- The market's ability to increase production of remaining fuels, including diesel fuel, to meet increased need for the fuel in light of other demands for that fuel.

- A load impact analysis detailing the consequences if load is unable to be served for a prolonged period of time. This analysis should detail multiple disruption and time combinations (e.g., 50% of load for one week, 75% of load for two weeks, etc). The analysis should include:
  - The financial impact to economy of the region.
  - The security of the region (e.g., loss of other critical infrastructure and life sustaining services).
- A contingency analysis detailing the ability of the system to withstand (for both short- and long-term) electric and gas failures. This analysis should model both existing and future generation mixes. The analysis should include:
  - Single gas pipeline failure.
  - Multiple gas pipeline failures (including shared right of ways and crossings).
  - Coordinated attacks on multiple gas pipelines supplying the majority of an organized market's gas.
  - Loss of all pipelines controlled by single company whether as a result of a physical or cyberattack.
  - Coordinated gas pipeline/electric failures.
- An assessment of the adequacy of existing capacity constructs in light of the resiliency findings, and suggestions of what changes need to be made.[68]

[68] *See* Stockton Testimony at 19-21,

SI-SSA-0010-2959

PJM has already begun a component of this process and started to consider the consequences of the loss of a single pipeline standing alone. This study indicated that in PJM, more than 11 GW of generation is connected to a single pipeline.[69] A disruption of that pipeline would be catastrophic. While PJM is ahead of other RTOs in initiating a planning process,[70] its analysis needs to more robust. For example, PJM should consider the loss of multiple pipelines simultaneously because of the real risk that terrorists or foreign governments might target multiple infrastructure components simultaneously,[71] as well as the risk that an attack on the pipeline system could be accompanied by an attack on components of the electric system. It should also consider the increased risk that will occur if more coal and nuclear units retire and leave the grid even more dependent on natural gas. The reporting requirements outlined above will help improve that planning process.

The other two RTOs need to rapidly advance and expand the planning process as well. NYISO has begun to study whether its system has adequate fuel assurance, recently seeking comment on an evaluation it commissioned the Analysis Group to perform.[72] Unfortunately, while ISO-NE similarly has been evaluating the fuel security of its region, and has "identified fuel security as one of the potential risks to future system reliability," it has nevertheless decided to

---

[70] Stockton Testimony at 18-19.

[71] *Id.* at 19.

[72] *See* Analysis Group, *Capacity Resource Performance in NYISO Markets, An Assessment of Wholesale Market Options*, at 18, 26 (Sept. 2017), *available at* http://www.nyiso.com/public/webdocs/markets_operations/committees/bic_icapwg/meeting_materials/2017-09-28/Analysis%20Group%20Draft%20Capacity%20Resource%20Performance%209-26-17.pdf (noting that "[t]he potential for growing future reliance on gas-fired resources suggests that further attention to fuel-related performance may be important to preventatively addressing potential system reliability risks").

"delay finalizing the study until the FERC has provided direction to the industry on how to interpret the DOE NOPR," suggesting that it will release the study "once the NOPR is sufficiently resolved."[73] ISO-NE's decision to delay its release of data is difficult to understand and unfortunate because it deprives commenters and experts in this proceeding of relevant data that would be highly relevant to FERC's response to the NOPR.

The Commission should urge PJM and NYISO to expeditiously complete their studies, and should not countenance ISO-NE's decision to shield its evaluation from public view. Rather, the Commission should order the RTOs to report promptly on their progress in conducting these types of planning efforts.

C. A Final Rule Is Urgently Needed, But Further Action Should Be Informed by a Design Basis Threat Analysis.

Before adopting a final rule to address the need to ensure resilience, the Commission should collaborate with other federal agencies to conduct a design basis threat analysis to measure the resiliency of the grid.[74] Exelon believes DOE might be well-situated to spearhead this analysis given its access to information, its expertise, and its relationship with the intelligence community. Here, such an analysis would help identify what vulnerabilities exist and must be addressed to ensure resiliency. The assessment should account for likelihood that a natural or manmade interruption in the energy sector might disrupt multiple pipelines simultaneously as well as other serious risks.[75]

---

[73] ISO New England, Study on Regional Fuel Security to be Delayed Pending Resolution of DOE Proposal on Grid Resiliency Pricing (Oct. 13, 2017), https://www.iso-ne.com/static-assets/documents/2017/10/20171013_fuel_security_analysis_delay_final.pdf.

[74] As Dr. Stockton explains, the Nuclear Regulatory Commission provides its licensees with such a threat assessment to help safeguard nuclear reactors. Stockton Testimony at 22.

[75] *Id.* at 19.

Once the Commission has a more detailed understanding of the bulk power system's vulnerabilities, and which of those vulnerabilities most urgently need to be addressed, it will be able to decide what steps must be taken to counter those threats and the best means of doing so. It can then order the organized markets to adopt tariffs that address this threat, and ensure that generators that provide vital and needed resiliency are able to do so in the years ahead. In considering whatever final action it decides to take, the Commission will need to solicit commentary and analysis from a wide array of stakeholders and market participants. But, regardless of whatever process the Commission deems necessary in coming to a final rule, it should act quickly and not allow the critical resiliency deficiencies that currently endanger the bulk power system to persist.

There are undoubtedly numerous ways markets could be reformed once the appropriate design basis is identified, and the Commission should expect the RTOs to develop solutions that best harmonize with their existing market designs. Key among these is providing sufficient financial support to units that currently make important contributions to system-wide resiliency, so that these units can continue operations and are not forced into retirement. As Dr. Stockton explains,

> Increased dependence on a single type of fuel heightens the risks of common mode failures: that is, the danger that a single attack vector (especially via cyber means) could enable the adversary to disrupt fuel supplies for power generation across major portions of the United States. A significant interruption of the natural gas supply available for electric generation can dramatically reduce the supply of electricity available to serve load. For example, a large-scale disruption of a natural gas pipeline would prevent that pipeline from delivering natural gas to the generators it serves. It would also incapacitate any downstream pipeline dependent on it as a source of gas. Because gas is delivered close in time to its use as a fuel for electric generation, the system would have little time to respond to the loss of a pipeline. Preserving a diverse generation mix that relies on multiple sources of fuel is essential to reducing this risk.[76]

[76] Stockton Testimony at 9.

SI-SSA-0010-2962

The Commission should ensure, however, that market reforms achieve the Design Basis Threat with a high degree of certainty and minimize total system costs in doing so. It may be the case, for example, that compensating an existing resilient unit for its costs of operation is less expensive than building new plants or retrofitting an existing plant to be equally resilient. In other words, providing cost of service payments may be in customers' best interests.

In conclusion, Exelon applauds DOE's focus on the threat posed to consumers and the bulk power system by insufficiently resilient generation. The wholesale markets have a long history of successfully delivering reliable and reasonably priced power to consumers at just and reasonable rates. But they need reform to ensure that the grid retains its most resilient resources.

CONCLUSION

The risks of non-action are real and potentially grave. The declining fuel security of the power system and increased reliance on a vulnerable natural gas pipeline system has created a real possibility of widespread, long-duration blackouts that would have catastrophic consequences. The American public cannot afford to take that risk. Fortunately, solutions exist if we have the stimulus to pursue them. We look forward to working with the Commission to develop those solutions.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	**)**	**Docket No. RM18-1-000**

PREPARED DIRECT TESTIMONY OF

DR. PAUL STOCKTON

ON BEHALF OF

EXELON CORPORATION

OCTOBER 23, 2017

I. BACKGROUND AND QUALIFICATIONS

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Paul Stockton. My business address is 325 7th Street NW, Suite 250, Washington D.C. 20004.

Q. DR. STOCKTON, BY WHOM ARE YOU EMPLOYED AND IN WHAT POSITION?

A. I am the Managing Director of Sonecon LLC, a security and economic advisory firm in Washington, DC.

Q. PLEASE DESCRIBE YOUR PROFESSIONAL QUALIFICATIONS, EMPLOYMENT EXPERIENCE, AND EDUCATIONAL BACKGROUND

A. I graduated with a Bachelor of Arts degree s*umma cum laude* from Dartmouth College and received a Ph.D. from Harvard University. From June 2009 until January 2013, I served as the Assistant Secretary of Defense for Homeland Defense and Americas' Security Affairs. In that position, I was responsible for Defense Critical Infrastructure Protection and led the creation of the Department's Mission Assurance Strategy. I also served as the Domestic Crisis Manager for the Department of Defense (DOD) and was responsible for Defense continuity of operations. I was the principal civilian advisor to the Secretary of Defense for providing Defense support to Federal Emergency Management Agency, the Department of Energy (DOE) and other Federal departments in Superstorm Sandy, Hurricane Irene, and other disasters. In addition, I was responsible for developing and overseeing the implementation of DOD security policy in the Western Hemisphere, including U.S.-Canada

cooperation on Defense-related issues concerning energy sector resilience. From January 2012 until January 2017, I served as a Special Government Employee for the Department of Defense, and helped conduct studies to strengthen deterrence of cyberattacks, counter insider threats, and meet other infrastructure resilience challenges. I was twice awarded the DOD Medal for Distinguished Public Service, the Pentagon's highest civilian honor, and a Distinguished Public Service Medal from the Department of Homeland Security.

Q. WHO IS SPONSORING YOUR TESTIMONY?

A. My testimony is sponsored by Exelon. My testimony reflects my informed opinion and does not necessarily reflect the perspectives and policies of the Department of Defense or any other government department or agency.

Q. HAVE YOU PREVIOUSLY TESTIFIED BEFORE THE COMMISSION?

A. In June 2016, I testified at the Commission's Reliability Technical Conference in Docket AD16-15-000.

Q. PLEASE DESCRIBE THE BASIS FOR YOUR FAMILIARITY WITH GRID RESLIANCE PLANNING EFFORTS.

A. In addition to my professional experience, I am the author of multiple works that examine the severe threats to energy sector resilience, and analyze measures that policymakers and stakeholders can take to reduce those risks. In 2016, I authored *Superstorm Sandy: Implications for Designing a Post-Cyber Attack Power Restoration System*, published by Johns Hopkins University Applied Physics Laboratory; *Electric Grid Protection Handbook*

II, Volume 1: Resilient Fuel Resources for Power Generation in Black Sky Events, published by the Electric Infrastructure Security Council; and co-authored the Homeland Security Advisory Council's *Final Report by the Cybersecurity Subcommittee: Incident Response.* I am also widely published on other issues of homeland security, national defense and infrastructure resilience, including *Resilience for Black Sky Days: Supplementing Reliability Metrics for Extraordinary and Hazardous Events*, prepared for the National Association of Regulatory Utility Commissioners.

II. PURPOSE OF TESTIMONY AND CONCLUSIONS

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. I examine how the increased reliance on natural gas for power generation is creating new risks to electric grid resilience, and analyze the implications for U.S. national security. I evaluate the adequacy of current measures to assess and mitigate these risks. I also propose measures to strengthen the resilience of the grid, and meet the challenges highlighted by the Department of Energy.

Q. COULD YOU PLEASE SUMMARIZE YOUR CONCLUSIONS?

A. I believe that this proceeding provides an opportunity to address the risks created by the growing dependence of the electric grid on natural gas as a fuel source. My testimony addresses three overall findings. *First*, the growing dependence of power generation on natural gas poses potential risks to U.S. national security. *Second*, current initiatives to identify and mitigate risks arising from gas-electric system interdependencies are not adequate. *Third*, before the Commission can decide on appropriate actions to help

strengthen fuel resilience, I believe that significant additional analysis will first be required to clarify the attributes of fuel resilience, develop metrics to assess them, and specify the threat against which fuel resilience should be measured. In particular, I recommend that a government agency (in consultation with appropriate Bulk Power System (BPS) entities) establish a Design Basis Threat (DBT) to help assess fuel resilience for power generation and that FERC gather additional data on the current status of resilience efforts. Finally, the Commission, in conjunction with other agencies, should implement measures that will ensure that resiliency is preserved.

Q. PLEASE SUMMARIZE YOUR FIRST FINDING. WHAT ARE THE POTENTIAL RISKS TO U.S. SECURITY POSED BY EMERGING THREATS TO ELECTRIC AND GAS SYSTEMS?

A. Russia, China, North Korea, and other potential adversaries may seek to disrupt U.S. defense capabilities by attacking the critical infrastructure on which our military bases rely. DOD's Mission Assurance Strategy emphasizes that "The Department of Defense's ability to ensure the performance of its Mission-Essential Functions (MEFs) is at growing risk. Potential adversaries are seeking asymmetric means to cripple our force projection, warfighting, and sustainment capabilities by targeting critical Defense and supporting civilian capabilities and assets – within the United States and abroad –on which our forces depend."[1]

[1] Department of Defense, *Mission Assurance Strategy*, April 2012, p. 1, http://policy.defense.gov/Portals/11/Documents/MA_Strategy_Final_7May12.pdf.

The power grid and fuel supplies for power generation are potential targets for these adversaries. While military installations and other national security facilities are strengthening their emergency power capabilities to serve their critical loads, long duration, wide area power outages could jeopardize their ability to execute their MEFs. We must assume that adversaries know this – and, accordingly, that in future conflicts they will attack the power grid and the flow of gas on which power generation increasingly relies.

Q. PLEASE SUMMARIZE YOUR SECOND FINDING. ARE CURRENT EFFORTS TO IDENTIFY AND MITIGATE RISKS STEMMING FROM INCREASED RELIANCE ON NATURAL GAS ADEQUATE TO ENSURE RESILIENCE?

A. No. Existing BPS reliability standards focus on protecting and maintaining the reliability of BPS systems and functions. These standards do not apply to the gas systems that are increasingly vital for power generation. Indeed, no mandatory standards exist for gas system reliability that are remotely equivalent to those that help strengthen the BPS against attack. Current efforts to provide dual-fuel capability for natural gas plants are not sufficient. While some planning efforts have begun, they do not go far enough.

Q. PLEASE SUMMARIZE YOUR THIRD FINDING. HOW CAN THE COMMISSION BEST ADVANCE GRID RESILIENCE?

A. As measures go forward to strengthen fuel resilience, and thereby bolster U.S. security, Commissioners should take a holistic approach that will involve collaboration with a range of government and private sector entities. Work should begin immediately to develop a detailed assessment of the risks being created by increasing gas-electric system

interdependencies. In my testimony that follows, I highlight a number of requirements for further analysis, including reporting requirements for RTOs to understand the current state of resiliency.

The Commission also should seek the creation of a DBT to help assess the resilience of fuel supplies for power generation and the potential value of measures taken to improve that resilience. Modelled on the approach of the Nuclear Regulatory Commission, a DBT should consider the type, composition, and nature of risks to resiliency including both catastrophic natural and manmade hazards.[2] That DBT should account for the risk –indeed, the likelihood – that if a major power decides to attack the U.S. energy sector, they will not merely strike a single pipeline, but seek to disrupt *all* major pipelines in a given region. Finally, implementation measures should be taken to ensure that the threat is appropriately mitigated and resiliency is preserved.

III. EMERGING RISKS TO RESILIENCY

Q. DID THE DEPARTMENT OF ENERGY FIND A RISK TO RESILIENCY FROM RELIANCE ON NATURAL GAS?

A. Yes. DOE's Notice of Proposed Rulemaking takes a crucial step forward to clarify these risks and highlight the value of measures to mitigate them. From 2002 until 2016, the share of electricity generated by gas-fired units increased from 18% to about 34% while the share

[2] *See* Nuclear Regulatory Commission Glossary, Design Basis Threat; https://www.nrc.gov/reading-rm/basic-ref/glossary/design-basis-threat-dbt.html (defining a design basis threat); 10 CFR § 73.1(a) (outlining particular threats).

generated by coal fell from about 50% to about 30%.[3] Risks of mutually-reinforcing failures between gas and electric systems have grown accordingly. DOE found that "the electric sector's growing reliance on natural gas raises concerns regarding the ability to maintain BPS reliability when facing constraints on the natural gas delivery systems."[4] Other key BPS stakeholders have reached similar conclusions. For example, Gerry Cauley, President and CEO of NERC, emphasizes that "[g]rowing reliance on natural gas continues to raise reliability concerns regarding the ability of both gas and electric infrastructures to maintain the BPS reliability at acceptable levels."[5]

Q. WHAT SPECIFIC RISKS DO YOU SEE?

A. In addition to the risks specified in the Notice, I would call the Commission's attention to three specific challenges: *First*, reliance on a single fuel creates the danger of "common-mode failures" where a lack of natural gas incapacitates multiple generators at the same time. *Second*, such failures could help create "black sky" power outages, which would entail outages lasting a month or more over multiple regions of the United States.[6] *Third*, rising gas-electric interdependencies create dangers of mutually-reinforcing failures.

[6] Paul Stockton, *Resilience for Black Sky Days: Supplementing Reliability Metrics for Extraordinary and Hazardous Events*, at 3, National Association of Regulatory Utility Commissioners (2014).

Q. PLEASE DESCRIBE HOW RELIANCE ON A SINGLE FUEL CAN MAGNIFY RISKS OF COMMON-MODE FAILURES.

A. Increased dependence on a single type of fuel heightens the risks of common mode failures: that is, the danger that a single attack vector (especially via cyber means) could enable the adversary to disrupt fuel supplies for power generation across major portions of the United States. A significant interruption of the natural gas supply available for electric generation can dramatically reduce the supply of electricity available to serve load. For example, a large-scale disruption of a natural gas pipeline would prevent that pipeline from delivering natural gas to the generators it serves. It would also incapacitate any downstream pipeline dependent on it as a source of gas. Because gas is delivered close in time to its use as a fuel for electric generation, the system would have little time to respond to the loss of a pipeline. Preserving a diverse generation mix that relies on multiple sources of fuel is essential to reducing this risk.

Q. WHAT WOULD BE THE CONSEQUENCES OF A "BLACK SKY" OUTAGE?

A. A black sky power outage would inflict immense disruption on national security, the U. S. economy, and public health and safety.

Q. WHY WOULD THE HARM BE SO SEVERE?

A. Many critical infrastructure systems and facilities have backup power generators and stored on-site fuel to keep them operating for a few days in a limited power outage. However, in a black sky event, the extensive length and geographic scope of power outages would soon produce failures in emergency power assets and the infrastructure system that rely on them.

Blackouts of this severity would cause cascading failures across multiple critical infrastructure sectors. As highlighted in recent hurricane events, generators will quickly break down through overuse. Demand for replacing them in a wide-area outage will rapidly outstrip available supplies, given the vast number of facilities that will require such replacements. Moreover, on-site fuel supplies for emergency generators will quickly be depleted. Massive, multi-sector requirements for fuel resupply will emerge. Contractors responsible for sustain resupply operations will be unable to meet these requirements, especially since transportation systems, refinery operations, and other systems on which these contractors depend will also be disrupted in a black sky outage. Hospitals would exhaust their ability to rely on backup power. Food manufacturing and distribution networks would cease to function. Other critical infrastructure sectors would also likely collapse. For example, water, wastewater, and cellular systems rely on a functioning power grid and are not currently prepared for such an event. A black sky event would likely disable those systems for sustained periods of time leaving them unavailable to the public. Finally, national defense installations would begin to fail. Domestic military facilities can operate without power for short periods of time but most are not designed to be independent of the electric grid for extended periods of time. Electric power is necessary to keep them in operation because they require access to transportation fuel, communication networks, water and wastewater systems that need electricity to operate. The net result: black sky outages will have catastrophic effects on national security, the U.S. economy, and public safety. Adversaries seeking to achieve such effects will therefore be all the more tempted to build capabilities to create black sky events, and exploit the gas-electric interdependencies that could contribute to the severity of future blackouts..

Q. HOW COULD GAS-ELECTRIC INTERDEPENDENCIES CREATE MUTUALLY REINFORCING FAILURES?

As natural gas has become an increasingly important fuel for electric generation, natural gas pipelines have also come to rely on electricity to function. Key components of gas pipeline systems, including the compressors and industrial control systems that keep gas flowing to power generators and other users, are more reliant on electric power. Gas pipeline systems need compression pumps to sustain the flow of gas. Historically, these compressors were fueled with gas taken from the pipelines themselves. However, in many regions of the United States, these compressors are being replaced by variable speed electric-powered units to reduce onsite methane emissions and increase compressor efficiency. Black sky outages could interrupt the flow of electricity to these units, and (in a classic case of spiraling effects) magnify those outages by disrupting gas deliveries to power generators essential for power restoration.[7] Some compression stations do have emergency power generators and at least some on-site fuel to sustain operations in a blackout. However, as noted above, fuel resupply operations for these stations will be at risk of catastrophic disruption in long duration, wide area outages. These growing interdependencies create risks of cascading, mutually-reinforcing failures across both the electricity and oil and natural gas energy subsectors.[8] Because of the need for generators to receive natural gas

[7] Electric Infrastructure Protection (EPRO) Handbook II (Vol 1 – Fuel), July 18, 2016, at 24, http://www.eiscouncil.com/App_Data/Upload/149e7a61-5d8e-4af3-bdbf-68dce1b832b0.pdf.s

[8] Electric Infrastructure Protection (EPRO) Handbook II (Vol 1 – Fuel), July 18, 2016, at 21, http://www.eiscouncil.com/App_Data/Upload/149e7a61-5d8e-4af3-bdbf-68dce1b832b0.pdf.s

fuel and the need for electricity by natural gas pipelines to deliver that fuel, a significant interruption of the supply of natural gas can start a chain of events that result in interruption of electricity, which can cause the loss of power to gas compressors, which can cause further interruptions of generator fuel supply, cascading toward a broader system outage. The result: *gas and electric systems will be vulnerable to mutually-reinforcing failures when such outages begin.*

Q. WHAT TYPES OF HAZARDS COULD CAUSE THESE FAILURES?

A. Both natural and manmade hazards pose risks. While I describe a few such potential vulnerabilities below, the Commission, in coordination with other knowledgeable agencies, should consider as many other such threats as possible and similarly develop and implement measures to ensure they are understood.

Q. WHAT ARE THE NATURAL HAZARDS THAT COULD CREATE SUCH MUTUALLY REINFORCING GAS-ELECTRIC SYSTEM FAILURES?

A. Catastrophic earthquakes could inflict massive damage on gas and electric infrastructure, and foster mutually-reinforcing failures between them that produce black sky outages. For example, a catastrophic earthquake in the New Madrid Seismic Zone would pose significant risks to PJM. Similar seismically active regions pose risks elsewhere. Other catastrophic natural hazards could also create such risks. Moreover, once a naturally-induced blackout was underway, adversaries could also exploit the resulting disruptions in gas-electric system interdependencies, and exacerbate the interruption of natural gas flows for power generation.

Q. WHAT ARE THE MANMADE RISKS?

A. In recent months, potential adversaries have staged sophisticated, multi-phase intrusion campaigns against the energy sector to insert Advanced Persistent Threats into our energy systems.[9] These efforts are part of a long-term trend towards increased severity in the cyber threats confronting electric and gas systems –a trend that is certain to continue. Coordinated physical attacks on critical gas and electric system infrastructure components pose an additional threat. Such attacks could come from the type of kinetic threats seen in the 2013 attack on the Metcalf substation in California[10], but also from unmanned aerial vehicles carrying advanced payloads and other non-traditional attack vectors. Combined cyber-physical attacks could magnify such risks of disruption.

Q. IN ADDITION TO THE CHANGE IN THE GENERATION MIX, WHAT ADDITIONAL FACTORS HAVE HEIGHTENED THE RISKS?

A. Electricity plays an increasingly important role in the operation of all other infrastructure sectors. DOE notes that "[t]he reliability of the electric system underpins virtually every sector of the modern U.S. economy, which depends on electricity – including sectors from food production to banking to health care. Electricity is at the center of key infrastructure systems that support these activities –transportation, oil and gas production, water, finance,

[10] Rebecca Smith, *Assault on California Power Station Raises Alarm on Potential for Terrorism,* Wall St. J., Feb. 5, 2014.

and information and communications technology. Electricity-dependent critical infrastructures represent the core underlying lifeline framework that supports the American economy and society."[11] This "electrification of everything" heightens the potential payoff to adversaries of attacking the grid and its fuel supplies, and reinforces the imperative to mitigate the risks of increased reliance on natural gas for power generation.

IV. CURRENT EFFORTS TO IDENTIFY AND MITIGATE RISKS TO RESILIENCY

Q. WHICH STAKEHOLDERS HAVE A ROLE TO PLAY IN PRESERVING THE RESILIENCY OF THE GRID?

A. By issuing the proposed rule, the Department of Energy has taken a critical step forward to facilitate progress on resilience. Other key stakeholders include the Federal Energy Regulatory Commission, the North American Electric Reliability Corporation (NERC), the Regional Transmission Organizations and Independent System Operators overseen by FERC, and other BPS entities. Commissioners and other entities may also wish to consult with the Department of Homeland Security, the Department of Transportation, and the Department of Defense, and other federal and state agencies.

Q. HAVE THE RELEVANT STAKEHOLDERS ADQUATELY CONSIDERED THE RISKS TO RESILIENCY?

---

[11] Department of Energy, *Quadrennial Energy Review – Transforming the Nation's Electricity System: Second Installment of the QER*, January 2017, p. 7-3.

A. Stakeholders are making progress, but significant gaps remain in assessing risks to resilience and developing mitigation options. In particular, stakeholders need to account for the growing severity of the threat and the implications for adversary exploitation of gas-electric interdependencies. To the best of my knowledge, for example, no RTO has performed a comprehensive analysis of whether the system can survive the disruption of multiple natural gas pipelines system for an extended period of time.

Q. FERC HAS APPROVED MANDATORY RELIABILITY STANDARDS FOR THE BULK ELECTRIC SYSTEM. DO THE RELIABILITY STANDARDS AIM TO ENSURE RESILIENCY?

A. No. As noted above, NERC reliability standards apply to electric infrastructure, not gas transmission lines and other fuel systems on which the grid depends. Moreover, these standards focus on reliability, not resilience. Studies conducted for the National Association of Regulatory Commissioners and other studies have highlighted significant ways in which resilience differs from reliability. These studies have also examined why traditional metrics for assessing reliability are inadequate for resilience.[12]

Q. DO EFFORTS TO PROVIDE DUAL-FUEL CAPABILITIES TO NATURAL GAS UNITS PROVIDE ADEQUATE RESILIENCE AGAINST THIS THREAT?

---

[12] *Resilience for Black Sky Days: Supplementing Reliability Metrics for Extraordinary and Hazardous Events*, National Association of Regulatory Utility Commissioners, February 2014), available at http://www.sonecon.com/docs/studies/Resilience_for_Black_Sky_Days_Stockton_Sonecon_FINAL_ONLINE_Feb5.pdf; Sayanti Mukhopadhyay, Public Utility Commissions to Foster Resilience Investment in Power Grid Infrastructure, available at http://www.sciencedirect.com/science/article/pii/S1877042816300052

A. Not yet. Generators that are able to utilize a secondary source of fuel if natural gas supplies are interrupted can provide a critical bulwark against cross-sector failure. Given that value, some markets have developed financial incentives to encourage the construction and retention of dual-fuel generators. However, there are indications that existing incentives may not be adequate. Moreover, these generators typically have enough secondary feel stored on site to operate for very limited periods. After that, fuel resupply will be essential to sustain their operations if natural gas flows remain interrupted. However, the same factors that will disrupt the resupply of fuel for emergency power generators will apply to resupply of the secondary fuels typically employed for dual-fuel generators. Demand for such fuel in a long duration, wide area outage will be vastly greater than the capacity of contractors to conduct resupply operations. This is especially true since such operations would need to go forward in severely disrupted environments, especially in terms of refining and transportation system functionality.

Q. HOW IMPORTANT IS ON-SITE FUEL STORAGE FOR ENSURING GENERATION RESILIENCE, AND WHAT ARE THE APPROPRIATE STANDARDS FOR RESILIENCE PRICING ELIGIBILITY?

A. Nuclear power plants can operate for many months between refueling operations. Accordingly, they can make special contributions to grid resilience. The proposed Rule also makes the case that because coal generators typically have many weeks of fuel supplies stored on-site, they are also highly resilient. However, much more comprehensive and systematic analysis of such issues should go forward before final decisions are made on eligibility and market design changes. Moreover, as these criteria design options are

developed, it will be vital to avoid crafting them in ways that favor one source of generation over another for reasons irrelevant to grid resilience.

Q. WHAT CURRENT ANALYTIC INITIATIVES ARE UNDERWAY THAT COULD HELP ASSESS CURRENT FUEL RESILIENCE AND REQUIREMENTS FOR PROGRESS UNDER THE NOPR?

A. Valuable studies have already been conducted on the risks that interruptions in gas supplies pose to BPS reliability.[13] NERC is now conducting a much-needed special reliability assessment to determine impacts of a single point of disruption of natural gas facilities.[14] Along with other industry initiatives, PJM is conducting especially important studies of the potential risks created by increased reliance on natural gas, including in its *Natural Gas Contingency Scenario Analysis*.[15] I commend PJM for taking these critical steps forward. These and other industry studies analysis can provide a useful model for BPS entities

[15] http://pjm.com/-/media/committees-groups/committees/teac/20170914/20170914-reliability-analysis-updates.ashx

nationwide to adapt to meet their own assessment requirements and fuel resilience challenges. However, as I discuss below, I believe other efforts are necessary.

V. ADVANCING GRID RESILIENCE

Q. WHAT ACTIONS SHOULD THE COMMISSION TAKE?

A. The Commission should obtain the analyses necessary to determine what actions to take next. For one, relevant information from the RTOs covered by the NOPR would help in this determination. Next, the Commission should collaborate with other agencies to conduct a DBT analysis.

Q. WHAT ADDITIONAL INFORMATION WOULD BE HELPFUL FROM THE RTOS?

A. PJM's analysis provides an extremely useful starting point, but it should be expanded. For example, analysis by RTOs should consider the loss of multiple pipelines simultaneously, as might occur in a coordinated physical or cyberattack. As noted above, any major power willing to take the risks of attacking a single U.S. pipeline may well decide to strike on a much more massive scale to disrupt U.S. defense capabilities, and seek to disrupt all flows of gas for power generation in a given RTO or ISO service area.

Useful additional information would include data from each generator on:

- For the primary fuel source:
    - Fuel source type.
    - On-site inventory reported as average days based on continuous full output.

- The nature of the fuel supply arrangement (e.g., firm gas, long-term coal contract, purchases of oil on the spot market, etc.).
- The primary method of fuel delivery (e.g., firm pipeline transportation, rail, barge, truck, etc.).
- Environmental permitting limitations.

- For the secondary or back-up fuel (if any):
  - Fuel source type.
  - On-site inventory reported as average days based on continuous full output. For oil and diesel this should include both the actual inventory and the maximum potential that can be stored on-site.
  - The nature of the fuel supply arrangement.
  - The primary method of fuel delivery.
  - Environmental permitting limitations.

The RTOs should also conduct a series of studies:

- A fuel reliance analysis detailing the impact on the organized market's ability to serve load if the supply of a particular fuel type is interrupted, or if the supply of a combination of fuel types is interrupted. The analysis should include:
  - How much load would not be served if a particular fuel type were unavailable for any reason.
  - How long primary inventories would last at generators' full output
  - How long secondary inventories would last at generators' full output
  - A generator's ability to resupply from existing secondary fuel inventories that are not on site.
  - The market's ability to increase production of remaining fuels, including diesel fuel, to meet increased need for the fuel in light of other demands for that fuel.

- A load impact analysis detailing the consequences if load is unable to be served for a prolonged period of time. This analysis should detail multiple disruption and time combinations (e.g., 50% of load for one week, 75% of load for two weeks, etc). The analysis should include:

- The financial impact to economy of the region.
- The impact to the security of the region (e.g., loss of other critical infrastructure and life sustaining services).

- A contingency analysis detailing the ability of the system to withstand (for both short- and long-term) electric and gas failures. This analysis should model both existing and future generation mixes. The analysis should include:
  - Single gas pipeline failure.
  - Multiple gas pipeline failures (including shared right of ways and crossings).
  - Coordinated attacks on the organized market's 3 of 4 biggest pipelines.
  - Loss of all pipelines controlled by single company whether as a result of a physical or cyber attack.
  - Coordinated gas pipeline/electric failures.
- The RTOs should also conduct an assessment of the adequacy of existing capacity constructs in light of the resiliency findings, and suggestions of what changes need to be made.

Q. DO THE RELIABILITY STANDARDS SUGGEST THAT THIS ANALYSIS IS APPROPRIATE?

A. NERC Reliability Standard TPL-001-4 directs transmission planners to assess the impact of extreme events, and if the analysis determines that such events cause cascading outages, the transmission planner should evaluate possible actions to reduce the likelihood or mitigate the consequences and adverse impacts to reliability.[16] I recommend that large-scale disruptions of gas supplies be included in such analysis. I also propose that planners

[16] *See* Requirements R 3.2 and R 3.5 of Standard TPL-001-4 – Transmission System Planning Requirements.

include contingency analysis of severe disruptions in secondary fuel resupply for dual fuel generators, and disruption of fuel resupply for backup power generators that serve critical natural gas compression stations and other key gathering and transmission infrastructure. Finally, planners should conduct sensitivity analysis on the degree to which retaining a mix of fuel-resilient generation assets, including nuclear assets, can help reinforce the resilience of the BPS as a whole.

Q. HOW COULD A DESIGN BASIS THREAT ASSIST THE COMMISSION?

A. At present, BPS entities lack a government-approved assessment of the threat against which they should measure the resilience of their fuel supplies. The Nuclear Regulatory Commission provides its licensees with a DBT to help design safeguard systems for the U.S. nuclear fleet. Fuel resilience issues pose a very different range of challenges. A DBT would help the Commission support analysis and mitigation of risks to fuel resilience. That effort should be led by a U.S. agency with access to appropriate threat information. The development of a DBT should also go forward in full consultation with the electric power industry, NERC, the E-ISAC, and other key sources of expertise. The design of the DBT should also leverage "best practices" developed by the NRC, and draw lessons learned from the NRC's past efforts that can help accelerate and improve the creation of a DBT for resilience.

Q. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	)	RM18-1-000

DECLARATION OF DR. PAUL STOCKTON

I, Paul Stockton, declare under penalty of perjury that the foregoing Prepared Direct Testimony of Dr. Paul Stockton on Behalf of Exelon Corporation is true and correct.

Executed: October 23, 2017

Paul Stockton

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	)	Docket No. RM18-1-000

REPLY COMMENTS OF EXELON CORPORATION[1]

The Commission should follow a three-step approach to address the generation resilience concern identified by the Secretary of Energy. *First*, the Commission should take immediate action to ensure that unjust and unreasonable market rules do not send inaccurate price signals to fuel-secure resources that are critical to any long-term solution to system resilience. This includes (a) directing PJM to complete energy market reforms within 90 days and (b) declaring that units receiving Zero Emissions Credits or other support payments, which preserve existing nuclear units in economic distress, will not have their capacity market bids mitigated. These actions will not fully solve the problem of resilience, but will help alleviate the immediate economic challenges to nuclear units and other fuel-secure resources.

There is widespread support among commenters for the prioritization of energy price formation issues.[2] Moreover, there is already a record that would allow the Commission to

[1] In addition to these comments, Exelon has prepared answers to certain of the questions placed in the docket by FERC Staff. These answers are attached to the conclusion of these reply comments.

[2] *See, e.g.*, United States Department of Energy, Staff Report to the Secretary on Electricity Markets and Reliability 107-117 (August 2017), *available at* https://energy.gov/sites/prod/files/2017/08/f36/Staff%20Report%20on%20Electricity%20Markets%20and%20Reliability_0.pdf ("DOE Staff Report"); Comments of Edison Electric Institute, Docket No. RM18-1 (Oct. 23, 2017) ("EEI Comments") at 4-6; Initial Comments of the Electric Power Supply Association, Docket No. RM18-1 (Oct. 23, 2017) at 51-53; Initial Comments of PJM Interconnection, L.L.C. on the United States Department of Energy Proposed Rule, Docket No. RM18-1 (Oct. 23, 2017) ("PJM Comments") at 39-49; Letter of Professor Willian W. Hogan

SI-SSA-0010-2988

determine under Section 206 that the current market rules are not just and reasonable in PJM.[3] The Commission should so find and direct PJM to adopt a solution within 90 days. PJM's energy markets are based on the economic principle that the marginal cost of the unit of supply needed to satisfy demand should set the price. Yet the current market rules violate this basic economic principle because units like coal and nuclear are not necessarily permitted to set the locational marginal price, even when they are needed to serve load. The rules thus are not just and reasonable and must be revised.[4]

Second, the Commission should create a process for gathering and assessing data from RTOs that will shed light on the system's vulnerabilities and potential impacts resulting from those vulnerabilities. No commenter disputes, in particular, the system's increasing vulnerability to gas pipeline interruptions, as nuclear and coal resources retire and are largely replaced by gas resources. And no one disputes the extreme toll to our society that would result from a prolonged and widespread outage resulting from a high impact, low frequency ("HILF") event, such as an interruption to multiple gas pipelines. Accordingly, the problem warrants further study. In its opening comments, Exelon provided a detailed list of the information that should be requested and proposed time frames for RTO responses.

Third, the Commission should use that data, together with threat analysis from the national security and intelligence communities, to establish a design basis threat ("DBT") that can inform

---

[3] PJM Comments at 48.

[4] Further, given that PJM has so plainly acknowledged price formation as a problem in PJM, a point with which many commenters and economists agree, the Commission would be justified in ordering PJM to develop and implement price formation improvements as set forth in PJM's Comments.

SI-SSA-0010-2989

cost-effective market reforms. Stakeholders largely agree that resilience is a concept distinct from reliability or resource adequacy. Resilience refers to the system's ability to prepare for, operate through, and recover from HILF events.[5] But as many stakeholders point out, the Commission lacks metrics to evaluate resilience.[6] A DBT will provide a benchmark against which resilience can be measured, and a basis for developing specific solutions for the RTOs to implement. Once that work is complete, Exelon supports PJM's proposal for the Commission to direct each RTO to submit specific reforms to address any resilience-related issues identified in an RTO, with a "deadline that is in the near term."[7] Exelon proposes a deadline of 90 days from the time the Commission establishes a design basis threat.

Each of these steps is moderate in scope and can be accomplished quickly. And the Commission should pursue them expeditiously. Our system's vulnerability is real and the threats grave, and the potential consequences of inaction are unimaginable. Hostile actors are constantly

[5] PJM Comments at 18-19. HILF events are frequently referred to as Black Swan events because the probability of the event occurring is difficult to determine. Unlike traditional reliability events based upon weather or forced outage rates which can be probabilistically determined based upon historical data, a HILF event (for example, a cyber-attack by a nation-state or other malicious actor) may not be forecastable. For this reason, HILF events not only encompass incidents that are expected to occur infrequently, but also events that cannot be forecasted because of significant unknowns. Resilience also differs from reliability in having to account for the underlying nature of man-made threats, which differ from hurricanes and other familiar natural hazards. Unlike hurricanes, adversaries are intelligent and adaptable. Adversaries will also be able to selectively target points of special vulnerability in energy systems, including those related to fuel resilience and gas-electric system interdependencies. Initiatives to define the attributes of resilience and assess measures to strengthen them will need to incorporate these non-traditional risk factors.

SI-SSA-0010-2990

probing for weaknesses in our electric grid. A single successful attack that leaves large swaths of the United States without power for an extended period would destroy our Nation's ability to ensure law and order, leave tens of millions of Americans without access to safe drinking water, food, or medical care, devastate our military capabilities, and result in an untold number of deaths.

Together, these steps are essential to achieving a resilient grid at the least cost for consumers. The first step strengthens markets by ensuring that they operate efficiently and consistent with basic economic principles, and that fuel-secure resources are not disadvantaged by flawed market rules. The second two steps do not prejudge what type of solution might be necessary or most cost-effective. Instead, they are focused on understanding the nature of the problem we face and developing a design standard around which solutions can be framed. Once the Commission has sufficient information before it to identify the vulnerabilities that must be addressed, it should consider a range of potential solutions for the design basis threat that can achieve resilience at least cost to customers. RTOs may be able to propose appropriate market-based solutions to accomplish those goals—and they should be encouraged to do so. But in the event that market-based solutions are unworkable or too costly, the Commission should not foreclose the possibility of other solutions. If a market-based solution is unavailable, the stakes are too high to reject a cost-based alternative simply on account of loyalty to a pro-market ideology.[8]

[8] *See, e.g.*, *ISO-New England Inc.,* 144 FERC ¶ 61,204, PP 9-11 (2013) (order conditionally accepting ISO-NE's out of market Winter Reliability Program oil procurement).

I. Grid Resilience is an Urgent Problem in the Eastern RTOs That Prior Reforms Have Not Addressed.

A. The Resource Mix in the Eastern RTOs Is Changing as Fuel-Secure Resources Retire, Creating New Vulnerabilities.

The resource mix in the eastern RTOs is changing rapidly, as many gigawatts of nuclear and coal capacity retire and are replaced largely by gas generation. In the PJM region, 90 percent of the new installed generation over the last five years has been gas-fueled, as is more than 90 percent of planned generation in the interconnection queue.[9] As gas generators enter, resilient baseload units leave.[10] Exelon noted in its initial comments that the loss of nuclear generation in particular has been dramatic. Between 2002 and 2016, 4,666 MW of nuclear generating capacity announced retirement, approximately 4.7 percent of the U.S. total.[11] Another eight nuclear reactors with 7,167 MW of capacity have announced retirement plans since 2016.[12]

The growing prevalence of gas generators, many of which are dependent upon a small number of pipelines for fuel, creates new risks to the system. As Dr. Stockton explains in his attached Supplemental Testimony (attached as Exhibit A), the emerging resource mix in the Eastern RTOs is increasingly susceptible to "common mode failure," in which a large fraction of

[9] For the PJM RPM auctions from 2015/16 through 2020/21, 90% of new cleared installed capacity has been either natural gas-fired combustion turbines or combined-cycle generators (approximately 32.4 out of 36.2 total GW of new build, reactivated, or uprated capacity). *See* PJM Interconnection L.L.C., *2020/21 RPM Base Residual Auction Results*, Table 8, http://www.pjm.com/-/media/markets-ops/rpm/rpm-auction-info/2020-2021-base-residual-auction-report.ashx?la=en.

[11] DOE Staff Report at 29.

[12] *Id*. at 30.

generation resources are susceptible to the same vulnerability.[13] In PJM, 11,000 MW of gas generation is dependent upon a single pipeline.[14] Thus, a single disruptive event—whether it is a physical attack by terrorists, a cyber-attack by a foreign government, or an adverse weather event—can undermine a significant share of the generating capacity serving the Nation's most populous region. Moreover, because pipelines are increasingly dependent upon electricity to function properly, a widespread outage could result in further fuel supply disruptions, leading to an even more widespread outage. Coordinated attacks on multiple pipelines would have far more severe consequences.

No steps have been taken to address the grid's increasing vulnerability due to the growing interdependence of gas supply and electric generation. The Secretary of Energy identified these risks in the NOPR that initiated this proceeding.[15] Other experts concur. According to NERC, "[n]atural gas-fired generation faces greater susceptibility to fuel supply chain disruption than coal and nuclear generation."[16] A disruption of the pipeline network could dramatically reduce the quantity of natural gas available for generators. Using a power-flow simulation, NERC found that "that 18 out of 19 areas studied experience transmission or operational challenges during an extreme event" involving disruption to natural gas supply facilities.[17] ISO-NE likewise

[16] NERC Comments at 9.

[17] NERC November 9, 2017 Board of Trustees Agenda, Item 8c, available at http://www.nerc.com/gov/bot/Agenda%20highlights%20and%20Mintues%202013/Board_Open_Meeting_November_9_2017_Agenda_Package.pdf.

highlighted this concern at the October 2017 Commission open meeting when it presented its Winter 2017-2018 Operations and Market Performance update. It noted that "*the ability to meet energy needs is at risk if gas cannot be supplied to gas-fired generators.*"[18] ISO-NE repeated these concerns in comments in this docket.[19] PJM, meanwhile, is studying the effects of a single gas pipeline outage, but that is not enough: PJM should also consider the effects of multiple pipeline failures occurring simultaneously.[20]

Currently, generation developers and owners have no economic incentive to consider the systemic consequences of their investment decisions.[21] RTOs have not attempted to place an economic value on a resource's contribution to system resiliency.[22] Moreover, PJM's market

design has aggravated the problem, by systematically undercompensating fuel-secure, baseload resources in the energy markets. As a result, private investment decisions are not aligned with the public interest in homeland security. The Commission cannot afford to ignore this issue, which could have devastating consequences for our society, as described above and in Dr. Stockton's testimony.

B. The Commission Should Reject Commenters' Arguments for Inaction.

Commenters opposed to action advance four basic arguments. *First*, some claim there is no reason to be concerned about resiliency—either because the threats are unproven, or because the Commission has already taken steps, such as the Capacity Performance ("CP") reforms in PJM, to enhance reliability, making further steps unnecessary. *Second*, some contend that the Commission should ignore generation-related vulnerabilities because there are also transmission- and distribution-related vulnerabilities that need to be addressed. *Third*, some commenters argue that the costs of implementing the DOE proposal will be very high.[23] *Fourth*, the PJM Independent Market Monitor ("PJM IMM"), using cherry-picked and misleadingly presented data, asserts that the potential changes to the resource mix are overstated, because nuclear generators by and large recover their costs from the markets. Each of these arguments should be rejected.

SI-SSA-0010-2995

1. Resiliency Threats Are Real, and Neither the Capacity Performance Reforms Nor High Reserve Margins Address Resiliency.

Some commenters oppose the DOE's proposal on the ground that there is no genuine threat to resiliency. The Commission should reject this view. Those with expertise concur that resiliency must be made a priority. NERC, the entity whose statutory mandate is to "conduct periodic assessments of the reliability and adequacy of the bulk-power system in North America,"[24] has emphasized the resilient and reliable generation furnished by coal and nuclear units, and the threat to the stability of the bulk power system resulting from those units' retirements. Specifically, NERC explained that "[b]urgeoning reliance on natural gas-fired generation as a replacement for coal and nuclear generation decreases fuel diversity and increases single source fuel dependency."[25] Thus, "[t]he electric sector's growing reliance on natural gas raises concerns regarding the ability to maintain BPS reliability when facing constraints on the natural gas delivery systems."[26] Not only are gas-fueled resources susceptible to supply interruptions that can affect numerous generators simultaneously, but the nuclear and coal generators that are being replaced "provide substantial essential reliability services as a function of large spinning generators and governor control settings, along with reactive support for voltage control."[27]

Dr. Paul Stockton's testimony, submitted with Exelon's initial comments, confirms NERC's observations.[28] Dr. Stockton is one of the country's leading experts on grid resiliency

[27] *See* NERC Comments at 8.

[28] Ex. A to Comments of Exelon ("Stockton Initial Testimony").

SI-SSA-0010-2996

and national security. From June 2009 until January 2013, he was the Assistant Secretary of Defense for Homeland Defense and Americas' Security Affairs. He was responsible for Defense Critical Infrastructure Protection and led the creation of the Department's Mission Assurance Strategy. He served as the Domestic Crisis Manager for the Department of Defense (DOD) and was responsible for Defense continuity of operations. He also was the principal civilian advisor to the Secretary of Defense for providing Defense support to Federal Emergency Management Agency, the Department of Energy (DOE) and other Federal departments in Superstorm Sandy, Hurricane Irene, and other disasters.[29]

Dr. Stockton outlined the existing risk to national security from overreliance on natural gas. He concluded that "[r]isks of mutually-reinforcing failures between gas and electric systems have grown."[30] These risks create the possibility of a "black sky" power outage which "would inflict immense disruption on national security, the U. S. economy, and public health and safety."[31] He recommends that the Commission take immediate efforts to study the problem and develop a design basis threat to help evaluate the risk.[32]

Other industry commenters also concur. PSEG, for example, supports the DOE's efforts "to immediately address the erosion of resiliency of our electric grid due to the risk of premature retirements of baseload generation."[33] This trend, particularly in PJM, is resulting in a resource mix placing "greater reliance on natural gas-fired generating resources and exposing the power

[33] PSEG Comments at 2.

SI-SSA-0010-2997

supply portfolio to a greater risk of single mode failure."[34] As PSEG notes, maintaining a resilient and diverse electric grid has important consequences for both human health and national security.[35] AEMA encourages the Commission to "[o]pen a proceeding on resilience with the objectives of defining the needs of resilience on a regional basis and how those needs have evolved."[36] ISO-NE's recently-released 2017 Regional System Plan makes much the same point, noting that "[p]reserving the reliable operation of the system will become increasingly challenging with potential retirements, the increased reliance on natural gas resources" [37]—which are estimated to rise from 44.5% of New England's 2017 summer fuel mix to 56% in 2026.[38] Thus, the Commission should take seriously the need to ensure our electric grid is resilient to the various threats—both human and natural—that could have devastating consequences.

Several commenters contend that the Commission has already taken sufficient action by approving the Capacity Performance product in PJM and the pay-for-performance reforms to the ISO-New England capacity market.[39] Other commenters contend that the Eastern RTOs have large reserve margins, and suggest that these reserve margins resolve any concern about resilience.[40]

SI-SSA-0010-2998

The Commission should reject these contentions, which erroneously conflate the concept of reliability with the concept of resilience. Existing capacity markets are targeted toward ensuring resource adequacy—in other words, that sufficient generation resources are available on the system to serve peak load in a wide range of operating conditions. The CP reforms were adopted to address a specific problem: although units had committed to provide capacity, they had not made the investments necessary to ensure that they were actually capable of operating during extreme and adverse weather conditions. The Commission adopted penalties for non-performance which were intended to incentivize the investments necessary to ensure unit performance.[41] This is certainly important, and, separate from its consideration of resilience, the Commission and PJM should evaluate whether the current penalty rate is high enough to provide the desired incentive.[42] Indeed, the first auction procuring only Capacity Performance resources has already been held, but clearing prices are too low to reflect investment by gas facilities in dual-fuel capability.

In all events, however, the CP and pay-for-performance reforms did not address the system-wide vulnerability to HILF events that results from the increasing interdependence of the gas and electric systems, which is aggravated by the retirement of fuel-secure resources like nuclear that do not rely on the gas supply system. To put it another way: the CP reforms focused on unit-level investments to improve unit-level performance, but did not address the system's increasing exposure to a common mode failure (such as an attack on the gas pipeline system) that would cause an entire class of generation of resources to fail simultaneously. Resiliency, in contrast to reliability, concerns this type of systemic threat. Making a system resilient to such threats ensures

[42] Exelon Comments at 31.

SI-SSA-0010-2999

that the system is capable of "operating through, and recovering from a high-impact, low-frequency event" to the system as a whole.[43] Thus, as PJM recognizes, "a heavy reliance on one resource type … *could* raise questions about system resilience."[44]

For similar reasons, the Commission should find no comfort in the Eastern RTOs' large reserve margins. Of course, large reserve margins help support resource adequacy and help keep prices low for consumers. But the question is whether the reserves on the system are the right kind of resources to help sustain the grid in the event of a HILF event. Simply pointing to a large reserve margin fails to engage with that crucial question. The Commission has previously recognized as much. When approving ISO-NE's first winter reliability program, the Commission underscored the distinction between (on the one hand) resource adequacy and (on the other hand) resiliency against system-wide threats. The Commission explained: "[R]esource adequacy would be unlikely to reflect the unpredictability of fuel shortages and the likelihood that outage result from fuel shortages will simultaneously affect multiple resources."[45] Indeed, in markets where natural gas-based generators increasingly dominate, large reserve margins can provide a false sense of security, since the system's overdependence on just a few pipelines could make the system particularly vulnerable in the case of an attack.

Equally off the mark is the Rhodium Group's analysis, cited by various commenters.[46] According to the Rhodium Group, "[b]etween 2012 and 2016, there were roughly 3.4 billion customer-hours impacted by major electricity disruptions. Of that, 2,382 hours, or 0.00007% of

[43] PJM Comments at 18-19.

the total, was due to fuel supply problems."[47] But that analysis, even if true, fails to appreciate the point of this proceeding. Experts are telling the Commission that there is a risk of a fuel supply disruption that could have disastrous consequences for our society. As Dr. Stockton describes in his comments, a HILF event that causes a cascading failure of the gas and electric infrastructure for a significant portion of the Nation's power grid for a prolonged period would have horrific consequences. Clean water would be unavailable and sewage systems would fail for weeks or months causing widespread risk of disease and ultimately jeopardize human lives. Food distribution would be sharply curtailed or stop entirely. Communication and transportation networks would collapse. Hospitals, nursing homes, and other medical facilities would lose their backup power and be unable to provide services to vulnerable members of the public.[48] Defense installations would gradually lose their ability to carry out their essential military function, making the nation significantly more vulnerable to attack from nation-state adversaries and terrorists and risking a collapse of law and order. It would be irresponsible to wait until after a HILF event has occurred to begin preparing for one. We have not experienced outages caused by massive cyber or physical attacks on the transmission and distribution system, either, but we still plan for them.[49]

Simply put, the Rhodium Group does not address the bulk power system's ability to withstand such an event. It does not even attempt to analyze, for example, what the consequences would be if the *single* gas pipeline serving more than 11,000 MW of generation in PJM were disrupted, let alone if multiple gas pipelines were disrupted. Nor does it assess the degree to which

our vulnerability to such attacks would increase as the resource mix continues to move away from fuel-secure resources. Those who cite the Rhodium Group's elementary analysis as a reason for inaction would have the Commission wait for a catastrophe to happen before assessing whether something could have been done to address it.

2. The Fact That the Distribution and Transmission Systems Also Need Hardening Is No Reason for Inaction.

Some commenters argue that the Commission should ignore generation-related vulnerabilities because there are also transmission- and distribution-related vulnerabilities that need to be addressed. The fact that there are multiple vulnerabilities is no reason for inaction. The Commission does not need to choose between potential risks. It can and should address all system-level vulnerabilities that are capable of being addressed.

Indeed, it has already taken many steps to make the transmission system more resilient. For example, it directed NERC to address supply chain risks to certain cyber assets; it directed NERC to develop physical security standards in the wake of the April 2013 attack on the Metcalf Transmission Substation; and it directed NERC to develop standards governing planning and operations with respect to a 1-in-a-100-year solar storm. Stakeholders have also invested in making transmission and distribution systems more resilient. Utilities have increased acquisition of critical spare equipment.[50] Under the auspices of the Edison Electric Institute ("EEI"), utilities have instituted a Spare Transformer Equipment Program, and the industry is developing additional

[50] U.S. Department of Energy, Strategic Transformer Reserve Report to Congress at 6 (Mar. 2017) ("utilities report they are purchasing additional spares").

equipment sharing programs, including Grid Assurance[51] and RESTORE.[52] Utilities have also hardened transmission systems against adverse weather events and flooding, and they are investing in microgrids. NERC and stakeholders also conduct large-scale exercises and simulations to practice their response to various HILF-type events. [53]

All of these developments are valuable and should not only be encouraged, but also expanded. The Commission, RTOs, NERC, states, and industry more broadly should continue to assess the resiliency of the Nation's transmission and distribution system and make further policy changes as appropriate.

In tandem with those efforts, the Commission should *also* assess the resiliency of the generation fleet. In contrast with the transmission and distribution systems, where already much work has been done analyzing vulnerabilities and taking steps to address them, nothing has yet been done with respect to the risk to the generation fleet posed by HILF events.

The Commission is also uniquely positioned to address vulnerabilities arising from the generation fleet in the Eastern RTOs, in which states generally engage in little integrated resource planning and in which generation resources largely sell at wholesale. The Commission has all the authority it needs to ensure that generation owners and developers have the economic incentives to account for the impact of their investment decisions on system resiliency. In contrast, efforts to

[53] For example, NERC will be conducting GridEx IV, its biennial exercise, November 16-17, 2017. GridEx IV will allow utilities to demonstrate how they would respond to and recover from a simulated coordinated cyber and physical attack. *See* http://www.nerc.com/pa/CI/CIPOutreach/Documents/TLP_WHITE_GridEx%20IV%20Fact%20Sheet_20161202.docx.

enhance the resiliency of the transmission system and gas pipeline network by siting new transmission lines and pipelines, and to enhance the resiliency of local distribution networks, all require the involvement of other regulatory authorities.

3. Discussion of Costs and Benefits Is Premature.

Several commenters emphasize the costs of DOE's comprehensive cost-of-service proposal to ensure resilience. But their studies are silent on the potential benefits of addressing resilience, and policymakers must always consider costs and benefits together. In any event, it is premature to discuss costs and benefits. Exelon does not advocate immediately providing cost-of-service contracts to every coal and nuclear plant in the eastern RTOs. The Commission must first understand the scope and urgency of the Nation's vulnerabilities. Once the Commission has that data, it can establish a design basis threat and identify cost-effective solutions tailored to address it.

4. The Commission Cannot Afford to Delay Taking Action.

According to the PJM IMM, urgent Commission action to address the resiliency of the generation fleet is not necessary because nuclear plants are not actually under any economic distress and are not in danger of retirement. [54] The PJM IMM's analysis is deeply flawed. As discussed below and in the attached testimony from Michael Schnitzer (attached as Exhibit B), as few as 6% of nuclear units in PJM fully recover their avoidable costs.[55] Unless market conditions change, or these units are compensated for the resiliency they provide to the system, many nuclear units currently in operation are likely to retire in the coming years.

In contending otherwise, the PJM IMM attempts to compare the market revenues of these units—revenues earned from the markets for energy, ancillary services and capacity—to their

[54] PJM IMM Comments at 18, 20.

[55] Testimony of Michael Schnitzer, attached as Exhibit B, at 5 ("Schnitzer Testimony").

avoidable costs. He claims that these revenues are sufficient to cover costs and these units are actually profitable.[56] The PJM IMM's analysis is premised on a dramatic understatement of the costs nuclear units face, and, as a result, draws entirely the wrong conclusions. Mr. Schnitzer has corrected the improper omission of these costs, and the data demonstrate that most nuclear generators throughout PJM do not currently earn market revenues sufficient to cover their costs.[57] As a result, these units are at risk of retirement absent improvements to the market or other measures and the electric grid is at risk of losing the resiliency benefits these units provide.

There are two key flaws in the PJM IMM's analysis of costs. *First*, the PJM IMM excludes the on-going capital expenditures that nuclear units incur annually. This error is inexplicable. Nuclear units are complicated machines that are pervasively regulated. Every year, owners must invest significant amounts of capital to keep nuclear units operational and comply with their regulatory obligations. The PJM IMM's own sources clearly show these costs. He draws cost data from a recent report of the Nuclear Energy Institute ("NEI") outlining the average costs of nuclear units.[58] The NEI data clearly shows that these units have significant ongoing capital expenditures.[59] Obviously, these ongoing capital expenditures can be avoided by retiring a unit.

Indeed, the PJM IMM himself treats ongoing to-go nuclear capital expenditures as an avoidable cost when reviewing Avoidable Cost Rate calculations for nuclear units. And for good

[56] PJM IMM Comments at 18-20.

[57] Schnitzer Testimony at 5-11.

[58] Nuclear Energy Institute, *Nuclear Costs in Context*, August 2017, at 2-3, *available at* https://www.nei.org/CorporateSite/media/filefolder/Policy/Papers/Nuclear-Costs-in-Context.pdf?ext=.pdf

[59] *Id.*; Schnitzer Testimony at 6.

reason: the PJM tariff includes such capital expenditures as avoidable costs.[60] Yet the IMM inexplicably departs from that settled treatment of capital expenditures in his comments here.

The PJM IMM is aware that his analysis is deceptive, but the omission is buried in a footnote and justified with the following cursory explanation: "Capital expenditures are generally sunk costs and appropriately excluded from this analysis. To the extent that there are additional annual avoidable costs, the results could differ."[61] The first sentence of this footnote is false; the second sentence is a massive understatement. The NEI report shows that these expenditures are not "sunk." Because they occur predictably every year, owners of nuclear units can avoid them by retiring units. Retirement decisions are inherently forward-looking—resource owners must ask themselves: Will it be profitable for these units to continue to operate if current market conditions continue? In that context, using 2016 or 2015 revenues as a proxy for future revenues and comparing them to going forward costs, capital additions are clearly avoidable.[62] No reasonable business owner would disregard such foreseeable and sizeable costs. And when these costs are considered, the results *do* differ—dramatically. Including these costs increases the total cost of operating units by approximately one-third over the PJM IMM's estimates.[63]

Second, the PJM IMM disregards the market and operational risk associated with operating a nuclear unit, risks that can be avoided by retiring a unit.[64] For example, nuclear units face energy market risks resulting from unexpected forced outages. If an unexpected outage occurs, these units face a loss of revenue from the energy markets, as well as the need to purchase energy on the

[60] PJM Tariff, Att. DD § 6.8.

[61] PJM IMM Comments at 19, n.17.

[62] Schnitzer Testimony at 9-10.

[63] *Id.* at 6-7.

[64] *Id.* at 7-8.

market at a high spot price in order to cover a forward market sale. The costs of covering forward energy sales can be significant. For example, when Exelon's Calvert Cliffs plant experienced an unexpected five day outage in January 2014, Exelon was forced to cover the plant's forward energy sales at a significant loss with replacement energy purchases made from the real-time and day-ahead energy markets. The loss was equal to about 35 percent of the total capacity revenue for the year.

Units also face risks arising from energy price volatility. Market prices are unpredictable and, given the size of nuclear generators, the market for the energy is often not liquid at the point of sale. Congestion can arise on the system due to forced transmission outages or transmission maintenance and upgrades, which can significantly impact the energy price received. For example, during outages for construction at a substation in the western portion of the ComEd system in the Fall of 2016, Byron and Quad Cities saw significant increases in congestion cost, on some days exceeding $30/MWh.[65] Owners of nuclear units are required to self-insure against this risk and bear these costs. For baseload plants, which receive most of the revenue from the energy markets, the risk of energy price volatility can be particularly significant. A nuclear plant, for example, can expect to recover as much as 75 percent of its going-forward costs through energy market revenues. Thus, a ten percent drop in energy prices can require a 30 percent increase in the capacity revenues needed to cover going-forward costs. As this example demonstrates, volatile energy prices present

[65] Similarly, disturbances on the transmission system can cause generators to unexpectedly trip offline. *See* NERC, *Washington, DC, Area Low Voltage Disturbance Event of April 7, 2015* (Sept. 2015), *available at* http://www.nerc.com/pa/rrm/April%202015%20Washington%20DC%20Area%20LowVoltage%20Disturban/Washington_DC_Area_Low-Voltage_Disturbance_Event_of_April_7_2015_final.pdf (describing a low voltage transmission problem experienced in the Washington, DC area that caused several generators, including Calvert Cliffs, to trip).

a significant commercial risk, and this risk, too, must be considered when determining the capacity revenues needed to cover going-forward costs.

Exelon is not alone in noting the risks and attendant costs faced by nuclear units. In its comments in the Capacity Performance docket, Exelon proposed tariff language addressing the energy market risks faced by nuclear units.[66] In that docket, PJM explicitly supported Exelon's requested tariff clarifications, noting that "[g]iven the importance of these risk premiums to reasonably reflecting a seller's costs of committing as a Capacity Performance Resource, and the inherent challenges in quantify such risks, these are reasonable modifications."[67]

Other companies who actually own and operate nuclear generators agree with Exelon that these plants face significant economic challenges. FirstEnergy has stated that its three nuclear power stations "are all in danger of closing within the next two years due to economic reasons … [and that] '[o]ur plants have been losing money. We've continued to operate them at a loss. But at some point, those economics don't make sense.'"[68] PSEG likewise states, "Nuclear plants are being financially challenged by current and expected market conditions."[69]

P.S.C. Aug. 1, 2017) (the New York State Public Service Commission analyzed the finances of the upstate New York nuclear plants in the course of approving the Zero Emissions Credit program, and made a determination that these units were financially distressed).

In sum, in recent years the majority of nuclear units in PJM have not earned sufficient market revenues to cover their avoidable costs, indicating that they are financially challenged and at risk of existing the market. For single unit nuclear generators, the PJM IMM estimates an average avoidable cost of $25.95/MWh. The cost of ongoing capital expenditures is $8.67/MWh and an appropriate measure of market and operational risk is $8.14/MWh, increasing the avoidable cost to $42.78/MWh. The costs from multi-unit sites similarly increases from the IMM's estimate of $18.73/MWh to $32.02/MWh.[70] Once the true costs of operating these units are accounted for, virtually all of the nuclear units in PJM are challenged and are at risk of retirement.[71]

II. The Commission Should Take Three Steps: Take Immediate Action to Ensure that the PJM Market Rules Do Not Cause Economic Stress to Fuel-Secure Resources, Gather and Assess Data from RTOs Regarding Bulk Power System Vulnerabilities, and Establish a Design Basis Threat That Can Serve as the Foundation for Specific Reforms.

The Commission should take a three-step approach to addressing the concern expressed by the Secretary, as described further below.

A. The Commission Should Take Immediate Action to Ensure That Unjust and Unreasonable Market Rules Do Not Send Inaccurate Prices Signals to Fuel-Secure Resources.

The Commission can take action in the immediate term to reduce the likelihood of further retirements by fuel-secure resources, while it gathers additional information regarding our vulnerabilities and considers how best to ensure generation resilience. *First*, the Commission should make clear that it will not mitigate the capacity market bids of fuel-secure units that receive state compensation intended to prevent their premature retirement. For example, New York and Illinois have adopted Zero Emissions Credit programs which place value on the carbon-free

[70] Schnitzer Testimony at 9.

[71] *Id.* at 9-10.

environmental attributes of nuclear generation, and focus their compensation on units whose attributes would be lost absent state support. Mitigating the capacity market bids of these units would undermine the state programs and run counter to the Secretary's goal of sustaining fuel-secure resources.

Second, Exelon endorses PJM's proposal for the Commission to create a pathway for PJM to correct a well-understood flaw in its energy markets that results in the systematic under compensation of units serving off-peak load.[72] Simply put, energy prices do not reflect the cost of producing power, as Michael Schnitzer explains in the attached testimony.[73] PJM's energy market has two stages. PJM first determines the security constrained economic commitment and dispatch for generation resources. That is, it decides which combination of units are able to serve load at the lowest cost. Next, PJM examines the dispatch and sets energy prices based on the short-run marginal cost of the units. To be economically efficient, energy prices must be set at a level that is consistent with the cost of the energy produced. In other words, prices should be set at a level sufficient to allow all generators that are operating to at least recover their variable costs, and the dispatch instruction for each generator should be profit-maximizing given the prices.[74]

PJM's current approach fails this test, as Mr. Schnitzer explains.[75] Baseload generators must often stay on overnight in order to meet load during peak hours. These generators cannot turn down below a certain level, but they are ineligible to set energy prices when operating at their minimum. As a result, energy prices during off-peak periods often do not reflect the production costs of generators operating during these periods, despite the fact that these generators are serving

[72] PJM Comments at 48.

[73] Schnitzer Testimony at 11-34.

[74] *Id.* at 15.

[75] *Id.* at 11-18, 25-30.

load and are part of the least-cost set of resources to do so. Instead, the energy price is set based on the short-run marginal cost of a different, cheaper unit. At night, these resources are sometimes wind units, which are willing to generate at very low or even negative LMPs in order to benefit from production tax credits; other times, they are the lowest cost combined-cycle gas units. At such times, the offers of these flexible units, rather than the cost of the baseload unit that is truly marginal, determines the locational marginal price. As a result, the baseload unit does not recover its costs, and energy prices do not reflect the true cost of serving load.[76]

Right now, PJM attempts to mitigate this problem through uplift to certain units. The self-scheduled coal and nuclear units needed for grid resiliency, though, are generally not eligible for uplift. Uplift also is not a long-term solution. As the Commission has repeatedly recognized, uplift payments should be reduced whenever possible. A central goal of the current price formation efforts is to move away from uplift as a solution to pricing errors. More fundamentally, these uplift payments undermine the notion of a single market-clearing price. Most generators receive one price—the market price—for the energy they produce. Certain generators, though, receive a different, higher price that is a combination of the market price and the uplift payment.[77]

This flaw in market design has severe consequences for nuclear units, which are always on and which typically self-schedule, so are ineligible to set price. At some times and in some locations, these nuclear units are the marginal resource, but LMP is set by flexible wind units willing to bid below zero. In these conditions, nuclear units are losing money every hour they operate, even though they are part of the least-cost set of resources needed to serve load. Even when LMPs are not negative, however, they are often lower than the marginal cost of serving load.

[76] *Id.* at 11-14.

[77] *Id.* at 14, 16.

For example, when a blockloaded coal plant is the marginal resource, it will not be allowed to set LMP, and so energy prices will be insufficient to support the dispatch.[78] Because nuclear units have very large fixed costs—higher fixed costs than they are able to recover from the capacity market—they depend upon energy margins in order to remain profitable.[79] When energy prices are lower than they ought to be, due to flawed price formation rules, nuclear units are no longer able to earn the revenues necessary to remain in operation.[80]

These nuclear resources are part of any reasonable least-cost portfolio over the long-run, particularly given their zero-emission characteristics, and any retirement of such a resource represents a permanent loss for customers and society at large. The units will not return and instead, they will be replaced by natural gas units that are, over the long term, more expensive. A system that already is over-dependent on natural gas will further lose resilient units and more gas-fired generation will be added to the system. Properly valuing the energy that these units produce thus not only will improve the efficiency and functioning of the market, but will also advance the Secretary's goal of preventing the further retirement of resilient resources.

PJM itself has recognized that this specific flaw in its approach to energy price formation is a problem that needs correction.[81] So too has the Commission. For inflexible peaking units, the Commission has declared market rules unjust and unreasonable in the Notice of Proposed

[78] *Id.* at 17-19.

[79] *Id.* at 6, 20-21.

[80] *Id.* at 17-19.

[81] PJM Comments at 43.

Rulemaking relating to fast-start pricing.[82] The Commission should make the same determination here.

To solve this problem in a manner consistent with principles of economics and good market design, PJM proposes to "relax" the price-setting constraints to better allow the costs of the power being produced to be reflected in the locational marginal price.[83] When an inflexible unit that is part of the least-cost set of resources is operating at its minimum, it will be allowed to set the energy market clearing price. This energy price formation proposal preserves the current security constrained economic dispatch and commitment. It simply sets prices in a manner that is consistent with actual operations—energy prices will reflect the true marginal costs of serving load. PJM's proposal will thus over time produce a lower-cost mix of resources that correctly balances low-cost baseload with more flexible (but usually more expensive) resources.

Additional work on this proposal still needs to be completed. In particular, certain committed units will be paid to ramp down to ensure that generation matches load.[84] Under the current approach to pricing, these units reduce their output in response to a lower energy price. Because energy prices will no longer be suppressed under the PJM proposal, these flexible units will need to receive an additional payment to follow the dispatch signal as large units become the marginal resource. The Commission should find the existing market rules unjust and unreasonable under Section 206, and direct PJM to adopt revisions within 90 days.

The PJM IMM has criticized these changes, even going as far as to suggest that PJM is proposing them to placate Exelon. The PJM IMM's unfortunate insinuation that PJM's integrity

---

[83] PJM Comments at 45.

[84] *Id.* at 39

and independence are in question is belied by a decade of academic commentary noting the very issue PJM has identified.[85] The reforms are supported not only by PJM, but also by many other economists and PJM stakeholders.[86] The weaknesses in the PJM IMM's technical objections, discussed further below, cannot be masked by taking a cheap shot at PJM.

The PJM IMM presents four major criticisms, each of which the Commission should dismiss.[87] First, he claims the proposal would raise costs to consumers without corresponding benefits. Second, he argues that the pricing change is not consistent with efficient dispatch. Third, he states that PJM's proposal inappropriately extends the theory behind the fast-start NOPR. Finally, he believes the proposal will have unintended consequences in the markets. The first three criticisms are not valid and the final one is premature.[88]

First, the concern about costs to consumers is both wrong and misses the point. Correcting the pricing error would produce long term savings by avoiding uneconomic retirement of units as well as incentivizing new, more efficient units to enter the market.[89] Additionally, because of their operational constraints, many units with long-lead times or high start-up costs cannot make commitment decisions within a 24-hour window. Because they cannot effectively participate in

[89] *Id.*

the day-ahead market, they self-commit instead. These self-commitment decisions are made in light of the predicted energy price and, to the extent that the energy price is not set optimally, the decision to self-commit is also not optimal.[90]

Equally important, a cost/benefit framework is misplaced here. The Commission needs to determine whether the pricing model is just and reasonable. Because the current pricing structure does not support the actual cost of production, basic principles of good market design are violated.[91] Specifically, locational *marginal* pricing, the basic principle that underlies energy market pricing, is violated given that a number of resources that are operating are prohibited from setting the clearing price. Units that are needed are not covering their variable costs. In such a model, while low prices produce "savings" for consumers, those savings are generated by undercompensating units that are needed to serve load. This pricing model is not sustainable and consumers do not benefit in the long-term.

Second, the PJM IMM does not describe PJM's proposal correctly when claiming that it would be inconsistent with efficient dispatch.[92] Under the proposal, the dispatch of units in PJM would be the same as it is today.[93] But energy market prices would allow *all* units needed to serve load to cover their costs.[94] To be sure, higher prices will mean that flexible resources will have an incentive to increase their output, but these resources would receive an additional payment

[90] *Id.* at 23.

[92] PJM IMM Comments at 39.

[93] Schnitzer Testimony at 23.

[94] *Id.* at 23-25.

designed to compensate it for the opportunity cost of following dispatch instructions.[95] This payment would resolve the incentive concerns raised by the PJM IMM.

Third, contrary to the PJM IMM"s assertions, PJM's proposal is also in fact a natural extension of the fast start NOPR.[96] PJM's energy market faces the same pricing problem whether the unit involved is a baseload inflexible unit or a fast-start inflexible unit. In either case, the relevant generator is part of a least-cost commitment and dispatch solution but it not permitted to set price. The LMP that results from the pricing run is not sufficient to cover the costs of the marginal unit and the pricing model does not support the dispatch. The same reasons that led the Commission to act under Section 206 in that rulemaking likewise warrant a finding here that PJM's energy pricing rules are no longer just and reasonable.

Fourth, the claim the proposal will produce unintended consequences is premature.[97] The PJM IMM claims that "no financial incentive supports the unit producing at the efficient dispatch level" and argues that resources will begin to self-commit at higher rates if the Commission approves the pricing proposal.[98] As PJM acknowledges, it will need to design an appropriate compensation mechanism to ensure that resources reduce their output in response to dispatch instructions. While this will be an important component of the proposal, it should be straightforward to design and mange. More fundamentally, this problem already exists in PJM. Without the current out-of-market payments to inflexible units, those units would not have the

[95] *Id.* at 24-25, 30-31.

[96] *Id.* at 25-30; PJM Comments at 44-46; *see also* Initial Post-Technical Conference Comments of PJM Interconnection, L.L.C., AD17-11, (June 22, 2017) at 4-5.

[97] Schnitzer Testimony at 32-33.

[98] PJM IMM Comments at 39.

appropriate incentives. PJM's proposal reduces this uplift and reduces the overall amount of out-of-market compensation needed to induce units to follow dispatch instructions.[99]

The argument that units will begin to self-commit inefficiently is also premature.[100] If designed correctly, self-commitment decisions will be improved. The core concept behind the proposal is that all units that are part of the least-cost solution should be permitted to set price, whether they are pool-scheduled or self-scheduled. Self-scheduled resources that are not part of the least-cost solution should not be allowed to set price. This approach should improve the incentives around self-commitment. Units that are part of a least-cost solution will have an incentive to self-commit when appropriate because they will be able to set price and recover their costs.[101]

* * *

Issuing a policy statement that fuel-secure units receiving state compensation will not have their capacity bids mitigated on account of that compensation, and fixing the well-understood flaw in PJM's energy markets, will not of course fully solve the problem of resilience. But these steps will improve the market's efficiency while also helping to prevent the further retirement of fuel-secure resources while FERC considers solutions more broadly targeted at resilience.

B. The Commission Must Gather Information from the Relevant RTOs That Will Enable It to Assess the System's Vulnerability.

In its initial comments in this docket, Exelon urged the Commission expeditiously to order the three eastern RTOs covered by DOE's NOPR to provide various critical pieces of information

[99] Schnitzer Testimony at 32-33.

[100] *Id.* at 33.

[101] *Id.* at 33.

SI-SSA-0010-3017

about the current resiliency of the electric systems they administer.[102] Within 30 days, the RTOs should provide the Commission with a comprehensive inventory of all fuel supply for all generation within their footprint, by generator.[103] This information, which should not be difficult for the RTOs to gather, is necessary to allow the Commission to assess the fuel security within each RTO and the vulnerability of each individual generator to disruption should its fuel supply be cut off. Within 60 days, the RTOs should provide the Commission with a comprehensive fuel reliance analysis, detailing the consequences to load should the supply of particular types of fuel, or a combination of fuel types, be interrupted.[104] This analysis should be detailed, and include not only a discussion of how much load will be unserved, but also the financial and security impacts of prolonged blackouts.[105] In addition, given that natural gas-based generation is peculiarly vulnerable to common mode failures, the RTOs should analyze and report to the Commission on their ability to continue to serve load even in the event of a multi-pipeline outage, and the time it would take to repair a significant pipeline outage.[106] This body of information will allow the Commission to order the changes necessary to ensure that the organized markets can sustain whatever threats DOE and others identify in the design basis threat analysis Exelon believes must also be immediately undertaken.[107]

SI-SSA-0010-3018

C. The Commission Should Work with Other Government Entities to Establish a Design Basis Threat.

Once the Commission receives the data from RTOs, it needs to be able to evaluate it. Right now, the Commission and the entities it regulates simply cannot assess the resilience of the electric grid against the threat of serious disruptions to the natural gas fuel supply. Because no description of the threat exists, the risk is uncertain and policy solutions are unclear. Exelon recommends that the Commission take action to remove this uncertainty by partnering with other federal agencies to develop a design basis threat. While DOE may be the appropriate agency to take the lead in developing a DBT, the Commission and other agencies have an important role to play.

As Dr. Paul Stockton outlined in his testimony attached to Exelon's initial comments and supplemented by additional testimony submitted with these reply comments (Exhibit A),[108] the DBT is a well-understood regulatory tool used by the Nuclear Regulatory Commission in order to provide guidance to owners of commercial nuclear generators. It identifies the threat to the units and allows owners of the units to develop strategies to mitigate the risk.[109] DBTs are also used by the Department of Homeland Security and the DOD to address threats to other critical infrastructure.[110]

A version of this model could serve a valuable purpose in guiding the analysis of the resilience of our power supply. Right now, RTOs and other entities are considering the risks of over-dependence on natural gas, but are doing so on their own. This approach means that the planning assumptions by these entities are not coordinated and are not necessarily consistent.

[108] Stockton Supplemental Testimony at 2.

[109] *Id.* at 7-8.

[110] *Id.*

SI-SSA-0010-3019

Moreover, the lack of involvement from national security agencies limits the opportunities for intelligence-related input from the DOE and other partner federal agencies.[111]

DOE need not start from scratch to develop a DBT for fuel resilience. NERC and other entities have already produced studies that could serve as the foundation of such a DBT. Dr. Stockton identifies three studies from NERC that touch on issues relating to the proposed DBT. First, NERC conducted a joint analysis in 2010 with the DOE on high impact, low frequency events.[112] This study warned that coordinated attacks on multiple vulnerable points on the system are possible and could produce extended, widespread outages.[113] Next, NERC came to a similar conclusion in 2012 in its *Severe Impact Resilience* study and recognized the risk of coordinated attacks on the grid.[114] Finally, NERC focused specifically on the risks of a cyberattack and also emphasized the risks of system collapse and widespread blackouts.[115] These studies, as well as others,[116] show the feasibility of assessing these risks in a DBT.

As it develops such a DBT, the DOE should consider a range of risks to resiliency. Dr. Stockton recommends analyzing potential large scale disruptions to the gas supply. Both natural and manmade threats could cause such disruptions. [117] International actors, as well as terrorist groups, could conduct physical or cyberattacks that disable natural gas infrastructure needed to

[116] *Id.*

[117] *Id.* at 12.

supply fuel for generation. Earthquakes and other natural disasters can have similar effects. Additionally, natural catastrophes could create weaknesses that can be exploited by adversaries.[118]

With a DBT in hand, the Commission will then be able to devise solutions that address the threat. In doing so, the Commission should not allow itself to be hide-bound by an ideological commitment to either markets or command-and-control regulation. It should offer RTOs the opportunity to propose market-based solutions, but should remain open to adopting non-market solutions if necessary. The Commission's ultimate priority must be to secure the Nation's electric grid—and to achieve that goal in the manner that is least burdensome to customers.

CONCLUSION

The deluge of comments the Commission has received in this docket is only further evidence, if any was needed, that the issue of grid resiliency is one of overarching importance, and that Commission action will have widespread consequences for the bulk power system and the nation as a whole. Exelon believes the Commission must expeditiously gather necessary information from the RTOs, and clearly define the resiliency threat it seeks to counter, before it develops a long-term solution. But these actions should not prevent the Commission from taking the immediate steps it can, today, to halt the retirements of baseload nuclear units that are among the most resilient in the generation fleet. The price formation proceedings already underway in PJM, and other state-based initiatives to support zero-emissions generators, are important steps towards that goal.

EXELON'S ANSWERS TO SELECTED QUESTIONS
POSED BY COMMISSION STAFF (OCT. 4, 2017)

Need for Reform

Question 1: *What is resilience, how is it measured, and how is it different from reliability? What levels of resilience and reliability are appropriate? How are reliability and resilience valued, or not valued, inside RTOs/ISOs? Do RTO/ISO energy and/or capacity markets properly value reliability and resilience? What resources can address reliability and resilience, and in what ways?*

Resiliency and reliability are fundamentally different concepts. Reliability concerns (1) resource adequacy, namely whether there exists sufficient generation resources to serve load at all times throughout a wide range of operating conditions; and (2) operational security, that is, the ability of the electric system to serve load notwithstanding disturbances. Resiliency, by contrast, refers to the system's ability to prepare for, absorb, and rapidly recover from high-impact, low-frequency or unknown-frequency ("HILF") events. Unlike traditional reliability events based upon weather or forced outage rates which can be probabilistically determined based upon historical data, a HILF event (for example, a cyber-attack by a nation-state or other malicious actor) may not be forecastable. For this reason, HILF events not only encompass incidents that are expected to occur infrequently, but also events that cannot be forecasted because of significant unknowns. Resilience also differs from reliability in having to account for the underlying nature of man-made threats, which differ from hurricanes and other familiar natural hazards. Unlike hurricanes, adversaries are intelligent and adaptable. Adversaries will also be able to selectively target points of special vulnerability in energy systems, including those related to fuel resilience and gas-electric system interdependencies. Initiatives to define the attributes of resilience and assess measures to strengthen them will need to incorporate these non-traditional risk factors.

The eastern RTO capacity markets generally value reliability by giving units a financial incentive to be capable of generating power whenever called upon. Because the capacity markets focus on unit level commitments, they do not account for "common mode failure"—that is, the risk that multiple units will fail due to a common cause external to the units, such as a gas supply interruption. Resiliency concerns systemic threats such as these. However, the RTOs/ISOs do not value a unit's contribution to system resiliency, and until this proceeding resiliency has not been a focus for either the organized markets or the Commission.

The Commission should take certain immediate steps to ensure that fuel-secure resources that contribute significantly to system resiliency are being appropriately compensated for the resiliency they provide. As Exelon, PJM, and others have explained in their comments, flaws in PJM's energy market design systematically undercompensate such units, exacerbating the economic pressures these units face and contributing to their retirements. The Commission should create a process for PJM to address this flaw in its energy market. The Commission should also gather information from RTOs to identify the bulk power system's vulnerabilities to HILF events. Using that information, the Commission should establish a design basis threat, which can serve as a reference point for the adoption of market reforms intended to value resiliency.

Question 2: *The proposed rule references the events of the 2014 Polar Vortex, citing the event as an example of the need for the proposed reform. Do commenters agree? Were the changes both operationally and to the RTO/ISO markets in response to these events effective in addressing issues identified during the 2014 Polar Vortex?*

The 2014 Polar Vortex was a significant event because it exposed serious reliability deficiencies within PJM and ISO-New England. Generators that had committed to perform during harsh winter weather were unable to perform, and their failure exposed the organized markets' failure to adequately incentivize generators to provide reliable service. PJM has not faced another weather event as extreme as the 2014 Polar Vortex, and so it is difficult to assess whether the Capacity Performance reforms have succeeded in incentivizing owners to make the investments necessary to ensure performance. Exelon continues to believe that the penalty rate in PJM for a generator's failure to perform remains too low, and, as a result, important investments have not been made. For example, capacity clearing prices have been too low to support the development of dual-fuel capability by gas-fired units.

In all events, however, the issues raised in this docket are quite different from those addressed by the Commission in the wake of the Polar Vortex. The Commission's focus post-Polar Vortex was on creating financial incentives that would lead unit owners to make investments in the performance of their units. This docket, by contrast, concerns systemic threats to the grid external to any particular unit—threats which could affect many units simultaneously. For example, the CP reforms were intended to incentivize owners of gas-fueled plants to enter firm fuel arrangements so their supply could not be curtailed during extreme cold weather. But the CP reforms were not intended to address the possibility that—notwithstanding firm supply arrangements—there might be a gas supply disruption due to a physical or cyber attack on key pipelines. Such a supply disruption would affect numerous units simultaneously. A resilient grid is one that can withstand that type of event.

Question 3: *The proposed rule also references the impacts of other extreme weather events, specifically hurricanes Irma, Harvey, Maria, and superstorm Sandy. Do commenters agree with the proposed rule's characterization of these events? For extreme events like hurricanes, earthquakes, terrorist attacks, or geomagnetic disturbances, what impact would the proposed rule have on the time required for system restoration, particularly if there is associated severe damage to the transmission or distribution system?*

Certainly some extreme weather events, earthquakes, terrorist attacks, or geomagnetic disturbances can properly be characterized as HILF events and are and should be the subject of resiliency planning. Exelon believes it is premature to settle on precise list of events that resiliency planning should address. Likewise, while it is commonly understood that nuclear units can significantly contribute to swift system restoration,[119] Exelon believes it is premature to

[119] Nuclear units are resilient during extreme weather conditions. During Hurricane Sandy, most of the nuclear units in the path of the storm stayed operational throughout the storm. Units that

settle on a particular "solution" to the problem. As Exelon indicated in its comments, the first critical step for the Commission is to work with DOE and others to establish a design basis threat that encapsulates the resiliency deficiencies that need to be addressed. Once this has occurred, the Commission should consider a variety of potential solutions and evaluate which ones will meet the design basis threat in the most cost-effective manner. The proposal in the NOPR may be part of the solution, but Exelon believes further analysis and study is required before that conclusion can be reached.

Question 4: *The proposed rule references the retirement of coal and nuclear resources and a concern from Congress about the potential further loss of valuable generation resources as a basis for action. What impact has the retirement of these resources had on reliability and resilience in RTOs/ISOs to date? What impact on reliability and resilience in RTOs/ISOs can be anticipated under current market constructs?*

As Exelon has noted in its comments, many experts – including NERC – have correctly concluded that retirements of resilient baseload generation is a serious problem. Increasing reliance on gas generation creates the danger that a common mode failure—such as a gas pipeline disruption—could wipe out a large quantity of generation all at once. Fuel-secure units such as nuclear stations provide a valuable hedge against that risk. Moreover, the retirement of a nuclear plant is irreversible. Once the resiliency benefits of these plants are lost, they cannot be regained. The Commission should direct RTOs to provide data to assess the impact that the retirement of these resources had had on reliability and resilience. In its comments, Exelon identified a number of categories of data that RTOs should be directed to provide to the Commission, so that the Commission can accurately assess what impact these retirements will likely have on resiliency and what reforms are needed.[120] ISO-NE likewise highlighted its concern about the disruption of the natural gas supply at the October 2017 Commission open meeting when it presented its Winter 2017-2018 Operations and Market Performance update. It noted that "the ability to meet energy needs is at risk if gas cannot be supplied to gas-fired generators."[121] ISO-NE repeated these concerns in its comments in this docket.[122]

---

were required to shut down restarted quickly when the storm ended. Because such units are safely taken offline during an event, they can return to service quickly after an event to allow the grid to resume operation. That quality would be crucial in the face of a major disruption to the natural gas supply. *See* Nuclear Energy Institute, *Nuclear Energy Facilities Prove Resilience During Hurricane Sandy*, October 30, 2012, *available at* https://www.nei.org/News-Media/Media-Room/News-Releases/Nuclear-Energy-Facilities-Prove-Resilience-During

[122] Comments of ISO-NE at 8-9 ("ISO-NE is concerned about the region's gas dependence").

SI-SSA-0010-3025

Question 5: *Is fuel diversity within a region or market itself important for resilience? If so, has the changing resource mix had a measurable impact on fuel diversity, or on resilience and reliability?*

There is no question that the changing resource mix has had a detrimental impact on the fuel diversity within RTOs/ISOs, and that declining fuel diversity in turn has made the system more susceptible to a common mode failure, such as a gas supply disruption. A diverse generation mix provides an extremely valuable hedge against that risk.

Other

Question 3: *Please describe any alternative approaches that could be taken to accomplish the stated goals of the proposed rule.*

As Exelon has noted in its comments, there are immediate steps the Commission should take to reduce the risk of further imminent retirements of nuclear resources and to gather the information needed to formulate comprehensive market reforms. These steps include: (1) providing a means for PJM to adopt energy market reforms intended to ensure that energy prices are sufficient to support dispatch; (2) issuing a policy statement declaring that nuclear units receiving compensation from state programs like the Illinois and New York Zero Emissions Credit programs, which have averted the retirement of nuclear resources, will not have their capacity market bids mitigated; (3) requiring RTOs/ISOs to submit information regarding their susceptibility to fuel-supply interruption and the potential impact of such interruption on the RTO/ISO's ability to serve load; and (4) establishing a design basis threat that can serve as a reference point for specific reforms.

Question 4: *What impact would the proposed rule have on consumers?*

As discussed in Dr. Stockton's testimony, the consequences to consumers of a black sky outage would be devastating. Preventing this by increasing the resiliency of the bulk power system is essential.

EXHIBIT A

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	**)**	**Docket No. RM18-1-000**

SUPPLEMENTAL TESTIMONY OF

DR. PAUL STOCKTON

ON BEHALF OF

EXELON CORPORATION

November 7, 2017

My name is Paul Stockton. I am the Managing Director of Sonecon, LLC, a security and economic advisory firm in Washington, D.C. I submitted initial testimony in this docket on behalf of Exelon outlining the risks to the resilience of fuel supplies for power generation, especially those related to natural gas, and proposed steps to mitigate those risks. This additional testimony is designed to expand on my earlier submission.

Bulk Power System (BPS) entities cannot adequately assess the resilience of their fuel supplies for power generation because they lack the necessary analytic framework. In particular, neither the Department of Energy (DOE) nor any other Federal agency has provided BPS entities with a description of the threat against which fuel resilience should be measured. Without the ability to anticipate the likely scope and severity of an attack on natural gas pipelines and other sources of fuel, the Federal Energy Regulatory Commission (FERC) and the entities it regulates cannot measure the adequacy of current fuel resilience measures, or evaluate the potential benefits of additional mitigation options.

In my initial testimony,[1] I recommended the establishment of a Design Basis Threat (DBT) to support such assessments. Government-vetted DBTs already provide descriptions of threats to other infrastructure sectors to help guide their evaluation of security requirements and mitigation measures. For example, the Nuclear Regulatory Commission (NRC) provides a DBT to owners of commercial nuclear generators to help them ensure the adequacy of their security measures against manmade threats. In this testimony, I examine how a DBT for fuel resilience might provide unique benefits for assessing the current status of that resilience, and for evaluating options to mitigate gaps that may emerge against increasingly severe threats. My

[1] Testimony of Paul Stockton at p. 4-5.

testimony presents three overall findings on why developing a DBT is so vital for addressing fuel resilience and recommendations on how that development process should go forward.

First, I explain the need for a DBT. Without a government-vetted DBT, RTOs and other BPS entities are left to develop their own characterizations of the threat, leading to disparate analytic frameworks for assessing the scale and potential impact of fuel interruptions.

Second, I recommend an approach to determine the threat characteristics that the DBT should comprise. The DBT established by the Nuclear Regulatory Commission for commercial nuclear power reactors provide a useful precedent and model for developing a DBT focused on fuel resilience. DBTs provided by the Department of Homeland Security (DHS), the Department of Defense (DOD), and other Federal departments and agencies provide additional models for consideration. However, a fuel resilience DBT would need to focus on specific threats of fuel supply interruption, including those related to gas-electric system interdependencies and the risks of cascading fuel-related infrastructure failures that adversaries could create. Those threat characterizations should also account for both natural and manmade hazards that could inflict the simultaneous disruption of multiple gas pipelines and other fuel supply systems in multi-state regions. Analytic efforts conducted by NERC, entities at the direction of the Electricity Subsector Coordinating Council (ESCC), and BPS entities can also help identify the key threat characteristics that the fuel resilience DBT should encompass.

Third, I discuss the path forward to develop a DBT for fuel resilience. One promising option would be for the Department of Energy to lead the development of the DBT, in close coordination with the Commission, other Federal departments and agencies, BPS entities, the ESCC, NERC, and additional stakeholders in grid resilience with expertise on emerging threats. Such a DBT could also be structured in a "tiered" fashion, with a baseline DBT provided to all

BPS entities at the level of "For Official Use Only" and supplementary DBTs provided as needed at higher levels of classification to cleared industry personnel.

I. The Need for a DBT

The Department of Energy's *Staff Report to the Secretary on Electricity Markets and Reliability* (August 2017) highlights the need to "develop policy metrics and tools for evaluating BPS-wide provision of resilience and considering all aspects of the electricity system that contribute to resilience," including fuel supply and storage, and other factors critical to grid reliability and resilience.[2]

A growing number of RTOs and other BPS entities are developing and applying such evaluative tools. In particular, these entities are either assessing or planning to assess potential risks to their fuel supplies, especially natural gas, and the potential impact of fuel interruptions on grid reliability. PJM, for example, has conducted pioneering studies of the potential risks created by increased reliance on natural gas, including in its *Natural Gas Contingency Scenario Analysis*.[3] These studies are essential to address the resilience challenges identified in the NOPR.

However, the DOE Staff Report also identifies a critical gap for conducting such assessments. The Report cites PJM's finding that "criteria for resilience are not explicitly defined or quantified today."[4] The Report goes on to recommend that "Each RTO/ISO should strive to explicitly define resilience on its system and conduct resource diversity assessments to more

[2] Department of Energy, *Staff Report to the Secretary on Electricity Markets and Reliability*, August 2017, p. 128.
[3] Transmission Expansion Advisory Committee, "Reliability Analysis Update," *PJM Interconnection*, September 14, 2017, http://pjm.com/-/media/committees-groups/committees/teac/20170914/20170914-reliability-analysis-updates.ashx.
[4] PJM Interconnection, *PJM's Evolving Resource Mix and System Reliability*, March 2017, p. 6.

fully understand the resilience of different resource portfolios. Federal, state, and local work to define and support system-wide resilience is also needed."[5]

Providing a DBT offers a uniquely valuable opportunity for such Federal support. The Federal government currently leaves RTOs and ISOs largely on their own to characterize threats to their fuel resilience. This approach is likely to produce disparate planning assumptions regarding the scale and severity of such threats. The government's "hands off" approach also limits opportunities for appropriate intelligence-related input from the Department of Energy and other Federal departments and agencies to support the development of a vetted, appropriately informed DBT. This lack of Federal support is especially notable given the risk that fuel supply interruptions could jeopardize the flow of power on which military bases and other national security assets depend. To help strengthen U.S. security, the Federal government should work with BPS entities and other resilience stakeholders to develop a vetted, intelligence-informed DBT for assessing and mitigating risks fuel resilience.

A DBT of this kind would also help RTO and ISO efforts to meet the underlying assessment problems posed by the proposed Rule. In commenting on the Rule, David Patton, Market Monitor for MISO, NYISO and ISO-NE, noted that "Without first identifying in detail the contingencies and associated reliability risks to the system, there is no way to quantify a resilience requirement."[6] Filling this gap with a DBT will be essential for establishing the objective, analytically sound assessment system needed to achieve the goals of the proposed

[5] Department of Energy, *Staff Report to the Secretary on Electricity Markets and Reliability*, August 2017, p. 128.
[6] Comments of Potomac Economics, Ltd., Docket No. RM18-1 (Oct. 20, 2017) at 5; Michael Kuser, Tom Kleckner, Rory D. Sweeney, Amanda Durish Cook, "RTOs Reject NOPR; Say Fuel Risks Exaggerated," *RTO Insider*, October 24, 2017, https://www.rtoinsider.com/market-monitor-nuclear-coal-nopr-iso-ne-78297/.

Rule. The need for a consistent, government-vetted DBT is further highlighted by the threat assumptions that undergird recent fuel resilience studies. While excellent as far as they go, these studies typically focus on assessing the consequences of the interruption of a single major gas pipeline. That is helpful but not sufficient. Any major power willing to accept the risks associated with attacking a single U.S. pipeline may well decide to strike on a much more massive scale, and seek to disrupt all flows of gas for power generation in a given RTO or ISO service area. Specifying the extent of such anticipated fuel interruptions will be essential to provide a foundation for assessing BPS fuel resilience, and for analyzing the cost-effectiveness of various options to mitigate the emerging threat.

II. Existing DBT Models and Special Requirements for a Fuel Resilience DBT

To accelerate the development of a DBT for fuel resilience, one promising approach would be to borrow from existing DBT models and adapt them to the special fuel-related challenges posed by catastrophic natural and manmade hazards. Most significantly, the NRC has created a DBT for nuclear power plants and related facilities.[7] The requirement to establish this DBT and the basic threats it should comprise are specified in the *Energy Policy Act* of 2005.[8] These threats include "multiple, coordinated groups of attackers, suicide attacks and cyber threats," as well as other potential attack vectors.[9]

[7] The NRC's DBT provide performance-based requirements which allow each facility to develop site-specific strategies. It applies to commercial nuclear power reactors and Category I Fuel Cycle Facilities. See: "Frequently Asked Questions About NRC's Design Basis Threat Final Rule," United States Nuclear Regulatory Commission, last updated August 11, 2017, https://www.nrc.gov/security/faq-dbtfr.html.
[8] 42 USC § 2210e (2005), https://www.ferc.gov/enforcement/enforce-res/EPAct2005.pdf.
[9] 10 CFR § 73.1 (2010), https://www.gpo.gov/fdsys/pkg/CFR-2010-title10-vol2/pdf/CFR-2010-title10-vol2-sec73-1.pdf.

The NRC also regularly reviews and revises the DBT to keep pace with evolving threats. In particular, the NRC monitors domestic and foreign threat intelligence in an attempt to stay ahead of potential adversaries, issues periodic threat advisories and annual reviews, and will use this information to update the DBT as required.[10] While the DBT focuses on manmade threats, the NRC also provides earthquake engineering criteria for nuclear power plants and other guidance related to natural hazards.[11]

The NRC DBT scheme offers valuable models for establishing a fuel resilience DBT. For example, given the evolving threat to gas pipelines and other fuel supplies, it will be essential that the fuel resilience DBT be periodically updated as well. The nuclear DBT also provides a model of the appropriate level of detail for characterizing key threat vectors in an unclassified manner. In addition, existing mechanisms for the Department of Energy to share classified information with BPS entities could also be used to supplement unclassified DBT descriptions. Finally, just as the NRC sets standards for both natural and manmade hazards, the fuel resilience DBT should as well.

Even when Congress has not established statutory requirements for DBTs, Federal departments have issued them to help strengthen resilience and security across a range of critical facilities and functions. For example, DOD provides DBTs to support anti-terrorism and force protection standards, and mitigation measures based on requirements generated internally by the Department.[12] DHS also provides a DBT that establishes "the type, composition, and capabilities

[11] "Appendix S to Part 50—Earthquake Engineering Criteria for Nuclear Power Plants," *United States Nuclear Regulatory Commission*, last updated August 29, 2017, https://www.nrc.gov/reading-rm/doc-collections/cfr/part050/part050-apps.html.
[12] *See* Department of Defense, DOD Security Engineering Facilities Planning Manual, September 2008, https://www.wbdg.org/FFC/DOD/UFC/ufc_4_020_01_2008.pdf

of adversaries" who might threaten Federal facilities. DHS uses the best available intelligence information and other relevant sources of data to develop and maintain the DBT. The baseline DBT provided by DHS is designated For Official Use Only (FOUO). In addition, DHS provides supplementary information as needed on specific threats and mitigation options, including at higher levels of classification.[13] A similar tiered approach to provide both an FOUO DBT and other threat assessments at higher levels of classification (to be provided to cleared BPS personnel) might also offer a useful design model for a fuel resilience DBT.

While these models from other departments are useful, a fuel-oriented DBT will need to focus on a different set of resilience challenges and threat vectors than those for nuclear power plants or Federal facilities. NERC Reliability Standard TPL-001-4 provides a valuable starting point. TPL-001-4 directs Transmission planners to assess the impact of extreme events, and if the analysis determines that such events could cause cascading outages, the Transmission planner should evaluate possible actions to reduce their likelihood or mitigate the consequences and adverse impacts to reliability.[14] To ensure that those assessments account for the risks posed by increasing reliance on gas for power generation, NERC is now considering a recommendation that "NERC registered entities should consider the loss of key natural gas infrastructure in their planning studies."[15] A DBT for fuel resilience could provide valuable support for such analysis

---

[14] *See* Requirements R 3.2 and R 3.5 of Standard TPL-001-4 – Transmission System Planning Requirements.

[15] Thomas Coleman, "Special Assessment: Potential Bulk Power System Impacts Due to Severe Disruptions on the Natural Gas System" (presentation at NERC Board of Trustees Meeting, New Orleans, LA November 9, 2017). http://www.nerc.com/gov/bot/Agenda%20highlights%20and%20Mintues%202013/Board_Presentations_November_2017.pdf.

by specifying the scope and severity of the gas infrastructure losses that entities should use in their studies.

However, no such DBT exists today. Only limited guidance exists on the scale and characteristics of the extreme events that should be used as a basis for assessing the impact of fuel system interruptions on grid reliability and resilience.[16] BPS entities would benefit from far more extensive support. In particular, using appropriate intelligence sources, it would be helpful if the Federal government could provide these entities with an assessment of the scale and nature of attacks that they must be prepared to confront. Such an assessment could also help entities account for specific risks to fuel resilience, including the risk that adversaries will target their attacks to exploit interdependencies between gas and electric infrastructure.

As a starting point to develop a Design Basis Threat for fuel resilience, NERC and other industry stakeholders have already produced studies that highlight key resilience challenges to address in such a DBT. In particular, three NERC studies have examined both the characteristics of natural and manmade hazards that could cause catastrophic outages, as well as possible mitigation measures to adopt against the risks they pose.[17] These and other studies are useful starting points, but also have gaps in terms of characterizing the threat to fuel supplies. Filling those gaps will be necessary for developing a fuel resilience DBT.

---

[16] *See*, *e.g.*, NERC, *2016 Long-Term Reliability Assessment*, December 2016, p. 21. The assessment notes that "As part of future transmission and resource planning studies, planning entities will need to more fully understand how impacts to the natural gas transportation system can impact electric reliability."

[17] NERC noted that coordinated cyber or physical attacks "could damage or destroy key system components, significantly degrade system operating conditions, and, in extreme cases, result in prolonged outages to large parts of the system." See: NERC, *2015 Long Term Reliability Assessment*, December 2015, p. 27.

The first NERC study is a joint analysis with the Department of Energy to examine the risk of high impact, low frequency events. Particularly useful is the study's analysis of coordinated cyber/physical attacks to the BPS.[18] The report warns that coordinated cyber/physical attacks will purposefully target multiple vulnerable points on the system, and that sophisticated adversaries will adapt to protective measures to maximize disruptions. Such attacks "could result in long-term (irreparable) damage to key system components in multiple simultaneous or near-simultaneous strikes… quickly bring[ing] the system outside the protection provided by current planning and operating practices."[19]A coordinated cyber/physical attack, as described, would likely result in extended outages over a wide geographic area.

The second study examines severe disruptions to the BPS, and stems from the work of the *High Impact, Low Frequency* report. Much like that report, the *Severe Impact Resilience* study focuses primarily on coordinated cyber and physical attacks.[20] The study cautions that a coordinated physical attack on critical nodes in the grid can cause extensive damage to equipment that is difficult to replace, with significant impact to the system as a whole. Similarly, coordinated cyberattacks could cause simultaneous disruptions or misoperation that could be detrimental to system integrity.[21] While *Severe Impact Resilience* treats cyber and physical attacks as separate threats, a future Design Basis Threat should assume advanced adversaries will conduct attacks in both domains near-simultaneously.

---

[18] The study also assesses the risks of pandemic illness and geomagnetic/electromagnetic disturbances. For more information, see: NERC and the Department of Energy, *High-Impact, Low-Frequency (HILF) Event Risk to the North American Bulk Power System*, June 2010.
[19] HILF Report, p. 26
[20] Like the *High Impact, Low Frequency* report, it also includes geomagnetic disturbances among the key threats for particularly severe events. See: NERC, *Severe Impact Resilience: Considerations and Recommendations*, May 2012, p. 1.
[21] NERC, *Severe Impact Resilience: Considerations and Recommendations*, May 2012, p. 1.

In a third study, NERC examined the cyberattack scenario in greater detail in a parallel effort from a cyber-focused task force. This study focuses on two primary attack vectors: 1) a coordinated attack which disables or impairs multiple control systems; and 2) intruders gaining control to purposefully misoperate the system, causing outages and/or damage. The potential ramifications are severe. If successful, adversaries could inflict losses of load and generation that cause system instability, and, ultimately, system collapse and widespread blackouts.[22]

Other industry initiatives could also be leveraged to create a DBT for fuel resilience. For example, NERC Standard CIP-014-2, *Physical Security*, provides a methodology for Transmission owners and operators to conduct their own assessment of potential physical threats and vulnerabilities.[23] NERC's *Geomagnetic Disturbance Planning Guide* provides yet another approach to assessing potential threats and system design requirements.[24] While neither of these guiding documents establishes a Design Basis Threat, they do provide useful methodological approaches that might be valuable in developing a DBT for fuel resilience.

The Department of Energy has also sponsored a study by ICF International to establish a 'baseline' of adversarial threats to the North American electric grid. The report provides an in-depth examination of an array of physical and cyber threats, including combined cyber-physical events.[25]

However, none of these studies provides a detailed analysis of the fuel resilience challenges identified in the NOPR. Nor are any of them adequate to capture the risks created by

SI-SSA-0010-3038

gas-electric interdependencies, common failure modes,[26] duel-fuel resupply challenges and other threats I examined in my previous testimony. The threat of common failure modes is particularly concerning, as an increasing number of gas generators depend on a limited number of pipelines to deliver fuel required for power generation. Pipeline disruptions that lead to a shortage and/or outage of natural gas could therefore incapacitate multiple generators at the same time, increasing the scope and severity of the resulting power outages A single attack vector (especially via cyber means) could enable the adversary to disrupt fuel supplies for power generation across major portions of the United States. A DBT that can help BPS entities assess resilience against these threats will need to go far beyond any previous study of interruption scenarios.

As I outlined in my original testimony, the DBT should study both natural and manmade risks the system. Manmade risks could include threats from international actors, such as Russia or China, as well as terrorist organizations. The DBT should account for both physical and cybersecurity risks. For physical attacks, the DBT should encompass both familiar attack vectors as well as threats emerging from new technologies, such as unmanned aerial vehicles carrying advanced payloads. Finally, the DBT should account for the possibility that adversaries will combine cyber and physical attacks to create especially significant challenges to fuel supply systems.

[26] NERC will be presenting a Special Assessment: Bulk Power System Impacts Due to Severe Disruptions on the Natural Gas System to its Board for approval on Nov. 9, 2017. *See* Item 8c, Agenda, Board of Trustees, Nov. 9, 2017; Special Assessment: Potential Bulk Power System Impacts Due to Severe Disruptions on the Natural Gas System, Preliminary Findings, Board of Trustees, Nov. 9, 2017, located at http://www.nerc.com/gov/bot/Agenda%20highlights%20and%20Mintues%202013/Board_Presentations_November_2017.pdf.

Catastrophic earthquakes and other natural hazards can also inflict catastrophic damage on fuel infrastructure. Accordingly, I recommend that the DBT include both manmade and natural hazards. Given the importance of dual fuel generators as an option to mitigate the risks posed by gas system disruptions, I also propose that planners include contingency analysis of severe disruptions in secondary fuel supplies for dual fuel generators, and disruption of fuel resupply for backup power generators that serve critical natural gas compression stations and other key gathering and Transmission infrastructure. Finally, planners should conduct sensitivity analysis on the degree to which retaining a mix of fuel-resilient generation assets, including nuclear assets, can help reinforce the resilience of the BPS as a whole.

III. The Path to a Fuel Resilience DBT

Developing a DBT will require the input of multiple stakeholders. I recommend the Department of Energy lead a multistage effort in consultation with the Commission and other grid resilience stakeholders. As the Sector-Specific Agency (SSA) for the energy sector, including both the electricity and oil and natural gas (ONG) subsectors, DOE is especially well positioned to serve as the government lead for this effort. Close coordination with other Federal departments and agencies will also be required, especially those with: 1) SSA responsibilities concerning specific fuel supplies; and 2) information on the evolving threat that could supplement DOE's own extensive expertise. The ESCC, NERC, BPS asset owners and operators, and other resilience stakeholders could also play valuable roles in guiding this process.

Most important, close coordination will also be required with BPS entities to ensure that the DBT incorporates their own analytic priorities and requirements for support. The ESCC and other appropriate entities might support this BPS engagement process as well.

Given the increasing severity of threats to fuel resilience and the need for timely assessments of those challenges, I also recommend that the development of the DBT go forward in a phased process. DOE might first bring stakeholders together to produce a rapidly-available, top-level assessment of threat vectors and characteristics, equivalent to that which the NRC provides to the nuclear fleet in its publicly-available DBT descriptions. For example, this basic DBT could specify the percentage of gas pipelines that BPS entities should assume will be disrupted (and for how long). Follow-on DBTs could then address the more detailed challenges raised by gas-electric interdependencies and the threat vectors by which adversaries may seek to exploit them.

I also recommend that the fuel resilience DBT be structured in a "tiered" fashion, with a baseline DBT provided to BPS entities at the level of "For Official Use Only" and supplementary DBTs provided as needed at higher levels of classification to cleared industry personnel.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	)	**Docket No. RM18-1-000**

DECLARATION OF PAUL STOCKTON

I declare, under penalty of perjury, that the foregoing Supplemental Testimony is true and correct.

Executed: November 7, 2017

EXHIBIT B

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Grid Reliability and Resilience Pricing	)	Docket No. RM18-1-000

PREPARED TESTIMONY OF MICHAEL M. SCHNITZER

ON BEHALF OF EXELON CORPORATION

I. INTRODUCTION AND SUMMARY OF CONCLUSIONS

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS

A. My name is Michael M. Schnitzer. My business address is 30 Monument Square, Concord MA 01742.

Q. MR. SCHNITZER, BY WHOM ARE YOU EMPLOYED AND IN WHAT POSITION?

A. I am a Director of The NorthBridge Group, Inc. ("NorthBridge"). NorthBridge is a consulting firm that provides economic and strategic advice to the electric and natural gas industries.

Q. PLEASE DESCRIBE YOUR PROFESSIONAL QUALIFICATIONS AND EMPLOYMENT EXPERIENCE

A. In 1992, I co-founded NorthBridge. Before that, I was a Managing Director of Putnam, Hayes & Bartlett, which I joined in 1979. I have experience working with private sector

SI-SSA-0010-3044

clients in the electric utility, natural gas, and private power industries, as well as with public and nonprofit agencies. My electric industry work has focused on regulatory policy, finance, and market structure issues.

I have testified before the Commission on a number of matters, and have participated in Commission technical conferences and workshops on capacity market and energy market design issues. I have also testified before the public utility commissions of Arkansas, California, Delaware, Illinois, Indiana, Maine, Maryland, Massachusetts, Mississippi, New Hampshire, New Mexico, New Orleans, New York, Ohio, Pennsylvania, Rhode Island, Texas, Vermont, and Wisconsin.

Q. WHO IS SPONSORING YOUR TESTIMONY?

A. My testimony is sponsored by Exelon Corporation ("Exelon" or "the Company").

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. On October 23, 2016, the PJM Independent Market Monitor (IMM), Dr. Joseph Bowring, filed extensive comments in this docket on several topics related to the DOE NOPR.[1] The IMM's comments included an analysis that purports to address the economics of nuclear plants in PJM[2] as well as a multi-paged critique of an energy price formation "white paper" published by PJM in June of this year.[3] The IMM concludes that the

[1] Comments of the Independent Market Monitor for PJM, October 23, 2017. ("IMM Comments")
[2] *Ibid.* at 18-20.
[3] *Ibid.* at 34-41. Also see PJM Interconnection LLC, "Energy Price Formation and Valuing Flexibility," June 15, 2017 (the "PJM White Paper").

overwhelming majority of nuclear units have been able to recover their going-forward costs of operation from market revenues in each of the last two years. The IMM further concludes that the price formation proposal outlined in the PJM white paper is unnecessary and counter-productive, and that the existing market is functioning well.

The purpose of my testimony is to respond to the IMM's analysis and critique and explain the errors contained therein. With respect to the IMM's analysis of nuclear plant economics, I correct several fundamental errors in the analysis and explain why the IMM's conclusions are incorrect. With respect to the IMM's criticism of PJM's energy price formation proposal, I first explain why, contrary to the IMM's conclusion, the current energy pricing approach in PJM is flawed and results in both efficiency losses and discrimination. I then explain why the central feature of PJM's proposal that the IMM appears to find so objectionable – separate pricing and dispatch solutions - can address both the efficiency and discrimination problems with the current approach.

Q. COULD YOU PLEASE SUMMARIZE YOUR CONCLUSIONS?

A. Yes. First, the IMM's conclusion that the overwhelming majority of nuclear units have been able to recover their costs in the last two years is not correct. The IMM's analysis erroneously omits two categories of costs that should have been included: going-forward capital expenditures as well as the cost of certain operating and market risks that are borne by owners/operators of nuclear units. When these components of going-forward cost are included, the data from the last two years indicate that the

overwhelming majority of nuclear units have failed to cover their costs and are at risk of retirement – the exact opposite of the IMM's conclusion.

Second, as to energy price formation, the IMM's conclusion rests on the false premise that the current market dispatch solution produces the least cost dispatch and prices that are consistent with that solution. It does not. While the current market dispatch solution can produce a least cost physical commitment and dispatch in the short-term (assuming the level of self-commitment is economic), the resulting prices are not necessarily consistent with that physical solution. As a result, the prices from the current market dispatch solution cannot be said to be efficient, which means they do not promote either economic retention or entry. The current prices are also discriminatory in that certain resources are paid a higher energy price than other resources. The price formation approach that PJM described in its October 23 comments is designed to address the flaws in the current pricing rules and to produce prices that support economic commitment and dispatch of generation. Given the number of nuclear units that are at risk of retirement due, in large part, to insufficient energy margins, the PJM proposal should be brought before the Commission without delay.

II. CONTRARY TO THE IMM'S ASSERTION, THE OVERWHELMING MAJORITY OF PJM NUCLEAR UNITS HAVE FAILED TO RECOVER THEIR COSTS IN RECENT YEARS AND ARE AT RISK OF RETIREMENT

Q. PLEASE SUMMARIZE THE IMM'S CONCLUSIONS WITH RESPECT TO THE FINANCIAL VIABILITY OF PJM NUCLEAR PLANTS.

A. The IMM concludes that 90 and 74 percent of all nuclear units in PJM fully recovered avoidable (or going-forward) costs in 2015 and 2016 respectively and then goes on to claim that "there are very few nuclear units in PJM that are at risk [of retirement]."[4]

Q. DO YOU AGREE WITH THE IMM'S CONCLUSIONS?

A. No.

Q. WHY NOT?

A. The IMM's analysis significantly under-states nuclear going-forward costs. When properly analyzed, the same data relied on by the IMM indicate that as few as 6 percent of PJM nuclear units fully recovered going-forward costs in 2016 and therefore many units are at risk of retirement.

Q. HOW DOES THE IMM UNDERSTATE GOING-FORWARD COSTS?

[4] *Ibid.* at 18 and 20.

A. The IMM assumes that nuclear going-forward costs (excluding fuel) are $25.83/MWh for single-unit sites and $18.73/MWh for multi-unit sites, based on national average actual cost data for 2016 published by the Nuclear Energy Institute ("NEI").[5] These values correspond to the operating cost for nuclear generators in 2016, but completely exclude two additional components of going-forward cost: ongoing capital expenditures and compensation for operational and market risk.

With regard to ongoing capital expenditures, the same NEI data indicate that in addition to operating costs, nuclear generators also incurred annual ongoing capital expenditure costs of $8.67/MWh and $6.15/MWh for single- and multi-unit sites respectively in 2016. Excluding these costs is not appropriate. These additional costs are avoidable if a nuclear unit retires. The capital costs reported by NEI do not represent recovery of sunk capital expenditures incurred in prior years. Rather, they are capital expenditures incurred in the present year. Further, the data demonstrate that these expenditures are ongoing and significant in every year tracked, and can be expected to continue at a similar level going out into the future.[6] Ongoing capital expenditures are critical to maintaining the operating condition of nuclear plants; the industry consistently incurs these capital investments, year in and year out, to maintain safe, reliable operations.

[5] Nuclear Energy Institute, "Nuclear Costs in Context," at 2 ("NEI"). Attached as Exhibit A. The IMM includes fuel in his analysis as an offset to revenue, rather than as a component of avoidable cost (*see* IMM comments, footnote 16). The IMM does not provide his estimate of fuel costs. In correcting the IMM analysis, I utilized the fuel costs published by NEI ($6.77 and $6.75/MWh for single- and multi-unit sites, respectively).
[6] NEI at 3.

Thus, ongoing capital expenditures would be avoided if the plant were to retire and are an appropriate component of going-forward costs.

Q. WHY DID THE IMM EXCLUDE THESE COSTS?

A. In a footnote, the IMM observes that, in an operating year, these capital additions are largely sunk costs, and therefore should not be treated as going forward costs.[7] That explanation completely misses the point. Retirement decisions are inherently forward-looking decisions, not backward-looking. If the IMM's analysis is to have any value, it is to provide an answer to the following question: if nuclear owners think that future market conditions will be similar to 2016 (or 2015), will it be profitable for them to continue to operate? In that context, using 2016 or 2015 revenues as a proxy for future revenues and comparing them to going forward costs, capital additions are clearly avoidable. My corrected analysis provides the correct answer to the question, which is "no". Unless market revenues increase relative to 2016 levels, it will not be profitable to continue to operate a large fraction of the PJM nuclear fleet. The retirement risk is real.

Q. WHAT RISKS ARE BORNE BY OWNERS OF OPERATING NUCLEAR PLANTS?

A. Nuclear plant owners incur significant operational and market risks in continuing to operate merchant nuclear plants. These risks include the risk of higher-than-expected operating costs, lower-than-expected production due to outages, the risk of needing to cover liquidated damages forward sales at a very high spot price in the event of a forced

[7] IMM Comments at footnote 17.

outage, the risk of higher-than-expected performance penalties when serving as a capacity resource in PJM's recently-reformed capacity market, and the ongoing market risk of lower-than-expected forward and spot sales prices for energy and capacity. These ongoing risks make owning and operating a nuclear plant on simply a cash breakeven basis an untenable proposition for investors. Rather, on an ongoing basis, investors will require that plant owners either realize compensation for these risks above simple ongoing avoidable cash costs or avoid these risks by retiring the plant. Exelon has in previous proceedings supported an overall level of operational and risk compensation equal to ten percent of operating costs, capital expenditures, and fuel costs plus four dollars per megawatt-hour.[8] I adopt this value in correcting the IMM's analysis and show the range of nuclear profitability between simple breakeven versus cash going-forward costs only, and the same with this measure of risk compensation included as well.

My corrections to the IMM's nuclear going-forward cost information are summarized below:

[8] New York Department of Public Service Case 15-E-0302, Comments of Constellation Energy Nuclear Group LLC Concerning Staff White Paper on Clean Energy Standard, April 22, 2016, at 19-28.

($/MWh)	Single-Unit Sites	Multi-Unit Sites
Operating Cost (per NEI)	$25.95	$18.73
IMM estimate of Going-Forward Cost[9]	$25.83	$18.73
Plus Correction to Operating Cost[10]	$0.12	--
Plus Ongoing Capital Expenditures (per NEI)[11]	$8.67	$6.15
Corrected Going-Forward Cost without Risk	$34.62	$24.88
Plus Market and Operational Risk[12]	$8.14	$7.16
Corrected Going-Forward Cost with Risk	$42.78	$32.02

With corrections, the appropriate going-forward cost for a single-unit site is between $34.62 and $42.78/MWh, rather than $25.83/MWh (excluding fuel) and between $24.88 and $32.02/MWh for a multi-unit site, rather than $18.73/MWh (also excluding fuel).

Q. HOW DOES THE UNDERSTATEMENT OF GOING-FORWARD COSTS AFFECT THE RESULTS OF THE IMM'S NUCLEAR FINANCIAL VIABILITY ANALYSIS?

A. The IMM's analysis of the economics of PJM nuclear generators rests on a comparison of the market revenues of these units to their going-forward costs. Because going-forward costs are greatly understated, the extent to which nuclear market revenues exceed going-forward costs is dramatically overstated. The IMM's comments presents data that purport to show that 90 percent of PJM nuclear units covered their going-forward costs in 2015 and 74 percent covered their going-forward costs in 2016. When the same analysis is performed using corrected going-forward costs, including ongoing

[9] IMM Comments at 18.
[10] The IMM miss-states the operating cost of Single Unit Sites published in the NEI data. The actual published cost is $25.95/MWh, rather than $25.83/MWh. *See* NEI at 2.
[11] NEI at 2.
[12] Market and operational risk equal to 10% of total cost (including fuel) plus $4/MWh.

capital expenditures and market and operational risk, only 19 and 6 percent of PJM nuclear units covered their going-forward costs in 2015[13] and 2016 respectively when risk compensation is included as a going-forward cost. Even without including any risk compensation in going forward costs, only 61 and 32 percent of PJM nuclear units covered their cash going-forward costs in the same years.

	Percent of Nuclear Units with Full Avoidable Cost Recovery from All Markets[14]	
	2015	2016
IMM Analysis[15]	90%	74%
Corrected Analysis excluding risk compensation	61%	32%
Corrected Analysis including risk compensation	19%	6%

Q. WHAT CONCLUSIONS DO YOU DRAW WITH RESPECT TO NUCLEAR FINANCIAL VIABILITY IN PJM FROM THIS ANALYSIS?

A. The corrected analysis does not support the conclusion reached by the IMM; rather it supports the opposite conclusion. Virtually all of PJM nuclear units are financially-challenged and therefore many are at risk of retirement. Energy margins, the principal source of going forward cost recovery for nuclear plants, have fallen to a level which is not adequate for many units. This underscores the urgency of addressing flaws in

[13] For the 2015 analysis, I used single- and multi-unit nuclear avoidable costs from NEI's earlier report on 2015 nuclear costs. *See* Nuclear Energy Institute, Nuclear Costs in Context, April 2016, at 2.

[14] In calculating the percentage of nuclear units covering their avoidable costs from all markets, I estimated energy revenues based on unit-level day-ahead locational marginal prices for the relevant year, capacity revenues based on actual cleared RPM capacity prices for the relevant years and I further assumed that all nuclear units cleared as Capacity Performance resources in the relevant CP transition auctions. I assumed that nuclear units did not earn any ancillary services revenues. For each year, I compared these revenue estimates to the appropriate measure of going-forward costs.

[15] Extracted from IMM Comments, Table 9.

energy price formation in PJM which contribute to nuclear unit financial stress, which I discuss in the next section of my testimony.

III. PJM's CURRENT MARKET DISPATCH SOLUTION DOES NOT PRODUCE PRICES THAT ARE CONSISTENT WITH THAT SOLUTION.

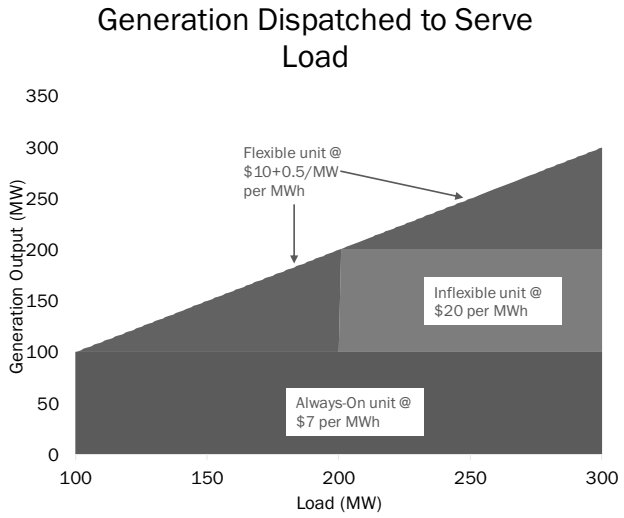
Q. PLEASE EXPLAIN WHY YOU DISAGREE WITH THE IMM ABOUT WHETHER THE CURRENT SYSTEM PRODUCES PRICES CONSISTENT WITH THE DISPATCH SOLUTION.

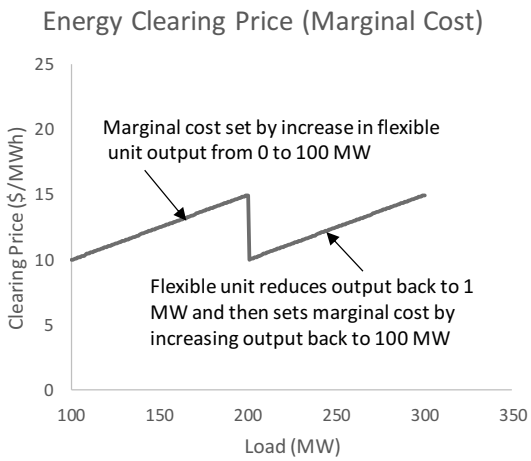
A. As I stated above, the contention that the current PJM market dispatch solution produces the least cost dispatch and prices that are consistent with that solution is central to the IMM's argument.[16] In effect, the IMM is arguing that the current system is not broken, and therefore does not need to be fixed. But a simple example illustrates that this is not the case, and that under the current system, prices are not always consistent with the dispatch.

Consider an electricity market with three generators: the first must always operate at a fixed output level of 100 MW and costs $7/MWh to operate (the "always-on unit"), the second can be either committed or offline but if committed must operate at a fixed level of 100 MW with variable costs of $20/MWh (the "inflexible unit"), and the third that can flexibly produce between 1 MW and 100 MW of output with an incremental cost of $10/MWh plus $0.05/MWh for each incremental MW of output (the "flexible unit").

[16] IMM Comments at 37.

The figures below show the economic dispatch solution at loads between 100 and 300 MW, and the associated energy clearing price under the current pricing regime.





As the dispatch chart illustrates, the least cost dispatch solution is to rely on the always-on and flexible units until load reaches 200 MW, to "back down" the flexible unit to 1 MW and bring on the inflexible unit when load is 201 MW, and then ramp the flexible unit back up as load increases from 201 to 300 MW.

What about the prices? As the price chart shows, energy prices increase and then decrease, and then increase again. From 100 to 200 MW the system marginal cost is defined by the marginal cost of the flexible unit and increases from $10 to $15/MWh. At 201 MW, the inflexible unit is committed but does not set the system marginal cost at that point. This is because, under PJM's current pricing methodology, the system marginal cost is set by the lowest-cost available source of incremental supply than can expand output in the very short term to supply an infinitesimal increase in demand.

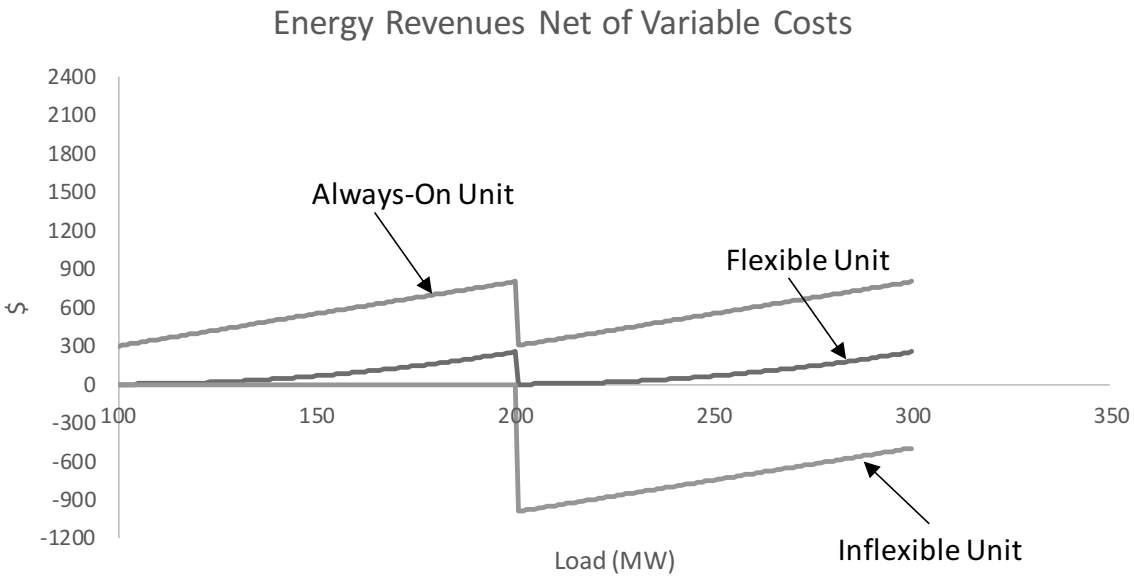
Thus, at 201 MW the inflexible unit is online at a fixed output level and cannot further increase output to supply any further increase in demand, however small, and the system marginal cost is set instead by the flexible unit at an output level of 1 MW, or $10/MWh. Thus, the system marginal cost (and energy clearing price) falls from $15/MWh at 200 MW of load to $10/MWh at 201 MW of load notwithstanding an increase in load. Basic micro-economic theory is based on the assumption that marginal supply costs increase as demand grows. But, as I will discuss in more detail below, electricity supply is different because of what economists refer to as a non-convexity, where the incremental cost of production is not continuously increasing with demand.[17] The failure of the existing pricing methodology to account for non-convexity causes a pricing anomaly where the clearing price goes down as demand increases. In my example, at load levels from 201 MW to 299 MW, the current PJM pricing methodology produces an anomaly where prices are not consistent with the physical dispatch.

Q. HOW DOES THIS ANOMALY IMPACT THE ABILITY OF DISPATCHED UNITS TO RECOVER THEIR VARIABLE COSTS?

A. The chart below shows the energy margin (energy revenues net of variable costs) of each of the generators at each load level. While the always-on and flexible units earn a positive energy margin at every load level, the inflexible unit is unable to cover its variable costs at every load level at which it is committed. Thus, at load levels up to 200

[17] *See* e.g., Richard P. O'Neill, Paul M. Sotkiewicz, Benjamin F. Hobbs, Michael H. Rothkopf, William R. Stewart, Jr., "Efficient Market-Clearing Prices in Markets with Nonconvexities," December 9, 2002.

MW, the energy prices are consistent with the dispatch. But, above 200 MW, the prices do not support the economic dispatch.



Recognizing that a generator cannot be compelled to operate at a loss, under the current system, PJM "solves" the pricing problem with an out of market uplift payment to the inflexible generator that offsets the losses it would sustain if it only received the prevailing market price. In the example, the uplift payment to the inflexible generator would result in it effectively receiving a price of $20 per MWh, split between the prevailing energy price of between $10 and $15 per MWh and whatever additional compensation is needed to move the compensation to the unit's breakeven point of $20 per MWh. But there are two problems with this solution: it does not produce "efficient" market clearing prices, and it is discriminatory.

Q. WHY ARE THESE PRICES NOT "EFFICIENT"? AND SHOULD THE COMMISSION BE CONCERNED?

A. In competitive markets, efficient prices are those that promote both productive and allocative efficiency. Productive efficiency is achieved when the quantity demanded is produced at the lowest possible cost. Allocative efficiency is achieved when the quantity demanded reflects the proper tradeoff of the cost of producing (and consuming) one product versus another.

In RTO energy markets, the commitment and dispatch solution is designed to achieve short-run productive efficiency – that is to produce the quantity demanded at each interval and across intervals at the lowest variable cost. Efficient prices must be consistent with that physical commitment and dispatch. If a unit that is economically dispatched does not receive energy market revenues that cover its variable costs, then the prices are not consistent with the dispatch. For prices to be completely consistent with the dispatch, each generator on the system has to be performing at an economic level, given the prices, and not be able to increase its profits by changing its output level up or down.

As I discussed above, and as illustrated by the simple example, the current energy pricing in PJM fails this simple test. There are both productive and allocative efficiency losses associated with this pricing failure – and that is why the Commission should be concerned.

Q. PLEASE EXPLAIN.

A. In economic terms, the current energy pricing regime in PJM is analogous to the pricing behavior of a partially discriminating monopsonist. I am using monopsony as an economic analogy here and I am not implying that PJM has any perverse intent. PJM, on behalf of the load in the footprint, buys the energy from the lowest cost producers, but it does not pay them all the same price for the energy they produce at the same time. Up to a point, all generators get the same price (the energy price, as calculated currently). But, some of the most expensive generators required to achieve a least cost dispatch, of which there might be one, ten or twenty or more on a given day, are each paid a different price that is in each case higher than the generally available energy price. In the example, the inflexible unit receives an effective price, including out of market uplift payments, of $20 per MWh, while the always-on and flexible units only receive the energy market clearing price of $10 to $15 per MWh.

Economics tells us what happens when this type of price discrimination occurs and why it is inefficient: what would and should be producer surplus under efficient pricing is instead converted to consumer surplus. All of the generators that just receive energy prices under-recover the efficient level of energy margin for every hour and day when the pricing does not support the dispatch. In the short run, a day or a month, this may not result in a significant productive efficiency penalty. But over the medium and longer

term, some of the otherwise economic generators that are harmed by this discrimination will leave the market.

As an illustration, we can return to the previous three-unit example. In this example, it is the always-on and flexible units that suffer from the inefficient price as those units effectively receive a lower price than the inflexible unit. Further, if there were other units running at the time, they would also receive the lower, inefficient price. To the extent that any of these generators withdraw from the market and would have remained in the market with efficient energy pricing, the retirement is "uneconomic" and increases the total cost of serving load, ultimately harming customers in the long run. In particular, the always-on unit, whose economics are analogous to a nuclear unit, would be particularly at risk of uneconomic retirement given that it has high fixed costs of operation that must largely be recovered through energy revenues. As I discussed in the first section of my testimony, many of the nuclear units in PJM are at risk of retirement as a result of the low level of energy margins, and the pricing inefficiency contributes to this retirement risk. Thus, the productive efficiency penalty could be quite substantial over time, and can be avoided through improved energy pricing.

Q. THUS FAR YOU HAVE JUST DISCUSSED THE POTENTIAL FOR PRODUCTIVE EFFICIENCY LOSSES. ARE THERE POTENTIAL ALLOCATIVE EFFICIENCY LOSSES, AS WELL?

A. Yes. In electricity energy markets, allocative efficiency is achieved when the "right" amount of electricity is consumed at the "right" time, consistent with efficient pricing.

As customer technology improves and becomes less expensive, sending efficient price signals on an hourly, fifteen minute, and five minute basis will become increasingly important to achieving allocative efficiency. While the amount of load that currently responds to hourly or real-time prices is not very large today, that proportion will likely grow substantially. So, by improving price formation to achieve prices that are consistent with the dispatch, the Commission should expect to realize both productive and allocative efficiency benefits over time.

Q. HASN'T THIS ENERGY PRICING INEFFICIENCY BEEN PRESENT FROM THE INCEPTION OF COMPETITIVE ENERGY MARKETS? WHY ARE CHANGES TO CORRECT ENERGY PRICE FORMATION ONLY BEING PROPOSED NOW?

A. It is correct that that this price formation inefficiency has been present since the inception of competitive markets. It is not true, however, that the problem is newly-identified, or that solutions to it have not been proposed previously. In fact, the problem of non-convexity in power markets has been well described since the inception of competitive power markets, and solutions to it have been proposed in that time frame as well, and in fact have served as the basis for a partial solution (Extended LMP) implemented in the Midcontinent ISO.[18]

[18] *See*, e.g. William W. Hogan and Brendan J. Ring, "On Minimum Uplift Pricing in Electricity Markets," March 19, 2003.

However, the problem of non-convexity has become more prevalent and apparent in recent years because of changes in market fundamentals, including very low natural gas prices, increased penetration by intermittent renewable resources, and low load growth. In prior years, higher gas prices and fewer low load / high renewables hours tended to mask the underlying problem. In recent years the flexible units setting prices during off-peak hours in PJM are more likely to be either renewables (which can vary their output via curtailment) which usually bid at either a zero or negative level, or natural gas combined-cycles with very low delivered natural gas prices. For example, between 2007 and 2012, the average PJM real-time energy price was below $20/MWH only about 3% of the hours, but the frequency of sub $20/MWH prices increased to 20% of the hours by 2016.[19] The frequency of very low prices is much higher at particular nodes – for example, at the Quad Cities nuclear plant, the real-time LMP was below $20/MWH for 47% of the hours in 2016.

Q. WHY DOES IT MATTER IF ENERGY PRICES DROP BELOW $20/MWH MORE FREQUENTLY?

A. That level of pricing would not be troubling if in fact, the marginal unit serving load during those hours was below $20/MWh. In PJM, however, there are numerous coal units, which have variable costs around or above $20/MWh, online in every hour of the

[19] Monitoring Analytics, LLC, *2016 State of the Market Report for PJM*, Table C-4.

year.[20] Thus, during hours where the price falls below $20/MWh the system will typically be relying on units whose variable costs exceed this level.

Q. WON'T ENERGY REVENUE SHORTFALLS FOR UNITS AFFECTED BY THIS INEFFICIENCY ULTIMATELY JUST BE RECOVERED THROUGH THE PJM CAPACITY MARKET?

A. No. Capacity markets, including PJM's Reliability Pricing Model ("RPM") are designed to procure sufficient capacity to ensure reliable supply during periods of peak demand at least cost. They are not, on their own, designed to produce an efficient least-cost mix of energy resources in all hours. That is primarily the role of the energy market, and, as I discussed, if the energy market is not producing efficient prices, it will not produce the least-cost mix of resources.

The demand curve in the RPM is calibrated based on the capacity revenues that a new peaking unit (a reference natural gas combustion turbine) needs to cover its costs, net of expected energy and ancillary services revenues. This energy offset calculation reflects only those high demand hours when such a unit would typically run, which are not typically the intervals when the pricing inefficiency results in prices that are too low. That is because the impact of the pricing inefficiency tends to be most prevalent and significant during low-load, off-peak hours when such a peaking unit would be offline. So the demand curve itself has not been "inflated" in any way due to the pricing

[20] I have analyzed publicly-available data on hourly unit-level output from the U.S. Environmental Protection Agency's Continuous Emission Monitoring System ("CEMS"). This data indicates that coal units were operating and producing output in every hour in PJM in 2015 and 2016.

inefficiency. In terms of the potential effect on capacity offers, many marginal supply bids in the RPM will be from peaking or intermediate resources such as combustion turbines and demand response whose energy margins, and hence capacity offers, are not significantly affected by the pricing inefficiency. To the extent that some marginal supply bids in the RPM are from resources impacted by the pricing inefficiency during certain hours (e.g., combined cycles), this could have some impact on the clearing price. The overall result of this is that RPM clearing prices based on the intersection of the peaker-calibrated demand curve and a supply curve reflecting the bids of many peaking resources will at most reflect only a portion of the energy revenue shortfalls borne by units affected by the pricing inefficiency, and will thus not offset these shortfalls. Over time, this will result in a bias in favor of peaking units at the expense of units which tend to run in all hours, which is not likely to produce the least cost mix of energy resources.

IV. THE IMM'S CRITICISMS OF PJM'S PROPOSAL ARE EITHER INCORRECT OR PREMATURE

Q. PLEASE SUMMARIZE THE IMM'S CRITICISMS OF PJM'S WHITE PAPER PROPOSAL.

A. The IMM has four major criticisms: 1) the PJM proposal would raise the cost to consumers with no counteracting decrease to production cost;[21] 2) the PJM proposed pricing solution is a fictitious solution that produces higher prices that are not consistent with the efficient dispatch of the market;[22] 3) the proposed pricing solution represents

[21] IMM Comments at 36.
[22] *Ibid.* at 37.

an "inappropriate" extension of the Commission's Fast Start Pricing NOPR;[23] and 4) the PJM proposal will have unintended consequences with respect to the incentives for flexible resources and for adverse economic behavior.[24]

Q. HOW DO YOU RESPOND?

A. As I explain below, none of the IMM's first three criticisms are valid. And the fourth is impossible to evaluate until more of the details of what PJM will propose are known.

There are two problems with the IMM's first criticism that the PJM proposal would raise costs to consumers without any offsetting production cost benefits. The first problem is that a comparison of cost increases to consumers against production cost savings is simply the wrong standard. The question presented by the price formation issue is whether energy prices that are inconsistent with economic commitment and dispatch are unjust and unreasonable and unduly discriminatory. If they are, then no "cost/benefit" test or comparison is required. This is merely a matter of ensuring that PJM's energy market is consistent with the basic economic theory on which it is based.

The second flaw in the IMM's argument is that the claim that there would be no production cost savings is simply untrue. As the preceding discussion of the productive efficiency benefits makes clear, lower production costs through avoided uneconomic retirement would be realized over time. In addition, efficient pricing could change the

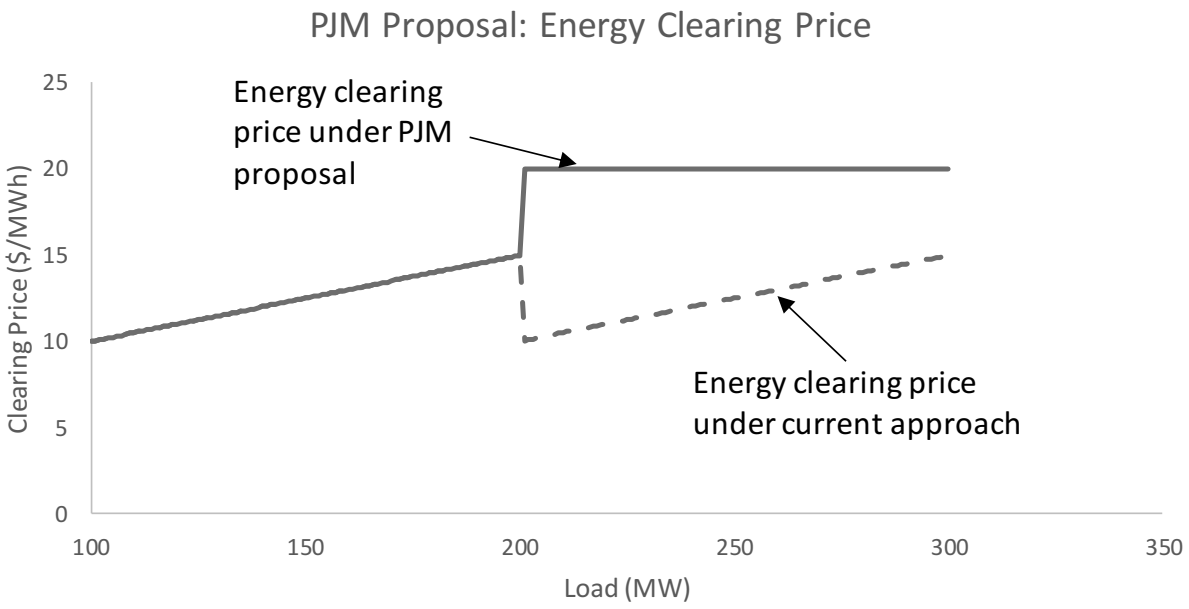
[23] *Ibid.* at 36.
[24] *Ibid.* 40-41.

SI-SSA-0010-3065

timing and mix of new supply, yielding additional productive efficiency benefits. Finally, it is possible that short-term production cost savings could also be realized, related to self-committed units. As the IMM observes, a number of long lead time or high startup cost units do not fit well into PJM's 24-hour day-ahead commitment, and self-commit instead. While that is rational way for these units to participate in the market, it is not without risk, and may not be optimal. Owners of these units must forecast prices over a multi-day period to decide when/whether to self-commit. To the extent energy prices are "too low" to support the dispatch for the reasons discussed above, the level of self-commitment may, in fact, be less than would otherwise be optimal. Under those circumstances, improved price formation could result in a more economic level of self-commitment, and lower production costs.

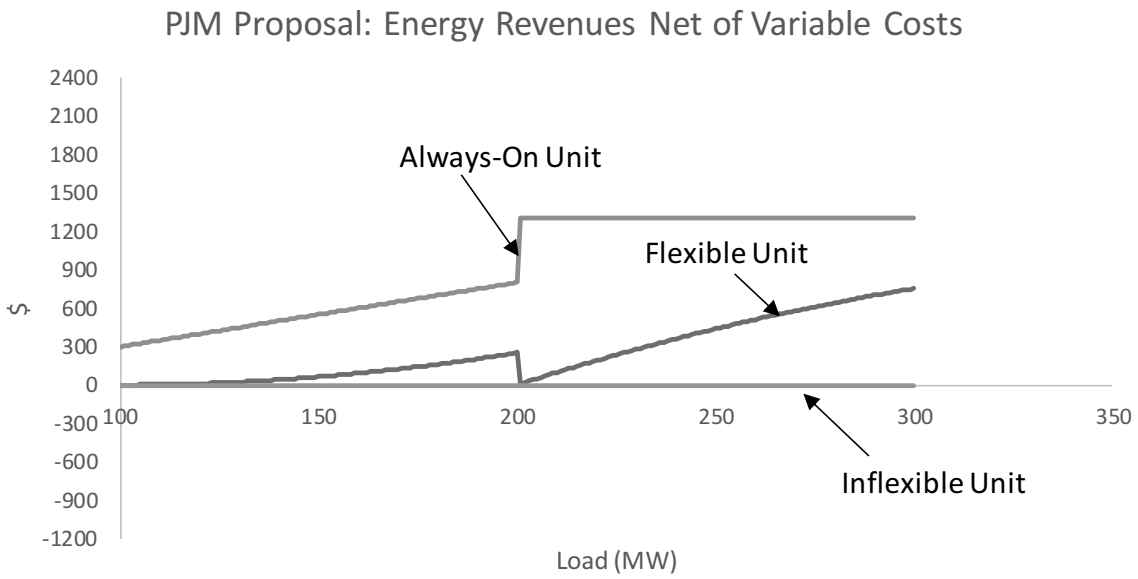
Q. WHAT ABOUT THE IMM'S SECOND CRITICISM THAT THE PJM PROPOSAL WOULD PRODUCE HIGHER PRICES THAT ARE NOT CONSISTENT WITH EFFICIENT DISPATCH?

A. I disagree. As I understand the approach that PJM is currently contemplating, the prices could sometimes be higher, but they would be consistent with the efficient dispatch, and would not be discriminatory. Let me illustrate this point by returning to the previous three-unit example discussed above. Under PJM's proposal, the dispatch would be the same as it is today. In the separate pricing run, the inflexible 100 MW unit with a variable cost of $20 per MWh would be represented as a flexible unit with a $20 per MWh variable cost. The prices that would result from this approach are shown below, together with the prices that result from the current approach.



From 100 MW through 200 MW of load, system marginal cost increases from $10 to $15 per MWh just as it would under the current pricing approach, following the marginal cost of the inflexible unit. At 201 MW and above, however, the inflexible unit is partially committed at an increasing rate, and thus sets the system marginal cost at $20/MWh.

The resulting energy clearing prices allow all three units to cover their variable costs at all load levels:



Because the price is $20/MWh over the range where the inflexible unit is committed, the inflexible unit breaks even, while the always-on and flexible units earn a positive energy margin. Thus, under PJM's proposal, the energy prices fully support the least-cost unit commitment.

However, from the load level of 201 MW to 299 MW (where the price of $20/MWh exceeds its variable cost), the flexible unit could increase its profits by dispatching at a higher level. Because of this, the flexible unit must be compensated for its lost opportunity cost to induce it to reduce its output to the level needed to avoid over generation. I discuss this out-of-market payment further below.

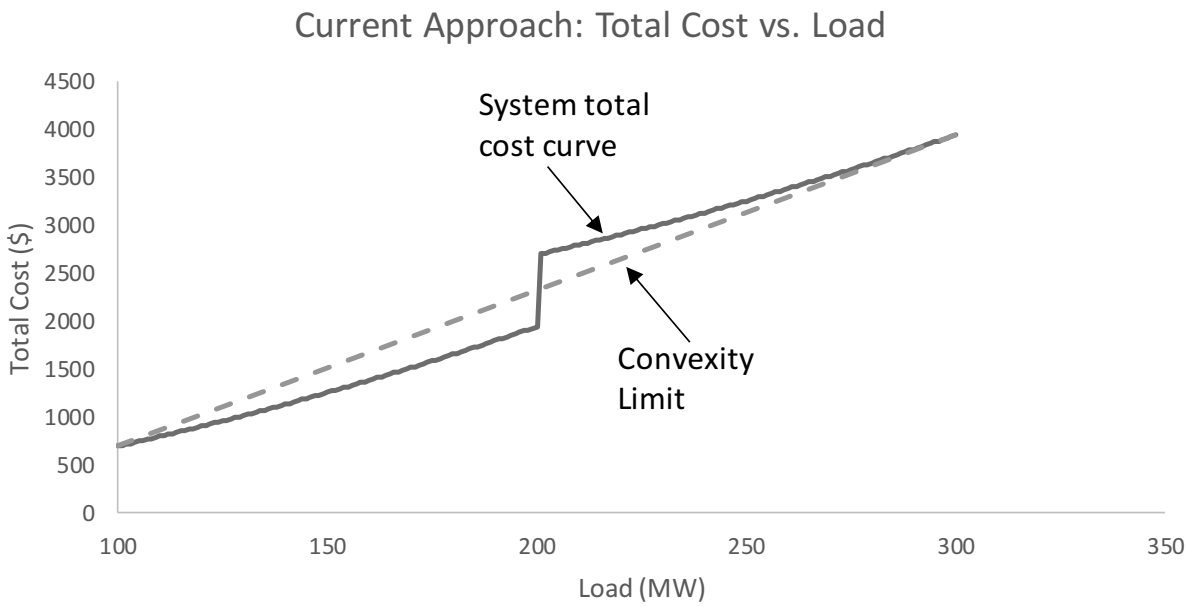
Q. TURNING TO THE IMM'S THIRD CRITICISM, IS PJM'S PROPOSAL AN INAPPROPRIATE EXTENSION OF THE FAST START NOPR PROPOSAL?

A. No. The Fast Start NOPR relates to the treatment of combustion turbines which can start quickly, but then typically must run at full output due to the physical characteristics of the unit. So, once the combustion turbine comes on, another unit must ramp down and becomes the "marginal" unit under PJM's current pricing approach. This is similar to the inflexible unit in my previous example, but a combustion turbine would typically have costs higher than $20/MWH. The solution discussed in the Fast Start NOPR is also similar to PJM's proposed solution which is to effectively let the inflexible resource set price.

The IMM believes that extending the Fast Start NOPR concepts to other inflexible units is inappropriate. I disagree. The pricing problem created by both inflexible fast start resources and inflexible baseload units is, in fact, the same problem. In both cases, we have a unit, or a portion of a unit which is either on or off, but which is part of a least cost commitment and dispatch. In both cases, the resulting prices under the current pricing rules are not sufficient to recover the variable costs of the inflexible unit, and hence are not consistent with the dispatch. In both cases, the pricing is inefficient. The only difference is that it is easier to "see" when the peaker was needed as part of the economic commitment and dispatch – it was needed when it was committed. But the key issue is not whether we know exactly when it was needed, but rather that we know it was part of an economic commitment and dispatch. In that respect, the minimum load portion of a coal unit can be thought of as a "slow start" peaker with a longer minimum run time. When it is economic to commit the slow start peaker, prices should

be consistent with that commitment just as the Fast Start NOPR would have prices consistent with the quick start peaker commitment.

The basic issue, which is common to both the slow start peaker and the fast start peaker is that the total cost of serving increasing levels of load, due to "on/off" segments, is not a smooth curve. To illustrate this point, let's return to my previous three-unit example. The total variable cost of production based on the efficient commitment and dispatch is shown in the chart below:



The minimum load level of 100 MW is served by the always-on unit at a cost of $700. From 100 MW to 200 MW of load, the flexible unit ramps up from 1 to 100 MW, with each incremental MW costing $0.05/MW more than the last MW to the point where total costs are $1950 at 200 MW, and marginal cost is $15/MWh. At 201 MW of load, however, a discontinuity appears because the inflexible unit is now needed to serve

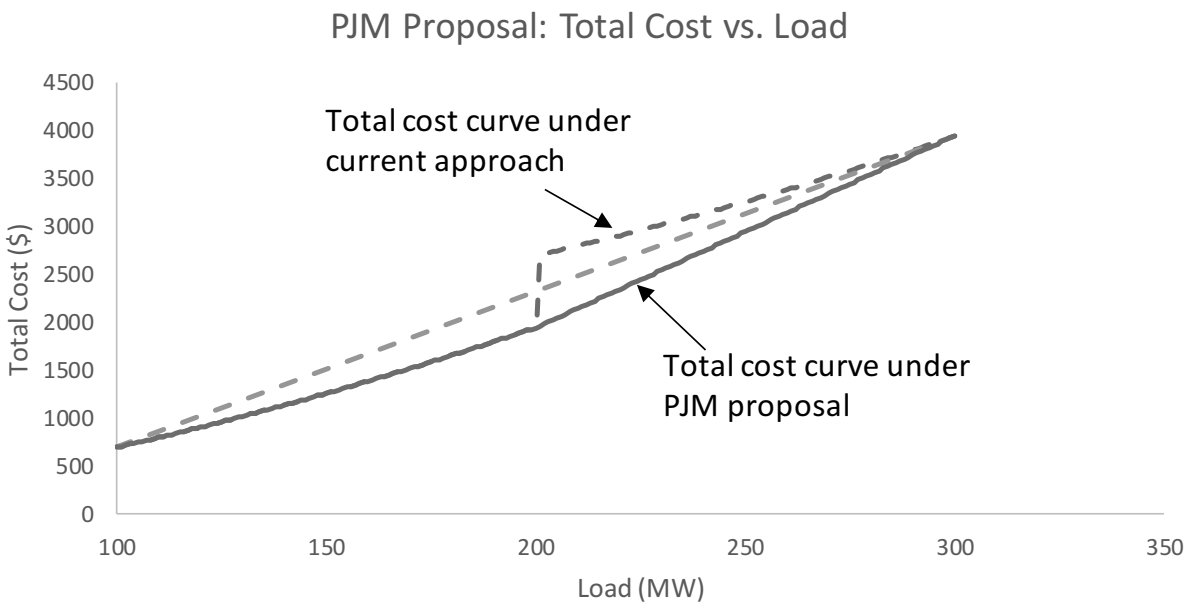
load. At this point the inflexible unit produces a fixed 100 MW of output and the flexible unit must ramp down to 1 MW of output to meet load. Total costs jump from $1950 at 200 MW to $2710 at 201 MW ($700 for the always-on unit, $2000 for the inflexible unit and $10 for the flexible unit). Moving from 201 to 202 MW the incremental cost falls back down to just over $10/MWh because the flexible unit returns to ramping up from 1 to 2 MW. This is indicative of what economists refer to as a non-convexity: the incremental cost of production is not continuously increasing with demand. Graphically, this can be seen by comparing the total cost curve to the straight line drawn between zero production and maximum production (shown in dashed red on the chart above). If any point on the total cost curve is above this line, the cost curve is non-convex. And if the total cost curve is non-convex, it means as system output increases, at some point marginal costs will decline, and prices based on marginal costs will not support the dispatch.

Much of micro-economic theory, and in particular the conclusion that short-term marginal cost is the efficient market price, is only valid under the assumption of a convex cost curve. But the electricity production cost curve is not convex because of operating constraints such as an on/off peaker or the minimum segment of an inflexible baseload unit. Despite significant economic literature on this point,[25] the IMM argues

[25] *See* e.g., Paul R. Gribik, William W. Hogan, and Susan L. Pope, "Market-Clearing Prices and Energy Uplift," Dec 31, 2007 ("Gribik et. al.").

that short-term marginal costs are always the right price and non-convexity should be selectively addressed rather than considered more broadly.

PJM's proposed energy price reform correctly considers all of the sources of non-convexity, not just on/off peakers, and would "relax" the on/off unit commitment decision for all inflexible units that are part of the economic commitment and dispatch, allowing the units to be partially committed in the pricing run and thus able to set price even when physically operating at their minimum output level. This change results in a convex total variable cost curve as shown below for the three-unit example:



The cost curve looks the same as the status quo through the 200 MW load point – the always-on unit serves the minimum 100 MW of load and then the lower cost flexible unit is committed first in either case – but at 201 MW load, rather than fully committing

the inflexible unit and ramping the flexible unit back to 1 MW, the pricing model partially commits the inflexible unit at an output level of 1 MW and leaves the inflexible unit at 100 MW. As a result, total costs increase from $1950 to $1970 as load moves from 200 to 201 MW, and continue to increase at $20/MW, the marginal cost of the inflexible unit, thereafter. Thus, the marginal cost curve, and energy clearing prices, are either increasing or constant with load level. This general approach of reforming the non-convex supply curve to be convex for purposes of setting prices has been well-established in the economic literature for over a decade and is the core economic concept underlying MISO's implementation of Extended Locational Pricing.[26] Given this history, the IMM's claim that "no economic theory supports allowing inflexible, baseload units to set price"[27] is surprising, and wrong. There is, in fact, a sound economic theory for allowing inflexible baseload units that are part of an economic commitment and dispatch to set price.

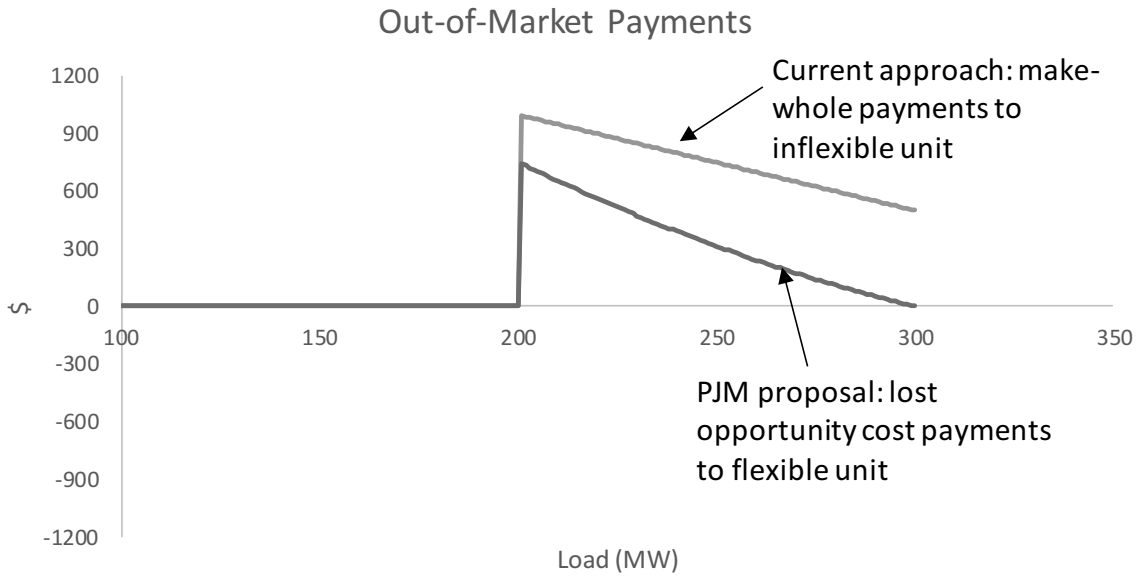
Q. WILL PJM'S PROPOSED APPROACH ELIMINATE OUT-OF-MARKET PAYMENTS?

A. PJM's approach should reduce, but will not eliminate out-of-market payments. Returning to the three-unit example, from the load level of 201 MW to 299 MW (where the price of $20/MWh exceeds its variable cost), the flexible unit could earn increased energy margin by increasing its output to its maximum level of 100 MW, as discussed

[26] *See* Gribik et. al. and Paul Gribik, Li Zhang, "Extended Locational Marginal Pricing (Convex Hull Pricing)," presentation at FERC Technical Conference on Unit Commitment Software, June 2-3, 2010, at 10-13. Available at https://www.ferc.gov/CalendarFiles/20100530130229-Gribik,%20Zhang,%20Midwest%20ISO%20-%20Extended%20LMP.pdf

[27] IMM Comments at 38.

above. While the flexible unit must be compensated for this lost opportunity cost to induce it to reduce its output to the level needed to avoid over-generation, these payments are lower than the payments which would need to be made to the inflexible unit under the status quo approach, as shown below.



Since out of market payments are required under the proposed PJM approach, it could be said that the prices are not completely consistent with the dispatch. But under PJM's proposed approach, units that are part of an economic commitment and dispatch will receive energy market revenues that are sufficient to cover their variable costs. Further, in contrast to the current pricing approach, the out of market payments are non-discriminatory in that all generating units receive revenues consistent with the same market clearing price. As a result, the efficiency losses associated with uneconomic retirement are avoided.

Q. DOES THE PJM PROPOSAL RESULT IN UNINTENDED CONSEQUENCES WITH RESPECT TO FLEXIBLE RESOURCES, AS SUGGESTED BY THE IMM?

A. The IMM suggests that the PJM Proposal "removes the economic incentive for the marginal resource to follow the dispatch signal."[28] This concern is speculative and premature because such incentives will be driven by design elements that PJM has not yet described in detailed terms. Further, in all likelihood, PJM's proposal will ultimately enhance, rather than reduce, incentives for generation to follow dispatch signals.

As noted previously, PJM's proposal will require out-of-market lost opportunity cost payments to induce certain generators to reduce output below their economically-optimal level to avoid physical over-generation. In its comments, PJM acknowledges the need for an appropriately-designed compensation mechanism to achieve this outcome, but does not at this point specify a solution. While care will be needed in designing such a compensation mechanism, the simple baseline lost opportunity cost payment ensures that resources will not have a disincentive to follow dispatch, and numerous options exist to provide an affirmative incentive for resources to follow the precise dispatch signal, such as penalties for failing to follow dispatch (or bonuses for doing so). Similar lost opportunity cost compensation mechanisms exist today in PJM's markets, such as in the synchronized reserve market and as uplift payments to resources scheduled in the day-ahead market but not committed in real-time, or to resources whose output level is restricted due to a reliability issue. While this will be an important element of PJM's

[28] *Ibid.* at 39.

ultimate proposal, it is a tractable issue and one that PJM has ample experience managing.

More fundamentally, the core problem with following dispatch raised by the IMM already exists in PJM's current market design, and PJM's proposal will make the problem better, rather than worse. As noted previously, in the current market, many inflexible units would generate less than the economic amount absent the out-of-market compensation paid to commit their units. This is the mirror image of the problem that the IMM describes, just applied to a different class of units. The PJM proposal largely eliminates the need for this type of uplift while reducing, but not eliminating, the overall amount of out-of-market compensation needed to induce units to follow dispatch. Thus, when viewed through this more holistic lens, the PJM Proposal improves, rather than reduces, the system-wide incentives for units to follow dispatch signals.

Q. DOES THE PJM PROPOSAL CREATE ADVERSE ECONOMIC INCENTIVES FOR SELF-COMMITMENT, AS SUGGESTED BY THE IMM?

A. The IMM suggests that the higher energy prices resulting from PJM's Proposal will lead to an inappropriate incentive for units to self-commit in the energy market, resulting in increased out-of-market payments and further price inefficiency. While PJM's Proposal lacks sufficient detail at this point to fully evaluate this concern, a properly-designed proposal will improve self-commitment incentives relative to the current pricing approach.

As noted previously, the core design principle underpinning PJM's proposal is the notion that all resources that are part of the least-cost solution should be eligible to set price, and the resulting market prices should support the least-cost solution. This principle should apply to both pool-scheduled resources[29] and self-scheduled resources that are part of the least-cost solution. It should not, however, apply to self-scheduled resources that are not part of the least-cost solution, and, by extension, if such resources were nonetheless self-committed, they should not be eligible to set price when running at minimum load. The key distinction here is the difference between economic and uneconomic resources, not the difference between pool-scheduled and self-scheduled resources. If a unit is part of the economic solution, it should be permitted to set price.

Q. DOES THIS CONCLUDE YOUR TESTIMONY?

A. Yes.

[29] PJM's Tariff defines pool-scheduled resources as "those resources for which Market Participants submitted offers to sell energy in the Day-ahead Energy Market and offers to reduce demand in the Day-ahead Energy Market, which [PJM] scheduled in the Day-ahead Energy Market as well as generators committed by [PJM] subsequent to the Day-ahead Energy Market." See PJM OATT, Section 1.10.2.

Total Generating Costs

In 2016, the average total generating cost for nuclear energy was $33.93 per MWh (megawatt-hour). Total generating costs include *capital, fuel and operating costs* – all the costs necessary to produce electricity from a nuclear power plant. Cost information for the U.S. nuclear fleet is collected by the Electric Utility Cost Group (EUCG) with prior years converted to 2016 dollars for accurate historical comparisons.[1]

2016 Cost Summary ($/MWh)

Category	Number of Plants / Sites	Fuel	Capital	Operating	Total Operating (Fuel + Operating)	Total Generating (Fuel + Capital + Operating)
All U.S.	60*	6.76	6.74	20.43	27.19	33.93
Plant Size						
Single-Unit	25	6.77	8.67	25.95	32.72	41.39
Multi-Unit	35	6.75	6.15	18.73	25.48	31.63
Operator						
Single	12	7.18	8.19	21.20	28.38	36.57
Fleet	48	6.63	6.32	20.21	26.84	33.16

**Costs exclude shutdown plants.*
Source: Electric Utility Cost Group (EUCG)

Approximately 80 percent of the electricity generated from nuclear power in the U.S. comes from plants with multiple reactors. The economies of scale allow plant operators to spread costs more over multi-unit sites, resulting in a lower total generating cost. In 2016, the average total generating cost at multi-unit plants was $31.63 per MWh compared to $41.39 per MWh for single-unit plants.[2] This separation is driven by operations and capital costs as there is not a meaningful difference in fuel costs.

The 2016 total generating costs were 6 percent lower than in 2015 and more than 15 percent below the 2012 costs. Prior to the 2012 peak, nuclear generating costs had increased steadily over the previous decade, for various reasons. Between 2002 and 2016,

[1] EUCG data are collected to perform benchmarking comparisons by companies that operate nuclear plants. The total generating cost does not include considerations for risk management or returns on investment that would be key factors in business decisions affecting a particular station.
[2] The data provided are averages across the operating fleet. Individual plants may vary notably from the average due to factors such as geographic location, local labor costs and the timing of refueling outages.

© 2017 Nuclear Energy Institute

fuel costs increased by 16 percent, capital expenditures by nearly 70 percent, and operating costs by more than 8 percent (in 2016 dollars per megawatt-hour). Total generating costs have increased by more than 18 percent in the last 14 years.

U.S. Nuclear Plant Costs (2016 $/MWh):

Year	Fuel	Capital	Operating	Total
2002	5.80	3.97	18.85	28.62
2005	5.09	5.88	19.21	30.18
2010	6.85	9.28	20.92	37.05
2011	7.19	10.20	22.18	39.58
2012	7.57	10.91	21.77	40.25
2013	7.84	8.32	21.22	37.37
2014	7.31	8.29	21.21	36.81
2015	6.95	8.07	21.11	36.13
2016	6.76	6.74	20.43	33.93
2002-2016 Change	**16.6%**	**69.8%**	**8.4%**	**18.6%**
2012-2016 Change	**-10.7%**	**-38.2%**	**-6.2%**	**-15.7%**

Capital Costs

Industry-wide, capital spending in 2016 decreased to $5.4 billion from $6.3 billion in 2015, compared to the peak of $8.8 billion in 2012 (all in 2016 dollars).

Capital investment saw a step-change increase around 2003 followed by steady increases until another step-change increase in 2009 and finally peaking in 2012. Capital costs have declined in each of the last four years. These inflections are the result of a few major items: a series of vessel head replacements, steam generator replacements and other upgrades as companies prepared their plants for operation after the initial 40-year license, and power uprates to increase output from existing plants. As a result of these investments, 84 of the 99 operating reactors have received twenty-year license renewals[3] and 92 of the operating reactors have been approved for uprates[4] that have added over 7,300 megawatts of capacity.

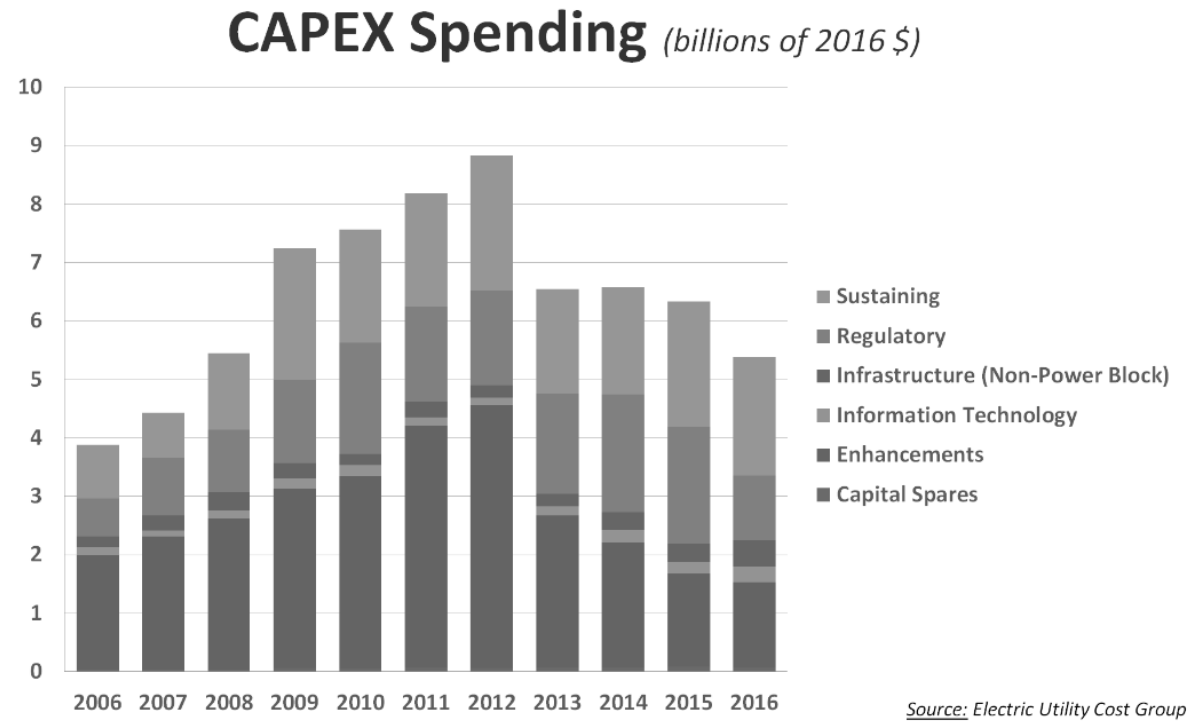
Capital spending on uprates and items necessary for operation beyond 40 years has moderated as most plants are completing these efforts. Investments in uprates peaked at $2.5 billion in 2012 but declined to $114 million in 2016. Some of this decline has been

[3] Nuclear Regulatory Commission: License Renewals Granted for Operating Nuclear Power Reactors. December 2016. https://www.nrc.gov/images/reading-rm/doc-collections/maps/power-reactors-license-renewals.png
[4] Nuclear Energy Institute: US Nuclear Power Uprates by Plant. June 2016. https://www.nei.org/Knowledge-Center/Nuclear-Statistics/US-Nuclear-Power-Plants/US-Nuclear-Power-Uprates-by-Plant

© 2017 Nuclear Energy Institute

offset in other areas where spending has increased, however capital spending decreased notably in 2016 over 2015. Capital spending to meet regulatory requirements increased from approximately $1 billion in 2007 to approximately $1.9 billion in 2010 and peaked at $2 billion in 2014, before dropping to $1.1 billion in 2016 (all numbers in 2016 dollars). This increase began with significant investments post-9/11 to enhance security, followed by expenditures for post-Fukushima items, which peaked at $1.4 billion in 2015, before falling to $373 million in 2016. As the Fukushima-related safety upgrades are nearly completed, regulatory capex should also moderate, and revert toward 2007-2008 levels.

The chart below breaks down capital costs over the last decade.



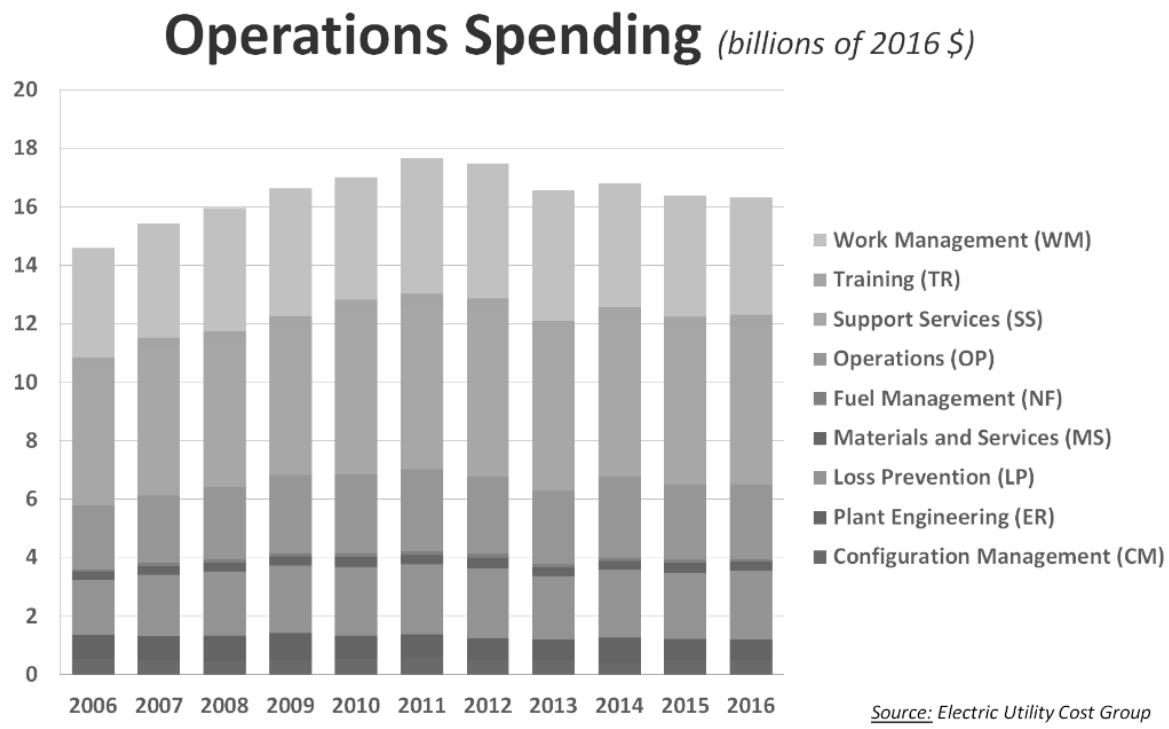
Operations

Operations costs increased over the last twelve years from $18.85 per megawatt-hour in 2002 to $20.43 per megawatt-hour in 2016. Operations costs have declined 8 percent from the peak in 2011.

This increase in operations costs was not driven by any single category. Operations costs in the 2002-2008 period are similar to where money was being spent in the 2009-2016 period. However, operations costs have remained flat compared to the past decade. Between 2002 and 2010, operations costs increased 11 percent while, over the past five years, operations costs have decreased by 6 percent.

The chart below breaks down operations spending over the last decade.

© 2017 Nuclear Energy Institute



Fuel

Fuel costs represent 15-20 percent of the total generating cost. Fuel costs experienced a relatively rapid increase from 2009 to 2013. This was largely the result of an escalation in uranium prices, which peaked in 2008. Since uranium is purchased far in advance of refueling and resides in the reactor for four to six years, the effect of this commodity price spike persisted for a long time after the price increase actually occurred.

Economic Pressures Facing Nuclear Plants

Since 2013, six nuclear reactors (Crystal River 3 in Florida, San Onofre 2 and 3 in California, Kewaunee in Wisconsin, Vermont Yankee, and Fort Calhoun in Nebraska) have shut down permanently. Entergy announced in October 2015 that it would close its Pilgrim plant in Massachusetts by June 2019. In June 2016, Pacific Gas & Electric announced it would close both Diablo Canyon units by August 2025. In December 2016, Entergy announced it would close its Palisades plant in 2018. A month later, Entergy announced it would close Indian Point 2 and 3 by April 2021. In May 2017, Exelon announced that Three Mile Island would cease operations in 2019.

Crystal River and San Onofre shut down due to failed steam generator replacements – unique situations that are unlikely to be repeated. Since the Surry nuclear power plant in Virginia replaced its steam generators in the early 1980s, it has become a routine practice.

Diablo Canyon is retiring due to a combination policy and market pressures that created a situation where the plant could not optimally operate. Kewaunee, Vermont Yankee, Fort Calhoun, Palisades, Pilgrim and Indian Point, Three Mile Island – all in competitive markets

© 2017 Nuclear Energy Institute

– succumbed to a combination of market-related factors (and, in some cases, a combination of several factors), including:

- Sustained low natural gas prices, which are suppressing prices in wholesale power markets, and will continue to do so.
- Relatively low growth (in some markets, no growth) in electricity demand due partly to subpar U.S. economic performance since the 2008 recession, partly to greater efficiency.
- Federal and state mandates for renewable generation, which suppress prices, particularly during off-peak hours (when wind generation is highest and the electricity is needed the least). For example, the federal production tax credit allows wind producers to bid negative prices, which places baseload plants at a disadvantage. Some nuclear plants in Illinois see negative prices as much as 10-11 percent of the off-peak hours and 5-6 percent of all hours.
- Transmission constraints, which require a power plant to pay a congestion charge or penalty to move its power on to the grid. Certain nuclear plants at particularly congested points on the grid pay a penalty of $6-9 per megawatt-hour to move their power out.
- Market designs that do not compensate the baseload nuclear plants for the value they provide to the grid, and market policies and practices – e.g., reliance on out-of-market revenues – that tend to suppress prices.

In the face of these pressures, additional plants will face the prospect of early closure unless policies are put in place to better reflect the value of the benefits provided by nuclear energy. New York and Illinois have enacted policies that will compensate nuclear plants for their environmental attributes, ensuring that a total of seven reactors in those two states will not be forced to shut down prematurely.

Economic Impact of Nuclear Plant Closures

The plants that have closed or announced closure were all highly reliable plants with high capacity factors and relatively low generating costs. Allowing these facilities to close will have long-term economic consequences: replacement generating capacity, when needed, will produce more costly electricity, fewer jobs that will pay less, and more pollution.

In 2016, on average, U.S. nuclear power plants produced electricity for less than $34 per megawatt-hour. The smaller single-unit plants like Kewaunee, Vermont Yankee and Fort Calhoun were a little more costly – about $41 per megawatt-hour. The larger, multi-unit sites were less costly – less than $32 per megawatt-hour range. The electricity these plants produce will likely be replaced with combined cycle gas-fired capacity at a levelized cost of $49 per megawatt-hour[5] according to the U.S. Energy Information Administration

Updated Market Power Analysis for the Northeast Region

Dear Secretary Bose:

The above-referenced entities (collectively, the "Exelon MBR Entities") hereby submit for filing this joint updated market power analysis for the Northeast ("NE") Region pursuant to Section 35.37 of the Federal Energy Regulatory Commission's ("Commission") regulations[1] and Order Nos. 697 and 697-A.[2]

The instant filing is the Exelon MBR Entities' first updated market power analysis filing for the NE Region following the March 12, 2012, Commission-approved merger of Exelon Corporation ("Exelon") and Constellation Energy Group, Inc. ("Constellation"). The Exelon MBR Entities are now all subsidiaries of Exelon, a public utility holding company.[3] The Commission has authorized each of the Exelon MBR Entities to make sales at market-based rates and has designated each of them as a "Category 2 Seller" in the NE Region. The Exelon MBR Entities submit their updated market power analysis in a consolidated manner for administrative efficiency.[4]

As discussed below, the Exelon MBR Entities continue to lack market power in the NE Region. Pursuant to Order No. 697, which provides for the submission of an updated market power analysis on a regional basis, the Exelon MBR Entities' enclosed analysis focuses on the NE Region and specifically the following balancing authority areas ("BAAs") where the Exelon MBR Entities own or control, or are affiliated with, generating facilities as described in greater detail herein: New York Independent System Operator, Inc. ("NYISO"), ISO New England, Inc.

---

1 18 C.F.R. § 35.37 (2013).

2 *Market-Based Rates for Wholesale Sales of Electric Energy, Capacity and Ancillary Services by Public Utilities*, Order No. 697, FERC Stats. & Regs. ¶ 31,252, *clarified*, 121 FERC ¶ 61,260 (2007), *order on reh'g*, Order No. 697-A, FERC Stats. & Regs. ¶ 31,268, *clarified*, 124 FERC ¶ 61,055, *order on reh'g*, Order No. 697-B, FERC Stats. & Regs. ¶ 31,285 (2008), *order on reh'g*, Order No. 697-C, FERC Stats. & Regs. ¶ 31,291 (2009), *order on reh'g*, Order No. 697-D, FERC Stats. & Regs. ¶ 31,305 (2010), *aff'd sub nom. Mont. Consumer Counsel v. FERC*, 659 F.3d 910 (9th Cir. 2011), *cert. denied*, 133 S. Ct. 26 (2012).

3 *Exelon Corp.*, 138 FERC ¶ 61,167 (2012) (Order Conditionally Authorizing Merger and Disposition of Jurisdictional Facilities) ("*Merger Order*"); *Exelon Corp.*, Docket Nos. EC11-83-000, *et al.*, Notice of Consummation (filed Mar. 19, 2012).

4 On December 20, 2013, certain of the Exelon MBR Entities filed revisions to their respective market-based rate tariffs under separate cover in compliance with Order No. 784, *Third-Party Provision of Ancillary Services; Accounting and Financial Reporting for New Electric Storage Technologies*, FERC Stats. & Regs. ¶ 31,349 (2013), *reh'g pending*.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

("ISO-NE"), and PJM Interconnection, L.L.C. ("PJM"). The Exelon MBR Entities respectfully request that the Commission accept their updated market power analysis for filing and grant the waivers requested herein.

In addition, the Exelon MBR Entities include a notice of change in status regarding a tolling agreement through which Exelon Generation Company, LLC ("ExGen") will acquire control over the Granite Ridge generating facility located in the ISO-NE BAA beginning on January 1, 2014. Lastly, certain of the Exelon MBR Entities request waiver of the Commission's open access requirements with respect to their limited and discrete generator interconnection facilities, as explained in Section VII below.

I. REQUEST FOR PRIVILEGED TREATMENT

The Exelon MBR Entities request privileged treatment pursuant to Section 388.112 of the Commission's regulations[5] for the Exelon MBR Entities' 2012 hourly load data. All the information for which privileged treatment is sought is contained in the work papers of Julie Solomon, submitted as part of Attachment A. The work papers contain information about confidential, commercially sensitive load data that could harm the Exelon MBR Entities if publicly released. Pursuant to Section 35.37(f) of the Commission's regulations,[6] a proposed protective order is included herewith as Attachment C.[7] Communications concerning this request for privileged treatment should be directed to Jane Rueger at 202-626-6534 or Caileen Gamache at 202-626-3671.

II. DOCUMENTS SUBMITTED

A. This Transmittal Letter.

B. Affidavit of Julie R. Solomon, Managing Director of Navigant Consulting, Inc. including exhibits and work papers (**Attachment A**).

C. Appendices required by Order No. 697 listing (1) all affiliates that have market-based rate authority and identifying all generation assets owned or controlled by the corporate family by balancing authority area and geographic region; and (2) all electric transmission and natural gas intrastate pipelines and/or gas storage facilities owned or controlled by the corporate family (**Attachment B**).

---

5 18 C.F.R. § 388.112.

6 *Id.* § 35.37(f).

7 The attached proposed protective order is a version of the Commission's Model Protective Order modified to apply to all documents in the proceeding, both those provided in discovery and those filed with the Commission, and to provide for additional protection for documents marked as "Highly Sensitive Protected Materials" from review by in-house personnel who may gain a competitive advantage through access to such information. The Model Protective Order was further modified to assure that the right to review, and the protections against disclosure, extend to review by any member of the Commission's staff, not just trial staff. However, Commission advisory staff are specifically exempt from the obligation to sign and return a non-disclosure agreement prior to viewing the materials.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

D. Proposed protective order (**Attachment C**).

III. COMMUNICATIONS

The Exelon MBR Entities request that all communications regarding this filing be sent to the following persons:

David O. Dardis*
Vice President &
Deputy General Counsel – Regulatory
Exelon Corporation
111 Market Place
Suite 500
Baltimore, MD 21202
Tel: (410) 470-3416

* Persons denoted with an asterisk are those designated for service pursuant to 18 C.F.R. § 385.2010. The Exelon MBR Entities respectfully request waiver of 18 C.F.R. § 385.2010(k) so that they may designate three persons to receive service on their behalf.

IV. DESCRIPTION OF THE EXELON MBR ENTITIES' AND THEIR AFFILIATES' GENERATION INTERESTS IN THE NORTHEAST REGION

The Exelon MBR Entities and their affiliates described below own or control generation, transmission and/or inputs to electric power production[8] in the NE Region. The Exelon MBR Entities also include in Attachment B the required appendices listing all affiliates that have market-based rate authority and identifying all generation assets owned or controlled by the corporate family by balancing authority area and geographic region, in accordance with Order No. 697.[9] Similarly, an appendix reflecting all electric transmission and natural gas intrastate pipelines and/or gas storage facilities owned or controlled by the corporate family is provided in Attachment B.[10]

[8] As defined in 18 C.F.R. § 35.36(a)(4) of the Commission's regulations.

[9] Order No. 697 at P 894.

[10] *See id.* at P 895.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

A. ***Exelon Generation Company, LLC***. ExGen, an indirect, wholly owned subsidiary of Exelon, has a diverse generation portfolio consisting of approximately 45,227 MW of directly owned and/or controlled capacity nationwide. ExGen serves as a supplier of energy to, among others, utilities and municipalities to meet their native load obligations. Through various subsidiaries, ExGen is also a retail competitive energy provider. ExGen's generation assets in the various FERC-defined geographic regions are listed in the Asset Appendix in Attachment B. In the NE Region, ExGen directly, or indirectly through its subsidiaries, owns and/or controls approximately 30,000 MW of capacity. ExGen's subsidiaries that own and/or control generation in the NE Region are further described below.[11] The Commission has granted ExGen market-based rate authority.[12]

i. **Calvert Cliffs Nuclear Power Plant, LLC ("CCNPP")**.[13] CCNPP is an indirect, wholly owned subsidiary of Constellation Energy Nuclear Group, Inc. ("CENG"), which is a joint venture between Exelon and EDF Inc. ("EDF").[14] EDF is not an affiliate of Exelon. CCNPP owns and operates the Calvert Cliffs Nuclear Power Plant in Lusby, Maryland, which has a generating capacity of approximately 1,735 MW.[15] The Calvert Cliffs Nuclear Power Plant is located in the PJM BAA. The Commission has granted CCNPP market-based rate authority.[16]

ii. **Constellation Mystic Power, LLC ("Mystic")**. Mystic is a Delaware limited liability company that has been granted market-based rate authority.[17] Mystic owns the following generating facilities and related interconnection facilities, all of which are located in the ISO-NE BAA: (a) Mystic Unit 7, an approximately 575 MW oil- and

---

[11] Unless otherwise stated, each subsidiary is a wholly owned subsidiary of ExGen.

[12] *Exelon Generation Co.*, 93 FERC ¶ 61,140 (2000), *reh'g denied*, 95 FERC ¶ 61,309 (2001).

[13] CCNPP is filing a Market Power Update under separate cover.

[14] On November 1, 2013, the Commission issued a letter order accepting for filing a Nuclear Operating Services Agreement ("NOSA") among ExGen, CENG and CENG's wholly owned subsidiaries, CCNPP, Nine Mile Point Nuclear Station, LLC, and R.E. Ginna Nuclear Power Plant, LLC (CENG and its subsidiaries collectively, the "CENG Nuclear Plant Owners"). *Exelon Generation Co.*, Docket Nos. ER13-2105-000, *et al*. (unpublished delegated letter order issued Nov. 1, 2013). The NOSA "provides for ExGen's assumption of the operations of the nuclear generating facilities and related jurisdictional transmission facilities owned by the CENG Nuclear Plant Owners." *Id.* at 2. The Commission stated that the effective date of the NOSA will be the date that the Nuclear Regulatory Commission "issues the conforming license amendments to implement the approval of the transfer from the CENG Nuclear Plant Owners to ExGen of the operating authority" of the CENG Nuclear Plant Owners' relevant facilities. *Id.* The NOSA will not affect control of the nuclear generating facilities for purposes of the Commission's market power analyses because the Exelon MBR Entities already attributed 100% of the ownership share of the relevant facilities due to their affiliation with CENG. As noted in Exhibit JRS-2 to Ms. Solomon's affidavit, Ms. Solomon also includes as a long-term sale by the Exelon MBR Entities the long-term agreement under which EDF markets 15% of the output of these facilities.

[15] Unless otherwise specified, unit ratings are summer season ratings.

[16] *Calvert Cliffs Nuclear Power Plant, Inc.*, 92 FERC ¶ 62,161 (2000).

[17] *Constellation Mystic Power, LLC*, Docket Nos. ER10-2281-000, *et al.* (unpublished delegated letter order issued Oct. 27, 2010).

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

natural gas-fired facility in Everett, Massachusetts; (b) Mystic Jet, an approximately 9 MW distillate fuel oil facility in Everett, Massachusetts; (c) Mystic Units 8 (at approximately 704 MW) and 9 (at approximately 714 MW), natural gas-fired facilities located in Everett, Massachusetts, with a total capacity of approximately 1,418 MW; and (d) the Fore River facility, an approximately 700 MW natural gas-fired facility in North Weymouth, Massachusetts.

iii. **Constellation Power, Inc. ("CPI")**. CPI indirectly holds a 25% ownership interest in the approximately 104 MW Colver qualifying cogeneration facility in the PJM BAA. Power from the Colver facility is sold pursuant to a contract that was executed on or before March 17, 2006, and therefore market-based rate authority is not necessary to make such sales.[18]

iv. **Constellation Power Source Generation, Inc. ("CPSG")**. CPSG owns and/or operates multiple generation facilities in the PJM BAA with a total capacity of approximately 972 MW. The Commission has granted CPSG market-based rate authority.[19] On or before December 31, 2013, CPSG is expected to be merged into Constellation Power Source Generation, LLC ("CPSGL"), a newly formed entity that currently does not engage in any jurisdictional activities.[20]

v. **Criterion Power Partners, LLC ("CPP")**. CPP owns an approximately 70 MW wind farm located in western Maryland. The facility is in the PJM BAA. The Commission has granted CPP market-based rate authority.[21]

vi. **Exelon Framingham, LLC ("EFL")**. EFL owns and operates three fossil fueled peaking plants with a combined capacity of approximately 33.08 MW in Framingham, Massachusetts, in the ISO-NE BAA. The Commission has granted EFL market-based rate authority.[22]

vii. **Exelon New Boston, LLC ("Exelon New Boston")**. Exelon New Boston owns and operates an approximately 16.03 MW fossil fueled peaking plant in the ISO-NE BAA. The Commission has granted Exelon New Boston market-based rate authority.[23]

---

[18] 18 C.F.R. § 292.601(c)(1).

[19] *AmerGen Vt., LLC*, 90 FERC ¶ 61,307, *reh'g denied sub nom. Baltimore Gas & Elec. Co.*, 91 FERC ¶ 61,270 (2000).

[20] Upon consummation of the transaction, CPSGL will file a Notice of Succession with respect to its succession to CPSG's market-based rate tariff pursuant to 18 C.F.R. § 35.16.

SI-SSA-0010-3091

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

viii. **Exelon Solar Chicago LLC ("Exelon Solar")**. Exelon Solar owns an approximately 8 MW qualifying small power production solar energy facility in Cook County, Illinois, located in the PJM BAA.[24]

ix. **Exelon West Medway, LLC ("Exelon West Medway")**. Exelon West Medway owns the following three fossil fueled peaking plants located in the ISO-NE BAA: Jet 1, with a capacity of approximately 42 MW; Jet 2, with an approximate capacity of 39.85 MW; and Jet 3, with a capacity of approximately 35.44 MW, for a combined total of approximately 117.29 MW. The Commission has granted Exelon West Medway market-based rate authority.[25]

x. **Exelon Wyman, LLC ("Wyman")**. Wyman owns a 5.89% interest in a fossil fueled peaking plant with a total capacity of approximately 610 MW in the ISO-NE BAA. The facility is operated by FPL Wyman Energy, LLC, which is a subsidiary of Florida Power & Light Company and is not an affiliate of Exelon. The Commission has granted Wyman market-based rate authority.[26]

xi. **Handsome Lake Energy, LLC ("Handsome Lake")**. Handsome Lake owns an approximately 267.5 MW natural gas-fired generating facility located in Venango County, Pennsylvania. The facility is located in the PJM BAA. The Commission has granted Handsome Lake market-based rate authority.[27]

xii. **Holyoke Solar LLC ("Holyoke Solar")**. Holyoke Solar owns two qualifying small power production solar energy facilities located in Hampden, Massachusetts. One facility has a net power production of approximately 2.95 MW, and the other has a net power production of approximately 0.87 MW. The facilities are located in the ISO-NE BAA.

xiii. **Nine Mile Point Nuclear Station, LLC ("Nine Mile Point")**.[28] Nine Mile Point is an indirect, wholly owned subsidiary of CENG. Nine Mile Point owns 100% of an approximately 630 MW unit ("Unit 1") and an 82% share of an approximately 1,287 MW unit ("Unit 2") of a nuclear generation facility located in

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

Scriba, New York. The facility is located in the NYISO BAA. The Commission has granted Nine Mile Point market-based rate authority. [29]

xiv. **R.E. Ginna Nuclear Power Plant, LLC ("Ginna")**.[30] Ginna is an indirect, wholly owned subsidiary of CENG. Ginna owns an approximately 581.5 MW nuclear generation facility located in Ontario, New York. The facility is located in the NYISO BAA. Ginna sells approximately 90% of its entitlement to capacity, energy, and ancillary services from the facility to the former owners of the facility pursuant to long-term power purchase agreements. The Commission has granted Ginna market-based rate authority.[31]

xv. **Safe Harbor Water Power Corporation ("Safe Harbor")**. ExGen indirectly owns 66 2/3% of Safe Harbor.[32] Safe Harbor owns and operates an approximately 416.5 MW hydroelectric generation facility located on the Susquehanna River in Conestoga, Pennsylvania. The facility is located in the PJM BAA. The Commission has granted Safe Harbor market-based rate authority.[33]

B. ***Net-Metered Affiliates***. Certain individual project company subsidiaries of Exelon ("Retail QF Subsidiaries") install, own and operate very small solar generating facilities on property controlled by their commercial, industrial or governmental electric customers. These generating facilities each qualify as a small power production qualifying facility pursuant to Section 292.203(a) of FERC's regulations and are included on the Asset Appendix in Attachment B. The Retail QF Subsidiaries sell all electricity from such generating facilities behind-the-meter, directly to their on-site, end-use customers, and do not participate in the wholesale markets. Therefore, the Retail QF Subsidiaries' generation is not included in the market power analyses of the relevant wholesale markets in the NE Region.

C. ***Franchised Public Utility Affiliates.***

i. **Baltimore Gas and Electric Company ("BGE")**. BGE is a combination electric and natural gas utility engaged in the transmission and distribution of electricity and natural gas to residential, commercial and industrial customers in central Maryland. BGE provides retail electric service to approximately 1.2 million customers and provides retail gas service to approximately 655,000 customers in all or part of 10 counties in central Maryland and the City of Baltimore, Maryland. BGE serves as the default service provider for those gas and electric customers who do not choose competitive suppliers or whose competitive supplier has

30 Ginna is filing a Market Power Update under separate cover.

31 *R.E. Ginna Nuclear Power Plant, LLC*, Docket No. ER04-485-000 (unpublished delegated letter order issued Mar. 24, 2004).

32 The remaining interest in Safe Harbor is owned by LSP Safe Harbor Holdings, LLC, an unaffiliated entity.

33 *Safe Harbor Water Power Corp*., Docket Nos. ER08-537-000, *et al.* (unpublished delegated letter order issued May 6, 2008).

SI-SSA-0010-3093

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

failed to deliver electric or gas supply. The Commission has granted BGE market-based rate authority.[34]

BGE neither owns nor operates any electric generating facilities, having transferred its generation assets to its affiliates, CPSG and CCNPP in 2000.[35] BGE engages in limited sales of capacity credits associated with the PJM Active Load Management load response program.

Subject to the direction and control of PJM, BGE owns and operates jurisdictional transmission facilities that are used in the transmission of wholesale bulk power to load serving entities within PJM and neighboring regions. BGE is a member of PJM and has made its transmission facilities available for service pursuant to PJM's open access transmission tariff ("OATT").

In addition, BGE operates natural gas distribution facilities in its service territory in Maryland and also operates a liquefied natural gas ("LNG") facility for the liquefaction and storage of natural gas on its distribution system, as well as a captive propane-air facility with a mined cavern. Both the LNG facility and the captive propane-air facility are associated with BGE's distribution activities and do not offer services to third parties.

ii. **Commonwealth Edison Company ("ComEd")**. ComEd is primarily engaged in the purchase, transmission, distribution, and sale of electricity to residential, commercial, industrial, and wholesale customers in Northern Illinois.[36] ComEd has approximately 3.8 million retail electricity customers. ComEd serves as the default service provider for electric generation supply to customers who do not choose a competitive supplier or whose competitive supplier has failed to deliver electric supply. The Commission has granted ComEd market-based rate authority.[37]

ComEd does not own or operate any electric generating facilities, but instead obtains all of its energy requirements for retail customers from market sources pursuant to the Illinois Commerce Commission-approved procurement process.[38] Subject to the direction and control of PJM, ComEd owns and operates jurisdictional transmission facilities that it uses to supply retail electric service to its service territory. ComEd is also a member of PJM and has made its transmission facilities available for service pursuant to PJM's OATT.

---

[34] *Green Power Partners I LLC*, 88 FERC ¶ 61,005 (1999).

[35] *See Baltimore Gas & Elec. Co.*, 90 FERC ¶ 62,222 (2000).

[36] Commonwealth Edison Company of Indiana, Inc., a wholly owned subsidiary of ComEd, owns a small amount of electric transmission property in Indiana. As with ComEd, the transmission facilities owned by ComEd of Indiana, Inc. are under the operational control of PJM.

[37] *Commonwealth Edison Co.*, 82 FERC ¶ 61,317 (1998).

[38] ComEd makes a small amount of purchases from Qualifying Facilities under the Public Utility Regulatory Policies Act of 1978 ("PURPA"). 16 U.S.C. §§ 2601-2645.

SI-SSA-0010-3094

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

iii. **PECO Energy Company ("PECO")**. PECO is primarily engaged in the purchase, transmission, distribution, and sale of electricity and natural gas to residential, commercial, and industrial customers in southeastern Pennsylvania. PECO provides electric delivery service to approximately 1.6 million customers and also provides natural gas service to approximately 500,500 customers. PECO serves as the default service provider for electric generation supply to customers who do not choose a competitive supplier or whose competitive supplier has failed to deliver electric supply. The Commission has granted PECO market-based rate authority.[39]

PECO does not own any generation, but instead purchases the power needed to satisfy its electric service obligations through a competitive procurement process approved by the Pennsylvania Public Utility Commission. PECO is a member of PJM and has made its transmission facilities available for service pursuant to PJM's OATT.

PECO has an LNG facility located in West Conshohocken, Pennsylvania, which has a storage capacity of 1,200 mmcf and a send-out capacity of 157 mmcf/day and a propane-air plant located in Chester, Pennsylvania, with a tank storage capacity of 1,980,000 gallons and a peaking capability of 25 mmcf/day. In addition PECO owns 31 natural gas city gate stations at various locations throughout its gas service territory. Both the LNG facility and the propane-air facility are associated with PECO's distribution activities and do not offer services to third parties.

V. THE EXELON MBR ENTITIES SATISFY THE COMMISSION'S STANDARD FOR AUTHORITY TO SELL POWER AT MARKET-BASED RATES

As explained in the attached Affidavit of Julie R. Solomon from the consulting firm Navigant Consulting Inc., the Exelon MBR Entities continue to satisfy the Commission's test for determining whether to grant a public utility market-based rate authority. This test includes evaluating horizontal (generation) market power and vertical market power, which the Commission defined in Order No. 697 to include both transmission market power and the ability to erect barriers to entry in the relevant markets.[40]

Using the Commission's current standards for evaluating horizontal market power, as set forth in Order No. 697 and subsequent orders, Ms. Solomon concludes that the Exelon MBR Entities pass the pivotal supplier and market share screens in all the relevant markets and submarkets and are therefore presumed not to have horizontal market power in the NE Region.[41] Likewise, Ms. Solomon concludes that the Exelon MBR Entities satisfy the Commission's requirements with respect to transmission market power and the ability to erect barriers to entry. Therefore, the Exelon MBR Entities continue to qualify for market-based rate authority. In

addition, as explained below, the Exelon MBR Entities continue to qualify for waiver of the code of conduct requirement.

A. The Exelon MBR Entities Lack Horizontal Market Power

In Order No. 697, the Commission retained two "indicative" screens for assessing generation market power in the relevant geographic markets: a pivotal supplier screen and a market share screen.[42] If the seller passes both indicative screens, there is a rebuttable presumption that the seller does not possess market power in generation, and no further analysis is required.

The pivotal supplier screen "measures the ability of a firm to dominate the market at peak periods."[43] If demand in a specific market can be met without at least some power from a supplier, that supplier passes the pivotal supplier screen.[44] The Commission's required analysis under the pivotal supplier screen measures the uncommitted capacity of the supplier seeking market-based rate authorization, determined by adding the total nameplate or seasonal capacity of generation owned or controlled through contract and firm purchases, less the supplier's long-term firm sales, operating reserves and native load commitments.[45] The supplier's uncommitted capacity is deemed available for wholesale transactions.[46] The same methodology used in the pivotal supplier screen to calculate an applicant's uncommitted capacity is applied to measure competing suppliers' uncommitted capacity.[47]

The market share screen addresses on a seasonal basis "whether a seller has a dominant position in the market based on the number of megawatts of uncommitted capacity owned or controlled by the seller as compared to the uncommitted capacity of the entire relevant market."[48] If the applicant has less than a 20% market share in all four seasons, it passes the market share screen.[49]

The relevant geographic markets where the Exelon MBR Entities own or control generation are PJM (as well as the following submarkets within PJM: PJM East, AP South, and

---

42 *Id.*

43 *Id.* at P 65; *see also AEP Power Mktg., Inc.*, 107 FERC ¶ 61,018, at P 71 (2004) ("*AEP Power Marketing*").

44 *AEP Power Marketing* at P 72.

45 Order No. 697 at P 38. Pursuant to Order No. 697-A, the applicable study period for this triennial is December 1, 2011 to November 30, 2012. The capacity ratings of some of the entities in Ms. Solomon's Affidavit may therefore vary slightly from the capacity reflected in Section IV of this filing and the Asset Appendix in Attachment B, as the ratings in Section IV and the Asset Appendix reflect current data from 2013 ISO/RTO ratings.

46 *Id.* at P 42; *AEP Power Marketing* at P 99.

47 In Order No. 697, the Commission adopted the same native load proxy for the market share screen as is employed in the pivotal supplier screen. Order No. 697 at P 135.

48 *Id.* at P 43.

49 *Id.* at PP 44, 89.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

5004/5005), ISO-NE (as well as the CT submarket), and NYISO.[50] Ms. Solomon has analyzed each of these relevant geographic markets, although she explains that PJM East and 5004/5005 may be of lesser relevance to the market power analysis because constraints on the interfaces with those submarkets have significantly declined since the Commission began reviewing them as separate submarkets.[51] Ms. Solomon provides a "Congestion Event Summary (Event Hours)" table that demonstrates that in the relevant test period, constraints on the PJM East interface occurred in only about 2% of hours in day-ahead and in only five hours in real-time. Likewise, constraints on the 5004/5005 interface occurred in only about 2% of hours in day-ahead and in about 1% of hours in real-time.

Ms. Solomon attributes to the Exelon MBR Entities the generation owned or controlled by the Exelon MBR Entities and their affiliates in each of the relevant markets and submarkets as well as a pro rata share of imports from affiliated uncommitted capacity in relevant first-tier markets.[52] Ms. Solomon deducts 500 MW[53] from the Exelon MBR Entities' uncommitted capacity in PJM and the 5004/5005 submarket that is associated with Exelon's commitment at the time of the Exelon-Constellation merger to enter into fixed-price power sales contracts to sell 500 MW per hour of around-the-clock baseload energy into the 5004/5005 submarket through December 31, 2014.[54]

With respect to load, Ms. Solomon attributes to the Exelon MBR Entities load they served in PJM and ISO-NE during the study period.[55] This load includes wholesale load directly supplied by ExGen such as net physical sales to parties that primarily serve load[56] as well as sales under certain long-term inter-company agreements by which ExGen sells energy, capacity and other electric products to several retail electric supplier affiliates that are necessary to meet those affiliates' retail load obligations in the relevant markets.[57] Under ExGen's long-term contracts with its retail electric supplier affiliates, ExGen is obligated to supply sufficient quantities to satisfy the physical retail supply obligations of each retail electric supplier affiliate. Indeed, one of the rationales for the Exelon-Constellation merger was that owning generation in

---

50 Solomon Aff. at 7.

51 *Id.* at 8.

52 *Id.* at 12.

53 *Id.* at Exhibit JRS-2.

54 *Merger Order*, 138 FERC ¶ 61,167, at P 52.

55 Ms. Solomon explains that her Total Uncommitted Capacity determination in each RTO market and submarket is "extremely conservative" because her "analysis assumes that every MW of generation is 'committed' to the extent there is load, even though in reality every MW of generation is not necessarily committed by ownership or contractual commitment to serving a specific load." Solomon Aff. at 11. As Ms. Solomon notes, some parties rely on short-term purchases from the RTO markets to meet load obligations and thus competing uncommitted capacity is conservatively low in her analysis.

56 *Id.* at 10-11 & n.28 (citing Order No. 697 at P 155).

57 As noted in the Solomon Affidavit at n.29, the Commission permits sellers to deduct "long-term load following contracts to the extent that the seller has included in its total capacity a corresponding generating unit or long-term firm purchase contract that will be used to meet the obligation." (Citing Order No. 697 at P 154.)

SI-SSA-0010-3097

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

the same markets as that in which the retail electric supplier affiliates do business would provide Exelon with a physical hedge against market variations. Therefore, the deduction of these sales in the load calculation is consistent with the Commission's permitted deductions in Order No. 697 as well as the load calculations used in Exelon's 2010 updated market power analysis that was accepted by the Commission on June 22, 2011.[58]

As demonstrated in Ms. Solomon's analysis in Attachment A, the Exelon MBR Entities pass the pivotal supplier screen and market share screen in each of the relevant markets and submarkets. Ms. Solomon's results are summarized in the following table:

Market/ Submarket	Exhibit No.	Pivotal Supplier	Exhibit No.	Market Share Analysis			
				Winter	Spring	Summer	Fall
PJM	JRS-4	PASS	JRS-5	11.1%	10.8%	12.4%	12.3%
PJM East	JRS-6	PASS	JRS-7	15.3%	15.1%	14.0%	14.9%
5004/5005	JRS-8	PASS	JRS-9	13.8%	13.5%	12.5%	14.0%
AP South	JRS-10	PASS	JRS-11	10.1%	9.9%	9.3%	10.5%
ISO-NE	JRS-12	PASS	JRS-13	5.3%	4.9%	4.0%	7.1%
CT	JRS-14	PASS	JRS-15	0.0%	0.0%	0.0%	0.0%
NYISO	JRS-16	PASS	JRS-17	11.2%	10.5%	14.3%	11.1%

Because the Exelon MBR Entities pass both screens in all the relevant markets and submarkets, they are entitled to a presumption that they cannot exercise horizontal market power.[59] Ms. Solomon also notes several additional protections in the relevant markets that ensure that the Exelon MBR Entities cannot exercise market power. First, as Ms. Solomon explains, PJM, ISO-NE and NYISO are subject to extensive Commission-approved market monitoring and mitigation, and the Commission previously has found that such market monitoring and mitigation generally results in transparent pricing and mitigates any attempts to exercise market power.[60] Second, Ms. Solomon notes that Exelon's hedging strategy also reduces its ability or incentive to exercise market power; as of the end of 2012, expected generation was more than 90% hedged for 2013 and more than 60% hedged for 2014.[61]

Third, the Exelon MBR Entities are subject to certain additional behavioral commitments in PJM, entered into via a Settlement Agreement with the PJM Market Monitor at the time of the merger between Exelon and Constellation.[62] These behavioral commitments include (i)

notification procedures for planned retirements; (ii) prescribed rules on energy market offers specific to nuclear generation, peaking generation and other types of generation; and (iii) agreement with respect to bidding ancillary services. The PJM Market Monitor stated that, together with the PJM market rules, these behavioral conditions will ensure "the Market Monitor will have the information needed to monitor compliance" and "satisfy the Market Monitor's concerns regarding the merger."[63] In the *Merger Order*, the Commission found "that the behavioral commitments, when monitored, are an effective tool in limiting anti-competitive conduct."[64] Thus, these additional behavioral commitments further strengthen the general market monitoring and mitigation in place in PJM.[65]

In sum, Ms. Solomon concludes that the Exelon MBR Entities do not have market power in any of the relevant markets and submarkets in the NE Region.

B. The Exelon MBR Entities and Their Affiliates Lack Vertical Market Power

In evaluating vertical market power, the Commission considers both transmission market power and the ability of the seller and its affiliates to erect barriers to entry in the relevant markets.[66] As explained below, the Exelon MBR Entities continue to lack vertical market power.

1. Transmission Market Power

In order to receive market-based rate authorization, the seller and its affiliates must lack, or have adequately mitigated, transmission market power. The Exelon MBR Entities are affiliated with PECO, BGE, and ComEd (the "Franchised Public Utilities") through which Exelon distributes electricity to approximately 6.6 million customers in Illinois, Maryland and Pennsylvania. The Franchised Public Utilities have each transferred operational control over their transmission systems to PJM, and transmission service over those facilities is provided by PJM under its OATT. None of the other Exelon MBR Entities nor their affiliates own or control any transmission facilities in the NE Region other than certain limited interconnection facilities necessary to interconnect their generating facilities to the electric grid. The Commission has previously ruled that such limited interconnection facilities do not convey transmission market power.[67] Accordingly, the Exelon MBR Entities and their affiliates lack transmission market power.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

2. Barriers to Entry

The Commission also considers whether a company that is authorized to sell at market-based rates can erect barriers to entry by competing wholesale power suppliers in the relevant geographic markets by exercising control over "intrastate natural gas transportation; intrastate natural gas storage or distribution facilities; sites for generation capacity development; and sources of coal supplies and the transportation of coal supplies such as barges and rail cars."[68]

As noted in Section III.C above, BGE provides retail gas service to approximately 655,000 customers in all or part of 10 counties in central Maryland and the City of Baltimore, Maryland. PECO also provides retail gas service to approximately 500,500 customers located in southeastern Pennsylvania, adjacent to the city of Philadelphia. In addition, both BGE and PECO operate natural gas distribution facilities in their respective service territories. PECO owns 31 natural gas city gate stations at various locations throughout its gas service territory. In addition, both BGE and PECO operate their own propane-air facilities and LNG facilities for the liquefaction and storage of natural gas. The LNG facilities and the propane-air facilities are associated with BGE's and PECO's distribution activities and do not offer services to third parties.

Aside from sites previously reported pursuant to Order No. 697-D, the Exelon MBR Entities and their affiliates do not own or control any sites for generation capacity development in the NE Region other than sites on which their existing generation facilities are located.

In Order No. 697, the Commission adopted a

> rebuttable presumption that sellers cannot erect barriers to entry with regard to the ownership or control of, or affiliation with any entity that owns or controls, intrastate natural gas transportation, intrastate natural gas storage or distribution facilities; sites for generation capacity development; and sources of coal supplies and the transportation of coal supplies such as barges and rail cars.[69]

The Exelon MBR Entities affirmatively state that they have not erected barriers to entry in the relevant markets and will not erect barriers to entry into the relevant markets.[70] Thus, the Exelon MBR Entities have demonstrated that they lack the ability to erect barriers to entry.

---

[68] Order No. 697 at P 446. The Commission no longer considers ownership or control of natural gas supply, interstate natural gas transportation (including interstate natural gas storage), oil supply or oil transportation in its barriers to entry analysis. *Id.* at P 442.

[69] *Id.* at P 446.

[70] *Id.* at P 448.

C. The Exelon MBR Entities and Their Affiliates Continue to Qualify for Waiver of the Affiliate Restrictions

The affiliate restrictions govern the relationship between franchised public utilities with captive customers and their market-regulated power sales affiliates, which include wholesale power sales by a market-based rate seller to its franchised public utility affiliates, as well as transactions involving non-power goods and services between the franchised public utility and its marketing affiliate.[71] The only franchised public utilities affiliated with the Exelon MBR Entities are the Franchised Public Utilities, and the Commission has previously found that the establishment of a code of conduct governing the relationship between the Franchised Public Utilities and their market-regulated power sales affiliates was not necessary because the Franchised Public Utilities do not have any captive wholesale or retail customers.[72] Consistent with Commission precedent, waiver of the affiliate restrictions with respect to the Exelon MBR Entities remains appropriate because, as explained below, the Franchised Public Utilities continue to have no captive wholesale or retail customers.

The regulations define "Franchised public utility" to mean "a public utility with a franchised service obligation under state law"[73] and "Captive customers" to mean "any wholesale or retail electric energy customers served by a franchised public utility under cost-based regulation."[74] None of the Franchised Public Utilities have any wholesale electric energy customers served under cost-based rates. While the Franchised Public Utilities serve retail electric energy customers under cost-based rates in the states of Illinois, Pennsylvania and Maryland, all of their retail customers have the option to choose a competitive retail electric supplier. The Commission clarified in Order No. 697 that

> the definition of "captive customers" does not include those customers who have retail choice, *i.e.* the ability to select a retail supplier based on the rates, terms and conditions of service offered. Retail customers who choose to be served under cost-based rates but have the ability, by virtue of state law, to choose one retail supplier over another, are not considered to be under "cost-based regulation" and therefore are not "captive."[75]

---

71 18 C.F.R. § 35.39; *see also id.* § 35.44.

72 *Exelon Generation Co.*, 126 FERC ¶ 61,031, at PP 43-48 (2009); *Baltimore Gas & Elec. Co.*, Docket Nos. ER99-2948-012, *et al.* (unpublished delegated letter order issued Sept. 16, 2008). Waiver of the code of conduct was originally granted in *Exelon Generation Co.*, 93 FERC ¶ 61,140, at 61,425-26 (2000), *reh'g denied*, 95 FERC ¶ 61,309 (2001) and *AmerGen Vt., LLC*, 90 FERC ¶ 61,307, at 61,995, *reh'g denied sub nom.*, *Baltimore Gas & Elec. Co.*, 91 FERC ¶ 61,270 (2000).

73 18 C.F.R. § 35.36(a)(5).

75 Order No. 697 at P 479.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

Thus, the Franchised Public Utilities do not have any retail captive customers. Because the Franchised Public Utilities do not have any wholesale or retail captive customers, continuation of the waiver of the affiliate restrictions is appropriate.

VI. NOTICE OF CHANGE IN STATUS

ExGen has entered into a one-year tolling agreement pursuant to which it will acquire control over the approximately 661 MW Granite Ridge generating facility, located in the ISO-NE BAA, beginning January 1, 2014. Ms. Solomon has included with her Affidavit an additional analysis demonstrating that the Exelon MBR Entities will continue to pass both indicative screens in the ISO-NE BAA once the tolling agreement commences.[76] Thus, acquisition of control over the Granite Ridge facility for the one-year term of the tolling agreement does not constitute a material departure from the characteristics the Commission relied upon in granting the Exelon MBR Entities market-based rate authority. As stated above, the Exelon MBR Entities confirm that they have not erected barriers to entry into the relevant markets and will not erect barriers to entry into the relevant markets. The Exelon MBR Entities respectfully request that the Commission accept this notice of change in status.

VII. REQUEST FOR WAIVER OF OPEN ACCESS REQUIREMENTS

Certain of the Exelon MBR Entities own or control generation facilities and corresponding limited and discrete interconnection facilities designed to interconnect the generation facilities to the grid (the "Project Company Sellers").[77] The Project Company Sellers do not own or control transmission facilities other than the interconnection facilities.[78] Nonetheless, the Commission has recently indicated that, absent a waiver, entities that only own generator interconnection facilities may also be subject to the requirements of Order Nos. 888,[79]

---

[76] Solomon Aff. at 2, 21 and Exhibits JRS-12 (CIS) and JRS-13 (CIS).

[77] Specifically, the Project Company Sellers are: Cassia Gulch Wind Park, LLC; CER Generation, LLC; CER Generation II, LLC; Mystic; CPI; CPSG; CPP; EFL; Exelon New Boston; Exelon Solar; Exelon West Medway; Handsome Lake; Holyoke Solar; Cow Branch Wind Power, LLC; CR Clearing, LLC; ExGen; Exelon Wind 4, LLC; Harvest Windfarm, LLC; High Mesa Energy, LLC; Michigan Wind 1, LLC; Tuana Springs Energy, LLC; Wind Capital Holdings, LLC; and Wyman. The Project Company Sellers do not include Exelon MBR Entities that have already received Open Access Waivers. *See, e.g.*, *AV Solar Ranch 1, LLC*, 140 FERC ¶ 61,159 (2012) (Order Granting AV Solar Ranch 1, LLC Market-Based Rate Authority and Request for Waivers).

[78] *See, e.g.*, *Baltimore Gas & Elec. Co.*, Docket Nos. ER10-2172-001, *et al.*, Triennial Filing at 15 (filed Dec. 29, 2010) ("Other than BGE, neither the Constellation MBR Entities nor their affiliates own or control any transmission facilities other than certain limited interconnection facilities necessary to interconnect their generating facilities to the electric grid."); *Commonwealth Edison Co.*, Docket Nos. ER10-1048-003, *et al.*, Triennial Filing at 6 (filed Dec. 30, 2010) (stating that the facilities owned by PECO and ComEd "are the only transmission assets owned by the transmission assets owned MBR Companies or their affiliates other than those necessary to connect their generation to the grid").

[79] *Promoting Wholesale Competition Through Open Access Nondiscriminatory Transmission Services by Public Utilities and Recovery of Stranded Costs by Public Utilities and Transmitting Utilities*, Order No. 888, FERC Stats. & Regs. ¶ 31,036 (1996), Order No. 888-A, FERC Stats. & Regs. ¶ 31,048 (1997), *order on reh'g*, Order No.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

889,[80] 890,[81] their implementing regulations at Section 35.28 and Part 37, and the requirements of Part 358[82] (collectively, the "Open Access Requirements").[83] The Project Company Sellers therefore request, out of an abundance of caution, that the Commission grant them waivers of the Open Access Requirements.

The generator interconnection facilities that the Project Company Sellers own ("Interconnection Facilities") are each limited and discrete facilities that do not form an integrated transmission grid.[84] The Interconnection Facilities consist of discrete, radial interconnection facilities used solely to interconnect the Project Company Sellers' respective generation facilities to the grid. The Commission has routinely granted waiver of its Open Access Requirements for similar limited and discrete interconnection facilities unless and until an owner of such facilities receives a request for transmission service.[85] Therefore, the Project Company Sellers request that the Commission grant them waiver of the Open Access Requirements.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

VIII. CONCLUSION

Based upon the foregoing, the Exelon MBR Entities respectfully request that the Commission accept for filing this joint updated market power analysis for the NE Region, accept the change in status notice regarding the Granite Ridge tolling agreement and grant the Project Company Sellers the requested waiver of the Open Access Requirements.

Respectfully submitted,

JULIE R. SOLOMON

I. INTRODUCTION

My name is Julie R. Solomon. I am a Managing Director of Navigant Consulting, Inc. My business address is 1200 19th Street, N.W., Suite 700, Washington, DC 20036. A large portion of my consulting activities involves electric utility industry restructuring and the transition from regulation to competition. I have been involved extensively in consulting on market power issues

concerning mergers, other asset transactions and market-based rate applications. I have filed a number of affidavits before the Federal Energy Regulatory Commission (the "Commission") in connection with electric utility mergers, the purchase and sale of jurisdictional assets, applications for market-based rates, and triennial updates. Included among these, I have filed a number of affidavits with the Commission on behalf of relevant affiliates of Exelon Corporation ("Exelon") with market-based rate authority in connection with past triennial updates. My resume is attached as Exhibit JRS-1.

I have been asked by counsel for the above-captioned subsidiaries of Exelon with market-based rate authority (the "Exelon MBR Entities" or "Sellers") to perform an analysis of market power in compliance with the Commission's guidelines contained in *Order No. 697*.[1] Here I provide an evaluation of horizontal and vertical market power issues for the relevant markets in the Northeast Region[2] in which the Exelon MBR Entities are transmission owners and/or own or control generation facilities.

This affidavit and accompanying exhibits also contain an additional horizontal market power screen analysis relevant to a notice of change in status that will occur on January 1, 2014, with respect to a one-year tolling agreement under which one of the Exelon MBR Entities will "control" the output of the Granite Ridge generating facility in ISO-NE.

II. SUMMARY OF CONCLUSIONS

Based on the analyses discussed herein, I find that, under the Commission's guidelines, the Exelon MBR Entities satisfy the Commission's horizontal market power screens. The Exelon MBR Entities also do not have vertical market power in the relevant markets.

---

1 *Market-Based Rates for Wholesale Sales of Elec. Energy, Capacity and Ancillary Servs. by Pub. Utils.*, Order No. 697, FERC Stats. & Regs. ¶ 31,252, *clarified*, 121 FERC ¶ 61,260 (2007), *order on reh'g and clarification*, Order No. 697-A, FERC Stats. & Regs ¶ 31,268, *order on reh'g and clarification*, 124 FERC ¶ 61,055, *order on reh'g and clarification*, Order No. 697-B, FERC Stats. & Regs ¶ 31,285 (2008), *order on reh'g and clarification*, Order No. 697-C, FERC Stats. & Regs ¶ 31,291 (2009), *order on reh'g and clarification*, Order No. 697-D, FERC Stats. & Regs. ¶ 31,305, *order on clarification*, 131 FERC ¶ 61,021, *reh'g denied*, 134 FERC ¶ 61,046 (2010), *appeal docketed sub nom. Mont. Consumer Counsel v. FERC,* Nos. 08-71827, *et al.* (9th Cir. filed May 1, 2008) (collectively, "Order No. 697") (codified at 18 C.F.R. pt. 35).

2 The Northeast Region includes PJM Interconnection, LLC ("PJM"), New York Independent System Operator, Inc. ("NYISO"), and ISO New England Inc. ("ISO-NE"). *Order No. 697*, Appendix D.

The analysis I have conducted is consistent with *Order No. 697* and related orders. I have performed the two indicative horizontal market power screens required by the Commission, namely a pivotal supplier analysis based on the annual peak demand of the relevant market ("Pivotal Supplier Analysis") and a market share analysis ("Market Share Analysis") applied on a seasonal basis for the relevant study period of December 2011-November 2012. Here I provide an evaluation of market power for the default relevant geographic markets in which the Exelon MBR Entities own generation in the Northeast Region, namely PJM and relevant submarkets (PJM East, AP South, and 5004/5005),[3] ISO-NE and a relevant submarket (Connecticut ("CT")), and NYISO (the "Northeast Region RTOs").[4]

The Exelon MBR Entities pass the Pivotal Supplier Analysis and Market Share Analysis in all relevant markets and submarkets, and hence are presumed not to have horizontal market power in the Northeast Region. Additionally, there are other protections in place that further prevent market power concerns. First, *Order No. 697* contemplates that Commission-approved market monitoring and mitigation in RTO markets or submarkets be considered as part of market power analysis.[5] Each of the relevant Northeast Region markets and submarkets is subject to extensive Commission-approved market monitoring and mitigation that generally results in transparent pricing and mitigates attempts to exercise market power.[6] Second, the Exelon MBR Entities are subject to additional behavioral commitments in PJM, entered into as part of the transaction between Exelon Corporation and Constellation Energy Group, Inc. (*see* Docket No. EC11-83-000) (the "Exelon-Constellation merger") that mitigate any horizontal market power.[7] Further, Exelon's hedging strategy limits exposure to risk but also reduces its ability or incentive to exercise market power. Exelon Generation Company, LLC ("Exelon Generation") maintains hedge percentage

---

3 Although not described in Order No. 697, the Commission has adopted the convention that AP South and 5004/5005 submarkets are relevant submarkets in PJM. *See, e.g.*, *Exelon Corp.*, 138 FERC ¶ 61,167 (2012).

4 While the Commission has identified submarkets in NYISO, none of the Exelon MBR Entities own or control generation in those submarkets so none of them are relevant to my analysis.

5 *See Order No. 697* at PP 241-242.

6 Order No. 697 at P 241.

7 *See* Answer of Exelon Corporation and Constellation Energy Group, Inc., Docket No. EC11-83-000 (filed Oct. 11, 2011) ("Section 203 Amendment") (describing the behavioral commitments). A copy of the Section 203 Amendment was provided in Attachment A-2 to the Exelon MBR Entities' April 11, 2012 Change in Status Filing in the captioned dockets.

targets for its entire generation fleet, and as of the end of 2012 expected generation was more than 90 percent hedged for 2013 and more than 60 percent hedged for 2014.

The Exelon MBR Entities also lack vertical market power. Commonwealth Edison Company ("ComEd"), PECO Energy Company ("PECO"), and Baltimore Gas and Electric ("BGE") each own transmission facilities in PJM, but such facilities are under the functional control of PJM and are subject to the terms and conditions of the PJM Open Access Transmission Tariff ("OATT"). Outside of PJM, the only transmission facilities owned or controlled by the Exelon MBR Entities or their affiliates consist of those necessary to connect their generating facilities to the grid and thus do not raise any vertical market power concerns.

The Exelon MBR Entities cannot erect barriers to entry in relevant markets. They have no ownership or control of intrastate natural gas transportation or intrastate natural gas storage. PECO and BGE operate natural gas distribution facilities in PJM and have liquefied natural gas ("LNG") facilities that are used to provide peak gas to their customers, but ownership of these assets is subject to the Commission's rebuttable presumption that such ownership does not allow a seller to raise entry barriers.[8] Hence, no vertical concerns are present with respect to the Exelon MBR Entities' owned natural gas distribution and LNG facilities.

The Exelon MBR Entities do not own or control any sites for generation capacity development that can be used to create barriers to entry in relevant markets. The Exelon MBR Entities do not own or control sources of coal supplies (except via coal supply contracts in PJM) or transportation of coal supplies other than private rail cars for transportation of coal supplies in PJM. Here again, these assets would be subject to the rebuttable presumption that such ownership or control does not allow a seller to raise entry barriers. There are no other issues that raise any relevant competitive concerns.

I understand that an affirmative statement on behalf of the Exelon MBR Entities is included in their submission to the effect that they have not erected barriers to entry and will not erect barriers to entry.

---

[8] *Order No. 697* at P 22.

III. DESCRIPTION OF EXELON MBR ENTITIES

For purposes of my analysis, Exhibit JRS-2 details the generation owned or controlled by the Exelon MBR Entities in the relevant markets in the Northeast Region, and also reflects generation owned or controlled in relevant first-tier markets. A more detailed description of the Exelon MBR Entities is provided in the submittal letter.

IV. HORIZONTAL MARKET POWER

In *Order No. 697*, the Commission codified a methodology for assessing market power to be used by applicants requesting market-based rate authority under Section 205 of the Federal Power Act or making their required triennial market power update filings. The Commission applies two screens – the Pivotal Supplier Analysis and the Market Share Analysis – intended to demonstrate a lack of horizontal market power. If an entity fails to pass either of the screens, there is a presumption of horizontal market power and further analysis is required.

In *Order No. 697*, the Commission defines the default relevant market as the balancing area authority ("BAA") in which the applicant is physically located. Where a generator is interconnected to a non-affiliate owned transmission system, the only relevant market is the BAA in which the generator is located.[9] Sellers located in, and members of, RTOs may use the geographic region under the control of the RTO as the default relevant geographic market.[10] If the Commission has made specific findings of submarkets within an RTO/ISO, the default relevant market becomes the submarket(s) of the RTO/ISO.[11]

---

9 *Order No.697* at P 232 n.217.

10 *Id.* at P 235.

11 *Id.* at PP 236, 246; *Order No. 697-A* at P 90. The relevant submarket in PJM that was identified in *Order No. 697* and related orders was PJM East. The AP South and 5004/5005 submarkets also have been reviewed by the Commission as relevant submarkets in PJM. *Exelon Corp.*, 138 FERC ¶ 61,167 (2012). (See page 8 and note 15 for a discussion of the current state of intra-RTO constraints in PJM.) Submarkets in ISO-NE identified in *Order No. 697* include CT (where the Exelon MBR Entities control generation) and SWCT (where the Exelon MBR Entities do not own or control generation). There are two submarkets in NYISO (New York City and Long Island), but the Exelon MBR Entities do not own or control generation in either of these submarkets.

Pivotal Supplier Analysis

The Pivotal Supplier Analysis seeks to determine if load can be served without an applicant's generation. *Order No. 697-A* specifies a number of calculations for the Pivotal Supplier Analysis.[12]

First, Total Uncommitted Supply is calculated based on installed capacity (adjusted for long-term firm purchases and sales) plus imports less the reserve requirement (*i.e.*, operating reserves) less the average daily peak native load for the peak month.

Second, Wholesale Load is calculated based on the difference between the annual peak load (needle peak) and the average daily peak native load for the peak month.

Third, Net Uncommitted Supply is calculated based on the difference between Total Uncommitted Supply and Wholesale Load. Seller's Uncommitted Capacity is based on Seller's Total Uncommitted Capacity less its average daily peak native load.

If Seller's Uncommitted Capacity is less than the Net Uncommitted Supply, the Pivotal Supplier Analysis is passed.

Market Share Analysis

The Market Share Analysis evaluates, for each of the four seasons, whether the seller has a dominant position in the market, with dominance defined as a market share in excess of 20 percent.

Order No. 697 specifies a number of calculations for the market share screen.[13]

First, Seller and Affiliate Capacity is calculated based on installed capacity (adjusted for long-term firm purchases and sales) plus imports less planned outages. Non-Affiliate Capacity is calculated in a similar manner.

Second, Capacity Deductions are calculated based on average peak native load in the season (averaged over all days)[14] plus operating reserves.

---

[12] *See Order No. 697-A* at Appendix A to Subpart H.

[13] *See id.*

Third, Seller's Uncommitted Capacity is calculated by subtracting the Capacity Deductions attributed to Seller from Seller and Affiliate Capacity, and Total Competing Supply is calculated by subtracting the Capacity Deductions attributed to others from Non-Affiliate Capacity. Total Seasonal Uncommitted Capacity is the sum of Seller's Uncommitted Capacity and Total Competing Supply.

Finally, Seller's Market Share is calculated as Seller's Uncommitted Capacity as a percentage of Total Seasonal Uncommitted Capacity.

If Seller's Market Share is less than 20 percent in all seasons, the Market Share Analysis is passed.

Assumptions

Relevant Geographic Markets. My analysis is focused on PJM (including PJM East, AP South, and 5004/5005), ISO-NE (including CT) and NYISO as the relevant geographic markets because those are the markets and submarkets in which the Exelon MBR Entities own or control generation. While the analysis I conduct of PJM is consistent with the Commission's current view of PJM submarkets, I note that submarkets cannot always be viewed as a static determination. Market conditions (generation, load patterns, transmission) change, including changes in response to such constraints. Constraints on the PJM East interface, in particular, are not nearly as significant as they have been historically and, likewise, constraints on the 5004/5005 interface have declined in recent years. In contrast, constraints on the AP South interface have increased.

The table below presents a summary of the number of hours in day-ahead and real-time that congestion occurred since 2010, and compares them to levels in 2005.[15]

---

[14] Consistent with the *Clarification Order* at P 12(a), I used the following seasons for my analysis: Winter (December-February), Spring (March-May), Summer (June-August) and Fall (September-November).

[15] These data are from the annual or quarterly PJM State of the Market Reports. http://www.monitoringanalytics.com/reports/PJM_State_of_the_Market/2013.shtml.

Congestion Event Summary (Event Hours)										
	2005		2010		2011		2012		2013 (Jan-Sept)	
Interface	Day-Ahead	Real-Time	Day-Ahead	Real-Time	Day-Ahead	Real-Time	Day-Ahead	Real-Time	Day-Ahead	Real-Time
PJM East	1,371	148	256	8	522	22	209	5	254	0
5004/5005	1,906	782	1,644	605	905	470	191	128	505	150
AP South	441	39	4,645	1,528	4,111	1,013	2,586	351	4,757	915

As shown, in 2012 (consistent with the study period of the indicative screens), constraints on the PJM East interface occurred in only about 2 percent of hours in day-ahead (209 hours) and in only 5 hours in real-time. Constraints on the 5004/5005 interface in 2012 also were less than 200 hours in both day-ahead and real-time. Thus, day-ahead constraints on the PJM East and 5004/5005 interfaces declined significantly since 2005, when constraints occurred in almost 16 percent and 22 percent of hours in day-ahead, respectively. Some increase in constraints on the 5004/5005 interface have been experienced in 2013 to-date, but constraints on the PJM East interface remain low. By comparison, constraints on the AP South interface in 2012 occurred in almost 30 percent of hours in day-ahead, and 4 percent of hours in real-time, much greater than experienced in 2005, and continued to increase in 2013 to-date. These data suggest that the PJM East and 5004/5005 submarkets may be of relatively lesser relevance in the context of the instant analysis.

Study Period. My analysis is based on a December 2011-November 2012 study period.

Generating Capacity. For PJM installed capacity, I relied on data reported by Energy Velocity based on seasonal EIA-860 ratings.[16] For the PJM submarkets, I relied on the same installed capacity data, identifying generating units in the submarkets consistent with the submarket definitions outlined by PJM in its 2012 Simultaneous Import Limit ("SIL") Study.[17]

For ISO-NE installed capacity, I relied on capacity ratings reported by ISO-NE.[18]

For NYISO installed capacity, I relied on capacity ratings reported by NYISO.[19]

---

16 http://www.eia.gov/cneaf/electricity/page/eia860.html.

17 *See 2012 Simultaneous Import Limit Study*, PJM, Docket No. AD10-002, October 2, 2013.

18 For ISO-NE: *2012-2021 Forecast Report of Capacity, Energy, Loads and Transmission*, System Planning, ISO New England, May 1, 2012, http://www.iso-ne.com/trans/celt/report/2012/2012_celt_report.xls.

I use each of these sources for seasonal ratings for the generation owned or controlled by the Exelon MBR Entities and their affiliates. Also, while affiliates of the Exelon MBR Entities own certain small, behind-the-meter generating facilities in the Northeast Region that sell directly to their on-site, end-use customers, I do not include these facilities in my analyses because they do not participate in the wholesale markets.[20]

For the Pivotal Supplier Analysis, I use summer ratings, consistent with the time of annual peak. For the Market Share Analysis, I use summer ratings for the Summer season, and winter ratings for all other seasons.

Operating Reserves. I calculated operating reserves for PJM and its relevant submarkets based on *PJM Manual 13 (Emergency Operations)*.[21] Day-ahead scheduling (operating) reserves in 2012 were based on 7.03 percent of the peak load forecast for the portion of PJM within the NERC Reliability*First* Corporation region. For the Dominion zone, the operating reserve requirement is based on Dominion's share of the Virginia-Carolinas ("VACAR") reserve sharing requirement.[22] I conservatively did not assign any operating reserves to the Exelon MBR Entities.

Operating reserves for ISO-NE are based on its operating procedures.[23] For this purpose, I used the actual average the 30-minute system-wide reserve requirements reported by the ISO-NE

---

19 *2012 Load and Capacity Data Report* 2012 ("Gold Book"), NYISO, April 2012, http://www.nyiso.com/public/webdocs/markets_operations/services/planning/Documents_and_Resources/Planning_Data_and_Reference_Docs/Data_and_Reference_Docs/2012_GoldBook_V3.pdf.

20 I understand that these behind-the-meter facilities are shown in the Exelon MBR Entities' asset appendix.

21 The current version of Manual 13 can be found at http://www.pjm.com/documents/~/media/documents/manuals/m13.ashx.

22 *See Manual 13* and http://www.serc1.org/Documents/SERC%20Standing%20Committee%20Documents/Regional%20Criteria/SERC%20Reg%20Criteria_Contingency%20Reserve%20Policy_Rev%205%20(10-07-11).pdf

23 *ISO New England Operating Procedure No. 8*, Operating Reserve and Regulation, Effective Date: March 11, 2013, Revision No. 8, http://www.iso-ne.com/rules_proceds/operating/isone/op8/op8_rto_final.pdf.

external market monitor.[24] For CT, operating reserves are based on ISO-NE's local operating reserve requirements.[25]

Operating reserves for NYISO are based on its reported locational reserve requirements for the "NYCA" control area, based on 30-minute reserves.[26]

Load Data. I used hourly load data reported on the websites for the Northeast Region RTOs.

The PJM submarkets are defined based on the following transmission zones:

Transmission Zones		PJM East	5004/5005	AP South
AE	Atlantic City Electric Company	x	x	x
DP&L	Delmarva Power & Light	x	x	x
JCP&L	Jersey Central Power & Light Company	x	x	x
PE	PECO Energy Company	x	x	x
PSE&G	Public Service Electric & Gas Company	x	x	x
RECO	Rockland Electric Company	x	x	x
ME	Metropolitan Edison Company		x	x
PPL	PPL Electric Utilities		x	x
BGE	Baltimore Gas & Electric		x	x
PEPCO	Potomac Electric Power Company		x	x
UGI	UGI Utilities, Inc.		x	x
VAP	Virginia Electric & Power (Dominion)			x

The Exelon MBR Entities provided me with data on the load they served in the relevant markets during the study period. This includes load directly supplied by Exelon Generation,[27] including net

24 *2012 Assessment Of the ISO New England Electricity Markets*, Potomac Economics, May 2013 at p. 38, http://www.iso-ne.com/markets/mktmonmit/rpts/ind_mkt_advsr/isone_2012_emm_rprt_final.pdf.

25 *See 2012 Regional System Plan*, ISO-NE, November 2, 2012, Table 4-9, Representative Future Operating-Reserve Requirements in Major New England Import Areas (MW), http://www.iso-ne.com/trans/rsp/2012/rsp_final_110212.docx.

26 NYISO, *Locational Reserve Requirements*, http://www.nyiso.com/public/webdocs/markets_operations/market_data/reports_info/nyiso_locational_reserve_reqmts.pdf.

27 On March 12, 2012, Constellation Energy Group, Inc. ("CEG") was merged into Exelon. Between March 12, 2012, and February 1, 2013, Exelon had two subsidiaries, Constellation Energy Commodities Group, Inc. ("CCG") and Exelon Generation, that were active participants in the wholesale energy markets, which included physical sales to parties that primarily serve load, as well as sales to retail affiliates in support of their load

physical sales to parties that primarily serve load,[28] as well as sales by Exelon Generation to retail affiliates of the Exelon MBR Entities in support of their load obligations.[29]

Other Load and Generation Commitments. I note that the Total Uncommitted Capacity determined in each of the RTO markets and submarkets is extremely conservative, because no attempt has been made to match load commitments (and, correspondingly, generation commitments) attributable to individual parties, other than the Exelon MBR Entities, in the RTOs. Under the Market Share Analysis, for example, the amount of load attributable to "others" is simply the difference between the total average peak native load in the season and the amount attributable to the seller (in this case, the Exelon MBR Entities). The result is conservative in that it assumes all load in the market is met with specific generation committed to serving it via ownership or contractual commitment, which is not an accurate reflection of the facts in a market where some parties rely on short-term market purchases from the RTO to meet load obligations. In other words, my analysis assumes that every MW of generation is "committed" to the extent there is load, even though in reality every MW of generation is not necessarily committed by ownership or contractual commitment to serving a specific load. Thus, the Total Competing (Uncommitted) Supply that is assumed to compete with Exelon MBR Entities' Uncommitted Capacity in my analysis is conservatively low.

Planned Outages. I calculated average planned outages for each of the seasons based on outages at time of monthly peaks reported in the PJM, ISO-NE and NYISO FERC Form No. 714s.[30] For the

---

obligations. As part of ongoing corporate reorganization, CCG was merged wholly and fully into Exelon Generation effective February 1, 2013, which effectively consolidated the wholesale energy operations into a single entity, which is Exelon Generation. For purposes of this filing any reference to Exelon Generation also covers the activity of CCG during the period between March 12, 2012, and February 1, 2013.

28 The Commission allows market-based rate sellers to consider their sales to load-serving entities on a short-term basis when computing their uncommitted capacity ("We will allow IPPs to deduct short term native load obligations if they can show that the power sold to the utility was used to meet native load." *Order No. 697* at P 155). For purposes of my screen calculations, I considered only sales by the Exelon MBR Entities to load-serving entities that are subject to contracts for the sale of physical energy while simultaneously netting out purchases from the same load-serving entities.

29 Sellers may deduct "long-term load following contracts to the extent that the seller has included in its total capacity a corresponding generating unit or long-term firm purchase contract that will be used to meet the obligation." *Order No. 697* at P 154.

30 *Order No. 697* indicates that planned outages should be consistent with those reported in FERC Form No. 714, and that "[t]o determine the amount of planned outages for a given season, the total number of MW-days of outages is

submarkets, I estimated outages based on the submarket's share of generation relative to total RTO generation. For the Exelon MBR Entities, I estimated outages based on their share of generation relative to total generation in the relevant market or submarket.

Simultaneous Import Limits ("SIL"). For PJM, I relied on the PJM 2012 Simultaneous Import Limit Study Report.[31] For ISO-NE, I relied on its 2012 Simultaneous Import Limit Study Report.[32] For NYISO, I relied on its 2012 Simultaneous Import Limit Study.[33]

Allocating Imports. I allocated imports to the Exelon MBR Entities in a manner consistent with the *Order No. 697-A Clarification Order*, which states that "market-based rate sellers, after accounting for the firm transmission rights held by the sellers and their affiliates, may allocate simultaneous transmission import capability on a *pro rata* basis (*i.e.*, based on the relative shares of the market-based rate seller's (and its affiliates') and competing suppliers' uncommitted generation capacity in first-tier markets when performing the indicative screens."[34] Based on the Exelon MBR Entities' share of uncommitted capacity in markets first-tier to the relevant markets (or submarkets) being analyzed, I allocated a pro rata share of the SIL to them. The remainder of the SIL was assumed to be Non-Affiliate Capacity.

Results of Analysis

Exhibit JRS-3 summarizes the results, as excerpted below. As shown, the Exelon MBR Entities pass the Pivotal Supplier Analysis and the Market Share Analysis in each of the relevant markets.

---

divided by the total number of days in the season." *Order No. 697* at P 43. However, the FERC Form No. 714 reports planned outages only at time of peak for the month, and hence it is not possible to determine the total number of MW-days of outages from these data.

33 *2012 Simultaneous Transmission Import Limit Study*, New York Independent System Operator, Inc., Docket No. AD10-2, December 19, 2013.

34 *Order No. 697-A Clarification Order* at Ordering Paragraph (A).

Market/ Submarket	Exhibit No.	Pivotal Supplier	Exhibit No.	Market Share Analysis			
				Winter	Spring	Summer	Fall
PJM	JRS-4	PASS	JRS-5	11.1%	10.8%	12.4%	12.3%
PJM East	JRS-6	PASS	JRS-7	15.3%	15.1%	14.0%	14.9%
5004/5005	JRS-8	PASS	JRS-9	13.8%	13.5%	12.5%	14.0%
AP South	JRS-10	PASS	JRS-11	10.1%	9.9%	9.3%	10.5%
ISO-NE	JRS-12	PASS	JRS-13	5.3%	4.9%	4.0%	7.1%
CT	JRS-14	PASS	JRS-15	0.0%	0.0%	0.0%	0.0%
NYISO	JRS-16	PASS	JRS-17	11.2%	10.5%	14.3%	11.1%

Exhibits JRS-4 through JRS-11 contain the detailed results of the Pivotal Supplier Analysis and the Market Share Analysis in PJM and the PJM submarkets. Exhibits JRS-12 through JRS-15 contain the detailed results in ISO-NE and the CT submarket. Exhibits JRS-16 through JRS-17 contain the detailed results in NYISO. Exhibits JRS-12 (CIS) and Exhibit JRS-13 (CIS) reflect detailed results in connection with the change in status arising from the Granite Ridge toll in ISO-NE.

PJM

In PJM, the Exelon MBR Entities own or control 25,677 MW of capacity, as shown in Exhibit JRS-2. This includes 1,666 MW of generation purchased or controlled under long-term contract, and 757 MW of long-term sales commitments.[35]

Pivotal Supplier Analysis. The Exelon MBR Entities' Installed Capacity is 24,255 MW, their Long-Term Firm Purchases are 1,666 MW and their Long-Term Sales are 757 MW. They are attributed 382 MW of imports. They are assigned 17,201 MW of load. Thus, Sellers' Uncommitted Capacity is 8,345 MW.

Total Uncommitted Supply is 63,975 MW. Wholesale Load is 20,871 MW, and Net Uncommitted Supply is 43,104 MW.

[35] As appropriate, the seasonal results reflect the retirement of the Cromby and Eddystone generating units (December 2011 and May 2012, respectively) during the study period.

Because Sellers' Uncommitted Capacity is less than the Net Uncommitted Supply, the Pivotal Supplier Screen is passed. See Exhibit JRS-4.

Market Share Analysis. The Exelon MBR Entities' Installed Capacity ranges from 24,255 MW to 25,138 MW. Their Long-Term Firm Purchases range from 1,666 MW to 1,914 MW, and their Long-Term Firm Sales range from 757 to 760 MW. They are attributed 214 MW to 3,582 MW of planned outages, 12,838 MW to 16,198 MW of load, and 168 MW to 347 MW of imports. Thus, Sellers' Uncommitted Capacity ranges from 9,099 MW to 11,060 MW.

Total Seasonal Uncommitted Capacity ranges from 73,493 MW to 98,338 MW.

Sellers' Market Share ranges from 10.8 to 12.4 percent. Because Sellers' Market Share is less than 20 percent in all seasons, the Market Share Screen is passed. See Exhibit JRS-5.

Thus, on the basis of the Commission's screens, the Exelon MBR Entities do not have horizontal market power in PJM.

PJM East

In PJM East, the Exelon MBR Entities own or control 7,926 MW of capacity (some of which was retired during the study period), as shown in Exhibit JRS-2.

Pivotal Supplier Analysis. The Exelon MBR Entities' Installed Capacity is 7,414 MW. They are attributed 1,085 MW of imports. They are assigned 6,599 MW of load. Thus, Sellers' Uncommitted Capacity is 1,899 MW.

Total Uncommitted Supply is 13,644 MW. Wholesale Load is 6,481 MW, and Net Uncommitted Supply is 7,162 MW.

Because Sellers' Uncommitted Capacity is less than the Net Uncommitted Supply, the Pivotal Supplier Screen is passed. See Exhibit JRS-6.

Market Share Analysis. The Exelon MBR Entities' Installed Capacity ranges from 7,414 MW to 8,122 MW. They are attributed 63 MW to 1,107 MW of planned outages, 4,623 MW to 6,115 MW of load, and 479 MW to 1,014 MW of imports. Thus, Sellers' Uncommitted Capacity ranges from 2,221 MW to 3,507 MW.

Total Seasonal Uncommitted Capacity ranges from 15,906 MW to 23,432 MW.

Sellers' Market Share ranges from 14.9 to 15.3 percent. Because Sellers' Market Share is less than 20 percent in all seasons, the Market Share Screen is passed. See Exhibit JRS-7.

Thus, on the basis of the Commission's screens, the Exelon MBR Entities do not have horizontal market power in PJM East.

5004/5005

In PJM 5004/5005, the Exelon MBR Entities own or control 12,611 MW of capacity (some of which was retired during the study period), as shown in Exhibit JRS-2. This includes 545 MW of generation purchased or controlled under long-term contract, and 757 MW of long-term sales commitments.

Pivotal Supplier Analysis. The Exelon MBR Entities' Installed Capacity is 12,311 MW, their Long-Term Firm Purchases are 545 MW, and their Long-Term Sales are 757 MW. They are attributed 1,318 MW of imports. They are assigned 11,091 MW of load. Thus, Sellers' Uncommitted Capacity is 2,325 MW.

Total Uncommitted Supply is 19,479 MW. Wholesale Load is 10,014 MW, and Net Uncommitted Supply is 9,465 MW.

Because Sellers' Uncommitted Capacity is less than the Net Uncommitted Supply, the Pivotal Supplier Screen is passed. See Exhibit JRS-8.

Market Share Analysis. The Exelon MBR Entities' Installed Capacity ranges from 12,311 MW to 13,083 MW, their Long-Term Firm Purchases are 545 MW and their Long-Term Sales range from 757 MW to 760 MW. They are attributed 103 MW to 1,753 MW of planned outages, 7,805 MW to 10,288 MW of load and 578 MW to 1,175 MW of imports. Thus, Sellers' Uncommitted Capacity ranges from 2,882 MW to 4,623 MW.

Total Seasonal Uncommitted Capacity ranges from 23,115 MW to 33,618 MW.

Sellers' Market Share ranges from 12.5 to 14.0 percent. Because Sellers' Market Share is less than 20 percent in all seasons, the Market Share Screen is passed. See Exhibit JRS-9.

Thus, on the basis of the Commission's screens, the Exelon MBR Entities do not have horizontal market power in 5004/5005.

AP South

In AP South, the Exelon MBR Entities own or control 12,611 MW of capacity (some of which was retired during the study period), as shown in Exhibit JRS-2. This includes 545 MW of generation purchased or controlled under long-term contract, and 757 MW of long-term sales commitments.

Pivotal Supplier Analysis. The Exelon MBR Entities' Installed Capacity is 12,311 MW, their Long-Term Firm Purchases are 545 MW, and their Long-Term Sales are 757MW. They are attributed 1,351 MW of imports. They are attributed 11,186 MW of load. Thus, Sellers' Uncommitted Capacity is 2,263 MW.

Total Uncommitted Supply is 25,964 MW. Wholesale Load is 12,317 MW, and Net Uncommitted Supply is 13,647 MW.

Because Sellers' Uncommitted Capacity is less than the Net Uncommitted Supply, the Pivotal Supplier Screen is passed. See Exhibit JRS-10.

Market Share Analysis. The Exelon MBR Entities' Installed Capacity ranges from 12,311 MW to 13,083 MW, their Long-Term Firm Purchases are 545 MW and their Long-Term Sales range from 757 MW to 760 MW. They are attributed 103 MW to 1,753 MW of planned outages, 7,866 MW to 10,372 MW of load and 501 MW to 1,212 MW of imports. Thus, Sellers' Uncommitted Capacity ranges from 2,848 MW to 4,437 MW.

Total Seasonal Uncommitted Capacity ranges from 30,717 MW to 42,227 MW.

Sellers' Market Share ranges from 9.3 to 10.5 percent. Because Sellers' Market Share is less than 20 percent in all seasons, the Market Share Screen is passed. See Exhibit JRS-11.

Thus, on the basis of the Commission's screens, the Exelon MBR Entities do not have horizontal market power in AP South.

Because the Exelon MBR Entities pass the indicative screens in the PJM market and each of the relevant submarkets, the Exelon MBR Entities are presumed not to have horizontal market power in these markets.

Market Mitigation. As I noted earlier, there are other protections in place that further prevent market power concerns. *Order No. 697* specifically considers that Commission-approved market monitoring and mitigation in RTO/ISO markets or submarkets are relevant to the market power analysis. In *Order No. 697*, the Commission stated that it "believe[s] the added protections provided in structured markets with market monitoring and mitigation generally result in a market where prices are transparent and attempts to exercise of market power will be sufficiently mitigated."[36]

PJM – as well as the other Northeast Region RTOs – is subject to extensive Commission-approved market monitoring and mitigation, and the Commission previously has found that such market monitoring and mitigation is sufficient to address any potential market power concerns in PJM and submarkets.[37]

Further, the Exelon MBR Entities also are subject to additional behavioral commitments in PJM entered into as part of the Exelon-Constellation merger that further mitigate any horizontal market power that the Exelon MBR Entities might be deemed to possess in PJM and relevant submarkets. These behavioral commitments include (i) notification procedures for planned retirements; (ii) prescribed rules on energy market offers specific to nuclear generation, peaking generation and other types of generation; and (iii) agreement with respect to bidding ancillary services.[38] In connection with these commitments, the PJM Independent Market Monitor ("IMM") concluded that "[t]he commitments made by the Applicants in the Settlement…would alleviate the Market Monitor's concerns about the effects of the merger on PJM markets. Based on the information that the Applicants will provide to the Market Monitor…and the information available

---

36 *See Order No. 697* at PP 241-242.

37 *See*, *Baltimore Gas and Electric et al.*, Docket Nos. ER10-2172-007 *et al*., (Nov 1, 2012) (unpublished letter order), also citing to *PSEG Energy Resources & Trade*, 125 FERC ¶ 61,073 (2008).

38 *See* note 7.

to the Market Monitor under the PJM market rules, the Market Monitor will have the information needed to monitor compliance…"

Thus, the existing market monitoring and mitigation in place generally in PJM is further strengthened by the behavioral commitments agreed upon to the Exelon MBR Entities.

ISO-NE

In ISO-NE, the Exelon MBR Entities own or control 3,463 MW of capacity, as shown in Exhibit JRS-2. This includes 620 MW of generation purchased or controlled under long-term contract.

Pivotal Supplier Analysis. The Exelon MBR Entities' Installed Capacity is 2,843 MW, and their Long-Term Firm Purchases are 620 MW. They are attributed 829 MW of imports. They are assigned 3,589 MW of load. Thus, Sellers' Uncommitted Capacity is 704 MW.

Total Uncommitted Supply is 13,171 MW. Wholesale Load is 4,963 MW, and Net Uncommitted Supply is 8,207 MW.

Because Sellers' Uncommitted Capacity is less than the Net Uncommitted Supply, the Pivotal Supplier Screen is passed. See Exhibit JRS-12.

Market Share Analysis. The Exelon MBR Entities' Installed Capacity ranges from 2,843 MW to 3,363 MW, and their Long-Term Firm Purchases are 620 MW. They are attributed 17 MW to 446 MW of planned outages, 2,764 MW to 3,518 MW of load and 347 MW to 636 MW of imports. Thus, Sellers' Uncommitted Capacity ranges from 565 MW to 1,149 MW.

Total Seasonal Uncommitted Capacity ranges from 14,167 MW to 18,406 MW.

Sellers' Market Share ranges from 4.0 to 7.1 percent. Because Sellers' Market Share is less than 20 percent in all seasons, the Market Share Screen is passed. See Exhibit JRS-13.

Thus, on the basis of the Commission's screens, the Exelon MBR Entities do not have horizontal market power in ISO-NE.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

CT

In CT, the Exelon MBR Entities control 620 MW of capacity under long-term contract, as shown in Exhibit JRS-2.

Pivotal Supplier Analysis. The Exelon MBR Entities' Installed Capacity is zero, and their Long-Term Firm Purchases are 620 MW. They are assigned 1,495 MW of load and are allocated 821 MW of imports. Thus, Sellers' Uncommitted Capacity is zero.

Total Uncommitted Supply is 4,323 MW. Wholesale Load is 1,530 MW, and Net Uncommitted Supply is 2,792 MW.

Because Sellers' Uncommitted Capacity is less than the Net Uncommitted Supply, the Pivotal Supplier Screen is passed. See Exhibit JRS-14.

Market Share Analysis. The Exelon MBR Entities' Installed Capacity is zero, and their Long-Term Firm Purchases are 620 MW. They are attributed 3 MW to 69 MW of planned outages, 1,117 MW to 1,399 MW of load and 221 MW to 262 MW of imports. Thus, Sellers' Uncommitted Capacity is zero.

Total Seasonal Uncommitted Capacity ranges from 5,185 MW to 5,831 MW.

Sellers' Market Share is zero in all seasons. Because Sellers' Market Share is less than 20 percent in all seasons, the Market Share Screen is passed. See Exhibit JRS-15.

Thus, on the basis of the Commission's screens, the Exelon MBR Entities do not have horizontal market power in CT.

Because the Exelon MBR Entities pass the indicative screens in ISO-NE and the relevant submarkets, the Exelon MBR Entities are presumed not to have horizontal market power in these markets.

Market Mitigation in ISO-NE. ISO-NE also is subject to extensive Commission-approved market monitoring and mitigation, and the Commission previously has found that such market

monitoring and mitigation is sufficient to provide protection against market power concerns in ISO-NE and submarkets.[39]

NYISO

In NYISO, the Exelon MBR Entities own or control 1,926 MW of capacity, including 322 MW of Long-Term Sales, as shown in Exhibit JRS-2.

Pivotal Supplier Analysis. The Exelon MBR Entities' Installed Capacity is 2,266 MW. Their Long-Term Firm Sales are 340 MW. They are allocated 1,142 MW of imports. Thus, Sellers' Uncommitted Capacity is 3,068 MW.

Total Uncommitted Supply is 17,433 MW. Wholesale Load is 5,116 MW, and Net Uncommitted Supply is 12,318 MW.

Because Sellers' Uncommitted Capacity is less than the Net Uncommitted Supply, the Pivotal Supplier Screen is passed. See Exhibit JRS-16.

Market Share Analysis. The Exelon MBR Entities' Installed Capacity is 2,266 MW to 2,268 MW and their Long-Term Firm Sales are 340 MW. They are attributed 44 MW to 277 MW of planned outages, and 599 MW to 798 MW of imports. Thus, Sellers' Uncommitted Capacity ranges from 2,249 MW to 2,626 MW.

Total Seasonal Uncommitted Capacity ranges from 18,358 MW to 22,761 MW.

Sellers' Market Share ranges from 10.5 to 14.3 percent. Because Sellers' Market Share is less than 20 percent in all seasons, the Market Share Screen is passed. See Exhibit JRS-17.

Thus, on the basis of the Commission's screens, the Exelon MBR Entities do not have horizontal market power in NYISO.

---

[39] "As the Commission has previously found, the ISO-NE market monitoring and mitigation rules are sufficient to address market power concerns in the ISO-NE market and Connecticut submarket." (citing to *Dominion Energy Marketing, Inc.*, 125 FERC ¶ 61,070 at P 27 (2008); *NRG Power Marketing LLC*, Docket No. ER97-4281-018 (April 27, 2009) (delegated letter order)). *Dominion Energy Marketing, Inc.*, Docket No. ER01-468-012 (July 28, 2011) (unpublished letter order).

Market Mitigation in NYISO. NYISO also is subject to extensive Commission-approved market monitoring and mitigation, and the Commission previously has found that such market monitoring and mitigation is sufficient to provide protection against market power concerns in NYISO and submarkets.[40]

Change in Status (Granite Ridge)

Effective January 1, 2014, for a one-year period, Exelon Generation has entered into a tolling agreement under which it will "control" the output of the 661 MW (summer rating) Granite Ridge generating facility in ISO-NE. In anticipation of a notice of change in status that would otherwise be due within 30 days of the effective date of the tolling agreement, I include an analysis of the effect of this additional generation that will be controlled by the Exelon MBR Entities. Exhibits JRS-12 (CIS) and JRS-13 (CIS) reflect the impact of the inclusion of the Granite Ridge facility on the ISO-NE indicative screens for ISO-NE. As summarized in Exhibit JRS-3, the Market Share Analysis is passed in ISO-NE, with the Exelon MBR Entities' market share remaining below 20 percent in all seasons. The ISO-NE market also is subject to Commission-approved market monitoring and mitigation that is relevant in the context of this analysis.

Transmission

ComEd, PECO and BGE each own transmission facilities located in PJM, but those facilities are under the functional control of PJM and subject to the terms and conditions of the PJM OATT, which the Commission has deemed to mitigate a seller's transmission market power.[41] The Exelon MBR Entities own no transmission in other relevant markets other than the equipment necessary to connect their generation to the grid and thus there are no vertical concerns in relation to these facilities.

---

[40] The Commission "will consider any existing Commission-approved market monitoring and mitigation regime already in place within the RTO/ISO that provides for mitigation of the submarket…We find that the NYISO market monitoring and mitigation rules are sufficient to address market power concerns in the New York City submarket." *Canandaigua Power Partners, LLC*, 141 FERC ¶ 61,210, P 17 (2012), also citing to *Niagara Mohawk Power Corp.*, 123 FERC ¶ 61,175, at P 35 (2008).

[41] *Order No. 697* at P 21.

Barriers to Entry

The Exelon MBR Entities have no ownership or control of intrastate natural gas transportation or intrastate natural gas storage, but as described above some of them do operate natural gas distribution facilities in PJM, and have LNG facilities that are used to provide peak gas to their customers. As the Commission has determined, there is rebuttable presumption that such ownership does not allow a seller to raise entry barriers.[42] Hence, no vertical concerns are present with respect to the Exelon MBR Entities' owned natural gas distribution company.

The Exelon MBR Entities do not own or control any sites for generation capacity development that can be used to erect barriers to entry in relevant markets.[43] The Exelon MBR Entities do not own or control sources of coal supplies (except via coal supply contracts) or the transportation of coal supplies other than private rail cars for the transport of coal supplies in PJM. Here again, the Commission has determined that there is a rebuttable presumption that such ownership or control does not allow a seller to raise entry barriers. There are no other issues that raise any relevant competitive concerns.

I understand that an affirmative statement on behalf of the Exelon MBR Entities is included in their submission that they have not erected barriers to entry and will not erect barriers to entry.

Based on these facts, the Exelon MBR Entities have demonstrated a lack of vertical market power.

Since the Exelon MBR Entities lack both horizontal and vertical market power, I conclude that they satisfy the Commission's tests for market-based rate authority.

V. CONCLUSION

On the basis of the foregoing analysis, the Exelon MBR Entities satisfy the Commission's horizontal and vertical market power tests for market-based rate authority in the relevant markets.

---

42 *Id.* at P 22.

43 New plant sites owned or controlled by the Exelon MBR Entities in relevant markets and meeting the Commission's reporting thresholds have been reported by the Exelon MBR Entities in accordance with the reporting requirements of Order No. 697-C.

- Managing Director, Navigant Consulting - 2010-Present
- Vice President, Charles River Associates - 2001-2010
- Senior Vice President, Putnam, Hayes and Bartlett, Inc. and PHB Hagler Bailly, Inc., Washington, DC - 1986-2000
- Economist, Economic Consulting Services, Inc., Washington, DC - 1979-1986
- Economist, U.S. Department of Labor, Washington, DC - 1976-1979

Education

- M.B.A. Finance, The Wharton School University of Pennsylvania
- B.A. Economics, Connecticut College

Testimony

- Written testimony provided in more than 150 regulatory proceedings

Julie Solomon is a Managing Director at Navigant Consulting, Inc. in the Energy Practice's Power Systems, Markets & Pricing group. She has more than 20 years of consulting experience, specializing in the areas of regulatory and utility economics, financial analysis and business valuation. Ms. Solomon has participated in analysis of proposed regulatory reforms, supply options and utility industry restructuring in the gas and electric industries. She also has advised utility clients in corporate strategy and corporate restructuring, and consulted to legal counsel on a variety of litigation and regulatory matters, including antitrust litigation and contract disputes. She has filed testimony in numerous proceedings before the Federal Energy Regulatory Commission. Much of her current practice focuses on regulatory and market power issues concerning mergers and acquisitions and compliance filings in the electricity market.

» Advised clients in the electric and gas utility industry on competition issues, including the impact of mergers on competition. Directed a large number of analytic studies relating to obtaining merger approval from regulatory authorities.

» Advised clients in the electric utility industry on restructuring strategies, including potential mergers and acquisitions, functional unbundling and cost savings.

» Consulted in the electric and gas utility industries in a variety of regulatory and competition matters, including rate proceedings, prudence reviews, proposed regulatory reforms, analysis of supply options, privatization and restructuring.

» Advised utility and non-utility clients on many aspects of the competitive independent power industry, including strategic and financial consulting assignments.

» Consulted legal counsel on a variety of litigation matters, including the development of expert testimony on liability issues and the calculation of damages in a variety of industries.

» Provided strategic and economic analyses for clients in trade regulatory proceedings such as dumping and subsidies.

» Provided financial and business valuation analyses in a number of transactions, including fair market value for taxation purposes and valuation of family-owned businesses.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

Professional Experience

Electric and Gas Utilities

Mergers and Acquisitions (Market Power and Competition Issues)

» Advised clients and conducted analytic studies in connection with a large number of major electric and electric-gas mergers and asset transactions of regulated companies. Provided testimony to FERC for a number of these types of transactions.

» Advised clients and provided confidential pre-screening analyses for potential mergers and acquisitions.

» Conducted numerous analytic studies in connection with FERC market-based rate applications and compliance filings for electricity sellers. Provided testimony to FERC for a number of these types of transactions.

» Conducted numerous analytic studies in connection with FERC market-based rate applications and compliance filings for gas storage facilities. Provided testimony to FERC for a number of these types of transactions.

Utility Restructuring and Stranded Cost

» Conducted analytic studies and provided litigation support in connection with state stranded cost proceedings in Ohio (Cincinnati Gas & Electric and Dayton Power & Light); West Virginia (Monongahela Power and Potomac Edison); Maryland (Potomac Edison) and Pennsylvania (West Penn Power).

» Provided analytic support evaluating the benefits of Public Service of Colorado's proposed DC transmission line between Colorado and Kansas in support of a regulatory proceeding.

» Assisted in studies relating to privatization of the electricity industry in the United Kingdom, including development of a computer model to simulate electricity dispatch and project future prices, capacity needs and utility revenues under various scenarios. During temporary assignment to London office.

» Participated in antitrust litigation involving a utility and a cogenerator, including preparation of an expert report on liability and damage issues, preparation of expert witnesses for deposition, and assistance in preparation for depositions of opposing expert and in-house witnesses.

» Assisted in the valuation of the interests of several firms in various cogeneration projects for the purpose of combining these interests into a new entity or selling interests to third parties.

» Analyzed the financial feasibility and viability of a large number of cogeneration projects, assisted in the preparation of presentations and filings and presented testimony to the relevant public utility commission. Ms. Solomon also assisted in the development of a PC-based financial model to analyze various cogeneration projects.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

» Participated in a study to analyze the financial effects of a variety of restructuring options for a utility, including transfer and/or sale of assets and subsequent sale-leasebacks, and debt restructuring alternatives. In addition, she developed a PC-based financial model with applications to utility restructuring plans.

» Provided litigation support in major utility rate proceedings, including assisting in the preparation of responses to interrogatories and data requests, preparation of company and outside expert witnesses for deposition and hearings, and assistance in the deposition and cross-examination of intervenor witnesses.

» Participated in proceedings involving regulation of an oil pipeline, which included evaluating the business risks faced by the company.

Business Valuation

» Participated in a valuation study involving the fair market value of a privately held company for purposes of an IRS proceeding.

» Participated in a valuation study in a divorce proceeding, where the assets being valued included a privately held business.

» Participated in two strategic engagements that developed business plans and identified potential acquisition candidates for the client.

» Provided advice to a client concerning the benefits and potential risks of developing a partnership with a competitor.

Note: Generation ratings are based on EIA-860, unless otherwise indicated.
http://www.eia.gov/cneaf/electricity/page/eia860.html

1/ Reflects Exelon's "control" over the nuclear plants owned by its affiliate, Constellation Energy Nuclear Group, LLC ("CENG"), and the long-term agreement under which EDF Inc., the joint-owner of CENG, markets 15% of the output. Reflects uprate for Nine Mile Point 2.

2/ Ratings based on NYISO 2012 Load and Capacity Data ("Gold Book") (ratings as of 2012).

---

1 Unless otherwise indicated, generation capacity ratings (megawatts) are based on the summer seasonal ratings.

2 Facilities solely in the region administered by the Electric Reliability Council of Texas ("ERCOT") are not included herein.

3 MBR authority was not obtained for this entity, because it is a qualifying facility with a capacity of less than 20 MW *(see* 18 C.F.R. § 292.601(c)(1)).

4 The capacity rating for this entity is based on its nameplate capacity.

5 MBR authority was not obtained for this entity, because it is a qualifying facility that sells power pursuant to a PURPA contract or pursuant to a contract executed on or before March 17, 2006 *(see* 18 C.F.R. § 292.601(c)(1)).

6 ExGen has a tolling agreement for 795 MW from Green Country.

7 This generation rating reflects the full plant rating, not just Exelon's ownership share.

8 This row pertains to one or more behind-the-meter facilities that sell entirely at retail and therefore do not participate in the wholesale market.

PROTECTIVE ORDER

(Issued December __, 2013)

1. This Protective Order shall govern the use of all Protected Materials produced by, or on behalf of, any Participant. Notwithstanding any order terminating this proceeding, this Protective Order shall remain in effect until specifically modified or terminated by the Presiding Administrative Law Judge ("Presiding Judge") or the Federal Energy Regulatory Commission ("Commission").

2. This Protective Order applies to the following two categories of materials: (A) A Participant may designate as protected those materials which customarily are treated by that Participant as sensitive or proprietary, which are not available to the public, and

which, if disclosed freely, would subject that Participant or its customers to risk of competitive disadvantage or other business injury; and (B) A Participant shall designate as protected those materials which contain critical energy infrastructure information, as defined in 18 C.F.R. § 388.113(c)(1) ("Critical Energy Infrastructure Information").

3. Definitions -- For purposes of this Order:

(a) The term "Participant" shall mean a Participant as defined in 18 C.F.R. § 385.102(b).

(b)(1) The term "Protected Materials" means (A) materials (including depositions) provided by a Participant in response to discovery requests and/or filed with the Commission and, in each case, designated by such Participant as protected; (B) any information contained in or obtained from such designated materials; (C) any other materials which are made subject to this Protective Order by the Presiding Judge, by the Commission, by any court or other body having appropriate authority, or by agreement of the Participants; (D) notes of Protected Materials; and (E) copies of Protected Materials. The Participant producing the Protected Materials shall physically mark them on each page as "PROTECTED MATERIALS" or with words of similar import as long as the term "Protected Materials" is included in that designation to indicate that they are Protected Materials. If the Protected Materials contain Critical Energy Infrastructure Information, the Participant producing such information shall additionally mark on each page containing such information the words "Contains Critical Energy Infrastructure Information — Do Not Release." In addition if the Protected Materials contain market sensitive information, public disclosure of which the disclosing Participant believes in good faith would competitively harm the Participant, the disclosing Participant shall additionally mark on each page containing such information the words "HIGHLY SENSITIVE PROTECTED MATERIALS." Except for the more limited list of persons who qualify as Reviewing Representatives for purposes of reviewing Highly Sensitive Protected Materials, such materials are subject to the same provisions in the Protective Order as Protected Materials.

(2) The term "Notes of Protected Materials" means memoranda, handwritten notes, or any other form of information (including electronic form) which copies or discloses materials described in Paragraph 3(b)(1). Notes of Protected Materials are subject to the same restrictions provided in this order for Protected Materials except as specifically provided in this order.

(3) Protected Materials shall not include (A) any information or document contained in the files of the Commission (other than pursuant to this Protective Order), or any other federal or state agency, or any federal or state court, unless the information or document has been determined to be protected by such agency or court, or (B) information that is public knowledge, or which becomes public knowledge, other than through disclosure in violation of this Protective Order, or (C) any information or document labeled as "Non-Internet Public" by a Participant, in accordance with Paragraph 30 of FERC Order No. 630, FERC Stat. & Reg. & 31,140. Protected Materials

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

do include any information or document contained in the files of the Commission that has been designated as Critical Energy Infrastructure Information.

(c) The term "Non-Disclosure Certificate" shall mean the certificate annexed hereto by which Participants who have been granted access to Protected Materials shall certify their understanding that such access to Protected Materials is provided pursuant to the terms and restrictions of this Protective Order, and that such Participants have read the Protective Order and agree to be bound by it. All Non-Disclosure Certificates shall be served on all parties on the official service list maintained by the Secretary in this proceeding.

(d) The term "Reviewing Representative" shall mean a person who has signed a Non-Disclosure Certificate (to the extent required by Section 9) and:

(i) For purposes of reviewing Protected Materials (other than Highly Sensitive Protected Materials), who is

(1) Commission Staff ("Staff");

(2) an attorney who has made an appearance in this proceeding for a Participant;

(3) attorneys, paralegals, and other employees associated for purposes of this case with an attorney described in Subparagraph (2);

(4) an expert or an employee of an expert retained by a Participant for the purpose of advising, preparing for or testifying in this proceeding;

(5) a person designated as a Reviewing Representative by order of the Presiding Judge or the Commission; or

(6) employees or other representatives of Participants appearing in this proceeding with significant responsibility for this docket.

(ii) For purposes of reviewing Highly Sensitive Protected Materials, who is:

(1) Staff;

(2) Members or staff of any state or local utilities commission which is a Participant;

(3) An outside attorney who has made an appearance in this proceeding for a Participant;

(4) Attorneys, paralegals, and other employees of the firm of the outside attorney described in Paragraph 3(d)(ii)(3) working with such outside attorney for purposes of this case;

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

(5) An outside expert or an employee of an outside expert retained by a Participant for the purpose of advising, preparing for or testifying in this proceeding who is working under the direction of an attorney described in Paragraph 3(d)(ii)(2) or 3(d)(ii)(3);

(6) If, after a good faith effort, parties fail to agree on designating a specifically-named inside employee(s) of a non-governmental Participant as a Reviewing Representative for the review of specific Highly Sensitive Protected Material(s), a party may request that the Presiding Judge so-designate such a specifically-named inside employee(s) who, for example, is not directly involved in, or having direct or supervisory responsibilities over, the purchase, sale, or marketing of electricity (including transmission service) at retail or wholesale, the negotiation or development of participation or cost-sharing arrangements for transmission or generation facilities, or other activities or transactions of a type with respect to which the disclosure of Highly Sensitive Protected Materials may present an unreasonable risk of harm; or

(7) A person designated as a Reviewing Representative by order of the Presiding Judge or the Commission specifically ruling on and indicating each such person by name.

4. Protected Materials shall be made available under the terms of this Protective Order only to Participants and only through their Reviewing Representatives as provided in Paragraphs 7-9.

5. Protected Materials shall remain available to Participants until the later of the date that an order terminating this proceeding becomes no longer subject to judicial review, or the date that any other Commission proceeding relating to the Protected Material is concluded and no longer subject to judicial review. If requested to do so in writing after that date, the Participants shall, within fifteen days of such request, return the Protected Materials (excluding Notes of Protected Materials) to the Participant that produced them, or shall destroy the materials, except that copies of filings, official transcripts and exhibits in this proceeding that contain Protected Materials, and Notes of Protected Material may be retained, if they are maintained in accordance with Paragraph 6, below. Within such time period each Participant, if requested to do so, shall also submit to the producing Participant an affidavit stating that, to the best of its knowledge, all Protected Materials and all Notes of Protected Materials have been returned or have been destroyed or will be maintained in accordance with Paragraph 6. To the extent Protected Materials are not returned or destroyed, they shall remain subject to the Protective Order.

6. All Protected Materials shall be maintained by the Participant in a secure place. Access to those materials shall be limited to those Reviewing Representatives specifically authorized pursuant to Paragraphs 8-9. The Secretary shall place any Protected Materials filed with the Commission in a non-public file. By placing such documents in a non-

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

public file, the Commission is not making a determination of any claim of privilege. The Commission retains the right to make determinations regarding any claim of privilege and the discretion to release information necessary to carry out its jurisdictional responsibilities. For documents submitted to Staff, Staff shall follow the notification procedures of 18 C.F.R. § 388.112 before making public any Protected Materials.

7. Protected Materials shall be treated as confidential by each Participant and by the Reviewing Representative in accordance with the certificate executed pursuant to Paragraph 9. Protected Materials shall not be used except as necessary for the conduct of this proceeding, nor shall they be disclosed in any manner to any person except a Reviewing Representative who is engaged in the conduct of this proceeding and who needs to know the information in order to carry out that person's responsibilities in this proceeding. Reviewing Representatives may make copies of Protected Materials, but such copies become Protected Materials. Reviewing Representatives may make notes of Protected Materials, which shall be treated as Notes of Protected Materials if they disclose the contents of Protected Materials.

8. (a) If a Reviewing Representative's scope of employment includes the marketing of energy, the direct supervision of any employee or employees whose duties include the marketing of energy, the provision of consulting services to any person whose duties include the marketing of energy, or the direct supervision of any employee or employees whose duties include the marketing of energy, such Reviewing Representative may not use information contained in any Protected Materials obtained through this proceeding to give any Participant or any competitor of any Participant a commercial advantage.

(b) In the event that a Participant wishes to designate as a Reviewing Representative a person not described in Paragraph 3 (d) above, the Participant shall seek agreement from the Participant providing the Protected Materials. If an agreement is reached that person shall be a Reviewing Representative pursuant to Paragraphs 3(d) above with respect to those materials. If no agreement is reached, the Participant shall submit the disputed designation to the Presiding Judge for resolution.

9. (a) A Reviewing Representative shall not be permitted to inspect, participate in discussions regarding, or otherwise be permitted access to Protected Materials pursuant to this Protective Order unless that Reviewing Representative has first executed a Non-Disclosure Certificate; provided, that if an attorney qualified as a Reviewing Representative has executed such a certificate, the paralegals, secretarial and clerical personnel under the attorney's instruction, supervision or control need not do so. A copy of each Non-Disclosure Certificate shall be provided to counsel for the Participant asserting confidentiality prior to disclosure of any Protected Material to that Reviewing Representative. NOTWITHSTANDING THE FOREGOING, A MEMBER OF THE COMMISSION'S ADVISORY STAFF REVIEWING PROTECTED MATERIAL OR HIGHLY SENSITIVE PROTECTED MATERIAL SUBJECT TO THIS AGREEMENT IN CONNECTION WITH ITS REVIEW OF APPLICANT'S MARKET-BASED RATE AUTHORIZATION SHALL NOT BE REQUIRED TO SIGN OR RETURN A NON-DISCLOSURE CERTIFICATE.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

(b) Attorneys qualified as Reviewing Representatives are responsible for ensuring that persons under their supervision or control comply with this order.

10. Any Reviewing Representative may disclose Protected Materials to any other Reviewing Representative as long as the disclosing Reviewing Representative and the receiving Reviewing Representative both have executed a Non-Disclosure Certificate. In the event that any Reviewing Representative to whom the Protected Materials are disclosed ceases to be engaged in these proceedings, or is employed or retained for a position whose occupant is not qualified to be a Reviewing Representative under Paragraph 3(d), access to Protected Materials by that person shall be terminated. Even if no longer engaged in this proceeding, every person who has executed a Non-Disclosure Certificate shall continue to be bound by the provisions of this Protective Order and the certification.

11. Subject to Paragraph 18, the Presiding Administrative Law Judge shall resolve any disputes arising under this Protective Order. Prior to presenting any dispute under this Protective Order to the Presiding Administrative Law Judge, the parties to the dispute shall use their best efforts to resolve it. Any participant that contests the designation of materials as protected shall notify the party that provided the protected materials by specifying in writing the materials the designation of which is contested. This Protective Order shall automatically cease to apply to such materials five (5) business days after the notification is made unless the designator, within said 5-day period, files a motion with the Presiding Administrative Law Judge, with supporting affidavits, demonstrating that the materials should continue to be protected. In any challenge to the designation of materials as protected, the burden of proof shall be on the participant seeking protection. If the Presiding Administrative Law Judge finds that the materials at issue are not entitled to protection, the procedures of Paragraph 18 shall apply. The procedures described above shall not apply to protected materials designated by a Participant as Critical Energy Infrastructure Information. Materials so designated shall remain protected and subject to the provisions of this Protective Order, unless a Participant requests and obtains a determination from the Commission's Critical Energy Infrastructure Information Coordinator that such materials need not remain protected.

12. All copies of all documents reflecting Protected Materials, including the portion of the hearing testimony, exhibits, transcripts, briefs and other documents which refer to Protected Materials, shall be filed and served in sealed envelopes or other appropriate containers endorsed to the effect that they are sealed pursuant to this Protective Order. Such documents shall be marked “PROTECTED MATERIALS” and shall be filed under seal and served under seal upon the Presiding Judge and all Reviewing Representatives who are on the service list. Such documents containing Critical Energy Infrastructure Information shall be additionally marked “Contains Critical Energy Infrastructure Information — Do Not Release.” For anything filed under seal, redacted versions or, where an entire document is protected, a letter indicating such, will also be filed with the Commission and served on all parties on the service list and the Presiding Judge. Counsel for the producing Participant shall provide to all Participants who request the

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

same, a list of Reviewing Representatives who are entitled to receive such material. Counsel shall take all reasonable precautions necessary to assure that Protected Materials are not distributed to unauthorized persons.

13. If any Participant desires to include, utilize or refer to any Protected Materials or information derived therefrom in testimony or exhibits during the hearing in these proceedings in such a manner that might require disclosure of such material to persons other than reviewing representatives, such participant shall first notify both counsel for the disclosing participant and the Presiding Judge of such desire, identifying with particularity each of the Protected Materials. Thereafter, use of such Protected Material will be governed by procedures determined by the Presiding Judge.

14. Nothing in this Protective Order shall be construed as precluding any Participant from objecting to the use of Protected Materials on any legal grounds.

15. Nothing in this Protective Order shall preclude any Participant from requesting the Presiding Judge, the Commission, or any other body having appropriate authority, to find that this Protective Order should not apply to all or any materials previously designated as Protected Materials pursuant to this Protective Order. The Presiding Judge may alter or amend this Protective Order as circumstances warrant at any time during the course of this proceeding.

16. Each party governed by this Protective Order has the right to seek changes in it as appropriate from the Presiding Judge or the Commission.

17. All Protected Materials filed with the Commission, the Presiding Judge, or any other judicial or administrative body, in support of, or as a part of, a motion, other pleading, brief, or other document, shall be filed and served in sealed envelopes or other appropriate containers bearing prominent markings indicating that the contents include Protected Materials subject to this Protective Order. Such documents containing Critical Energy Infrastructure Information shall be additionally marked "Contains Critical Energy Infrastructure Information – Do Not Release."

18. If the Presiding Judge finds at any time in the course of this proceeding that all or part of the Protected Materials need not be protected, those materials shall, nevertheless, be subject to the protection afforded by this Protective Order for three (3) business days from the date of issuance of the Presiding Judge's determination, and if the Participant seeking protection files an interlocutory appeal or requests that the issue be certified to the Commission, for an additional seven (7) business days. None of the Participants waives its rights to seek additional administrative or judicial remedies after the Presiding Judge's decision respecting Protected Materials or Reviewing Representatives, or the Commission's denial of any appeal thereof. The provisions of 18 C.F.R. §§ 388.112 and 388.113 shall apply to any requests under the Freedom of Information Act. (5 U.S.C. ¶ 552) for Protected Materials in the files of the Commission.

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

19. Nothing in this Protective Order shall be deemed to preclude any Participant from independently seeking through discovery in any other administrative or judicial proceeding information or materials produced in this proceeding under this Protective Order.

20. None of the Participants waives the right to pursue any other legal or equitable remedies that may be available in the event of actual or anticipated disclosure of Protected Materials.

21. The contents of Protected Materials or any other form of information that copies or discloses Protected Materials shall not be disclosed to anyone other than in accordance with this Protective Order and shall be used only in connection with this (these) proceeding(s). Any violation of this Protective Order and of any Non-Disclosure Certificate executed hereunder shall constitute a violation of an order of the Commission.

http://www.iso-ne.com/markets/mktmonmit/rpts/ind_mkt_advsr/isone_2012_emm_rprt_final.pdf

Sufficient reserves must be held in the ISO-NE reserve zones to protect the system in case contingencies (e.g., generator outages) occur. The ISO used to hold an amount of 10-minute reserves (i.e., TMSR plus TMNSR) at the system level equal to the size of the largest generation contingency on the system. However, the ISO increased this requirement by 25 percent effective July 23, 2012, (i.e., now 125 percent of the largest generation contingency of the system) due to generator performance issues during past reserve activation events.37 Based on system conditions, the operator determines how much of the 10-minute reserve requirement to hold as spinning reserves.

The ISO holds an amount of 30-minute reserves that includes the system's 10-minute reserve (TMSR and TMNSR) requirements plus an incremental quantity of 30-minute reserves (TMOR). This total used to equal to the size of the largest generation contingency on the system plus half of the size of the second-largest contingency on the system. However, the increase in the 10-minute reserve requirement on July 23, 2012 resulted in a corresponding increase in the 30-minute reserve requirement by 25 percent of the size of the largest contingency. Since higher quality reserves may always be used to satisfy requirements for lower quality products, the entire 30-minute reserve requirement can be satisfied with TMSR or TMNSR.

In 2012, the system-wide reserve requirements averaged:
- 10-Minute Reserves: 1,370 MW prior to July 23 and 1,735 MW afterwards; and
- 30-Minute Reserves: 2,060 MW prior to July 23 and 2,430 MW afterwards.

NYISO
Locational Reserve Requirements

The NYISO shall define requirements for Spinning Reserve, which may be met only by Suppliers that are eligible to provide Spinning Reserve; 10-Minute Reserve, which may be met by Suppliers that are eligible to provide either Spinning Reserve or 10-Minute Non-Synchronized Reserve; and 30-Minute Reserve, which may be met by Suppliers that are eligible to provide any Operating Reserve product. The NYISO shall also define locational requirements for Spinning Reserve, 10-Minute Reserve, and 30-Minute Reserve located East of Central East and on Long Island as shown in the following table:

	NYCA	Eastern NY	Long Island
A=most severe NYCA Operating Capability Loss (1310 MWs)	Zone A-K	Zone F-K	Zone K
10 Minute Spinning Reserve	½ A = 655 MWs (I)	¼ A = 330 MWs (IV)	0 MWs (VII)
10 Minute Total Reserve	A = 1310 MWs (II)	1200 MWs (V)	1/10 V = 120 MWs (VIII)
30 Minute Reserve	1½ A = 1965 MWs (III)	1200 MWs (VI)	270-540 MWs (I)

I NYCA 10-minute spinning reserve is equal to at least one-half of the 10-minute total reserve. [NYS RC D-R3]

II NYCA 10-minute total reserve is equal to the operating capability loss caused by the most severe contingency under normal transfer conditions. [NYS RC D-R2]

III NYCA 30-minute total reserve is equal to one and one-half the 10-minute reserve necessary to replace the operating capability loss caused by the most severe contingency under normal transfer conditions. [NYS RC D-R2]

IV ENY 10-minute spinning reserve is based on the NERC requirement to plan to meet energy reserve requirements, including the deliverability/capability for any single Contingency and the NPCC requirement that reserves be distributed to ensure that they can be used without exceeding individual element ratings or transfer limitations. [NERC TOP-002, NPCC A-06]

V ENY 10-minute total reserve is based on Reliability Rules that require immediate measures (activation of ENY 10-minute reserves) be applied to bring loadings on an internal NY transfer interface to within limits in 15 minutes. [NYS RC F-R6]

VI ENY 30-minute total reserve is based on the NERC requirement to plan to meet energy reserve requirements, including the deliverability/capability for any single Contingency and the NPCC requirement that reserves be distributed to ensure that they can be used without exceeding individual element ratings or transfer limitations. [NERC TOP-002, NPCC A-06]

VII LI 10-minute spinning reserve is based on the NERC requirement to plan to meet energy reserve requirements, including the deliverability/capability for any single Contingency and the NPCC requirement that reserves be distributed to ensure that they can be used without exceeding individual element ratings or transfer limitations. [NERC TOP-002, NPCC A-06]

VIII LI 10-minute total reserve is based on the NERC requirement to plan to meet energy reserve requirements, including the deliverability/capability for any single Contingency and the NPCC requirement that reserves be distributed to ensure that they can be used without exceeding individual element ratings or transfer limitations. [NERC TOP-002, NPCC A-06]

IX LI 30-minute total reserve is based on Reliability Rules that require the ability to restore a transmission circuit loading to Normal Operating Criteria within 30 minutes of the contingency. The LI 30-minute reserve requirement will vary from 270MW for off-peak hours to 540MW for on-peak hours. [NYS RC F-R1]

20131230-5187 FERC PDF (Unofficial) 12/30/2013 10:48:38 AM

SIL

value progressed as PJM implemented operational procedures to mitigate associated constraints on limiting transmission equipment. While PJM would normally implement operating procedures in its AFC process only as requested and necessary to grant the next transmission service request, PJM implemented operational adjustments as part of the SIL study in order to reflect the real-time import capability of the system.

Table 2 – PJM RTO SIL Results

2012	Month	PJM SIL (MW)	LOAD (MW)
WINTER	January	10194	139759
SPRING	April	5642	116000
SUMMER	July	8434	154805
FALL	November	7029	113772

Table 3 – PJM RTO SIL Results Showing Impact of Generation Redispatch

2012 Season	PJM RTO SIL with no redispatch (MW)	PJM RTO SIL with redispatch (MW)	LOAD (MW)
WINTER	10194	****	139759
SPRING	3738	5642	116000
SUMMER	8434	****	154805
FALL	7029	****	113772

PJM uses these data to manage the OASIS-ATC when assessing transmission availability, and is consistent with PJM practices and procedures.

- The granularity of the first tier areas were represented by their respective BAs.
  - PJM calculated these SIL values based on its ability to import from each BA while simultaneously respecting the limiting elements of other BAs.
  - PJM calculated the transfer distribution factors of each BA on the network. The impact that each BA has on the other BAs was used to calculate the SIL. The SIL is a single calculation at concurrent interface limits rather than the sum of the non-simultaneous import capabilities from each BA. This process is consistent with PJM practices and procedures.

- Rudimentary operational adjustments were applied to relieve a limiting constraint if, in doing so, the overall PJM SIL could be increased. The internal constraints that were mitigated are flowgates that would not limit the ability of PJM to import from external resources. This process is consistent with PJM practices and procedures.

Table 8 below shows the results of all PJM Submarket SIL Analyses.

Table 8 –PJM Submarket SIL Results

2012 Season	Eastern		AP South		5004/5005	
	SIL (MW)	LOAD (MW)	SIL (MW)	LOAD (MW)	SIL (MW)	LOAD (MW)
WINTER	7267	24088	4888	65152	8869	46751
SPRING	4570	20459	4346	55319	5517	39606
SUMMER	6993	31056	7489	74002	7956	54843
FALL	8368	22740	7968	53545	8071	39664

The Tables 9-11 below provide the limiting element for each PJM Submarket SIL categorized by season.

III. SIL TRANSMISSION CAPABILITY

A. The ISO New England-Wide Market

To determine the SILs for the New England-wide geographic market, the ISO used the Attachment C-determined TTC values for all of the external interfaces, except for the NE/HQTE-Phase II external interface, in which case the ISO used 1400 MW to account for the transfer limit that may be imposed based on New York and PJM transmission system conditions. As explained above, the TTCs for the New England Area external interfaces are not adjusted to account for firm transmission reservations, TRM or CBM, and are as posted on the OASIS. Accordingly, the SILs for the New England-wide market for the 2012 power year, which are shown in Table 1, below, are the sum of the 1400 MW limit of the NE/HQTE-Phase II and the TTCs for the remainder external interfaces in the New England Area, and are consistent for all seasons. The SILs are indicative of what could feasibly be simultaneously imported into the New England Area in the Real-Time Energy Market. While these limits can be utilized simultaneously in the Real-Time Energy Market, the ISO does not consider this magnitude of total imports for use in other evaluations due to the historical use of the interfaces by market participants.

Table 1
SILs For New England-Wide Market*

Season/Year	Winter 2012	Spring 2012	Summer 2012	Fall 2012
SIL (MW)	4548	4548	4548	4548
Peak Load (MW)	19600	19500	25500	21100

* The peak load values reflected in this table have been rounded down

B. CT and SWCT Import Interfaces Submarkets

As discussed above, the SILs for the CT Import Interface and SWCT Import Interface for the 2012 power year are based on the limits reported in the RSP 2012.[34] The limits reported in RSP 2012 and utilized here are the all-lines-in conditions, first contingency limits at the peak load.

[34] *See* RSP 2012 at 56, notes (d) and (f). The Commission has previously found reliance on limits reported in the ISO's RSP to be acceptable. *See Northeast Utilities Service Company, et al.*, 123 FERC ¶ 61,172 at P 12 (2008) (finding use of RSP satisfies the requirements in the April 14 Order that "an applicant is required to provide a reasonable approximation of simultaneous import capability that would have been available to suppliers in surrounding first-tier markets during each seasonable peak.").

Table 2**
SILs For CT and SWCT Import Interfaces

Season/Year	Winter 2012	Spring 2012	Summer 2012	Fall 2012
CT Import SIL (MW)	2500	2500	2500	2500
CT Peak Load (MW)	4950	5860	6950	5650
SWCT Import SIL (MW)	2450***	2900***	3200	2820***
SWCT Peak Load (MW)	2450	2900	3410	2820

** The peak load values reflected in this table have been rounded down.

*** The import transfer limit for these seasons was determined to be 3200 MW. However, in accordance with Order No. 697, for purposes of determining the SILs, those limits were adjusted to be no greater than the SWCT peak load for the respective season.

IV. DOCUMENTS INCLUDED IN THIS FILING

The Supplemental Filing includes the following documents:

- This transmittal letter; and
- excel spreadsheets files:
  - ISO-NE SIL 2012 Historical Data

2012 NYISO Simultaneous Import limits

Seasonal Simultaneous Import Limit (SIL)		
2011-12 Season	NYISO Simultaneous Import Limits	NYISO System Peak Loads
Winter	8099 MW	24137 MW
Spring	7360 MW	28470 MW
Summer	7820 MW	32587 MW
Fall	8130 MW	28296 MW

Simultaneous import limits (SIL) values provided are consistent with the TTCs employed in operating the transmission system and posting availability on OASIS during the seasonal peak loads periods of 2011-12
