Accessory Equip Allocator Account 315, 324, 334, 345
NUCLEAR FLEET
The following allocation factors pertain to the nuclear fleet. The values are based on a very general assessment of plant design and a subjective interpretation of the category definitions using Exhibit A-38 as guidance. There was no review performed of actual design information or plant accounting dollars to support the development of the allocation factors provided below.

Item		Comment
Storage Batteries	15%	A large portion of storage station battery capacity is dedicated to nuclear safety-related functions such as numerous valve actuators, back-up inverters and relaying/ annunciators/controls. The remaining balance-of-plant battery capacity would be largely dedicated to the seal oil and lube oil backup pumps.
Control&Power Cabling	1%	AVR/ generator / exciter cabling is very small when compared to the overall control and power cable systems in a nuclear generating facility.
Switch Board Equipment	1%	The nuclear plant control rooms contain a vast array of switchboard equipment dedicated to plant functions not associated with vendor supplied package systems. The allocation to AVR, exciter, and generator would be a relatively small component of the non-packaged systems.
Switching Equipment	1%	This category excludes main generator breakers. The remaining switching equipment associated with generator / exciter is fraction of the large switching network in a nuclear facility. The largest would be the seal oil pumps (AC and DC), lube oil pumps (AC and DC), stator water pumps, and AVR contactor / field circuit breaker. The transmission system operators (PECo, ComEd, etc.) on the PJM system own the Exelon nuclear plant output circuit breakers, with the exception of TMI and Nine Mile Point whose breakers are Exelon owned.
Transformers	3%	As instructed during the 8/5/16 telecon, this account does not include the main transformer (GSU). The excitation system power is self-fed from the turbine generator such that no significant auxiliary transformer power is used. Aux power is supplied to the lube oil, seal oil and stator water pumps, and miscellaneous equipment. The capacity is no more than 3% of the total auxiliary power.
Aux Generator	0%	The main generator and exciter would be off-line when the emergency and station black out diesel generators are in use. They do not contribute to main generator power generation.
Fire Protection System	0%	As instructed during the 8/5/16 telecon, the fire deluge system to mitigate shaft seal oil and hydrogen fires is not in this account.
HVAC	0%	As instructed during the 8/5/16 telecon, HVAC is not allocated in this account.
Regulating Equipment	50%	The main generator Automatic Voltage Regulator (AVR) used to control excitation (and VAR generation) is significant, but its allocation factor is reduced by other regulating systems such as the Reactor Recirc ASDs, battery inverters, etc.
Structure	0%	As instructed during the 8/5/16 telecon, HVAC is not allocated in this account.
Misc.	0%	None
Exciter & PPT	100%	The AVR, exciter, and subsystems are control reactive power generation
Station Grounding	1%	The AVR / Exciter Generator is relatively simple and a small subset of all equipment grounding in the plant. The generator armature uses a distribution transformer to achieve grounding, but the overall allocation of capital for this system is small when compared to the grounding installations through in the plant.
Bus & Insulators	80%	The IsoPhase bus and switchyard high voltage insulator systems comprise a major portion of this category when compared to the remaining plant buses.
Capacitor Bank	0%	Capacitor banks are used to control reactive power. However, they are the property of the transmission system owner.

Accessory Equipment Allocator -- FOSSIL & HYDRO

	CTs	Notes (Combustion Turbine Units)	Hydro & Steam Units	Notes (Hydro & Steam Units)
Storage Batteries	50%	Battery load is split between equipment directly related to power production (generator emergency lube oil, seal oil pump) and auxiliary load (fire pump, relays, etc.)	30%	A significant percentage of battery load at Hydro and Steam units relates to plant auxiliary equipment (fire pump, auxiliary dc circuits, relays, etc.).
Control & Power Cabling	50%	This percentage most likely reflects DCS, exciter, AVR, and breaker DC load as compared to total control and power cabling load. Other load reflects control and powering of auxiliary equipment such as annunciators, fuel valves, fire protection, auxiliary breaker, etc. as well as any cabling associated with 480V AC systems.	15%	A significant percentage of control and power cabling at Hydro and Steam sites is associated with auxiliary systems. 15% is assumed to be the load related directly to power generation.
Switch Board Equipment	50%	This portion is made up of relaying, annunciators, exciter, AVR, or DCS controls relating to generator or transformer as compared to plant auxiliaries.	30%	This portion is made up of relaying, annunciators, exciter, AVR, or DCS controls relating to generator or transformer as compared to plant auxiliaries.
Switching Equipment	40%	This percentage is made up of generator breakers and auxiliary breakers supplying power to equipment such as lube oil pumps.	20%	This percentage is made up of generator breakers and auxiliary breakers supplying power to equipment such as lube oil pumps.
Transformers	10%	Most of the auxiliary load that transformers serve does not relate directly to power production, such as water treatment, fire pump, CEMS module distribution power, etc. This number excludes GSUs.	5%	This is assumed to be the portion of total transformer investment serving load relatable to power production (oil pumps, etc.) This number excludes GSUs.
Aux. Generator	0%	None present directly for power generation - only for backup power.	0%	None present directly for power generation - only for backup power.
Fire Protection System	0%	No direct contribution towards power generation.	0%	No direct contribution towards power generation.
HVAC	0%	No direct contribution towards power generation.	0%	No direct contribution towards power generation.
Regulating Equipment	75%	The Automatic Voltage Regulator (AVR) is directly attributed towards power production, but Static Frequency Converters (SFCs), including static start systems, or motor control equipment are not.	75%	The Automatic Voltage Regulator (AVR) is directly attributed towards power production, but Static Frequency Converters (SFCs), including static start systems, or motor control equipment are not.
Structure	0%	No direct contribution towards power generation.	0%	No direct contribution towards power generation.
Misc.	0%	No direct contribution towards power generation.	0%	No direct contribution towards power generation.
Exciter & PPT	100%	All such equipment used for control of power produced (MVARs).	100%	All such equipment used for control of power produced (MVARs).
Station Grounding	5%	5% is assumed to be the cost of generator and transformer neutral grounding as compared to the entire site grounding system.	0%	Generator and transformer neutral grounding is a very small percentage of total grounding at Hydro and Steam sites.
Bus & Insulators	80%	The majority of bus-work in Combustion Turbine (CT) sites runs from generator to generator breaker and towards to point-of-interconnection.	60%	This is an estimate of bus-work running from generator to point-of-interconnection as compared to other bus-work that exists on site.
Capacitor Bank	0%	Item not owned by Generation.	0%	Item not owned by Generation.

Protective Agreement

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Constellation Power Source Generation, LLC	**)**	**Docket No. ER17-___-000**
Exelon Generation Company, LLC	**)**	**Docket No. ER17-___-000**
Handsome Lake Energy, LLC	**)**	**Docket No. ER17-___-000**

PROTECTIVE AGREEMENT

1. This Protective Agreement shall govern the use of all Privileged Materials produced by, or on behalf of, any Participant. Notwithstanding any order terminating this proceeding, this Protective Agreement shall remain in effect until specifically modified or terminated by the Presiding Administrative Law Judge ("Presiding Judge") (which includes the Chief Administrative Law Judge) or the Federal Energy Regulatory Commission ("Commission").

2. This Protective Agreement applies to the following two categories of materials: (A) A Participant may designate as privileged those materials which customarily are treated by that Participant as sensitive or proprietary, which are not available to the public, and which, if disclosed freely, would subject that Participant or its customers to risk of competitive disadvantage or other business injury; and (B) A Participant shall designate as p privileged those materials which contain critical energy infrastructure information, as defined in 18 C.F.R. § 388.113(c)(1) ("Critical Energy Infrastructure Information").

3. Definitions – For purposes of this Agreement:

(a) The term "Participant" shall mean a Participant as defined in 18 C.F.R. § 385.102(b).

(b) (1) The term "Privileged Materials" means (A) materials filed with the Commission by a Participant pursuant to 18 C.F.R. § 388.112 and designated as privileged; (B) materials (including depositions) provided by a Participant in response to discovery requests and designated by such Participant as privileged; (C) any information contained in or obtained from such designated materials; (D) any other materials which are made subject to this Protective Agreement by the Presiding Judge, by the Commission, by any court or other body having appropriate authority, or by agreement of the Participants; (E) notes of Privileged Materials; and (F) copies of Privileged Materials. The Participant producing the Privileged Materials shall physically mark them on each page as "PRIVILEGED MATERIALS" or with words of similar import as long as the term "Privileged Materials" is included in that designation to indicate that they are Privileged Materials. If the Privileged Materials contain Critical Energy Infrastructure Information, the Participant producing such information shall additionally mark on each page containing such information the words "Contains Critical Energy Infrastructure Information – Do Not Release."

(2) The term "Notes of Privileged Materials" means memoranda, handwritten notes, or any other form of information (including electronic form) which copies or discloses materials described in Paragraph 3(b)(1). Notes of Privileged Materials are subject to the same restrictions provided in this Protective Agreement for Privileged Materials except as specifically provided in this Protective Agreement.

(3) Privileged Materials shall not include (A) any information or document that has been filed with and accepted into the public files of the Commission, or contained in the public files of any other federal or state agency, or any federal or state court, unless the information or document has been determined to be privileged by such agency or court, or (B) information that is public knowledge, or which becomes public knowledge, other than through disclosure in violation of this Protective Agreement. Privileged Materials do include any information or document contained in the files of the Commission that has been designated as Critical Energy Infrastructure Information.

(c) The term "Non-Disclosure Certificate" shall mean the certificate annexed hereto by which Participants who have been granted access to Privileged Materials shall certify their understanding that such access to Privileged Materials is provided pursuant to the terms and restrictions of this Protective Agreement, and that such Participants have read the Protective Agreement and agree to be bound by it. All Non-Disclosure Certificates shall be served on all parties on the official service list maintained by the Secretary in this proceeding.

(d) The term "Reviewing Representative" shall mean a person who has signed a Non-Disclosure Certificate and who is:

(1) Commission Trial Staff designated as such in this proceeding;

(2) an attorney who has made an appearance in this proceeding for a Participant;

(3) attorneys, paralegals, and other employees associated for purposes of this case with an attorney described in Subparagraph (2);

(4) an expert or an employee of an expert retained by a Participant for the purpose of advising, preparing for or testifying in this proceeding;

(5) a person designated as a Reviewing Representative by order of the Presiding Judge or the Commission; or

(6) employees or other representatives of Participants appearing in this proceeding with significant responsibility for this docket.

4. Privileged Materials shall be made available under the terms of this Protective Agreement only to Participants and only through their Reviewing Representatives as provided in Paragraphs 7-9.

5. Privileged Materials shall remain available to Participants until the later of the date that an order terminating this proceeding becomes no longer subject to judicial review, or the date that

any other Commission proceeding relating to the Privileged Material is concluded and no longer subject to judicial review. If requested to do so in writing after that date, the Participants shall, within fifteen days of such request, return the Privileged Materials (excluding Notes of Privileged Materials) to the Participant that produced them, or shall destroy the materials, except that copies of filings, official transcripts and exhibits in this proceeding that contain Privileged Materials, and Notes of Privileged Material may be retained, if they are maintained in accordance with Paragraph 6, below. Within such time period each Participant, if requested to do so, shall also submit to the producing Participant an affidavit stating that, to the best of its knowledge, all Privileged Materials and all Notes of Privileged Materials have been returned or have been destroyed or will be maintained in accordance with Paragraph 6. To the extent Privileged Materials are not returned or destroyed, they shall remain subject to the Protective Agreement.

6. All Privileged Materials shall be maintained by the Participant in a secure place. Access to those materials shall be limited to those Reviewing Representatives specifically authorized pursuant to Paragraphs 8-9. The Secretary shall place any Privileged Materials filed with the Commission in a non-public file. By placing such documents in a non-public file, the Commission is not making a determination of any claim of privilege. The Commission retains the right to make determinations regarding any claim of privilege and the discretion to release information necessary to carry out its jurisdictional responsibilities. For documents submitted to Commission Trial Staff ("Staff"), Staff shall follow the notification procedures of 18 C.F.R. § 388.112 before making public any Privileged Materials.

7. Privileged Materials shall be treated as privileged by each Participant and by the Reviewing Representative in accordance with the certificate executed pursuant to Paragraph 9. Privileged Materials shall not be used except as necessary for the conduct of this proceeding, nor shall they be disclosed in any manner to any person except a Reviewing Representative who is engaged in the conduct of this proceeding and who needs to know the information in order to carry out that person's responsibilities in this proceeding. Reviewing Representatives may make copies of Privileged Materials, but such copies become Privileged Materials. Reviewing Representatives may make notes of Privileged Materials, which shall be treated as Notes of Privileged Materials if they disclose the contents of Privileged Materials.

8. (a) If a Reviewing Representative's scope of employment includes the marketing of energy, the direct supervision of any employee or employees whose duties include the marketing of energy, the provision of consulting services to any person whose duties include the marketing of energy, or the direct supervision of any employee or employees whose duties include the marketing of energy, such Reviewing Representative may not use information contained in any Privileged Materials obtained through this proceeding to give any Participant or any competitor of any Participant a commercial advantage.

(b) In the event that a Participant wishes to designate as a Reviewing Representative a person not described in Paragraph 3 (d) above, the Participant shall seek agreement from the Participant providing the Privileged Materials. If an agreement is reached that person shall be a Reviewing Representative pursuant to Paragraphs 3(d) above with respect to those materials. If no agreement is reached, the Participant shall submit the disputed designation to the Presiding Judge for resolution.

9. (a) A Reviewing Representative shall not be permitted to inspect, participate in discussions regarding, or otherwise be permitted access to Privileged Materials pursuant to this Protective Agreement unless that Reviewing Representative has first executed a Non-Disclosure Certificate; provided, that if an attorney qualified as a Reviewing Representative has executed such a certificate, the paralegals, secretarial and clerical personnel under the attorney's instruction, supervision or control need not do so. A copy of each Non-Disclosure Certificate shall be provided to counsel for the Participant asserting privilege prior to disclosure of any Privileged Material to that Reviewing Representative.

(b) Attorneys qualified as Reviewing Representatives are responsible for ensuring that persons under their supervision or control comply with this Protective Agreement.

10. Any Reviewing Representative may disclose Privileged Materials to any other Reviewing Representative as long as the disclosing Reviewing Representative and the receiving Reviewing Representative both have executed a Non-Disclosure Certificate. In the event that any Reviewing Representative to whom the Privileged Materials are disclosed ceases to be engaged in these proceedings, or is employed or retained for a position whose occupant is not qualified to be a Reviewing Representative under Paragraph 3(d), access to Privileged Materials by that person shall be terminated. Even if no longer engaged in this proceeding, every person who has executed a Non-Disclosure Certificate shall continue to be bound by the provisions of this Protective Agreement and the certification.

11. Subject to Paragraph 18, the Commission shall resolve any disputes arising under this Protective Agreement, unless a Presiding Administrative Law Judge has been appointed in which case the Presiding Administrative Law Judge shall resolve any disputes arising under this Protective Agreement. Prior to presenting any dispute under this Protective Agreement to the Commission or Presiding Administrative Law Judge, the parties to the dispute shall use their best efforts to resolve it. Any Participant that contests the designation of materials as privileged shall notify the Participant that provided the privileged materials by specifying in writing the materials the designation of which is contested. This Protective Agreement shall automatically cease to apply to such materials five (5) business days after the notification is made unless the designator, within said 5-day period, files a motion with the Commission or Presiding Administrative Law Judge, with supporting affidavits, demonstrating that the materials should continue to be privileged. In any challenge to the designation of materials as privileged, the burden of proof shall be on the Participant seeking privilege. If the Commission or Presiding Administrative Law Judge finds that the materials at issue are not entitled to privilege, the procedures of Paragraph 18 shall apply.

The procedures described above shall not apply to privileged materials designated by a Participant as Critical Energy Infrastructure Information. Materials so designated shall remain privileged and subject to the provisions of this Protective Agreement, unless a Participant requests and obtains a determination from the Commission's Critical Energy Infrastructure Information Coordinator that such materials need not remain privileged.

12. All copies of all documents reflecting Privileged Materials, including the portion of the hearing testimony, exhibits, transcripts, briefs and other documents which refer to Privileged

Materials, shall be filed and served in sealed envelopes or other appropriate containers endorsed to the effect that they are sealed pursuant to this Protective Agreement. Such documents shall be marked "PRIVILEGED MATERIALS" and shall be filed under seal and served under seal upon the Presiding Judge and all Reviewing Representatives who are on the service list. Such documents containing Critical Energy Infrastructure Information shall be additionally marked "Contains Critical Energy Infrastructure Information – Do Not Release." For anything filed under seal, redacted versions or, where an entire document is privileged, a letter indicating such, will also be filed with the Commission and served on all Participants on the service list and the Presiding Judge. Counsel for the producing Participant shall provide to all Participants who request the same, a list of Reviewing Representatives who are entitled to receive such material. Counsel shall take all reasonable precautions necessary to assure that Privileged Materials are not distributed to unauthorized persons.

13. If any Participant desires to include, utilize or refer to any Privileged Materials or information derived therefrom in testimony or exhibits during the hearing in these proceedings in such a manner that might require disclosure of such material to persons other than reviewing representatives, such Participant shall first notify both counsel for the disclosing Participant and the Presiding Judge of such desire, identifying with particularity each of the Privileged Materials. Thereafter, use of such Privileged Material will be governed by procedures determined by the Presiding Judge.

14. Nothing in this Protective Agreement shall be construed as precluding any Participant from objecting to the use of Privileged Materials on any legal grounds.

15. Nothing in this Protective Agreement shall preclude any Participant from requesting the Presiding Judge, the Commission, or any other body having appropriate authority, to find that this Protective Agreement should not apply to all or any materials previously designated as Privileged Materials pursuant to this Protective Agreement. The Presiding Judge may alter or amend this Protective Agreement as circumstances warrant at any time during the course of this proceeding.

16. Each Participant governed by this Protective Agreement has the right to seek changes in it as appropriate from the Presiding Judge or the Commission.

17. All Privileged Materials filed with the Commission, the Presiding Judge, or any other judicial or administrative body, in support of, or as a part of, a motion, other pleading, brief, or other document, shall be filed and served in sealed envelopes or other appropriate containers bearing prominent markings indicating that the contents include Privileged Materials subject to this Protective Agreement. Such documents containing Critical Energy Infrastructure Information shall be additionally marked "Contains Critical Energy Infrastructure Information – Do Not Release."

18. If the Commission or Presiding Judge finds at any time in the course of this proceeding that all or part of the Privileged Materials need not be privileged, those materials shall, nevertheless, be subject to the privilege afforded by this Protective Agreement for three (3) business days from the date of issuance of a determination of the Presiding Judge or the Commission, and if the Participant seeking privilege files an interlocutory appeal or requests that the issue be certified to the Commission, for an additional seven (7) business days. None of the

Participants waives its rights to seek additional administrative or judicial remedies after the Presiding Judge's decision respecting Privileged Materials or Reviewing Representatives, or the Commission's denial of any appeal thereof. The provisions of 18 C.F.R. § 388.112 and § 388.113 shall apply to any requests under the Freedom of Information Act. (5 U.S.C. § 552) for Privileged Materials in the files of the Commission.

19. Nothing in this Protective Agreement shall be deemed to preclude any Participant from independently seeking through discovery in any other administrative or judicial proceeding information or materials produced in this proceeding under this Protective Agreement.

20. None of the Participants waives the right to pursue any other legal or equitable remedies that may be available in the event of actual or anticipated disclosure of Privileged Materials.

21. The contents of Privileged Materials or any other form of information that copies or discloses Privileged Materials shall not be disclosed to anyone other than in accordance with this Protective Agreement and shall be used only in connection with this (these) proceeding(s). Any violation of this Protective Agreement and of any Non-Disclosure Certificate executed hereunder shall constitute a breach of an order of the Commission.

22. This Protective Agreement may be executed in one or more counterparts each of which shall be deemed an original and all of which shall be deemed one and the same Protective Agreement. Delivery of an executed counterpart of this Protective Agreement by email transmitting a PDF or similar image will be deemed as effective as delivery of an originally executed counterpart. Delivery of an executed counterpart of this Protective Agreement shall be made to:

Re: Public Service Enterprise Group Incorporated
2012 FERC Form 566

Dear Ms. Bose:

In accordance with 18 C.F.R. Part 46.3, the following indirect subsidiaries of Public Service Enterprise Group Incorporated ("PSEG") report that they had no sales of electric energy to purchasers, other than those purchasing for resale during any of the three preceding years:

- PSEG Energy Resources & Trade LLC
- PSEG Fossil LLC
- PSEG New Haven LLC
- PSEG Nuclear LLC
- PSEG Power Connecticut LLC
- PSEG Power New York LLC

PSEG Power Form 566 2013-01-25.PDF.....1-1

Filing Deadline: March 31, 2017

Federal Energy Regulatory Commission
2016 FERC Form 580 Interrogatory on Fuel and Energy Purchase Practices

Title 18, U.S.C. 1001 makes it a crime for any person knowingly and willingly to make to any Agency or Department of the United States any false, fictitious or fraudulent statements as to any matter within its jurisdiction.

Refer to the general guidance and directions provided in the 2016 FERC Form 580 Desk Reference to complete the interrogatory. Included herein is Appendix A *Coal Contract Types* and a *Glossary* of terms used. Terms highlighted in blue are defined in the glossary.

1a Enter the exact legal name of the filing Utility (as company is registered with the Commission).

Utility name:	PSEG Nuclear LLC

1b Identify the principal contact person for clarification and additional information concerning your Utility's fuel procurement.

Name	Address					Telephone	Email address
	street	suite	city	state	zip code		
David F. Caffery	80 Park Plaza	T19	Newark	NJ	07102	(973) 430-6821	David.Caffery@pseg.com

1c Identify the principal contact person for clarification and additional information concerning your Utility's energy purchases (purchased power).

Name	Address					Telephone	Email address
	street	suite	city	state	zip code		
Lathrop Craig	80 Park Plaza	T19	Newark	NJ	07102	(973) 430-7268	Lathrop.Craig@pseg.com

SI-SSA-0010-4290

2.

a. Provide the following information regarding non-transmission related wholesale automatic adjustment clauses (AACs) your Utility had on file with the Commission during calendar years 2014 and 2015. Note: use the add and delete row buttons to manage information entry.

Docket number under which rate schedule containing AAC through which costs were passed during 2014 and/or 2015 was accepted for filing by FERC	Is this AAC a fuel adjustment clause (FAC)	Tariff volume number containing AAC	Rate schedule number containing AAC	Date rate schedule was first accepted for filing by the Commission	First effective date of rate schedule	Was rate schedule superseded or abandoned during 2014-2015? If so, provide dates	Identify service agreement within rate schedule containing AAC

If the Utility had no non-transmission-related wholesale AACs during the reporting years, check here: ☒

Add Row (+) Delete Row (-)

b. If any of the Utility's wholesale rate and/or service agreements containing an AAC listed in Question 2a, that was used during 2014 and/or 2015, was filed with the Commission before January 1, 1990, attach an electronic copy of it with this filing. List the documents you are submitting below. Note: once this information is submitted electronically in a text-searchable format it will not be necessary to submit it in future Form 580 filings. See: http://www.ferc.gov/docs-filing/elibrary/accept-file-formats.asp for listing of Commission-accepted document types.

File name with extension	Document/ File Description:

Add Row (+) Delete Row (-)

NOTE: If the Utility for which you are filing did not have any rate/service schedules on file with the Commission allowing the automatic adjustment of fuel and/or fuel-related items subject to 18 CFR 35.14 during 2014-15, STOP HERE, you are finished. File your responses to questions 1 and 2 with the Commission. Otherwise, continue with the questions that follow.

SI-SSA-0010-4291

3. If during the 2014-2015 period, the Utility had any contracts or agreements for the purchase of either energy or capacity under which all or any portion of the purchase costs were passed through a fuel adjustment clause (FAC), for each purchase from a PURPA Qualifying Facility (QF) or Independent Power Producer (IPP), provide the information requested in the non-shaded columns of the table below. Provide the information separately for each reporting year 2014 and 2015. Do not report purchased power where none of the costs were recovered through a FAC. Fill-in the non-shaded columns and either the "Only energy charges" columns OR "The total cost of the purchase of economic power" columns, whichever apply.

If the Utility did not recover any purchased power costs through a FAC, check here: ☒

					Cost item/s recovered through a FAC					
					Only energy charges		***The total cost of the purchase of economic power***			
Year	Seller name	Purchase cost ($)	Annual amount recovered through an AAC ($)	Does the Commission-accepted FAC used to recover this cost allow for automatic recovery of purchased power costs?	Was the total of such charges less than the total avoided variable costs?	Was economic dispatch used to determine whether the charges were less than avoided costs?	Was the total cost of purchased power less than the total avoided variable costs?	Was the duration of the purchased power equal to or less than twelve months?	Did the FAC used for cost recovery include the system reserve capacity criteria by which the system operator decides whether a reliability purchase is required?	If the purchased power was wind-generated, was the avoided cost comparison done on a contract-by-contract basis?

Add Row (+) Delete Row (-)

SI-SSA-0010-4292

4a If emission allowance costs were incurred by the Utility in 2014 and/or 2015 and were recovered through a FAC, provide the following information.

Origin of emission allowance cost	Dollar value of emission allowance cost passed through a FAC		Docket number, if any, of Commission acceptance of emission allowance cost recovery through a FAC	Date Commission accepted FAC recovery of emission allowance costs
	2014	2015		

Add Row (+) Delete Row (-)

4b Were emission allowance costs recovered in any other method than through a FAC? No

If yes, how were they recovered? Include specific Commission rate schedule and service agreement notations.

SI-SSA-0010-4293

5. Provide the information requested below regarding the Utility's fuel procurement policies and practices in place during 2014 and/or 2015 for fuels whose costs were subject to 18 CFR 35.14. **Note: Responses to this question may be filed as Privileged. To do so, skip this question now and answer it via the Fuel Procurement Policies and Practices Privileged Addendum provided. Otherwise, answer it here and your responses will be made public.**

Are you filing the Question 5 Privileged Addendum?		
a1. How often does Utility management review the fuel procurement process?	Select value:	
a2. When was the last review?		
a3. Who conducted the last review? (Last, First, MI) & (Title)		
a4. What was covered in the last review?		
b1. Does the Utility have a policy on fuel inventory levels?		
b2. Does the policy state under what circumstance/s fuel inventory is increased or decreased?		
☐ Utility has no policy on fuel inventory levels.		
b3. When was the fuel inventory policy last reviewed, and who last approved it?		
b4. Who made the working decisions to change inventory levels? (Last, First, MI) & (Title)		

c. Describe any use by the Utility of systematic procedures for periodic market investigations of fuel costs and availability, particularly prior to renewal or renegotiation of contracts.

d. Describe any environmental constraints which influenced the Utility's fuel purchase practices.

e. What quality characteristics were routinely specified in the Utility's fuel contracts?

Fuel	*Energy Content*	*Sulfur Content*	*Ash Content*	*Moisture Content*	*Other*
Coal	☐	☐	☐	☐	
Oil	☐	☐	☐	☐	
Natural gas	☐	☐	☐	☐	
Other	☐	☐	☐	☐	

SI-SSA-0010-4294

f. What percentage of the Utility's fuel was purchased from utility-controlled (i.e. affiliate) sources?	%	0%	>0-25%	25-50%	50-75%	75-100%
	Coal	☐	☐	☐	☐	☐
	Oil	☐	☐	☐	☐	☐
	Natural gas	☐	☐	☐	☐	☐
	Other	☐	☐	☐	☐	☐

g1. How were potential fuel suppliers qualified?
g2. What criteria are used to rank bidders?
g3. How were credit and performance ratings of potential fuel suppliers checked?

g4. Do you automatically select the lowest bidder?	Y ☐ N ☐
If not, what criteria are used for selection and negotiation of the fuel contract?	

g5. Describe the procurement procedures used on your most recent fuel procurement contract for both:	
- the purchase from a non-affiliated company	
- the purchase from an affiliated company	

h. Do the Utility's purchase policy practices differ for associated companies?	Y ☐ N ☐
If so, what generally are the differences?	

SI-SSA-0010-4295

6. For each fuel supply contract, of longer than one year in duration, in force at any time during 2014 and/or 2015, where costs were subject to 18 CFR 35.14, (including informal agreements with *associated companies*), provide the requested information. Report the information individually for each contract, *for each calendar year.* [No response to any part of Question 6 for fuel oil no. 2 is necessary.] Report all fuels consumed for electric power generation and thermal energy associated with the production of electricity. Information for only coal, natural gas, and oil should be reported.

Contract 1

a. Contract specifications

Use the add, or delete buttons to manage contract records — Add Contract (+) — Del Contract (-)

Contract ID / number	Reporting year	Contract signing date	Contract expiration date	Is contract evergreen ?	Contract type: Coal (choose from list)	Contract type: Gas supply (choose from list)	Contract type: Gas transportation (choose from list)	Fuel quantity: Gas ($x10^3$ mmbtu)	Fuel quantity: Oil ($x10^3$ bbls)	Fuel quantity: Coal ($x10^3$ tons)	Fuel quality: Gas (Btu/ft^3)	Fuel quality: Pipeline quality? (Y/N)	Fuel quality: Oil (Btu/gal)	Fuel quality: Coal (Btu/lb)	Impurity content: Sulfur content (%weight)	Impurity content: Ash content (%weight)	Impurity content: Moisture (%)

b. Delivered characteristics

Fuel origin: Primary State / Country of Origin	Fuel origin: Type of purchase point	Fuel destination: Total fuel transportation distance (mi.) from Utility's receipt point to plant	Fuel quantity: Gas ($x10^3$ mmbtu)	Fuel quantity: Oil ($x10^3$ bbls)	Fuel quantity: Coal ($x10^3$ tons)	Fuel quantity: Coal ($x10^3$ tons) not delivered by end of contract year	Fuel quality: Gas (Btu/ft^3)	Fuel quality: Pipeline quality? (Y/N)	Fuel quality: Oil (Btu/gal)	Fuel quality: Coal (Btu/lb)	Impurity content: Sulfur content (%weight)	Impurity content: Ash content (% weight)	Impurity content: Moisture (%)	Fuel cost (see desk reference): Actual weighted average fuel price paid **FOB origin**/year (cents/mmBtu)	Fuel cost (see desk reference): Actual weighted average fuel price paid **FOB plant**/year (cents/mmBtu)
1.	*Destination Plant:*							*Enter Plant Not Listed:*							

Use the add, delete and copy buttons to manage Delivery characteristics information for each Contract : Add Delivery (+) — Del Delivery (-) — Copy Delivery

c. Fuel and transportation contract affiliates

Name of any entity affiliated with the Utility that is involved in the procurement or transportation of its fuel	Type of affiliation	Affiliated entity involvement with the Utility

Add Row (+) — Delete Row (-)

SI-SSA-0010-4296

7. For each fuel supply contract, including informal agreements with associated or affiliated companies in force at any time during 2014 or 2015 WHERE CONTRACT SHORTFALL COSTS WERE PASSED THROUGH an FAC subject to 18 CFR 35.14, provide for each contract separately the information requested below. Only report the information requested for shortfalls that occurred under your contracts during reporting years 2014 or 2015 and that are not under dispute i.e. parties agree there was indeed a shortfall.

a) Cause of the shortfall [e.g., disruption in production, fuel not meeting quality specifications, dispute over contract provisions, a disruption in supplier's transportation system or other (specify)].	b) Amount of shortfall costs passed through the FAC	c) Utility or Supplier-caused?	d) Did contract contain a provision for shortfall consequences?

Add Row (+) Delete Row (-)

8. For each fuel supply contract that was bought-out or bought-down, including informal agreements with associated or affiliated companies in force at any time during 2014 or 2015 WHERE CONTRACT BUY-OUT AND/OR BUY-DOWN COSTS WERE PASSED THROUGH an FAC subject to 18 CFR 35.14, provide for each contract separately the information requested below. Only report the information requested for contract buy-downs and buy-outs that occurred under your contracts during reporting years 2014 or 2015 and that are not under dispute i.e. parties agree there was indeed a shortfall.

a) Type of change (buy-down, buy-out, renegotiation or other)	b) Effective date of buy-out or buy-down (mm/dd/yy).	c) Amount of any buy-out and buy-down costs that were passed through the FAC ($xx).	d) Docket number of Commission waiver, if any, allowing recovery of contract buy-down and buy-out costs through the FAC.

Add Row (+) Delete Row (-)

SI-SSA-0010-4297

APPENDIX A

Coal Contract Types

1. Base Price plus Escalation

Different components of the price escalate (or de-escalate) as a function of changing economic conditions (indices).

2. Price Renegotiation

The price is renegotiated at predetermined intervals, usually one year. This type of contract, frequently known as an “EVERGREEN CONTRACT,” may also contain provisions for price adjustments between renegotiations.

3. Price Tied to Market

Price tied to the price of coal being sold in a particular market. Product and market area are defined in the contract. Contract may contain a "Most Favored Nations" clause, *i.e.*, supplier will not sell to any utility at a price lower than your utility is paying.

4. Cost-Plus Contract with a Fixed Fee Provision

Purchaser agrees to pay all producer costs plus a management fee. Some contracts provide for payment of both a management fee and a profit. This contract has a *Fixed Fee* provision.

5. Cost-Plus Contract with an Incentive Fee Provision

Purchaser agrees to pay all producer costs plus a management fee. Some contracts provide for payment of both a management fee and a profit. This contract has an *Incentive Fee* provision, *i.e.*, a variable fee that is tied to various productivity and cost reduction incentives.

6. Fixed-Price Contract

Price is fixed over the life of the contract.

Glossary

Term	Definition
Annual weighted average	An average taken over a 12-month period in which each item being averaged is multiplied by a number (weight) based on the item's relative importance. The result is summed and the total is divided by the sum of the weights.
Associated (affiliated) companies	Companies or persons that directly or indirectly through one or more intermediaries, control, or are controlled by, or are under common control with the account company. (see 18 CFR Part 101 for more information)
Automatic adjustment clause (AAC)	A provision of a rate schedule which provides for increases or decreases (or both), without prior hearing, in rates reflecting increases or decreases (or both) in costs incurred by an electric utility.
Avoided variable costs	All identified and documented variable costs (costs that change or vary with usage, output or production, e.g., fuel costs) that would have been incurred by the buyer had a particular purchase not been made. Such costs include, but are not limited to, those associated with fuel, start-up, shut-down or any purchases that would have been made in lieu of the purchase made.
Base price plus escalation	Different components of the price escalate (or de-escalate) as a function of changing economic conditions (indices).
Contract buy-downs	Costs paid in compensation to suppliers for reducing the contract amount to below the minimum requirement.
Contract buy-outs	Buy-out costs are compensation paid to suppliers for ending a contract before the previously agreed upon contract expiration date.
Capacity	Electricity available to provide to a market during a defined period.
Commission cite	Reference to a Commission document/issuance.
Contract ID/ number	Unique contract identifier that the Utility uses internally to identify a contract.
Cost-plus contract with a fixed fee provision	Purchaser agrees to pay all producer costs plus a management fee. Some contracts provide for payment of both a management fee and a profit. This contract has a Fixed Fee provision.
Cost-plus contract with an incentive fee provision	Purchaser agrees to pay all producer costs plus a management fee. Some contracts provide for payment of both a management fee and a profit. This contract has an Incentive Fee provision, i.e., a variable fee that is tied to various productivity and cost reduction incentives.
Economic power	Power or energy purchased over a period of twelve months or less where the total cost of the purchase is less than the buyer's total avoided variable cost.
Effective date of rate schedule	The date upon which service is approved by FERC to begin.
EIA	EIA is an acronym for Energy Information Administration.
EIA code	Unique identification number assigned by EIA to utilities and plants.
Emission allowance	an authorization by the Administrator under the Acid Rain Program to emit a specified limited amount of sulfur dioxide during or after a specified calendar year (see 40 CFR Part 72)
Energy charge	That portion of the charge for electric service based upon the electric energy (kWh) consumed or billed.
Evergreen contract	A contract that is renewed automatically or by notice from year to year until canceled by either party.
Filing year	The year the data is collected.

Term	Definition
Fixed-price contract	Price is fixed over the life of the contract.
FOB	FOB is an acronym for Free On Board. The term FOB (often seen as f.o.b.) is commonly used when shipping goods to indicate who pays loading and transportation costs, and/or the point at which the responsibility of the goods transfers from shipper to buyer. FOB origin is the term used when the ownership/liability of goods passes from the seller to the buyer at the time the goods leave the origin. FOB plant designates that the seller is responsible for the goods until the buyer takes possession at the delivery point. This is important in determining who is responsible for lost or damaged goods when they are in transit from the seller to the buyer. The buyer is responsible when shipped FOB origin and the seller is responsible when shipped FOB delivery point.
Hourly economic dispatch	A forward-looking process by which the system personnel responsible for selecting the source(s) of energy to be used by the company to meet its loads in the next hour are free to, and do in fact, decide which available energy resources will be used and in what amount solely on the basis of the relative projected energy costs of those resources for that hour with the goal of minimizing total production cost for that hour.
Independent Power Producer (IPP)	A generator who provides either capacity or wholesale power to utilities. IPPs operate in the franchised territories of host utilities and do not possess transmission facilities or sell electricity on the retail market.
Price renegotiation	The price is renegotiated at predetermined intervals, usually one year. This type of contract, frequently known as an “Evergreen Contract,” may also contain provisions for price adjustments between renegotiations.
Price tied to market	Price tied to the price of coal being sold in a particular market. Product and market area are defined in the contract. Contract may contain a "Most Favored Nations" clause, i.e., supplier will not sell to any utility at a price lower than your utility is paying.
Qualifying Facility (QF)	A QF is a generating facility which meets the requirements for QF status under the Public Utility Regulatory Policies Act of 1978 and 18 CFR Part 292 of the Commission's regulations, and which has either self-certified with the Commission or has obtained FERC certification of QF status. There are two types of QFs: cogeneration facilities and small power production facilities.
Rate schedule	The rates, charges, and provisions under which service is supplied to customers.
Receipt point	Where the Utility or Utility's contracted agent takes possession of the fuel.
Reliability purchase	An energy purchase made when a utility does not have sufficient generating capability to meet its own load plus its planning reserve requirement.
Renewable Energy Credit (REC)	A tax credit offered by some states as an incentive for the installation and operation of renewable energy systems such as solar or wind power.
Reporting year	The time period to which the data provided in the FERC-580 applies.
Service schedule	A document describing the kinds of services to be furnished to the identified parties at the rates specified.
Shortfall	Contracted less delivered amount.
System reserve capacity criteria	Planning criteria used to determine when a reliability purchase is made.
Total avoided variable cost	All identified and documented variable costs that would have been incurred by the buyer had a particular purchase not been made.
Utility name	The exact legal name of the Utility

Filing Deadline: October 31, 2018

Federal Energy Regulatory Commission
2016 FERC Form 580 Interrogatory on Fuel and Energy Purchase Practices

Title 18, U.S.C. 1001 makes it a crime for any person knowingly and willingly to make to any Agency or Department of the United States any false, fictitious or fraudulent statements as to any matter within its jurisdiction.

Refer to the general guidance and directions provided in the 2018 FERC Form 580 Desk Reference to complete the interrogatory. Included herein is Appendix A *Coal Contract Types* and a *Glossary* of terms used. Terms highlighted in blue are defined in the glossary.

1a Enter the exact legal name of the filing Utility (as company is registered with the Commission).

Utility name:	PSEG Nuclear LLC

1b Identify the principal contact person for clarification and additional information concerning your Utility's fuel procurement.

Name	Address					Telephone	Email address
	street	suite	city	state	zip code		
Kory Dyer	PSEG Nuclear LLC Purchas	NDC7	Hancocks Bridge	NJ	08038	(856) 339-1140	Kory.Dyer@pseg.com

1c Identify the principal contact person for clarification and additional information concerning your Utility's energy purchases (purchased power).

Name	Address					Telephone	Email address
	street	suite	city	state	zip code		
Lathrop Craig	80 Park Plaza	T19	Newark	NJ	07102	(973) 430-7268	Lathrop.Craig@pseg.com

SI-SSA-0010-4301

2.

a. Provide the following information regarding non-transmission related wholesale automatic adjustment clauses (AACs) your Utility had on file with the Commission during calendar years 2016 and 2017. Note: use the add and delete row buttons to manage information entry.

Docket number under which rate schedule containing AAC through which costs were passed during 2016 and/or 2017 was accepted for filing by FERC	Is this AAC a fuel adjustment clause (FAC)	Tariff volume number containing AAC	Rate schedule number containing AAC	Date rate schedule was first accepted for filing by the Commission	First effective date of rate schedule	Was rate schedule superseded or abandoned during 2016-2017? If so, provide dates	Identify service agreement within rate schedule containing AAC

If the Utility had no non-transmission-related wholesale AACs during the reporting years, check here: ☒

Add Row (+) Delete Row (-)

b. If any of the Utility's wholesale rate and/or service agreements containing an AAC listed in Question 2a, that was used during 2016 and/or 2017, was filed with the Commission before January 1, 1990, attach an electronic copy of it with this filing. List the documents you are submitting below. Note: once this information is submitted electronically in a text-searchable format it will not be necessary to submit it in future Form 580 filings. See: http://www.ferc.gov/docs-filing/elibrary/accept-file-formats.asp for listing of Commission-accepted document types.

File name with extension	Document/ File Description:

Add Row (+) Delete Row (-)

NOTE: If the Utility for which you are filing did not have any rate/service schedules on file with the Commission allowing the automatic adjustment of fuel and/or fuel-related items subject to 18 CFR 35.14 during 2016-17, STOP HERE, you are finished. File your responses to questions 1 and 2 with the Commission. Otherwise, continue with the questions that follow.

SI-SSA-0010-4302

3. If during the 2016-2017 period, the Utility had any contracts or agreements for the purchase of either energy or capacity under which all or any portion of the purchase costs were passed through a fuel adjustment clause (FAC), for each purchase from a PURPA Qualifying Facility (QF) or Independent Power Producer (IPP), provide the information requested in the non-shaded columns of the table below. Provide the information separately for each reporting year 2016 and 2017. Do not report purchased power where none of the costs were recovered through a FAC. Fill-in the non-shaded columns and either the "Only energy charges" columns OR "The total cost of the purchase of economic power" columns, whichever apply.

If the Utility did not recover any purchased power costs through a FAC, check here: ☒

					Cost item/s recovered through a FAC					
					Only energy charges		***The total cost of the purchase of economic power***			
Year	Seller name	Purchase cost ($)	Annual amount recovered through an AAC ($)	Does the Commission-accepted FAC used to recover this cost allow for automatic recovery of purchased power costs?	Was the total of such charges less than the total avoided variable costs?	Was economic dispatch used to determine whether the charges were less than avoided costs?	Was the total cost of purchased power less than the total avoided variable costs?	Was the duration of the purchased power equal to or less than twelve months?	Did the FAC used for cost recovery include the system reserve capacity criteria by which the system operator decides whether a reliability purchase is required?	If the purchased power was wind-generated, was the avoided cost comparison done on a contract-by-contract basis?

Add Row (+) Delete Row (-)

SI-SSA-0010-4303

4a If emission allowance costs were incurred by the Utility in 2016 and/or 2017 and were recovered through a FAC, provide the following information.

Origin of emission allowance cost	Dollar value of emission allowance cost passed through a FAC		Docket number, if any, of Commission acceptance of emission allowance cost recovery through a FAC	Date Commission accepted FAC recovery of emission allowance costs
	2016	2017		

Add Row (+) Delete Row (-)

4b Were emission allowance costs recovered in any other method than through a FAC? No

If yes, how were they recovered? Include specific Commission rate schedule and service agreement notations.

SI-SSA-0010-4304

5. Provide the information requested below regarding the Utility's fuel procurement policies and practices in place during 2016 and/or 2017 for fuels whose costs were subject to 18 CFR 35.14. **Note: Responses to this question may be filed as Privileged. To do so, skip this question now and answer it via the Fuel Procurement Policies and Practices Privileged Addendum provided. Otherwise, answer it here and your responses will be made public.**

Are you filing the Question 5 Privileged Addendum?		
a1. How often does Utility management review the fuel procurement process?	Select value:	
a2. When was the last review?		
a3. Who conducted the last review? (Last, First, MI) & (Title)		
a4. What was covered in the last review?		
b1. Does the Utility have a policy on fuel inventory levels?		
b2. Does the policy state under what circumstance/s fuel inventory is increased or decreased?		
☐ Utility has no policy on fuel inventory levels.		
b3. When was the fuel inventory policy last reviewed, and who last approved it?		
b4. Who made the working decisions to change inventory levels? (Last, First, MI) & (Title)		

c. Describe any use by the Utility of systematic procedures for periodic market investigations of fuel costs and availability, particularly prior to renewal or renegotiation of contracts.

d. Describe any environmental constraints which influenced the Utility's fuel purchase practices.

e. What quality characteristics were routinely specified in the Utility's fuel contracts?

Fuel	*Energy Content*	*Sulfur Content*	*Ash Content*	*Moisture Content*	*Other*
Coal	☐	☐	☐	☐	
Oil	☐	☐	☐	☐	
Natural gas	☐	☐	☐	☐	
Other	☐	☐	☐	☐	

SI-SSA-0010-4305

f. What percentage of the Utility's fuel was purchased from utility-controlled (i.e. affiliate) sources?	%	0%	>0-25%	25-50%	50-75%	75-100%
	Coal	☐	☐	☐	☐	☐
	Oil	☐	☐	☐	☐	☐
	Natural gas	☐	☐	☐	☐	☐
	Other	☐	☐	☐	☐	☐

g1. How were potential fuel suppliers qualified?
g2. What criteria are used to rank bidders?
g3. How were credit and performance ratings of potential fuel suppliers checked?

g4. Do you automatically select the lowest bidder?	Y ☐ N ☐
If not, what criteria are used for selection and negotiation of the fuel contract?	

g5. Describe the procurement procedures used on your most recent fuel procurement contract for both:	
- the purchase from a non-affiliated company	
- the purchase from an affiliated company	

h. Do the Utility's purchase policy practices differ for associated companies?	Y ☐ N ☐
If so, what generally are the differences?	

SI-SSA-0010-4306

6. For each fuel supply contract, of longer than one year in duration, in force at any time during 2016 and/or 2017, where costs were subject to 18 CFR 35.14, (including informal agreements with *associated companies*), provide the requested information. Report the information individually for each contract, *for each calendar year.* [No response to any part of Question 6 for fuel oil no. 2 is necessary.] Report all fuels consumed for electric power generation and thermal energy associated with the production of electricity. Information for only coal, natural gas, and oil should be reported.

Contract 1

a. Contract specifications

Use the add, or delete buttons to manage contract records — Add Contract (+) — Del Contract (-)

Contract ID / number	Reporting year	Contract signing date	Contract expiration date	Is contract evergreen ?	Contract type: Coal (choose from list)	Contract type: Gas supply (choose from list)	Contract type: Gas transportation (choose from list)	Fuel quantity: Gas ($x10^3$ mmbtu)	Fuel quantity: Oil ($x10^3$ bbls)	Fuel quantity: Coal ($x10^3$ tons)	Fuel quality: Gas (Btu/ft^3)	Fuel quality: Pipeline quality? (Y/N)	Fuel quality: Oil (Btu/gal)	Fuel quality: Coal (Btu/lb)	Impurity content: Sulfur content (%weight)	Impurity content: Ash content (%weight)	Impurity content: Moisture (%)

b. Delivered characteristics

Fuel origin: Primary State / Country of Origin	Fuel origin: Type of purchase point	Fuel destination: Total fuel transportation distance (mi.) from Utility's receipt point to plant	Fuel quantity: Gas ($x10^3$ mmbtu)	Fuel quantity: Oil ($x10^3$ bbls)	Fuel quantity: Coal ($x10^3$ tons)	Fuel quantity: Coal ($x10^3$ tons) not delivered by end of contract year	Fuel quality: Gas (Btu/ft^3)	Fuel quality: Pipeline quality? c. Fuel and transportation contract affiliates

Name of any entity affiliated with the Utility that is involved in the procurement or transportation of its fuel	Type of affiliation	Affiliated entity involvement with the Utility

Add Row (+) — Delete Row (-)

SI-SSA-0010-4307

7. For each fuel supply contract, including informal agreements with associated or affiliated companies in force at any time during 2016 or 2017 WHERE CONTRACT SHORTFALL COSTS WERE PASSED THROUGH an FAC subject to 18 CFR 35.14, provide for each contract separately the information requested below. Only report the information requested for shortfalls that occurred under your contracts during reporting years 2016 or 2017 and that are not under dispute i.e. parties agree there was indeed a shortfall.

a) Cause of the shortfall [e.g., disruption in production, fuel not meeting quality specifications, dispute over contract provisions, a disruption in supplier's transportation system or other (specify)].	b) Amount of shortfall costs passed through the FAC	c) Utility or Supplier-caused?	d) Did contract contain a provision for shortfall consequences?

Add Row (+) Delete Row (-)

8. For each fuel supply contract that was bought-out or bought-down, including informal agreements with associated or affiliated companies in force at any time during 2016 or 2017 WHERE CONTRACT BUY-OUT AND/OR BUY-DOWN COSTS WERE PASSED THROUGH an FAC subject to 18 CFR 35.14, provide for each contract separately the information requested below. Only report the information requested for contract buy-downs and buy-outs that occurred under your contracts during reporting years 2016 or 2017 and that are not under dispute i.e. parties agree there was indeed a shortfall.

a) Type of change (buy-down, buy-out, renegotiation or other)	b) Effective date of buy-out or buy-down (mm/dd/yy).	c) Amount of any buy-out and buy-down costs that were passed through the FAC ($xx).	d) Docket number of Commission waiver, if any, allowing recovery of contract buy-down and buy-out costs through the FAC.

SI-SSA-0010-4308

APPENDIX A

Coal Contract Types

1. Base Price plus Escalation

Different components of the price escalate (or de-escalate) as a function of changing economic conditions (indices).

2. Price Renegotiation

The price is renegotiated at predetermined intervals, usually one year. This type of contract, frequently known as an “EVERGREEN CONTRACT,” may also contain provisions for price adjustments between renegotiations.

3. Price Tied to Market

Price tied to the price of coal being sold in a particular market. Product and market area are defined in the contract. Contract may contain a "Most Favored Nations" clause, *i.e.*, supplier will not sell to any utility at a price lower than your utility is paying.

4. Cost-Plus Contract with a Fixed Fee Provision

Purchaser agrees to pay all producer costs plus a management fee. Some contracts provide for payment of both a management fee and a profit. This contract has a *Fixed Fee* provision.

5. Cost-Plus Contract with an Incentive Fee Provision

Purchaser agrees to pay all producer costs plus a management fee. Some contracts provide for payment of both a management fee and a profit. This contract has an *Incentive Fee* provision, *i.e.*, a variable fee that is tied to various productivity and cost reduction incentives.

6. Fixed-Price Contract

Price is fixed over the life of the contract.

Glossary

Term	Definition
Annual weighted average	An average taken over a 12-month period in which each item being averaged is multiplied by a number (weight) based on the item's relative importance. The result is summed and the total is divided by the sum of the weights.
Associated (affiliated) companies	Companies or persons that directly or indirectly through one or more intermediaries, control, or are controlled by, or are under common control with the account company. (see 18 CFR Part 101 for more information)
Automatic adjustment clause (AAC)	A provision of a rate schedule which provides for increases or decreases (or both), without prior hearing, in rates reflecting increases or decreases (or both) in costs incurred by an electric utility.
Avoided variable costs	All identified and documented variable costs (costs that change or vary with usage, output or production, e.g., fuel costs) that would have been incurred by the buyer had a particular purchase not been made. Such costs include, but are not limited to, those associated with fuel, start-up, shut-down or any purchases that would have been made in lieu of the purchase made.
Base price plus escalation	Different components of the price escalate (or de-escalate) as a function of changing economic conditions (indices).
Contract buy-downs	Costs paid in compensation to suppliers for reducing the contract amount to below the minimum requirement.
Contract buy-outs	Buy-out costs are compensation paid to suppliers for ending a contract before the previously agreed upon contract expiration date.
Capacity	Electricity available to provide to a market during a defined period.
Commission cite	Reference to a Commission document/issuance.
Contract ID/ number	Unique contract identifier that the Utility uses internally to identify a contract.
Cost-plus contract with a fixed fee provision	Purchaser agrees to pay all producer costs plus a management fee. Some contracts provide for payment of both a management fee and a profit. This contract has a Fixed Fee provision.
Cost-plus contract with an incentive fee provision	Purchaser agrees to pay all producer costs plus a management fee. Some contracts provide for payment of both a management fee and a profit. This contract has an Incentive Fee provision, i.e., a variable fee that is tied to various productivity and cost reduction incentives.
Economic power	Power or energy purchased over a period of twelve months or less where the total cost of the purchase is less than the buyer's total avoided variable cost.
Effective date of rate schedule	The date upon which service is approved by FERC to begin.
EIA	EIA is an acronym for Energy Information Administration.
EIA code	Unique identification number assigned by EIA to utilities and plants.
Emission allowance	an authorization by the Administrator under the Acid Rain Program to emit a specified limited amount of sulfur dioxide during or after a specified calendar year (see 40 CFR Part 72)
Energy charge	That portion of the charge for electric service based upon the electric energy (kWh) consumed or billed.
Evergreen contract	A contract that is renewed automatically or by notice from year to year until canceled by either party.
Filing year	The year the data is collected.

Term	Definition
Fixed-price contract	Price is fixed over the life of the contract.
FOB	FOB is an acronym for Free On Board. The term FOB (often seen as f.o.b.) is commonly used when shipping goods to indicate who pays loading and transportation costs, and/or the point at which the responsibility of the goods transfers from shipper to buyer. FOB origin is the term used when the ownership/liability of goods passes from the seller to the buyer at the time the goods leave the origin. FOB plant designates that the seller is responsible for the goods until the buyer takes possession at the delivery point. This is important in determining who is responsible for lost or damaged goods when they are in transit from the seller to the buyer. The buyer is responsible when shipped FOB origin and the seller is responsible when shipped FOB delivery point.
Hourly economic dispatch	A forward-looking process by which the system personnel responsible for selecting the source(s) of energy to be used by the company to meet its loads in the next hour are free to, and do in fact, decide which available energy resources will be used and in what amount solely on the basis of the relative projected energy costs of those resources for that hour with the goal of minimizing total production cost for that hour.
Independent Power Producer (IPP)	A generator who provides either capacity or wholesale power to utilities. IPPs operate in the franchised territories of host utilities and do not possess transmission facilities or sell electricity on the retail market.
Price renegotiation	The price is renegotiated at predetermined intervals, usually one year. This type of contract, frequently known as an “Evergreen Contract,” may also contain provisions for price adjustments between renegotiations.
Price tied to market	Price tied to the price of coal being sold in a particular market. Product and market area are defined in the contract. Contract may contain a "Most Favored Nations" clause, i.e., supplier will not sell to any utility at a price lower than your utility is paying.
Qualifying Facility (QF)	A QF is a generating facility which meets the requirements for QF status under the Public Utility Regulatory Policies Act of 1978 and 18 CFR Part 292 of the Commission's regulations, and which has either self-certified with the Commission or has obtained FERC certification of QF status. There are two types of QFs: cogeneration facilities and small power production facilities.
Rate schedule	The rates, charges, and provisions under which service is supplied to customers.
Receipt point	Where the Utility or Utility's contracted agent takes possession of the fuel.
Reliability purchase	An energy purchase made when a utility does not have sufficient generating capability to meet its own load plus its planning reserve requirement.
Renewable Energy Credit (REC)	A tax credit offered by some states as an incentive for the installation and operation of renewable energy systems such as solar or wind power.
Reporting year	The time period to which the data provided in the FERC-580 applies.
Service schedule	A document describing the kinds of services to be furnished to the identified parties at the rates specified.
Shortfall	Contracted less delivered amount.
System reserve capacity criteria	Planning criteria used to determine when a reliability purchase is made.
Total avoided variable cost	All identified and documented variable costs that would have been incurred by the buyer had a particular purchase not been made.
Utility name	The exact legal name of the Utility

Filing Deadline: December 31, 2014

Federal Energy Regulatory Commission
2014 FERC Form 580 Interrogatory on Fuel and Energy Purchase Practices

Title 18, U.S.C. 1001 makes it a crime for any person knowingly and willingly to make to any Agency or Department of the United States any false, fictitious or fraudulent statements as to any matter within its jurisdiction.

Refer to the general guidance and directions provided in the 2014 FERC Form 580 Desk Reference to complete the interrogatory. Included herein is Appendix A *Coal Contract Types* and a *Glossary* of terms used. Terms highlighted in blue are defined in the glossary.

1a Enter the exact legal name of the filing Utility (as company is registered with the Commission).

Utility name:	PSEG Nuclear LLC

1b Identify the principal contact person for clarification and additional information concerning your Utility's fuel procurement.

Name	Address					Telephone	Email address
	street	suite	city	state	zip code		
John P. Scarlata	80 Park Plaza	T19	Newark	NJ	07102	(973) 430-6803	John.Scarlata@pseg.com

1c Identify the principal contact person for clarification and additional information concerning your Utility's energy purchases (purchased power).

Name	Address					Telephone	Email address
	street	suite	city	state	zip code		
Lathrop Craig	80 Park Plaza	T19	Newark	NJ	07102	(973) 430-7268	Lathrop.Craig@pseg.com

SI-SSA-0010-4312

2.

a. Provide the following information regarding non-transmission related wholesale automatic adjustment clauses (AACs) your Utility had on file with the Commission during calendar years 2012 and 2013. Note: use the add and delete row buttons to manage information entry.

Docket number under which rate schedule containing AAC through which costs were passed during 2012 and/or 2013 was accepted for filing by FERC	Is this AAC a fuel adjustment clause (FAC)	Tariff volume number containing AAC	Rate schedule number containing AAC	Date rate schedule was first accepted for filing by the Commission	First effective date of rate schedule	Was rate schedule superseded or abandoned during 2012-2013? If so, provide dates	Identify service agreement within rate schedule containing AAC

If the Utility had no non-transmission-related wholesale AACs during the reporting years, check here: ☒

Add Row (+) Delete Row (-)

b. If any of the Utility's wholesale rate and/or service agreements containing an AAC listed in Question 2a, that was used during 2012 and/or 2013, was filed with the Commission before January 1, 1990, attach an electronic copy of it with this filing. List the documents you are submitting below. Note: once this information is submitted electronically in a text-searchable format it will not be necessary to submit it in future Form 580 filings. See: http://www.ferc.gov/docs-filing/elibrary/accept-file-formats.asp for listing of Commission-accepted document types.

File name with extension	Document/ File Description:

Add Row (+) Delete Row (-)

NOTE: If the Utility for which you are filing did not have any rate/service schedules on file with the Commission allowing the automatic adjustment of fuel and/or fuel-related items subject to 18 CFR 35.14 during 2012-13, STOP HERE, you are finished. File your responses to questions 1 and 2 with the Commission. Otherwise, continue with the questions that follow.

SI-SSA-0010-4313

3. If during the 2012-2013 period, the Utility had any contracts or agreements for the purchase of either energy or capacity under which all or any portion of the purchase costs were passed through a fuel adjustment clause (FAC), for each purchase from a PURPA Qualifying Facility (QF) or Independent Power Producer (IPP), provide the information requested in the non-shaded columns of the table below. Provide the information separately for each reporting year 2012 and 2013. Do not report purchased power where none of the costs were recovered through a FAC. Fill-in the non-shaded columns and either the "Only energy charges" columns OR "The total cost of the purchase of economic power" columns, whichever apply.

If the Utility did not recover any purchased power costs through a FAC, check here: ☒

					Cost item/s recovered through a FAC					
					Only energy charges		***The total cost of the purchase of economic power***			
Year	Seller name	Purchase cost ($)	Annual amount recovered through an AAC ($)	Does the Commission-accepted FAC used to recover this cost allow for automatic recovery of purchased power costs?	Was the total of such charges less than the total avoided variable costs?	Was economic dispatch used to determine whether the charges were less than avoided costs?	Was the total cost of purchased power less than the total avoided variable costs?	Was the duration of the purchased power equal to or less than twelve months?	Did the FAC used for cost recovery include the system reserve capacity criteria by which the system operator decides whether a reliability purchase is required?	If the purchased power was wind-generated, was the avoided cost comparison done on a contract-by-contract basis?

Add Row (+) Delete Row (-)

SI-SSA-0010-4314

4a If emission allowance costs were incurred by the Utility in 2012 and/or 2013 and were recovered through a FAC, provide the following information.

Origin of emission allowance cost	Dollar value of emission allowance cost passed through a FAC		Docket number, if any, of Commission acceptance of emission allowance cost recovery through a FAC	Date Commission accepted FAC recovery of emission allowance costs
	2012	2013		

Add Row (+) Delete Row (-)

4b Were emission allowance costs recovered in any other method than through a FAC? No

If yes, how were they recovered? Include specific Commission rate schedule and service agreement notations.

SI-SSA-0010-4315

5. Provide the information requested below regarding the Utility's fuel procurement policies and practices in place during 2012 and/or 2013 for fuels whose costs were subject to 18 CFR 35.14. **Note: Responses to this question may be filed as Privileged. To do so, skip this question now and answer it via the Fuel Procurement Policies and Practices Privileged Addendum provided. Otherwise, answer it here and your responses will be made public.**

Are you filing the Question 5 Privileged Addendum?		
a1. How often does Utility management review the fuel procurement process?	Select value:	
a2. When was the last review?		
a3. Who conducted the last review? (Last, First, MI) & (Title)		
a4. What was covered in the last review?		
b1. Does the Utility have a policy on fuel inventory levels?		
b2. Does the policy state under what circumstance/s fuel inventory is increased or decreased?		
☐ Utility has no policy on fuel inventory levels.		
b3. When was the fuel inventory policy last reviewed, and who last approved it?		
b4. Who made the working decisions to change inventory levels? (Last, First, MI) & (Title)		

c. Describe any use by the Utility of systematic procedures for periodic market investigations of fuel costs and availability, particularly prior to renewal or renegotiation of contracts.

d. Describe any environmental constraints which influenced the Utility's fuel purchase practices.

e. What quality characteristics were routinely specified in the Utility's fuel contracts?

Fuel	*Energy Content*	*Sulfur Content*	*Ash Content*	*Moisture Content*	*Other*
Coal	☐	☐	☐	☐	
Oil	☐	☐	☐	☐	
Natural gas	☐	☐	☐	☐	
Other	☐	☐	☐	☐	

SI-SSA-0010-4316

f. What percentage of the Utility's fuel was purchased from utility-controlled (i.e. affiliate) sources?	%	0%	>0-25%	25-50%	50-75%	75-100%
	Coal	☐	☐	☐	☐	☐
	Oil	☐	☐	☐	☐	☐
	Natural gas	☐	☐	☐	☐	☐
	Other	☐	☐	☐	☐	☐

g1. How were potential fuel suppliers qualified?
g2. What criteria are used to rank bidders?
g3. How were credit and performance ratings of potential fuel suppliers checked?

g4. Do you automatically select the lowest bidder?	Y ☐ N ☐
If not, what criteria are used for selection and negotiation of the fuel contract?	

g5. Describe the procurement procedures used on your most recent fuel procurement contract for both:	
- the purchase from a non-affiliated company	
- the purchase from an affiliated company	

h. Do the Utility's purchase policy practices differ for associated companies?	Y ☐ N ☐
If so, what generally are the differences?	

SI-SSA-0010-4317

6. For each fuel supply contract, of longer than one year in duration, in force at any time during 2012 and/or 2013, where costs were subject to 18 CFR 35.14, (including informal agreements with *associated companies*), provide the requested information. Report the information individually for each contract, *for each calendar year.* [No response to any part of Question 6 for fuel oil no. 2 is necessary.] Report all fuels consumed for electric power generation and thermal energy associated with the production of electricity. Information for only coal, natural gas, and oil should be reported.

APPENDIX A

Coal Contract Types

1. Base Price plus Escalation

Different components of the price escalate (or de-escalate) as a function of changing economic conditions (indices).

2. Price Renegotiation

The price is renegotiated at predetermined intervals, usually one year. This type of contract, frequently known as an “EVERGREEN CONTRACT,” may also contain provisions for price adjustments between renegotiations.

3. Price Tied to Market

Price tied to the price of coal being sold in a particular market. Product and market area are defined in the contract. Contract may contain a "Most Favored Nations" clause, *i.e.*, supplier will not sell to any utility at a price lower than your utility is paying.

4. Cost-Plus Contract with a Fixed Fee Provision

Purchaser agrees to pay all producer costs plus a management fee. Some contracts provide for payment of both a management fee and a profit. This contract has a *Fixed Fee* provision.

5. Cost-Plus Contract with an Incentive Fee Provision

Purchaser agrees to pay all producer costs plus a management fee. Some contracts provide for payment of both a management fee and a profit. This contract has an *Incentive Fee* provision, *i.e.*, a variable fee that is tied to various productivity and cost reduction incentives.

6. Fixed-Price Contract

Price is fixed over the life of the contract.

Glossary

Term	Definition
Annual weighted average	An average taken over a 12-month period in which each item being averaged is multiplied by a number (weight) based on the item's relative importance. The result is summed and the total is divided by the sum of the weights.
Associated (affiliated) companies	Companies or persons that directly or indirectly through one or more intermediaries, control, or are controlled by, or are under common control with the account company. (see 18 CFR Part 101 for more information)
Automatic adjustment clause (AAC)	A provision of a rate schedule which provides for increases or decreases (or both), without prior hearing, in rates reflecting increases or decreases (or both) in costs incurred by an electric utility.
Avoided variable costs	All identified and documented variable costs (costs that change or vary with usage, output or production, e.g., fuel costs) that would have been incurred by the buyer had a particular purchase not been made. Such costs include, but are not limited to, those associated with fuel, start-up, shut-down or any purchases that would have been made in lieu of the purchase made.
Base price plus escalation	Different components of the price escalate (or de-escalate) as a function of changing economic conditions (indices).
Contract buy-downs	Costs paid in compensation to suppliers for reducing the contract amount to below the minimum requirement.
Contract buy-outs	Buy-out costs are compensation paid to suppliers for ending a contract before the previously agreed upon contract expiration date.
Capacity	Electricity available to provide to a market during a defined period.
Commission cite	Reference to a Commission document/issuance.
Contract ID/ number	Unique contract identifier that the Utility uses internally to identify a contract.
Cost-plus contract with a fixed fee provision	Purchaser agrees to pay all producer costs plus a management fee. Some contracts provide for payment of both a management fee and a profit. This contract has a Fixed Fee provision.
Cost-plus contract with an incentive fee provision	Purchaser agrees to pay all producer costs plus a management fee. Some contracts provide for payment of both a management fee and a profit. This contract has an Incentive Fee provision, i.e., a variable fee that is tied to various productivity and cost reduction incentives.
Economic power	Power or energy purchased over a period of twelve months or less where the total cost of the purchase is less than the buyer's total avoided variable cost.
Effective date of rate schedule	The date upon which service is approved by FERC to begin.
EIA	EIA is an acronym for Energy Information Administration.
EIA code	Unique identification number assigned by EIA to utilities and plants.
Emission allowance	an authorization by the Administrator under the Acid Rain Program to emit a specified limited amount of sulfur dioxide during or after a specified calendar year (see 40 CFR Part 72)
Energy charge	That portion of the charge for electric service based upon the electric energy (kWh) consumed or billed.
Evergreen contract	A contract that is renewed automatically or by notice from year to year until canceled by either party.
Filing year	The year the data is collected.

Term	Definition
Fixed-price contract	Price is fixed over the life of the contract.
FOB	FOB is an acronym for Free On Board. The term FOB (often seen as f.o.b.) is commonly used when shipping goods to indicate who pays loading and transportation costs, and/or the point at which the responsibility of the goods transfers from shipper to buyer. FOB origin is the term used when the ownership/liability of goods passes from the seller to the buyer at the time the goods leave the origin. FOB plant designates that the seller is responsible for the goods until the buyer takes possession at the delivery point. This is important in determining who is responsible for lost or damaged goods when they are in transit from the seller to the buyer. The buyer is responsible when shipped FOB origin and the seller is responsible when shipped FOB delivery point.
Hourly economic dispatch	A forward-looking process by which the system personnel responsible for selecting the source(s) of energy to be used by the company to meet its loads in the next hour are free to, and do in fact, decide which available energy resources will be used and in what amount solely on the basis of the relative projected energy costs of those resources for that hour with the goal of minimizing total production cost for that hour.
Independent Power Producer (IPP)	A generator who provides either capacity or wholesale power to utilities. IPPs operate in the franchised territories of host utilities and do not possess transmission facilities or sell electricity on the retail market.
Price renegotiation	The price is renegotiated at predetermined intervals, usually one year. This type of contract, frequently known as an “Evergreen Contract,” may also contain provisions for price adjustments between renegotiations.
Price tied to market	Price tied to the price of coal being sold in a particular market. Product and market area are defined in the contract. Contract may contain a "Most Favored Nations" clause, i.e., supplier will not sell to any utility at a price lower than your utility is paying.
Qualifying Facility (QF)	A QF is a generating facility which meets the requirements for QF status under the Public Utility Regulatory Policies Act of 1978 and 18 CFR Part 292 of the Commission's regulations, and which has either self-certified with the Commission or has obtained FERC certification of QF status. There are two types of QFs: cogeneration facilities and small power production facilities.
Rate schedule	The rates, charges, and provisions under which service is supplied to customers.
Receipt point	Where the Utility or Utility's contracted agent takes possession of the fuel.
Reliability purchase	An energy purchase made when a utility does not have sufficient generating capability to meet its own load plus its planning reserve requirement.
Renewable Energy Credit (REC)	A tax credit offered by some states as an incentive for the installation and operation of renewable energy systems such as solar or wind power.
Reporting year	The time period to which the data provided in the FERC-580 applies.
Service schedule	A document describing the kinds of services to be furnished to the identified parties at the rates specified.
Shortfall	Contracted less delivered amount.
System reserve capacity criteria	Planning criteria used to determine when a reliability purchase is made.
Total avoided variable cost	All identified and documented variable costs that would have been incurred by the buyer had a particular purchase not been made.
Utility name	The exact legal name of the Utility

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Grid Resilience in Regional Transmission Organizations and Independent System Operators	)))	Docket No. AD18-7-000

COMMENTS OF EXELON CORPORATION

Resilience is an increasingly important concern in the face of significant man-made and natural threats to the bulk power system. Foreign adversaries and other bad actors have already demonstrated an interest in attacking the bulk power system, as the Commission and RTOs have recognized. Yet the system's vulnerability to these threats is growing, due to exit of numerous fuel-secure baseload generators from the market, combined with an increased reliance on natural gas generators susceptible to fuel supply interruption. Fuel security is thus a serious emerging issue affecting grid resilience. PJM acknowledges that its reliability studies do not include consideration of "the resilience of the system with various potential [resource] portfolios nor the risks associated with significant disruptive events," and that PJM "needs to understand the fuel-supply risks in an environment trending toward greater reliance on natural gas supply and delivery."[1]

In a recent scoping document and letter to stakeholders, PJM indicated its intent to conduct a study in the coming few months to "perform targeted analyses to identify fuel security risks that could affect specific locations on the system," including "the deliverability logistics of fuel supplies during stressed conditions over time."[2] PJM then intends to model various contingencies

[1] PJM Interconnection, L.L.C., *Valuing Fuel Security*, at 1 (Apr. 30, 2018) ("PJM Fuel Security"), http://www.pjm.com/-/media/library/reports-notices/special-reports/2018/20180430-valuing-fuel-security.ashx?la=en.
[2] *Id.* at 2.

and propose market-based solutions to improve system resilience. Exelon strongly supports that initiative—though PJM should also model and consider the environmental impacts of different approaches to ensuring resilience. Nevertheless, PJM's proposal only underscores the need for the Commission's leadership.

Put simply: unless PJM is modeling the right scenarios, its analysis of fuel security vulnerabilities, and the solutions it will propose based on that analysis, will not necessarily ensure resilience. Yet PJM lacks access to the information needed to assess which risks it should plan its system to meet. PJM has identified obstacles it faces in obtaining the information necessary to assess cyber and supply chain threats, and has called on the Commission "to provide intelligence and metrics to apply to resilience vulnerability and threat analyses, such that they can then guide and anchor subsequent RTO planning, market design, and/or operations directives."[3] Below, we explain how the Commission should answer that call.

First, the Commission should direct PJM and other RTOs to conduct studies on fuel security in their regions. Recently, ISO-New England analyzed fuel security in that region and identified fuel insecurity as a major threat. The ISO-New England study not only identifies a fuel security problem in the region; it also provides a strong foundation for stakeholder discussions and planning to reduce fuel insecurity and increase grid resilience. PJM should conduct a similarly rigorous study to define the fuel security threats to PJM—which existing studies already suggest are present and immediate—and enable PJM to better address man-made and natural threats to the bulk power system. In particular, PJM should focus on potential RTO vulnerability to gas pipeline disruptions, and assess the degree to which oil-fueled resources can support grid resilience. A

[3] Comments and Responses of PJM Interconnection, L.L.C., FERC Docket No. AD18-7-000, at 32 (Mar. 9, 2018) ("PJM Response").

SI-SSA-0010-4324

study by Navigant Consulting, Inc. (attached as Exhibit A) indicates that contribution of oil-fueled resources diminishes rapidly as the length of a resilience-related event extends beyond four days.

Second, while PJM and other RTOs are studying fuel security in their regions, the federal government should develop a design-basis threat ("DBT") to identify resilience threats and provide a baseline against which PJM and other RTOs can measure their efforts at creating a resilient grid. As explained in detail in an affidavit from Dr. Paul Stockton, former Assistant Secretary of Defense for Homeland Defense and Americas' Security Affairs (attached as Exhibit B), the DBT tool is well-suited to identify man-made threats to the bulk power system and guide efforts to address those threats. The Commission, together with the Department of Energy, should lead the effort to develop a DBT, with input from the national security agencies, so that RTOs can ground their efforts to protect the grid in up-to-date and reliable threat information drawn from intelligence sources. If the DBT is not yet ready when PJM begins its modeling of various contingencies, PJM should nevertheless vet its scenarios with the Department of Energy and Department of Homeland Security and address their feedback, so that PJM can implement market changes on its proposed timeline of May 2019; however, as soon as the DBT is completed, the Commission should require PJM to update its modeling and analysis in light of the threats identified as part of the DBT. To the extent PJM cannot implement market rule changes that consider the DBT in time for the May 2019 Base Residual Auction, PJM can then move quickly to adopt any needed changes to market rules in time for the 2020 Base Residual Auction in light of its enhanced understanding of the region's fuel security vulnerabilities.

Finally, the Commission should explicitly clarify that RTOs and transmission owners should consider resiliency in their transmission planning and in RTO market design. Transmission owners should retain their traditional authority to consider resilience in transmission planning for

local projects as well as planning on the distribution grid, while the RTOs must explicitly add resilience considerations to their regional transmission planning and market design. The Commission should then review RTO filings under Sections 205 and/or 206 to ensure the adoption and implementation of any needed reforms to address the vulnerabilities identified by the DBT tool. RTOs should additionally be required to model the emissions consequences of potential resilience solutions.

I. The Resilience Threat Suggests That Existing Market Structures Are Not Just and Reasonable.

Grid resilience is a serious and growing concern: the Nation is increasingly reliant on natural gas-fired generation, and thus on the natural gas transmission system, at the same time as that infrastructure has become more susceptible to disruption and attack by foreign enemies. Yet the Commission has not, to date, addressed resilience in the tariffs governing the operation of the organized markets. This latent risk calls into question whether the market rules and transmission planning criteria remain just and reasonable under the Federal Power Act.

Ensuring that the grid is resilient in the face of man-made and natural threats is an increasing concern that requires urgent attention. Prolonged disruption to the grid would have an immense and devastating impact on the daily lives of Americans. Critical systems would be incapacitated, including electric and natural gas heating at residential, commercial, and industrial locations; water treatment plants; the food distribution system; the medical system; and communications networks.[4] National security would be at risk. Military facilities and other

[4] Exhibit A to Comments of Exelon Corp., Prepared Direct Testimony of Dr. Paul Stockton on Behalf of Exelon Corp. at 9-10, Docket No. RM18-1-000 (Oct. 23, 2017) (attached hereto as Exhibit B-1).

national security organizations depend on power to function. A prolonged period without power would severely hamper their ability to protect the nation.[5]

As the Department of Energy has recognized, "[f]uel assurance is a growing consideration for the electricity system" and a major threat to system resilience.[6] As resilient nuclear generators announce retirements in growing numbers, the grid irreversibly loses a set of reliable, fuel-secure resources that contribute greatly to overall fuel diversity. For example, between 2012 and 2016, 4,666 MW of nuclear generating capacity—or about 4.7% of the country's total—announced retirements.[7] Twelve more nuclear reactors, representing 11,109 MW of capacity, have announced retirements since 2016.[8] Still other nuclear retirements have been avoided only by state programs that compensate these plants' zero-emissions attributes. FirstEnergy's announcement last month that it intends to shutter Beaver Valley, Davis-Besse, and Perry—amounting to 3,942 MW of capacity—indicates a critical inflection point, and urgent action is needed to prevent further nuclear retirements. Widespread nuclear retirements irreversibly remove an integral foundational resource from the grid.

As fuel-secure resources retire, the energy supply is increasingly dependent on natural gas. In the PJM region, 90% of the new installed capacity over the last five years and more than 90% of planned capacity in the interconnection queue is gas fueled.[9] Yet overreliance on natural gas

poses serious risks to the resilience of the grid. Natural gas generators often lack on-site fuel. Instead, they rely on a pipeline network to distribute fuel, which could easily be disrupted by a man-made or natural event.[10] In fact, a PJM study found that a single gas pipeline in the PJM region serves more than 11,000 MW of generation, and a recent study by ICF examining generation clusters in PJM and New York found that more than 18,000 MW of generation would be at risk from an extended pipeline outage[11]—all in the most densely populated parts of the Eastern United States.[12] The loss of that pipeline alone—whether from an earthquake, a cyberattack, a physical attack, or some other event—could wreak havoc in the region and nationally.

Fuel insecurity due to increased reliance on natural gas is a particular problem for the Eastern MAAC ("EMAAC") portion of PJM.[13] The region does not produce much gas locally; it is supplied by several large, discrete pipelines; it lacks significant storage; its dual-fuel capability may be less robust than believed; and it has a significant demand for natural gas as a heating fuel during the winter season, which usually takes priority over power generation demand. All of these factors, combined with the increasing demand for and reliance on natural gas for power generation, create acute vulnerability to natural and man-made threats. Other areas of PJM may have vulnerabilities similar to those of EMAAC, or may develop vulnerabilities in future years as natural gas capacity continues to displace other types of resources.

---

[10] There are areas within the pipeline system where disruption events could have cascading effects on generation resources. ICF Study at 44.

[13] The Eastern MAAC portion of PJM contains the zones of Atlantic City Electric (AE), Delmarva Power & Light (DPL), Jersey Central Power & Light (JCPL), PECO Energy (PECO), Public Service Electric & Gas (PSE&G) and Rockland Electric (RE).

Recent studies show that fuel security is not a hypothetical concern. The recent Cold Snap demonstrated areas of vulnerability in the PJM system.[14] Over the course of eleven days in December 2017 and January 2018, PJM maintains the region generally performed well, but one notable area for future improvement was fuel security. If the Cold Snap had been longer or had occurred outside of the holiday period and weekend, when loads are generally moderated, the level of system stress would have been much greater. Many fewer gas generators were online at the end of the Cold Snap than at the beginning; and forced outages of gas generation due to fuel supply issues increased more than five-fold over the six-day period studied by PJM, from 1.1 GW to nearly 6 GW.[15] In some regions of the RTO, there was no natural gas to be had; the natural gas could not be transported to the generator.[16] To improve fuel security in light of the RTO's increasing reliance on natural gas, PJM determined that it needs to continue to improve gas-electric coordination capabilities, as well as the tracking and transportation of fuel oil supply.[17]

Dual-fuel generators, which can run on natural gas as well as another type of fuel, such as oil, have historically been seen as a hedge against the risk of gas supply interruption. But dual-fuel units provide a false sense of security: the limited storage and restricted delivery of fuel to dual-fuel and oil-only plants in the PJM region is itself a threat to resilience. A natural gas pipeline incident can take many months to be fully resolved; indeed, a pipeline rupture involving the Tetco Delmont Line 27 was not fully resolved for over six months.[18] Yet oil-fueled generation cannot

[14] As the Department of Energy explained in its recent Staff Report, fuel security was also an issue in the Polar Vortex of 2014, where "[m]any natural gas-fired generators had their fuel supplied curtailed." DOE Staff Report at 98.
[15] PJM Interconnection, *PJM Cold Snap Performance Dec. 28, 2017 to Jan. 7, 2018*, at 13 (Feb. 26, 2018) ("PJM Cold Snap Report"), http://www.pjm.com/-/media/library/reports-notices/weather-related/20180226-january-2018-cold-weather-event-report.ashx.

[17] *Id.* at 33.
[18] ICF Report at 5.

reliably provide power in the event of a prolonged event. A study performed by Navigant (*see* Exhibit A) confirms that, in the PJM region, more than 50 percent of dual-fuel and oil-only capacity would be offline due to a lack of fuel after four days of full-load operation, and nearly 80 percent would be offline after seven days.[19]

Moreover, once oil stores are depleted, they cannot be quickly replenished.[20] Most oil capacity in PJM relies on trucks to deliver oil. That delivery often takes five to ten days under normal conditions.[21] In times of extreme weather, delivery is often delayed up to three additional days.[22] In an extreme weather or man-made event that lasts more than four days, oil-burning units run the very real risk of running out of oil that they cannot replenish.[23] That is in part because of slow delivery, and in part because in such events, other sources—such as oil heating demand, and hospitals and government institutions running oil-fired generators—will compete for a largely fixed supply of oil trucks and other oil delivery assets for whatever oil can be delivered.[24] The problem would only be compounded if multiple events occurred close in time, increasing demand and making delivery logistics more challenging. Indeed, as PJM recognized, fuel resupply can be

[21] PJM Liquid Fuel Survey at 5.
[22] *Id*.
[23] Environmental permit limitations also threaten to restrict a dual-fuel plant's ability to continue to operate at peak levels for an extended period of time. Although permit limits might be waived in an emergency situation, it is irresponsible to plan a system with the expectation of invoking emergency waiver authorities. Moreover, exceeding permit limits to serve load in an emergency comes at an environmental cost that should not be ignored—especially when retiring nuclear units could have met the need without imposing environmental externalities. As PJM further studies fuel security in its region and develops solutions to ensure sufficient fuel-secure resources, it should also consider the environmental consequences of its proposed solutions.
[24] PJM Liquid Fuel Survey at 5; ICF Study at 43 (replenishing oil is a "significant logistical challenge[]" when the need is unanticipated and widespread).

a significant problem for coal units as well as oil. PJM reported that, during the Cold Snap, "about 28 percent of combined coal and oil units (by ICAP MW) with on-site fuel inventories reported issues with fuel resupply due to fuel transportation constraints."[25] Coal units faced barge resupply delays due in part to frozen rivers.[26]

A recent study by the National Energy Technology Laboratory ("NETL") likewise highlighted potential vulnerabilities resulting from overdependence on natural gas supplies. The study analyzed the conditions in ERCOT and every Commission jurisdictional-market except CAISO during the 2017-18 Cold Snap (which it calls the "Bomb Cyclone"). The study described the various fuel sources that enabled the grid to sustainably operate at times of extreme stress and identified a number of key takeaways from the event, including that the natural gas fuel supply rapidly depleted due to delivery constraints and was barely able to meet surging demand.[27]

The NETL report erred, however, in describing coal as the "most resilient form of generation."[28] Its basis for that conclusion was that coal provided the largest incremental increase in output during the Cold Snap,[29] but that is only because coal plants were sitting idle. The better measure of resilience is whether a plant was able to operate during extreme conditions, both during the period of peak stress, as well as through a long-duration event. By that measure, nuclear was by far the most resilient type of generation. In PJM, nuclear provided 35.5 GW of reliable (and clean) power each day of the Cold Snap and suffered only a 200 MW derate at one plant.[30] That

amounts to a nuclear forced outage rate of less than 1 percent. Coal, by contrast, suffered between 5.2 GW and 8 GW of forced outages over the six-day period, which amounts to between a 9 percent and 15 percent peak-hour forced outage rate during the highest stress period of the Cold Snap.[31] Gas and oil fared significantly worse. On the final day of the Cold Snap, gas, dual-fuel, and oil generators suffered nearly 16 GW in forced outages, and over the course of the entire event, the peak-hour forced outage rate for gas and oil ranged from 17 percent to 42 percent.[32] Gas supply issues were a major cause of these high outage rates. Gas supply issues accounted for over 50 percent of gas outages on the second day of the Cold Snap; nearly 47 percent on the third day; and over 42 percent on the last day.[33] The following charts summarize this data.

Forced Outages in PJM During the Cold Snap[34]

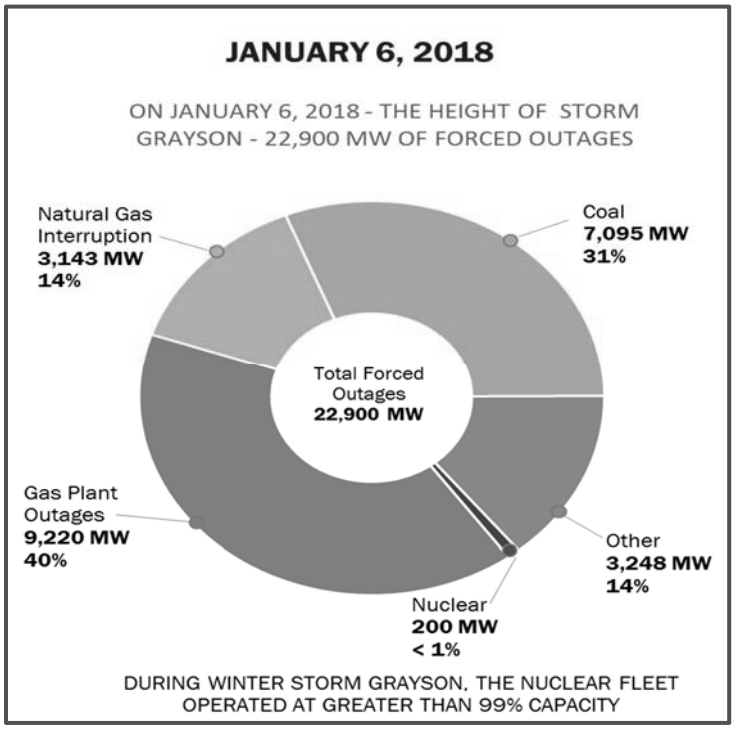
Forced Outages in PJM on January 6, 2018[35]



Some have argued that the fact that the grid passed through these events without any blackouts shows that the system is working as intended. But such self-assurance ignores the facts and is a grave mistake. These weather events were not nearly as severe as the Polar Vortex in 2014, as NETL points out;[36] and more importantly, they were simply cold weather events, not cold weather combined with a major natural gas system disruption or other compounding problem.[37]

---

[35] PJM Interconnection L.L.C., *Cold Weather Summary December 27, 2017 - January 7, 2018* (Jan. 9, 2018), http://www.pjm.com/-/media/committees-groups/committees/oc/20180109/20180109-item-07-cold-weather-testing.ashx.

[36] NETL Report at 20.

[37] The cold weather events of 2014 and 2017-18 were not isolated incidents. There were also severe cold spells in, for example, 1977-78 and 1978-79. *See, e.g.,* Patricia M. Dare, *A Study of the Severity of the Midwestern Winters of 1977 and 1978 Using Heating Degree Days Determined from Both Measured and Wind Chill Temperatures*, 62 Bull. Am. Meteorological Soc'y 974 (1981). And during a 1994 cold spell, PJM and Virginia Power curtailed firm customers to maintain system reliability, and non-firm gas supply was interrupted—and this was at a time that the system was much less reliant on natural gas than it is today. NERC, *Report on Electric Utilities' Response to the Cold Wave of January 1994*, at 2, 6 (Apr. 11, 1994), https://bit.ly/2ruUIk1.

PJM recognizes that its existing reliability standards do not account for the "potential fuel security risks" that result from "increased reliance on any one resource type," and that the Capacity Performance product does not encompass, and is not intended to encompass, systemic risks to resilience that are "beyond the ability of any individual unit owner to control through more secure fuel contracts or investment in particular units."[38] These systemic risks include common-mode failures resulting from fuel supply disruptions that affect a large number of units.

Moreover, the most concerning threats to fuel security are man-made, not weather-related—and traditional reliability analyses are not well-suited to analyze system resilience during high-impact, low-probability events intentionally instigated by malicious actors to maximize societal harm. Malicious actors must be presumed to know about our vulnerabilities, and should be expected to target them.[39] Indeed, in just the last few months, a number of significant attacks on the bulk power system have come to light. For example, in March, the federal government announced that Russian hackers had conducted a cyberattack targeting nuclear power plants.[40] Similarly, natural gas companies announced in April that a cyberattack on the data network for natural gas pipelines forced the temporary shutdown of computer communications with customers.[41] More generally, an increasing number of academic studies, energy industry reports,

[38] PJM Fuel Security at 2.

[40] *See, e.g.,* Nicole Perlroth & David E. Sanger, *Cyberattacks Put Russian Fingers on the Switch at Power Plants, U.S. Says*, N.Y. Times (Mar. 15, 2018), https://www.nytimes.com/2018/03/15/us/politics/russia-cyberattacks.html.
[41] *See, e.g.*, Clifford Krauss, *Cyberattack Shows Vulnerability of Gas Pipeline Network*, N.Y. Times (Apr. 4, 2018), https://www.nytimes.com/2018/04/04/business/energy-environment/pipeline-cyberattack.html.

and unclassified government assessments have identified cyber-attacks on the energy infrastructure as an increasingly severe threat.[42]

The attacks observed so far do not represent the full scope of the threat. Adversaries likely have more effective and destructive tools that they have not yet implemented, instead waiting for a time when they will be most devastating. Similarly, adversaries have not yet attacked in coordinated fashion that would cause cascading ramifications throughout the system. But that is not out of the question. For example, a multi-pronged attack on the supply chain could wreak havoc on the bulk power system. An adversary could attack the software, firmware, hardware, or network services of the gas pipeline system, for example, which could trigger widespread failures across the gas distribution system and the bulk power system more generally.[43] The grid needs to be resilient enough to withstand the real threat of cyberattacks by enemy nations and other malevolent groups.

In sum, as the grid moves toward greater reliance on natural gas, the vulnerability of the grid to natural gas supply interruption will grow. If current trends are left unchecked, the system will become significantly less resilient than it is today.

II. PJM's Over-Reliance on Natural Gas Poses Resilience Risks and Requires a Study Similar to the One Conducted by ISO-New England.

The importance of grid resilience, and threats to it, are broadly recognized—and so too is the need for a deeper and more rigorous understanding of the Nation's vulnerabilities.[44] Some RTOs identified specific resiliency concerns in their March 9 filing. PJM, for example, identified

[42] Stockton Report at 6-7.
[43] *Id.* at 6; *see also* DOE Staff Report at 8 (noting that "[c]ybersecurity is a critical component to ensuring the reliable and resilient operation of the Nation's energy infrastructure").
[44] *See, e.g.,* DOE Staff Report at 100 ("More work is needed to define, quantify, and value resilience.").

SI-SSA-0010-4335

a number of risks posed by high-impact, low frequency events. Those risks include a significant loss or disruption of infrastructure; a significant loss or disruption of control systems; a significant loss or disruption of interdependent systems like gas pipelines, communications networks, and water utilities; a degraded capacity to black start; and a significant loss of wholesale supply.[45]

Only ISO-New England, however, has done a detailed study of fuel security as a potential cause of grid vulnerability, in an Operational Fuel Security Analysis published in January 2018. Its findings were sobering.[46] The study modeled twenty-three possible scenarios that could occur in the 2024/2025 winter. In every scenario except the most optimistic, emergency actions were necessary to ensure that enough power was available to supply the grid.[47] In 19 of the 23 scenarios, load-shedding resulted.[48] Moreover, the load-shedding was significant. Six of those 19 scenarios resulted in more than 50 hours of load-shedding; a scenario in which a larger number of fuel-secure resources retire than is expected resulted in *105 hours* of load-shedding over 16 days.[49] The loss of a pipeline compressor was projected to result in *138 hours* of load-shedding over 17 days, even assuming increased LNG imports and more frequent refilling of oil tanks.[50]

The study identified fuel security as the most important factor threatening resilience in New England, and the growing dependence on natural gas was critical in causing, and exacerbating, fuel-security vulnerability.[51] ISO-New England explained: "Current trends are pushing the New England power system on a path toward greater fuel-security risks. These trends include the

[45] PJM Response at 12-13.

[49] *Id.* at 40
[50] *Id.* at 43-44.
[51] *Id.* at 4.

increasing retirements of power plants with fuel stored onsite (nuclear, coal and oil); the growth in power plants dependent on natural gas, a fuel that's delivered just in time; growing demand for natural gas from local gas utilities in both New England and the Maritimes, which will likely leave less for power plants; and an increase in renewable resources with variable production."[52] The study will help frame the ongoing discussion among stakeholders, regulators, and policy makers around improving fuel security and resilience in New England.

Every ISO/RTO—and particularly PJM—should conduct a careful analysis of fuel security issues similar to ISO-New England's study, in order to identify any fuel security issues and provide a groundwork for future policy decisions. PJM, in particular, needs to conduct such a study given the tremendous increase in the retirement of fuel-secure nuclear plants in PJM, the growing reliance on gas (which will increase as a result of nuclear retirement), and the inability of back-up fuel at natural gas-fired plants to meaningfully respond to an extended gas outage event.[53]

The ideal study would have the following key components. Rather than focusing on short-term weather conditions, as past studies have done, a study should go further and conduct a season-long analysis. The RTO should model its system over a simulated winter with a range of weather conditions, including conditions similar to those seen in recent severe winters.[54] That will enable PJM and other RTOs to understand their resilience challenges over the course of an entire winter season.[55] The study should incorporate reasonable assumptions with respect to oil fuel capability and resupply, and it should take into account a range of future retirement scenarios (particularly in

[52] *Id.* at 53.
[53] *See supra* Section I.
[54] *See supra* note 37 (noting the severe winters of 1977-78 and 1978-79).
[55] For example, the 2016 Spectra Pipeline explosion in western Pennsylvania took six months to repair. Debra Erdley, *6 Months After Salem Township Explosion, Spectra Energy Has Gas Pipelines Running*, TribLive.com (Nov. 18, 2016), http://triblive.com/local/westmoreland/11496039-74/pipeline-spectra-explosion.

the aftermath of the significant nuclear retirements recently announced) and a range of critical infrastructure outage scenarios that have been vetted by the Department of Energy and Department of Homeland Security, each of which have critical, classified information about the nature of the threats that face the bulk power system. At a minimum, in each scenario, the study should analyze the frequency and magnitude of load shed, the frequency and magnitude of reserve shortages, and regional energy prices. A comprehensive study with these components would provide a strong foundation on which PJM and other RTOs can assess and plan for resiliency to natural threats to the bulk power system.

III. Exelon Supports PJM's Proposed Fuel Security Analysis, But an RTO-Led Study Is Not Adequate to Ensure Resilience.

To its credit, PJM recently announced its intent to "perform targeted analyses to identify fuel security risks that could affect specific locations on the system," including "the deliverability logistics of fuel supplies during stressed conditions over time," in order to "better understand reliability outcomes resulting from the current capability of local onsite fuel and back-up fuel."[56] PJM's goal is "to identify potential system vulnerabilities and to determine attributes such as requirements for amounts of on-site fuel and dual-fuel capability, among others, to ensure that peak demands can be met during realistic but extreme contingency scenarios in various supply portfolios."[57] PJM correctly acknowledges that its reliability analyses and market rules are not currently designed to achieve fuel security for the 65 million people it serves.[58]

---

[56] PJM Fuel Security at 2; *see also* ICF Study at 44 ("While the interstate pipeline network is robust and highly interconnected, there are locations within the system where disruption events could have cascading implications on generation resources. RTO/ISOs should review the interrelationship between existing and planned gas-fired generation facilities and the upstream gas infrastructure and related power transmission systems.").
[57] PJM Fuel Security at 2.
[58] *Id.* at 1.

Exelon strongly supports these analyses. Performing a robust fuel security analysis that considers credible natural gas supply disruption scenarios and realistic dual fuel resupply timeframes is a vital first step toward addressing resilience. In addition, PJM should consider the emissions implications of reliance on dual-fuel resources to replace gas-fired resources during periods of natural gas disruption. In New England for example, two million barrels of oil were burned this winter in less than two weeks—more than twice the amount burned in New England during the entire preceding year.

Nevertheless, RTO-led fuel-security analyses and modeling by themselves are not sufficient to address bulk power system resilience, because PJM and other RTOs lack the information needed to identify the key contingencies that should be modeled. For example, in its scoping document for its fuel security initiative, PJM identifies potential "disruptions to fuel delivery systems" that it would model, including "[r]eduction of a realistic percentage of delivery capability on particular constrained portions of pipelines in the PJM regions," and "a few realistic but extreme contingencies such as a *force majeure* event on key delivery facilities."[59] But PJM and other RTOs do not have the full body of knowledge needed to assess what types of disruptions should be modeled, what reductions in delivery capability are "realistic," and what particular "extreme contingencies" are realistic.[60]

Thus, the notion that RTOs should lead the process of identifying threats is dangerously misguided. PJM's scoping document appears to contemplate that PJM would interface with government agencies only after it has developed its fuel-security modeling.[61] That approach makes little sense. While PJM should certainly begin the process of analyzing potential system

[59] *Id.* at 4.
[60] *Id.*
[61] *Id.* at 3.

vulnerabilities and developing a model to plan for them, government involvement is essential in the modeling stage. PJM's proposal would require the RTOs to guess at the vulnerabilities they should be planning for and then submit their guesses to the Commission for approval.[62] Instead, as detailed below, the Commission, together with the Department of Energy (DOE) and federal agencies tasked with intelligence gathering and national security, should lead the effort to identify the threats that the system should be planned to meet. These federal agencies, not the RTOs, have access to the relevant information regarding threats to system resilience.[63]

IV. A Design-Basis Threat Is Needed to Judge Resilience and Guide Action.

In order to design a resilient grid, it is essential for planners and policymakers to know what threats must be addressed. Once the relevant threats are identified, the system can then be planned to meet those threats. In particular, planners need to know what man-made threats they must plan to address. As PJM has put it, "[t]o define potential fuel-security criteria, PJM needs to understand the fuel-supply risks in an environment trending towards greater reliance on natural gas supply and delivery."[64]

Other federal agencies have tools that can assist in this process. Specifically, national security agencies throughout the federal government use DBTs to identify man-made threats posed by foreign adversaries and other malevolent actors and to mitigate the risk from those threats.[65] At its most basic, a DBT is a document that provides guidelines to the relevant industry about threats facing the industry, so that the industry can guard against those threats. For example, the Nuclear Regulatory Commission has created a DBT for nuclear power plants and related

[62] PJM Response at 81; PJM Fuel Security at 3.
[63] PJM Fuel Security at 3.
[64] *Id.* at 1.
[65] Stockton Report at 16-17.

facilities.[66] That DBT imposes security requirements on nuclear power plants based on analyses of various factors, such as the potential for a terrorist threat or the potential for an attack assisted by workers at the facility. Comparable examples exist at other agencies. The Department of Defense has created a DBT to support anti-terrorism and force protection standards; the Department of Homeland Security's DBT considers the characteristics of adversaries that might threaten federal facilities.[67] The Commission, together with other government agencies, should lead an effort to develop a DBT directed at grid resilience. The development of this DBT should begin immediately, while PJM is conducting its fuel security study, so that PJM can move quickly to adopt appropriate market rules changes in light of the DBT and the study results.

A. A DBT Would Provide Significant Benefits.

Currently, RTOs lack the information they need to assess man-made threats to resilience, such as terrorist attacks or attacks by enemy nations. They are largely on their own in attempting to identify resilience threats. They do not receive input on intelligence issues from the federal government.[68] Nor do they even have much guidance on the size and type of events that could cause severe disruption.[69] This information gap makes it nearly impossible for RTOs to effectively plan for resilience in the face of man-made threats: they do not know the risks, so they cannot plan effectively to avoid them. In fact, PJM emphasized in its March 9 filing that "there needs to be a process for vulnerability threat verification. The Commission needs to provide intelligence and

[66] *See, e.g.,* United States Nuclear Regulatory Commission, *Backgrounder on Nuclear Security*, https://www.nrc.gov/reading-rm/doc-collections/fact-sheets/security-enhancements.html (last visited May 8, 2018); United States Nuclear Regulatory Commission, *Frequently Asked Questions about NRC's Design Basis Threat Final Rule*, https://www.nrc.gov/security/faq-dbtfr.html (last visited May 8, 2018).
[67] Stockton Report at 16-17.
[68] *Id.* at 13.
[69] *Id.*

metrics to apply to resilience vulnerability and threat analyses, such that they can then guide and anchor subsequent RTO planning, market design, and/or operations directives. Overall there needs to be better information made available to the RTOs on the above-identified risks to enable the RTOs to assess the risks."[70] The need for assistance from the federal government is particularly high when it comes to sensitive or classified information that only the federal government can access.[71]

The Commission can answer this call for help. A DBT for RTOs would go a long way toward increasing the resilience of the nation's power grid by providing a foundation for reforms to address man-made threats. In the first instance, the systematic and holistic analysis would enable the Commission and RTOs to more fully and accurately understand the grid's vulnerabilities to man-made threats. Then, armed with accurate information and a full understanding of the risks inherent in the grid, RTOs and transmission owning entities could better plan to mitigate those risks. For example, the Commission could order the RTOs to adopt tariff changes that address the threats identified in the DBT. Moreover, a DBT could ensure that resilience planning is consistent and coordinated across RTOs and other entities.

To be clear, PJM should not wait for the DBT to be completed before beginning its modeling and analysis, or even before proposing initial market rule changes to address resilience; but the Commission should at least direct PJM to consult with the Department of Energy and Department of Homeland Security in selecting scenarios to model, and to incorporate any feedback these agencies provide. PJM can then remain on target to adopt market rules changes by May 2019.

[70] PJM Response at 32.
[71] *Id.* at 52.

SI-SSA-0010-4342

In the meantime, the federal government, led by the Commission, should complete its development of the DBT addressing the man-made threats to the grid. The Commission should then direct PJM to revisit its modeling and analysis in light of the DBT. To the extent any needed revisions to the market rules cannot be implemented in time for the 2019 Base Residual Auction, PJM can at least propose their adoption for the 2020 Base Residual Auction. Additionally, PJM should include the expected environmental impacts (including carbon emissions) of any solutions it considers.

B. The DBT Should Build on Existing Efforts and Incorporate Man-made Threats.

Prior NERC studies have already been completed that could serve as a foundation for the DBT. For example, in February 2018, NERC produced its report *ERO Reliability Priorities—RISC Recommendations to the NERC Board of Trustees* that outlined some of the current risks facing the electric grid.[72] Multiple risk profiles identified fuel vulnerabilities as potential issues. But more analysis is necessary. Fundamentally, the DBT should address all man-made threats to the grid. At a high level, the following types of serious risk should be studied and analyzed in a DBT: cyber and physical security threats, whether from nation-state actors, terrorist groups, or insider threats; pipeline disruptions in general; and other resilience risks to transmission, generation, and distribution.

As to fuel security specifically, various risks created by man-made threats should be explicitly incorporated into the DBT. *First*, the DBT should address the number of gas transmission pipelines that adversaries could interrupt.[73] For example, planning for an N-1

[72] NERC, *ERO Reliability Priorities—RISC Recommendations to the NERC Board of Trustees* (Feb. 2018), https://bit.ly/2KKielG.
[73] Stockton Report at 17-18.

contingency for gas transmission would not be sufficient if an adversary targeted multiple pipelines simultaneously. The federal government should provide guidance about the appropriate scale of attack for which the RTOs should plan. In this context in particular, the DBT should address regional differences that arise given different regions' topology and gas pipeline availability.

Second, the DBT should address the duration of gas system interruptions.[74] Natural gas systems could face extended outages if an attack destroyed multiple critical transmission system nodes, compressor stations, communications infrastructure, other critical assets, or other power generation.[75] RTOs need to be aware of the scope of the possible outage so that they can prepare, and they need information from the government in order to do so.

Finally, the DBT should address factors that might make it difficult to resupply at the exact moment that resupply is needed.[76] For example, RTOs need to understand how man-made actions that are timed to exploit bad weather conditions can affect the resilience of the grid. An attack on a gas pipeline during a cold snap could wreak havoc on a system that is already running low on natural gas because it has been operating at peak capacity for days. As another example, RTOs need to understand the barriers to resupplying secondary fuel for dual-fuel generators in stressed or disrupted conditions.

C. The Government, not the RTOs, Should Develop the DBT.

The Commission should take the lead on crafting the DBT.[77] The Commission is intimately familiar with the RTOs and their practices and has the jurisdictional responsibility to ensure that the market rules are just and reasonable. It can lead discussions with stakeholders,

[74] *Id.* at 18-19.
[75] *Id.* at 19.
[76] *Id.* at 19-21.
[77] *Id.* at 21-22.

including RTOs, NERC, and other bulk power system entities, to gather information about what knowledge gaps the DBT can fill, and it can bring that information to the DBT development process. After that process is complete, it also has the authority to require the RTOs to make changes in response to the DBT. The Commission should work closely with the DOE.[78] DOE employees are subject-matter experts who deeply understand the threats to the energy sector, and they have access to data and analysis from sources such as the National Laboratory system to aid in identifying the risks that need to be addressed in the DBT.[79]

Other federal agencies, too, should have input into the DBT to ensure that the full scope of intelligence and national security threats are built into the DBT. For example, the Department of Homeland Security has expertise on cybersecurity issues and can provide intelligence regarding physical threats to fuel infrastructure.[80] Likewise, the Department of Defense can provide information about the broader national security context that can be incorporated into the DBT.[81]

A multi-agency process will necessarily require some level of coordination. One form that may take—though certainly not the only option—is using existing interagency coordination mechanisms.[82] The National Security Council and the Homeland Security Council both have established processes for coordinating the security-related activities of executive departments and agencies. Either could establish a Policy Coordination Committee and working groups that could work to develop the DBT. No matter the form the coordination takes, though, the important point is that the relevant government agencies work together to craft a DBT that considers the various areas of expertise each agency brings to the process.

D. The DBT can be Implemented Without Exposing Classified Information.

A strong and comprehensive DBT will necessarily require sensitive national security information known only to certain people in the federal government. As a result, it will depend on classified information. However, RTOs largely operate in an unclassified environment. The DBT needs to be usable by the RTOs and others who must plan for resiliency, and it will not be useful if it cannot be reviewed.

Given those realities, the DBT should take a two-phased approach. First, RTO personnel with security clearances should work with the Commission, DOE, and other federal agencies to determine details about the risks included in the DBT, such as how many pipelines could safely be assumed to be disrupted in an attack and how long the pipelines could be disrupted.[83] Then, those teams should construct guidance documents that does not include classified information.[84] That document should share relevant unclassified assumptions and information with RTO planners so that the planners can assess how the RTO would respond to the risks and plan to address them.

In addition, the RTOs are not the only organizations that should have access to the DBT. Transmission owners, as well as other stakeholders, should be able to access and use the DBT. Transmission owners also need to have a thorough understanding of the threats they need to protect against to ensure resiliency of their facilities.

Once the RTOs, transmission owners, and other stakeholders have the DBT, they should work in concert with the Commission to develop solutions to alleviate the risks identified. These solutions could be market-based in the first instance. Market reforms, for example, could ensure that units that currently make important contributions to system-wide resiliency are sufficiently

[83] *Id.* at 24.
[84] *Id.* at 24-25.

SI-SSA-0010-4346

compensated for the resilience attributes they provide and are not forced into retirement. Market reforms should address risk with a high degree of certainty and by minimizing total system costs.

V. The Commission Must Require The RTOs To Consider Resilience In Their Market Design and Transmission Planning.

Building system resilience is key to ensuring that the bulk power system is able to survive any major man-made or natural threats that the grid faces. As described above, these threats are real and growing. A DBT and an in-depth study of resource availability and fuel security will likely only uncover additional areas for attention. The RTOs are at the front line of managing the bulk power system and have an integral role in planning for resilience. To ensure that the RTOs can properly plan for major risks and build a resilient system, the Commission must eliminate any uncertainty and explicitly clarify that RTOs have the obligation to consider resilience in their market rules and transmission planning. The Commission should make clear that the failure to incorporate resilience concepts into RTO tariffs renders them unjust and unreasonable.

Along these lines, Exelon supports PJM's recommendation in its comments that the Commission initiate a rulemaking to articulate the role of RTOs in planning for resilience.[85] Exelon also supports PJM's recommendation that the Commission encourage RTOs to bring forward market-based solutions to the resilience challenges.[86] In addition, as both PJM and ISO-New England recognize in their comments, there may be limited instances where markets are

[85] PJM Response at 81.
[86] *Id.* at 74-75; *see also* PJM Fuel Security at 5.

SI-SSA-0010-4347

insufficient to address resilience challenges. In such cases, RTOs should be able to identify and propose cost-based recovery options for generation resources when appropriate.[87]

To be sure, this consideration of resilience should supplement, but not supplant, the authority of transmission owners to adopt resilience considerations in their local transmission and distribution planning efforts. Transmission owners should continue to be able to plan for and make decisions related to resilience. For example, it may be appropriate to impose a higher standard of resiliency for elements or regions of the transmission system that serve significant load or critical infrastructure, such as Washington, DC or New York City, or defense-critical electric infrastructure.

But the current transmission planning process is not adequate alone. RTOs should be required to consider resilience as an independent planning obligation separate and apart from the transmission planning process established under Order Nos. 890 and 1000. System resilience requires considerations of market features that are broader than contemplated in the current transmission planning. Ensuring fuel security, in particular, is a key component of resilience planning. Along those lines, the RTOs should both incorporate resilience into the planning process and develop market-based approaches to incentivize the retention of resilient resources. This could be accomplished through the development of new products or through modifying existing market design elements and transmission planning criteria. Resilience also requires consideration of sensitive national security issues that go well beyond the transmission planning process. A DBT

[87] A model similar to the RMR provisions of RTO tariffs could be adopted if market mechanisms are insufficient to retain resources needed for fuel security.

will be a first step in incorporating national security concerns into resilience planning, but should not be the last.

The Commission ultimately would be responsible, under Sections 205 and 206, for reviewing or ordering RTO tariff changes needed to address the threats identified, and for ensuring that those changes are implemented.

CONCLUSION

The Commission has rightly recognized that resilience is an important and growing concern given the rising number of man-made and natural threats to the bulk power system. As planning for resilience continues to develop, three major steps would meaningfully contribute to planning for and creating a more resilient grid. First, PJM should conduct a study into fuel security in the region, just as ISO-New England recently did, to identify fuel security risks and create a basis for discussion for addressing them. In conducting this study, PJM should be required to consult with and incorporate the recommendations of the Department of Energy and the Department of Homeland Security in its modeling scenarios. Second, the government should create a DBT to identify resilience threats. The DBT would serve as a baseline against which the RTOs can plan for resilience. Finally, the Commission should explicitly require RTOs to consider resilience in their market design and transmission planning criteria, and propose any appropriate reforms for the Commission's review and approval. For example, if the RTOs and the Commission determine, in light of the DBT, that resilience is threatened because power plants making resilience-focused contributions to the grid are not being adequately compensated for those attributes, then the Commission can order the RTOs to develop products to address this deficiency and submit them for Commission approval under Sections 205 or 206. Such proposals should also

identify and consider environmental consequences. Together, these three steps will go a long way toward creating a more resilient grid.

PJM Liquid Fuel Survey and Research Results and Recommendations

BACKGROUND AND OVERVIEW

Exelon requested Navigant Consulting, Inc. (Navigant) to assess the fuel reliability of the dual-fueled (i.e., gas and oil) and oil-only units within the PJM RTO when called upon to generate electricity during periods when the natural gas supply is curtailed or eliminated entirely. These gas curtailment periods may be the result of extreme weather events, major gas infrastructure failures and/or interruption due to other events such as terrorism.

To complete this assessment, information was gathered through a confidential survey and from publicly available sources such as Title V operating permits or data provided by state agencies. The combination of the survey and research efforts provided liquid fuel tank capacity` information on nearly 74% of the dual-fuel and oil-only fueled units representing nearly 80% of the dual-fuel and oil only fueled MWs within PJM. This level of information provides strong confidence on the analysis results and our conclusions.

Survey

Navigant identified 26 companies owning 72 plants within PJM that had dual-fuel (gas/oil) or oil-only burning capabilities. These 72 plants represent 199 units and a total of 35,518 MWs of capacity. Navigant was able to contact 25 of the 26 companies owning 71 of the 72 plants requesting their participation in the survey. Eight companies representing 62 units and 9,898 MWs of capacity agreed to provide survey information.

The survey consisted of nine questions addressing the following areas:

- Design capacity of on-site fuel oil storage.
- Typical winter operating capacity of on-site fuel oil storage.
- Number of full load operating hours given the design capacity of on-site fuel oil storage and the winter operating fuel oil inventory typically carried.
- Primary and secondary (backup) fuel oil delivery methods.
- Typical lead times for delivery of fuel oil once an order is placed.
- Difficulty and estimated/actual delay of obtaining fuel oil during an extreme weather event.
- Identification of operating permit conditions which could potentially limit the burning of fuel oil.
- Determination of whether fuel oil is purchased under contract or not.

Details of the survey and resulting participation and results are included in Appendix A of this document.

Research Using Publicly Available Sources

To supplement the survey, Navigant researched publicly available data such as Title V operating permits and/or data provided by state agencies related to on-site fuel oil storage capacities as well as potential limitations to burning fuel oil due to existing operational permits. This research provided on-site fuel storage information for an additional 85 units representing 18,278 MWs of capacity. The summary of this research is included in Appendix A.

Table 1 provides a summary of the survey and research data used to conduct the analysis and develop our conclusions regarding the fuel oil storage capacities at dual-fuel and oil-only fueled plants in PJM.

TABLE 1
On-Site Fuel Storage Summary Data

Source	# of Plants	# of Units	# of MWs
Navigant Survey	17	62	9,898
Navigant Research Using Publicly Available Data	37	85	18,278
Sum of Survey and Research	54	147	28,176
Total in PJM	72	199	35,518
% of Total*	75.0%	73.8%	79.3%

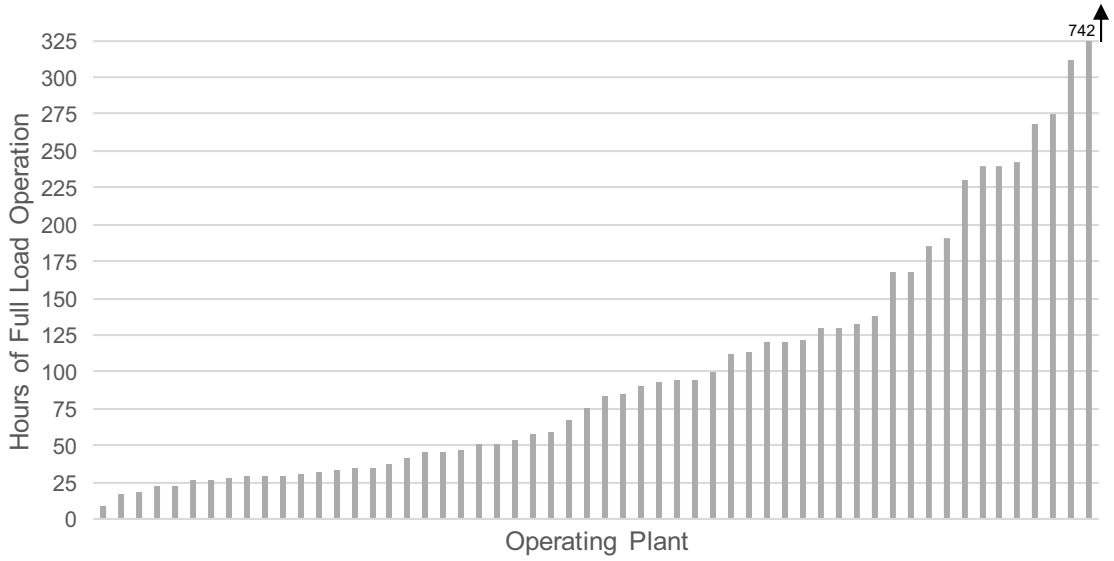
* While the survey and secondary research resulted in information on the majority of studied plants, we were unable to gather fuel oil storage tank capacity information on 25% of the identified plants representing slightly more than 20% of the related MW's of capacity.

Confidential and Proprietary
©2018 Navigant Consulting, Inc.
Do not distribute or copy

ANALYSIS

The data demonstrate that dual-fuel and oil-only plants do not typically maintain on site the full amount of fuel oil that is capable of being stored. For example, the average plant, weighted by capacity, has a design capacity that would allow it to run at full load for 195 hours (8.1 days), but only maintains sufficient oil on site to allow it to run at full load for 107 hours, or slightly more than four days. A distribution of the number of hours that dual fuel and oil-only plants in PJM are capable of running at full load given their typical on-site winter fuel oil inventory.

Graph 1
Distribution of Winter Inventory Liquid Fuel Full Load Operating Hours



Graph 2 and the related table below demonstrate how quickly dual-fuel and oil-only fueled capacity drops off over the length of time an event occurs. As shown, more than 50% of the capacity would be off line within 4 days and more than 75% would be off-line within six days. Moreover, even if tanks were filled to their design capacity, more than 50% of the capacity would be off-line within six days and 75% of the capacity would be off-line within nine days.

Do not distribute or copy

Graph 2
Liquid Fuel Generation Capability Analysis
Available Liquid Fuel Capacity Over Event Duration

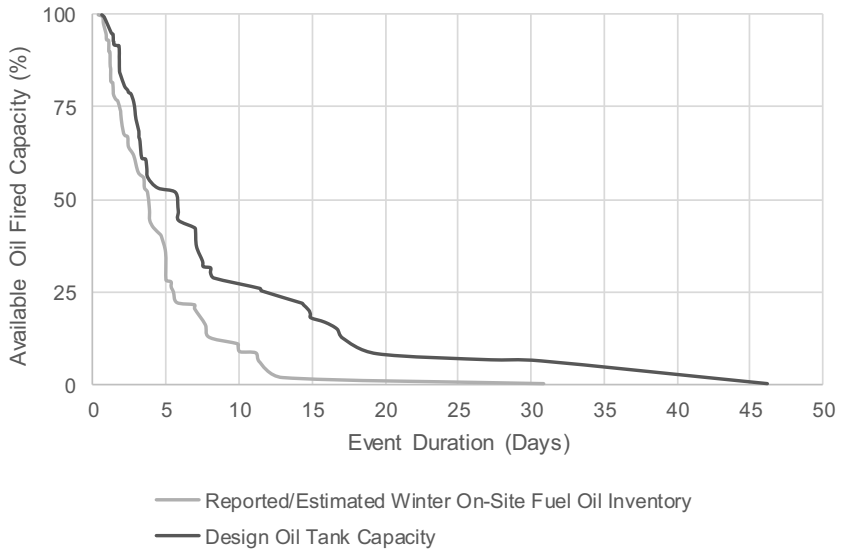

Table 2
Liquid Fuel Capacity Loss for Event Duration

Description	Event Day 2	Event Day 3	Event Day 4	Event Day 5	Event Day 6	Event Day 7
Winter Oil Inventory Loss of Capacity (MWs)	8,854	11,969	16,168	18,057	21,854	22,344
Winter Oil Inventory Loss of Capacity (%)	31.4%	42.5%	57.4%	64.1%	77.6%	79.3%
Design Oil Storage Loss of Capacity (MWs)	5,412	8,854	12,394	13,490	15,623	16,398
Design Oil Storage Loss of Capacity (%)	19.2%	31.4%	44.0%	47.9%	55.4%	58.2%

* Assumes continuous full-load operation, burning fuel oil on site (without resupply)

We believe these figures under-estimate the loss of capacity for the following reasons:

- Due to fuel contaminant settlement issues, some portion of the fuel in any tank (approximately 2-3%) will be unusable without incurring operational issues.
- Continuous operation of these units without some experiencing unplanned outages or derates is very unlikely.

Confidential and Proprietary
©2018 Navigant Consulting, Inc.
Do not distribute or copy

- Absent an emergency declaration, these plants typically are required to meet certain environmental conditions that may impact their ability operate continuously over a long period of time. Indeed, 63% of the plants had other operational permit limits which could potentially limit the burning of fuel oil.

The survey data also show that once a tank is empty, it cannot necessarily be refilled promptly to allow for continued operation.

Even under normal conditions, 88% of the survey respondents reported that an order to refill fuel tanks can take between 5 and 10 days to be refilled. In the case of extreme weather, the majority of the survey respondents reported that they had experienced additional delays of 3 days or more for fuel oil deliveries.

Plants would face an even greater challenge in refilling their tanks promptly if the entire dual-fuel and oil-only PJM fleet were simultaneously trying to refill their tanks, and if they were competing for scarce delivery sources with other fuel oil users, such as hospitals, governmental institutions, and others operating generators. The total gallons of on-site winter fuel storage for the plants is more than 195 million gallons. Logistics for refilling this level of fuel oil in a reasonable amount of time would likely exceed the current delivery capabilities. Assuming a capacity of 11,600 gallons for a fuel delivery truck, nearly 17,000 trips would be required to refill to on-site winter storage capacity. And that ignores other competing users of fuel oil that might also seek delivery.

Based on actual reported delay times and on the delivery logistics it is reasonable to assume that fuel oil refills will require 8 days or more in the event of extreme weather or another event that makes travel or communications challenging. If this occurs, more than 20,000 MWs of capacity would be in a position of unreliability due to lack of necessary fuel supply. Only 20% of dual fuel and oil-only capacity currently maintain more than 8 days of fuel on-site, and only 32% of dual fuel and oil-only capacity have tanks designed to hold more than 8 days of fuel on-site.

RECOMMENDATIONS

Overall, and based on this analysis and our experience, we believe there are sufficient questions regarding the reliability of the dual-fuel and oil only fueled capacity within PJM during natural gas curtailment periods. In particular, if a curtailment event lasts longer than a few days, significant quantities of dual fuel and oil-only resources could be forced out due to a lack of fuel, and be unable to timely receive new fuel supplies. We recommend a more in-depth analysis that incorporates mandatory responses to a more comprehensive survey as a cost-effective means to define specific areas and levels of risk for which reasonable steps can be taken to minimize and/or mitigate these risks.

The January 2018 report for ISO New England titled "Operational Fuel-Security Analysis" reached a set of conclusions that are, in part, similar to those stated here. The report stated that *"… the foremost risk to current and future power system reliability revolves around fuel security – the ability of power plants to get the fuel they need to run, when they need it."* The Dual-Fuel Replenishment scenario that lowered the number of times oil tanks were filled to just once during the winter showed 46 hours of load shedding over 10 days. Lastly, the report referenced the logistics and ability of trucks to deliver fuel-oil refills to power plants during extreme weather events.

We note PJM previously took actions to protect system reliability following the Polar Vortex event. We believe this report identifies a level of uncertainty and risk associated with the dual-fuel and oil only fueled units in PJM and deserves additional scrutiny through a more comprehensive analysis.

No.	Question	Response
1	What is the total design fuel oil storage capability at the plant (gallons)?	
2	What is the average (i.e., typical) amount of fuel oil stored at the plant during the winter (i.e., starting December 1) season (gallons)?	
3	With the fuel oil inventory at the level shown in question 1, approximately how many **hours** of operation at full load can be sustained for **all** the dual fuel capable units running simultaneously?	
4	What is the primary method for delivering fuel oil to the plant?	
	If "Other", please provide explanation	
5	How long does it typically take to get the fuel oil tank(s) refilled to the winter operating levels specified in question 2 once an order has been placed?	
6	Please specify the backup method for fuel oil delivery if one exists.	Does not exist
7	Has this plant tried to get fuel oil delivered during an extreme weather event (e.g., polar vortex) during which gas supplies were curtailed or went away entirely?	
	If "Yes", please describe how much the normal delivery time was impacted by the event.	
	If "No", please estimate how you think delivery would be impacted in such an event.	
8	Do any operating permits limit the plants ability to burn fuel oil or distillate aside from exceeding permit operating limits such as particulate, opacity, etc.?	
	If "Yes", please specify the limits by type. For example: 1) air permit with instantaneous or over some averaging period tonnage limit; 2) time of day operation limits (i.e. noise); 3) other, etc.	
9	Is fuel oil purchasing done under contract?

FEDERAL ENERGY REGULATORY COMMISSION

Grid Resilience in Regional Transmission Organizations and Independent System Operators	)))	Docket No. AD18-7-000

DECLARATION OF DALE R PROBASCO

I, Dale R Probasco, declare under penalty of perjury that the foregoing is true and correct.

Dale R. Probasco

Executed: Washington, DC
May 8, 2018

Exhibit B

SONECON

FUEL RESILIENCE FOR THE BULK POWER SYSTEM: THREAT-BASED MODELING AND ANALYSIS

Paul Stockton, May 8, 2018

My name is Paul Stockton. I am the Managing Director of Sonecon, LLC, a security and economic advisory firm in Washington, D.C. On October 23, 2017, I submitted testimony (attached as Exhibit 1) on the *Proposed Rule on Grid Reliability and Resilience Pricing* (Docket No. RM18-1-000) on behalf of Exelon Corporation that examined how an increased reliance on natural gas for power generation is creating new risks to electric grid resilience and U.S. national security. In supplemental testimony on November 7, 2017 (attached as Exhibit 2), I found that Bulk Power System entities lack the data they need to assess fuel system resilience against cyber and physical attacks by Russia and other potential adversaries. I recommended that the Federal Energy Regulatory Commission (Commission) coordinate with the Department of Energy and other partners to fill that gap, and develop a design basis threat (DBT) to help Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs) assess and mitigate potential gaps in fuel resilience

This filing addresses the additional assessment challenges and opportunities for progress identified in the Commission's January 8, 2018 order on *Grid Resilience in Regional Transmission Organizations and Independent System Operators* (Docket No. AD18-7-000).[1] My filing also builds on the responses that the Commission has received to that Order. I have five principal findings and recommendations:

1. The gap is widening between what RTOs and ISOs know about the threat and the knowledge they need to assess and ensure resilience. PJM's response to the Grid Resilience Order emphasized that RTOs face "obstacles in obtaining information necessary to assess cyber security threats."[2] The need to improve RTO/ISO access to that information is greater than ever. Army Lieutenant General Paul Nakasone, Commander of US Cyber Command and Director of the National Security Agency, stated in March 2018 that cyber threats to U.S. infrastructure constitute "a critical vulnerability in the nation's armor" and pose a growing danger to U.S. national security.[3] Since the Commission issued its Grid Resilience Order, threats to U.S. energy infrastructure have intensified. This testimony reviews emerging challenges to fuel resilience and the imperative to

give RTOs and ISOs a realistic, government-vetted foundation for resilience assessments beyond typical N-1 contingencies for gas pipeline interruptions. My testimony also examines an additional risk examined by ISO-New England: that dual-fuel generators will fail to compensate for gas interruptions in the severe events to come.[4]

2. Assessing and mitigating gaps in fuel resilience can help achieve key U.S. national security goals. In December 2017 the White House issued the *National Security Strategy of the United States of America* (Strategy).[5] The Strategy highlights the growing severity of cyber threats to energy infrastructure, provides a strategic framework to ensure that improvements in fuel resilience can help deter attacks on the United States, and – if deterrence fails – help the U.S. military defeat our adversaries. My testimony examines these opportunities to contribute to national security and explains why the Department of Defense and other Federal departments have knowledge, expertise, and compelling incentives to help the Commission bolster RTO/ISO resilience assessments.

3. Government entities should provide RTOs and ISO with the information essential for accurate resilience assessments before those assessments are made. PJM not only emphasized the need for improved access to data on the threat, but also proposed a way to obtain that access. PJM urged the Commission to collaborate with the Department of Energy (DOE) and other partners "to provide intelligence and metrics to apply to resilience vulnerability and threat analysis that can guide and anchor subsequent RTO planning, market design, and/or operations directives."[6] Specifically, PJM proposes that after RTOs and ISOs develop their own assessments of vulnerabilities and threats, the Commission would verify the reasonableness of those assessments. Once verified, the assessments could provide the basis for RTO/ISO actions under their planning and operations authorities.[7] PJM's proposal would provide a far stronger basis to assess and remedy shortfalls in fuel resilience than exists today.

However, given gaps in the threat data that the government currently provides to RTOs and ISOs, their initial assessments are almost certain to be grounded on incomplete (and potentially faulty) information. It would be more efficient and effective to provide RTOs and ISOs with the data they need at the front end of the assessment process. My testimony therefore recommends that the Commission and its partners provide RTOs and ISOs with information on key planning factors *before* these entities conduct their assessments, so that such assessments can be informed by key, region-specific considerations. Considerations may include the number of pipelines that RTOs and ISOs should assume will be disrupted, the length of those disruptions, and other factors to be identified though discussions with the North American Electricity Reliability Corporation (NERC) and other industry partners.

[7] *Ibid.*

SI-SSA-0010-4368

4. The Commission should help lead the DBT development process. The Commission has an absolutely vital role to play in developing a design basis threat for fuel resilience. The Grid Resilience Order not only recognizes that "we must remain vigilant with respect to resilience challenges," but also provides a potential basis for additional Commission actions to strengthen resilience, including those associated with assessing the impact and likelihood of resilience risks.[8] My testimony identifies specific initiatives for the Commission to consider, including regulatory proceedings and informal discussions with RTOs and ISOs to determine how DBTs can best support their resilience studies.

I also recommend that the Commission collaborate with the Department of Energy (DOE) and other Federal interagency partners to gather and synthesize necessary threat data. The Department of Energy is the Sector-Specific Agency for the energy sector and has deep expertise on emerging threats to fuel resilience. This testimony examines how DOE's proposal to develop an energy sector model could be especially valuable for supporting RTO and ISO resilience assessments.[9] However, other Federal departments and agencies also have data that will be useful for developing a design basis threat, including the Department of Homeland Security (DHS) and the Department of Defense (DOD). The Commission should support DOE in leading an interagency process to create a DBT. Utilizing the Policy Coordination Committee (PCC) system under the auspices of either the National Security Council or Homeland Security Council (HSC) could offer an especially efficient mechanism to facilitate such interagency coordination.[10]

5. Create a phased, two-level process to distribute *and protect* DBTs. It will be imperative to protect the data in DBTs from potential adversaries. One option to do so would be to classify DBTs at the Secret level or higher. However, most RTOs and ISOs have only a very small number of personnel cleared for access to classified data, and many employees who help conduct resilience assessments may lack such clearances. The *Fixing America's Surface Transportation (FAST) Act* amendments to the Federal Power Act (FPA) direct the Secretary of Energy to "facilitate, and to the extent practicable, expedite" adequate security clearances for key industry personnel.[11] Over time, that process (and the associated expansion of BPS entity capabilities to store classified materials) should enable the distribution of classified DBT material to more RTO and ISO personnel than is possible today.

Nevertheless, the number of transmission system planners and other personnel that will need to participate in resilience assessments is so great that it will not be practical for all of them to have clearances. The Commission and its partners should consider developing a phased DBT distribution process at two levels of protection.

[11] 16 U.S.C. § 824o–1, Section (e), https://www.law.cornell.edu/uscode/text/16/824o-1.

- Phase 1 (Secret level or higher): Cleared RTO/ISO personnel would collaborate with government partners to determine the number and duration of pipeline disruptions their organizations should adopt as planning factors. Cleared personnel would also leverage the TPL-001-4 methodologies to account for the criticality of disrupted infrastructure.[12] Based on that analysis, cleared personnel would distribute For Official Use Only (FOUO) assumptions to RTO/ISO planners regarding how much gas-fueled generation they should assume will be lost in a given location and how long those losses will last.

- Phase 2 (FOUO): Planners would use those planning factors to assess system resilience, identify potential gaps, and develop mitigation measures. FPA information sharing and protection mechanisms could be applied to help protect these resilience assessments and their underlying data. The Commission recently incorporated its Critical Energy Infrastructure Information scheme into a broader Critical Electric Infrastructure Information (CEII) program, per FAST Act amendment requirements.[13] The new CEII scheme created criteria and procedures to designate certain information as critical and prohibit unauthorized disclosure of this information.[14] DOE and the Commission should consider leveraging this mechanism to help protect DBTs and related data. The Commission and its partners could also consider using the Traffic Light Protocol (TLP) system to safeguard DBTs.[15] In addition, the Commission and DOE should consult with industry on how the DBT distribution process can leverage existing systems operated by the Electricity Subsector Information Sharing and Analysis Center (E-ISAC) and other proven mechanisms.

I. FUEL RESILIENCE AS A CHALLENGE FOR NATIONAL SECURITY

The foundational importance of the electric grid makes it a prime target for attack. DOE's *Quadrennial Energy Review 1.2* (2017) emphasizes that the reliability of the grid "underpins virtually every sector of the modern U.S. economy … [and] is a growing and essential component of national security."[16] In turn, ensuring the availability of fuel for power generation is essential to the reliability of the grid, and thus also to the resilience of the United States.

My previous testimony examined three overarching challenges to such resilience: *First*, reliance on a single fuel creates the danger of "common mode failures" where a lack of natural gas incapacitates multiple generators at the same time. *Second*, rising gas-electric interdependencies create dangers of mutually-reinforcing failures. *Third*, such failures could help create "black sky"

[16] Department of Energy, *Quadrennial Energy Review – Transforming the Nation's Electricity System: Second Installment of the QER*, January 2017, p. 4-2. A recent DOE report also states that reliable electric service is "essential to the modern economy," and that the grid is a "national security asset." See: Department of Energy, *Staff Report to the Secretary on Electricity Markets and Reliability*, August 2017, pp. 11 and 61.

power outages, which would entail outages lasting a month or more over multiple regions of the United States.[17]

The Grid Resilience Order provides an opportunity to conduct a more sharply focused, detailed analysis of threats to fuel resilience. The intensifying threat provides an imperative to do so, most notably to support national defense. Grid-provided power is essential for the ports, transportation systems, and other civilian-owned assets and infrastructure on which DOD increasingly depends to deploy and sustain forces abroad. We must assume that Russia and other potential adversaries recognize that dependence. Grid owners and operators are making major improvements to the resilience of their own systems against cyber and physical attacks, consistent with mandatory reliability standards established by the North American Electric Reliability Corporation. But adversaries can also attack the grid indirectly, by disrupting the flow of natural gas that provides the primary source of fuel for power generation in growing portions of the United States. The net effect of these trends: threats to fuel resilience constitute a potentially devastating threat to U.S. security.

Recent factors have heightened the importance of strengthening fuel resilience and helping RTOs and ISOs acquire the U.S. government data they need to assess resilience shortfalls. Cyber threats to fuel resilience continue to intensify. Challenges to the availability of secondary fuel for duel-fuel generators, which provide a critical hedge against gas supply interruptions in many U.S. regions, are also intensifying. Moreover, the issuance of the U.S. *National Security Strategy* in December 2017 has provided a new basis on which to understand the importance of such resilience, and to account for the benefits of resilient power generation for deterring and defeating attacks on the United States.

A. INTENSIFYING THREATS TO FUEL RESILIENCE

In responding to the Commission's Grid Resilience Order, New England ISO (NE-ISO) provided an especially vivid assessment of the degree to which power generation is at risk to fuel interruptions – especially in the flow of natural gas. ISO-NE found that:

> In New England, the most significant resilience challenge is fuel security – or the assurance that power plants will have or be able to obtain the fuel they need to run, particularly in winter – especially against the backdrop of coal, oil, and nuclear unit retirements, constrained fuel infrastructure, and the difficulty in permitting and operating dual-fuel generating capability.[18]

New England is far from the only region where disruptions of natural gas flows could jeopardize grid reliability.[19] A DOE-sponsored report titled *Reliability, Resilience and the Oncoming Wave*

[17] Paul Stockton, *Prepared Direct Testimony (On Behalf of Exelon Corporation) on Grid Reliability and Resilience Pricing* (Docket No. RM18-1-000), October 23, 2017, p. 8.
[18] ISO New England, Inc. "RESPONSE OF ISO NEW ENGLAND INC.," *Response to Grid Resilience in Regional Transmission Organization and Independent System Operators* (AD18-7-000), March 9, 2018, p. 1, https://www.iso-ne.com/static-assets/documents/2018/03/ad18-7_iso_response_to_grid_resilience.pdf.
[19] As examined later in this filing, PJM is also launching an analysis of fuel resilience that includes an especially valuable assessment of severe contingency risks to power generation.

of Retiring Baseload Units: The Critical Role of Thermal Units During Extreme Weather Events (March 2018) notes that many RTOs and ISOs will face a combined challenge of inadequate natural gas pipeline infrastructure and competing demands for fuel from users apart from power generators.[20] Premature retirements of nuclear power plants and the loss of other baseload generation assets will exacerbate the resulting risks to grid resilience. In New York ISO, for example, such retirements could result in "severe reliability, let alone resilience, issues."[21]

However, these studies suffer from a key limitation: they focus almost entirely on severe weather events such as the "Bomb Cyclone" which struck the Mid-Atlantic and Northeast from December 27, 2017 to January 8, 2018. To be sure, it is vital to assess the threats that severe weather and other natural hazards pose to fuel resilience for power generation. Such assessments will be especially useful to account for much more catastrophic risk to the flow of natural gas, including earthquakes in the Cascadia and New Madrid Seismic Zones. Ground liquefaction and other effects from major earthquakes in these areas could produce extensive, difficult-to-repair damage to critical gas transmission lines and to the grid itself, creating disruptions across a significant portion of the Pacific Northwest and Southern and Midwestern states, respectively.[22]

But Mother Nature does not conduct reconnaissance of natural gas systems to identify critical nodes and vulnerabilities. Nor do natural hazards selectively strike nodes where they can create the greatest impact and exploit the growing interdependencies between gas and electric systems. And while hurricanes, severe cold snaps, and earthquakes can pose immense challenges to fuel resilience, they are not part of a long-term strategic competition to undermine U.S. preeminence and hold U.S. security, the national economy, and public health and safety at risk.

Potential adversaries such as Russia and China present just such a challenge and are honing their cyber capabilities to attack U.S. natural gas systems and other energy infrastructure. The National Defense Strategy of the United States of America (January 2018) emphasizes that the "central challenge to U.S. prosperity and security is *the re-emergence of long-term, strategic competition*" by Russia, China, and other "revisionist powers" [emphasis in the original].[23]

For example, a growing number of academic studies, energy industry reports, and unclassified government assessments document the increasingly severe cyber threats confronting U.S. energy infrastructure. Some of these reports focus exclusively on the "exponential" growth of threats to the Oil and Natural Gas (ONG) subsector.[24] Others examine the implications of the near-constant (and increasingly sophisticated) cyberattacks on Middle Eastern oil and natural gas systems for U.S. system owners.[25] However, because adversaries could employ multiple attack vectors across both the electricity and ONG subsectors, a more comprehensive overview of cyber threats offers the best perspective for assessing fuel resilience challenges.

In April 2018, attacks on the electronic data interchanges used by pipeline operators and other energy sector companies garnered extensive headlines. The attacks temporarily disrupted customer billing, scheduling, and document-sharing, but do not appear to have affected industrial control systems or other operational technology networks and components that help control the flow of natural gas to power generators and other customers.[26]

Threats to operational technology (OT) systems are much more concerning, and are also on the rise. On March 15, 2018, the Department of Homeland Security (DHS) revealed that Russia has a sophisticated cyber campaign underway that has enabled that nation to access OT systems in the energy sector, and position its cyber warriors to shut down or intentionally mis-operate critical energy system components.[27] Natural gas systems and BPS entities rely on OT systems to conduct their operations on a day-to-day basis. Both are taking measures to secure those systems, and to strengthen their ability to fall back on manual operations if cyberattacks disrupt industrial control systems. Nevertheless, the scale and sophistication of Russia's efforts to "prepare the battlefield" for possible future attacks exemplifies the imperative to go beyond traditional N-1 or N-2 assumptions regarding potential fuel interruptions.

Adversaries have already demonstrated the ability to disrupt oil and natural gas systems by employing data wiper modules to effectively destroy targeted systems. The 2012 attack on the Saudi Arabian ONG firm Saudi Aramco wiped data from 30,000 Windows-based computers,

though it did not affect industrial control systems (ICS).[28] More recent attacks on energy sector infrastructure, however, have included wiper modules that target those ICS systems and other OT components,[29] which could exacerbate the lasting effects of a more complex attack.

Over the past few months, potential adversaries have conducted "test drives" of additional ways to attack the grid and other critical infrastructure. The Dragonfly campaign, which is still ongoing today, enables adversaries to use utility vendors and other trusted third parties to conduct attacks on targeted systems.[30] Triton malware (in use since at least September 2017) enables adversaries to corrupt the safety systems that monitor and protect the performance of key system components, creating new pathways for adversaries to sabotage energy infrastructure.[31] Adversary malware can also prevent gas pipeline and energy system operators from understanding the status of their own systems, exacerbating the risks and potential consequences of system mis-operation.[32]

Additional government warnings of campaigns against energy sector infrastructure occur almost monthly. In March 2018, DHS alerted sector companies that researchers had identified a vulnerability which gave adversaries the ability to overwrite authorization passwords, modify the configuration of grid protection systems, and – potentially – cause them to fail in the midst of a cyberattack.[33] In April 2018, an unprecedented joint alert by the United States and the United Kingdom warned infrastructure owners and operators that Russia is conducting yet another campaign. In this attack vector, Russian operatives exploit network routers and other network devices to maintain persistent presence in infrastructure system and "potentially lay the foundation for future offensive operations." In particular, "actor controlling a router between Industrial Control Systems – Supervisory Control and Data Acquisition (ICS-SCADA) sensors and

Fortunately, the vulnerabilities were first disclosed to the device manufacturer, who released updates for the majority of vulnerable products. See: Siemens Product CERT, *SSA-203306: Password Vulnerabilities in SIPROTEC 4 and SIPROTEC Compact Relay Families*, March 8, 2018, https://cert-portal.siemens.com/productcert/pdf/ssa-203306.pdf.

controllers in a critical infrastructure – such as the Energy Sector – can manipulate the messages, creating dangerous configurations that could lead to loss of service or physical destruction."[34]

Concerning as they are, these demonstrated adversary capabilities fail to represent the true scale and severity of the threat confronting the U.S. grid. Russia, China, North Korea, and other potential adversaries have powerful incentives to hold their most destructive cyber capabilities in reserve; doing so helps hobble U.S. efforts at building protections against such weapons.

Supply chain corruption poses an especially significant challenge in this regard.[35] If adversaries are able to corrupt the product development and production process for widely-used gas system components, they could gain the ability to later sabotage or covertly control those components, and launch simultaneous attacks on multiple pipelines. Doing so would cause common mode failures, disrupting power generation over wide areas. Electric grid owners and operators often find it difficult to ensure the integrity of their supply chains, and already face the risk that adversaries will exploit software vulnerabilities in their own widely-used components.[36] Grid resilience assessments should also account for the corruption of widely-distributed natural gas system components.

As in the bulk power system, owners and operators of natural gas systems are working diligently to meet these emerging threats. The Transportation Security Administration has also recently updated and expanded its voluntary guidelines for securing pipelines in modest but helpful ways.[37] But adversaries are seeking to improve their ability to disrupt the flow of gas at least as rapidly. William Evanina, director of the National Counterintelligence and Security Center in the Office of the Director of National Intelligence, offered an overall assessment of this risk to fuel supplies in March 2017. He noted that "if we have a cyberattack from one of our adversaries, and they hit the power grid in the East Coast," federal authorities have a good handle on the amount of time it would take to recover. However, "If the natural gas is shut off ... [there's] not even an estimate."[38]

DBTs to support fuel resilience assessments can play a critical role in creating such estimates and addressing key vulnerabilities to power generation.

B. AN ADDITIONAL RISK FACTOR: RESUPPLYING DUAL-FUEL GENERATORS

A crucial means to hedge against the risk of natural gas disruptions has been maintain a level of fuel diversity, including the construction of dual-fuel generators. In addition to their primary fuel (natural gas), these dual-fuel generators can use diesel, no. 2 fuel oil, or other secondary sources of fuel to sustain operations when gas flows are disrupted.[39] This dual-fuel capability can bolster system reliability and improve resilience against extreme events.[40] As a result, some regions have developed financial incentives to encourage utilities to build and/or retain dual-fuel generators and associated on-site fuel storage. However, trends in generation technology (in part due to environmental pressures) have caused a shift away from dual-capable generators.[41] PJM and other RTOs and ISOs are developing additional incentives for generation asset owners to retain and construct such generators. Those initiatives are valuable and should be sustained.

Measures to ensure that dual-fuel generators are prepared to operate in severe weather events will also be essential. In the 2011 Southwestern "Big Chill," for example, a quarter of dual-capable generating units that attempted to switch fuels failed to do so successfully due to inadequately maintained switching equipment or derating.[42] In the 2014 Polar Vortex, owners of dual-fuel generators faced a number of other problems, including unit startup failures and run-times restricted by environmental regulations.[43]

However, even if asset owners dramatically increase the number of dual-fuel generators that can operate when natural gas supplies are interrupted, several factors limit the ability to rely on dual-fueled resources especially as the duration of gas unavailability increases. For example, on-site storage is general very limited.[44] Air and other permits may limit the duration of operations on alternative fuel (though BPS entities acting in compliance with grid security emergency orders may have the enforcement of environmental violations waived).[45] Another potentially devastating

[45] 16 U.S.C. § 824o-1, Section (f), https://www.law.cornell.edu/uscode/text/16/824o-1.

problem is the resupply of secondary fuel. A recent study by Navigant found that roughly 50% of dual-fuel units with typical winter levels of oil storage would need fuel oil resupplies after three days.[46] If cyber or physical attacks disrupt the flow of gas for longer periods, resupplying secondary fuels will be essential to sustain power generation.

Conducting resupply operations in the face of cyber or physical attacks on U.S. infrastructure will pose enormous challenges. If natural gas interruptions and other factors create blackouts, dual-fuel generators will be competing for resupply against many thousands of other customers in most states, including those operating backup generators for water systems, hospitals, cell towers, and other critical facilities. A coincident cold weather event could increase demand for back up fuel for ordinary household and business heating purposes, exacerbating the situation. An overwhelming mismatch will emerge between the capacity of fuel contractors to resupply such customers and the demand for them to do so. Even in severe weather events such as the 2014 Polar Vortex, suppliers began exhausting their inventories and cut back on delivery to generators.[47] Cyber and physical attacks that specially target gas infrastructure for disruption and seek to exploit gas-electric interdependences to create long duration outages will create much more serious problems for secondary fuel resupply.

ISO-NE highlights an additional "unquantifiable X factor:" fuel delivery logistics in the face of a "withering delivery supply chain." A recent study by ISO-NE notes that as more and more oil-fired power plants have retired, the delivery supply chain has declined as well.[48] And while the study focuses on oil, rapid restructuring is also underway in the refining and delivery infrastructure for other liquid fuels for generators, especially as the transition accelerates towards ultra-low sulfur diesel fuel.

Neither the Energy Information Agency nor any other organization of which I am aware has conducted a comprehensive study of the implications of this restructuring (and resulting loss of system capacity) for secondary fuel resupply in natural or manmade disasters. However, given the importance of dual-fuel generators as a hedge against attacks on gas transmission systems, it would be helpful to account for such risks as part of an overall DBT to support fuel resilience assessments.

C. FUEL RESILIENCE: OPPORTUNITIES TO HELP ACHIEVE U.S. NATIONAL SECURITY GOALS

Russia and other potential adversaries will not disrupt the flow of natural gas as an end in itself. Rather, given the growing dependence of power generation on interruptible fuel, and the reliance of all other critical infrastructure sectors on the availability of electric power, attacks on natural gas systems will aim to inflict devastating damage to public health and safety and the national economy and jeopardize the ability of the United States to project military power abroad. The 2017 U.S. *National Security Strategy* notes that cyber weapons "enable adversaries to attempt strategic

attacks against the United States -- without resorting to nuclear weapons -- in ways that could cripple our economy and our ability to deploy our military forces."[49]

This broader strategic context provides the starting point to develop a design basis threat for fuel resilience. While it is (barely) conceivable that an adversary will attack a single natural gas pipeline, perhaps as a demonstration of its ability to do so, cyberattacks that strike multiple gas transmission systems at the same time will be better attuned to achieve the crippling effects highlighted in the *National Security Strategy* (NSS).

The NSS offers a number of additional benefits for framing a design basis threat. Especially valuable, the Strategy helps clarify how assessing and remedying gaps in fuel resilience can help deter cyberattacks against the United States. The Strategy notes that to deter adversaries from attacking, it will be necessary to convince them that they will suffer "swift and costly consequences" if they strike the grid or other U.S. targets.[50] Ensuring that power generators can continue to provide electricity to military bases and supporting Defense critical infrastructure, even in the face of a sustained campaign against the U.S. energy sector, can bolster such deterrence.

Improving fuel resilience can also help deter attacks through a different means. In addition to deterring adversaries by being able to inflict unacceptable costs on them, the United States can also discourage attacks by making adversaries doubt that such attacks can inflict the disruptive effects they seek. The *National Security Strategy* notes that "A stronger and more resilient critical infrastructure will strengthen deterrence by creating doubt in our adversaries that they can achieve their objectives."[51] Bolstering such "deterrence by denial" constitutes a benefit of strengthening fuel resilience.

Another way in which the NSS supports the development of a DBT is by highlighting the degree to which the Department of Defense and DOE's other Federal partners have "skin in the game" to assess and improve fuel resilience. It is altogether fitting and proper that *National Security Presidential Memorandum - 4: Organization of the National Security Council, the Homeland Security Council, and Subcommittees* (April 2017) specifies that the Secretary of Energy shall be a "regular attendee" of both Councils.[52] Resilient electricity and fuel supplies for generation are vital to national and homeland security. That same importance provides compelling incentives for DOD, DHS, and other Federal agencies to help the Commission and DOE develop an accurate design basis threat. In particular, providing such a DBT will enable RTOs, ISOs, and other BPS entities to assess the vulnerability of their fuel supplies much more effectively than they can today, and, as needed, to develop pricing initiatives and other measures to ensure that military bases and other key national and homeland security facilities will have the resilient power they need.

[52] President Donald J. Trump, *National Security Presidential Memorandum - 4: Organization of the National Security Council, the Homeland Security Council, and Subcommittees*, April 4, 2017, https://www.whitehouse.gov/presidential-actions/national-security-presidential-memorandum-4/.

The *National Security Strategy* also provides a further benefit for assessing and strengthening resilience – one that is closely aligned with the purposes and requirements in the Commission's Grid Resilience Order. The Commission noted that "we must remain vigilant with respect to resilience challenges, because affordable and reliable electricity is vital to the country's economic and national security."[53] Accordingly, the order directs RTOs and ISOs to offer comments to clarify the attributes of resilience. Respondents are then asked to help "(1) determine which risks to the grid we are going to protect against, and (2) identify the steps, if any, needed to ensure those risks are addressed."[54]

The NSS provides *foundational* guidance to address these issues and assess the value of resilient sources of generation. To deter and (if necessary) defeat attacks against the United States, the nation cannot depend solely on fuel supplies that adversaries are able to interrupt via cyberattacks and other means. By developing a design basis threat to help RTOs and ISOs assess the risks of fuel interruptions, the Commission and its partners can take a decisive step to strengthen grid resilience against rapidly intensifying threats.

II. GAPS IN THREAT AND VULNERABILITY DATA AVAILABLE TO BPS ENTITIES, AND IMPLICATIONS FOR ASSESSING FUEL RESILIENCE

The Federal government currently leaves RTOs and ISOs largely on their own to characterize threats to their fuel resilience. This approach is likely to produce disparate planning assumptions regarding the scale and severity of such threats. The government's "hands off" approach also limits opportunities for appropriate intelligence-related input from the Department of Energy and other Federal departments and agencies to support the development of a vetted, appropriately-informed DBT.

This lack of Federal support is especially notable given the risk that fuel supply interruptions could jeopardize the flow of power on which military bases and other national security assets depend. General Nakasone, Commander of U.S. Cyber Command, told Congress in March 2017 that "It is paramount that the U.S. public and private sectors work together to create shared understanding of the threat in order to better defend our national security interests."[55] Yet only limited guidance exists on the scale and characteristics of the extreme events that should be used as a basis for assessing the impact of fuel system interruptions on grid reliability and resilience.[56]

BPS entities would benefit from far more extensive support. In particular, using appropriate intelligence sources, the Federal government could provide these entities with an assessment of the severity and nature of attacks that they must be prepared to confront. Such an assessment could

[53] Grid Resilience Order, p. 1.

The assessment notes that "As part of future transmission and resource planning studies, planning entities will need to more fully understand how impacts to the natural gas transportation system can impact electric reliability."

SI-SSA-0010-4379

also help entities account for specific risks to fuel resilience, including the risk that adversaries will target their attacks to exploit interdependencies between gas and electric infrastructure.

Responses to the Grid Resilience Order have highlighted the degree to which RTOs and ISOs lack the data they need to assess threats to their resilience, and their desire for governmental assistance to fill those gaps. Dr. David Patton, Market Monitor for MISO, NYISO and ISO-NE, noted that "Without first identifying in detail the contingencies and associated reliability risks to the system, there is no way to quantify a resilience requirement."[57] PJM similarly emphasized the need for Federal support on identifying and assessing risks: "there needs to a process for vulnerability threat verification. The Commission needs to provide intelligence and metrics to apply to resilience vulnerability and threat analyses, such that they can then guide and anchor subsequent RTO planning, market design, and/or operations directives. Overall there needs to be better information made available to the RTOs on the above-identified risks to enable the RTOs to assess the risks. This information could be supplied from a wide range of federal agencies and interdependent systems."[58] Filling this gap with a DBT will be essential for establishing the objective, analytically sound assessment system needed to achieve the goals of the proposed Rule.

The need for government support to help BPS entities understand the threats they confront is especially significant for cyber risks. PJM notes that "There are obstacles to obtaining information necessary to assess cyber security threats because RTOs can only base their threat assessments on open source information and certain classified intelligence, but the information from classified sources is limited and does not provide a full and complete understanding needed to detect and respond to cyber-attacks. In addition, RTOs lack access to all relevant information about supply chain threats which pose a significant risk to the electric industry. Without this information, the electric industry is unable to help to mitigate certain risks that may be associated with such threats."[59]

In particular, RTOs and ISOs are at risk of drastically underestimating the number of pipelines that adversaries will disrupt in an attack and the duration of the outage. Many of the filings to the Commission indicate that N-1 or N-2 planning factors are currently used to assess fuel resilience. PJM, for example, notes that "the PJM studies that have been conducted to date have focused on identifying specific vulnerabilities such as the loss of a substation or common mode outages such as the loss of generation fed from common gas infrastructure, but have not taken into consideration the effects associated with the loss of multiple substations or critical system components as could be contemplated in a coordinated physical attack."[60]

SI-SSA-0010-4380

PJM deserves great credit for proposing how the Commission can provide the threat data needed provide a stronger foundation for assessing and mitigating risks. PJM recommends that the Commission should:

> establish a process, either informally through one or more of the Commission's existing offices, or formally through a filing process, that would allow an RTO to receive verification as to the reasonableness of vulnerability and threat assessments based on information that may be available to the Commission but not available to the RTOs because of national security issues. Those assessments, once verified, could then form the basis for RTO actions under its own planning or operations authority consistent with its tariffs. In coordination with other federal agencies the Commission needs to provide intelligence and metrics to apply to resilience threat analyses that can then guide and anchor subsequent RTO planning, market or operations directives."[61]

PJM's proposal would provide a far stronger basis to assess and remedy shortfalls in fuel resilience than exists today. Moreover, an immediate opportunity has emerged to apply this approach. On April 30, 2018, PJM launched a new initiative to identify and model system vulnerabilities to fuel interruptions and other disturbances. This analysis will "study a few realistic but extreme contingencies such as a force majeure event on key delivery facilities" for natural gas.[62] Given the gaps in government-provided threat data that PJM has identified, the challenge will remain of determining how far these contingencies should go beyond traditional N-1 planning factors. Having the Commission verify the reasonableness of the extreme contingencies used in the new study will be enormously helpful.

At the same time, the Commission and its partners should begin developing an even more efficient and effective basis for future resilience assessments. The Commission should provide threat and vulnerability data at the start of the analytic process, rather than leaving RTOs and ISOs to devise their own assessments (based on limited and potentially faulty information) and then having the Commission verify that they had used accurate and realistic planning factors. The section that follows examines how the Commission and its partners can provide a design basis threat to RTO/ISOs at the outset of their analysis of system resilience.

III. DEVELOPING AND DESIGNING A DESIGN BASIS THREAT TO STRENGTHEN FUEL RESILIENCE

Federal commissions, departments, and their industry partners already use design basis threats to help support resilience assessments and identify potential requirements for mitigation measures. These existing DBTs provide models that might be adapted to help develop an equivalent foundation for RTOs, ISOs, and other BPS entities to assess fuel resilience. However, a DBT for fuel resilience will also need to address the special challenges that confront power generation.

[61] *Ibid*., at p. 81.

[62] PJM, Valuing Fuel Security, April 30, 2018, p. 4, http://www.pjm.com/-/media/library/reports-notices/special-reports/2018/20180430-valuing-fuel-security.ashx?la=en

SI-SSA-0010-4381

The section that follows summarizes my previous testimony on existing DBTs. I then recommend specific planning factors that a fuel resilience DBT should include, propose an interagency process to develop that foundation for resilience assessments, and suggest ways in which FERC and its partners might distribute DBTs while also protecting them from potential attackers.

A. CURRENT DBT PROGRAMS

From an energy sector perspective, an especially useful precedent to leverage lies in the DBT that the Nuclear Regulatory Commission (NRC) created for nuclear power plants and related facilities.[63] As noted in my previous testimony to the Commission, the requirement to establish this DBT and the basic threats it should comprise are specified in the *Energy Policy Act* of 2005.[64] These threats include "multiple, coordinated groups of attackers, suicide attacks and cyber threats," as well as other potential attack vectors.[65]

The NRC also regularly reviews and revises the DBT to keep pace with evolving threats. In particular, the NRC monitors domestic and foreign threat intelligence in an attempt to stay ahead of potential adversaries, issues periodic threat advisories and annual reviews, and will use this information to update the DBT as required.[66] While the DBT focuses on manmade threats, the NRC also provides earthquake engineering criteria for nuclear power plants and other guidance related to natural hazards.[67]

The NRC's DBT model offers valuable insights for developing a DBT for fuel resilience. For example, given the evolving threat to gas pipelines and other fuel supplies, it will be essential that the fuel resilience DBT be periodically updated as well. The nuclear DBT also provides a model of the appropriate level of detail for characterizing key threat vectors in an unclassified manner. In addition, existing mechanisms for the Department of Energy to share classified information with BPS entities could also be used to supplement unclassified DBT descriptions. Finally, just as the NRC sets standards for both natural and manmade hazards, the fuel resilience DBT should as well.

Even when Congress has not established statutory requirements for DBTs, Federal departments have issued them to help strengthen resilience and security across a range of critical facilities and functions. For example, DOD provides DBTs to support anti-terrorism and force protection standards, and mitigation measures based on requirements generated internally by the

[63] The NRC's DBT provide performance-based requirements which allow each facility to develop site-specific strategies. It applies to commercial nuclear power reactors and Category I Fuel Cycle Facilities. SI-SSA-0010-4382

Department.[68] DHS also provides a DBT that establishes "the type, composition, and capabilities of adversaries" who might threaten Federal facilities.[69]

As in the case of the DOD and DHS models, the Commission and its partners can develop a DBT to support fuel resilience studies without a legislative requirement to do so. However, BPS entities will need a unique set of planning factors and threat assessments, focused on gas-electric interdependencies and related energy sector challenges.

B. KEY COMPONENTS OF A DESIGN BASIS THREAT FOR FUEL RESILIENCE

RTOs and ISOs are exceptionally well positioned to identify the elements of a DBT that they would find most helpful to support their analysis of fuel resilience against manmade threats. The Commission should consider conducting informal discussions with them and with other appropriate BPS entities to receive their views on DBT priorities and planning factors. To provide a starting point for those discussions, the items below might be addressed as options for inclusion.

1. The number of gas transmission pipelines that adversaries will interrupt

Unless a DBT accounts for the risk that adversaries will strike multiple transmission pipelines and supporting infrastructure at the same time, RTOs and ISOs are likely to assume that only a single pipeline will be disrupted. In some regions of the United States, even such an N-1 gas contingency could produce catastrophic effects on power generation. For example, ISO-NE notes that given the limited number of pipelines and supporting gas infrastructure in New England, the loss of even a single natural gas compressor station or other gas system facility "would result in frequent energy shortages that would require frequent and long periods of rolling blackouts." [70] In such infrastructure-constrained regions, assuming that adversaries will attack only one pipeline could provide an appropriate starting point to assess fuel resilience, since adversaries would not need to attack additional pipelines in order to achieve catastrophic effects on grid reliability and on critical electricity-dependent facilities and functions.

Even RTOs and ISOs with much more robust gas infrastructure view N-1 contingencies as a stringent foundation for assessing resilience. For example, PJM notes that "Modeling the loss of an entire pipeline is ultraconservative as the nature of the pipeline system and the relatively slow speed of the movement of gas would argue that more limited disturbances should be modeled."[71] Modeling very limited attacks that fail to fully halt gas flows in a single pipeline would indeed be useful as part of an overall portfolio of contingences for analyzing fuel resilience. However, N-1 (or lesser) contingencies will fall drastically short of the number of pipelines that adversaries could simultaneously target. If a crisis with the United States is so dire than an adversary will launch

SI-SSA-0010-4383

cyber or physical attacks on gas systems, despite the risk of provoking an overwhelming response by U.S. forces, adversaries may seek to disrupt military bases and other critical facilities on a vastly greater scale than can be achieved by attacking a single pipeline.

The Commission and its Federal partners should not leave BPS entities to make such threat-related national security assessments on their own. As previously noted, RTO and ISO responses to the Grid Resilience Rule have emphasized that they lack the classified data on cyber threats they need to analyze fuel resilience. But they also face a broader problem. To establish a consistent, nationwide framework for analysis, RTOs and ISOs need government-vetted guidance on the overall scale of fuel system attacks they should assume will occur. PJM notes that while its current process to model fuel resilience contingencies complies with applicable NERC standards, "this process lacks an overall national regulatory framework as well as the regulatory support to ensure that there is cooperation in identification of vulnerabilities and threats on the gas pipelines, modeling efforts and the sharing of system topology so as to make the modeling of contingencies accurate and meaningful."[72]

One of the most valuable features of the Grid Resilience Order is the Commission's focus on the risks of common mode failures. In requesting RTOs/ISOs to describe how they assess threats to resilience, the Commission asked: "should RTOs/ISOs identify as a resilience threat the potential for multiple outages that are correlated (e.g., a correlated generator outage event, such as a wide-scale disruption to fuel supply that could result in outages of a greater number of generating facilities)?"[73] This filing argues that it is absolutely imperative to do so. As I noted above, these adversaries could, for example, corrupt the supply chain of commonly-used network components, enabling them to exploit a single vulnerability to cause widespread failures. Other potential sources of common failure modes in natural gas supplies could provide equivalent wide-area threats to power generation.

A fuel resilience DBT can assist RTOs and ISOs by specifying the number of pipelines that they should assume will be simultaneously disrupted. Because regions of the United States vary so widely in terms of gas system topology, and the degree to which redundant pipelines provide a hedge against N-1 or N-2 contingencies, the DBT must account for such regional differences. For example, the DBT might specify that adversaries will disrupt 50% percent of major transmission pipelines or regional gas flows (with the actual figure to be determined through an interagency DBT development process). The Commission should consider engaging with RTOs and ISOs to examine how the DBT can best provide a consistent, nationwide framework for fuel resilience assessments while also accounting for regional variations in gas system topology and other factors.

2. The duration of gas system interruptions

Attacks on natural gas systems will rarely create an immediate, "all or nothing" situation for power generators. The pressure of natural gas in each section of gas transmission pipelines typically

[72] PJM Interconnection, L.L.C, "COMMENTS AND RESPONSES OF PJM INTERCONNECTION, L.L.C.," *Response to Grid Resilience in Regional Transmission Organization and Independent System Operators* (AD18-7-000), March 9, 2018, p. 5, http://pjm.com/-/media/documents/ferc/filings/2018/20180309-ad18-7-000.ashx.
[73] Grid Resilience Order, p. 14.

ranges from 200 pounds to 1,500 pounds per square inch, depending on the type of area in which the pipeline is operating.[74] If adversaries attack those pipelines and the compressor stations that maintain the pressure within them, gas could continue to flow to generators at gradually diminishing levels rather than being abruptly halted. Moreover, once attacks occur, gas companies have extensive plans and capabilities in place to restore service as quickly as possible. The combination of sustained post-attack gas flows and rapid restoration could enable generators to face only brief, low-impact interruptions.

But interruptions could also last far longer. Physical attacks that destroy multiple critical transmission system nodes, including key compressor stations, will require the repair and replacement of equipment on a scale never before experienced. These operations would also have to go forward in the face of disrupted transportation systems, communications infrastructure, and other assets critical for restoration support if adversaries conduct multi-sector attacks. The greatest challenge, however, will likely be power outages – in part due to gas shortages – which deny power to the compression stations and other critical gas facilities required to sustain and restore service.

The fuel resilience DBT should specify the duration of gas interruptions that RTOs and ISOs should assume will occur (and must be prepared for). As with estimates of the number of pipelines adversaries will attack, without the benefit of government-vetted planning factors, resilience studies will vary widely in terms of projected event duration.

3. Additional Planning Factors

Over time, DOE and the Commission might supplement DBTs with additional considerations to provide a more thorough, detailed basis for assessing fuel resilience. Assumptions about weather could provide one such supplement. As in the Polar Vortex, Bomb Cyclone and other severe weather events, extended cold snaps can spike demand for gas and lead to curtailments in supplies to power generators (especially those that lack firm, higher-cost contracts).[75] Attacks on gas that occurred during such events, or that were timed to exploit the occurrence of hurricanes or other natural disasters, could contribute to much greater resilience challenges than would otherwise confront BPS entities.[76]

Assumptions regarding secondary fuel resupply capacity for dual-fuel generators would also help make resilience assessments more robust. As discussed in Section II, dual-fuel generators provide a crucial hedge against interruptions in gas supplies in many regions of the United States. Yet the durability of such dual-fuel alternatives and the resilience of the resupply system for the oil and distillates that generators will require is increasingly uncertain – especially in terms of the ability of that system to meet generation needs in a severely disrupted environment where fuel demand will dwarf delivery capacity.

SI-SSA-0010-4385

RTOs and ISOs are currently left on their own to determine how, if at all, to account for the risk that resupply operations will fail precisely when they are most vital. Over time, the fuel resilience DBT should provide a consistent planning framework to consider such risks (adapted to account for regional variations in secondary fuel infrastructure). The prerequisite for doing so will be for DOE and the ONG subsector to provide a much stronger factual basis to assess the resilience of that infrastructure than currently exists.

NERC can provide a crucial source of guidance in shaping the scope and evolution of the DBT development process. NERC has been facilitating increasingly close coordination between BPS entities and natural gas companies to address fuel resilience and interdependency challenges. NERC notes that:

> With increased growth in gas usage comes greater reliance and associated risk due to the dependency that each industry now has on the other. The operational impact of these dependencies requires gas and electric system operators to actively coordinate planning and operations. The goal of the coordination is to ensure that both the gas and electric systems remain secure and reliable during normal, abnormal and emergency conditions.[77]

Accordingly, NERC has offered a set of recommendations on opportunities for gas-electric coordination, many of which might be supported by DBT data to facilitate broader assessments of fuel resilience and collaborative mitigation measures. For example, NERC recommends that gas and electric companies identify "each pipeline (interstate and intrastate) that operates within the electric footprint and mapping the associated electric resources that are dependent upon those pipelines."[78] On that basis, NERC recommends that companies could then identify "gas single element contingencies and how those contingencies will impact the electric infrastructure."[79] However, against threats from Russia or other capable adversaries, such N-1 contingencies will be inadequate as a basis for resilience assessments. Government-provided DBT data will be needed to help RTOs and ISOs account for the risk that adversaries will disrupt pipelines on a much greater scale, and analyze the implications for power generation and grid resilience.

In turn, the DBT could support NERC initiatives on grid reliability. NERC and its industry partners are evaluating opportunities to modify the planning guidance in TPL-001-4 – *Transmission System Planning Performance Requirements*. The standard currently requires entities to assess the impacts of "extreme events," including the loss of "a large gas pipeline into a region or multiple regions that have significant gas-fired generation," and evaluate possible mitigation actions.[80] As those modification efforts go forward, NERC and its industry partners should consider how DBT material might support the analysis and planning process for resilience against gas supply interruptions beyond N-1.

SI-SSA-0010-4386

C. ENERGY INFRASTRUCTURE MODELING

DOE has proposed an energy sector modeling initiative that would be enormously helpful for developing a fuel resilience DBT – and which the DBT development process might, in turn, be able to support. Current models of interdependent gas-electric infrastructure and functions do not provide an adequate basis to assess and mitigate gaps in nationwide fuel resilience, especially as the transition to electric-powered gas compressors and other system modernizations go forward. Bruce Walker, Assistant Secretary of DOE's Office of Electricity Delivery and Energy Reliability, emphasizes that "we need an in-depth understanding of the resilience of our electricity and related infrastructure in order to know how best to either modify existing market structures or build new resiliency standards into the system."[81]

DOE's proposed modeling initiative is crucial for meeting these requirements. In particular, Assistant Secretary Walker has proposed the development of a North American energy model that integrates ongoing resilience planning efforts at local, state, and regional levels, filling any gaps and harmonizing any inconsistencies between their efforts.[82]

The DBT development process should be structured to capitalize on the findings of this modeling initiative. For example, given the importance of natural gas from Canada for U.S. power generation, the creation of an integrated, cross-sector model for North America can help guide the development of planning factors on the scale and length of gas interruptions that fuel resilience assessments ought to encompass. The Commission and its partners should also help ensure that support flows in the reverse direction. As RTOs and ISOs use the DBT to refine their resilience studies and advance mitigation initiatives to fill any gaps they identify, their findings and plans for improvement (shared and protected as appropriate) can help update DOE's proposed model.

D. BUILDING AN INTERAGENCY DEVELOPMENT PROCESS

A number of RTO and ISO responses to the Grid Resilience Rule have emphasized the need for the Commission to build a stronger foundation for fuel resilience assessments. The Commission can play an especially valuable role in helping these organizations acquire the threat data they need to make realistic, prudent assumptions about the scale and severity of the fuel interruptions they should expect in a major attack by Russia or other highly capable adversaries.

One such Commission role would be to conduct informal discussions with NERC, RTOs/ISOs, and other appropriate BPS entities on what they believe a design basis threat should comprise, and the gaps in threat data that are most necessary to for the government to fill. Other Federal departments and agencies, especially the Department of Energy, could also provide valuable recommendations on the scope and structure of the DBT.

On the basis of those discussions and responses that RTOs and ISOs have already made to the Grid Resilience Order, the Commission could then establish additional procedures to propose and

[81] Bruce Walker, *Testimony Before the United States Senate Committee on Energy and Natural Resources*, January 23, 2018, p. 2, https://www.energy.senate.gov/public/index.cfm/files/serve?File_id=165FF5C6-CB75-437E-9742-F90A1F0B580C.
[82] *Ibid*.

SI-SSA-0010-4387

request formal input on the creation of a design basis threat and the mechanisms by which it would be distributed (as discussed in the next section of my filing).

The Commission should also partner with the Department of Energy to jointly lead the interagency process needed to integrate Federal-wide input into the fuel resilience DBT. DOE is the Sector-Specific Agency for the energy sector. Department personnel have an especially strong understanding of emerging threats to the sector, and can draw on the National Laboratory system and other sources of data and analysis to build the planning factors vital so support RTO and ISO resilience assessments.

The DBT will also benefit from input from the Department of Homeland Security (DHS). The Department's National Cybersecurity and Communications Integration Center (NCCIC) is "the Nation's flagship cyber defense, incident response, and operational integration center," and can provide a unique, integrated perspective on emerging cyber resilience challenges.[83] In particular, NCCIC's United States Computer Emergency Readiness Team (US-CERT) program offers BPS entities a leading source of data on cyber threats. Other components in DHS, including the Office of Infrastructure Protection, will be essential for providing data for the DBT on physical threats to fuel infrastructure.[84]

The Department of Defense can make key contributions to the DBT as well. DOD components will be able to contribute to threat assessments and help ISOs and RTOs account for the broader national security context for their resilience studies. The Department will also have a vested interest in doing so. If attacks on fuel supplies help create long duration, wide area power outages, the ability of DOD installations, ports, and other supporting infrastructure to project power abroad and assist disaster management at home will be at increasing risk. DOD has powerful incentives to help BPS entities strengthen fuel resilience; providing Defense input into the creation of a design basis threat provides a valuable, extraordinarily low-cost means to do so.

To help FERC incorporate input from other Federal departments and agencies, existing interagency coordination mechanisms provide an ideal opportunity for progress. Either the National Security Council (NSC) or the Homeland Security Council (HSC) could provide for the necessary coordination. Under *National Security Presidential Memorandum - 4: Organization of the National Security Council, the Homeland Security Council, and Subcommittees* (April 2017), the NSC advises the President with respect to the integration of domestic, foreign, and military policies pertaining to national security. The HSC is responsible for advising the President on matters pertaining to homeland security. Both Councils are also responsible for "the effective coordination of the security-related activities and functions of the executive departments and agencies."[85] In addition, both include the Secretary of Energy as a regular attendee.

---

SI-SSA-0010-4388

Attacks on fuel supplies for power generation could affect both national and homeland security. Accordingly, depending on their other priorities and broader ongoing efforts related to U.S. infrastructure resilience, either the NSC or HSC could help coordinate the development of a fuel resilience DBT. In either case, the Policy Coordination Committee (PCC) process could offer a useful coordination framework for the DBT effort. NSPD-4 states that "Management and development of national security polices by multiple executive departments and agencies typically shall be accomplished by the PCCs," with subordinate working groups as needed.[86] A working group to facilitate the development of the DBT might provide an especially useful starting point for interagency coordination. Nevertheless, the Commission and its industry partners will also need to help guide the DBT development process to ensure that the resulting product meets their priorities and analytic requirements to strengthen fuel resilience.

E. DISTRIBUTING AND PROTECTING DBTs AND SUPPORTING DATA

We can be sure that Russia and other potential adversaries are collecting every scrap of information that might help them identify and exploit vulnerabilities in the flow of fuel for U.S. power generation. As fuel resilience assessments go forward, and the Commission and its partners support those assessments by developing a design basis threat, it will be essential to avoid giving adversaries a roadmap for striking the energy sector or otherwise assist their attack planning and execution.

The most obvious way to protect the DBTs and their supporting data is to classify them at the Secret level or higher. However, most RTOs and ISOs have only a very small number of personnel cleared for access to such classified data and no authorized facilities to store the material, and many employees who help conduct resilience assessments may lack required clearances.

The FAST Act amendments to the Federal Power Act provide an opportunity to close this gap. The Act specifies that: "the Secretary shall facilitate and, to the extent practicable, expedite the acquisition of adequate security clearances by key personnel of any entity subject to the requirements of this section, to enable optimum communication with Federal agencies regarding threats to the security of the critical electric infrastructure."[87]

However, the backlog in applications for Federal government clearances is enormous and growing. Hundreds of thousands of clearance requests are awaiting the necessary investigations and the time required to complete those investigations is growing longer and longer.[88] The Commission cannot wait for RTOs and ISOs to significantly increase their number of cleared personnel to develop and distribute fuel resilience DBTs. Moreover, the total number of transmission system planners and other relevant personnel that will need to participate in resilience assessments is so great that it will not be practical for them all to have clearances.

---

[86] *Ibid*.
[87] 16 U.S.C. § 824o–1, Section (e), https://www.law.cornell.edu/uscode/text/16/824o-1.
[88] Government Accountability Office, *Personnel Security Clearances: Additional Actions Needed to Ensure Quality, Address Timeliness, and Reduce Investigation Backlog* (GAO-18-29), December 2017, p. 32, https://www.gao.gov/assets/690/688918.pdf.

SI-SSA-0010-4389

While DOE and its Federal partners should continue to press for industry personnel to get considered for the clearances their work requires, and support efforts by BPS entities to get the facilities they need to transmit and store classified materials, a more realistic solution is need for the near term. A two-phased approach to DBT analysis and distribution can provide such a solution.

Phase 1 (Secret level or higher)

Based on classified information regarding threats to the Oil and Natural Gas subsector, cleared RTO/ISO personnel should partner with experts from the Commission, DOE and other appropriate Federal agencies to determine how many pipelines they should assume will be disrupted in an attack by Russia or other high-capability adversaries, and how long they should expect those interruptions to last. Cleared personnel would also leverage the TPL-001-4 methodologies to account for the criticality of specific critical infrastructure components that these attacks would disrupt.[89]

Based on that classified analysis, cleared personnel would distribute For Official Use Only (FOUO) assumptions to the broader team of RTO/ISO planners, specifying: 1) how much gas-fueled generation they should assume will be lost in a given location; 2) how long those disruptions will last; and 3) other planning factors needed to support resilience assessments.

Phase 2 (For Official Use Only)

These FOUO assessments should be targeted to help RTO/ISO planners assess 'downstream' impacts and consequences on BPS operations. The planners could then use this data to survey each generating station to determine the gas transmission (and LDC) for each generating unit; assess if alternate or dual gas transportation arrangements are in place; the type of transportation and supply contract (firm vs. interruptible); and the maximum amount of dual fuel, if any is available, to determine the impact of any natural gas transportation outage on individual generators. Planners also should collect information on secondary fuel supply contracts to analyze 'common mode' limitations (many generators turning toward same supplier at the same time), as well as information on the curtailment of gas supply/transportation to non-residential customers. With these estimates regarding disruptions to gas generation, planners can perform system assessments and recommend corresponding mitigations.

The Commission and DOE should partner with industry to examine how existing mechanisms to share sensitive information can be used to protect these FOUO assessments. A prime opportunity to do so lies in the information sharing and protection mechanisms required by the Federal Power Act (FPA). The *Fixing America's Surface Transportation (FAST) Act* (2015) amendments to the FPA require the Commission, in consultation with the Secretary of Energy, to establish criteria and procedures to designate certain information – Critical Electric Infrastructure Information (CEII) – as critical and prohibit its unauthorized disclosure.[90] In establishing those criteria, the

[89] North American Electric Reliability Corporation, *TPL-001-4 — Transmission System Planning Performance Requirements*, effective January 1, 2015.
[90] 16 U.S.C. § 824o–1, Section (d)(2), https://www.law.cornell.edu/uscode/text/16/824o-1.

Commission also leveraged and subsumed its long-established scheme to protect Critical *Energy* Infrastructure Information.[91] That joint mechanism might be leveraged to help protect sensitive FOUO DBT information.

The Traffic Light Protocol (TLP) offers another promising option for securely sharing FOUO fuel resilience planning assumptions. TLP is "a set of designations used to ensure that sensitive information is shared with the appropriate audience," using traditional traffic light colors to indicate three levels of expected sharing boundaries.[92] TLP:RED – the most restrictive designation – could be potential a starting point for safeguarding the sharing of fuel resilience information. The Commission and DOE should also consult with industry on how the DBT distribution process can leverage existing systems operated by the Electricity Subsector Information Sharing and Analysis Center and other proven mechanisms.

CONCLUSION

The Commission's issuance of the Grid Resilience Order marks a decisive step forward to strengthen the resilience of the bulk power system. Based on the Order and the responses by PJM, ISO-NE, and other RTOs and ISOs, the Commission now has the opportunity to help these organizations provide a stronger data-based foundation to analyze and remedy shortfalls in resilience.

Threats to the flow of natural gas on which power generation depends are intensifying in many regions of the United States. The time has come to fill the gaps in threat data that RTOs and ISOs highlighted in their responses to the Order and – in so doing – help strengthen both grid resilience and U.S. national security.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	**)**	**Docket No. RM18-1-000**

PREPARED DIRECT TESTIMONY OF

DR. PAUL STOCKTON

ON BEHALF OF

EXELON CORPORATION

OCTOBER 23, 2017

I. BACKGROUND AND QUALIFICATIONS

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Paul Stockton. My business address is 325 7th Street NW, Suite 250, Washington D.C. 20004.

Q. DR. STOCKTON, BY WHOM ARE YOU EMPLOYED AND IN WHAT POSITION?

A. I am the Managing Director of Sonecon LLC, a security and economic advisory firm in Washington, DC.

Q. PLEASE DESCRIBE YOUR PROFESSIONAL QUALIFICATIONS, EMPLOYMENT EXPERIENCE, AND EDUCATIONAL BACKGROUND

A. I graduated with a Bachelor of Arts degree s*umma cum laude* from Dartmouth College and received a Ph.D. from Harvard University. From June 2009 until January 2013, I served as the Assistant Secretary of Defense for Homeland Defense and Americas' Security Affairs. In that position, I was responsible for Defense Critical Infrastructure Protection and led the creation of the Department's Mission Assurance Strategy. I also served as the Domestic Crisis Manager for the Department of Defense (DOD) and was responsible for Defense continuity of operations. I was the principal civilian advisor to the Secretary of Defense for providing Defense support to Federal Emergency Management Agency, the Department of Energy (DOE) and other Federal departments in Superstorm Sandy, Hurricane Irene, and other disasters. In addition, I was responsible for developing and overseeing the implementation of DOD security policy in the Western Hemisphere, including U.S.-Canada

cooperation on Defense-related issues concerning energy sector resilience. From January 2012 until January 2017, I served as a Special Government Employee for the Department of Defense, and helped conduct studies to strengthen deterrence of cyberattacks, counter insider threats, and meet other infrastructure resilience challenges. I was twice awarded the DOD Medal for Distinguished Public Service, the Pentagon's highest civilian honor, and a Distinguished Public Service Medal from the Department of Homeland Security.

Q. WHO IS SPONSORING YOUR TESTIMONY?

A. My testimony is sponsored by Exelon. My testimony reflects my informed opinion and does not necessarily reflect the perspectives and policies of the Department of Defense or any other government department or agency.

Q. HAVE YOU PREVIOUSLY TESTIFIED BEFORE THE COMMISSION?

A. In June 2016, I testified at the Commission's Reliability Technical Conference in Docket AD16-15-000.

Q. PLEASE DESCRIBE THE BASIS FOR YOUR FAMILIARITY WITH GRID RESLIANCE PLANNING EFFORTS.

A. In addition to my professional experience, I am the author of multiple works that examine the severe threats to energy sector resilience, and analyze measures that policymakers and stakeholders can take to reduce those risks. In 2016, I authored *Superstorm Sandy: Implications for Designing a Post-Cyber Attack Power Restoration System*, published by Johns Hopkins University Applied Physics Laboratory; *Electric Grid Protection Handbook*

II, Volume 1: Resilient Fuel Resources for Power Generation in Black Sky Events, published by the Electric Infrastructure Security Council; and co-authored the Homeland Security Advisory Council's *Final Report by the Cybersecurity Subcommittee: Incident Response.* I am also widely published on other issues of homeland security, national defense and infrastructure resilience, including *Resilience for Black Sky Days: Supplementing Reliability Metrics for Extraordinary and Hazardous Events*, prepared for the National Association of Regulatory Utility Commissioners.

II. PURPOSE OF TESTIMONY AND CONCLUSIONS

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. I examine how the increased reliance on natural gas for power generation is creating new risks to electric grid resilience, and analyze the implications for U.S. national security. I evaluate the adequacy of current measures to assess and mitigate these risks. I also propose measures to strengthen the resilience of the grid, and meet the challenges highlighted by the Department of Energy.

Q. COULD YOU PLEASE SUMMARIZE YOUR CONCLUSIONS?

A. I believe that this proceeding provides an opportunity to address the risks created by the growing dependence of the electric grid on natural gas as a fuel source. My testimony addresses three overall findings. *First*, the growing dependence of power generation on natural gas poses potential risks to U.S. national security. *Second*, current initiatives to identify and mitigate risks arising from gas-electric system interdependencies are not adequate. *Third*, before the Commission can decide on appropriate actions to help

strengthen fuel resilience, I believe that significant additional analysis will first be required to clarify the attributes of fuel resilience, develop metrics to assess them, and specify the threat against which fuel resilience should be measured. In particular, I recommend that a government agency (in consultation with appropriate Bulk Power System (BPS) entities) establish a Design Basis Threat (DBT) to help assess fuel resilience for power generation and that FERC gather additional data on the current status of resilience efforts. Finally, the Commission, in conjunction with other agencies, should implement measures that will ensure that resiliency is preserved.

Q. PLEASE SUMMARIZE YOUR FIRST FINDING. WHAT ARE THE POTENTIAL RISKS TO U.S. SECURITY POSED BY EMERGING THREATS TO ELECTRIC AND GAS SYSTEMS?

A. Russia, China, North Korea, and other potential adversaries may seek to disrupt U.S. defense capabilities by attacking the critical infrastructure on which our military bases rely. DOD's Mission Assurance Strategy emphasizes that "The Department of Defense's ability to ensure the performance of its Mission-Essential Functions (MEFs) is at growing risk. Potential adversaries are seeking asymmetric means to cripple our force projection, warfighting, and sustainment capabilities by targeting critical Defense and supporting civilian capabilities and assets – within the United States and abroad –on which our forces depend."[1]

[1] Department of Defense, *Mission Assurance Strategy*, April 2012, p. 1, http://policy.defense.gov/Portals/11/Documents/MA_Strategy_Final_7May12.pdf.

The power grid and fuel supplies for power generation are potential targets for these adversaries. While military installations and other national security facilities are strengthening their emergency power capabilities to serve their critical loads, long duration, wide area power outages could jeopardize their ability to execute their MEFs. We must assume that adversaries know this – and, accordingly, that in future conflicts they will attack the power grid and the flow of gas on which power generation increasingly relies.

Q. PLEASE SUMMARIZE YOUR SECOND FINDING. ARE CURRENT EFFORTS TO IDENTIFY AND MITIGATE RISKS STEMMING FROM INCREASED RELIANCE ON NATURAL GAS ADEQUATE TO ENSURE RESILIENCE?

A. No. Existing BPS reliability standards focus on protecting and maintaining the reliability of BPS systems and functions. These standards do not apply to the gas systems that are increasingly vital for power generation. Indeed, no mandatory standards exist for gas system reliability that are remotely equivalent to those that help strengthen the BPS against attack. Current efforts to provide dual-fuel capability for natural gas plants are not sufficient. While some planning efforts have begun, they do not go far enough.

Q. PLEASE SUMMARIZE YOUR THIRD FINDING. HOW CAN THE COMMISSION BEST ADVANCE GRID RESILIENCE?

A. As measures go forward to strengthen fuel resilience, and thereby bolster U.S. security, Commissioners should take a holistic approach that will involve collaboration with a range of government and private sector entities. Work should begin immediately to develop a detailed assessment of the risks being created by increasing gas-electric system

interdependencies. In my testimony that follows, I highlight a number of requirements for further analysis, including reporting requirements for RTOs to understand the current state of resiliency.

The Commission also should seek the creation of a DBT to help assess the resilience of fuel supplies for power generation and the potential value of measures taken to improve that resilience. Modelled on the approach of the Nuclear Regulatory Commission, a DBT should consider the type, composition, and nature of risks to resiliency including both catastrophic natural and manmade hazards.[2] That DBT should account for the risk –indeed, the likelihood – that if a major power decides to attack the U.S. energy sector, they will not merely strike a single pipeline, but seek to disrupt *all* major pipelines in a given region. Finally, implementation measures should be taken to ensure that the threat is appropriately mitigated and resiliency is preserved.

III. EMERGING RISKS TO RESILIENCY

Q. DID THE DEPARTMENT OF ENERGY FIND A RISK TO RESILIENCY FROM RELIANCE ON NATURAL GAS?

A. Yes. DOE's Notice of Proposed Rulemaking takes a crucial step forward to clarify these risks and highlight the value of measures to mitigate them. From 2002 until 2016, the share of electricity generated by gas-fired units increased from 18% to about 34% while the share

[2] *See* Nuclear Regulatory Commission Glossary, Design Basis Threat; https://www.nrc.gov/reading-rm/basic-ref/glossary/design-basis-threat-dbt.html (defining a design basis threat); 10 CFR § 73.1(a) (outlining particular threats).

generated by coal fell from about 50% to about 30%.[3] Risks of mutually-reinforcing failures between gas and electric systems have grown accordingly. DOE found that "the electric sector's growing reliance on natural gas raises concerns regarding the ability to maintain BPS reliability when facing constraints on the natural gas delivery systems."[4] Other key BPS stakeholders have reached similar conclusions. For example, Gerry Cauley, President and CEO of NERC, emphasizes that "[g]rowing reliance on natural gas continues to raise reliability concerns regarding the ability of both gas and electric infrastructures to maintain the BPS reliability at acceptable levels."[5]

Q. WHAT SPECIFIC RISKS DO YOU SEE?

A. In addition to the risks specified in the Notice, I would call the Commission's attention to three specific challenges: *First*, reliance on a single fuel creates the danger of "common-mode failures" where a lack of natural gas incapacitates multiple generators at the same time. *Second*, such failures could help create "black sky" power outages, which would entail outages lasting a month or more over multiple regions of the United States.[6] *Third*, rising gas-electric interdependencies create dangers of mutually-reinforcing failures.

---

[5] Gerry Cauley letter to Energy Secretary Rick Perry, May 9, 2017.

[6] Paul Stockton, *Resilience for Black Sky Days: Supplementing Reliability Metrics for Extraordinary and Hazardous Events*, at 3, National Association of Regulatory Utility Commissioners (2014).

Q. PLEASE DESCRIBE HOW RELIANCE ON A SINGLE FUEL CAN MAGNIFY RISKS OF COMMON-MODE FAILURES.

A. Increased dependence on a single type of fuel heightens the risks of common mode failures: that is, the danger that a single attack vector (especially via cyber means) could enable the adversary to disrupt fuel supplies for power generation across major portions of the United States. A significant interruption of the natural gas supply available for electric generation can dramatically reduce the supply of electricity available to serve load. For example, a large-scale disruption of a natural gas pipeline would prevent that pipeline from delivering natural gas to the generators it serves. It would also incapacitate any downstream pipeline dependent on it as a source of gas. Because gas is delivered close in time to its use as a fuel for electric generation, the system would have little time to respond to the loss of a pipeline. Preserving a diverse generation mix that relies on multiple sources of fuel is essential to reducing this risk.

Q. WHAT WOULD BE THE CONSEQUENCES OF A "BLACK SKY" OUTAGE?

A. A black sky power outage would inflict immense disruption on national security, the U. S. economy, and public health and safety.

Q. WHY WOULD THE HARM BE SO SEVERE?

A. Many critical infrastructure systems and facilities have backup power generators and stored on-site fuel to keep them operating for a few days in a limited power outage. However, in a black sky event, the extensive length and geographic scope of power outages would soon produce failures in emergency power assets and the infrastructure system that rely on them.

Blackouts of this severity would cause cascading failures across multiple critical infrastructure sectors. As highlighted in recent hurricane events, generators will quickly break down through overuse. Demand for replacing them in a wide-area outage will rapidly outstrip available supplies, given the vast number of facilities that will require such replacements. Moreover, on-site fuel supplies for emergency generators will quickly be depleted. Massive, multi-sector requirements for fuel resupply will emerge. Contractors responsible for sustain resupply operations will be unable to meet these requirements, especially since transportation systems, refinery operations, and other systems on which these contractors depend will also be disrupted in a black sky outage. Hospitals would exhaust their ability to rely on backup power. Food manufacturing and distribution networks would cease to function. Other critical infrastructure sectors would also likely collapse. For example, water, wastewater, and cellular systems rely on a functioning power grid and are not currently prepared for such an event. A black sky event would likely disable those systems for sustained periods of time leaving them unavailable to the public. Finally, national defense installations would begin to fail. Domestic military facilities can operate without power for short periods of time but most are not designed to be independent of the electric grid for extended periods of time. Electric power is necessary to keep them in operation because they require access to transportation fuel, communication networks, water and wastewater systems that need electricity to operate. The net result: black sky outages will have catastrophic effects on national security, the U.S. economy, and public safety. Adversaries seeking to achieve such effects will therefore be all the more tempted to build capabilities to create black sky events, and exploit the gas-electric interdependencies that could contribute to the severity of future blackouts..

Q. HOW COULD GAS-ELECTRIC INTERDEPENDENCIES CREATE MUTUALLY REINFORCING FAILURES?

As natural gas has become an increasingly important fuel for electric generation, natural gas pipelines have also come to rely on electricity to function. Key components of gas pipeline systems, including the compressors and industrial control systems that keep gas flowing to power generators and other users, are more reliant on electric power. Gas pipeline systems need compression pumps to sustain the flow of gas. Historically, these compressors were fueled with gas taken from the pipelines themselves. However, in many regions of the United States, these compressors are being replaced by variable speed electric-powered units to reduce onsite methane emissions and increase compressor efficiency. Black sky outages could interrupt the flow of electricity to these units, and (in a classic case of spiraling effects) magnify those outages by disrupting gas deliveries to power generators essential for power restoration.[7] Some compression stations do have emergency power generators and at least some on-site fuel to sustain operations in a blackout. However, as noted above, fuel resupply operations for these stations will be at risk of catastrophic disruption in long duration, wide area outages. These growing interdependencies create risks of cascading, mutually-reinforcing failures across both the electricity and oil and natural gas energy subsectors.[8] Because of the need for generators to receive natural gas

[8] Electric Infrastructure Protection (EPRO) Handbook II (Vol 1 – Fuel), July 18, 2016, at 21, http://www.eiscouncil.com/App_Data/Upload/149e7a61-5d8e-4af3-bdbf-68dce1b832b0.pdf.s

fuel and the need for electricity by natural gas pipelines to deliver that fuel, a significant interruption of the supply of natural gas can start a chain of events that result in interruption of electricity, which can cause the loss of power to gas compressors, which can cause further interruptions of generator fuel supply, cascading toward a broader system outage. The result: *gas and electric systems will be vulnerable to mutually-reinforcing failures when such outages begin.*

Q. WHAT TYPES OF HAZARDS COULD CAUSE THESE FAILURES?

A. Both natural and manmade hazards pose risks. While I describe a few such potential vulnerabilities below, the Commission, in coordination with other knowledgeable agencies, should consider as many other such threats as possible and similarly develop and implement measures to ensure they are understood.

Q. WHAT ARE THE NATURAL HAZARDS THAT COULD CREATE SUCH MUTUALLY REINFORCING GAS-ELECTRIC SYSTEM FAILURES?

A. Catastrophic earthquakes could inflict massive damage on gas and electric infrastructure, and foster mutually-reinforcing failures between them that produce black sky outages. For example, a catastrophic earthquake in the New Madrid Seismic Zone would pose significant risks to PJM. Similar seismically active regions pose risks elsewhere. Other catastrophic natural hazards could also create such risks. Moreover, once a naturally-induced blackout was underway, adversaries could also exploit the resulting disruptions in gas-electric system interdependencies, and exacerbate the interruption of natural gas flows for power generation.

Q. WHAT ARE THE MANMADE RISKS?

A. In recent months, potential adversaries have staged sophisticated, multi-phase intrusion campaigns against the energy sector to insert Advanced Persistent Threats into our energy systems.[9] These efforts are part of a long-term trend towards increased severity in the cyber threats confronting electric and gas systems –a trend that is certain to continue. Coordinated physical attacks on critical gas and electric system infrastructure components pose an additional threat. Such attacks could come from the type of kinetic threats seen in the 2013 attack on the Metcalf substation in California[10], but also from unmanned aerial vehicles carrying advanced payloads and other non-traditional attack vectors. Combined cyber-physical attacks could magnify such risks of disruption.

Q. IN ADDITION TO THE CHANGE IN THE GENERATION MIX, WHAT ADDITIONAL FACTORS HAVE HEIGHTENED THE RISKS?

A. Electricity plays an increasingly important role in the operation of all other infrastructure sectors. DOE notes that "[t]he reliability of the electric system underpins virtually every sector of the modern U.S. economy, which depends on electricity – including sectors from food production to banking to health care. Electricity is at the center of key infrastructure systems that support these activities –transportation, oil and gas production, water, finance,

---

[10] Rebecca Smith, *Assault on California Power Station Raises Alarm on Potential for Terrorism,* Wall St. J., Feb. 5, 2014.

and information and communications technology. Electricity-dependent critical infrastructures represent the core underlying lifeline framework that supports the American economy and society."[11] This "electrification of everything" heightens the potential payoff to adversaries of attacking the grid and its fuel supplies, and reinforces the imperative to mitigate the risks of increased reliance on natural gas for power generation.

IV. CURRENT EFFORTS TO IDENTIFY AND MITIGATE RISKS TO RESILIENCY

Q. WHICH STAKEHOLDERS HAVE A ROLE TO PLAY IN PRESERVING THE RESILIENCY OF THE GRID?

A. By issuing the proposed rule, the Department of Energy has taken a critical step forward to facilitate progress on resilience. Other key stakeholders include the Federal Energy Regulatory Commission, the North American Electric Reliability Corporation (NERC), the Regional Transmission Organizations and Independent System Operators overseen by FERC, and other BPS entities. Commissioners and other entities may also wish to consult with the Department of Homeland Security, the Department of Transportation, and the Department of Defense, and other federal and state agencies.

Q. HAVE THE RELEVANT STAKEHOLDERS ADQUATELY CONSIDERED THE RISKS TO RESILIENCY?

[11] Department of Energy, *Quadrennial Energy Review – Transforming the Nation's Electricity System: Second Installment of the QER*, January 2017, p. 7-3.

A. Stakeholders are making progress, but significant gaps remain in assessing risks to resilience and developing mitigation options. In particular, stakeholders need to account for the growing severity of the threat and the implications for adversary exploitation of gas-electric interdependencies. To the best of my knowledge, for example, no RTO has performed a comprehensive analysis of whether the system can survive the disruption of multiple natural gas pipelines system for an extended period of time.

Q. FERC HAS APPROVED MANDATORY RELIABILITY STANDARDS FOR THE BULK ELECTRIC SYSTEM. DO THE RELIABILITY STANDARDS AIM TO ENSURE RESILIENCY?

A. No. As noted above, NERC reliability standards apply to electric infrastructure, not gas transmission lines and other fuel systems on which the grid depends. Moreover, these standards focus on reliability, not resilience. Studies conducted for the National Association of Regulatory Commissioners and other studies have highlighted significant ways in which resilience differs from reliability. These studies have also examined why traditional metrics for assessing reliability are inadequate for resilience.[12]

Q. DO EFFORTS TO PROVIDE DUAL-FUEL CAPABILITIES TO NATURAL GAS UNITS PROVIDE ADEQUATE RESILIENCE AGAINST THIS THREAT?

---

[12] *Resilience for Black Sky Days: Supplementing Reliability Metrics for Extraordinary and Hazardous Events*, National Association of Regulatory Utility Commissioners, February 2014), available at http://www.sonecon.com/docs/studies/Resilience_for_Black_Sky_Days_Stockton_Sonecon_FINAL_ONLINE_Feb5.pdf; Sayanti Mukhopadhyay, Public Utility Commissions to Foster Resilience Investment in Power Grid Infrastructure, available at http://www.sciencedirect.com/science/article/pii/S1877042816300052

A. Not yet. Generators that are able to utilize a secondary source of fuel if natural gas supplies are interrupted can provide a critical bulwark against cross-sector failure. Given that value, some markets have developed financial incentives to encourage the construction and retention of dual-fuel generators. However, there are indications that existing incentives may not be adequate. Moreover, these generators typically have enough secondary feel stored on site to operate for very limited periods. After that, fuel resupply will be essential to sustain their operations if natural gas flows remain interrupted. However, the same factors that will disrupt the resupply of fuel for emergency power generators will apply to resupply of the secondary fuels typically employed for dual-fuel generators. Demand for such fuel in a long duration, wide area outage will be vastly greater than the capacity of contractors to conduct resupply operations. This is especially true since such operations would need to go forward in severely disrupted environments, especially in terms of refining and transportation system functionality.

Q. HOW IMPORTANT IS ON-SITE FUEL STORAGE FOR ENSURING GENERATION RESILIENCE, AND WHAT ARE THE APPROPRIATE STANDARDS FOR RESILIENCE PRICING ELIGIBILITY?

A. Nuclear power plants can operate for many months between refueling operations. Accordingly, they can make special contributions to grid resilience. The proposed Rule also makes the case that because coal generators typically have many weeks of fuel supplies stored on-site, they are also highly resilient. However, much more comprehensive and systematic analysis of such issues should go forward before final decisions are made on eligibility and market design changes. Moreover, as these criteria design options are

developed, it will be vital to avoid crafting them in ways that favor one source of generation over another for reasons irrelevant to grid resilience.

Q. WHAT CURRENT ANALYTIC INITIATIVES ARE UNDERWAY THAT COULD HELP ASSESS CURRENT FUEL RESILIENCE AND REQUIREMENTS FOR PROGRESS UNDER THE NOPR?

A. Valuable studies have already been conducted on the risks that interruptions in gas supplies pose to BPS reliability.[13] NERC is now conducting a much-needed special reliability assessment to determine impacts of a single point of disruption of natural gas facilities.[14] Along with other industry initiatives, PJM is conducting especially important studies of the potential risks created by increased reliance on natural gas, including in its *Natural Gas Contingency Scenario Analysis*.[15] I commend PJM for taking these critical steps forward. These and other industry studies analysis can provide a useful model for BPS entities

[15] http://pjm.com/-/media/committees-groups/committees/teac/20170914/20170914-reliability-analysis-updates.ashx

nationwide to adapt to meet their own assessment requirements and fuel resilience challenges. However, as I discuss below, I believe other efforts are necessary.

V. ADVANCING GRID RESILIENCE

Q. WHAT ACTIONS SHOULD THE COMMISSION TAKE?

A. The Commission should obtain the analyses necessary to determine what actions to take next. For one, relevant information from the RTOs covered by the NOPR would help in this determination. Next, the Commission should collaborate with other agencies to conduct a DBT analysis.

Q. WHAT ADDITIONAL INFORMATION WOULD BE HELPFUL FROM THE RTOS?

A. PJM's analysis provides an extremely useful starting point, but it should be expanded. For example, analysis by RTOs should consider the loss of multiple pipelines simultaneously, as might occur in a coordinated physical or cyberattack. As noted above, any major power willing to take the risks of attacking a single U.S. pipeline may well decide to strike on a much more massive scale to disrupt U.S. defense capabilities, and seek to disrupt all flows of gas for power generation in a given RTO or ISO service area.

Useful additional information would include data from each generator on:

- For the primary fuel source:
    - Fuel source type.
    - On-site inventory reported as average days based on continuous full output.

- The nature of the fuel supply arrangement (e.g., firm gas, long-term coal contract, purchases of oil on the spot market, etc.).
- The primary method of fuel delivery (e.g., firm pipeline transportation, rail, barge, truck, etc.).
- Environmental permitting limitations.

- For the secondary or back-up fuel (if any):
  - Fuel source type.
  - On-site inventory reported as average days based on continuous full output. For oil and diesel this should include both the actual inventory and the maximum potential that can be stored on-site.
  - The nature of the fuel supply arrangement.
  - The primary method of fuel delivery.
  - Environmental permitting limitations.

The RTOs should also conduct a series of studies:

- A fuel reliance analysis detailing the impact on the organized market's ability to serve load if the supply of a particular fuel type is interrupted, or if the supply of a combination of fuel types is interrupted. The analysis should include:
  - How much load would not be served if a particular fuel type were unavailable for any reason.
  - How long primary inventories would last at generators' full output
  - How long secondary inventories would last at generators' full output
  - A generator's ability to resupply from existing secondary fuel inventories that are not on site.
  - The market's ability to increase production of remaining fuels, including diesel fuel, to meet increased need for the fuel in light of other demands for that fuel.

- A load impact analysis detailing the consequences if load is unable to be served for a prolonged period of time. This analysis should detail multiple disruption and time combinations (e.g., 50% of load for one week, 75% of load for two weeks, etc). The analysis should include:

- The financial impact to economy of the region.
- The impact to the security of the region (e.g., loss of other critical infrastructure and life sustaining services).

- A contingency analysis detailing the ability of the system to withstand (for both short- and long-term) electric and gas failures. This analysis should model both existing and future generation mixes. The analysis should include:
  - Single gas pipeline failure.
  - Multiple gas pipeline failures (including shared right of ways and crossings).
  - Coordinated attacks on the organized market's 3 of 4 biggest pipelines.
  - Loss of all pipelines controlled by single company whether as a result of a physical or cyber attack.
  - Coordinated gas pipeline/electric failures.
- The RTOs should also conduct an assessment of the adequacy of existing capacity constructs in light of the resiliency findings, and suggestions of what changes need to be made.

Q. DO THE RELIABILITY STANDARDS SUGGEST THAT THIS ANALYSIS IS APPROPRIATE?

A. NERC Reliability Standard TPL-001-4 directs transmission planners to assess the impact of extreme events, and if the analysis determines that such events cause cascading outages, the transmission planner should evaluate possible actions to reduce the likelihood or mitigate the consequences and adverse impacts to reliability.[16] I recommend that large-scale disruptions of gas supplies be included in such analysis. I also propose that planners

[16] *See* Requirements R 3.2 and R 3.5 of Standard TPL-001-4 – Transmission System Planning Requirements.

include contingency analysis of severe disruptions in secondary fuel resupply for dual fuel generators, and disruption of fuel resupply for backup power generators that serve critical natural gas compression stations and other key gathering and transmission infrastructure. Finally, planners should conduct sensitivity analysis on the degree to which retaining a mix of fuel-resilient generation assets, including nuclear assets, can help reinforce the resilience of the BPS as a whole.

Q. HOW COULD A DESIGN BASIS THREAT ASSIST THE COMMISSION?

A. At present, BPS entities lack a government-approved assessment of the threat against which they should measure the resilience of their fuel supplies. The Nuclear Regulatory Commission provides its licensees with a DBT to help design safeguard systems for the U.S. nuclear fleet. Fuel resilience issues pose a very different range of challenges. A DBT would help the Commission support analysis and mitigation of risks to fuel resilience. That effort should be led by a U.S. agency with access to appropriate threat information. The development of a DBT should also go forward in full consultation with the electric power industry, NERC, the E-ISAC, and other key sources of expertise. The design of the DBT should also leverage "best practices" developed by the NRC, and draw lessons learned from the NRC's past efforts that can help accelerate and improve the creation of a DBT for resilience.

Q. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes.

UNITED STATES OF AMERICA

SUPPLEMENTAL TESTIMONY OF

DR. PAUL STOCKTON

ON BEHALF OF

EXELON CORPORATION

November 7, 2017

20171107-5164 FERC PDF (Unofficial) 11/7/2017 2:23:07 PM

My name is Paul Stockton. I am the Managing Director of Sonecon, LLC, a security and economic advisory firm in Washington, D.C. I submitted initial testimony in this docket on behalf of Exelon outlining the risks to the resilience of fuel supplies for power generation, especially those related to natural gas, and proposed steps to mitigate those risks. This additional testimony is designed to expand on my earlier submission.

Bulk Power System (BPS) entities cannot adequately assess the resilience of their fuel supplies for power generation because they lack the necessary analytic framework. In particular, neither the Department of Energy (DOE) nor any other Federal agency has provided BPS entities with a description of the threat against which fuel resilience should be measured. Without the ability to anticipate the likely scope and severity of an attack on natural gas pipelines and other sources of fuel, the Federal Energy Regulatory Commission (FERC) and the entities it regulates cannot measure the adequacy of current fuel resilience measures, or evaluate the potential benefits of additional mitigation options.

In my initial testimony,[1] I recommended the establishment of a Design Basis Threat (DBT) to support such assessments. Government-vetted DBTs already provide descriptions of threats to other infrastructure sectors to help guide their evaluation of security requirements and mitigation measures. For example, the Nuclear Regulatory Commission (NRC) provides a DBT to owners of commercial nuclear generators to help them ensure the adequacy of their security measures against manmade threats. In this testimony, I examine how a DBT for fuel resilience might provide unique benefits for assessing the current status of that resilience, and for evaluating options to mitigate gaps that may emerge against increasingly severe threats. My

[1] Testimony of Paul Stockton at p. 4-5.

testimony presents three overall findings on why developing a DBT is so vital for addressing fuel resilience and recommendations on how that development process should go forward.

First, I explain the need for a DBT. Without a government-vetted DBT, RTOs and other BPS entities are left to develop their own characterizations of the threat, leading to disparate analytic frameworks for assessing the scale and potential impact of fuel interruptions.

Second, I recommend an approach to determine the threat characteristics that the DBT should comprise. The DBT established by the Nuclear Regulatory Commission for commercial nuclear power reactors provide a useful precedent and model for developing a DBT focused on fuel resilience. DBTs provided by the Department of Homeland Security (DHS), the Department of Defense (DOD), and other Federal departments and agencies provide additional models for consideration. However, a fuel resilience DBT would need to focus on specific threats of fuel supply interruption, including those related to gas-electric system interdependencies and the risks of cascading fuel-related infrastructure failures that adversaries could create. Those threat characterizations should also account for both natural and manmade hazards that could inflict the simultaneous disruption of multiple gas pipelines and other fuel supply systems in multi-state regions. Analytic efforts conducted by NERC, entities at the direction of the Electricity Subsector Coordinating Council (ESCC), and BPS entities can also help identify the key threat characteristics that the fuel resilience DBT should encompass.

Third, I discuss the path forward to develop a DBT for fuel resilience. One promising option would be for the Department of Energy to lead the development of the DBT, in close coordination with the Commission, other Federal departments and agencies, BPS entities, the ESCC, NERC, and additional stakeholders in grid resilience with expertise on emerging threats. Such a DBT could also be structured in a "tiered" fashion, with a baseline DBT provided to all

BPS entities at the level of "For Official Use Only" and supplementary DBTs provided as needed at higher levels of classification to cleared industry personnel.

I. The Need for a DBT

The Department of Energy's *Staff Report to the Secretary on Electricity Markets and Reliability* (August 2017) highlights the need to "develop policy metrics and tools for evaluating BPS-wide provision of resilience and considering all aspects of the electricity system that contribute to resilience," including fuel supply and storage, and other factors critical to grid reliability and resilience.[2]

A growing number of RTOs and other BPS entities are developing and applying such evaluative tools. In particular, these entities are either assessing or planning to assess potential risks to their fuel supplies, especially natural gas, and the potential impact of fuel interruptions on grid reliability. PJM, for example, has conducted pioneering studies of the potential risks created by increased reliance on natural gas, including in its *Natural Gas Contingency Scenario Analysis*.[3] These studies are essential to address the resilience challenges identified in the NOPR.

However, the DOE Staff Report also identifies a critical gap for conducting such assessments. The Report cites PJM's finding that "criteria for resilience are not explicitly defined or quantified today."[4] The Report goes on to recommend that "Each RTO/ISO should strive to explicitly define resilience on its system and conduct resource diversity assessments to more

[2] Department of Energy, *Staff Report to the Secretary on Electricity Markets and Reliability*, August 2017, p. 128.
[3] Transmission Expansion Advisory Committee, "Reliability Analysis Update," *PJM Interconnection*, September 14, 2017, http://pjm.com/-/media/committees-groups/committees/teac/20170914/20170914-reliability-analysis-updates.ashx.
[4] PJM Interconnection, *PJM's Evolving Resource Mix and System Reliability*, March 2017, p. 6.

fully understand the resilience of different resource portfolios. Federal, state, and local work to define and support system-wide resilience is also needed."[5]

Providing a DBT offers a uniquely valuable opportunity for such Federal support. The Federal government currently leaves RTOs and ISOs largely on their own to characterize threats to their fuel resilience. This approach is likely to produce disparate planning assumptions regarding the scale and severity of such threats. The government's "hands off" approach also limits opportunities for appropriate intelligence-related input from the Department of Energy and other Federal departments and agencies to support the development of a vetted, appropriately informed DBT. This lack of Federal support is especially notable given the risk that fuel supply interruptions could jeopardize the flow of power on which military bases and other national security assets depend. To help strengthen U.S. security, the Federal government should work with BPS entities and other resilience stakeholders to develop a vetted, intelligence-informed DBT for assessing and mitigating risks fuel resilience.

A DBT of this kind would also help RTO and ISO efforts to meet the underlying assessment problems posed by the proposed Rule. In commenting on the Rule, David Patton, Market Monitor for MISO, NYISO and ISO-NE, noted that "Without first identifying in detail the contingencies and associated reliability risks to the system, there is no way to quantify a resilience requirement."[6] Filling this gap with a DBT will be essential for establishing the objective, analytically sound assessment system needed to achieve the goals of the proposed

[5] Department of Energy, *Staff Report to the Secretary on Electricity Markets and Reliability*, August 2017, p. 128.

[6] Comments of Potomac Economics, Ltd., Docket No. RM18-1 (Oct. 20, 2017) at 5; Michael Kuser, Tom Kleckner, Rory D. Sweeney, Amanda Durish Cook, "RTOs Reject NOPR; Say Fuel Risks Exaggerated," *RTO Insider*, October 24, 2017, https://www.rtoinsider.com/market-monitor-nuclear-coal-nopr-iso-ne-78297/.

Rule. The need for a consistent, government-vetted DBT is further highlighted by the threat assumptions that undergird recent fuel resilience studies. While excellent as far as they go, these studies typically focus on assessing the consequences of the interruption of a single major gas pipeline. That is helpful but not sufficient. Any major power willing to accept the risks associated with attacking a single U.S. pipeline may well decide to strike on a much more massive scale, and seek to disrupt all flows of gas for power generation in a given RTO or ISO service area. Specifying the extent of such anticipated fuel interruptions will be essential to provide a foundation for assessing BPS fuel resilience, and for analyzing the cost-effectiveness of various options to mitigate the emerging threat.

II. Existing DBT Models and Special Requirements for a Fuel Resilience DBT

To accelerate the development of a DBT for fuel resilience, one promising approach would be to borrow from existing DBT models and adapt them to the special fuel-related challenges posed by catastrophic natural and manmade hazards. Most significantly, the NRC has created a DBT for nuclear power plants and related facilities.[7] The requirement to establish this DBT and the basic threats it should comprise are specified in the *Energy Policy Act* of 2005.[8] These threats include "multiple, coordinated groups of attackers, suicide attacks and cyber threats," as well as other potential attack vectors.[9]

[7] The NRC's DBT provide performance-based requirements which allow each facility to develop site-specific strategies. It applies to commercial nuclear power reactors and Category I Fuel Cycle Facilities. See: "Frequently Asked Questions About NRC's Design Basis Threat Final Rule," United States Nuclear Regulatory Commission, last updated August 11, 2017, https://www.nrc.gov/security/faq-dbtfr.html.
[8] 42 USC § 2210e (2005), https://www.ferc.gov/enforcement/enforce-res/EPAct2005.pdf.
[9] 10 CFR § 73.1 (2010), https://www.gpo.gov/fdsys/pkg/CFR-2010-title10-vol2/pdf/CFR-2010-title10-vol2-sec73-1.pdf.

The NRC also regularly reviews and revises the DBT to keep pace with evolving threats. In particular, the NRC monitors domestic and foreign threat intelligence in an attempt to stay ahead of potential adversaries, issues periodic threat advisories and annual reviews, and will use this information to update the DBT as required.[10] While the DBT focuses on manmade threats, the NRC also provides earthquake engineering criteria for nuclear power plants and other guidance related to natural hazards.[11]

The NRC DBT scheme offers valuable models for establishing a fuel resilience DBT. For example, given the evolving threat to gas pipelines and other fuel supplies, it will be essential that the fuel resilience DBT be periodically updated as well. The nuclear DBT also provides a model of the appropriate level of detail for characterizing key threat vectors in an unclassified manner. In addition, existing mechanisms for the Department of Energy to share classified information with BPS entities could also be used to supplement unclassified DBT descriptions. Finally, just as the NRC sets standards for both natural and manmade hazards, the fuel resilience DBT should as well.

Even when Congress has not established statutory requirements for DBTs, Federal departments have issued them to help strengthen resilience and security across a range of critical facilities and functions. For example, DOD provides DBTs to support anti-terrorism and force protection standards, and mitigation measures based on requirements generated internally by the Department.[12] DHS also provides a DBT that establishes "the type, composition, and capabilities

[11] "Appendix S to Part 50—Earthquake Engineering Criteria for Nuclear Power Plants," *United States Nuclear Regulatory Commission*, last updated August 29, 2017, https://www.nrc.gov/reading-rm/doc-collections/cfr/part050/part050-apps.html.
[12] *See* Department of Defense, DOD Security Engineering Facilities Planning Manual, September 2008, https://www.wbdg.org/FFC/DOD/UFC/ufc_4_020_01_2008.pdf

of adversaries" who might threaten Federal facilities. DHS uses the best available intelligence information and other relevant sources of data to develop and maintain the DBT. The baseline DBT provided by DHS is designated For Official Use Only (FOUO). In addition, DHS provides supplementary information as needed on specific threats and mitigation options, including at higher levels of classification.[13] A similar tiered approach to provide both an FOUO DBT and other threat assessments at higher levels of classification (to be provided to cleared BPS personnel) might also offer a useful design model for a fuel resilience DBT.

While these models from other departments are useful, a fuel-oriented DBT will need to focus on a different set of resilience challenges and threat vectors than those for nuclear power plants or Federal facilities. NERC Reliability Standard TPL-001-4 provides a valuable starting point. TPL-001-4 directs Transmission planners to assess the impact of extreme events, and if the analysis determines that such events could cause cascading outages, the Transmission planner should evaluate possible actions to reduce their likelihood or mitigate the consequences and adverse impacts to reliability.[14] To ensure that those assessments account for the risks posed by increasing reliance on gas for power generation, NERC is now considering a recommendation that "NERC registered entities should consider the loss of key natural gas infrastructure in their planning studies."[15] A DBT for fuel resilience could provide valuable support for such analysis

[13] See: Department of Homeland Security, *The Risk Management Process for Federal Facilities: An Interagency Security Committee Standard: 2nd Edition*, November 2016, https://www.dhs.gov/publication/isc-risk-management-process.

[14] *See* Requirements R 3.2 and R 3.5 of Standard TPL-001-4 – Transmission System Planning Requirements.

[15] Thomas Coleman, "Special Assessment: Potential Bulk Power System Impacts Due to Severe Disruptions on the Natural Gas System" (presentation at NERC Board of Trustees Meeting, New Orleans, LA November 9, 2017). http://www.nerc.com/gov/bot/Agenda%20highlights%20and%20Mintues%202013/Board_Presentations_November_2017.pdf.

by specifying the scope and severity of the gas infrastructure losses that entities should use in their studies.

However, no such DBT exists today. Only limited guidance exists on the scale and characteristics of the extreme events that should be used as a basis for assessing the impact of fuel system interruptions on grid reliability and resilience.[16] BPS entities would benefit from far more extensive support. In particular, using appropriate intelligence sources, it would be helpful if the Federal government could provide these entities with an assessment of the scale and nature of attacks that they must be prepared to confront. Such an assessment could also help entities account for specific risks to fuel resilience, including the risk that adversaries will target their attacks to exploit interdependencies between gas and electric infrastructure.

As a starting point to develop a Design Basis Threat for fuel resilience, NERC and other industry stakeholders have already produced studies that highlight key resilience challenges to address in such a DBT. In particular, three NERC studies have examined both the characteristics of natural and manmade hazards that could cause catastrophic outages, as well as possible mitigation measures to adopt against the risks they pose.[17] These and other studies are useful starting points, but also have gaps in terms of characterizing the threat to fuel supplies. Filling those gaps will be necessary for developing a fuel resilience DBT.

---

[16] *See*, *e.g.*, NERC, *2016 Long-Term Reliability Assessment*, December 2016, p. 21. The assessment notes that "As part of future transmission and resource planning studies, planning entities will need to more fully understand how impacts to the natural gas transportation system can impact electric reliability."

[17] NERC noted that coordinated cyber or physical attacks "could damage or destroy key system components, significantly degrade system operating conditions, and, in extreme cases, result in prolonged outages to large parts of the system." See: NERC, *2015 Long Term Reliability Assessment*, December 2015, p. 27.

The first NERC study is a joint analysis with the Department of Energy to examine the risk of high impact, low frequency events. Particularly useful is the study's analysis of coordinated cyber/physical attacks to the BPS.[18] The report warns that coordinated cyber/physical attacks will purposefully target multiple vulnerable points on the system, and that sophisticated adversaries will adapt to protective measures to maximize disruptions. Such attacks "could result in long-term (irreparable) damage to key system components in multiple simultaneous or near-simultaneous strikes… quickly bring[ing] the system outside the protection provided by current planning and operating practices."[19]A coordinated cyber/physical attack, as described, would likely result in extended outages over a wide geographic area.

The second study examines severe disruptions to the BPS, and stems from the work of the *High Impact, Low Frequency* report. Much like that report, the *Severe Impact Resilience* study focuses primarily on coordinated cyber and physical attacks.[20] The study cautions that a coordinated physical attack on critical nodes in the grid can cause extensive damage to equipment that is difficult to replace, with significant impact to the system as a whole. Similarly, coordinated cyberattacks could cause simultaneous disruptions or misoperation that could be detrimental to system integrity.[21] While *Severe Impact Resilience* treats cyber and physical attacks as separate threats, a future Design Basis Threat should assume advanced adversaries will conduct attacks in both domains near-simultaneously.

---

[18] The study also assesses the risks of pandemic illness and geomagnetic/electromagnetic disturbances. For more information, see: NERC and the Department of Energy, *High-Impact, Low-Frequency (HILF) Event Risk to the North American Bulk Power System*, June 2010.
[19] HILF Report, p. 26
[20] Like the *High Impact, Low Frequency* report, it also includes geomagnetic disturbances among the key threats for particularly severe events. See: NERC, *Severe Impact Resilience: Considerations and Recommendations*, May 2012, p. 1.
[21] NERC, *Severe Impact Resilience: Considerations and Recommendations*, May 2012, p. 1.

In a third study, NERC examined the cyberattack scenario in greater detail in a parallel effort from a cyber-focused task force. This study focuses on two primary attack vectors: 1) a coordinated attack which disables or impairs multiple control systems; and 2) intruders gaining control to purposefully misoperate the system, causing outages and/or damage. The potential ramifications are severe. If successful, adversaries could inflict losses of load and generation that cause system instability, and, ultimately, system collapse and widespread blackouts.[22]

Other industry initiatives could also be leveraged to create a DBT for fuel resilience. For example, NERC Standard CIP-014-2, *Physical Security*, provides a methodology for Transmission owners and operators to conduct their own assessment of potential physical threats and vulnerabilities.[23] NERC's *Geomagnetic Disturbance Planning Guide* provides yet another approach to assessing potential threats and system design requirements.[24] While neither of these guiding documents establishes a Design Basis Threat, they do provide useful methodological approaches that might be valuable in developing a DBT for fuel resilience.

The Department of Energy has also sponsored a study by ICF International to establish a 'baseline' of adversarial threats to the North American electric grid. The report provides an in-depth examination of an array of physical and cyber threats, including combined cyber-physical events.[25]

However, none of these studies provides a detailed analysis of the fuel resilience challenges identified in the NOPR. Nor are any of them adequate to capture the risks created by

[25] ICF International, *Electric Grid Security and Resilience: Establishing a Baseline for Adversarial Threats*, June 2016, p. 19.

gas-electric interdependencies, common failure modes,[26] duel-fuel resupply challenges and other threats I examined in my previous testimony. The threat of common failure modes is particularly concerning, as an increasing number of gas generators depend on a limited number of pipelines to deliver fuel required for power generation. Pipeline disruptions that lead to a shortage and/or outage of natural gas could therefore incapacitate multiple generators at the same time, increasing the scope and severity of the resulting power outages A single attack vector (especially via cyber means) could enable the adversary to disrupt fuel supplies for power generation across major portions of the United States. A DBT that can help BPS entities assess resilience against these threats will need to go far beyond any previous study of interruption scenarios.

As I outlined in my original testimony, the DBT should study both natural and manmade risks the system. Manmade risks could include threats from international actors, such as Russia or China, as well as terrorist organizations. The DBT should account for both physical and cybersecurity risks. For physical attacks, the DBT should encompass both familiar attack vectors as well as threats emerging from new technologies, such as unmanned aerial vehicles carrying advanced payloads. Finally, the DBT should account for the possibility that adversaries will combine cyber and physical attacks to create especially significant challenges to fuel supply systems.

[26] NERC will be presenting a Special Assessment: Bulk Power System Impacts Due to Severe Disruptions on the Natural Gas System to its Board for approval on Nov. 9, 2017. *See* Item 8c, Agenda, Board of Trustees, Nov. 9, 2017; Special Assessment: Potential Bulk Power System Impacts Due to Severe Disruptions on the Natural Gas System, Preliminary Findings, Board of Trustees, Nov. 9, 2017, located at http://www.nerc.com/gov/bot/Agenda%20highlights%20and%20Mintues%202013/Board_Presentations_November_2017.pdf.

Catastrophic earthquakes and other natural hazards can also inflict catastrophic damage on fuel infrastructure. Accordingly, I recommend that the DBT include both manmade and natural hazards. Given the importance of dual fuel generators as an option to mitigate the risks posed by gas system disruptions, I also propose that planners include contingency analysis of severe disruptions in secondary fuel supplies for dual fuel generators, and disruption of fuel resupply for backup power generators that serve critical natural gas compression stations and other key gathering and Transmission infrastructure. Finally, planners should conduct sensitivity analysis on the degree to which retaining a mix of fuel-resilient generation assets, including nuclear assets, can help reinforce the resilience of the BPS as a whole.

III. The Path to a Fuel Resilience DBT

Developing a DBT will require the input of multiple stakeholders. I recommend the Department of Energy lead a multistage effort in consultation with the Commission and other grid resilience stakeholders. As the Sector-Specific Agency (SSA) for the energy sector, including both the electricity and oil and natural gas (ONG) subsectors, DOE is especially well positioned to serve as the government lead for this effort. Close coordination with other Federal departments and agencies will also be required, especially those with: 1) SSA responsibilities concerning specific fuel supplies; and 2) information on the evolving threat that could supplement DOE's own extensive expertise. The ESCC, NERC, BPS asset owners and operators, and other resilience stakeholders could also play valuable roles in guiding this process.

Most important, close coordination will also be required with BPS entities to ensure that the DBT incorporates their own analytic priorities and requirements for support. The ESCC and other appropriate entities might support this BPS engagement process as well.

Given the increasing severity of threats to fuel resilience and the need for timely assessments of those challenges, I also recommend that the development of the DBT go forward in a phased process. DOE might first bring stakeholders together to produce a rapidly-available, top-level assessment of threat vectors and characteristics, equivalent to that which the NRC provides to the nuclear fleet in its publicly-available DBT descriptions. For example, this basic DBT could specify the percentage of gas pipelines that BPS entities should assume will be disrupted (and for how long). Follow-on DBTs could then address the more detailed challenges raised by gas-electric interdependencies and the threat vectors by which adversaries may seek to exploit them.

I also recommend that the fuel resilience DBT be structured in a "tiered" fashion, with a baseline DBT provided to BPS entities at the level of "For Official Use Only" and supplementary DBTs provided as needed at higher levels of classification to cleared industry personnel.

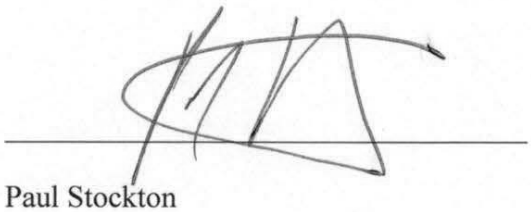
UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	)	**Docket No. RM18-1-000**

DECLARATION OF PAUL STOCKTON

I declare, under penalty of perjury, that the foregoing Supplemental Testimony is true and correct.



Executed: November 7, 2017

Washington, DC

Paul Stockton

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Grid Resilience in Regional Transmission Organizations and Independent System Operators	)))	Docket No. AD18-7-000

REPLY COMMENTS OF EXELON CORPORATION

The Commission initiated this proceeding because it recognized that it did not yet know what it needed to know. The Commission terminated the proposed rulemaking in RM18-1-000 but emphasized it "must remain vigilant with respect to resilience challenges."[1] Thus, it opened this docket to define resilience, learn what steps the RTOs are currently taking, and evaluate whether additional efforts are necessary.[2] The Commission correctly decided to understand the *problem* before jumping to a *solution*.

Numerous commenters, though, leap straight to discussion of solutions. They debate whether resilience is properly advanced through NERC or through the organized markets; whether solutions addressing resilience can be adopted in a market-based manner or whether they will require command-and-control regulation; and what types of resilience-related reforms are most cost-effective. All of this discussion, while extremely important, ignores the critical first step. The Commission cannot assess what solution should be implemented, who should implement it, and how, until it first understands the problem it needs to solve.

What the Commission needs now is simply information: a design-basis threat (DBT) analysis conducted in conjunction with appropriate national security agencies that the Commission can then use to guide studies regarding resilience. Only after the Commission knows the

[1] *Grid Reliability and Resilience Pricing*, 162 FERC ¶ 61,012, at P 17 (2018).
[2] *Id.* at P 18.

vulnerabilities of the grid can it turn to these policy considerations to identify the appropriate solution.

These steps need to be taken deliberately and thoughtfully and with appropriate consideration of the environmental consequences, but should occur as quickly as possible. The Commission needs to immediately work with its sister agencies to create a DBT and require the RTOs to submit reports analyzing their risks in light of it and their plans to address those risks. Preliminary analyses in both ISO-NE and PJM suggest that, at least in those markets, the risks of a disruption to the natural gas supply are too great to continue to be allowed to persist, and could result in significant hours of unserved energy due to the loss of multiple gas pipelines. This risk is exacerbated by the retirement of additional nuclear resources in PJM.[3] Rapid action by the Commission to generate the necessary information and appropriate response is essential to ensure the resilience of the grid.

I. The Commission Should Immediately Develop a Design-Basis Threat and Order RTOs to Assess and Report Their Vulnerabilities In Light of the DBT.

Commenters spilled much ink debating how a resilience policy should be implemented. Some commenters argued that resilience is just a form of reliability and should be addressed through reform of the existing reliability standards.[4] Others argued that resilience-related policies are the death-knell for markets,[5] or that resilience solutions should be evaluated using a

cost-benefit analysis.[6] But all of these arguments are premature: they analyze proposed resilience solutions without sufficient information about the range of threats to system resilience that need to be addressed. Other arguments focus almost entirely on historical reliability threats rather than considering plausible threats in the future. Before determining which solutions should be implemented to address resilience vulnerabilities—both manmade and natural—the Commission must work with other government agencies to create a DBT to identify the vulnerabilities that need to be addressed. The Commission must also order the RTOs to study their vulnerabilities in light of the DBT and their plans to address those vulnerabilities. That should be the primary goal at this stage of developing a policy to ensure a resilient grid.

Numerous commenters take the position that resilience should be addressed through the NERC reliability standards.[7] This focus on NERC, though, starts from a false premise. It assumes a narrow range of resiliency problems to be addressed: problems that can be effectively managed through engineering standards that fall within the scope of Section 215 of the Federal Power Act. But that assumption may well be incorrect. While reliability standards are indisputably important to addressing certain dimensions of resilience—such as the hardening of critical transmission infrastructure—they cannot be readily used to address other potential dimensions to resilience.

[7] *See supra* n.4.

For example, the ISO-NE study indicates that a major threat to resilience in that region is the grid's overdependence on a natural gas infrastructure that is highly vulnerable to disruption.[8] The same may be true in the Mid-Atlantic/New York region —an initial study prepared by ICF for NEI, for example, found a potential pipeline outage could result in up to 27 GW of electric generation being interrupted of which 18 GW are in PJM[9]—but a thorough study is needed addressing a wide range of contingencies, informed by the national security establishment. A solution to fuel security vulnerability might be the development of a market-based product to value units with significant fuel on-site. But that type of solution falls well outside the scope of NERC's role and the engineering-based reliability standards that NERC implements. The Commission should not assume that NERC is the answer before it fully understands the nature of the threats and problems to be solved.

Another strain of criticism in the comments is that resilience-related policies will be the death knell for markets.[10] API, for instance, claims that resilience efforts will cause a move away from market-based solutions and toward command-and-control regulation.[11] But API and others assume away the ability of the Commission do to what it has historically done, which is address issues through the creation of attributes that can be procured competitively. Once the Commission has sufficient information about which resilience vulnerabilities exist and need to be fixed, it can quickly move to implement necessary actions consistent with its existing market design.

[11] API Comments at 2.

SI-SSA-0010-4435

Arguments about the cost-effectiveness of various resilience solutions also are premature.[12] The PJM Consumers Representatives, for example, propose a framework "that accounts for the time-sensitive and probabilistic nature of identifiable disruptive events" that can be used to evaluate the costs and benefits of resilience efforts.[13] Likewise, the Silverstein Report proposes a cost-benefit framework and assesses the value of the resilience solutions proposed in the Report.[14] But the problem with a cost-benefit framework in the context of national security-related threats to resilience is that a probabilistic analysis may be very difficult to conduct with any accuracy. Unlike severe weather events, national security threats cannot readily be modeled based on history. Accordingly, where the national security agencies establish a genuine threat to resilience, that determination should suffice to warrant actions to mitigate the threat. To the extent that a cost-benefit framework is attempted, it is necessary to identify what vulnerability the proposed reform addresses and the comparative consequences of inaction.[15] The inquiry should span a wide range of scenarios, both manmade and natural, and consider outage of extended duration, weather and cascading events. Without preparing a DBT to identify the grid's vulnerabilities and the potential consequences of those vulnerabilities, it is impossible to fairly evaluate the value of a proposed reform.

Therefore, the Commission need not resolve the debate among these commenters at this time. Rather, the Commission's goal now should be more fundamental: to gather information about resilience threats and vulnerabilities. Only with more information will it be possible to

SI-SSA-0010-4436

evaluate the best ways to address resilience. There are two ways the Commission should collect this needed information. The Commission should pursue both with urgency.

First, the Commission should develop a DBT. As described in Exelon's Reply comments, a DBT would identify potential threats to the electric grid. The Commission should lead the effort to develop a DBT. The Commission should facilitate input from the RTOs, NERC, and other entities to determine what information gaps the DBT could fill. Then, the Commission should lead an inter-agency process of developing the DBT. Input from the Department of Energy and the national security agencies will be crucial to ensuring that the relevant expertise is incorporated into the DBT and man-made threats are comprehensively considered. The DBT should not shy away from classified information; only by incorporating every information source can the DBT be an effective tool to identify vulnerabilities to the grid. RTO representatives with classified clearance can create guidance documents that will enable the RTOs to implement the findings of the DBT without exposing classified information.

Second, the Commission should order RTOs to conduct studies to assess their vulnerabilities in light of the DBT and report back to the Commission.[16] Individual studies by RTOs will enable them to more fully understand how the general threats identified in the DBT apply to their specific markets. Armed with that information, RTOs will be able to assess which resilience vulnerabilities are most significant and which resilience solutions are most important.

It is crucial that these RTO studies be informed by the DBT. PJM proposes to undertake a study in the interim, and Exelon supports PJM's initiative. However, as outlined in Exelon's comments in the PJM stakeholder process, PJM does not have access to the information from the

[16] Under Sections 301(b) and 309 of the Federal Power Act, the Commission has well-established authority to issue orders directed to the RTOs requiring them to report information relevant to the Commission's statutory responsibilities. *See* 16 U.S.C. §§ 825b, 825h.

SI-SSA-0010-4437

Department of Energy and the national security agencies needed for it to assess fully what contingencies to model.[17] Accordingly, PJM's study is likely to underestimate the true vulnerability of the system, and worse yet, may be used to justify inaction on the critical issue of fuel security. The Commission should make clear that RTOs must ultimately perform resilience studies reflecting the DBT, and that to the extent RTOs seek to get a head start on their modeling and analyses, they must include a broad range of potential contingencies.

II. Fuel Security Presents an Urgent Risk.

While a DBT and RTO analysis is needed to develop a full understanding of the scope of resilience vulnerabilities, the information already available to date suggests that fuel insecurity presents an urgent threat to resilience. The energy supply is growing increasingly dependent on natural gas. In PJM, 90% of newly installed capacity over the last five years relies on natural gas.[18] This heavy dependence on gas poses real threats to fuel security and resilience. Natural gas generators rely on a network of pipelines for fuel delivery, which are susceptible to both natural and man-made disruptions as well as cascading failures. Dual-fuel generators, which have traditionally been seen as a hedge against this risk, do not provide a reliable back-up over long-term events. As shown in a study by Navigant that was attached to Exelon's comments, many dual-fuel generators do not store enough fuel onsite to survive a disruption longer than

[17] Exelon also notes the overall concern that PJM's proposed approach underestimates the range of threats and the potential duration of critical infrastructure outages (particularly gas transmission facility outages) that the PJM region faces. As a result, any PJM fuel security study based on these underestimated input assumptions will be severely inadequate. Exelon has raised these concerns with PJM and recommended solutions in its comments on PJM's proposed fuel security study. Those comments are attached as Exhibit A.

SI-SSA-0010-4438

several days. In the PJM region, more than half of the dual-fuel and oil-only capacity has enough fuel for only four days of full-load operations, and nearly 80 percent of the capacity cannot run longer than seven days.[19]

The serious threat that fuel security poses to resilience was confirmed in the recent Operational Fuel Security Analysis conducted by ISO-New England. The study analyzed how fuel security will affect grid vulnerability in the future. Specifically, the study modeled twenty-three possible scenarios that could occur in the 2024/2025 winter. In every scenario but one, emergency actions were necessary to ensure that enough power was available to supply the grid.[20] In 19 of the 23 scenarios, load-shedding was necessary.[21] The study determined that fuel security was the greatest threat to resilience in the New England Region.

Similarly, the recent ICF study highlighted fuel security threats in PJM. Assuming additional nuclear retirements, a significant gas infrastructure event could result in a loss of 18 GW of gas-fired generation in PJM, part of a total of 27 GW loss in the whole Mid-Atlantic/New York region. In that scenario, up to 22% of the area's load would be at risk of being shed at peak demand. Over a 60-day event, load shedding in PJM alone could occur in 280 hours over 34 days.[22]

The risk to resilience posed by the increasing reliance on natural gas was recently emphasized by Bruce Walker, Assistant Secretary for the Office of Electricity in the Department of Energy. Mr. Walker explained that the infrastructure necessary to serve natural gas needs is vulnerable to attack, and that "dependency on our pipelines . . . has effectively doubled and

[19] Exelon Reply Comments, Docket No. AD18-7-000 (May 9, 2018), Ex. A, Navigant Consulting, Inc., *PJM Liquid Fuel Survey and Research Results and Recommendations*, at 4 (Apr. 25, 2018).

[22] ICF Study, at 1.

tripled the amount of critical infrastructure that is necessary for us to protect predominantly on a cyber front but also from a physical security front."[23] This is a significant and growing challenge to ensuring the North American energy system is resilient.[24]

Some commenters say that fuel security is not a threat and there are no new circumstances that warrant special attention to the issue of fuel security.[25] But the Department of Energy disagrees, and it possesses the necessary information and expertise to make the appropriate judgment. As the Department of Energy has recognized, "[f]uel assurance is a growing consideration for the electricity system" and a major threat to system resilience.[26] Those who think nothing has changed are ignoring reality. Indeed, this is one reason why it is important to conduct a DBT: it will clarify growing threats to fuel security and ground further analysis and action in evidence and intelligence assessments.[27]

The results of the PJM 2021/2022 Base Residual Auction provide a significant new data point that has become available since the last round of comments in this docket. They show a significant loss in nuclear generation capacity in PJM.[28] This year, only 22,000 MW out of the 32,700 MW of nuclear power that was offered cleared in the auction; 33% of MW offered did

SI-SSA-0010-4440

not clear. This was down from 27,000 MW of nuclear power that cleared last year.[29] That is an impending loss of nearly one-fourth of nuclear generating capacity in PJM, which represents an increase in uncleared nuclear capacity of over 200 percent compared to the previous year. Once the plants retire, that loss is irreversible. If these units retire, the result will likely be even greater reliance on natural gas generators—which will increase the risk of fuel insecurity and further undermine grid resilience.[30] Further, the retirement of these nuclear units will result in a more limited option set for policymakers to address fuel insecurity going forward.

Accordingly, there is a particular need for RTOs to evaluate the risk of major gas contingencies as they assess resilience concerns. Commenters have recognized the impact natural gas has on grid resilience.[31] Calpine Corporation, for example, noted that greater communication and coordination between pipelines, local distribution companies, and RTOs is necessary so that RTOs can predict and recover from disruptive events to the natural gas supply and distribution.[32] PSEG, too, commented that there are delivery risks associated with natural gas and that excessive reliance on natural gas, which delivers supply as needed, can expose customers to electricity disruption.[33] The recent ICF report found that 18 GW of electric generation in PJM could be lost and significant hours of unserved energy would result from the

[29] Gavin Bade, Utility Dive, PJM Loses A Quarter Of Its Nuke Capacity In latest Power Auction, May 23, 2018, *available at* https://www.utilitydive.com/news/pjm-loses-a-quarter-of-its-nuke-capacity-in-latest-power-auction/524247/; *see also* PJM, 2021-2022 RPM Base Residual Action Results.

[30] This likely replacement of retiring nuclear resources with gas-fired resources will significantly impact air emissions, which are an increasingly important state policy concern. That illustrates why environmental ramifications of any fuel security solutions must be considered in any cost/benefit analysis.

[31] NERC Comments, at 18-19.

[32] Calpine Comments, at 9-10.

[33] Motion to Intervene and Reply Comments of the PSEG Companies Docket, No. AD18-7-000 (May 9, 2018) at 3, 16 ("PSEG Comments").

loss of multiple natural gas pipelines.[34] RTOs should keep considerations of gas contingencies in the forefront of any assessment of fuel security.

Given the pressing need, the Commission should require the RTOs to move forward with their fuel security studies with urgency. While many commenters argue that the Commission should focus its attention on improving gas-electric coordination, that analysis is only part of the story.[35] Gas-electric coordination is important, [36] but it is not a resilience issue. The resilience threat stems from interruption of the natural gas supply, not from a lack of coordination between the natural gas and electric systems. The Commission should instead focus its attention on the true resilience threat: the growing level of fuel insecurity.

III. Transmission Is An Important Element of Resilience.

Exelon agrees with commenters that argue that transmission is a key component of resilience planning.[37] The grid needs both the supply resources capable of producing power sufficient to serve load even under extreme contingencies, as well as the transmission infrastructure necessary to move that electricity to customers at all times. RTOs and transmission owners both need to consider the goal of grid resilience in making their investment decisions.

---

[34] ICF Study at 1.

[35] *E.g.,* Reply Comments of the Environmental Defense Fund, No. AD18-7-000 (May 9, 2018) at 11-25; PJM Consumer Representatives Comments at 37-39; Reply Comments of PJM Interconnection, L.L.C., Docket No. AD18-7-000 (May 9, 2018) at 5-8; Comments of the Electric Power Supply Association, Docket No. AD18-7-000 (May 9, 2018) at 16-17.

[36] While further gas/electric coordination improvements are important, the Commission has already worked extensively on this issue, harvesting the low-hanging, most beneficial improvements; while further improvements may be possible, they will have diminishing returns compared to those already made.

[37] Comments of WIRES, Docket No. AD18-7-000 (May 9, 2018) at 2; Reply Comments of the American Wind Energy Association and the American Council on Renewable Energy, Docket No. AD18-7-000 (May 9, 2018) at 32-37; Reply Comments of the PJM Transmission Owners Agreement-Administrative Committee, Docket No. AD18-7-000 (May 9, 2018) at 5-6.

SI-SSA-0010-4442

First, RTOs should incorporate resilience considerations into the regional transmission planning process. Transmission planning should eliminate *existing* vulnerabilities to the system, and also ensure that *new* vulnerabilities are not created. Such steps are appropriate even when the more resilient solution may be more costly. For example, transmission planners should strive to reduce the number of critical substations in favor of creating new substations. Such an approach may be more expensive than making additional use of existing substations but the resilience considerations may justify the additional cost. Transmission planners might also consider putting new transmission lines on new rights-of-way rather than adding lines to existing rights-of-way, even though higher costs may result. The Commission should clarify that solutions that are more resilient may be appropriate even if they are more expensive.

Second, transmission owners have an important role to play in ensuring the resilience of the system outside the regional transmission process. The Commission should ensure that transmission owners can incorporate resilience considerations in the planning process for their local transmission and distribution systems. For example, transmission owners need to have the ability to reinvest in their equipment, harden their systems, and create microgrids where appropriate. Moreover, in addition to having access to the DBT, they should also continue to conduct extreme event analysis to guide their planning. They should be allowed to take these actions to reinforce the resilience of their systems even when doing so goes beyond NERC criteria. Such steps are particularly important in areas of the country with critical local infrastructure, such as the Washington D.C. region, densely populated areas or areas with Defense Critical Electric Infrastructure.

IV. FERC Should Pursue Energy Pricing Reform.

Numerous commenters suggest that energy price reforms should play a central role in advancing the Commission's resilience goals.[38] PJM itself has recognized that the current market design is flawed and that because certain units "are not able to set clearing prices, those clearing prices are artificially lower than they should be."[39] Exelon agrees, and has emphasized elsewhere that this clear market flaw must be corrected.[40] And, as PSEG correctly notes, this market flaw does have consequences for resilience: "technologies such as nuclear plants with high operating factors do not receive the proper level of energy market payments which contributes to the economic challenges they face."[41]

Thus, energy price reforms are an important goal for the Commission and the RTOs to pursue expeditiously regardless of whether these reforms are the focus of this resilience docket. In other words, unjust and unreasonable energy market prices should be rectified regardless of whether that is done as part of any resilience matter or on their own. Price formation proceedings are pending at the Commission,[42] and various reforms are at different stages at the Commission and in RTO stakeholder processes. Some proposed changes, such as PJM's fast-start pricing

[41] PSEG Comments, at 18.

[42] *See, e.g.,* Final Rule, Uplift Cost Allocation and Transparency in Markets Operated by Regional Transmission Organizations and Independent System Operators, 163 FERC ¶ 61,041 (2018) (modifying rules for uplift allocation); *PJM Interconnection, L.L.C.,* 161 FERC ¶ 61,295 (2017) (opening Section 206 proceeding on fast start pricing); Order Directing Reports, Price Formation in Energy and Ancillary Services Markets Operated by Regional Transmission Organizations and Independent System Operators, 153 FERC ¶ 61,221 (2015) (requiring RTOs to submit reports on price formation).

proceeding in EL18-34, have completed the comment process and are awaiting a Commission order. Those matters are ready for resolution now, and the Commission should not delay in taking action. The Commission should not wait on the DBT and RTO analyses outlined above in order to continue the process of energy market reform. Those reforms are independently justified on their own merits—ensuring that energy market prices reflect the true cost of serving load.

As part of these efforts, the Commission and the RTOs must incorporate into their analyses the expected environmental impacts (including carbon emissions) of any market reforms. Environmental consequences of power generation are directly related to the severe weather events that are in part the genesis of this proceeding. So, for example, if a region plans to meet its fuel security challenges by retaining resources that burn coal or by incentivizing the addition of oil storage, it will be contributing to the very problem it is trying to solve. Planning a generation system that is resilient must include planning for a system that is both able to withstand interruptions and also does not contribute to interruptions by exacerbating climate change. As the RTOs study their vulnerabilities and propose solutions, and as the Commission reviews any filings, the environmental consequences deserve appropriate weight.

CONCLUSION

The Commission has taken the appropriate first step by opening this resilience docket. It now should complete the process of gathering the information needed to ensure that the markets it oversees remain just and reasonable. In light of significant fuel security risks in ISO-NE, PJM, and elsewhere, the Commission should first work with its coordinate federal agencies to develop the DBT and then require market operators to analyze their risks and submit their plans to address them. The Commission can then move rapidly to adopt the appropriate policy response to reduce or eliminate those resilience risks.

EXHIBIT A

Exelon Feedback on Valuing Fuel Security Scope

PJM's market rules are not designed to consider, let alone ensure, the fuel security needed to serve the 65 million people in the PJM region or to value fuel secure, resilient resources. PJM has properly identified fuel security as an unaddressed resilience risk that must be further analyzed and addressed through reforms that adequately value the resilience contributions of fuel-secure resources and ensure fuel-security is preserved. Exelon supports PJM fully in this effort.

But PJM's approach is too narrow. Specifically, PJM underestimates the range of threats and the potential duration of critical infrastructure outages (particularly gas transmission facility outages) that the PJM region faces. As a result, any PJM fuel security study based on these underestimated input assumptions will be severely inadequate. Thus, as elaborated (on pages 5 - 9) below, Exelon recommends several enhancements to PJM's study so it reflects all credible and reasonably foreseeable fuel security challenges over foreseeable durations. For example, Exelon recommends that PJM consider long-term pipeline outages and/or underground storage restrictions affecting multiple facilities and pipeline components. Exelon also proposes a baseline scenario from which PJM should calibrate needed market reforms. Further, Exelon suggests modification to the timing of the proposed "phased approach" that PJM plans to undertake, so that critical national security inputs from government agencies regarding threat priorities can be incorporated in a timely manner into PJM's fuel security study. Finally, solving PJM's fuel security challenges may lead to significant environmental impacts if the emissions implications of potential future fleet compositions are not taken into account. Thus, PJM should calculate and make available the environmental costs and impacts of its current resource portfolio during stressed conditions as well as that of the expected portfolio of resources as a result of any potential fuel security solutions. Exelon has attached a report by Dr. Paul Stockton, former Assistant

Secretary of Defense for Homeland Defense and America's Security Affairs, further describing many of these recommendations.

Fuel Security Poses a Significant Resilience Risk

PJM is correct to undertake an analysis of fuel security at this time. PJM's aggregate supply portfolio is quickly transitioning toward an over-reliance upon gas-fired resources that will challenge system resilience and could result in significant hours of unserved energy if multiple natural gas pipelines are interrupted for an extended period of time.[1] In 2005, coal and nuclear resources generated 91% of the electricity on the PJM system. Over time, state and federal policy initiatives aimed at reducing environmental emissions, a wholesale market design that ignores fuel security, technology improvements, and overall economics spurred a shift from coal to natural gas and renewable generation. From 2010 to 2016 in PJM, coal-fired units made up 79% of the megawatts retired, and natural gas and renewables made up 87% of new megawatts placed in service.[2] Recent retirement announcements (including TMI, Beaver Valley, Davis-Besse and Perry) reflect that in excess of 5,000 MW of nuclear resources plan to retire in PJM in the near future. Reflecting further potential financial struggles by nuclear resources, in the 2018 PJM Base Residual Auction, 10.6 GW of nuclear capacity representing 30% of the nuclear capacity in the PJM region did not clear, a 200% increase from the previous year. At the same time, nuclear resources have been the most resilient, fuel-secure resources in PJM, reflecting stellar performance during the 2014 Polar Vortex, the 2017/18 cold snap and other extreme events.

The nuclear resources facing premature retirement will be replaced with natural gas resources and its "just-in-time" fuel delivery system with very finite back up capability. This trend poses significant common mode failure risks that PJM does not consider as part of its current resource adequacy

[2] PJM Interconnection, *PJM's Evolving Resource Mix and System Reliability*, Page 9 (March 30, 2017)

construct. Numerous reliability and resilience experts have recently expressed concern with this trend. For example, NERC points out in its recent Summer Assessment report that "the growing reliance on natural gas continues to raise BPS reliability concerns."[3] PJM has found that a single gas pipeline in the PJM region serves more than 11,000 MW of generation,[4] and a recent study by ICF examining generation clusters in PJM and New York found that 18,000 MW[5] of generation in PJM alone would be at risk from an extended pipeline outage[6]—all in the most densely populated parts of the Eastern United States.

Throughout the history of the industry, system operators have avoided an over-reliance on one resource type for good reason - system resilience requires fuel security that is fostered by fuel diversity. For example, in a report on the coal strike of 1977-78, both the diversity of generation fuel types and diversity of fuel supply sources were cited as major factors in permitting the industry to minimize the adverse impact of the strike.[7] When system operators have failed to account for fuel security, impacts have been dramatic for consumers. For example, during a 1994 cold spell, non-firm gas supply was interrupted resulting in PJM and Virginia Power curtailing firm electric customers to maintain system reliability, and that was at a time that the system was much less reliant on natural gas than it is today.[8]

As described above, absent swift action to value fuel security, the trend of fuel secure resource retirements will continue, and they will be replaced predominantly with natural gas resources reliant

upon gas pipeline delivery and storage as well as finite back up fuel sources. PJM's analysis should carefully consider the limits of such a portfolio during high-impact, low-frequency events caused by both weather and man-made contingencies and determine the needed fuel security constraints to appropriately mitigate the tremendous risks inherent during such scenarios. The grid is changing faster than anyone anticipated, and the consequences of inaction are permanent, particularly when it comes to nuclear resource retirements. Further, the grid and its vulnerabilities are well understood by our adversaries.

PJM's Proposed Phase I Analysis Is Too Narrow

Performing a robust fuel security analysis, as proposed by PJM in Phase I, is the first and most critical step in the entire PJM initiative. PJM should commence the Phase I analytics immediately in order to define a reasonable baseline scenario that can be used as the basis for taking action to ensure resilience starting with the 2019 Base Residual Auction. This baseline scenario can be modified later to the extent that more information becomes known, but PJM should not delay in moving to develop its initial version.

However, PJM's approach as drafted in its April 30, 2018 scoping document is too narrow and will not sufficiently inform the incremental resilience needs of PJM customers. PJM proposes to extend the recent experiences of the Polar Vortex and the recent Cold Snap to simulate the occurrence of high-impact, low-frequency events, employing a 12-14 day event duration assumption. PJM will stress-test the system under various fuel supply disruption scenarios to understand reliability outcomes resulting from the current capability of local onsite fuel and back-up fuel. However, constraining the study assumptions to the severity and duration of recent historical weather events is the equivalent of what the government and the airline industry did on September 10, 2001 and fails to reflect all realistic potential scenarios that PJM could face. As Dr. Stockton suggests, PJM needs to modify its disruption

scenarios and stress testing in both scope and duration taking into account not just weather events that have already transpired, but realistic scenarios caused by manmade interruptions. As elaborated below, Dr. Stockton generally concludes that since adversaries would attack more than one pipeline, PJM should expand the scope of its study to consider multiple simultaneous pipeline outages and/or restrictions on storage and assume that repair of such infrastructure could take many months. For example, the 2016 Spectra Pipeline explosion in Western Pennsylvania took six months to repair under ideal non-winter, blue sky conditions. According to Spectra, this event was caused by corrosion near a weld that progressed faster than usual causing the pipeline to fail, and could have been far worse if caused by a calculated attack coupled with a cyber-attack during an extreme weather event.[9] A poorly defined study will lead to a poorly defined solution and continued vulnerabilities and exposure to risk that threaten the health and safety of the consumers throughout PJM, as well as national security.

Exelon's Proposed Modifications To The Phase I Analysis

Dr. Stockton's recommendations are set out in the attached memo, *Valuing Fuel Security: Recommendations on Study Scope and Simulated Disruptions*. Dr. Stockton recommends the scope of the analysis be expanded to include multiple pipelines and/or storage facilities and recommends extension of the duration of the disruption scenarios to comport with man-made threats.

To this end, Exelon suggests that PJM should consider the following principles when developing the Phase I analysis.

- Evaluate a full 90-day winter. While the specific events (extreme weather and man-made infrastructure disruptions) that PJM analyzes may not last the whole winter, extremely stressful events can cause later resilience issues even after the event itself

[9] Debra Erdley, *6 Months After Salem Township Explosion, Spectra Energy Has Gas Pipelines Running*, TribLive.com (Nov. 18, 2016), http://triblive.com/local/westmoreland/11496039-74/pipeline-spectra-explosion.

has passed. For example, if the collective oil inventory is depleted in a weather event, the system may have difficulty meeting load later in the season even with more normal conditions due to lack of oil resource availability. A Navigant study confirms that, in the PJM region, more than 50% of dual-fuel and oil-only resources would be offline due to a lack of fuel after four days of full-load operation, and nearly 80% would be offline after seven days.[10] Efforts to refill oil tanks during a cold winter present numerous additional challenges. Thus, PJM's analysis should cover the full winter, even if the individual disruptions are shorter than the entire winter.

- Develop a "stress weather" scenario that combines a multi-week extreme cold snap with an overall colder-than-average winter. Resilience issues can arise from a multi-week extremely cold period like that experienced this past winter, but can also arise from the cumulative effect of an overall cold winter, with multiple cold periods. In performing the full winter analysis we suggest above, PJM should develop a full-winter "stress weather" scenario that includes a 14-day extreme period with temperatures and wind-chill comparable to the 2013/14 Polar Vortex, but also includes overall average temperatures over the course of the entire winter consistent with the coldest historic winter.
- Examine infrastructure disruption scenarios lasting at least 90 days. PJM's proposal to limit the duration of the analysis to at most 14 days is not adequate to describe the potential duration of infrastructure disruptions. Major pipeline disruptions can, and have in the past (such as the recent Spectra disruption discussed above), lasted up to six months. Thus, a full-winter, 90-day disruption is quite plausible and an appropriate stress case to consider. A full winter-long disruption is also consistent with the duration

[10] Navigant Consulting, Inc., *PJM Liquid Fuel Survey and Research Results and Recommendations* (Apr. 25, 2018) ("PJM Liquid Fuel Survey") attached to Exelon's May 9, 2018 Response in FERC Docket No. AD18-7.

ISO-New England utilized in developing its recent Operational Fuel Security analysis. While it may be appropriate to also consider shorter-duration infrastructure disruption events (such as 15, 30, and 60 days), a full winter-long disruption should serve as the baseline scenario used to develop a market-base resilience solution.

- Consider broader gas system disruptions when developing infrastructure stress events. As Dr. Stockton elaborates in his attached report, gas system disruptions that should be studied include multiple pipeline outages as well as disruptions of other gas system components such as storage facilities, network connected components and other facilities. While a range of potential infrastructure disruption scenarios are possible, in developing the baseline stress scenario, PJM should consider the most disruptive gas contingency in terms of gas generation affected. A recent study conducted by ICF showed that an extended pipeline outage would put 18,000 MW of generation in PJM at risk.[11] In follow up work by ICF that included a plausible amount of premature nuclear generation retirements in PJM and loss of multiple gas pipelines for a long duration, ICF found there would be as much as 280 hours of unserved energy which would impact customers, businesses and commu**n**ities.[12]
- Consider the effect of priority heating demand on any gas contingency. LDC heating demand typically has priority over power generation demand. Because of this, a full disruption of a given pipeline is not necessary to fully cut off the supply of gas for downstream power generators. Accordingly, in modeling its infrastructure development scenarios, PJM should assume that gas generators downstream of the gas contingency have no access to gas for the duration of the disruption, due to being pushed out by higher priority heating load. EIA data over the past two winters (Dec-Jan) confirms this

[11] ICF, *The Impact of Fuel Supply Security on Grid Resilience in PJM-Final Report*, Page 2 (June 8, 2018)
[12] ICF, *The Impact of Fuel Supply Security on Grid Resilience in PJM-Final Report*, Page 2 (June 8, 2018)

point; it shows that with between 25% and 40% of gas generation resources unavailable, there may be ”no gas for electric generation” due to other requirements like home heating load. [13] Similarly, a 2014 Eastern Interconnection Planning Collaborative report showed that about 38.7 GW of the gas-capable generation in PJM is located behind LDC citygates, the points at which interstate or intrastate pipelines transfer gas to the local delivery system.[14]

- Evaluate simultaneous weather and man-made infrastructure/cyber events. The highest stress resilience scenarios arise when extreme weather co-occurs with an infrastructure disruption. Therefore, any baseline scenario should jointly consider the extreme weather scenario as occurring simultaneous with a high-impact, 90-day infrastructure disruption scenario.
- Evaluate all scenarios against a range of future generation portfolios. Exelon agrees with PJM’s proposed generation portfolio scenarios (“base,” “stressed” and “high stressed”). Any weather and infrastructure disruption scenario should be evaluated under each generation portfolio.
- Consider scenarios that assume no “help” from other regions as those other regions may be struggling themselves to serve their load and have no excess to spare.
- Consider a summer stress scenario. Considerable attention has been devoted to winter periods, but given changes in summer load and other factors, it would be prudent for PJM to also consider a high-stress summer scenario.

Given these principles, Exelon proposes the following scenario as a reasonable baseline for developing a resilience solution.

[13] EIA, Natural Gas Consumption by End Use Data, Release Date 05/31/2018
[14] Eastern Interconnection Planning Collaborative, *Gas-Electric System Interface Study Existing Natural Gas-Electric System Interfaces*, Page 19 (April 4, 2014).

- A "stress weather" winter, combining a 14-day period of extreme cold and wind chill (consistent with those experienced during the 2013/14 Polar Vortex) with full-winter average temperatures consistent with the most extreme winter over history.
- A significant 90-day disruption of the pipeline system entering Eastern PJM that is sufficient to cause all gas generation within MAAC to have no access to gas for the entire winter, given the priority of heating load coupled with extreme winter temperatures.
- Generator forced outages consistent with those observed under recent winter stress conditions.
- Modeling of backup liquid fuel capability that considers expected fleet storage levels and limited re-supply capability especially as would occur during winter stress conditions and/or during a long-term outage where secondary supply impacts (e.g., refinery outages as a result of insufficient electric service) could exacerbate re-supply problems.
- Evaluate this scenario using PJM's proposed "base," "stressed," and "high-stressed" generation portfolios. The high stressed generation portfolio should not assume that only nuclear resources that did not clear will retire, rather it should assume that all financially stressed nuclear resources will retire.[15]

This scenario combines plausible extreme weather and man-made infrastructure disruption scenarios consistent with observed historical events. This scenario is consistent with the guidance provided by Dr. Stockton in his attached memo and aligns with the first manmade disruption scenario he recommends

[15] While failing to clear a capacity auction is a clear indication of likely financial stress, some nuclear resources that clear may also be under financial stress and thus candidates for retirement. *See* ICF*, The Impact of Fuel Supply Security on Grid Resilience in PJM – Final Report* (June 8, 2018)

that proposes PJM examines a reduction of a realistic percentage of delivery capability on particularly constrained portions of pipelines and/or storage facilities in the PJM region.[16]

While this scenario should serve as the baseline for any solution, PJM should consider a range of other scenarios varying along the various identified dimensions (such as weather; number, impact, and duration of infrastructure/cyber disruptions; availability of liquid fuel resupply) to further inform the stakeholder discussion. Consistent with Dr. Stockton's recommendation, PJM should also evaluate a realistic but extreme contingency scenario that disrupts 80% of the natural gas pipeline infrastructure across the entire PJM region for six months. This scenario represents the severe threat that a major state adversary might pose. This scenario should be conducted using the same assumptions as described above for the baseline scenario.

Exelon Recommends that PJM Coordinate with Federal Agencies on Resilience Threats Now

PJM's "Phase III: Ongoing Coordination" is a critical part of the overall success of this effort. While PJM should immediately begin modeling Phase I as suggested by Exelon, PJM must have additional input from DOD, DHS, FERC, and DOE to assess the level of fuel security necessary to protect our Nation or its studies will miss critical threats. PJM must consult with and incorporate the recommendations of the DOE and other national security organizations in its modeling scenarios now. Dr. Stockton also highlights the need for PJM to reach out to FERC, DOE, and other Federal partners for a near-term review of the disruption scenarios he recommends.[17] Over the long term, PJM's effort should be informed by a design-basis threat (DBT) from the federal government to identify resilience threats and provide a baseline against which PJM can measure its efforts at creating a resilient grid. While a specific DBT may not be available in the first phase due to timing, PJM should consult with the

[16] Paul Stockton, *Valuing Fuel Security: Recommendations on Study Scope and Simulated Disruptions*, Page 2 (May 29, 2018).
[17] Paul Stockton, *Valuing Fuel Security: Recommendations on Study Scope and Simulated Disruptions*, Page 6 (May 29, 2018)

organizations to obtain initial feedback on national security threats to consider in the first year it conducts its analysis, and thereafter, PJM should build a model sufficiently robust to include a DBT once established and share with the DOE, on a classified basis, the threats that can debilitate the PJM system.

PJM Should Provide Transparency on Environmental Impacts

For each of the scenarios that PJM models, it should provide transparency into the environmental and emissions costs that will result. Stakeholders should be provided a comparative analysis that shows the current emissions profile in PJM and changes to that profile under the various scenarios that are being analyzed in PJM's Valuing Fuel Security effort.

New England's fuel security challenges are well known. As a result of retirements of fuel secure resources and increased reliance on dual fuel natural gas-fired generators, that region must turn to burning oil when the system is stressed. This past winter, two million barrels of oil were burned in less than two weeks—more than double the amount burned in the region the entire year before. The carbon and other air pollution impacts of those circumstances are troubling for two reasons. First, they challenge the ability of those regions to meet their emissions goals now and in the future. Second, they stand to exacerbate the severe weather events that are interrupting electric service to customers in the first place.

In PJM, this risk is even more significant. If PJM plans to meet its fuel security challenges by retaining resources that burn coal or by incentivizing the addition of oil storage, it will be contributing to the very problem it is trying to solve. Planning a generation system that is resilient must include planning for a system that is both able to withstand interruptions and also does not contribute to interruptions by exacerbating climate change. To prevent future instances like this, PJM must include within its analysis an evaluation of the emissions implications of greater reliance on coal and dual fuel resources during periods of natural gas disruption.

Feedback on Next Steps

Exelon is encouraged by PJM's willingness to work with stakeholders on this important resilience issue. We support PJM's effort to prioritize this issue of critical importance and push for a resolution in advance of the May 2019 Base Residual Auction. To that end, Exelon recommends that PJM incorporate Exelon's suggested improvements into its proposal. In addition, PJM should provide updates at future MRC meetings, and request that PJM also provide regular milestone reports on the progress of each phase. Such reports will enable stakeholders to provide additional feedback on the analysis contemporaneous with the undertaking, instead of only at the end when it is too late for PJM to act on any suggestions. Exelon also requests that PJM provide stakeholders with additional detail on the specifics behind the disruptions to fuel delivery systems that will be analyzed, and the composition of the three portfolios that PJM will be analyzing. We look forward to engaging with PJM on these efforts.

SONECON

VALUING FUEL SECURITY: RECOMMENDATIONS ON STUDY SCOPE AND SIMULATED DISRUPTIONS

Paul Stockton
June 8, 2018

PJM's study on *Valuing Fuel Security* is timely and urgently needed. PJM and its member companies serve many thousands of facilities vital for national defense, the U.S. economy, and public health and safety. That makes the region's grid – and the fuel supplies on which it depends – potential targets for cyber and physical attacks.

The study provides a strong foundation to assess these threats to fuel supplies. In an April 30, 2018 message outlining the study, PJM President and CEO Andrew L. Ott noted that the study will "simulate disruptions to fuel systems that could be the result of credible extreme events such as coordinated physical or cyber-attacks, extreme weather, etc."[1] Developing weather contingencies to study will be easy; ample historical data is available to help do so. No equivalent basis exists for developing contingencies for cyber or physical attacks. Moreover, as PJM has previously emphasized, RTOs face obstacles in acquiring the government data they need to assess cyber threats.[2]

But it would be a grave mistake to do what is easy and focus the study solely on extreme weather. Coordinated cyber or physical attacks can create fuel disruptions far more catastrophic that those caused by the 2018 bomb cyclone or any other severe weather events to date. The Department of Energy (DOE) warns that cyber threats are becoming increasingly severe, and that the risks of physical attacks on natural gas systems merit special concern.[3] PJM is making a unique (and uniquely valuable) contribution to national security and grid resilience by structuring the study to encompass manmade threats.

This letter offers three recommendations to support the study. First, to support Phase I of the study, I propose specific disruption scenarios for the study to employ. It is not credible that a potential adversary such as Russia or China will attack a single pipeline and/or storage facility. If those nations are going to strike the U.S. energy sector, and risk incurring an overwhelming military response, they are much more likely to attack as many pipelines and/or storage facilities

[1] Andrew L. Ott (letter to PJM Members), April 30, 2018, http://www.pjm.com/-/media/committees-groups/committees/mrc/20180508-special/20180508-ott-fuel-security-member-letter.ashx.
[2] PJM Interconnection, L.L.C, "COMMENTS AND RESPONSES OF PJM INTERCONNECTION, L.L.C.," *Response to Grid Resilience in Regional Transmission Organization and Independent System Operators* (AD18-7-000), March 9, 2018, p. 52.
[3] Department of Energy, *Multiyear Plan for Energy Sector Cybersecurity*, March 2018, p. 3.

as possible to disrupt the flow of power to defense installations and other national security-related assets. Nor is it credible that disruptions caused by manmade threats will last 14 days or less. If adversaries conduct coordinated high explosive attacks against critical gas infrastructure, many months could be required to repair pipelines and restore the flow of gas. Consistent with the study's proposed structure, PJM should use two disruption scenarios to assess manmade risks to fuel security:

- Reduction of a realistic percentage of delivery capability on particular constrained portions of pipelines and disruption of storage facilities in the PJM region: assume that adversaries interrupt the flow of gas on two major pipelines for three months, including in the coastal region. This scenario constitutes a limited threat to fuel supplies.

- Realistic but extreme contingency: assume that adversaries disrupt 80 percent of the gas pipelines in the PJM region as a whole for six months. This scenario represents the severe threat that a major state adversary might pose, reflecting the outcome of combined high explosive and cyberattacks on all major pipelines in the region, potentially combined with attacks on gas storage facilities and other critical gas infrastructure components.

The most likely way that adversaries could create an 80 percent disruption would be to exploit common failure modes in the natural gas systems that serve the PJM region. As will be discussed later in this study, adversaries may be able to disrupt widely-distributed gas system components in a single cyberattack, by exploiting supply chain vulnerabilities and related threat vectors which DHS recently attributed to Russian actors.[4] PJM may also want to adopt a sub-regional approach to model realistic but extreme contingencies. For example, in certain coastal portions of the PJM service area, physical attacks on a small number of major pipelines could disrupt 80 percent of that sub-region's pipeline capacity and potentially cause disruption of storage for extended periods.

PJM may find it useful to model additional contingencies as well. However, given the critical military installations and other national security facilities in the PJM service area, this area will be *ground zero* if Russia, China, or other potential adversaries launch comprehensive attacks to disrupt the flow of natural gas for power generation. Such attacks could also spread disruptions to New York and other regions that are densely populated and vital to the U.S. economy. The realistic but extreme scenario proposed in this paper will be essential to assess fuel security against such threats.

Second, the PJM study approach notes that Phase I will incorporate locational variations in system infrastructure, such as the proximity of generators to gas production facilities co-located with gas fields in the Marcellus. This granularity will greatly improve the accuracy of company-specific models. However, we should also assume that in a comprehensive attack on gas flows, adversaries will target all types of infrastructure components that might be vulnerable to high-consequence cyber or physical attacks, ranging from key nodes in gathering and refining

[4] "Alert (TA18-074A): Russian Government Cyber Activity Targeting Energy and Other Critical Infrastructure Sectors," *United States Computer Emergency Readiness Team*, last revised March 16, 2018, https://www.us-cert.gov/ncas/alerts/TA18-074A.

facilities to storage facilities. Modeling initiatives in Phase I should account for the risk of such multi-component attacks.

My third recommendation is that PJM launch Phase III of the study ("Ongoing Coordination") at the same time that it begins executing Phase I. The first phase involves identifying system vulnerabilities and developing fuel security criteria to assess them. Given the severity of threats to fuel resilience and the length of time the government requires to identify security needs in the PJM footprint, PJM should not delay work on this first phase of the study until such information is available. The third phase calls for collaboration with government agencies to address concerns related to cyber and physical security. However, precisely because so much time may be required to reach government-industry agreement on threat data priorities and sharing mechanisms, PJM should immediately reach out to FERC and other appropriate agencies to begin that consensus-building process. The analysis that follows offers specific recommendations on how to structure that coordination.

I. DISRUPTION SCENARIOS FOR PHASE I

PJM defines fuel security as "the ability of the system's supply portfolio, given its fuel supply dependencies, to continue serving electricity demand through credible disturbance events, such as *coordinated physical or cyberattacks* or extreme weather that could lead to disruptions in fuel delivery systems, which would impact the availability of generation over extended periods of time."[5]

Manmade and weather threats to fuel resilience are not mutually exclusive. Indeed, as Phase I goes forward, PJM may want to consider adding a dual-disruption scenario: i.e., cyber or physical attacks occurring in the midst of a severe, extended winter freeze, when heating demand and risks of gas curtailment to power generators would be most extreme.

Initially, however, PJM should develop manmade disruption scenarios that help scope fuel security vulnerabilities against high-capability nation states (Al-Qaeda and other terrorist organizations will constitute lesser included cases). Two factors will be most important in developing disruption scenarios and assessing their impact on power generation: the number of pipelines and/or storage facilities that adversaries will be able to disrupt, and how long fuel interruptions will last.

A. NUMBER OF PIPELINES DISRUPTED AND STORAGE FACILITIES CONSTRAINED

Threat assessments by the Transportation Security Agency (TSA) provide the starting point for scoping the threat to pipelines, storage facilities, and other gas infrastructure components in the PJM region. TSA has regulatory authority for pipeline security under P.L. 107-71 and P.L. 110-53 (though TSA relies on voluntary industry compliance with the agencies' security guidance, versus the mandatory relatability standards that NERC issues for the bulk power system) and provides a Pipeline Threat Assessment (For Official Use Only).[6] However, TSA has not updated

[5] PJM Interconnection, LLC, *Valuing Fuel Security*, April 30, 2018, p. 1.
[6] Aviation and Transportation Security Act, Public Law 107-71, *U.S. Statutes at Large* 115 (2001); Implementing

that document since 2011. DOE and the Department of Homeland Security have provided more recent assessments. Both Departments have found that cyber threats to electric and natural gas systems are rapidly intensifying.[7] My May 10, 2018 testimony to FERC examines these threats.

U.S. reliance on natural gas for power generation has been increasing along with adversary capabilities to attack pipelines and storage sites in the PJM region and beyond. The net result: according to Bruce Walker, Assistant Secretary of Energy for Electricity Delivery and Energy Reliability, this "increased dependency on our pipelines" has "effectively doubled and tripled the amount of critical infrastructure that is necessary for us to protect predominantly on a cyber front but also from a physical security front."[8]

The expansion of natural gas infrastructure in the Marcellus and other areas can benefit fuel security. Where redundant pipeline systems exist to serve power generators, the loss of a single pipeline may have little or no effect. But other portions of the PJM region have much less gas infrastructure redundancy. In coastal regions of New Jersey and Maryland, for example, the loss of even two major pipelines and/or storage facilities could have major effects on power generation. Accordingly, as PJM already envisions, it will be important to employ disruption scenarios to identify fuel security risks that could affect specific locations of the system.

The question remains of how many disruptions of pipelines and other gas system components these scenarios should entail. It is (barely) conceivable that in an escalating crisis, Russia or another potential adversary might attack a single pipeline or storage site to demonstrate their ability to hold the gas transmission system at risk, and/or threaten further attacks unless the United States acceded to whatever demands they were making. But it is far more likely that adversaries will attack on a larger scale. If a crisis with the United States is so dire than an adversary will launch cyber or physical attacks on gas systems, despite the risk of provoking an overwhelming response by U.S. forces, we should expect that the enemy will seek to deal us a crippling blow.

For cyberattacks, the actual number of pipelines in the PJM footprint that adversaries will be able to disrupt will vary with their ability to exploit common modes of failure, and conduct simultaneous attacks on multiple pipelines in the region. Supply chain corruption poses an especially significant challenge in this regard.[9] If adversaries are able to corrupt the development

[8] Bruce Walker, (speech delivered at the GridWise Alliance 2018 Spring Group Meetings, Chicago, IL, May 11, 2018).

[9] In July 2016, FERC directed NERC to develop a Supply Chain Risk Management reliability standard for BES entities, which is currently available (Standard CIP-013-1). NERC intends the standard to "mitigate cyber security risks to the reliable operation of the Bulk Electric System (BES) by implementing security controls for supply chain risk management of BES Cyber Systems." See: North American Electric Reliability Corporation, *CIP-013-1 – Cyber Security - Supply Chain Risk Management*, July 2017, p. 3, https://www.nerc.com/pa/Stand/Project%20201603%20Cyber%20Security%20Supply%20Chain%20Managem/CIP

and production process for widely-used gas system software and hardware components, they could gain the ability to later sabotage or covertly control those components, and attack multiple pipelines at the same moment. Doing so would cause common mode failures, disrupting power generation over wide areas. Conducting special forces-type physical attacks on multiple compressor stations, storage facilities, and pipelines would entail greater coordination and pre-attack planning challenges.[10] However, because of the massive damage that vehicle-borne improvised explosive devices (VBIEDs) or other kinetic attacks could create,[11] adversaries seeking to maximize disruption to power generation will have strong incentives to conduct such attacks against critical gas infrastructure nodes.

Given the variations in adversary capabilities to conduct such large scale cyber and physical attacks, PJM should consider employing credible high- and low-threat scenarios of cyber and physical attacks. At the low end, the disruptive scenario should assume that adversaries interrupt the flow of gas on two major pipelines. At the higher end, reflecting the risk of common mode failures *combined* with carefully targeted attacks using high explosives, a "realistic but extreme" contingency should reflect the disruption of 80 percent of major pipelines in the PJM region, as well as severe disruptions in gas storage.

B. DURATION OF FUEL INTERRUPTIONS

The impact of pipeline system attacks on power generation will also depend on how long gas interruptions last. From a cyber perspective, a primary threat for extend-duration interruptions will come from Advanced Persistent Threats hidden in gas system networks and components, which – unless entirely eradiated – will launch repeated attacks based on timing or system conditions.[12] However, physical attacks offer special risks of extend gas supply disruptions. Attackers have frequently used high explosives against gas pipelines in the Middle East and elsewhere to halt gas flows and require extensive, time-consuming repairs.[13] Fortunately, no such attacks have yet occurred in the United States. But terrorists have employed truck bombs with tons of explosives against other U.S. targets in Oklahoma City and beyond all too often.

Even corrosion-induced pipeline failures can take many months to repair. In the case of the 2016 Spectra pipeline explosion, for example, repairs took six months to complete.[14] Gas companies would no doubt seek to accelerate the restoration of service if the United States were in the midst

---

-013-1_Clean_071117.pdf. FERC issued a Notice of Proposed Rulemaking proposing to approve this standard with some additional requirements. *See* Supply Chain Risk Management Reliability Standards, 162 FERC ¶ 61,044 (2018). Without similar strategies for natural gas systems, however, potential supply chain vulnerabilities that could have cascading effects in the Bulk Power System remain.

[14] Debra Erdley, "6 months after Salem Township explosion, Spectra Energy has gas pipelines running," *Tribune Review*, November 18, 2016, http://triblive.com/local/westmoreland/11496039-74/pipeline-spectra-explosion.

of a national security crisis. However, multi-point physical attacks would create unprecedented challenges for restoring gas flows. The Spectra repair operation took place in blue sky conditions. Efforts to repair gas systems after attacks by Russia or China would need to go forward in a much more challenging environment, especially if the electric grid and communications systems were affected as well. A truck bomb carrying tons of high explosives would create damage far more extensive than in the Spectra incident or any previous U.S. pipeline failure – potentially over multiple, carefully-selected sites in the PJM region.

As with assumptions on the number of pipelines and/or storage facilities that an adversary will attack, PJM should consider adopting low- and high-end estimates of gas interruptions, and combine those risk factors into two consolidated disruption scenarios. The low could assume that adversaries will halt the flow of gas on two major pipelines for 3 months. The higher end "realistic but extreme" scenario would posit the disruption of 80 percent of the major pipelines including storage facilities in the PJM region for 6 months.

C. ATTACKS ON MULTIPLE TYPES OF SYSTEM COMPONENTS

PJM's proposed study approach for Phase I emphasizes the need for the stakeholder process to account for local variations in gas infrastructure and the resulting implications for fuel security. The proposal notes that generation located "on top of a Marcellus shale field does not face the same fuel security issues as a generator more distant from supply and connected to a lateral pipeline served by a single natural gas distribution company."[15] Accounting for such variations will greatly improve model accuracy.

However, as these system-specific modeling efforts go forward, it would be a mistake to assume that adversaries will only attack pipelines and the compression stations that serve them. The NERC *Special Reliability Assessment: Potential Bulk Power System Impacts Due to Severe Disruptions on the Natural Gas System* (November 2017) notes that gas storage facilities and other gas infrastructure components are critical for enabling the electric industry to meet its load-serving obligations.[16]

Industrial control systems and other network-connected electronic devices and control mechanisms are embedded across many of these gas system components, from production, gathering, and processing facilities to local distribution company infrastructure. All such connected systems may be vulnerable to cyberattacks or supply chain exploitation (including the introduction of corrupted software though Russian threat vectors recently identified by DHS).[17] Depending on the configuration of specific gas systems, physical attacks against crucial but

[17] "Alert (TA18-074A): Russian Government Cyber Activity Targeting Energy and Other Critical Infrastructure Sectors," *United States Computer Emergency Readiness Team*, last revised March 16, 2018, https://www.us-cert.gov/ncas/alerts/TA18-074A.

unprotected system components could also produce long-term disruptions to fuel supplies for power generation.

The net result: factors such as generator proximity to the Marcellus shale field may not automatically translate into reduced vulnerability. As location-specific modeling goes forward, Phase I should account for the risk of attacks on multiple types of gas system components, especially if they offer adversaries alternative and more efficient means of interrupting fuel flows than by attacking pipelines alone.

II. ONGOING COOPERATION: ADVANTAGES OF AN EARLY LAUNCH FOR PHASE III

The study overview notes that "PJM anticipates overlap between phases" as the initiative goes forward. While Phase I should be initiated as soon as possible, PJM should also consider a rapid start for the "Ongoing Coordination" called for in Phase III.

PJM has already found that "There are obstacles to obtaining information necessary to assess cyber security threats because RTOs can only base their threat assessments on open source information and certain classified intelligence, but the information from classified sources is limited and does not provide a full and complete understanding needed to detect and respond to cyber-attacks."[18] PJM similarly emphasized the need for Federal support on identifying and assessing risks: "there needs to be a process for vulnerability threat verification. The Commission needs to provide intelligence and metrics to apply to resilience vulnerability and threat analyses, such that they can then guide and anchor subsequent RTO planning, market design, and/or operations directives. Overall there needs to be better information made available to the RTOs on the above-identified risks to enable the RTOs to assess the risks. This information could be supplied from a wide range of federal agencies and interdependent systems."[19]

Phase III should be structured to fill these gaps to support fuel security assessments for both cyber and physical threats. Ideally, PJM could reach out to FERC, DOE, and other Federal partners for a near-term review of the disruption scenarios provided in this paper. However, over the longer term, PJM should collaborate with these partners to develop a more holistic design basis threat to assess and mitigate gaps in grid resilience.

Government assistance in developing a design basis threat will be especially important for incorporating national security considerations into fuel security assessments. Assistant Secretary Walker recently stated that "I don't know that the RTOs or NERC have the visibility or proposer information to determine if something is a national security issue." Indeed, "with the various

[18] PJM Interconnection, L.L.C, "COMMENTS AND RESPONSES OF PJM INTERCONNECTION, L.L.C.," *Response to Grid Resilience in Regional Transmission Organization and Independent System Operators (AD18-7-000)*, March 9, 2018, pp. 52-3, http://pjm.com/-/media/documents/ferc/filings/2018/20180309-ad18-7-000.ashx.

[19] PJM "COMMENTS AND RESPONSES OF PJM INTERCONNECTION, p. 32

intelligence agencies we have throughout the federal government" as well the Department of Defense, "we have different information" than RTOs and NERC.[20]

As PJM moves forward in the Phase III process, it will be essential to build a secure process so that this government information can help guide PJM fuel resilience assessments. PJM and its member companies serve a broad array of military installations and other facilities vital to national security, and are already taking aggressive measures to ensure these facilities have the power they require. The Valuing Fuel Security study offers a timely and much-need opportunity to further reinforce such resilience. Basing PJM's analysis on realistic, credible assessments of the threat is a prerequisite for ensuring that the initiative succeeds.

Re: PSEG Keys Energy Center LLC
Docket No. ER17-2426-000
Application for Market-Based Rate Authorization and Request for Waivers and Blanket Approvals

Dear Secretary Bose:

On September 1, 2017, PSEG Keys Energy Center LLC submitted an application in the above-captioned matter for market-based rate authorization and request for waivers and blanket approvals. A review of the filing shows the application was not in the XML package submitted through eTariff. Please accept the application included with this filing.

Thank you for your attention to this matter.

Respectfully submitted,

Cara J. Lewis
Cara J. Lewis

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

PSEG Keys Energy Center LLC) Docket No. ER17-__-000

APPLICATION FOR MARKET-BASED RATE AUTHORIZATION AND REQUEST FOR WAIVERS AND BLANKET APPROVALS

Pursuant to Section 205 of the Federal Power Act ("FPA"),[1] Rules 204 and 205 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("Commission" or "FERC"),[2] and Part 35 of the Commission's regulations,[3] PSEG Keys Energy Center LLC ("PSEG Keys" or "Applicant") hereby requests that the Commission: (1) accept the proposed market-based rate tariff for PSEG Keys; (2) authorize PSEG Keys to sell energy, capacity, and certain ancillary services at market-based rates; (3) grant such waivers and blanket authorizations as the Commission has granted to other entities with market-based rate authorization; and (4) find that a change in status report is not required.[4]

I. COMMUNICATIONS

PSEG Keys respectfully requests that all service and correspondence related to this matter be directed to the following individuals:

[1] 16 U.S.C. § 824d (2012).

[2] 18 C.F.R. §§ 385.204, 385.205 (2011).

[3] 18 C.F.R. Part 35 (2017).

[4] This filing is being submitted independently of the PSEG Companies' Triennial Market Power Update, which is currently pending before the Commission ("December 2016 Triennial Filing") in Docket Nos. ER10-1768-004, *et al*. For convenience, the Triennial Market Power Update is attached as Appendix F. The Triennial Market Power Update also identifies the entities the comprise the PSEG Companies.

II. DESCRIPTION OF PSEG Keys AND ITS AFFILIATES

A. PSEG Keys

PSEG Keys, a Delaware limited liability company, is a direct subsidiary of PSEG Fossil LLC ("PSEG Fossil"), which is a direct subsidiary of PSEG Power LLC ("PSEG Power"), a direct subsidiary of Public Service Enterprise Group Incorporated ("PSEG"), a publicly traded company. PSEG Keys is currently constructing a new natural gas-fired, power plant in Prince George's County, Maryland (the "PSEG Keys Energy Center"). The PSEG Keys Energy Center, a 755 MW combined cycle plant, is targeted to be in commercial operation by June 1, 2018. The Maryland electricity ratepayer is not subsidizing or guaranteeing any portion of the revenue of the plant. The plant will participate in the capacity and energy markets established by PJM Interconnection, L.L.C. ("PJM") for wholesale electric generators. All of the output of the PSEG Keys Energy Center will be sold to PSEG Keys' affiliate, PSEG Energy Resources & Trade LLC ("PSEG ER&T").

B. PSEG Keys's Affiliates

1. Public Service Electric and Gas Company ("PSE&G")

PSE&G is a public utility operating company engaged primarily in the transmission of electricity, and the provision of gas and electric distribution service in the State of New Jersey. During the study period, PSE&G owned less than 140 MW of solar

generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities. PSE&G is a member of the PJM, a FERC-approved Regional Transmission Organization, and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access Transmission Tariff ("OATT") administered by PJM. PSE&G is authorized to sell power at market-based rates and makes wholesale sales falling within several different categories, as described below.

Non-utility generation ("NUG") output. PSE&G's NUG output expired in 2015 and 2016 pursuant to the terms of the NUG contracts. PSE&G currently has no further NUG obligations, other than 0.6 MW of energy associated with the former Kinsley Landfill which no longer operates.

Solar. In 2007, the New Jersey legislature passed Regional Greenhouse Gas Initiative ("RGGI") legislation authorizing state utilities to invest in renewable resources such as wind or solar in order to promote increased use of renewable resources within the state and in turn reduce greenhouse gas emissions. *See* L. 2007, c. 340, codified at N.J.S.A. 48:98-1. The New Jersey Board Public Utilities ("BPU") has approved two (2) PSE&G Solar 4 All® (S4A) programs under which PSE&G has sited, designed and built twenty-nine (29) grid connected solar facilities. PSE&G currently owns and operates approximately 125MW-dc of grid connected solar under the S4A program. In 2016, PSE&G received NJBPU approval of its Solar 4 All Extension II filing to install an additional 33 MW-dc of grid connected solar on landfills and brownfields in the PSE&G electric service territory to begin in 2017.

2. PSEG Energy Resources & Trade LLC ("PSEG ER&T")

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power, as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission.[5]

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

Basic Generation Service ("BGS") Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.,* which initiated the transition from a regulated to a competitive retail power market in New Jersey, BPU annually approves statewide auctions to determine the entities that will supply BGS in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSEG ER&T has participated directly in all of the auctions for BGS supply held since 2004, has been a winning bidder in these auctions and has incurred contractual commitments to provide supply to BGS

[5] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999).

load pursuant to BPU approved contracts beginning with the 2004 auction and continuing to the present

Basic Gas Supply Service ("BGSS") Gas Contract. In an April 16, 2002 order, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract remains in effect and provides for annual renewals unless terminated by either party on 12 months' advance written notice.

Long Island Power Authority ("LIPA") Fuel Supply: On November 26, 2013, PSEG ER&T executed an agreement with the LIPA under which ER&T began providing fuel supply and power supply management activities for LIPA on January 1, 2015.

3. PSEG Fossil LLC ("PSEG Fossil")

PSEG Fossil is an Exempt Wholesale Generator ("EWG")[6] and is authorized to sell power at market-based rates. PSEG Fossil owns and operates electric generation facilities located within PJM and sells their entire output to its affiliate PSEG ER&T.[7] The assets of PSEG Fossil (and its subsidiary, PSEG Keys Energy Center LLC ("PSEG Keys")) are located entirely within PJM. However, PSEG Fossil's subsidiaries PSEG

[6] *PSEG Fossil LLC*, Docket No. EG00-3-000, 89 FERC ¶ 62,237 (December 20, 1999); *PSEG Fossil LLC*, 95 FERC ¶ 61,405 (June 14, 2001); *PSEG Fossil LLC*, 99 FERC ¶ 62,167 (June 10, 2002).

[7] These contracts were originally approved by the Commission as cost-based contracts. *See Public Service Electric and Gas Company*, *et al*., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Fossil obtained market based rate authority covering sales from its generating units.

Power Connecticut LLC ("PSEG Power CT"), PSEG Power New York LLC ("Power New York") and PSEG New Haven LLC ("PSEG New Haven") own facilities in ISO New England Inc. ("ISO-NE") and New York Independent System Operator Inc. ("NYISO"). PSEG Fossil also co-owns certain facilities in PJM.

PSEG Fossil and its subsidiaries PSEG Power CT and PSEG Keys have begun constructing three new gas-fired generation units. PSEG Fossil is constructing Sewaren 7,[8] a 540 MW combined cycle unit in Woodbridge, New Jersey which is expected to be reach commercial operations by no later than June 1, 2018. PSEG Keys is constructing a 755 MW combined cycle unit in Prince George's County, Maryland which is expected to reach commercial operations by no later than June 1, 2018. PSEG Power CT is constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019. On June 1, 2017, PSEG Fossil retired Hudson 2 (659 MW nameplate rating) and Mercer Units 1 and 2 (652 MW nameplate rating).

PSEG Fossil satisfies most of the electricity needs of its plants from PJM under PJM's "station power" Tariff provisions. PSEG Fossil procures gas supply for its plants from PSEG ER&T and receives gas distribution service from PSE&G at a rate approved by the BPU on May 29, 2013.[9]

4. PSEG Power CT

PSEG Power CT, a Connecticut limited liability company, is an EWG that owns and operates electric generation facilities in the State of Connecticut and is authorized to

[8] Once Sewaren 7 begins commercial operation, PSEG Fossil plans to retire Sewaren 1, 2, 3 and 4.

[9] BPU Docket No. GM12100935 (May 29, 2013).

sell power at market-based rates.[10] Both of PSEG Power CT's generation facilities, Bridgeport Harbor and New Haven Harbor, are located in the State of Connecticut within the market administered by ISO-NE. PSEG Power CT sells the output of its generation facilities to its affiliate PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. As noted above, PSEG Power CT is currently constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

5. PSEG New Haven

PSEG New Haven is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG New Haven owns and operates a facility (the "New Haven facility") in New Haven, Connecticut with a nameplate rating of 181 MWs. The New Haven facility is located within the New Haven Harbor generation station. The New Haven facility is interconnected to the adjacent United Illuminating East Shore Substation using a 115 kV underground cable. PSEG New Haven has no other generation assets. The commercial operation date for the New Haven facility was June 1, 2012 and PSEG New Haven has obtained MBR authority from FERC.[11]

The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[12] pursuant to a Connecticut statute that sought proposals

[10] *Wisvest Corporation,* et al., 101 FERC ¶ 61,166 (2002).

[11] *PSEG New Haven LLC*, Docket No. ER12-1250-000, *et al*., (May 29, 2012).

[12] *Re Review of Peaking Generation Projects*, Docket No. 08-01-01, Connecticut Department of Public Utility Control, June 25, 2008 ("Awards Decisions") (2008 WL 2587405 (Conn. D.P.U.C.)). The PURA is the successor to the Department of Public Utility Control ("DPUC"). PURA came into being in July 2011 as part of a reorganization of Connecticut state energy agencies. For consistency, this application refers to the agency as the PURA.

for peaking generation in Connecticut.[13] All of the energy and capacity of the New Haven facility is sold into the ISO New England ("ISO-NE") markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA[14] has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder. The 181 MW nameplate rating of the New Haven Facility has not been included in the capacity controlled by PSEG for purposes of Dr. Morris' market power analysis.

5. PSEG Nuclear LLC

PSEG Nuclear is an EWG[15] and is authorized to sell power at market-based rates. PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission.[16] The assets of PSEG Nuclear are located entirely within PJM.

6. Pavant Solar LLC, San Isabel Solar LLC and Bison Solar LLC

PSEG Power Ventures portfolio includes three (3) solar companies with market-based rate authority: (1) *Pavant Solar II LLC*[17] is a QF which owns a 50 MW (AC) solar

[13] Section 50 of Public Act 07-242, now codified at Section 16-243u of the Connecticut General Statutes.

[14] The CFD was approved on October 29, 2010 in a letter order ruling on Motion Number 62 in Docket No. 08-01-01.

[15] *PSEG Nuclear LLC*, 97 FERC ¶ 62,191 (November 30, 2001).

facility in Fillmore Utah; (2) *San Isabel Solar LLC*[18] is a QF which owns a 30 MW (AC) solar facility in Las Animas County, Colorado; and (3) *Bison Solar LLC*[19] is a QF which owns a 30 MW (AC) solar facility 25 miles north of Fort Collins, Colorado.

7. PSEG Energy Solutions LLC

PSEG Energy Solutions LLC ("PSEG Solutions") is a Delaware limited liability company and a direct subsidiary of PSEG ER&T. PSEG Solutions obtained market-based rate authority[20] and will operate within the PJM, NYISO and ISO-NE markets. Energy Solutions has contracted with PSEG ER&T to purchase power from the regional transmission organization ("RTO") at wholesale and sell it to retail customers. PSEG Solutions will not own or operate any generation assets. PSEG Solutions has begun its retail business in 2017.

C. Affiliated Generation Ownership

A list of the PSEG Keys' affiliated domestic FERC jurisdictional generation assets owned is contained in Appendix B attached hereto.[21] Those additional subsidiaries of PSEG Keys that may be considered relevant to this request are described below:

Public Service Enterprise Group Incorporated ("PSEG"). PSEG, a New Jersey corporation, is a public utility holding company engaged in, among other things, the generation of electric energy and the transmission, distribution and sale of electricity and natural gas through its subsidiaries.

---

[18] *San Isabel Solar LLC*, Docket No. QF16-712-000.

[19] *Bison Solar LLC*, Docket No. QF16-711-001.

[20] *See* Letter Order dated December 21, 2016 in Docket No. ER16-2725-000.

[21] Appendix B excludes generation assets located in Hawaii as well as generation assets in which PSEG's interest is limited to a leveraged lease interest.

PSEG Power LLC. PSEG Power was formed in 1999 to acquire the former generation assets of PSE&G. PSEG Power, a Delaware limited liability company, does not directly own any generation facilities or engage in any FERC jurisdictional activities but is the parent company of several FERC jurisdictional entities, including PSEG ER&T (and its subsidiary PSEG Solutions), PSEG Fossil, PSEG Nuclear, PSEG Power CT, PSEG New Haven and PSEG Power Ventures (which owns PSEG Solar Source LLC).

PSEG Power Ventures LLC ("Power Ventures") and PSEG Solar Source LLC. PSEG Power Ventures is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source LLC and has an in-direct ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 349 MWs DC (274 MW AC) of solar capacity across the United States, including a combined 92 MWs[22] (72 MW AC) of solar capacity in PJM and approximately the following amount of MWs in the following states all through separate project companies which have all obtained QF status:

- 15 MWs (12 MW AC) in Florida;
- 92 MWs in PJM (72 MW AC) – 12 MWs in Ohio, 2 MWs in New Jersey, 15 MWs in Delaware, 50 MWs in North Carolina and 13 MWs in Maryland;
- 45 MWs in Arizona (34 MW AC) – 25 MW Queen, approximately 20 MW Badger;
- 13 MWs (10 MW AC) in Texas;

[22] The 92 MWs are attributed to four (7) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs) Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

- 34 MWs (25 MW AC) in California;[23]
- 4 MWs (3 MW AC) in Vermont;
- 74 MW (60 MW AC) in Colorado (to be in operation in 2016) – 38 MWs for San Isabel and 36 MWs for Bison;
- 62 MW (50 MW AC) in Utah;
- 10.5 MW (8 MW AC) in Oregon; and
- 47.2 MW (36 MW AC) in North Carolina.

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that, through its subsidiaries owns interests, through leveraged leases, in various generation stations and other real estate holdings. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC. PSEG Power NY is a Delaware limited liability company and an EWG that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 835 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a FERC-approved cost-based contract.[24]

PSEG Long Island LLC ("PSEG Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution system ("T&D") on Long

[23] The 28 MWs (DC) are associated with the Shasta Solar Facility in California (4 MW), Whitehorn Solar (3 MWs) the Columbia Solar Project (19 MW). All have obtained QF status.

[24] *PSEG Power New York Inc.*, Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither PSEG Long Island nor Servco will be FERC jurisdictional public utilities as neither will exercise ultimate decision making authority over the T&D system in Long Island. PSEG Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[25]

D. Affiliated Transmission Ownership

With the exception of the electric transmission assets owned by PSE&G, all of which are located within the PJM RTO, and the generation interconnection facilities owned by the various EWG and QF affiliates listed herein, neither PSEG Keys nor any of its affiliates own or operate FERC jurisdictional electric or natural gas transmission facilities within the United States. As discussed below, FERC granted PSE&G a Hinshaw exemption in 1954, finding that it was exempt from the provisions of the Natural Gas Act.

E. JOINTLY OWNED FACILITIES

PSEG Nuclear is a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear is the operator of Salem and Exelon Generation is the operator of Peach Bottom.[26] PSEG Fossil is approximately a 23% joint owner in the Conemaugh and Keystone generating stations

[25] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), *order dismissing request for rehearing*, 145 FERC ¶ 61,183 (2013).

[26] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in Appendix E. The ownership percentages have not changed since the date of this letter. PSEG Nuclear owns a 50% interest in Peach Bottom and a 57.41% interest in Salem.

located in Pennsylvania. An affiliate of NRG Energy is the operator.[27] Accordingly, for purposes of the December 2016 triennial analysis, the capacity of Salem, Peach Bottom, Conemaugh and Keystone was attributed to PSEG in accordance with PSEG's ownership interests in these facilities.

PSEG Fossil and Jersey Central Power and Light Company ("JCP&L") are each 50% co-owners of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to the unit. Accordingly, for the purpose of the December 2016 triennial market power analysis, the entire unit capacity – nominally 400 MWs – was assigned to JCP&L.[28]

III. REQUEST FOR MARKET-BASED RATE AUTHORITY

PSEG Keys respectfully requests authorization to sell electric energy, capacity, and ancillary services at market-based rates in the PJM market. The Commission allows wholesale sales of energy and capacity at market-based rates if the seller and its affiliates do not have, or have adequately mitigated, the ability to exercise horizontal and vertical market power in any relevant market.[29] As demonstrated below, neither PSEG Keys nor

[27] A letter of concurrence supporting the allocation of plant output based on ownership interest is attached in Appendix E. The ownership percentages have not changed since the date of this letter.

[28] A letter of concurrence supporting this determination is attached in Appendix E. The ownership percentages have not changed since the date of this letter.

[29] *See* 18 C.F.R. §§ 35.37 and 35.38 (2011); and *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 697, FERC Stats. & Regs. ¶ 31,252, *clarified*, 121 FERC ¶ 61,260 (2007), *order on reh'g*, Order No. 697-A, FERC Stats. & Regs. ¶ 31,268, *clarified*, 124 FERC ¶ 61,055, *order on reh'g*, Order No. 697-B, FERC Stats. & Regs. ¶ 31,285 (2008), *order on reh'g*, Order No. 697-C, FERC Stats. & Regs. ¶ 31,291 (2009), *order on reh'g*, Order No. 697-D, FERC Stats. & Regs. ¶ 31,305 (2010), *aff'd sub nom. Montana Consumer Counsel v. FERC*, 659 F.3d 910 (9th Cir. 2011).

its affiliates have the ability to exercise market power in the PJM geographic market. Accordingly, PSEG Keys meets the Commission's requirements for receiving authority to make sales of energy, capacity and ancillary services at market-based rates.

(1) PSEG Keys Fully Satisfy the Commission's Standards For Authority to Make Power Sales at Market-Based Rates

Pursuant to Order No. 697[30] and 697-A,[31] an applicant seeking market-based rate authority must demonstrate that, in the relevant markets, it does not possess horizontal or vertical market power. The Commission allows power sales at market-based rates if the seller (and any affiliates) do not have, or have adequately mitigated, horizontal and vertical market power. The Commission requires that an applicant seeking market-based rate authority show that it does not possess horizontal market power by demonstrating that it and its affiliates can pass the market power screen, "unless the seller and its affiliates do not own or control generation capacity or all of their capacity is fully committed."[32] To demonstrate that an applicant does not possess vertical market power, it must show that it lacks market power and does not control any other barrier to market entry in the relevant markets.[33] In addition, as established in the December 2016 triennial

[30] *Market-Based Rates For Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, 119 FERC ¶ 61,295 (2007).

[31] *Market-Based Rates For Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, 123 FERC ¶ 61,055 (2008).

[32] Refinements to Policies and Procedures for Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities, 153 FERC ¶ 61,065, at p. 28 (2015) ("Order No. 816); see also 18 C.F.R. § 35.37(c)(1); Order No. 697 at p. 62.

[33] *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 697, at p. 8, FERC Stats. & Regs. ¶ 31,252, clarified, 121 FERC ¶ 61,260 (2007), order on reh'g, Order No. 697-A, FERC Stats. & Regs. ¶ 31,268, clarified, 124 ¶61,055, order on reh'g, Order No. 697-B, FERC Stats. & Regs. ¶ 31,285 (2008), order on reh'g, Order No. 697-C, FERC Stats. & Regs. ¶ 31,291 (2009), order on reh'g, Order No. 697-D, FERC Stats. & Regs. ¶ 31,305 (2010). Applicants must (continued…)

analysis, neither PSEG Keys nor any of its affiliate have any market power concerns or have adequately mitigated same.[34]

A. Horizontal Market Power

The Commission evaluates whether a seller can exercise horizontal market power in a relevant market through two indicative screens: (1) a pivotal supplier analysis; and (2) a wholesale market share analysis. If a seller passes both screens, there will be a rebuttable presumption that the seller lacks market power.[35] Each indicative screen is applied with respect to "relevant geographic markets" for an applicant's generating units. The Commission requires that an applicant seeking market-based rate authority show it does not possess horizontal market power by demonstrating that it and its affiliates can pass the market power screen, "unless the seller and its affiliates do not own or control generation capacity or all of their capacity is fully committed."[36]

Applicants located in ISOs/RTOs possessing sufficient market structure may consider the geographic region under the control of the ISO/RTO as the relevant default geographic region for purposes of completing their generation market power analyses.[37] However, where the Commission has previously found a "submarket" to exist within a boundary of an RTO, such finding is controlling as to the scope of the relevant

---

also comply with affiliate abuse restrictions; however, again, such regulations are inapplicable to Applicant. *See* 18 C.F.R. § 35.39.

[34] Triennial Market Power Update in Compliance with Order No. 697, *PSEG Energy Resources & Trade LLC, et al.*, Docket Nos. ER10-1768-004 (December 28, 2016) ("December 2016 Triennial Filing").

[35] 18 C.F.R. § 35.37(c)(1) (2011).

[36] *Refinements to Policies and Procedures for Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, 153 FERC ¶ 61,065, at p. 28 (2015) ("Order No. 816"); see also 18 C.F.R. § 35.37(c)(1); Order No. 697 at p. 62.

[37] Order No. 697 at PP 231, 235.

geographic market for all generation units located within that submarket for the application of the indicative screens and any delivered price test that may be performed. The Commission further listed several such submarkets, including PJM East ("PJME"),[38] PJM East of 5004/5005 ("PJM50") and PJM East of AP South ("PJMAP") that would be relevant to an MBR analysis for applicants in the Northeast Region.[39]

As shown in the attached Appendix G, Dr. John Morris has updated Applicant's market power analysis that was submitted in the December 2016 Triennial Filing. Specifically, Dr. Morris' update of the market-based rate screens accounts for the addition of the 755 MWs from the PSEG Keys Energy Center and the retirements of the Mercer and Hudson generating plants (1252 MWs).[40] Dr. Morris' updated analysis shows that there has been only a minor increase in the market power with the addition of the PSEG Key Energy Center since the December 2016 Triennial Filing. This minor increase should not be viewed to impact the factors that Dr. Morris relied upon in his findings in the December 2016 Triennial Filing that the PSEG Companies with market-based rate authority have satisfied the requirements demonstrating that they lack horizontal and vertical market power. Specifically, Dr. Morris analysis shows that with the addition of PSEG Keys, the PSEG Companies still pass all of the pivotal suppler

[38] Order No. 697 at P 236 (citing *Exelon Corp.*, 112 FERC ¶ 61,011, *reh'g denied*, 113 FERC ¶ 61,299 (2005)). FERC eliminated the Northern PSEG zone as a default submarket in Order No. 697-A at P 99.

[39] Order Conditionally Authorizing Merger and Disposition of Jurisdictional Facilities, *Exelon Corporation, et al.*, 138 FERC ¶ 61,167 (2012).

[40] Affidavit of Dr. John R. Morris at 1 (dated September 1, 2017), Attached as Appendix G.

analysis ("PSA") screens for all of the relevant markets, namely, PJM, PJMAP, PJME and PJM50.[41]

Dr. Morris' analysis also shows that the PSEG Companies failed only an additional two screens with the addition of PSEG Keys, each by a small quantity, as compared to the December 2016 Triennial Filing in the wholesale market share analysis ("WMSA").[42] Specifically, for PJME, the PSEG Companies failed one market concentration (HHI) screen for the Available Economic Capacity ("AEC"); however, this screen was only 156 above the screening threshold of 2,500.[43] Notably, the PSEG Companies were below the 2500 HHI level for all of the other seasons, which means that the PSEG Companies have little ability to exercise market power even with the addition of PSEG Keys. In addition, for PJME, with the addition of PSEG Keys, the PSEG Companies also failed one additional market share screen for Economic Capacity ("EC") by 0.3 percent above the established threshold of 20 percent.[44] Although the PSEG Companies market shares are greater than the 20 percent screen, their market shares are

[41] *See* attached Appendix A-1, at p. 1. The pivotal supplier analysis ("PSA") focuses on the ability of a seller to exercise unilateral market power. The screen assesses whether market demand can be met during peak times without the applicant and its affiliates. If demand can be met without the applicant and its affiliates, the applicant passes that the PSA screen.

[42] *Id.* The wholesale market share analysis ("WMSA") is applied each season to determine whether an applicant has a dominant market position based on the total number of megawatts of uncommitted capacity owned or controlled by the applicant and its affiliates in relation to the uncommitted capacity of the entire relevant wholesale electricity market. The established threshold is 20 percent; a supplier who has less than 20 percent market share in the relevant market for all seasons passes the WMSA screen.

[43] *See* attached Appendix A-2 at p. 2.

[44] *Id.*

well below the 35 percent threshold that is typically used for imputing unilateral market power.[45]

In sum, with the addition of PSEG Keys (and the retirement of Hudson and Mercer Generation Station), the PSEG Companies failed the market share screen for EC in 5 periods in this update compared to 4 periods in the analysis for the December 2016 Triennial Filing.[46] Therefore, overall, the PSEG Companies have a change in the result in one screen for one period out of a total of 80 periods that were analyzed between EC and AEC for PJME and PJM50.[47] Based on the minor changes in the results since the December 2016 Triennial Filing, we submit that Dr. Morris' determination that PSEG Companies could not exercise horizontal market power still stands with the addition of PSEG Keys. As stated by Dr. Morris in his affidavit:

> Although there are some minor differences in the results from those presented with the December Affidavit, the differences are not material and do not change the conclusions made at that time. Under the standards utilized by the Commission, continuing market-based rates for PSEG and all of its Northeastern affiliates remain in the public interest.[48]

Moreover, Applicants rely on the same RTO monitoring and mitigation described in the December 2016 Triennial Filing to show that it has met the standards necessary to obtain market-based rate authority. Accordingly, it is clear that PSEG Keys has satisfied the standards necessary for market-based rate authority.

[46] *See* Attached Appendix A-2.

[47] *Id.*

[48] Affidavit of Dr. John R. Morris at 2 (dated September 1, 2017), Attached as Appendix G.

B. Vertical Market Power

1. The Applicants Lack Transmission Market Power and Cannot Erect Entry Barriers.

In its previous order accepting the PSEG Companies triennial market power analysis for the Northeast Region, the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding vertical market power.[49] There have been no subsequent changes in status that would reflect a departure from the characteristics the Commission relied upon in granting market-based rate authority. As demonstrated below, PSEG Keys and its affiliates are not able to exercise vertical market power.

PSEG Keys nor its affiliates are able to exercise transmission market power. Neither PSEG Keys nor is affiliates, except PSE&G, own transmission assets in the U.S. other than incidental generator interconnection facilities. PSE&G owns transmission facilities in PJM, but transmission service over those facilities is provided under the PJM Open Access Transmission Tariff.

In addition, neither PSEG Keys nor its affiliates are able to exercise vertical market power in wholesale energy markets through affiliation, ownership or control of inputs to electric power production. As required by Section 35.37(e) of the Commission's regulations, Applicant provides the following information:

(1) PSE&G owns and operates a natural gas distribution system that receives interstate pipeline gas within the State of New Jersey and distributes that

[49] *PSEG Energy Resources & Trade, LLC, et al,* Letter Order, June 29, 2011, Docket No. ER99-3151-017. In addition, in that letter order the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding horizontal market power.

gas to its customers within the State of New Jersey. The distribution system consists of 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3 and peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers. Service over such distribution facilities is made available pursuant to state regulated tariffs on an open access type basis. PSE&G was granted a Hinshaw exemption from the FERC in 1954.[50] The gas distribution rates paid by PSEG Fossil to PSE&G have been set at rates approved by the BPU in an order dated May 29, 2013.

(2) Certain of the PSEG Key's affiliates own sites within the Northeast Region that would be suitable for future generating facilities. These include space at many of the existing generating sites of PSEG Fossil and at the sites of PSEG Power NY and PSEG Power CT. PSEG Nuclear's Salem facility may also be suitable for future construction. PSE&G also owns certain sites that would be suitable for generating facilities, but under New Jersey's Electric Discount and Energy Competition Act, N.J.S.A 48:3-43 et seq., PSE&G is effectively barred from owning and operating generation except "on site" generation for supply and Class I renewable energy resources as defined in N.J.S.A. 48:3-98.1.

[50] 13 F.P.C. 1348 (1954).

(3) Neither PSEG Keys nor any of its affiliates own or control any physical coal supply resources or own or control who may access transportation of coal supplies.

(4) As required by section 35.37(e)(4) of the Commission's regulations, PSEG Keys and its affiliates state that they have not erected barriers to entry into any market, including the PJM, NYISO or ISO-NE market and will not erect barriers to entry into any markets.

IV. SELLER CATEGORY

The PSEG Companies own or control more than 500 MW of electric generation in the Northeast Region and include an entity that owns transmission facilities in the Northeast Region. Therefore, PSEG Keys is a Category 2 Seller in the Northeast Region.

PSEG Keys qualifies as a Category 1 seller in the Central, Northwest, Southeast, Southwest and Southwest Power Pool regions. As shown by a review of Appendix B, PSEG Keys nor its affiliates own or control in the aggregate more than 500 MWs of electric generation in any of such regions. Moreover, PSEG Keys: (i) does not own, operate or control transmission facilities other than limited equipment necessary to connect individual generating facilities to the transmission grid in such regions; (ii) is not affiliated with anyone that owns, operates or controls transmission facilities in such regions; and (iii) is not affiliated with a franchised public utility in such regions. Finally, as discussed above, neither PSEG Keys nor its affiliates raise other vertical market power issues.

V. REQUEST FOR WAIVERS, BLANKET AUTHORITY AND ADDITIONAL FINDING

PSEG Keys respectfully request that the Commission grant their waivers and blanket authorization consistent with those granted to other entities with market-based rate authority.[51] Specifically, PSEG Keys requests the following:

- Waiver of the accounting, reporting, and other requirements of Parts 41, 101, and 141 of the Commission's regulations, with the exception of 18 C.F.R. §§ 141.14 and 141.15;
- Waiver of the full filing requirements of subparts B and C of Part 35 of the Commission's regulations, except the transmittal requirements of 18 C.F.R. §§ 35.12(a), 35. 13(b), and the notification of succession and cancellation of service requirements of 18 C.F.R. §§ 35.15 and 35.16;
- Blanket authorization under Section 204 of the FPA and Part 34 of the Commission's regulations for future issuances of securities and assumptions of liability; and
- Such other appropriate waivers and authorizations as the Commission may deem appropriate.

VI. APPENDIX OF ASSETS

As required by section 35.37(b) of the Commission's regulations, Appendix B to this application provides an appendix of assets in the form provided in Appendix B of Subpart H of Part 35 of the Commission's regulations.

[51] *See* Order No. 697 at PP 984, 999, & n. 1126.

20170906-5081 FERC PDF (Unofficial) 9/6/2017 12:48:53 PM

VII. EFFECTIVE DATE

PSEG Keys respectfully requests that the Commission accept PSEG Key's tariff effective on November 1, 2017.

VIII. DOCUMENTS SUBMITTED WITH FILING

The following documents are submitted with this application.

- Appendix A: Updated Market Power Analysis
    - A-1 PSEG 2016 MBR for PJM – Add Keys and Retire Mercer and Hudson
    - A-2 Delivered Price Test
- Appendix B: Appendix of Assets
- Appendix C: Appendix of Transmission Assets
- Appendix D: Appendix of Long Term Purchase Agreements
- Appendix E: PSEG Key's Tariff
- Appendix F: December 2016 Triennial Filing
- Appendix G: Affidavit of John Morris

20170906-5081 FERC PDF (Unofficial) 9/6/2017 12:48:53 PM

IX. CONCLUSION

PSEG Keys respectfully requests that the Commission: (1) accept for filing the proposed market-based rate tariff for PSEG Keys contained herein; (2) authorize PSEG Keys to sell energy, capacity, and certain ancillary services at market-based rates; and (3) grant such waivers and blanket authorizations as the Commission has granted to other entities with market-based rate authorization, as described herein.

Respectfully submitted,

PSEG Keys Energy Center LLC

Re: PSEG Keys Energy Center LLC
Docket No. ER17-_____-000
Application for Market-Based Rate Authorization and Request for Waivers and Blanket Approvals

Dear Secretary Bose:

Pursuant to Section 205 of the Federal Power Act, Rules 204 and 205 of the Rules of Practice and Procedure of the Federal Energy Regulatory Commission ("Commission"), and Part 35 of the Commission's regulations, PSEG Keys Energy Center LLC ("PSEG Keys" or "Applicant") hereby submits for filing an application for market-based rate authorization and request for waivers and blanket approvals. The enclosed application requests that the Commission: (1) accept for filing the proposed market-based rate tariff for PSEG Keys contained herein; (2) authorize PSEG Keys to sell energy, capacity, and certain ancillary services at market-based rates; (3) grant such waivers and blanket authorizations as the Commission has granted to other entities with market-based rate authorization; and (4) find that a change in status report is not required.

In addition to the application, the following documents are included:

- Appendix A: Updated Market Power Analysis
  - A-1 PSEG 2016 MBR for PJM – Add Keys and Retire Mercer and Hudson
  - A-2 Delivered Price Test
- Appendix B: Appendix of Assets
- Appendix C: Appendix of Transmission Assets
- Appendix D: Appendix of Long Term Purchase Agreements

1. **Availability.** PSEG Keys Energy Center LLC ("PSEG Keys" or "Seller") will make wholesale electric energy, capacity, and ancillary services available under this Tariff to any purchaser for resale, except as prohibited below.

2. **Applicability.** This Tariff is applicable to all sales of energy, capacity, and ancillary services by PSEG Keys not otherwise subject to a particular rate schedule of PSEG Keys.

3. **Rates.** All sales shall be made at the rates established between the purchaser and PSEG Keys.

4. **Other Terms and Conditions.** All other terms and conditions shall be established by agreement between the purchaser and PSEG Keys.

5. **Compliance with Commission Regulations.** PSEG Keys shall comply with the provisions of 18 C.F.R. Part 35, Subpart H, as applicable, and with any conditions the Commission imposes in its orders concerning PSEG Key's market-based rate authority, including orders in which the Commission authorizes PSEG Keys to engage in affiliate sales under this Tariff or otherwise restricts or limits the PSEG Key's market-based rate authority. Failure to comply with the applicable provisions of 18 C.F.R. Part 35, Subpart H, and with any orders of the Commission concerning PSEG Key's market-based rate authority, will constitute a violation of this Tariff.

6. **Limitations and Exemptions Regarding Market Based Rate Authority.** PSEG Keys does not have any limitations on its market-based rate authority except as other provided in this Tariff. The Commission granted Seller in Docket No. ER17-___-000 the following waivers and blanket authorization: (a) waiver of Subparts B and C of Part 35 of the Commission's regulations requiring the filing of cost-of-service information, except for sections 35.12(a), 35.13(b), 35.15 and 35.16; (b) waiver of the requirements of Part 41 and Part 101; (c) waiver of Part 141 of the Commission's regulations concerning accounting and reporting requirements, with the exception of 18 C.F.R. §§ 141.14 and 141.15; and (d) blanket approval as to Section 204 of the FPA and Part 34 of the Commission's regulations for all future issuances of securities and debt and assumption of liabilities.

7. **Ancillary Services.**

   Third-party ancillary services: PSEG Keys offers Regulation and Frequency Response Service, Reactive Supply and Voltage Control Service, Energy and Generator Imbalance Service, Operating Reserve-Spinning, and Operating Reserve-Supplemental. Sales will not include the following: (1) sales to an RTO or an ISO, *i.e.*, where that entity has no ability to self-supply ancillary services but instead depends on third parties; and (2) sales to a traditional, franchised public utility affiliated with the third-party supplier, or sales where the underlying transmission service is on the system of the public utility affiliated with the third-party supplier.

20170901-5226 FERC PDF (Unofficial) 9/1/2017 4:56:13 PM

Sales of Operating Reserve-Spinning and Operating Reserve-Supplemental will not include sales to a public utility that is purchasing ancillary services to satisfy its own open access transmission tariff requirements to offer ancillary services to its own customers, except where the Commission has granted authorization. Sales of Regulation and Frequency Response Service and Reactive Supply and Voltage Control Service will not include sales to a public utility that is purchasing ancillary services to satisfy its own open access transmission tariff requirements to offer ancillary services to its own customers, except at rates not to exceed the buying public utility transmission provider's OATT rate for the same service or where the Commission has granted authorization.

8. **Seller Category.** PSEG Keys is a Category 2 Seller in the Northeast Region and a Category 1 seller in the Central, Northwest, Southeast, Southwest and Southwest Power Pool regions, as defined by 18 C.F.R. 35.36(a),

9. **Effective Date.** This Tariff is effective on the date specified by the Commission. This Tariff shall continue in effect until terminated or changed in accordance with any applicable regulatory requirements.

20170901-5226 FERC PDF (Unofficial) 9/1/2017 4:56:13 PM

1. **Availability.** PSEG Keys Energy Center LLC ("PSEG Keys" or "Seller") will make wholesale electric energy, capacity, and ancillary services available under this Tariff to any purchaser for resale, except as prohibited below.

2. **Applicability.** This Tariff is applicable to all sales of energy, capacity, and ancillary services by PSEG Keys not otherwise subject to a particular rate schedule of PSEG Keys.

3. **Rates.** All sales shall be made at the rates established between the purchaser and PSEG Keys.

4. **Other Terms and Conditions.** All other terms and conditions shall be established by agreement between the purchaser and PSEG Keys.

5. **Compliance with Commission Regulations.** PSEG Keys shall comply with the provisions of 18 C.F.R. Part 35, Subpart H, as applicable, and with any conditions the Commission imposes in its orders concerning PSEG Key's market-based rate authority, including orders in which the Commission authorizes PSEG Keys to engage in affiliate sales under this Tariff or otherwise restricts or limits the PSEG Key's market-based rate authority. Failure to comply with the applicable provisions of 18 C.F.R. Part 35, Subpart H, and with any orders of the Commission concerning PSEG Key's market-based rate authority, will constitute a violation of this Tariff.

6. **Limitations and Exemptions Regarding Market Based Rate Authority.** PSEG Keys does not have any limitations on its market-based rate authority except as other provided in this Tariff. The Commission granted Seller in Docket No. ER17-___-000 the following waivers and blanket authorization: (a) waiver of Subparts B and C of Part 35 of the Commission's regulations requiring the filing of cost-of-service information, except for sections 35.12(a), 35.13(b), 35.15 and 35.16; (b) waiver of the requirements of Part 41 and Part 101; (c) waiver of Part 141 of the Commission's regulations concerning accounting and reporting requirements, with the exception of 18 C.F.R. §§ 141.14 and 141.15; and (d) blanket approval as to Section 204 of the FPA and Part 34 of the Commission's regulations for all future issuances of securities and debt and assumption of liabilities.

7. **Ancillary Services.**

   Third-party ancillary services: PSEG Keys offers Regulation and Frequency Response Service, Reactive Supply and Voltage Control Service, Energy and Generator Imbalance Service, Operating Reserve-Spinning, and Operating Reserve-Supplemental. Sales will not include the following: (1) sales to an RTO or an ISO, *i.e.*, where that entity has no ability to self-supply ancillary services but instead depends on third parties; and (2) sales to a traditional, franchised public utility affiliated with the third-party supplier, or sales where the underlying transmission service is on the system of the public utility affiliated with the third-party supplier.

20170901-5226 FERC PDF (Unofficial) 9/1/2017 4:56:13 PM

Sales of Operating Reserve-Spinning and Operating Reserve-Supplemental will not include sales to a public utility that is purchasing ancillary services to satisfy its own open access transmission tariff requirements to offer ancillary services to its own customers, except where the Commission has granted authorization. Sales of Regulation and Frequency Response Service and Reactive Supply and Voltage Control Service will not include sales to a public utility that is purchasing ancillary services to satisfy its own open access transmission tariff requirements to offer ancillary services to its own customers, except at rates not to exceed the buying public utility transmission provider's OATT rate for the same service or where the Commission has granted authorization.

8. **Seller Category.** PSEG Keys is a Category 2 Seller in the Northeast Region and a Category 1 seller in the Central, Northwest, Southeast, Southwest and Southwest Power Pool regions, as defined by 18 C.F.R. 35.36(a),

9. **Effective Date.** This Tariff is effective on the date specified by the Commission. This Tariff shall continue in effect until terminated or changed in accordance with any applicable regulatory requirements.

PSEG Services Corporation

December 28, 2016

ELECRONICALLY AND VIA OVERNIGHT MAIL

Kimberly J. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, DC 20426

RE: Triennial Market Power Update in Compliance with Order No. 697:
***PSEG Energy Resources & Trade LLC*, Docket No. ER99-3151-____;**
***Public Service Electric and Gas Company*, Docket No. ER97-837-____;**
***PSEG Power Connecticut LLC*, Docket No. ER03-327 -___;**
***PSEG Fossil LLC*, Docket No. ER08-447-___;**
***PSEG Nuclear LLC*, ER08-448-___; and**
***PSEG New Haven LLC*, ER12-1250-___**
Pavant Solar II LLC, ER16-1925-___
San Isabel Solar LLC, ER16-1926-___
Bison Solar LLC, ER16-1924-___
PSEG Energy Solutions LLC, ER16-2725-___

Dear Secretary Bose:

Pursuant to the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), Public Service Electric and Gas Company ("PSE&G"), PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear"), PSEG New Haven LLC ("PSEG New Haven") Pavant Solar II LLC, San Isabel Solar LLC, Bison Solar LLC and PSEG Energy Solutions LLC (collectively the "Applicants" or "PSEG") hereby jointly submit for filing their updated market power analysis in support of their continued eligibility to engage in market-based rates

transactions. This market power analysis satisfies the requirements of Order No. 697[1] for the filing of updated market power analyses on a regional schedule basis by holders of market-based rate certificates and their affiliates. In accordance with the regional schedule for those utilities in the Northeast Region, as modified by the MBR Clarifying Order, this filing is being made by the December 2016 deadline.[2] In conformance with the Commission's requirements, except when expressly noted otherwise, the market power analysis is based on activity during the study period from December 1, 2014 through November 30, 2015 ("study period").

PSEG, through its subsidiary PSE&G, owns transmission facilities within the Northeast Region. Specifically, PSE&G owns transmission facilities in the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization. PSEG Power LLC and its subsidiaries do not own any transmission facilities other than transmission to connect generating units to the grid in PJM, the New York Independent System Operator, Inc. ("NYISO") and ISO New England Inc. ("ISO-NE").

In their original applications for market-based rate authority and previously-submitted updates to the Commission, PSEG ER&T, PSE&G, PSEG Power CT, PSEG Fossil, PSEG Nuclear and PSEG New Haven demonstrated that they and their affiliates: (a) do not exercise generation market power; (b) lack the ability to manipulate access to transmission facilities that they own or control; and (c) cannot erect any other barriers to market entry. As further demonstrated herein and in the Affidavit of Dr. John R. Morris attached hereto in the appendices, Applicants continue to satisfy the Commission's requirements to sell energy, capacity and ancillary services at market-based rates and thus should be permitted to continue to make such sales.

I. SERVICE AND COMMUNICATION

All service and correspondence related to this matter should be directed to the following individuals:

[1] 18 C.F.R. Part 35, Subpart H (2007); Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

[2] This filing is made on the three year anniversary of the December 2013 deadline set forth in Order No. 697 Appendix D.

As to the Applicants Generally:

Kenneth Carretta, Esq.
Deputy General Counsel
PSEG Services Corporation
80 Park Plaza, T5G
Newark, NJ 07102
(973) 430-6462
(973) 430-5983 (facsimile)
Kenneth.carretta@pseg.com

David K. Richter, Esq.
Associate General Regulatory and Property Counsel
PSEG Services Corporation
80 Park Plaza, T5G
Newark, NJ 07102
(973) 430-6451
(973) 430-5983 (facsimile)
David.Richter@PSEG.com

Applicants request waiver of Rule 203(b)(3)[3] so that a copy of any communications in these proceedings may be served on all persons listed above.

II. DESCRIPTION OF THE APPLICANTS AND RELEVANT AFFILIATES

A. The Applicants

The Applicants are each wholly owned, direct and indirect subsidiaries of Public Service Enterprise Group Incorporated ("PSEG"). PSEG is a public utility holding company engaged in, among other things, the generation of electric energy and the transmission, distribution and sale of electricity and natural gas through its subsidiaries.

1. Public Service Electric and Gas Company

PSE&G is a public utility operating company engaged primarily in the transmission of electricity, and the provision of gas and electric distribution service in the State of New Jersey. During the study period, PSE&G owned less than 140 MW of solar generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities. PSE&G is a member of the PJM Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access

[3] 18 C.F.R. § 385.203(b)(3).

Transmission Tariff ("OATT") administered by PJM. PSE&G is authorized to sell power at market-based rates and makes wholesale sales falling within several different categories, as described below.

Non-utility generation ("NUG") output. PSE&G's NUG output expired in 2015 and 2016 pursuant to the terms of the NUG contracts. PSE&G currently has no further NUG obligations, other than 0.6 MW of energy associated with the former Kinsley Landfill which no longer operates. .

Solar. In 2007, the New Jersey legislature passed Regional Greenhouse Gas Initiative ("RGGI") legislation authorizing state utilities to invest in renewable resources such as wind or solar in order to promote increased use of renewable resources within the state and in turn reduce greenhouse gas emissions. *See* L. 2007, c. 340, codified at N.J.S.A. 48:98-1. The NJBPU has approved two (2) PSE&G Solar 4 All® (S4A) programs under which PSE&G has sited, designed and built twenty-nine (29) grid connected solar facilities. PSE&G currently owns and operates approximately 115MW-dc of grid connected solar under the S4A program. PSE&G expects the S4A fleet to increase to approximately 125MW-dc by the end of 2016. In 2016, PSE&G received NJBPU approval of its Solar 4 All Extension II filing to install an additional 33MW-dc of grid connected solar on landfills and brownfields in the PSE&G electric service territory.

2. PSEG Energy Resources & Trade LLC

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.,* which initiated the transition from a regulated to a competitive retail power market in New Jersey, BPU annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSEG ER&T has participated directly in all of the auctions for BGS supply held since 2004, has been a winning bidder in these auctions and has incurred contractual

commitments to provide supply to BGS load pursuant to BPU approved contracts beginning with the 2004 auction and continuing to the present

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract remains in effect and provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply: On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015.

3. PSEG Fossil LLC

PSEG Fossil is an Exempt Wholesale Generator ("EWG") and is authorized to sell power at market-based rates. PSEG Fossil owns and operates electric generation facilities located within PJM and sells their entire output to its affiliate PSEG ER&T.[4] The assets of PSEG Fossil (and its subsidiary, PSEG Keys Energy Center LLC ("PSEG Keys")) are located entirely within PJM. However, PSEG Fossil's subsidiaries PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Power New York LLC and PSEG New Haven LLC own facilities in ISO-NE and NYISO. As noted below, PSEG Fossil also co-owns certain facilities in PJM.

PSEG Fossil and its subsidiaries PSEG Power CT and PSEG Keys are currently beginning construction on three new gas-fired generation units. PSEG Fossil is constructing Sewaren 7[5] which is a 540 MW combined cycle unit in Woodbridge, New Jersey which is expected to be in-service in 2018, PSEG Keys is constructing a 755 MW combined cycle unit in Prince George's County, Maryland which is expected to be in service in 2018 and PSEG Power CT is constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

Since the last triennial filing in December 2013 PSEG Fossil has retired 1,813.5 MWs (nameplate) inclusive of the following units:

Kearny 9 (18.6 MW)
Bergen 3 (18.6 MW)

[4]These contracts were originally approved by the Commission as cost-based contracts. *See Public Service Electric and Gas Company*, et al., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Fossil obtained market based rate authority covering sales from its generating units.

[5] Once Sewaren 7 begins commercial operation, PSEG Fossil plans to retire Sewaren 1, 2, 3 and 4.

Bridgeport 2 (179.5 MW)
Burlington 8 (18.6 MW
Burlington 9 (162.4 MW)
Burlington 11 (162.4 MW)
Edison 1 (167.4 MW)
Edison 2 (167.4 MW)
Edison 3 (167.4 MW)
Essex 10 (167.4 MW)
Essex 11 (167.4 MW)
Essex 12 (167.4 MW)
Mercer 3 (115.2 MW)
National Park (18.6 MW)
Sewaren 6 (115.2 MW)

In addition, PSEG Fossil, LLC notified PJM of its intent to retire Hudson 2 (659 MW nameplate rating) and Mercer Units 1 and 2 (652MW nameplate rating) by June 1, 2017.

PSEG Fossil satisfies most of the electricity needs of its plants from PJM under PJM's "station power" Tariff provisions. PSEG Fossil procures gas supply for its plants from PSEG ER&T and receives gas distribution service from PSE&G at a rate approved by the BPU on May 29, 2013.[6]

4. PSEG Power Connecticut LLC

PSEG Power CT is a Connecticut limited liability company and an EWG that owns and operates electric generation facilities in the State of Connecticut and is authorized to sell power at market-based rates.[7] Both of PSEG Power CT's generation facilities, Bridgeport Harbor and New Haven Harbor, are located in the State of Connecticut within the market administered by ISO-NE. PSEG Power CT sells the output of its generation facilities to its affiliate PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. As noted above, PSEG Power CT is currently constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

5. PSEG New Haven LLC

PSEG New Haven is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG New Haven owns and operates a facility (the "New Haven facility") in New Haven, Connecticut with a nameplate rating of 181 MWs. The New Haven facility is located within the New Haven Harbor generation station. The New Haven facility is interconnected to the adjacent United Illuminating East Shore Substation using a 115 KV underground cable. PSEG New Haven has no other

[6] BPU Docket No. GM12100935 (May 29, 2013).
[7] *Wisvest Corporation,* et al., 101 FERC ¶ 61,166 (2002).

generation assets. The commercial operation date for the New Haven facility was June 1, 2012 and PSEG New Haven has obtained MBR authority from FERC.[8]

The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[9] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[10] All of the energy and capacity of the New Haven facility is sold into the ISO New England ("ISO-NE") markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA[11] has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder. The 181 MW nameplate rating of the New Haven Facility has not been included in the capacity controlled by PSEG for purposes of Dr. Morris' market power analysis.

6. PSEG Nuclear LLC

PSEG Nuclear is an EWG[12] and is authorized to sell power at market-based rates. PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission.[13] The assets of PSEG Nuclear are located entirely within PJM. PSEG Nuclear performed the following uprates since the last triennial filing: (1) an uprate of 120 MWs at its Hope Creek plant in 2014, which increased its nameplate rating to 1290 MWs, (2) an uprate to Peach Bottom 2 and 3 which increases PSEG's share of the nameplate MWs by 241 MWs for a updated nameplate of 704 MW for Peach Bottom 2 and 689 MWs for Peach Bottom 3.

7. Pavant Solar LLC, San Isabel Solar LLC and Bison Solar LLC

PSEG Power Ventures portfolio includes three (3) solar companies with market-based rate authority: (1) *Pavant Solar II LLC*[14] is a QF which owns a 50 MW (AC) solar facility in Fillmore Utah; (2) *San Isabel Solar LLC*[15] is a QF which owns a 30 MW (AC)

solar facility in Las Animas County, Colorado and (3) *Bison Solar LLC*[16] is a QF which owns a 30 MW (AC) solar facility 25 miles north of Fort Collins, Colorado.

8. PSEG Energy Solutions LLC

PSEG Energy Solutions LLC ("PSEG Solutions") is a Delaware limited liability company and a direct subsidiary of PSEG ER&T. PSEG Solutions obtained market-based rate authority[17] and will operate within the PJM Interconnection, L.L.C. ("PJM"), New York Independent System Operator, Inc. ("NYISO") and ISO New England Inc. ("ISO-NE") markets. Energy Solutions will purchase power from the regional transmission organization ("RTO") at wholesale and sell it to retail customers. PSEG Solutions will not own or operate any generation assets. PSEG Solutions proposes to begin its retail business on January 1, 2017.

OTHER RELEVANT AFFILIATES

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities, as discussed below.

7. Affiliated Generation Ownership.

A list of the Applicants' affiliated domestic FERC jurisdictional generation assets owned is contained in Appendix B attached hereto. [18] Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the Northeast Region are described below:

PSEG Power LLC ("PSEG Power") was formed in 1999 to acquire the former generation assets of PSE&G. PSEG Power, a Delaware limited liability company, does not directly own any generation facilities or engage in any FERC jurisdictional activities but is the parent company of several FERC jurisdictional entities, including Applicants PSEG ER&T (and it subsidiary PSEG Energy Solutions LLC), PSEG Fossil, PSEG Nuclear, PSEG Power CT, PSEG New Haven and PSEG Power Ventures LLC (which owns PSEG Solar Source LLC).

PSEG Power Ventures LLC and PSEG Solar Source LLC. PSEG Power Ventures LLC ("Power Ventures") is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source LLC and has an in-direct ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 349 MWs DC (274 MW AC) of solar capacity across the United States, including a combined 92

[16] *Bison Solar LLC*, Docket No. QF16-711-001.
[17] See Letter Order dated December 21, 2016 in Docket No. ER16-2725-000.
[18] Appendix B excludes generation assets located in Hawaii as well as generation assets in which PSEG's interest is limited to a leveraged lease interest.

MWs[19] (72 MW AC) of solar capacity in PJM and approximately the following amount of MWs in the following states all through separate project companies which have all obtained QF status.

- 15 MWs (12 MW AC) in Florida,
- 92 MWs in PJM (72 MW AC) – 12 MWs in Ohio, 2 MW in New Jersey, 15 MW in Delaware, 50 MW in North Carolina and 13 MW in Maryland
- 45 MWs in Arizona (34 MW AC) – 25 MW Queen, approximately 20 MW Badger
- 13 MWs (10 MW AC) in Texas,
- 34 MWs (25 MW AC) in California[20]
- 4 MWs (3 MW AC) in Vermont and
- 74 MW (60 MW AC) in Colorado (to be in operation in 2016) – 38 MWs for San Isabel and 36 MWs for Bison
- 62 MW (50 MW AC) in Utah (to be in operation in 2016).
- 10.5 MW (8 MW AC) in Oregon (to be in operation in 2016).

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company and an EWG that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a FERC-approved cost-based contract.[21]

---

[19] The 92MWs are attributed to four (7) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs) Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

[20] The 28MWs (DC) are associated with the Shasta Solar Facility in California (4 MW), Whitehorn Solar (3 MWs) the Columbia Solar Project (19 MW). All have obtained QF status.

[21] *PSEG Power New York Inc.*, Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

PSEG Keys Energy Center LLC ("PSEG Keys") is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG Keys was formed to construct, operate and maintain the Keys Energy Center, a 755MW combined cycle power plant in Prince Georges County, Maryland. Construction began in 2015 and is expected to be completed in 2018 at which time the capacity will be available in the PJM market. All of the output of the Keys Energy Center will be sold to PSEG Keys affiliate, PSEG ER&T.

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution system ("T&D") on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco will be FERC jurisdictional public utilities as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[22]

8. Affiliated Transmission Ownership

With the exception of the electric transmission assets owned by Applicant PSE&G, all of which are located within the PJM RTO, and the generation interconnection facilities owned by the various EWG and QF affiliates listed herein, the Applicants, nor their affiliates have any affiliates that own or operate FERC jurisdictional electric or natural gas transmission facilities within the United States[23]. As discussed below, FERC granted PSE&G a Hinshaw exemption in 1954, finding that it was exempt from the provisions of the Natural Gas Act.

B. JOINTLY OWNED FACILITIES

PSEG Nuclear is a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear is the operator of Salem and Exelon Generation is the operator of Peach Bottom.[24] PSEG Fossil is approximately a 23% joint owner in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[25] Accordingly, for

[22] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), *order dismissing request for rehearing*, 145 FERC ¶ 61,183 (2013).

[23] PSEG Power LLC is a 10% owner of the PennEast Pipeline Company LLC which has filed an application for approval to construct and operate a natural gas transmission line.

[24] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in Appendix E. The ownership percentages have not changed since the date of this letter. PSEG Nuclear owns a 50% interest in Peach Bottom and a 57.41% interest in Salem.

[25] A letter of concurrence supporting the allocation of plant output based on ownership interest is attached in Appendix E. The ownership percentages have not changed since the date of this letter.

purposes of this market power analysis, the capacity of Salem, Peach Bottom, Conemaugh and Keystone has been attributed to PSEG in accordance with PSEG's ownership interests in these facilities.

PSEG Fossil and Jersey Central Power and Light Company ("JCP&L") are each 50% co-owners of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity – nominally 400 MWs – has been assigned to JCP&L.[26]

III. Applicants Fully Satisfy The Commission's Standards For Authority to Make Power Sales At Market-Based Rates.

The Commission allows power sales at market-based rates if the seller and its affiliates do not have, or have adequately mitigated, horizontal and vertical market power.[27] The Commission has also codified affiliate restrictions in its regulations which must be satisfied on an ongoing basis. In previous submissions for market-based rate authority the Applicants PSE&G, PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear, and PSEG New Haven, demonstrated compliance with each of these requirements. As detailed herein and in the attached affidavit, the Applicants continue to meet these standards.

A. The Applicants Lack, Or Have Effectively Mitigated, Any Horizontal Market Power

In the MBR Order, the Commission established two indicative screens: a pivotal supplier screen based on the control area's annual peak demand and a wholesale market share screen applied on a seasonal basis. If an applicant passes both screens, there is a rebuttable presumption that the applicant does not possess horizontal market power. Each indicative screen is applied with respect to "relevant geographic markets" for an applicant's generating units.

Applicants located in ISOs/RTOs possessing sufficient market structure may consider the geographic region under the control of the ISO/RTO as the relevant default geographic region for purposes of completing their generation market power analyses.[28] However, where the Commission has previously found a "submarket" to exist within a boundary of an RTO, such finding is controlling as to the scope of the relevant geographic market for all generation units located within that submarket for the application of the indicative screens and any delivered price test that may be performed. The Commission further listed several such submarkets, including PJM East ("PJME"),

[26] A letter of concurrence supporting this determination is attached in Appendix E. The ownership percentages have not changed since the date of this letter.
[27] MBR Order, FERC Stats. & Regs. ¶ 31,252 at P 62, 399, 408, 440.
[28] *MBR Order at* PP. 231 and 235.

Connecticut and Southwest Connecticut.[29] Subsequent to the MBR order, in approving a merger between Exelon Corporation and Constellation Energy Group, Inc., the Commission identified additional submarkets in PJM - PJM East of 5004/5005 ("PJM50") and PJM East of AP South ("PJMAP") - that would be relevant to an MBR analysis for applicants in the Northeast Region.[30]

As discussed below and in the attached Affidavit of Dr. John Morris contained in Appendix A, Applicants have conducted market power analyses of the entire PJM RTO, the PJME, PJM50 and PJMAP submarkets, the entire NYISO, the entire ISO-NE, the Connecticut submarket and the Southwest Connecticut submarket for the study period. The results are set forth below.

1. Indicative Screens

a. Pivotal Supplier Analysis

The pivotal supplier analysis ("PSA") focuses on the ability of a seller to exercise unilateral market power.[31] The screen assesses whether market demand can be met during peak times without the applicant and its affiliates. If demand can be met without the applicant and its affiliates, the applicant passes that the PSA screen. The Affidavit of Dr. John Morris, attached hereto as Appendix A, finds that the Applicants pass the PSA screen for all relevant markets: PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut, PJMAP, PJME and PJM50.[32]

b. Wholesale Market Share Analysis

The wholesale market share analysis ("WMSA") is applied each season to determine whether an applicant has a dominant market position based on the total number of megawatts of uncommitted capacity owned or controlled by the applicant and its affiliates in relation to the uncommitted capacity of the entire relevant wholesale electricity market.[33] The established threshold is 20 percent; a supplier who has less than 20 percent market share in the relevant market for all seasons passes the WMSA screen.

In his Affidavit Dr. Morris finds that the Applicants pass the WMSA screen for PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut and PJMAP but do not pass the WMSA screen for the PJME and PJM50 submarkets.[34]

---

[29] *Order No. 697* at P 236 (citing *Exelon Corp.*, 112 FERC ¶ 61,011, *reh'g denied*, 113 FERC ¶ 61, 299 (2005)). FERC eliminated the Northern PSEG zone as a default submarket in Order No. 697-A, P 99.

[30] Order Conditionally Authorizing Merger and Disposition of Jurisdictional Facilities, *Exelon Corporation, et al.*, 138 FERC ¶ 61,167 (2012).

[31] *AEP I* at P 72.

[32] *See* Morris Affidavit, at 15-29.

[33] *AEP I,* P 100.

[34] *See* Morris Affidavit, at 15-29.

c. Results of Indicative Screen Analysis

As shown in Dr. Morris's affidavit, Applicants therefore pass both indicative screen tests for PJM RTO, NYISO, ISO-NE, Connecticut and Southwest Connecticut and PJMAP. For PJME and PJM50, the Applicants pass the PSA but do not pass the WMSA.

2. Delivered Price Test Analysis For PJME and PJM50 Submarkets

In accordance with the MBR Order, applicants who fail either indicative screen test can rebut the presumption of market power through the submission of a delivered price test analysis ("DPT"). Applicants may submit this study at the same time that the results of the indicative screens are provided.[35] The DPT is based on two measurements of potential market power: economic capacity ("EC") and available economic capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting native load commitments from EC. Both calculations are performed for ten different season and load conditions.

In applying the DPT, "[a] showing of an HHI less than 2,500 in the relevant market for all season/load conditions for sellers that have also shown that they are not pivotal and do not possess a 20 percent or greater market share in any of the season/load conditions would constitute a showing of a lack of market power, absent compelling contrary evidence from intervenors."[36] However, while meeting these threshold benchmarks provides "safe harbor" protection, the Commission has found in numerous other cases that applicants lack market power even when they exceed one or more of the thresholds for particular study periods. As stated in *Public Service Company of New Mexico*, 115 FERC ¶ 61,090, P 38 (2006), "the Commission weights the results of both the economic and available economic capacity tests and considers the arguments of the applicant and intervenors." (footnote omitted.) [37]

---

[35] *Order No. 697,* P 76.

[36] *Order No. 697* at P 111.

[37] Indeed, in that case, the applicant was deemed "on balance" to have adequately rebutted a showing of market power mitigation for the PNM control area where the results exceeded the 20% safe harbor in two cases under the AEC measure and in all 10 cases at values between 35% and 41% under the EC measure. *See, e.g.*, *Kansas City Power and Light Company, et al.*, Docket Nos. ER99-1005-011 et al. (August 12, 2010) (finding no market power where applicant had EC market shares in the 40-60% range and had significant HHI failures in the KCPL and GMO markets); *Cordova Energy Company LLC et al,* Docket Nos. ER99-2156-011, *et al.*, November 13, 2007 (finding no market power in case where applicant had EC market shares in PACE control area between 53.1% and 60.0%, HHIs between 2,958 and 3,696 and was pivotal in 8 out of 10 periods.); *PacifiCorp*, Letter Order, Docket Nos. ER97-2801-007, *et al.*, February 1, 2007; *Tucson Elec. Power Co.*, 116 FERC ¶ 61,051 (2006)(finding market power standard satisfied where applicant had EC market shares above 20% in all ten season/load periods in the Tucson control area, exceeded the 2,500 HHI threshold in eight periods, and was pivotal in 5 periods); *PacifiCorp*, 115 FERC ¶ 61,349 (2006) (finding that applicants rebutted presumption of market power in the PacifiCorp East control area where under available economic capacity measure, market share is less than 20% in 8 season/load periods and 28% in the summer and winter off-peak periods, HHI does not exceed 2500 in any season/load period and applicants are not pivotal); *Kansas City Power & Light Co.*, 113 FERC ¶ 61,074 (2005) (finding

a. Results of the DPT for PJM50 Submarket

For both the AEC and EC, PSEG passes all screens in all periods except for the pivotal supplier screen in the Summer Top 1% period.

b. Results of the DPT for PJME Submarket

With respect to AEC, PSEG passes all the screens in all 10 periods. With respect to the EC, PSEG passes the Market Concentration screens in all periods. It also passes the Pivotal Supplier Screen in 8 of 10 periods, and passes the Market Share Screen in 6 of 10 periods. PSEG's market shares are never above 25 percent. Although greater than the 20 percent screen, PSEG's market shares are well below the 35 percent threshold that is typically used for imputing unilateral market power.

3. Analysis of DPT Results

Based on his analysis of the overall results, Dr. Morris concludes that, although PSEG fails limited number of screens, the failures are substantially below levels that typically indicate market power. As set forth in his Affidavit, Dr. Morris states that:

> Although PSEG fails some screens in the PJME destination market, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the AEC screens and all market concentration (HHI) screens for EC. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[38] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all the AEC pivotal supplier screens, and most of the EC pivotal supplier screens. This means that typically PSEG's generation is not necessary to serve load; and when its generation is necessary, its forward sale commitments are sufficient so that its uncommitted generation is not necessary to serve the remaining load. Finally, PSEG's market shares are never above 15 percent in PJM50 and for AEC in PJM East. Its market shares for EC are never above 25 percent in PJM East. Although greater than the 20 percent screen, PSEG's market shares are

---

no market power in the KCPL control area where applicant had EC market shares above 20% in all periods, exceeded the HHI 2,500 threshold in 5 of 10 periods and was pivotal supplier in 1 period); *Acadia Power Partners, L.P.*, 113 FERC ¶ 61,073 (2005) (finding no market power in the Cleco Power home control where, utilizing the EC measure, the applicant exceeded the thresholds set for all season/load periods using the market share measure, one season/load period using the market concentration measure, and for all season/load periods using the pivotal supplier measure).

[38] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

well below the 35 percent threshold that is typically used for imputing unilateral market power.[39]

Dr. Morris's conclusion is consistent with Commission precedent finding a lack of market power in cases in which the DPT results included more instances of findings outside of the "safe harbor" thresholds and at higher levels than exist here.[40] In these circumstances, Dr. Morris's analysis successfully rebuts any inference of market power created by the WMSA screen failures for PJME.

4. Existing RTO/ISO Mitigation Rules Also Eliminate The Potential for Exercising Market Power In the PJME, PJME PJM50 and PJMAP Submarkets

PJM mitigation rules eliminate the potential for the exercise of market power in the PJME submarket. The MBR Order specifically contemplated that RTO/ISO mitigation rules may serve as evidence that any market power has been adequately mitigated. The Commission declared, "We believe the added protections provided in structured markets with market monitoring and mitigation generally result in a market where prices are transparent and attempts to exercise of market power will be sufficiently mitigated."[41] The Order on Rehearing went even further and specifically created a presumption that any potential market power had been adequately mitigated by an established and effective RTO market monitoring scheme.[42]

Taking account of the pervasive PJM mitigation rule, Dr. Morris concludes that these rules "fully address the potential for PSEG to exercise market power" in PJME.[43] Accordingly, PJM's mitigation schemes in place are sufficient to rebut any inference of market power created by the failure to pass the WMSA screens in PJME and PJM50.

In addition, in the Applicants' last triennial approval order, the Commission found that "the PJM market monitoring and mitigation rules are sufficient to address market power concerns in the PJM-East submarket."[44]

[41] MBR Order at P 241.

[42] Order No. 697A at P 111.

[43] Morris Affidavit, pp. 24-26.

[44] *See* October 14, 2014 letter order approving Applicants' prior triennial market update in Docket No. ER10-1789-003 et al. at page 3.

a. The Applicants Lack Transmission Market Power and Cannot Erect Entry Barriers.

In its previous order accepting PSEG's triennial market power analysis for the Northeast Region, the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding vertical market power.[45] There have been no subsequent changes in status that would reflect a departure from the characteristics the Commission relied upon in granting market-based rate authority. As demonstrated below, neither Applicants nor any of its affiliates are able to exercise vertical market power.

Applicants are not able to exercise transmission market power. Neither Applicants nor any of their affiliates, except PSE&G, own transmission assets in the U.S. other than incidental generator interconnection facilities. PSE&G owns transmission facilities in PJM but transmission service over those facilities is provided under the PJM Open Access Transmission Tariff.

In addition, neither Applicants nor their affiliates are able to exercise vertical market power in wholesale energy markets through affiliation, ownership or control of inputs to electric power production. As required by Section 35.37(e) of the Commission's regulations, Applicants provide the following information:

(1) PSE&G owns and operates a natural gas distribution system that receives interstate pipeline gas within the State of New Jersey and distributes that gas to its customers within the State of New Jersey. The distribution system consists of 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3 and peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers. Service over such distribution facilities is made available pursuant to state regulated tariffs on an open access type basis. PSE&G was granted a Hinshaw exemption from the FERC in 1954.[46] The gas distribution rates paid by PSEG Fossil to PSE&G have been set at rates approved by the BPU in an order dated May 29, 2013.

(2) Certain of the Applicants and their affiliates own sites within the Northeast Region that would be suitable for future generating facilities. These include space at many of the existing generating sites of PSEG Fossil and at the sites of PSEG Power NY and PSEG Power CT. PSEG Nuclear's Salem facility may also be suitable for future construction. PSE&G also owns certain sites that would be suitable for generating facilities, but under New Jersey's Electric Discount and Energy Competition Act, N.J.S.A 48:3-43 et seq., PSE&G is effectively barred from owning and operating

[45] *Id.*
[46] 13 F.P.C. 1348 (1954).

generation except "on site" generation for supply and Class I renewable energy resources as defined in N.J.S.A. 48:3-98.1.

(3) Neither Applicants nor any of their affiliates own or control any physical coal supply resources or own or control who may access transportation of coal supplies.

(4) As required by section 35.37(e)(4) of the Commission's regulations, Applicants and its affiliates state that they have not erected barriers to entry into any market, including the PJM, NYISO or ISO-NE market and will not erect barriers to entry into any markets.

IV. REQUEST FOR CONFIDENTIAL TREATMENT

Under separate cover via UPS Overnight this office is submitting compact disks containing the workpapers of Dr. John Morris supporting his analysis in Appendix A, as required by the Commission's April 2004 Order.[47] The CD (of which six copies are included) contains: (i) proprietary information provided by Energy Velocity under an agreement that requires confidential treatment to be requested for these materials; (ii) modeling and computer programs that are the proprietary intellectual property of Economists Incorporated, the firm which employs Dr. Morris; (iii) commercially sensitive information about Applicants and their affiliates; and (iv) documents and information deemed to be confidential by PJM and ISO-NE. Accordingly, Applicants respectfully request confidential treatment for CD and the workpapers pursuant to 18 C.F.R. § 388.112 (2006), consistent with the confidential treatment accorded other applicants submitting such proprietary and commercially sensitive data.[48] Pursuant to the Commission's rules, the public version of this filing contains all materials submitted herein except for CD, which is labeled as "PRIVILEGED AND CONFIDENTIAL/NON-PUBLIC."

V. SERVICE

This filing has been served on all parties on the official service list as currently maintained by Commission in the above-referenced dockets. Applicants are also providing a copy to the New Jersey Board of Public Utilities and the New Jersey Division of Rate Counsel.

VI. ENCLOSURES

Applicants enclose the following:

- An original filing;

[47] AEP II, 107 FERC at P 61,087-88.

[48] *See, e.g., Idaho Power Company*, Docket No. ER97-1481-009 (February 3, 2006) (submission of revised Pivotal Supplier Screen and Market Share Screen calculations including similar data).

- Appendix A – Affidavit of Dr. John R. Morris;[49]
- Appendix B – List of Entities with Market-Based Rates Authority and Their Generation Assets. (This is an appendix listing the filing entities and all their energy affiliates and their associated assets);
- Appendix C – List of Entities with Market-Based Rate Authority and Their Transmission Assets;
- Appendix D – List of Long Term Power Purchase Agreements;
- Appendix E – Letters of concurrence regarding the control of certain jointly owned generation facilities;
- Appendix F – Form of notice suitable for publication in the Federal Register.

[49] Compact disks, as described above, containing the workpapers for the Affidavit of John R. Morris in Appendix A are being sent concurrently with this filing via UPS Overnight. As noted *supra*, privileged treatment is being requested for Dr. Morris's confidential workpapers submitted with the non-public version of this filing.

VII. CONCLUSION.

Applicants respectfully request the Commission

(i) to accept this market power compliance filing as meeting the Commission's requirements under Order No. 697 for the continuation of market-based rate authority for Applicants PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Nuclear LLC, PSEG Fossil LLC, Pavant Solar II, LLC, Bison Solar LLC , San Isabel Solar LLC and PSEG Energy Solutions LLC;

(ii) to grant the request for confidential treatment; and

(iii) to grant such other relief or waivers as may be appropriate or necessary.

Respectfully submitted,

Public Service Electric and Gas Company
PSEG Energy Resources & Trade LLC
PSEG Power Connecticut LLC
PSEG Fossil LLC
PSEG Nuclear LLC
PSEG New Haven LLC
Pavant Solar II, LLC

NOTICE OF FILING
( )

Take notice that on December 28, 2016: (i) PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Fossil LLC, PSEG Nuclear LLC, Pavant II Solar LLC, Bison Solar LLC, San Isabel Solar LLC and PSEG Energy Solutions LLC tendered for filing their joint triennial market power update in compliance with Order No. 679 and with prior Commission Orders granting them market-based rate authority in Docket Nos. ER99-3151, ER97-837, ER03-327, ER08-447 ER08-448, DR-12-1250, ER16-1926, ER16-1925, ER16-1924 and ER16-2725 respectively.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR §§ 385.211 and 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. Such notices, motions, or protests must be filed on or before the comment date. Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant. On or before the comment date, it is not necessary to serve motions to intervene or protests on persons other than the Applicant.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the "eFiling" link at http://www.ferc.gov. Persons unable to file

electronically should submit an original and 14 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street, N.E., Washington, D.C. 20426.

This filing is accessible on-line at http://www.ferc.gov, using the "eLibrary" link and is available for review in the Commission's Public Reference Room in Washington, D.C. There is an "eSubscription" link on the web site that enables subscribers to receive email notification when a document is added to a subscribed docket(s). For assistance with any FERC Online service, please email FERCOnlineSupport@ferc.gov, or call (866) 208-3676 (toll free). For TTY, call (202) 502-8659.

Comment Date: 5:00 pm Eastern Time on (insert date).

Report & Affidavit of
Dr. John R. Morris

December 22, 2016

Public Service Enterprise Group Incorporated Northeast Region Market Power Study

1. Introduction

My name is Dr. John R. Morris. I am a Principal at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Washington, DC 20037. I have a bachelor's degree in economics from Georgetown University, and I have a master's degree and a Ph.D. in economics from the University of Washington. I have been studying and consulting within energy industries since joining the Federal Trade Commission in 1985. Since joining Economists Incorporated in 1992, I have consulted on many mergers involving electric and gas companies, examined competitive issues relating to utility rates, provided market power studies for applications for market-based rate authority, and studied market power issues in state restructuring proceedings. I have published articles on competition and energy matters, and I have spoken on numerous occasions concerning competition in natural gas, electric power and other industries. I have previously been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission ("FERC" or "Commission"), state commissions and in federal court. A complete listing of my experience, publications and testimony is contained in my resume, presented in Exhibit PEG-2.

Public Service Enterprise Group Incorporated ("PSEG") asked that I prepare a market power study for its subsidiaries that have market-based rate authority in the Northeast Region.[1] These subsidiaries are: Public Service Electric and Gas

[1] The Northeast Region includes ISO-New England Inc. ("ISO-NE"), Connecticut, Southwest Connecticut, New York Independent System Operator, Inc. ("NYISO"), PJM Interconnection, L.L.C. ("PJM"), PJM East, PJM East of 5004/5005 and PJM East of AP South.

("PSE&G"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear"), PSEG Power Connecticut LLC ("PSEG Power CT"). PSEG New Haven LLC ("PSEG New Haven") Pavant II Solar LLC, Bison Solar LLC and San Isabel Solar LLC.[2] The purpose of this study is to determine whether these PSEG entities have market power in any Northeast Region market under the Commission's Pivotal Supplier Analysis ("PSA") and Wholesale Market Share Analysis ("WMSA") screens as articulated in FERC Order No. 697 and if the Applicants do fail any of the screens, whether they otherwise lack market power under the Delivered Price Test ("DPT") or are subject to sufficient mitigation to guard against any market power concerns.[3]

PSEG

PSEG is a public utility holding company headquartered in in Newark, New Jersey. Through its subsidiaries, PSEG engages in the generation, transmission, distribution and sale of electric energy, and distribution and sale of natural gas to commercial, residential, and industrial customers primarily in the Northeastern and Mid-Atlantic United States. PSEG, through its subsidiaries, owns approximately 11,300 MW of seasonal generation capacity located in the Northeast Region.[4]

---

[2] Pavant II Solar LLC, Bison Solar LLC and San Isabel Solar LLC all have QF status.

[3] *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

[4] *See* Exhibit PEG-3 (accounting for retirements).

PSE&G

PSE&G is a public utility operating company engaged primarily in the transmission of electricity and the provision of gas and electric distribution service in the State of New Jersey. It is New Jersey's oldest and largest investor-owned utility. PSE&G was founded in 1903 and is based in Newark, New Jersey. It is a member of the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access Transmission Tariff ("OATT") administered by PJM. The company also owns and operates 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3. During the study period, PSE&G owned less than 140 MW of solar generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities.

PSEG ER&T

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission. PSEG ER&T also makes wholesale sales of natural gas.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.,* which initiated the transition from a regulated to a competitive retail power market in New Jersey, the New Jersey Board of Public Utilities ("BPU") annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSE&G's affiliate, PSEG ER&T, has participated directly in all of the auctions for BGS supply held since 2004 and has consistently won tranches in those auctions, including auctions for BGS service within the franchised service territory of PSE&G.

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, PSE&G's FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract, which currently remains in effect, provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply. On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which

ER&T provides fuel supply and power supply management activities for LIPA as of January 1, 2015.

PSEG Fossil

PSEG Fossil owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission under the umbrella of PSEG Fossil's market-based rate authority.[5] The assets of PSEG Fossil are located entirely within PJM.[6] Since the last triennial filing in 2013, PSEG Fossil has retired approximately 1,800 MW of capacity in the eastern portion of PJM. Much of this capacity was retired at the end of May 2015. We included this capacity in the Winter and Spring season screens and exclude the capacity for the Summer and Fall screens.

PSEG Fossil is approximately a 23 percent joint owner of interests in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[7] PSEG Fossil is a 50 percent co-owner with Jersey Central Power and Light Company ("JCP&L") of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to

---

[5] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

[6] PSEG Fossil's subsidiaries PSEG Power Connecticut LLC, PSEG New Haven LLC and PSEG Power New York LLC own generation units in Connecticut and New York respectively.

[7] A letter of concurrence supporting the allocation of these facilities' output based on ownership interests is attached in our workpapers.

the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity, nominally 400 MWs, has been assigned to JCP&L.[8]

PSEG Power CT

PSEG Power CT owns the Bridgeport Harbor and New Haven Harbor generation facilities located in the state of Connecticut within ISO-NE and is authorized to sell power at market-based rates.[9] The output of these facilities is sold to PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. PSEG Power CT is currently constructing Bridgeport 5, a 485 MW gas-fired combined cycle in Bridgeport, Connecticut, which is expected in service in 2019.

PSEG New Haven

PSEG New Haven owns and operates the New Haven facility, a gas-fired plant located in New Haven, CT that entered service in June 2012 with a nameplate capacity of 181.5 MW. The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[10] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[11] All of the energy and capacity of the New Haven facility is sold

---

[8] A letter of concurrence supporting the allocation of this facility's output to JCP&L is attached in our workpapers.

[9] *Wisvest Corporation, et al*., 101 FERC ¶ 61,166 (2002).

[10] *Re Review of Peaking Generation Projects*, Docket No. 08-01-01, Connecticut Department of Public Utility Control, June 25, 2008 ("Awards Decisions") (2008 WL 2587405 (Conn. D.P.U.C.)). The PURA is the successor to the Department of Public Utility Control (DPUC). PURA came into being in July 2011 as part of a reorganization of Connecticut state energy agencies. For consistency, this application refers to the agency as the PURA.

[11] Section 50 of Public Act 07-242, now codified at Section 16-243u of the Connecticut General Statutes.

into the ISO-NE markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder.[12] As such, neither PSEG New Haven nor any other PSEG affiliate has operational control of the New Haven facility. As a result, the capacity of the facility is not attributable to PSEG for the purpose of this market power analysis.

PSEG Nuclear

PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission in accordance with PSEG Nuclear's market-based rate authority.[13] PSEG Nuclear is the owner of Hope Creek and a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear operates the Salem plant and Exelon Generation is the operator of Peach Bottom.[14] Since the last triennial filing, uprates at Peach Bottom and Hope Creek plants have increased PSEG Nuclear's capacity at those facilities.

---

[12] The CFD was approved on October 29, 2010 in a letter order ruling on Motion Number 62 in Docket No. 08-01-01.

[13] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

[14] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in our workpapers.

Other Subsidiaries

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities in the United States. Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the PJM region are as follows.

PSEG Power LLC is a Delaware limited liability company. It does not directly own any generation facilities or engage in any FERC jurisdictional activities but it is the parent company of several FERC jurisdictional entities, including applicants PSEG ER&T, PSEG Fossil and PSEG Nuclear.

PSEG Power Ventures LLC ("Power Ventures") is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source LLC and has an in-direct ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 349 MWs DC (274 MW AC) of solar capacity across the United States, including a combined 92 MWs (72 MW AC) of solar capacity in PJM.[15] All of PSEG Solar Source's solar capacity has obtained QF status. Because all of this capacity is QF capacity, per Order No. 816 this capacity is not included in the market power analyses.[16]

---

[15] The 42MWs are attributed to four (7) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs) Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

[16] *Refinements to Policies and Procedures for Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 816, 80 *Fed. Reg*. 67056 (2015), FERC STAT & REGS ¶ 31,374, P55 (2015), *reh'g denied and clarification*, Order No. 816-A, 155 FERC ¶ 61,188 (2016) ("… qualifying facilities that are exempt from FPA section 205 and facilities that are behind-the-meter facilities do not need to be reported in the asset appendix or indicative screens." (note omitted))

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. PSEG Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. PSEG Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a cost-based contract.[17]

PSEG Keys Energy Center LLC ("PSEG Keys"), direct subsidiary of PSEG Fossil, was formed to construct, operate, and maintain the Keys Energy Center, a 755 gas-fired combined cycle facility located in Prince George's County, Maryland. Construction began in 2015 and is scheduled to be completed in 2018. All the capacity and energy from PSEG Keys will be sold to PSEG ER&T.

PSEG Energy Solutions LLC ("PSEG Solutions") is a direct subsidiary of PSEG ER&T that is schedule to begin retail operations in the Northeast Region in

[17] *PSEG Power New York Inc.,* Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

January 2017. It has obtained market-rate authority to allow it to sell excess energy in wholesale markets.[18]

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution ("T&D") system on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco are FERC jurisdictional public utilities, as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[19]

When an applicant has affiliates in the relevant market, the Commission considers the combined capacity of all the affiliated entities in its market power assessment.[20] Accordingly, I have included the capacity controlled by PSE&G, PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear, and PSEG Power New York (which on a combined basis constitutes the capacity of all of PSEG's affiliates not excluded for a reason explained above). Future references in this Affidavit to PSEG are inclusive of the foregoing entities.

The primary purpose of this study is to determine whether PSEG passes the PSA and WMSA screen thresholds in ISO-NE, the NYISO and PJM. In the PSA, the Commission requires applicants to examine whether the generation owned by

---

[18] *See* December 21, 2016 letter order approving Energy Solutions request for market-based rate authority in Docket No. ER16-2725-000.

[19] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), order dismissing request for rehearing, 145 FERC ¶ 61,183 (2013).

[20] *Heartland Energy Services, Inc.,* 68 FERC ¶ 61,223 at 62,061-62,062 (1994).

the applicant is necessary to serve wholesale demand within a balancing authority area. The applicant first calculates the total generation capacity for an area. This is the total of generation in the balancing authority area plus the import capability to the area.[21] From this total, the applicant subtracts out firm contractual commitments, native load obligations, and operating reserves, giving uncommitted capacity for the area. Net uncommitted capacity is calculated by subtracting a wholesale load proxy from uncommitted capacity. Net uncommitted capacity is then compared to the applicant's uncommitted capacity within the area. When the applicant's uncommitted capacity is less than the net uncommitted capacity for the area, then all wholesale demand could be served without energy from the applicant and the applicant passes the PSA screen. When the applicant's uncommitted capacity is greater than the net uncommitted capacity, then the applicant does not pass the screen because its capacity is necessary to meet wholesale peak loads in the market.

In the WMSA, the Commission requires applicants to examine whether the generation owned by the applicant is 20 percent or more of the uncommitted capacity in each of four seasons under average daily peak conditions for the season. The applicant first calculates the total generation capacity for an area. The applicant then adds the import capability to the area. From this total, the applicant subtracts out planned outages and deratings, long-term firm contractual commitments, native load obligations, and operating reserves. The sum gives the total uncommitted capacity. The applicant then calculates its share by dividing its uncommitted capacity by the total uncommitted capacity. When the applicant's share is less than 20 percent, the applicant passes the WMSA screen.

---

[21] Import capability is the lesser of either the simultaneous import limit ("SIL") into the area or available capacity in interconnected balancing authority areas. Available capacity is equal to total generation capacity in an area less outages and derating, a native load proxy and operating reserves.

20161028-5228 FERC PDF (Unofficial) 9/28/2016 4:58:28 PM

The Commission presumes that an applicant does not have market power when it passes both the PSA and WMSA screens. If the applicant fails either of the screens, then the applicant may present other analyses to demonstrate that it does not possess market power. Alternatively, the applicant may propose mitigation measures or accept the Commission's default mitigation measures to demonstrate that it has mitigated market power.

2. New England

2.1. Overview of Electric Power Markets in New England

New England operates a competitive wholesale power market. Substantial restructuring has taken place in New England, and many of the vertically integrated utilities have sold either most or all of their generation assets. The traditional utilities often have standard offer obligations to serve retail customers, but utilities often fulfill these obligations by securing supplies in competitive wholesale markets. For example, a utility may secure contracts in which the supplier agrees to provide power for 30 percent of the utility's standard offer obligation. The transmission system is managed by ISO-NE. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

2.2. Geographic Markets

In the case of generation wholly located in an RTO, such as ISO-NE, the Commission accepts the RTO as the relevant destination market.[22] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[23] In New England,

[22] Order No. 697 at PP 231, 235.

[23] Order No. 697 at P 236.

20160928-5228 FERC PDF (Unofficial) 9/28/2016 4:58:28 PM

the Commission has identified two submarkets: Connecticut and Southwest Connecticut.[24] PSEG owns the Bridgeport Harbor plant in Southwest Connecticut. PSEG also owns the New Haven Harbor 1 unit in Connecticut and PSEG New Haven owns the New Haven facility. When the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[25] Accordingly, the PSA and WMSA are provided for the ISO-NE balancing authority area, and also for Connecticut and Southwest Connecticut.

2.3. Data Sources and Analysis

The data source for generation is ISO-NE Seasonal Claimed Capability (SCC) Reports.[26] Summer and winter capacities were taken from the November 2015 report. Planned outages are from the ISO-NE Form 714. Planned outages for Connecticut and Southwest Connecticut are prorated based on their shares of the total generation capacity in ISO-NE. PSEG's generation capacity in ISO-NE consists of the New Haven facility, New Haven Harbor and Bridgeport Harbor. PSEG's Northeast Region generation facilities are presented in Exhibit PEG-3.

Load data for ISO-NE are from Energy Velocity. Energy Velocity also provides load data by New England ISO zone, thus loads are calculated by sub-market as well. PSEG load obligations in New England come from PSEG's agreements to supply standard offer generation within Rhode Island. The data were supplied by PSEG.

---

[24] *Id*.

[25] Order No. 697 at footnotes 215, 217.

[26] See http://www.iso-ne.com/genrtion_resrcs/snl_clmd_cap/index.html.

20170228-5228 FERC PDF (Unofficial) 2/28/2017 11:58:28 AM

Import capability was taken from the ISO-NE's December 20, 2016 FERC filing.[27] This report indicates that the simultaneous transfer limits in all seasons is 4,548 MW for the ISO-NE as a whole, 3,050 MW for Connecticut, and 2,370 (Spring) to 3,200 MW (Summer) for Southwest Connecticut. PSEG has no firm transmission rights into New England.

Operating reserves are calculated as follows. ISO-NE Operating Procedure No. 8 specifies spinning reserves (or 10-minute reserves) equal to the size of the loss of the largest unit times a Contingency Reserve Adjustment Factor ("CRAF").[28] The CRAF in 2015 was 1.25.[29] The largest unit is the 1,400 MW (summer capacity) Seabrook Unit 1. In addition, 30-minute reserves require capacity to cover 50 percent of the loss of a second contingency (i.e., the second largest unit) plus 160 MW for daylight-savings time periods and 180 MW during standard time (i.e., winter). The second largest unit is the 1,200 MW (summer capacity) Millstone Unit 3. Thus, in total, operating reserves are 2,510 MW in summer.[30] Operating reserves for Connecticut and Southwest Connecticut are based on resource needs in forward reserve auctions for 2015.[31]

2.4. Results

Exhibit PEG-4 summarizes the results for the PSA and the WMSA in New England. Exhibit PEG-5 shows the calculations to determine whether PSEG is a

pivotal supplier in the three New England destination markets. PSEG passes the PSA screen in all areas. Exhibit PEG-6 presents the WMSA results for the destination areas in New England. PSEG easily passes the WMSA in all areas.

3. New York

3.1. Overview of Electric Power Markets in New York

New York also has a competitive wholesale power market. Substantial restructuring has taken place in New York, and the investor-owned vertically integrated utilities have sold either most or all of their generation assets. These utilities often have standard offer obligations to serve retail customers, and utilities can fulfill these obligations by securing supplies in competitive wholesale markets. The transmission system is operated by the NYISO, which also operates a competitive wholesale market. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

3.2. Geographic Markets

In the case of generation wholly located in an RTO such as the New York ISO, the Commission has accepted the RTO as the relevant destination market.[32] PSEG only owns generation in Albany, New York. In addition, when the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[33] Accordingly, the PSA and WMSA are provided for the NYISO only.

---

[32] Order No. 697 at PP 231, 235.

[33] Order No. 697 at footnotes 215, 217.

3.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Operations database. Planned outages are from the FERC Form 714. PSEG's generation capacity in New York consists of its ownership of the Bethlehem Energy Center in Albany, which has winter capacity of 845 MW. Information for PSEG's Northeast Region generation is presented in Exhibit PEG-3.

Load data for NYISO were downloaded from Energy Velocity.

Import capability comes from the most recent NYISO SIL filing as of December 19, 2016.[34] This filing indicates that ISO simultaneous import capability ranges from 6,850 MW in spring to 7,695 MW in summer. NYISO does not recognize physical imports, accordingly, all the SIL import capability is allocated pro rata, except for a 265 MW reservation that PSEG has from PJM to New York on the Linden VFT DC transmission line.

Operating reserves are calculated as follows. The NYISO Locational Reserve Requirements specify 30-minute total reserves equal to twice the 10-minute reserve necessary to replace the operating capability loss caused by the most severe contingency under normal transfer conditions. Thus, the operating reserves for the NYISO are 2,620 MW for each season.[35]

---

[34] New York Independent System Operator, Inc., *Informational Filing Regarding the Simultaneous Import Limitation Study*, Docket No. AD10-2, December 19, 2016.

[35] NYISO Locational Reserve Requirements, Table 2, available at http://www.nyiso.com/public/webdocs/market_data/reports_info/nyiso_locational_reserve_reqmts.pdf

3.4. Results

Exhibit PEG-7 shows the calculations to determine whether PSEG is a pivotal supplier in New York, and PSEG passes the PSA screen. Exhibit PEG-8 presents the WMSA results for New York, and PSEG easily passes the WMSA.

4. PJM

4.1. Overview of Electric Power Markets in PJM

PJM operates a competitive wholesale power market and serves as the regional RTO for an area that covers all or parts of 13 states and the District of Columbia. PJM also plans and operates the transmission system within the RTO. Monitoring Analytics acts as the market monitor, and has a market power mitigation program in place to identify and mitigate any potential exercise of market power.

4.2. Geographic Markets

PSEG owns both generation and transmission facilities in PJM. In the case of generation wholly located in an RTO such as PJM, the Commission has accepted the RTO as the relevant destination market.[36] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[37] In PJM, the Commission has identified three submarkets: PJM East ("PJME"), PJM East of 5004/5005 ("PJM50") and PJM East of AP-South ("PJMAP").[38] The PSA and WMSA are provided for PJM and for the PJME, PJM50 and PJMAP sub-markets.

4.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Ops database. Generation within PJM was assigned to submarket consistent with the definitions in PJM's SIL Study.[39] Planned outages are from the FERC Form 714. In addition, for the sub-market analysis, planned outages were allocated to PJME based on the share of total PJME generation, by season. Information for PSEG's generation in PJM and PJME is presented in Exhibit PEG-3.

Load data for PJM was downloaded from Energy Velocity. Energy Velocity also provides load data by PJM zone, thus loads are calculated for the PJM sub-markets as well.

Import capability was taken from the 2015 Simultaneous Import Limit Study Report.[40] This report indicates simultaneous transfer limits of 11,997 MW in the winter and 7,600 MW in summer. Additionally, this report indicates transmission capabilities of the PJM sub-markets. The report conservatively uses the reported SIL as the SIL amount to be allocated pro rata. This is a simplifying assumption because PSEG has no firm transmission reservations into PJM and it effectively excludes the additional 8,500 MW of firm reservations into PJM in the base case of the SIL study.

[40] *Id*.

20160928-5228 FERC PDF (Unofficial) 9/28/2016 11:58:28 AM

Operating reserves are calculated according to PJM Manual 13 as the sum of Day Ahead Scheduling Reserves (Operating), Contingency (Primary) and Synchronized (Spinning Reserve) Requirements.[41]

Data on PSEG's long-term contracts come from PSEG. The contracts were included in the area where the energy is delivered under the contract. For contracts delivered to the Western Hub in PJM, the contracts were included in the PJM, PJM50, and PJMAP destinations and not the PJME destination.

4.4. Results

Exhibit PEG-9 summarizes the results for the PSA and the WMSA in PJM. Exhibit PEG-10 shows the calculations to determine whether PSEG is a pivotal supplier in the four PJM destination markets. PSEG passes the PSA screen for all four destinations. Exhibit PEG-11 presents the WMSA results for the destination markets in PJM. PSEG easily passes the WMSA in PJM and PJM east of AP South, but has greater than a 20 percent market share in the PJM East and PJM East of 5004/5005 destination markets.

5. Delivered Price Test

When an applicant does not pass either the PSA or WMSA for a destination market, the Commission invites the applicant to provide additional information via a delivered price test ("DPT"). PSEG requested that I perform a DPT for the PJM East and PJM East of 5004/5005 sub-markets. Accordingly, I now discuss the DPT for these sub-markets.

[41] PJM Manual 13 - Emergency Operations, at 17, available at http://pjm.com/~/media/documents/manuals/m13.ashx

5.1. Overview of the DPT

The DPT utilizes substantially more information than the PSA or the WMSA, including additional information on generation ownership, generation costs, demand conditions, and transmission limits. The Commission considers two types of capacity: Economic Capacity ("EC") and Available Economic Capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting load commitments from EC. EC and AEC are calculated for a number of different seasonal and load conditions.

Because we do not know the firm retail obligations of the competitive suppliers, as explained below, the AEC calculation is based on the assumption that market participants serve load in proportion to their generation capacity and that 70 percent of load obligations are contracted more than one year from delivery.

For both the EC and AEC measures, the Commission prescribes three screens: (1) a pivotal supplier screen; (2) a market share screen; and (3) a Herfindahl-Hirschman Index ("HHI") screen. The HHI is the sum of the squared market shares of the firms in the market. So a market with four firms of market shares of 40, 30, 20, and 10 percent would have an HHI of 3,000 (this is calculated as $40^2 + 30^2 + 20^2 + 10^2 = 1{,}600 + 900 + 400 + 100 = 3{,}000$). A monopolist would produce a HHI of 10,000 and 10 equally-sized firms would produce a HHI of 1,000.

Although the Commission has not drawn bright lines for its review of DPT results, it has given general guidance. When (1) the applicant is not pivotal; (2) the applicants' market share is less than 20 percent; and (3) the HHI is below 2,500, the Commission is likely to conclude that the applicant does not have market power. The three standards establish a "safe harbor" for lack of market power, unless intervenors present clear and convincing contrary evidence. The Commission has also determined in some cases that an applicant did not have

20161028-5228 FERC PDF (Unofficial) 9/28/2016 11:58:28 AM

market power when the analysis showed isolated HHI and market share results above screening levels. Finally, despite the DPT results, the Commission may conclude that an applicant does not have market power if other evidence, such as historical sales data, indicates that the DPT results do not reflect the actual competition in the marketplace.

A detailed description of data sources and methods to prepare the data for the DPT is presented in Exhibit PEG-12. An overview of the sources and methods used at Economists Incorporated for conducting the DPT is presented here.

The DPT is calculated for 10 representative periods, three for each of three seasonal conditions plus a summer super peak period. The three seasons are spring/fall, summer, and winter. Each season is divided into (1) top 10 percent of peak hours; (2) remaining peak hours; and (3) off-peak hours. In addition, there is a summer super peak period which is comprised to the top 1 percent (10 hours) of summer peak hours. These ten periods cover the range of load conditions for each season, and for the year as a whole.

The primary source for generation data is Energy Velocity. In addition to generation capacity, Energy Velocity provides data on ownership (including holding companies), fully-loaded heat rates, emission rates, and generation availability. Generation is included for all of PJM and NYISO, which is the only first-tier balancing authority area in which PSEG owns generation. Unit capabilities are derated to account for seasonal maintenance and likely plant unavailability due to forced outages. Because demand in PJM peaks in summer and winter, the planned outages are assumed to be during the spring/fall season.

The transmission system is represented by contract paths between balancing authority areas and within PJM. Limits between regions in PJM are from Energy Velocity.

Market prices come from hourly prices reported by PJM.

20160928-5228 FERC PDF (Unofficial) 9/28/2016 11:58:28 AM

As in the PSA and WMSA, load data come from Energy Velocity. To compute load requirements for market participants, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[42] To account for their greater load obligations, we assume that Dominion, which does not operate in a restructured retail market, has 100 percent responsibility for its allocation of load and that AEP, which operates in a partly restructured retail market, has 90 percent of its allocation as opposed to the standard 70 percent.

The DPT and market share calculations were calculated using the Power Acquisition Screening System developed at Economists Incorporated. The mathematical details are presented in Exhibit PEG-13.

5.2. Results of the DPT for PJM50 Sub-market

The results of the DPT for PJM50 are presented in Exhibit PEG-14. The top part of the exhibit shows the results for AEC. PSEG passes the Pivotal Supplier Screen in all 10 periods. PSEG also passes both the Market Share Screens and the HHI Screens in all 10 periods.

The lower part of Exhibit PEG-14 shows the results for EC in PJM50. PSEG passes all the screens in all the periods, except for the pivotal supplier screen in the Summer Top 1% period.

[42] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers in restructured markets.

5.3. Results of the DPT for PJME Sub-market

The results of the DPT for PJME are presented in Exhibit PEG-15. The top part of the exhibit shows the results for AEC. PSEG passes all the screens for AEC.

The lower part of Exhibit PEG-15 shows the results for EC in PJME. PSEG passes the Market Concentration screens in all periods. It passes the Market share screens in six of ten periods, and its market share is never more than 25 percent. It passes the pivotal supplier screen in eight of ten periods.

5.4. Analysis of the DPT Results

Although PSEG fails some screens, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the AEC screens and all market concentration (HHI) screens for EC. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[43] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all the AEC pivotal supplier screens, and most of the EC pivotal supplier screens. This means that typically PSEG's generation is not necessary to serve load; and when its generation is necessary, its forward sale commitments are sufficient so that its uncommitted generation is not necessary to serve the remaining load. Finally, PSEG's market shares are never above 15 percent in PJM50 and for AEC in PJM East. Its market shares for EC are never above 25 percent in PJM East. Although greater than the 20 percent screen, PSEG's

[43] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

market shares are well below the 35 percent threshold that is typically used for imputing unilateral market power.[44]

5.5. Mitigation

PJM has a Commission-approved market monitoring and mitigation plan in place to ensure that generation facilities cannot exercise market power. The Commission has stated that Commission-approved market monitoring and mitigation plans are sufficient to mitigate market power in RTO markets.[45] In particular, the Commission found in connection with PSEG's last triennial filing that the PJM market monitoring and mitigation rules are sufficient to address market power concerns.[46]

Under the local market power mitigation procedures in PJM, if a supplier fails the "three pivotal supplier test" (TPS), it is offer-capped by the Market Monitor. The Market Monitor's TPS test is applied on an ongoing basis, potentially as frequently as every 5 minutes, to reflect day-ahead and real-time operating conditions. These offer caps provide direct protection against the exercise of locational market power by suppliers in PJME, PJM50, PJMAP and elsewhere.

The protection against the exercise of market power is enhanced by "must offer" requirements under PJM's Operating Agreement. These mandate that generation resources that are used to meet capacity requirements in PJM and

---

[44] *See*, *e.g.*, U.S. Department of Justice, 1984 Merger Guidelines, at Section 3.12, available at https://www.justice.gov/sites/default/files/atr/legacy/2007/07/11/11249.pdf ("the Department is likely to challenge the merger of any firm with a market share of at least one percent with the leading firm in the market, provided the leading firm has a market share that is at least 35 percent.")..

[45] Order No. 697 at P 241.

[46] *See* October 14, 2014 letter order approving Applicants' prior triennial market update in Docket No. ER10-1789-003 et al. at page 3.

that are not subject to an outage must offer their available capacity in PJM's day-ahead energy market.[47] PJM has also implemented a Reliability Pricing Model (RPM) to secure sufficient capacity to meet its requirements through a series of auctions, including a Base Residual Auction (BRA) held annually for capacity 3 years in advance, and incremental auctions held at varying intervals prior to the delivery year. Various features of the RPM process work to prevent the exercise of market power in capacity markets in PJM. First, the RPM model includes bid cap rules designed to mitigate the potential exercise of market power. Second, RPM includes a must-offer requirement pursuant to which all generating units that have available capacity must bid into the RPM auctions or face disqualification from being recognized as capacity resources (and therefore from receiving any capacity payments) in the delivery year.

In addition to the local market power mitigation described above, the presence of market monitoring within PJM lessens potential concerns that PSEG might be able to exercise market power notwithstanding the indicative DPT screens. The Market Monitor has the specific responsibility under the market monitoring plan to monitor the potential of any market participant to exercise market power. To perform its market monitoring function, the Market Monitor can file reports or complaints with the Commission and other government agencies to address various market concerns including market power. The Market Monitor can also make its view known to the Commission staff and PJM members in cases where PJM does not follow its recommendations concerning complaints or requested rule changes. In addition, the Market Monitor can consult with regulatory bodies, including state commissions, regarding the need for specific investigations and monitoring activities, and to consider and evaluate additional enforcement mechanisms. The Market Monitor can also act on specific

[47] *See* PJM Operating Agreement at 1.10.1A(d).

complaints that have been filed by market participants to examine any potential market power issues.

In sum, the local market power mitigation rules, the role of the Market Monitor, the existence of must-offer requirements and PJM's RPM auctions address the potential for PSEG to exercise market power.

6. Vertical Market Power

In determining whether the market-based rates are in the public interest, the Commission also considers whether the Applicant has transmission market power or can erect barriers to entry.[48] None of these factors are relevant in the instant case. First, other than incidental generator interconnection facilities and the transmission assets owned by PSE&G in PJM, no transmission assets are owned by the Applicants or any of their affiliates in ISO-NE and NYISO. Transmission service over PSE&G's transmission facilities is provided under the PJM Open Access Transmission Tariff. Thus, consistent with Commission precedent, Applicants have alleviated any concerns regarding potential transmission market power. Second, PSEG has no ability to erect barriers to entry. As explained in Applicants' previous initial applications for market-based rate authority and triennial market power reports, PSEG is unable to erect barriers to entry. There has been no change in facts since the submission of those applications that would alter this conclusion.

The Commission is concerned with the ownership of natural gas pipelines or natural gas distribution facilities and the possibility that they may be used to exercise market power in electricity markets. PSEG does not own or operate any

[48] Order No. 697 at PP 397, 399.

FERC jurisdictional natural gas pipelines in PJM, ISO-NE or NYISO.[49] PSE&G owns natural gas distribution facilities in the State of New Jersey including peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers.

7. Conclusion

PSEG and its subsidiaries do not have market power in New England, New York or PJM. PSEG is not a pivotal supplier in New England, New York or PJM. PSEG's market shares in the WMSA are below the Commission's 20 percent screening threshold in each of these market areas. PSEG is also not a pivotal supplier in the Connecticut or Southwest Connecticut sub-markets and its market shares in the WMSA are below 20 percent in these sub-markets. PSEG fails the WMSA screens in only the PJME and PJM50 sub-markets. For these sub-markets, we conducted a DPT analysis. PSEG passes all the DPT screens for the PJM50 submarket, and it only fails the Market Share Screen in the PJME submarket. Its market shares are never above 25 percent, a level that the Commission has accepted in other market-based rate matters.[50] As such, they are not evidence of actual market power.

---

[49] PSEG Power LLC currently owns a 10 percent interest in the PennEast Pipeline Company LLC which has filed an application with FERC for construction and operation of a gas transmission line.

[50] *See*, *e.g.*, *Dogwood Energy, LLC*, 135 FERC ¶ 61,089 (2011) (under the AEC measure, Dogwood failed the market share screen in seven of ten periods, with market shares ranging from 32.7% to 39.6%); *Kansas City Power & Light Company and KCP&L Greater Missouri Operation Company*, Docket No. ER10-2074-001 et al., Supplement to Change in Status Filing at 11 (Feb. 4, 2013) (accepted by Letter Order, November 22, 2013) (market shares for AEC ranging from 17 to 36%); *Shell Energy N.A. (US), L.P.*, 135 FERC ¶ 61,090 (2011) (under the AEC measure, Shell failed the market share screen for seven of ten periods, with market shares ranging from 29.3% to 37.0%); *Calpine Energy Services, L.P.*, 137 FERC ¶ 61,085 at P 21 (2011) (under the AEC measure, Calpine failed the market share screen in all ten periods, with market shares ranging from 20.4% to 28.9%); *Wildcat Power Holdings, LLC*, 136 FERC ¶ 61,013 at P 14 (2011) ("When the available economic capacity measure is used, Wildcat Power's market shares range from 22 to 24 percent in the three summer super peak and winter

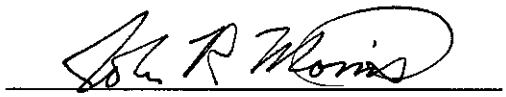
Further, PSEG operates under New England's, New York's, and PJM's market power mitigation programs, which mitigate PSEG's potential market power. Therefore, under standards for market-based rate authority articulated by the Commission in Order No. 697, PSEG has no ability to exercise market power in the relevant markets, and maintaining market-rate authority in New England, New York and PJM would be in the public interest.

Therefore, I recommend that the Commission continue to authorize PSEG to sell electric power in Northeast Region wholesale markets at market-based rates.

super peak season/load periods and zero percent in the remainder of the season/load periods."); *LS Power Marketing*, LLC,139 FERC ¶ 61,140 at P 23 (2012) (under the AEC measure, LS Power failed the market share screen in all ten periods, with market shares ranging from 20.4% to 28.9%); *Gila River Power, L.P.*, Docket Nos. ER05-1178-015, et al., Second Supplement to Updated Market Power Analysis at 4 (Jan. 12, 2011) (accepted by Letter Order, April 5, 2011) (market shares for AEC ranging from 21 to 23% in four season/load periods).

Pursuant to 28 U.S.C. §1746, I state under penalty of perjury that the foregoing is true and correct to the best of my information, knowledge, and belief.

Executed on this 22rd day of December 2016.



John R. Morris, Ph.D.
Principal
Economists Incorporated

EXPERIENCE AND QUALIFICATIONS OF

Dr. John R. Morris

OVERVIEW	Dr. Morris, a recognized expert in studying competition in energy industries, currently is a Principal at Economists Incorporated. He began his research of competition in energy industries in 1985 while working for the Federal Trade Commission. Since joining Economists Incorporated in 1992, he has consulted on many mergers and acquisitions involving energy companies, examined competitive issues relating to rates, and studied issues in state restructuring proceedings. He has published articles on competition and energy matters, and he has spoken on numerous occasions concerning competition in natural gas, electric power and other industries. He has been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission, state regulatory commissions, and in federal court.
EDUCATION	Ph.D., University of Washington, August 1985 Dissertation: *Intellectual Property: Creating, Pricing, Copying* • M.A., University of Washington, December 1983 • A.B., Georgetown University, May 1981
PRESENT POSITION	Dr. Morris is a *Principal* at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Suite 1100, Washington, DC 20037. (202-223-4700) Economists Incorporated studies competition and regulation in many industries in the United States and in other countries. It is a leading firm in studying the competitive effects of mergers and acquisitions.
PREVIOUS EXPERIENCE	*Senior Vice President*, Economists Incorporated, December 2001 – December 2002 • *Vice President*, Economists Incorporated, December 1995 – December 2001 • *Senior Economist*, Economists Incorporated, June 1992 – December 1995 • *Economic Tutorial Leader*, Stanford University (Stanford in Washington), April 1993 – June 1995 • *Visiting Assistant Professor,* Department of Business Economics and Public Policy, School of Business, Indiana University, September 1991 – May 1992 • *Assistant to the Director for Antitrust,* Bureau of Economics, Federal Trade Commission, November 1989 – August 1991 • *Economic Advisor,* Office of Commissioner Machol, Federal Trade Commission, December 1988 – October 1989 • *Economist,* Division of Antitrust, Bureau of Economics, Federal Trade Commission, October 1985 – December 1988
MEMBERSHIPS	Member, International Association of Energy Economics • Associate, Energy Bar Association • Member, American Economic Association • Member, Western Economic Association International • Associate, American Bar Association

Source: PSEG.

Notes:

[1] PSEG Fossil has a 22.5% interest in the Conemaugh coal-fired units.

[2] PSEG Global has a 4% interest in the Conemaugh Hydroelectric facility.

[3] PSEG Fossil has a 22.84% ownership interest in the Keystone facility.

[4] PSEG Nuclear has a 57.41% interest in the Salem Nuclear facility.

[5] PSEG Fossil has a 50% interest in the Yards Creek facility. Yards Creek is operated by Jersey Central Power & Light, and thus is controlled by JCP&L in the analysis.

[6] PSEG Nuclear has a 50% interest in the Peach Bottom Nuclear facility.

[7] Unit retired on 06/01/2015

[8] Unit retired on 08/31/2014

[9] Unit retired on 07/31/2015

DATA AND ASSUMPTIONS FOR ECONOMISTS INCORPORATED'S DELIVERED PRICE TEST STUDY FOR PSEG

This exhibit describes data and assumptions used in the delivered price test study ("study") carried out by Economists Incorporated for PSEG. Because the data are voluminous, we provide them in electronic workpapers. In those workpapers, the Files.xlsx spreadsheet provides a brief description of the organization of the data files.

This Exhibit has six sections. Section I discusses the study's representative periods. Section II discusses the geographic region and balancing authority areas. Section III discusses generation resources, including adjustments to generating capacity for seasons, maintenance, water availability, and long-term contracts. Section IV discusses transmission, including transmission pricing and losses. Section V discusses market prices. Section VI discusses the load data.

I. Periods

The study calculates market shares and concentration indexes for electric energy for ten representative periods during the year. The year is divided into three seasons (spring/fall, summer and winter). Spring/fall and winter seasons are divided into three periods based on days of the week, times of day and load levels. Summer is divided into four periods based on days of the week, times of day and load levels. Each calculation of market shares and concentration indexes reflects average conditions (e.g., average loads) during one of the resulting ten periods during the year (e.g., Summer Low Peak).

The study places each of the periods in each season into three condition categories: off-peak, low peak, and spike. Transmission pricing (see Section

IV.B below) and plant availability (see Section III.A.2 below) vary among these three categories.

Table I-1 summarizes the ten periods for the destination markets.

Table I-1– Definition of Ten Periods for Destination Market

Number	*Season*	*Time*	*Condition*	*Hours*	*Description**
1	Spring/Fall	Top 10%	Spike	203	Top 10% of peak hours
2	Spring/Fall	Peak	Peak	1829	Remaining peak hours
3	Spring/Fall	Off-peak	Off-Peak	2360	Off-peak hours
4	Summer	Top 1%	Spike	11	Top 1% of peak hours
5	Summer	Top 10%	Spike	106	Top 10% of peak hours
6	Summer	Peak	Peak	950	Remaining peak hours
7	Summer	Off-peak	Off-Peak	1152	Off-peak hours
8	Winter	Top 10%	Spike	101	Top 10% of peak hours
9	Winter	Peak	Peak	907	Remaining peak hours
10	Winter	Off-peak	Off-Peak	1152	Off-peak Hours

Note: *Peak hours include hours ending 8 a.m. through 11 p.m. Eastern Time weekdays, excluding six major holidays. Off-peak hours = Hours ending 12 a.m. through 7 a.m. on weekdays and all weekend and holiday hours.

The Off-peak periods are all NERC holidays and weekend hours plus weekdays from the hour ending at midnight EPT until the hour ending at 0700.[1] The Off-peak periods have off-peak transmission pricing and plant availability.

In order to define the Top 1% and Top 10% periods for a given season, we removed all Off-peak hours from that season. We then ranked the remaining (peak) hours based on load levels in the destination market by season. We then defined as the Top 1% as the 1 percent of these remaining hours in which loads in the destination market were highest and the Top 10% as the highest 10 percent of peak hours based on load levels. These periods have spike transmission pricing and plant availability.

[1] Major holidays are New Year's, Memorial Day, 4th of July, Labor Day, Thanksgiving and Christmas. Major holidays are included in the Weekend period.

The Peak periods are weekdays from the hour ending at 0800 until the hour ending at 2300 EPT, excluding hours in the Top 10% periods and major holidays. The Low Peak period has on-peak transmission pricing and plant availability.

II. Geographic Coverage and Market Areas

The study includes market areas that correspond to the balancing authority areas used by the North American Electric Reliability Council (NERC), and PJM submarkets as defined by FERC. Table II-1 lists these market areas and their abbreviations. There are two study destination markets, PJM East and PJM East of 5004/5005.

Table II-1– List of Eastern Market Areas and Study Destinations

Abbreviation	*Full Name*	*Study Destination*
PJME	PJM East	Yes
PJM50	PJM East of 5004/5005	Yes
PJMS	PJM East of AP South	
PJM	PJM	
NYISO	New York ISO	

III. Generation

A. Generation Capacity and Ownership

The study includes generating units located in the areas that are (1) connected to the power grid, (2) not exclusively used for self-generation, and (3) either in a plant used primarily for electric generation or a Qualifying Facility.

1. Generating Unit Data

The study uses data for summer and winter capability at the unit level reported in the Energy Velocity (EV) database available from Ventyx. The units include all

units with a status of operating, standby, cold standby, restart, mothballed, testing, or under construction that went online before November 30, 2015 and with a retirement date after November 30, 2015. We exclude generation units that are less than 5 MW unless they are owned by PSEG.

2. Ownership

The study uses relies on Ventyx determination of plant and unit ownership. When Ventyx reports a holding company, the ownership is assigned to the holding company. For PSEG generation, the study relies upon Appendix B data from market-based rate filings and updates from the companies to determine plant ownership and seasonal capability. Operational control of PSEG units is consistent with the methodology used for market-based rates.

3. Seasonal variation in capability

The study uses seasonal capability data from EV. Spring/fall capacities are the average of summer and winter capacities.

4. Adjustments to Generating Capability

The generating capability figures used for each period are obtained by multiplying the seasonal capabilities by an availability factor, which is based on the period, unit location, and NERC General Availability Data Systems (GADS) category of the unit. The GADS database gives national average operating information for generating units by unit type and size. For example, it gives data for coal-fired steam units with capacities between 300 MW and 399 MW.

For each period and each generating unit, the availability factor adjusts for the following.

a) Unplanned outage rates by GADS category

For a given GADS category, the study assumes that unplanned (forced) outage rates (as a share of generating capability available after allowing for planned outages) are constant across seasons and generating units throughout the Region, regardless of owner. Based on GADS data for 2007 through 2011, the study calculates an equivalent forced outage rate (EIFOR), which measures the share of generating capability in a GADS category that is not available because of forced outages. The computation is EIFOR = (FOH)/AH, where FOH is number of forced outage hours and AH is total hours available for generation after planned outages (but before forced outages).[2]

b) Planned outage rates by GADS category and season

With four exceptions (hydro, pumped storage, wind, and solar units), the study assumes that the planned outage rate is constant for all generating units for a given GADS category and season. For a given GADS category, the share of hours of generating capability that is not available as a result of planned outages is computed as (POH + POEH)/PH; where PH are the period hours, POH are the hours not available because of planned outages, and POEH are the hours not available because of planned outage extensions

The study assumes that balancing authority areas are both summer and winter peaking. Therefore, the study assumes that all planned outages for thermal units occur during spring/fall.

[2] EIFOR differs slightly from the EFOR provided in the GADS data. EIFOR provides a better measure of a forced outage rate for peaking units that are operated a small percentage of the year.

c) Variation in hydro availability across seasons and periods

In general, utilities use hydro facilities to generate energy during the hours when energy prices are highest, subject to constraints imposed by availability of water and reservoir capacity. In order to incorporate these constraints, the study proceeds in the following manner.

First, the study uses EIA Form 923 monthly production data for the period 2011 to 2015 to compute average hourly hydro generation by season. Average hourly generation is then divided by hydro capability to give an average hourly hydro operating rate by season.

Second, depending upon the level of the hydro operating rate for a given season, the study calculates availability factors for the spike, low peak and off-peak periods. When the historical seasonal operating rate is below 30 percent, the availability factor for each period in the season is set equal to the operating rate; the 30 percent figure is an assumed "run of river" constraint. The study assumes that prospectively the maximum operating rate is 90 percent; this is the assumed "maximum rate" constraint. When the historical seasonal operating rate is above 90 percent, the availability factor for each period is set to 90 percent.

When the seasonal operating rate is above the run of river constraint and below the maximum rate, we reason that the hydro generator owner would be likely to produce a higher level of energy during spike hours, when energy prices are highest, than during low peak hours, and that the owner would be likely to produce a higher level during low peak than during off-peak hours.

Based on this reasoning, when the seasonal operating rate is between the run of river constraint and the maximum rate, as is the case for each of the three

seasons, the study uses a spike availability factor of 90 percent, which is the assumed maximum operating rate, and off-peak availability factor of 30 percent, which is the assumed run-of-river constraint, and a calculated availability factor for the peak periods, as described below.

The seasonal peak availability factor is calculated using actual total seasonal hydro generation. The study then computes the hydro generation during all spike and off-peak hours, assuming the generation rates implied by the spike and off-peak derate factors computed in the manner described above. The study then calculates total peak hydro generation as the difference between total seasonal hydro generation and the sum of hydro generation during all spike and off-peak hours. The seasonal low peak availability factor is computed as total low peak hydro generation divided first by the number of hours in the off-peak period and then by hydro generating capacity.

d) Variation in pumped storage availability across seasons and periods

We assume that pumped storage units have 90 percent availability during Top 1% and Top 10% periods, 50 percent availability during Low Peak periods, and no availability during off-peak periods.

e) Wind availability

For each area, we calculate average operating rates from 2011 to 2015 by season from EIA-923 data. The average operating rates are the availability factors.

f) Solar availability

Availability for solar power is also calculated based on average operating rates from 2011 through 2015 reported in EIA-923. There is little solar power during

off-peak periods because of darkness. Accordingly, solar availability is weighted to on-peak periods.

B. Variable Costs of Generation

The study uses variable costs of generation that include fuel costs, sulfur dioxide and nitrogen oxide emissions costs, and variable operations and maintenance (VOM) costs. The study calculates fuel costs from unit heat rates and Platts' Gas Daily spot prices at the unit's reported natural gas hub by Energy Velocity, #2 Diesel, Low-Sulfur – Industrial for the East Coast, and Residual Fuel Oil sales to end users for the East Coast for the test period. Natural gas prices vary by hub, but were $2.67 per mmBtu at TETCO M3, the hub with the largest reported capacity in the study. Fuel costs for other fuels are based upon the average fuel costs reported in the EV data for each fuel type. Emissions prices during the test year were $2 per ton for SO2 year-round and $300 per ton for NOx in the summer season. CO_2 costs for units located in Regional Greenhouse Gas Initiative (RGGI) states are $5.21/ton, which is based upon RGGI Auction results in Dec 2014. Units in Montgomery County, MD have an additional $5/ton carbon tax on CO_2 emissions. VOM costs are from the EV database.

C. Long-term Contracts

We reviewed Appendix B data from market-based rate filings, FERC Form 1 filings, and Electric Quarterly Report ("EQR") data to obtain data on long-term contracts. Where the market-based rate filing indicates a change of operational control, we include a contract transferring control to the buyer. We leave the generation unit in the BAA where it is physically interconnected to the transmission system. When the buyer is a load-serving entity in another BAA, we give a priority firm transmission path to the BAA with the load.

Long-term contracts that expire prior to January 1, 2015 are not included in the study. Long-term contracts that expire between January 1, 2015 and July 31,

2015 are included only in the seasons for which they are in effect. Contracts that expire after August 31, 2015 are included in the study.

IV. Transmission

A. Transmission Network

The study incorporates a contract path transmission network for modeling purposes. Transmission pricing between balancing authority areas is represented by a traditional contract path transmission network in which the direct physical connections between balancing authority areas are also the individually priced links from which contract paths are constructed.

B. Transmission and Ancillary Services Pricing and Losses

As specified by the Commission's Appendix A, the study generally uses ceiling prices for transmission service from Schedules 1, 2 and 8 of the utility's *pro forma* open-access transmission tariff. Transmission providers may require transmission customers to purchase ancillary services under Schedule 1 (scheduling, system control and dispatch) and Schedule 2 (reactive supply and voltage control). Schedule 8 gives the rates for non-firm point-to-point transmission service. The study uses transmission prices from tariffs.

When we have tariffs available, we calculate rates for off-peak, peak and spike categories. Because of discounting and the nature of baseload purchases, off-peak rates are often lower than peak rates.[3] We use two steps to determine off-peak rates. Step 1: When a utility posts off-peak hourly rates, we use the posted rates. Step 2: When a utility does not post off-peak hourly rates, we calculate an hourly off-peak rate based on other tariff information. To calculate hourly off-

[3] For transactions longer than one hour, the *pro forma* tariff caps the amount that the purchaser pays per day by the daily rate, and the amount that the purchaser pays per week by the weekly rate.

peak rates, we divide the weekly rate by 168, the number of hours in a week. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

We use similar steps to determine peak rates. Step 1: When a utility posts maximum hourly rates in its tariff, we use the maximum tariff rates. Step 2: When a utility does not post off-peak hourly rates, we calculate a peak rate based on other tariff information. To calculate hourly peak rates, we divide the weekly rate by 80—the "Appalachian" method. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

For spike periods, we use ceiling hourly rates from tariffs, when available. Otherwise, we use the Appalachian method.

Whenever practical, the study uses loss rates from tariffs. When these methods did not provide a loss rate for a particular utility, the study assumes that losses are three percent per utility.[4] The study assumes that transmission customers pay losses in-kind. That is, if area A exports 100 MW to area B and the losses are 3 percent, only 97 MW arrive at area B.

For areas where tariffs are not available, rates and losses are the average by period for all the reporting areas.

C. Transfer Capability and SILs

The geographic market includes only PJM and NYISO. The SILs for PJM East and PJM East of 5004/5005 comes from the 2015 Simultaneous Import Limit

[4] Losses of 3 percent are representative of the industry. See, FERC Open Access NOPR, *FERC Stats & Regs*, ¶32,514 at 33,150 (1995).

Study filed by PJM on September 2, 2016.[5] The total imports into the destination markets may be less than the actual ability to import into the destination because not all the generation capability owned or controlled by load-serving entities within the destination markets studied in PJM have been identified in the data.

V. Market Prices

The study used December 2014-November 2015 real-time hourly prices from the RTO LMP for PJM East and PJM East of 5004/5005. Table V-1 shows the PJM East of 5004/5005 market prices in each of the ten periods, and Table V-2 shows the PJM East market prices.

Table V-1 – PJM East of 5004/5005 Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$148.44	-----
Top 10%	$62.03	$64.59	$185.57
Low Peak	$35.73	$35.56	$47.55
Off-Peak	$29.46	$24.88	$50.16

Table V-2 – PJM East Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$145.63	-----
Top 10%	$57.82	$63.88	$193.51
Low Peak	$32.73	$29.67	$50.59
Off-Peak	$26.67	$21.25	$50.94

VI. Load and Contract Obligations for AEC Calculations

Load data come from PJM for PJM and from Energy Velocity for the other supply areas.

To compute load requirements for market participants in New York and PJM, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[6] To account for their greater load obligations, we assume that Dominion has 100 percent responsibility for its allocation of load and that AEP has 90 percent of its allocation as opposed to the standard 70 percent.

[6] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers.

Technical Appendix:

Methods Used to Compute Concentration

This Exhibit describes the methods used to calculate market shares and concentration in destination markets.

Allocation of scarce transmission capability is accomplished using linear and nonlinear programs that model generation dispatch and the contract path transmission system. This Exhibit provides an overview of the structure of the programs and presents the equations.

Overview of Linear Program

The linear program models control areas as nodes in a transmission system. Each node has a demand for and a supply of electric energy. The supply is based on the generators at the node and potential deliveries to the node via transmission links from other control areas. The linear program allows for net import and export limits to and from an individual control area. Given generation capability and costs and transmission capability and costs, the linear program finds the least-cost solution that satisfies the specified loads. Costs are defined as dispatch (generation) costs plus transmission costs including losses plus the default cost for "unserved" load. For each solution, the linear program determines the quantities produced in, exported from, and imported into each control area.

The Mathematical Equations

The linear program to be solved is given below:

Minimize Total Cost: $Cost = GC + TC + UC$

Subject to:

(1) Generation: $TG_a = \sum_{u}^{u \in a} G_{a,u}$ for each area *a*;

(2) Imports: $YI_a = \sum_{b}^{a,b \in network} (1 - h_{b,a}) T_{b,a}$ for each area *a*;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

(3)	Exports:	$YE_a = \sum_{b}^{a,b \in network} T_{a,b}$	for each area *a*;
(4)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(5)	Supply/Demand Balance:	$TG_a + Y_a + U_a = D_a$	for each area *a*;
(6)	Generation Cost:	$GC = \sum_{a} \sum_{u}^{u \in a} d_{a,u} G_{a,u}$	for each area *a*;
(7)	Transmission Cost:	$TC = \sum_{a,b}^{a,b \in network} r_{a,b} T_{a,b}$	for each path *a* to *b*;
(8)	Unfilled Demand Cost:	$UC = \sum_{a} pU_a$	for each area *a*;
(9)	Generation Limits:	$g\min_{a,u} \le G_{a,u} \le g\max_{a,u}$	for each unit *u* in each area *a*;
(10)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(11)	Net Import Limits	$Y\min_{a} \le Y_a \le Y\max_{a}$	for each area *a*;

where:

a,b	are subscripts for control/transmission areas;
Cost	is total system cost;
$d_{a,u}$	is the dispatch cost of unit *u* in area *a*;
D_a	is demand for power in area *a*;
$G_{a,u}$	is generation output of unit *u* in area *a*;
GC	is total system generation cost;
$G\max_{a,u}$	is the maximum output of unit *u* in area *a*;
$G\min_{a,u}$	is the minimum output of unit *u* in area *a*;
$h_{b,a}$	is the fraction of power lost to resistance from moving power from area *b* to area *a*;
N	is a subscript to identify simultaneous transmission constraint *n*;
P	is the default price;
$r_{a,b}$	is the transmission rate from area *a* to area *b*;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

$T_{a,b}$	is the power flow from area *a* to area *b*;
TC	is total system transportation expenses;
TG_a	is total generation output in area *a*;
t $\max_{a,b}$	is the maximum power flow from area *a* to area *b*;
t $\min_{a,b}$	is the minimum power flow from area *a* to area *b*;
U	is a subscript to identify units in an area;
U_a	is the amount of demand in area *a* not met by generation or imports
UC	is total system cost of not meeting demand;
Y_a	is net imports into area *a*;
YE_a	is total exports from area *a*; and
YI_a	is total imports into area *a*;
Y $\min_a$	is minimum net imports in area *a;*
Y $\max_a$	is maximum net imports in area *a.*

This linear program is solved using the BDMLP solver in GAMS. In order to calculate concentration for different destinations, seasons, and periods, the PASS GAMS program loops through the destinations, seasons, and periods with calls to Solvers to solve the linear programs. Loads, unit availability and transmission availability are adjusted for each season-period combination.

Calculating Concentration

Transmission allocation is accomplished in four steps. In the first step the linear program finds the net-back prices in all control areas given a price at the destination control area equal to 105 percent of the pre-merger price. Suppose the pre-merger price at the destination, control area A, is $20/MWh. Then all generation capability with a dispatch cost of $21/MWh or less in the destination area would be included in the market because $21 is 105 percent of $20. If transmission cost (including losses) is $5/MWh from control area B to A, then the net-back price at B would be $16/MWh, which is the $21/MWh less the $5/MWh transmission cost between B and A. Then, all generation capability at B with dispatch costs equal to or less than $16/MWh would be included in the market if there were no transmission constraints. Calculation of net-back prices is

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

accomplished by setting the default price, *p*, equal to 105 percent of the pre-merger price at the destination, setting load at the destination to a high number and loads elsewhere to zero, setting transmission limits high enough so that the transmission system is not constrained, and setting a limited amount of generation in each area with a zero dispatch cost. The shadow prices produced by the linear program will be *p* at the destination and the relevant net-back prices in other areas.

In the second step, one calculates Economic Capacity (EC) and Available Economic Capacity (AEC) in each area. These values are then used to limit generation capability. The ownership shares of AEC and EC are calculated for each node in the system.

In the third step, the linear program determines the amount of energy that can be imported into an area given available EC (or AEC) and limits on transmission capacity. This is accomplished by limiting generation in each area to the capacity amount (EC or AEC), giving generation outside the destination market a lower cost than generation inside the destination market, and minimizing cost to serve a large load at the destination market. The amount of generation supplied to the destination is the maximum that can be imported into the destination market.

In the fourth step, transmission is allocated by the following non-linear program:

Minimize Loss: $$Loss = \sum_{\alpha}\left(\frac{C_{\alpha}^{2}}{Y_{Dest}s_{\alpha}} - 2C_{\alpha}\right)$$

Subject to:

(1) Pre Shares: $$s_{\alpha} = \frac{C\max_{\alpha}}{\sum_{\beta} C\max_{\beta}}$$ for each area α;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

(2)	Allocated Shares:	$A_\alpha = \frac{C_\alpha}{Y_{Dest}}$	for each area α;
(3)	Imports:	$YI_a = \sum_b^{a,b \in network} (1 - h_{b,a}) T_{b,a}$	for each area *a*;
(4)	Exports:	$YE_a = \sum_b^{a,b \in network} T_{a,b}$	for each area *a*;
(5)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(6)	Supply/Demand Balance:	$C_a + Y_a + U_a = D_a$	for each area *a*;
(7)	Capacity Limits:	$c\min_a \le C_a \le C\max_a$	for each area *a*;
(8)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(9)	Max Import Limit	Y_{Dest} = Maximum imports from step 3;	

where:

a,b	are subscripts for control/transmission areas;
α,β	are subscripts for control/transmission areas other than the destination market;
s_α	Is area α's share of capacity outside of the destination;
A_α	is area α's share of allocated capacity outside of the destination;
Loss	is the loss function to be minimized.

The loss function is derived from the weighted squared-errors between the pre-allocation shares and the post-allocation shares, where Y_{Dest}/s_α are the weights. For each source control area, the weighted squared-error is given by:[1]

$$W_\alpha = \frac{Y_{Dest}}{s_\alpha}(A_\alpha - s_\alpha)^2.$$

[1] This exposition ignores the adjustments necessary to give priority to minimum transfer levels from a source area to the destination.

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

Accordingly, the sum of the weighted squared-errors gives rise to the loss function, which can be seen by:

$$\begin{aligned} Loss &= \sum_{\alpha} W_{\alpha} \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha} - s_{\alpha})^2 \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha}^2 - 2 s_{\alpha} A_{\alpha} + s_{\alpha}^2) \\ &= \sum_{\alpha} \left(\frac{C_{\alpha}^2}{Y_{Dest} s_{\alpha}} - 2 C_{\alpha} \right) + \text{constant}. \end{aligned}$$

The resulting shares from minimizing this loss functions preserve the relative shares of capacity behind any transmission constraint going to the destination. This can be seen from the following LaGrangian equation to be minimized:

$$L = \sum_{i} \left(\frac{C_i^2}{Y_{Dest} s_i} - 2 C_i \right) + \lambda \left(T - \sum_{i} C_i \right),$$

where *T* is the transmission limit affecting control areas *i*. The first order conditions are:

$$\frac{\partial L}{\partial C_i} = \frac{2 C_i}{Y_{Dest} s_i} - 2 - \lambda = 0,$$

which can be rearranged to give:

$$A_i = \frac{C_i}{Y_{Dest}} = \left(\frac{2 + \lambda}{2} \right) s_i,$$

which shows that the allocated market shares of those areas affected by the transmission constraint are proportional to their shares of capacity before the transmission allocation. Moreover, this is the only transmission allocation

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

method that maintains the relative shares of capacity behind any binding transmission constraint in the allocation process.

This non-linear program is solved using the COINIPOPT solver in GAMS. The calculated capacities from the nonlinear program above less transmission losses determine the capacities for the market share calculations for sources outside of the destination market. The capacities within the destination market are given full weights.

Market concentration is the HHI, which is the sum of the squared market shares. Mathematically,

$$HHI = \sum_{i=1}^{n} S_i^2,$$

where S_i is the allocated share of firm *i* and *n* is the number of firms in the market. The summary sheets combine all the firms with shares of 0.7 percent or less (other than Applicants) into the "Other" category. The collective share of the Other category does not directly enter the HHI calculation other than the represented capacity as each independent entity enters the HHI calculation. For example, if ten firms with 0.5 percent shares were in the Other category, the HHI contribution of the Other category would be 0.625 (= 10 x .5 x .5 = 10 x .0625) and ***not*** 25.

Re: Joint Owners of the Conemaugh Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Conemaugh Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Conemaugh Electric Generating Station:

1. The Owners jointly own the Conemaugh Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in East Wheatfield and West Wheatfield Townships, Indiana County, Pennsylvania (the "Station").

[1] Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20160928-5228 FERC PDF (Unofficial) 9/28/2016 6:58:58 AM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Conemaugh Power LLC	3.72%
Constellation Power Source Generation, Inc.	10.56%
Duquesne Conemaugh LLC	3.83%
Exelon Generation Company, LLC	20.72%
PPL Montour, LLC	16.25%
PSEG Fossil LLC	22.50%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.45%
UGI Development Company	5.97%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

Sincerely yours,

Georgianna R. Stenger
Administrative Manager

Re: Joint Owners of the Keystone Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Keystone Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Keystone Electric Generating Station:

1. The Owners jointly own the Keystone Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in Plumcreek, South Bend and Cowanshannock Townships, Armstrong County, Pennsylvania, and Armstrong Township, Indiana County, Pennsylvania (the "Station").

[1] Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Constellation Power Source Generation, Inc.	20.99%
Duquesne Keystone LLC	2.47%
Exelon Generation Company, LLC	20.99%
Keystone Power LLC	3.70%
PPL Montour, LLC	12.34%
PSEG Fossil LLC	22.84%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.67%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

Sincerely yours,

Georgianna R. Stenger

Carol Peterson
Vice President Finance
Exelon Nuclear
4300 Winfield Road
Warrenville, IL 60555

Letter Regarding Control of Jointly-Owned Nuclear Facilities

Dear Ms. Peterson:

In connection with its upcoming compliance filings pursuant to Order No. 697,[1] PSEG Nuclear LLC ("PSEG") is submitting this letter in order to set forth its understanding of, and is requesting Exelon Generation Company LLC's ("Exelon") concurrence on, the respective level of control exercised by both companies with respect to the two nuclear facilities that they jointly own.[2]

PSEG avers and requests Exelon's concurrence on the following:

1. PSEG and Exelon jointly own and control two nuclear power plants, Peach Bottom Atomic Power Station located in Delta, PA and the Salem Nuclear Generating Station in Lower Alloways Creek, NJ.

2. In accordance with the Joint Owners Agreement for Peach Bottom dated November 24, 1971, as amended on thereafter, between the Parties, PSEG and Exelon each own 50% of the generating station. Under the Agreement, Exelon is the designated operator of Peach Bottom.

3. In accordance with the Joint Owners Agreement for Salem dated November 24, 1971, as amended thereafter, between the Parties, Exelon owns 42.59% and PSEG owns 57.41% of the generating station. Under the Agreement, PSEG is the designated operator of Salem.

4. Section 4.1 of each of the Joint Owners' Agreements states, "The signatories shall be entitled to shares of the installed capacity, available capacity, operating capacity and hourly energy generation of the Station in proportion to their ownership . . .."

[1] *Market-Based Rates For Wholesale Sales Of Electric Energy, Capacity And Ancillary Services By Public Utilities*, 119 FERC ¶ 61,295 (2007).

[2] PSEG has requested a letter of concurrence from Exelon in order to facilitate the Commission's review of the market power analysis submitted by PSEG with respect to facilities it jointly owns with Exelon. Exelon has no objection to PSEG's submission of this letter as part of PSEG's compliance filing,.

Thomas P. Joyce
Senior Vice President

P.O. Box 236, Hancocks Bridge, NJ 08038
tel: 856.339.1100 fax: 856.339.1104
email: Thomas.Joyce@pseg.com

PSEG
Nuclear L.L.C.

5. Section 11.1 of each of the Joint Owners' Agreements provides that the generating station will be operated by the party designated as operator for the mutual benefit of PSEG and Exelon.

6. In Order No. 697 the Commission stated that under "where a jointly-owned generation facility is operated by one of the joint-owners for the benefit of and on behalf of all of the joint-owners . . . it may be reasonable to allocate capacity based on ownership percentages...." Order No. 697 at P 188.

7. In accordance with the guidance provided in Order No. 697 and with the language of each of the joint owners' agreements, PSEG and Exelon should be deemed to control each of the nuclear facilities' output in line with their proportionate ownership share of each facility. As such, PSEG and Exelon should each be deemed to control 50% of Peach Bottom's output, and PSEG should be deemed to control 57.41% of Salem's output with Exelon controlling 42.59%.

Please indicate Exelon's concurrence to the above by executing the Acknowledgement and Agreement section below.

Sincerely

Thomas P. Joyce
Senior Vice President – Operations

Acknowledged and Agreed to
this 21 day of December, 2007.

Carol Peterson
Vice President Finance, Exelon Nuclear, and
an officer of Exelon Generation Company, LLC

JOINT LETTER OF CONCURRENCE

Regulations of the Federal Energy Regulatory Commission (the "FERC") require each public utility with market-based rate authority to file an updated market power analysis every three years in accordance with a schedule adopted in *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 697, FERC Stat. & Regs., Regulations Preambles ¶ 31,252 (2007) ("Order No. 697"). See, 18 CFR § 35.37(a)(1). Each public utility with market-based rate authority may also be required to file a change-in-status report regarding certain changes in circumstances that occur between the dates on which its triennial market power analyses are filed. 18 CFR § 35.42. Among other matters, the market power analysis is to address the amount of generation capacity that the affected utility owns or controls. Where more than one public utility owns a generating facility, FERC requires the utility that is submitting a market power analysis seek a "letter of concurrence" from the other affected co-owning public utilities that identifies the degree to which each public utility controls the generating facility, and to submit the letter with its filing. *See* FERC Order No. 697, 119 FERC ¶ 61,295, P 187 (2007).

The Yards Creek Pumped Storage Hydroelectric Project (the "Yards Creek Project") is a FERC-licensed pumped-storage hydroelectric project with a nameplate capacity of 400 MWs, and is located in Pahaquarry and Blairstown Townships, in Warren County, New Jersey. *See* FERC Project No. P-2309.

PSEG Fossil LLC ("PSEG") and Jersey Central Power & Light Company ("JCPL") each own, as tenants in common with the other, an undivided 50% interest in the Yards Creek Project. Accordingly, if and when PSEG or JCPL submit an updated market power analysis to the FERC, each will be subject to FERC's requirement to seek a "letter of concurrence" regarding the degree to which each controls the Yards Creek Project.

Both PSEG and JCP&L (and their affiliates) own transmission facilities and provide wholesale electric service in the Northeast region, as defined in Order No. 697. Pursuant to the schedule adopted in Order No. 697, PSEG and JCP&L are each required to submit an updated market power analysis to the FERC for markets within the Northeast region in December 2010. PSEG and/or JCP&L may also be obligated to file a change-in-status report or other market power analyses before its subsequent triennial market power analysis for the Northeast region is scheduled to be filed. Therefore, for the sole purpose of enabling either PSEG or JCP&L to submit a market power analysis that addresses, among other issues (to the extent necessary), the scope of each party's control of the Yards Creek Project, PSEG and JCP&L each aver and agree as follows:

1. JCP&L operates and maintains the Yards Creek Project pursuant to the Yards Creek Pumped Storage Hydroelectric Generating Station Operating Agreement, which is dated October 6, 1965 (the "Operating Agreement').

2. Article 2 of the Operating Agreement designates JCP&L as holding sole responsibility for the operations and maintenance the Yards Creek Project. Article 2 further provides that JCPL shall operate the Yards Creek project in the same manner as if JCPL had the complete ownership interest in the Yards Creek Project.

3. JCP&L does, in fact, operate and control the Yards Creek Project in the same manner as if JCP&L had the complete ownership interest in the Yards Creek Project in accordance with Article 2 of the Operating Agreement.

4. Accordingly, PSEG and JCP&L each agree and concur that for the purpose of the market power analyses required by Order No. 697, JCPL shall be deemed to control the Yards Creek Project generation capacity and electric energy output.

ACKNOWLEDGED AND AGREED:

Richard P. Lopriore
President, PSEG Fossil LLC

Dated: 12/21/10

UNITED STATES OF AMERICA

BEFORE THE

FEDERAL ENERGY REGULATORY COMMISSION

PSEG Keys Energy Center LLC	)	Docket No.	ER17-____-000

Affidavit of
Dr. John R. Morris

September 1, 2017

20170901-5226 FERC PDF (Unofficial) 9/1/2017 4:56:13 PM

Public Service Enterprise Group Incorporated
Northeast Region Market Power Study

1. My name is Dr. John R. Morris. I am a Principal at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Washington, DC 20037. I am the same Dr. John R. Morris who filed Public Service Enterprise Group Incorporated's ("PSEG") market power study for the Northeast Region in December 2016 under this docket. See Report & Affidavit of Dr. John R. Morris, FERC Accession Number 20161228-5212, December 28, 2016, and hereinafter the "December Affidavit". PSEG has asked that I update the market power study for the PJM market and relevant submarkets in order to account for the addition of Keys Energy Center, a natural gas combined cycle plant with a generating capacity of 755 MW currently under construction in Prince Georges County, Maryland to PSEG's fleet and the retirements of Hudson (620 MW capacity) and Mercer (632 MW capacity) Generating Stations located in New Jersey.[1] PSEG also requested that I perform a delivered price test ("DPT") for the PJM East and PJM East of 5004/5005 sub-markets.

2. Per PSEG's requests, I updated the market power study submitted in December 2016 by adding Keys Energy Center in the PJM East of 5004/5005 submarket and retiring Hudson and Mercer from the PJM East market. Market sizes were adjusted accordingly. Those were the only changes made to the data. All methods are the same as in the December Affidavit.

[1] PJM Interconnection, L.L.C. ("PJM"), PJM East, PJM East of 5004/5005 and PJM East of AP South.

20170901-5226 FERC PDF (Unofficial) 9/1/2017 4:56:13 PM

3. The results of the pivotal supplier and market share assessments are provided in Exhibit No. PEG-2. The DPT results are presented in Exhibit No. PEG-3.

4. Although there are some minor differences in the results from those presented with the December Affidavit, the differences are not material and do not change the conclusions made at that time. Under the standards utilized by the Commission, continuing market-based rates for PSEG and all of its Northeastern affiliates remain in the public interest.

5. This concludes my affidavit.

Pursuant to 28 U.S.C. §1746, I state under penalty of perjury that the foregoing is true and correct to the best of my information, knowledge, and belief.

Executed on this 1st day of September 2017.

John R. Morris, Ph.D.
Principal
Economists Incorporated

Proposed Date: 2017-09-01
Priority Order: 500
Record Change Type: New
Record Content Type: 1
Associated Filing Identifier:

1. **Availability.** PSEG Keys Energy Center LLC ("PSEG Keys" or "Seller") will make wholesale electric energy, capacity, and ancillary services available under this Tariff to any purchaser for resale, except as prohibited below.

2. **Applicability.** This Tariff is applicable to all sales of energy, capacity, and ancillary services by PSEG Keys not otherwise subject to a particular rate schedule of PSEG Keys.

3. **Rates.** All sales shall be made at the rates established between the purchaser and PSEG Keys.

4. **Other Terms and Conditions.** All other terms and conditions shall be established by agreement between the purchaser and PSEG Keys.

5. **Compliance with Commission Regulations.** PSEG Keys shall comply with the provisions of 18 C.F.R. Part 35, Subpart H, as applicable, and with any conditions the Commission imposes in its orders concerning PSEG Key's market-based rate authority, including orders in which the Commission authorizes PSEG Keys to engage in affiliate sales under this Tariff or otherwise restricts or limits the PSEG Key's market-based rate authority. Failure to comply with the applicable provisions of 18 C.F.R. Part 35, Subpart H, and with any orders of the Commission concerning PSEG Key's market-based rate authority, will constitute a violation of this Tariff.

6. **Limitations and Exemptions Regarding Market Based Rate Authority.** PSEG Keys does not have any limitations on its market-based rate authority except as other provided in this Tariff. The Commission granted Seller in Docket No. ER17-___-000 the following waivers and blanket authorization: (a) waiver of Subparts B and C of Part 35 of the Commission's regulations requiring the filing of cost-of-service information, except for sections 35.12(a), 35.13(b), 35.15 and 35.16; (b) waiver of the requirements of Part 41 and Part 101; (c) waiver of Part 141 of the Commission's regulations concerning

20170901-5226 FERC PDF (Unofficial) 9/1/2017 4:56:13 PM

accounting and reporting requirements, with the exception of 18 C.F.R. §§ 141.14 and 141.15; and (d) blanket approval as to Section 204 of the FPA and Part 34 of the Commission's regulations for all future issuances of securities and debt and assumption of liabilities.

7. **Ancillary Services.**

Third-party ancillary services: PSEG Keys offers Regulation and Frequency Response Service, Reactive Supply and Voltage Control Service, Energy and Generator Imbalance Service, Operating Reserve-Spinning, and Operating Reserve-Supplemental. Sales will not include the following: (1) sales to an RTO or an ISO, *i.e.*, where that entity has no ability to self-supply ancillary services but instead depends on third parties; and (2) sales to a traditional, franchised public utility affiliated with the third-party supplier, or sales where the underlying transmission service is on the system of the public utility affiliated with the third-party supplier. Sales of Operating Reserve-Spinning and Operating Reserve-Supplemental will not include sales to a public utility that is purchasing ancillary services to satisfy its own open access transmission tariff requirements to offer ancillary services to its own customers, except where the Commission has granted authorization. Sales of Regulation and Frequency Response Service and Reactive Supply and Voltage Control Service will not include sales to a public utility that is purchasing ancillary services to satisfy its own open access transmission tariff requirements to offer ancillary services to its own customers, except at rates not to exceed the buying public utility transmission provider's OATT rate for the same service or where the Commission has granted authorization.

8. **Seller Category.** PSEG Keys is a Category 2 Seller in the Northeast Region and a Category 1 seller in the Central, Northwest, Southeast, Southwest and Southwest Power Pool regions, as defined by 18 C.F.R. 35.36(a),

9. **Effective Date.** This Tariff is effective on the date specified by the Commission. This Tariff shall continue in effect until terminated or changed in accordance with any applicable regulatory requirements.

Re: PSEG Keys Energy Center LLC
Docket No. ER17-2426-000
Application for Market-Based Rate Authorization and Request for Waivers and Blanket Approvals

Dear Secretary Bose:

On September 1, 2017, PSEG Keys Energy Center LLC ("PSEG Keys") submitted an application in the above-referenced matter for market-based rate authorization and request for waivers and blanket approvals. This letter clarifies that, in addition to the waivers requested in the September 1, 2017 application, PSEG Keys is seeking the waivers set forth in Order No. 807, *Open Access and Priority Rights on Interconnection Customer's Interconnection Facilities*, Order No. 807, 150 FERC ¶ 61,211, Docket No. RM14-11-000 (2015).

PSEG Keys does not own or control any transmission facilities other than the interconnection facilities necessary to interconnect PSEG Keys. The generator interconnection facilities that PSEG Keys owns and controls are limited and discrete radial facilities that do not form an integrated transmission grid that are used solely to interconnect PSEG Keys' facility to the grid. PSEG Keys affirms to the Commission that it (together with its affiliates) is eligible for priority rights and waiver under Order No. 807, *Id.* at P 165, such that Keys Energy Center LLC and its affiliates are immune from the Open Access Requirements to the extent set forth under Order No. 807, without the need for further filings or orders.

20171004-5160 FERC PDF (Unofficial) 10/4/2017 4:05:04 PM

In addition, we are resubmitting three attachments, specifically Appendix B, Appendix C and Appendix D, to conform to the Federal Energy Regulatory Commission's formatting and heading descriptions. In addition, we are resubmitting Appendices A-1 and A-2 in Excel format as required by the Commission's regulations.

Thank you for your attention to this matter.

Respectfully submitted,

Cara J. Lewis

PSEG Energy Solutions	**ER16-2725-002**
PSEG Keys Energy Center LLC	**ER17-2426-000**
(collectively, PSEG Affiliates)	

Dear Secretary Bose:

Pursuant to section 35.42(a)(1) of the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"),[1] the PSEG Affiliates submit this notice of non-material change in status. On November 24, 2017, the Commission accepted for filing the application of PSEG Keys Energy Center LLC ("PSEG Keys") for market-based rate authority.[2] In addition, on November 21, 2017, the Commission accepted the PSEG Affiliates updated market power analysis for the Northeast region and granted the PSEG Affiliates continuing authority to sell electric energy, capacity and ancillary service at market-based rates.[3]

[1] 18 C.F.R. Part 35.42 (2017).

[2] *PSEG Keys Energy Center LLC*, Docket No. ER17-2426-000 (November 24, 2017).

[3] *PSEG Energy Resources & Trade LLC, et al*., Docket Nos. ER10-1789-000, *et al*., (November 21, 2017).

Accordingly, each of the PSEG Affiliates has been authorized to make market-based rate sales pursuant to a filed tariff.

The purpose of this filing is to supplement the information contained in PSEG Keys' application for market-based rate authority[4] to reflect the commencement of test power deliveries from the new 585 MW Sewaren 7 plant, which is targeted to be in operation in June 2018. This notice also reflects the retirements of Sewaren units 1, 2, 3 and 4, which will retire once Sewaren 7 begins commercial operation. This change does not affect the basis upon which the Commission relied when it granted PSEG Keys' application for market-based rate authorization or the updated market power analyses submitted in the Triennial Review supporting the market-based rate authorization for the other PSEG Affiliates.

I. DESCRIPTION OF THE PSEG AFFILIATES

A. PSEG Fossil Sewaren Urban Renewal LLC

PSEG Fossil Sewaren Urban Renewal LLC, New Jersey LLC ("PSEG Sewaren"), is a direct subsidiary of PSEG Fossil LLC ("PSEG Fossil"), which is a direct subsidiary of PSEG Power LLC ("PSEG Power"), a direct subsidiary of Public Service Enterprise Group Incorporated ("PSEG"), a publicly traded company. PSEG Sewaren constructed a new, natural gas-fired, power plant and related electrical facilities required for interconnection of the plant to electric grid, on property that it owns in Woodbridge, New Jersey (the "Sewaren 7").[5] Prior to becoming commercially operational, PSEG Sewaren leased Sewaren 7 to PSEG Fossil. The Sewaren 7 generating facilities comprise a highly-efficient, dual-fuel, combined-cycle plant with a nameplate rating of 585 MW. Sewaren 7 was first connected to the electric grid on April 27, 2018 and is expected to reach commercial operation in June, 2018. PSEG Fossil will be solely responsible for all operations and maintenance for Sewaren 7 under the lease, and will have exclusive control over decisions regarding dispatch or the submission of bids or offers for plant operation. The New Jersey electricity ratepayer is not subsidizing or guaranteeing any portion of the revenue of the plant. The plant will participate in the capacity and energy markets administered by PJM Interconnection, L.L.C. ("PJM") for wholesale electric generators. All of the output of the Sewaren 7 will be sold to PSEG Fossil's affiliate, PSEG Energy Resources & Trade LLC ("PSEG ER&T").

B. Public Service Electric and Gas Company ("PSE&G")

PSE&G is a public utility operating company engaged primarily in the transmission of electricity, and the provision of gas and electric distribution service in the State of New Jersey. During the study period, PSE&G owned less than 140 MW of solar generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities. PSE&G is a member of the PJM, a FERC-approved Regional Transmission Organization, and has made all of its transmission facilities available for open access transmission service pursuant to the Open Access Transmission Tariff ("OATT") administered

[4] PSEG Keys Energy Center LLC, Application for Market-based Rate Authorization and Request for Waivers and Blanket Approvals, Docket No. ER17-2426-000 (filed September 1, 2017, amended October 4, 2017) ("PSEG Keys Application").

[5] Once Sewaren 7 begins commercial operations, PSEG Fossil will retire Sewaren 1, 2, 3 and 4.

by PJM. PSE&G is authorized to sell power at market-based rates and makes wholesale sales falling within several different categories, as described below.

Non-utility generation ("NUG") output. PSE&G's NUG output expired in 2015 and 2016 pursuant to the terms of the NUG contracts. PSE&G currently has no further NUG obligations, other than 0.6 MW of energy associated with the former Kinsley Landfill which no longer operates.

Solar. In 2007, the New Jersey legislature passed Regional Greenhouse Gas Initiative ("RGGI") legislation authorizing state utilities to invest in renewable resources such as wind or solar in order to promote increased use of renewable resources within the state and in turn reduce greenhouse gas emissions. See L. 2007, c. 340, codified at N.J.S.A. 48:98-1. The New Jersey Board of Public Utilities ("NJBPU") has approved two (2) PSE&G Solar 4 All® (S4A) programs under which PSE&G has sited, designed and built twenty-nine (29) grid connected solar facilities. PSE&G currently owns and operates approximately 125 MW DC of grid connected solar under the S4A program. In 2016, PSE&G received NJBPU approval of its Solar 4 All Extension II filing to install an additional 33 MW-DC of grid connected solar on landfills and brownfields in the PSE&G electric service territory to begin in 2017.

C. PSEG Energy Resources & Trade LLC ("PSEG ER&T")

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil LLC ("PSEG Fossil") and PSEG Nuclear LLC ("PSEG Nuclear"), each wholly-owned subsidiaries of PSEG Power, as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission.[6]

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

1. Basic Generation Services ("BGS") Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 et seq., which initiated the transition from a regulated to a competitive retail power market in New Jersey, the NJBPU annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSEG ER&T has participated directly in all of the auctions for BGS supply held since 2004, has been a winning bidder in these auctions and has incurred contractual commitments to provide supply to BGS load pursuant to NJBPU approved contracts beginning with the 2004 auction and continuing to the present.

2. Basic Gas Supply Service ("BGSS") Gas Contract. By order issued April 16, 2002, the NJBPU approved a full requirements contract for the provision of gas supply

[6] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999).

by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the NJBPU, PSEG ER&T assumed, through capacity release, FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract remains in effect and provides for annual renewals unless terminated by either party on 12 months' advance written notice.

3. Long Island Power Authority ("LIPA") Fuel Supply: On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015.

D. PSEG Fossil

PSEG Fossil is an Exempt Wholesale Generator ("EWG")[7] and is authorized to sell power at market-based rates. PSEG Fossil owns and operates electric generation facilities located within PJM and sells their entire output to its affiliate PSEG ER&T.[8] The assets of PSEG Fossil (and its subsidiary, PSEG Sewaren) are located entirely within PJM. However, PSEG Fossil's subsidiaries PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Power New York LLC ("PSEG Power NY") and PSEG New Haven LLC ("PSEG New Haven") own facilities in ISO New England Inc. ("ISO-NE") and the New York Independent System Operator, Inc. ("NYISO"). As noted below, PSEG Fossil also co-owns certain facilities in PJM.

PSEG Fossil's subsidiaries, PSEG Power CT, PSEG Keys and PSEG Sewaren, are currently constructing three new gas-fired generation units. PSEG Sewaren is constructing Sewaren7,[9] which is a 585 MW (nameplate rating) combined cycle unit in Woodbridge, New Jersey which is expected to reach commercial operations in June 1, 2018. PSEG Power CT is constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019. Once Sewaren 7 begins commercial operations, Sewaren 1, 2, 3 and 4 will be retired.

PSEG Fossil satisfies most of the electricity needs of its plants from PJM under PJM's "station power" Tariff provisions. PSEG Fossil procures gas supply for its plants from PSEG ER&T and receives gas distribution service from PSE&G at rates approved by the NJBPU on May 29, 2013.[10]

E. PSEG Power CT

[7] PSEG Fossil LLC, Docket No. EG00-3-000, 89 FERC ¶ 62,237 (December 20, 1999); PSEG Fossil LLC, 95 FERC ¶ 61,405 (June 14, 2001); PSEG Fossil LLC, 99 FERC ¶ 62,167 (June 10, 2002).

[8] These contracts were originally approved by the Commission as cost-based contracts. *See Public Service Electric and Gas Company*, et al., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Fossil obtained market based rate authority covering sales from its generating units.

[9] Once Sewaren 7 begins commercial operations, PSEG Fossil plans to retire Sewaren 1, 2, 3 and 4.

[10] NJBPU Docket No. GM12100935 (May 29, 2013).

PSEG Power CT is a Connecticut limited liability company and an EWG that owns and operates electric generation facilities in the State of Connecticut and is authorized to sell power at market-based rates.[11] Both of PSEG Power CT's generation facilities, Bridgeport Harbor and New Haven Harbor, are located in the State of Connecticut within the market administered by ISO-NE. PSEG Power CT sells the output of its generation facilities to its affiliate PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. As noted above, PSEG Power CT is currently constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

F. PSEG New Haven

PSEG New Haven is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG New Haven owns and operates a facility (the "New Haven facility") in New Haven, Connecticut with a nameplate rating of 181 MWs. The New Haven facility is located within the New Haven Harbor generation station. The New Haven facility is interconnected to the adjacent United Illuminating East Shore Substation using a 115 KV underground cable. PSEG New Haven has no other generation assets. The commercial operation date for the New Haven facility was June 1, 2012 and PSEG New Haven has obtained MBR authority from FERC.[12]

The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[13] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[14] All of the energy and capacity of the New Haven facility is sold into the ISO-NE markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA[15] has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder. The 181 MW nameplate rating of the New Haven Facility was not included in PSEG's triennial analysis.

G. PSEG Nuclear

PSEG Nuclear is an EWG[16] and is authorized to sell power at market-based rates. PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire

[11] *Wisvest Corporation,* et al., 101 FERC ¶ 61,166 (2002).

[12] *PSEG New Haven LLC*, Docket No. ER12-1250-000, *et al*., (May 29, 2012).

[13] *Re Review of Peaking Generation Projects*, Docket No. 08-01-01, Connecticut Department of Public Utility Control, June 25, 2008 ("Awards Decisions") (2008 WL 2587405 (Conn. D.P.U.C.)). The PURA is the successor to the Department of Public Utility Control. PURA came into being in July 2011 as part of a reorganization of Connecticut state energy agencies. For consistency, this application refers to the agency as the PURA.

[14] Section 50 of Public Act 07-242, now codified at Section 16-243u of the Connecticut General Statutes.

[15] The CFD was approved on October 29, 2010 in a letter order ruling on Motion Number 62 in Docket No. 08-01-01.

[16] *PSEG Nuclear LLC*, 97 FERC ¶ 62,191 (November 30, 2001).

output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission.[17] The assets of PSEG Nuclear are located entirely within PJM.

H. Pavant Solar LLC, San Isabel Solar LLC and Bison Solar LLC

PSEG Power Ventures portfolio includes three (3) solar companies with market-based rate authority: (1) Pavant Solar II LLC[18] is a QF which owns a 50 MW (AC) solar facility in Fillmore Utah; (2) San Isabel Solar LLC[19] is a QF which owns a 30 MW (AC) solar facility in Las Animas County, Colorado; and (3) Bison Solar LLC[20] is a QF which owns a 30 MW (AC) solar facility 25 miles north of Fort Collins, Colorado.

I. PSEG Energy Solutions LLC

PSEG Energy Solutions LLC ("PSEG Solutions") is a Delaware limited liability company and a direct subsidiary of PSEG ER&T. PSEG Solutions obtained market-based rate authority[21] and will operate within the PJM, NYISO and ISO-NE markets. PSEG Solutions will purchase power from the regional transmission organization ("RTO") at wholesale and sell it to retail customers. PSEG Solutions will not own or operate any generation assets. PSEG Solutions began its retail business in 2017.

II. Affiliated Generation Ownership

A list of the Applicants' affiliated domestic FERC jurisdictional generation assets owned is contained in Appendix B attached hereto.[22] Those additional subsidiaries of PSEG that may be considered relevant to this request are described below:

(1) Public Service Enterprise Group Incorporated ("PSEG"). PSEG, a New Jersey corporation, is a public utility holding company engaged in, among other things, the generation of electric energy and the transmission, distribution and sale of electricity and natural gas through its subsidiaries.

(2) PSEG Power LLC. PSEG Power was formed in 1999 to acquire the former generation assets of PSE&G. PSEG Power, a Delaware limited liability company, does not directly own any generation facilities or engage in any FERC jurisdictional activities but is the parent company of several FERC jurisdictional entities, including Applicants PSEG ER&T (and

[17] *Public Service Electric and Gas Company, et al.,* 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Nuclear obtained market-based rate authority.

[18] *Pavant Solar II LLC*, Docket No. QF16-1072-000.

[19] *San Isabel Solar LLC*, Docket No. QF16-712-000.

[20] *Bison Solar LLC*, Docket No. QF16-711-001.

[21] *See* Letter Order dated December 21, 2016 in Docket No. ER16-2725-000.

[22] Appendix B excludes generation assets located in Hawaii as well as generation assets in which PSEG's interest is limited to a leveraged lease interest. *See* PSEG Keys Application, Docket No. ER17-2426, attached Appendix B.

its subsidiary PSEG Solutions), PSEG Fossil, PSEG Nuclear, PSEG Power CT, PSEG New Haven and PSEG Power Ventures (which owns PSEG Solar Source).

(3) PSEG Power Ventures LLC ("Power Ventures") and PSEG Solar Source LLC. PSEG Power Ventures is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source and has an indirect ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 414 MWs DC (325 MW AC) of solar capacity across the United States, including a combined 146 MWs[23] (113 MW AC) of solar capacity in PJM and approximately the following amount of MWs in the following states, all through separate project companies which have obtained QF status.

- 15 MWs (12 MW AC) in Florida
- 146 MWs in PJM (113 MW AC) – 12 MW in Ohio, 2 MW in New Jersey, 15 MW in Delaware, 103 MW in North Carolina and 13 MW in Maryland
- 45 MWs in Arizona (34 MW AC) – 25 MW Queen, approximately 20 MW Badger
- 13 MWs (10 MW AC) in Texas
- 34 MWs (25 MW AC) in California[24]
- 4 MWs (3 MW AC) in Vermont and
- 74 MWs (60 MW AC) in Colorado – 38 MW (San Isabel) and 36 MW (Bison)
- 62 MW (50 MW AC) in Utah
- 10.5 MW (8 MW AC) in Oregon
- 103 MW (79 MW AC) in North Carolina
- 11 MW DC (9 MW AC) in Long Island NY

(4) PSEG Resources LLC ("Resources"). Resources is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

(5) PSEG Power NY. PSEG Power NY is a Delaware limited liability company and an EWG that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW (nameplate rating) combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a FERC-approved cost-based contract.[25]

[23] The 146 MWs are attributed to four (9) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs), Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW), Cork Oak (26 MW), Sunflower (21 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

[24] The 28 MWs (DC) are associated with the Shasta Solar Facility in California (4 MW), Whitethorn Solar (3 MWs) the Columbia Solar Project (34 MW). All have obtained QF status.

[25] *PSEG Power New York Inc.*, Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

(6) PSEG Keys. PSEG Keys is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG Keys was formed to construct, operate and maintain the Keys Energy Center, a 755MW combined cycle power plant in Prince Georges County, Maryland. Construction began in 2015 and is expected to be completed by June 1, 2018 at which time the capacity and energy will be available in the PJM market. All of the output of the Keys Energy Center will be sold to PSEG Keys affiliate, PSEG ER&T.

(7) PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco"). Long Island and Servco are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution system ("T&D") on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco are FERC jurisdictional public utilities as neither exercises ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[26]

III. Affiliated Transmission Ownership

With the exception of the electric transmission assets owned by PSE&G, all of which are located within the PJM RTO, and the generation interconnection facilities owned by the various EWG and QF affiliates listed herein, none of the PSEG Affiliates own or operate FERC jurisdictional electric or natural gas transmission facilities within the United States. As discussed below, FERC granted PSE&G a Hinshaw exemption in 1954, finding that it was exempt from the provisions of the Natural Gas Act.

A. Jointly Owned Facilities

PSEG Nuclear is a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear is the operator of Salem and Exelon Generation is the operator of Peach Bottom. PSEG Fossil is approximately a 23% joint owner in the Conemaugh and Keystone generating stations located in Pennsylvania. As of the date of this filing, an affiliate of NRG Energy is the operator. Accordingly, for purposes of the December 2016 triennial analysis, the capacity of Salem, Peach Bottom, Conemaugh and Keystone was attributed to PSEG in accordance with PSEG's ownership interests in these facilities.

PSEG Fossil and Jersey Central Power and Light Company ("JCP&L") are each 50% co-owners of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to the unit. Accordingly, for the purpose of the December 2016 triennial market power analysis, the entire unit capacity – nominally 400 MWs – was assigned to JCP&L.

IV. NOTICE OF CHANGE IN STATUS

[26] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), *order dismissing request for rehearing*, 145 FERC ¶ 61,183 (2013).

The PSEG Affiliates submit this Notice of Change in Status to report to the Commission its addition of Sewaren 7 to the generation fleet attributable to PSEG Fossil. Sewaren 7 is a highly efficient, dual-fuel 585 MW combined-cycle plant (nameplate) that is targeted to be in-service in June, 2018. Once Sewaren 7 is in-service, Sewaren 1-4 will be retired.

The addition of Sewaren 7 and the retirements of Sewaren 1-4 results in an increase in excess of 100 MW in the PSEG Affiliate's generation capacity, but does not materially affect the conditions the Commission relied upon in granting PSEG Keys' market-based rate authority or the PSEG Affiliates' Triennial application. As discussed further below, the addition of Sewaren 7 and retirements of Sewaren 1-4 raises no market power concerns. While the PSEG Affiliates understand that the submission of indicative screens is not required for this change in status,[27] the PSEG Affiliates nevertheless submit the indicative screens to show that the addition of Sewaren 7 and retirements of Sewaren 1-4 does not have a material impact on the PSEG Affiliates market power.

V. UPDATED MARKET-BASED RATE ANALYSIS

As demonstrated in the attached market power screens, the PSEG Affiliates continue to lack market power in generation, despite adding Sewaren 7's generation capacity and retiring Sewaren 1-4's generation capacity. Further, PSEG Affiliates' addition of Sewaren 7 has no material impact on the vertical market power analysis submitted to the Commission in the PSEG Keys' application.

A. Horizontal Market Power

The Commission evaluates whether a seller can exercise horizontal market power in a relevant market through two indicative screens: (1) a pivotal supplier analysis; and (2) a wholesale market share analysis. If a seller passes both screens, there will be a rebuttable presumption that the seller lacks market power.[28] Each indicative screen is applied with respect to the "relevant geographic markets" for an applicant's generating units. The Commission requires that an applicant seeking market-based rate authority show it does not possess horizontal market power by demonstrating that it and its affiliates can pass the market power screen, "unless the seller and its affiliates do not own or control generation capacity or all of their capacity is fully committed."

Applicants that are located in ISOs/RTOs possessing sufficient market structure may consider the geographic region under the control of the ISO/RTO as the relevant default geographic region for purposes of completing their generation market power analyses. However, where the Commission has previously found a "submarket" to exist within a boundary of an RTO, such finding is controlling as to the scope of the relevant geographic market for all generation units located within that submarket for the application of the indicative screens and any delivered price test that may be performed. The Commission further listed several such submarkets, including PJM East ("PJME"), PJM East of 5004/5005 ("PJM50") and PJM East of

[27] *See Refinements to Policies and Procedures for Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 816, 153 FERC ¶ 61,065, at P 293 (2015), *order on reh'g and clarify*., Order No. 679-A. 155 FERC ¶ 61,188 (2016).

[28] 18 C.F.R. § 35.37(c)(1) (2011).

AP South ("PJMAP") that would be relevant to an MBR analysis for applicants in the Northeast Region.

As shown in the attached Appendix C, Dr. John Morris has updated the market power analysis that was submitted in the December 2016 Triennial Filing[29] and the market power study for the PJM market and relevant submarkets that were submitted on September 1, 2017 in support of PSEG Keys Application.[30] Specifically, Dr. Morris has updated the market-based rate screens contained in the PSEG Keys Application to account for the addition of the 585 MWs from the PSEG Sewaren unit and the retirements of the Sewaren 1-4 units at the same location (452.3 MWs). Dr. Morris also moved the test year of the analysis forward by one year from December 2014-November 2015 to December 2015-November 2016 because this is the latest period for which FERC Form 714 data on unplanned generator outages is available.[31] Dr. Morris also updated the overall market sizes of the PJM market and submarkets, along with the first tier areas of NYISO and MISO.[32] Finally, Dr. Morris updated load data both for the applicant and for the overall markets in the study.[33] All methods are the same as in Dr. Morris' December 2016 Affidavit.

Dr. Morris' updated analysis shows that there has been a minor decrease in the market power with the addition of Sewaren 7 since the September 2017 PSEG Keys Application. This minor decrease should not be viewed to impact the factors that Dr. Morris relied upon in his findings in either the PSEG Keys MBR Filing or the December 2016 Triennial Filing that the PSEG Affiliates with market-based rate authority have satisfied the requirements demonstrating that they lack horizontal and vertical market power. Specifically, Dr. Morris analysis shows that with the addition of Sewaren 7, the PSEG Affiliates pass all of the pivotal supplier analysis ("PSA") screens for all of the relevant markets, namely, PJM, PJMAP, PJME and PJM50.[34]

Dr. Morris' analysis also shows that the PSEG Affiliates pass two additional screens as compared to the PSEG Keys Application in the wholesale market share analysis ("WMSA").[35]

---

[29] PSEG Energy Resources & Trade LLC, *et al*., Docket Nos. ER10-1789-000, *et al*., (filed December 29, 2016) ("December 2016 Triennial Filing"), attached Exhibit A, Report of Affidavit of Dr. John R. Morris ("December 2016 Affidavit"); PSEG Keys Energy Center LLC, Docket No. ER17-2426-000 (filed September 1, 2017 and amended on October 4, 2017); attached Appendix G, Affidavit of John Morris.

[30] *See* PSEG Keys Application attached Appendices A-1, A-2.

[31] PSEG Energy Resources & Trade LLC, *et al*., Notice of Non-material Change in Status, Docket No. ER18-__-000, (filed May 25, 2018), attached Appendix C, Affidavit of Dr. John R. Morris P 2 ("Morris Affidavit").

[32] *Id.*

[33] *Id.*

[34] *See* attached Appendix A-1. The pivotal supplier analysis ("PSA") focuses on the ability of a seller to exercise unilateral market power. The screen assesses whether market demand can be met during peak times without the applicant and its affiliates. If demand can be met without the applicant and its affiliates, the applicant passes that the PSA screen.

[35] *Id.* The wholesale market share analysis ("WMSA") is applied each season to determine whether an applicant has a dominant market position based on the total number of megawatts of uncommitted capacity owned or controlled by the applicant and its affiliates in relation to the uncommitted capacity of the entire relevant

Notably, in the updated analysis, the PSEG Affiliates now pass the PJM50 for summer and fall. As a result, we submit that Dr. Morris' determination that the PSEG Affiliates could not exercise horizontal market power still stands with the addition of Sewaren 7 (and the retirement of Sewaren 1-4). As stated by Dr. Morris in his affidavit:

> Although there are some minor differences in the results from those presented with the December Affidavit, the differences are not material and do not change the conclusions made at that time. Under the standards utilized by the Commission, continuing market-based rates for PSEG and all of its Northeastern affiliates remain in the public interest. In addition, granting market-rate authority to the Sewaren LLC would also be in the public interest.[36]

Moreover, to the extent necessary, the PSEG Affiliates rely on the same PJM RTO monitoring and mitigation described in the December 2016 Triennial Filing to show that they have met the standards necessary to obtain market-based rate authority. Accordingly, it is clear that with the addition of Sewaren 7 that PSEG Fossil and the other PSEG Affiliates continue to satisfy the standards necessary for market-based rate authority.

B. Vertical Market Power

1. The Applicants Lack Transmission Market Power and Cannot Erect Entry Barriers.

In its previous order accepting PSEG Affiliates' triennial market power analysis for the Northeast Region, the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding vertical market power.[37] As demonstrated below, the PSEG Affiliates are not able to exercise vertical market power.

PSE&G is the only PSEG Affiliate that owns transmission assets in the U.S. other than incidental generator interconnection facilities. PSE&G owns transmission facilities in PJM, but transmission service over those facilities is provided under the PJM Open Access Transmission Tariff.

In addition, none of the PSEG Affiliates are able to exercise vertical market power in wholesale energy markets through affiliation, ownership or control of inputs to electric power production. As required by Section 35.37(e) of the Commission's regulations, the PSEG Affiliates provide the following information:

---

wholesale electricity market. The established threshold is 20 percent; a supplier who has less than 20 percent market share in the relevant market for all seasons passes the WMSA screen.

[36] Morris Affidavit PP 4, 6.

[37] *PSEG Energy Resources & Trade, LLC, et al,* Letter Order, June 29, 2011, Docket No. ER99-3151-017. In addition, in that letter order the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding horizontal market power.

(a) PSE&G owns and operates a natural gas distribution system that receives interstate pipeline gas within the State of New Jersey and distributes that gas to its customers within the State of New Jersey. The distribution system consists of approximately 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3 and peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers. Service over such distribution facilities is made available pursuant to state regulated tariffs on an open access type basis. PSE&G was granted a Hinshaw exemption from the FERC in 1954.[38] The gas distribution rates paid by PSEG Fossil to PSE&G have been set at rates approved by the NJBPU in an order dated May 29, 2013.

(b) Certain of the PSEG Affiliates or their affiliates own sites within the Northeast Region that would be suitable for future generating facilities. These include space at many of the existing generating sites of PSEG Fossil and at the sites of PSEG Power NY and PSEG Power CT. PSEG Nuclear's Salem facility may also be suitable for future construction. PSE&G also owns certain sites that would be suitable for generating facilities, but under New Jersey's Electric Discount and Energy Competition Act, N.J.S.A 48:3-43 et seq., PSE&G is effectively barred from owning and operating generation except "on site" generation and Class I renewable energy resources as defined in N.J.S.A. 48:3-98.1.

(c) Neither the PSEG Affiliates nor any of their affiliates own or control any physical coal supply resources or own or control who may access transportation of coal supplies.

(d) As required by section 35.37(e)(4) of the Commission's regulations, the PSEG Affiliates state that they have not erected barriers to entry into any market, including the PJM, NYISO or ISO-NE market and will not erect barriers to entry into any markets.

VI. DOCUMENTS SUBMITTED WITH FILING

The following documents are submitted with this application.[39]

Appendix A-1: Summary of Market Power Analysis for PJM
Appendix A-2: Market Power Analysis for PJM
Appendix B: December 2016 Triennial Filing
Appendix C: Affidavit of John Morris

VII. CONCLUSION

Based on the foregoing, the PSEG Affiliates submit that, with the addition of Sewaren 7 and retirements of Sewaren 1-4, they continue to lack horizontal and vertical market power and otherwise continue to satisfy the Commission's market-based rate eligibility criteria. In short,

[38] 13 F.P.C. 1348 (1954).

[39] In the event that the Commission deems it necessary to submit an Appendix B (generation assets), the PSEG Affiliates request waiver of such requirement given that the asset appendix would be the same as the one submitted in the PSEG Keys Application, but for the inclusion of the 585 MWs for Sewaren 7 and the retirements of Sewaren 1, 2, 3 and 4 (452.3 MWs).

adding Sewaren 7 to the PSEG Affiliates generation assets raises no market power concerns and does not materially affect the conditions the Commission relied on in granting PSEG Keys' and the PSEG Affiliates' demonstrations in the Triennial Review for the continuation of authorization to sell energy, capacity, and certain ancillary services at market-based rates.

Respectfully submitted,

By: *Cara Lewis*

PSEG Services Corporation

December 28, 2016

ELECRONICALLY AND VIA OVERNIGHT MAIL

Kimberly J. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, DC 20426

RE: Triennial Market Power Update in Compliance with Order No. 697:
***PSEG Energy Resources & Trade LLC*, Docket No. ER99-3151-____;**
***Public Service Electric and Gas Company*, Docket No. ER97-837-____;**
***PSEG Power Connecticut LLC*, Docket No. ER03-327 -___;**
***PSEG Fossil LLC*, Docket No. ER08-447-___;**
***PSEG Nuclear LLC*, ER08-448-___; and**
***PSEG New Haven LLC*, ER12-1250-___**
Pavant Solar II LLC, ER16-1925-___
San Isabel Solar LLC, ER16-1926-___
Bison Solar LLC, ER16-1924-___
PSEG Energy Solutions LLC, ER16-2725-___

Dear Secretary Bose:

Pursuant to the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), Public Service Electric and Gas Company ("PSE&G"), PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear"), PSEG New Haven LLC ("PSEG New Haven") Pavant Solar II LLC, San Isabel Solar LLC, Bison Solar LLC and PSEG Energy Solutions LLC (collectively the "Applicants" or "PSEG") hereby jointly submit for filing their updated market power analysis in support of their continued eligibility to engage in market-based rates

transactions. This market power analysis satisfies the requirements of Order No. 697[1] for the filing of updated market power analyses on a regional schedule basis by holders of market-based rate certificates and their affiliates. In accordance with the regional schedule for those utilities in the Northeast Region, as modified by the MBR Clarifying Order, this filing is being made by the December 2016 deadline.[2] In conformance with the Commission's requirements, except when expressly noted otherwise, the market power analysis is based on activity during the study period from December 1, 2014 through November 30, 2015 ("study period").

PSEG, through its subsidiary PSE&G, owns transmission facilities within the Northeast Region. Specifically, PSE&G owns transmission facilities in the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization. PSEG Power LLC and its subsidiaries do not own any transmission facilities other than transmission to connect generating units to the grid in PJM, the New York Independent System Operator, Inc. ("NYISO") and ISO New England Inc. ("ISO-NE").

In their original applications for market-based rate authority and previously-submitted updates to the Commission, PSEG ER&T, PSE&G, PSEG Power CT, PSEG Fossil, PSEG Nuclear and PSEG New Haven demonstrated that they and their affiliates: (a) do not exercise generation market power; (b) lack the ability to manipulate access to transmission facilities that they own or control; and (c) cannot erect any other barriers to market entry. As further demonstrated herein and in the Affidavit of Dr. John R. Morris attached hereto in the appendices, Applicants continue to satisfy the Commission's requirements to sell energy, capacity and ancillary services at market-based rates and thus should be permitted to continue to make such sales.

I. SERVICE AND COMMUNICATION

All service and correspondence related to this matter should be directed to the following individuals:

[1] 18 C.F.R. Part 35, Subpart H (2007); Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

[2] This filing is made on the three year anniversary of the December 2013 deadline set forth in Order No. 697 Appendix D.

As to the Applicants Generally:

David.Richter@PSEG.com

Applicants request waiver of Rule 203(b)(3)[3] so that a copy of any communications in these proceedings may be served on all persons listed above.

II. DESCRIPTION OF THE APPLICANTS AND RELEVANT AFFILIATES

A. The Applicants

The Applicants are each wholly owned, direct and indirect subsidiaries of Public Service Enterprise Group Incorporated ("PSEG"). PSEG is a public utility holding company engaged in, among other things, the generation of electric energy and the transmission, distribution and sale of electricity and natural gas through its subsidiaries.

1. Public Service Electric and Gas Company

PSE&G is a public utility operating company engaged primarily in the transmission of electricity, and the provision of gas and electric distribution service in the State of New Jersey. During the study period, PSE&G owned less than 140 MW of solar generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities. PSE&G is a member of the PJM Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access

[3] 18 C.F.R. § 385.203(b)(3).

Transmission Tariff ("OATT") administered by PJM. PSE&G is authorized to sell power at market-based rates and makes wholesale sales falling within several different categories, as described below.

Non-utility generation ("NUG") output. PSE&G's NUG output expired in 2015 and 2016 pursuant to the terms of the NUG contracts. PSE&G currently has no further NUG obligations, other than 0.6 MW of energy associated with the former Kinsley Landfill which no longer operates. .

Solar. In 2007, the New Jersey legislature passed Regional Greenhouse Gas Initiative ("RGGI") legislation authorizing state utilities to invest in renewable resources such as wind or solar in order to promote increased use of renewable resources within the state and in turn reduce greenhouse gas emissions. *See* L. 2007, c. 340, codified at N.J.S.A. 48:98-1. The NJBPU has approved two (2) PSE&G Solar 4 All® (S4A) programs under which PSE&G has sited, designed and built twenty-nine (29) grid connected solar facilities. PSE&G currently owns and operates approximately 115MW-dc of grid connected solar under the S4A program. PSE&G expects the S4A fleet to increase to approximately 125MW-dc by the end of 2016. In 2016, PSE&G received NJBPU approval of its Solar 4 All Extension II filing to install an additional 33MW-dc of grid connected solar on landfills and brownfields in the PSE&G electric service territory.

2. PSEG Energy Resources & Trade LLC

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.,* which initiated the transition from a regulated to a competitive retail power market in New Jersey, BPU annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSEG ER&T has participated directly in all of the auctions for BGS supply held since 2004, has been a winning bidder in these auctions and has incurred contractual

commitments to provide supply to BGS load pursuant to BPU approved contracts beginning with the 2004 auction and continuing to the present

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract remains in effect and provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply: On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015.

3. PSEG Fossil LLC

PSEG Fossil is an Exempt Wholesale Generator ("EWG") and is authorized to sell power at market-based rates. PSEG Fossil owns and operates electric generation facilities located within PJM and sells their entire output to its affiliate PSEG ER&T.[4] The assets of PSEG Fossil (and its subsidiary, PSEG Keys Energy Center LLC ("PSEG Keys")) are located entirely within PJM. However, PSEG Fossil's subsidiaries PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Power New York LLC and PSEG New Haven LLC own facilities in ISO-NE and NYISO. As noted below, PSEG Fossil also co-owns certain facilities in PJM.

PSEG Fossil and its subsidiaries PSEG Power CT and PSEG Keys are currently beginning construction on three new gas-fired generation units. PSEG Fossil is constructing Sewaren 7[5] which is a 540 MW combined cycle unit in Woodbridge, New Jersey which is expected to be in-service in 2018, PSEG Keys is constructing a 755 MW combined cycle unit in Prince George's County, Maryland which is expected to be in service in 2018 and PSEG Power CT is constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

Since the last triennial filing in December 2013 PSEG Fossil has retired 1,813.5 MWs (nameplate) inclusive of the following units:

Kearny 9 (18.6 MW)
Bergen 3 (18.6 MW)

[4] These contracts were originally approved by the Commission as cost-based contracts. *See Public Service Electric and Gas Company*, et al., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Fossil obtained market based rate authority covering sales from its generating units.

[5] Once Sewaren 7 begins commercial operation, PSEG Fossil plans to retire Sewaren 1, 2, 3 and 4.

Bridgeport 2 (179.5 MW)
Burlington 8 (18.6 MW
Burlington 9 (162.4 MW)
Burlington 11 (162.4 MW)
Edison 1 (167.4 MW)
Edison 2 (167.4 MW)
Edison 3 (167.4 MW)
Essex 10 (167.4 MW)
Essex 11 (167.4 MW)
Essex 12 (167.4 MW)
Mercer 3 (115.2 MW)
National Park (18.6 MW)
Sewaren 6 (115.2 MW)

In addition, PSEG Fossil, LLC notified PJM of its intent to retire Hudson 2 (659 MW nameplate rating) and Mercer Units 1 and 2 (652MW nameplate rating) by June 1, 2017.

PSEG Fossil satisfies most of the electricity needs of its plants from PJM under PJM's "station power" Tariff provisions. PSEG Fossil procures gas supply for its plants from PSEG ER&T and receives gas distribution service from PSE&G at a rate approved by the BPU on May 29, 2013.[6]

4. PSEG Power Connecticut LLC

PSEG Power CT is a Connecticut limited liability company and an EWG that owns and operates electric generation facilities in the State of Connecticut and is authorized to sell power at market-based rates.[7] Both of PSEG Power CT's generation facilities, Bridgeport Harbor and New Haven Harbor, are located in the State of Connecticut within the market administered by ISO-NE. PSEG Power CT sells the output of its generation facilities to its affiliate PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. As noted above, PSEG Power CT is currently constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

5. PSEG New Haven LLC

PSEG New Haven is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG New Haven owns and operates a facility (the "New Haven facility") in New Haven, Connecticut with a nameplate rating of 181 MWs. The New Haven facility is located within the New Haven Harbor generation station. The New Haven facility is interconnected to the adjacent United Illuminating East Shore Substation using a 115 KV underground cable. PSEG New Haven has no other

[6] BPU Docket No. GM12100935 (May 29, 2013).
[7] *Wisvest Corporation,* et al., 101 FERC ¶ 61,166 (2002).

generation assets. The commercial operation date for the New Haven facility was June 1, 2012 and PSEG New Haven has obtained MBR authority from FERC.[8]

The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[9] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[10] All of the energy and capacity of the New Haven facility is sold into the ISO New England ("ISO-NE") markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA[11] has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder. The 181 MW nameplate rating of the New Haven Facility has not been included in the capacity controlled by PSEG for purposes of Dr. Morris' market power analysis.

6. PSEG Nuclear LLC

PSEG Nuclear is an EWG[12] and is authorized to sell power at market-based rates. PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission.[13] The assets of PSEG Nuclear are located entirely within PJM. PSEG Nuclear performed the following uprates since the last triennial filing: (1) an uprate of 120 MWs at its Hope Creek plant in 2014, which increased its nameplate rating to 1290 MWs, (2) an uprate to Peach Bottom 2 and 3 which increases PSEG's share of the nameplate MWs by 241 MWs for a updated nameplate of 704 MW for Peach Bottom 2 and 689 MWs for Peach Bottom 3.

7. Pavant Solar LLC, San Isabel Solar LLC and Bison Solar LLC

PSEG Power Ventures portfolio includes three (3) solar companies with market-based rate authority: (1) *Pavant Solar II LLC*[14] is a QF which owns a 50 MW (AC) solar facility in Fillmore Utah; (2) *San Isabel Solar LLC*[15] is a QF which owns a 30 MW (AC)

---

[8] *PSEG New Haven LLC*, Docket No. ER12-1250-000, et al., (May 29, 2012).

[9] *Re Review of Peaking Generation Projects*, Docket No. 08-01-01, Connecticut Department of Public Utility Control, June 25, 2008 ("Awards Decisions") (2008 WL 2587405 (Conn. D.P.U.C.)). The PURA is the successor to the Department of Public Utility Control (DPUC). PURA came into being in July 2011 as part of a reorganization of Connecticut state energy agencies. For consistency, this application refers to the agency as the PURA.

[10] Section 50 of Public Act 07-242, now codified at Section 16-243u of the Connecticut General Statutes.

[11] The CFD was approved on October 29, 2010 in a letter order ruling on Motion Number 62 in Docket No. 08-01-01.

[12] *PSEG Nuclear LLC*, 97 FERC ¶ 62,191 (November 30, 2001).

[13] *Public Service Electric and Gas Company*, et al., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Nuclear obtained market based rate authority from the FERC.

[14] *Pavant Solar II LLC*, Docket No. QF16-1072-000.

[15] *San Isabel Solar LLC*, Docket No. QF16-712-000.

solar facility in Las Animas County, Colorado and (3) *Bison Solar LLC*[16] is a QF which owns a 30 MW (AC) solar facility 25 miles north of Fort Collins, Colorado.

8. PSEG Energy Solutions LLC

PSEG Energy Solutions LLC ("PSEG Solutions") is a Delaware limited liability company and a direct subsidiary of PSEG ER&T. PSEG Solutions obtained market-based rate authority[17] and will operate within the PJM Interconnection, L.L.C. ("PJM"), New York Independent System Operator, Inc. ("NYISO") and ISO New England Inc. ("ISO-NE") markets. Energy Solutions will purchase power from the regional transmission organization ("RTO") at wholesale and sell it to retail customers. PSEG Solutions will not own or operate any generation assets. PSEG Solutions proposes to begin its retail business on January 1, 2017.

OTHER RELEVANT AFFILIATES

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities, as discussed below.

7. Affiliated Generation Ownership.

A list of the Applicants' affiliated domestic FERC jurisdictional generation assets owned is contained in Appendix B attached hereto. [18] Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the Northeast Region are described below:

PSEG Power LLC ("PSEG Power") was formed in 1999 to acquire the former generation assets of PSE&G. PSEG Power, a Delaware limited liability company, does not directly own any generation facilities or engage in any FERC jurisdictional activities but is the parent company of several FERC jurisdictional entities, including Applicants PSEG ER&T (and it subsidiary PSEG Energy Solutions LLC), PSEG Fossil, PSEG Nuclear, PSEG Power CT, PSEG New Haven and PSEG Power Ventures LLC (which owns PSEG Solar Source LLC).

PSEG Power Ventures LLC and PSEG Solar Source LLC. PSEG Power Ventures LLC ("Power Ventures") is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source LLC and has an in-direct ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 349 MWs DC (274 MW AC) of solar capacity across the United States, including a combined 92

[16] *Bison Solar LLC*, Docket No. QF16-711-001.
[17] See Letter Order dated December 21, 2016 in Docket No. ER16-2725-000.
[18] Appendix B excludes generation assets located in Hawaii as well as generation assets in which PSEG's interest is limited to a leveraged lease interest.

MWs[19] (72 MW AC) of solar capacity in PJM and approximately the following amount of MWs in the following states all through separate project companies which have all obtained QF status.

- 15 MWs (12 MW AC) in Florida,
- 92 MWs in PJM (72 MW AC) – 12 MWs in Ohio, 2 MW in New Jersey, 15 MW in Delaware, 50 MW in North Carolina and 13 MW in Maryland
- 45 MWs in Arizona (34 MW AC) – 25 MW Queen, approximately 20 MW Badger
- 13 MWs (10 MW AC) in Texas,
- 34 MWs (25 MW AC) in California[20]
- 4 MWs (3 MW AC) in Vermont and
- 74 MW (60 MW AC) in Colorado (to be in operation in 2016) – 38 MWs for San Isabel and 36 MWs for Bison
- 62 MW (50 MW AC) in Utah (to be in operation in 2016).
- 10.5 MW (8 MW AC) in Oregon (to be in operation in 2016).

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company and an EWG that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a FERC-approved cost-based contract.[21]

---

[19] The 92MWs are attributed to four (7) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs) Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

[20] The 28MWs (DC) are associated with the Shasta Solar Facility in California (4 MW), Whitehorn Solar (3 MWs) the Columbia Solar Project (19 MW). All have obtained QF status.

[21] *PSEG Power New York Inc.*, Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

PSEG Keys Energy Center LLC ("PSEG Keys") is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG Keys was formed to construct, operate and maintain the Keys Energy Center, a 755MW combined cycle power plant in Prince Georges County, Maryland. Construction began in 2015 and is expected to be completed in 2018 at which time the capacity will be available in the PJM market. All of the output of the Keys Energy Center will be sold to PSEG Keys affiliate, PSEG ER&T.

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution system ("T&D") on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco will be FERC jurisdictional public utilities as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[22]

8. Affiliated Transmission Ownership

With the exception of the electric transmission assets owned by Applicant PSE&G, all of which are located within the PJM RTO, and the generation interconnection facilities owned by the various EWG and QF affiliates listed herein, the Applicants, nor their affiliates have any affiliates that own or operate FERC jurisdictional electric or natural gas transmission facilities within the United States[23]. As discussed below, FERC granted PSE&G a Hinshaw exemption in 1954, finding that it was exempt from the provisions of the Natural Gas Act.

B. JOINTLY OWNED FACILITIES

PSEG Nuclear is a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear is the operator of Salem and Exelon Generation is the operator of Peach Bottom.[24] PSEG Fossil is approximately a 23% joint owner in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[25] Accordingly, for

[22] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), *order dismissing request for rehearing*, 145 FERC ¶ 61,183 (2013).

[23] PSEG Power LLC is a 10% owner of the PennEast Pipeline Company LLC which has filed an application for approval to construct and operate a natural gas transmission line.

[24] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in Appendix E. The ownership percentages have not changed since the date of this letter. PSEG Nuclear owns a 50% interest in Peach Bottom and a 57.41% interest in Salem.

[25] A letter of concurrence supporting the allocation of plant output based on ownership interest is attached in Appendix E. The ownership percentages have not changed since the date of this letter.

purposes of this market power analysis, the capacity of Salem, Peach Bottom, Conemaugh and Keystone has been attributed to PSEG in accordance with PSEG's ownership interests in these facilities.

PSEG Fossil and Jersey Central Power and Light Company ("JCP&L") are each 50% co-owners of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity – nominally 400 MWs – has been assigned to JCP&L.[26]

III. Applicants Fully Satisfy The Commission's Standards For Authority to Make Power Sales At Market-Based Rates.

The Commission allows power sales at market-based rates if the seller and its affiliates do not have, or have adequately mitigated, horizontal and vertical market power.[27] The Commission has also codified affiliate restrictions in its regulations which must be satisfied on an ongoing basis. In previous submissions for market-based rate authority the Applicants PSE&G, PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear, and PSEG New Haven, demonstrated compliance with each of these requirements. As detailed herein and in the attached affidavit, the Applicants continue to meet these standards.

A. The Applicants Lack, Or Have Effectively Mitigated, Any Horizontal Market Power

In the MBR Order, the Commission established two indicative screens: a pivotal supplier screen based on the control area's annual peak demand and a wholesale market share screen applied on a seasonal basis. If an applicant passes both screens, there is a rebuttable presumption that the applicant does not possess horizontal market power. Each indicative screen is applied with respect to "relevant geographic markets" for an applicant's generating units.

Applicants located in ISOs/RTOs possessing sufficient market structure may consider the geographic region under the control of the ISO/RTO as the relevant default geographic region for purposes of completing their generation market power analyses.[28] However, where the Commission has previously found a "submarket" to exist within a boundary of an RTO, such finding is controlling as to the scope of the relevant geographic market for all generation units located within that submarket for the application of the indicative screens and any delivered price test that may be performed. The Commission further listed several such submarkets, including PJM East ("PJME"),

[26] A letter of concurrence supporting this determination is attached in Appendix E. The ownership percentages have not changed since the date of this letter.
[27] MBR Order, FERC Stats. & Regs. ¶ 31,252 at P 62, 399, 408, 440.
[28] *MBR Order at* PP. 231 and 235.

Connecticut and Southwest Connecticut.[29] Subsequent to the MBR order, in approving a merger between Exelon Corporation and Constellation Energy Group, Inc., the Commission identified additional submarkets in PJM - PJM East of 5004/5005 ("PJM50") and PJM East of AP South ("PJMAP") - that would be relevant to an MBR analysis for applicants in the Northeast Region.[30]

As discussed below and in the attached Affidavit of Dr. John Morris contained in Appendix A, Applicants have conducted market power analyses of the entire PJM RTO, the PJME, PJM50 and PJMAP submarkets, the entire NYISO, the entire ISO-NE, the Connecticut submarket and the Southwest Connecticut submarket for the study period. The results are set forth below.

1. Indicative Screens

a. Pivotal Supplier Analysis

The pivotal supplier analysis ("PSA") focuses on the ability of a seller to exercise unilateral market power.[31] The screen assesses whether market demand can be met during peak times without the applicant and its affiliates. If demand can be met without the applicant and its affiliates, the applicant passes that the PSA screen. The Affidavit of Dr. John Morris, attached hereto as Appendix A, finds that the Applicants pass the PSA screen for all relevant markets: PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut, PJMAP, PJME and PJM50.[32]

b. Wholesale Market Share Analysis

The wholesale market share analysis ("WMSA") is applied each season to determine whether an applicant has a dominant market position based on the total number of megawatts of uncommitted capacity owned or controlled by the applicant and its affiliates in relation to the uncommitted capacity of the entire relevant wholesale electricity market.[33] The established threshold is 20 percent; a supplier who has less than 20 percent market share in the relevant market for all seasons passes the WMSA screen.

In his Affidavit Dr. Morris finds that the Applicants pass the WMSA screen for PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut and PJMAP but do not pass the WMSA screen for the PJME and PJM50 submarkets.[34]

---

[29] *Order No. 697* at P 236 (citing *Exelon Corp.*, 112 FERC ¶ 61,011, *reh'g denied*, 113 FERC ¶ 61, 299 (2005)). FERC eliminated the Northern PSEG zone as a default submarket in Order No. 697-A, P 99.

[30] Order Conditionally Authorizing Merger and Disposition of Jurisdictional Facilities, *Exelon Corporation, et al.*, 138 FERC ¶ 61,167 (2012).

[31] *AEP I* at P 72.

[32] *See* Morris Affidavit, at 15-29.

[33] *AEP I,* P 100.

[34] *See* Morris Affidavit, at 15-29.

c. Results of Indicative Screen Analysis

As shown in Dr. Morris's affidavit, Applicants therefore pass both indicative screen tests for PJM RTO, NYISO, ISO-NE, Connecticut and Southwest Connecticut and PJMAP. For PJME and PJM50, the Applicants pass the PSA but do not pass the WMSA.

2. Delivered Price Test Analysis For PJME and PJM50 Submarkets

In accordance with the MBR Order, applicants who fail either indicative screen test can rebut the presumption of market power through the submission of a delivered price test analysis ("DPT"). Applicants may submit this study at the same time that the results of the indicative screens are provided.[35] The DPT is based on two measurements of potential market power: economic capacity ("EC") and available economic capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting native load commitments from EC. Both calculations are performed for ten different season and load conditions.

In applying the DPT, "[a] showing of an HHI less than 2,500 in the relevant market for all season/load conditions for sellers that have also shown that they are not pivotal and do not possess a 20 percent or greater market share in any of the season/load conditions would constitute a showing of a lack of market power, absent compelling contrary evidence from intervenors."[36] However, while meeting these threshold benchmarks provides "safe harbor" protection, the Commission has found in numerous other cases that applicants lack market power even when they exceed one or more of the thresholds for particular study periods. As stated in *Public Service Company of New Mexico*, 115 FERC ¶ 61,090, P 38 (2006), "the Commission weights the results of both the economic and available economic capacity tests and considers the arguments of the applicant and intervenors." (footnote omitted.) [37]

---

[35] *Order No. 697,* P 76.

[36] *Order No. 697* at P 111.

[37] Indeed, in that case, the applicant was deemed "on balance" to have adequately rebutted a showing of market power mitigation for the PNM control area where the results exceeded the 20% safe harbor in two cases under the AEC measure and in all 10 cases at values between 35% and 41% under the EC measure. *See, e.g.*, *Kansas City Power and Light Company, et al.*, Docket Nos. ER99-1005-011 et al. (August 12, 2010) (finding no market power where applicant had EC market shares in the 40-60% range and had significant HHI failures in the KCPL and GMO markets); *Cordova Energy Company LLC et al,* Docket Nos. ER99-2156-011, *et al.*, November 13, 2007 (finding no market power in case where applicant had EC market shares in PACE control area between 53.1% and 60.0%, HHIs between 2,958 and 3,696 and was pivotal in 8 out of 10 periods.); *PacifiCorp*, Letter Order, Docket Nos. ER97-2801-007, *et al.*, February 1, 2007; *Tucson Elec. Power Co.*, 116 FERC ¶ 61,051 (2006)(finding market power standard satisfied where applicant had EC market shares above 20% in all ten season/load periods in the Tucson control area, exceeded the 2,500 HHI threshold in eight periods, and was pivotal in 5 periods); *PacifiCorp*, 115 FERC ¶ 61,349 (2006) (finding that applicants rebutted presumption of market power in the PacifiCorp East control area where under available economic capacity measure, market share is less than 20% in 8 season/load periods and 28% in the summer and winter off-peak periods, HHI does not exceed 2500 in any season/load period and applicants are not pivotal); *Kansas City Power & Light Co.*, 113 FERC ¶ 61,074 (2005) (finding

a. Results of the DPT for PJM50 Submarket

For both the AEC and EC, PSEG passes all screens in all periods except for the pivotal supplier screen in the Summer Top 1% period.

b. Results of the DPT for PJME Submarket

With respect to AEC, PSEG passes all the screens in all 10 periods. With respect to the EC, PSEG passes the Market Concentration screens in all periods. It also passes the Pivotal Supplier Screen in 8 of 10 periods, and passes the Market Share Screen in 6 of 10 periods. PSEG's market shares are never above 25 percent. Although greater than the 20 percent screen, PSEG's market shares are well below the 35 percent threshold that is typically used for imputing unilateral market power.

3. Analysis of DPT Results

Based on his analysis of the overall results, Dr. Morris concludes that, although PSEG fails limited number of screens, the failures are substantially below levels that typically indicate market power. As set forth in his Affidavit, Dr. Morris states that:

> Although PSEG fails some screens in the PJME destination market, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the AEC screens and all market concentration (HHI) screens for EC. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[38] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all the AEC pivotal supplier screens, and most of the EC pivotal supplier screens. This means that typically PSEG's generation is not necessary to serve load; and when its generation is necessary, its forward sale commitments are sufficient so that its uncommitted generation is not necessary to serve the remaining load. Finally, PSEG's market shares are never above 15 percent in PJM50 and for AEC in PJM East. Its market shares for EC are never above 25 percent in PJM East. Although greater than the 20 percent screen, PSEG's market shares are

---

no market power in the KCPL control area where applicant had EC market shares above 20% in all periods, exceeded the HHI 2,500 threshold in 5 of 10 periods and was pivotal supplier in 1 period); *Acadia Power Partners, L.P.*, 113 FERC ¶ 61,073 (2005) (finding no market power in the Cleco Power home control where, utilizing the EC measure, the applicant exceeded the thresholds set for all season/load periods using the market share measure, one season/load period using the market concentration measure, and for all season/load periods using the pivotal supplier measure).

[38] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

> well below the 35 percent threshold that is typically used for imputing unilateral market power.[39]

Dr. Morris's conclusion is consistent with Commission precedent finding a lack of market power in cases in which the DPT results included more instances of findings outside of the "safe harbor" thresholds and at higher levels than exist here.[40] In these circumstances, Dr. Morris's analysis successfully rebuts any inference of market power created by the WMSA screen failures for PJME.

4. Existing RTO/ISO Mitigation Rules Also Eliminate The Potential for Exercising Market Power In the PJME, PJME PJM50 and PJMAP Submarkets

PJM mitigation rules eliminate the potential for the exercise of market power in the PJME submarket. The MBR Order specifically contemplated that RTO/ISO mitigation rules may serve as evidence that any market power has been adequately mitigated. The Commission declared, "We believe the added protections provided in structured markets with market monitoring and mitigation generally result in a market where prices are transparent and attempts to exercise of market power will be sufficiently mitigated."[41] The Order on Rehearing went even further and specifically created a presumption that any potential market power had been adequately mitigated by an established and effective RTO market monitoring scheme.[42]

Taking account of the pervasive PJM mitigation rule, Dr. Morris concludes that these rules "fully address the potential for PSEG to exercise market power" in PJME.[43] Accordingly, PJM's mitigation schemes in place are sufficient to rebut any inference of market power created by the failure to pass the WMSA screens in PJME and PJM50.

In addition, in the Applicants' last triennial approval order, the Commission found that "the PJM market monitoring and mitigation rules are sufficient to address market power concerns in the PJM-East submarket."[44]

a. The Applicants Lack Transmission Market Power and Cannot Erect Entry Barriers.

In its previous order accepting PSEG's triennial market power analysis for the Northeast Region, the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding vertical market power.[45] There have been no subsequent changes in status that would reflect a departure from the characteristics the Commission relied upon in granting market-based rate authority. As demonstrated below, neither Applicants nor any of its affiliates are able to exercise vertical market power.

Applicants are not able to exercise transmission market power. Neither Applicants nor any of their affiliates, except PSE&G, own transmission assets in the U.S. other than incidental generator interconnection facilities. PSE&G owns transmission facilities in PJM but transmission service over those facilities is provided under the PJM Open Access Transmission Tariff.

In addition, neither Applicants nor their affiliates are able to exercise vertical market power in wholesale energy markets through affiliation, ownership or control of inputs to electric power production. As required by Section 35.37(e) of the Commission's regulations, Applicants provide the following information:

(1) PSE&G owns and operates a natural gas distribution system that receives interstate pipeline gas within the State of New Jersey and distributes that gas to its customers within the State of New Jersey. The distribution system consists of 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3 and peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers. Service over such distribution facilities is made available pursuant to state regulated tariffs on an open access type basis. PSE&G was granted a Hinshaw exemption from the FERC in 1954.[46] The gas distribution rates paid by PSEG Fossil to PSE&G have been set at rates approved by the BPU in an order dated May 29, 2013.

(2) Certain of the Applicants and their affiliates own sites within the Northeast Region that would be suitable for future generating facilities. These include space at many of the existing generating sites of PSEG Fossil and at the sites of PSEG Power NY and PSEG Power CT. PSEG Nuclear's Salem facility may also be suitable for future construction. PSE&G also owns certain sites that would be suitable for generating facilities, but under New Jersey's Electric Discount and Energy Competition Act, N.J.S.A 48:3-43 et seq., PSE&G is effectively barred from owning and operating

[45] *Id.*
[46] 13 F.P.C. 1348 (1954).

generation except "on site" generation for supply and Class I renewable energy resources as defined in N.J.S.A. 48:3-98.1.

(3) Neither Applicants nor any of their affiliates own or control any physical coal supply resources or own or control who may access transportation of coal supplies.

(4) As required by section 35.37(e)(4) of the Commission's regulations, Applicants and its affiliates state that they have not erected barriers to entry into any market, including the PJM, NYISO or ISO-NE market and will not erect barriers to entry into any markets.

IV. REQUEST FOR CONFIDENTIAL TREATMENT

Under separate cover via UPS Overnight this office is submitting compact disks containing the workpapers of Dr. John Morris supporting his analysis in Appendix A, as required by the Commission's April 2004 Order.[47] The CD (of which six copies are included) contains: (i) proprietary information provided by Energy Velocity under an agreement that requires confidential treatment to be requested for these materials; (ii) modeling and computer programs that are the proprietary intellectual property of Economists Incorporated, the firm which employs Dr. Morris; (iii) commercially sensitive information about Applicants and their affiliates; and (iv) documents and information deemed to be confidential by PJM and ISO-NE. Accordingly, Applicants respectfully request confidential treatment for CD and the workpapers pursuant to 18 C.F.R. § 388.112 (2006), consistent with the confidential treatment accorded other applicants submitting such proprietary and commercially sensitive data.[48] Pursuant to the Commission's rules, the public version of this filing contains all materials submitted herein except for CD, which is labeled as "PRIVILEGED AND CONFIDENTIAL/NON-PUBLIC."

V. SERVICE

This filing has been served on all parties on the official service list as currently maintained by Commission in the above-referenced dockets. Applicants are also providing a copy to the New Jersey Board of Public Utilities and the New Jersey Division of Rate Counsel.

VI. ENCLOSURES

Applicants enclose the following:

- An original filing;

[47] AEP II, 107 FERC at P 61,087-88.

[48] *See, e.g., Idaho Power Company*, Docket No. ER97-1481-009 (February 3, 2006) (submission of revised Pivotal Supplier Screen and Market Share Screen calculations including similar data).

- Appendix A – Affidavit of Dr. John R. Morris;[49]
- Appendix B – List of Entities with Market-Based Rates Authority and Their Generation Assets. (This is an appendix listing the filing entities and all their energy affiliates and their associated assets);
- Appendix C – List of Entities with Market-Based Rate Authority and Their Transmission Assets;
- Appendix D – List of Long Term Power Purchase Agreements;
- Appendix E – Letters of concurrence regarding the control of certain jointly owned generation facilities;
- Appendix F – Form of notice suitable for publication in the Federal Register.

[49] Compact disks, as described above, containing the workpapers for the Affidavit of John R. Morris in Appendix A are being sent concurrently with this filing via UPS Overnight. As noted *supra*, privileged treatment is being requested for Dr. Morris's confidential workpapers submitted with the non-public version of this filing.

VII. CONCLUSION.

Applicants respectfully request the Commission

(i) to accept this market power compliance filing as meeting the Commission's requirements under Order No. 697 for the continuation of market-based rate authority for Applicants PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Nuclear LLC, PSEG Fossil LLC, Pavant Solar II, LLC, Bison Solar LLC , San Isabel Solar LLC and PSEG Energy Solutions LLC;

(ii) to grant the request for confidential treatment; and

(iii) to grant such other relief or waivers as may be appropriate or necessary.

Respectfully submitted,

Public Service Electric and Gas Company
PSEG Energy Resources & Trade LLC
PSEG Power Connecticut LLC

NOTICE OF FILING
( )

Take notice that on December 28, 2016: (i) PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Fossil LLC, PSEG Nuclear LLC, Pavant II Solar LLC, Bison Solar LLC, San Isabel Solar LLC and PSEG Energy Solutions LLC tendered for filing their joint triennial market power update in compliance with Order No. 679 and with prior Commission Orders granting them market-based rate authority in Docket Nos. ER99-3151, ER97-837, ER03-327, ER08-447 ER08-448, DR-12-1250, ER16-1926, ER16-1925, ER16-1924 and ER16-2725 respectively.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR §§ 385.211 and 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. Such notices, motions, or protests must be filed on or before the comment date. Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant. On or before the comment date, it is not necessary to serve motions to intervene or protests on persons other than the Applicant.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the "eFiling" link at http://www.ferc.gov. Persons unable to file

electronically should submit an original and 14 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street, N.E., Washington, D.C. 20426.

This filing is accessible on-line at http://www.ferc.gov, using the "eLibrary" link and is available for review in the Commission's Public Reference Room in Washington, D.C. There is an "eSubscription" link on the web site that enables subscribers to receive email notification when a document is added to a subscribed docket(s). For assistance with any FERC Online service, please email FERCOnlineSupport@ferc.gov, or call (866) 208-3676 (toll free). For TTY, call (202) 502-8659.

Comment Date: 5:00 pm Eastern Time on (insert date).

Report & Affidavit of
Dr. John R. Morris

December 22, 2016

20160328-5240 FERC PDF (Unofficial) 3/28/2016 6:31:16 AM

Public Service Enterprise Group Incorporated Northeast Region Market Power Study

1. Introduction

My name is Dr. John R. Morris. I am a Principal at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Washington, DC 20037. I have a bachelor's degree in economics from Georgetown University, and I have a master's degree and a Ph.D. in economics from the University of Washington. I have been studying and consulting within energy industries since joining the Federal Trade Commission in 1985. Since joining Economists Incorporated in 1992, I have consulted on many mergers involving electric and gas companies, examined competitive issues relating to utility rates, provided market power studies for applications for market-based rate authority, and studied market power issues in state restructuring proceedings. I have published articles on competition and energy matters, and I have spoken on numerous occasions concerning competition in natural gas, electric power and other industries. I have previously been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission ("FERC" or "Commission"), state commissions and in federal court. A complete listing of my experience, publications and testimony is contained in my resume, presented in Exhibit PEG-2.

Public Service Enterprise Group Incorporated ("PSEG") asked that I prepare a market power study for its subsidiaries that have market-based rate authority in the Northeast Region.[1] These subsidiaries are: Public Service Electric and Gas

[1] The Northeast Region includes ISO-New England Inc. ("ISO-NE"), Connecticut, Southwest Connecticut, New York Independent System Operator, Inc. ("NYISO"), PJM Interconnection, L.L.C. ("PJM"), PJM East, PJM East of 5004/5005 and PJM East of AP South.

20160328-5240 FERC PDF (Unofficial) 5/23/2016 3:16:58 PM

("PSE&G"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear"), PSEG Power Connecticut LLC ("PSEG Power CT"). PSEG New Haven LLC ("PSEG New Haven") Pavant II Solar LLC, Bison Solar LLC and San Isabel Solar LLC.[2] The purpose of this study is to determine whether these PSEG entities have market power in any Northeast Region market under the Commission's Pivotal Supplier Analysis ("PSA") and Wholesale Market Share Analysis ("WMSA") screens as articulated in FERC Order No. 697 and if the Applicants do fail any of the screens, whether they otherwise lack market power under the Delivered Price Test ("DPT") or are subject to sufficient mitigation to guard against any market power concerns.[3]

PSEG

PSEG is a public utility holding company headquartered in in Newark, New Jersey. Through its subsidiaries, PSEG engages in the generation, transmission, distribution and sale of electric energy, and distribution and sale of natural gas to commercial, residential, and industrial customers primarily in the Northeastern and Mid-Atlantic United States. PSEG, through its subsidiaries, owns approximately 11,300 MW of seasonal generation capacity located in the Northeast Region.[4]

---

[2] Pavant II Solar LLC, Bison Solar LLC and San Isabel Solar LLC all have QF status.

[3] *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

[4] *See* Exhibit PEG-3 (accounting for retirements).

PSE&G

PSE&G is a public utility operating company engaged primarily in the transmission of electricity and the provision of gas and electric distribution service in the State of New Jersey. It is New Jersey's oldest and largest investor-owned utility. PSE&G was founded in 1903 and is based in Newark, New Jersey. It is a member of the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access Transmission Tariff ("OATT") administered by PJM. The company also owns and operates 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3. During the study period, PSE&G owned less than 140 MW of solar generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities.

PSEG ER&T

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission. PSEG ER&T also makes wholesale sales of natural gas.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.,* which initiated the transition from a regulated to a competitive retail power market in New Jersey, the New Jersey Board of Public Utilities ("BPU") annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSE&G's affiliate, PSEG ER&T, has participated directly in all of the auctions for BGS supply held since 2004 and has consistently won tranches in those auctions, including auctions for BGS service within the franchised service territory of PSE&G.

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, PSE&G's FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract, which currently remains in effect, provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply. On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which

ER&T provides fuel supply and power supply management activities for LIPA as of January 1, 2015.

PSEG Fossil

PSEG Fossil owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission under the umbrella of PSEG Fossil's market-based rate authority.[5] The assets of PSEG Fossil are located entirely within PJM.[6] Since the last triennial filing in 2013, PSEG Fossil has retired approximately 1,800 MW of capacity in the eastern portion of PJM. Much of this capacity was retired at the end of May 2015. We included this capacity in the Winter and Spring season screens and exclude the capacity for the Summer and Fall screens.

PSEG Fossil is approximately a 23 percent joint owner of interests in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[7] PSEG Fossil is a 50 percent co-owner with Jersey Central Power and Light Company ("JCP&L") of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to

---

[5] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

[6] PSEG Fossil's subsidiaries PSEG Power Connecticut LLC, PSEG New Haven LLC and PSEG Power New York LLC own generation units in Connecticut and New York respectively.

[7] A letter of concurrence supporting the allocation of these facilities' output based on ownership interests is attached in our workpapers.

the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity, nominally 400 MWs, has been assigned to JCP&L.[8]

PSEG Power CT

PSEG Power CT owns the Bridgeport Harbor and New Haven Harbor generation facilities located in the state of Connecticut within ISO-NE and is authorized to sell power at market-based rates.[9] The output of these facilities is sold to PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. PSEG Power CT is currently constructing Bridgeport 5, a 485 MW gas-fired combined cycle in Bridgeport, Connecticut, which is expected in service in 2019.

PSEG New Haven

PSEG New Haven owns and operates the New Haven facility, a gas-fired plant located in New Haven, CT that entered service in June 2012 with a nameplate capacity of 181.5 MW. The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[10] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[11] All of the energy and capacity of the New Haven facility is sold

---

[8] A letter of concurrence supporting the allocation of this facility's output to JCP&L is attached in our workpapers.

[9] *Wisvest Corporation, et al*., 101 FERC ¶ 61,166 (2002).

[10] *Re Review of Peaking Generation Projects*, Docket No. 08-01-01, Connecticut Department of Public Utility Control, June 25, 2008 ("Awards Decisions") (2008 WL 2587405 (Conn. D.P.U.C.)). The PURA is the successor to the Department of Public Utility Control (DPUC). PURA came into being in July 2011 as part of a reorganization of Connecticut state energy agencies. For consistency, this application refers to the agency as the PURA.

[11] Section 50 of Public Act 07-242, now codified at Section 16-243u of the Connecticut General Statutes.

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

into the ISO-NE markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder.[12] As such, neither PSEG New Haven nor any other PSEG affiliate has operational control of the New Haven facility. As a result, the capacity of the facility is not attributable to PSEG for the purpose of this market power analysis.

PSEG Nuclear

PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission in accordance with PSEG Nuclear's market-based rate authority.[13] PSEG Nuclear is the owner of Hope Creek and a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear operates the Salem plant and Exelon Generation is the operator of Peach Bottom.[14] Since the last triennial filing, uprates at Peach Bottom and Hope Creek plants have increased PSEG Nuclear's capacity at those facilities.

---

[12] The CFD was approved on October 29, 2010 in a letter order ruling on Motion Number 62 in Docket No. 08-01-01.

[13] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

[14] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in our workpapers.

Other Subsidiaries

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities in the United States. Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the PJM region are as follows.

PSEG Power LLC is a Delaware limited liability company. It does not directly own any generation facilities or engage in any FERC jurisdictional activities but it is the parent company of several FERC jurisdictional entities, including applicants PSEG ER&T, PSEG Fossil and PSEG Nuclear.

PSEG Power Ventures LLC ("Power Ventures") is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source LLC and has an in-direct ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 349 MWs DC (274 MW AC) of solar capacity across the United States, including a combined 92 MWs (72 MW AC) of solar capacity in PJM.[15] All of PSEG Solar Source's solar capacity has obtained QF status. Because all of this capacity is QF capacity, per Order No. 816 this capacity is not included in the market power analyses.[16]

---

[15] The 42MWs are attributed to four (7) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs) Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

(note omitted))

20160328-5240 FERC PDF (Unofficial) 3/28/2016 6:31:16 PM

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. PSEG Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. PSEG Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a cost-based contract.[17]

PSEG Keys Energy Center LLC ("PSEG Keys"), direct subsidiary of PSEG Fossil, was formed to construct, operate, and maintain the Keys Energy Center, a 755 gas-fired combined cycle facility located in Prince George's County, Maryland. Construction began in 2015 and is scheduled to be completed in 2018. All the capacity and energy from PSEG Keys will be sold to PSEG ER&T.

PSEG Energy Solutions LLC ("PSEG Solutions") is a direct subsidiary of PSEG ER&T that is schedule to begin retail operations in the Northeast Region in

[17] *PSEG Power New York Inc.,* Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

January 2017. It has obtained market-rate authority to allow it to sell excess energy in wholesale markets.[18]

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution ("T&D") system on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco are FERC jurisdictional public utilities, as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[19]

When an applicant has affiliates in the relevant market, the Commission considers the combined capacity of all the affiliated entities in its market power assessment.[20] Accordingly, I have included the capacity controlled by PSE&G, PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear, and PSEG Power New York (which on a combined basis constitutes the capacity of all of PSEG's affiliates not excluded for a reason explained above). Future references in this Affidavit to PSEG are inclusive of the foregoing entities.

The primary purpose of this study is to determine whether PSEG passes the PSA and WMSA screen thresholds in ISO-NE, the NYISO and PJM. In the PSA, the Commission requires applicants to examine whether the generation owned by

---

[18] *See* December 21, 2016 letter order approving Energy Solutions request for market-based rate authority in Docket No. ER16-2725-000.

[19] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), order dismissing request for rehearing, 145 FERC ¶ 61,183 (2013).

[20] *Heartland Energy Services, Inc.,* 68 FERC ¶ 61,223 at 62,061-62,062 (1994).

the applicant is necessary to serve wholesale demand within a balancing authority area. The applicant first calculates the total generation capacity for an area. This is the total of generation in the balancing authority area plus the import capability to the area.[21] From this total, the applicant subtracts out firm contractual commitments, native load obligations, and operating reserves, giving uncommitted capacity for the area. Net uncommitted capacity is calculated by subtracting a wholesale load proxy from uncommitted capacity. Net uncommitted capacity is then compared to the applicant's uncommitted capacity within the area. When the applicant's uncommitted capacity is less than the net uncommitted capacity for the area, then all wholesale demand could be served without energy from the applicant and the applicant passes the PSA screen. When the applicant's uncommitted capacity is greater than the net uncommitted capacity, then the applicant does not pass the screen because its capacity is necessary to meet wholesale peak loads in the market.

In the WMSA, the Commission requires applicants to examine whether the generation owned by the applicant is 20 percent or more of the uncommitted capacity in each of four seasons under average daily peak conditions for the season. The applicant first calculates the total generation capacity for an area. The applicant then adds the import capability to the area. From this total, the applicant subtracts out planned outages and deratings, long-term firm contractual commitments, native load obligations, and operating reserves. The sum gives the total uncommitted capacity. The applicant then calculates its share by dividing its uncommitted capacity by the total uncommitted capacity. When the applicant's share is less than 20 percent, the applicant passes the WMSA screen.

---

[21] Import capability is the lesser of either the simultaneous import limit ("SIL") into the area or available capacity in interconnected balancing authority areas. Available capacity is equal to total generation capacity in an area less outages and derating, a native load proxy and operating reserves.

The Commission presumes that an applicant does not have market power when it passes both the PSA and WMSA screens. If the applicant fails either of the screens, then the applicant may present other analyses to demonstrate that it does not possess market power. Alternatively, the applicant may propose mitigation measures or accept the Commission's default mitigation measures to demonstrate that it has mitigated market power.

2. New England

2.1. Overview of Electric Power Markets in New England

New England operates a competitive wholesale power market. Substantial restructuring has taken place in New England, and many of the vertically integrated utilities have sold either most or all of their generation assets. The traditional utilities often have standard offer obligations to serve retail customers, but utilities often fulfill these obligations by securing supplies in competitive wholesale markets. For example, a utility may secure contracts in which the supplier agrees to provide power for 30 percent of the utility's standard offer obligation. The transmission system is managed by ISO-NE. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

2.2. Geographic Markets

In the case of generation wholly located in an RTO, such as ISO-NE, the Commission accepts the RTO as the relevant destination market.[22] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[23] In New England,

[22] Order No. 697 at PP 231, 235.

[23] Order No. 697 at P 236.

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

the Commission has identified two submarkets: Connecticut and Southwest Connecticut.[24] PSEG owns the Bridgeport Harbor plant in Southwest Connecticut. PSEG also owns the New Haven Harbor 1 unit in Connecticut and PSEG New Haven owns the New Haven facility. When the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[25] Accordingly, the PSA and WMSA are provided for the ISO-NE balancing authority area, and also for Connecticut and Southwest Connecticut.

2.3. Data Sources and Analysis

The data source for generation is ISO-NE Seasonal Claimed Capability (SCC) Reports.[26] Summer and winter capacities were taken from the November 2015 report. Planned outages are from the ISO-NE Form 714. Planned outages for Connecticut and Southwest Connecticut are prorated based on their shares of the total generation capacity in ISO-NE. PSEG's generation capacity in ISO-NE consists of the New Haven facility, New Haven Harbor and Bridgeport Harbor. PSEG's Northeast Region generation facilities are presented in Exhibit PEG-3.

Load data for ISO-NE are from Energy Velocity. Energy Velocity also provides load data by New England ISO zone, thus loads are calculated by sub-market as well. PSEG load obligations in New England come from PSEG's agreements to supply standard offer generation within Rhode Island. The data were supplied by PSEG.

[24] *Id*.

[25] Order No. 697 at footnotes 215, 217.

[26] See http://www.iso-ne.com/genrtion_resrcs/snl_clmd_cap/index.html.

Import capability was taken from the ISO-NE's December 20, 2016 FERC filing.[27] This report indicates that the simultaneous transfer limits in all seasons is 4,548 MW for the ISO-NE as a whole, 3,050 MW for Connecticut, and 2,370 (Spring) to 3,200 MW (Summer) for Southwest Connecticut. PSEG has no firm transmission rights into New England.

Operating reserves are calculated as follows. ISO-NE Operating Procedure No. 8 specifies spinning reserves (or 10-minute reserves) equal to the size of the loss of the largest unit times a Contingency Reserve Adjustment Factor ("CRAF").[28] The CRAF in 2015 was 1.25.[29] The largest unit is the 1,400 MW (summer capacity) Seabrook Unit 1. In addition, 30-minute reserves require capacity to cover 50 percent of the loss of a second contingency (i.e., the second largest unit) plus 160 MW for daylight-savings time periods and 180 MW during standard time (i.e., winter). The second largest unit is the 1,200 MW (summer capacity) Millstone Unit 3. Thus, in total, operating reserves are 2,510 MW in summer.[30] Operating reserves for Connecticut and Southwest Connecticut are based on resource needs in forward reserve auctions for 2015.[31]

2.4. Results

Exhibit PEG-4 summarizes the results for the PSA and the WMSA in New England. Exhibit PEG-5 shows the calculations to determine whether PSEG is a

20160328-5240 FERC PDF (Unofficial) 5/23/2016 3:11:58 PM

pivotal supplier in the three New England destination markets. PSEG passes the PSA screen in all areas. Exhibit PEG-6 presents the WMSA results for the destination areas in New England. PSEG easily passes the WMSA in all areas.

3. New York

3.1. Overview of Electric Power Markets in New York

New York also has a competitive wholesale power market. Substantial restructuring has taken place in New York, and the investor-owned vertically integrated utilities have sold either most or all of their generation assets. These utilities often have standard offer obligations to serve retail customers, and utilities can fulfill these obligations by securing supplies in competitive wholesale markets. The transmission system is operated by the NYISO, which also operates a competitive wholesale market. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

3.2. Geographic Markets

In the case of generation wholly located in an RTO such as the New York ISO, the Commission has accepted the RTO as the relevant destination market.[32] PSEG only owns generation in Albany, New York. In addition, when the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[33] Accordingly, the PSA and WMSA are provided for the NYISO only.

---

[32] Order No. 697 at PP 231, 235.

[33] Order No. 697 at footnotes 215, 217.

3.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Operations database. Planned outages are from the FERC Form 714. PSEG's generation capacity in New York consists of its ownership of the Bethlehem Energy Center in Albany, which has winter capacity of 845 MW. Information for PSEG's Northeast Region generation is presented in Exhibit PEG-3.

Load data for NYISO were downloaded from Energy Velocity.

Import capability comes from the most recent NYISO SIL filing as of December 19, 2016.[34] This filing indicates that ISO simultaneous import capability ranges from 6,850 MW in spring to 7,695 MW in summer. NYISO does not recognize physical imports, accordingly, all the SIL import capability is allocated pro rata, except for a 265 MW reservation that PSEG has from PJM to New York on the Linden VFT DC transmission line.

Operating reserves are calculated as follows. The NYISO Locational Reserve Requirements specify 30-minute total reserves equal to twice the 10-minute reserve necessary to replace the operating capability loss caused by the most severe contingency under normal transfer conditions. Thus, the operating reserves for the NYISO are 2,620 MW for each season.[35]

---

[34] New York Independent System Operator, Inc., *Informational Filing Regarding the Simultaneous Import Limitation Study*, Docket No. AD10-2, December 19, 2016.

[35] NYISO Locational Reserve Requirements, Table 2, available at http://www.nyiso.com/public/webdocs/market_data/reports_info/nyiso_locational_reserve_reqmts.pdf

3.4. Results

Exhibit PEG-7 shows the calculations to determine whether PSEG is a pivotal supplier in New York, and PSEG passes the PSA screen. Exhibit PEG-8 presents the WMSA results for New York, and PSEG easily passes the WMSA.

4. PJM

4.1. Overview of Electric Power Markets in PJM

PJM operates a competitive wholesale power market and serves as the regional RTO for an area that covers all or parts of 13 states and the District of Columbia. PJM also plans and operates the transmission system within the RTO. Monitoring Analytics acts as the market monitor, and has a market power mitigation program in place to identify and mitigate any potential exercise of market power.

4.2. Geographic Markets

PSEG owns both generation and transmission facilities in PJM. In the case of generation wholly located in an RTO such as PJM, the Commission has accepted the RTO as the relevant destination market.[36] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[37] In PJM, the Commission has identified three submarkets: PJM East ("PJME"), PJM East of 5004/5005 ("PJM50") and PJM East of AP-South ("PJMAP").[38] The PSA and WMSA are provided for PJM and for the PJME, PJM50 and PJMAP sub-markets.

---

[36] Order No. 697 at PP 231, 235.

[37] Order No. 697 at P 236.

[38] *Id*. *See also* Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities, Order No. 697-A, 73 FR 25832 (May 7, 2008), FERC

4.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Ops database. Generation within PJM was assigned to submarket consistent with the definitions in PJM's SIL Study.[39] Planned outages are from the FERC Form 714. In addition, for the sub-market analysis, planned outages were allocated to PJME based on the share of total PJME generation, by season. Information for PSEG's generation in PJM and PJME is presented in Exhibit PEG-3.

Load data for PJM was downloaded from Energy Velocity. Energy Velocity also provides load data by PJM zone, thus loads are calculated for the PJM sub-markets as well.

Import capability was taken from the 2015 Simultaneous Import Limit Study Report.[40] This report indicates simultaneous transfer limits of 11,997 MW in the winter and 7,600 MW in summer. Additionally, this report indicates transmission capabilities of the PJM sub-markets. The report conservatively uses the reported SIL as the SIL amount to be allocated pro rata. This is a simplifying assumption because PSEG has no firm transmission reservations into PJM and it effectively excludes the additional 8,500 MW of firm reservations into PJM in the base case of the SIL study.

Stats, & Regs. ¶ 31,268 (2008) at P 90; Order Conditionally Authorizing Merger and Disposition of Jurisdictional Facilities, *Exelon Corporation, et al.*, 138 FERC ¶ 61,167 (2012).

[39] PJM Interconnection, L.L.C., *Informational Filing of 2015 Simultaneous Import Limit Study Report for PJM Region*, Docket No. AD1-2-007, September 2, 2016, Accession No. 20160902-5155.

[40] *Id*.

Operating reserves are calculated according to PJM Manual 13 as the sum of Day Ahead Scheduling Reserves (Operating), Contingency (Primary) and Synchronized (Spinning Reserve) Requirements.[41]

Data on PSEG's long-term contracts come from PSEG. The contracts were included in the area where the energy is delivered under the contract. For contracts delivered to the Western Hub in PJM, the contracts were included in the PJM, PJM50, and PJMAP destinations and not the PJME destination.

4.4. Results

Exhibit PEG-9 summarizes the results for the PSA and the WMSA in PJM. Exhibit PEG-10 shows the calculations to determine whether PSEG is a pivotal supplier in the four PJM destination markets. PSEG passes the PSA screen for all four destinations. Exhibit PEG-11 presents the WMSA results for the destination markets in PJM. PSEG easily passes the WMSA in PJM and PJM east of AP South, but has greater than a 20 percent market share in the PJM East and PJM East of 5004/5005 destination markets.

5. Delivered Price Test

When an applicant does not pass either the PSA or WMSA for a destination market, the Commission invites the applicant to provide additional information via a delivered price test ("DPT"). PSEG requested that I perform a DPT for the PJM East and PJM East of 5004/5005 sub-markets. Accordingly, I now discuss the DPT for these sub-markets.

[41] PJM Manual 13 - Emergency Operations, at 17, available at http://pjm.com/~/media/documents/manuals/m13.ashx

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

5.1. Overview of the DPT

The DPT utilizes substantially more information than the PSA or the WMSA, including additional information on generation ownership, generation costs, demand conditions, and transmission limits. The Commission considers two types of capacity: Economic Capacity ("EC") and Available Economic Capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting load commitments from EC. EC and AEC are calculated for a number of different seasonal and load conditions.

Because we do not know the firm retail obligations of the competitive suppliers, as explained below, the AEC calculation is based on the assumption that market participants serve load in proportion to their generation capacity and that 70 percent of load obligations are contracted more than one year from delivery.

For both the EC and AEC measures, the Commission prescribes three screens: (1) a pivotal supplier screen; (2) a market share screen; and (3) a Herfindahl-Hirschman Index ("HHI") screen. The HHI is the sum of the squared market shares of the firms in the market. So a market with four firms of market shares of 40, 30, 20, and 10 percent would have an HHI of 3,000 (this is calculated as $40^2 + 30^2 + 20^2 + 10^2 = 1{,}600 + 900 + 400 + 100 = 3{,}000$). A monopolist would produce a HHI of 10,000 and 10 equally-sized firms would produce a HHI of 1,000.

Although the Commission has not drawn bright lines for its review of DPT results, it has given general guidance. When (1) the applicant is not pivotal; (2) the applicants' market share is less than 20 percent; and (3) the HHI is below 2,500, the Commission is likely to conclude that the applicant does not have market power. The three standards establish a "safe harbor" for lack of market power, unless intervenors present clear and convincing contrary evidence. The Commission has also determined in some cases that an applicant did not have

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

market power when the analysis showed isolated HHI and market share results above screening levels. Finally, despite the DPT results, the Commission may conclude that an applicant does not have market power if other evidence, such as historical sales data, indicates that the DPT results do not reflect the actual competition in the marketplace.

A detailed description of data sources and methods to prepare the data for the DPT is presented in Exhibit PEG-12. An overview of the sources and methods used at Economists Incorporated for conducting the DPT is presented here.

The DPT is calculated for 10 representative periods, three for each of three seasonal conditions plus a summer super peak period. The three seasons are spring/fall, summer, and winter. Each season is divided into (1) top 10 percent of peak hours; (2) remaining peak hours; and (3) off-peak hours. In addition, there is a summer super peak period which is comprised to the top 1 percent (10 hours) of summer peak hours. These ten periods cover the range of load conditions for each season, and for the year as a whole.

The primary source for generation data is Energy Velocity. In addition to generation capacity, Energy Velocity provides data on ownership (including holding companies), fully-loaded heat rates, emission rates, and generation availability. Generation is included for all of PJM and NYISO, which is the only first-tier balancing authority area in which PSEG owns generation. Unit capabilities are derated to account for seasonal maintenance and likely plant unavailability due to forced outages. Because demand in PJM peaks in summer and winter, the planned outages are assumed to be during the spring/fall season.

The transmission system is represented by contract paths between balancing authority areas and within PJM. Limits between regions in PJM are from Energy Velocity.

Market prices come from hourly prices reported by PJM.

As in the PSA and WMSA, load data come from Energy Velocity. To compute load requirements for market participants, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[42] To account for their greater load obligations, we assume that Dominion, which does not operate in a restructured retail market, has 100 percent responsibility for its allocation of load and that AEP, which operates in a partly restructured retail market, has 90 percent of its allocation as opposed to the standard 70 percent.

The DPT and market share calculations were calculated using the Power Acquisition Screening System developed at Economists Incorporated. The mathematical details are presented in Exhibit PEG-13.

5.2. Results of the DPT for PJM50 Sub-market

The results of the DPT for PJM50 are presented in Exhibit PEG-14. The top part of the exhibit shows the results for AEC. PSEG passes the Pivotal Supplier Screen in all 10 periods. PSEG also passes both the Market Share Screens and the HHI Screens in all 10 periods.

The lower part of Exhibit PEG-14 shows the results for EC in PJM50. PSEG passes all the screens in all the periods, except for the pivotal supplier screen in the Summer Top 1% period.

[42] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers in restructured markets.

5.3. Results of the DPT for PJME Sub-market

The results of the DPT for PJME are presented in Exhibit PEG-15. The top part of the exhibit shows the results for AEC. PSEG passes all the screens for AEC.

The lower part of Exhibit PEG-15 shows the results for EC in PJME. PSEG passes the Market Concentration screens in all periods. It passes the Market share screens in six of ten periods, and its market share is never more than 25 percent. It passes the pivotal supplier screen in eight of ten periods.

5.4. Analysis of the DPT Results

Although PSEG fails some screens, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the AEC screens and all market concentration (HHI) screens for EC. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[43] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all the AEC pivotal supplier screens, and most of the EC pivotal supplier screens. This means that typically PSEG's generation is not necessary to serve load; and when its generation is necessary, its forward sale commitments are sufficient so that its uncommitted generation is not necessary to serve the remaining load. Finally, PSEG's market shares are never above 15 percent in PJM50 and for AEC in PJM East. Its market shares for EC are never above 25 percent in PJM East. Although greater than the 20 percent screen, PSEG's

[43] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

20160328-5240 FERC PDF (Unofficial) 5/23/2016 6:31:16 PM

market shares are well below the 35 percent threshold that is typically used for imputing unilateral market power.[44]

5.5. Mitigation

PJM has a Commission-approved market monitoring and mitigation plan in place to ensure that generation facilities cannot exercise market power. The Commission has stated that Commission-approved market monitoring and mitigation plans are sufficient to mitigate market power in RTO markets.[45] In particular, the Commission found in connection with PSEG's last triennial filing that the PJM market monitoring and mitigation rules are sufficient to address market power concerns.[46]

Under the local market power mitigation procedures in PJM, if a supplier fails the "three pivotal supplier test" (TPS), it is offer-capped by the Market Monitor. The Market Monitor's TPS test is applied on an ongoing basis, potentially as frequently as every 5 minutes, to reflect day-ahead and real-time operating conditions. These offer caps provide direct protection against the exercise of locational market power by suppliers in PJME, PJM50, PJMAP and elsewhere.

The protection against the exercise of market power is enhanced by "must offer" requirements under PJM's Operating Agreement. These mandate that generation resources that are used to meet capacity requirements in PJM and

[44] *See*, *e.g.*, U.S. Department of Justice, 1984 Merger Guidelines, at Section 3.12, available at https://www.justice.gov/sites/default/files/atr/legacy/2007/07/11/11249.pdf ("the Department is likely to challenge the merger of any firm with a market share of at least one percent with the leading firm in the market, provided the leading firm has a market share that is at least 35 percent.")..

[45] Order No. 697 at P 241.

[46] *See* October 14, 2014 letter order approving Applicants' prior triennial market update in Docket No. ER10-1789-003 et al. at page 3.

that are not subject to an outage must offer their available capacity in PJM's day-ahead energy market.[47] PJM has also implemented a Reliability Pricing Model (RPM) to secure sufficient capacity to meet its requirements through a series of auctions, including a Base Residual Auction (BRA) held annually for capacity 3 years in advance, and incremental auctions held at varying intervals prior to the delivery year. Various features of the RPM process work to prevent the exercise of market power in capacity markets in PJM. First, the RPM model includes bid cap rules designed to mitigate the potential exercise of market power. Second, RPM includes a must-offer requirement pursuant to which all generating units that have available capacity must bid into the RPM auctions or face disqualification from being recognized as capacity resources (and therefore from receiving any capacity payments) in the delivery year.

In addition to the local market power mitigation described above, the presence of market monitoring within PJM lessens potential concerns that PSEG might be able to exercise market power notwithstanding the indicative DPT screens. The Market Monitor has the specific responsibility under the market monitoring plan to monitor the potential of any market participant to exercise market power. To perform its market monitoring function, the Market Monitor can file reports or complaints with the Commission and other government agencies to address various market concerns including market power. The Market Monitor can also make its view known to the Commission staff and PJM members in cases where PJM does not follow its recommendations concerning complaints or requested rule changes. In addition, the Market Monitor can consult with regulatory bodies, including state commissions, regarding the need for specific investigations and monitoring activities, and to consider and evaluate additional enforcement mechanisms. The Market Monitor can also act on specific

[47] *See* PJM Operating Agreement at 1.10.1A(d).

complaints that have been filed by market participants to examine any potential market power issues.

In sum, the local market power mitigation rules, the role of the Market Monitor, the existence of must-offer requirements and PJM's RPM auctions address the potential for PSEG to exercise market power.

6. Vertical Market Power

In determining whether the market-based rates are in the public interest, the Commission also considers whether the Applicant has transmission market power or can erect barriers to entry.[48] None of these factors are relevant in the instant case. First, other than incidental generator interconnection facilities and the transmission assets owned by PSE&G in PJM, no transmission assets are owned by the Applicants or any of their affiliates in ISO-NE and NYISO. Transmission service over PSE&G's transmission facilities is provided under the PJM Open Access Transmission Tariff. Thus, consistent with Commission precedent, Applicants have alleviated any concerns regarding potential transmission market power. Second, PSEG has no ability to erect barriers to entry. As explained in Applicants' previous initial applications for market-based rate authority and triennial market power reports, PSEG is unable to erect barriers to entry. There has been no change in facts since the submission of those applications that would alter this conclusion.

The Commission is concerned with the ownership of natural gas pipelines or natural gas distribution facilities and the possibility that they may be used to exercise market power in electricity markets. PSEG does not own or operate any

[48] Order No. 697 at PP 397, 399.

20160328-5240 FERC PDF (Unofficial) 3/28/2016 3:16:58 PM

FERC jurisdictional natural gas pipelines in PJM, ISO-NE or NYISO.[49] PSE&G owns natural gas distribution facilities in the State of New Jersey including peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers.

7. Conclusion

PSEG and its subsidiaries do not have market power in New England, New York or PJM. PSEG is not a pivotal supplier in New England, New York or PJM. PSEG's market shares in the WMSA are below the Commission's 20 percent screening threshold in each of these market areas. PSEG is also not a pivotal supplier in the Connecticut or Southwest Connecticut sub-markets and its market shares in the WMSA are below 20 percent in these sub-markets. PSEG fails the WMSA screens in only the PJME and PJM50 sub-markets. For these sub-markets, we conducted a DPT analysis. PSEG passes all the DPT screens for the PJM50 submarket, and it only fails the Market Share Screen in the PJME submarket. Its market shares are never above 25 percent, a level that the Commission has accepted in other market-based rate matters.[50] As such, they are not evidence of actual market power.

---

[49] PSEG Power LLC currently owns a 10 percent interest in the PennEast Pipeline Company LLC which has filed an application with FERC for construction and operation of a gas transmission line.

[50] *See*, *e.g.*, *Dogwood Energy, LLC*, 135 FERC ¶ 61,089 (2011) (under the AEC measure, Dogwood failed the market share screen in seven of ten periods, with market shares ranging from 32.7% to 39.6%); *Kansas City Power & Light Company and KCP&L Greater Missouri Operation Company*, Docket No. ER10-2074-001 et al., Supplement to Change in Status Filing at 11 (Feb. 4, 2013) (accepted by Letter Order, November 22, 2013) (market shares for AEC ranging from 17 to 36%); *Shell Energy N.A. (US), L.P.*, 135 FERC ¶ 61,090 (2011) (under the AEC measure, Shell failed the market share screen for seven of ten periods, with market shares ranging from 29.3% to 37.0%); *Calpine Energy Services, L.P.*, 137 FERC ¶ 61,085 at P 21 (2011) (under the AEC measure, Calpine failed the market share screen in all ten periods, with market shares ranging from 20.4% to 28.9%); *Wildcat Power Holdings, LLC*, 136 FERC ¶ 61,013 at P 14 (2011) ("When the available economic capacity measure is used, Wildcat Power's market shares range from 22 to 24 percent in the three summer super peak and winter

Further, PSEG operates under New England's, New York's, and PJM's market power mitigation programs, which mitigate PSEG's potential market power. Therefore, under standards for market-based rate authority articulated by the Commission in Order No. 697, PSEG has no ability to exercise market power in the relevant markets, and maintaining market-rate authority in New England, New York and PJM would be in the public interest.

Therefore, I recommend that the Commission continue to authorize PSEG to sell electric power in Northeast Region wholesale markets at market-based rates.

super peak season/load periods and zero percent in the remainder of the season/load periods."); *LS Power Marketing*, LLC,139 FERC ¶ 61,140 at P 23 (2012) (under the AEC measure, LS Power failed the market share screen in all ten periods, with market shares ranging from 20.4% to 28.9%); *Gila River Power, L.P.*, Docket Nos. ER05-1178-015, et al., Second Supplement to Updated Market Power Analysis at 4 (Jan. 12, 2011) (accepted by Letter Order, April 5, 2011) (market shares for AEC ranging from 21 to 23% in four season/load periods).

Pursuant to 28 U.S.C. §1746, I state under penalty of perjury that the foregoing is true and correct to the best of my information, knowledge, and belief.

Executed on this 22rd day of December 2016.

John R. Morris, Ph.D.
Principal
Economists Incorporated

20160328-5240 FERC PDF (Unofficial) 3/28/2016 6:31:16 PM

EXPERIENCE AND QUALIFICATIONS OF

Dr. John R. Morris

OVERVIEW	Dr. Morris, a recognized expert in studying competition in energy industries, currently is a Principal at Economists Incorporated. He began his research of competition in energy industries in 1985 while working for the Federal Trade Commission. Since joining Economists Incorporated in 1992, he has consulted on many mergers and acquisitions involving energy companies, examined competitive issues relating to rates, and studied issues in state restructuring proceedings. He has published articles on competition and energy matters, and he has spoken on numerous occasions concerning competition in natural gas, electric power and other industries. He has been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission, state regulatory commissions, and in federal court.
EDUCATION	Ph.D., University of Washington, August 1985 Dissertation: *Intellectual Property: Creating, Pricing, Copying* • M.A., University of Washington, December 1983 • A.B., Georgetown University, May 1981
PRESENT POSITION	Dr. Morris is a *Principal* at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Suite 1100, Washington, DC 20037. (202-223-4700) Economists Incorporated studies competition and regulation in many industries in the United States and in other countries. It is a leading firm in studying the competitive effects of mergers and acquisitions.
PREVIOUS EXPERIENCE	*Senior Vice President*, Economists Incorporated, December 2001 – December 2002 • *Vice President*, Economists Incorporated, December 1995 – December 2001 • *Senior Economist*, Economists Incorporated, June 1992 – December 1995 • *Economic Tutorial Leader*, Stanford University (Stanford in Washington), April 1993 – June 1995 • *Visiting Assistant Professor,* Department of Business Economics and Public Policy, School of Business, Indiana University, September 1991 – May 1992 • *Assistant to the Director for Antitrust,* Bureau of Economics, Federal Trade Commission, November 1989 – August 1991 • *Economic Advisor,* Office of Commissioner Machol, Federal Trade Commission, December 1988 – October 1989 • *Economist,* Division of Antitrust, Bureau of Economics, Federal Trade Commission, October 1985 – December 1988
MEMBERSHIPS	Member, International Association of Energy Economics • Associate, Energy Bar Association • Member, American Economic Association • Member, Western Economic Association International • Associate, American Bar Association

Source: PSEG.
Notes:
[1] PSEG Fossil has a 22.5% interest in the Conemaugh coal-fired units.
[2] PSEG Global has a 4% interest in the Conemaugh Hydroelectric facility.
[3] PSEG Fossil has a 22.84% ownership interest in the Keystone facility.
[4] PSEG Nuclear has a 57.41% interest in the Salem Nuclear facility.
[5] PSEG Fossil has a 50% interest in the Yards Creek facility. Yards Creek is operated by Jersey Central Power & Light, and thus is controlled by JCP&L in the analysis.
[6] PSEG Nuclear has a 50% interest in the Peach Bottom Nuclear facility.

DATA AND ASSUMPTIONS FOR ECONOMISTS INCORPORATED'S DELIVERED PRICE TEST STUDY FOR PSEG

This exhibit describes data and assumptions used in the delivered price test study ("study") carried out by Economists Incorporated for PSEG. Because the data are voluminous, we provide them in electronic workpapers. In those workpapers, the Files.xlsx spreadsheet provides a brief description of the organization of the data files.

This Exhibit has six sections. Section I discusses the study's representative periods. Section II discusses the geographic region and balancing authority areas. Section III discusses generation resources, including adjustments to generating capacity for seasons, maintenance, water availability, and long-term contracts. Section IV discusses transmission, including transmission pricing and losses. Section V discusses market prices. Section VI discusses the load data.

I. Periods

The study calculates market shares and concentration indexes for electric energy for ten representative periods during the year. The year is divided into three seasons (spring/fall, summer and winter). Spring/fall and winter seasons are divided into three periods based on days of the week, times of day and load levels. Summer is divided into four periods based on days of the week, times of day and load levels. Each calculation of market shares and concentration indexes reflects average conditions (e.g., average loads) during one of the resulting ten periods during the year (e.g., Summer Low Peak).

The study places each of the periods in each season into three condition categories: off-peak, low peak, and spike. Transmission pricing (see Section

IV.B below) and plant availability (see Section III.A.2 below) vary among these three categories.

Table I-1 summarizes the ten periods for the destination markets.

Table I-1– Definition of Ten Periods for Destination Market

Number	*Season*	*Time*	*Condition*	*Hours*	*Description**
1	Spring/Fall	Top 10%	Spike	203	Top 10% of peak hours
2	Spring/Fall	Peak	Peak	1829	Remaining peak hours
3	Spring/Fall	Off-peak	Off-Peak	2360	Off-peak hours
4	Summer	Top 1%	Spike	11	Top 1% of peak hours
5	Summer	Top 10%	Spike	106	Top 10% of peak hours
6	Summer	Peak	Peak	950	Remaining peak hours
7	Summer	Off-peak	Off-Peak	1152	Off-peak hours
8	Winter	Top 10%	Spike	101	Top 10% of peak hours
9	Winter	Peak	Peak	907	Remaining peak hours
10	Winter	Off-peak	Off-Peak	1152	Off-peak Hours

Note: *Peak hours include hours ending 8 a.m. through 11 p.m. Eastern Time weekdays, excluding six major holidays. Off-peak hours = Hours ending 12 a.m. through 7 a.m. on weekdays and all weekend and holiday hours.

The Off-peak periods are all NERC holidays and weekend hours plus weekdays from the hour ending at midnight EPT until the hour ending at 0700.[1] The Off-peak periods have off-peak transmission pricing and plant availability.

In order to define the Top 1% and Top 10% periods for a given season, we removed all Off-peak hours from that season. We then ranked the remaining (peak) hours based on load levels in the destination market by season. We then defined as the Top 1% as the 1 percent of these remaining hours in which loads in the destination market were highest and the Top 10% as the highest 10 percent of peak hours based on load levels. These periods have spike transmission pricing and plant availability.

[1] Major holidays are New Year's, Memorial Day, 4th of July, Labor Day, Thanksgiving and Christmas. Major holidays are included in the Weekend period.

The Peak periods are weekdays from the hour ending at 0800 until the hour ending at 2300 EPT, excluding hours in the Top 10% periods and major holidays. The Low Peak period has on-peak transmission pricing and plant availability.

II. Geographic Coverage and Market Areas

The study includes market areas that correspond to the balancing authority areas used by the North American Electric Reliability Council (NERC), and PJM submarkets as defined by FERC. Table II-1 lists these market areas and their abbreviations. There are two study destination markets, PJM East and PJM East of 5004/5005.

Table II-1– List of Eastern Market Areas and Study Destinations

Abbreviation	*Full Name*	*Study Destination*
PJME	PJM East	Yes
PJM50	PJM East of 5004/5005	Yes
PJMS	PJM East of AP South	
PJM	PJM	
NYISO	New York ISO	

III. Generation

A. Generation Capacity and Ownership

The study includes generating units located in the areas that are (1) connected to the power grid, (2) not exclusively used for self-generation, and (3) either in a plant used primarily for electric generation or a Qualifying Facility.

1. Generating Unit Data

The study uses data for summer and winter capability at the unit level reported in the Energy Velocity (EV) database available from Ventyx. The units include all

units with a status of operating, standby, cold standby, restart, mothballed, testing, or under construction that went online before November 30, 2015 and with a retirement date after November 30, 2015. We exclude generation units that are less than 5 MW unless they are owned by PSEG.

2. Ownership

The study uses relies on Ventyx determination of plant and unit ownership. When Ventyx reports a holding company, the ownership is assigned to the holding company. For PSEG generation, the study relies upon Appendix B data from market-based rate filings and updates from the companies to determine plant ownership and seasonal capability. Operational control of PSEG units is consistent with the methodology used for market-based rates.

3. Seasonal variation in capability

The study uses seasonal capability data from EV. Spring/fall capacities are the average of summer and winter capacities.

4. Adjustments to Generating Capability

The generating capability figures used for each period are obtained by multiplying the seasonal capabilities by an availability factor, which is based on the period, unit location, and NERC General Availability Data Systems (GADS) category of the unit. The GADS database gives national average operating information for generating units by unit type and size. For example, it gives data for coal-fired steam units with capacities between 300 MW and 399 MW.

For each period and each generating unit, the availability factor adjusts for the following.

a) Unplanned outage rates by GADS category

For a given GADS category, the study assumes that unplanned (forced) outage rates (as a share of generating capability available after allowing for planned outages) are constant across seasons and generating units throughout the Region, regardless of owner. Based on GADS data for 2007 through 2011, the study calculates an equivalent forced outage rate (EIFOR), which measures the share of generating capability in a GADS category that is not available because of forced outages. The computation is EIFOR = (FOH)/AH, where FOH is number of forced outage hours and AH is total hours available for generation after planned outages (but before forced outages).[2]

b) Planned outage rates by GADS category and season

With four exceptions (hydro, pumped storage, wind, and solar units), the study assumes that the planned outage rate is constant for all generating units for a given GADS category and season. For a given GADS category, the share of hours of generating capability that is not available as a result of planned outages is computed as (POH + POEH)/PH; where PH are the period hours, POH are the hours not available because of planned outages, and POEH are the hours not available because of planned outage extensions

The study assumes that balancing authority areas are both summer and winter peaking. Therefore, the study assumes that all planned outages for thermal units occur during spring/fall.

[2] EIFOR differs slightly from the EFOR provided in the GADS data. EIFOR provides a better measure of a forced outage rate for peaking units that are operated a small percentage of the year.

c) Variation in hydro availability across seasons and periods

In general, utilities use hydro facilities to generate energy during the hours when energy prices are highest, subject to constraints imposed by availability of water and reservoir capacity. In order to incorporate these constraints, the study proceeds in the following manner.

First, the study uses EIA Form 923 monthly production data for the period 2011 to 2015 to compute average hourly hydro generation by season. Average hourly generation is then divided by hydro capability to give an average hourly hydro operating rate by season.

Second, depending upon the level of the hydro operating rate for a given season, the study calculates availability factors for the spike, low peak and off-peak periods. When the historical seasonal operating rate is below 30 percent, the availability factor for each period in the season is set equal to the operating rate; the 30 percent figure is an assumed "run of river" constraint. The study assumes that prospectively the maximum operating rate is 90 percent; this is the assumed "maximum rate" constraint. When the historical seasonal operating rate is above 90 percent, the availability factor for each period is set to 90 percent.

When the seasonal operating rate is above the run of river constraint and below the maximum rate, we reason that the hydro generator owner would be likely to produce a higher level of energy during spike hours, when energy prices are highest, than during low peak hours, and that the owner would be likely to produce a higher level during low peak than during off-peak hours.

Based on this reasoning, when the seasonal operating rate is between the run of river constraint and the maximum rate, as is the case for each of the three

seasons, the study uses a spike availability factor of 90 percent, which is the assumed maximum operating rate, and off-peak availability factor of 30 percent, which is the assumed run-of-river constraint, and a calculated availability factor for the peak periods, as described below.

The seasonal peak availability factor is calculated using actual total seasonal hydro generation. The study then computes the hydro generation during all spike and off-peak hours, assuming the generation rates implied by the spike and off-peak derate factors computed in the manner described above. The study then calculates total peak hydro generation as the difference between total seasonal hydro generation and the sum of hydro generation during all spike and off-peak hours. The seasonal low peak availability factor is computed as total low peak hydro generation divided first by the number of hours in the off-peak period and then by hydro generating capacity.

d) Variation in pumped storage availability across seasons and periods

We assume that pumped storage units have 90 percent availability during Top 1% and Top 10% periods, 50 percent availability during Low Peak periods, and no availability during off-peak periods.

e) Wind availability

For each area, we calculate average operating rates from 2011 to 2015 by season from EIA-923 data. The average operating rates are the availability factors.

f) Solar availability

Availability for solar power is also calculated based on average operating rates from 2011 through 2015 reported in EIA-923. There is little solar power during

off-peak periods because of darkness. Accordingly, solar availability is weighted to on-peak periods.

B. Variable Costs of Generation

The study uses variable costs of generation that include fuel costs, sulfur dioxide and nitrogen oxide emissions costs, and variable operations and maintenance (VOM) costs. The study calculates fuel costs from unit heat rates and Platts' Gas Daily spot prices at the unit's reported natural gas hub by Energy Velocity, #2 Diesel, Low-Sulfur – Industrial for the East Coast, and Residual Fuel Oil sales to end users for the East Coast for the test period. Natural gas prices vary by hub, but were $2.67 per mmBtu at TETCO M3, the hub with the largest reported capacity in the study. Fuel costs for other fuels are based upon the average fuel costs reported in the EV data for each fuel type. Emissions prices during the test year were $2 per ton for SO2 year-round and $300 per ton for NOx in the summer season. CO_2 costs for units located in Regional Greenhouse Gas Initiative (RGGI) states are $5.21/ton, which is based upon RGGI Auction results in Dec 2014. Units in Montgomery County, MD have an additional $5/ton carbon tax on CO_2 emissions. VOM costs are from the EV database.

C. Long-term Contracts

We reviewed Appendix B data from market-based rate filings, FERC Form 1 filings, and Electric Quarterly Report ("EQR") data to obtain data on long-term contracts. Where the market-based rate filing indicates a change of operational control, we include a contract transferring control to the buyer. We leave the generation unit in the BAA where it is physically interconnected to the transmission system. When the buyer is a load-serving entity in another BAA, we give a priority firm transmission path to the BAA with the load.

Long-term contracts that expire prior to January 1, 2015 are not included in the study. Long-term contracts that expire between January 1, 2015 and July 31,

2015 are included only in the seasons for which they are in effect. Contracts that expire after August 31, 2015 are included in the study.

IV. Transmission

A. Transmission Network

The study incorporates a contract path transmission network for modeling purposes. Transmission pricing between balancing authority areas is represented by a traditional contract path transmission network in which the direct physical connections between balancing authority areas are also the individually priced links from which contract paths are constructed.

B. Transmission and Ancillary Services Pricing and Losses

As specified by the Commission's Appendix A, the study generally uses ceiling prices for transmission service from Schedules 1, 2 and 8 of the utility's *pro forma* open-access transmission tariff. Transmission providers may require transmission customers to purchase ancillary services under Schedule 1 (scheduling, system control and dispatch) and Schedule 2 (reactive supply and voltage control). Schedule 8 gives the rates for non-firm point-to-point transmission service. The study uses transmission prices from tariffs.

When we have tariffs available, we calculate rates for off-peak, peak and spike categories. Because of discounting and the nature of baseload purchases, off-peak rates are often lower than peak rates.[3] We use two steps to determine off-peak rates. Step 1: When a utility posts off-peak hourly rates, we use the posted rates. Step 2: When a utility does not post off-peak hourly rates, we calculate an hourly off-peak rate based on other tariff information. To calculate hourly off-

[3] For transactions longer than one hour, the *pro forma* tariff caps the amount that the purchaser pays per day by the daily rate, and the amount that the purchaser pays per week by the weekly rate.

peak rates, we divide the weekly rate by 168, the number of hours in a week. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

We use similar steps to determine peak rates. Step 1: When a utility posts maximum hourly rates in its tariff, we use the maximum tariff rates. Step 2: When a utility does not post off-peak hourly rates, we calculate a peak rate based on other tariff information. To calculate hourly peak rates, we divide the weekly rate by 80—the "Appalachian" method. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

For spike periods, we use ceiling hourly rates from tariffs, when available. Otherwise, we use the Appalachian method.

Whenever practical, the study uses loss rates from tariffs. When these methods did not provide a loss rate for a particular utility, the study assumes that losses are three percent per utility.[4] The study assumes that transmission customers pay losses in-kind. That is, if area A exports 100 MW to area B and the losses are 3 percent, only 97 MW arrive at area B.

For areas where tariffs are not available, rates and losses are the average by period for all the reporting areas.

C. Transfer Capability and SILs

The geographic market includes only PJM and NYISO. The SILs for PJM East and PJM East of 5004/5005 comes from the 2015 Simultaneous Import Limit

[4] Losses of 3 percent are representative of the industry. See, FERC Open Access NOPR, *FERC Stats & Regs*, ¶32,514 at 33,150 (1995).

20160328-5240 FERC PDF (Unofficial) 3/28/2016 6:31:16 PM

Study filed by PJM on September 2, 2016.[5] The total imports into the destination markets may be less than the actual ability to import into the destination because not all the generation capability owned or controlled by load-serving entities within the destination markets studied in PJM have been identified in the data.

V. Market Prices

The study used December 2014-November 2015 real-time hourly prices from the RTO LMP for PJM East and PJM East of 5004/5005. Table V-1 shows the PJM East of 5004/5005 market prices in each of the ten periods, and Table V-2 shows the PJM East market prices.

Table V-1 – PJM East of 5004/5005 Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$148.44	-----
Top 10%	$62.03	$64.59	$185.57
Low Peak	$35.73	$35.56	$47.55
Off-Peak	$29.46	$24.88	$50.16

Table V-2 – PJM East Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$145.63	-----
Top 10%	$57.82	$63.88	$193.51
Low Peak	$32.73	$29.67	$50.59
Off-Peak	$26.67	$21.25	$50.94

[5] PJM Interconnection, L.L.C., *Informational Filing of 2015 Simultaneous Import Limit Study Report for PJM Region*, Docket No. AD1-2-007, September 2, 2016, Accession No. 20160902-5155.

VI. Load and Contract Obligations for AEC Calculations

Load data come from PJM for PJM and from Energy Velocity for the other supply areas.

To compute load requirements for market participants in New York and PJM, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[6] To account for their greater load obligations, we assume that Dominion has 100 percent responsibility for its allocation of load and that AEP has 90 percent of its allocation as opposed to the standard 70 percent.

[6] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers.

20160328-5240 FERC PDF (Unofficial) 3/28/2016 8:31:16 AM

This Exhibit describes the methods used to calculate market shares and concentration in destination markets.

Allocation of scarce transmission capability is accomplished using linear and nonlinear programs that model generation dispatch and the contract path transmission system. This Exhibit provides an overview of the structure of the programs and presents the equations.

Overview of Linear Program

The linear program models control areas as nodes in a transmission system. Each node has a demand for and a supply of electric energy. The supply is based on the generators at the node and potential deliveries to the node via transmission links from other control areas. The linear program allows for net import and export limits to and from an individual control area. Given generation capability and costs and transmission capability and costs, the linear program finds the least-cost solution that satisfies the specified loads. Costs are defined as dispatch (generation) costs plus transmission costs including losses plus the default cost for "unserved" load. For each solution, the linear program determines the quantities produced in, exported from, and imported into each control area.

The Mathematical Equations

The linear program to be solved is given below:

Minimize Total Cost: $Cost = GC + TC + UC$

Subject to:

(1) Generation: $TG_a = \sum_{u}^{u \in a} G_{a,u}$ for each area *a*;

(2) Imports: $YI_a = \sum_{b}^{a,b \in network} (1 - h_{b,a}) T_{b,a}$ for each area *a*;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

(3)	Exports:	$YE_a = \sum_{b}^{a,b \in network} T_{a,b}$	for each area *a*;
(4)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(5)	Supply/Demand Balance:	$TG_a + Y_a + U_a = D_a$	for each area *a*;
(6)	Generation Cost:	$GC = \sum_{a} \sum_{u}^{u \in a} d_{a,u} G_{a,u}$	for each area *a*;
(7)	Transmission Cost:	$TC = \sum_{a,b}^{a,b \in network} r_{a,b} T_{a,b}$	for each path *a* to *b*;
(8)	Unfilled Demand Cost:	$UC = \sum_{a} pU_a$	for each area *a*;
(9)	Generation Limits:	$g\min_{a,u} \le G_{a,u} \le g\max_{a,u}$	for each unit *u* in each area *a*;
(10)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(11)	Net Import Limits	$Y\min_{a} \le Y_a \le Y\max_{a}$	for each area *a*;

where:

a,b	are subscripts for control/transmission areas;
Cost	is total system cost;
$d_{a,u}$	is the dispatch cost of unit *u* in area *a*;
D_a	is demand for power in area *a*;
$G_{a,u}$	is generation output of unit *u* in area *a*;
GC	is total system generation cost;
$G\max_{a,u}$	is the maximum output of unit *u* in area *a*;
$G\min_{a,u}$	is the minimum output of unit *u* in area *a*;
$h_{b,a}$	is the fraction of power lost to resistance from moving power from area *b* to area *a*;
N	is a subscript to identify simultaneous transmission constraint *n*;
P	is the default price;
$r_{a,b}$	is the transmission rate from area *a* to area *b*;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

$T_{a,b}$	is the power flow from area *a* to area *b*;
TC	is total system transportation expenses;
TG_a	is total generation output in area *a*;
t $\max_{a,b}$	is the maximum power flow from area *a* to area *b*;
t $\min_{a,b}$	is the minimum power flow from area *a* to area *b*;
U	is a subscript to identify units in an area;
U_a	is the amount of demand in area *a* not met by generation or imports
UC	is total system cost of not meeting demand;
Y_a	is net imports into area *a*;
YE_a	is total exports from area *a*; and
YI_a	is total imports into area *a*;
Y $\min_a$	is minimum net imports in area *a;*
Y $\max_a$	is maximum net imports in area *a.*

This linear program is solved using the BDMLP solver in GAMS. In order to calculate concentration for different destinations, seasons, and periods, the PASS GAMS program loops through the destinations, seasons, and periods with calls to Solvers to solve the linear programs. Loads, unit availability and transmission availability are adjusted for each season-period combination.

Calculating Concentration

Transmission allocation is accomplished in four steps. In the first step the linear program finds the net-back prices in all control areas given a price at the destination control area equal to 105 percent of the pre-merger price. Suppose the pre-merger price at the destination, control area A, is $20/MWh. Then all generation capability with a dispatch cost of $21/MWh or less in the destination area would be included in the market because $21 is 105 percent of $20. If transmission cost (including losses) is $5/MWh from control area B to A, then the net-back price at B would be $16/MWh, which is the $21/MWh less the $5/MWh transmission cost between B and A. Then, all generation capability at B with dispatch costs equal to or less than $16/MWh would be included in the market if there were no transmission constraints. Calculation of net-back prices is

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

accomplished by setting the default price, *p*, equal to 105 percent of the pre-merger price at the destination, setting load at the destination to a high number and loads elsewhere to zero, setting transmission limits high enough so that the transmission system is not constrained, and setting a limited amount of generation in each area with a zero dispatch cost. The shadow prices produced by the linear program will be *p* at the destination and the relevant net-back prices in other areas.

In the second step, one calculates Economic Capacity (EC) and Available Economic Capacity (AEC) in each area. These values are then used to limit generation capability. The ownership shares of AEC and EC are calculated for each node in the system.

In the third step, the linear program determines the amount of energy that can be imported into an area given available EC (or AEC) and limits on transmission capacity. This is accomplished by limiting generation in each area to the capacity amount (EC or AEC), giving generation outside the destination market a lower cost than generation inside the destination market, and minimizing cost to serve a large load at the destination market. The amount of generation supplied to the destination is the maximum that can be imported into the destination market.

In the fourth step, transmission is allocated by the following non-linear program:

Minimize Loss: $$Loss = \sum_{\alpha}\left(\frac{C_{\alpha}^{2}}{Y_{Dest}s_{\alpha}} - 2C_{\alpha}\right)$$

Subject to:

(1) Pre Shares: $$s_{\alpha} = \frac{C\max_{\alpha}}{\sum_{\beta} C\max_{\beta}}$$ for each area α;

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

(2)	Allocated Shares:	$A_\alpha = \frac{C_\alpha}{Y_{Dest}}$	for each area α;
(3)	Imports:	$YI_a = \sum_b^{a,b \in network} (1 - h_{b,a}) T_{b,a}$	for each area *a*;
(4)	Exports:	$YE_a = \sum_b^{a,b \in network} T_{a,b}$	for each area *a*;
(5)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(6)	Supply/Demand Balance:	$C_a + Y_a + U_a = D_a$	for each area *a*;
(7)	Capacity Limits:	$c\min_a \le C_a \le C\max_a$	for each area *a*;
(8)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(9)	Max Import Limit	Y_{Dest} = Maximum imports from step 3;	

where:

a,b	are subscripts for control/transmission areas;
α,β	are subscripts for control/transmission areas other than the destination market;
s_α	Is area α's share of capacity outside of the destination;
A_α	is area α's share of allocated capacity outside of the destination;
Loss	is the loss function to be minimized.

The loss function is derived from the weighted squared-errors between the pre-allocation shares and the post-allocation shares, where Y_{Dest}/s_α are the weights. For each source control area, the weighted squared-error is given by:[1]

$$W_\alpha = \frac{Y_{Dest}}{s_\alpha}(A_\alpha - s_\alpha)^2.$$

[1] This exposition ignores the adjustments necessary to give priority to minimum transfer levels from a source area to the destination.

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

Accordingly, the sum of the weighted squared-errors gives rise to the loss function, which can be seen by:

$$\begin{aligned} Loss &= \sum_{\alpha} W_{\alpha} \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha} - s_{\alpha})^2 \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha}^2 - 2 s_{\alpha} A_{\alpha} + s_{\alpha}^2) \\ &= \sum_{\alpha} \left(\frac{C_{\alpha}^2}{Y_{Dest} s_{\alpha}} - 2 C_{\alpha} \right) + \text{constant}. \end{aligned}$$

The resulting shares from minimizing this loss functions preserve the relative shares of capacity behind any transmission constraint going to the destination. This can be seen from the following LaGrangian equation to be minimized:

$$L = \sum_{i} \left(\frac{C_i^2}{Y_{Dest} s_i} - 2 C_i \right) + \lambda \left(T - \sum_{i} C_i \right),$$

where *T* is the transmission limit affecting control areas *i*. The first order conditions are:

$$\frac{\partial L}{\partial C_i} = \frac{2 C_i}{Y_{Dest} s_i} - 2 - \lambda = 0,$$

which can be rearranged to give:

$$A_i = \frac{C_i}{Y_{Dest}} = \left(\frac{2 + \lambda}{2} \right) s_i,$$

which shows that the allocated market shares of those areas affected by the transmission constraint are proportional to their shares of capacity before the transmission allocation. Moreover, this is the only transmission allocation

© ***Economists Incorporated***, Washington, DC, 2008, 2013, 2016

method that maintains the relative shares of capacity behind any binding transmission constraint in the allocation process.

This non-linear program is solved using the COINIPOPT solver in GAMS. The calculated capacities from the nonlinear program above less transmission losses determine the capacities for the market share calculations for sources outside of the destination market. The capacities within the destination market are given full weights.

Market concentration is the HHI, which is the sum of the squared market shares. Mathematically,

$$HHI = \sum_{i=1}^{n} S_i^2,$$

where S_i is the allocated share of firm *i* and *n* is the number of firms in the market. The summary sheets combine all the firms with shares of 0.7 percent or less (other than Applicants) into the "Other" category. The collective share of the Other category does not directly enter the HHI calculation other than the represented capacity as each independent entity enters the HHI calculation. For example, if ten firms with 0.5 percent shares were in the Other category, the HHI contribution of the Other category would be 0.625 (= 10 x .5 x .5 = 10 x .0625) and ***not*** 25.

PSEG Fossil LLC
Reliant Energy Mid-Atlantic Power Holdings, LLC
UGI Development Company

Re: Joint Owners of the Conemaugh Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Conemaugh Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Conemaugh Electric Generating Station:

1. The Owners jointly own the Conemaugh Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in East Wheatfield and West Wheatfield Townships, Indiana County, Pennsylvania (the "Station").

[1] Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20160328-5240 FERC PDF (Unofficial) 5/23/2018 6:31:65804 PM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Conemaugh Power LLC	3.72%
Constellation Power Source Generation, Inc.	10.56%
Duquesne Conemaugh LLC	3.83%
Exelon Generation Company, LLC	20.72%
PPL Montour, LLC	16.25%
PSEG Fossil LLC	22.50%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.45%
UGI Development Company	5.97%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

Sincerely yours,

Georgianna R. Stenger
Administrative Manager

Re: Joint Owners of the Keystone Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Keystone Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Keystone Electric Generating Station:

1. The Owners jointly own the Keystone Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in Plumcreek, South Bend and Cowanshannock Townships, Armstrong County, Pennsylvania, and Armstrong Township, Indiana County, Pennsylvania (the "Station").

[1] Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20160328-5240 FERC PDF (Unofficial) 5/23/2018 6:31:65804 PM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Constellation Power Source Generation, Inc.	20.99%
Duquesne Keystone LLC	2.47%
Exelon Generation Company, LLC	20.99%
Keystone Power LLC	3.70%
PPL Montour, LLC	12.34%
PSEG Fossil LLC	22.84%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.67%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

Sincerely yours,

Georgianna R. Stenger
Administrative Manager
Keystone-Conemaugh Projects

PSEG
Nuclear L.L.C.

Carol Peterson
Vice President Finance
Exelon Nuclear
4300 Winfield Road
Warrenville, IL 60555

Letter Regarding Control of Jointly-Owned Nuclear Facilities

Dear Ms. Peterson:

In connection with its upcoming compliance filings pursuant to Order No. 697,[1] PSEG Nuclear LLC ("PSEG") is submitting this letter in order to set forth its understanding of, and is requesting Exelon Generation Company LLC's ("Exelon") concurrence on, the respective level of control exercised by both companies with respect to the two nuclear facilities that they jointly own.[2]

PSEG avers and requests Exelon's concurrence on the following:

1. PSEG and Exelon jointly own and control two nuclear power plants, Peach Bottom Atomic Power Station located in Delta, PA and the Salem Nuclear Generating Station in Lower Alloways Creek, NJ.

2. In accordance with the Joint Owners Agreement for Peach Bottom dated November 24, 1971, as amended on thereafter, between the Parties, PSEG and Exelon each own 50% of the generating station. Under the Agreement, Exelon is the designated operator of Peach Bottom.

3. In accordance with the Joint Owners Agreement for Salem dated November 24, 1971, as amended thereafter, between the Parties, Exelon owns 42.59% and PSEG owns 57.41% of the generating station. Under the Agreement, PSEG is the designated operator of Salem.

4. Section 4.1 of each of the Joint Owners' Agreements states, "The signatories shall be entitled to shares of the installed capacity, available capacity, operating capacity and hourly energy generation of the Station in proportion to their ownership . . .."

[1] *Market-Based Rates For Wholesale Sales Of Electric Energy, Capacity And Ancillary Services By Public Utilities*, 119 FERC ¶ 61,295 (2007).

[2] PSEG has requested a letter of concurrence from Exelon in order to facilitate the Commission's review of the market power analysis submitted by PSEG with respect to facilities it jointly owns with Exelon. Exelon has no objection to PSEG's submission of this letter as part of PSEG's compliance filing,.

Thomas P. Joyce
Senior Vice President

P.O. Box 236, Hancocks Bridge, NJ 08038
tel: 856.339.1100 fax: 856.339.1104
email: Thomas.Joyce@pseg.com

PSEG
Nuclear L.L.C.

5. Section 11.1 of each of the Joint Owners' Agreements provides that the generating station will be operated by the party designated as operator for the mutual benefit of PSEG and Exelon.

6. In Order No. 697 the Commission stated that under "where a jointly-owned generation facility is operated by one of the joint-owners for the benefit of and on behalf of all of the joint-owners . . . it may be reasonable to allocate capacity based on ownership percentages...." Order No. 697 at P 188.

7. In accordance with the guidance provided in Order No. 697 and with the language of each of the joint owners' agreements, PSEG and Exelon should be deemed to control each of the nuclear facilities' output in line with their proportionate ownership share of each facility. As such, PSEG and Exelon should each be deemed to control 50% of Peach Bottom's output, and PSEG should be deemed to control 57.41% of Salem's output with Exelon controlling 42.59%.

Please indicate Exelon's concurrence to the above by executing the Acknowledgement and Agreement section below.

Sincerely

Thomas P. Joyce
Senior Vice President – Operations

Acknowledged and Agreed to

20160328-5240 FERC PDF (Unofficial) 5/23/2016 8:31:05 AM

JOINT LETTER OF CONCURRENCE

Regulations of the Federal Energy Regulatory Commission (the "FERC") require each public utility with market-based rate authority to file an updated market power analysis every three years in accordance with a schedule adopted in *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 697, FERC Stat. & Regs., Regulations Preambles ¶ 31,252 (2007) ("Order No. 697"). See, 18 CFR § 35.37(a)(1). Each public utility with market-based rate authority may also be required to file a change-in-status report regarding certain changes in circumstances that occur between the dates on which its triennial market power analyses are filed. 18 CFR § 35.42. Among other matters, the market power analysis is to address the amount of generation capacity that the affected utility owns or controls. Where more than one public utility owns a generating facility, FERC requires the utility that is submitting a market power analysis seek a "letter of concurrence" from the other affected co-owning public utilities that identifies the degree to which each public utility controls the generating facility, and to submit the letter with its filing. *See* FERC Order No. 697, 119 FERC ¶ 61,295, P 187 (2007).

The Yards Creek Pumped Storage Hydroelectric Project (the "Yards Creek Project") is a FERC-licensed pumped-storage hydroelectric project with a nameplate capacity of 400 MWs, and is located in Pahaquarry and Blairstown Townships, in Warren County, New Jersey. *See* FERC Project No. P-2309.

PSEG Fossil LLC ("PSEG") and Jersey Central Power & Light Company ("JCPL") each own, as tenants in common with the other, an undivided 50% interest in the Yards Creek Project. Accordingly, if and when PSEG or JCPL submit an updated market power analysis to the FERC, each will be subject to FERC's requirement to seek a "letter of concurrence" regarding the degree to which each controls the Yards Creek Project.

Both PSEG and JCP&L (and their affiliates) own transmission facilities and provide wholesale electric service in the Northeast region, as defined in Order No. 697. Pursuant to the schedule adopted in Order No. 697, PSEG and JCP&L are each required to submit an updated market power analysis to the FERC for markets within the Northeast region in December 2010. PSEG and/or JCP&L may also be obligated to file a change-in-status report or other market power analyses before its subsequent triennial market power analysis for the Northeast region is scheduled to be filed. Therefore, for the sole purpose of enabling either PSEG or JCP&L to submit a market power analysis that addresses, among other issues (to the extent necessary), the scope of each party's control of the Yards Creek Project, PSEG and JCP&L each aver and agree as follows:

1. JCP&L operates and maintains the Yards Creek Project pursuant to the Yards Creek Pumped Storage Hydroelectric Generating Station Operating Agreement, which is dated October 6, 1965 (the "Operating Agreement').

2. Article 2 of the Operating Agreement designates JCP&L as holding sole responsibility for the operations and maintenance the Yards Creek Project. Article 2 further provides that JCPL shall operate the Yards Creek project in the same manner as if JCPL had the complete ownership interest in the Yards Creek Project.

3. JCP&L does, in fact, operate and control the Yards Creek Project in the same manner as if JCP&L had the complete ownership interest in the Yards Creek Project in accordance with Article 2 of the Operating Agreement.

4. Accordingly, PSEG and JCP&L each agree and concur that for the purpose of the market power analyses required by Order No. 697, JCPL shall be deemed to control the Yards Creek Project generation capacity and electric energy output.

ACKNOWLEDGED AND AGREED:

Richard P. Lopriore
President, PSEG Fossil LLC

UNITED STATES OF AMERICA

BEFORE THE

FEDERAL ENERGY REGULATORY COMMISSION

PSEG Fossil Sewaren Urban Renewal Entity LLC	))))	Docket No. ER17-____-000

Affidavit of
Dr. John R. Morris

May 25, 2018

20180525-5240 FERC PDF (Unofficial) 5/25/2018 3:36:30 PM

Public Service Enterprise Group Incorporated
Sewaren Market Power Study

1. My name is Dr. John R. Morris. I am a Principal at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Washington, DC 20037. I am the same Dr. John R. Morris who filed Public Service Enterprise Group Incorporated's ("PSEG") market power study for the Northeast Region in December 2016 under this docket. See Report & Affidavit of Dr. John R. Morris, FERC Accession Number 20161228-5212, December 28, 2016. I also filed a Change in Status application to reflect the addition of Keys Energy Center and the retirement of Hudson and Mercer generating stations in September 2017 for PSEG in Docket No. ER17-2426-000. PSEG has asked that I update the September 2017 market power study for the PJM market and relevant submarkets in order to account for the addition of PSEG Fossil Sewaren Urban Renewal Entity LLC, hereinafter "Sewaren LLC", which owns Sewaren Unit 7, a natural gas combined cycle plant with a generating capacity of 585 MW currently under construction in Woodbridge Township, New Jersey. When Sewaren LLC enters service, PSEG will retire Sewaren Units 1-4 at the same location.[1]

2. Per PSEG's request, I added the new 585 MW Sewaren Unit 7 in the PJM East market and retired Sewaren Units 1-4, which are located in PJM East. I moved the test year of the analysis forward by one year from December 2014-November 2015 to December 2015-November 2016, as this is the latest period for which FERC Form 714 data on unplanned generator outages is

[1] The relevant markets are PJM Interconnection, L.L.C. ("PJM"), PJM East, PJM East of 5004/5005 and PJM East of AP South.

20180525-5240 FERC PDF (Unofficial) 5/25/2018 3:36:30 PM

available. I also updated the overall market sizes of the PJM market and submarkets, along with the first tier areas of NYISO and MISO. I updated load data both for the applicant and for the overall markets in the study. All methods are the same as in the December Affidavit.

3. The results of the pivotal supplier and market share assessments are provided in Exhibit No. PEG-2.

4. Although there are some minor differences in the results from those presented with the December Affidavit, the differences are not material and do not change the conclusions made at that time.

5. Although there are some Wholesale Market Share screen failures in the PJM East and PJM 5004/5005 submarkets, Sewaren LLC and most of the PSEG generation is located in PJM, which has Commission approved market power monitoring and mitigation. The Commission has adopted a rebuttable presumption that existing Commission approved RTO/ISO market monitoring and mitigation is sufficient to address any market power concerns. See Order No. 697, FERC Stats. & Regs. ¶ 31,252 at P 240-42, P 246, P 290; Order No. 697-A, FERC Stats. & Regs. ¶ 31,268 at P 111.

6. Under the standards utilized by the Commission, continuing market-based rates for PSEG and all of its Northeastern affiliates remain in the public interest. In addition, granting market-rate authority to the Sewaren LLC would also be in the public interest.

7. This concludes my affidavit.

20180525-5240 FERC PDF (Unofficial) 5/25/2018 3:36:30 PM

Pursuant to 28 U.S.C. §1746, I state under penalty of perjury that the foregoing is true and correct to the best of my information, knowledge, and belief.

Executed on this 25th day of May 2018.

John R. Morris, Ph.D.

Principal

Economists Incorporated

Dear Ms. Bose:

On May 25, 2018, the PSEG Affiliates submitted a notice of non-material change in status ("Notice") pursuant to section 35.42(a)(1) of the regulations of the Federal Energy Regulatory Commission ("Commission").[1] The PSEG Affiliates are submitting this supplement to the Notice to include: (1) Appendix B – Generation Assets; and (2) Appendix A-3 in Excel format as required by the Commission's regulations.

Please feel free to contact me at (973) 430-8836 if you have any questions about this matter.

Very truly yours,

Cara J. Lewis

Asset Appendix: Generation Assets								
						Location		
Filing Entity and its Energy Affiliates	**Docket # where MBR authority was granted**	**Generation Name (Plant or Unit Name)**	**Owned By**	**Controlled By**	**Date Control Transferred**	**Balancing Authority Area**	**Geographic Region**	**In-service Date**
[i] PSEG Fossil has a 22.5% interest in the Conemaugh coal fired plants.								
[ii] PSEG Global has a 4% interest Conemaugh Hydroelectric plants.								
[iii] PSEG Nuclear has a 50% interest in the Peach Bottom Nuclear Plants.								
[iv] PSEG Nuclear has a 57.41% interest in the Salem Nuclear Plants.								
[v] JCP&L – Jersey Central Power & Light Company								
[vi] PSEG Fossil has a 50% interest in each of the Yards Creek facilities.								
[vii] CL&P – The Connecticut Light and Power Company.								
[viii] PSEG Power Ventures has a 100% ownership in PSEG Hackettstown LLC.								
[ix] PSEG Power Ventures has a 100% ownership interest in PSEG Solar Source LLC								
[x] All solar assets are using AC MW ratings. PSEG's previous triennial listed the DC ratings.								
[xi] PG&E -- Pacific Gas and Electric Company								
[xii] PSE&G started installations of pole units in September of 2009. As of November 30, 2016, a total of 174,630

Dear Secretary Bose:

On December 28, 2016, PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG Fossil LLC, PSEG Nuclear LLC, PSEG New Haven LLC, Pavant Solar II LLC, San Isabel Solar LLC, Bison Solar LLC, and PSEG Energy Solutions LLC, ("Applicants") jointly submitted their updated market power analysis in support of their continued eligibility to engage in market-based rate transactions.

Applicants' application included the Report & Affidavit of Dr. John R. Morris ("Morris Affidavit"), which contained the following exhibits: PEG-2; PEG-3; PEG-4; PEG-5; PEG-6; PEG-7; PEG-8; PEG-9; PEG-10; and PEG-11. In the instant filing, Applicants are resubmitting the above-mentioned exhibits to the Morris Affidavit in Excel format as required by the Commission's regulations.

Thank you for your attention to this matter.

Respectfully submitted,

Cara J. Lewis

RE: Notice of Non-Material Change in Status
***PSEG Energy Resources & Trade LLC*, Docket No. ER10-1789-____;**
***Public Service Electric and Gas Company*, Docket No. ER10-1768-___;**
***PSEG Power Connecticut LLC,* Docket No. ER10-1793-____;**
***PSEG Fossil LLC,* Docket No. ER10-1770-___;**
***PSEG Nuclear LLC,* ER10-1771-____;**
***PSEG New Haven LLC,* ER12-1250-____:**

Dear Secretary Bose:

PSEG Energy Resources & Trade LLC ("PSEG ERT") hereby submits for filing this notice of a non-material change in status, in compliance with the reporting requirements adopted by the Federal Energy Regulatory Commission ("Commission") in Order No. 652.[1] Specifically, PSEG ERT hereby notifies the Commission that it has executed with the Long Island Power Authority ("LIPA") a Contract Providing Power Supply Management Services dated November 26, 2013 ("the 2013 Contract"). Under the 2013 Contract, which will be fully implemented on January 1, 2015, PSEG ERT will provide LIPA with Power Supply Management Front and Back Office Services ("PSMFB Services").[2] Such PSMFB Services are, in all respects pertaining to the sale or transmission of electric energy, the same services that Consolidated Edison Energy, Inc. ("Con Edison Energy") has been providing to LIPA since January 1, 2010 pursuant to an agreement between Con Edison Energy and LIPA dated December 1, 2008 (the "2008 Contract").[3]

[1] Reporting Requirement for Changes in Status for Public Utilities with Market-Based Rate Authority, 110 FERC ¶ 61,097 (Order No. 652), order on reh'g, 111 FERC ¶ 61,413 (2005) (Order No. 652-A).

[2] While the 2013 Contract will be fully implemented on January 1, 2015, to begin the transition from Con Edison Energy to PSEG ERT, PSEG ERT began performing PSMFB Services as to LIPA's rights (i) to seven must-take qualifying facilities (about 230 MW) on September 16, 2014; (ii) to 29 oil combustion generating units (about 1,520 MW) on October 14, 2014; and (iii) to four Northport steam generating units (about 1,600 MW) on October 28, 2014.

[3] Currently, two affiliates of PSEG ERT (PSEG Long Island LLC and Long Island Electric Utility Servco LLC) provide certain management, operations and maintenance services to LIPA with respect to LIPA's transmission and distribution system. In *PSEG Long Island LLC*, 145 FERC ¶ 61,010 at P 4 (2013), the Commission disclaimed jurisdiction under Section 201(e) of the Federal Power Act over these two affiliates based on a finding that LIPA and its Board will retain ultimate control and decision-making authority over the transmission and distribution facilities.

20141113-5228 FERC PDF (Unofficial) 11/13/2014 4:36:57 PM

In connection with the 2008 Contract between Con Edison Energy and LIPA, on April 7, 2009, Con Edison Energy submitted to the Commission a notice of a non-material change in status, which was accepted by the Commission by letter order on June 8, 2009.[4] Con Edison Energy's April 7, 2009 notice is attached hereto as Attachment A, and the Commission's June 8, 2009 acceptance letter is attached hereto as Attachment B.

Like Con Edison Energy's change in status notification, PSEG ERT hereby submits this notice of a non-material change in status, notifying the Commission that, as of January 1, 2015, it will take over the functions that are currently performed by Con Edison Energy under the 2008 Contract.[5] PSEG ERT's execution of the 2013 Contract and its performance of services thereunder will not provide PSEG ERT with ownership of, or control over, the Power Supply Resources. PSEG ERT will perform services under the 2013 Contract as an agent for, or representative of, LIPA (in the same manner that Con Edison Energy currently performs services for LIPA), and, therefore, control over the Power Supply Resources at all times will remain with LIPA, as it did with respect to the 2008 Contract between Con Edison Energy and LIPA. Thus, PSEG ERT's execution of the 2013 Contract and its performance of the services on behalf of LIPA do not constitute a material change in status as contemplated by the Commission's regulations.[6]

PSEG ERT also notes that, on December 23, 2013, PSEG ERT and its affiliates with market-based rate authorization except PSEG New Haven LLC submitted their triennial market power update with the Commission in Docket Nos. ER99-3151 et al.[7] In that filing (at page 5), PSEG ERT provided the Commission with notice of the 2013 Contract, stating: "On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015." The Commission accepted this triennial update filing on October 14, 2014.

In sum, PSEG ERT hereby notifies the Commission of the foregoing non-material change in status and requests that the Commission accept this filing on the same grounds that it accepted the April 8, 2009 Con Edison Energy filing.

Sincerely,

Jodi L. Moskowitz

[4] *See* June 8, 2009 Letter Order accepting Con Edison Energy's notice of change in status in Docket Nos. ER98-2491-015 et al.

[5] *See supra* n.2 at 1.

[6] In Order 652, the Commission stated that the requirement to make a change in status filing is triggered by a change in "ownership" or "control" of generation or transmission facilities. Order 652 at PP 2, 18.

[7] PSEG New Haven LLC was not included in the 2013 triennial market power update because it received initial MBR authority on May 29, 2012 in Docket No. ER12-1250-00 and therefore was not yet due to make a triennial update filing.

***PSEG New Haven LLC,* ER12-1250-003:**

Dear Secretary Bose:

PSEG Energy Resources & Trade LLC ("PSEG ERT") hereby submits for filing this notice of a non-material change in status,[1] in compliance with the reporting requirements adopted by the Federal Energy Regulatory Commission ("Commission") in Order No. 652.[2] Specifically, PSEG ERT hereby notifies the Commission that it has executed with the Long Island Power Authority ("LIPA") a Contract Providing Power Supply Management Services dated November 26, 2013 ("the 2013 Contract"). Under the 2013 Contract, which will be fully implemented on January 1, 2015, PSEG ERT will provide LIPA with Power Supply Management Front and Back Office Services ("PSMFB Services").[3] Such PSMFB Services are, in all respects pertaining to the sale or transmission of electric energy, the same services that Consolidated Edison Energy, Inc. ("Con Edison Energy") has been providing to LIPA since January 1, 2010 pursuant to an agreement between Con Edison Energy and LIPA dated December 1, 2008 (the "2008 Contract").[4]

[1] This notice supplements the notice that was filed on November 13, 2014 (Accession No.: 201411135228).

[2] Reporting Requirement for Changes in Status for Public Utilities with Market-Based Rate Authority, 110 FERC ¶ 61,097 (Order No. 652), order on reh'g, 111 FERC ¶ 61,413 (2005) (Order No. 652-A).

[3] While the 2013 Contract will be fully implemented on January 1, 2015, to begin the transition from Con Edison Energy to PSEG ERT, PSEG ERT began performing PSMFB Services as to LIPA's rights (i) to seven must-take qualifying facilities (about 230 MW) on September 16, 2014; (ii) to 29 oil combustion generating units (about 1,520 MW) on October 14, 2014; and (iii) to four Northport steam generating units (about 1,600 MW) on October 28, 2014.

[4] Currently, two affiliates of PSEG ERT (PSEG Long Island LLC and Long Island Electric Utility Servco LLC) provide certain management, operations and maintenance services to LIPA with respect to LIPA's transmission and distribution system. In *PSEG Long Island LLC*, 145 FERC ¶ 61,010 at P 4 (2013), the Commission disclaimed jurisdiction under Section 201(e) of the Federal Power Act over these two affiliates based on a finding that LIPA and its Board will retain ultimate control and decision-making authority over the transmission and distribution facilities.

20141114-5149 FERC PDF (Unofficial) 11/14/2014 1:49:39 PM

In connection with the 2008 Contract between Con Edison Energy and LIPA, on April 7, 2009, Con Edison Energy submitted to the Commission a notice of a non-material change in status, which was accepted by the Commission by letter order on June 8, 2009.[5] Con Edison Energy's April 7, 2009 notice is attached hereto as Attachment A, and the Commission's June 8, 2009 acceptance letter is attached hereto as Attachment B.

Like Con Edison Energy's change in status notification, PSEG ERT hereby submits this notice of a non-material change in status, notifying the Commission that, as of January 1, 2015, it will take over the functions that are currently performed by Con Edison Energy under the 2008 Contract.[6] PSEG ERT's execution of the 2013 Contract and its performance of services thereunder will not provide PSEG ERT with ownership of, or control over, the Power Supply Resources. PSEG ERT will perform services under the 2013 Contract as an agent for, or representative of, LIPA (in the same manner that Con Edison Energy currently performs services for LIPA), and, therefore, control over the Power Supply Resources at all times will remain with LIPA, as it did with respect to the 2008 Contract between Con Edison Energy and LIPA. Thus, PSEG ERT's execution of the 2013 Contract and its performance of the services on behalf of LIPA do not constitute a material change in status as contemplated by the Commission's regulations.[7]

PSEG ERT also notes that, on December 23, 2013, PSEG ERT and its affiliates with market-based rate authorization except PSEG New Haven LLC submitted their triennial market power update with the Commission in Docket Nos. ER99-3151 et al.[8] In that filing (at page 5), PSEG ERT provided the Commission with notice of the 2013 Contract, stating: "On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015." The Commission accepted this triennial update filing on October 14, 2014.

In sum, PSEG ERT hereby notifies the Commission of the foregoing non-material change in status and requests that the Commission accept this filing on the same grounds that it accepted the April 8, 2009 Con Edison Energy filing.

Sincerely,

Jodi L. Moskowitz

[5] *See* June 8, 2009 Letter Order accepting Con Edison Energy's notice of change in status in Docket Nos. ER98-2491-015 et al.

[6] *See supra* n.2 at 1.

[7] In Order 652, the Commission stated that the requirement to make a change in status filing is triggered by a change in "ownership" or "control" of generation or transmission facilities. Order 652 at PP 2, 18.

[8] PSEG New Haven LLC was not included in the 2013 triennial market power update because it received initial MBR authority on May 29, 2012 in Docket No. ER12-1250-00 and therefore was not yet due to make a triennial update filing.

Notification of Non-Material Change in Status

Dear Ms. Bose:

Consolidated Edison Energy, Inc. ("Con Edison Energy") submits for filing this notice of a non-material change in status, in compliance with the reporting requirements adopted by the Federal Energy Regulatory Commission ("Commission") in Order No. 652.[1] The change in circumstance is the execution by Con Edison Energy and the Long Island Power Authority ("LIPA") of a Contract for Providing Power Supply Management Front and Back Office Services dated December 1, 2008 ("Contract").[2]

Con Edison Energy does not believe that it has obtained control over the facilities affected by the Contract and, thus, that the Contract is not a change in status as contemplated by the Commission's regulations. Nevertheless, even if the Contract were deemed to convey control to Con Edison Energy, this change in status does not reflect a material change from the characteristics the Commission relied upon in granting CEE market-based rate authorization[3] or the results of the last triennial market power analysis submitted on behalf of Con Edison Energy and its affiliates ("the Con Edison Companies).[4]

---

[1] *Reporting Requirement for Changes in Status for Public Utilities with Market-Based Rate Authority*, 110 FERC ¶ 61,097 (Order No. 652), *order on reh'g*, 111 FERC ¶ 61,413 (2005) (Order No. 652-A).

[2] The Contract is conditioned upon its approval by the New York State Comptroller, which was granted on March 13, 2009.

[3] *Consolidated Edison Energy, Inc.*, 83 FERC ¶ 61,236 (1998).

[4] The Commission recently accepted a triennial market power analysis on behalf of the Con Edison Companies. *Consolidated Edison Company of New York, Inc.*, Dkt. No. ER99-2251-003,

Under the Contract, Con Edison Energy will provide specified services, as an agent, to LIPA with respect to certain resources (referred to in the Contract as "Power Supply Resources") that LIPA will use to serve its retail load, including (i) electric generating facilities owned by or under contract to LIPA having a total rating of 6,683 MW, (ii) LIPA's long-term transmission rights over the Cross Sound Cable and the Neptune Cable ("CSC and Neptune"), and (iii) LIPA's rights to certain emissions credits, transmission congestion contracts and financial transmission rights. The services that Con Edison Energy will perform on behalf of LIPA with respect to the Power Supply Resources include (i) the purchase and sale of capacity, energy, ancillary services, and transmission congestion contracts to meet the needs of LIPA's retail customers; (ii) the bidding and scheduling in wholesale electric markets of energy, capacity and ancillary services associated with the Power Supply Resources in order to serve the requirements of LIPA's retail load; and (iii) associated accounting, settlement, dispute resolution support, and reporting.

Commencing on January 1, 2010 and continuing for a base term of five years, Con Edison Energy will assume full responsibility for bidding and scheduling all of the Power Supply Resources in wholesale electric markets. In mid to late-2009, Con Edison Energy may undertake limited bidding and scheduling activities for one or more of the Power Supply Resources as part of training and pre-implementation preparations for bidding and scheduling activities.

Con Edison Energy's execution of the Contract and its performance of services thereunder do not vest Con Edison Energy with ownership of, or control over, the Power Supply Resources. The Contract does not alter the ownership of the Power Supply Resources in any respect. Because Con Edison Energy will perform services under the Contract as an agent for or representative of LIPA, control over the Power Supply Resources will remain with LIPA, as LIPA acknowledges in the enclosed concurrence letter. Thus, Con Edison Energy's execution of the Contract and its performance of services for LIPA do not constitute a material change in status as contemplated by the Commission's regulations.

With respect to LIPA's transmission rights over the CSC and Neptune, these transmission facilities are operationally controlled by ISO New England and PJM Interconnection, with transmission service scheduled over each facility pursuant to

---

et al., *Letter Order*, June 24, 2008. At the time it was filed, that analysis included the following Con Edison Companies with market-based rate authority: Newington Energy, L.L.C.; CED Rock Springs, Inc.; Consolidated Edison Energy Massachusetts; Lakewood Cogeneration, L.P.; and Ocean Peaking Power, L.L.C. The Commission subsequently authorized the transfer of these companies to North American Energy Alliance, LLC. *See Consolidated Edison Development, Inc. et al.*, 123 FERC ¶ 61,022 (2008). As such, this non-material change in status is not being filed in the dockets in which these divested companies received market-based rate authority.

specific rules set forth in the ISO-NE and PJM Open Access Transmission Tariffs on file with the Commission. In contracting for long-term transmission service rights over CSC and Neptune, LIPA did not acquire any ownership or operational control over those transmission facilities. Accordingly, by executing the Contract, LIPA did not convey to Con Edison Energy any operational control over the CSC or Neptune transmission facilities.

Even if the Contract were deemed to vest Con Edison Energy with control over the Power Supply Resources and with localized market power, that change in status would not reflect a material change from the characteristics the Commission relied upon in granting Con Edison Energy market-based rate authorization or in the results of the last triennial market power analysis submitted on behalf of Con Edison Energy and its affiliates. Currently, a subsidiary of National Grid USA manages LIPA's generation and energy portfolio.[5] Notwithstanding those services, the Commission recently concluded that the National Grid USA subsidiary satisfies the Commission's standards for market-based rate authority.[6] As a successor to the National Grid USA subsidiary, Con Edison Energy will manage LIPA's generation and energy portfolio after the current arrangement between LIPA and the National Grid USA subsidiary expires. Under the Contract, Con Edison Energy has no responsibility with respect to operation or management of LIPA's transmission and distribution systems. Accordingly, the Commission's prior conclusion and rationale apply equally to Con Edison Energy.

Accordingly, Con Edison Energy advises the Commission of the foregoing non-material change in status and requests that the Commission accept this filing and confirm Con Edison Energy's continued authorization to sell power at market-based rates.

Respectfully submitted,

Reference: Notice of Change in Status

Dear Mr. Wemple:

Pursuant to the authority delegated to the Director, Division of Tariffs and Market Development - West, under 18 C.F.R. § 375.307, your submittal filed in the referenced dockets is accepted for filing.

On April 8, 2009, you filed on behalf of ConEdison a notice of change in status to inform the Commission that ConEdison entered into a Contract for Providing Power Supply Management Front and Back Office Services with Long Island Power Authority. You state that the execution of this contract does not affect the conditions the Commission relied upon when granting ConEdison market-based rate authority. Based on your representations, the notice of change in status is accepted for filing.

Your filing was noticed on April 8, 2009, with comments, protests or interventions due on or before April 29, 2009. None was filed.

This action does not constitute approval of any service, rate, charge, classification, or any rule, regulation, or practice affecting such rate or service provided for in the filed documents; nor shall such action be deemed as recognition of any claimed contractual right or obligation affecting or relating to such service or rate; and such acceptance is without prejudice to any findings or orders which have been or may hereafter be made by

20090608-5049 FERC PDF (Unofficial) 06/08/2009 1:49:39 PM

the Commission in any proceeding now pending or hereafter instituted by or against any of the applicant(s).

This order constitutes final agency action. Requests for rehearing by the Commission may be filed within 30 days of the date of issuance of this order, pursuant to 18 C.F.R. § 385.713.

Questions regarding the above order should be directed to:

Federal Energy Regulatory Commission

December 23, 2013

ELECTRONICALLY AND VIA FEDERAL EXPRESS

Kimberly J. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, DC 20426

RE: Triennial Market Power Update and Revised Market-Based Rates Tariff in Compliance with Order No. 697:

***PSEG Energy Resources & Trade LLC*, Docket No. ER99-3151-____;**

***Public Service Electric and Gas Company*, Docket No. ER97-837-____;**

***PSEG Power Connecticut LLC*, Docket No. ER03-327 -___;**

***PSEG Fossil LLC*, Docket No. ER08-447-___;**

***PSEG Nuclear LLC*, ER08-448-___; and**

***PSEG New Haven LLC*, ER12-1250-___**

Dear Secretary Bose:

Pursuant to the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), Public Service Electric and Gas Company ("PSE&G"), PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear") and PSEG New Haven LLC ("PSEG New Haven") (collectively the "Applicants" or "PSEG") hereby jointly submit for filing their updated market power analysis in support of their continued eligibility to engage in market-based rates transactions. This market power analysis satisfies the requirements of Order No. 697[1] for the filing of updated market power analyses on a regional schedule basis by holders of market-based rate certificates and their affiliates. In accordance with the regional

[1] 18 C.F.R. Part 35, Subpart H (2007); Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

schedule for those utilities in the Northeast Region, as modified by the MBR Clarifying Order, this filing is being made by the December 2013 deadline.[2] In conformance with the Commission's requirements, except when expressly noted otherwise, the market power analysis is based on activity during the study period from December 1, 2011 through November 30, 2012 ("study period").

PSEG, through its subsidiary PSE&G, owns transmission facilities within the Northeast Region. Specifically, PSE&G owns transmission facilities in the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization. PSEG Power LLC and its subsidiaries do not own any transmission facilities other than transmission to connect generating units to the grid in PJM, the New York Independent System Operator, Inc. ("NYISO") and ISO New England Inc. ("ISO-NE").

In their original applications for market-based rate authority and previously-submitted updates to the Commission, PSEG ER&T, PSE&G, PSEG Power CT, PSEG Fossil, PSEG Nuclear and PSEG New Haven demonstrated that they and their affiliates: (a) do not exercise generation market power; (b) lack the ability to manipulate access to transmission facilities that they own or control; and (c) cannot erect any other barriers to market entry. As further demonstrated herein and in the Affidavit of Dr. John R. Morris attached hereto in the appendices, Applicants continue to satisfy the Commission's requirements to sell energy, capacity and ancillary services at market-based rates and thus should be permitted to continue to make such sales.

I. SERVICE AND COMMUNICATION

All service and correspondence related to this matter should be directed to the following individuals:

Applicants request waiver of Rule 203(b)(3)[3] so that a copy of any communications in these proceedings may be served on all persons listed above.

II. DESCRIPTION OF THE APPLICANTS AND RELEVANT AFFILIATES

A. The Applicants

The Applicants are each wholly owned, direct and indirect subsidiaries of Public Service Enterprise Group Incorporated ("PSEG"). PSEG is a public utility holding company engaged in, among other things, the generation of electric energy and the transmission, distribution and sale of electricity and natural gas through its subsidiaries.

1. Public Service Electric and Gas Company

PSE&G is a public utility operating company engaged primarily in the transmission of electricity, and the provision of gas and electric distribution service in the State of New Jersey. During the study period, PSE&G owned less than 100 MW of solar generation and otherwise did not own or operate any electric generation facilities. PSE&G is a member of the PJM Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access Transmission Tariff ("OATT") administered by PJM. PSE&G is authorized to sell power at market-based rates and makes wholesale sales falling within several different categories, as described below.

Non-utility generation ("NUG") output. Pursuant to certain long-term contracts entered into under the Public Utility Regulatory Policy Act of 1978 ("PURPA") or restructured successor contracts to PURPA contracts that PSE&G originally entered into with Qualifying Facilities ("QFs"), PSE&G has a continuing obligation to purchase certain quantities of energy and capacity. The total maximum quantity that PSE&G is

[3] 18 C.F.R. § 385.203(b)(3).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

contractually obligated to purchase from non-utility generators ("NUGs") is approximately 257 MW in installed capacity and associated energy. PSE&G sells the energy quantities purchased under these contracts into the PJM-administered spot market pursuant to its market-based rate authority. With respect to capacity from the facilities, PSE&G receives non-unit specific capacity rights covering the vast bulk of its capacity purchases – about 195 MWs – which are settled financially with the counterparty. The remainder of the capacity purchased by PSE&G under three (3) NUG contracts – about 62 MWs – is bid directly into the RPM auctions. Since PSE&G has a contractually-based obligation to offer the NUG capacity into the market, which obligation is also set forth in a New Jersey Board of Public Utilities ("BPU") Order approving a rate stipulation involving PSE&G,[4] the capacity has not been attributed to PSE&G for purposes of this market power analysis.

Solar. In 2007, the New Jersey legislature passed Regional Greenhouse Gas Initiative ("RGGI") legislation authorizing state utilities to invest in renewable resources such as wind or solar in order to promote increased use of renewable resources within the state and in turn reduce greenhouse gas emissions. *See* L. 2007, c. 340, codified at N.J.S.A. 48:98-1. In the fall of 2009, the BPU approved PSE&G's "Solar 4 All" program under which PSE&G is able to install, own and operate on a regulated basis solar generation up to a maximum of 80 MWs DC. PSE&G currently owns and operates approximately 77 MWs DC of solar power under the Solar 4 All program. In May 2013, the BPU approved PSE&G's "Solar 4 All Extension" to allow PSE&G to install, own and operate an additional 45 MWs DC of solar generation.

2. PSEG Energy Resources & Trade LLC

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.*, which initiated the transition from a regulated to a competitive retail power market in New Jersey, BPU annually approves statewide auctions to determine the entities that will supply Basic

[4] The stipulation states that "the parties agree that the Company will continue to sell NUG power into the PJM Spot Market unless and until the Board determines that a different selling protocol is appropriate." *In the Matter of Public Service Electric and Gas Company for Approval of Changes in Electric Rates*, Docket No. ER02050303, ¶ 18 (2003).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSEG ER&T has participated directly in all of the auctions for BGS supply held since 2004, has been a winning bidder in these auctions and has incurred contractual commitments to provide supply to BGS load pursuant to BPU approved contracts beginning with the 2004 auction and continuing to the present

RMR Tariff for PJM Units. As explained in PSEG ER&T's 2010 triennial submission, ER&T began providing reliability services to PJM pursuant to Reliability Must-Run ("RMR") tariffs covering operations at PSEG Fossil's Hudson 1 generating unit in 2005. The RMR tariff for the Hudson 1 unit expired effective as of December 7, 2011. Additionally, the Hudson 1 unit and its 454.8 MWs were retired when the RMR was terminated.

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract remains in effect and provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply: On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015.

3. PSEG Fossil LLC

PSEG Fossil is an Exempt Wholesale Generator ("EWG") and is authorized to sell power at market-based rates. PSEG Fossil owns and operates electric generation facilities located within PJM and sells their entire output to its affiliate PSEG ER&T.[5] The assets of PSEG Fossil are located entirely within PJM. However, PSEG Fossil's subsidiaries PSEG Power Connecticut LLC, PSEG Power New York LLC and PSEG New Haven LLC own facilities in ISO-NE and NYISO. As noted below, PSEG Fossil also co-owns certain facilities in PJM.

[5]These contracts were originally approved by the Commission as cost-based contracts. *See Public Service Electric and Gas Company*, et al., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Fossil obtained market based rate authority covering sales from its generating units.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

On December 7, 2011, PSE&G retired Hudson 1 and its 454.8 MW (and the accompanying RMR Agreement). Additionally, on June 1, 2012, PSEG Fossil energized six (6) new combustion turbines at its Kearny site in New Jersey. Four (4) units – designated "Kearny 13" - have a combined generator nameplate rating of 242 MWs. Two (2) other units – designated "Kearny 14" - have a combined generator nameplate rating of 142.3 MWs. The addition of this new peaking generation coincided with the retirement of Kearny 10 and 11 with nameplate ratings of 146.3 MWs each.

PSEG Fossil notified PJM in April 2010 that it planned to retire Kearny 9, a unit with a capacity nameplate rating of 18.6 MW, on or about March 2013. However, in November 2011, PSEG Fossil notified PJM that, although Kearny 9 would not have any capacity commitments after May 31, 2013, it would be available for energy and ancillary services. In addition, PSEG Fossil has notified PJM that it will retire the following units on the following dates:

Burlington 9 – June 1, 2014
Salem 3 – June 1, 2015[6]
Bergen 3 – June 1, 2015
Burlington 8 – June 1, 2015
National Park – June 1, 2015
Mercer 3 – June 1, 2015
Sewaren 6 – June 1, 2015
Burlington 11 – June 1, 2015
Edison 1 – 3 – June 1, 2015
Essex 10 – 12 – June 1, 2015

PSEG Fossil satisfies most of the electricity needs of its plants from PJM under PJM's "station power" Tariff provisions and receives station power for its National Park station from PSE&G under a retail tariff approved by the BPU. PSEG Fossil procures gas supply for its plants from PSEG ER&T and receives gas distribution service from PSE&G at a rate approved by the BPU on May 29, 2013.[7]

4. PSEG Power Connecticut LLC

PSEG Power CT is a Connecticut limited liability company and an EWG that owns and operates electric generation facilities in the State of Connecticut and is authorized to sell power at market-based rates.[8] Both of PSEG Power CT's generation facilities, Bridgeport Harbor and New Haven Harbor, are located in the State of Connecticut within the market administered by ISO-NE. PSEG Power CT sells the output of its generation facilities to its affiliate PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority.

---

[6] No longer available as a capacity resource in PJM though still available to supply emergency back-up generation for the Salem 1 and 2 nuclear units.
[7] BPU Docket No. GM12100935 (May 29, 2013).
[8] *Wisvest Corporation,* et al., 101 FERC ¶ 61,166 (2002).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

5. PSEG New Haven LLC

PSEG New Haven is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG New Haven owns and operates a facility (the "New Haven facility") in New Haven, Connecticut with a nameplate rating of 181 MWs. The New Haven facility is located within the New Haven Harbor generation station. The New Haven facility is interconnected to the adjacent United Illuminating East Shore Substation using a 115 KV underground cable. PSEG New Haven has no other generation assets. The commercial operation date for the New Haven facility was June 1, 2012 and PSEG New Haven has obtained MBR authority from FERC.[9]

The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[10] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[11] All of the energy and capacity of the New Haven facility is sold into the ISO New England ("ISO-NE") markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA[12] has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder. The 181 MW nameplate rating of the New Haven Facility has not been included in the capacity controlled by PSEG for purposes of Dr. Morris' market power analysis.

6. PSEG Nuclear LLC

PSEG Nuclear is an EWG[13] and is authorized to sell power at market-based rates. PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission.[14] The assets of PSEG Nuclear are located entirely within PJM. PSEG Nuclear performed an uprate of 120 MWs at its Hope Creek plant in 2009, which increased its nameplate rating to 1290 MWs.

---

[9] *PSEG New Haven LLC*, Docket No. ER12-1250-000, et al., (May 29, 2012).

[10] *Re Review of Peaking Generation Projects*, Docket No. 08-01-01, Connecticut Department of Public Utility Control, June 25, 2008 ("Awards Decisions") (2008 WL 2587405 (Conn. D.P.U.C.)). The PURA is the successor to the Department of Public Utility Control (DPUC). PURA came into being in July 2011 as part of a reorganization of Connecticut state energy agencies. For consistency, this application refers to the agency as the PURA.

[11] Section 50 of Public Act 07-242, now codified at Section 16-243u of the Connecticut General Statutes.

[12] The CFD was approved on October 29, 2010 in a letter order ruling on Motion Number 62 in Docket No. 08-01-01.

[13] *PSEG Nuclear LLC*, 97 FERC ¶ 62,191 (November 30, 2001).

[14] *Public Service Electric and Gas Company*, et al., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Nuclear obtained market based rate authority from the FERC.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

OTHER RELEVANT AFFILIATES

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities, as discussed below.

7. Affiliated Generation Ownership.

A list of the Applicants' affiliated domestic FERC jurisdictional generation assets owned is contained in Appendix B attached hereto. [15] Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the Northeast Region are described below:

PSEG Power LLC ("PSEG Power") was formed in 1999 to acquire the former generation assets of PSE&G. PSEG Power, a Delaware limited liability company, does not directly own any generation facilities or engage in any FERC jurisdictional activities but is the parent company of several FERC jurisdictional entities, including Applicants PSEG ER&T, PSEG Fossil, PSEG Nuclear, PSEG Power CT and PSEG New Haven.

PSEG Global LLC ("PSEG Global") is an indirect subsidiary of PSEG and owns an indirect interest in a domestic power plant in Hawaii.[16]

PSEG Solar Source LLC ("Solar Source") A PSEG Global subsidiary, PSEG Solar Source LLC owns a combined 29 MWs[17] of solar capacity in PJM, about 15 MWs in Florida, 37 MWs in Arizona and 3 MWs in California, all through separate project companies which have all obtained QF status.[18] By the end of 2013, all of the Solar Source facilities will be transferred to a new subsidiary of PSEG Power – PSEG Power Ventures LLC - which will be a Delaware limited liability company that will not itself be an operating company. As a result, these companies will become subsidiaries of PSEG Power rather than subsidiaries of

---

[15] Appendix B excludes generation assets located in Hawaii as well as generation assets in which PSEG's interest is limited to a leveraged lease interest.

[16] PSEG Global previously owned indirect interests in facilities in California and New Hampshire and a hydro plant in Pennsylvania. Since the last PSEG triennial market power update, PSEG Global has (i) sold its 40% interest in Bridgewater Holdings LLC (the New Hampshire facility) on May 11, 2012 (ii) shut down operations of its plants in California on February 24, 2012 and (iii) sold its interest in Pennsylvania Renewable Resource's two 7.5 MW (net) hydro facilities in May 2011.

[17] The 29MWs are attributed to three (3) separate project companies that have QF status: PSEG Solar Source Hackettstown (2 MW); PSEG Solar Source Delaware (15 MW) and PSEG Solar Source Ohio (12 MW).

[18] The 3MWs (DC) are associated with the Shasta Solar Facility in California, which began testing energy on December 20, 2013. PSEG Global is also under contract to purchase ownership of the Acacia Solar Project, which is expected to produce 20 MW DC beginning in the first quarter 2014. Both Shasta and Acacia will have QF status.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

PSEG Global. This is simply a change in upstream ownership that will not affect the operations of the facilities.[19]

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company and an EWG that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a FERC-approved cost-based contract.[20]

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution system ("T&D") on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco will be FERC jurisdictional public utilities as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[21]

8. Affiliated Transmission Ownership

With the exception of the electric transmission assets owned by Applicant PSE&G, all of which are located within the PJM RTO, and the generation interconnection facilities owned by the various EWG and QF affiliates listed herein, the Applicants do not have any affiliates that own or operate FERC jurisdictional electric or natural gas transmission facilities within the United States. As discussed below, FERC granted PSE&G a Hinshaw exemption in 1954, finding that it was exempt from the provisions of the Natural Gas Act.

---

[19] It should be noted that the Hawaii generating facility referenced above will also be transferred to PSEG Power Ventures LLC as of the end of 2013.

[20] *PSEG Power New York Inc.*, Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

[21] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), *order dismissing request for rehearing*, 145 FERC ¶ 61,183 (2013).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

B. JOINTLY OWNED FACILITIES

PSEG Nuclear is a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear is the operator of Salem and Exelon Generation is the operator of Peach Bottom.[22] PSEG Fossil is approximately a 23% joint owner in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[23] Accordingly, for purposes of this market power analysis, the capacity of Salem, Peach Bottom, Conemaugh and Keystone has been attributed to PSEG in accordance with PSEG's ownership interests in these facilities.

PSEG Fossil and Jersey Central Power and Light Company ("JCP&L") are each 50% co-owners of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity – nominally 400 MWs – has been assigned to JCP&L.[24]

III. Applicants Fully Satisfy The Commission's Standards For Authority to Make Power Sales At Market-Based Rates.

The Commission allows power sales at market-based rates if the seller and its affiliates do not have, or have adequately mitigated, horizontal and vertical market power.[25] The Commission has also codified affiliate restrictions in its regulations which must be satisfied on an ongoing basis. In previous submissions for market-based rate authority the Applicants PSE&G, PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear and PSEG New Haven demonstrated compliance with each of these requirements. As detailed herein and in the attached affidavit, the Applicants continue to meet these standards.

A. The Applicants Lack, Or Have Effectively Mitigated, Any Horizontal Market Power

In the MBR Order, the Commission established two indicative screens: a pivotal supplier screen based on the control area's annual peak demand and a wholesale market share screen applied on a seasonal basis. If an applicant passes both screens, there is a rebuttable presumption that the applicant does not possess generation market power.

---

[22] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in Appendix D. The ownership percentages have not changed since the date of this letter. PSEG Nuclear owns a 50% interest in Peach Bottom and a 57.41% interest in Salem.

[23] A letter of concurrence supporting the allocation of plant output based on ownership interest is attached in Appendix D. The ownership percentages have not changed since the date of this letter.

[24] A letter of concurrence supporting this determination is attached in Appendix D. The ownership percentages have not changed since the date of this letter.

[25] MBR Order, FERC Stats. & Regs. ¶ 31,252 at P 62, 399, 408, 440.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Each indicative screen is applied with respect to "relevant geographic markets" for an applicant's generating units.

Applicants located in ISOs/RTOs possessing sufficient market structure may consider the geographic region under the control of the ISO/RTO as the relevant default geographic region for purposes of completing their generation market power analyses.[26] However, where the Commission has previously found a "submarket" to exist within a boundary of an RTO, such finding is controlling as to the scope of the relevant geographic market for all generation units located within that submarket for the application of the indicative screens and any delivered price test that may be performed. The Commission further listed several such submarkets, including PJM East ("PJME"), Connecticut and Southwest Connecticut.[27] Subsequent to the MBR order, in approving a merger between Exelon Corporation and Constellation Energy Group, Inc., the Commission identified additional submarkets in PJM - PJM East of 5004/5005 ("PJM50") and PJM East of AP South ("PJMAP") - that would be relevant to an MBR analysis for applicants in the Northeast Region.[28]

As discussed below and in the attached Affidavit of Dr. John Morris contained in Appendix A, Applicants have conducted market power analyses of the entire PJM RTO, the PJME, PJM50 and PJMAP submarkets, the entire NYISO, the entire ISO-NE, the Connecticut submarket and the Southwest Connecticut submarket for the study period. The results are set forth below.

1. Indicative Screens

a. Pivotal Supplier Analysis

The pivotal supplier analysis ("PSA") focuses on the ability of a seller to exercise unilateral market power.[29] The screen assesses whether market demand can be met during peak times without the applicant and its affiliates. If demand can be met without the applicant and its affiliates, the applicant passes that the PSA screen. The Affidavit of Dr. John Morris, attached hereto as Appendix A, finds that the Applicants pass the PSA screen for all relevant markets: PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut, PJMAP, PJME and PJM50.[30]

---

[30] *See* Morris Affidavit, at 15-28.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

b. Wholesale Market Share Analysis

The wholesale market share analysis ("WMSA") is applied each season to determine whether an applicant has a dominant market position based on the total number of megawatts of uncommitted capacity owned or controlled by the applicant and its affiliates in relation to the uncommitted capacity of the entire relevant wholesale electricity market.[31] The established threshold is 20 percent; a supplier who has less than 20 percent market share in the relevant market for all seasons passes the WMSA screen.

In his Affidavit Dr. Morris finds that the Applicants pass the WMSA screen for PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut and PJMAP but do not pass the WMSA screen for the PJME and PJM50 submarkets.[32]

c. Results of Indicative Screen Analysis

As shown in Dr. Morris's affidavit, Applicants therefore pass both indicative screen tests for PJM RTO, NYISO, ISO-NE, Connecticut, Southwest Connecticut and PJMAP. For PJME and PJM50, the Applicants pass the PSA but do not pass the WMSA.

2. Delivered Price Test Analysis For PJME and PJM50 Submarkets

In accordance with the MBR Order, applicants who fail either indicative screen test can rebut the presumption of market power through the submission of a delivered price test analysis ("DPT"). Applicants may submit this study at the same time that the results of the indicative screens are provided.[33] The DPT is based on two measurements of potential market power: economic capacity ("EC") and available economic capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting native load commitments from EC. Both calculations are performed for twelve different seasonal and load conditions.

In applying the DPT, "[a] showing of an HHI less than 2,500 in the relevant market for all season/load conditions for sellers that have also shown that they are not pivotal and do not possess a 20 percent or greater market share in any of the season/load conditions would constitute a showing of a lack of market power, absent compelling contrary evidence from intervenors."[34] However, while meeting these threshold benchmarks provides "safe harbor" protection, the Commission has found in numerous other cases that applicants lack market power even when they exceed one or more of the thresholds for particular study periods. As stated in *Public Service Company of New Mexico*, 115 FERC ¶ 61,090, P 38 (2006), "the Commission weights the results of both

the economic and available economic capacity tests and considers the arguments of the applicant and intervenors." (footnote omitted.) [35]

a. Results of the DPT for PJM50 Submarket

With respect to AEC, PSEG passes all screens in all periods. For EC, PSEG passes the HHI Screen and market share screens for all periods but does not pass the PSA screen in 6 of 10 periods.

b. Results of the DPT for PJME Submarket

With respect to AEC, PSEG passes all screens in all periods. For EC, PSEG does not pass the PSA screen in 2 of 10 periods and has marginal Market Share screen failures in 4 of 10 periods.

3. Analysis of DPT Results

Based on his analysis of the overall results, Dr. Morris concludes that, although PSEG fails limited number of screens, the failures appear to be more in the nature of technical violations and not indicators of market power. As set forth in his Affidavit, Dr. Morris states that:

> Although PSEG fails some of the screens for EC in both the PJM50 and the PJME destination markets, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the market concentration (HHI) screens. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically

[35] Indeed, in that case, the applicant was deemed "on balance" to have adequately rebutted a showing of market power mitigation for the PNM control area where the results exceeded the 20% safe harbor in two cases under the AEC measure and in all 10 cases at values between 35% and 41% under the EC measure. *See, e.g., Kansas City Power and Light Company, et al.*, Docket Nos. ER99-1005-011 et al. (August 12, 2010) (finding no market power where applicant had EC market shares in the 40-60% range and had significant HHI failures in the KCPL and GMO markets); *Cordova Energy Company LLC et al,* Docket Nos. ER99-2156-011, *et al.*, November 13, 2007 (finding no market power in case where applicant had EC market shares in PACE control area between 53.1% and 60.0%, HHIs between 2,958 and 3,696 and was pivotal in 8 out of 10 periods.); *PacifiCorp*, Letter Order, Docket Nos. ER97-2801-007, *et al.*, February 1, 2007; *Tucson Elec. Power Co.*, 116 FERC ¶ 61,051 (2006)(finding market power standard satisfied where applicant had EC market shares above 20% in all ten season/load periods in the Tucson control area, exceeded the 2,500 HHI threshold in eight periods, and was pivotal in 5 periods); *PacifiCorp*, 115 FERC ¶ 61,349 (2006) (finding that applicants rebutted presumption of market power in the PacifiCorp East control area where under available economic capacity measure, market share is less than 20% in 8 season/load periods and 28% in the summer and winter off-peak periods, HHI does not exceed 2500 in any season/load period and applicants are not pivotal); *Kansas City Power & Light Co.*, 113 FERC ¶ 61,074 (2005) (finding no market power in the KCPL control area where applicant had EC market shares above 20% in all periods, exceeded the HHI 2,500 threshold in 5 of 10 periods and was pivotal supplier in 1 period); *Acadia Power Partners, L.P.*, 113 FERC ¶ 61,073 (2005) (finding no market power in the Cleco Power home control where, utilizing the EC measure, the applicant exceeded the thresholds set for all season/load periods using the market share measure, one season/load period using the market concentration measure, and for all season/load periods using the pivotal supplier measure).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

> substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[36] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all pivotal supplier screens for AEC. This shows that, given commitments to serve load, its generation was not necessary to serve remaining wholesale load. In other words, although PSEG fails the pivotal supplier tests for some periods with EC, once accounting for its actual forward sales commitments, PSEG's uncommitted generation is not necessary to meet total demand in any of the regions in any period. Thus, PSEG has little to no ability to exercise unilateral market power. Finally, PSEG's market shares are not above 20 percent for any of the Market Share Screens, except only four (4) periods for EC in PJM East. Although greater than 20 percent, PSEG's market shares during these four (4) periods are not substantially above 20 percent. The highest share is only 22.4 percent. Hence, although PSEG fails the Market Share Screens and the Pivotal Supplier Screens for EC in some instances, the failures are more in the nature of technical violations and not true indicators of market power.[37]

As noted above, Dr. Morris' conclusion that the limited DPT screen failures identified through his study are "in the nature of technical violations" is consistent with Commission precedent finding a lack of market power in cases in which the DPT results included more instances of findings outside of the "safe harbor" thresholds and at higher levels than exist here.[38] In these circumstances, Dr. Morris's analysis successfully rebuts any inference of market power created by the WMSA screen failures for PJME and PJM50.

4. Existing RTO/ISO Mitigation Rules Also Eliminate The Potential for Exercising Market Power In the PJME, PJME PJM50 and PJMAP Submarkets

PJM mitigation rules eliminate the potential for the exercise of market power in the PJME and PJM50 submarkets. The MBR Order specifically contemplated that RTO/ISO mitigation rules may serve as evidence that any market power has been adequately mitigated. The Commission declared, "We believe the added protections provided in structured markets with market monitoring and mitigation generally result in a market where prices are transparent and attempts to exercise of market power will be sufficiently mitigated."[39] The Order on Rehearing went even further and specifically

---

[36] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

[37] Morris Affidavit at 32-33.

[38] *See Public Service Company of New Mexico*, 115 FERC ¶ 61,090 (2006) discussed above and cases discussed in fn. 38 above.

[39] MBR Order at P 241.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

created a presumption that any potential market power had been adequately mitigated by an established and effective RTO market monitoring scheme.[40]

Taking account of the pervasive PJM mitigation rule, Dr. Morris concludes that these rules "address the potential for PSEG to exercise market power" in PJME and PJM50.[41] Accordingly, PJM's mitigation schemes in place are sufficient to rebut any inference of market power created by the failure to pass the WMSA screens in PJME and PJM50.

In addition, in the Applicants' last triennial approval order, the Commission found that "the PJM market monitoring and mitigation rules are sufficient to address market power concerns in the PJM-East submarket."[42]

a. The Applicants Lack Transmission Market Power and Cannot Erect Entry Barriers.

In its previous order accepting PSEG's triennial market power analysis for the Northeast Region, the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding vertical market power.[43] There have been no subsequent changes in status that would reflect a departure from the characteristics the Commission relied upon in granting market-based rate authority. As demonstrated below, neither Applicants nor any of its affiliates are able to exercise vertical market power.

Applicants are not able to exercise transmission market power. Neither Applicants nor any of their affiliates, except PSE&G, own transmission assets in the U.S. other than incidental generator interconnection facilities. PSE&G owns transmission facilities in PJM but transmission service over those facilities is provided under the PJM Open Access Transmission Tariff.

In addition, neither Applicants nor their affiliates are able to exercise vertical market power in wholesale energy markets through affiliation, ownership or control of inputs to electric power production. As required by Section 35.37(e) of the Commission's regulations, Applicants provide the following information:

(1) PSE&G owns and operates a natural gas distribution system that receives interstate pipeline gas within the State of New Jersey and distributes that gas to its customers within the State of New Jersey. The distribution system consists of 17,709.5 miles of gas distribution pipe and an additional 61.5 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3 and peak-

[40] Order No. 697A at P 111.
[41] Morris Affidavit, pp. 35.
[42] *See* June 29, 2011 letter order approving Applicants' prior triennial market update in Docket No. ER99-3151-017 at page 4.
[43] *Id.*

shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers. Service over such distribution facilities is made available pursuant to state regulated tariffs on an open access type basis. PSE&G was granted a Hinshaw exemption from the FERC in 1954.[44] The gas distribution rates paid by PSEG Fossil to PSE&G have been set at rates approved by the BPU in an order dated May 29, 2013.

(2) Certain of the Applicants and their affiliates own sites within the Northeast Region that would be suitable for future generating facilities. These include space at many of the existing generating sites of PSEG Fossil and at the sites of PSEG Power NY and PSEG Power CT. PSEG Nuclear's Salem facility may also be suitable for future construction. PSE&G also owns certain sites that would be suitable for generating facilities, but under New Jersey's Electric Discount and Energy Competition Act, N.J.S.A 48:3-43 et seq., PSE&G is effectively barred from owning and operating generation except "on site" generation for supply and Class I renewable energy resources as defined in N.J.S.A. 48:3-98.1.

(3) Neither Applicants nor any of their affiliates own or control any physical coal supply resources or ownership or control over who may access transportation of coal supplies.

(4) As required by section 35.37(e)(4) of the Commission's regulations, Applicants state that they have not erected barriers to entry into the PJM, NYISO or ISO-NE market and will not erect barriers to entry into those markets.

IV. REQUEST FOR CONFIDENTIAL TREATMENT

Under separate cover via UPS Overnight this office is submitting compact disks containing the workpapers of Dr. John Morris supporting his analysis in Appendix A, as required by the Commission's April 2004 Order.[45] Disk 1 (of which six copies are included) contains publicly available information. Disk 2 (of which one copy is included) contains: (i) proprietary information provided by Energy Velocity under an agreement that requires confidential treatment to be requested for these materials; (ii) modeling and computer programs that are the proprietary intellectual property of Economists Incorporated, the firm which employs Dr. Morris; (iii) commercially sensitive information about Applicants and their affiliates; and (iv) documents and information deemed to be confidential by PJM and ISO-NE. Accordingly, Applicants respectfully request confidential treatment for Disk 2 pursuant to 18 C.F.R. § 388.112 (2006), consistent with the confidential treatment accorded other applicants submitting such proprietary and commercially sensitive data.[46] Pursuant to the Commission's rules,

---

[44] 13 F.P.C. 1348 (1954).

[45] AEP II, 107 FERC at P 61,087-88.

the public version of this filing contains all materials submitted herein except for Disk 2, which is labeled as "PRIVILEGED AND CONFIDENTIAL/NON-PUBLIC."

V. SERVICE

This filing has been served on all parties on the official service list as currently maintained by Commission in the above-referenced dockets. Applicants are also providing a copy to the New Jersey Board of Public Utilities and the New Jersey Division of Rate Counsel.

VI. ENCLOSURES

Applicants enclose the following:

- An original filing;
- Appendix A – Affidavit of Dr. John R. Morris;[47]
- Appendix B – List of Entities with Market-Based Rates Authority and Their Generation Assets. (This is an appendix listing the filing entities and all their energy affiliates and their associated assets);
- Appendix C – List of Entities with Market-Based Rate Authority and Their Transmission Assets;
- Appendix D – Letters of concurrence regarding the control of certain jointly owned generation facilities;
- Appendix E – Form of notice suitable for publication in the Federal Register.

VII. CONCLUSION.

Applicants respectfully request the Commission:

i. to accept this market power compliance filing as meeting the Commission's requirements under Order No. 697 for the continuation of market-based rate authority for Applicants PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Nuclear LLC and PSEG Fossil LLC;

ii. to grant the request for confidential treatment; and

iii. to grant such other relief or waivers as may be appropriate or necessary.

[47] Compact disks, as described above, containing the workpapers for the Affidavit of John R. Morris in Appendix A are being sent concurrently with this filing via UPS Overnight. As noted *supra*, privileged treatment is being requested for Dr. Morris's confidential workpapers submitted with the non-public version of this filing.

Public Service Enterprise Group Incorporated Northeast Region Market Power Study

1. Introduction

My name is Dr. John R. Morris. I am a Principal at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Washington, DC 20037. I have a bachelor's degree in economics from Georgetown University, and I have a master's degree and a Ph.D. in economics from the University of Washington. I have been studying and consulting within energy industries since joining the Federal Trade Commission in 1985. Since joining Economists Incorporated in 1992, I have consulted on many mergers involving electric and gas companies, examined competitive issues relating to utility rates, provided market power studies for applications for market-based rate authority, and studied market power issues in state restructuring proceedings. I have published articles on competition and energy matters, and I have spoken on numerous occasions concerning competition in natural gas, electric power and other industries. I have previously been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission ("FERC" or "Commission"), state commissions and in federal court. A complete listing of my experience, publications and testimony is contained in my resume, presented in Exhibit PEG-2.

Public Service Enterprise Group Incorporated ("PSEG") asked that I prepare a market power study for its subsidiaries that have market-based rate authority in the Northeast Region.[1] These subsidiaries are: Public Service Electric and Gas

[1] The Northeast Region includes ISO-New England Inc. ("ISO-NE"), Connecticut, Southwest Connecticut, New York Independent System Operator, Inc. ("NYISO"), PJM Interconnection, L.L.C. ("PJM"), PJM East, PJM East of 5004/5005 and PJM East of AP South.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

("PSE&G"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear"), PSEG Power Connecticut LLC ("PSEG Power CT") and PSEG New Haven LLC ("PSEG New Haven"). The purpose of this study is to determine whether these PSEG entities have market power in any Northeast Region market under the Commission's Pivotal Supplier Analysis ("PSA") and Wholesale Market Share Analysis ("WMSA") screens as articulated in FERC Order No. 697 and if the Applicants do fail any of the screens, whether they otherwise lack market power under the Delivered Price Test ("DPT") or are subject to sufficient mitigation to guard against any market power concerns.[2]

PSEG

PSEG is a public utility holding company headquartered in in Newark, New Jersey. Through its subsidiaries, PSEG engages in the generation, transmission, distribution and sale of electric energy, and distribution and sale of natural gas to commercial, residential, and industrial customers primarily in the Northeastern and Mid-Atlantic United States. PSEG, through its subsidiaries, owns approximately 13,000 MW of seasonal generation capacity located in the Northeast Region.[3]

PSE&G

PSE&G is a public utility operating company engaged primarily in the transmission of electricity and the provision of gas and electric distribution service in the State of New Jersey. It is New Jersey's oldest and largest investor-owned

---

[2] *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

[3] *See* Exhibit PEG-3.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

utility. PSE&G was founded in 1903 and is based in Newark, New Jersey. It is a member of the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access Transmission Tariff ("OATT") administered by PJM. The company also owns and operates 17,709.5 miles of gas distribution pipe and an additional 61.5 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3.

PSEG ER&T

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission. PSEG ER&T also makes wholesale sales of natural gas.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.*, which initiated the transition from a regulated to a competitive retail power market in New Jersey, the New Jersey Board of Public Utilities ("BPU") annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSE&G's affiliate, PSEG ER&T, has participated directly in all of the auctions for BGS supply held since 2004 and has consistently won tranches in those auctions, including auctions for BGS service within the franchised service territory of PSE&G.

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, PSE&G's FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract, which currently remains in effect, provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply. On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015.

PSEG Fossil

PSEG Fossil owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission under the umbrella of PSEG Fossil's

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

market-based rate authority.[4] The assets of PSEG Fossil are located entirely within PJM.[5] As explained in PSEG ER&T's previous triennial submission, ER&T began providing reliability services to PJM pursuant to Reliability Must-Run ("RMR") tariffs covering operations at PSEG Fossil's Sewaren and Hudson 1 generating units in 2005. The RMR tariff for the Sewaren units expired effective as of September 1, 2008. The RMR tariff for the Hudson 1 unit expired effective as of December 7, 2011. Additionally, the Hudson 1 unit and its 454.8 MWs were retired when the RMR was terminated. Thus, the capacity attributable to Hudson 1 is not included in the subject market power analysis.

PSEG Fossil is approximately a 23 percent joint owner of interests in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[6] PSEG Fossil is a 50 percent co-owner with Jersey Central Power and Light Company ("JCP&L") of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity, nominally 400 MWs, has been assigned to JCP&L.[7]

PSEG Power CT

4 *Public Service Electric and Gas Company, et al.*, 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

5 PSEG Fossil's subsidiaries PSEG Power Connecticut LLC, PSEG New Haven LLC and PSEG Power New York LLC own generation units in Connecticut and New York respectively.

6 A letter of concurrence supporting the allocation of these facilities' output based on ownership interests is attached in our workpapers.

7 A letter of concurrence supporting the allocation of this facility's output to JCP&L is attached in our workpapers.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

PSEG Power CT owns the Bridgeport Harbor and New Haven Harbor generation facilities located in the state of Connecticut within ISO-NE and is authorized to sell power at market-based rates.[8] The output of these facilities is sold to PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority.

PSEG New Haven

PSEG New Haven owns and operates the New Haven facility, a gas-fired plant located in New Haven, CT that entered service in June 2012 with a nameplate capacity of 181.5 MW. The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[9] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[10] All of the energy and capacity of the New Haven facility is sold into the ISO-NE markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder.[11] As such, neither PSEG New Haven nor any other PSEG affiliate has operational control of

---

[8] *Wisvest Corporation, et al.*, 101 FERC ¶ 61,166 (2002).

[9] *Re Review of Peaking Generation Projects*, Docket No. 08-01-01, Connecticut Department of Public Utility Control, June 25, 2008 ("Awards Decisions") (2008 WL 2587405 (Conn. D.P.U.C.)). The PURA is the successor to the Department of Public Utility Control (DPUC). PURA came into being in July 2011 as part of a reorganization of Connecticut state energy agencies. For consistency, this application refers to the agency as the PURA.

[10] Section 50 of Public Act 07-242, now codified at Section 16-243u of the Connecticut General Statutes.

[11] The CFD was approved on October 29, 2010 in a letter order ruling on Motion Number 62 in Docket No. 08-01-01.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

the New Haven facility. As a result, the capacity of the facility is not attributable to PSEG for the purpose of this market power analysis.

PSEG Nuclear

PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission in accordance with PSEG Nuclear's market-based rate authority.[12] PSEG Nuclear is a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear operates the Salem plant and Exelon Generation is the operator of Peach Bottom.[13]

Other Subsidiaries

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities in the United States. Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the PJM region are as follows.

PSEG Power LLC is a Delaware limited liability company. It does not directly own any generation facilities or engage in any FERC jurisdictional activities but it is the parent company of several FERC jurisdictional entities, including applicants PSEG ER&T, PSEG Fossil and PSEG Nuclear.

---

[12] *Public Service Electric and Gas Company, et al.*, 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

[13] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in our workpapers.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

PSEG Global LLC ("PSEG Global") is an indirect subsidiary of PSEG and owns an indirect interest in a domestic power plant in Hawaii.[14]

PSEG Solar Source LLC ("Solar Source") is a PSEG Global subsidiary that owns a combined 29 MWs of solar capacity in the PJM region (through three separate project companies), about 15 MWs in Florida, 37 MWs in Arizona and 3 MWs in California, all through separate project companies which have all obtained QF status.[15] By the end of 2013, all of the Solar Source facilities will be transferred to a new subsidiary of PSEG Power – PSEG Power Ventures LLC - which will be a Delaware limited liability company that will not itself be an operating company. As a result, these companies will become subsidiaries of PSEG Power rather than subsidiaries of PSEG Global. This is simply a change in upstream ownership that will not affect the operations of the facilities.[16]

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. PSEG Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. PSEG Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not

---

[14] PSEG Global previously owned indirect interests in facilities in California and New Hampshire and a hydro plant in Pennsylvania. Since the last PSEG triennial market power update, PSEG Global has (i) sold its 40 percent interest in Bridgewater Holdings LLC (the New Hampshire facility) on May 11, 2012 (ii) shut down operations of its plants in California on February 24, 2012 and (iii) sold its interest in Pennsylvania Renewable Resource's two 7.5 MW (net) hydro facilities in May 2011..

[15] The 3MWs (DC) are associated with the Shasta Solar Facility in California, which began testing energy on December 20, 2013. PSEG Global is also under contract to purchase ownership of the Acacia Solar Project, which is expected to produce 20 MW DC beginning in the first quarter 2014. Both Shasta and Acacia will have QF status.

[16] It should be noted that the Hawaii generating facility referenced above will also be transferred to PSEG Power Ventures LLC as of the end of 2013.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a cost-based contract.[17]

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution ("T&D") system on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco are FERC jurisdictional public utilities, as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[18]

When an applicant has affiliates in the relevant market, the Commission considers the combined capacity of all the affiliated entities in its market power assessment.[19] Accordingly, I have included the capacity controlled by PSE&G,

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear, PSEG Global subsidiaries and PSEG Power New York (which on a combined basis constitutes the capacity of all of PSEG's affiliates). Future references in this Affidavit to PSEG are inclusive of the foregoing entities.

The primary purpose of this study is to determine whether PSEG passes the PSA and WMSA screen thresholds in ISO-NE, the NYISO and PJM. In the PSA, the Commission requires applicants to examine whether the generation owned by the applicant is necessary to serve wholesale demand within a balancing authority area. The applicant first calculates the total generation capacity for an area. This is the total of generation in the balancing authority area plus the import capability to the area.[20] From this total, the applicant subtracts out firm contractual commitments, native load obligations, and operating reserves, giving uncommitted capacity for the area. Net uncommitted capacity is calculated by subtracting a wholesale load proxy from uncommitted capacity. Net uncommitted capacity is then compared to the applicant's uncommitted capacity within the area. When the applicant's uncommitted capacity is less than the net uncommitted capacity for the area, then all wholesale demand could be served without energy from the applicant and the applicant passes the PSA screen. When the applicant's uncommitted capacity is greater than the net uncommitted capacity, then the applicant does not pass the screen because its capacity is necessary to meet wholesale peak loads in the market.

In the WMSA, the Commission requires applicants to examine whether the generation owned by the applicant is 20 percent or more of the uncommitted capacity in each of four seasons under average daily peak conditions for the

[20] Import capability is the lesser of either the simultaneous import limit ("SIL") into the area or available capacity in interconnected balancing authority areas. Available capacity is equal to total generation capacity in an area less outages and derating, a native load proxy and operating reserves.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

season. The applicant first calculates the total generation capacity for an area. The applicant then adds the import capability to the area. From this total, the applicant subtracts out planned outages and deratings, long-term firm contractual commitments, native load obligations, and operating reserves. The sum gives the total uncommitted capacity. The applicant then calculates its share by dividing its uncommitted capacity by the total uncommitted capacity. When the applicant's share is less than 20 percent, the applicant passes the WMSA screen.

The Commission presumes that an applicant does not have market power when it passes both the PSA and WMSA screens. If the applicant fails either of the screens, then the applicant may present other analyses to demonstrate that it does not possess market power. Alternatively, the applicant may propose mitigation measures or accept the Commission's default mitigation measures to demonstrate that it has mitigated market power.

2. New England

2.1. Overview of Electric Power Markets in New England

New England operates a competitive wholesale power market. Substantial restructuring has taken place in New England, and many of the vertically integrated utilities have sold either most or all of their generation assets. The traditional utilities often have standard offer obligations to serve retail customers, but utilities often fulfill these obligations by securing supplies in competitive wholesale markets. For example, a utility may secure contracts in which the supplier agrees to provide power for 30 percent of the utility's standard offer obligation. The transmission system is managed by ISO-NE. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

2.2. Geographic Markets

In the case of generation wholly located in an RTO, such as ISO-NE, the Commission accepts the RTO as the relevant destination market.[21] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[22] In New England, the Commission has identified two submarkets: Connecticut and Southwest Connecticut.[23] PSEG owns the Bridgeport Harbor plant in Southwest Connecticut. PSEG also owns the New Haven Harbor 1 unit in Connecticut and PSEG New Haven owns the New Haven facility. When the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[24] Accordingly, the PSA and WMSA are provided for the ISO-NE balancing authority area, and also for Connecticut and Southwest Connecticut.

2.3. Data Sources and Analysis

The data source for generation is ISO-NE Seasonal Claimed Capability (SCC) Reports.[25] Generation for December 2011, January-March 2012 and August 2012 are directly from these monthly reports, and the minimum of the values of these months is taken as generation for other months, to be conservative. Planned outages are from the ISO-NE Form 714. Planned outages for Connecticut and Southwest Connecticut are prorated based on their shares of the total generation capacity in ISO-NE. PSEG's generation capacity in

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

ISO-NE consists of the New Haven facility, New Haven Harbor and Bridgeport Harbor. PSEG's Northeast Region generation facilities are presented in Exhibit PEG-3.

Load data for ISO-NE are from Energy Velocity. Energy Velocity also provides load data by New England ISO zone, thus loads are calculated by sub-market as well. PSEG load obligations in New England come from PSEG's agreements to supply standard offer generation within Rhode Island. The data were supplied by PSEG.

Import capability was taken from the ISO-NE's November 20, 2013 FERC filing.[26] This report indicates that the simultaneous transfer limits in all seasons is 4,548 MW for the ISO-NE as a whole, 2,500 MW for Connecticut, and 2,450 (Winter) to 3,200 MW (Summer) for Southwest Connecticut. The Table 1 and Table 2 data for the SILs are presented in workpapers.

Operating reserves are calculated as follows. ISO-NE Operating Procedure No. 8 specifies spinning reserves (or 10-minute reserves) equal to the size of the loss of the largest unit.[27] The largest unit is the 1,400 MW (summer capacity) Seabrook Unit 1. In addition, 30-minute reserves require capacity to cover 50 percent of the loss of a second contingency (i.e., the second largest unit). The second largest unit is the 1,200 MW (summer capacity) Millstone Unit 3. Thus, in total, operating reserves are 2,000 MW in summer.[28] Operating reserves for

---

[26] ISO New England Inc. Simultaneous Import Limit, *Guidance on Simultaneous Transmission Import Limit Studies*; Docket No. AD10-02-002, November 20, 2012.

[27] ISO New England Operating Procedure No. 8, at 5-6, available at http://www.iso-ne.com/rules_proceds/operating/isone/op8/op8_rto_final.pdf.

[28] 2,000 MW = 1,400 MW + 50% x 1,200 MW.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Connecticut and Southwest Connecticut are based on resources offered for the summer 2012 and winter 2012/2013 forward reserve auction.[29]

2.4. PSA-Entire New England

Exhibit PEG-4 shows the calculations to determine whether PSEG passes the PSA screen in the ISO-NE balancing authority area. The peak load in 2012 occurred in July. The ISO-NE balancing authority area had 31,969 MW of generation capability in the summer of 2012. In addition, 4,548 MW of imports in summer of 2012 were available to serve load. Therefore there were 36,517 MW of total generation resources. Of this amount, 30,993 MW of the generation, and 4,260 MW of the imports are from non-affiliate sources. Thus, total non-affiliate generation resources are 35,274 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for ISO-NE were calculated to be 20,917 MW. Operating reserves were 2,000 MW. Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 13,600 MW.

The proxy for the wholesale load is the difference between the peak load of 25,880 MW and the native load proxy of 20,917 MW. Therefore, the proxy for the wholesale load is 4,963 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 8,637 MW.

In comparison, PSEG has 955 MW of uncommitted capacity from its generation assets. Additionally, PSEG has 288 MW of imports from its generation assets. After subtracting 314 MW of load and 61 MW of reserves, PSEG has a total of 868 MW of uncommitted capacity. This leaves other

[29] ISO New England, Inc. 2012 Regional System Plan ("Regional System Plan"), available at http://www.iso-ne.com/trans/rsp/2012/, Table 4.9 at p.56.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

generation companies with 7,769 MW of net uncommitted supply. Accordingly, as Exhibit PEG-4 shows, PSEG passes the PSA screen in New England.

2.5. WMSA-Entire New England ISO

Exhibit PEG-5 presents the WMSA. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 816 MW in fall to 890 MW in summer. PSEG's share of uncommitted capacity ranges from 4.5 percent in winter to 5.6 percent in summer. These shares are substantially below the 20 percent screening threshold adopted by the Commission. Therefore, PSEG passes the WMSA screen in this area.

2.6. PSA-Connecticut

Exhibit PEG-6 shows the calculations to determine whether PSEG passes the PSA screen in the Connecticut area. The peak load in 2012 in the Connecticut area occurred in July. The Connecticut area had 7,979 MW of generation capability in the summer of 2012. In addition, 2,500 MW of imports in summer of 2012 were available to serve load. Therefore there were 10,479 MW of total generation resources. Of this amount, 7,013 MW of the generation, and 2,444 MW of the imports are from non-affiliate sources. Thus, total non-affiliate generation resources are 9,457 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for the Connecticut area were calculated to be 5,425 MW. Operating reserves were 765 MW.[30] Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 4,289 MW.

---

[30] *See* ISO New England Inc., 2012 Regional System Plan, November 2, 2012, Table 4-9 at 56.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

The proxy for the wholesale load is the difference between the peak load of 6,957 MW and the native load proxy of 5,425 MW. Therefore, the proxy for the wholesale load is 1,532 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 2,757 MW.

In comparison, PSEG has 872 MW of uncommitted capacity from its generation assets. Additionally, PSEG has 56 MW of imports for a total of 928 MW of uncommitted capacity. This leaves other generation companies with 1,829 MW of net uncommitted supply. Accordingly, as Exhibit PEG-6 shows, PSEG passes the PSA screen in the Connecticut area.

2.7. WMSA-Connecticut

Exhibit PEG-7 presents the WMSA. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 810 MW in fall to 918 MW in summer. PSEG's share of uncommitted capacity ranges from 15.8 percent in spring to 18.5 percent in summer. These shares are below the 20 percent screening threshold adopted by the Commission. Therefore, PSEG passes the WMSA screen in the Connecticut area.

2.8. PSA-Southwest Connecticut

Exhibit PEG-8 shows the calculations to determine whether PSEG passes the PSA screen in the Southwest Connecticut area. The peak load in 2012 occurred in July. The Southwest Connecticut area had 2,798 MW of generation capability in the summer of 2012. In addition, 3,200 MW of imports in summer of 2012 were available to serve load. Therefore there were 5,998 MW of total generation resources. Of this amount, 2,270 MW of the generation, and 3,100 MW of the imports are from non-affiliate sources. Thus, total non-affiliate

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

generation resources are 5,370 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for Southwest Connecticut were calculated to be 2,687 MW. Operating reserves were 0 MW.[31] Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 3,311 MW. The proxy for the wholesale load is the difference between the peak load of 3,419 MW and the native load proxy of 2,687 MW. Therefore, the proxy for the wholesale load is 732 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 2,579 MW.

In comparison, PSEG has 528 MW of uncommitted capacity from its generation assets. Additionally, PSEG has 100 MW of imports for a total of 628 MW of uncommitted capacity. This leaves other generation companies with 1,951 MW of net uncommitted supply. Accordingly, as Exhibit PEG-8 shows, PSEG passes the PSA screen in the Southwest Connecticut area.

2.9. WMSA-Southwest Connecticut

Exhibit PEG-9 presents the WMSA. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the Southwest Connecticut area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 545 MW in fall to 616 MW in summer. PSEG's share of uncommitted capacity ranges from 15.3 percent in spring to 17.0 percent in winter. These shares are below the 20 percent screening threshold adopted by the Commission in for all seasons. Therefore, PSEG passes the WMSA screen in the Southwest Connecticut area.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

3. New York

3.1. Overview of Electric Power Markets in New York

New York also has a competitive wholesale power market. Substantial restructuring has taken place in New York, and the investor-owned vertically integrated utilities have sold either most or all of their generation assets. These utilities often have standard offer obligations to serve retail customers, and utilities can fulfill these obligations by securing supplies in competitive wholesale markets. The transmission system is operated by the NYISO, which also operates a competitive wholesale market. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

3.2. Geographic Markets

In the case of generation wholly located in an RTO such as the New York ISO, the Commission has accepted the RTO as the relevant destination market.[32] PSEG only owns generation in Albany, New York. In addition, when the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[33] Accordingly, the PSA and WMSA are provided for the NYISO only.

3.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Operations database. Planned outages are from the FERC Form 714. PSEG's

---

[32] Order No. 697 at PP 231, 235.

[33] Order No. 697 at footnotes 215, 217.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

generation capacity in New York consists of its ownership of the Bethlehem Energy Center in Albany, which has winter capacity of 845 MW. Information for PSEG's Northeast Region generation is presented in Exhibit PEG-3.

Load data for the NYISO were downloaded from Energy Velocity.

Import capability comes from the most recent NYISO SIL filing as of December 19, 2013.[34] This filing indicates that ISO simultaneous import capability ranges from 7,360 MW in spring to 8,130 MW in fall. NYISO does not recognize physical imports, accordingly, all the SIL import capability is allocated pro rata, except for a 250 MW reservation that PSEG has from PJM to New York. The Table 1 and Table 2 SIL data in the study is presented in workpapers.

Operating reserves are calculated as follows. The NYISO Locational Reserve Requirements specify 30-minute total reserves equal to one and one half the 10-minute reserve necessary to replace the operating capability loss caused by the most severe contingency under normal transfer conditions. Thus, the operating reserves for the NYISO are 1,965 MW for each season.[35]

3.4. PSA-NYISO

Exhibit PEG-10 shows the calculations to determine whether PSEG passes the PSA screen in the NYISO balancing authority area. The peak load in 2012 occurred in July. The NYISO had 38,493 MW of generation capability in the summer of 2012. In addition, 7,820 MW of imports in summer were available to serve load. Therefore, there were 46,313 MW of total generation resources. Of this amount, 37,739 MW of the generation, and 6,465 MW of the imports are from

---

[34] New York Independent System Operator, Inc., *Informational Filing Regarding the Simultaneous Import Limitation Study*, Docket No. AD10-2-001, December 19, 2013.

[35] NYISO Locational Reserve Requirements, Table 2, available at http://www.nyiso.com/public/webdocs/market_data/reports_info/nyiso_locational_reserve_reqmts.pdf

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

non-affiliate sources. Thus, total non-affiliate generation resources are 44,204 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for NYISO were calculated to be 27,324 MW. Operating reserves were 1,965 MW. Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 17,024 MW. The proxy for the wholesale load is the difference between the peak load of 32,439 MW and the native load proxy of 27,324 MW. Therefore, the proxy for the wholesale load is 5,116 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 11,909 MW.

In comparison, PSEG has 716 MW of uncommitted capacity from its generation assets in New York, and 1,355 MW of imports for a total of 2,071 MW of uncommitted capacity. This leaves other generation companies with 9,838 MW of net uncommitted supply. Accordingly, as Exhibit PEG-10 shows, PSEG passes the PSA screen in the New York ISO.

3.5. WMSA-NYISO

Exhibit PEG-11 presents the WMSA for the NYISO. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 1,264 MW in spring to 1,381 MW in summer. PSEG's share of uncommitted capacity ranges from 5.9 percent in winter to 7.2 percent in summer. These shares are below the 20 percent screening threshold adopted by the Commission. Therefore, PSEG passes the WMSA screen in the NYISO.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

4. PJM

4.1. Overview of Electric Power Markets in PJM

PJM operates a competitive wholesale power market and serves as the regional RTO for an area that covers all or parts of 13 states and the District of Columbia. PJM also plans and operates the transmission system within the RTO. Monitoring Analytics acts as the market monitor, and has a market power mitigation program in place to identify and mitigate any potential exercise of market power.

4.2. Geographic Markets

PSEG owns both generation and transmission facilities in PJM. In the case of generation wholly located in an RTO such as PJM, the Commission has accepted the RTO as the relevant destination market.[36] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[37] In PJM, the Commission has identified three submarkets: PJM East ("PJME"), PJM East of 5004/5005 ("PJM50") and PJM East of AP-South ("PJMAP").[38] The PSA and WMSA are provided for PJM and for the PJME, PJM50 and PJMAP sub-markets.

4.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Ops database. Generation within PJM was assigned to submarket consistent with the

---

[36] Order No. 697 at PP 231, 235.

[37] Order No. 697 at P 236.

[38] *Id. 20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

definitions in PJM's SIL Study.[39] Planned outages are from the FERC Form 714. In addition, for the sub-market analysis, planned outages were allocated to PJME based on the share of total PJME generation, by season. Information for PSEG's generation in PJM and PJME is presented in Exhibit PEG-3.

Load data for PJM was downloaded from Energy Velocity. Energy Velocity also provides load data by PJM zone, thus loads are calculated for the PJM sub-markets as well.

Import capability was taken from the 2012 Simultaneous Import Limit Study Report.[40] This report indicates simultaneous transfer limits of 10,194 MW in the winter and 8,434 MW in summer. Additionally, this report indicates transmission capabilities of the PJM sub-markets. The report conservatively uses the reported SIL as the SIL amount to be allocated pro rata. This is a simplifying assumption because PSEG has no firm transmission reservations into PJM and it effectively excludes the additional 4,000 MW of net imports into PJM in the base case of the SIL study. The Table 1 and Table 2 data for the study are presented in workpapers.

Operating reserves are calculated according to PJM Manual 13 as the sum of Day Ahead Scheduling Reserves (Operating), Contingency (Primary) and Synchronized (Spinning Reserve) Requirements.[41]

Data on PSEG's long-term contracts come from PSEG. The contracts were included in the area where the energy is delivered under the contract. For

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

contracts delivered to the Western Hub in PJM, the contracts were included in the PJM, PJM50, and PJMAP destinations and not the PJME destination.

4.4. PSA – PJM

Exhibit PEG-12 shows the calculations to determine whether PSEG passes the PSA screen in the PJM balancing authority area. The peak load in 2012 occurred in July. PJM had 193,478 MW of generation capability in the summer of 2012. In addition, 8,434 MW of imports in summer were available to serve load. Therefore, there were 201,912 MW of total generation resources. Of this amount, 182,128 MW of the generation, and 8,310 MW of the imports are from non-affiliate sources. Thus, total non-affiliate generation resources are 192,545 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for PJM were calculated to be 133,565 MW. Operating reserves were 12,510 MW. Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 55,837 MW. The proxy for the wholesale load is the difference between the peak load of 154,339 MW and the native load proxy of 133,565 MW. Therefore, the proxy for the wholesale load is 20,774 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 35,063 MW.

In comparison, PSEG has 5,362 MW of uncommitted capacity from its generation assets in PJM, and 124 MW of imports, for a total of 5,486 MW of uncommitted capacity. This leaves other generation companies with 29,577 MW of net uncommitted supply. Accordingly, as Exhibit PEG-12 shows, PSEG passes the PSA screen in PJM as a whole.

4.5. WMSA – Entire PJM

Exhibit PEG-13 presents the WMSA for PJM. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total,

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 5,393 MW in spring to 6,118 MW in summer. PSEG's share of uncommitted capacity ranges from 4.7 percent in winter to 5.5 percent in summer. These shares are below the 20 percent screening threshold adopted by the Commission. Therefore, PSEG passes the WMSA screen in PJM as a whole.

4.6. PSA – PJME Sub-market

Exhibit PEG-14 shows the calculations to determine whether PSEG passes the PSA screen in the PJME sub-market of PJM's balancing authority area. The peak load in 2012 occurred in July. The PJME sub-market area had 34,847 MW of generation capability in the summer of 2012. In addition, 6,993 MW of imports in summer were available to serve load. Therefore, there were 41,840 MW of total generation resources. Of this amount, 25,407 MW of the generation, and 6,883 MW of the imports are from non-affiliate sources. Thus, total non-affiliate generation resources are 32,277 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for the PJME sub-market were calculated to be 26,061 MW. Operating reserves were 2,551 MW. Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 13,229 MW. The proxy for the wholesale load is the difference between the peak load of 32,542 MW and the native load proxy of 26,061 MW. Therefore, the proxy for the wholesale load is 6,481 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 6,747 MW.

In comparison, PSEG has 5,695 MW of uncommitted capacity from its generation assets in PJME and 110 MW of imports, for a total of 5,805 MW of uncommitted capacity. This leaves other generation companies with 942 MW of net uncommitted supply. Accordingly, as Exhibit PEG-14 shows, PSEG passes the PSA screen in PJME.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

4.7. WMSA – PJME Sub-market

Exhibit PEG-15 presents the WMSA for the PJME sub-market. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 5,886 MW in spring to 6,546 MW in fall. PSEG's share of uncommitted capacity ranges from 27.1 percent in winter to 37.2 percent in summer. These shares are above the 20 percent screening threshold adopted by the Commission. Therefore, PSEG fails the WMSA screen in the PJME sub-market.

4.8. PSA – PJM East of 5004/5005 Sub-market

Exhibit PEG-16 shows the calculations to determine whether PSEG passes the PSA screen in the PJM50 sub-market of PJM's balancing authority area. The peak load in 2012 occurred in July. The PJM50 sub-market area had 59,995 MW of generation capability in the summer of 2012. In addition, 7,956 MW of imports in summer were available to serve load. Therefore, there were 67,951 MW of total generation resources. Of this amount, 49,433 MW of the generation, and 7,870 MW of the imports are from non-affiliate sources. Thus, total non-affiliate generation resources are 59,410 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for the PJM50 sub-market were calculated to be 46,146 MW. Operating reserves were 4,400 MW. Subtracting native load obligations and operating reserves from total generation resources gives uncommitted supply of 17,404 MW. The proxy for the wholesale load is the difference between the peak load of 56,172 MW and the native load proxy of 46,146 MW. Therefore, the proxy for the wholesale load is 10,025 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 7,379 MW.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

In comparison, PSEG has 4,988 MW of uncommitted capacity from its generation assets in PJM50 and 86 MW of imports, for a total of 5,074 MW of uncommitted capacity. This leaves other generation companies with 2,305 MW of net uncommitted supply. Accordingly, as Exhibit PEG-10 shows, PSEG passes the PSA screen in PJM50.

4.9. WMSA – PJM East of 5004/5005 Sub-market

Exhibit PEG-17 presents the WMSA for the PJM50 sub-market. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 4,882 MW in spring to 5,709 MW in summer. PSEG's share of uncommitted capacity ranges from 16.5 percent in winter to 23.8 percent in summer. The summer share is above the 20 percent screening threshold adopted by the Commission. Therefore, PSEG fails the WMSA screen in the PJM50 sub-market.

4.10. PSA – PJM East of AP South Sub-market

Exhibit PEG-18 shows the calculations to determine whether PSEG passes the PSA screen in the PJMAP sub-market of PJM's balancing authority area. The peak load in 2012 occurred in July. The PJMAP sub-market area had 82,198 MW of generation capability in the summer of 2012. In addition, 7,489 MW of imports in summer were available to serve load. Therefore, there were 89,687 MW of total generation resources. Of this amount, 73,743 MW of the generation, and 7,393 MW of the imports are from non-affiliate sources. Thus, total non-affiliate generation resources are 81,136 MW. From the total generation resources, it is necessary to subtract native load obligations and operating reserves. Native load obligations for the PJMAP sub-market were calculated to be 62,753 MW. Operating reserves were 5,911 MW. Subtracting native load obligations and operating reserves from total generation resources gives

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

uncommitted supply of 21,023 MW. The proxy for the wholesale load is the difference between the peak load of 75,082 MW and the native load proxy of 62,753 MW. Therefore, the proxy for the wholesale load is 12,329 MW. Subtracting the wholesale load from total uncommitted supply gives net uncommitted supply of 8,694 MW.

In comparison, PSEG has 4,988 MW of uncommitted capacity from its generation assets in PJMAP and 96 MW of imports, for a total of 5,084 MW of uncommitted capacity. This leaves other generation companies with 3,610 MW of net uncommitted supply. Accordingly, as Exhibit PEG-18 shows, PSEG passes the PSA screen in PJMAP.

4.11. WMSA – PJM East of AP South Sub-market

Exhibit PEG-19 presents the WMSA for the PJMAP sub-market. Similar to the PSA calculation for uncommitted capacity, total generation resources equal the sum of the generation in the balancing authority area and available imports. From this total, planned outage and derating, native load obligations, and operating reserves are subtracted to give uncommitted capacity. PSEG's uncommitted supply ranges from 4,876 MW in spring to 5,718 MW in summer. PSEG's share of uncommitted capacity ranges from 14.0 percent in winter to 19.0 percent in summer.

These shares are below the 20 percent screening threshold adopted by the Commission. Therefore, PSEG passes the WMSA screen in the PJMAP sub-market.

5. Delivered Price Test

When an applicant does not pass either the PSA or WMSA for a destination market, the Commission invites the applicant to provide additional information via a delivered price test ("DPT"). PSEG requested that I perform a DPT for the PJM

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

East and PJM East of 5004/5005 sub-markets. Accordingly, I now discuss the DPT for these sub-markets.

5.1. Overview of the DPT

The DPT utilizes substantially more information than the PSA or the WMSA, including additional information on generation ownership, generation costs, demand conditions, and transmission limits. The Commission considers two types of capacity: Economic Capacity ("EC") and Available Economic Capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting load commitments from EC. EC and AEC are calculated for a number of different seasonal and load conditions.

Because we do not know the firm retail obligations of the competitive suppliers, as explained below, the AEC calculation is based on the assumption that market participants serve load in proportion to their generation capacity and that 70 percent of load obligations are contracted more than one year from delivery.

For both the EC and AEC measures, the Commission prescribes three screens: (1) a pivotal supplier screen; (2) a market share screen; and (3) a Herfindahl-Hirschman Index ("HHI") screen. The HHI is the sum of the squared market shares of the firms in the market. So a market with four firms of market shares of 40, 30, 20, and 10 percent would have an HHI of 3,000 (this is calculated as $40^2 + 30^2 + 20^2 + 10^2 = 1{,}600 + 900 + 400 + 100 = 3{,}000$). A monopolist would produce a HHI of 10,000 and 10 equally-sized firms would produce a HHI of 1,000.

Although the Commission has not drawn bright lines for its review of DPT results, it has given general guidance. When (1) the applicant is not pivotal; (2) the applicants' market share is less than 20 percent; and (3) the HHI is below 2,500, the Commission is likely to conclude that the applicant does not have

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

market power. The three standards establish a "safe harbor" for lack of market power, unless intervenors present clear and convincing contrary evidence. The Commission has also determined in some cases that an applicant did not have market power when the analysis showed isolated HHI and market share results above screening levels. Finally, despite the DPT results, the Commission may conclude that an applicant does not have market power if other evidence, such as historical sales data, indicates that the DPT results do not reflect the actual competition in the marketplace.

A detailed description of data sources and methods to prepare the data for the DPT is presented in Exhibit PEG-20. An overview of the sources and methods used at Economists Incorporated for conducting the DPT is presented here.

The DPT is calculated for 10 representative periods, three for each of three seasonal conditions plus a summer super peak period. The three seasons are spring/fall, summer, and winter. Each season is divided into (1) top 10 percent of peak hours; (2) remaining peak hours; and (3) off-peak hours. In addition, there is a summer super peak period which is comprised to the top 1 percent (10 hours) of summer peak hours. These ten periods cover the range of load conditions for each season, and for the year as a whole.

The primary source for generation data is Energy Velocity. In addition to generation capacity, Energy Velocity provides data on ownership (including holding companies), fully-loaded heat rates, emission rates, and generation availability. Generation is included for all of PJM and for surrounding areas. Unit capabilities are derated to account for seasonal maintenance and likely plant unavailability due to forced outages. Because demand in PJM peaks in summer and winter, the planned outages are assumed to be during the spring/fall season.

The transmission system is represented by contract paths between balancing authority areas and within PJM. Limits between regions in PJM are from Energy Velocity.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Market prices come from hourly prices reported by PJM.

As in the PSA and WMSA, load data come from Energy Velocity. To compute load requirements for market participants, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[42] To account for their greater load obligations, we assume that Dominion, which does not operate in a restructured retail market, has 100 percent responsibility for its allocation of load and that AEP, which operates in a partly restructured retail market, has 90 percent of its allocation as opposed to the standard 70 percent.

The DPT and market share calculations were calculated using the Power Acquisition Screening System developed at Economists Incorporated. The mathematical details are presented in Exhibit PEG-21.

5.2. Results of the DPT for PJM50 Sub-market

The results of the DPT for PJM50 are presented in Exhibit PEG-22. The top part of the exhibit shows the results for AEC. PSEG passes the Pivotal Supplier Screen in all 10 periods. PSEG also passes both the Market Share Screens and the HHI Screens in all 10 periods.

The lower part of Exhibit PEG-22 shows the results for EC in PJM50. PSEG passes the Pivotal Supplier Screen in 4 out of 10 periods. PSEG passes the Market Share Screens and HHI Screens in all 10 periods.

[42] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers in restructured markets.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

5.3. Results of the DPT for PJME Sub-market

The results of the DPT for PJME are presented in Exhibit PEG-23. The top part of the exhibit shows the results for AEC. PSEG passes the Pivotal Supplier Screen in all 10 periods. It also passes the Market Share Screens and the HHI Screens in all 10 periods.

The lower part of Exhibit PEG-23 shows the results for EC in PJME. PSEG passes the Pivotal Supplier Screen in 8 out of 10 periods. PSEG passes the Market Share Screens in 6 periods, and passes the HHI Screens in all 10 periods.

5.4. Analysis of the DPT Results

Although PSEG fails some of the screens for EC in both the PJM50 and the PJME destination markets, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the market concentration (HHI) screens. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[43] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all pivotal supplier screens for AEC. This shows that, given commitments to serve load, its generation was not necessary to serve remaining wholesale load. In other words, although PSEG fails the pivotal supplier tests for some periods with EC, once accounting for its expected forward sales commitments, PSEG's uncommitted generation is not necessary to meet total demand in any of the regions in any period. Thus, PSEG has little to no

[43] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

ability to exercise unilateral market power given current market conditions. Finally, PSEG's market shares are not above 20 percent for any of the Market Share Screens, except in only four (4) periods for EC in PJM East. Although greater than 20 percent, PSEG's market shares during these four (4) periods are not substantially above 20 percent. The highest share is only 22.4 percent. Hence, although PSEG fails the Market Share Screens and the Pivotal Supplier Screens for EC in some instances, the failures are more in the nature of technical violations and not true indicators of market power.

5.5. Mitigation

PJM has a Commission-approved market monitoring and mitigation plan in place to ensure that generation facilities cannot exercise market power. The Commission has stated in general that Commission-approved market monitoring and mitigation plans are sufficient to mitigate market power in RTO markets.[44] In particular, the Commission found in connection with PSEG's last triennial filing that the PJM market monitoring and mitigation rules are sufficient to address market power concerns.[45]

Under the local market power mitigation procedures in PJM, if a supplier fails the "three pivotal supplier test" (TPS), it is offer-capped by the Market Monitor. The Market Monitor's TPS test is applied on an ongoing basis, potentially as frequently as every 5 minutes, to reflect day-ahead and real-time operating conditions. These offer caps provide direct protection against the exercise of locational market power by suppliers in PJME, PJM50, PJMAP and elsewhere.

---

[44] Order No. 697 at P 241.

[45] *PSEG Energy Resources and Trade*, Docket Nos. ER99-3151-017, et al. (June 29, 2011).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

The protection against the exercise of market power is enhanced by "must offer" requirements under PJM's Operating Agreement. These mandate that generation resources that are used to meet capacity requirements in PJM and that are not subject to an outage must offer their available capacity in PJM's day-ahead energy market.[46] PJM has also implemented a Reliability Pricing Model (RPM) to secure sufficient capacity to meet its requirements through a series of auctions, including a Base Residual Auction (BRA) held annually for capacity 3 years in advance, and incremental auctions held at varying intervals prior to the delivery year. Various features of the RPM process work to prevent the exercise of market power in capacity markets in PJM. First, if PJM's Market Monitor determines that the market structure test is failed, bids of those failing the test are cost-capped. Second, RPM includes a must-offer requirement pursuant to which all generating units that have available capacity must bid into the RPM auctions or face disqualification from being recognized as capacity resources (and therefore from receiving any capacity payments) in the delivery year.

In addition to the local market power mitigation described above, the presence of market monitoring within PJM lessens potential concerns that PSEG might be able to exercise market power notwithstanding the indicative DPT screens. The Market Monitor has the specific responsibility under the market monitoring plan to monitor the potential of any market participant to exercise market power. To perform its market monitoring function, the Market Monitor can file reports or complaints with the Commission and other government agencies to address various market concerns including market power. The Market Monitor can also make its view known to the Commission staff and PJM members in cases where PJM does not follow its recommendations concerning complaints or requested rule changes. In addition, the Market Monitor can consult with regulatory bodies, including state commissions, regarding the need for specific

[46] *See* PJM Operating Agreement at 1.10.1A(d).

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

investigations and monitoring activities, and to consider and evaluate additional enforcement mechanisms. The Market Monitor can also act on specific complaints that have been filed by market participants to examine any potential market power issues.

In sum, the local market power mitigation rules, the role of the Market Monitor, the existence of must-offer requirements and PJM's RPM auctions address any potential for PSEG to exercise market power.

6. Vertical Market Power

In determining whether the market-based rates are in the public interest, the Commission also considers whether the Applicant has transmission market power or can erect barriers to entry.[47] None of these factors are relevant in the instant case. First, other than incidental generator interconnection facilities and the transmission assets owned by PSE&G in PJM, no transmission assets are owned by the Applicants or any of their affiliates in ISO-NE and NYISO. Transmission service over PSE&G's transmission facilities is provided under the PJM Open Access Transmission Tariff. Thus, consistent with Commission precedent, Applicants have alleviated any concerns regarding potential transmission market power. Second, PSEG has no ability to erect barriers to entry. As explained in Applicants' previous initial applications for market-based rate authority and triennial market power reports, PSEG is unable to erect barriers to entry. There has been no change in facts since the submission of those applications that would alter this conclusion.

The Commission is concerned with the ownership of natural gas pipelines or natural gas distribution facilities and the possibility that they may be used to

[47] Order No. 697 at PP 397, 399.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

exercise market power in electricity markets. PSEG does not own or operate any FERC jurisdictional natural gas pipelines in PJM, ISO-NE or NYISO. PSE&G owns natural gas distribution facilities in the State of New Jersey including peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers.

7. Conclusion

PSEG and its subsidiaries do not have market power in New England, New York or PJM. PSEG is not a pivotal supplier in New England, New York or PJM. PSEG's market shares in the WMSA are below the Commission's 20 percent screening threshold in each of these market areas. PSEG is also not a pivotal supplier in the Connecticut or Southwest Connecticut sub-markets and its market shares in the WMSA are below 20 percent in these sub-markets. PSEG fails the WMSA screens in only the PJME and PJM50 sub-markets. For these sub-markets, we conducted a DPT analysis. PSEG passes all the DPT screens for AEC in both submarkets, and it fails the Market Share Screens and the Pivotal Supplier Screens in only a few instances for EC. Accordingly, the market share screen failures are more of a technical nature than true indicators of market power. As such, they are not evidence of actual market power.

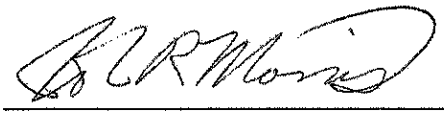
Further, PSEG operates under New England's, New York's, and PJM's market power mitigation programs, which mitigate PSEG's potential market power. Therefore, under standards for market-based rate authority articulated by the Commission in Order No. 697, PSEG has no ability to exercise market power in the relevant markets, and maintaining market-rate authority in New England, New York and PJM would be in the public interest.

Therefore, I recommend that the Commission continue to authorize PSEG to sell electric power in Northeast Region wholesale markets at market-based rates.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Pursuant to 28 U.S.C. §1746, I state under penalty of perjury that the foregoing is true and correct to the best of my information, knowledge, and belief.

Executed on this 23rd day of December 2013.



John R. Morris, Ph.D.
Principal
Economists Incorporated

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

EXPERIENCE AND QUALIFICATIONS OF

Dr. John R. Morris

OVERVIEW	Dr. Morris, a recognized expert in studying competition in energy industries, currently is a Principal at Economists Incorporated. He began his research of competition in energy industries in 1985 while working for the Federal Trade Commission. Since joining Economists Incorporated in 1992, he has consulted on many mergers and acquisitions involving energy companies, examined competitive issues relating to rates, and studied issues in state restructuring proceedings. He has published articles on competition and energy matters, and he has spoken on numerous occasions concerning competition in natural gas, electric power and other industries. He has been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission, state regulatory commissions, and in federal court.
EDUCATION	Ph.D., University of Washington, August 1985 Dissertation: *Intellectual Property: Creating, Pricing, Copying* • M.A., University of Washington, December 1983 • A.B., Georgetown University, May 1981
PRESENT POSITION	Dr. Morris is a *Principal* at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Suite 1100, Washington, DC 20037. (202-223-4700) Economists Incorporated studies competition and regulation in many industries in the United States and in other countries. It is a leading firm in studying the competitive effects of mergers and acquisitions.
PREVIOUS EXPERIENCE	*Senior Vice President*, Economists Incorporated, December 2001 – December 2002 • *Vice President*, Economists Incorporated, December 1995 – December 2001 • *Senior Economist*, Economists Incorporated, June 1992 – December 1995 • *Economic Tutorial Leader*, Stanford University (Stanford in Washington), April 1993 – June 1995 • *Visiting Assistant Professor*, Department of Business Economics and Public Policy, School of Business, Indiana University, September 1991 – May 1992 • *Assistant to the Director for Antitrust*, Bureau of Economics, Federal Trade Commission, November 1989 – August 1991 • *Economic Advisor*, Office of Commissioner Machol, Federal Trade Commission, December 1988 – October 1989 • *Economist*, Division of Antitrust, Bureau of Economics, Federal Trade Commission, October 1985 – December 1988
MEMBERSHIPS	Member, International Association of Energy Economics • Associate, Energy Bar Association • Member, American Economic Association • Member, Western Economic Association International • Associate, American Bar Association

Source: PSEG.

Notes:

[1] PSEG Fossil has a 22.5% interest in the Conemaugh coal-fired units.

[2] PSEG Global has a 4% interest in the Conemaugh Hydroelectric facility.

[3] PSEG Fossil has a 22.84% ownership interest in the Keystone facility.

[4] PSEG Nuclear has a 57.41% interest in the Salem Nuclear facility.

[5] PSEG Fossil has a 50% interest in the Yards Creek facility. Yards Creek is operated by Jersey Central Power & Light, and thus is controlled by JCP&L in the analysis.

[6] PSEG Nuclear has a 50% interest in the Peach Bottom Nuclear facility.

DATA AND ASSUMPTIONS FOR ECONOMISTS INCORPORATED'S DELIVERED PRICE TEST STUDY FOR PSEG

This exhibit describes data and assumptions used in the delivered price test study ("study") carried out by Economists Incorporated for PSEG. Because the data are voluminous, we provide them in electronic workpapers. In those workpapers, the Files.xlsx spreadsheet provides a brief description of the organization of the data files.

This Exhibit has six sections. Section I discusses the study's representative periods. Section II discusses the geographic region and balancing authority areas. Section III discusses generation resources, including adjustments to generating capacity for seasons, maintenance, water availability, and long-term contracts. Section IV discusses transmission, including transmission pricing and losses. Section V discusses market prices. Section VI discusses the load data.

I. Periods

The study calculates market shares and concentration indexes for electric energy for ten representative periods during the year. The year is divided into three seasons (spring/fall, summer and winter). Spring/fall and winter seasons are divided into three periods based on days of the week, times of day and load levels. Summer is divided into four periods based on days of the week, times of day and load levels. Each calculation of market shares and concentration indexes reflects average conditions (e.g., average loads) during one of the resulting ten periods during the year (e.g., Summer Low Peak).

The study places each of the periods in each season into three condition categories: off-peak, low peak, and spike. Transmission pricing (see Section

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

IV.B below) and plant availability (see Section III.A.2 below) vary among these three categories.

Table I-1 summarizes the ten periods for the destination markets.

Table I-1– Definition of Ten Periods for Destination Market

Number	*Season*	*Time*	*Condition*	*Hours*	*Description**
1	Spring/Fall	Top 10%	Spike	102	Top 5% of peak hours
2	Spring/Fall	Low Peak	Low Peak	1727	Remaining peak hours
3	Spring/Fall	Off-peak	Off-Peak	2360	Off-peak hours
4	Summer	Top 1%	Spike	10	Top 10% of peak hours
5	Summer	Top 10%	Spike	102	Next 10% of peak hours
6	Summer	Low Peak	Low Peak	871	Remaining peak hours
7	Summer	Off-peak	Off-Peak	1184	Off-peak hours
8	Winter	Top 10%	Spike	102	Next 10% of peak hours
9	Winter	Low Peak	Low Peak	871	Remaining peak hours
10	Winter	Off-peak	Off-Peak	1136	Off-peak Hours

Note: *Peak hours include hours ending 7 a.m. through 10 p.m. Central Time weekdays, excluding six major holidays. Off-peak hours = Hours ending 11 p.m. through 6 a.m. on weekdays and all weekend and holiday hours.

The Off-peak periods are all NERC holidays and weekend hours plus weekdays from the hour ending at midnight EPT until the hour ending at 0700.[1] The Off-peak periods have off-peak transmission pricing and plant availability.

In order to define the Top 1% and Top 10% periods for a given season, we removed all Off-peak hours from that season. We then ranked the remaining (peak) hours based on load levels in the destination market by season. We then defined as the Top 1% as the 1 percent of these remaining hours in which loads in the destination market were highest and the Top 10% as the highest 10 percent of peak hours based on load levels. These periods have spike transmission pricing and plant availability.

[1] Major holidays are New Year's, Memorial Day, 4th of July, Labor Day, Thanksgiving and Christmas. Major holidays are included in the Weekend period.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

The Low Peak periods are weekdays from the hour ending at 0800 until the hour ending at 2300 EPT, excluding hours in the Top 10% periods and major holidays. The Low Peak period has on-peak transmission pricing and plant availability.

It is important to divide the year initially into three seasons to avoid aggregating across hours in which the suppliers in the market that have available economic capacity (e.g., summer peaking vs. winter peaking utilities) are different. In addition, the division of the year into three seasons makes it possible to take into account seasonal differences in generation availability, contracts, transmission pricing, and transfer capability.

II. Geographic Coverage and Market Areas

The study includes market areas that correspond to the balancing authority areas used by the North American Electric Reliability Council (NERC), and PJM submarkets as defined by FERC. Table II-1 lists these market areas and their abbreviations. There are two study destination markets, PJM East and PJM East of 5004/5005.

Table II-1– List of Eastern Market Areas and Study Destinations

Abbreviation	*Full Name*	*Study Destination*
PJME	PJM East	Yes
PJMC	PJM East of 5004/5005	Yes
PJMS	PJM East of AP South	
PJM	PJM

III. Generation

A. Generation Capacity and Ownership

The study includes generating units located in the areas that are (1) connected to the power grid, (2) not exclusively used for self-generation, and (3) either in a plant used primarily for electric generation or a Qualifying Facility.

1. Generating Unit Data

The study uses data for summer and winter capability at the unit level reported in the Energy Velocity (EV) database available from Ventyx. The units include all units with a status of operating, standby, cold standby, restart, mothballed, testing, or under construction that will be online before November 30, 2012 and a retirement date after November 30, 2012. We exclude generation units that are less than 5 MW unless they are owned by PSEG.

2. Ownership

The study uses relies on Ventyx determination of plant and ownership. When Ventyx reports a holding company, the ownership is assigned to the holding company. For PSEG generation, the study relies upon Appendix B data from market-based rate filings and updates from the companies to determine plant ownership and seasonal capability. Operational control of PSEG units is consistent with the methodology used for market-based rates.

3. Seasonal variation in capability

The study uses seasonal capability data from EV. Spring/fall capacities are the average of summer and winter capacities.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

4. Adjustments to Generating Capability

The generating capability figures used for each period are obtained by multiplying the seasonal capabilities by an availability factor, which is based on the period, unit location, and NERC General Availability Data Systems (GADS) category of the unit. The GADS database gives national average operating information for generating units by unit type and size. For example, it gives data for coal-fired steam units with capacities between 300 MW and 399 MW.

For each period and each generating unit, the availability factor adjusts for the following.

a) Unplanned outage rates by GADS category

For a given GADS category, the study assumes that unplanned (forced) outage rates (as a share of generating capability available after allowing for planned outages) are constant across seasons and generating units throughout the Region, regardless of owner. Based on GADS data for 2007 through 2011, which are the most recent data in the EV database, the study calculates an equivalent forced outage rate (EIFOR), which measures the share of generating capability in a GADS category that is not available because of forced outages. The computation is EIFOR = (FOH)/AH, where FOH is number of forced outage hours and AH is total hours available for generation after planned outages (but before forced outages).[2]

b) Planned outage rates by GADS category and season

With four exceptions (hydro, pumped storage, wind, and solar units), the study assumes that the planned outage rate is constant for all generating units for a

[2] EIFOR differs slightly from the EFOR provided in the GADS data. EIFOR provides a better measure of a forced outage rate for peaking units that are operated a small percentage of the year.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

given GADS category and season. For a given GADS category, the share of hours of generating capability that is not available as a result of planned outages is computed as (POH + POEH)/PH; where PH are the period hours, POH are the hours not available because of planned outages, and POEH are the hours not available because of planned outage extensions

The study assumes that balancing authority areas are both summer and winter peaking. Therefore, the study assumes that all planned outages for thermal units occur during spring/fall.

c) Variation in hydro availability across seasons and periods

In general, utilities use hydro facilities to generate energy during the hours when energy prices are highest, subject to constraints imposed by availability of water and reservoir capacity. In order to incorporate these constraints, the study proceeds in the following manner.

First, the study uses EIA Form 923 monthly production data for the period 2011 to 2012 to compute average hourly hydro generation by season. Average hourly generation is then divided by hydro capability to give an average hourly hydro operating rate by season.

Second, depending upon the level of the hydro operating rate for a given season, the study calculates availability factors for the spike, low peak and off-peak periods. When the historical seasonal operating rate is below 30 percent, the availability factor for each period in the season is set equal to the operating rate; the 30 percent figure is an assumed "run of river" constraint. The study assumes that prospectively the maximum operating rate is 90 percent; this is the assumed "maximum rate" constraint. When the historical seasonal operating rate is above 90 percent, the availability factor for each period is set to 90 percent.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

When the seasonal operating rate is above the run of river constraint and below the maximum rate, we reason that the hydro generator owner would be likely to produce a higher level of energy during spike hours, when energy prices are highest, than during low peak hours, and that the owner would be likely to produce a higher level during low peak than during off-peak hours.

Based on this reasoning, when the seasonal operating rate is between the run of river constraint and the maximum rate, as is the case for each of the three seasons, the study uses a spike availability factor of 90 percent, which is the assumed maximum operating rate, and off-peak availability factor of 30 percent, which is the assumed run-of-river constraint, and a calculated availability factor for the low peak periods, as described below.

The seasonal low peak availability factor is calculated with actual total seasonal hydro generation. The study then computes the hydro generation during all spike and off-peak hours, assuming the generation rates implied by the spike and off-peak derate factors computed in the manner described above. The study then calculates total low peak hydro generation as the difference between total seasonal hydro generation and the sum of hydro generation during all spike and off-peak hours. The seasonal low peak availability factor is computed as total low peak hydro generation divided first by the number of hours in the off-peak period and then by hydro generating capacity.

d) Variation in pumped storage availability across seasons and periods

We assume that pumped storage units have 90 percent availability during Top 1% and Top 10% periods, 50 percent availability during Low Peak periods, and no availability during off-peak periods.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

e) Wind availability

For each area-owner combination, we calculate average operating rates in 2011 and 2012 by season from EIA-923 data. The average operating rates are the availability factors. When operating rates are not available for an owner in an area, we use the average operating rate for that area.

f) Solar availability

Availability for solar power is also calculated based on average operating rates for 2011 and 2012 reported in EIA-923. There is little solar power during off-peak periods because of darkness. Accordingly, solar availability is weighted to on-peak periods.

B. Variable Costs of Generation

The study uses variable costs of generation that include fuel costs, sulfur dioxide and nitrogen oxide emissions costs, and variable operations and maintenance (VOM) costs. The study calculates fuel costs from unit heat rates and Platts' Gas Daily spot prices at the unit's reported natural gas hub by Energy Velocity, #2 Diesel, Low-Sulfur – Industrial for the East Coast, and Residual Fuel Oil sales to end users for the East Coast for the years 2011-2012. Natural gas prices vary by hub, but were $3.78 per mmBtu at TETCO M3, the hub with the largest reported capacity in the study. The prices for oil units are as follows: #2 fuel oil $20.43 per mmBtu, and residual fuel oil $14.47 per mmBtu. Fuel costs for other fuels are based upon the average fuel costs reported in the EV data for each fuel type. Emissions prices for 2011-2012 are $0.75 per ton for SO2 year-round and $39 per ton for NOx in the summer season. CO_2 costs for units located in Regional Greenhouse Gas Initiative (RGGI) states are $1.93/ton, which is based upon RGGI Auction results in 2012. Units in Montgomery County, MD have an

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

additional $5/ton carbon tax on CO_2 emissions. VOM costs are from the EV database.

C. Long-term Contracts

We reviewed Appendix B data from market-based rate filings and FERC Form 1 filings to obtain data on long-term contracts. Where the market-based rate filing indicates a change of operational control, we include a contract transferring control to the buyer. We leave the generation unit in the BAA where it is physically interconnected to the transmission system. When the buyer is a load-serving entity in another BAA, we give a priority firm transmission path to the BAA with the load.

Long-term contracts that expire prior to December 1, 2011 are not included in the study. Long-term contracts that expire between December 1, 2011 and August 31, 2012 are included only in the seasons for which they are in effect. Contracts that expire after September 1, 2012 are included in the study.

IV. Transmission

A. Transmission Network

The study incorporates a contract path transmission network for modeling purposes. Transmission pricing between balancing authority areas is represented by a traditional contract path transmission network in which the direct physical connections between balancing authority areas are also the individually priced links from which contract paths are constructed.

B. Transmission and Ancillary Services Pricing and Losses

As specified by the Commission's Appendix A, the study generally uses ceiling prices for transmission service from Schedules 1, 2 and 8 of the utility's *pro*

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

forma open-access transmission tariff. Transmission providers may require transmission customers to purchase ancillary services under Schedule 1 (scheduling, system control and dispatch) and Schedule 2 (reactive supply and voltage control). Schedule 8 gives the rates for non-firm point-to-point transmission service. The study uses transmission prices from tariffs.

When we have tariffs available, we calculate rates for off-peak, peak and spike categories. Because of discounting and the nature of baseload purchases, off-peak rates are often lower than peak rates.[3] We use two steps to determine off-peak rates. Step 1: When a utility posts off-peak hourly rates, we use the posted rates. Step 2: When a utility does not post off-peak hourly rates, we calculate an hourly off-peak rate based on other tariff information. To calculate hourly off-peak rates, we divide the weekly rate by 168, the number of hours in a week. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

We use similar steps to determine peak rates. Step 1: When a utility posts maximum hourly rates in its tariff, we use the maximum tariff rates. Step 2: When a utility does not post off-peak hourly rates, we calculate a peak rate based on other tariff information. To calculate hourly peak rates, we divide the weekly rate by 80—the "Appalachian" method. When tariffs specify fees on a per transaction basis, we divide them by 25 to put them on a per MW basis.

For spike periods, we use ceiling hourly rates from tariffs, when available. Otherwise, we use the Appalachian method.

---

[3] For transactions longer than one hour, the *pro forma* tariff caps the amount that the purchaser pays per day by the daily rate, and the amount that the purchaser pays per week by the weekly rate.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Whenever practical, the study uses loss rates from tariffs. When these methods did not provide a loss rate for a particular utility, the study assumes that losses are three percent per utility.[4] The study assumes that transmission customers pay losses in-kind. That is, if area A exports 100 MW to area B and the losses are 3 percent, only 97 MW arrive at area B.

For areas where tariffs are not available, rates and losses are the average by period for all the reporting areas.

C. Transfer Capability and SILs

The geographic market includes only PJM and first tier BAAs. Per the recent *NRG/GenOn* order, transmission into a destination market from first tier areas is to be limited only by the simultaneous import limit ("SIL").[5] Accordingly, the transfer capability from each first tier area to the destination market is set to 99,999 MW. The SIL for PJM East and PJM East of 5004/5005 comes from the 2012 Simultaneous Import Limit Study Report filed by PJM on October 1, 2013.[6] The total imports into the destination markets may be less than the actual ability to import into the destination because not all the generation capability owned or controlled by load-serving entities within the destination markets studied in PJM have been identified in the data.

---

[4] Losses of 3 percent are representative of the industry. See, FERC Open Access NOPR, *FERC Stats & Regs*, ¶32,514 at 33,150 (1995).

V. Market Prices

The study used December 2011-November 2012 real-time hourly prices from the RTO LMP for PJM East and PJM East of 5004/5005. Table V-1 shows the PJM East of 5004/5005 market prices in each of the ten periods, and Table V-2 shows the PJM East market prices.

Table V-1 – PJM East of 5004/5005 Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$181.98	-----
Top 10%	$66.65	$107.58	$60.87
Low Peak	$38.72	$42.40	$34.68
Off-Peak	$28.24	$28.32	$30.46

Table V-2 – PJM East Market Prices ($/MWh)

Time	*Spring/Fall*	*Summer*	*Winter*
Top 1%	-----	$188.24	-----
Top 10%	$66.52	$109.22	$61.53
Low Peak	$37.36	$42.17	$34.72
Off-Peak	$27.77	$28.67	$29.97

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

VI. Load and Contract Obligations for AEC Calculations

Load data come from PJM for PJM and from Energy Velocity for the other supply areas.

To compute load requirements for market participants in New York and PJM, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[7] To account for their greater load obligations, we assume that Dominion has 100 percent responsibility for its allocation of load and that AEP has 90 percent of its allocation as opposed to the standard 70 percent. Utilities south of PJM have traditional load obligations and have 100 percent load responsibility for their respective planning area loads. Small utilities for which have not load data available were not imputed a share of PJM or NYISO load were assumed to have no AEC.

[7] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers.

This Exhibit describes the methods used to calculate market shares and concentration in destination markets.

Allocation of scarce transmission capability is accomplished using linear and nonlinear programs that model generation dispatch and the contract path transmission system. This Exhibit provides an overview of the structure of the programs and presents the equations.

Overview of Linear Program

The linear program models control areas as nodes in a transmission system. Each node has a demand for and a supply of electric energy. The supply is based on the generators at the node and potential deliveries to the node via transmission links from other control areas. The linear program allows for net import and export limits to and from an individual control area. Given generation capability and costs and transmission capability and costs, the linear program finds the least-cost solution that satisfies the specified loads. Costs are defined as dispatch (generation) costs plus transmission costs including losses plus the default cost for "unserved" load. For each solution, the linear program determines the quantities produced in, exported from, and imported into each control area.

The Mathematical Equations

The linear program to be solved is given below:

Minimize Total Cost: $Cost = GC + TC + UC$

Subject to:

(1) Generation: $TG_a = \sum_{u}^{u \in a} G_{a,u}$ for each area *a*;

(2) Imports: $YI_a = \sum_{b}^{a,b \in network} (1 - h_{b,a}) T_{b,a}$ for each area *a*;

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

(3)	Exports:	$YE_a = \sum_{b}^{a,b \in network} T_{a,b}$	for each area *a*;
(4)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(5)	Supply/Demand Balance:	$TG_a + Y_a + U_a = D_a$	for each area *a*;
(6)	Generation Cost:	$GC = \sum_{a} \sum_{u}^{u \in a} d_{a,u} G_{a,u}$	for each area *a*;
(7)	Transmission Cost:	$TC = \sum_{a,b}^{a,b \in network} r_{a,b} T_{a,b}$	for each path *a* to *b*;
(8)	Unfilled Demand Cost:	$UC = \sum_{a} pU_a$	for each area *a*;
(9)	Generation Limits:	$g\min_{a,u} \le G_{a,u} \le g\max_{a,u}$	for each unit *u* in each area *a*;
(10)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(11)	Net Import Limits	$Y\min_{a} \le Y_a \le Y\max_{a}$	for each area *a*;

where:

a,b	are subscripts for control/transmission areas;
Cost	is total system cost;
$d_{a,u}$	is the dispatch cost of unit *u* in area *a*;
D_a	is demand for power in area *a*;
$G_{a,u}$	is generation output of unit *u* in area *a*;
GC	is total system generation cost;
$G\max_{a,u}$	is the maximum output of unit *u* in area *a*;
$G\min_{a,u}$	is the minimum output of unit *u* in area *a*;
$h_{b,a}$	is the fraction of power lost to resistance from moving power from area *b* to area *a*;
N	is a subscript to identify simultaneous transmission constraint *n*;
P	is the default price;
$r_{a,b}$	is the transmission rate from area *a* to area *b*;

© ***Economists Incorporated***, Washington, DC, 2008, 2013

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

$T_{a,b}$	is the power flow from area *a* to area *b*;
TC	is total system transportation expenses;
TG_a	is total generation output in area *a*;
$t\max_{a,b}$	is the maximum power flow from area *a* to area *b*;
$t\min_{a,b}$	is the minimum power flow from area *a* to area *b*;
U	is a subscript to identify units in an area;
U_a	is the amount of demand in area *a* not met by generation or imports
UC	is total system cost of not meeting demand;
Y_a	is net imports into area *a*;
YE_a	is total exports from area *a*; and
YI_a	is total imports into area *a*;
$Y\min_a$	is minimum net imports in area *a;*
$Y\max_a$	is maximum net imports in area *a.*

This linear program is solved using the BDMLP solver in GAMS. In order to calculate concentration for different destinations, seasons, and periods, the PASS GAMS program loops through the destinations, seasons, and periods with calls to Solvers to solve the linear programs. Loads, unit availability and transmission availability are adjusted for each season-period combination.

Calculating Concentration

Transmission allocation is accomplished in four steps. In the first step the linear program finds the net-back prices in all control areas given a price at the destination control area equal to 105 percent of the pre-merger price. Suppose the pre-merger price at the destination, control area A, is $20/MWh. Then all generation capability with a dispatch cost of $21/MWh or less in the destination area would be included in the market because $21 is 105 percent of $20. If transmission cost (including losses) is $5/MWh from control area B to A, then the net-back price at B would be $16/MWh, which is the $21/MWh less the $5/MWh transmission cost between B and A. Then, all generation capability at B with dispatch costs equal to or less than $16/MWh would be included in the market if there were no transmission constraints. Calculation of net-back prices is

© ***Economists Incorporated***, Washington, DC, 2008, 2013

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

accomplished by setting the default price, *p*, equal to 105 percent of the pre-merger price at the destination, setting load at the destination to a high number and loads elsewhere to zero, setting transmission limits high enough so that the transmission system is not constrained, and setting a limited amount of generation in each area with a zero dispatch cost. The shadow prices produced by the linear program will be *p* at the destination and the relevant net-back prices in other areas.

In the second step, one calculates Economic Capacity (EC) and Available Economic Capacity (AEC) in each area. These values are then used to limit generation capability. The ownership shares of AEC and EC are calculated for each node in the system.

In the third step, the linear program determines the amount of energy that can be imported into an area given available EC (or AEC) and limits on transmission capacity. This is accomplished by limiting generation in each area to the capacity amount (EC or AEC), giving generation outside the destination market a lower cost than generation inside the destination market, and minimizing cost to serve a large load at the destination market. The amount of generation supplied to the destination is the maximum that can be imported into the destination market.

In the fourth step, transmission is allocated by the following non-linear program:

Minimize Loss: $$Loss = \sum_{\alpha}\left(\frac{C_{\alpha}^{2}}{Y_{Dest}s_{\alpha}} - 2C_{\alpha}\right)$$

Subject to:

(1) Pre Shares: $$s_{\alpha} = \frac{C\max_{\alpha}}{\sum_{\beta} C\max_{\beta}}$$ for each area α;

© ***Economists Incorporated***, Washington, DC, 2008, 2013

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

(2)	Allocated Shares:	$A_\alpha = \frac{C_\alpha}{Y_{Dest}}$	for each area α;
(3)	Imports:	$YI_a = \sum_b^{a,b \in network} (1 - h_{b,a}) T_{b,a}$	for each area *a*;
(4)	Exports:	$YE_a = \sum_b^{a,b \in network} T_{a,b}$	for each area *a*;
(5)	Net Imports:	$Y_a = YI_a - YE_a$	for each area *a*;
(6)	Supply/Demand Balance:	$C_a + Y_a + U_a = D_a$	for each area *a*;
(7)	Capacity Limits:	$c\min_a \le C_a \le C\max_a$	for each area *a*;
(8)	Transmission Limits:	$t\min_{a,b} \le T_{a,b} \le t\max_{a,b}$	for each link *a* to *b* in the transmission network; and
(9)	Max Import Limit	Y_{Dest} = Maximum imports from step 3;	

where:

a,b	are subscripts for control/transmission areas;
α,β	are subscripts for control/transmission areas other than the destination market;
s_α	Is area α's share of capacity outside of the destination;
A_α	is area α's share of allocated capacity outside of the destination;
Loss	is the loss function to be minimized.

The loss function is derived from the weighted squared-errors between the pre-allocation shares and the post-allocation shares, where Y_{Dest}/s_α are the weights. For each source control area, the weighted squared-error is given by:[1]

$$W_\alpha = \frac{Y_{Dest}}{s_\alpha}(A_\alpha - s_\alpha)^2.$$

[1] This exposition ignores the adjustments necessary to give priority to minimum transfer levels from a source area to the destination.

© ***Economists Incorporated***, Washington, DC, 2008, 2013

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

Accordingly, the sum of the weighted squared-errors gives rise to the loss function, which can be seen by:

$$\begin{aligned} Loss &= \sum_{\alpha} W_{\alpha} \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha} - s_{\alpha})^2 \\ &= \sum_{\alpha} \frac{Y_{Dest}}{s_{\alpha}} (A_{\alpha}^2 - 2s_{\alpha}A_{\alpha} + s_{\alpha}^2) \\ &= \sum_{\alpha} \left(\frac{C_{\alpha}^2}{Y_{Dest}s_{\alpha}} - 2C_{\alpha} \right) + \text{constant}. \end{aligned}$$

The resulting shares from minimizing this loss functions preserve the relative shares of capacity behind any transmission constraint going to the destination. This can be seen from the following LaGrangian equation to be minimized:

$$L = \sum_{i} \left(\frac{C_i^2}{Y_{Dest}s_i} - 2C_i \right) + \lambda \left(T - \sum_{i} C_i \right),$$

where T is the transmission limit affecting control areas i. The first order conditions are:

$$\frac{\partial L}{\partial C_i} = \frac{2C_i}{Y_{Dest}s_i} - 2 - \lambda = 0,$$

which can be rearranged to give:

$$A_i = \frac{C_i}{Y_{Dest}} = \left(\frac{2+\lambda}{2} \right) s_i,$$

which shows that the allocated market shares of those areas affected by the transmission constraint are proportional to their shares of capacity before the transmission allocation. Moreover, this is the only transmission allocation

© ***Economists Incorporated***, Washington, DC, 2008, 2013

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

method that maintains the relative shares of capacity behind any binding transmission constraint in the allocation process.

This non-linear program is solved using the COINIPOPT solver in GAMS. The calculated capacities from the nonlinear program above less transmission losses determine the capacities for the market share calculations for sources outside of the destination market. The capacities within the destination market are given full weights.

Market concentration is the HHI, which is the sum of the squared market shares. Mathematically,

$$HHI = \sum_{i=1}^{n} S_i^2,$$

where S_i is the allocated share of firm i and n is the number of firms in the market. The summary sheets combine all the firms with shares of 0.7 percent or less (other than Applicants) into the "Other" category. The collective share of the Other category does not directly enter the HHI calculation other than the represented capacity as each independent entity enters the HHI calculation. For example, if ten firms with 0.5 percent shares were in the Other category, the HHI contribution of the Other category would be 0.625 (= 10 x .5 x .5 = 10 x .0625) and ***not*** 25.

[3] Please note that this number is 120 MW higher than the nameplate rating number provided in Appendix B of the 2010 triennial filing in Docket No. ER08-448-007 and the PSEG New Haven initial MBR filing in Docket No. ER12-1250-000. This is due to the fact that a capacity increase associated with an uprate to the Hope Creek nuclear unit was inadvertently not included in the nameplate number included in Appendix B. This capacity uprate was, however, discussed in the 2007 and 2010 triennial applications themselves.

Re: Joint Owners of the Conemaugh Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Conemaugh Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Conemaugh Electric Generating Station:

1. The Owners jointly own the Conemaugh Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in East Wheatfield and West Wheatfield Townships, Indiana County, Pennsylvania (the "Station").

---

1 Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Conemaugh Power LLC	3.72%
Constellation Power Source Generation, Inc.	10.56%
Duquesne Conemaugh LLC	3.83%
Exelon Generation Company, LLC	20.72%
PPL Montour, LLC	16.25%
PSEG Fossil LLC	22.50%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.45%
UGI Development Company	5.97%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

Sincerely yours,

Georgianna R. Stenger
Administrative Manager

Re: Joint Owners of the Keystone Electric Generating Station (collectively, the "Owners") statement of ownership and control

Dear Owners:

This letter sets forth the understanding of the degree of ownership and control exercised by each of the Owners with respect to the jointly-owned Keystone Electric Generating Station for purposes of facilitating compliance with the requirements of FERC Order No. 697.[1]

The Owners and Reliant Energy Northeast Management Company (the "Operator") each confirm its concurrence with the following statement of facts relating to the Keystone Electric Generating Station:

1. The Owners jointly own the Keystone Electric Generating Station, consisting of two 850 MW net pulverized coal fired once-through boilers and related facilities having a combined rated seasonal net generating capacity of 1,712 MW (1,884 MW nameplate), located in Plumcreek, South Bend and Cowanshannock Townships, Armstrong County, Pennsylvania, and Armstrong Township, Indiana County, Pennsylvania (the "Station").

---

1 Not all of the Owners agree as to whether Order No. 697 requires the submission of a letter of concurrence when the putative submitting party is not claiming that it does not control its percentage ownership share of a jointly-owned unit. Notwithstanding, all of the Owners have no objection to submission of this letter by an Owner which does believe that such a submission is required.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

2. As of the date hereof, the Station is collectively owned by the Owners as tenants-in-common, each holding an undivided interest in the Station (and all real and personal property comprising the same) in the respective ownership percentages set forth below:

Owner	Ownership Interest
Constellation Power Source Generation, Inc.	20.99%
Duquesne Keystone LLC	2.47%
Exelon Generation Company, LLC	20.99%
Keystone Power LLC	3.70%
PPL Montour, LLC	12.34%
PSEG Fossil LLC	22.84%
Reliant Energy Mid-Atlantic Power Holdings, LLC	16.67%

3. Each of the Owners is deemed to control the generating capacity of the Station in accordance with its respective ownership percentage as set forth in the preceding paragraph for purposes of facilitating compliance with the requirements of FERC Order No. 697.

Please indicate your company's concurrence to the above statement of facts by executing this letter in the space provided below your company's name at the foot hereof.

PSEG
Nuclear L.L.C.

Carol Peterson
Vice President Finance
Exelon Nuclear
4300 Winfield Road
Warrenville, IL 60555

Letter Regarding Control of Jointly-Owned Nuclear Facilities

Dear Ms. Peterson:

In connection with its upcoming compliance filings pursuant to Order No. 697,[1] PSEG Nuclear LLC ("PSEG") is submitting this letter in order to set forth its understanding of, and is requesting Exelon Generation Company LLC's ("Exelon") concurrence on, the respective level of control exercised by both companies with respect to the two nuclear facilities that they jointly own.[2]

PSEG avers and requests Exelon's concurrence on the following:

1. PSEG and Exelon jointly own and control two nuclear power plants, Peach Bottom Atomic Power Station located in Delta, PA and the Salem Nuclear Generating Station in Lower Alloways Creek, NJ.

2. In accordance with the Joint Owners Agreement for Peach Bottom dated November 24, 1971, as amended on thereafter, between the Parties, PSEG and Exelon each own 50% of the generating station. Under the Agreement, Exelon is the designated operator of Peach Bottom.

3. In accordance with the Joint Owners Agreement for Salem dated November 24, 1971, as amended thereafter, between the Parties, Exelon owns 42.59% and PSEG owns 57.41% of the generating station. Under the Agreement, PSEG is the designated operator of Salem.

4. Section 4.1 of each of the Joint Owners' Agreements states, "The signatories shall be entitled to shares of the installed capacity, available capacity, operating capacity and hourly energy generation of the Station in proportion to their ownership . . .."

---

[1] *Market-Based Rates For Wholesale Sales Of Electric Energy, Capacity And Ancillary Services By Public Utilities*, 119 FERC ¶ 61,295 (2007).

[2] PSEG has requested a letter of concurrence from Exelon in order to facilitate the Commission's review of the market power analysis submitted by PSEG with respect to facilities it jointly owns with Exelon. Exelon has no objection to PSEG's submission of this letter as part of PSEG's compliance filing,.

tel: 856.339.1100 fax: 856.339.1104
email: Thomas.Joyce@pseg.com

PSEG
Nuclear L.L.C.

5. Section 11.1 of each of the Joint Owners' Agreements provides that the generating station will be operated by the party designated as operator for the mutual benefit of PSEG and Exelon.

6. In Order No. 697 the Commission stated that under "where a jointly-owned generation facility is operated by one of the joint-owners for the benefit of and on behalf of all of the joint-owners . . . it may be reasonable to allocate capacity based on ownership percentages...." Order No. 697 at P 188.

7. In accordance with the guidance provided in Order No. 697 and with the language of each of the joint owners' agreements, PSEG and Exelon should be deemed to control each of the nuclear facilities' output in line with their proportionate ownership share of each facility. As such, PSEG and Exelon should each be deemed to control 50% of Peach Bottom's output, and PSEG should be deemed to control 57.41% of Salem's output with Exelon controlling 42.59%.

Please indicate Exelon's concurrence to the above by executing the Acknowledgement and Agreement section below.

Sincerely

Thomas P. Joyce
Senior Vice President – Operations

JOINT LETTER OF CONCURRENCE

Regulations of the Federal Energy Regulatory Commission (the "FERC") require each public utility with market-based rate authority to file an updated market power analysis every three years in accordance with a schedule adopted in *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 697, FERC Stat. & Regs., Regulations Preambles ¶ 31,252 (2007) ("Order No. 697"). See, 18 CFR § 35.37(a)(1). Each public utility with market-based rate authority may also be required to file a change-in-status report regarding certain changes in circumstances that occur between the dates on which its triennial market power analyses are filed. 18 CFR § 35.42. Among other matters, the market power analysis is to address the amount of generation capacity that the affected utility owns or controls. Where more than one public utility owns a generating facility, FERC requires the utility that is submitting a market power analysis seek a "letter of concurrence" from the other affected co-owning public utilities that identifies the degree to which each public utility controls the generating facility, and to submit the letter with its filing. *See* FERC Order No. 697, 119 FERC ¶ 61,295, P 187 (2007).

The Yards Creek Pumped Storage Hydroelectric Project (the "Yards Creek Project") is a FERC-licensed pumped-storage hydroelectric project with a nameplate capacity of 400 MWs, and is located in Pahaquarry and Blairstown Townships, in Warren County, New Jersey. *See* FERC Project No. P-2309.

PSEG Fossil LLC ("PSEG") and Jersey Central Power & Light Company ("JCPL") each own, as tenants in common with the other, an undivided 50% interest in the Yards Creek Project. Accordingly, if and when PSEG or JCPL submit an updated market power analysis to the FERC, each will be subject to FERC's requirement to seek a "letter of concurrence" regarding the degree to which each controls the Yards Creek Project.

Both PSEG and JCP&L (and their affiliates) own transmission facilities and provide wholesale electric service in the Northeast region, as defined in Order No. 697. Pursuant to the schedule adopted in Order No. 697, PSEG and JCP&L are each required to submit an updated market power analysis to the FERC for markets within the Northeast region in December 2010. PSEG and/or JCP&L may also be obligated to file a change-in-status report or other market power analyses before its subsequent triennial market power analysis for the Northeast region is scheduled to be filed. Therefore, for the sole purpose of enabling either PSEG or JCP&L to submit a market power analysis that addresses, among other issues (to the extent necessary), the scope of each party's control of the Yards Creek Project, PSEG and JCP&L each aver and agree as follows:

1. JCP&L operates and maintains the Yards Creek Project pursuant to the Yards Creek Pumped Storage Hydroelectric Generating Station Operating Agreement, which is dated October 6, 1965 (the "Operating Agreement').

2. Article 2 of the Operating Agreement designates JCP&L as holding sole responsibility for the operations and maintenance the Yards Creek Project. Article 2 further provides that JCPL shall operate the Yards Creek project in the same manner as if JCPL had the complete ownership interest in the Yards Creek Project.

20131223-5279 FERC PDF (Unofficial) 12/23/2013 4:51:06 PM

3. JCP&L does, in fact, operate and control the Yards Creek Project in the same manner as if JCP&L had the complete ownership interest in the Yards Creek Project in accordance with Article 2 of the Operating Agreement.

4. Accordingly, PSEG and JCP&L each agree and concur that for the purpose of the market power analyses required by Order No. 697, JCPL shall be deemed to control the Yards Creek Project generation capacity and electric energy output.

NOTICE OF FILING
( )

Take notice that on December 23, 2013 that: (i) PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Fossil LLC and PSEG Nuclear LLC tendered for filing their joint triennial market power update in compliance with Order No. 679 and with prior Commission Orders granting them market-based rate authority in Docket Nos. ER99-3151, ER97-837, ER03-327, ER08-447 ER08-448 and DR-12-1250 respectively.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR §§ 385.211 and 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. Such notices, motions, or protests must be filed on or before the comment date. Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant. On or before the comment date, it is not necessary to serve motions to intervene or protests on persons other than the Applicant.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the "eFiling" link at http://www.ferc.gov. Persons unable to file electronically should submit an original and 14 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street, N.E., Washington, D.C. 20426.

This filing is accessible on-line at http://www.ferc.gov, using the "eLibrary" link and is available for review in the Commission's Public Reference Room in Washington, D.C. There is an "eSubscription" link on the web site that enables subscribers to receive email notification when a document is added to a subscribed docket(s). For assistance with any FERC Online service, please email FERCOnlineSupport@ferc.gov, or call (866) 208-3676 (toll free). For TTY, call (202) 502-8659.

RE: Triennial Market Power Update and Revised Market-Based Rates Tariff in Compliance with Order No. 697:

PSEG Energy Resources & Trade LLC -> ER10-1789-003
Public Service Electric and Gas Company -> ER10-1768-002
PSEG Power Connecticut LLC -> ER10-1793-002
PSEG Fossil LLC -> ER10-1770-002
PSEG Nuclear LLC -> ER10-1771-002
PSEG New Haven LLC -> ER12-1250-002

Dear Secretary Bose:

20131223-5279

Earlier today, PSEG Energy Resources & Trade LLC ("PSEG ER&T"), Public Service Electric and Gas Company ("PSE&G"), PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear") and PSEG New Haven LLC ("PSEG New Haven") (collectively the "Applicants" or "PSEG") jointly submitted their Triennial Market Power Update. Enclosed with this transmittal letter, please find CD-ROMs containing the workpapers of Dr. John Morris supporting his analysis in support of that filing.

More specifically, these CD-ROMs contain the following materials:

- Disk 1 (of which six copies are included) contains publicly available information.
- Disk 2 (of which one copy is included) contains: (i) proprietary information provided by Energy Velocity under an agreement that requires confidential treatment to be requested for these materials; (ii) modeling and computer programs that are the proprietary intellectual property of Economists Incorporated, the firm by which Dr. Morris is employed; (iii)

SI-SSA-0010-5204

commercially sensitive information about Applicants and their affiliates; and (iv) documents and information deemed to be confidential by PJM, NYISO and ISO-NE.

Accordingly, Applicants respectfully request confidential treatment for Disk 2 pursuant to 18 C.F.R. § 388.112 (2006), consistent with the confidential treatment accorded other applicants submitting such proprietary and commercially sensitive data.[1] Pursuant to the Commission's rules, the public version of this filing contains all materials submitted herein except for Disk 2, which is labeled as "PRIVILEGED AND CONFIDENTIAL/NON-PUBLIC.

Thank you for your attention to this matter. Please direct any questions concerning this submission or the request for privileged treatment to the undersigned.

Respectfully submitted,

Public Service Electric and Gas Company
PSEG Energy Resources & Trade LLC
PSEG Power Connecticut LLC
PSEG Fossil LLC
PSEG Nuclear LLC
PSEG New Haven LLC

RE: Triennial Market Power Update in Compliance with Order No. 697:
***PSEG Energy Resources & Trade LLC*, Docket No. ER99-3151-____;**
***Public Service Electric and Gas Company*, Docket No. ER97-837-____;**
***PSEG Power Connecticut LLC*, Docket No. ER03-327 -___;**
***PSEG Fossil LLC*, Docket No. ER08-447-___;**
***PSEG Nuclear LLC*, ER08-448-___; and**
***PSEG New Haven LLC*, ER12-1250-___**
Pavant Solar II LLC, ER16-1925-___
San Isabel Solar LLC, ER16-1926-___
Bison Solar LLC, ER16-1924-___
PSEG Energy Solutions LLC, ER16-2725-___

Dear Secretary Bose:

Pursuant to the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), Public Service Electric and Gas Company ("PSE&G"), PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear"), PSEG New Haven LLC ("PSEG New Haven") Pavant Solar II LLC, San Isabel Solar LLC, Bison Solar LLC and PSEG Energy Solutions LLC (collectively the "Applicants" or "PSEG") hereby jointly submit for filing their updated market power analysis in support of their continued eligibility to engage in market-based rates

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

transactions. This market power analysis satisfies the requirements of Order No. 697[1] for the filing of updated market power analyses on a regional schedule basis by holders of market-based rate certificates and their affiliates. In accordance with the regional schedule for those utilities in the Northeast Region, as modified by the MBR Clarifying Order, this filing is being made by the December 2016 deadline.[2] In conformance with the Commission's requirements, except when expressly noted otherwise, the market power analysis is based on activity during the study period from December 1, 2014 through November 30, 2015 ("study period").

PSEG, through its subsidiary PSE&G, owns transmission facilities within the Northeast Region. Specifically, PSE&G owns transmission facilities in the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization. PSEG Power LLC and its subsidiaries do not own any transmission facilities other than transmission to connect generating units to the grid in PJM, the New York Independent System Operator, Inc. ("NYISO") and ISO New England Inc. ("ISO-NE").

In their original applications for market-based rate authority and previously-submitted updates to the Commission, PSEG ER&T, PSE&G, PSEG Power CT, PSEG Fossil, PSEG Nuclear and PSEG New Haven demonstrated that they and their affiliates: (a) do not exercise generation market power; (b) lack the ability to manipulate access to transmission facilities that they own or control; and (c) cannot erect any other barriers to market entry. As further demonstrated herein and in the Affidavit of Dr. John R. Morris attached hereto in the appendices, Applicants continue to satisfy the Commission's requirements to sell energy, capacity and ancillary services at market-based rates and thus should be permitted to continue to make such sales.

I. SERVICE AND COMMUNICATION

All service and correspondence related to this matter should be directed to the following individuals:

[1] 18 C.F.R. Part 35, Subpart H (2007); Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

[2] This filing is made on the three year anniversary of the December 2013 deadline set forth in Order No. 697 Appendix D.

David.Richter@PSEG.com

Applicants request waiver of Rule 203(b)(3)[3] so that a copy of any communications in these proceedings may be served on all persons listed above.

II. DESCRIPTION OF THE APPLICANTS AND RELEVANT AFFILIATES

A. The Applicants

The Applicants are each wholly owned, direct and indirect subsidiaries of Public Service Enterprise Group Incorporated ("PSEG"). PSEG is a public utility holding company engaged in, among other things, the generation of electric energy and the transmission, distribution and sale of electricity and natural gas through its subsidiaries.

1. Public Service Electric and Gas Company

PSE&G is a public utility operating company engaged primarily in the transmission of electricity, and the provision of gas and electric distribution service in the State of New Jersey. During the study period, PSE&G owned less than 140 MW of solar generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities. PSE&G is a member of the PJM Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access

[3] 18 C.F.R. § 385.203(b)(3).

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Transmission Tariff ("OATT") administered by PJM. PSE&G is authorized to sell power at market-based rates and makes wholesale sales falling within several different categories, as described below.

Non-utility generation ("NUG") output. PSE&G's NUG output expired in 2015 and 2016 pursuant to the terms of the NUG contracts. PSE&G currently has no further NUG obligations, other than 0.6 MW of energy associated with the former Kinsley Landfill which no longer operates. .

Solar. In 2007, the New Jersey legislature passed Regional Greenhouse Gas Initiative ("RGGI") legislation authorizing state utilities to invest in renewable resources such as wind or solar in order to promote increased use of renewable resources within the state and in turn reduce greenhouse gas emissions. *See* L. 2007, c. 340, codified at N.J.S.A. 48:98-1. The NJBPU has approved two (2) PSE&G Solar 4 All® (S4A) programs under which PSE&G has sited, designed and built twenty-nine (29) grid connected solar facilities. PSE&G currently owns and operates approximately 115MW-dc of grid connected solar under the S4A program. PSE&G expects the S4A fleet to increase to approximately 125MW-dc by the end of 2016. In 2016, PSE&G received NJBPU approval of its Solar 4 All Extension II filing to install an additional 33MW-dc of grid connected solar on landfills and brownfields in the PSE&G electric service territory.

2. PSEG Energy Resources & Trade LLC

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.,* which initiated the transition from a regulated to a competitive retail power market in New Jersey, BPU annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSEG ER&T has participated directly in all of the auctions for BGS supply held since 2004, has been a winning bidder in these auctions and has incurred contractual

commitments to provide supply to BGS load pursuant to BPU approved contracts beginning with the 2004 auction and continuing to the present

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract remains in effect and provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply: On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which ER&T will provide fuel supply and power supply management activities for LIPA beginning on January 1, 2015.

3. PSEG Fossil LLC

PSEG Fossil is an Exempt Wholesale Generator ("EWG") and is authorized to sell power at market-based rates. PSEG Fossil owns and operates electric generation facilities located within PJM and sells their entire output to its affiliate PSEG ER&T.[4] The assets of PSEG Fossil (and its subsidiary, PSEG Keys Energy Center LLC ("PSEG Keys")) are located entirely within PJM. However, PSEG Fossil's subsidiaries PSEG Power Connecticut LLC ("PSEG Power CT"), PSEG Power New York LLC and PSEG New Haven LLC own facilities in ISO-NE and NYISO. As noted below, PSEG Fossil also co-owns certain facilities in PJM.

PSEG Fossil and its subsidiaries PSEG Power CT and PSEG Keys are currently beginning construction on three new gas-fired generation units. PSEG Fossil is constructing Sewaren 7[5] which is a 540 MW combined cycle unit in Woodbridge, New Jersey which is expected to be in-service in 2018, PSEG Keys is constructing a 755 MW combined cycle unit in Prince George's County, Maryland which is expected to be in service in 2018 and PSEG Power CT is constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

Since the last triennial filing in December 2013 PSEG Fossil has retired 1,813.5 MWs (nameplate) inclusive of the following units:

Kearny 9 (18.6 MW)
Bergen 3 (18.6 MW)

[4]These contracts were originally approved by the Commission as cost-based contracts. *See Public Service Electric and Gas Company*, et al., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000). In 2008, PSEG Fossil obtained market based rate authority covering sales from its generating units.

[5] Once Sewaren 7 begins commercial operation, PSEG Fossil plans to retire Sewaren 1, 2, 3 and 4.

Bridgeport 2 (179.5 MW)
Burlington 8 (18.6 MW
Burlington 9 (162.4 MW)
Burlington 11 (162.4 MW)
Edison 1 (167.4 MW)
Edison 2 (167.4 MW)
Edison 3 (167.4 MW)
Essex 10 (167.4 MW)
Essex 11 (167.4 MW)
Essex 12 (167.4 MW)
Mercer 3 (115.2 MW)
National Park (18.6 MW)
Sewaren 6 (115.2 MW)

In addition, PSEG Fossil, LLC notified PJM of its intent to retire Hudson 2 (659 MW nameplate rating) and Mercer Units 1 and 2 (652MW nameplate rating) by June 1, 2017.

PSEG Fossil satisfies most of the electricity needs of its plants from PJM under PJM's "station power" Tariff provisions. PSEG Fossil procures gas supply for its plants from PSEG ER&T and receives gas distribution service from PSE&G at a rate approved by the BPU on May 29, 2013.[6]

4. PSEG Power Connecticut LLC

PSEG Power CT is a Connecticut limited liability company and an EWG that owns and operates electric generation facilities in the State of Connecticut and is authorized to sell power at market-based rates.[7] Both of PSEG Power CT's generation facilities, Bridgeport Harbor and New Haven Harbor, are located in the State of Connecticut within the market administered by ISO-NE. PSEG Power CT sells the output of its generation facilities to its affiliate PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. As noted above, PSEG Power CT is currently constructing Bridgeport 5, a 485 MW combined cycle unit in Bridgeport, Connecticut which is expected to be in service in 2019.

5. PSEG New Haven LLC

PSEG New Haven is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG New Haven owns and operates a facility (the "New Haven facility") in New Haven, Connecticut with a nameplate rating of 181 MWs. The New Haven facility is located within the New Haven Harbor generation station. The New Haven facility is interconnected to the adjacent United Illuminating East Shore Substation using a 115 KV underground cable. PSEG New Haven has no other

[6] BPU Docket No. GM12100935 (May 29, 2013).
[7] *Wisvest Corporation,* et al., 101 FERC ¶ 61,166 (2002).

generation assets. The commercial operation date for the New Haven facility was June 1, 2012 and PSEG New Haven has obtained MBR authority from FERC.[8]

The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[9] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[10] All of the energy and capacity of the New Haven facility is sold into the ISO New England ("ISO-NE") markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA[11] has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder. The 181 MW nameplate rating of the New Haven Facility has not been included in the capacity controlled by PSEG for purposes of Dr. Morris' market power analysis.

6. PSEG Nuclear LLC

PSEG Nuclear is an EWG[12] and is authorized to sell power at market-based rates. PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission.[13] The assets of PSEG Nuclear are located entirely within PJM. PSEG Nuclear performed the following uprates since the last triennial filing: (1) an uprate of 120 MWs at its Hope Creek plant in 2014, which increased its nameplate rating to 1290 MWs, (2) an uprate to Peach Bottom 2 and 3 which increases PSEG's share of the nameplate MWs by 241 MWs for a updated nameplate of 704 MW for Peach Bottom 2 and 689 MWs for Peach Bottom 3.

7. Pavant Solar LLC, San Isabel Solar LLC and Bison Solar LLC

PSEG Power Ventures portfolio includes three (3) solar companies with market-based rate authority: (1) *Pavant Solar II LLC*[14] is a QF which owns a 50 MW (AC) solar facility in Fillmore Utah; (2) *San Isabel Solar LLC*[15] is a QF which owns a 30 MW (AC)

solar facility in Las Animas County, Colorado and (3) *Bison Solar LLC*[16] is a QF which owns a 30 MW (AC) solar facility 25 miles north of Fort Collins, Colorado.

8. PSEG Energy Solutions LLC

PSEG Energy Solutions LLC ("PSEG Solutions") is a Delaware limited liability company and a direct subsidiary of PSEG ER&T. PSEG Solutions obtained market-based rate authority[17] and will operate within the PJM Interconnection, L.L.C. ("PJM"), New York Independent System Operator, Inc. ("NYISO") and ISO New England Inc. ("ISO-NE") markets. Energy Solutions will purchase power from the regional transmission organization ("RTO") at wholesale and sell it to retail customers. PSEG Solutions will not own or operate any generation assets. PSEG Solutions proposes to begin its retail business on January 1, 2017.

OTHER RELEVANT AFFILIATES

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities, as discussed below.

7. Affiliated Generation Ownership.

A list of the Applicants' affiliated domestic FERC jurisdictional generation assets owned is contained in Appendix B attached hereto. [18] Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the Northeast Region are described below:

PSEG Power LLC ("PSEG Power") was formed in 1999 to acquire the former generation assets of PSE&G. PSEG Power, a Delaware limited liability company, does not directly own any generation facilities or engage in any FERC jurisdictional activities but is the parent company of several FERC jurisdictional entities, including Applicants PSEG ER&T (and it subsidiary PSEG Energy Solutions LLC), PSEG Fossil, PSEG Nuclear, PSEG Power CT, PSEG New Haven and PSEG Power Ventures LLC (which owns PSEG Solar Source LLC).

PSEG Power Ventures LLC and PSEG Solar Source LLC. PSEG Power Ventures LLC ("Power Ventures") is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source LLC and has an in-direct ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 349 MWs DC (274 MW AC) of solar capacity across the United States, including a combined 92

[16] *Bison Solar LLC*, Docket No. QF16-711-001.
[17] See Letter Order dated December 21, 2016 in Docket No. ER16-2725-000.
[18] Appendix B excludes generation assets located in Hawaii as well as generation assets in which PSEG's interest is limited to a leveraged lease interest.

MWs[19] (72 MW AC) of solar capacity in PJM and approximately the following amount of MWs in the following states all through separate project companies which have all obtained QF status.

- 15 MWs (12 MW AC) in Florida,
- 92 MWs in PJM (72 MW AC) – 12 MWs in Ohio, 2 MW in New Jersey, 15 MW in Delaware, 50 MW in North Carolina and 13 MW in Maryland
- 45 MWs in Arizona (34 MW AC) – 25 MW Queen, approximately 20 MW Badger
- 13 MWs (10 MW AC) in Texas,
- 34 MWs (25 MW AC) in California[20]
- 4 MWs (3 MW AC) in Vermont and
- 74 MW (60 MW AC) in Colorado (to be in operation in 2016) – 38 MWs for San Isabel and 36 MWs for Bison
- 62 MW (50 MW AC) in Utah (to be in operation in 2016).
- 10.5 MW (8 MW AC) in Oregon (to be in operation in 2016).

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company and an EWG that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a FERC-approved cost-based contract.[21]

[19] The 92MWs are attributed to four (7) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs) Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

[20] The 28MWs (DC) are associated with the Shasta Solar Facility in California (4 MW), Whitehorn Solar (3 MWs) the Columbia Solar Project (19 MW). All have obtained QF status.

[21] *PSEG Power New York Inc.*, Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

PSEG Keys Energy Center LLC ("PSEG Keys") is a Delaware limited liability company and a direct subsidiary of PSEG Fossil. PSEG Keys was formed to construct, operate and maintain the Keys Energy Center, a 755MW combined cycle power plant in Prince Georges County, Maryland. Construction began in 2015 and is expected to be completed in 2018 at which time the capacity will be available in the PJM market. All of the output of the Keys Energy Center will be sold to PSEG Keys affiliate, PSEG ER&T.

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution system ("T&D") on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco will be FERC jurisdictional public utilities as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[22]

8. Affiliated Transmission Ownership

With the exception of the electric transmission assets owned by Applicant PSE&G, all of which are located within the PJM RTO, and the generation interconnection facilities owned by the various EWG and QF affiliates listed herein, the Applicants, nor their affiliates have any affiliates that own or operate FERC jurisdictional electric or natural gas transmission facilities within the United States[23]. As discussed below, FERC granted PSE&G a Hinshaw exemption in 1954, finding that it was exempt from the provisions of the Natural Gas Act.

B. JOINTLY OWNED FACILITIES

PSEG Nuclear is a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear is the operator of Salem and Exelon Generation is the operator of Peach Bottom.[24] PSEG Fossil is approximately a 23% joint owner in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[25] Accordingly, for

[22] *PSEG Long Island LLC*, 145 FERC ¶ 61,010 (2013), *order dismissing request for rehearing*, 145 FERC ¶ 61,183 (2013).

[23] PSEG Power LLC is a 10% owner of the PennEast Pipeline Company LLC which has filed an application for approval to construct and operate a natural gas transmission line.

[24] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in Appendix E. The ownership percentages have not changed since the date of this letter. PSEG Nuclear owns a 50% interest in Peach Bottom and a 57.41% interest in Salem.

[25] A letter of concurrence supporting the allocation of plant output based on ownership interest is attached in Appendix E. The ownership percentages have not changed since the date of this letter.

purposes of this market power analysis, the capacity of Salem, Peach Bottom, Conemaugh and Keystone has been attributed to PSEG in accordance with PSEG's ownership interests in these facilities.

PSEG Fossil and Jersey Central Power and Light Company ("JCP&L") are each 50% co-owners of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity – nominally 400 MWs – has been assigned to JCP&L.[26]

III. Applicants Fully Satisfy The Commission's Standards For Authority to Make Power Sales At Market-Based Rates.

The Commission allows power sales at market-based rates if the seller and its affiliates do not have, or have adequately mitigated, horizontal and vertical market power.[27] The Commission has also codified affiliate restrictions in its regulations which must be satisfied on an ongoing basis. In previous submissions for market-based rate authority the Applicants PSE&G, PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear, and PSEG New Haven, demonstrated compliance with each of these requirements. As detailed herein and in the attached affidavit, the Applicants continue to meet these standards.

A. The Applicants Lack, Or Have Effectively Mitigated, Any Horizontal Market Power

In the MBR Order, the Commission established two indicative screens: a pivotal supplier screen based on the control area's annual peak demand and a wholesale market share screen applied on a seasonal basis. If an applicant passes both screens, there is a rebuttable presumption that the applicant does not possess horizontal market power. Each indicative screen is applied with respect to "relevant geographic markets" for an applicant's generating units.

Applicants located in ISOs/RTOs possessing sufficient market structure may consider the geographic region under the control of the ISO/RTO as the relevant default geographic region for purposes of completing their generation market power analyses.[28] However, where the Commission has previously found a "submarket" to exist within a boundary of an RTO, such finding is controlling as to the scope of the relevant geographic market for all generation units located within that submarket for the application of the indicative screens and any delivered price test that may be performed. The Commission further listed several such submarkets, including PJM East ("PJME"),

[26] A letter of concurrence supporting this determination is attached in Appendix E. The ownership percentages have not changed since the date of this letter.
[27] MBR Order, FERC Stats. & Regs. ¶ 31,252 at P 62, 399, 408, 440.
[28] *MBR Order at* PP. 231 and 235.

Connecticut and Southwest Connecticut.[29] Subsequent to the MBR order, in approving a merger between Exelon Corporation and Constellation Energy Group, Inc., the Commission identified additional submarkets in PJM - PJM East of 5004/5005 ("PJM50") and PJM East of AP South ("PJMAP") - that would be relevant to an MBR analysis for applicants in the Northeast Region.[30]

As discussed below and in the attached Affidavit of Dr. John Morris contained in Appendix A, Applicants have conducted market power analyses of the entire PJM RTO, the PJME, PJM50 and PJMAP submarkets, the entire NYISO, the entire ISO-NE, the Connecticut submarket and the Southwest Connecticut submarket for the study period. The results are set forth below.

1. Indicative Screens

a. Pivotal Supplier Analysis

The pivotal supplier analysis ("PSA") focuses on the ability of a seller to exercise unilateral market power.[31] The screen assesses whether market demand can be met during peak times without the applicant and its affiliates. If demand can be met without the applicant and its affiliates, the applicant passes that the PSA screen. The Affidavit of Dr. John Morris, attached hereto as Appendix A, finds that the Applicants pass the PSA screen for all relevant markets: PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut, PJMAP, PJME and PJM50.[32]

b. Wholesale Market Share Analysis

The wholesale market share analysis ("WMSA") is applied each season to determine whether an applicant has a dominant market position based on the total number of megawatts of uncommitted capacity owned or controlled by the applicant and its affiliates in relation to the uncommitted capacity of the entire relevant wholesale electricity market.[33] The established threshold is 20 percent; a supplier who has less than 20 percent market share in the relevant market for all seasons passes the WMSA screen.

In his Affidavit Dr. Morris finds that the Applicants pass the WMSA screen for PJM, NYISO, ISO-NE, Connecticut, Southwest Connecticut and PJMAP but do not pass the WMSA screen for the PJME and PJM50 submarkets.[34]

---

[29] *Order No. 697* at P 236 (citing *Exelon Corp.*, 112 FERC ¶ 61,011, *reh'g denied*, 113 FERC ¶ 61, 299 (2005)). FERC eliminated the Northern PSEG zone as a default submarket in Order No. 697-A, P 99.

[30] Order Conditionally Authorizing Merger and Disposition of Jurisdictional Facilities, *Exelon Corporation, et al.*, 138 FERC ¶ 61,167 (2012).

[31] *AEP I* at P 72.

[32] *See* Morris Affidavit, at 15-29.

[33] *AEP I,* P 100.

[34] *See* Morris Affidavit, at 15-29.

c. Results of Indicative Screen Analysis

As shown in Dr. Morris's affidavit, Applicants therefore pass both indicative screen tests for PJM RTO, NYISO, ISO-NE, Connecticut and Southwest Connecticut and PJMAP. For PJME and PJM50, the Applicants pass the PSA but do not pass the WMSA.

2. Delivered Price Test Analysis For PJME and PJM50 Submarkets

In accordance with the MBR Order, applicants who fail either indicative screen test can rebut the presumption of market power through the submission of a delivered price test analysis ("DPT"). Applicants may submit this study at the same time that the results of the indicative screens are provided.[35] The DPT is based on two measurements of potential market power: economic capacity ("EC") and available economic capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting native load commitments from EC. Both calculations are performed for ten different season and load conditions.

In applying the DPT, "[a] showing of an HHI less than 2,500 in the relevant market for all season/load conditions for sellers that have also shown that they are not pivotal and do not possess a 20 percent or greater market share in any of the season/load conditions would constitute a showing of a lack of market power, absent compelling contrary evidence from intervenors."[36] However, while meeting these threshold benchmarks provides "safe harbor" protection, the Commission has found in numerous other cases that applicants lack market power even when they exceed one or more of the thresholds for particular study periods. As stated in *Public Service Company of New Mexico*, 115 FERC ¶ 61,090, P 38 (2006), "the Commission weights the results of both the economic and available economic capacity tests and considers the arguments of the applicant and intervenors." (footnote omitted.) [37]

---

[35] *Order No. 697,* P 76.

[36] *Order No. 697* at P 111.

[37] Indeed, in that case, the applicant was deemed "on balance" to have adequately rebutted a showing of market power mitigation for the PNM control area where the results exceeded the 20% safe harbor in two cases under the AEC measure and in all 10 cases at values between 35% and 41% under the EC measure. *See, e.g.*, *Kansas City Power and Light Company, et al.*, Docket Nos. ER99-1005-011 et al. (August 12, 2010) (finding no market power where applicant had EC market shares in the 40-60% range and had significant HHI failures in the KCPL and GMO markets); *Cordova Energy Company LLC et al,* Docket Nos. ER99-2156-011, *et al.*, November 13, 2007 (finding no market power in case where applicant had EC market shares in PACE control area between 53.1% and 60.0%, HHIs between 2,958 and 3,696 and was pivotal in 8 out of 10 periods.); *PacifiCorp*, Letter Order, Docket Nos. ER97-2801-007, *et al.*, February 1, 2007; *Tucson Elec. Power Co.*, 116 FERC ¶ 61,051 (2006)(finding market power standard satisfied where applicant had EC market shares above 20% in all ten season/load periods in the Tucson control area, exceeded the 2,500 HHI threshold in eight periods, and was pivotal in 5 periods); *PacifiCorp*, 115 FERC ¶ 61,349 (2006) (finding that applicants rebutted presumption of market power in the PacifiCorp East control area where under available economic capacity measure, market share is less than 20% in 8 season/load periods and 28% in the summer and winter off-peak periods, HHI does not exceed 2500 in any season/load period and applicants are not pivotal); *Kansas City Power & Light Co.*, 113 FERC ¶ 61,074 (2005) (finding

a. Results of the DPT for PJM50 Submarket

For both the AEC and EC, PSEG passes all screens in all periods except for the pivotal supplier screen in the Summer Top 1% period.

b. Results of the DPT for PJME Submarket

With respect to AEC, PSEG passes all the screens in all 10 periods. With respect to the EC, PSEG passes the Market Concentration screens in all periods. It also passes the Pivotal Supplier Screen in 8 of 10 periods, and passes the Market Share Screen in 6 of 10 periods. PSEG's market shares are never above 25 percent. Although greater than the 20 percent screen, PSEG's market shares are well below the 35 percent threshold that is typically used for imputing unilateral market power.

3. Analysis of DPT Results

Based on his analysis of the overall results, Dr. Morris concludes that, although PSEG fails limited number of screens, the failures are substantially below levels that typically indicate market power. As set forth in his Affidavit, Dr. Morris states that:

> Although PSEG fails some screens in the PJME destination market, the overall results are not indicative of PSEG having market power. To begin, PSEG passes all the AEC screens and all market concentration (HHI) screens for EC. The HHI levels in all periods, capacity types, and areas are below the screening threshold of 2,500, and typically substantially below this level. In terms of the DPT for market rate authority and under the 2010 DOJ and FTC Horizontal Merger Guidelines, the market is not highly concentrated.[38] The low HHI levels mean that PSEG has little ability to exercise market power in coordination with other suppliers. It also passes all the AEC pivotal supplier screens, and most of the EC pivotal supplier screens. This means that typically PSEG's generation is not necessary to serve load; and when its generation is necessary, its forward sale commitments are sufficient so that its uncommitted generation is not necessary to serve the remaining load. Finally, PSEG's market shares are never above 15 percent in PJM50 and for AEC in PJM East. Its market shares for EC are never above 25 percent in PJM East. Although greater than the 20 percent screen, PSEG's market shares are

---

no market power in the KCPL control area where applicant had EC market shares above 20% in all periods, exceeded the HHI 2,500 threshold in 5 of 10 periods and was pivotal supplier in 1 period); *Acadia Power Partners, L.P.*, 113 FERC ¶ 61,073 (2005) (finding no market power in the Cleco Power home control where, utilizing the EC measure, the applicant exceeded the thresholds set for all season/load periods using the market share measure, one season/load period using the market concentration measure, and for all season/load periods using the pivotal supplier measure).

[38] See U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, Issued August 19, 2010, at Section 5.3, available at http://www.justice.gov/atr/public/guidelines/hmg-2010.html.

> well below the 35 percent threshold that is typically used for imputing unilateral market power.[39]

Dr. Morris's conclusion is consistent with Commission precedent finding a lack of market power in cases in which the DPT results included more instances of findings outside of the "safe harbor" thresholds and at higher levels than exist here.[40] In these circumstances, Dr. Morris's analysis successfully rebuts any inference of market power created by the WMSA screen failures for PJME.

4. Existing RTO/ISO Mitigation Rules Also Eliminate The Potential for Exercising Market Power In the PJME, PJME PJM50 and PJMAP Submarkets

PJM mitigation rules eliminate the potential for the exercise of market power in the PJME submarket. The MBR Order specifically contemplated that RTO/ISO mitigation rules may serve as evidence that any market power has been adequately mitigated. The Commission declared, "We believe the added protections provided in structured markets with market monitoring and mitigation generally result in a market where prices are transparent and attempts to exercise of market power will be sufficiently mitigated."[41] The Order on Rehearing went even further and specifically created a presumption that any potential market power had been adequately mitigated by an established and effective RTO market monitoring scheme.[42]

Taking account of the pervasive PJM mitigation rule, Dr. Morris concludes that these rules "fully address the potential for PSEG to exercise market power" in PJME.[43] Accordingly, PJM's mitigation schemes in place are sufficient to rebut any inference of market power created by the failure to pass the WMSA screens in PJME and PJM50.

In addition, in the Applicants' last triennial approval order, the Commission found that "the PJM market monitoring and mitigation rules are sufficient to address market power concerns in the PJM-East submarket."[44]

---

[39] *See*, *e.g.*, U.S. Department of Justice, 1984 Merger Guidelines, at Section 3.12, available at https://www.justice.gov/sites/default/files/atr/legacy/2007/07/11/11249.pdf ("the Department is likely to challenge the merger of any firm with a market share of at least one percent with the leading firm in the market, provided the leading firm has a market share that is at least 35 percent.")

[41] MBR Order at P 241.

[42] Order No. 697A at P 111.

[43] Morris Affidavit, pp. 24-26.

[44] *See* October 14, 2014 letter order approving Applicants' prior triennial market update in Docket No. ER10-1789-003 et al. at page 3.

a. The Applicants Lack Transmission Market Power and Cannot Erect Entry Barriers.

In its previous order accepting PSEG's triennial market power analysis for the Northeast Region, the Commission found that the submittal satisfied the Commission's requirements for market-based rates regarding vertical market power.[45] There have been no subsequent changes in status that would reflect a departure from the characteristics the Commission relied upon in granting market-based rate authority. As demonstrated below, neither Applicants nor any of its affiliates are able to exercise vertical market power.

Applicants are not able to exercise transmission market power. Neither Applicants nor any of their affiliates, except PSE&G, own transmission assets in the U.S. other than incidental generator interconnection facilities. PSE&G owns transmission facilities in PJM but transmission service over those facilities is provided under the PJM Open Access Transmission Tariff.

In addition, neither Applicants nor their affiliates are able to exercise vertical market power in wholesale energy markets through affiliation, ownership or control of inputs to electric power production. As required by Section 35.37(e) of the Commission's regulations, Applicants provide the following information:

(1) PSE&G owns and operates a natural gas distribution system that receives interstate pipeline gas within the State of New Jersey and distributes that gas to its customers within the State of New Jersey. The distribution system consists of 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3 and peak-shaving, liquefied petroleum gas and liquefied natural gas facilities, which are used to provide distribution service to retail customers. Service over such distribution facilities is made available pursuant to state regulated tariffs on an open access type basis. PSE&G was granted a Hinshaw exemption from the FERC in 1954.[46] The gas distribution rates paid by PSEG Fossil to PSE&G have been set at rates approved by the BPU in an order dated May 29, 2013.

(2) Certain of the Applicants and their affiliates own sites within the Northeast Region that would be suitable for future generating facilities. These include space at many of the existing generating sites of PSEG Fossil and at the sites of PSEG Power NY and PSEG Power CT. PSEG Nuclear's Salem facility may also be suitable for future construction. PSE&G also owns certain sites that would be suitable for generating facilities, but under New Jersey's Electric Discount and Energy Competition Act, N.J.S.A 48:3-43 et seq., PSE&G is effectively barred from owning and operating

[45] *Id.*
[46] 13 F.P.C. 1348 (1954).

generation except "on site" generation for supply and Class I renewable energy resources as defined in N.J.S.A. 48:3-98.1.

(3) Neither Applicants nor any of their affiliates own or control any physical coal supply resources or own or control who may access transportation of coal supplies.

(4) As required by section 35.37(e)(4) of the Commission's regulations, Applicants and its affiliates state that they have not erected barriers to entry into any market, including the PJM, NYISO or ISO-NE market and will not erect barriers to entry into any markets.

IV. REQUEST FOR CONFIDENTIAL TREATMENT

Under separate cover via UPS Overnight this office is submitting compact disks containing the workpapers of Dr. John Morris supporting his analysis in Appendix A, as required by the Commission's April 2004 Order.[47] The CD (of which six copies are included) contains: (i) proprietary information provided by Energy Velocity under an agreement that requires confidential treatment to be requested for these materials; (ii) modeling and computer programs that are the proprietary intellectual property of Economists Incorporated, the firm which employs Dr. Morris; (iii) commercially sensitive information about Applicants and their affiliates; and (iv) documents and information deemed to be confidential by PJM and ISO-NE. Accordingly, Applicants respectfully request confidential treatment for CD and the workpapers pursuant to 18 C.F.R. § 388.112 (2006), consistent with the confidential treatment accorded other applicants submitting such proprietary and commercially sensitive data.[48] Pursuant to the Commission's rules, the public version of this filing contains all materials submitted herein except for CD, which is labeled as "PRIVILEGED AND CONFIDENTIAL/NON-PUBLIC."

V. SERVICE

This filing has been served on all parties on the official service list as currently maintained by Commission in the above-referenced dockets. Applicants are also providing a copy to the New Jersey Board of Public Utilities and the New Jersey Division of Rate Counsel.

VI. ENCLOSURES

Applicants enclose the following:

- An original filing;

[47] AEP II, 107 FERC at P 61,087-88.

[48] *See, e.g., Idaho Power Company*, Docket No. ER97-1481-009 (February 3, 2006) (submission of revised Pivotal Supplier Screen and Market Share Screen calculations including similar data).

- Appendix A – Affidavit of Dr. John R. Morris;[49]
- Appendix B – List of Entities with Market-Based Rates Authority and Their Generation Assets. (This is an appendix listing the filing entities and all their energy affiliates and their associated assets);
- Appendix C – List of Entities with Market-Based Rate Authority and Their Transmission Assets;
- Appendix D – List of Long Term Power Purchase Agreements;
- Appendix E – Letters of concurrence regarding the control of certain jointly owned generation facilities;
- Appendix F – Form of notice suitable for publication in the Federal Register.

[49] Compact disks, as described above, containing the workpapers for the Affidavit of John R. Morris in Appendix A are being sent concurrently with this filing via UPS Overnight. As noted *supra*, privileged treatment is being requested for Dr. Morris's confidential workpapers submitted with the non-public version of this filing.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

VII. CONCLUSION.

Applicants respectfully request the Commission

(i) to accept this market power compliance filing as meeting the Commission's requirements under Order No. 697 for the continuation of market-based rate authority for Applicants PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Nuclear LLC, PSEG Fossil LLC, Pavant Solar II, LLC, Bison Solar LLC , San Isabel Solar LLC and PSEG Energy Solutions LLC;

(ii) to grant the request for confidential treatment; and

(iii) to grant such other relief or waivers as may be appropriate or necessary.

Respectfully submitted,

Public Service Electric and Gas Company
PSEG Energy Resources & Trade LLC
PSEG Power Connecticut LLC
PSEG Fossil LLC
PSEG Nuclear LLC
PSEG New Haven LLC
Pavant Solar II, LLC
Bison Solar, LLC
San Isabel Solar, LLC

NOTICE OF FILING
( )

Take notice that on December 28, 2016: (i) PSEG Energy Resources & Trade LLC, Public Service Electric and Gas Company, PSEG Power Connecticut LLC, PSEG New Haven LLC, PSEG Fossil LLC, PSEG Nuclear LLC, Pavant II Solar LLC, Bison Solar LLC, San Isabel Solar LLC and PSEG Energy Solutions LLC tendered for filing their joint triennial market power update in compliance with Order No. 679 and with prior Commission Orders granting them market-based rate authority in Docket Nos. ER99-3151, ER97-837, ER03-327, ER08-447 ER08-448, DR-12-1250, ER16-1926, ER16-1925, ER16-1924 and ER16-2725 respectively.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR §§ 385.211 and 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. Such notices, motions, or protests must be filed on or before the comment date. Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant. On or before the comment date, it is not necessary to serve motions to intervene or protests on persons other than the Applicant.

The Commission encourages electronic submission of protests and interventions in lieu of paper using the "eFiling" link at http://www.ferc.gov. Persons unable to file

electronically should submit an original and 14 copies of the protest or intervention to the Federal Energy Regulatory Commission, 888 First Street, N.E., Washington, D.C. 20426.

This filing is accessible on-line at http://www.ferc.gov, using the "eLibrary" link and is available for review in the Commission's Public Reference Room in Washington, D.C. There is an "eSubscription" link on the web site that enables subscribers to receive email notification when a document is added to a subscribed docket(s). For assistance with any FERC Online service, please email FERCOnlineSupport@ferc.gov, or call (866) 208-3676 (toll free). For TTY, call (202) 502-8659.

Comment Date: 5:00 pm Eastern Time on (insert date).
Kimberly J. Bose

Report & Affidavit of
Dr. John R. Morris

December 22, 2016

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Public Service Enterprise Group Incorporated Northeast Region Market Power Study

1. Introduction

My name is Dr. John R. Morris. I am a Principal at Economists Incorporated, an economic consulting firm located at 2121 K Street, NW, Washington, DC 20037. I have a bachelor's degree in economics from Georgetown University, and I have a master's degree and a Ph.D. in economics from the University of Washington. I have been studying and consulting within energy industries since joining the Federal Trade Commission in 1985. Since joining Economists Incorporated in 1992, I have consulted on many mergers involving electric and gas companies, examined competitive issues relating to utility rates, provided market power studies for applications for market-based rate authority, and studied market power issues in state restructuring proceedings. I have published articles on competition and energy matters, and I have spoken on numerous occasions concerning competition in natural gas, electric power and other industries. I have previously been accepted as an expert witness on energy matters before the Federal Energy Regulatory Commission ("FERC" or "Commission"), state commissions and in federal court. A complete listing of my experience, publications and testimony is contained in my resume, presented in Exhibit PEG-2.

Public Service Enterprise Group Incorporated ("PSEG") asked that I prepare a market power study for its subsidiaries that have market-based rate authority in the Northeast Region.[1] These subsidiaries are: Public Service Electric and Gas

[1] The Northeast Region includes ISO-New England Inc. ("ISO-NE"), Connecticut, Southwest Connecticut, New York Independent System Operator, Inc. ("NYISO"), PJM Interconnection, L.L.C. ("PJM"), PJM East, PJM East of 5004/5005 and PJM East of AP South.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

("PSE&G"), PSEG Energy Resources & Trade LLC ("PSEG ER&T"), PSEG Fossil LLC ("PSEG Fossil"), PSEG Nuclear LLC ("PSEG Nuclear"), PSEG Power Connecticut LLC ("PSEG Power CT"). PSEG New Haven LLC ("PSEG New Haven") Pavant II Solar LLC, Bison Solar LLC and San Isabel Solar LLC.[2] The purpose of this study is to determine whether these PSEG entities have market power in any Northeast Region market under the Commission's Pivotal Supplier Analysis ("PSA") and Wholesale Market Share Analysis ("WMSA") screens as articulated in FERC Order No. 697 and if the Applicants do fail any of the screens, whether they otherwise lack market power under the Delivered Price Test ("DPT") or are subject to sufficient mitigation to guard against any market power concerns.[3]

PSEG

PSEG is a public utility holding company headquartered in in Newark, New Jersey. Through its subsidiaries, PSEG engages in the generation, transmission, distribution and sale of electric energy, and distribution and sale of natural gas to commercial, residential, and industrial customers primarily in the Northeastern and Mid-Atlantic United States. PSEG, through its subsidiaries, owns approximately 11,300 MW of seasonal generation capacity located in the Northeast Region.[4]

---

[2] Pavant II Solar LLC, Bison Solar LLC and San Isabel Solar LLC all have QF status.

[3] *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, 119 FERC ¶ 61,295, ("Order No. 697" or "MBR Order"), *order clarifying final rule*, 121 FERC ¶ 61,260 (2007) ("MBR Clarifying Order"), *order on reh'g and clarification*, 123 FERC ¶ 61,055 (2008) FERC Stats. & Regs ¶ 31,268 ("Order No. 697-A"), *order on reh'g and clarification*, 124 FERC ¶ 61,055 (2008) ("SIL Allocation Order").

[4] *See* Exhibit PEG-3 (accounting for retirements).

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

PSE&G

PSE&G is a public utility operating company engaged primarily in the transmission of electricity and the provision of gas and electric distribution service in the State of New Jersey. It is New Jersey's oldest and largest investor-owned utility. PSE&G was founded in 1903 and is based in Newark, New Jersey. It is a member of the PJM Interconnection, L.L.C. ("PJM") Regional Transmission Organization and has made all of its transmission facilities available for open access transmission service pursuant to the PJM Open Access Transmission Tariff ("OATT") administered by PJM. The company also owns and operates 18,050 miles of gas distribution pipe and an additional 62 miles of gas transmission pipe, as that term is defined by the Department of Transportation Pipeline and Hazardous Materials Safety Administration Pipeline Safety Regulations Part 192, §192.3. During the study period, PSE&G owned less than 140 MW of solar generation, 8 MW of Energy Efficiency and 91 MWs of Demand Response but otherwise did not own or operate any electric generation facilities.

PSEG ER&T

PSEG ER&T does not own or operate any generation, transmission or distribution facilities. PSEG ER&T was formed to market the power that it purchases from its affiliates, including PSEG Fossil and PSEG Nuclear, each wholly-owned subsidiaries of PSEG Power LLC ("PSEG Power"), as well as from other sources, and to engage in wholesale marketing, brokering and trading and hedging activities. PSEG ER&T engages in the sale of electric energy, capacity and ancillary services pursuant to market-based rate authority granted by the Commission. PSEG ER&T also makes wholesale sales of natural gas.

Further details are provided with regard to the following wholesale power transactions or other arrangements to which PSEG ER&T is a party:

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

BGS Electric Sales. Pursuant to the Electric Discount and Energy Competition Act of 1999, N.J.S.A. § 48:3-49 *et seq.,* which initiated the transition from a regulated to a competitive retail power market in New Jersey, the New Jersey Board of Public Utilities ("BPU") annually approves statewide auctions to determine the entities that will supply Basic Generation Service ("BGS") in New Jersey. BGS, known in other states as "provider of last resort" service or "default" service, is electric generation service provided to the customers of an electric distribution company that have not chosen an alternative power supplier. PSE&G and other New Jersey electric utilities with franchised service territories are required to obtain all electric supply requirements through this BGS auction on an annual basis for retail customers that do not purchase electric supply from third-party suppliers. PSE&G's affiliate, PSEG ER&T, has participated directly in all of the auctions for BGS supply held since 2004 and has consistently won tranches in those auctions, including auctions for BGS service within the franchised service territory of PSE&G.

BGSS Gas Contract. By order issued April 16, 2002, the BPU approved a full requirements contract for the provision of gas supply by PSEG ER&T to PSE&G for the purpose of satisfying all of PSE&G's retail gas service obligations. As part of the transaction approved by the BPU, PSEG ER&T assumed, through capacity release, PSE&G's FERC-jurisdictional gas transportation and storage contracts with interstate pipelines then held by PSE&G. The BGSS gas contract, which currently remains in effect, provides for annual renewals unless terminated by either party on 12 months' advance written notice.

LIPA Fuel Supply. On November 26, 2013, PSEG ER&T executed an agreement with the Long Island Power Authority ("LIPA") under which

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

ER&T provides fuel supply and power supply management activities for LIPA as of January 1, 2015.

PSEG Fossil

PSEG Fossil owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission under the umbrella of PSEG Fossil's market-based rate authority.[5] The assets of PSEG Fossil are located entirely within PJM.[6] Since the last triennial filing in 2013, PSEG Fossil has retired approximately 1,800 MW of capacity in the eastern portion of PJM. Much of this capacity was retired at the end of May 2015. We included this capacity in the Winter and Spring season screens and exclude the capacity for the Summer and Fall screens.

PSEG Fossil is approximately a 23 percent joint owner of interests in the Conemaugh and Keystone generating stations located in Pennsylvania. An affiliate of NRG Energy is the operator.[7] PSEG Fossil is a 50 percent co-owner with Jersey Central Power and Light Company ("JCP&L") of the 400 MW Yards Creek pumped storage hydroelectric facility. JCP&L is the operator and makes dispatch decisions in accordance with the joint operating agreement applicable to

---

[5] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

[6] PSEG Fossil's subsidiaries PSEG Power Connecticut LLC, PSEG New Haven LLC and PSEG Power New York LLC own generation units in Connecticut and New York respectively.

[7] A letter of concurrence supporting the allocation of these facilities' output based on ownership interests is attached in our workpapers.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

the unit. Accordingly, for the purpose of this market power analysis, the entire unit capacity, nominally 400 MWs, has been assigned to JCP&L.[8]

PSEG Power CT

PSEG Power CT owns the Bridgeport Harbor and New Haven Harbor generation facilities located in the state of Connecticut within ISO-NE and is authorized to sell power at market-based rates.[9] The output of these facilities is sold to PSEG ER&T under an agreement entered into pursuant to PSEG Power CT's market-based rate authority. PSEG Power CT is currently constructing Bridgeport 5, a 485 MW gas-fired combined cycle in Bridgeport, Connecticut, which is expected in service in 2019.

PSEG New Haven

PSEG New Haven owns and operates the New Haven facility, a gas-fired plant located in New Haven, CT that entered service in June 2012 with a nameplate capacity of 181.5 MW. The New Haven facility was selected by the Connecticut Public Utilities Regulatory Authority ("PURA")[10] pursuant to a Connecticut statute that sought proposals for peaking generation in Connecticut.[11] All of the energy and capacity of the New Haven facility is sold

---

[8] A letter of concurrence supporting the allocation of this facility's output to JCP&L is attached in our workpapers.

[9] *Wisvest Corporation, et al*., 101 FERC ¶ 61,166 (2002).

[10] *Re Review of Peaking Generation Projects*, Docket No. 08-01-01, Connecticut Department of Public Utility Control, June 25, 2008 ("Awards Decisions") (2008 WL 2587405 (Conn. D.P.U.C.)). The PURA is the successor to the Department of Public Utility Control (DPUC). PURA came into being in July 2011 as part of a reorganization of Connecticut state energy agencies. For consistency, this application refers to the agency as the PURA.

[11] Section 50 of Public Act 07-242, now codified at Section 16-243u of the Connecticut General Statutes.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

into the ISO-NE markets, as directed by the PURA, pursuant to the Amended Peaking Generation Cost of Service Contract for Differences ("CFD") with Connecticut Light and Power Company ("CL&P"). The CFD approved by the PURA has a 30-year term and provides that PSEG New Haven will be paid its cost of service for the energy and capacity supplied thereunder.[12] As such, neither PSEG New Haven nor any other PSEG affiliate has operational control of the New Haven facility. As a result, the capacity of the facility is not attributable to PSEG for the purpose of this market power analysis.

PSEG Nuclear

PSEG Nuclear owns and operates electric generation facilities located within PJM and sells its entire output to its affiliate PSEG ER&T pursuant to cost-based contracts approved by the Commission in accordance with PSEG Nuclear's market-based rate authority.[13] PSEG Nuclear is the owner of Hope Creek and a joint owner of the Salem and Peach Bottom nuclear plants with Exelon Generation LLC ("Exelon Generation"). PSEG Nuclear operates the Salem plant and Exelon Generation is the operator of Peach Bottom.[14] Since the last triennial filing, uprates at Peach Bottom and Hope Creek plants have increased PSEG Nuclear's capacity at those facilities.

---

[12] The CFD was approved on October 29, 2010 in a letter order ruling on Motion Number 62 in Docket No. 08-01-01.

[13] *Public Service Electric and Gas Company, et al*., 88 FERC ¶ 61,299 (1999); *Public Service Electric and Gas Company*, Docket No. ER99-3151-001, Letter Order (issued February 4, 2000).

[14] A letter of concurrence supporting the allocation of plant output based on ownership interests is attached in our workpapers.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Other Subsidiaries

PSEG is also the direct or indirect parent of certain other subsidiaries engaged in energy related activities in the United States. Those additional subsidiaries of PSEG that may be considered relevant to this market power update for the PJM region are as follows.

PSEG Power LLC is a Delaware limited liability company. It does not directly own any generation facilities or engage in any FERC jurisdictional activities but it is the parent company of several FERC jurisdictional entities, including applicants PSEG ER&T, PSEG Fossil and PSEG Nuclear.

PSEG Power Ventures LLC ("Power Ventures") is a Delaware Limited Liability company and a direct subsidiary of PSEG Power. PSEG Power Ventures owns 100% interest in PSEG Solar Source LLC and has an in-direct ownership interest in a domestic power plant in Hawaii. PSEG Solar Source owns approximately 349 MWs DC (274 MW AC) of solar capacity across the United States, including a combined 92 MWs (72 MW AC) of solar capacity in PJM.[15] All of PSEG Solar Source's solar capacity has obtained QF status. Because all of this capacity is QF capacity, per Order No. 816 this capacity is not included in the market power analyses.[16]

---

[15] The 42MWs are attributed to four (7) separate project companies that have QF status: PSEG Solar Hackettstown LLC (2 MW); PSEG Solar Delaware LLC (15 MW), Rockfish Solar LLC (13 MWs) Meadows Solar (26 MW), Turkey Creek (17 MW) Hemlock Solar (7 MW) in North Carolina and PSEG Solar Ohio LLC (12 MW).

[16] *Refinements to Policies and Procedures for Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 816, 80 *Fed. Reg*. 67056 (2015), FERC STAT & REGS ¶ 31,374, P55 (2015), *reh'g denied and clarification*, Order No. 816-A, 155 FERC ¶ 61,188 (2016) ("… qualifying facilities that are exempt from FPA section 205 and facilities that are behind-the-meter facilities do not need to be reported in the asset appendix or indicative screens." (note omitted))

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

PSEG Resources LLC ("Resources") is a New Jersey limited liability company that provides energy infrastructure financing in developed countries. PSEG Resources invests primarily in energy-related financial transactions and manages a diversified portfolio of investments including leveraged leases. PSEG Resources owns interests, through leveraged leases, in various generation stations. Pursuant to the terms of these triple net leases, the lessee, not Resources, has all operational responsibility and control over the leased generation stations.

PSEG Power New York LLC ("PSEG Power NY") is a Delaware limited liability company that owns and operates the Bethlehem Energy Center ("BEC") located in the State of New York. The BEC Station is located within the NYISO and is an approximately 750 MW combined-cycle natural gas fired facility. PSEG Power NY sells the output of the BEC station to its affiliate PSEG ER&T pursuant to a cost-based contract.[17]

PSEG Keys Energy Center LLC ("PSEG Keys"), direct subsidiary of PSEG Fossil, was formed to construct, operate, and maintain the Keys Energy Center, a 755 gas-fired combined cycle facility located in Prince George's County, Maryland. Construction began in 2015 and is scheduled to be completed in 2018. All the capacity and energy from PSEG Keys will be sold to PSEG ER&T.

PSEG Energy Solutions LLC ("PSEG Solutions") is a direct subsidiary of PSEG ER&T that is schedule to begin retail operations in the Northeast Region in

[17] *PSEG Power New York Inc.,* Docket No. ER05-323-000, Letter Order (issued February 8, 2005).

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

January 2017. It has obtained market-rate authority to allow it to sell excess energy in wholesale markets.[18]

PSEG Long Island LLC ("Long Island") and Long Island Electric Utility Servco, LLC ("Servco") are both New York limited liability companies created to provide management, operations and maintenance services to the Long Island Power Authority with respect to the transmission and distribution ("T&D") system on Long Island, New York pursuant to a 12-year Operations Service Agreement beginning on January 1, 2014. Neither Long Island nor Servco are FERC jurisdictional public utilities, as neither will exercise ultimate decision making authority over the T&D system in Long Island. Long Island and Servco have received a declaratory order from FERC confirming this status and disclaiming jurisdiction.[19]

When an applicant has affiliates in the relevant market, the Commission considers the combined capacity of all the affiliated entities in its market power assessment.[20] Accordingly, I have included the capacity controlled by PSE&G, PSEG ER&T, PSEG Power CT, PSEG Fossil, PSEG Nuclear, and PSEG Power New York (which on a combined basis constitutes the capacity of all of PSEG's affiliates not excluded for a reason explained above). Future references in this Affidavit to PSEG are inclusive of the foregoing entities.

The primary purpose of this study is to determine whether PSEG passes the PSA and WMSA screen thresholds in ISO-NE, the NYISO and PJM. In the PSA, the Commission requires applicants to examine whether the generation owned by

the applicant is necessary to serve wholesale demand within a balancing authority area. The applicant first calculates the total generation capacity for an area. This is the total of generation in the balancing authority area plus the import capability to the area.[21] From this total, the applicant subtracts out firm contractual commitments, native load obligations, and operating reserves, giving uncommitted capacity for the area. Net uncommitted capacity is calculated by subtracting a wholesale load proxy from uncommitted capacity. Net uncommitted capacity is then compared to the applicant's uncommitted capacity within the area. When the applicant's uncommitted capacity is less than the net uncommitted capacity for the area, then all wholesale demand could be served without energy from the applicant and the applicant passes the PSA screen. When the applicant's uncommitted capacity is greater than the net uncommitted capacity, then the applicant does not pass the screen because its capacity is necessary to meet wholesale peak loads in the market.

In the WMSA, the Commission requires applicants to examine whether the generation owned by the applicant is 20 percent or more of the uncommitted capacity in each of four seasons under average daily peak conditions for the season. The applicant first calculates the total generation capacity for an area. The applicant then adds the import capability to the area. From this total, the applicant subtracts out planned outages and deratings, long-term firm contractual commitments, native load obligations, and operating reserves. The sum gives the total uncommitted capacity. The applicant then calculates its share by dividing its uncommitted capacity by the total uncommitted capacity. When the applicant's share is less than 20 percent, the applicant passes the WMSA screen.

---

[21] Import capability is the lesser of either the simultaneous import limit ("SIL") into the area or available capacity in interconnected balancing authority areas. Available capacity is equal to total generation capacity in an area less outages and derating, a native load proxy and operating reserves.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

The Commission presumes that an applicant does not have market power when it passes both the PSA and WMSA screens. If the applicant fails either of the screens, then the applicant may present other analyses to demonstrate that it does not possess market power. Alternatively, the applicant may propose mitigation measures or accept the Commission's default mitigation measures to demonstrate that it has mitigated market power.

2. New England

2.1. Overview of Electric Power Markets in New England

New England operates a competitive wholesale power market. Substantial restructuring has taken place in New England, and many of the vertically integrated utilities have sold either most or all of their generation assets. The traditional utilities often have standard offer obligations to serve retail customers, but utilities often fulfill these obligations by securing supplies in competitive wholesale markets. For example, a utility may secure contracts in which the supplier agrees to provide power for 30 percent of the utility's standard offer obligation. The transmission system is managed by ISO-NE. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

2.2. Geographic Markets

In the case of generation wholly located in an RTO, such as ISO-NE, the Commission accepts the RTO as the relevant destination market.[22] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[23] In New England,

[22] Order No. 697 at PP 231, 235.

[23] Order No. 697 at P 236.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

the Commission has identified two submarkets: Connecticut and Southwest Connecticut.[24] PSEG owns the Bridgeport Harbor plant in Southwest Connecticut. PSEG also owns the New Haven Harbor 1 unit in Connecticut and PSEG New Haven owns the New Haven facility. When the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[25] Accordingly, the PSA and WMSA are provided for the ISO-NE balancing authority area, and also for Connecticut and Southwest Connecticut.

2.3. Data Sources and Analysis

The data source for generation is ISO-NE Seasonal Claimed Capability (SCC) Reports.[26] Summer and winter capacities were taken from the November 2015 report. Planned outages are from the ISO-NE Form 714. Planned outages for Connecticut and Southwest Connecticut are prorated based on their shares of the total generation capacity in ISO-NE. PSEG's generation capacity in ISO-NE consists of the New Haven facility, New Haven Harbor and Bridgeport Harbor. PSEG's Northeast Region generation facilities are presented in Exhibit PEG-3.

Load data for ISO-NE are from Energy Velocity. Energy Velocity also provides load data by New England ISO zone, thus loads are calculated by sub-market as well. PSEG load obligations in New England come from PSEG's agreements to supply standard offer generation within Rhode Island. The data were supplied by PSEG.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Import capability was taken from the ISO-NE's December 20, 2016 FERC filing.[27] This report indicates that the simultaneous transfer limits in all seasons is 4,548 MW for the ISO-NE as a whole, 3,050 MW for Connecticut, and 2,370 (Spring) to 3,200 MW (Summer) for Southwest Connecticut. PSEG has no firm transmission rights into New England.

Operating reserves are calculated as follows. ISO-NE Operating Procedure No. 8 specifies spinning reserves (or 10-minute reserves) equal to the size of the loss of the largest unit times a Contingency Reserve Adjustment Factor ("CRAF").[28] The CRAF in 2015 was 1.25.[29] The largest unit is the 1,400 MW (summer capacity) Seabrook Unit 1. In addition, 30-minute reserves require capacity to cover 50 percent of the loss of a second contingency (i.e., the second largest unit) plus 160 MW for daylight-savings time periods and 180 MW during standard time (i.e., winter). The second largest unit is the 1,200 MW (summer capacity) Millstone Unit 3. Thus, in total, operating reserves are 2,510 MW in summer.[30] Operating reserves for Connecticut and Southwest Connecticut are based on resource needs in forward reserve auctions for 2015.[31]

2.4. Results

Exhibit PEG-4 summarizes the results for the PSA and the WMSA in New England. Exhibit PEG-5 shows the calculations to determine whether PSEG is a

pivotal supplier in the three New England destination markets. PSEG passes the PSA screen in all areas. Exhibit PEG-6 presents the WMSA results for the destination areas in New England. PSEG easily passes the WMSA in all areas.

3. New York

3.1. Overview of Electric Power Markets in New York

New York also has a competitive wholesale power market. Substantial restructuring has taken place in New York, and the investor-owned vertically integrated utilities have sold either most or all of their generation assets. These utilities often have standard offer obligations to serve retail customers, and utilities can fulfill these obligations by securing supplies in competitive wholesale markets. The transmission system is operated by the NYISO, which also operates a competitive wholesale market. The market has a market monitor and market power mitigation program in place to identify and to mitigate any potential exercise of market power.

3.2. Geographic Markets

In the case of generation wholly located in an RTO such as the New York ISO, the Commission has accepted the RTO as the relevant destination market.[32] PSEG only owns generation in Albany, New York. In addition, when the applicant does not own the transmission system, as in the instant case, the applicant needs to provide an analysis only for the balancing authority area to which the generation is interconnected.[33] Accordingly, the PSA and WMSA are provided for the NYISO only.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

3.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Operations database. Planned outages are from the FERC Form 714. PSEG's generation capacity in New York consists of its ownership of the Bethlehem Energy Center in Albany, which has winter capacity of 845 MW. Information for PSEG's Northeast Region generation is presented in Exhibit PEG-3.

Load data for NYISO were downloaded from Energy Velocity.

Import capability comes from the most recent NYISO SIL filing as of December 19, 2016.[34] This filing indicates that ISO simultaneous import capability ranges from 6,850 MW in spring to 7,695 MW in summer. NYISO does not recognize physical imports, accordingly, all the SIL import capability is allocated pro rata, except for a 265 MW reservation that PSEG has from PJM to New York on the Linden VFT DC transmission line.

Operating reserves are calculated as follows. The NYISO Locational Reserve Requirements specify 30-minute total reserves equal to twice the 10-minute reserve necessary to replace the operating capability loss caused by the most severe contingency under normal transfer conditions. Thus, the operating reserves for the NYISO are 2,620 MW for each season.[35]

3.4. Results

Exhibit PEG-7 shows the calculations to determine whether PSEG is a pivotal supplier in New York, and PSEG passes the PSA screen. Exhibit PEG-8 presents the WMSA results for New York, and PSEG easily passes the WMSA.

4. PJM

4.1. Overview of Electric Power Markets in PJM

PJM operates a competitive wholesale power market and serves as the regional RTO for an area that covers all or parts of 13 states and the District of Columbia. PJM also plans and operates the transmission system within the RTO. Monitoring Analytics acts as the market monitor, and has a market power mitigation program in place to identify and mitigate any potential exercise of market power.

4.2. Geographic Markets

PSEG owns both generation and transmission facilities in PJM. In the case of generation wholly located in an RTO such as PJM, the Commission has accepted the RTO as the relevant destination market.[36] When the Commission has identified a sub-market within an RTO, the applicant must also provide market power screens for the relevant sub-markets.[37] In PJM, the Commission has identified three submarkets: PJM East ("PJME"), PJM East of 5004/5005 ("PJM50") and PJM East of AP-South ("PJMAP").[38] The PSA and WMSA are provided for PJM and for the PJME, PJM50 and PJMAP sub-markets.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

4.3. Data Sources and Analysis

The principal data source for generation is the Energy Velocity Market-Ops database. Generation within PJM was assigned to submarket consistent with the definitions in PJM's SIL Study.[39] Planned outages are from the FERC Form 714. In addition, for the sub-market analysis, planned outages were allocated to PJME based on the share of total PJME generation, by season. Information for PSEG's generation in PJM and PJME is presented in Exhibit PEG-3.

Load data for PJM was downloaded from Energy Velocity. Energy Velocity also provides load data by PJM zone, thus loads are calculated for the PJM sub-markets as well.

Import capability was taken from the 2015 Simultaneous Import Limit Study Report.[40] This report indicates simultaneous transfer limits of 11,997 MW in the winter and 7,600 MW in summer. Additionally, this report indicates transmission capabilities of the PJM sub-markets. The report conservatively uses the reported SIL as the SIL amount to be allocated pro rata. This is a simplifying assumption because PSEG has no firm transmission reservations into PJM and it effectively excludes the additional 8,500 MW of firm reservations into PJM in the base case of the SIL study.

Stats, & Regs. ¶ 31,268 (2008) at P 90; Order Conditionally Authorizing Merger and Disposition of Jurisdictional Facilities, *Exelon Corporation, et al.*, 138 FERC ¶ 61,167 (2012).

[39] PJM Interconnection, L.L.C., *Informational Filing of 2015 Simultaneous Import Limit Study Report for PJM Region*, Docket No. AD1-2-007, September 2, 2016, Accession No. 20160902-5155.

[40] *Id*.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

Operating reserves are calculated according to PJM Manual 13 as the sum of Day Ahead Scheduling Reserves (Operating), Contingency (Primary) and Synchronized (Spinning Reserve) Requirements.[41]

Data on PSEG's long-term contracts come from PSEG. The contracts were included in the area where the energy is delivered under the contract. For contracts delivered to the Western Hub in PJM, the contracts were included in the PJM, PJM50, and PJMAP destinations and not the PJME destination.

4.4. Results

Exhibit PEG-9 summarizes the results for the PSA and the WMSA in PJM. Exhibit PEG-10 shows the calculations to determine whether PSEG is a pivotal supplier in the four PJM destination markets. PSEG passes the PSA screen for all four destinations. Exhibit PEG-11 presents the WMSA results for the destination markets in PJM. PSEG easily passes the WMSA in PJM and PJM east of AP South, but has greater than a 20 percent market share in the PJM East and PJM East of 5004/5005 destination markets.

5. Delivered Price Test

When an applicant does not pass either the PSA or WMSA for a destination market, the Commission invites the applicant to provide additional information via a delivered price test ("DPT"). PSEG requested that I perform a DPT for the PJM East and PJM East of 5004/5005 sub-markets. Accordingly, I now discuss the DPT for these sub-markets.

[41] PJM Manual 13 - Emergency Operations, at 17, available at http://pjm.com/~/media/documents/manuals/m13.ashx

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

5.1. Overview of the DPT

The DPT utilizes substantially more information than the PSA or the WMSA, including additional information on generation ownership, generation costs, demand conditions, and transmission limits. The Commission considers two types of capacity: Economic Capacity ("EC") and Available Economic Capacity ("AEC"). EC is the capacity that can be delivered to a destination market for 105 percent or less than the market price. AEC is calculated by subtracting load commitments from EC. EC and AEC are calculated for a number of different seasonal and load conditions.

Because we do not know the firm retail obligations of the competitive suppliers, as explained below, the AEC calculation is based on the assumption that market participants serve load in proportion to their generation capacity and that 70 percent of load obligations are contracted more than one year from delivery.

For both the EC and AEC measures, the Commission prescribes three screens: (1) a pivotal supplier screen; (2) a market share screen; and (3) a Herfindahl-Hirschman Index ("HHI") screen. The HHI is the sum of the squared market shares of the firms in the market. So a market with four firms of market shares of 40, 30, 20, and 10 percent would have an HHI of 3,000 (this is calculated as $40^2 + 30^2 + 20^2 + 10^2 = 1{,}600 + 900 + 400 + 100 = 3{,}000$). A monopolist would produce a HHI of 10,000 and 10 equally-sized firms would produce a HHI of 1,000.

Although the Commission has not drawn bright lines for its review of DPT results, it has given general guidance. When (1) the applicant is not pivotal; (2) the applicants' market share is less than 20 percent; and (3) the HHI is below 2,500, the Commission is likely to conclude that the applicant does not have market power. The three standards establish a "safe harbor" for lack of market power, unless intervenors present clear and convincing contrary evidence. The Commission has also determined in some cases that an applicant did not have

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

market power when the analysis showed isolated HHI and market share results above screening levels. Finally, despite the DPT results, the Commission may conclude that an applicant does not have market power if other evidence, such as historical sales data, indicates that the DPT results do not reflect the actual competition in the marketplace.

A detailed description of data sources and methods to prepare the data for the DPT is presented in Exhibit PEG-12. An overview of the sources and methods used at Economists Incorporated for conducting the DPT is presented here.

The DPT is calculated for 10 representative periods, three for each of three seasonal conditions plus a summer super peak period. The three seasons are spring/fall, summer, and winter. Each season is divided into (1) top 10 percent of peak hours; (2) remaining peak hours; and (3) off-peak hours. In addition, there is a summer super peak period which is comprised to the top 1 percent (10 hours) of summer peak hours. These ten periods cover the range of load conditions for each season, and for the year as a whole.

The primary source for generation data is Energy Velocity. In addition to generation capacity, Energy Velocity provides data on ownership (including holding companies), fully-loaded heat rates, emission rates, and generation availability. Generation is included for all of PJM and NYISO, which is the only first-tier balancing authority area in which PSEG owns generation. Unit capabilities are derated to account for seasonal maintenance and likely plant unavailability due to forced outages. Because demand in PJM peaks in summer and winter, the planned outages are assumed to be during the spring/fall season.

The transmission system is represented by contract paths between balancing authority areas and within PJM. Limits between regions in PJM are from Energy Velocity.

Market prices come from hourly prices reported by PJM.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

As in the PSA and WMSA, load data come from Energy Velocity. To compute load requirements for market participants, we apportion the total load in each market area in New York and PJM to all suppliers in proportion to their respective generation capacities. We assumed 70 percent of load is committed for a year or longer and the remaining 30 percent is contracted for shorter periods.[42] To account for their greater load obligations, we assume that Dominion, which does not operate in a restructured retail market, has 100 percent responsibility for its allocation of load and that AEP, which operates in a partly restructured retail market, has 90 percent of its allocation as opposed to the standard 70 percent.

The DPT and market share calculations were calculated using the Power Acquisition Screening System developed at Economists Incorporated. The mathematical details are presented in Exhibit PEG-13.

5.2. Results of the DPT for PJM50 Sub-market

The results of the DPT for PJM50 are presented in Exhibit PEG-14. The top part of the exhibit shows the results for AEC. PSEG passes the Pivotal Supplier Screen in all 10 periods. PSEG also passes both the Market Share Screens and the HHI Screens in all 10 periods.

The lower part of Exhibit PEG-14 shows the results for EC in PJM50. PSEG passes all the screens in all the periods, except for the pivotal supplier screen in the Summer Top 1% period.

[42] This is a reasonable estimate for the long-term load coverage since this number is generally between 60 and 80 percent for most generation suppliers in restructured markets.

20161228-5212 FERC PDF (Unofficial) 12/28/2016 11:58:46 AM

5.3. Results of the DPT for PJME Sub-market

The results of the DPT for PJME are presented in Exhibit PEG-15. The top part of the exhibit shows the results for AEC. PSEG passes all the screens for AEC.

The lower part of Exhibit PEG-15 shows the results for EC in PJME. PSEG passes the Market Concentration screens in all periods. It passes the Market share screens in six of ten periods, and its market share is never more than 25 percent. It passes the pivotal supplier screen in eight of ten periods.

5.4. Analysis of the DPT Results
