plants is set to the relevant technology-specific existing resource ACR identified by PJM in its initial comments less the generic energy and ancillary services offset for new units also identified in their initial comments.[17] This estimate results in a MOPR floor price of $232 per MW-day (in UCAP terms) for dual-unit nuclear plants and $270 per MW-day for single-unit nuclear plants. While I have utilized these assumptions for the purposes of the illustrative modeling below, the actual MOPR floor prices for individual plants could be higher or lower depending on the resource-specific energy revenues estimated prior to the auction, and actual plant costs to the extent that the plant owner elects to calculate a resource-specific gross ACR for the resource. Further, if the Commission were to instead establish a MOPR Floor price at Net CONE x B, rather than at the Net ACR as proposed by PJM, the MOPR Floor prices would be similar to what I assumed - $244 per MW-day for Eastern MAAC. For the renewable resources, most of which are existing, I have conservatively assumed that the MOPR floor price is well below the clearing price in markets, consistent with PJM's suggested technology-specific MOPR floor prices. Figure 2 below shows how the MOPR changes the supply curves (estimated based on PJM's sensitivity analysis) in Eastern MAAC relative to the status quo, and the resulting impact on market clearing prices and quantities. The MOPR also has an effect on the RTO clearing price because it causes less supply to be cleared in Eastern MAAC. Because the supply cleared for LDAs is entered into the broader

[17] Initial Submission of PJM Interconnection, L.L.C., Oct 2, 2018, Table 1 and Table 3.

RTO supply curve at zero, this causes the RTO supply curve to shift inward as well (by roughly 600 MW). Based on the shape of the RTO supply curve, I estimate that this causes the RTO price to rise by about $6 per MW-day, from $140 to $146 per MW-day. This price increase would be borne broadly by customers in all unconstrained regions of the RTO.

Figure 2



54. The MOPR has two effects. First it results in different market clearing prices throughout PJM. In the Eastern MAAC region supply is constrained enough, and the amount of MOPR'd resources is significant enough, that some of the MOPR'd nuclear resources would still clear but would set price at a much higher level consistent with the MOPR floor price. This results in higher customer costs throughout Eastern MAAC paid by all consumers, regardless of the state in which they are located. In addition, I estimate that about 1,700 MW of the EMAAC nuclear capacity that cleared in the status quo would not clear due to application of the MOPR. To the extent that the lost revenue for this capacity is made up by the state to keep the capacity in the market, customers in the state in question would continue to effectively procure and pay for this capacity and would pay an incremental cost of over-procurement as a result. Further, there is an

increase in RTO capacity prices that results from the inward shift of the RTO supply curve due to the lesser amount of resources cleared in EMAAC relative to the status quo. Table 1 below summarizes the overall cost impact in customers in Eastern MAAC, relative to the status quo.

Table 1

		Capacity Price $/MWD	RPM Capacity Cost $ Millions	Reduction in State-Supported Resources Cleared MW	Over-Procurement Cost $ Millions	Total Cost to Customers $ Millions	Increase in Cost $ Millions
Status Quo	EMAAC*	173	1,847	- na -	- na -	1,847	- na -
	Rest of RTO	140	5,214	- na -	- na -	5,214	- na -
	Total		7,061	- na -	- na -	7,061	- na -
MOPR no RCO	EMAAC*	232	2,428	(1719)	104	2,532	685
	Rest of RTO	146	5,445	0	0	5,445	231
	Total		7,873	(1719)	104	7,977	916

* EMAAC includes PSEG. Status quo capacity price for EMAAC is a blend of PSEG and Rest of EMAAC prices.

55. The overall net impact is that customers in Eastern MAAC would end up paying nearly $700 million per year or 37% more under a MOPR-only structure than they do under the status quo. About $600 million of this is due to market price impacts that would be borne by all customers in Eastern MAAC and another $100 million from over-procurement costs borne by customers in the states supporting the nuclear resources in question (New Jersey in this case). Further, customers across the unconstrained portion of the RTO would in the aggregate bear about $230 million of additional costs due to the ripple effect of the EMAAC changes on broader RTO prices. In total, the incremental costs of the MOPR are approximately $920 million.

56. Alternatively, if the MOPRd resources that would not clear due to the application of the MOPR instead retired, customers would not bear the over-procurement cost, but the market would be deprived of 3.4 GW of zero-emission capacity that annually displaces about 19 million tons of carbon emissions that impose a societal cost of about $980 million per year when valued at the SCC. When added to the customer cost increase due to market price impacts, the scenario increases total costs by about $1.8 billion per year.

57. If the resources in question instead elect the RCO, the market clearing outcome would be similar to the status quo, and the unnecessary price inflation and costs associated with over-procurement and/or loss of efficient zero-emission resources would be avoided. Contrary to the

claims of MOPR-only advocates, this outcome does not represent "price suppression" but rather represents the most efficient possible outcome that complies with the Commission's order.

B. THE EXISTING FRR IS CONCEPTUALLY SIMILAR TO THE FRR-RS OR RCO, BUT IS LESS EFFICIENT FOR ACCOMMODATING STATE PROGRAMS

58. MOPR-only proponents point to the current FRR option in the PJM Tariff as an appropriate means of accommodating state programs designed to support environmentally-valuable resources.[18] Indeed, there is apparently no dispute that the existing FRR is just and reasonable and thus a viable option for states.

59. In most respects, however, if elected by the states, the existing FRR would be less efficient and produce similar or even larger impacts on prices than the RCO or FRR-RS options contained in PJM's Base Proposal and Exelon's Proposal, respectively. That is, the RCO and FRR-RS are less extreme, more efficient versions of the existing FRR.

60. To see how this is so, take the example of a state that seeks to retain two nuclear plants, but whose load far exceeds the capacity provided by those plants. Under the FRR-RS or RCO, those plants would elect the FRR-RS or RCO and just those plants would be removed from the RPM auction, while loads in the state would have an offsetting credit to their capacity obligation in the amount of the capacity of the plants. Relative to an outcome where those plants were subject to the MOPR and did not clear, market prices would be lower. Under the existing FRR, the state would be forced to induce all Load Serving Entities ("LSEs") in the state to elect the existing FRR, and then assemble an FRR resource portfolio sufficient to cover all load in the state to the PJM Installed Reserve Margin target. By removing the two nuclear plants from the auction, along with a commensurate amount of load, the existing FRR would have at least the same price impact relative to a MOPR-only outcome as the RCO or FRR-RS. However, depending on how resources are selected for the FRR portfolio, it is possible the existing FRR could have more of an impact because the additional resources supported by the state could include those that would not have cleared. To the extent that these additional resources are not economic when environmental externalities are considered, their retention via the FRR would be inefficient.

[18] *See* Initial Brief of the PJM Power Providers Group, Oct 2, 2018, at 13-18; Initial Brief of the Electric Power Supply Association, Oct 2, 2018 at 14.

61. Like the PJM Base Proposal and Exelon's Proposal, the existing FRR has no capacity re-pricing mechanism akin to PJM's Extended RCO proposal (discussed below) that seeks to somehow "fix" and inflate the resulting prices back to a "competitive" level, despite it having similar or even greater price impacts. PJM (with respect to its Extended RCO proposal), the IMM, and other proponents of MOPR-only or capacity re-pricing solutions fail to offer any credible justification as to why the existing FRR, which is less efficient and has at least the same impact on price as either the RCO or FRR-RS, can produce just and reasonable market price outcomes while the RCO or FRR-RS should be either eliminated or greatly limited (in the case of MOPR-only proponents) or subjected to a capacity repricing mechanism (in the case of PJM's Extended RCO proposal). This inconsistency suggests that calls to rely on the existing FRR instead of the FRR-RS or the RCO in PJM's Base Proposal are motivated not by a conceptual difference between the two, but rather on the practical reality that the existing FRR is more cumbersome than the FRR-RS or RCO and thus less likely to be utilized by states seeking to exercise their right to determine their generation mix. But this justification is entirely at odds with the letter and spirit of the Commission's Order, which explicitly identified the FRR-RS as a vehicle for states to do just this in the full knowledge that the existing FRR was already in place and available.

62. The reality is that the existing FRR is more cumbersome for the states in question than the FRR-RS or the RCO. And, if utilized to accommodate state programs, the FRR would introduce a number of inefficiencies that are avoided with the FRR-RS or RCO.

63. First, the existing FRR requires that LSEs (and thus, effectively entire states in the question of state programs) fully withdraw all of their load from the market, rather than just load matched to specific resources, and simultaneously withdraw a matching portfolio of resources, not just the specific resources they seek to support. Compared to the FRR-RS or RCO, this deprives the market of a large amount of depth, efficiency, and scale that it would otherwise have. Relatedly, because the existing FRR fully withdraws both load and resources from the market clearing mechanism, PJM must adopt cumbersome rules to ensure that all reliability constraints are met in the residual market. While this approach works well enough under the current market (where about 8% of load/resources utilize the FRR option) it becomes increasingly difficult if the amount of FRR where to double, or more, particularly if the FRR option were elected in a state located in or around significant transmission constraints, such as most states in the Eastern portion

of PJM. This loss of efficiency affects all PJM market participants, not just those that elect the FRR option.

64. Second, and more specific to the states that would seek to elect FRR, the FRR is more difficult and cumbersome to reconcile with retail competition in states that have it. Because the FRR requires that the state assume full responsibility for capacity procurement, rather than just for specific state-supported resources, it effectively puts the state in the position of procuring capacity for all retail providers, fully removing capacity from the portion of the retail bill subject to competition and requiring that the state develop mechanisms for delivery companies to recover the full cost of capacity from competitive retailers. While some of these issues may exist with respect to the FRR-RS or RCO, because they only cover specific resources and provides the option for PJM to continue payment and billing for these resources, the scale of the issues is much smaller.

C. A CAP ON THE TOTAL AMOUNT OF CAPACITY THAT CAN ELECT THE RCO SUFFERS FROM THE SAME PROBLEMS AS MOPR-ONLY PROPOSALS

65. LS Power and their witnesses, Strunk and Geffert, propose that the total amount of capacity able to elect the RCO be capped at 6 gigawatts, with the amount of FRR-RS or RCO capacity pro-rated across all resources that elect the FRR-RS or RCO in the event that the cap is oversubscribed.[19]

66. A cap on the amount of FRR-RS or RCO capacity suffers from the same problems as a MOPR-only proposal that I discuss above. If the cap is binding, which it most likely would be immediately at a level of 6 GW, a portion of eligible capacity would not be able to elect the FRR-RS or RCO and would thus be subject to MOPR. As I discuss above, subjecting resources with state environmental support to the MOPR results in them being inserted into the RPM supply curve at an inefficiently high price, which results in unnecessarily inflated market clearing prices and an inefficient portfolio of cleared resources. This in turn creates additional over-procurement costs for states (if they are not deterred from pursuing state programs) and/or deprives the market of efficient zero-carbon resources. This is just as true if only a fraction of the resources receiving state environmental support are subjected to the MOPR (as they would be under a FRR-RS or RCO cap) as it is under a MOPR-only structure.

[19] Initial Brief of LS Power Associates, L.P., Oct 2, 2018 at 17.

67. A cap of 6 GW on FRR-RS or RCO capacity is likely to ultimately result in massive over-subscription to the point where it is likely to be essentially indistinguishable from a MOPR-only structure in practical terms. As an initial matter, there are approximately 7 GW of existing nuclear and renewables in the market currently receiving state support of some kind, so the cap is likely to be immediately binding based on current RCO-eligible resources only. Second, while only several nuclear facilities in PJM currently receive state support, many additional nuclear facilities are uneconomic under the current market structure but would likely be economic if compensated for their zero-emission attributes, or if a carbon price were implemented, making them efficient candidates for state support. Approximately 10 GW of nuclear not receiving state support failed to clear the most recent RPM BRA and much of the merchant nuclear that cleared is economically-challenged in the current market and could fail to clear in the RPM in future years. In addition to nuclear, PJM has estimated that an incremental 4 GW of renewable capacity (in UCAP terms) will need to enter the market through 2033 to satisfy state renewable energy mandates.[20] Thus, there is on the order of 14 GW of additional potential efficient zero-emission capacity that could seek to elect the RCO in the future, on top of the 7 GW that is likely eligible today, or a total of 21 GW of potential RCO capacity. Arrayed against these totals, a RCO cap of 6 GW would only cover about 30% of RCO capacity, which is not economically distinguishable from MOPR-only in terms of its practical effect.

68. Furthermore, in addition to advocating for the FRR-RS or RCO cap, LS Power also supports a MOPR with no exemption for public power and self-supply resources from vertically-integrated regulated utilities. I estimate that these two types of capacity amount to approximately 31 GW that currently clear through the RPM.[21] If these entities are included in the MOPR, the amount of capacity sharing the cap could thus reach 52 GW, and the cap would only cover a little over 10% of RCO capacity. In addition to the inefficiencies and costs this creates for resources supported by states for environmental resources, it would render the FRR-RS or RCO non-viable as an option for self-supply and public power entities and would likely force them to elect the existing FRR option, with all the disruptions and inefficiencies that that entails. Thus, a cap on

[20] Affidavit of Dr. Anthony Giacomoni on Behalf of PJM Interconnection, L.L.C., Docket No. ER-1314-000, April 9, 2018, ¶ 29.

[21] Declaration of Michael M. Schnitzer, Docket No. EL18-169-000, June 20, 2018, at 5.

FRR-RS or RCO resources effectively renders impossible a true non-discriminatory MOPR as envisioned in the Order.

IV. PJM'S EXTENDED RCO PROPOSAL RESULTS IN ECONOMICALLY INEFFICIENT PRICES, UNNECESSARILY RAISES COSTS FOR CONSUMERS, AND INAPPROPRIATELY TRANSFERS COSTS TO CLEAN RESOURCES

69. In addition to its Base Proposal, which does not adjust the prices that result from the application of the MOPR and RCO, PJM has proposed an alternative "Extended RCO" which retains the MOPR and RCO provisions of the Base Proposal but adds a second step that adjusts the resulting clearing prices paid to the resources in the RPM. This second "repricing" step is similar to PJM's prior capacity repricing proposal but contains additional provisions that make it even less economically efficient, more costly for consumers, and more destructive to legitimate state environmental goals.

70. To accomplish re-pricing, PJM first determines what resources clear the RPM from an initial clearing of the Base Residual Auction where the supply curve includes application of the MOPR for resources with actionable subsidies that do not elect the RCO, and insertion of the RCO resources into the supply curve as price-takers for those resources that do elect the RCO, with the demand curve not otherwise adjusted. Rather than using the market clearing prices resulting from this first step, however, for price determination purposes only under the Extended RCO, PJM simply removes the RCO resources from the supply curve altogether while leaving the demand curve as-is. The prices that result from this second market clearing step are paid to the non-RCO resources that clear the first step.

71. The re-pricing step will generally result in the market price clearing above the offers of some amount of resources which do not receive a capacity obligation in the initial step. These resources have been generally referred to as the "in-between" resources. To avoid potential distorted bidding incentives, PJM proposes that these resources receive an "infra-marginal rent" payment equal to the difference between the market clearing price and their bid price. These resources would not receive a capacity obligation and would be free to exit the market. PJM proposes that the cost of the infra-marginal rent payments be allocated to the RCO resources.

72. While broadly similar in concept to PJM's original Capacity Re-Pricing proposal that the Commission found to be unjust and unreasonable, the Extended RCO has three important

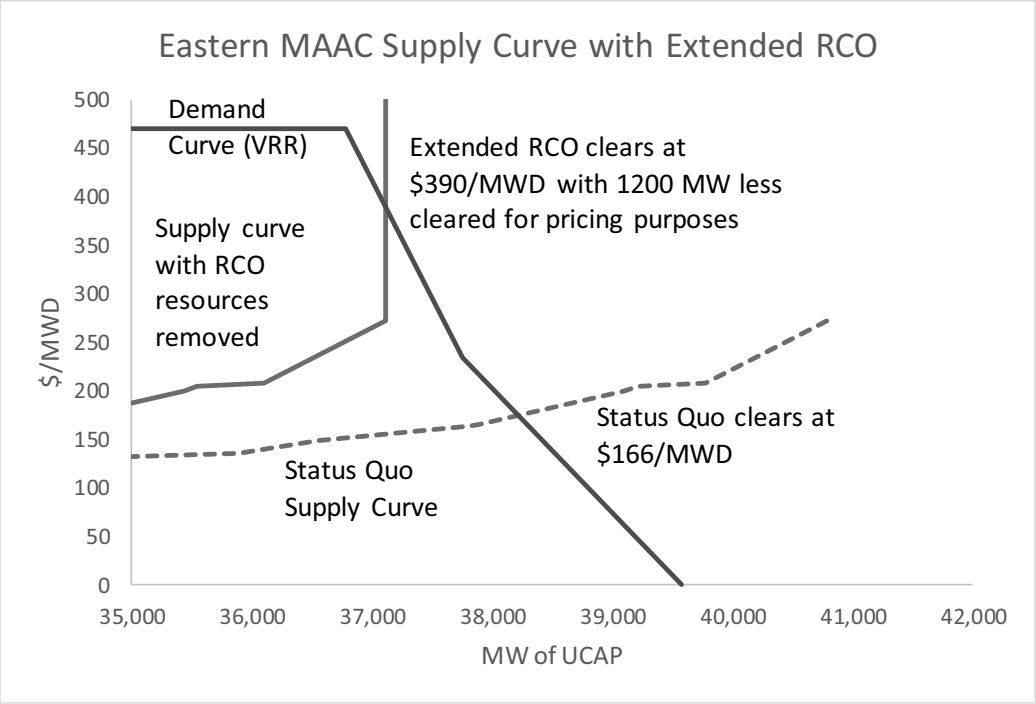
differences. First, in the original Capacity Re-Pricing proposal, all state resources that were determined to be receiving "actionable subsidies" and thus had their offers adjusted for purposes of price formation were paid the resulting market prices. Under the Extended RCO, RCO resources receive no compensation from PJM for capacity. Second, in the re-pricing step, the Capacity Re-Pricing proposal inserted resources with "actionable subsidies" into the supply curve at a competitive proxy price equal to the higher of the resource's net ACR or opportunity cost of committing as a Capacity Performance resource. The Extended RCO, on the other hand, removes RCO resources from the supply curve entirely, acting as if they do not exist even though PJM would be relying on the resources to meet reliability requirements. Third, unlike the Extended RCO, Capacity Re-Pricing did not include any infra-marginal rent payment for in-between resources. The first of these differences (non-payment of the clearing price to RCO resources) is not problematic in and of itself and is a natural consequence of the RCO structure. The total removal of RCO resources from the repricing step and the cost allocation methodology of the inframarginal rent payments, however, are deeply problematic and exacerbate the flaws already inherent in PJM's capacity repricing concept.

73. The core premise of the Extended RCO -that the prices resulting from PJM's Base Proposal are somehow wrong or inefficient -is simply incorrect. As I discuss above in my analysis of PJM's Base Proposal, with respect to resources receiving environmental support from states (which is essentially all current RCO-eligible resources), the resource offers, market clearing prices, and capacity resource selection that result from the combined application of the MOPR with appropriate election of the RCO for relevant resources are economically efficient and maximize social surplus. Any mechanism which inflates resource offers and results in different market clearing prices and/or different resource selection than PJM's Base Proposal creates inefficiencies and unnecessary costs for consumers. Relative to MOPR-only structures, to the extent that it does not deter states from supporting environmentally advantaged resources, the Extended RCO, like Capacity Repricing does result in the correct resource selection because resources receiving state environmental support may elect the RCO option and thus ensure that they receive a capacity obligation. However, because it effectively assigns an infinite offer price to RCO resources for purposes of price formation, the Extended RCO results in an inefficiently inflated set of market clearing prices which unnecessarily raise costs for consumers and send incorrect price signals to the market.

74. Even relative to the already inefficient and inflated prices produced by a MOPR-only approach or PJM's original Capacity Re-Pricing proposal, the Extended RCO stands out as producing potentially even more extreme price inflation. The reason for this is that by removing RCO resources from the supply curve entirely in the re-pricing step, PJM thus effectively sets their offers to an arbitrary infinitely high level. MOPR-only and Capacity Re-Pricing, by contrast, effectively insert the offers from RCO resources into the supply curve at a competitive proxy price, either a MOPR Floor Price based on the resources' net ACR or the higher of net ACR and the opportunity cost of committing as Capacity Performance, depending on the proposal. While these offer levels are unnecessarily inflated above the efficient level, they are nonetheless much more reasonable and lower than simply removing the offers altogether. Because of this, under the Extended RCO, the resulting supply curve for price determination purposes contracts inward by the amount of RCO resources with no offsetting change to the demand curve. Depending on the amount of RCO resources and other offers, it is possible for the market clearing prices that result to be greatly inflated and potentially even clear at the RPM price cap of 1.5 times Net CONE even if the market is not physically under-supplied. This outcome is particularly likely to occur in constrained LDAs where the amount of non-RCO offers may be limited, but it is also a possibility RTO-wide if enough resources elect the RCO. To illustrate the potential for extreme price inflation created by this provision, I have estimated how it would change the supply curves in the Eastern MAAC LDA if applied to the most recent RPM auction, assuming that all wind and solar and all nuclear resources receiving state support (a total of approximately 3.7 GW of capacity, of which about 3.0 GW cleared the market in the status quo) in this region elects the RCO and are thus removed from the supply curve used for price determination in the Extended RCO.[22] Figure 3 below shows how the supply curve, and ultimate market clearing prices would responds in EMAAC:

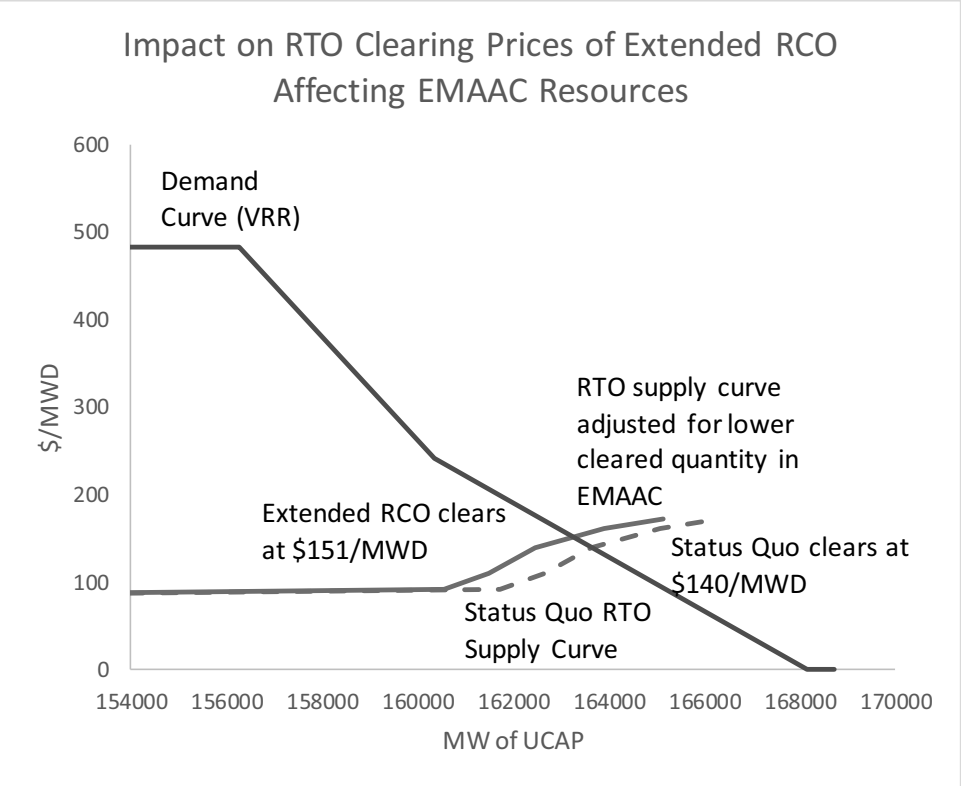
[22] Based on the amount of capacity currently receiving state support in the ComEd region and the 2021/22 supply curve, it is unclear whether the application of the Extended RCO would have significantly changed the market clearing price. If additional capacity were to receive state support in the ComEd LDA, or if a significant portion of the uncleared capacity were to retire, application of the Extended RCO would likely have a significant effect on ComEd market clearing prices.

Figure 3



75. Further, because the dramatic change in the EMAAC supply curve would reduce the total amount cleared in EMAAC for price formation purposes by about 1,200 MW, prices in the Rest of RTO would be affected because this supply would be effectively removed from the RTO supply curve. Figure 4 shows this effect:

Figure 4



76. The Extended RCO will thus drive up customer costs by greatly inflating the capacity price that all consumers in the region pay, to $390 per MW-day from the status quo EMAAC price of $166 per MW-day ($204 per MW-day in the PSEG portion of EMAAC). Further, prices in the broader RTO would also increase, albeit by a much smaller amount, which drives up costs for customers far removed from the state actually supporting the RCO resources. I estimate that based on the clearing prices shown in Figure 3 and Figure 4, relative to either the status quo or PJM Base Proposal, customers in EMAAC would pay approximately $2.1 billion per year due to higher capacity prices (which would roughly double the capacity payments of customers in EMAAC).[23] In addition, while the loads matched to RCO capacity would need to continue to compensate that

[23] Under the status quo, a total of 29.3 GW of resources cleared in EMAAC at a blended average price of $173 per MW-day ($204 per MW-day for PSEG resources and $166 per MW-day for Rest of EMAAC resources). Of these resources, I estimate that just3 GW of nuclear and renewables would be eligible to elect the RCO and would be effectively compensated at the status quo price level from states or other LSEs via the RCO mechanism, an additional 700 MW of nuclear resources that did not clear the market and would also elect the RCO. Under the extended RCO, I estimate then that 26.3 GW of resources would be cleared in the RPM (the status quo cleared resources less the 3 GW of cleared resources electing the RCO) at a price of $390 per MW-day. Incremental to the status quo, this results in additional customer costs of $2.076 billion due purely to increased prices paid to cleared resources. In the Rest of RTO, just 102 GW of resources cleared at $140 per MW-day. These resources are paid an additional $11 per MW-day due to prices rising to $151/MWD under Extended RCO, or $430 million annually.

capacity outside the RPM, under the Extended RCO proposal, the RCO resources would be allocated the costs of the infra-marginal rents paid to in-between resources. I estimate that, again based on the example shown in Figure 3, PJM would pay out $120 million per year in infra-marginal rents allocated to the RCO resources.[24] Ultimately, if these infra-marginal rents are allocated to the RCO resources, these costs would either be borne by the associated matched load, or would result in those resources existing the market. Thus, incremental to PJM's Base Proposal, the Extended RCO raises would have raised costs for EMAAC customers by about $2.1 billion per year due to inflated market prices if it were in place for the 2021/22 BRA, and further would have allocated incremental infra-marginal rent payments of about $120 million per year to consumers in the states supporting RCO resources, for a total cost to consumers in EMAAC of about $2.2 billion. In addition to this, the increased prices in the rest of RTO region would have raised costs for consumers outside of EMAAC by about $430 million, despite these customers being far removed from the RCO resources in question. Thus, the total cost to consumers in all regions of Extended RCO would have been $2.6 billion. These costs are both unnecessary and inefficient.

77. If, rather than eliminating the RCO resources from the supply stack entirely for price formation purposes, the RCO resources were re-entered into the supply stack at their MOPR Floor prices, the overall cost impact of the Extended RCO would be approximately the same as the market price impact associated with MOPR-only proposals that I calculated in the previous section, or about $800 million annually for EMAAC and Rest of RTO customers. If the value of the zero-emission attributes of RCO resources (valued at the Social Cost of Carbon) were deducted from the MOPR Floor price of the RCO resources for the purposes of the re-pricing step, which, as I discuss previously, produces the most economically-efficient offer price for these resources, the Extended RCO would not have an incremental cost (assuming all RCO resources are economic

[24] Based on the shape of the PSEG and EMAAC supply curves indicated in the RPM sensitivities provided by PJM (*See* https://www.pjm.com/-/media/markets-ops/rpm/rpm-auction-info/2021-2022/2021-2022-bra-scenario-analysis.ashx?la=en), I estimate that that the Extended RCO would result in 521 MW and 1,271 MW of "in-between" resources in PSEG and Rest of EMAAC respectively, with average bid prices of $207 and $213 per MW-day respectively, which results in an average infra-marginal rent payment of $178 per MW-day to a total of 1,792 MW of resources, resulting in a total payment of $117 million. I estimate that there would be an additional 800 MW of in-between resources in the Rest of RTO, but the infra-marginal rent payment to these resources would only be about $5 per MW-day, resulting in additional costs of $2 million, or $119 million total.

and clear once environmental attributes are explicitly incorporated into their offers) and would produce market prices similar to PJM's Base Proposal.

78. The aspect of PJM's Extended RCO proposal that would allocate the infra-marginal rent payments to resources electing the RCO is both economically backward and creates an inappropriate impediment to the workability of the RCO for states seeking to support clean resources. PJM claims that the reason to allocate these costs to the RCO resources is because the RCO resources cause "resource substitution" whereby they displace other resources that would have been economic had the RCO resources offered at a price level that did not incorporate they value of their state payments. These resources are conceptually the same as the in-between resources paid infra-marginal rents under the Extended RCO, and because they do not clear due to the RCO resources, PJM claims that the infra-marginal rents are a measure of inefficiency or "deadweight loss" attributable to the RCO resources, and are thus appropriately allocated to those resources.[25] This reasoning is completely backwards. As I have discussed in depth, the state payments in question that result in resources electing the RCO in the first place are intended to at least partially correct a distortion that exists in the current market, namely the fact that carbon-emitting resources are not charged for the public costs of those emissions, and thus appear cheaper, and are utilized more frequently than they would be in both energy and capacity markets than they would in the presence of a carbon price. Because of this, there is considerable deadweight loss in markets attributable to this inefficiency that primarily takes the form of economic damage from emissions from dirty resources in excess of the efficient level that would prevail if there were a price on carbon. The "resource substitution" whereby RCO resources displace non-RCO resources, thus reduces deadweight loss, or inefficiency relative to the status quo. PJM's witness Chao in fact acknowledges this. Dr. Chao notes that if a "marginal divergence" or difference between the public and private costs of a resource (such as occurs in electricity markets today due to emissions characteristics of different resources) is caused by a market imperfection or externality (as is generally accepted to be the case with the failure of markets to value carbon), then it is not considered a distortion.[26]

[25] Initial Submission of PJM Interconnection, L.L.C., Oct 2, 2018, at 72.

[26] Affidavit of Hung-Pao Chao, Ph.D. on Behalf of PJM Interconnection LLC, Oct 2, 2018, ¶ 5.

79. Thus, by allocating the infra-marginal rent payments to RCO resources receiving state support for environmental reasons, PJM is effectively imposing an additional charge on them and their sponsoring state for providing net benefits to the market as a whole. This is clearly inappropriate and creates an unnecessary and damaging impediment to states seeking to support economically-efficient zero-emission resources. To the extent that this provision deters states from pursuing these programs, such resources will either exit or never enter the market, thus creating additional deadweight losses for all market participants.

80. While the Extended RCO, with its attendant inframarginal rent payments, is unnecessary because PJM's Base Proposal reduces, rather than increases inefficiency and deadweight loss in the market, to the extent that Extended RCO is adopted, the RCO resources should be placed into the supply curve at their MOPR floor price, preferably adjusted for SCC, and the cost of infra-marginal rent payments should be allocated to the non-RCO resources that do clear the market. This repricing approach would produce lower prices and be more efficient than PJM's Extended RCO proposal.

81. At their core, PJM's Extended RCO proposal and the various MOPR-only proposals all ask the Commission to implicitly conclude that all retention/entry associated with state-sponsored resources is uneconomic. For the assumption of uneconomic retention/entry is the only thing that might justify either result. That stands in stark contrast to the Commission's intent to accommodate state interests, and to the undeniable state jurisdiction over resource adequacy, should they choose to assert it. It also flies in the face of the evidence offered here that the state-sponsored resources comprise, in the main, economic entry/retention when environmental attributes are taken into account. This core failing is the primary reason that both proposals produce such economically inefficient outcomes with unnecessary price inflation, and also clearly frustration of states' rights and violate the intent of the Commission's Order. For this reason, the Commission should reject all the proposals that fall in these categories.

82. This concludes my declaration.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

State Policies and Wholesale Markets Operated by ISO New England Inc., New York Independent System Operator, Inc., and PJM Interconnection, L.L.C.

Docket No. AD17-11-000

PRE-TECHNICAL CONFERENCE COMMENTS OF EXELON CORPORATION

Exelon commends the Commission for opening a dialogue on how wholesale markets should evolve in light of state environmental priorities. In Exelon's view, the Commission could take one of two main approaches.

First, the Commission could continue to operate wholesale market auctions that select resources according to least-cost principles, against a backdrop of state environmental policies that address the environmental externalities of electric generation by altering the economics of generators based on their level of emissions. States have adopted a wide variety of such programs, including renewable energy credit (REC) trading programs to support state renewable portfolio standards, carbon cap-and-trade programs such as the Regional Greenhouse Gas Initiative (RGGI), and the zero-emission credit (ZEC) programs recently created by New York and Illinois, which value the environmental attributes of nuclear power. Each of these state programs addresses the environmental externalities of electric generation by penalizing pollution or promoting clean energy production. Historically, the Commission's wholesale markets have been agnostic as to environmental externalities, and states have decided for themselves how, and whether, to address them. The Commission could continue that course, while leaving open the possibility of future market reforms if there is evidence that competitive generation investment is inadequate to ensure reliability.

Second, the Commission could allow independent system operators (ISOs) or regional transmission organizations (RTOs) to file tariffs that integrate states' environmental goals into the wholesale market. ISOs and RTOs could do so in a number of different ways, ranging from a centralized procurement of environmental attributes identified by the states to the inclusion of a carbon or pollution adder in wholesale energy bids. ISOs and RTOs could also craft a combination of these two main approaches, integrating state environmental goals in part, while leaving states free to pursue different or more stringent environmental goals in the way states currently do and always have done. Section 205 of the Federal Power Act grants the Commission the authority and flexibility to accept ISO or RTO tariff revisions implementing these integrative solutions.

The Commission may not, however, undermine or interfere with states' ability to achieve their environmental goals. State environmental programs fall comfortably within the states' inherent police powers and relate to states' core sovereign interests in protecting the health and safety of their citizens.[1] If the Commission requires states to forgo their sovereign power to make their own environmental policy

as the price of admission to the federal wholesale markets, states may rethink their participation in these markets. The Commission should avoid forcing states to make such a choice.

I. The Commission's Wholesale Markets Can Continue to Coexist in Harmony With State Environmental Initiatives.

The Federal Power Act reserves for states the authority to regulate generation facilities,[2] and the Commission has already affirmed that states may support particular generation resources that advance states' legitimate policy interests, including environmental protection. The Commission has found that states "may … grant loans, subsidies[,] or tax credits to particular facilities on environmental or policy grounds,"[3] and may "encourage renewable or other types of resources … by giving direct subsidies," even when doing so "allow[s] states to affect the [wholesale] price."[4] Indeed, states are "free" to incentivize clean generation in these ways "even if the price signals in the regional wholesale capacity market indicate that [those] resources are [not] needed."[5] Responding to these precedents, states in the Eastern RTOs have adopted a variety of programs that favor clean generation, including REC/ZEC programs, carbon cap-and-trade programs, state-directed bilateral procurements, and tax and development incentives. Moreover, with respect to REC programs and other renewable subsidies, there is no natural ceiling constraining the size of these programs.[6] Particularly as storage technology improves, states can be expected to mandate that an ever-growing share of their generation fleets consists of renewable resources. New York has set its goal to have half its electricity generation come from renewable resources by 2030, and other states have likewise set aggressive goals.[7] The Commission has modified its rules to accommodate these initiatives, by exempting new renewables from minimum offer price rules that otherwise apply to new entrants and by approving increasingly negative price floors to enable sellers to realize the full value of their environmental attribute payments.[8]

Illinois and New York have recognized that existing nuclear facilities provide significant environmental value to their states by displacing carbon and air pollution that would otherwise occur if these plants retired and were replaced by fossil fuel generation. Like the environmental benefits of renewable generation, the environmental benefits of nuclear generation are not addressed by the wholesale markets; instead, states have been left to address those issues.

Shumlin*, 733 F.3d 393, 417 (2d Cir. 2013); *Conn. Dep't of Pub. Util. Control v. FERC*, 569 F.3d 477, 481 (D.C. Cir. 2009) (states may "require retirement of existing generators, [require construction of] expensive, environmentally-friendly units, or … take any other action in their role as regulators of generation facilities," even though "those choices … affect[] the [wholesale] market clearing price").

[6] Indeed, in all of the Eastern RTOs, the amount of state-supported renewable generation and rate-regulated generation in 2025 will exceed by a significant margin the amount of ZEC-supported generation, based on current renewable targets. *See* Exhibit A.

[7] Illinois' renewable energy targets roughly double between 2017 and 2025 to 25 percent of load. *See* 20 ILCS 3855/1-75(c)(1)(B) (eff. June 1, 2017). Massachusetts has set a renewable energy target of 28.6% by 2030, Mass. Gen. Laws ch. 25A § 11F; 225 C.M.R. § 15.07. Other New England states seek to procure similar quantities. *See generally* www.dsireusa.org.

[8] *California Indep. Sys. Operator Corp.*, 145 FERC ¶ 61,254, at PP 5, 34 (2013) (approving CAISO proposal to lower its "bid floor" in the energy markets "from negative $30/MWh to negative $150/MWh" in order to permit "variable energy resources" to submit bids accounting for "production tax credits, renewable energy credits, and contractual energy payments"); *ISO New England Inc.*, 146 FERC ¶ 61,084, at P 32 (2014) (rejecting argument that REC revenues are out-of-market, and approving reduction of ORTP for new renewable resources to account for REC revenues).

The environmental problem addressed by ZEC programs is both clear and urgent. When a nuclear facility retires, it cannot feasibly be replaced by renewable generation in the time necessary to avoid a spike in emissions. Instead, it will be replaced predominantly by fossil fuel-fired plants emitting significant carbon and other air pollution. Germany's and California's recent experiences illustrate the problem. After Germany prematurely retired its nuclear fleet, it saw a massive increase in emissions despite investing in new renewable generation to such a degree that its electricity rates are now among the world's highest. In California, the closure of the San Onofre nuclear plant in early 2012 resulted in an increase in emissions that more than offset all of California's investment to date in wind, solar, and biomass generation.[9] New York similarly found that replacing its nuclear fleet would require that it triple its already-aggressive energy efficiency targets or construct "9,000 MW of onshore wind or 22,000 MW of solar," which "is virtually impossible to deploy . . . in the short-term."[10] By valuing at-risk nuclear plants' environmental benefits, ZEC programs provide a necessary bridge that allows states to decarbonize their electricity sector consistently and cost-effectively over time.

ZEC programs, like other state environmental programs including REC programs,[11] complement the efficiency of FERC's wholesale markets by addressing the environmental externalities that result from generation. Fossil-fuel generation emits pollution, a negative externality. The private cost of generating electricity using fossil fuels is therefore much lower than the social cost, and the market outcome is accordingly unlikely to be efficient. Because of this distortion, wholesale market prices create the appearance that at-risk nuclear units are not efficiently competitive, but that appearance is misleading: at-risk nuclear units are competitive once the environmental benefits they provide to society are considered. Basic economics teaches that a tax or subsidy could correct this market inefficiency by internalizing the negative or positive externalities of electricity generation.[12] Moreover, ZEC programs have been designed to harmonize with wholesale markets. The value of a ZEC is capped at the value of the environmental externality being abated, which the states have determined to be equal to the social cost of carbon. The programs thus are not intended to, and cannot, replace lost wholesale revenues if wholesale prices drop. Moreover, payments are made only to those generators whose environmental benefits would otherwise be lost. This is indistinguishable from REC programs, which likewise compensate renewable generators that would not be economic (and thus whose environmental benefits would not exist) but for revenues from selling renewable energy credits. And state environmental

[10] *See* N.Y. Pub. Serv. Comm'n, Order Adopting a Clean Energy Standard at 127, Docket No. 15-E-0302 (Aug. 1, 2016).

[11] The ZEC programs are modeled on the features of REC programs that make such programs fall within state jurisdiction. As the Commission has explained, a REC "certif[ies] that electric energy was generated pursuant to certain requirements and standards." *WSPP, Inc.*, 139 FERC ¶ 61,061, at P 21 (2012). RECs are therefore "separate commodities" that "are *not* compensation for capacity and energy." *Cal. Pub. Utils. Comm'n*, 133 FERC ¶ 61,059, at P 31 n.62. The Commission has held that when RECs are sold unbundled from capacity and energy, they fall outside the Commission's jurisdiction. *WSPP*, 139 FERC ¶ 61,061 at P 24. ZEC programs follow this well-trodden path. ZECs, like RECs, certify that electricity was produced in a particular way—by a zero-emissions nuclear facility. And ZECs are sold unbundled from any wholesale sale of electricity. Under *WSPP*, that means ZECs (like RECs) fall outside the Commission's jurisdiction.

The Commission's reasoning in *WSPP* is supported by that of the Supreme Court in *Hughes v. Talen Energy Marketing, LLC*, 136 S. Ct. 1288 (2016). *Hughes* held that a state illegally "sets an interstate wholesale rate" when it expressly conditions a state payment on completion of a wholesale sale. *Hughes*, 136 S. Ct. at 1297. A program that "does not condition payment of funds on capacity clearing the auction" would not suffer the "fatal defect" that doomed the program in *Hughes*. *Id.* at 1299. Thus, "measures" to "encourage" clean generation, "including tax incentives, land grants, direct subsidies," as well as REC and ZEC programs, fall on the permissible side of the line, because they do not condition payment on "a generator's wholesale market participation." *Id.* at 1299 (quoting Br. for Resp't 40).

SI-SSA-0010-6529

programs of this kind have contributed to resource adequacy and have not chilled merchant investment.[13]

Accordingly, FERC could simply maintain the status quo, in which wholesale markets optimize for resource adequacy against a backdrop in which states adopt their own environmental policies aimed at addressing the environmental externalities of generation.

II. The Commission Can Grant ISOs And RTOs Flexibility To Integrate State Policies And Wholesale Markets On A Regional Basis.

Alternatively, if the Commission chooses to create a pathway for states to achieve their environmental goals through wholesale markets, it should permit ISOs and RTOs the flexibility to integrate state goals in a manner that respects divergent state policy choices and regional priorities. Such an approach has the greatest potential to achieve both cost savings and stakeholder support, avoiding the litigation that has proliferated around these issues. The approach that receives the most support among economists is imposing a carbon price on emitting resources dispatched through the RTOs. The RTO would administer the carbon price on behalf of the states at a level agreed upon by the states to achieve their goals. Such an approach would internalize the environmental costs of carbon pollution and reward lower emitting resources, obviating the need for state programs to support such resources.

While it would be most efficient if an entire region participated, a multi-state RTO could also permit states to opt in or out to respect differing state policy choices. For example, an RTO could apply a border adjustment similar to the tariff provisions the Commission has already approved for the California ISO. Under this approach, the RTO would add a constraint that requires all load in carbon-pricing zones to be matched with an equal amount of generation across the RTO. Generators selected to serve the load in carbon-pricing zones would be charged for emissions; generators selected to serve the load in non-carbon pricing zones would not be charged. Effectively, such a border adjustment provision creates a new "carbon obligation" market that is analogous to a reserve constraint and is co-optimized with the energy market, as reserves are today. This solution will integrate states' environmental goals efficiently and is fair to customers in neighboring states that choose not to price carbon.[14] A border adjustment of this kind is necessary; otherwise, as RGGI has demonstrated, carbon-pricing states face difficulty achieving their environmental goals due to the "leakage" of emissions from non-carbon states, and consumers in non-participating states experience price increases due to the policies adopted by the carbon-pricing states.

We note that PJM, in its pre-technical conference comments, identifies a regional or subregional carbon price as its primary initiative. The NYISO is also studying the effects of such an approach, and the Integrating Markets and Public Policy effort in the ISO-NE region has examined the same concept. The Commission should encourage these efforts and, as described below, provide a forum for them to be cultivated. In addition, the Commission should encourage the RTOs to redouble their efforts on energy market price formation to ensure that all units that are needed to serve load are permitted to set LMP. Under current market rules, energy prices do not always reflect the true economic marginal cost of the resources operating on the system, which contributes to the economic challenges currently faced

[13] In PJM, for example, the last five Base Residual Auctions have resulted in nearly 25 GW of new gas capacity. And that is despite the fact that PJM continues to have large reserve margins—22.4% in the last Base Residual Auction, compared to a target reserve margin of 16.5%. *See* PJM Interconnection, L.L.C., *2019/2020 RPM Base Residual Auction Results* at 1, 24, http://www.pjm.com/~/media/markets-ops/rpm/rpm-auction-info/2019-2020-base-residual-auction-report.ashx.

[14] The California ISO, along with its stakeholders, is currently evaluating enhancements to its border adjustment system that would assign a carbon obligation only to the portion of external generation that incrementally serves California load relative to a no-import baseline. If successfully implemented, this enhancement is likely to further improve the efficacy of border adjustments in reducing emission leakage and enhancing the quality of the carbon price signal. It could serve as an improved template for other RTOs in developing their own border adjustment systems.

by many nuclear resources. Correcting this flaw in price formation has the potential to more appropriately value nuclear resources' contribution to reliable operations and greatly diminish the need for additional state programs to preserve existing nuclear plants' environmental attributes.

III. Mitigating Resources Receiving Support Through State Environmental Programs Is Inappropriate And Imposes Needless Costs On Consumers.

Buyer-side mitigation rules are aimed at large buyers seeking to suppress market prices by introducing new, uneconomic supply.[15] But environmental programs like ZEC programs do not fit that description. First, in ZEC and REC programs, the state is purchasing a separate environmental attribute, so ZECs and RECs are not tied to energy or capacity sales. A price-suppression mechanism would clearly condition payment on participation in the capacity market. Second, the value of a ZEC is capped at the social cost of carbon, so the ZEC program is cost-justified based solely on the state's record-based determination of its environmental benefit—unlike a price-suppression mechanism, in which the anticipated price-suppression benefits would be necessary to render the program cost-effective. ZEC facilities also still bear market risk. A price-suppression mechanism would guarantee sufficient revenues for the uneconomic supplier to remain in the capacity market. Environmental programs like ZEC programs thus are not vehicles for price suppression.[16]

Instead, to the extent clean energy resources are paid for their environmental benefits, they have lower going-forward costs and should be permitted to offer accordingly. Commission orders have long recognized as much. The Commission has approved the deduction of revenues from REC payments in the calculation of the offer-review trigger price,[17] and has approved CAISO's proposal to lower its energy "bid floor" to permit "variable energy resources" to offer at extremely low prices because they "generally receive, in addition to market revenues … renewable energy credits …."[18] The Commission thus has recognized that renewable resources receive significant compensation for their environmental attributes, but instead of mitigating them, it approved a change in the energy market offer rules to allow them to account for that compensation in their offers.

That makes sense. States could pursue these same ends in a number of ways, including emissions controls or an emissions tax. Yet the Commission would not mitigate the offers of clean resources that are exempt from emissions controls or taxes, even though those resources could underbid polluting resources because they are not so regulated. Nor should the Commission mitigate clean resources in the parallel situation when they could underbid polluting resources because they receive payments for their environmental services.

IV. Regional Technical Conferences Would Be the Appropriate Next Step.

The Commission has a critical role to play in supporting the evolution of wholesale markets to address the policy goals of the states. Exelon recommends that the Commission hold regional technical conferences to facilitate further discussion among states, RTOs, and stakeholders. At these conferences, FERC and its staff should be prepared to provide guidance regarding the Commission review process for any market rule changes developed. While it is clear that the Commission would prefer a negotiated solution, such negotiations may only be possible with such preliminary guidance from the Commission.

RE: PSEG Energy Resources & Trade LLC
Docket Nos. ER15-1882-000 and ER15-1882-001
Compliance Filing Pursuant to Letter Order Issued February 24, 2016

Dear Secretary Bose:

On February 24, 2016 the Federal Energy Regulatory Commission ("FERC" or "Commission") issued a letter order[1] approving the Unilateral Offer of Settlement filed in this docket by PSEG Energy Resources & Trade LLC ("PSEG ER&T) on December 23, 2015. The Offer of Settlement resolved all pending issues arising from PSEG ER&T's submittal of its cost-based revenue requirement for providing Reactive Supply and Voltage Control from Generation or Other Sources Service ("Reactive Power") owned by PSEG Fossil LLC ("PSEG Fossil").

In compliance with the Commission's directive, PSEG ER&T hereby submits under cover of this letter in eTariff format its First Revised Rate Schedule FERC No. 3 ("Rate Schedule"), which was approved by the Commission in its February 24 order and which replaces current PSEG ER&T Rate Schedule FERC No. 3. PSEG ER&T also submits a redlined version of its Rate Schedule showing the changes being made to the as-filed version of the rate schedule. PSEG ER&T proposes that, consistent with the Commission's order approving the Offer of Settlement, the Rate Schedule become effective on January 7, 2016. To the extent necessary, PSEG ER&T respectfully request waiver of the notice requirement in Section 35.3 of the Commission' Regulations, 18 C.F.R. § 35.3 (2015), to allow the revised rate schedule to become effective on January 7, 2016.

Please contact the undersigned if there are any questions concerning this submittal.

Respectfully submitted,

By: *Hesser G. McBride, Jr.*

Marked Tariff

~~PSEG ENERGY RESOUCES & TRADE LLC~~

~~RATE SCHEUDLE FERC NO. 3~~

Reactive Supply and ~~voltage~~ Voltage Control from Generation Sources Service

PSEG Energy Resources & Trade LLC ("PSEG ER&T") provides Reactive Supply and Voltage from Generation Sources Service ("Reactive Supply Service") from various generating facilities to the PJM Interconnection, LLC ("PJM") system. This Rate Schedule, which consists of seventeen separate tariff sections for each of PSEG ER&T's generating facilities, sets forth PSEG ER&T's revenue requirements for the provision of Reactive Supply Service to PJM, as contemplated by Schedule 2 of the PJM open access transmission tariff.

PSEG ER&T's total monthly revenue requirement consists of the sum of the charges for the following: (1) the Fixed Capability Revenue Requirement; and (2) the Heating Losses Component~~. Total charges~~ for ~~any 12 month period will not be less than~~each of its generating facilities. The Fixed Capability Revenue Requirement:~~-~~ the ~~sum of~~ Heating Losses Component, and the ~~annual charges specified~~ Total Revenue Requirements for each generating facility is set forth in the Rate Schedule below. This Rate Schedule and its separate sections shall be effective upon the date authorized by the Federal Energy Regulatory Commission.

Nothing contained herein shall be construed as affecting in any way the right of PSEG ER&T to unilaterally make application to the Federal Energy Regulatory Commission for a change in rates under section 205 of the Federal Power Act and pursuant to the Commission's Rules and Regulations promulgated thereunder. If PSEG ER&T seeks to change one of the revenue requirements stated herein, it will abide by relevant FERC procedures for changes in rates and notify PJM in accordance with any notice requirement in the PJM Tariff.

~~**MONTHLY REVENUE REQUIREMENT:**~~

~~**1. FIXED CAPABILITY COMPONENT**~~

~~The annual revenue requirement for the Fixed Capability Component is $25,750,450.~~

~~The monthly charge to PJM is $25,750,450 / 12 = $2,145,871~~

~~**2. HEATING LOSSES COMPONENT**~~

~~The annual revenue requirement for the Heating Losses Component is $876,337.~~

~~The monthly charge to PJM is $$876,337 / 12 = $73,028.~~

~~**3. TOTAL REVENUE REQUIREMENT**~~

~~Total Annual Revenue Requirement is $25,750,450 + $876,337 = $26,626,787~~

20160317-5036 FERC PDF (Unofficial) 3/17/2016 10:28:06 AM

~~Total Monthly Revenue Requirement is $26,626,787 / 12 = $2,218,899.~~

Reactive Supply and Voltage Control from Generation Sources Service

PSEG Energy Resources & Trade LLC ("PSEG ER&T") provides Reactive Supply and Voltage from Generation Sources Service ("Reactive Supply Service") from various generating facilities to the PJM Interconnection, LLC ("PJM") system. This Rate Schedule, which consists of seventeen separate tariff sections for each of PSEG ER&T's generating facilities, sets forth PSEG ER&T's revenue requirements for the provision of Reactive Supply Service to PJM, as contemplated by Schedule 2 of the PJM open access transmission tariff.

PSEG ER&T's total monthly revenue requirement consists of the sum of the charges for the following: (1) the Fixed Capability Revenue Requirement; and (2) the Heating Losses Component for each of its generating facilities. The Fixed Capability Revenue Requirement: the Heating Losses Component, and the Total Revenue Requirements for each generating facility is set forth in the Rate Schedule below. This Rate Schedule and its separate sections shall be effective upon the date authorized by the Federal Energy Regulatory Commission.

Nothing contained herein shall be construed as affecting in any way the right of PSEG ER&T to unilaterally make application to the Federal Energy Regulatory Commission for a change in rates under section 205 of the Federal Power Act and pursuant to the Commission's Rules and Regulations promulgated thereunder. If PSEG ER&T seeks to change one of the revenue requirements stated herein, it will abide by relevant FERC procedures for changes in rates and notify PJM in accordance with any notice requirement in the PJM Tariff.

Re: PSEG Energy Resources & Trade, LLC
Docket No. ER17-1054-00_
Reactive Supply and Voltage Control from Generation or Other Sources – Schedule 2 PJM Tariff – Cancelation of tariff record

Dear Secretary Bose:

This filing is being made on behalf of PSEG Energy Resources & Trade ("PSEG ER&T"). PSEG ER&T provides reactive power service from various PSEG ER&T affiliated generating units pursuant to tariffs on file with the Federal Energy Regulatory Commission ("Commisssion", "FERC). As a result, PSEG ER&T receives reactive power service revenue requirements from PJM.[1]

Through conversations with FERC Staff and review of the Commission's eTariff website, we have learned that certain tariff sections PSE&G's Reactive Power Schedule that should have been cancelled by a prior filing are currently on file. The specific tariff records that should have been cancelled are identified below.

The relevant tariff sections that need to cancelled are as follows:

- 1250 Rate Schedule No. 3, Sheet 02
- 2250 Bergen 1, Sheet 3
- 3250 Bergen 2, Sheet 4

[1] On February 24, 2016, the Commission issued an order approving an offer of settlement revising PSEG ER&T's Schedule FERC No. 3 (Reactive Power Schedule) which sets forth the revenue requirement for the provision of Reactive Supply and Voltage Control from Generation Sources Service by facilities owned by PSEG Fossil LLC and PSEG Nuclear LLC. See *PSEG Energy Resources & Trade, LLC*, 154 FERC ¶ 63,008 (2016) ("Settlement Order"). On March 17, 2016, PSEG ER&T submitted tariff revisions[1] to comply with the Settlement Order. On April 14, 2016, the Commission issued an order accepting the tariff revisions submitted on March 17, 2016. See *PSEG Energy Resources & Trade, LLC*, Docket No. ER 1882-002, Order Accepting Compliance filing, April 14, 2016.

20170426-5252 FERC PDF (Unofficial) 4/26/2017 2:34:16 PM

- 4250 Linden 1 & 2, Sheet 5
- 5250 Hudson 2, Sheet 6
- 6250 Mercer 1, Sheet 7
- 7250 Mercer 2, Sheet 8
- 8250 Conemaugh 1 & 2, Sheet 9
- 9250 Keystone 1 & 2, Sheet 10
- 10250 Salem 1 & 2, Sheet 11
- 11250 Hope Creek 1, Sheet 12
- 12250 Peach Bottom 1 & 2, Sheet 13
- 13250 Sewaren 1 - 4, Sheet 14
- 14250 Burlington 12, Sheet 15
- 15250 Essex 9, Sheet 16
- 16250 Kearny 12, 13, 14, Sheet 17
- 17250 Linden 5, 6, 7, 8, Sheet 18
- 18250 Yards Creek, Sheet 19

We are hereby submitting an electronic tariff filing that cancels the above-refernced records.

Conclusion

PSEG ER&T respectfully requests that the Commission accept this filing to cancel the above-referenced tariff records.

Respectfully submitted,

Hesser G. McBride

Hesser G. McBride

Reactive Supply and Voltage Control from Generation Sources Service

PSEG Energy Resources & Trade LLC ("PSEG ER&T") provides Reactive Supply and Voltage from Generation Sources Service ("Reactive Supply Service") from various generating facilities to the PJM Interconnection, LLC ("PJM") system. This Rate Schedule which consists of seventeen separate tariff rate sections for each of PSEG ER&T's generating facilities sets forth PSEG ER&T's revenue requirements for the provision of Reactive Supply Service to PJM, as contemplated by Schedule 2 of the PJM open access transmission tariff.

PSEG ER&T's total monthly revenue requirement consists of the sum of the charges for the following: (1) the Fixed Capability Revenue Requirement; and (2) the Heating Losses Component for each of its generating facilities. The Fixed Capability Revenue Requirement; the Heating Losses Component, and the Total Revenue Requirement for each generating facility is set forth in the Rate Schedule sections below. This Rate Schedule and its separate sections shall be effective upon the date authorized by the Federal Energy Regulatory Commission.

Nothing contained herein shall be construed as affecting in any way the right of PSEG ER&T to unilaterally make application to the Federal Energy Regulatory Commission for a change in rates under section 205 of the Federal Power Act and pursuant to the Commission's Rules and Regulations promulgated thereunder. If PSEG ER&T seeks to change one of the revenue requirements stated herein, it will abide by relevant FERC procedures for changes in rates and notify PJM in accordance with any notice requirement in the PJM Tariff.

BERGEN 1 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $2,925,105.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $28,652.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $2,925,105 + $28,652 = $2,953,757.

Total Monthly Revenue Requirement is $2,953,757 / 12 = $246,146.

Record Content Description, Tariff Record Title, Record Version Number, Option Code:

Proposed Date: 2016-01-07
Priority Order: 600
Record Change Type: Cancel
Record Content Type: 1
Associated Filing Identifier: 114

BERGEN 2 GENERATING FACILITY

1. FIXED CAPABILITY COMPONENT

The annual revenue requirement for the Fixed Capability Component is $2,330,193.

2. HEATING LOSSES COMPONENT

The annual revenue requirement for the Heating Losses Component is $31,021.

3. TOTAL REVENUE REQUIREMENT

Total Annual Revenue Requirement is $2,330,193 + $31,021= $ 2,361,214.

Total Monthly Revenue Requirement is $2,361,214 / 12 = $ 196,768.

Re: PSEG Energy Resources & Trade, LLC
Docket No. ER15-1882-003
Reactive Supply and Voltage Control from Generation or Other Sources – Schedule 2 PJM Tariff – Cancelation of tariff record

Dear Secretary Bose:

On April 26, 2017, PSEG Energy Resources & Trade LLC ("PSEG ER&T") submitted a filing in the eTariff system in the above captioned matter (Accession No.: 20170426-5252). PSEG ER&T hereby submits for filing a withdrawal of the filing. Because of a coding error, this filing was inadvertently filed in a closed docket.

PSEG ER&T respectfully requests that the Commission withdraw the filing (Accession No.: 20170426-5252).

Respectfully submitted,

Hesser G. McBride

RE: PSEG Energy Resources & Trade LLC
Docket Nos. ER15-1882-000 and ER15-1882-001
Filing of Unilateral Offer of Settlement

Dear Secretary Bose:

Pursuant to Rule 602 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("FERC" or "Commission"), 18 C.F.R. § 385.602 (2015), PSEG Energy Resources & Trade LLC ("PSEG ER&T") hereby submits under cover of this letter a unilateral Offer of Settlement in this docket. The Offer of Settlement, if approved by the Commission without condition or modification (or if approved subject to one or more conditions or modifications that are acceptable to PSEG ER&T), will resolve the matter set for hearing by the Commission in its "Order Accepting and Suspending Proposed Rate Schedule and Establishing Hearing Procedures" issued August 7, 2015.[1]

The following documents are submitted herewith in support of PSEG ER&T's Offer of Settlement:

1. The Offer of Settlement;
2. Explanatory Statement;
3. Revised Tariff Sheet (in clean and redline format);
4. Draft of notice of filing of the Offer of Settlement;
5. Draft of letter order approving the Offer of Settlement; and
6. Certificate of service.

PSEG ER&T requests that this Offer of Settlement and supporting materials be promptly transmitted to the Honorable Steven A. Glazer, who is serving as Settlement Judge in this proceeding.

[1] *PSEG Energy Resources & Trade LLC*, 151 FERC ¶ 61,113 (2015).

20151223-5241 FERC PDF (Unofficial) 12/23/2015 11:43:14 AM

PSEG ER&T hereby requests a shortening of the time for filing comments and reply comments on the Offer of Settlement. Interventions and protests were due in Docket No. ER15-1882-000 on or before June 26, 2015 and in Docket No. ER15-1882-001 on or before July 1, 2015. No protests or adverse comments were filed. The undersigned also represents that it is PSEG ER&T's understanding that: (1) the Offer of Settlement is not opposed by the Commission Trial Staff, and (2) PJM Interconnection, L.L.C. ("PJM") which is the only intervenor in the docket, does not oppose the settlement. As no protests or adverse comments were filed and the Offer of Settlement is unopposed, PSEG ER&T requests that the Commission shorten the deadline for the filing of initial comments on the Offer of Settlement to ten (10) business days after the date on which the Commission issues notice of the filing of the Offer of Settlement, and that reply comments be due three (3) business days thereafter.

In accordance with Commission Rule 602(d), a copy of this submittal is being served on each participant in Docket Nos. ER15-1882-000 and ER15-1882-001. A certificate evidencing such service is provided herewith.

Please contact the undersigned if there are any questions concerning this submittal.

Respectfully submitted,

By: *Hesser G. McBride, Jr.*

OFFER OF SETTLEMENT

20151223-5241 FERC PDF (Unofficial) 12/23/2015 11:43:14 AM

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

PSEG Energy Resources & Trade LLC	))	Docket Nos.	ER15-1882-000 ER15-1882-001

OFFER OF SETTLEMENT BY
PSEG ENERGY RESOURCES & TRADE LLC

Pursuant to Rule 602 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("FERC" or "Commission"), 18 C.F.R. § 385.602 (2015), PSEG Energy Resources & Trade LLC ("PSEG ER&T") hereby submits an Offer of Settlement in the above-captioned proceeding. If this Offer of Settlement is approved by the Commission without condition or modification, or if it is approved by the Commission subject to one or more conditions or modifications that are acceptable to PSEG ER&T, the Offer of Settlement will resolve the matter set for hearing by the Commission in this proceeding.

I. BACKGROUND

1.1 On June 5, 2015, PSEG ER&T tendered for filing pursuant to Section 205 of the Federal Power Act its revised Rate Schedule FERC No. 3 ("Rate Schedule"), which sets forth the cost-based revenue requirements for the provision of Reactive Supply and Voltage Control from Generation Sources Service ("Reactive Power") owned by PSEG Fossil LLC ("PSEG Fossil") and PSEG Nuclear LLC ("PSEG Nuclear") ("Reactive Power filing"). The Reactive Power filing covers all of the generating facilities currently owned by subsidiaries of PSEG Power LLC ("PSEG Power") within the PJM Interconnection, L.L.C. ("PJM") region ("the Facilities").[1] While the filing includes all of generation facilities within the PJM region owned by subsidiaries

[1] PSEG ER&T, PSEG Nuclear and PSEG Fossil are each direct subsidiaries of PSEG Power. PSEG ER&T is responsible for the administration within PJM of the assets covered by this filing and is currently recognized by PJM as the entity responsible for providing Reactive Power provided by the assets and is paid by PJM for providing such service. PSEG ER&T accordingly is the proper entity to provide this service.

of PSEG Power, the filing sets forth a proposed separate and distinct revenue requirement reflected in a separate tariff record for each "generating facility."[2]

1.2 The Commission issued the notice of PSEG ER&T's filing on June 8, 2015. The notice established a deadline of June 26, 2015 for the filing of protests and motions to intervene.

1.3 On June 10, 2015 PSEG ER&T filed an errata to correct an error in the proposed effective date and to include certain workpapers referenced in the June 5, 2015 filing.

1.4 The Commission issued the notice of PSEG ER&T's errata filing on June 10, 2015. The notice established a deadline of July 1, 2015 for the filing of protests and motions to intervene.

1.5 On June 22, 2015, PJM submitted an intervention and comments.[3]

1.6 On August 7, 2015, the Commission issued an order accepting PSEG ER&T's proposed revenue requirement, allowing it to become effective on January 7, 2016, but suspending it and establishing hearing and settlement judge procedures.[4] The Commission stated that "[w]e find that PSEG ER&T's proposed Reactive Power Schedule raises issues of material fact that cannot be resolved based on the record before us, and that are more appropriately addressed in the hearing and settlement judge procedures ordered below."[5]

1.7 On August 14, 2015, the Chief Administrative Law Judge issued an order designating the Honorable Steven A. Glazer to serve as Settlement Judge and directing the participants to explore the possibility of settlement.

---

2 The term "generating facility" refers to a specific location where a generation unit or generation units are located. In some instances, one generating unit is located at a generating facility and in others more than one generating unit is located at a generating facility.

3 *See* "Motion to Intervene and Comments of PJM Interconnection, L.L.C.," *PSEG Energy Resources & Trade LLC*, Docket No. ER15-1882-000 (June 22, 2015).

4 *See PSEG Energy Resources & Trade LLC*, 152 FERC ¶ 61,113 (2015) (the "August 7 Order").

5 *Id.*, P 10.

1.8 On August 27, 2015, Settlement Judge Glazer convened a settlement conference for the purpose of establishing a procedural schedule regarding the parties' exchange of information. PSEG ER&T and the Commission Trial Staff agreed upon a procedural schedule that the Settlement Judge adopted in an order issued on the same date.[6]

1.9 On various dates after August 27, 2015, PSEG ER&T and the Commission Trial Staff met and exchanged information in connection with settlement discussions. On October 15, 2015 and December 3, 2015, PSEG ER&T and the Commission Trial Staff participated in settlement conferences conducted by Settlement Judge Glazer.

II. OFFER OF SETTLEMENT

2.1 Pursuant to Commission Rule 602 and subject to the conditions set forth herein, and with the understanding that each term of this Offer of Settlement is in consideration and support of every other term and condition, PSEG ER&T's offers to settle the matter pending in Docket Nos. ER15-1882-000 and ER15-1882-001 on the terms set forth below. If this Offer of Settlement is approved by the Commission in its entirety or with conditions or modifications acceptable to PSEG ER&T (as provided in Section 3.1 below), the Offer would resolve the matter set for hearing by the August 7 Order.

2.2 In order to resolve the matter pending in this docket, and without prejudice to its position should the Commission reject this Offer of Settlement or approve it with conditions or modifications unacceptable to PSEG ER&T, PSEG ER&T hereby offers to reduce the aggregate reactive revenue requirement for the generation facilities set forth in the rate sheets in Rate Schedule FERC No. 3 filed in this proceeding from the aggregate amount of $38,671,025 to an aggregated amount of $34,000,000 per year. The Reactive Power revenue requirement set forth

[6] "Notice Scheduling Settlement Activities," *PSEG Energy Resources & Trade LLC*, Docket No. ER15-1882-001 (August 27, 2015).

in each rate sheet shall remain in place until the effectiveness of any subsequent PSEG ER&T's Reactive Power filing with respect to these generating facilities.

2.3 Attachment 1 to this Offer of Settlement, incorporated by reference herein, presents (in clean form) PSEG ER&T's First Revised Rate Schedule FERC No. 3, which incorporates the reduced annual revenue requirement for all rate sheets set forth in Section 2.1. PSEG ER&T's First Revised Rate Schedule FERC No. 3 specifically identifies the annual revenue requirement for each generation facility included in PSEG ER&T's Reactive Power filing in this proceeding. Thus, the First Revised Rate Schedule FERC No. 3 sets forth a separate rate for each generation facility.

2.4 In order to resolve the matter pending in this docket, and without prejudice to its position should the Commission reject this Offer of Settlement or approve it with conditions or modifications unacceptable to PSEG ER&T, PSEG ER&T hereby offers to agree to file, a Section 205 request for the Commission to modify or re-approve PSEG ER&T's rates for reactive power service for the generating facilities identified in PSEG ER&T's First Revised Rate Schedule FERC No. 3 attached hereto, to be effective no later than January 7, 2022; provided, however, that PSEG ER&T shall have the right to make a Section 205 filing to modify any or all of its Reactive Power service rates for its generating facilities at any time prior to January 7, 2022. Also, for newly constructed generation units or newly acquired units added to PSEG ER&T's generation fleet (including generators owned by any affiliate of PSEG ER&T) which have not previously supplied reactive power services to PJM, PSEG ER&T shall have the right to file under FPA Section 205 to establish an "initial" rate for each new generation unit effective as of the date of commercial operation of such unit.

2.5 If this Offer of Settlement is approved by the Commission without condition or modification, or if it is approved subject to one or more conditions or modifications acceptable to PSEG ER&T, PSEG ER&T will place First Revised Rate Schedule FERC No. 3 on file with the Commission, through the Commission's eTariff system, no later than thirty (30) days after such Commission order is issued, or on or before such other date as the Commission's order approving this Offer of Settlement may specify. PSEG ER&T's filing will request that First Revised Rate Schedule FERC No. 3 be made effective as of January 7, 2016, and will propose that PSEG ER&T's First Revised Rate Schedule FERC No. 3 supersede Original Rate Schedule FERC No. 3 in its entirety. If and to the extent PSEG ER&T has received compensation for reactive service pursuant to Original Rate Schedule FERC No. 3 that is in excess of the settlement amount, PSEG ER&T will refund the excess compensation to PJM with interest calculated in accordance with 18 C.F.R. §35.19a; provided, however, that such refund may be effectuated, with PJM's consent, through a one-time adjustment to charges payable to PJM by PSEG ER&T under the PJM Tariff.

2.6 If for any reason the Commission rejects this Offer of Settlement, or if the Commission approves the Offer of Settlement subject to one or more conditions or modifications unacceptable to PSEG ER&T, this Offer of Settlement shall be null and void, and shall be deemed to have been withdrawn by PSEG ER&T contemporaneously with the issuance of the Commission's order addressing this Offer of Settlement.

III. GENERAL PROVISIONS

3.1 Non-Severability. The provisions of this Offer of Settlement are not severable and shall not bind PSEG ER&T or any other party unless and until the Commission issues an order approving this Offer of Settlement as to all its terms and conditions without modification

or condition, unless PSEG ER&T advises the Commission within five (5) business days of the issuance of said order that any modification(s) or condition(s) imposed by such order are acceptable to PSEG ER&T.

3.2 No Admission or Precedent. PSEG ER&T's tender of this Offer of Settlement is solely for the purpose of compromising the matter set for hearing by the Commission and avoiding the costs and burdens of litigation, and is not intended to establish any principle or precedent with respect to any issue in this proceeding. Accordingly, neither this Offer of Settlement nor PSEG ER&T's performance in accordance herewith shall be deemed to constitute an admission or concession as to (i) the justness and reasonableness of any cost, charge, cost of service component, or ratemaking method, or (ii) any contention or position that was asserted, or that could have been asserted, in this docket. The Commission's approval of this Offer of Settlement shall not constitute a determination by the Commission as to the merits of any allegation or contention that was made or that could have been made in this proceeding; nor shall the Commission's approval of this Offer of Settlement be deemed to establish a "settled practice" as that term was interpreted and applied in Public Service Commission of the State of New York v. FERC, 642 F.2d 1335 (D.C. Cir. 1980).

3.3 Settlement Discussions. This Offer of Settlement results from settlement discussions conducted between PSEG ER&T and the Commission's Trial Staff. The results of those discussions were subsequently communicated to counsel for PJM. Such discussions and communication were conducted on the explicit understanding, pursuant to Rule 602 of the Commission's Rules of Practice and Procedure, 18 C.F.R. § 385.602 (2015), that all offers of settlement and communications relating thereto shall be privileged and confidential, shall be without prejudice to the position of any party or participant presenting any such offer or

participating in any settlement discussions and communications, and are not to be used in any manner in connection with this proceeding, any other proceeding, or otherwise.

3.4 Effect on Statutory Rights. Other than as provided in Paragraph 2.3 above, neither PSEG ER&T's tender of this Offer of Settlement nor the Commission's approval thereof shall be construed as affecting PSEG ER&T's right to seek to amend Rate Schedule FERC No. 3 in any respect pursuant to Section 205 of the Federal Power Act and the Commission's Rules and Regulations adopted thereunder, or the right of any entity having a cognizable interest to oppose, to seek modification, to seek rejection, to seek suspension, or to seek refunds of any such amendment proposed by PSEG ER&T; or (ii) the right of any entity having a cognizable interest to petition the Commission to amend Rate Schedule FERC No. 3 under Section 206 of the Federal Power Act and pursuant to the Commission's Rules and Regulations promulgated thereunder, or PSEG ER&T's right to oppose any such petition.

3.5 No Effect on Commission Review Authority. Nothing in this Offer of Settlement is intended to affect the Commission's authority, pursuant to Section 205 of the Federal Power Act or otherwise, to review, accept (with or without conditions or modifications) or reject this Offer, or the legal standard applicable to the exercise of such authority.

20151223-5241 FERC PDF (Unofficial) 12/23/2015 11:43:14 AM

3.6 Interpretation. To the extent there is any inconsistency between this Offer of Settlement and the Explanatory Statement submitted in support hereof, the Offer of Settlement shall control.

Respectfully submitted,

PSEG Energy Resources & Trade LLC

EXPLANATORY STATEMENTIN SUPPORT OFOFFER OF SETTLEMENT

20151223-5241 FERC PDF (Unofficial) 12/23/2015 11:43:14 AM

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

PSEG Energy Resources & Trade LLC	))	Docket Nos.	ER15-1882-000 ER15-1882-001

EXPLANATORY STATEMENT IN SUPPORT OF OFFER OF SETTLEMENT

Pursuant to Rule 602 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("FERC" or "Commission"), 18 C.F.R. § 385.602 (2015), PSEG Energy Resources & Trade LLC ("PSEG ER&T") hereby submits an Explanatory Statement in support of the Offer of Settlement being filed by PSEG ER&T herewith.

I. BACKGROUND

On June 5, 2015, PSEG ER&T tendered for filing pursuant to Section 205 of the Federal Power Act its revised Rate Schedule FERC No. 3 ("Rate Schedule"), which sets forth the cost-based revenue requirements for the provision of Reactive Supply and Voltage Control from Generation Sources Service ("Reactive Power") owned by PSEG Fossil LLC ("PSEG Fossil") and PSEG Nuclear LLC ("PSEG Nuclear") ("Reactive Power filing"). The Reactive Power filing covers all of the generating facilities currently owned by subsidiaries of PSEG Power LLC ("PSEG Power") within the PJM Interconnection, L.L.C. ("PJM") region ("the Facilities").[1] While the Reactive Power filing includes all of generation facilities within the PJM region

[1] PSEG ER&T, PSEG Nuclear and PSEG Fossil are each direct subsidiaries of PSEG Power. PSEG ER&T is responsible for the administration within PJM of the assets covered by this filing and is currently recognized by PJM as the entity responsible for providing Reactive Power provided by the assets and is paid by PJM for providing such service. PSEG ER&T accordingly is the proper entity to provide this service.

owned by subsidiaries of PSEG Power, the filing sets forth a separate and distinct revenue requirement reflected in a separate tariff record for each "generating facility."[2]

The Commission issued notice of PSEG ER&T's filing on June 8, 2015. The notice established a deadline of June 26, 2015 for the filing of protests and motions to intervene.

On June 10, 2015 PSEG ER&T filed an errata to correct an error in the proposed effective date and to include certain workpapers referenced in the Reactive Power filing.

The Commission issued notice of PSEG ER&T's errata filing on June 10, 2015. The notice established a deadline of July 1, 2015 for the filing of protests and motions to intervene.

On June 22, 2015, PJM submitted an intervention and comments.[3]

On August 7, 2015, the Commission issued an order accepting PSEG ER&T's proposed revenue requirement, allowing it to become effective on January 7, 2016, but suspending it and setting it for hearing.[4] The Commission stated that "[w]e find that PSEG ER&T's proposed Reactive Power Schedule raises issues of material fact that cannot be resolved based on the record before us, and that are more appropriately addressed in the hearing and settlement judge procedures ordered below."[5]

On August 14, 2015, the Chief Administrative Law Judge issued an order designating the Honorable Steven A. Glazer to serve as Settlement Judge and directing participants to negotiate and accept or approve settlement terms.

---

2 The term "generating facility" refers to a specific location where a generation unit or generation units are located. In some instances, one generating unit is located at a generating facility and in others more than one generating unit is located at a generating facility.

3 *See* "Motion to Intervene and Comments of PJM Interconnection, L.L.C.," *PSEG Energy Resources & Trade LLC*, Docket No. ER15-1882-000 (June 22, 2015).

4 *See PSEG Energy Resources & Trade LLC*, 152 FERC ¶ 61,113 (2015) (the "August 7 Order").

5 *Id.*, P 10.

On August 27, 2015, Settlement Judge Glazer convened a settlement conference for the purpose of establishing a procedural schedule. PSEG ER&T and the Commission Trial Staff submitted a proposed procedural schedule that the Settlement Judge adopted in an order issued on the same date.6

On various dates after August 27, 2015 PSEG ER&T and the Commission Trial Staff met and exchanged information in connection with settlement discussions aimed at reaching agreement on a negotiated resolution of the matter at issue in the case. And on October 15, 2015 and December 3, 2015 PSEG ER&T and the Commission Trial Staff participated in settlement conferences conducted by Settlement Judge Glazer. Those efforts resulted in an agreement in principle to resolve the matter at issue through a reduction in PSEG ER&T's requested revenue requirement.

The Offer of Settlement presents the basis for a resolution of the matter set for hearing in this docket. It is submitted by PSEG ER&T in the form of a unilateral offer of settlement, rather than a settlement agreement for reasons that are perhaps unique to this proceeding. First, Commission Trial Staff typically comments on proposed settlements rather than enters into them as a signatory. Second, PJM Interconnection, L.L.C. ("PJM"), which is the only intervenor in the docket, has advised PSEG ER&T that it will not be a signatory to the document (but also will not oppose the settlement). Accordingly, there is no participant in the docket that would be a counter-party to a settlement agreement with PSEG ER&T. In these circumstances, a unilateral offer of settlement by PSEG ER&T appears to be the correct vehicle for submitting its terms for the Commission's consideration.

6 "Notice Scheduling Settlement Activities," *PSEG Energy Resources & Trade LLC*, Docket No. ER15-1882-001 (August 27, 2015).

II. TERMS OF THE OFFER OF SETTLEMENT

A. Specific Terms

1. Subject to the other terms and conditions set forth in the Offer, PSEG ER&T will to reduce the aggregate reactive revenue requirement for the generation facilities set forth in the rate sheets in Rate Schedule FERC No. 3 filed in this proceeding from the aggregated amount of $38,671,025 to an aggregated amount of $34,000,000 per year. The Reactive Power revenue requirement set forth in each rate sheet shall remain in place until the effectiveness of any subsequent PSEG ER&T's Reactive Power filing with respect to these generating facilities. (See Section 2.1 of the Offer.) PSEG ER&T's Rate Schedule FERC No. 3 specifically identifies the annual revenue requirement for each generation facility included in PSEG ER&T's Reactive Power filing in this proceeding. Thus, each generating facility identified in Rate Schedule FERC No. 3 sets forth a separate rate for each generating facility. Attachment 1 to this Offer of Settlement, incorporated by reference herein, presents (in clean form) PSEG ER&T's First Revised Rate Schedule FERC No. 3, which incorporates the reduced annual revenue requirement for all rate sheets set forth in this Reactive Power filing.

2. In order to resolve the matter pending in this docket, and without prejudice to its position should the Commission reject this Offer of Settlement or approve it with conditions or modifications unacceptable to PSEG ER&T, PSEG ER&T hereby offers to agree to file, a Section 205 request for the Commission to modify or re-approve PSEG ER&T's rates for reactive power service for the generating facilities identified in PSEG ER&T's First Revised Rate Schedule FERC No. 3 attached hereto, to be effective no later than January 7, 2022; provided, however, that PSEG ER&T shall have the right to make a Section 205 filing to modify any or all of its Reactive Power service rates for its generating facilities at any time prior to

January 7, 2022. Also, for newly constructed generation units or newly acquired units added to PSEG ER&T's generation fleet (including generators owned by any affiliate of PSEG ER&T) which have not previously supplied reactive power services to PJM, PSEG ER&T shall have the right to file under FPA Section 205 to establish an "initial" rate for each new generation unit effective as of the date of commercial operation of such unit.

3. No later than 30 days after the Commission issues an order approving the Offer (or on or before such other date as the Commission may specify), PSEG ER&T would file a revised version of its Rate Schedule FERC No. 3 incorporating the settlement revenue requirement. (See section 2.3 of the Offer.)

4. If and to the extent PSEG ER&T has received compensation for reactive service in excess of the settlement amount, PSEG ER&T would refund the excess compensation to PJM with interest calculated in accordance with 18 C.F.R. §35.19a; provided that such refund may be effectuated through a one-time adjustment to charges otherwise payable by PSEG ER&T to PJM pursuant to the PJM Tariff.

5. Approval of the Offer without condition or modification, or with one or more conditions or modifications that are acceptable to PSEG ER&T (as provided in Section 3.1 of the Offer), would resolve the matter set for hearing in PSEG Energy Resource & Trade LLC, 151 FERC ¶ 61,113 (2015). (See Article II of the Offer.)

6. If for any reason the Commission does not approve the Offer of Settlement, or if the Offer of Settlement is approved subject to one or more conditions or modifications unacceptable to PSEG ER&T, the Offer of Settlement will then be null and void, and will be deemed to have been withdrawn by PSEG ER&T contemporaneous with the issuance of the Commission's order addressing the Offer of Settlement. (See section 2.4 of the Offer.)

B. General Terms

Sections 3.1 through 3.6 of the Offer of Settlement contain standard terms and conditions typically found in offers of settlement and settlement agreements filed with the Commission, including those pertaining to the non-severability of provisions, the absence of any precedent created by the Offer or its approval, confidentiality of settlement discussions, and preservation of parties 'Section 205 and 206 rights. The Offer also states that, in the event of any inconsistency between the Offer of Settlement and this Explanatory Statement, the Offer of Settlement controls.

III. RESPONSE TO QUESTIONS

By order dated October 15, 2003, the Chief Judge required that five questions be answered as part of every Explanatory Statement submitted in support of a proposed settlement. The questions and specific responses applicable to this Settlement are as follows:

1. What are the issues underlying the settlement and what are the major implications?

Approval of the Offer of Settlement would resolve issues relating to the justness and reasonableness of PSEG ER&T's proposed annual revenue requirement for reactive supply from its ownership interest in various generation units operating within the PJM Interconnection, LLC region. The Offer of Settlement proposes a reduction in PSEG ER&T's reactive revenue requirement without specification of any underlying cost elements or rate methodologies. Accordingly, Commission approval of the Offer of Settlement would have no major implications.

2. Whether any of the issues raise policy implications?

No. Approval of the Offer of Settlement would simply resolve the matter set by the Commission for hearing in this proceeding without specifying any particular ratemaking treatment or methodology.

3. Whether other pending cases may be affected?

No other pending cases will be affected by the proposed settlement.

4. Whether the settlement involves issues of first impression, or if there are any previous reversals on the issues involved?

There are no issues of first impression, and no previous reversals on the issues involved.

5. Whether the proceeding is subject to the just and reasonable standard or whether there is Mobile-Sierra language making it the standard, i.e., the applicable standards of review?

Section 3.5 of the Offer of Settlement states that nothing in the Offer is intended to affect the Commission's authority, pursuant to Section 205 of the Federal Power Act or otherwise, to review, accept (with or without conditions or modifications) or reject the Offer, or the legal standard applicable to the exercise of such authority. It is PSEG ER&T's understanding that, in the context of a unilateral settlement offer, any such exercise of the Commission's authority would be governed by the "just and reasonable" standard.

20151223-5241 FERC PDF (Unofficial) 12/23/2015 11:43:14 AM

IV. CONCLUSION

Approval of the Offer of Settlement would fully resolve the matter set for hearing by the August 7 Order in a fair and reasonable manner. Approval of the Offer of Settlement would allow the participants and the Commission to avoid the expense and risks of litigation, and, on that basis, approval of the Offer of Settlement is in the public interest. For these reasons, PSEG ER&T requests that, following consideration of any comments as may be filed, the Offer of Settlement be promptly certified to the Commission, and that the Commission then expeditiously approve the Offer of Settlement without condition or modification.

Respectfully submitted,

PSEG Energy Resources & Trade LLC

Reactive Supply and Voltage Control from Generation Sources Service

PSEG Energy Resources & Trade LLC ("PSEG ER&T") provides Reactive Supply and Voltage from Generation Sources Service ("Reactive Supply Service") from various generating facilities to the PJM Interconnection, LLC ("PJM") system. This Rate Schedule, which consists of seventeen separate tariff sections for each of PSEG ER&T's generating facilities, sets forth PSEG ER&T's revenue requirements for the provision of Reactive Supply Service to PJM, as contemplated by Schedule 2 of the PJM open access transmission tariff.

PSEG ER&T's total monthly revenue requirement consists of the sum of the charges for the following: (1) the Fixed Capability Revenue Requirement; and (2) the Heating Losses Component for each of its generating facilities. The Fixed Capability Revenue Requirement: the Heating Losses Component, and the Total Revenue Requirements for each generating facility is set forth in the Rate Schedule below. This Rate Schedule and its separate sections shall be effective upon the date authorized by the Federal Energy Regulatory Commission.

Nothing contained herein shall be construed as affecting in any way the right of PSEG ER&T to unilaterally make application to the Federal Energy Regulatory Commission for a change in rates under section 205 of the Federal Power Act and pursuant to the Commission's Rules and Regulations promulgated thereunder. If PSEG ER&T seeks to change one of the revenue requirements stated herein, it will abide by relevant FERC procedures for changes in rates and notify PJM in accordance with any notice requirement in the PJM Tariff.

~~PSEG ENERGY RESOUCES & TRADE LLC~~

~~RATE SCHEUDLE FERC NO. 3~~

Reactive Supply and ~~voltage~~ Voltage Control from Generation Sources Service

PSEG Energy Resources & Trade LLC ("PSEG ER&T") provides Reactive Supply and Voltage from Generation Sources Service ("Reactive Supply Service") from various generating facilities to the PJM Interconnection, LLC ("PJM") system. This Rate Schedule, which consists of seventeen separate tariff sections for each of PSEG ER&T's generating facilities, sets forth PSEG ER&T's revenue requirements for the provision of Reactive Supply Service to PJM, as contemplated by Schedule 2 of the PJM open access transmission tariff.

PSEG ER&T's total monthly revenue requirement consists of the sum of the charges for the following: (1) the Fixed Capability Revenue Requirement; and (2) the Heating Losses Component~~. Total charges~~ for ~~any 12 month period will not be less than~~each of its generating facilities. The Fixed Capability Revenue Requirement:~~-~~ the ~~sum of~~ Heating Losses Component, and the ~~annual charges specified~~ Total Revenue Requirements for each generating facility is set forth in the Rate Schedule below. This Rate Schedule and its separate sections shall be effective upon the date authorized by the Federal Energy Regulatory Commission.

Nothing contained herein shall be construed as affecting in any way the right of PSEG ER&T to unilaterally make application to the Federal Energy Regulatory Commission for a change in rates under section 205 of the Federal Power Act and pursuant to the Commission's Rules and Regulations promulgated thereunder. If PSEG ER&T seeks to change one of the revenue requirements stated herein, it will abide by relevant FERC procedures for changes in rates and notify PJM in accordance with any notice requirement in the PJM Tariff.

~~**MONTHLY REVENUE REQUIREMENT:**~~

~~**1. FIXED CAPABILITY COMPONENT**~~

~~The annual revenue requirement for the Fixed Capability Component is $25,750,450.~~

~~The monthly charge to PJM is $25,750,450 / 12 = $2,145,871~~

~~**2. HEATING LOSSES COMPONENT**~~

~~The annual revenue requirement for the Heating Losses Component is $876,337.~~

~~The monthly charge to PJM is $$876,337 / 12 = $73,028.~~

~~**3. TOTAL REVENUE REQUIREMENT**~~

~~Total Annual Revenue Requirement is $25,750,450 + $876,337 = $26,626,787~~

~~Total Monthly Revenue Requirement is $26,626,787 / 12 = $2,218,899.~~

DRAFT NOTICE OF FILING OF THE OFFER OF SETTLEMENT

20151223-5241 FERC PDF (Unofficial) 12/23/2015 11:43:14 AM

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

PSEG Energy Resources & Trade LLC	)	Docket Nos.	ER15-1882-000
	)		ER15-1882-001

NOTICE OF OFFER OF SETTLEMENT AND NOTICE OF SHORTENED COMMENT PERIOD

(Issued December __, 2015)

On December __, 2015, PSEG Energy Resources & Trade LLC filed an Offer of Settlement to resolve the matter set for hearing in the above-captioned proceeding. Included in its filing was a request to shorten the period for filing comments in response to the Offer of Settlement.

Interventions and protests were due in Docket Nos. ER15-1882-000 and ER15-1882-001 on or before July 1, 2015. No protests or adverse comments were filed. The motion to intervene and comment filed by PJM Interconnection, L.L.C. did not raise any substantive issues regarding the filing in Docket Nos. ER15-1882-000 and ER15-1882-001. As no protests or adverse comments were filed and the Settlement appears unopposed, we are shortening the date for filing initial comments to and including _____, 2016. Reply comments should be filed on or before _____, 2016.

Kimberly D. Bose,
Secretary

DRAFT LETTER ORDER APPROVING OFFER OF SETTLEMENT

20151223-5241 FERC PDF (Unofficial) 12/23/2015 11:43:14 AM

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, DC 20426

_____, 2015

In Reply Refer To:
PSEG Energy Resources & Trade LLC
Docket Nos. ER15-1882-000 and ER15-1882-001

Hesser G. McBride, Jr.
Associate General Regulatory Counsel
PSEG Services Corporation
80 Park Plaza – T5
Newark, New Jersey 07102

Dear Mr. McBride:

1. On December __, 2015, you filed, in the above-referenced proceeding, a unilateral Offer of Settlement (Settlement) by PSEG Energy Resources & Trade LLC ("PSEG ER&T"). On January __, 2016, Commission Trial Staff filed comments in support of the Settlement. No other comments were filed. On January ___, 2016, the Settlement Judge certified the Settlement to the Commission as an uncontested settlement.[1]

2. The Settlement concerns PSEG ER&T's cost-based annual revenue requirement for Reactive Supply and Voltage Control from Generation Sources Service (reactive service) provided by various generation units that operation in the PJM Interconnection, LLC region and which PSEG has an ownership interest.

3. The Settlement states that "[n]othing in this [Settlement] is intended to affect the Commission's authority, pursuant to section 205 of the Federal Power Act or otherwise, to review, accept (with or without conditions or modifications) or reject this [Settlement], or the legal standard applicable to the exercise of such authority."[2]

4. The Settlement resolves all issues in this proceeding. The Settlement appears to be fair and reasonable and in the public interest, and is hereby approved. The Commission's approval of this Settlement does not constitute approval of, or precedent regarding, any principle or issue in this proceeding.

5. PSEG ER&T is directed to file tariff revisions to PSEG ER&T's reactive service

[1] PSEG Energy Resources & Trade LLC, ___ FERC ¶ _____ (2015).

[2] Settlement, § 3.5.

tariff (Rate Schedule FERC No. 3) in eTariff format,[3] within 30 days of the date of this order, to reflect the Commission's action in this order.

6. This letter order terminates Docket Nos. ER15-1882-000 and ER15-1882-001.

By direction of the Commission.

Kimberly D. Bose,
Secretary
